Appendix BIO-1: Biological Assessment

NATIONAL ENERGY TECHNOLOGY LABORATORY
Albany, OR • Morgantown, WV • Pittsburgh, PA

U.S. DEPARTMENT OF ENERGY

March 1, 2013

Thomas Leeman
Chief, San Joaquin Valley Division
U.S. Fish and Wildlife Service
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

Dear Mr. Leeman:

The U. S. Department of Energy (DOE) is proposing to provide financial assistance to construct the Hydrogen Energy California (HECA) Integrated Gasification Combined-Cycle Polygeneration Project in western Kern County, California. The enclosed biological assessment (BA) evaluates potential effects to endangered and threatened species and designated critical habitats associated with the construction and operation of the HECA Project and the related Occidental of Elk Hills, Inc. (OEHI) Project (the proposed action). A detailed description of the proposed action and the area that would be affected by the proposed action is provided in the BA.

Formal consultation was originally initiated on February 4, 2010 with the transmittal of the draft BA. The enclosed version of the BA has been revised to address comments provided by the USFWS on August 6, 2010 and subsequent project modifications.

Although the DOE is not providing financial assistance to OEHI in connection with the OEHI Project, this BA evaluates the potential effects associated with the OEHI Project during the demonstration period as reasonably foreseeable indirect effects of the proposed agency action.

As described in the enclosed BA (*2 copies*), the proposed action may affect and is likely to adversely affect, the following species that are listed under the Endangered Species Act (ESA):

- Blunt-nosed leopard lizard;
- Giant kangaroo rat;
- Tipton kangaroo rat; and
- San Joaquin kit fox.

However, the proposed action may affect, but is not likely to adversely affect, the following species that is listed as endangered under the federal ESA:

- Buena Vista Lake shrew.

There is no designated critical habitat in the action area, and the proposed action would not affect the designated critical habitat.

3610 Collins Ferry Road, P.O. Box 880, Morgantown, WV 26507
fred.pozzuto@netl.doe.gov • Voice (304) 285-5219 • Fax (304) 285-4403 • www.netl.doe.gov

The current condition and locations of the affected species are described in the BA. Potential effects would include temporary and permanent loss of habitats potentially utilized by blunt-nosed leopard lizard, giant kangaroo rat, Tipton kangaroo rat, and San Joaquin kit fox associated with the proposed action. The construction, operation, and decommissioning of the HECA Project and the OEHI Project will also disturb, and in some limited instances, result in mortality of individuals. Avoidance and minimization measures are proposed or already exist that would reduce potential take of federally listed species and provide long-term beneficial effects. These measures would avoid or minimize the potential for mortality, disturbance, and habitat degradation, as well as, other potential adverse effects on federally listed species. Additional conservation measures would restore and provide permanent protection and enhancement of habitats for federally listed species in the action area. Collectively, when implemented, these measures would avoid jeopardy of the affected species, and improve opportunities for recovery of the species.

DOE requests initiation of formal consultation under Section 7(a)(2) of the ESA. We look forward to working with you towards the successful resolution of this process. Please contact me at (304) 285-5219, or contact HECA's biological consultant, Steve Leach, at (510) 874-3205 regarding this consultation request.

Sincerely,

Fred E. Pozzuto
NEPA Compliance Officer

EXECUTIVE SUMMARY

Hydrogen Energy California LLC (HECA LLC) is proposing an Integrated Gasification Combined-Cycle polygeneration project (hereafter referred to as the HECA Project). HECA LLC is owned by SCS Energy California LLC. The HECA Project will gasify a 75 percent coal and 25 percent petroleum coke fuel blend to produce synthesis gas (syngas). Syngas produced via gasification will be purified to hydrogen-rich fuel, which will be used to generate low-carbon baseload electricity in a Combined-Cycle Power Block; low-carbon nitrogen-based fertilizer in an integrated Manufacturing Complex; and carbon dioxide (CO_2) for use in enhanced oil recovery (EOR).

The fertilizer and power produced by the HECA Project have a low-carbon footprint, because more than 90 percent of the CO_2 in the syngas is captured and approximately 3 million tons per year of CO_2 is transported via pipeline for use in EOR, which results in simultaneous sequestration (storage) of the CO_2 in a secure geologic formation (HECA, 2012). CO_2 will be transported for use in EOR in the adjacent Elk Hills Oil Field, which is owned and operated by Occidental of Elk Hills, Inc. (OEHI) (hereafter referred to as the OEHI Project). This Biological Assessment (BA) covers both the HECA Project and the OEHI Project during the period of the U.S. Department of Energy (DOE) Demonstration Period, which is explained below.

The DOE is providing financial assistance to the HECA Project under the Clean Coal Power Initiative Round 3 (CCPI) via a cost-sharing agreement with HECA LLC covering project construction and a "Demonstration Period" for the first 2 years of project operations. The DOE's financial assistance for the construction and operation of the HECA Project during the Demonstration Period is referred to herein as the proposed Agency Action. The DOE will analyze potential environmental impacts associated with the proposed Agency Action by preparing an Environmental Impact Statement pursuant to the National Environmental Policy Act (NEPA). The DOE and the California Energy Commission plan to prepare a joint Environmental Impact Statement/Environmental Impact Report equivalent to satisfy both the requirements of NEPA and the California Environmental Quality Act.

Pursuant to the federal Endangered Species Act (ESA), DOE must ensure that "any action authorized, funded, or carried out…is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat. . ." 16 U.S. Code § 1536[a][2]. Although the DOE would not have any regulatory authority over the HECA Project or the OEHI Project, the funding associated with the proposed Agency Action triggers the need for DOE to consult with the U.S. Fish and Wildlife Service pursuant to Section 7 of the ESA regarding potential effects of the proposed Agency Action on endangered or threatened species.

Accordingly, this BA has been prepared to facilitate the Section 7 consultation process. The scope of this BA covers potential effects to endangered and threatened species associated with the construction and operation of the HECA Project and the OEHI Project. Operational effects are evaluated for the 25-year life of the HECA Project, and during the Demonstration Period for the OEHI Project. Although the DOE is not providing financial assistance to OEHI in connection with the OEHI Project, this BA evaluates the potential effects associated with the OEHI Project during the Demonstration Period as reasonably foreseeable indirect effects of the proposed Agency Action.

Construction, operation, and decommissioning of the HECA Project and the OEHI Project, including associated linears (pipelines, rail spurs, transmission lines, etc.) are likely to adversely affect the following federally listed species:

- Blunt-nosed leopard lizard;
- Giant kangaroo rat;
- Tipton kangaroo rat; and
- San Joaquin kit fox.

The proposed action may affect but is not likely to adversely affect the following species that is listed as endangered under the federal ESA:

- Buena Vista Lake shrew.

These determinations are based on temporary and permanent loss, associated with the proposed action, of habitats potentially used by blunt-nosed leopard lizard, giant kangaroo rat, Tipton kangaroo rat, and San Joaquin kit fox. Construction, operation, and decommissioning of the HECA Project and the OEHI Project will also disturb—and in some limited instances, result in—mortality of individuals. Avoidance and minimization measures are proposed, or already exist, that would reduce potential take of federally listed species and provide long-term beneficial effects. These measures include actions that would avoid or minimize the potential for mortality, disturbance, habitat degradation, and other potential adverse effects on federally listed species. Additional conservation measures would restore and provide permanent protection and enhancement of habitats for federally listed species in the Action Area (defined below). Collectively, when implemented, these measures would avoid jeopardy of the affected species, and improve opportunities for recovery of the species.

1.0 INTRODUCTION

Hydrogen Energy California LLC (HECA LLC) is proposing an Integrated Gasification Combined-Cycle polygeneration project (hereafter referred to as the HECA Project). HECA LLC is owned by SCS Energy California LLC. The HECA Project will gasify a 75 percent coal and 25 percent petroleum coke (petcoke) fuel blend to produce synthesis gas (syngas). Syngas produced via gasification will be purified to hydrogen-rich fuel, which will be used to generate low-carbon baseload electricity in a Combined-Cycle Power Block, low-carbon nitrogen-based fertilizers in an integrated Manufacturing Complex, and carbon dioxide (CO_2) for use in enhanced oil recovery (EOR).

The fertilizers and power produced by the HECA Project have a low-carbon footprint because more than 90 percent of the CO_2 in the syngas is captured and approximately 3 million tons per year of CO_2 is transported via pipeline for use in EOR, which results in simultaneous sequestration (storage) of the CO_2 in a secure geologic formation (HECA, 2012). CO_2 will be transported (via a ±3.4-mile pipeline) for use in EOR in the adjacent Elk Hills Oil Field (EHOF), which is owned and operated by Occidental of Elk Hills, Inc. (OEHI) (hereafter referred to as the OEHI Project). This Biological Assessment (BA) covers both the HECA Project and the OEHI Project during the period of the U.S. Department of Energy (DOE) Demonstration Period, as explained below.

The 453-acre HECA Project Site is approximately 7 miles west of the city of Bakersfield, and approximately 2 miles northwest of the unincorporated community of Tupman in western Kern County, California (Figure 1, Project Location). The HECA Project Site is adjacent to the EHOF (Figure 2, Project Vicinity). HECA has an agreement to purchase the HECA Project Site, as well as an additional 653 acres adjacent to the HECA Project Site, herein referred to as the Controlled Area (Figure 3, Project Site Map). The HECA Project Site and Controlled Area are currently used for farming purposes, including the cultivation of cotton, alfalfa, and onions.

OEHI is proposing to extend the life of the EOR operations at its Elk Hills Unit by using CO_2 to facilitate oil production. A pipeline will be constructed to transport CO_2 from the HECA Project Site to the OEHI Project Site; it will temporarily disturb approximately 28.89 acres and permanently impact approximately 0.11 acre. In addition, the OEHI Project will include construction of a 60.61-acre CO_2 EOR processing facility; and three additional 1.06-acre Satellite Gathering Stations for CO_2 EOR and sequestration. The OEHI Project will also use existing producing and injection wells.

The DOE has proposed providing financial assistance to the HECA Project under the Clean Coal Power Initiative Round 3 (CCPI) via a cost-sharing agreement with HECA LLC, covering project construction and a "Demonstration Period" for the first 2 years of project operations.[1] The DOE's proposed financial assistance for the construction and 25-year operation of the HECA Project, as well as the construction and operation of the OEHI Project during the Demonstration Period, is referred to herein as the proposed Agency Action. The DOE will analyze potential environmental impacts associated with the proposed Agency Action by preparing an Environmental Impact Statement pursuant to the National Environmental Policy Act (NEPA).[2] The DOE and the California Energy Commission (CEC) plan to prepare a joint Environmental Impact Statement/Environmental Impact Report equivalent to satisfy both the requirements of NEPA and the California Environmental Quality Act.[3]

Pursuant to the federal Endangered Species Act (ESA), DOE must ensure that "any action authorized, funded, or carried out...is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat. . ."[4] Although the DOE would not have any regulatory authority over the HECA Project or the OEHI Project, the funding associated with the proposed Agency Action triggers the need for DOE to consult with the U.S. Fish and Wildlife Service (USFWS) pursuant to Section 7 of the ESA, regarding potential effects of the proposed Agency Action on endangered or threatened species.

Accordingly, this BA has been prepared to facilitate the Section 7 consultation process. The scope of this BA covers potential effects to endangered and threatened species associated with the construction and operation of the HECA Project. Operational effects are evaluated for the

[1] *See* DOE website, Clean Coal Power Initiative Round 3 ("On July 1, 2009, U.S. Department of Energy Secretary Steven Chu announced that projects by Basin Electric Power Cooperative and Hydrogen Energy International HECA LLC had been selected for up to $408 million in funding from the American Recovery and Reinvestment Act.") http://www.fossil.energy.gov/recovery/projects/ccpi.html. The DOE and HECA LLC entered into a Cooperative Agreement effective September 30, 2009. Under this agreement, the DOE has awarded up to $408 million in government sharing of the HECA Project costs associated with project construction and the Demonstration Period. Total HECA Project costs are estimated to be $4 billion; however, more detailed estimates are currently being prepared. *See* DOE website, DOE Signs Cooperative Agreement for New Hydrogen Power Plant, November 6, 2009, http://www.fossil.energy.gov/news/techlines/2009/09077-DOE_Signs_Cooperative_Agreement.html. The DOE financial assistance under the CCPI program relates to project construction and the Demonstration Period defined by a Cooperative Agreement between HECA LLC and the DOE.

[2] *See* DOE, Amended Notice of Intent Modifying the Scope of the Environmental Impact Statement for the Hydrogen Energy California's Integrated Gasification Combined Cycle Project, Kern County, CA, 77 Fed. Reg. 36519 (June 19, 2012).

[3] *See* 77 Fed. Reg. 36519, 36520.

[4] 16 USC § 1536[a][2]. Under the ESA, "[a]ction" is defined as "all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by federal agencies" (50 Code of Federal Regulations § 402.02). The "effects of the action" are defined as "direct and indirect effects of an action ... together with the effects of other activities that are interrelated or interdependent with that action" (50 CFR § 402.02). "Interrelated actions" are, in turn, defined by the Services' regulations as "those that are part of a larger action and depend on the larger action for their justification." Interdependent action is defined as "those that have no independent utility apart from the action under consideration" (50 CFR § 402.02). Indirect effects as "those that are caused by the proposed action and are later in time, but still are reasonably certain to occur" (50 CFR § 402.02).

25-year operation of the HECA Project, and for the OEHI Project during the Demonstration Period. Although DOE is not providing financial assistance to OEHI in connection with the OEHI Project, this BA evaluates the potential effects associated with the OEHI Project during the Demonstration Period as reasonably foreseeable indirect effects of the proposed Agency Action.

The EHOF has already been the subject of Section 7 consultation. The EHOF is currently being operated in compliance with a 1995 Biological Opinion (Appendix A) issued by the USFWS, and a related 1997 Memorandum of Understanding (MOU) between OEHI and the California Department of Fish and Game (CDFG) (Appendix B) that has twice been updated, and remains in effect until 2014 (CDFG, 1997; 1999; 2010). The earlier Section 7 consultation was undertaken in connection with the Supplemental Environmental Impact Statement/Program Environmental Impact Report for the federal government's divestment of the EHOF, and that document contemplated CO_2 EOR and associated impacts. Compliance with the 1995 USFWS Biological Opinion and the 1997 CDFG MOU has been documented in annual and semi-annual monitoring reports submitted to USFWS since 1998.

OEHI reinitiated consultations with USFWS and CDFG in 2002 to support a multi-decade Habitat Conservation Plan (HCP) for the EHOF, and anticipates the new HCP being approved by the end of 2013. The new HCP is being negotiated in contemplation of continued operations consistent with the Supplemental Environmental Impact Statement/Program Environmental Impact Report for the federal government's divestment of the EHOF. OEHI reinitiated consultations with USFWS and CDFG to support a 50-year HCP for all production operations at the field, and anticipates that the Biological Opinion and MOU will be replaced by new Section 10 and Section 2081 permits supported by the HCP at some point in the future. However, until that occurs, the Biological Opinion remains in effect indefinitely, and the MOU remains in effect until December 31, 2014.

1.1 PROJECT PURPOSE AND NEED

The DOE proposed Agency Action is to provide limited financial assistance for the development, construction, and demonstration of the HECA Project. DOE has selected the HECA Project through a competitive process under the CCPI program. The Purpose and Need for DOE's proposed Agency Action are to advance the CCPI program by funding projects that have the best chance of achieving the program's objective as established by Congress—the commercialization of clean coal technologies that advance efficiency, environmental performance, and cost competitiveness well beyond the level of technologies that are currently in commercial service. The proposed HECA Project was selected under the CCPI program as one in a portfolio of projects that would represent the most appropriate mix to achieve programmatic objectives and meet legislative requirements.

The HECA Project will be a state-of-the-art facility that will produce electricity and other useful products for California with dramatically lower carbon emissions compared to traditional facilities.

The HECA Project is needed to provide dependable, low-carbon electricity to help meet future power needs, and to help "back up" intermittent renewable power sources, such as wind and solar, to support a reliable power grid. The HECA Project is also needed to provide low-carbon nitrogen-based fertilizers.

According to DOE:

> *The project will be among the cleanest of any commercial solid fuel power plant built or under construction and will significantly exceed the emission reduction targets for 2020 established under the Energy Policy Act of 2005. In addition, emissions from the project plant will be well below the California regulation requiring baseload plants to emit less greenhouse gases than comparably-sized natural gas combined cycle power plants (U.S. Department of Energy, HECA Project Facts, November 2011).*

In addition to DOE's directive to meet emission reduction targets by 2020, California Assembly Bill 32 (AB 32) also has a directive to reduce greenhouse gas emissions to 1990 levels by 2020. AB 32 requires the California Air Resources Board to assign emissions targets to each sector in the California economy, and to develop regulatory and market methods to ensure compliance. These government actions reinforce the timeliness of the HECA Project.

The HECA Project will achieve these important environmental objectives by capturing carbon from its processes and transporting the CO_2 for use in EOR, resulting in permanent sequestration (storage) in secure geologic formations within the earth. A key factor in the siting of the HECA Project is its proximity to EHOF. The EHOF offers an opportunity to beneficially use the CO_2 for EOR. In addition, because of the extensive and long-standing operations at the EHOF, much is known about the subsurface geology, which verifies that it is an ideal location for sequestration. Finally, locating the HECA Project adjacent to the EHOF minimizes the distance the CO_2 must be transported. The proposed Project Site is also close to existing power transmission and natural gas infrastructure, as well as a viable cooling water supply, all of which minimizes the cost and impacts of associated water and natural gas pipelines and electric transmission lines.

DOE recognizes HECA's importance in advancing carbon capture and sequestration:

> *A need exists to further develop carbon management technologies that capture and store or beneficially reuse carbon dioxide (CO_2) that would otherwise be emitted into the atmosphere from coal-based electric power generating facilities. Carbon capture and storage (CCS) technologies offer great potential for reducing CO_2 emissions and mitigating global climate change, while minimizing the economic impacts of the solution. Once demonstrated, the technologies can be readily considered in the commercial market-place by the electric power industry (U.S. Department of Energy, HECA Project Facts, November 2011).*

The HECA Project will provide numerous local, state, regional, national, and global benefits, including the following:

- Promoting energy security by converting abundant and inexpensive solid fuels—petcoke and coal—to clean hydrogen fuel to produce electricity and other useful products.
- Advancing a hydrogen-based transportation system in California by increasing the supply of available hydrogen.
- Improving the reliability of California's electrical grid by generating a nominal 300 megawatts of new, low-carbon baseload electricity—enough electricity to power over 160,000 homes.
- Supporting California's agricultural industries by producing over 1 million tons per year of low-carbon fertilizer.
- Reducing greenhouse gas emissions by capturing approximately 3 million tons of CO_2 per year—equivalent to eliminating 650,000 automobiles from the road—and transporting it for use in EOR, resulting in permanent sequestration.
- Demonstrating the commercial viability of carbon capture and sequestration as a viable method for reducing the carbon footprint of power generation and manufacturing.
- Promoting energy independence by increasing California's production of oil through EOR, extracting an otherwise unrecoverable 5 million barrels of oil each year.
- Improving local groundwater quality and agricultural production by extracting, treating, and using degraded groundwater.
- Providing local jobs to an estimated 2,500 construction workers at peak construction, and to 200 fulltime employees during Project operations.
- Boosting the local and California economy through direct investment and the resulting economic activity and tax revenues in the billions of dollars.

1.2 PURPOSE OF THE BIOLOGICAL ASSESSMENT

This BA documents potential effects of the HECA Project and the OEHI Project on federally listed threatened and endangered species within the Action Area. In addition to construction effects of the proposed facilities, this BA evaluates potential effects during the 25-year operational life of the HECA Project and the 2-year Demonstration Period of the OEHI Project. The Action Area is defined in this BA as the 453-acre HECA Project Site, the 4-acre Pacific Gas and Electric Company (PG&E) switching station, the 1.15–acre water wells, the 93-acre OEHI Project Site, and the construction footprints of the associated linear facilities and adjacent areas that could be directly or indirectly affected by the proposed action (50 Code of Federal Regulations §402.02). Consistent with CEC guidelines and the federal ESA regulations, the Action Area evaluated in this BA is a 1-mile area around the HECA Project Site, a 1,000-foot area adjacent to all associated linear facilities including the CO_2 pipeline, and the OEHI Project

Site. This BA was prepared in accordance with Section 7 of the ESA (16 U.S. Code [USC] 1536 [c]), and follows the standards established in DOE NEPA guidelines.

This BA is organized into eight sections based on the USFWS recommended outline (2008). Section 1 introduces the HECA Project and OEHI Project, HECA Project benefits, as well as the purpose and need for the proposed HECA Project, as detailed above in Section 1.1. Section 2 describes the HECA Project and OEHI Project in more detail. Section 3 describes the environmental setting, including the vegetation communities within the Action Area. Section 4 describes the study methods used to identify the federally listed species that may be affected by the HECA Project and OEHI Project, and describes the life history of these species. Section 5 evaluates the potential adverse effects to these species and associated habitats. Section 6 summarizes the effects to these species and habitat, and includes an effects determination for each species. References are listed in Section 7, and the list of preparers for this BA is provided in Section 8.

The scope of this document is for use by the DOE to support consultation with the USFWS under the ESA. Potential effects on federally listed species are evaluated in accordance with Section 7 of the ESA (16 USC 1536). Criteria used to determine which species were considered for this BA and potential adverse effects to those species from HECA Project and OEHI Project activities are presented in Section 4. In addition, this BA proposes conservation measures to avoid and/or minimize mortality or disturbance to potentially affected species (Section 2).

1.3 SPECIES CONSIDERED IN THIS BIOLOGICAL ASSESSMENT

Federally listed species occurrences and associated habitats in the Action Area are identified based on the results of a literature review, comprehensive background search, and field surveys. A search of four U.S. Geological Survey (USGS) quadrangles in the HECA Project area was conducted (Appendix C); this list was reduced based on habitat and known ranges. The eight species listed as federally endangered or threatened that have the potential to occur within the Action Area are listed in Table 1 (on the following page). These federally listed species are discussed in Sections 4, 5, and 6, and are the subject of this BA. There is no designated Critical Habitat in the Action Area or the vicinity.

1.4 HISTORY OF CONSULTATION

HECA and the DOE have coordinated with the USFWS regarding the HECA Project since 2008. Consultation has included informal discussion, site visits, and formal submittals. A detailed chronology of coordination with the USFWS regarding the HECA Project and the federal Section 7 consultation process is presented below. It should be noted that the original BP/Rio Tinto Project was located in a more sensitive area; any correspondence prior to September 2010 may discuss site conditions and/or impacts that no longer apply, because the project now is being proposed in a different location.

- April 22, 2008, electronic mail from David Kisner (URS Corporation [URS]) to Susan Jones (USFWS) and James Diven (URS) regarding biological aspects in the vicinity of the Project. This discussion related to the former HECA Project Site located in Elk Hills.

Table 1
Federally Listed Species with Potential to Occur within the Action Area

Common Name	Scientific Name	Federal Status
Plants		
California jewel-flower	*Caulanthus californicus*	Endangered
Kern mallow	*Eremalche kernensis*	Endangered
San Joaquin woollythreads	*Monolopia congdonii*	Endangered
Reptiles		
Blunt-nosed leopard lizard	*Gambelia sila*	Endangered
Mammals		
Buena Vista lake shrew	*Sorex ornatus relictus*	Endangered
Giant kangaroo rat	*Dipodomys ingens*	Endangered
Tipton kangaroo rat	*Dipodomys nitratoides nitratoides*	Endangered
San Joaquin kit fox	*Vulpes macrotis mutica*	Endangered

- July 10, 2008, meeting at California CDFG Office in Fresno, California with Julie Vance (CDFG), Susan Jones (USFWS; by telephone), and Peter Cross (USFWS; by telephone). This discussion again involved the former HECA Project Site located in Elk Hills.
- October 14, 2008, Project meeting at CDFG Office in Fresno, California with Julie Vance (CDFG), Susan Jones (USFWS; by telephone), and Peter Cross (USFWS; by telephone). This discussion again involved the former HECA Project Site located in Elk Hills.
- January 29, 2009, phone conversation between Tim Kuhn (USFWS) and David Kisner (URS) regarding BA/Biological Opinion and conservation measures for the current HECA Project Site.
- June 6, 2009, site visit with Tim Kuhn (USFWS) and Julie Vance (CDFG) to review HECA Project linears and biological constraints.
- February 4, 2010, letter from R. Paul Detwiler (DOE) to Tim Kuhn (USFWS), requesting initiation of formal Section 7 consultation for the *Hydrogen Energy International Integrated Gasification Combined Cycle and Carbon Capture and Sequestration Project.*
- February 5, 2010, electronic mail and attached BA transmitted from Dale Shileikis (URS) to Tim Kuhn and Paul Detwiler on behalf of HECA.
- March 30, 2010, phone conversation between Tim Kuhn (USFWS) and David Kisner (URS) regarding BA/Biological Opinion, rare plants, Migratory Bird Treaty Act, and Coles Levee Ecological Reserve.

- April 12, 2010, CEC Data Response and Issue Resolution Workshop in Tupman, California. Public meeting with CEC (Amy Golden), USFWS (Tim Kuhn), and CDFG (Julie Vance) to discuss biological aspects of the proposed HECA Project.
- June 9, 2010, email correspondence from USFWS biologist Tim Kuhn to CEC and CDFG regarding comments on the February 5, 2010 BA for the HECA Project.
- August 6, 2010, comment letter from USFWS biologist Tim Kuhn regarding the February 8, 2010 BA for the HECA Project.
- September 15, 2010, phone conversation between Tim Kuhn (USFWS) and David Kisner (URS) regarding comments on BA, *California Aqueduct Habitat Conservation Plan*, and San Joaquin Kit Fox Recovery Area Geographic Information System (GIS) data layer.
- September 23, 2010, electronic mail transmittal from Tim Kuhn (USFWS) to David Kisner (URS) of San Joaquin Kit Fox Recovery Area GIS layer and *Draft California Aqueduct San Joaquin Field Division Habitat Conservation Plan.*
- November 2, 2010, meeting with Tim Kuhn (USFWS), U.S. Environmental Protection Agency Region IX, DOE, HECA, and URS regarding ESA consultation for the HECA Project.
- January 18, 2012, meeting with Bill Pelle, Thomas Leeman, and Dan Russell from USFWS to discuss Section 7 consultation for the HECA Project. The meeting was organized by DOE to provide an overview of the new HECA Project components for USFWS and review the potential ESA issues. Other attendees included R. Paul Detwiler (DOE), Marisa Mascaro (HECA), George Landman (HECA) and Steve Leach (URS).
- February 6, 2012, meeting at CDFG office in Fresno, California with Julie Vance (CDFG), and Annee Ferranti (CDFG). This discussion involved introducing the new project team and identifying new project components; the new project elements were discussed with regard to the known and potential biological resources in the area.
- October 17, 2012, field meeting with Thomas Leeman from USFWS to discuss Section 7 consultation for the HECA Project. The meeting included a field review of the HECA Project components for USFWS and CDFG and discussion of the potential ESA issues. Other attendees included Julie Vance (CDFG), Amy Golden (CEC), George Landman (HECA), Ed Western (HECA), Jan Novak (URS), David Kisner (URS), and Steve Leach (URS).

2.0 PROJECT DESCRIPTION

The 453-acre HECA Project Site is currently used for active agricultural purposes, including cultivation of cotton, alfalfa, and onions. HECA also has the option to purchase 653 acres adjacent to the HECA Project Site, over which HECA will control access and future land uses. The HECA Project will generate a nominal 300-megawatt output of low-carbon baseload electrical power. The HECA Project will capture more than 90 percent of the CO_2 in the production of the hydrogen fuel, and transport (via pipeline) approximately 3 million tons per year of CO_2 to the EHOF for EOR and sequestration. In addition, the HECA Project will use the hydrogen produced in the gasifier to produce low-carbon nitrogen-based fertilizer in an integrated Manufacturing Complex.

In addition to the Project Site, the HECA Project includes construction and operation of five linear facilities, which include (1) an approximately 2-mile-long electrical transmission line to a new PG&E switching station; (2) an approximately 13-mile-long natural gas interconnection with an existing PG&E natural gas pipeline; (3) an approximately 15-mile-long process water supply pipeline from the Buena Vista Water Storage District (BVWSD); (4) an approximately 1-mile-long potable water supply pipeline from West Kern Water District; and (5) an approximately 5-mile-long industrial railroad spur that will connect to the San Joaquin Valley Rail Road.

The OEHI Project will include construction and operation of three primary EOR components, including (1) an approximately 3.4-mile-long CO_2 Pipeline from HECA to the Elk Hills Oil Field; (2) a CO_2 EOR Processing Facility at the southern terminus of the CO_2 Pipeline; and (3) three Satellite Gathering Stations.

Construction activities associated with each of the HECA and OEHI project components, including avoidance, minimization, and conservation measures, are described below, followed by descriptions of operation and maintenance of the facilities and the project schedule.

2.1 CONSTRUCTION ACTIVITIES

This section describes the construction activities associated with the proposed action. The activities are organized by location.

2.1.1 Power Generating Facility

The 453-acre HECA Project Site is intensively cultivated for the production of alfalfa, cotton, and onions, and has little habitat value for native flora and fauna. In addition, the closest area with habitat value for native flora and fauna is the Kern River Flood Control Channel (KRFCC), approximately 700 feet south of the HECA Project Site. The majority of the 653-acre Controlled Area may remain in active agriculture and act as a buffer between the Project and the KRFCC. The western border of the Tule Elk State Natural Reserve is approximately 1,700 feet to the east of the HECA Project Site.

Construction activities for the HECA Project will occur throughout the 42-month construction period. All construction laydown and parking areas will be within the HECA Project Site and the Controlled Area. Onsite construction activities include clearing and grubbing, grading, hauling, layout of equipment, delivery and handling of materials and supplies, and HECA Project construction and testing operations. The HECA Project Site occurs in an area of relatively flat topography. Site grading will occur as necessary to form level building pads for major process units.

Construction site access will be via Dairy Road for truck deliveries and Adohr Road for construction craft vehicles arriving and departing the site. Initial site preparation will include construction of temporary access roads, parking, laydown areas, office and warehouse facilities, installation of erosion control measures, and other improvements necessary for construction. Erosion control measures will include construction of stormwater retention basins and related site drainage facilities to control runoff within the HECA Project Site boundary. Existing drainage patterns outside the HECA Project Site boundary will remain unchanged, and no runoff from outside the HECA Project Site boundary will flow onto the HECA Project Site.

2.1.2 Electrical Transmission Line

An electrical transmission line will interconnect the HECA Project to PG&E's future switching station. The transmission line will be constructed and owned by HECA up to the point of interconnection. The power generated by the HECA Project will be connected to the existing PG&E system by a single-tower, 230-kilovolt transmission line that will be constructed as part of the HECA Project. This single-circuit line will be connected to a new switchyard at the HECA Project Site.

The proposed electrical transmission line route is approximately 2 miles long to HECA's property boundary, and passes through previously disturbed areas or active agriculture, predominantly pistachio orchards, alfalfa, and cotton. Construction of the line will require installing approximately 26 (15 offsite and 11 onsite) tubular-steel transmission structures and the supporting foundations.

The electrical transmission line route extends east from the HECA Project Site to a new PG&E switching station (adjacent to the existing Midway-Wheeler Ridge transmission lines) as shown on Figure 4, Project Location Details. The new PG&E switching station will be constructed at the eastern terminus of the electrical transmission line, approximately 2 miles east of the HECA Project Site and next to Elk Valley Road. Access to the switching station site would be along an existing unimproved farm road from Morris Road or Elk Valley Road. The electric transmission switching station will be designed, constructed, owned, and operated by PG&E.

The area occupied by the PG&E switching station will be approximately 417 feet by 417 feet. Portions of the site will be excavated to install a grounding grid, underground control and protection cabling, and foundations. It is anticipated that "dead-end" structures to terminate the transmission line from the HECA site would be approximately 30 feet tall near the western end of the switching station site. A similar set(s) of structures at the eastern end of the station for the incoming lines from Midway and the outgoing lines to Wheeler Ridge would also be required. The height of a two-level structure would be on the order of 50 to 60 feet. The station would also have structures associated with interconnecting buses and cable "drops" to the circuit breakers. The height of these structures would be on the order of 20 to 30 feet.

Approximately 15 steel poles are expected to be required outside of the HECA Project Site. Construction of the interconnection line will consist of installing footings, poles, insular and hardware, and pulling conductor and shield wires. The new transmission line interconnection will be placed in an approximately 100-foot-wide permanent right-of-way (ROW).

Construction of the new 230-kilovolt transmission line interconnection will require approximately 3 months. It will be scheduled for completion and be operational in time for generation testing of the HECA Project. HECA will provide for the transmission line via a Large Generator Interconnection Agreement up to the point of interconnection at the future PG&E switching station.

Upon completion of the linear installation, agricultural uses may be reestablished along the linear route within the 100-foot-wide permanent ROW. Orchards would be limited to 25 feet in height within the permanent ROW.

2.1.3 Natural Gas Supply

A 13-mile natural gas linear will interconnect with a PG&E natural gas pipeline north of the HECA Project Site. The interconnect will consist of one tap off the existing natural gas line, and one metering station at the beginning of the natural gas linear adjacent to a PG&E Inlet. The metering station will be up to 100 feet by 100 feet, and 8 feet tall, surrounded by a chain-link fence. In addition, there will be a metering station at the end of the natural gas linear, on the western side of the HECA Project Site, and a pressure-limiting station on the HECA Project Site. PG&E will construct and own the natural gas pipeline.

The majority of the natural gas linear extends across areas used for active agriculture and existing roadways. However, the natural gas linear is adjacent to several areas with natural habitat value near Interstate 5 (I-5) and at the northern terminus near Magnolia Avenue.

The natural gas linear would require a 50-foot construction ROW and a 25-foot permanent ROW; however, most of the ROW would be in cultivated fields or other disturbed habitat types adjacent to paved and unpaved roads.

Wetland features adjacent to the proposed natural gas linear ROW will be avoided. Non-wetland potential waters of the U.S. within the natural gas pipeline construction limits are degraded, seasonally ponded claypan depressions. If avoidance of non-wetland waters is not feasible, the feature(s) will be temporarily disturbed by the construction activities during installation of the natural gas pipeline, and the site will be restored to pre-construction condition.

Construction of the natural gas pipeline interconnection will involve a variety of crews performing the following typical pipeline construction activities: hauling and stringing the pipe along the route; welding, radiographic inspection, and coating the pipe welds; trenching; lowering the pipe into the trench; backfilling the trench; hydrostatic testing of the pipeline; tying into the existing pipeline; purging the pipeline; and cleaning up and restoring construction areas. Roads and ROWs will be restored to specifications of the involved agencies. Open trenching will be minimized, and trenches will be covered or ramped when left overnight. In areas with habitat value and in agricultural areas, the topsoil from the trenching will be set aside, preserved, and used to cover the excavation.

Construction of the natural gas pipeline interconnection will take approximately 6 months. It will be scheduled to be finished and operational in time to provide test gas to the HECA Project. Construction will occur in accordance with a traffic management plan to minimize impacts to traffic traveling on the affected roadways. Affected areas will be restored to their original state so as to minimize erosion.

2.1.4 Water Supply Pipelines

For process water, the HECA Project will use brackish groundwater supplied by the Buena Vista Water Storage District (BVWSD) via a new 15-mile pipeline. Potable water for drinking and sanitary use will be supplied by West Kern Water District (WKWD), who will construct a new 1-mile pipeline for that purpose. Installation of the process water and potable water pipelines will involve industry standard construction activities for pipelines, including trenching; hauling and stringing of pipe along the routes; welding; radiographic inspection and coating of pipe welds; lowering welded pipe into the trench; hydrostatic testing; and backfilling and restoring the approximate surface grade. Construction of the water pipelines is expected to take approximately 6 months to complete.

Process Water Supply Pipeline

A new 15-mile, 30-inch-diameter pipeline will convey brackish groundwater supplied from the BVWSD to be used for process water by the HECA project. BVWSD will construct and own the process water supply pipeline, and approximately 14.5 miles of the pipeline will be located in an existing BVWSD ROW. The proposed process water pipeline would be constructed entirely within an existing unpaved road, or within areas that are currently actively farmed; therefore, no direct impacts to natural habitats are anticipated. Once the process water is delivered to the HECA Project Site, the brackish water will be treated on site to meet all process and utility water requirements. The process water supply pipeline will be approximately 15 miles in length and will be constructed by BVWSD.

In addition, BVWSD will own, construct, operate, and maintain the well field that will provide brackish groundwater for the HECA Project's process water supply. This well field will be in the northwestern portion of BVWSD's service area within active agricultural fields near the West Side Canal, in the vicinity of Seventh Standard Road, at the northern end of the 15-mile-long process water line. It is currently anticipated that there will be up to five groundwater extraction wells. Two of these wells will provide operational redundancy. The maximum depth of the wells will be approximately 300 feet below ground surface. The brackish water will be treated at the Project Site to meet all process and utility water requirements. The process water supply pipeline would require a 50-foot construction ROW and a 25-foot permanent ROW.

BVWSD addressed the groundwater extraction wells and the process water supply pipeline in their Draft and Final Environmental Impact Reports for BVWSD's Groundwater Management Program, issued in October 2009 and December 2009, respectively (BVWSD, 2009a; 2009b). The Final Environmental Impact Report for the Groundwater Management Program (State Clearinghouse No. 2009011008) concludes that the wells and the process water pipeline do not result in significant impacts to any federally listed species.

Potable Water Pipeline

For drinking and sanitary use, the HECA Project will use potable water supplied by WKWD. A new 4-inch-diameter potable water line will be constructed, owned, and maintained by HECA LLC.

The potable water line would be approximately 1 mile in length. This pipeline will require a 10-foot construction and permanent ROW that will be placed within the proposed electrical transmission line ROW. Most of the proposed ROW is within or adjacent to existing dirt access roads, or in cultivated fields.

2.1.5 Industrial Railroad Spur

The industrial railroad spur is approximately 5 miles long and will connect the HECA Project Site to the existing San Joaquin Valley Railroad Buttonwillow Branch (formerly called the SP Buttonwillow Branch). Two public at-grade crossings may be required, and several private crossings will be needed for farmers' access to croplands and the irrigation canal. The industrial railroad spur would require a 75-foot construction ROW, 60-foot permanent ROW, and 3-acre rail laydown area.

2.1.6 OEHI Carbon Dioxide Pipeline

An approximately 3.4-mile-long CO_2 12-inch-diameter pipeline will be constructed to transfer the CO_2 from the HECA Project Site to the OEHI CO_2 Processing Facility used by OEHI for injection into deep underground hydrocarbon reservoirs for CO_2 EOR and sequestration. Additional components of the CO_2 pipeline will include metering facilities at the pipeline origin and terminus, a cathodic protection system, and four emergency block valves. Two of the block valves will be automated and two will be manual block valves.

The CO_2 pipeline route originates at the southern portion of the HECA Project Site and will be constructed using a combination of standard open-trench installation and Horizontal Directional Drilling (HDD). One HDD will be approximately 500 feet in length under the levees associated with the West Side/Outlet Canal crossing. A second HDD will be approximately 2,000 feet long, and will be used to install the pipeline under the KRFCC and the California Aqueduct. On the southern side of the Aqueduct, the pipeline alignment extends southeast and south to the OEHI CO_2 Processing Facility, and parallels existing private roads. OEHI will construct and own the pipeline.

With the exception of HDD crossings where the depth of the CO_2 pipeline may reach 100 feet below grade, the CO_2 Pipeline will be buried approximately 5 feet below grade. Installation of the CO_2 supply pipeline will involve typical construction activities, including trenching; hauling and stringing pipe along routes; welding; radiographic inspection and coating pipe welds; lowering welded pipe into the trench; backfill of the trench; hydrostatic testing of the pipeline; purging the pipeline; and cleanup and restoration of construction areas. Grade cuts will be restored to their original contours, and affected areas will be restored to their original condition to minimize erosion. The pipeline will be protected by cathodic protection, and monitored by independent leak-detection systems.

Construction of the CO_2 pipeline is expected to take approximately 6 months to complete. The CO_2 pipeline would require a 50- to 80-foot construction ROW and a 25-foot permanent ROW.

HDD involves using a drilling rig that will bore a horizontal hole under water crossings. At each of these crossings, a laydown area (or entry/exit pit) has been identified on either side of the water course to accommodate the HDD installation (see Figure 4, Sheet 4, Project Location Details). The temporary disturbance area would be approximately 120 feet by 100 feet for each HDD entry pit; and approximately 75 feet by 100 feet for each HDD exit pit (Stantec, 2012b).

Best management practices for HDD will include silt fencing around the drill sites, energy dissipation devices for discharging water from hydrostatic testing of the pipeline, selecting drilling fluids for environmental compatibility, and removing spent fluids from the areas immediately adjacent to the water bodies for safe disposal and to prevent contamination. In addition, soil erosion control measures will be implemented to prevent runoff and impacts to water quality.

2.1.7 OEHI Carbon Dioxide EOR Processing Facility

The CO_2 from the HECA plant will be received by the CO_2 EOR Processing Facility, which will be located at the southern terminus of the CO_2 Pipeline in the southeastern quarter of Section 27S. The CO_2 EOR Processing Facility will include the Central Tank Battery (CTB), Reinjection Compression Facility (RCF), CO_2 Recovery Plant (CRP), and a Water Treatment Plant. The CO_2 EOR Processing Facility is expected to occupy and permanently disturb an area of 1,200 feet by 2,200 feet (60.61 acres). These dimensions do not include the area of the CO_2 Pipeline or the Satellite Gathering Stations.

Central Tank Battery

The CTB is the primary oil/water separation system for the CO_2 EOR process. The inlet liquid gathering lines from the Satellite Gathering Stations will be manually directed to one of the three gas separator tanks. The gas from this process will be combined with the gas from the gas separators. The oil and water will be separated, and the oil will be skimmed off and pumped to Section 18G and metered for sale. The partially treated water will be conveyed via pipeline to the existing water treating facilities.

Water Treatment Plant

The oily water from the inlet section of the CTB will be treated to remove oil, solids, and other contaminants from the produced water. The produced water will be pressurized in the injection pumps and sent to the satellites for injection. Low-pressure gas collected from the CTB will be compressed and then routed to the inlet of the RCF and the CRP for processing.

Reinjection Compression Facility

The RCF will be the first portion of the CO_2 treating/recovery facilities to be installed. Produced gas from the Satellite Gathering Stations (see Section 2.1.8) will initially flow to the RCF. At the RCF, the CO_2 gas will be dehydrated, compressed, blended with CO_2 purchased from the HECA Project, and re-injected into a closed-loop system.

CO_2 Recovery Plant

The CRP is the second part of the gas treating/recovery plant. This facility will separate CO_2 from produced hydrocarbon gas and recycle the separated CO_2. The CRP will consist of several processing units for the separation of the CO_2 from the recovered natural gas. The CRP is not expected to be constructed until 2020, and would not be part of the Demonstration Period defined by DOE.

2.1.8 OEHI Satellite Gathering Stations

The Satellite Gathering Stations (satellites, also known as Production/Well-Testing Satellites) will be a series of facilities that will provide primary separation of the oil/water and gas from the production well stream. Initially, three satellites are scheduled to be installed to handle the expected production for the first several years of the field development during the Demonstration Period. Satellites 1, 2, and 3 are each expected to have a permanent surface footprint of 230 by 200 feet. This footprint is included in the total area of the OEHI Project site evaluated in this Biological Assessment.

Each satellite will be equipped with an inlet manifold in which well flow lines associated with that satellite are connected. Flow from each well flow line will be diverted into either the production separator or the test separator via automated manual valves. The production separator is a two-phase separator to handle primary vapor liquid separation of the fluid recovered from the production wells at each satellite. The gases will be separated and routed to the inlet of the RCF. The entire field production pressure will be controlled at the RCF inlet header, and the individual satellites will “float” on that pressure.

Liquid and gas flow rates will be metered for production trending and monitoring. The test separator will be a three-phase, bucket and weir separator to allow for a 24-hour test cycle of each well serviced by that satellite. The oil and water will be controlled by level control, and the gas will be controlled by a back-pressure controller to hold the test separator pressure slightly above that of the associated production separator. Oil, water, and gas from the test separator will be re-combined and directed to the inlet manifold and then to the production separator.

2.2 OPERATION AND MAINTENANCE

This section describes the operation and maintenance of the HECA and OEHI projects.

2.2.1 HECA Project

HECA Project operation and maintenance will occur within the HECA Project Site. The adjacent Controlled Area will remain in active agriculture similar to the existing condition. Access to linears will be limited in nature, and will be along existing access roads or access roads developed during initial installation activity. HECA LLC will own, operate, and maintain the approximately 2-mile transmission line up to the interconnection with a future PG&E switching station. It is anticipated that annual maintenance of the electrical transmission line will be provided for under an agreement between PG&E and the Project. The electrical transmission line is located entirely within areas that are actively farmed or are developed. Most of the maintenance will be routine and can be scheduled during periods when damage to the crops and land can be minimized. Maintenance activities will be conducted by personnel trained to be aware of the presence of sensitive wildlife.

PG&E will own, operate, and maintain the natural gas pipeline. Maintenance of the natural gas pipeline would follow PG&E corporate policies and protocols. Long-term maintenance needs of the natural gas pipeline would be minimal during the 25-year lifespan of the Project; therefore, they are not quantified in this document.

BVWSD will own, operate, and maintain the approximately 15-mile, 30-inch-diameter process water pipeline and associated wells. Annual maintenance of the process water pipeline and associated groundwater wells would be conducted by BVWSD. Maintenance activities of the wells and the pipeline would follow BVWSD corporate policies and protocols. Long-term maintenance needs of the process water pipeline would be minimal during the 25-year lifespan of the Project, and therefore is not quantified in this document.

HECA LLC will own, operate, and maintain the approximately 1-mile potable water pipeline. Maintenance activities of the pipeline would include:

- Annual reconnaissance of the pipeline ROW;
- Annual inspection and exercising (opening and closing for one cycle) of valves, as necessary;
- Annual vegetation removal, re-grading, and application of dirt for the access road after wet periods and pipe work, as necessary; and

- Replacement of pipeline components (lining and coating, valves, and joints), as determined necessary by routine inspection.

Long-term maintenance needs of the potable water pipeline would be minimal during the 25-year lifespan of the HECA Project; therefore, they are not quantified in this document.

HECA LLC currently anticipates that it will own, operate, and maintain the approximately 5-mile railroad spur. Regardless of final ownership of the spur, maintenance activities will consist of routine annual maintenance activities and programmed maintenance conducted on a periodic basis. Annual maintenance activities consist of visual inspections, vegetation control, spot surfacing and lining of rough spots in the track, and adjusting/lubrication of turnouts. In addition, any warning devices at road crossings will be inspected as frequently as monthly.

Programmed major maintenance consists of surfacing and lining the rail line, typically every 3 to 5 years; replacing the rail, potentially once during the life of the HECA Project; and replacing 15 percent of the timber ties on a 10-year cycle. If concrete ties are used, the ties will not need to be replaced. Major maintenance activities will be conducted using on-track equipment. Replaced materials will be removed from the ROW and recycled. Timber ties will be disposed of by incineration, landfill disposal, or other approved disposal options.

2.2.2 OEHI Project

OEHI will own, operate, and maintain the CO_2 pipeline and the related components of the OEHI Project. Maintenance of the CO_2 pipeline and other EOR facilities will follow existing OEHI operational procedures as required by the existing USFWS Biological Opinion (Appendix A) and the related 1997 MOU between OEHI and the CDFG (Appendix B), which has twice been updated and remains in effect until 2014 (CDFG, 1997; 1999; 2010). The EOR facility operations will be similar to the existing facility operations by OEHI at the EHOF. Operations activities include facility inspection and maintenance. Maintenance needs of the CO_2 pipeline and associated EOR facilities would be minimal during the Demonstration Period of the Project; therefore, they are not quantified in this document.

2.3 PROPOSED CONSERVATION MEASURES

This section describes the conservation measures that are included in the HECA Project and the OEHI Project to avoid, minimize, and/or compensate for impacts on listed species.

2.3.1 HECA Project Design Modifications

The HECA Project design has been refined in coordination with the resource agencies and environmental specialists to avoid and minimize impacts on sensitive biological resources to the extent practicable. These measures include relocating the HECA Project Site from the originally proposed location to its current location across the Aqueduct to reduce impacts to the blunt-nosed leopard lizard; and relocating the natural gas pipeline to avoid portions of the Coles Levee Ecosystem Preserve. In addition, the potable water linear and electrical transmission linear were shortened and relocated to the east of the HECA Project Site, which avoided impacts to 1.9 acres of Allscale Scrub habitat.

The HECA Project also includes general and species-specific measures to avoid and minimize impacts on listed species and their habitat. For potential impacts on listed species that remain after implementation of feasible avoidance and minimization measures, comprehensive compensatory measures through habitat enhancement, establishment, and preservation are included in the Project to offset potential losses of listed species or their habitat. HECA LLC is committed to implementing these measures as part of the Project. These conservation measures are extracted from the Amended Application for Certification (AFC) submitted to the CEC in May 2012, and the corresponding numbers or mitigation measures from the 2012 Amended AFC (e.g., BIO-1, BIO-2, etc.) are provided where applicable.

2.3.2 OEHI Project Design

The proposed CO_2 pipeline crossings of the West Site Canal/Outlet Canal, the KRFCC, and the California Aqueduct will be constructed using HDD to avoid direct and indirect effects to species movement and dispersal at these locations.

OEHI will minimize impacts associated with the OEHI Project by using existing wells and previously disturbed areas to the maximum extent feasible. Avoidance and minimization will also be achieved by minimizing future land disturbance on those portions of the EHOF considered high value on the HCP multi-species map. The OEHI Project will also be implemented in compliance with the 1995 Biological Opinion issued by the USFWS (Appendix A), and a related 1997 MOU between OEHI and the CDFG, as updated (Appendix B). Finally, the OEHI Project will be implemented in compliance with a 50-year HCP for the EHOF, which is currently under development and anticipated to be approved by the end of 2013.

2.3.3 General Avoidance and Minimization Measures

HECA will implement the following general measures to avoid and minimize potential adverse effects to special-status biological resources. The OEHI Project will implement the avoidance and minimization measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between OEHI and the CDFG, as amended in 1999 and 2010; and the HCP for the EHOF, when approved.

Biological Resource Mitigation Implementation and Monitoring Plan (BIO-17)

Prior to ground-disturbing activities, HECA will develop a Biological Resource Mitigation Implementation and Monitoring Plan (BRMIMP) in coordination with the CEC, CDFG, and USFWS. The BRMIMP will identify the biological mitigation, monitoring, and compliance measures that will be implemented during construction of the HECA Project. The measures identified in the BRMIMP will address each of the avoidance and minimization measures below, in addition to the terms and conditions of the permits and approvals by the CEC, USFWS, and

CDFG. The BRMIMP will include the qualifications, responsible parties, and schedules for implementing each of the avoidance and minimization measures described below. A draft BRMIMP will be submitted to the CEC, USFWS, and CDFG for review prior to the start of ground-disturbing activities.

Construction Worker Education Program (BIO-7)

A worker education program will be implemented for all HECA Project construction personnel. These personnel will be required to read educational materials and attend an education class given by a qualified biologist. The brochure and class will describe the special-status species that could be encountered, the regulatory protection of the species, and appropriate measures to take upon discovery of a special-status species.

Construction personnel will be instructed to set equipment off the ground when possible to minimize access to small mammals. All work areas will be kept clear of trash and food items to minimize attracting wildlife. Construction techniques to minimize potential adverse impacts will also be presented, such as filling or covering excavations. If excavations are to be left open overnight, ramps will be installed to allow wildlife to escape.

The names and affiliations of all people trained will be documented, and submitted to the CEC, USFWS, and CDFG (see measure BIO-17).

Operations and Maintenance Education Program (BIO-8)

The worker education program will be implemented for HECA Project operations and maintenance personnel. Personnel will be instructed to be alert to and aware of the presence of special-status wildlife. If any special-status wildlife is spotted, activities in the vicinity of the sighting that could impact the species will be halted, and the animal allowed to move away from the activity area.

2.3.4 Special-Status Plant Avoidance, Minimization, and Conservation

The following measures will be implemented to avoid and minimize potential adverse effects to special-status plant species.

Special-Status Plant Pre-Construction Survey (BIO-1)

Qualified biologists will conduct a special-status plant pre-construction survey of the affected areas for the HECA Project and within 200 feet of the affected areas, or to the property boundary if less than 200 feet, and if permission from the adjacent landowner cannot be obtained. Surveys will be conducted according to Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities (CDFG, 2009). Special-status plants will be identified, counted, and mapped. Populations of special-status plants will be monitored through the course of the year to determine how many mature and bloom. The results of all pre-construction surveys will be documented, and submitted to the CEC, USFWS, and the CDFG (see conservation measure BIO-17).

Special-Status Plant Avoidance (BIO-2)

If listed plant species are present that will be affected by construction within the HECA Project area, direct impacts to the plants will be avoided, to the greatest extent feasible.

Special-Status Plant Mitigation (BIO-3)

During construction, construction equipment that travels off the Project Site will be cleaned to remove dirt and seeds of noxious weeds. Native plants will be reestablished in areas where construction activities temporarily disturb natural vegetation. Post-construction monitoring will be conducted, and additional control measures such as hand removal, mowing, or herbicide application will be implemented as needed to minimize the establishment of noxious or invasive species (as defined by the California Agricultural Department and/or the California Invasive Plant Council) in areas where natural vegetation was removed during construction.

For permanent impacts to populations of California Native Plant Society (CNPS)-Ranked plant species that cannot be avoided, disturbance will be timed until after available seeds can be collected. These seeds will be properly stored, and then scattered over a suitable area near the parental site just prior to the first rains of the season.

Prior to temporary disturbance of special-status plant occurrences, seeds will be collected and properly stored for replanting after completion of construction. During construction, the topsoil will be salvaged and replaced on site after construction is completed. After work is completed in that area, the topsoil will be replaced and the seeds will be redistributed prior to the first rains of the season.

Both types of the above-mentioned re-seeded areas will be demarcated in the field, mapped, and monitored post-construction for 3 years. If the re-seeded areas have not met the performance criteria established in the BRMIMP after 3 years, additional monitoring will be conducted based on coordination with the resource agencies. Monitoring will be conducted during the early spring to determine whether the target species are present and whether weed species are common. Weeding will occur if weed species appear abundant or are adversely impacting the target species. Weeding will be done in a fashion that will minimize impacts to special-status plant or animal species and other native species, but may include hand-weeding, weed-whacking, or spraying with an agency-approved herbicide.

As part of the BRMIMP, a monitoring report will be submitted by HECA to the CEC and CDFG each year for 3 years that will document the status of each population, weeding efforts that have been undertaken, and suggested work for the next season (see measure BIO-17); these reports will be available to USFWS, if requested.

It is anticipated that these measures will be sufficient to avoid significant impacts to any special-status plant species that may be present.

2.3.5 Special-Status Wildlife Avoidance and Minimization Measures

The following measures will be implemented to avoid and minimize potential adverse effects to special-status wildlife species.

Terrestrial Wildlife Pre-Construction Survey (BIO-4)

Pre-construction surveys will be conducted in affected areas that have potentially suitable habitat for blunt-nosed leopard lizard, San Joaquin kit fox, giant kangaroo rats, and Tipton's kangaroo rats. Surveys will be conducted less than 2 weeks prior to the start of ground disturbance within the affected areas and adjacent habitats within 200 feet of the affected areas, or to the property boundary if less than 200 feet, and permission from the adjacent landowner cannot be obtained. Efforts will include visual surveys for blunt-nosed leopard lizard, San Joaquin kit fox, giant kangaroo, rats and Tipton's kangaroo rats. Visual surveys will also be conducted for Buena Vista Lake shrew in areas within the process water pipeline construction limits that are adjacent to the West Side Canal and the Kern River Flood Control Channel.

All sightings and/or signs of sensitive wildlife will be mapped using a global positioning system device. The results of all pre-construction surveys will be documented, and submitted to the CEC, USFWS, and CDFG (see measure BIO-17).

Site Clearance Prior to Ground Disturbance (BIO-5)

Prior to ground-disturbing activities in undeveloped and uncultivated lands within the HECA Project area, surveys will be conducted to determine whether San Joaquin kit fox, small mammals, or blunt-nosed leopard lizards are present. To ensure that no blunt-nosed leopard lizards are taken during the initial site preparation, each area with potential habitat will be surveyed by a CEC-approved biologist according to the standard protocols for survey timing and ambient temperature. These surveys will occur prior to any ground disturbance. Exclusion fencing will be installed around the perimeter of the work area to ensure that no wildlife re-enters. Exclusion fencing will consist of tin flashing (or other material approved by CDFG and USFWS) that will be buried at least 9 inches underground, and rise at least 2 feet above the ground.

Once the exclusion fencing has been established, the area will be visually surveyed during the day for wildlife, and small mammals will be trapped and relocated (see conservation measure BIO-15) during the night. All surveying and trapping efforts will be conducted in a manner that minimizes collapsing any small mammal burrows. Tracking stations will be used to determine whether there are additional individuals in the area.

The HECA Project construction areas will be surveyed daily for blunt-nosed leopard lizards when soil and air temperatures are within CDFG survey protocol limits. An area will be deemed clear of any blunt-nosed leopard lizards after there have been no signs or sightings for 5 survey days. If a blunt-nosed leopard lizard is observed within the construction area, the exclusion fencing will be opened to allow the lizard to leave on its own accord. Once the lizard has left the area, the exclusion fencing will be closed and surveyed until there are no signs or sightings of blunt-nosed leopard lizards for 5 consecutive days.

Exclusion fencing will be left in place only for as long as needed to complete the work. For installation of the Project linears, no one area is likely to be closed for more than 6 months. The fencing will be inspected and maintained daily by the approved biologist. If the exclusion fencing is compromised (by wind or other means) and left open, an approved biologist will repair the fencing and determine if the area will need to be re-surveyed and/or re-trapped for wildlife.

To confirm that BIO-5 is successful, ground disturbance will be monitored (see measure BIO-16).

The results of the blunt-nosed lizard surveys and area clearance will be documented, and submitted to the CEC, USFWS, and CDFG (see measure BIO-17).

Predatory Bird Minimization Measures (BIO-6)

Several species of raptors and corvids (such as common ravens, American crows, and red-tailed hawks) are known to prey on blunt-nosed leopard lizards; common ravens are the most abundant potential avian predator in the Action Area. The HECA Project transmission design has been modified to incorporate elements to discourage raven nesting. For example; instead of lattice-style transmission towers, the HECA Project will use a single-pole transmission line design that minimizes potential perches and nesting sites. The proposed single-pole design is consistent with the Avian Power Line Interaction Committee's suggested practices for avian protection on power lines (APLIC, 2006).

To minimize the number of common ravens in the area, no raven will be allowed to nest in the HECA Project transmission towers within 1 mile of known blunt-nosed leopard lizard habitat. Raven nests will be removed by a CEC-approved biologist prior to egg-laying in early spring. For all bird nests removed, documentation will be prepared by HECA and submitted to the CEC, USFWS, and CDFG (see measure BIO-17).

San Joaquin Kit Fox Mitigation (BIO-14)

Disturbance (including any excavation and/or destruction) to all San Joaquin kit fox dens shall be avoided to the maximum extent possible, and shall only occur in accordance with the protocol described in the Standardized Recommendations for Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance (USFWS, 1999b), or as approved by the wildlife agencies. In essence, the following hierarchy shall be adhered to:

1. Pre-construction surveys shall be conducted by the CEC-approved biologist no less than 14 days and no more than 30 days prior to the beginning of ground disturbance and/or

construction activities or any HECA Project activity likely to impact the San Joaquin kit fox. Surveys shall identify kit fox habitat features on the HECA Project Site, and evaluate use by kit fox; and if possible, assess the potential impacts to the kit fox by the proposed activity. The status of all dens will be determined and mapped, and all appropriate equipment exclusion zones (per den type) will be demarcated in a manner that sufficiently alerts equipment operators of the exclusion zone.

2. Regardless of time of year, no natal kit fox dens will be excavated unless authorized by the Wildlife Agencies. Other den types may be excavated only by agency-approved biologists, and only after occupancy status has been determined. Excavation and/or destruction of dens would then be allowed in accordance with the procedures specified in Standardized Recommendations (USFWS, 1999b), or as approved by the wildlife agencies.

3. All known and natal kit fox dens that are slated for destruction will be replaced. Prior to destruction of an active den, artificial replacement dens will be constructed outside the buffer zone. Replaced dens will be constructed according to protocols set forth by the Wildlife Agencies. The replacement ratio will be 1:1 for non-natal dens. If excavation or destruction is approved by the Wildlife Agencies, replacement ratios will be 2:1 for natal dens.

The results of all den assessments, burrow scoping, and excavation activities will be documented, and submitted to the CEC, USFWS, and CDFG (see measure BIO-17).

Small Mammal Mitigation (BIO-15)

Construction work areas will be surveyed and small mammals will be relocated as necessary prior to any ground disturbance to minimize impacts to small mammals during the initial site preparation; work areas will be cleared in accordance with the *Survey Protocol for the Morro Bay Kangaroo Rat* (USFWS and CDFG, 1996), or as determined in consultation with either CDFG or USFWS. Areas will be secured prior to this effort so that wildlife species cannot re-enter the area (in conjunction with conservation measure BIO-5).

Small mammal trapping and relocation will be conducted for 5 consecutive nights, or until no animals are caught on 2 consecutive nights per area. The small mammal trapping surveys would occur within the construction work areas in potentially suitable habitat (alkali desert scrub, pasture, annual grassland, and barren) that contains evidence of small mammals. Traps will be set according to "sign" (burrows, trails, scat, etc.) and/or in areas of high habitat quality. Small mammal trapping and relocation will be performed by a qualified biologist(s) approved by the CEC with the necessary permits. The results of the small mammal trapping and area clearance will be documented, and submitted to the CEC, USFWS, and CDFG (see Mitigation Measure BIO-17).

2.3.6 Monitoring and Mitigation Reporting

Ground-Disturbance Monitoring for Terrestrial Wildlife (BIO-16)

Construction activities in areas with habitat value for listed species will be monitored by a qualified biologist while the top 18 inches of soil are initially disturbed. The biologist(s) will watch for any special-status animals and will have the authority to stop work if a listed wildlife species is encountered in the construction area. If authorized to remove and/or relocate the species, biologists will relocate the animal to the nearest safe location. If the species cannot be legally relocated, work at that location will be shut down and all personnel will be required to leave the area. The approved biologist will watch the wildlife in question from a distance until the individual has left the area. The results of all construction monitoring will be documented, and submitted to the CEC, USFWS, and CDFG (see Mitigation Measure BIO-17).

Reporting to Agencies (BIO-17)

During construction, a quarterly BRMIMP report will be prepared by HECA and submitted to the CEC, CDFG, and USFWS. The report will be submitted by the 20th of the following month (i.e., the report for May will be submitted by June 20). If the 20th falls on a weekend or holiday, the report will be due the first business day following the 20th. To reduce the use of paper, the BRMIMP may be submitted on compact disc (CD) or electronically, as directed by each agency.

During construction at the HECA Project Site, a CEC-approved biologist will examine active work areas every day prior to the onset of activities to ensure that no special-status species are in the area, and that all wildlife barriers are still in place. Biologists will inform the construction crews when areas are clear, and report significant observations of wildlife to the agencies, as required in the BRMIMP.

2.3.7 Habitat Compensation

HECA LLC will implement the following compensation for temporary and permanent losses of habitats used by special-status species due to construction and operation of the HECA Project. Compensation would include offsite acquisition, preservation, and enhancement of land potentially used by one or more of the affected special-status species.

HECA Project Sensitive Habitat Mitigation (BIO-18)

HECA will compensate for the permanent and temporary loss of habitats potentially used by federally and state-listed species by acquiring credits from the USFWS-approved Kern Water Bank Authority mitigation bank.

HECA LLC will acquire USFWS-approved mitigation credits that meet the habitat and/or species requirements of the federally and state-listed species that would be affected by the proposed action. The compensation proposal consists of the following components:

- Compensation for temporary habitat loss associated with construction of the natural gas pipeline: a total of 8.0 acres (credits) would be acquired to compensate for 3.7 acres of natural vegetation that would be temporarily removed during construction.
- Compensation for permanent habitat loss associated with construction of the Project Site, the railroad spur, the natural gas pipeline, and the PG&E switching station: a total of 47 acres (credits) would be acquired to compensate for the permanent loss of 466 acres of cultivated fields that may be used infrequently by San Joaquin kit fox for movement and migration.

OEHI Project Sensitive Habitat Mitigation

OEHI will provide compensation for the OEHI Project, including the CO_2 pipeline, in accordance with the 1995 USFWS Biological Opinion concerning oil production at Maximum Efficient Rate on Elk Hills Naval Petroleum Reserve (USFWS File # 1-1-95-F-102) and the draft HCP currently under review by the USFWS.

2.4 PROJECT SCHEDULE

The anticipated schedule milestones for the Project are as follows:

DOE submits Biological Assessment to USFWS .... March 2013
USFWS finalizes Biological Opinion .... May 2013
Completion of CEC permitting process .... June 2013
Commencement of pre-construction and construction activities .... June 2013
Commencement of truck deliveries and ground disturbance .... August 2013
Completion of construction .... February 2017
Commencement of pre-commissioning and commissioning .... March 2016
Commencement of commercial operation of the Project .... September 2017

3.0 ACTION AREA AND ENVIRONMENTAL SETTING

The following is a discussion of the environmental settings and biological resources currently present in the Action Area, defined in this report as the 453-acre Project Site, the 4-acre PG&E switching station, the OEHI Project Site, and the construction footprints of the associated linear facilities and associated buffers per CEC guidelines (1-mile buffer from the HECA Project Site and 1,000-foot buffer from all associated linear facilities as shown in Figure 5). Information regarding the environmental setting within 35 miles of the HECA Project Site is included when a regional perspective is required.

3.1 PROJECT SETTING

The HECA Project Site is in unincorporated Kern County approximately 2 miles northwest of the unincorporated community of Tupman, and south of Adohr Road. The land use in this portion of Kern County is resource-based oil exploration and production, which provides a large segment of the employment base. Clay mineral extraction also occurs in the area. The 453-acre HECA Project Site is comprised of portions of two agricultural parcels in Section 10 within Township 30 South, Range 24 East.

The HECA Project Site is currently used for farming purposes, including cultivation of cotton, alfalfa, and onions. Land surrounding the HECA Project Site, including the Controlled Area, is also used primarily for farming, particularly the cultivation of alfalfa and cotton. The Outlet Canal, KRFCC, and the California Aqueduct (State Water Project) are 500, 700, and 1,900 feet south of the Project Site, respectively. The western border of the Tule Elk State Natural Reserve is approximately 1,700 feet to the east of the Project Site. The nearest single-family dwellings are approximately 1,400 feet to the east. HECA LLC has an option to purchase the HECA Project Site and Controlled Area.

Land uses in the vicinity of the approximately 13-mile-long natural gas pipeline route are primarily active agricultural land (mainly alfalfa cultivation), disturbed and/or developed areas, and patches of open/undeveloped land (Allscale Scrub).

Land uses in the vicinity of the approximately 15-mile-long process water pipeline are primarily farming (mainly alfalfa, cotton, and wheat cultivation), and orchards (pistachio). Much of the land between the West Side Canal and the KRFCC is Allscale Scrub.

Land uses in the vicinity of the approximately 1-mile-long potable water pipeline consist of previously disturbed habitat and farming (mainly alfalfa, cotton, oat, and wheat cultivation).

Existing land uses in the vicinity of the approximately 2-mile-long electrical transmission line consists of previously disturbed habitat and farming (mainly alfalfa, cotton, oat, and wheat cultivation). The new PG&E switching station at the terminus of the electrical transmission line would occupy approximately 4 acres in a field that is currently cultivated for alfalfa.

The OEHI Project Site consists of approximately 64 acres that will be permanently developed during the Demonstration Period of the project, and approximately 29 acres that will be temporarily disturbed to construct the CO_2 Pipeline. The EHOF is a mix of developed lands used for oil production and undeveloped lands. Land uses in the vicinity of the OEHI Project include farming (mainly alfalfa cultivation), open/undeveloped land (Allscale Scrub; Sawyer, Keeler-Wolf, and Evens, 2009), and resource extraction (oil production). The CO_2 pipeline would cross under the West Side/Outlet Canal, KRFCC, and the California Aqueduct using HDD.

3.1.1 Existing Conservation Lands in the Project Vicinity

Existing conservation lands within 35 miles of the HECA Project Site are listed in Table 2; Figure 5, Existing Natural Resource Conservation Areas, shows those areas within 10 miles, with the exception of the *Elk Hills Unit Draft Habitat Conservation Plan* area, whose boundaries have not yet been published.

Table 2
Existing Natural Resource Conservation Areas near the HECA Project Site

Conservation Area	Approximate Distance (miles)	Direction from HECA Project Site
California Aqueduct San Joaquin Draft Habitat Conservation Plan (developed by Department of Water Resources)	0.3	Southeast
Tule Elk State Reserve	0.3	East
Lokern Ecological Reserve	0.5	South
Occidental of Elk Hills, Inc., Elk Hills Unit Draft Habitat Conservation Plan	1.0	South
Kern Water Bank	1.0	East
Coles Levee Ecosystem Preserve	3.5	Southeast
Buttonwillow Ecological Reserve	6.5	North
Buena Vista Aquatic Recreation Area	7.8	Southeast
Northern Semitropic Ridge Ecological Reserve	22.5	Northwest
Carrizo Plain National Monument	22.7	West
Kern and Pixley National Wildlife Refuges	33.4	Northwest

3.2 CRITICAL HABITAT

Neither the HECA Project nor the OEHI Project would impact any USFWS-designated critical habitat. The nearest critical habitat is for Buena Vista Lake shrew, which is more than 20 miles to the southeast of the HECA Project Site (USFWS 2005).

3.3 ONGOING ACTIVITIES

Numerous ongoing activities in the Action Area may be affecting sensitive habitat, or federally listed plants or wildlife. To the east of the California Aqueduct are areas of active agriculture, active oil and gas extraction, and areas subject to periodic flooding as part of a water-banking system. The EHOF, located south of the California Aqueduct, is one of the most productive oil fields in the western United States, with thousands of existing production wells; it has been in production for decades.

4.0 CONSIDERATION OF FEDERALLY LISTED SPECIES

This section describes the methods used to characterize the HECA Project and OEHI Project's environmental setting and biological resources, and discusses the eight federally listed species with the potential to occur within the Action Area. Giant garter snakes are also included because they historically occupied the Action Area, but are presumed to be extirpated from the area.

4.1 EVALUATION METHODS

The Action Area evaluated for biological resources includes the area within a 1-mile radius of both the 453-acre Project Site and the OEHI Project Site, as well as the area within 1,000 feet of all proposed linear facilities. The proposed linear facilities surveyed by HECA included the process and potable water line corridor, the natural gas pipeline corridor, the railroad spur, the CO_2 pipeline route, and the transmission line route, where access was granted. These surveyed areas are shown on Figure 5, Existing Natural Resource Conservation Areas. In addition to the surveys conducted by HECA, OEHI biologists conducted surveys of the current CO_2 pipeline route and associated facilities in the EHOF.

The impact assessment for biological resources included informal consultation with resource management agencies, literature review, and preliminary field surveys. The literature search included an examination of environmental documents from adjacent and nearby areas, and a review of pertinent maps, scientific literature, and regional biological field guides. Key resources and references include the following:

- Recovery Plan for Upland Species of the San Joaquin Valley, California (USFWS, 1998)
- 2001 Special-status plant species survey results at Elk Hills Oil Field, Kern County, California (Quad Knopf, 2001)
- Supplemental Environmental Information, Occidental of Elk Hills, Inc., CO_2 Enhanced Oil Recovery Project (Stantec, 2012a)
- Modified CO_2 Supply Line Alignment Data Gap Analysis (Stantec, 2012b)
- Endangered Species Program 2011 Annual Report (OEHI, 2012)
- Coles Levee Ecosystem Preserve 2007 Annual Report (Live Oak, 2008a)
- Kern Water Bank Authority Habitat Conservation Plan/Natural Community Conservation Plan 2007 Compliance Report and Management Plan (Kern Water Bank Authority, 2008)
- California Natural Diversity Database (CDFG, 2012a)

A summary of the biological resources surveys performed is provided in Table 3. Qualifications of the biologists who contributed to the BA are provided in Appendix D. Plant species observed during these field surveys are listed in Appendix E, and wildlife species observed are provided in Appendix F. Additional wildlife surveys, including protocol surveys for blunt-nosed leopard lizard, were conducted for the OEHI project components in 2012 (Stantec, 2013).

Table 3
Biological Resources Field Surveys

Resource	Field Surveys Completed	Conducted by URS Biologists(s)
General biology	Habitat assessment, small mammal evaluation, general reconnaissance conducted for the process water linear on April 13 and April 24, 2008	Alex Brown and Julian Valenzuela
General biology	Habitat assessment, small mammal evaluation, general reconnaissance conducted for the CO_2 gas linear route on May 20, 2008	David Kisner
Potential jurisdictional wetlands	Habitat assessment in the vicinity of the CO_2 linear route, conducted on March 5, 6, and 20, 2008 and May 28, 2008	David Kisner and Alyssa Berry
General biology	Habitat assessment of the Project Site on December 30, 2008	David Kisner and Cletis England
General biology	Habitat assessment of the Project Site on January 8 and 9, 2009	Cletis England, Alyssa Berry, Robin Murray, Ronald Cummings, David Compton, and Jessica Birnbaum
Special-status wildlife, and potential jurisdictional wetlands	Rare plant, wildlife, and potential jurisdictional wetlands surveys in the vicinity of the CO_2 linear on March 17, 18, and 26, 2009	David Kisner, Wayne Vogler, Alyssa Berry, and Robin Murray
Special-status plant, wildlife, and potential jurisdictional wetlands	Rare plant, wildlife, and potential jurisdictional wetlands surveys of the Project Site on March 23, 2009	David Kisner and Cletis England
Protocol blunt-nosed leopard lizard surveys and special-status plant and wildlife	April through July 2009 protocol surveys were conducted in areas within or south of the Kern River Flood Control Channel	Wayne Vogler, Kate Eldredge, Alyssa Berry, Cletis England, Robin Murray, Ronald Cummings, Jessica Birnbaum, David Kisner, and Andy Evans
Rare plant survey	April 6 through 9, 2010 Surveys were conducted in the vicinity of the CO_2 linear	David Kisner, Kate Eldredge, and Kelly Kephart
General biology survey	April 5 through 9, 19 through 21, and 28, 2010 Surveys were conducted along the electrical transmission linear	David Kisner, Kate Eldredge, Alyssa Berry, and Kelly Kephart
General biology survey	July 27 and 28, 2010 Surveys were conducted along the natural gas linear alignment	David Kisner, Ronald Cummings, Dave Compton, and Kelly Kephart
Blunt-nosed leopard lizard	Protocol adult and juvenile surveys along natural gas linear: 2010 – August 5 through September 15, 2010 2012 – May, June, July, and August, 2012	<u>2010</u> – David Kisner, Ronald Cummings, Dave Compton, Kate Eldredge, Jolie Henricks, Melissa Newman, Jane Donaldson, Mark Wilson, and Gilda Barboza <u>2012</u> – Level two biologists Chris Julian, David Kisner, and Kate Eldridge; and level one biologists Jamie Deutsch, Kelly Kephart, Johanna Kisner, Melissa Newman, Mike Carbiener, Mike Dempsey, and Jane Donaldson

Table 3
Biological Resources Field Surveys (Continued)

Resource	Field Surveys Completed	Conducted by URS Biologists(s)
Field Reconnaissance for Wetlands and Other Waters	December 7, 2010 Field review of the natural gas linear alignment	David Kisner, Jan Novak
Rare plant survey	March 15, 16, and 17, 2011 The survey was conducted along the natural gas linear alignment	David Kisner, Kelly Kephart, Johanna Kisner, Chris Julian, and Jamie Deutsch
Wetland delineation survey	March 15, 16, and 17, 2011 The survey was conducted along the natural gas linear alignment	David Kisner, Kelly Kephart, Johanna Kisner, Chris Julian, and Jamie Deutsch
Habitat Assessment Surveys/Hawk Winter Nest Structure Survey	February 23, 2012 The survey was conducted along the revised natural gas linear alignment, rail spur, and process water linear alignments	David Kisner and Steve Zembsch
Rare Plant Survey, Wetland Delineation and Habitat Assessment	March 27-30, 2012 The surveys evaluated the entire Action Area, including the Project Site and all Project linears, including the industrial rail spur alignment	Kelly Kephart, Jan Novak, and Jane Donaldson

Per CEC guidelines, a record search was performed for a 5-mile radius of the HECA Project Site, and within 1,000 feet of the HECA Project linears. Federally listed species with the potential to occur within 5 miles of the HECA Project Site or within 1,000 feet of the HECA Project linears were identified from the following data sources:

- USFWS species lists provided for each 7.5-minute USGS quadrangle in the biological resources Action Area (called the East Elk Hills and Tupman quadrangles).A search of all species occurrences in the California Natural Diversity Database (CNDDB) within a 5-mile radius of the Project Site and 1,000 feet of linears (CDFG, 2012a).
- The CNPS Inventory of Rare and Endangered Plants for the East Elk Hills and Tupman quadrangles (CNPS, 2009)
- 2001 Special-status plant species survey results at *Elk Hills Oil Field*, Kern County, California (Quad Knopf, 2001)
- Coles Levee Ecosystem Preserve 2007 Annual Report (Live Oak, 2008a)
- Kern Water Bank Authority Habitat Conservation Plan/Community Conservation Plan 2007 Compliance Report and Management Plan (Kern Water Bank Authority, 2008)
- Occidental Elk Hills Oil Field, Kern County, California Biological Database (2008).

Appendix C identifies all federally listed species with potential to occur within 5 miles of the Action Area. Table 4 shows all federally listed plant species with potential to occur within the Action Area. Table 5 is provided in Section 4.3, and identifies all the federally listed and special-status wildlife species with the potential to occur in the vicinity of the Action Area. These tables summarize the preferred habitats for species with potential to occur in the vicinity of the Action Area. Only species identified on Table 4 and Table 5 with a "low" or greater likelihood of occurrence in Action Area are discussed in more detail in the following sections.

4.2 FEDERALLY LISTED PLANT SPECIES

No federally listed plant species were detected during the 2008, 2009, 2010, 2011, or 2012 surveys conducted by HECA northeast of the California Aqueduct. Multi-year vegetation surveys of the Action Area within the EHOF by OEHI have not documented any federally listed plant species within the OEHI Project Site (Quad Knopf, 2001). Surveys conducted northeast of the California Aqueduct used the protocols set forth in the CDFG Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities (CDFG, 2009). The surveys were floristic in nature, covered an extensive study area that extended 1,000 feet from the centerline of proposed linears, and reference sites from the Lokern and Lost Hills areas were visited to confirm search images for individual species, and verify that the survey timing coincided with the blooming period for the listed plant species. Figure 6, Federally Listed Plant Species Near the Action Area, shows the species that have been identified near the Action Area; however, no listed plants are within the Action Area.

4.2.1 California Jewel-Flower (*Caulanthus californicus*)

California jewel-flower (listed as federally endangered) is an annual herb that occurs primarily in Fresno, Kern, and Tulare counties. A member of the *Brassicaceae* family, it inhabits chenopod scrub, pinyon and juniper woodlands, and valley and foothill grasslands. Its habitat ranges in elevation from 70 to 1,000 meters. The blooming period is from February to May. The decline of this species is attributable to agriculture, urbanization, energy development, and grazing, and possibly by invasion of non-native plants.

Based on the location of known populations, this species is not expected to be impacted by the HECA Project or the OEHI Project.

4.2.2 Kern Mallow (*Eremalche kernensis*)

Kern mallow (listed as federally endangered) is an annual herb that occurs primarily in Kern and Tulare counties. A member of the *Malvaceae* family, it inhabits chenopod scrub and valley and foothill grasslands. Its habitat ranges in elevation from 70 to 1,000 meters. The blooming period is from March to May. The decline of this species is attributable to conversion of habitat to agricultural use, as well as grazing and oil and gas development.

Table 4
Federally Listed Plant Species with Potential to Occur within 5 Miles of the Action Area

Common Name	Scientific Name	Federal Listing Status[1]	Likelihood of Occurrence in Action Area	Habitat Associations and Flowering/ Greatest Activity Period for Area
California jewel-flower	*Caulanthus californicus*	E	Low Recorded approximately 8 miles south of the Project Site	Chenopod scrub, pinyon and juniper woodlands, valley and foothill grasslands: February-May
Kern mallow	*Eremalche kernensis*	E	Low Recorded near the northern portion of the potable water linear	Chenopod scrub, valley and foothill grasslands: March-May
San Joaquin woollythreads	*Monolopia [Lembertia] congdonii*	E	Moderate Found approximately 2 miles to east of the Project Site	Chenopod scrub, valley and foothill grasslands: February-May
Bakersfield cactus	*Opuntia basilaris* var. *treleasei*	E	Very Low Not recorded in area	Chenopod scrub, cismontane woodland, valley and foothill grassland: April-May

Notes:
[1] E= Endangered

Table 5
Federally Listed or Candidate Wildlife Species with Potential to Occur within 5 Miles of the Action Area

Common Name	Scientific Name	Federal Listing Status	Likelihood of Occurrence in Action Area	Habitat Associations
Reptiles				
Blunt-nosed leopard lizard	*Gambelia sila*	E	Present Observed in 2008 within 1 mile south of the Project Site along the previously proposed CO_2 linear, and in 2010 near the northern terminus of the natural gas linear.	Inhabits sparsely vegetated alkali and desert scrub habitats in areas of low topographic relief. Preferred habitat includes semiarid grasslands, alkali flats, and washes.
Giant garter snake	*Thamnophis gigas*	T	Very Low Last recorded in 1940 within the region. Likely extirpated from Kern County.	Requires adequate water during its active season, herbaceous wetland vegetation as cover, openings in wetland vegetation for basking, and higher elevations for refuge from flood waters during the dormant season. Adapted to irrigation ditches and canals.
Birds				
Western snowy plover	*Charadrius alexandrinus nivosus*	T	Very Low Not found within 5 miles of Project Site.	Breeds above high tide-line on coastal beaches, sand spits, sparsely vegetated dunes, and beaches at creek or river mouths. Western snowy plovers that nest at inland sites are not considered part of the Pacific coast population.
Yellow-billed cuckoo	*Coccyzus americanus*	C	Very Low Poor nesting habitat; migrants may pass through area.	Inhabits open woodlands with clearings and a dense shrub layer. Often frequents woodlands near streams, rivers, or lakes.
Southwestern willow flycatcher	*Empidonax traillii extimus*	E	Very Low Poor nesting habitat; migrants may pass through area.	Breeds in dense riparian habitats along rivers, streams, or other wetlands.
Least Bell's vireo	*Vireo bellii pusillus*	E	Very Low Poor nesting habitat; migrants may pass through area.	Prefers dense, shrubby vegetation, woodlands, scrub oak, coastal chaparral, and mesquite brushlands, often near water in arid regions.

Table 5
Federally Listed or Candidate Wildlife Species with Potential to Occur within 5 Miles of the Action Area (Continued)

Common Name	Scientific Name	Federal Listing Status	Likelihood of Occurrence in Action Area	Habitat Associations
Mammals				
Buena Vista Lake shrew	*Sorex ornatus relictus*	E	Low Habitats in the Action Area are not suitable for this species; no freshwater marsh wetlands or riparian habitats with dense cover in the Action Area.	Inhabits valley freshwater marsh with well-developed ground layer of dead branches, leaf litter, downed logs, exposed cottonwood and willow roots, and high soil moisture.
Giant kangaroo rat	*Dipodomys ingens*	E	High Observed approximately 1 mile south of the Project Site in 1990. Per February 2012 communication with CDFG, this species is expected on the southern side of California Aqueduct, but not likely to occur east of the Aqueduct.	Saltbush scrub and sink scrub communities in the Tulare Lake Basin of the southern San Joaquin Valley. Requires soft, friable soils, which escape seasonal flooding where it will dig burrows in elevated soil mounds at the base of shrubs.
Tipton kangaroo rat	*Dipodomys nitratoides nitratoides*	E	High Previously documented within 1 mile of the Project Site and within the Action Area for the linear Project components.	Valley sink scrub and valley saltbush scrub in the Tulare basin. Sparse top moderate shrub cover is associated with high-density populations. Terrain not subject to flooding is an important factor for permanent occupancy.
San Joaquin kit fox	*Vulpes macrotis mutica*	E	Present Active dens observed in vicinity of CO_2 linear in 2008 and potential tracks/sign observed in KRFCC in 2009.	Chenopod scrub, grasslands, and other habitats. Sometimes forages in agricultural areas.

Notes:
E Federal Endangered T Federal Threatened C Federal Candidate

Based on the location of known populations, this species may be found near the process water pipeline. However, the process water pipeline would be installed within an existing dirt road, and therefore the Kern mallow is not expected to be impacted by the HECA Project or the OEHI Project.

4.2.3 San Joaquin Woollythreads (*Monolopia [Lembertia] congdonii*)

San Joaquin woollythreads (listed as federally endangered) is an annual herb that occurs primarily in Fresno, Kern, and Kings Counties. A member of the *Asteraceae* family, it inhabits chenopod scrub as well as valley and foothill grasslands. Its habitat ranges in elevation from 60 to 800 meters. The blooming period is from February to May. The decline of this species is attributable to agriculture, urbanization, oil and gas development, grazing, trampling, and vehicles.

Based on the location of known populations, this species is not expected to be impacted by the HECA Project or the OEHI Project.

4.3 FEDERALLY LISTED REPTILE SPECIES

Federally listed reptile species with the potential to occur within the Action Area are described below and shown in Table 5. Species with no suitable habitat, and those that have been extirpated in the vicinity of the Action Area, are not discussed further in this document.

4.3.1 Blunt-Nosed Leopard Lizard *(Gambelia sila)*

The blunt-nosed leopard lizard is listed as federally endangered. It inhabits sparsely vegetated alkali and desert scrub habitats. Blunt-nosed leopard lizards are carnivorous. They forage opportunistically on the ground, catching grasshoppers, cicadas, and small lizards, including smaller leopard lizards. They commonly hunt by slowly stalking prey, then rapidly dashing in to capture it.

Leopard lizards typically find shelter by using mammal burrows, shrubs, or structures such as fence posts. Females can create nests by altering unused mammal burrows to form a closed chamber below the soil surface (Tollestrup, 1983). Leopard lizard habitat is characterized by sparsely vegetated scrub and grassland habitats in flat areas. Blunt-nosed leopard lizards hibernate during the winter and are active from late March to late June or July. Metabolic rates and activity are regulated by ambient temperatures. They mate from late April through May and the females usually lay eggs between May and June. The usual clutch size is three eggs, but a clutch can range from two to six. Females usually produce one clutch per year, although occasionally a second is produced. The incubation period is approximately 57 days. Females may breed during their first spring, but males may not breed until they are large enough to secure a territory (Tollestrup, 1982; 1983).

Blunt-nosed leopard lizard populations are located in scattered sites in the San Joaquin Valley and adjacent foothills and are found between elevations of 100 to 2,400 feet (Stebbins, 2003) on alkali flats, large washes, arroyos, canyons, and low foothills. The decline of this species is primarily attributable to conversion of habitat to agricultural land. Other potential factors in the decline of blunt-nosed leopard lizard populations include predation by ravens.

No blunt-nosed leopard lizards have been observed on the Project Site or within the KRFCC area, portions of which were surveyed in 2008. Figure 7, Blunt-Nosed Leopard Lizard Occurrences Near the Action Area, shows known current blunt-nosed leopard lizard observations and the current understanding of occupied habitat within the Action Area; Figure 7 summarizes the information collected on the OEHI portion of the project over the course of 17 years of data collected for annual reporting requirements. In addition to CNDDB records, blunt-nosed leopard lizards have been observed by URS biologists at several other locations in the vicinity of the proposed HECA Project:

- In August 2008, 20 juvenile blunt-nosed leopard lizards were seen in the course of 1 day on the southwest side of the California Aqueduct, west of the proposed CO_2 pipeline.
- In 2009, a male blunt-nosed leopard lizard was seen approximately 0.2 mile west of the town of Tupman north of the east-west access road.
- In late August 2010, one blunt-nosed leopard lizard was observed approximately 0.4 mile east of the Buttonwillow Ecological Reserve.

The CO_2 pipeline south of the California Aqueduct will be constructed within habitats assumed to be used by blunt-nosed leopard lizard based on known occurrences in the vicinity. Annual surveys of the northern flank of Elk Hills for blunt-nosed leopard lizards have detected this species sporadically since 2000 (OEHI, 2012; Figure 7). Most of the recently documented occurrences of blunt-nosed leopard lizard in the Elk Hills have been on the southwestern side of the hills adjacent to the Buena Vista Valley (OEHI, 2012; Stantec, 2013).

The Kern Water Bank properties are potentially suitable for blunt-nosed leopard lizard, but may not be occupied due to the abundance of grass cover and past management activities (i.e., disking or tilling and periodic flooding). The CNDDB shows records for blunt-nosed leopard lizard on the Tule Elk Reserve approximately 0.5 mile to the south of the proposed alignment from 1990.

Protocol surveys for adults and juveniles were conducted by URS in 2012. The 2012 blunt-nosed leopard lizard surveys were conducted according to the protocols described in the California Department of Fish and Game May 2004 Approved Survey Methodology for the adult blunt-nosed leopard lizard (CDFG, 2004). Five sites along the natural gas and/or rail line shown on Figure 7 were determined to have potential habitat for blunt-nosed leopard lizards. No other habitat suitable for this species is present along the linears that will be constructed by HECA. No blunt-nosed leopard lizards were detected in the Action Area during the 2012 adult and juvenile surveys conducted on the five sites shown on Figure 7.

4.3.2 Giant Garter Snake *(Thamnophis gigas)*

The giant garter snake is a federally threatened species and is one of the largest garter snakes, attaining a total length of at least 63 inches. Females tend to be slightly longer and proportionately heavier than males. Its diet consists of small fish, tadpoles, and frogs. Adequate water during the early spring through mid-autumn to provide food and cover is an essential habitat requirement. During its active season, wetland vegetation such as cattails and bulrushes provide essential cover and foraging habitat; openings alongside waterways facilitate basking. During the dormant season of winter, giant garter snakes require higher elevation uplands for cover and safety from flood water. Throughout the dormant season, giant garter snakes inhabit small mammal burrows that lie above flood elevations. Giant garter snakes breed through March and April, and females give birth to live young from late July through early September. Brood size ranges from 10 to 46 young, with an average brood size of 23. Young immediately disperse into dense cover and absorb their yolk sacs, after which they begin foraging independently. Sexual maturity is reached at an average age of 3 years for males and 5 years for females (Stebbins, 2003).

The giant garter snake lives in agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands in the Central Valley. Due to the direct loss of natural habitat, the giant garter snake relies heavily on rice fields in the Sacramento Valley, but also uses managed marsh areas in Federal National Wildlife Refuges and State Wildlife Areas. Giant garter snakes are usually absent from larger rivers due to a dearth of suitable habitat and emergent vegetative cover, and from areas with sand, gravel, or rock substrates. Only a few recent sightings of giant garter snakes in the San Joaquin Valley are documented in the CNDDB (CDFG, 2012a).

The species is now apparently extirpated or very rare in most of its former range in the southern San Joaquin Valley. Surveys in the 1970s and 1980s yielded some previously unknown localities and several cases of extirpation or at least severe population declines (USFWS, 1993). The area of occupancy, number of sub-populations, and population size are probably continuing to decline, but the rate of decline is unknown. The decline of this species is primarily attributable to loss and degradation of habitat (USFWS, 1999a). Activities that may degrade habitat include maintenance of flood control and agricultural waterways, weed abatement, rodent control, discharge of contaminants into wetlands and waterways, and overgrazing in wetland or streamside habitats. Factors that may be significant in some areas include predation by and competition with introduced species, parasitism, and road kills (USFWS, 1999a). USFWS (1993) listed threats as habitat loss, flooding (in rice production areas), pollutants, vehicular traffic, livestock grazing, and introduced predators such as house cats and bullfrogs.

No giant garter snakes were observed during the 2008, 2009, 2010, 2011, or 2012 surveys. In addition, based on input from USFWS and CDFG, this species is presumed to be extirpated from the Action Area.

4.4 FEDERALLY LISTED MAMMAL SPECIES

No small mammal trapping was conducted to the northeast of the California Aqueduct during the 2008, 2009, 2010, 2011, or 2012 assessment surveys. Information on the small mammals in the Action Area was gained from other ongoing surveys mentioned above. There is evidence of small mammal activity, including burrows of various sizes, gopher mounds, scat, and tracks within areas of natural vegetation. Potential signs of listed mammals, such as Tipton kangaroo rat (*Dipodomys nitratoides nitratoides)* were seen within the Kern Water Bank properties.

Listed mammal activity on the OEHI property has been monitored over the course of 17 years as part of the ongoing biological monitoring (OEHI, 2012).

4.4.1 Buena Vista Lake Shrew (*Sorex ornatus relictus*)

The Buena Vista Lake shrew is a federally endangered species that inhabits the marshes of the southern San Joaquin Valley. It is a subspecies of the ornate shrew, *S. ornatus ornatus*. Shrews primarily feed on invertebrates, particularly insects. The Buena Vista Lake shrew does not cache food in burrows, and must forage frequently throughout the day and night to maintain its rapid metabolic rate. During the hottest months, activity is mostly confined to cooler periods of the day and night. The reproductive period stretches from late February through September and early October. Females of this species may have from one to eight offspring per litter, though four to six is typical. Nothing is known about the reproductive and mating system of the Buena Vista Lake shrew, but the breeding season may begin in autumn and end with the onset of the dry season in May or June (Williams and Kilburn, 1992).

The Buena Vista Lake shrew formerly occupied the marshlands of the San Joaquin Valley and the Tulare Basin. Its range has diminished due to the loss of lakes and sloughs in the area. It has been recorded from the Kern Lake Preserve area and the Kern National Wildlife Refuge. It occurred in the wetland habitats around the original historic Buena Vista, Tulare, and Kern lakes, and along streams and sloughs throughout the lake basins. Recent captures of shrews at the Kern Lake Preserve were made within a meter of the water line of Gator Pond in the shaded understory of cottonwood-willow riparian habitat, in dense stands of cattails (*Typha* spp.) and bulrushes (*Scirpus* spp.), or occasionally in dense patches of alkali heath (*Frankenia grandifolia*) (Maldonado, 1992; Maldonado et al., 1998). A partial list of plants found at many capture sites is: Fremont cottonwood (*Populus fremontii*), willow (*Salix* spp.), pickleweed (*Salicornia* sp.), alkali heath (*Frankenia grandifolia*), wild-rye (*Elymus* sp.), and Baltic rush (*Juncus balticus*). Many capture sites contain a well-developed ground layer of dead branches, leaf litter, downed logs, exposed cottonwood and willow roots, and high soil moisture. Its current distribution is unknown but is likely to be very restricted due to the loss of habitat. The decline of this species is attributable to loss of habitat due to agricultural conversion (Williams and Kilburn, 1992). Due to lack of study, information about the home range size, breeding territory size, and population densities of the shrew is lacking.

No Buena Vista Lake shrews were seen during the 2008, 2009, 2010, 2011, or 2012 surveys. Established riparian habitat that is potentially suitable for this species is approximately 1 mile southeast of the HECA Project Site; agricultural waterways which may offer marginal habitat are common within the larger Project Area. There have been observations of this species approximately 3.5 miles southeast of the HECA Project Site in 1999 (CDFG, 2012b). This species is not expected to occur in the HECA Project Site or along any of the linears; however, based on a recent observation of this species in the KRFCC, the USFWS noted during the October 17, 2012, site visit that this species might occur in the vicinity of the process water pipeline, where it is located adjacent to canals or drainage features. These canals or drainage features may offer periodic and temporary dispersal corridors between larger patches of suitable habitat; long-term occupation of the canals and drainage features is not expected due to the lack of sustained habitat, prey, and water levels.

No Buena Vista Lake shrews have been documented in the OEHI Project Site, and no shrews are expected due to the arid habitat and lack of canals, wetlands, or other water features. The proposed CO_2 Pipeline would avoid potential disturbance of the KRFCC by constructing this segment using HDD installation.

4.4.2 Giant Kangaroo Rat *(Dipodomys ingens)*

Giant kangaroo rats are nocturnal rodents that are federally endangered and occur in scattered colonies along the western side of the San Joaquin Valley. They are typically found on fine, sandy loam soils with sparse annual grass and forb vegetation, and marginally found in low-density alkali desert scrub. Their diet primarily consists of seeds, which are cached in burrows (Shaw, 1934) and green vegetation in spring. Level terrain and sandy loam soils are needed for burrowing. Optimal cover consists of areas with almost no shrub overstory, and very few physiographic variations (Grinnell, 1932; Shaw, 1934; Hawbecker, 1951).

Breeding season lasts from January to May, peaking in early spring. Litter size ranges from four to six individuals and young are born and reared in the burrows. Predators include kit foxes, badgers, coyotes, barn owls, rattlesnakes, and gopher snakes. *D. ingens* currently occupies about 2 percent of its former range (CDFG, 1980). The decline of this species is attributable to loss of habitat to cultivation and overgrazing, and the use of rodenticides (CDFG, 1980).

No giant kangaroo rats or precincts were seen during the 2008, 2009, 2010, 2011, or 2012 surveys. Figure 8, Giant Kangaroo Rat Occurrences Near the Action Area, shows all known current giant kangaroo rat observations and the current understanding of occupied habitat within the Action Area. Based on annual monitoring conducted by OEHI, it is assumed that this species may occur within the OEHI Project Site along the CO_2 pipeline, but is not expected to occur farther south within the CO_2 EOR Processing Facility area or satellite development areas.

4.4.3 Tipton Kangaroo Rat (*Dipodomys nitratoides nitratoides*)

The Tipton kangaroo rat is a federally endangered species typically found in arid-land vegetative communities with flat or gently sloping terrain located within the floor of the Tulare Basin in the southern San Joaquin Valley. Tipton kangaroo rats generally occupy grassland with scattered shrubs and desert-shrub associations on friable soils. Burrows are commonly located in slightly elevated earth, canal embankments, and bases of shrubs and fences where mobile soils gather above the level of surrounding terrain. Soft soils generally support higher densities of Tipton kangaroo rats than other soil types (Williams and Kilburn, 1992). Tipton kangaroo rats require terrain that is not subject to flooding to support a sustainable population. Reproduction occurs in the winter months, with most females giving birth to only two young.

The historical geographic range of Tipton kangaroo rats encompassed over 1.7 million acres of arid land. Their populations occupied the valley floor of the Tulare Basin throughout level or nearly level terrain. Current occurrences are restricted to scattered, isolated areas. In the southern San Joaquin Valley this includes the Kern National Wildlife Refuge, Delano, and other scattered areas within Kern County. Agricultural and residential development and the widespread use of rodenticides are principally responsible for the decline of the species (Williams and Kilburn, 1992).

No Tipton kangaroo rats were seen during the 2008, 2009, 2010, 2011, or 2012 surveys. However, signs of kangaroo rats (burrows, tail drag, foot prints, and scat) were observed within areas with suitable habitat along portions of the natural gas pipeline alignment. A local small mammal expert noted that 2010 had the highest capture rate for Tipton kangaroo rats ever recorded for the area (Warrick, 2010). Tipton kangaroo rats are assumed to be present throughout the Action Area northeast of the aqueduct in areas where suitable habitat is present. Figure 9, Tipton Kangaroo Rat Occurrences Near the Action Area, shows the locations of known Tipton kangaroo rat. Many of these records are very broad and non-specific and/or older than 20 years, but Tipton kangaroo rats could be present throughout the Action Area in areas with suitable habitat.

4.4.4 San Joaquin Kit Fox (*Vulpes macrotis mutica*)

The San Joaquin kit fox is federally listed as an endangered species (USFWS, 1999b). It historically ranged throughout the San Joaquin Valley from Contra Costa County to northern Santa Barbara County. San Joaquin kit foxes remain widely dispersed but have greatly reduced numbers and isolated populations (Williams and Kilburn, 1992). San Joaquin kit foxes primarily live in grassland and to a lesser extent, shrub and agricultural habitats. They predominantly eat rodents, ground squirrels, rabbits, hares, and ground-nesting birds. The pups are born in late winter and early spring, and the male provides most of the food for the female while she is nursing. Kit foxes change dens frequently, often enlarging existing ground squirrel burrows to create new dens. Predation or competitive exclusion of kit foxes may occur in the presence of coyotes, introduced red foxes, domestic dogs, bobcats, and large raptors. Human threats to the San Joaquin kit fox include destruction of habitat, habitat degradation, predator and pest control programs, and accidents caused by proximity to humans such as electrocution, road-kills, and suffocation from accidental burial in dens (Williams and Kilburn, 1992). Finally, natural factors such as drought, flooding, and rabies cause a significant percent of kit fox deaths.

San Joaquin kit foxes could occur throughout the region of the Project Site and linears; however, based on observations of dens, scat, and burrows during surveys from 2008 through 2010, the Elk Hills area southwest of the Kern River Flood Control Channel is likely to be the most intensively used area within the Action Area (Figure 10, San Joaquin Kit Fox Occurrences Near the Action Area). Very few kit foxes have been recorded northeast of the Kern River Flood Control Channel near the Project Site and linears in the last 20 years, based on CNDDB records (2012a). No active kit fox dens were seen in 2008, 2009, 2010, 2011, or 2012 in areas northeast of the KRFCC; numerous historic burrows were evident along the proposed natural gas pipeline alignment, but none of the burrows showed sign of recent use.

The Kern Water Bank properties have the potential to contain kit fox habitat, because they are open scrub with friable soils for digging burrows, and support a prey base of rodents. However, no burrows were seen that appeared suitable for kit fox, and coyotes were seen in this area periodically; coyotes tend to exclude kit fox from the immediate vicinity.

San Joaquin kit fox have been regularly documented in the northern portion of the OEHI Project Site along the proposed CO_2 pipeline and the CO_2 EOR Processing Facility during the course of the 17 years of monitoring in this area (OEHI, 2012). There have been no documented kit fox in the area surrounding the three satellites.

5.0 EFFECTS ANALYSIS

This section evaluates the potential effects of the proposed HECA Project and OEHI Project on federally listed species. The effects analysis addresses the federally listed plant and wildlife species described in the previous sections. Potential effects are evaluated based on the area of direct habitat disturbance (direct effect) and additional indirect effects, as defined below. This section also addresses potential cumulative effects.

5.1 DEFINITION OF EFFECTS

Potential effects of the proposed action are characterized in this section using the following terms:

- Direct effects are the immediate effects of a proposed action on a federally listed species or its habitat.
- Indirect effects are defined as "those effects that are caused by or would result from the proposed action and are later in time, but are still reasonably certain to occur" (USFWS/NMFS, 1998).
- Cumulative effects are defined as "those effects of future State or private activities, not involving Federal activities, that are reasonably certain to occur within the action area of the Federal action subject to consultation" (USFWS, 1998).

Potential effects are also characterized as either temporary or permanent in duration. Effects that would be restored to pre-construction elevations within 1 calendar year, and are not subject to active project-related disturbance are identified as temporary effects; effects that cannot be restored to pre-construction conditions within 1 calendar year or are subject to active project-related disturbance are characterized as permanent.

5.2 HABITAT DISTURBANCE

This section summarizes potential habitat disturbance that would be associated with the HECA Project and the OEHI Project. This summary focuses on habitats that are potentially used by federally listed species. Potential habitat disturbance would include permanent conversion to other habitat types (e.g., developed) and temporary removal of habitats during construction.

The HECA Project and OEHI Project would affect habitat that supports or has the potential to support federally listed wildlife species. The estimated direct impacts to habitats potentially used by federally listed species are quantified in Table 6. Construction of the natural gas and CO_2 pipelines would directly impact Natural/Ruderal (Allscale Scrub) habitat that is known to support breeding, foraging, and dispersal of federally listed species listed in the direct effects discussion below. The proposed OEHI CO_2 EOR facilities would affect habitat that has moderate multispecies habitat value in the draft Elk Hills HCP (HCP Section 5, Figure 5.1) (Stantec, 2012a). Therefore, Table 6 includes the OEHI EOR impacts under the Natural/Ruderal habitat category, based on the Demonstration Period project information provided by OEHI (Stantec, 2012c). Habitats within the HECA Project

Notes:

[1] Areas not designated as crop land or Natural/Ruderal land have been classified as Developed/Disturbed.
[2] Source: DOE Data Request – Initial Injection Phase Project Description (Stantec, 2012c).
[3] The area of temporary habitat disturbance along the portion of the natural gas linear that follows the railroad spur from the Project Site to the interconnection of the railroad with the existing San Joaquin Valley Railroad line is included in the temporary effects for the railroad spur.
[4] The area that would be permanently affected is based on five wells that would occupy approximately 100 feet by 100 feet each. The exact well locations are not known, but the entire area is assumed to be within alfalfa fields.

CO_2 = carbon dioxide
EOR = enhanced oil recovery
OEHI = Occidental of Elk Hills, Incorporated
PG&E = Pacific Gas and Electric Company

Site, process water pipeline route, and electrical transmission line route are not likely to be used by blunt-nosed leopard lizards or kangaroo rats; however, these areas may offer limited foraging opportunities and dispersal corridors for the San Joaquin kit fox.

One of the constraints associated with the OEHI Project EOR facilities is the presence of existing conservation lands, including the CDFG Lokern Ecological Reserve and other areas. The HECA and OEHI project linears have been aligned to avoid impacts to existing conservation areas and biologically significant areas.

5.2.1 Direct Effects

Direct effects are identified as either permanent or temporary, depending on the duration of disturbance. Permanent disturbance is defined as a disturbance of the substrate that results in paving or development of the surface that will not eventually revert back to natural habitat with value for plants and wildlife. A temporary disturbance implies a physical impact to an area for less than one season, and that the value of the habitat can typically be reestablished within 2 years of disturbance.

Natural habitat types within the Action Area include Allscale Scrub, which includes small patches of Allscale, Riparian Scrub, and open areas dominated by non-native grasses and fiddleneck (*Amsinckia* sp.) (Sawyer, Keeler-Wolf, and Evens, 2009). This document refers to this habitat as Natural/Ruderal habitat. The HECA Project would temporarily and/or permanently remove the following habitats:

- Agricultural lands
- Natural/Ruderal Habitat (Allscale Scrub)

Temporary and permanent direct effects to agricultural lands are not likely to adversely affect blunt-nosed leopard lizards or Tipton or giant kangaroo rats. However, agricultural lands are occasionally used by San Joaquin kit fox for movement and migration. The HECA Project would permanently remove agricultural lands that are cultivated for alfalfa, cotton, and onions. Permanent development of 435 acres of cultivated lands within the HECA Project Site, the 1.15-acre water wells, and the 4-acre PG&E switching station is assumed to have a minimal direct effect on the San Joaquin kit fox population in the region, due to the current land use practices and the distance (approximately 1 mile) from more suitable habitats in the Elk Hills area.

Construction of portions of the CO_2 and natural gas pipelines would affect Allscale Scrub that is potentially used by blunt-nosed leopard lizard, giant kangaroo rat, and San Joaquin kit fox. Approximately 3.7 acres of Natural/Ruderal habitat would be temporarily disturbed during construction of the natural gas pipeline. The OEHI Project would permanently impact 63.79 acres and temporarily impact 28.89 acres within the EHOF (Stantec, 2012a; Stantec, 2012b; and Stantec, 2012c). All of the OEHI temporary effects would be associated with the CO_2 pipeline construction, which would permanently impact approximately 0.11 acre. However, a significant portion of the EOR facilities will be located in areas of the EHOF where disturbance has already occurred, and OEHI will design project components to use existing disturbed acreage to the maximum extent feasible.

5.2.2 Indirect Effects

The proposed action could indirectly affect adjacent habitats for listed species. Indirect effects could include increased emissions of air pollutants, nitrogen deposition, erosion, dust from construction vehicles, and introduction of invasive or noxious species.

The increased emissions from the construction activities are not expected to significantly affect agricultural or natural habitats. The emissions from the construction vehicles would occur over the course of the 42-month construction schedule and are not anticipated to significantly impact the region's air quality or the vegetation and wildlife in the Action Area. The emissions from the HECA Project include emissions from the plant's heat recovery steam generator stack and cooling tower facilities. The emissions will meet regional air quality standards, and will not result in an impact to the surrounding federally listed plants or wildlife.

Erosion will be controlled by implementing the Storm Water Pollution Prevention Plan and an erosion protection plan.

Dust associated with construction will be controlled by wetting dry, friable soils in the construction area. Periodic wetting of the access routes may also prove necessary depending on the wind and weather patterns.

Ground-disturbing construction activities could potentially introduce or facilitate the establishment of noxious or invasive species. HECA LLC will implement the conservation measures described in Section 2.3 to minimize this impact. OEHI will continue to implement the terms and conditions of the 1995 USFWS Biological Opinion and the 1997 CDFG MOU that are intended to minimize potential effects on listed species.

5.3 FEDERALLY LISTED PLANT SPECIES

No federally listed plant species were detected during the 2008, 2009, 2010, 2011, or 2012 plant surveys, and no federally listed plants are expected to be directly affected by the HECA Project or OEHI Project. The federally listed California jewel-flower, Kern mallow, and San Joaquin woollythreads are known to occur in the region, but are absent from the Action Area. Surveys along the natural gas pipeline are currently being conducted by HECA; however, based on site visits and existing data, no federally listed plants are expected in this area. If any federally listed plant species are found along the natural gas pipeline, the USFWS will be informed immediately and the population will be avoided by rerouting the pipeline, and/or reducing the construction corridor (see conservation measure BIO-3). Additional information will be provided to USFWS following the completion of the surveys.

5.4 FEDERALLY LISTED REPTILE SPECIES

5.4.1 Blunt-Nosed Leopard Lizard

Blunt-nosed leopard lizards were detected within the Elk Hills portion of the Action Area during the 2008 and 2009 surveys. One individual was also detected east of the Buttonwillow Ecological Reserve during the 2010 surveys of the natural gas linear; no blunt-nosed leopard lizards were detected during protocol adult and juvenile surveys completed in 2012 within the five areas of potentially suitable habitat along the natural gas pipeline (Figure 7). Based on these survey results and the distribution of other documented occurrences, blunt-nosed leopard lizards are only expected, if at all, in the flatter portions of the CO_2 pipeline within the Elk Hills area. Potential direct and indirect effects to the blunt-nosed leopard lizard are evaluated below.

Direct Effects

Blunt-nosed leopard lizards have the potential to be directly affected by habitat removal, vehicle strikes, or entrapment in open trenches or within a burrow during the installation and maintenance of the associated pipelines. However, implementation of the proposed conservation measures would substantially minimize potential direct impacts to blunt-nosed leopard lizards during construction, operation, and maintenance. These measures would avoid take of individuals, which is prohibited under the California Fish and Game Code.

Indirect Effects

Indirect effects to blunt-nosed leopard lizards may include:

- Temporary disturbance due to noise from construction and operation activities and human presence.
- A temporary reduction in natural food sources as a result of habitat disturbance.
- Predators attracted to construction-related food or trash in the area may prey on blunt-nosed leopard lizards.
- Construction, maintenance, and operational activities associated with roads and various facilities may result in the disturbance of blunt-nosed leopard lizards.

5.4.2 Giant Garter Snake

No giant garter snakes were observed during the 2008, 2009, 2010, 2011, or 2012 surveys within the Action Area. This species is presumed to be extirpated from the Action Area.

5.5 FEDERALLY LISTED MAMMAL SPECIES

5.5.1 Buena Vista Lake Shrew

No Buena Vista Lake shrews were detected during the 2008, 2009, 2010, 2011, or 2012 surveys. This species is not expected to be present in the Action Area, based on the absence of suitable habitats and the distance from known occurrences; however, due to the unpredictable nature of this species, and to the length of the process water alignment, the USFWS requested that HECA evaluate potential for take of this species.

Direct Effects

Buena Vista Lake shrews have the potential to be directly affected by habitat removal, vehicle strikes, or entrapment in open trenches or within a burrow during the installation and maintenance of the associated pipelines. However, implementation of the proposed conservation measures would substantially minimize potential direct impacts to Buena Vista Lake shrews during construction, operation, and maintenance. These measures would avoid mortality of individuals.

Indirect Effects

Indirect effects to Buena Vista Lake shrews may include:

- Temporary disturbance due to noise from construction and operation activities and human presence.
- A temporary reduction in natural food sources as a result of habitat disturbance.
- Predators attracted to construction-related food or trash in the area may prey on Buena Vista Lake shrews.
- Construction, maintenance, and operational activities associated with roads and various facilities may result in the disturbance of Buena Vista Lake shrews.

5.5.2 Giant Kangaroo Rat

Based on range generalizations and known occurrences (refer to Figure 8), giant kangaroo rats presumably could be present along the Elk Hills portions of the CO_2 pipeline. Based on habitat preferences, more individuals would be expected within the flatter portions of the alignment, although there are only records for the steeper topographic portions of the Elk Hills area.

Direct Effects

Giant kangaroo rats have the potential to be directly affected by temporary habitat removal, vehicle strikes, or entrapment in open trenches or within a burrow during the installation and maintenance of the CO_2 pipeline. Potential direct effects will be minimized by implementation of the avoidance and minimization measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between Oxy and the California CDFG as updated, and the HCP for the EHOF, when approved.

Indirect Effects

Indirect effects to giant kangaroo rats may include the following:

- Temporary disturbance of individual animals caused by noise associated with Project activities and human presence;

- Temporary reduction in natural food sources as a result of habitat disturbance; and

- Increased predation due to night lighting from the HECA Project Site, which would make kangaroo rats more visible to predators, and may interfere with the kangaroo rat's foraging ability.

5.5.3 Tipton Kangaroo Rat

Based on range generalizations and previously documented occurrences, Tipton kangaroo rats are presumed to be present where habitat is potentially suitable for this species, including several segments of the natural gas pipeline (Figure 9). This species is not expected to be present south of the California Aqueduct along the CO_2 pipeline route based on discussions with CDFG (Vance, 2012).

Direct Effects

Tipton kangaroo rats have the potential to be directly affected by temporary habitat removal, vehicle strikes, or entrapment in open trenches or burrows during the installation and maintenance of the natural gas pipeline. Implementation of the trapping, relocation, worker education program, and speed limits would minimize these potential direct effects. Direct impacts to Tipton kangaroo rats are not expected to affect more than 10 individuals over the life of the HECA Project.

Indirect Effects

Indirect effects to Tipton kangaroo rats may include the following:

- Temporary disturbance from noise associated with construction and operation activities and human presence;
- Reduced availability of natural food sources as a result of habitat disturbance; and
- Increased predation because night lighting from the HECA Project may make the Tipton kangaroo rats more visible to predators, and may interfere with the kangaroo rat's foraging ability.

5.5.4 San Joaquin Kit Fox

Potential direct and indirect effects to San Joaquin kit foxes are evaluated in this section. San Joaquin kit fox are known to occur in the Elk Hills area about 1 mile south of the HECA Project Site (Figure 10). This species has also been occasionally observed in agricultural areas in the HECA Project Site and the Controlled Area, as well as the construction areas of the various linear facilities.

Direct Effects

Construction of the HECA Project and OEHI Project could directly affect San Joaquin kit foxes in the region. Direct effects could include temporary and permanent habitat loss, vehicle strikes, and entrapment in open trenches or within burrows during the installation and maintenance of the natural gas, process water, and CO_2 pipelines. In addition, portions of the HECA Project would be within the Western Kern County Core recovery area identified in the Recovery Plan for Upland Species of the San Joaquin Valley (USFWS, 1998).

The USFWS Recovery Plan identifies several kit fox recovery areas in the Action Area, including:

- Western Kern County Core
- Antelope Plain/Semitropic Kern Satellite
- Urban Bakersfield Satellite

The HECA Project Site is adjacent to the northeastern edge of the Western Kern County Core recovery area. In addition, portions of the proposed CO_2 linear, electrical transmission lines, and process water pipeline are within this area (Figure 11 and Table 7). The HECA Project would temporarily disturb or remove habitats in these areas that are already degraded by existing activities (i.e., dirt roads, active agriculture, and canals), and are not likely to provide habitat for breeding or denning kit foxes. These areas are also not high-quality habitat for kangaroo rats, because kit foxes appear to be strongly linked ecologically to kangaroo rats (Cypher, 2006).

Table 7
Overlap of Project Components and the San Joaquin Kit Fox Western Kern County Core Recovery Area

HECA Project Component	Area (Acres) within the Western Kern County Core Recovery Area
HECA Project Site	7.0[1]
Carbon Dioxide Pipeline	28.9
Process Water Pipeline	42.2[2]
Total	**78.2**

Notes:
[1] Acreage is actively farmed and is poor habitat for the San Joaquin kit fox.
[2] Acreage is included in the HECA Project Site area, is actively farmed, and is poor habitat for the San Joaquin kit fox.

The HECA Project Site and other permanent project components are actively farmed and are unlikely to provide foraging or movement habitat for San Joaquin kit fox. Although the HECA Project Site is approximately 1 mile from the margin of the Elk Hills area, the likelihood that kit fox would be present in this area is reduced by the presence of the California Aqueduct, roads, and other existing physical barriers, in addition to human activity associated with cultivated fields. Therefore, permanent loss of 435 acres at the HECA Project Site, 26 acres for the new railroad spur, 0.23 acre for the new natural gas pipeline, 1.15 acre for the BVWSD well field, and 4 acres at the PG&E switching station would have a minimal direct effect on San Joaquin kit fox in the region, because this species is not likely to regularly use the affected fields.

Approximately half of the Western Kern County Core recovery area that would be impacted by the CO_2 pipeline is high-quality habitat potentially used for denning, foraging, and dispersal of San Joaquin kit fox. The other half is less suitable for denning, foraging, and dispersal due to the steep topography of the Elk Hills and the level of existing disturbance to the area. The portion of the Western Kern County Core recovery area impacted by the process water pipeline is generally poor habitat for denning, foraging, and dispersal due to the level of disturbance (i.e., graded dirt roads, agricultural canals, and actively farmed lands) and proximity to other types of human disturbance (i.e., dumping, target shooting, and spraying).

Traffic associated with construction and operations would pass through portions of habitat for the Western Kern County Core recovery area, the Antelope Plain/Semitropic/Kern and Urban Bakersfield Satellite recovery area, and potential habitat linkages along I-5 and State Route 46 (Figure 11). The existing average daily traffic (ADT) and the HECA Project-related increase to the ADT were evaluated for the road segments inside of the San Joaquin kit fox recovery areas (Table 8). Most of the increases in traffic during construction were minimal, with the exception of the increase in traffic on Tupman Road and Stockdale Highway. Operation-related traffic includes the workforce for the HECA Project, the delivery of coal and petcoke, and shipping of some products. Petcoke deliveries are included in the operation-related traffic impacts because the trucks delivering the fuel pass through portions of the Antelope Plain/Semitropic/Kern and Urban Bakersfield Satellite Population. Coal will be delivered by truck or by rail; therefore, the potential increase in truck traffic for coal delivery is addressed in the mortality calculations because it represents the most conservative estimate of potential impacts.

The existing mortality of San Joaquin kit fox in the western Bakersfield area was determined through the 6-year study *Urban Roads and the Endangered San Joaquin Kit Fox* by Bjurlin, Cypher, Wingert, and Van Horn Job (2005). Existing, construction, and operations traffic levels were determined using Section 5.10 of the Amended AFC (Hydrogen Energy California, 2012) and Caltrans traffic estimates. Based on known mortality rates and traffic levels, the HECA Project-related mortality of San Joaquin kit fox is estimated at approximately 39 foxes over the course of 25 years (Table 9). This is a conservatively high estimate because the time of day during which the increased traffic would be on the road was not considered in the estimate; most HECA Project-related traffic would be on the roads during daylight hours when kit fox are less likely to be present. Kit foxes tend to travel during the evenings, at night, or near dawn.

The combination of potential traffic-related impacts summarized above and other potential habitat impacts to San Joaquin kit fox identified in this section is estimated to affect fewer than 39 individuals over the 25-year life of the HECA Project.

Indirect Effects

San Joaquin kit foxes inhabiting the Action Area and surrounding vicinity are likely to be subject to indirect effects, including:

- The temporary and permanent loss of kit fox foraging, pupping, and movement corridor habitat.
- Temporary harassment from noise associated with construction and operation activities and human presence.
- A temporary reduction in natural food sources as a result of habitat disturbance.
- Construction, maintenance, and operational activities associated with roads and various facilities may result in the disturbance of nearby San Joaquin kit foxes.
- Night lighting from the HECA Project Site may make kit foxes more visible to predators, and may interfere with the kit fox's foraging ability.

Table 8
Existing and HECA Project-Related Traffic Estimates within the San Joaquin Kit Fox Recovery Area

Roadway	Current ADT[1]	Construction		Operations[2]		Product Deliveries[3]

Total Project-related take over 25 years							**39.28**	

Notes:
1 Mortality calculated from data presented in: esrp.csustan.edu/publications/pdf/esrp_urbanroad_sjkf.pdf.
2 Mortality estimated based on road type described in: esrp:csustan.edu/publications/pdf/esrp_urbanroad_sjkf.pdf.
3 Baseline take for SR 46 was estimated based on home range size from http://humboldt-dspace.calstate.edu/xmlui/bitstream/handle/2148/36/Frost.pdf?sequence=1 compared to "urban" kit fox. Link populations were assumed to be half of the satellite population.
4 Traffic-related impacts associated with operation and product deliveries would be reduced if coal is transported to the project site using the proposed rail spur.

I-5 = Interstate 5
SR = State Route

5.6 CUMULATIVE EFFECTS

Cumulative effects include the effects of future state, tribal, local, or private projects that are reasonably certain to occur in the Action Area. Future federal projects that are unrelated to the proposed action are not considered in this section because they would require separate consultation pursuant to Section 7 of the ESA (16 USC § 1536).

Only one potential non-federal proposed project occurs within the Action Area (Table 10). This project is an application for a conditional use permit to establish a 1,061-acre dairy complex, consisting of a 121-acre dairy, a 739-acre liquid waste disposal/spreading site, and a 201-acre solid waste disposal/spreading site) at Palm Ranch. Based on aerial topography, this area appears to be an existing agricultural field. Depending on the current agricultural practices at the site, conversion of habitat could potentially contribute to the loss of movement and migration habitat for the San Joaquin kit fox. If patches of alkali and scrub habitats are present within the site, habitat conversion could contribute to the loss of burrowing or denning habitat for the blunt-nosed leopard lizard, Tipton kangaroo rat, and giant kangaroo rat. Agricultural land, which may include small isolated marginal blocks of native vegetation, is marginal habitat for these species. Marginal agricultural habitats are less likely to support these species than higher quality habitats such as the Elk Hills and the Kern River floodplain. However, the loss of 1,061 acres of agricultural habitat in conjunction with the proposed action would result in substantial cumulative effects to federally listed species under USFWS jurisdiction.

Table 10 also presents potential non-federal projects that could occur within the larger vicinity of the proposed action. Most of the projects are at least 5 miles from the Action Area and are clustered around existing highway and road corridors in areas that appear to be used for agricultural, residential, commercial, and industrial purposes. Many of the projects are separated from the Action Area by I-5 and Highway 43, and by large blocks of agricultural land uses. A few of the proposed projects are located south of the Action Area either in the Elk Hills or just east of the Action Area. These projects appear to be located in areas of higher quality habitats (e.g., native vegetation) than the projects in the urban or agricultural areas; they also appear not to have significant dispersal barriers between them and the Action Area, aside from the California Aqueduct, which bisects the Action Area. Therefore, these projects could contribute to the incremental cumulative loss of habitat for the San Joaquin kit fox, blunt-nosed leopard lizard, Tipton kangaroo rat, and Giant kangaroo rat.

All of the potential non-federal projects in the vicinity of the Action Area will be required to comply with state and local regulatory requirements that also protect federally listed wildlife and plant species. Effects from these projects are expected to be mitigated through the regulatory pathways that would reduce the cumulative effects on federally listed species; however, the HECA Project and OEHI Project would contribute to a cumulatively adverse effect to the federally listed species, as identified in this biological assessment.

Table 10
Proposed Projects, Which May Lack a Federal-Nexus, Within the Vicinity of the Proposed Action

6.0 CONCLUSION AND DETERMINATION OF EFFECTS

This section presents determinations of the potential effects of the HECA Project and OEHI Project on federally listed species, based on the effects analysis discussed in Section 5.

6.1 FEDERALLY LISTED PLANT SPECIES

The proposed action would have **no effect** on plant species that are listed or proposed for federal listing. No federally threatened or endangered plant species or plant species proposed for listing were observed in the Action Area during 2008, 2009, 2010, 2011, or 2012 plant surveys. BIO-2 would require avoidance of any listed plant species, to the greatest extent feasible.

6.2 FEDERALLY LISTED REPTILE SPECIES

6.2.1 Blunt-Nosed Leopard Lizard

Implementation of the proposed action **may affect, and is likely to adversely affect** the blunt-nosed leopard lizard. Blunt-nosed leopard lizards have been observed along the CO_2 pipeline alignment, and would be addressed as part of the OEHI Project. Under California law, no mortality is allowed for this fully protected species. For the HECA Project, the avoidance and conservation measures BIO-4, BIO-5, BIO-6, BIO-8, BIO-15, and BIO-17 described in Section 2.3 would avoid mortality and reduce other direct effects on the blunt-nosed leopard lizard, including habitat loss or degradation. For the portions of the project within the EHOF, the avoidance measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between Oxy and the California CDFG as updated, and the HCP for the EHOF, when approved, would avoid mortality and reduce other direct effects on the blunt-nosed leopard lizard.

The HECA Project would temporarily remove up to 3.7 acres of natural/ruderal habitat that does not appear to be occupied by the blunt-nosed leopard lizard, based on 2012 protocol surveys. The OEHI Project activities would temporarily remove up to 28.89 acres of habitat and permanently remove up to 63.90 acres of habitat potentially used by the blunt-nosed leopard lizard. Habitat compensation is proposed as described by conservation measure BIO-18 (HECA Project), and in accordance with the 1995 USFWS Biological Opinion (USFWS File # 1-1-95-F-102) and draft HCP currently under review by the USFWS (OEHI Project), which will benefit this species to offset the loss of habitat.

6.3 FEDERALLY LISTED MAMMAL SPECIES

6.3.1 Buena Vista Lake Shrew

The proposed action **may affect, but is not likely to adversely affect** the Buena Vista Lake shrew. No Buena Vista Lake shrews were observed in the Action Area during 2008, 2009, 2010, 2011, or 2012 surveys; however, this species is presumed to be present because Buena Vista Lake shrews have been previously documented in the greater biological region. Potential effects could include temporary loss of habitat during construction, and mortality of individuals caused by construction activities. The avoidance and conservation measures BIO-4, BIO-7, BIO-8, BIO-15, and BIO-16 described in Section 2.3 would substantially reduce the potential for direct effects on the Buena Vista Lake shrews. Also, habitat compensation, as described by conservation measure BIO-18, will provide additional benefits for long-term survival and recovery of the Buena Vista Lake shrew.

6.3.2 Giant Kangaroo Rat

The proposed action **may affect, and is likely to adversely affect** the giant kangaroo rat. No giant kangaroo rats were observed in the Action Area during 2008, 2009, 2010, 2011, or 2012 surveys; however, this species is presumed to be present because giant kangaroo rats have been previously documented in the Elk Hills region that would be crossed by the CO_2 pipeline. Potential effects could include temporary loss of habitat during construction, and mortality of individuals caused by construction activities. The OEHI Project actions would temporarily remove up to 28.89 acres and permanently remove approximately 63.90 acres of habitat potentially occupied by giant kangaroo rat. These 93 acres overlap entirely with the acreage already identified for blunt-nosed leopard lizard above. The avoidance and conservation measures BIO-4, BIO-7, BIO-8, BIO-15, and BIO-16 described in Section 2.3 would substantially reduce the potential for direct effects on the giant kangaroo rats for the portions of the CO_2 pipeline not within the EHOF. For the portions of the pipeline within the EHOF, the avoidance measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between Oxy and the California CDFG as updated, and the HCP for the EHOF, when approved, would substantially reduce the potential for direct effects on the giant kangaroo rats. Also, habitat compensation, as described by conservation measure BIO-18 (HECA Project), and the 1995 USFWS Biological Opinion (USFWS File # 1-1-95-F-102) and draft HCP currently under review by the USFWS (OEHI Project), will provide additional benefits for long-term survival and recovery of the giant kangaroo rat.

6.3.3 Tipton Kangaroo Rat

The proposed action **may affect, and is likely to adversely affect** the Tipton kangaroo rat. No Tipton kangaroo rats were observed in the Action Area during 2008, 2009, 2010, 2011, and 2012 surveys; however, based on existing information in the CNDDB and personal communications with local experts, Tipton kangaroo rats are presumed to be present in some areas along the natural gas pipeline. Potential effects could include temporary loss of habitat during construction, and mortality of individuals caused by construction activities. The proposed action would temporarily remove up to 3.7 acres of habitat potentially occupied by Tipton kangaroo rat. In addition, the OEHI Project actions would temporarily remove up to 28.89 acres and permanently remove approximately 63.90 acres of habitat potentially occupied by Tipton kangaroo rat. This is the same area identified for blunt-nosed leopard lizard above. The avoidance and conservation measures BIO-4, BIO-7, BIO-8, BIO-14, BIO-12, and BIO-15 described in Section 2.3 would substantially reduce the potential for direct effects on the Tipton kangaroo rats, which were known to occur in the region, for the HECA Project and the portion of the CO_2 pipeline not within the EHOF. For the portions of the project within the EHOF, the avoidance measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between Oxy and the California CDFG as amended, and the HCP for the EHOF, when approved, would substantially reduce the potential for direct effects on the Tipton kangaroo rats. Also, habitat compensation, as described by conservation measure BIO-18 (HECA Project), and the 1995 USFWS Biological Opinion (USFWS File # l-1-95-F-102) and draft HCP currently under review by the USFWS (OEHI Project),will provide additional benefits for long-term survival and recovery of the Tipton kangaroo rat.

6.3.4 San Joaquin Kit Fox

The proposed action **may affect, and is likely to adversely affect** the San Joaquin kit fox. San Joaquin kit fox signs were observed during surveys in the Elk Hills area (southwest of the Kern River Flood Control Channel) between 2008 and 2010. Based on these observations and other existing information reviewed for this BA, San Joaquin kit fox are presumed to be present along the CO_2 pipeline (OEHI, 2012). Based on field observations and habitat characteristics, kit fox are substantially less likely to be present along the natural gas pipeline alignment, electrical transmission line, or at the Project Site. Potential effects could include temporary loss of habitat during construction, permanent loss of low-quality migration/movement habitat at the HECA Project Site, and mortality of individuals caused by construction activities and HECA Project operations. The OEHI Project actions would temporarily remove up to 28.89 acres and permanently remove approximately 0.11 acre of habitats that provide all constituent elements (breeding, foraging, and migration) required by San Joaquin kit fox. These 29 acres overlap entirely with the acreage already identified for blunt-nosed leopard lizard above. These impacts would occur only in the CO_2 pipeline construction limits in the Elk Hills area. The Natural/ Ruderal (Allscale Scrub) habitats elsewhere in the HECA Project area are less likely to provide habitat for breeding and foraging kit foxes.

Based on the conservative traffic model described in Section 5.5.4, construction and operation traffic could result in mortality of approximately 39 kit foxes over the course of the 25-year HECA Project lifespan. This mortality would be spread over an area of approximately 3,000 square miles, so the impact to any one population would be minimal on an annual basis. The avoidance and conservation measures BIO-4, BIO-7, and BIO-13 described in Section 2.3 would substantially reduce the potential for direct effects on the San Joaquin kit fox from the HECA Project and portion of the CO_2 pipeline not within the EHOF. For the portions of the pipeline within the EHOF, the avoidance measures in the 1995 Biological Opinion issued by the USFWS and 1997 MOU between Oxy and the California CDFG as updated, would minimize or avoid direct effects on the San Joaquin Kit Fox. Also, habitat compensation, as described by conservation measure BIO-18 (HECA Project), and the 1995 USFWS Biological Opinion (USFWS File # l-1-95-F-102) and the draft HCP currently under review by the USFWS (OEHI Project), will improve recovery and survival of the kit fox populations in the region by establishing additional permanent conservation areas, and implementing land management activities that will facilitate better regional protection for habitats used by this species. Additional land management activities that may be implemented on existing conservation lands include control of non-native species, limiting off-road vehicle access, and installation of fencing to reduce trespass and trash disposal.

CARBON SEQUESTRATION AND GREENHOUSE GAS EMISSIONS

William Walters, P.E., David Vidaver, Abdel-Karim Abulaban, Ph.D., P.E., and Tad Patzek, Ph.D.

SUMMARY AND CONCLUSIONS

The Hydrogen Energy California project (HECA)[1] is planned to be an integrated gasification combined cycle power generating facility combined with a fertilizer manufacturing facility. HECA would gasify petroleum coke (petcoke) and coal to produce hydrogen rich fuel for a combustion turbine operating in combined cycle mode. The combined cycle plant would produce 416 megawatt (MW) gross electric power with an average, on-peak net export power output of 266 MW using hydrogen rich fuel[2]. HECA would separate and pipe most of the carbon dioxide (CO_2) formed in the gasification process to the associated Enhanced Oil Recovery (EOR) component, which is owned and operated by Occidental of Elk Hills, Inc (OEHI). The remaining CO_2 would be used in the onsite fertilizer manufacturing facility. This project would capture about 90 percent of the CO_2 in the synthetic gas produced in the gasifier, or approximately 3 million tons per year. Of this amount, 2.6 million tons per year of CO_2 would be sequestered through EOR operations and 0.4 million tons per year of CO_2 would be used in fertilizer manufacturing.

HECA's likely actual operating profile is not known; the applicant has described the facility's expected operation using more than one potential operating profile. Different operating profiles may need to be evaluated to determine which set of operating conditions represent worst case impacts. Some operating profiles may result in the facility not complying with certain regulatory requirements. For example, a profile provided by the applicant indicated reduced electricity production for eight hours each day, reducing the portion of the hydrogen-rich gas used to produce electricity and increasing that used to produce fertilizer. Under this operating profile, the project may not comply with California's Greenhouse Gases (GHG) Emission Performance Standard (EPS), as described more fully below. Even with this reduced electricity production, HECA would be operated at a capacity factor of 85 percent, roughly equal to that of the Intermountain Power Plant in Utah or the Argus Cogeneration Plant in Trona, California, both of which use coal.

Electricity is produced by operation of inter-connected generation resources. The operation of one power plant affects the operation of other power plants in the

---

[1] A comprehensive acronym list is provided at the end of this section.

[2] These generation values represent the applicant's latest gross and net megawatt estimates and are based on specific operating and ambient conditions, where these generation values would occur under average annual ambient conditions. The net megawatt estimate includes the fertilizer plant's parasitic load and its associated small amount of generation but does not include the air separation unit's parasitic load, and when considering this item the net generation value drops to approximately 160 MW.

interconnected system. HECA, if accompanied by permanent sequestration, would affect the overall electricity system operation and GHG emissions in several ways. HECA:

- would, upon attaining mature operations, provide base load generation with emissions that are lower than other fossil fuel fired power plants except for the most efficient natural gas fired combined cycle facilities.
- would facilitate reductions in the import of electricity from specific power plants located out-of-state, such as coal-fired power plants with long-term contracts that have higher GHG emissions per megawatt hour, as well as imports from unspecified sources which are assumed to have higher GHG emissions per megawatt hour by the California Air Resources Board,
- could facilitate the retirement of aging fossil-fired power plants that use once-through cooling by providing necessary replacement capacity to meet reserve margin requirements in Southern California.
- would use a California petroleum refinery by-product, petroleum coke, as a fuel feedstock source which would reduce the transportation GHG emissions associated with international export of this material.
- would enable additional domestic petroleum production which would reduce the need for petroleum imports to meet California's ongoing petroleum oil product demand and would reduce associated petroleum oil transportation GHG emissions.
- would be operated in conjunction with an enhanced oil recovery/CO_2 sequestration project in the Elk Hills Oil Field (EHOF) that would be the third largest carbon capture and storage (CCS) project in the world, after La Barge in Wyoming and Gorgon in Australia. The demonstration of CCS from a large scale coal-fired power plant is the reason why this project has been selected to receive funding under the Department of Energy's (DOE) Clean Coal Power Initiative (CCPI).
- would be a polygeneration plant that would use a portion of the hydrogen produced from the gasification of the fuel to make fertilizer products to increase the electrical generation flexibility of the facility. This would provide HECA with the ability to reduce generation when necessary by approximately 45 percent to operate with some flexibility/dispatchability as needed depending on electrical load demand.
- would produce fertilizer products within an agricultural valley that could displace GHG emissions from their manufacture at other existing or new sources and reduce associated transportation emissions from fertilizer manufacture that occurs outside the San Joaquin Valley.

These system impacts, and the other GHG emission effects of the proposed project, would provide energy and capacity to California and would also lead to a net reduction of GHG emissions considering the other sectors affected, such as petroleum coke fuel transport, petroleum production and imports, and fertilizer transportation. Thus, staff concludes that the proposed project would result in a cumulative overall reduction in

California’s GHG emissions, would not worsen current conditions, and would not result in impacts that are cumulatively significant.

Staff concludes that the short-term minor emission of GHG during construction would be sufficiently reduced by “best practices” and would be more than offset by the system-wide GHG emission reductions during operation and would, therefore, not result in significant, adverse impacts.

The project could meet the EPS that applies to utility purchases of base load power from power plants (Title 20, California Code of Regulations, section 2900 et seq.), if the majority of HECA’s CO_2 emissions are permanently sequestered depending on the operating profile of the facility. However, the potential range of facility operating profiles is uncertain at this time, so staff cannot at this time make a final determination regarding compliance with the EPS. Staff is in the process of designing conditions of certification that would enforce the carbon sequestration that is necessary for this project to comply with this regulation. Staff has provided preliminary conditions of certification that outline the type of requirements that will be recommended by staff; however, significant additional detail will be added to these conditions in the FSA and additional conditions may be required for the facility to comply with the EPS so they could sell electricity to a California electric utility.

The United States Environmental Protection Agency has promulgated regulations for the permitting of major GHG emission sources and GHG emission reporting, and the California Air Resources Board has promulgated regulations for the California Global Warming Solutions Act of 2006 (AB 32 Núñez, Statutes of 2006, Chapter 488, Health and Safety Code sections 38500 et seq.) and has recently implemented a GHG emissions cap and trade regulation that has been designed to help achieve the state’s GHG emission reduction goals. The San Joaquin Valley Air Pollution Control District has found in its Preliminary Determination of Compliance that the project complies with all laws, ordinances, regulations and standards, including federal GHG emissions permitting requirements. The proposed project would also have to comply with the state cap and trade regulations, federal GHG emission source permitting, and federal and state GHG emissions reporting requirements.

In summary staff believes that with appropriate conditions of certification that staff is currently designing and that will be provided in the Final Staff Assessment/Final Environmental Impact Statement (FSA/FEIS), HECA would not create significant greenhouse gas impacts or geologic impacts and would comply with all laws, ordinances, regulations, and standards (LORS).

UNRESOLVED AREAS RELATING TO CARBON SEQUESTRATION AND GREENHOUSE GASES

Greenhouse Gases Analysis

Staff believes that the greenhouse gas emissions from HECA and the Occidental of Elk Hills, Inc. Enhanced Oil Recovery component should be able to meet all regulatory requirements, and staff is in the process of designing conditions of certification that will ensure carbon sequestration and compliance with the EPS. However, staff requires that prior to publication of the Final Staff Assessment/Final Environmental Impact Statement the applicant shall enter into a binding contract with Occidental of Elk Hills, Inc. that:

- Identifies the responsibilities of each party to demonstrate and document permanent sequestration of the supplied CO_2.
- Documents Hydrogen Energy California's rights to the entire CO_2 sequestration emissions reductions as necessary for SB 1368 EPS and other regulatory compliance.
- Clearly states that the CO_2 sequestration emissions reductions shall not be used for any other purpose than providing for the compliance obligation needs for HECA.
- This contract shall also require Occidental of Elk Hills, Inc. to provide a Carbon Dioxide Emissions Sequestration Plan to the Energy Commission for review and approval as detailed under the preliminary staff Condition of Certification **GHG-3**.

This contract is required before staff can finalize its recommendation for the project in the Final Staff Assessment/Final Environmental Impact Statement.

Staff's findings are contingent on the energy generation and consumption assumptions and operating profile that staff is currently using. However, staff has identified issues with those values, such as changes in the gas turbine gross generation rating. Staff has requested a complete energy balance for the HECA facility that includes all sources of generation and consumption, including the air separation unit. The applicant has not yet provided that information. This information is required before staff can finalize its regulatory compliance analysis and determine its recommendation for the project.

Carbon Sequestration Geology Analysis

The presence of the numerous surface and subsurface faults give reason to staff for concern that the increased pressures associated with the injection of the CO_2 can cause increased stresses on faults that can cause those faults to slip and the apertures to dilate.

Despite several attempts by staff to get site specific geologic information from the applicant such information was not provided. Therefore, staff had to rely on information from a nearby oil field that is believed to have similar characteristics as the EHOF. Using geologic data from the nearby oil field, staff has concluded that there are no unresolved geology issues that would threaten the integrity of the proposed CO_2/water injection EOR component at the EHOF. See the **Geology and Paleontology** section of this Preliminary Staff Assessment/Draft Environmental Impact Statement (PSA/DEIS) for more information on earthquake faults in the region and potential impacts that would be expected from the project, if constructed.

Based on information presented in a number of workshops between staff and the applicant as well as representatives from OEHI, staff concludes that it is feasible to inject the projected amount of CO_2 over 20 years into the Stevens reservoir. OEHI estimates that the amount of CO_2 that is estimated to be sequestered by the EOR operations after 20 years would fill only about 5 percent of the usable pore space of the reservoir. This leaves a very large volume of the reservoir available for further injection and storage in the event that the injection activities continue beyond the projected lifetime of HECA. Given the geologic lifetime of natural CO_2 domes, and many long-lasting CO_2 injection projects, it is likely that the CO_2 would be stored permanently in the EHOF. This is assuming that existing production wells as well as abandoned wells are rehabilitated to meet specifications for injection wells and monitoring wells associated with injection of CO_2 for sequestration purposes. Additionally, the CO_2 filled reservoirs would be 5,000 to 7,000 feet below the surface. The formations where the CO_2 would be stored are separated from the surface by other formations including thick and continuous shale layers. These formations offer a tight lid to prevent the stored CO_2 from leaking through the formation to the surface. The only likely pathways for leakage that remain are therefore the well borings where leakage can take place through the casings themselves or through the annular space between the casings and the formation.

Underground injection of fluids and gases is known to cause increased levels of microscopic seismic activities. As discussed in the Geology and Paleontology section, the maximum anticipated peak acceleration produced by the injection is on the order of 0.01 g, which is more than an order of magnitude less intense than site accelerations associated with maximum credible earthquakes on major faults mapped in the vicinity of the project site. Also, as discussed in the **Geology and Paleontology** section, any additional seismic event resulting from proposed CO_2 injection is not expected to exceed a magnitude 4 earthquake, a magnitude that can be felt by a human observer but is incapable of causing structural damage to facilities and buildings. Therefore, injection of the CO_2 is not expected to result in significant impacts in terms of increased seismic activity.

The enhanced oil recovery component associated with the injection of the CO_2 would include a monitoring program to ensure that there is no geologic leakage of the injected CO_2 and that after the field is retired the wells will be properly plugged and abandoned in accordance with the requirements for Class VI Underground Injection Control (UIC) regulation, as specified in the proposed conditions of certification. There are many oil production wells in the formation above the Reef Ridge formation where the carbon is planned to be injected. According to the Monitoring, Reporting, and Verification (MRV) plan that was submitted by OEHI, the prospective injector of the $CO_{2,}$ those wells are equipped with a sophisticated network of monitoring equipment that is centrally monitored and controlled. The monitoring system in those wells would include monitoring for CO_2 leakage and would offer an added level of monitoring to detect that any leaks through the formation, though unlikely, would be detected early and would be dealt with appropriately. Staff further concludes that the injection pressures required for this project are below pressures required to fracture the formation and would not induce significant seismic events.

In such a vast operation with hundreds of wells for injection and production, let alone the thousands of well bores that abound in the site for different purposes and at varying depths of penetration, leaks are prone to happen at some of the well bores. Tier 4 of the monitoring is for dealing with leaks when they are detected. OEHI's proposed procedure to deal with detected leaks involves immediate isolation of the leaking well, depressurizing the zone, and repairing the leaking well. While most likely the repair process would involve injecting a plug of cement to seal the place of the leak, this type of leak is not always accessible to inject a plug of cement. In case the leaking spot in a well is not accessible for plugging, OEHI will have to abandon that well and drill another well. OEHI stated that standard procedures would be followed to detect leaks in a well bore and follow standard procedures to repair the leak. In the event a leak is detected, which has a low-probability of occurrence; OEHI would first depressurize the reservoir at the location of the leak and then isolate the leaking zone so that repairs can be made.

OEHI has not provided detailed information on the approach it would apply to assess the amounts of CO_2 leaked to the surface. Staff therefore cannot assess the effectiveness of the approach. OEHI should decide on one or more approaches to be used for assessing the amounts of fugitive CO_2 ahead of the detection of leaks and provide details of those approaches to staff for assessment. Without this information, staff cannot conclude that HECA would comply with the state's EPS.

GHG EMISSIONS ANALYSIS – William Walters

INTRODUCTION

The generation of electricity using fossil fuels produces air emissions known as greenhouse gases in addition to the criteria air pollutants that have been traditionally regulated under the federal and state Clean Air Acts (CAA). California is actively pursuing policies to reduce GHG emissions that include adding non-GHG emitting renewable generation resources to the system. The California-regulated greenhouse gases include CO_2, nitrous oxide (N_2O), methane (CH_4), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFC), and perflurocarbons (PFC).

GHGs have wide ranging global warming potentials (GWP). Global warming potential is a relative measure, compared to CO_2, of a compound's residence time in the atmosphere and ability to warm the planet. CO_2 emissions are the most common of these emissions; as a result, even though the other GHGs may have a greater impact on climate change on a per-unit basis, GHG emissions are often "normalized" in terms of metric tons of CO_2-equivalent (MT CO2E) for simplicity. By convention, CO_2 is assigned a GWP of 1. In comparison, CH_4 has a GWP of 21, which means that it has a global warming effect 21 times greater than CO_2 on an equal-mass basis. The CO2E for a source is calculated by multiplying each GHG emission by its GWP, and adding the results together to produce a single, combined emission rate representing all GHGs.

GHG emissions include both direct and indirect emissions. Direct emissions are those that would be emitted from sources owned or controlled by a project applicant and generated directly as a result of project actions. Direct emissions from construction activities include GHG emissions generated from construction equipment and vehicles. Direct emissions from operating activities include GHG emissions generated from stationary sources, and vehicle trips. Indirect GHG emissions sources can take many forms, such as electricity usage or waste disposal, depending on the type of project.

GHG emissions are not criteria pollutants. Since the impact of the GHG emissions from a power plant's operation has global, rather than local effects, those impacts should be assessed not only by analysis of the plant's emissions, but also in the context of the operation of the entire electricity system of which the plant is an integrated part. Furthermore, the impact of the GHG emissions from a power plant's operation should be analyzed in the context of applicable GHG laws and policies, such as Assembly Bill (AB) 32, California's Global Warming Solutions Act (Stats. 2006, ch. 488.), the EPS, and Prevention of Serious Deterioration (PSD) permitting requirements.

GLOBAL CLIMATE CHANGE – DOE

Climate Change

The human and natural causes of climate change and the impacts of climate change are global in scope. GHG emissions, which are believed to contribute to climate change, do not remain localized, but become dispersed throughout the Earth's atmosphere. Therefore, this analysis cannot separate the particular contribution of HECA's and OEHI's GHG emissions to regional or global climate change from the many other past, present, and reasonably foreseeable projects that have produced or would produce or mitigate GHG emissions. Rather, this review focuses on the cumulative effects of GHG emissions and climate change from a global perspective.

Background

A worldwide environmental issue is the likelihood of changes in the global climate as a consequence of global warming produced by increasing atmospheric concentrations of GHGs (IPCC 2007c). The atmosphere allows a large percentage of incoming solar radiation to pass through to the Earth's surface, where it is converted to heat energy (infrared radiation) that is more readily absorbed by GHGs than the incoming solar radiation. The heat energy absorbed near the Earth's surface increases the temperature of air, soil, and water.

GHGs include water vapor, CO_2, methane, nitrous oxide, ozone (O_3), and several chlorofluorocarbons. Although GHGs constitute a small percentage of the Earth's atmosphere, they are responsible for its heat-trapping properties. Water vapor, a natural component of the atmosphere, is the most abundant GHG, but its atmospheric concentration is driven primarily by changes in the Earth's temperature. As such, water vapor can amplify the effects of other GHGs such as CO_2. The second-most abundant GHG is CO_2, which remains in the atmosphere for long periods of time. Due to human activities, atmospheric CO_2 concentrations have increased by approximately 35 percent over preindustrial levels. Fossil fuel burning, specifically from power production and transportation, is the primary contributor to increasing concentrations of CO_2 (IPCC

2007c). In the U.S., stationary CO_2 sources include energy facilities (such as coal and natural gas power plants) and industrial facilities. Industrial processes that emit these gases include cement manufacture, limestone and dolomite calcination, soda ash manufacture and consumption, and aluminum production (Energy Information Administration 2009). In addition, industrial and agricultural activities release GHGs other than CO_2 -- notably methane, NOx, O_3, and chlorofluorocarbons -- to the atmosphere, where they can remain for long periods of time.

In the preindustrial era (before 1750 A.D.), the concentration of CO_2 in the atmosphere appears to have been 275 to 285 ppm (IPCC 2007c). In 1958, C.D. Keeling and others began measuring the concentration of atmospheric CO_2 at Mauna Loa in Hawaii (Keeling et al. 1976). The data collected by Keeling's team and others since then indicate that the amount of CO_2 in the atmosphere has been steadily increasing from approximately 316 ppm in 1959 to 396.8 ppm in February 2013 (National Oceanic and Atmospheric Administration 2010, 2013). In addition, the Fourth U.S. Climate Action Report concluded, in assessing current trends, that CO_2 emissions increased by 20 percent from 1990 to 2004, while methane and nitrous oxide emissions decreased by 10 percent and 2 percent, respectively. This increase in atmospheric CO_2, methane and nitrous oxides is attributed almost entirely to human activities.

Impacts of Greenhouse Gases on Climate

Climate is defined as the average weather of a region, or more rigorously as the statistical description of a region's weather in terms of the means and variability of relevant parameters over time periods ranging from months to thousands of years. The relevant parameters include temperature, precipitation, wind, and dates of meteorological events such as first and last frosts, beginning and end of rainy seasons, and appearance and disappearance of pack ice. Because GHGs in the atmosphere absorb energy that would otherwise radiate into space, the possibility that human-caused emissions of these gases could result in warming that might eventually alter climate was recognized soon after the data from Mauna Loa and elsewhere confirmed that the atmosphere's content of CO_2 was steadily increasing (IPCC 2007c; National Oceanic and Atmospheric Administration 2010).

Changes in climate are difficult to detect because of the natural and complex variability in meteorological patterns over long periods of time and across broad geographical regions. There is much uncertainty regarding the extent of global warming caused by human-induced GHG emissions, the climate changes this warming has or will produce, and the appropriate strategies for stabilizing the concentrations of GHGs in the atmosphere. The World Meteorological Organization and United Nations Environment Programme established the IPCC to provide an objective source of information about global warming and climate change, and IPCC's reports are generally considered to be an authoritative source of information on these issues.

According to the IPCC fourth assessment report, "[w]arming of the climate system is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level" (IPCC 2007d). The IPCC report finds that the global average surface temperature has increased by approximately 0.74 degrees Celsius in the last 100 years, global average sea level has risen approximately 150 millimeters over the same period, and cold days, cold nights, and frosts over most land areas have become less frequent during the past 50 years. The report concludes that most of the temperature increases since the middle of the twentieth century are “very likely due to the observed increase in anthropogenic [GHG] concentrations.”

The 2007 report estimates that, at present, CO_2 accounts for approximately 77 percent of the global warming potential attributable to human-caused releases of GHGs, with most (74 percent) of this CO_2 coming from the combustion of fossil fuels. Although the report considers a variety of future scenarios regarding GHG emissions, CO_2 would continue to contribute more than 70 percent of the total warming potential under all of the scenarios. The IPCC therefore believes that further warming is inevitable, but that this warming and its effects on climate could be mitigated by stabilizing the atmosphere’s concentration of CO_2 through the use of 1) “low-carbon technologies” for power production and industrial processes, 2) more efficient use of energy, and 3) management of terrestrial ecosystems to capture atmospheric CO_2 (IPCC 2007d).

Environmental Impacts of Climate Changes

The IPCC and the U.S. Climate Change Science Program have examined the potential environmental impacts of climate change at global, national, and regional scales. The IPCC report states that, in addition to increases in global surface temperatures, the impacts of climate change on the global environment may include:

- more frequent heat waves, droughts, and fires;
- rising sea levels and coastal flooding;
- melting glaciers, ice caps, and polar ice sheets;
- more severe hurricane activity and increases in frequency and intensity of severe precipitation;
- spread of infectious diseases to new regions;
- loss of wildlife habitats; and
- heart and respiratory ailments from higher concentrations of ground-level O_3 (IPCC 2007d).

On a national scale, average surface temperatures in the U.S. have increased, with the last decade being the warmest in more than a century of direct observations (U.S. Climate Change Science Program 2008). Impacts on the environment attributed to climate change that have been observed in North America include:

- extended periods of high fire risk and large increases in burned areas;
- increased intensity, duration, and frequency of heat waves;
- decreased snowpack, increased winter and early spring flooding potentials, and reduced summer stream flows in the western mountains; and

- increased stress on biological communities and habitat in coastal areas (IPCC 2007d).

On a regional scale, there is greater natural variability in climate parameters that makes it difficult to attribute particular environmental impacts to climate change (IPCC 2007d). However, based on observational evidence, there is likely to be an increasing degree of impacts such as coral reef bleaching, loss of specific wildlife habitats, reductions in the area of certain ecosystems, and smaller yields of major cereal crops in the tropics (IPCC 2007d). For the northern hemisphere, regional climate change could affect physical and biological systems, agriculture, forests, and amounts of allergenic pollens (IPCC 2007d).

HECA's and OEHI's Potential Greenhouse Gas Emissions

The HECA component and OEHI component of the project, jointly, would demonstrate the technical and economic feasibility of capturing a high percentage of CO_2 produced by the use of coal and petcoke mixture as a feedstock in an IGCC electricity and chemicals production plant. Carbon in the coal would be converted mostly into syngas components: CO_2, CO, and small amounts of COS and other carbon forms. The polygeneration plant's water-gas shift reactor and acid gas removal units would convert most of the CO and COS in the syngas into CO_2. Approximately 92 percent of the carbon in the fuel feedstock would be captured as CO_2, and as much as 6 percent of this captured CO_2, or 5 percent of the total CO_2 in the fuel feedstock, may be released annually through the CO_2 Vent (HECA 2012s).

Carbon from fuel used at HECA's plant would take one of three primary pathways:

1. Approximately 8 percent of the coal and petcoke fuel's carbon would not be captured and would pass through as CO_2 or would be converted to CO_2 in the gas turbine and duct burner as small amounts of carbon-bearing compounds are fully oxidized. The CO_2 emission to the atmosphere, including the CO_2 Vent emissions, from the carbon in the petcoke and coal would amount to approximately 0.44 million MT per year as permitted during normal plant operations, or 11 million MT over a 25-year life of the plant. A small amount of carbon would go into slag and particulates. Preferably the slag would be sold for beneficial uses; alternatively it would be sent to a landfill.
2. Approximately 92 percent of the fuel's carbon would be captured as CO_2. Of the captured and unvented CO_2, approximately 84 percent would be sold to OEHI's project with an expectation of permanent sequestration of almost all of this CO_2. The CO_2 amount that would be sold would range from approximately 2.5-3.0 million MT per year during normal plant operations or 75-90 million MT over the 25-year life of the plant, depending on electricity and urea demand.
3. Of the captured and unvented CO_2, approximately 16 percent would be used to make urea and urea ammonium nitrate to be sold on the national market with no expectation of permanent sequestration of this CO_2. This CO_2 is assumed to remain in the surface and near surface environment but would benefit the production of crops and vegetation. The CO_2 captured in the urea product would amount to

approximately 0.53 million MT per year during normal plant operations or 13 million MT over the 25-year life of the plant, based on minimum and maximum capacities.

The electric power sector in the U.S. releases approximately 2.40 billion MT of CO_2 annually; U.S. coal-fired power plants account for 1.97 billion MT of that amount (EPA 2010). Globally, 49 billion MT of CO_2-equivalent anthropogenic GHGs are emitted annually, with fossil fuel combustion contributing approximately 29 billion MT of that amount. Annual emissions of CO_2 from the proposed project would add to these emissions.

It is likely that new fossil fuel-based electricity generating plants will be built in the United States. Although renewable energy projects have been proposed and are being developed in California, as they are in other parts of the country, the California ISO, CPUC and the Energy Commission have projected demand for replacement generating capacity that is greater than the projected capacity of new renewable sources. Similar projections have been made in other regions of the U.S. Renewable sources (wind and solar) are intermittent, requiring additional base-load to balance electric power supplies.

Although a DOE decision to contribute funding to HECA would not make it "reasonably foreseeable," within the meaning of 40 C.F.R. § 1508.7 that future fossil fuel-based power plants will incorporate carbon capture, successful construction and operation of HECA could demonstrate the feasibility of incorporating the capture of CO_2, making it more likely that it would be incorporated into new fossil fuel power plants. Should HECA demonstrate the feasibility of utility-scale electric power generation with carbon capture, it could result in the incorporation of carbon capture in new power plants, with resulting reductions in CO_2 emissions from new electricity generating capacity built in the future.

Because HECA is designed for over 90 percent carbon capture, it represents a step toward reducing GHG emissions from both coal and natural gas power plants.

GLOBAL CLIMATE CHANGE AND CALIFORNIA– William Walters

Worldwide, with the exception of 1998, over the past 132-year record the nine warmest years all have occurred since 2000, with the two hottest years on record being 2010 and 2005 (NASA 2013). According to "The Future Is Now: An Update on Climate Change Science Impacts and Response Options for California," an Energy Commission document, the American West is heating up faster than other regions of the United States (CEC 2009a). The California Climate Change Center (CCCC) reports that, by the end of this century, average global surface temperatures could rise by 4.7°F to 10.5°F due to increased GHG emissions.

The accumulation of GHGs in the atmosphere regulates the earth's temperature. Without these natural GHGs, the earth's surface would be approximately 61°F (34°C) cooler (CalEPA 2006); however, emissions from fossil fuel combustion for activities such as electricity production and vehicular transportation have elevated the concentration of GHGs in the atmosphere above natural levels. ARB estimated that the mobile source sector accounted for approximately 38 percent of the GHG emissions generated in California in 2009, while the electricity generating sector accounted for approximately 23 percent of the 2009 California GHG emissions inventory with just more than half of that from in-state generation sources (ARB 2011).

The Fourth U.S. Climate Action Report concluded, in assessing current trends, that CO_2 emissions increased by 20 percent from 1990 to 2004, while methane and nitrous oxide emissions decreased by 10 percent and 2 percent, respectively. The Intergovernmental Panel on Climate Change (IPCC) constructed several emission trajectories of GHGs needed to stabilize global temperatures and climate change impacts. It concluded that stabilization of GHGs at 450 ppm carbon dioxide equivalent concentration is required to keep the global mean warming increase below 3.8°F (2.1°C) from year 2000 base line levels (IPCC 2007a).

GHGs differ from criteria pollutants in that GHG emissions from a specific project do not cause direct adverse localized human health effects. Rather, the direct environmental effect of GHG emissions is the cumulative effect of an overall increase in global temperatures, which in turn has numerous indirect effects on the environment and humans. The impacts of climate change include potential physical, economic and social effects. These effects could include inundation of settled areas near the coast from rises in sea level associated with melting of land-based glacial ice sheets, exposure to more frequent and powerful climate events, and changes in suitability of certain areas for agriculture, reduction in Artic sea ice, thawing permafrost, later freezing and earlier break-up of ice on rivers and lakes, a lengthened growing season, shifts in plant and animal ranges, earlier flowering of trees, and a substantial reduction in winter snowpack (IPCC 2007b). For example, current estimates include a 30 to 90 percent reduction in snow pack in the Sierra Nevada mountain range. Current data suggest that in the next 25 years, in every season of the year, California could experience unprecedented heat, longer and more extreme heat waves, greater intensity and frequency of heat waves, and longer dry periods. More specifically, the CCCC predicted that California could witness the following events (CCCC 2006):

- Temperature rises between 3 and 10.5 ºF
- 6 to 20 inches or greater rise in sea level
- 2 to 4 times as many heat-wave days in major urban centers
- 2 to 6 times as many heat-related deaths in major urban centers
- 1 to 1.5 times more critically dry years
- Losses to mountaintop snowpack and water supply (e.g., according to the CCCC, Sierra Nevada snowpack could be reduced by as much as 20 to 40 percent by 2100 [CEC 2009])
- 25 to 85 percent increase in days conducive to ozone formation
- 3 to 20 percent increase in electricity demand
- 10 to 55 percent increase in the risk of wildfires

There is general scientific consensus that climate change is occurring and that human activity contributes in some measure (perhaps substantially) to that change. Man-made emissions of greenhouse gases, if not sufficiently curtailed, are likely to contribute further to continued increases in global temperatures. Indeed, the California Legislature finds that "[g]lobal warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California" (Cal. Health & Safety Code, sec. 38500, division 25.5, part 1).

The state has demonstrated a clear willingness to address global climate change (GCC) through research, adaptation[3], and GHG emission reductions. In that context, staff evaluates the GHG emissions from the proposed project, presents information on GHG emissions related to electricity generation (see "**Electricity System GHG Impacts**" below), and describes the applicable GHG policies and programs.

In April 2007, the U.S. Supreme Court held that GHG emissions are pollutants within the meaning of the CAA. In reaching its decision, the Court also acknowledged that climate change results, in part, from anthropogenic causes (Massachusetts et al. v. Environmental Protection Agency 549 U.S. 497, 2007). The Supreme Court's ruling paved the way for the regulation of GHG emissions by USEPA under the CAA.

In response to this Supreme Court decision, on December 7, 2009 the USEPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA:

- Endangerment Finding: That the current and projected concentrations of the GHGs in the atmosphere threaten the public health and welfare of current and future generations; and
- Cause or Contribute Finding: That the combined emissions of GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

In December 2009, the U.S. Environmental Protection Agency (U.S. EPA) declared that greenhouse gases (GHGs) threaten the public health and welfare of the American people (the so-called "endangerment finding"). Regulating GHGs at the federal level is required by PSD Program for sources that exceed 100,000 tons per year of CO2E emissions, or more than 75,000 tons if the stationary source is a major source for a non-GHG regulated pollutant. Additionally, federal rules that became effective December 29, 2009 (40 CFR 98) require federal reporting of GHG emissions. As federal rulemaking continues to evolve, staff at this time focuses on analyzing the ability of the project to comply with existing federal- and state-level policies and programs for GHGs.

[3] While working to understand and reverse global climate change, it is prudent to also adapt to potential changes in the state's climate (for example, changing rainfall patterns).

HECA's GHG emissions exceed the PSD permitting trigger level and HECA is subject to GHG PSD permitting, which is a part of the air permit that the San Joaquin Valley Air Pollution Control District (SJVAPCD) is currently completing for HECA. Conditions in the SJVAPCD's Preliminary Determination of Compliance (PDOC), released for a 45-day public comment period on February 7, 2013 that was later extended to an even longer comment period, related to the GHG PSD permitting are included in this Preliminary Staff Assessment/Draft Environmental Impact Statement (PSA/DEIS), and any changes to those conditions that are included in the SJVAPCD Final Determination of Compliance (FDOC) will be included in the Final Staff Assessment/Final Environmental Impact Statement (FSA/FEIS). It is also likely that the OEHI CO_2 EOR component, itself or as part of the larger Occidental operating complex, would also require a PSD permit for GHG emissions prior to construction because the CO_2 emissions without the regulated recycling of the produced CO_2 would easily exceed the CO_2 PSD emissions permitting trigger level.

In 1998, the Energy Commission identified a range of strategies to prepare for an uncertain climate future, including a need to account for the environmental impacts associated with energy production, planning, and procurement (CEC 1998, p.5). In 2003, the Energy Commission recommended that the state require reporting of GHGs or global climate change[4] (GCC) emissions as a condition of state licensing of new electric generating facilities (CEC 2003, IEPR p. 42). In 2006, California enacted the California Global Warming Solutions Act of 2006 (AB 32). It requires the ARB to adopt standards that will reduce statewide GHG emissions to statewide GHG emissions levels in 1990, with such reductions to be achieved by 2020. To achieve this, ARB has a mandate to define the 1990 emissions level and achieve the maximum technologically feasible and cost-effective GHG emission reductions to meet this requirement. Executive Order S-3-05 also requires ARB to plan for further GHG emissions reductions to achieve an 80 percent reduction from 1990 GHG emissions by the year 2050.

The ARB adopted early action GHG reduction measures in October 2007, adopted mandatory reporting requirements and the 2020 statewide target in December 2007, and adopted a statewide scoping plan in December 2008 to identify how emission reductions will be achieved from major sources of GHG via regulations, market mechanisms, and other actions. ARB adopted regulations implementing cap-and-trade regulations on December 22, 2011 and ARB staff continues to develop and implement regulations to refine key elements of the GHG reduction measures to improve their linkage with other GHG reduction programs. The ARB has not yet determined approved quantification methods that ensure that the emissions reductions from geologic sequestration are real, permanent, quantifiable, verifiable, and enforceable.

The California Climate Action Team produced a report to the Governor (CalEPA 2006) which included many examples of strategies that the state could pursue to reduce GHG emissions in California, in addition to several strategies that had been recommended by

[4] Global climate change is the result of greenhouse gases, or air emissions with global warming potentials, affecting the global energy balance, and thereby, climate of the planet. The term greenhouse gases (GHG) and global climate change (GCC) gases are used interchangeably.

the Energy Commission and the Public Utilities Commission. Improvements in transportation energy efficiency (fuel economy) and land use planning and alternatives to petroleum-based fuels are slated to provide substantial reductions by 2020 (CalEPA 2006). Their third biennial report, published in December 2010 and required by Executive Order S-3-05, is the most recent report addressing actions that California could take to reduce GHG emissions (CalEPA 2010).

The scoping plan approved by ARB in December 2008 builds upon the overall climate change policies of the Climate Action Team reports and includes recommended strategies to achieve the goals for 2020 and beyond. Some strategies focus on reducing consumption of petroleum across all areas of the California economy. The scoping plan includes a 33 percent Renewables Portfolio Standard (RPS), aggressive energy efficiency targets, and a cap-and-trade program that includes the electricity sector (ARB 2008). Senate Bill 2 (Simitian, Chapter 1, Statutes of 2011-12) expresses the intent of the California Legislature to have 33 percent of California's electricity supplied by renewable sources by 2020. Mandatory compliance with cap-and-trade requirements commenced on January 1, 2012, and enforcement began in January 2013.

SB 1368[5], enacted in 2006, and regulations adopted by the Energy Commission and the Public Utilities Commission pursuant to Title 20, California Code of Regulations, section 2900 et seq. prohibit California utilities from entering into long-term commitments with any base load facilities that exceed the EPS of 0.5 metric tonnes CO_2 per megawatt-hour[6] (equivalent to 1,100 pounds CO_2/MWh). Specifically, the EPS applies to power from new power plants, new investments in existing power plants, and new or renewed contracts with terms of five years or more, including contracts with power plants located outside of California, where the power plant in question is "intended and designed" to operate as a base load power plant.[7] *Base load* units are defined as units that operate at a capacity factor higher than 60 percent. If a project, in-state or out of state, plans to sell electricity to a California utility under a long-term contract (five years or more), that utility will have to demonstrate that the project meets the EPS. Compliance with the EPS is determined by dividing the annual average carbon dioxide emissions by the annual average net electricity production in MWh. This determination is based on capacity factors, heat rates, and corresponding emissions rates that reflect the *expected* operations of the power plant and not on full load heat rates [Title 20, California Code of Regulations, §2903(a)]. HECA is expected to operate continuously, outside of process upsets and annual maintenance; even if the facility were to maximize urea fertilizer manufacturing it would be expected to operate at a capacity factor greater than 60 percent. Accordingly, it would have to comply with the EPS in order for California utilities to acquire an ownership share in the project, or to purchase energy from it under a long-term contract.

[5] Public Utilities Code § 8340 et seq.

[6] The Emission Performance Standard only applies to carbon dioxide, and does not include emissions of other greenhouse gases converted to carbon dioxide equivalent.

[7] See Rule at http://www.cpuc.ca.gov/PUBLISHED/FINAL_DECISION/64072.htm

SB1018 (Stats. 2012, ch. 39.) establishes new legislative oversight and controls over the Air Resources Board including: the creation of a separate expenditure fund for proceeds from the auction or sale of GHG allowances pursuant to the market-based compliance mechanism (the cap-and-trade program); the establishment of a separate Cost of Implementation Fee account for oversight and tracking of funds; oversight of actions taken on behalf of the State of California related to market-based compliance and auctions, specific to the Western Climate Initiative (WCI) and WCI, Inc.; and provides for return of certain funds to ratepayers of Investor Owned Utilities from funds related to the auction or sale of allowances.

If built, HECA would be required to participate in California's greenhouse gas cap-and-trade program. This cap-and-trade program is part of a broad effort by the State of California to reduce GHG emissions as required by AB32, which is being implemented by ARB. Market participants such as HECA would be required to report their GHG emissions and to obtain GHG emissions allowances (and offsets) for those reported emissions by purchasing allowances from the capped market and offsets from outside the AB32 program. Thus, HECA, as a GHG cap-and-trade participant, would be consistent with California's landmark AB 32 Program, which is a statewide program coordinated with a region wide WCI program to reduce California's GHG emissions to 1990 levels by 2020.

The applicable LORS for HECA and the associated OEHI CO_2 EOR component are both detailed below.

HECA

The following federal, state, and local laws and policies in **Carbon Sequestration and Greenhouse Gas Emissions Table 1** pertain to the control and mitigation of HECA's greenhouse gas emissions. Staff's analysis examines the proposed project's compliance with these requirements.

OEHI CO_2 EOR Component

The following federal, state, and local laws and policies in **Carbon Sequestration and Greenhouse Gas Emissions Table 2** pertain to the control and mitigation of the OEHI CO_2 EOR component as it relates to the sequestration of HECA's CO_2 emissions. Because carbon sequestration is necessary for regulatory compliance as explained further below, and because it is considered part of the proposed project, staff's analysis examines the proposed OEHI CO_2 EOR component's emissions in determining HECA's compliance with these requirements.

Carbon Sequestration and Greenhouse Gas Emissions Table 1
HECA
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
40 Code of Federal Regulations (CFR) Parts 51, 52, 70 and 71	This rule "tailors" GHG emissions to PSD and Title V permitting applicability criteria. A new stationary source that emits more than 100,000 tons per year (TPY) of GHGs is considered to be a major stationary source subject to PSD requirements. This project would trigger the 100,000 TPY PSD threshold. SJVAPCD has been granted authority to enforce this regulation.
40 Code of Federal Regulations (CFR) Part 98	This rule requires mandatory reporting of GHG emissions for facilities that emit more than 25,000 metric tons of CO_2 equivalent emissions per year. This requirement is triggered for this project.
State	
California Global Warming Solutions Act of 2006, AB 32 (Stats. 2006; Chapter 488; Health and Safety Code sections 38500 et seq.)	This act requires the ARB to enact standards that will reduce GHG emissions to 1990 levels by 2020. Electricity production is a covered sector under AB 32.
California Code of Regulations, tit. 17, Subchapter 10, Article 2, sections 95100 et. seq.	These ARB regulations implement mandatory GHG emissions reporting as part of the California Global Warming Solutions Act of 2006 (Stats. 2006; Chapter 488; Health and Safety Code sections 38500 et seq.)
California Code of Regulations, tit. 17, Subchapter 10, Article 5, sections 95800 et. seq. (Cap and Trade)	These ARB regulations cap greenhouse gas emissions from specified California emission sources, including power plants that emit more than 25,000 metric tons of CO_2 equivalent emissions per year. These regulations include provisions for facility registration, setting of state-wide GHG emissions allowances, initial allocation of GHG emissions, trading and banking of GHG emissions, and the provisions for the creation and use of GHG emission offsets.
Title 20, California Code of Regulations, section 2900 et seq.; CPUC Decision D0701039 in proceeding R0604009	The regulations prohibit utilities from entering into long-term contracts with any base load facility that does not meet a greenhouse gas emission standard of 0.5 metric tonnes carbon dioxide per megawatt-hour (0.5 MT CO_2/MWh), equivalent to 1,100 pounds carbon dioxide per megawatt-hour (1,100 lbs CO_2/MWh).
Local	
SJVAPCD Rule 2410	This rule incorporates by reference the current federal PSD rule including the GHG emissions permitting requirements.

Carbon Sequestration and Greenhouse Gas Emissions Table 2
OEHI CO_2 EOR Component
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
40 Code of Federal Regulations (CFR) Part 98	This rule requires mandatory reporting of GHG emissions for facilities that emit more than 25,000 metric tons of CO_2 equivalent emissions per year. This requirement is triggered on this project. Subpart RR requires that reporting of geologic CO_2 sequestration, including reporting the amount received, injected, and emitted from surface activities.
40 CFR Parts 51, 52, 70 and 71	This rule "tailors" GHG emissions to PSD and Title V permitting applicability criteria. A new stationary source that emits more than 100,000 TPY of GHGs is considered to be a major stationary source subject to PSD requirements. This project would not trigger the 100,000 TPY PSD threshold.
40 CFR Part 146, Subpart H, §146.81 et seq.	Federal UIC regulations for injection wells intended for long term storage of carbon dioxide
State	
California Global Warming Solutions Act of 2006, AB 32 (Stats. 2006; Chapter 488; Health and Safety Code sections 38500 et seq.)	This act requires the California Air Resource Board (ARB) to enact standards that will reduce GHG emission to 1990 levels by 2020.
California Code of Regulations, tit. 17, Subchapter 10, Article 2, sections 95100 et. seq.	These ARB regulations implement mandatory GHG emissions reporting as part of the California Global Warming Solutions Act of 2006 (Stats. 2006; Chapter 488; Health and Safety Code sections 38500 et seq.)
California Code of Regulations, tit. 17, Subchapter 10, Article 5, sections 95800 et. seq.	These ARB regulations cap greenhouse gas emissions from specified California emission sources that emit more than 25,000 metric tons of CO_2 equivalent emissions per year. These regulations include provisions for facility registration, setting of state-wide GHG emissions allowance budgets, initial allocation of GHG emissions, trading and banking of GHG emissions, and the provisions for the creation and use of GHG emission offsets. Currently these regulations do not have methodologies for accounting for geologic sequestration projects; however, ARB is beginning work on these parts of the regulation.
California Code of Regulations, tit. 14, sections 1722-1724	Regulations for the construction and operation of Class II injection wells that would be used to inject the CO_2 for sequestration purposes.

CLIMATE CHANGE, GREENHOUSE GASES, AND THE DOE CLEAN COAL POWER INITIATIVE FINANCIAL ASSISTANCE – DOE

As described in more detail in the **Introduction** section of this PSA/DEIS, the DOE selected the proposed project for further, more detailed consideration for financial assistance. The project would serve the DOE's Clean Coal Power Initiative (CCPI) Round 3 objective to demonstrate advanced coal-based technologies that capture and sequester CO_2 emissions. DOE believes that accelerated commercial use of new or improved technologies will help sustain economic growth, yield environmental benefits, and produce a more stable and secure energy supply.

Demonstration and advancement of technologies that increase efficiency, facilitate carbon capture, beneficially use CO_2, and ultimately sequester CO_2 are important steps in developing strategies for controlling GHG emissions. The 2007 IPCC report states that there is "high agreement" that atmospheric concentrations can be stabilized by "deployment of a portfolio of technologies that are either currently available or expected to be commercialized in coming decades assuming that appropriate and effective incentives are in place for their development." The IPCC identifies carbon capture and storage (CCS) for coal-fired power plants as one of the "key mitigation technologies" for development before 2030 (IPCC 2007c). The IPCC notes that energy efficiency will also play a key role in stabilizing atmospheric concentrations of GHGs.

DOE believes that the objectives of the CCPI cost-shared effort between the U.S. Government and industry fulfill, in part, the recommendations of the IPCC. The DOE further believes that by providing financial assistance for this proposed project, the DOE would be providing appropriate incentives for developing technologies that can help reduce GHG emissions and climate change concerns. Therefore, successful demonstration of the proposed project, in combination with its broader-scale application of its technology, and other similar DOE-sponsored GHG-reducing initiatives in the region and across the U.S., would be expected to result in a significant long-term cumulative (beneficial) effect by reducing GHG emissions and addressing climate change concerns.

DOE does acknowledge that the oil produced by EOR (i.e., CO_2 floods) would ultimately lead to the emissions of CO_2 to the atmosphere when the oil-derived products are produced and consumed. However, DOE does not expect that this project would result in increased GHG emissions from consumption of oil-derived fuels domestically or globally. Domestic production of crude oil in 2011 was 5.7 million barrels per day (bpd). The estimated CO_2 capture rate for this project would be as high as 3.0 million tons per year (2.7 MMTA). Assuming a typical CO_2 EOR efficiency of 3.1 barrels of crude oil produced per metric ton of CO_2 sequestered, this project could result in an average crude oil production rate of approximately 23,000 bpd (0.023 million bpd) over the life of the project[8]. DOE believes that the resulting 0.40 percent increase in domestic supply of crude oil would not be enough to change the market price. With no price signal, the project would not affect the crude oil consumption rate, and therefore there would be no change in CO_2 emissions from the combustion of oil-derived fuels.

DOE predicts that the increased domestic crude oil production from this project would offset imports of crude oil as a source of supply. Imported crude oil is more expensive and would be the first source to be offset with an increase in domestic supply. This assertion is supported by crude oil supply data from the Energy Information

[8] Please note that OEHI has estimated oil production as approximately 4,500 to 22,500 bpd for the EOR component (HECA 2012dd).

Administration. During the economic downturn in 2007, demand for crude oil decreased. However, domestic supply remained level, and all of the reduction in supply came from imports. Based on the estimated crude oil production rate of 0.023 million barrels per day and using a five-year rolling average price for crude oil of $78.00 per barrel, which might underestimate future oil prices by 25 percent or more, the project would reduce the outflow of cash for imported crude oil by roughly $650 million per year and enhance the nation's energy security.

GHG NO ACTION ALTERNATIVE – DOE

If HECA is not built, it cannot be assumed that the additional emissions attributed to the project would be avoided. Other less efficient or more CO_2-emitting fossil fuel power plants might be constructed in its place, existing plants might produce more power thereby increasing their CO_2 emissions, or existing, less efficient and/or more CO_2-emitting fossil fuel power plants might remain online instead of being replaced.

Under the No-Action Alternative, DOE would not provide financial assistance to the applicant for the HECA Project. The applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative.

In the No-Action Alternative, demonstration of the project's integration of technologies for carbon capture, geologic storage of CO_2 through EOR, generation of electricity, and manufacture of urea would not occur. Consequently, commercialization of these integrated technologies may be delayed or not occur because utilities tend to use demonstrated technologies with predictable costs and risks. The No-Action Alternative would not contribute to DOE goals of accelerating advanced emission controls and demonstrating new coal technologies that capture and beneficially use CO_2.

The No-Action Alternative would not directly cause appreciable global warming that would lead to climate changes. However other sources of GHG's would continue to increase the atmosphere's concentration of GHG's, and, in combination with past and future emissions from all other sources, contribute incrementally to the global warming that produces the adverse effects on climate change. At present, there is no methodology that would allow DOE to estimate the specific impacts (if any) this increment of warming would produce in the vicinity of the plant or elsewhere.

Domestically produced oil, with or without EOR, reduces CO_2 emissions caused by the transportation of foreign oil into the United States. The average distance of "water carrier" transport of imported oil is estimated at 4,300 miles/barrel (bbl). The CO_2 equivalent emissions associated with this transport are estimated at approximately 12 pounds of CO_2 per barrel of foreign oil transported to refineries in the United States. Based on the estimated increased production of domestic oil resulting from the use of the project's CO_2 for EOR at the OEHI (4,500 to 22,500 bbl/day), HECA could result in a

CO_2 reduction of 10,000 to 49,000 tons/yr. This potential reduction in CO_2 would not be realized under the No-Action Alternative.[9]

Similarly, under the No-Action Alternative, there would be no production of urea or other nitrogenous compounds. HECA is estimated to generate 550,000 tons/yr of pelletized urea. Presently, all of the urea consumed in California's Central Valley is produced outside of California. Rail transport from the mid-west accounts for approximately 60 percent of the urea used in the Central Valley; at certain times of the year 20 percent is imported from Canada (via rail) and 20 percent is imported from China and Russia (via ocean transport and rail). Accordingly, the No-Action Alternative would require California's Central Valley to continue to import 100 percent of its urea, resulting in CO_2 from its transportation. Unlike the urea produced by HECA, it is likely that this imported urea is produced by facilities that do not capture and sequester their CO_2 emissions.

GHG EMISSIONS SOURCES DESCRIPTION– William Walters

The proposed project includes two components for purposes of this analysis: emissions from the HECA site (HECA component) and emissions resulting from the OEHI CO_2 EOR activities (OEHI CO_2 EOR component).This section includes short descriptions of each.

HECA

HECA would be an integrated gasification combined cycle (IGCC) project, which gasifies the fuel feedstocks, in this case nominally 25 percent petroleum coke (petcoke) and 75 percent sub bituminous coal, into a hydrogen rich fuel that is used in the combined cycle gas turbine to make electricity. The raw CO_2 emissions from this process are not substantially different from other types of coal fired power technologies; however, this technology allows separation of the fuel carbon, in the form of carbon dioxide, prior to the power production process. Once separated, the carbon dioxide can be sent for sequestration.

The HECA component's GHG emissions include both the direct onsite emissions from the fuel conversion and power production process, as well as emissions from an onsite fertilizer manufacturing complex and onsite ancillary and auxiliary equipment and from offsite feedstock, material, and personnel transportation. The onsite emissions sources include:

- Combustion Turbine Generator/Heat Recovery Steam Generator (CTG/HRSG)
- CO_2 Vent
- Auxiliary Boiler

[9] Variations in crude oil and relationships of supply and demand are not reflected in these numbers. Numbers calculated using DOE-NETL's UpStreamDashBoard_v2.0.3 (DOE 2013) available at http://www.netl.doe.gov/energy-analyses/refshelf/PubDetails.aspx?Action=View&PubId=439

- Thermal Oxidizer
- Gasification Flare
- Rectisol® Flare
- Sulfur Recovery Unit (SRU) Flare
- Emergency Engines
- CO_2 piping fugitive emissions
- Onsite dedicated mobile equipment
- SF_6 containing electrical equipment
- Coal Dryer
- Nitric Acid unit
- Urea Absorber Vents
- Ammonia Synthesis Plant Start-up Heater

The offsite emission sources include:

- Material Transportation (truck and train)
- Worker Transportation
- CO_2 transportation and sequestration process (described separately under the OEHI CO_2 EOR Component description)

Onsite GHG Emission Sources Description

The primary onsite GHG emissions, over 90 percent of the onsite total, are emitted from the combustion gas turbine/heat recovery steam generator (CTG/HRSG). Unlike a typical natural gas-fired power plant there are a number of onsite emission sources from the gasification process and fertilizer manufacturing complex, and there is a much larger consumption of onsite power which reduces the net power transmitted from the site when operating on hydrogen rich fuel. A description of the onsite emission sources follows with the expected annual emissions rates shown in **Carbon Sequestration and Greenhouse Gas Emissions Table 4** that is provided in the Electricity and Greenhouse Gas Emissions section. There are also the indirect GHG emissions and climate change factors of the reduction of CO_2 uptake through the change in land use, in this case removing land from active farming, and the change in land albedo. Staff has reviewed these factors for other much larger acreage renewable energy projects and has found that these indirect impacts are insignificant in comparison to a power plant's direct GHG emissions.

Large GHG Emissions Sources (>10,000 MT/year)

CTG/HRSG

The combustion turbine generator/heat recovery steam generator provides most of the electrical energy derived by this project. The CTG/HRSG proposed for this project is a Mitsubishi Heavy Industries 501GAC® (G-Class) model gas turbine operating in combined cycle mode with duct burners. The main gas turbine burners and duct burners would both be designed to operate on the hydrogen rich fuel from the gasification system or natural gas. Carbon sequestration would only occur when the gasifier is making hydrogen rich fuel. Sequestering carbon dioxide from natural gas combustion is not yet a technically mature technology at the scale of this project and would not be cost effective for this project given the fact that natural gas use would be very limited. Additionally, this project is a demonstration project for low carbon energy production from coal, so changing the project's primary fuel to natural gas would not fulfill the objectives of the project. The GHG emission performance when operating on natural gas is roughly the same as that for recently approved natural gas-fired combined-cycle projects. The primary GHG emissions from the CTG/HRSG would be CO_2 from the hydrogen rich fuel[10] and natural gas combustion, with small amounts of nitrous oxide and methane (natural gas combustion only) in the exhaust. The CTG/HRSG is, by a large margin, the largest HECA annual GHG emission source.

CO_2 Vent

When there are any upsets in the CO_2 transmission system or when the OEHI CO_2 EOR component cannot receive CO_2 due to upsets or other operating conditions, the CO_2 stream cannot be sequestered and would be vented onsite. The maximum annual CO_2 venting has been estimated to be 504 hours, which should only happen during early operations. CO_2 venting for mature operations is estimated to drop to no more than 120 hours per year. When operating the CO_2 vent has the second highest instantaneous GHG emission rate of any HECA emission source.

Auxiliary Boiler

The auxiliary boiler would be used to provide steam to facilitate CTG startup and other miscellaneous uses when Gasification Block or HRSG steam is not available. The auxiliary boiler would be limited to 2,190 hours per year of operation. The primary GHG emission from the auxiliary boiler is CO_2 from natural gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Gasification Flare

The gasification flare would be used to safely dispose of gasifier startup gases, syngas (also called unshifted and shifted gases[11]), and hydrogen-rich fuel generated during

---

[10] Hydrogen rich fuel contains carbon dioxide created in the gasification process that is not able to be separated and sequestered.

[11] Shifted gas sent to the flare would contain large amounts of hydrogen and carbon dioxide but would still contain sulfur, as H_2S, and other impurities, such as low levels of mercury, not yet removed in the

short-term combustion turbine outages and other unplanned power plant upsets or equipment failures[12]. Reduced pressure sour gas would be scrubbed to remove sulfur and both high and low pressure gases would be vented through knockout drums to remove water and other entrained liquids. The primary GHG emissions from the gasification flare is the CO_2 emitted from the flare's combustion of the syngas, with smaller amounts of methane and nitrous oxide in the syngas flare exhaust, and small amounts of CO_2, methane, and nitrous oxide from the pilot gas combustion. The gasification flare, when operating under turbine outage or upset conditions and under full syngas production, has the highest instantaneous GHG emission rate of any HECA emission source. However, gasification flare operation is expected to occur only approximately 28 hours per year during startup/shutdown events, so it is expected that annual emissions would be well below those of the gas turbine/HRSG.

Coal Dryer

The coal dryer would be used to dry the feedstock. Its heat source is the hot turbine exhaust gas from CTG/HRSG. Exhaust gases from the CTG/HRSG are used to dry the coal before it is fed to the gasifier. These exhaust gases are collected from the HRSG after emissions control but before final heat recovery to provide adequate heat for the coal drying. The total annual operation of the coal dryer is 8,110 hours. The coal dryer uses approximately 14 percent of the HRSG off-gas flow and therefore approximately 14 percent of the total GHG emissions from the CTG/HRSG operations. For the purposes of the GHG emissions tables the CTG/HRSG and Coal Dryer GHG emissions are combined.

Moderate GHG Emissions Sources (>1,000 and <10,000 MT/year)

Thermal Oxidizer

The SRU tail gas thermal oxidizer would be operated to oxidize hydrogen sulfide (H_2S) and other vent gas components that are generated during startup, shutdown, and other miscellaneous gasification unit streams (tank and equipment vents) during normal operation to prevent nuisance odors during operation. The primary GHG emissions from the thermal oxidizer is CO_2 from the pilot gas and vent gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Rectisol® Flare

The Rectisol® flare would be used as an emergency flare to safely dispose of low temperature gas streams from the acid gas removal (AGR) unit and its associated refrigeration unit during startup, shutdown, and unplanned upsets or emergency events. These gases, which are first vented through a knockout drum to remove any entrained

---

process. Unshifted gas sent to the flare would contain large amounts of carbon monoxide, carbon dioxide and hydrogen and would also contain sulfur compounds, as carbonyl sulfide (COS), and the other impurities contained in the shifted gas.

[12] The process is continuous without any significant syngas or fuel storage capacity so any upsets require the gases to be vented to a flare while the source of the upset is corrected or the gasification system is shutdown.

liquids prior to introduction to the flare header, are below the freezing point of water and require segregation from the other flared gases. The primary GHG emissions from the Rectisol® flare would be the CO_2 from the pilot gas and vented gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Nitric Acid Unit

Nitric acid production occurs through a three-step process consisting of ammonia oxidation, nitric oxide (NO) oxidation, and absorption. The total annual operation of the nitric acid unit would be 8,053 hours. The primary GHG emissions from the nitric acid unit would be the N_2O from the absorber column tail gas which would be cleaned before being discharged by catalytic decomposition and reduction of both N_2O and nitrogen oxides (NOx).

Small GHG Emissions Sources (<1,000 MT CO2E/year)

SRU Flare

The SRU flare would be operated to safely dispose of acid-gas streams containing sulfur from the AGR unit, gasification unit, and sour water stripper unit during startup or during emergency or upset events. The acid gas is first vented through an emergency caustic scrubber and knockout drum to remove sulfur compounds and entrained liquids and then vented to the flare for oxidation of the remaining acid gas. The primary GHG emissions from the SRU flare would be the CO_2 that is entrained in the acid-gas streams with additional CO_2 from the pilot gas and vented gas combustion and small amounts of methane and nitrous oxide in the exhaust.

Emergency Engines

The project is proposing two diesel-fired emergency generators (2,922 horsepower [hp] each) and one diesel-fired emergency fire pump (565 hp) that would combust diesel fuel during routine “readiness testing”. The primary GHG emissions would be CO_2 with smaller amounts of methane and nitrous oxide in the exhaust.

CO_2 Piping Fugitive Emissions

CO_2 would be emitted onsite from piping components (valves, flanges, compressor seals, etc.) within the gasification and CO_2 separation systems. For the purposes of onsite emissions, the fugitive emissions are assumed to occur from piping components until the CO_2 custody transfer point located near the HECA fence line, at which point additional CO_2 fugitive emissions are considered offsite emissions and thus under the control of Occidental Petroleum. At this point, responsibility for all of the OEHI CO_2 EOR component’s CO_2 emissions that are directly attributable to the CO_2 would be transferred from HECA to OEHI. However, GHG emissions attributable to the CO_2 sequestration are included in the overall CO_2 emissions estimate for the project. The CO_2 fugitive emissions are calculated in the same general manner as emissions of volatile organic compounds (VOC) from piping components within refineries.

Onsite Dedicated Mobile Equipment

This includes trucks, forklifts, and other on-road and off-road equipment that primarily or solely operates onsite. GHG emissions from this emission source are from the combustion of diesel, gasoline, or propane fuels.

SF_6 Containing Electrical Equipment

An electrical switchyard would be constructed onsite that would include eight new circuit breakers containing SF_6 as an insulator. A total of six 230 kilovolt (kV) circuit breakers containing 240 pounds (lbs) of SF_6 each and two 18 kV circuit breakers containing 73 lbs of SF_6 each have been proposed for the project. The emissions of SF_6 occur from equipment leakage, which have been conservatively estimated by the applicant to be one half of one percent per year.

Urea Absorber Vents

The low-pressure (LP) and high-pressure (HP) absorbers reduce the ammonia content of the off-gases from the urea synthesis process in the vents. The primary GHG emissions from the urea absorber vents would be the CO_2 from the off-gases.

Ammonia Synthesis Unit Start-Up Heater

The 55-Million British Thermal Units/hour (MMBtu/hr) natural-gas-fired start-up heater would be operated to heat the catalyst bed, used for ammonia synthesis reaction, during initial plant commissioning or during a start-up after a long period of plant shut-down. The annual heat input for this heater is not expected to exceed 7,700 MMBtu higher heating value, which is equivalent to approximately 140 hours of operation at full capacity. The primary GHG emissions would be the CO_2 from the natural gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Undetermined GHG Emissions Source

Limestone Fluxant

The applicant has revised the project description to include the use of a limestone fluxant in the gasifier feedstock. The maximum annual limestone fluxant use would be 59,000 tons per year. Limestone is composed of calcium carbonate ($CaCO_3$) that would breakdown and release carbon dioxide in the gasifier, with a maximum annual CO_2 emissions rate of approximately 23,550 metric tonnes per year (26,000 short tons/year). The applicant has not indicated how this additional generation of CO_2 would change the overall HECA CO_2 emissions/export balance; however, the total quantity of CO_2 from the fluxant is a small fraction of the maximum total CO_2 generated annually from the gasifier, which would be over 3 million tonnes. The emissions tables presented in this section do not include the potential CO_2 emissions from the fluxant shipping and use. Staff will provide updated emissions data that includes the fluxant shipping use in the FSA/FEIS.

Offsite GHG Emission Sources Description

Offsite emission sources include material delivery and employee transportation emissions and the emissions from the OEHI CO_2 EOR component's CO_2 sequestration process, where the latter is described separately below.

Material and Product Transport

HECA is considering two alternative methods for transporting materials and products to the project site:

- **Alternative 1, Rail Transportation.** An approximately 5-mile-long new industrial railroad spur that would connect the project site to the existing San Joaquin Valley Railroad Buttonwillow railroad line, north of the project site. This railroad spur would be used to transport coal to the site and fertilizer plant products to the market. Truck travel would still be used for petcoke delivery and other miscellaneous deliveries and hauling a portion of the secondary products (sulfur, ash) to market.
- **Alternative 2, Truck Transportation.** An approximately 27-mile-long truck transport route via existing roads from an existing coal transloading facility northeast of the project site. This alternative would be used to transport coal to the site. This alternative assumes petcoke and all fertilizer plant products and secondary products would be trucked to the site or to the market.

This includes delivery of the fuel feedstock by truck and train, other material deliveries and secondary product export trips, including fertilizer, ash, and sulfur. Staff has included a separate accounting of this emission source that was prepared by the applicant. However, fuel transportation emissions, including methane losses from pipeline transport, have not been included in past Energy Commission licensing case project GHG analyses; there currently is no regulatory requirement to control, offset, or inventory such emissions from stationary source projects such as HECA. Additionally, the petcoke and the fertilizer products might otherwise be shipped longer distances than they would with HECA. In the case of petcoke, it would otherwise be shipped overseas for use; and in the case of the fertilizer products, they might otherwise be shipped from outside of California for use in California. No analysis has been completed, or credit taken, for these potential net reductions in shipping emissions.

Employee Transportation

Employees would commute from communities surrounding HECA. The primary GHG emissions from employee vehicles would be CO_2 from their fuel combustion, with smaller amounts of methane and nitrous oxide. It is assumed that these GHG emissions, a minor source in the context of HECA, would be reduced over time as vehicle emissions are reduced through greater fuel efficiency or fuel substitution, including electrification.

OEHI CO_2 EOR COMPONENT

Occidental of Elk Hills, Inc. (OEHI) is proposing to extend the life of the EOR operations by using CO_2 from the proposed HECA project to facilitate oil production from its Elk

Hills Unit operations. The CO_2 would be compressed and delivered via pipeline to the OEHI's EOR Processing Facility. The process involves re-compressing and injecting the CO_2 to enable trapped oil to flow more readily into the reservoir, thereby improving recovery. Occidental Petroleum has stated that ultimately essentially all of the injected CO_2 is expected to become trapped in the formation and sequestered.

The EOR process would inject alternating slugs of CO_2 and water into a number of injection wells in what is known as the water alternating gas (WAG) injection process. The supercritical CO_2 that is used in this tertiary oil recovery process increases the miscibility and lowers the viscosity of the oil in the formation and the water sweep and then helps move the oil through the formation from the injection wells to the production wells. Occidental Petroleum notes that the industry standard CO_2 utilization efficiency ranges from 6 million standard cubic feet per barrel of produced petroleum oil (mmscf/bbl) to 30 mmscf/bbl. Assuming that the OEHI CO_2 EOR component falls into this range, Occidental Petroleum has estimated that they would produce an incremental 4,500 to 22,500 bbl/day of oil over the life of the project (HECA 2012dd).

There would also be the recovery of associated natural gas and natural gas liquids that would be sent offsite for sale by pipeline. In terms of their carbon and energy value they would be recovered in rates that would be much lower than the oil recovered. Therefore, these products are not the focus of the EOR component and their recovery rate has not been estimated by OEHI.

The OEHI CO_2 EOR component would include facilities to recapture, separate, and re-inject the CO_2 that accompanies the produced oil from the EOR process. Additionally, the water that accompanies the produced oil would also be recovered for reinjection. CO_2 would be injected continuously throughout the injection well field; any upsets that would require a CO_2 delivery shutdown would be handled at the HECA site (i.e. CO_2 venting), so that there would be no need to store any of the CO_2 received from HECA or recovered during the EOR process.

Occidental Petroleum has estimated that the maximum recycle rate of CO_2 that would occur prior to moving to a new injection and production well grid area would be approximately 550 mmscfd. Therefore, the maximum CO_2 injection rate would be 685 mmscfd, or approximately 4.7 times the amount of 135 mmscfd of CO2 that is received from HECA (OXY 2013c). Occidental Petroleum has not determined an average injection rate to establish expected long-term average emissions and noted that this analysis should use the maximum injection rate as the basis to determine the average annual emissions for the project (OXY 2013e).

The OEHI CO_2 EOR component's GHG emissions include the direct onsite emissions from EOR processing facility processes and the indirect onsite emissions from power consumption, as well as emissions from onsite ancillary and auxiliary equipment and from material and personnel transportation. The onsite emissions sources include the following sources:

- EOR Component Power Consumption (indirect)
- CO_2 Injection Heater
- Regeneration Gas Heater
- Triethlylene Glycol (TEG) Reboiler
- Amine Unit
- Central Tank Battery (CTB)
- Reinjection Compression Facility (RCF)
- Fire Pump Engines
- Piping Fugitives

The offsite emission sources include:

- Material Transportation
- Worker Transportation

Onsite GHG Emission Sources Description

Over 75 percent of the onsite GHG emission total is indirectly emitted emissions that account for the EOR component's power consumption. A description of the onsite emission sources follows with expected annual emissions rates shown provided later in this section in **Carbon Sequestration and Greenhouse Gas Emissions Table 7**.

Large GHG Emissions Sources (>10,000 MT/year)

EOR Power Consumption

The EOR component would require a total of approximately 940,000 MWh/yr, which is approximately 34 percent of HECA's annual generation total. The indirect GHG emissions from the EOR power consumption is by a large margin, at over 80 percent of the total EOR component's CO2E emissions, the largest OEHI CO_2 EOR component GHG emission source.

CO_2 Injection Heater

The CO_2 injection heater would be used to maintain desired operating temperatures. The primary GHG emissions from the CO_2 injection heater would be the CO_2 from the natural gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Moderate GHG Emissions Sources (>1,000 and <10,000 MT/year)

Regeneration Gas Heater

The regeneration gas heater would be used to heat up the regeneration gas from the molecular sieve bed where the gas is dehydrated to prevent ice or hydrate formation in the cold sections of the fractionation system. The primary GHG emissions from the CO_2

injection heater would be the CO_2 from the natural gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

TEG Reboiler

The Triethylene Glycol (TEG) reboiler would be used to dehydrate the TEG to the CO_2 water content specification. This dehydration step would allow for the use of standard carbon steel material throughout the reinjection compression facility. The primary GHG emissions from the CO_2 injection heater would be the CO_2 from the natural gas combustion, with small amounts of methane and nitrous oxide in the exhaust.

Flares

OEHI proposes to use flares for the Central Tank Battery (CTB) and the Reinjection Compression Facility (RCF). These intermittent sources would operate only a few hours per year and would primarily have emissions of CO_2 from combustion of their pilot gas and their occasional flare use, with small amounts of methane and nitrous oxide in the exhaust.

Small GHG Emissions Sources (<1,000 MT CO2E/year)

CTB

The CTB would be used as the primary oil/water separation system for the CO_2 EOR process and would be collocated with the RCF and CO_2 Recovery Plant (CRP). It would consist of an inlet header system, gas separators, gas flume, and vortex tanks for oil/water separation. The primary GHG emissions from the CTB would be a small amount CO_2 and methane from the vortex tank breathing and working loss for the small amount of each that remains in the liquids after the gases are separated, and the piping component fugitives.

Amine Unit

The amine unit would remove the remaining CO_2 and sulfur compounds and then reduce the nitrogen content in the recovered hydrocarbon gases before they are sent to sales. The primary GHG emissions from the amine unit would be from the Nitrogen Removal Unit (NRU) heater and the CO_2 that is entrained in the acid-gas streams lost as fugitive emissions.

Fire Pump Engines

The project is proposing two fire pump engines (175 hp each). The primary GHG emissions from the fire pump engines would be the CO_2 from the diesel fuel combustion during routine readiness testing.

Piping Fugitives

Fugitive emissions of CO_2 may occur in some areas of the facility due to leaks in the piping and components. Piping fugitives are associated with all areas of the well fields and EOR processing facility, but do not include upsets, such as well blow-outs.

Offsite GHG Emission Sources Description

Offsite emission sources include material delivery and employee transportation emissions.

Material and Product Transport

This includes material deliveries and associated oil production secondary product (natural gas liquids and sulfur) export trips. The primary GHG emissions from employee vehicles would be CO_2 from their fuel combustion, with smaller amounts of methane and nitrous oxide. It is assumed that these GHG emissions, a minor source in the context of the OEHI CO_2 EOR component, would be reduced over time as vehicle emissions are reduced through greater fuel efficiency.

Employee Transportation

Employees would commute from communities surrounding the OEHI CO_2 EOR component. The primary GHG emissions from employee vehicles would be CO_2 from their fuel combustion, with smaller amounts of methane and nitrous oxide. It is assumed that these GHG emissions, a minor source in the context of the OEHI CO_2 EOR component, would be reduced over time as vehicle emissions are reduced through greater fuel efficiency or fuel substitution, including electrification.

ELECTRICITY AND GREENHOUSE GAS EMISSIONS

ELECTRICITY PROJECT GREENHOUSE GAS EMISSIONS

The system to deliver adequate and reliable electricity supply is complex and variable. But it operates as an integrated whole to meet demand, such that the dispatch of a new source of generation generally curtails or displaces one or more less efficient or less competitive existing sources. Within the system, generation resources provide electricity, or energy, generating capacity, and ancillary services to stabilize the system and facilitate electricity delivery, or movement, over the grid. *Capacity* is the instantaneous output of a resource, in megawatts. *Energy* is the capacity output over a unit of time, for example an hour or year, generally reported as megawatt-hours (MWh) or gigawatt-hours (GWh). Ancillary services[13] include regulation, spinning reserve, non-spinning reserve, voltage support, and black start capability. Individual generation resources can be built and operated to provide only one specific service. Alternatively, a resource may be able to provide one or all of these services, depending on its design and constantly changing system needs and operations.

California is actively pursuing policies to reduce GHG emissions that include adding non-GHG emitting renewable generation resources to the system mix. The generation of electricity using fossil fuels produces air emissions known as greenhouse gases in addition to the criteria air pollutants that have been traditionally regulated under the

[13] See page CEC 2009c, page 95.

federal and state Clean Air Acts. Greenhouse gas emissions contribute to the warming of the earth's atmosphere, leading to climate change.

This analysis provides staff's conclusions concerning greenhouse gas emissions for this siting case. Future power plant siting and amendment cases are likely to be reviewed with the benefit of new information and policy direction from the Energy Commission. This analysis recognizes that the "prudent use" of fossil fuels for electricity generation will serve to optimize the system (for providing reliability), but, without further analysis and policy direction by the Commission to refine this general understanding, this analysis leaves the implications for optimizing the system to future cases (CEC 2009b).

PROJECT CONSTRUCTION

Construction of industrial facilities such as power plants requires coordination of numerous equipment and personnel. The concentrated on-site activities result in short-term, unavoidable increases in vehicle and equipment emissions that include greenhouse gases. The construction would last 42 months. The greenhouse gas emissions estimate, presented below in **Carbon Sequestration and Greenhouse Gas Emissions Table 3,** were converted by staff into MT CO2E and totaled.

Carbon Sequestration and Greenhouse Gas Emissions Table 3
Estimated HECA Construction Greenhouse Gas Emissions

Construction Element	CO_2-Equivalent (MT CO2E) [a,b]
Project Construction Emissions	
On-Site Combustion Emissions	
Construction Equipment – On-road	5,244.7
Construction Equipment – Off-road	8,385.2
Worker Vehicles	249.9
Delivery Trucks	353.8
Linear Combustion Engines	2,450.9
Subtotal of On-Site and Linear Emissions	16,684.5
Off-Site On-Road Emissions	
Off-Site Combustion Emissions	
Worker Vehicles	14,536.2
Delivery Trucks	5,376.6
Subtotal of Off-Site On-Road Emissions	19,912.9
Total Emissions	36,597.4

Source: HECA 2013a, HECA 2013b
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms
[b] The vast majority of the CO2E emissions, over 99 percent, is CO_2 from these combustion sources.

PROJECT OPERATIONS

Alternative 1

GHG emissions associated with the operation of HECA are shown in **Carbon Sequestration and Greenhouse Gas Emissions Table 4**. Operation of the proposed HECA project would cause GHG emissions from a number of onsite and offsite sources including the CTG/HRSG, CO_2 vent, auxiliary boiler, thermal oxidizer, gasifier, fertilizer manufacturing units, onsite facility vehicle fleet trips (including from locomotives/switch engine), and employee trips.

Carbon Sequestration and Greenhouse Gas Emissions Table 4 shows the proposed project's expected annual GHG emissions, as permitted by emission source, during early and mature operation periods. All emissions are converted to CO2E and totaled. Electricity generation GHG emissions are generally dominated by CO_2 emissions from the carbon-based fuels; other sources of GHG are typically small and also are more likely to be easily controlled or reused/recycled. **Carbon Sequestration and Greenhouse Gas Emissions Table 4** shows the project's emissions without the CO_2 that is transported to the OEHI CO_2 EOR component for sequestration. The CO2E emissions attributable to the OEHI CO_2 EOR component and the combined HECA and OEHI CO_2 EOR totals are provided later in this document.

Carbon Sequestration and Greenhouse Gas Emissions Table 4
Estimated HECA Alternative 1 Operating GHG Emissions with Sequestration

Operating Assumptions	**Early Operations[a] (Maximum Permitted)**	**Mature Operations[a]**	**Expected Mature Syngas Operations[a]**
Natural Gas Operation, hours/yr	351	351	15
Hydrogen-Rich Fuel Operation, hours/yr	8,108	8,108	8,108
Intermittent CO_2 venting, hours/yr	504	120	0
Stationary Sources	**Annual CO2E (MT/yr)[b]**	**Annual CO2E (MT/yr)[b]**	**Annual CO2E (MT/yr)[b]**
CTG/HRSG Hydrogen-Rich Fuel and PSA Off-Gas	269,153	269,153	269,153

Total HECA CO2E Emissions (MT/year)	**598,177**	**465,520**	**381,205**

Sources: HECA 2012e, HECA 2013a, HECA 2013b, and staff's interpretation of net generation.
[a] Early operations, which are assumed to occur during the first two years of operation, include maximum permitted amounts of natural gas use and CO_2 venting that could occur early in HECA facility operation and OEHI CO_2 EOR component operation when both are undergoing initial commissioning and operators are learning how to operate most efficiently alone and in concert. For the mature operations case, which is assumed to occur after the first two years of operation, the applicant assumes that there are fewer upsets requiring CO_2 venting due to optimization of operations that occurs over time. Finally, the applicant expects that mature operations could occur with very little natural gas firing, startup/shutdown only, and with no CO_2 venting. This expected mature syngas operations case represents the best case scenario for GHG emissions during mature operations. All permits would be based on the limits in the Early Operations case, which is the worst-case scenario that staff has used to determine LORS compliance; the other two cases were provided by the applicant for informational purposes for expected versus permitted emissions.
[b] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms.

The proposed project as shown above in **Carbon Sequestration and Greenhouse Gas Emissions Table 4** is estimated to emit, directly from primary and secondary emission sources on an annual basis, as much as 600,000 MT CO2E/yr during the early operations period and that it could be reduced to approximately 380,000 MT CO2E/yr during mature syngas only operations.

The offsite material transportation GHG emission estimates provided by the applicant, including fuel stock transportation, are also provided in **Carbon Sequestration and Greenhouse Gas Emissions Table 4**. These mobile source emissions do not count towards SB 1368 EPS compliance. Additionally, no accounting for the offset of emissions from transportation that would occur in lieu of the project, such as alternate transportation of the petcoke to other users, is included in this emissions summary table.

Alternative 2

Alternative 2 changes the feedstock and product transportation assumptions for the project, the other emission sources at the project site are not affected. This alternative would not have a rail spur, so the feed materials and the products would be shipped to and from the site by truck, where the coal is shipped by train to Wasco and trucked from Wasco to the site. The distance for the shipping of the fertilizer products under this alternative is reduced as those products when shipped by truck are assumed to be shipped to regional distribution/transloading facilities within a 40 mile radius of the site, rather then shipped by train to more distant locations. **Carbon Sequestration and Greenhouse Gas Emissions Table 5** summarizes facility emissions under Alternative 2 and presents the total project emissions for this alternative. These mobile source emissions do not count towards SB 1368 EPS compliance. Additionally, no accounting for the offset of emissions from transportation that would occur in lieu of the project, such as alternate transportation of the petcoke to other users, is included in this emissions summary table. The GHG emissions from Alternative 2 are nearly identical to those from Alternative 1, with just a small increase in transportation emissions. The transportation emissions for Alternative 2 would have increased more if the same product delivery locations were assumed for these two alternatives.

Carbon Sequestration and Greenhouse Gas Emissions Table 5
Estimated HECA Alternative 2 Operating GHG Emissions with Sequestration

Operating Assumptions[b]	**Early Operations (Maximum Permitted)**	**Mature Operations**	**Expected Mature Syngas Operations**
Natural Gas Operation, hours/yr	351	351	15

Total HECA CO2E Emissions (MT/year)	**598,274**	**465,617**	**381,302**

Sources: HECA 2012e, HECA 2013a, HECA 2013b, and staff determination of net generation.
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms.
[b] Operating assumptions are the same for Alternative 2, but are presented again for clarity.
[c] These values are the same as for Alternative 1, so only the subtotal is presented, please see **Carbon Sequestration and Greenhouse Gas Emissions Table 4** for the detailed stationary source emissions.

CLOSURE AND DECOMMISSIONING

Eventually the facility would close, either at the end of its useful life or due to some unexpected situation such as a change in market conditions or regulations. When the facility closes, all sources of air emissions would cease to operate and thus impacts associated with those greenhouse gas emissions would no longer occur. The only other expected, albeit temporary, GHG emissions would be equipment exhaust (off-road and on-road) from dismantling activities. These activities would be of a much shorter duration than construction of the proposed project, equipment used to dismantle the facility are assumed to have lower comparative GHG emissions due to technology advancement, and would be required to be controlled in a manner at least equivalent to that required during construction. It is assumed that the beneficial GHG impacts of this facility, displacement of higher GHG emitting fossil fuel fired generation, would be replaced by the construction of renewable energy or other low GHG generating technology facilities that would be necessary to comply with existing state regulations. Also, the recycling of the facility components (steel, concrete, etc.) could indirectly reduce GHG emissions from decommissioning activities. Therefore, these emissions would be substantially less than the HECA operation emissions and they are determined to be less than significant.

GREENHOUSE GAS/CLIMATE CHANGE IMPACTS AND MITIGATION

Staff assesses four kinds of impacts: construction, operation, closure and decommissioning, and cumulative effects. As the name implies, construction impacts result from the emissions occurring during the construction of the proposed project. The operation impacts result from the emissions of the proposed project during operation. Closure and decommissioning impacts result from emissions occurring due to the dismantling and restoration required at the end of the project's operational life. Cumulative impacts analysis assesses the impacts that result from the proposed project's incremental effect viewed over time. Staff is continuing to monitor development of AB 32 Scoping Plan implementation efforts and general trends and developments affecting GHG regulation in the construction and electricity sectors.

The impact of GHG emissions caused by the proposed facility must be considered in terms of how the power plant would affect emissions of the overall electricity system. The integrated electricity system depends on non-fossil and fossil-fueled generation resources to provide energy and satisfy local demands. The five separate roles that fossil fuel-fired power plants are most likely to fulfill in the future of a low-GHG system with increasing reliance on renewables include: 1) Intermittent generation support; 2) Local capacity requirements; 3) Grid operations support; 4) Extreme load and system emergencies support; and 5) General energy support (CEC 2009d, p. 93). HECA is analyzed below for its role in providing local capacity and base load generation and general energy support for expected generation retirements or replacements.

PROPOSED PROJECT

Construction Impacts and Mitigation

Staff concludes that the GHG emission increases from construction activities would not be significant for several reasons. First, the period of construction would be short-term, not ongoing during the life of the proposed project. Second, best practices control measures that staff recommends, such as limiting idling times and requiring, as appropriate, equipment that meets the latest emissions standards would further minimize greenhouse gas emissions since the use of newer equipment would increase efficiency and reduce GHG emissions and be compatible with low-carbon fuel (e.g., bio-diesel and ethanol) mandates that will likely be part of the ARB's low-carbon fuel regulations to reduce GHG from construction vehicles and equipment. Finally, the construction emissions are minimal in comparison with the GHG emission reductions that would occur from project operation. In fact, if the project construction emissions were distributed over the applicant projected minimum 25 year life of the proposed project those emissions would only increase the project life time annual facility GHG performance by approximately 0.0005 MT CO2E per MW, assuming that the project operates as a base load facility as assumed in **Carbon Sequestration and Greenhouse Gas Emissions Table 4**.

Operation Impacts and Mitigation

If sequestration is successful, the proposed HECA project, in the context of the Energy Commission's *Integrated Energy Policy Report*, promotes the state's efforts to move towards a low-GHG electricity system. As stated in the 2009 *Framework for Evaluating Greenhouse Gas Implications of Natural Gas-Fired Power Plants in California* (CEC 2009d, p.20):

> When one resource is added to the system, all else being held equal, another resource will generate less power. If the new resource has a lower cost or fewer emissions than the existing resource mix, the aggregate system characteristics will change to reflect the cheaper power and lower GHG emissions rate.

Net GHG emissions for the integrated electric system will decline when new power plants are added that: 1) move renewable generation towards the 33 percent target; or 2) improve the overall efficiency, or GHG emission rate, of the electric system; or 3) serve load growth or capacity needs more efficiently, or with fewer GHG emissions. While HECA is not a natural gas-fired power plant, as designed it should provide base load energy at a lower GHG emission rate per megawatt than older natural gas-fired power plants and that are comparable with the emission rates of newer natural gas-fired power plants.

Additionally, HECA has several indirect GHG emissions benefits that are not directly related to electricity generation. These indirect benefits are:

- Petroleum extracted within California would be refined within California, which would reduce transportation emissions from imported oil. Additionally, all natural gas (i.e. methane) extracted would be collected and beneficially used, which is not always the case for imported oil.
- A portion of the CO_2 and hydrogen produced would be used to create fertilizer products that are a desired product within the agriculturally rich San Joaquin Valley. This could reduce the overall fertilizer transportation emissions to the San Joaquin Valley from more distant suppliers.
- The use of petcoke from California oil refineries would reduce their export overseas and reduce their transportation emissions. The exported petcoke is burned overseas and the associated GHG emissions are not controlled. These would be reduced approximately 90 percent by HECA, in the form of sequestered carbon dioxide.

While it can be concluded that the project has these indirect GHG emissions benefits, the exact amount of these indirect GHG emissions benefits cannot be reasonably quantified. Therefore, these indirect GHG emissions benefits have not been included in any of the GHG emissions quantifications provided in this section.

OEHI CO_2 EOR Component GHG Emissions

The OEHI CO_2 EOR component requires moving of the injection and production wells periodically, corresponding new or repurposed pipeline work, and new well drilling. Therefore, construction of this project is ongoing for the twenty year life of the project. The GHG emissions estimated for the OEHI CO_2 EOR component construction are summarized in **Carbon Sequestration and Greenhouse Gas Emissions Table 6**.

Carbon Sequestration and Greenhouse Gas Emissions Table 6
Estimated OEHI CO_2 EOR Component Construction Greenhouse Gas Emissions

	CO_2-Equivalent (MT CO2E) [a,b]
Total Construction Emissions (20-year period)	86,605
Annual Average Emissions	4,330

Source: HECA 2012s
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms
[b] The vast majority of the CO2E emissions, over 99 percent, is CO_2 from on-road and off-road combustion sources.

Operations GHG emissions for the OEHI CO_2 EOR component are shown In **Carbon Sequestration and Greenhouse Gas Emissions Table 7**. Operation of the proposed OEHI CO_2 EOR component would cause GHG emissions from a number of onsite and offsite sources including the EOR component power consumption (indirect), CO_2 Injection Heater, Regeneration Gas Heater, Triethlylene Glycol (TEG) Reboiler, Amine Unit, Central Tank Battery (CTB) Flare, Reinjection Compression Facility (RCF) Flare, Fire Pump Engines, Piping Fugitives, and materials and employee vehicle trips.

Carbon Sequestration and Greenhouse Gas Emissions Table 7
Estimated OEHI CO_2 EOR Operating GHG Emissions with Sequestration

OEHI CO_2 EOR Component Emission Sources	**Annual CO2E (MT)[a]**
CO_2 Injection Heaters	34,516
Regeneration Gas Heater	5,753
TEG Reboiler	2,876
Amine Unit	575
Fire Pump Engines	3
CTB – Flare	6,923
RCF – Flare	6,536
Fugitive GHG Emissions	115
Maintenance GHG	127
Pressure Relief GHG	2
Miscellaneous Small Tanks	4
EOR Component Power Consumption[b]	282,124
Workers Commuting	207
Well Maintenance Activities	215
Total EOR Component CO2E Emissions	**339,976**

Sources: HECA 2012e, OXY 2013c, OXY 2013e
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms
[b] The power consumption emission factor has been revised from the value of 524 lbs CO2E/MWh used by the applicant to the current recommended value of 661.2 lbs CO2E/MWh for the WECC California Area by The Climate Registry (TCR 2013)

The emissions estimates above are based on the maximum recycle rate correction provided by OEHI, and are also used as the project average emission rate per OEHI (OXY 2013a, OXY 2013b). Staff revised the power consumption emissions factor to the value currently recommended by The Climate Registry (TCR 2013) that staff feels is a more accurate value for new base load power consumption, which would be generated by a mix of newer generation resources including new natural gas-fired resources and renewable resources. The total cumulative project's emissions and the cumulative CO2E emission rate per net MWh are provided below in **Carbon Sequestration and Greenhouse Gas Emissions Table 8**.

Carbon Sequestration and Greenhouse Gas Emissions Table 8
Estimated HECA and EOR Component Emissions and Generation Efficiency

	Early Operations (Maximum Permitted)	Mature Operations	Expected Mature Syngas Operations
	Annual CO2E (MT)[a]	Annual CO2E (MT)[a]	Annual CO2E (MT)[a]
Direct Annual HECA Component CO2E Emissions [b]	**598,274**	**465,617**	**381,302**
Direct Annual EOR Component CO2E Emissions [b]	**62,182**	**62,182**	**62,182**
Total Combined Annual	**660,456**	**527,799**	**443,484**
Net Annual Generation [c]	940,281	940,281	839,481
Generation Efficiency (MT CO2E/MWh)	**0.702**	**0.561**	**0.528**

Sources: HECA 2012e, HECA 2012s, HECA 2013a, HECA 2013b, OXY 2013c, OXY 2013e, and staff interpretation of net generation.
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms.
[b] Emissions include the amortized annual construction emissions based on a 20 year project life, but do not include the indirect CO_2 emissions from electricity use.
[c] This is the total net generation including all generation and all consumption for HECA and the EOR component, including the air separation unit. This estimate is a preliminary staff estimate and will likely change when staff obtains a complete HECA facility energy balance from the applicant.

This table indicates, considering the addition of the HECA mobile source emissions, the direct and indirect emissions from the OEHI CO_2 EOR component, and all of the power consumption necessary for HECA and the EOR component that the combined CO2E emissions will be lower than those of other types of coal-fired power plants, but would be higher than those of efficient natural gas fired combined cycle power plants. For comparison the Avenal Energy power plant was estimated to have an emissions rate of 0.384 MT CO2E/MWh. However, unlike Avenal Energy, HECA and the EOR component would be providing useful products other than electricity, namely 1 million tons per year of nitrogen-based fertilizers from HECA and approximately 12,000 barrels per day of oil[14] from the EOR component. Therefore, comparing the CO2E efficiency between HECA and natural-gas fired combined cycle power plants is an incomplete comparison. The actual CO2E emissions and net efficiency in terms of CO2E per net MWh will be a function of the actual operating profile for the HECA facility and determination of actual CO_2 emissions from the OEHI CO_2 EOR component, which could be somewhat higher or lower than the values shown above.

CUMULATIVE IMPACTS

Cumulative impacts are defined as "two or more individual effects which, when considered together, are considerable or . . . compound or increase other environmental impacts" (California Environmental Quality Act [CEQA] Guidelines § 15355). "A cumulative impact consists of an impact that is created as a result of a combination of the project evaluated in the EIR together with other projects causing related impacts" (CEQA Guidelines § 15130[a][1]). Such impacts may be relatively minor and

[14] The total heat equivalent of 12,000 barrels per day of oil is approximately 920 MW per hour, and after consideration of useful efficiency, assuming around 33 percent efficiency, would be over 300 MW of equivalent useful energy. Considering that useful energy in the total efficiency would drop the maximum combined HECA and EOR component permitted efficiency value from 0.702 CO2E/MWh to 0.185 CO2E/MWh.

incremental, yet still be significant because of the existing environmental background, particularly when one considers other closely related past, present, and reasonably foreseeable future projects.

This entire assessment is a cumulative impact assessment. The project alone would not be sufficient to change global climate, but would emit greenhouse gases and therefore has been analyzed as a potential cumulative impact in the context of existing GHG regulatory requirements and GHG energy policies.

COMPLIANCE WITH LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Compliance with LORS is addressed both for the HECA component as necessary for the Committee to make a decision on this project, and for the associated OEHI CO_2 EOR component.

HECA

HECA would be subject to ARB's mandatory reporting requirements and potentially other future requirements mandating compliance with AB 32 that are being developed by ARB. How the project would comply with these ARB requirements is speculative at this time, but compliance would be mandatory. The ARB's mandatory GHG emissions reporting requirements do not indicate whether the project, as defined, would comply with the potential GHG emissions reduction regulations being formulated under AB 32. The project may have to provide additional reports and GHG reductions, depending on the future regulations expected from ARB.

Reporting of GHG emissions would enable the project to demonstrate consistency with the policies described above and the regulations that ARB adopts and to provide the information to demonstrate compliance with any applicable EPS that could be enacted in the next few years. Since this power project would be permitted for more than a 60 percent annual capacity factor, and to be financially viable would have to obtain a long-term contract from an IOU or POU, the project would be subject to the requirements of SB 1368 and the current EPS. As described below, HECA's GHG emission performance would be well below the SB 1368 EPS as long as the carbon dioxide emissions sent to the oil field remain sequestered underground. Operational period testing would be conducted to demonstrate compliance with the GHG performance standards.

GHG LORS COMPLIANCE

<u>EPS Compliance</u>

California's EPS prohibits California utilities from acquiring ownership shares in or entering into long-term contracts for energy with base load facilities whose CO_2 emissions exceed 1,100 lbs per MWh (0.5 metric tonnes per MWh). The EPS further defines annual average carbon dioxide emissions and annual average electricity production (§ 2904 and § 2905). The following practical assumptions are taken from those sections of the regulations:

1) The CO_2 emissions within the HECA project site that are included in the total CO_2 emissions for EPS compliance include the following CO_2 emission sources:
    a. CTG/HRSG (all fuels)
    b. CO_2 Vent [per §2904(c)]
    c. Gasification Flare [per §2904(c)]
    d. Rectisol® Flare [per §2904(a)]
    e. SRU Flare [per §2904(a)]
    f. Auxiliary Boiler [per §2904(a), ancillary equipment]
    g. Thermal Oxidizer [per §2904(a)]
    h. Gasification Heater [per §2904(a)]
    i. Gasification and Gas Handling Units Fugitives (piping components) [per §2904(c)]
    j. Ammonia Synthesis Plant Start-Up Heater
    k. Urea Absorber Vents
    l. Fertilizer Plant Fugitives

    Emissions sources a. through i. are sources considered necessary for, not ancillary to, the operation of the gasification process and gas turbine/HRSG. CO_2 emissions associated with the fertilizer manufacture (j. through k.) are included in the emissions total, and the positive amount of electricity generated by the fertilizer manufacture is also included in total facility net generation. The combined effect of including both the CO_2 emissions and electricity generation from the fertilizer manufacture actually reduces the project-wide CO_2 emissions per MWh value.

2) The CO_2 emissions within the HECA project site that are not included in the total CO_2 emissions for EPS compliance include the following CO_2 emission sources:
    a. Emergency Engines [per §2904(a), ancillary equipment]
    b. Onsite/Offsite Mobile Equipment [per §2904(a), vehicles]
    c. The carbon remaining in the gasification solids.

    The carbon in the gasification solids is not considered to be a CO_2 emission source, as is generally required per §2904(a)[15], since the carbon in the gasification solids is bound into the structure of the solids and will not be emitted

[15] Regardless that the carbon is in a solid form part (a) notes “the calculation shall assume that all carbon in the fuels is converted to carbon dioxide. However, in this case the petcoke and coal are not directly used as fuels but rather as feedstock to make the fuel, so the provision in part (a) is not considered applicable to the carbon left in the gasification solids.

as a gas, and the gasification solids are planned to be used as a secondary product that will supplant the use of other raw materials.

3) The CO_2 emissions within the OEHI CO_2 EOR component that are included in the total CO_2 emissions for EPS compliance include the following CO_2 emission sources:

   a. HECA's CO_2 emissions that are not sequestered, which at this time is only considered to be the piping and other fugitive emissions from the EOR component, and CO_2 that is dissolved in the recovered oil or contained in the produced natural gas that is not recovered and recycled back for re-injection.

   b. CO_2 emission created at the OEHI CO_2 EOR component that is directly related to the CO_2 sequestration. Those sources include:

      i) CO_2 Injection Heater

      ii) Regeneration Gas Heater

      iii) Triethlylene Glycol (TEG) Reboiler

      iv) Amine Unit

      v) Central Tank Battery (CTB) flare

      vi) Reinjection Compression Facility (RCF) flare

   c. Indirect CO_2 emissions generated from the electricity consumed to sequester the CO_2.

   These three emissions sources are considered necessary to meet the intent of the EPS regulation [§2904(c)] to determine the net amount of CO_2 emissions sequestered.

4) The CO_2 emissions within the OEHI CO_2 EOR component site that are not included in the total CO_2 emissions for EPS compliance include the following CO_2 emission sources:

   a. Emergency Engines [per §2904(a), ancillary equipment]

   b. CO_2 emissions created in the downstream refining or use of the recovered petroleum products.

   c. Onsite/Offsite Mobile Equipment [per §2904(a), vehicles]

   The GHG emissions from the EOR component's produced oil use are not considered to be relevant in the discussion of the project's impacts. With or without this project necessary oil production to meet petroleum product demand will occur, at the Elk Hills site using other means, domestically, or overseas. It can also be argued that production closer to demand, similar to the greenhouse reduction concept of using local products, actually reduces overall GHG emissions.

5) The total net MWh for determination of EPS compliance includes the following assumptions:

   a. The total net MWh to the grid from the HECA project site minus the MWh needed for operation of the Air Separation Unit [per §2905(a)].

   b. The total net MWh used in the fertilizer production [per §2905(a)] and incremental generation from the fertilizer production.

These interpretations of §2904 and §2905 are based on the following overarching concepts:

1) The onsite fuel preparation process (i.e. gasification process and its various emission sources) is not an ancillary process. This realizes that the actual fuel is the coal and coke feed stocks that are gasified as the hydrogen rich fuel combusted in the gas turbine/HRSG would not exist without the coal and coke.

2) The fact that the geologic sequestration is being performed by a third party and that the air separation unit will be owned and operated by a third party does not mean that additional CO_2 emissions created by the sequestration process or the energy (MWh) used in the air separation process, which is integral to the operation of the gasifier, can be neglected[16].

3) The petroleum produced by the sequestration process will supplant petroleum production that would occur elsewhere that would have similar or higher emissions, given that the sequestration process CO_2 emissions have been considered as part of HECA's CO_2 emission performance. Therefore, the downstream GHG emissions would not create an incremental increase in CO_2 emissions from petroleum production.

Additionally, there are three main operating conditions:

1) The production of hydrogen rich fuel with separation and sequestration of CO_2.
2) The production of hydrogen rich fuel with separation but no sequestration of CO_2 (i.e. CO_2 vent operating).
3) The generation of electricity with natural gas when the gasification system is not operating.

The applicant has provided annual assumptions for each of these operating conditions to create worst case (early and mature operations) and best case (mature operations) annual operating scenarios.

[16] If HECA were proposing to sequester CO_2 emissions using onsite injection wells into a salt formation, then the onsite emissions and electrical consumption would certainly be considered in the final CO_2 emissions performance. Similarly, if the air separation unit were owned and operated by HECA directly then the parasitic load would be considered in the total net MW calculations. The positive intent of allowing CO_2 sequestration to meet the EPS is lost if third party sequestration CO_2 emissions and electrical consumption are not considered as part of the total emissions performance.

Using these assumptions, and the applicant's CO_2 emission estimates for the HECA facility and Occidental Petroleum's CO_2 emission estimates for the EOR component, staff has completed a summary of the SB 1368 CO_2 emission sources and Net MW in **Carbon Sequestration and Greenhouse Gas Emissions Table 9**, where the worst-case (early operations and mature operations) and best-case (mature operations) annual operating scenarios from **Carbon Sequestration and Greenhouse Gas Emissions Table 4** have been tabulated to identify the project's potential range for CO_2 emission performance.

Carbon Sequestration and Greenhouse Gas Emissions Table 9
HECA SB 1368 EPS Compliance – Preliminary Calculations

	Early Operations (Maximum Permitted)	**Mature Operations**	**Expected Mature Syngas Operations**
Net Electrical Energy Production	**Annual CO_2 (MT/yr)**	**Annual CO_2 (MT/yr)**	**Annual CO_2 (MT/yr)**

Sources: HECA 2012e, HECA 2012s, HECA 2013a, HECA2013b, and staff interpretation of net generation.
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms.
[b] These emissions do not match those on **CARBON SEQUESTRATION AND GREENHOUSE GAS EMISSIONS Table 8** because they are CO_2, not CO2E, and they do not include the annualized OEHI construction emissions.
[c] These values are based on the applicants values of 325 MWh net on hydrogen rich fuel when not subtracting the manufacturing facility parasitic load and generation and 300 MWh net when operating on natural gas.
[d] These values are based on an average hourly consumption rate of 106 MW for the ASU over 8,108 hours of operation per year. It should be noted that part of the ASU's gas production is used for fertilizer production; however, staff does not have enough information to determine what proportion is reasonable and so is conservatively assuming the entire power consumption is related to the gasifier operation and part of the HECA net MW determination.

There is the potential that there are greater CO_2 losses due to lower than expected separation efficiencies at HECA or lower than intended sequestration efficiency from the OEHI CO_2 EOR component; however, the emissions estimates show some margin of safety[17], so compliance with the EPS is expected as long as HECA's CO_2 is separated and sequestered through the OEHI CO_2 EOR component as proposed and the ratio of gas turbine operating hours versus venting hours is not substantially higher than the cases shown above. However, if the gas turbine operation is substantially lower than 8,100 hours per year and the venting hours are as high as permitted maximum level of 504 hours per year then there is the potential that HECA's CO_2 emission performance could exceed the EPS. Based upon preliminary data, if the facility were to reduce electricity production by 110 MW and maximize ammonia production during off-peak hours (eight hours per night), HECA would emit 0.51 MT CO_2/MWh, just above the 0.5 MT CO_2/MWh required by the EPS.

Staff is recommending staff conditions **GHG-1** through **GHG-3** and **GHG-5** to ensure compliance with this regulation. Condition **GHG-1** would require the project owner to prepare and operate under a CO_2 Emissions Performance Compliance Plan (EPCP) that would detail the operating procedures that would be used to reduce project site CO_2 emissions to the extent feasible and maintain emissions below the EPS. Condition **GHG-2** would require the project owner to shutdown gasifier operations if OEHI stops accepting the CO_2 for sequestration or otherwise as necessary for compliance with the EPCP, SB 1368, or other regulatory requirements. Condition **GHG-3** would require that the applicant, and through a binding contract OEHI, prepare and operate in compliance with a CO_2 Emissions Sequestration Plan (CO_2 ESP) that details the design and operation requirements, monitoring requirements and recordkeeping requirements for ensuring CO_2 emissions sequestration. Condition **GHG-5** would require HECA to annually compute their actual emission performance. Currently these conditions are preliminary. Staff is continuing our evaluation of the detailed requirements that are needed for these conditions and will publish any needed final amendments to these conditions in the FSA/FEIS.

Applicant Position

The applicant does not agree with staff's interpretation of the emissions accounting under the EPS (URS 2013). In general the differences are that staff includes emissions sources that the applicant does not, including the emissions from the OEHI CO_2 EOR component, staff includes the air separation unit's power consumption in the HECA net energy production calculation, and staff includes the fertilizer manufacturing plant's generation in the net generation totals. Therefore, staff includes more emissions in the numerator and less megawatt hours of generation in the denominator of the EPS determination. A summary of the applicant's stated position, based on their

[17] This margin of safety would increase if and when staff can determine that a portion of the air separation unit's electricity consumption can be apportioned to the manufacturing complex, rather than the entire consumption being counted against HECA's net generation. For example, if one third of the power consumption from the ASU can be apportioned to the manufacturing plant then the CO_2 emissions performance value for the early operations case would be reduced from 0.454 MT CO_2/MWh to 0.394 MT CO_2/MWh. Likewise, the margin of safety could decrease if HECA is not able to meet their expected operating hours profile due to factors such as the competitive California electricity market's acceptance of the electricity produced by HECA.

interpretation of the Energy Commission Regulations, Chapter 11, Article 1, is as follows:

- The EPS emission calculations include only the annual GHG emissions from each fuel used in any component directly involved in electricity production or associated with the sequestration of CO_2.
- Emissions from electricity production come from the CTG/HRSG and coal dryer when burning syngas, PSA off-gas and natural gas, and SF_6 from the circuit breakers.
- Emissions associated with the CO_2 sequestration include the CO_2 vent and fugitives from CO_2 preparation for sequestration.
- The EPS emission calculations do not include emissions associated with the Gasification Block (flares, thermal oxidizer), Manufacturing Complex (ammonia synthesis plant start-up heater, urea absorbers, and nitric acid unit), auxiliary boiler, emergency generators, fire pump, and vehicles.
- CO_2 emissions associated with the recovery of oil have nothing to do with power production at HECA or the sequestration of the CO_2. HECA would provide CO_2 to OEHI that would be pressurized adequately that it could be injected directly into the ground for sequestration without further compression. But since OEHI's main purpose is to extract oil, they would further pressurize this CO_2 so that it can push out the oil. Thus all emissions associated with the OEHI component that were presented in the Supplemental Environmental Information (SEI) are associated with the recovery of oil, and should not be included in the emission inventory for determining EPS compliance.
- The net electricity production calculated for EPS compliance for hydrogen-rich fuel generation includes the net power exported plus the power used on-site in the Manufacturing Complex minus the steam generated from the ammonia production unit.

The three major differences in approach are that: 1) staff is considering the coal and petcoke feedstocks to be the fuel, while the applicant is considering the gasification product as the fuel; 2) staff considers the air separation unit as an integral part of the plant, regardless of ownership, which must be considered in the HECA net energy production calculation; and 3) staff considers the CO_2 sequestration process as proposed to be integral to the project, while the applicant considers a theoretical sequestration project that does not exist and that would not cause additional emissions.

A comparison of staff's calculation approach for EPS emissions and HECA facility net MWh accounting and the applicant's approach for the range of operations, early operations and best case mature operations, is shown in **Carbon Sequestration and Greenhouse Gas Emissions Figure 1** and numerical values are provided in **Carbon Sequestration and Greenhouse Gas Emissions Table 10**.

Carbon Sequestration and Greenhouse Gas Emissions Figure 1 graphically shows how different the interpretations of EPS calculation requirements are between staff and the applicant. The applicant believes that only a very small part of the overall project, centered around the gasifier and gas turbine, should be included in the EPS calculations. Staff's interpretation of the SB 1368 regulation suggests that most of the project, and certainly the carbon sequestration portion of the project, must be included in the emissions and net electricity generation calculations to determine whether the project would comply with the EPS. **Carbon Sequestration and Greenhouse Gas Emissions Table 10** below shows in numeric terms just how different the EPS calculation approaches are between staff and the applicant.

Carbon Sequestration and Greenhouse Gas Emissions Table 10
HECA EPS Compliance – Staff Versus Applicant Comparison

	Early Operations Staff Assumptions	Early Operations Applicant Assumptions	Mature Operations Staff Assumptions	Mature Operations Applicant Assumptions
Net Electrical Energy Production	**Annual CO_2 (MT/yr)**	**Annual CO_2 (MT/yr)**	**Annual CO_2 (MT/yr)**	**Annual CO_2 (MT/yr)**

HECA Only Emission Performance	0.274	**0.176**	0.168	**0.100**
HECA and OEHI Emission Performance [b]	**0.454**	**0.176**	**0.358**	**0.100**
Emission Performance Standard	**0.500**	**0.500**	**0.500**	**0.500**

Sources: HECA 2012e, HECA 2012s, HECA 2013a, HECA 2013b, OXY 2013c, OXY 2013e, and staff's interpretation of net generation.
[a] One metric tonne (MT) equals 1.1 short tons or 2,204.6 pounds or 1,000 kilograms.
[b] HECA and OEHI emission performance could be as high as 0.51 MT CO_2/MWh during early operations under some staff assumptions.

The table above includes corrections to several errors in the applicant's data provided in AFC Table 5.1-23, as follows:

1) Only CO_2 emissions, not CO2E emissions are provided for the combustion emissions sources;
2) The SF_6 emissions source included in AFC Table 5.1-23 was removed; and
3) The emissions were updated per data responses received.

The differences shown in this table are significant in terms of percentage where staff's approach provides CO_2 emission performance results that are over two and a half times higher for the early operations case and over three and half times higher for the mature operations case. However, both calculation methods support the same finding that the project's emissions would be below the EPS.

GHG Emissions Cap and Trade

HECA is forecast to emit far more than the 25,000 MT CO2E applicability threshold for the cap and trade regulation (see **Carbon Sequestration and Greenhouse Gas Emissions Table 4**). Therefore, the project owner would be required to obtain GHG emission allowances, or other emissions reductions or offsets, in sufficient amounts to cover the GHG emissions to the atmosphere occurring within the facility (CCR Title 17 §95850(b)). The facility would also be regulated as a CO_2 supplier and would have a compliance obligation based on the CO_2 supplied minus the emissions geologically sequestered through use of an ARB-approved carbon capture and geologic sequestration quantification methodology that ensures that the emissions reductions are real, permanent, quantifiable, verifiable, and enforceable[18]. ARB staff has been directed to initiate a public process to establish a quantification methodology for geologic sequestration but ARB does not currently have a defined schedule to complete this process.[19] However, no ARB-approved methodology currently exists and HECA would currently have a compliance obligation for the total CO_2 supplied until ARB implements their geologic sequestration regulations.

HECA would be required to obtain sufficient valid compliance instruments (a combination of emission allowances, offset credits, or sector based offset credits, although offsets are limited to no more than 8 percent of total compliance obligation) every three years (triennially) to cover its triennial emissions by November of the year following each triennial compliance period, and they would have to retire at least 30 percent of their GHG emissions reported from the previous calendar year each November following that calendar year. HECA would have to obtain necessary GHG allowances or offset credits to meet its total compliance obligation. HECA would be subject to this regulation immediately upon facility start-up.

PSD Permitting

HECA is subject to GHG PSD permitting, which is included in the SJVAPCD PDOC (SJVAPCD 2013). The PDOC has concluded that the project meets GHG emissions best available control technology (BACT) requirements and also contains conditions relevant to GHG emissions. These conditions are included with the rest of the PDOC conditions in the Air Quality section of this PSA/DEIS.

GHG Emission Inventory and Reporting

HECA, which as proposed would emit significantly more than 25,000 MT CO2E per year, would be subject to both federal and state GHG emission inventory preparation and reporting. Staff is proposing under Condition of Certification **GHG-4** that these

[18] While regulations exist for electric generating facilities and for CO_2 suppliers, the regulations for geologic carbon sequestration under the Cap and Trade program have not yet been completed.

[19] See page 15 of ARB resolution: http://www.arb.ca.gov/regact/2010/capandtrade10/res1042.pdf

inventories and reports be kept at the site, for a period of 5 years, for inspection by appropriate agencies.

AVENAL PRECEDENT DECISION

The Energy Commission established a precedent in the Final Commission Decision for the Avenal Energy Project. This decision requires the Energy Commission to determine that any new natural gas fired power plants certified by the Energy Commission are likely to: (a) not increase the overall system heat rate for natural gas plants; (b) not interfere with generation from existing renewable facilities nor interfere with the integration of new renewable generation; and, (c) taking into account these factors, reduce system-wide GHG emissions and support the goals and policies of AB 32 (CEC 2009c, page 111).

While the decision is intended to apply to new natural gas fired projects, HECA would be fueled with a blend of 75 percent coal and 25 percent petroleum coke. Both of these have a much higher carbon content than natural gas. As proposed, the project would also use a limited amount of natural gas, with more being used in the early years of operation and less used as the project matures and the operators learn how to optimize operations as described above. Based upon preliminary data and subject to revision, HECA is estimated to emit from 0.454 MT CO_2/MWh to 0.51 MT CO_2/MWh during early years of operation and as little as 0.358 MT CO_2/MWh thereafter. In comparison, today's new natural gas fired combined cycles emit about 0.364 to 0.386 MT CO_2/MWh.

The system mentioned above is the Western Electricity Coordinating Council (WECC), which includes the western United States, the Canadian provinces of British Columbia and Alberta, and the northern portion of Baja California, Mexico. Staff's estimate of the average heat rate for natural-gas fired generation in the WECC, based on the Energy Information Administration's (EIA) Form EIA-923 data, is 0.41 MT CO_2/MWh Thus, when HECA is new, it would operate with CO_2 emissions that are higher per megawatt-hour than the electricity production system's average natural gas fired power plants and may exceed the EPS of 0.5 MT CO_2/MWh. However, when HECA is mature it would operate with CO_2 emissions that are below the system average and slightly lower than today's new natural gas combined cycle facilities.

If HECA were a conventional natural gas-fired plant, its having a higher heat rate upon starting operations than the WECC average would not affect a detrimental effect on the latter as it would displace higher-emission resources. As it burns gasified coal, however, its initial impact on average system-wide GHG emissions may be negative; see **The Role of HECA in Energy Displacement** below.

OEHI CO_2 EOR COMPONENT

GHG Emissions Cap and Trade

The OEHI CO_2 EOR component is also forecast to emit more than the 25,000 MT CO2E applicability threshold for cap and trade regulation. (see **Carbon Sequestration and Greenhouse Gas Emissions Table 7**). Therefore, Occidental Petroleum would be required to obtain GHG emission allowances in sufficient amounts to cover the GHG emissions to the atmosphere occurring within the facility and its other covered emissions units (CCR Title 17 §95850(b)). Additionally, Occidental Petroleum would be responsible for following an ARB-approved carbon capture and geologic sequestration quantification methodology, if and when the ARB-approved methodology is prepared, that would ensure that the emissions reductions from the EOR component's carbon sequestration are real, permanent, quantifiable, verifiable, and enforceable.

PSD Permitting

The OEHI CO_2 EOR component would trigger GHG PSD permitting. This permit would be processed by the SJVAPCD with the other required air quality permits for that project. Occidental Petroleum is not expected to file the necessary permit applications for the EOR component until a decision has been made on HECA. Therefore, the EOR component's GHG PSD permit is expected to be finalized well after the Energy Commissions licensing process has been completed. Because the EOR component is not subject to the Energy Commission's jurisdiction, the District would complete an Authority to Construct, which would be subject to public notice and by rule would have a comment period of at least 30 days. Staff has not identified any issues with the EOR component that might affect the timely completion of a GHG PSD permit.

GHG Emission Inventory and Reporting

The OEHI CO_2 EOR component would emit significantly more than 25,000 MT CO2E per year and would be subject to both federal and state GHG emission inventory preparation and reporting. Staff is proposing under Condition of Certification **GHG-4** that these inventories and reports be obtained by the HECA project owners from Occidental Petroleum and kept at the HECA site, for a period of 5 years, for inspection by appropriate agencies.

Because leaks of injected CO_2 have the potential to contaminate underground sources of drinking water (USDW), the U.S. EPA, with mandate under the Clean Water Act, has issued regulations to control injection wells intended for long term storage of CO_2 in terms of construction, operation, monitoring, plugging, post-injection site care (PISC), and closure, as well as financial responsibility for any maintenance and correction action plans. The U.S. EPA regulations were codified under 40 CFR part 146 subpart H commencing with subsection 146.81. Compliance of the project owner with the regulations for injection wells as required by Condition of Certification **GHG-3**, with the exception that the project owner would not have to obtain the actual permit, would ensure that impacts from the injection of the carbon dioxide would have no significant impacts on USDWs.

DIRECT/INDIRECT OPERATION IMPACTS AND MITIGATION

GHG Emissions During Plant Operation

HECA would produce GHG emissions during operations through the combustion of hydrogen-rich fuel produced by coal and petcoke gasification, as well as limited amounts of natural gas, to generate electricity. Preliminary data supplied by the applicant and shown in **Reliability Table 1** of the Power Plant Reliability section indicate the facility would operate 50 weeks a year, require 192 hours (total), to start up twice a year, have a 91.3 percent equivalent availability factor and an 85 percent capacity factor. On a typical day it would operate at full electrical power production (originally stated as 405 MW gross output, more recently stated as 416 MW) for 16 hours and at a reduced electrical output for the remainder of the day, when it would be maximizing fertilizer production. HECA would emit approximately 0.454 to 0.51 MT CO_2/MWh during early years of operation and as little as 0.358 MT CO_2/MWh during thereafter. In comparison, today's new natural gas fired combined cycles emit about 0.364 to 0.386 MT CO_2/MWh.

Approximately 92 percent of the CO_2 generated during from the gasification process would be separated and approximately 80 to 85 percent of the separated CO_2 would be exported by pipeline to Occidental Petroleum for sequestration in the process of enhanced oil extraction. Power production is forecast to occur over 90 percent of the year, and the hourly net electricity generation rate added to the grid would be turned down 45 percent during off peak periods. HECA's fertilizer plant provides limited flexibility in the use of the hydrogen production from the gasifier allowing part of the plant's generation to be dispatchable.

Based upon this preliminary data, HECA, upon operational maturity, promotes the state's efforts to move towards a low-GHG electricity system in two primary ways:

- The energy produced by HECA would displace energy from higher GHG-emitting coal- and natural gas-fired generation resources, lowering the GHG emissions from electricity generation in the western United States, Canada and Mexico, the relevant geographic area for the discussion of GHG emissions from California's electricity generation.
- The dependable capacity provided by HECA may facilitate the retirement of resources that are adversely affected by the State Water Resources Control Board's (SWRCB) policy on once-through cooling (OTC).

California's Energy Action Plan Loading Order

In 2003, the three key energy agencies in California at the time – the California Energy Commission (Energy Commission), the California Power Authority, and the California Public Utilities Commission (CPUC) – came together in a spirit of unprecedented cooperation to adopt an "Energy Action Plan" (EAP) that listed joint goals for California's energy future and set forth a commitment to achieve these goals through specific actions. The EAP is a living document meant to change with time, experience, and need. In 2005 the CPUC and the CEC jointly prepared an Energy Action Plan II to identify further actions necessary to meet California's future energy needs (CEC 2005).

The EAP's overarching goal is for California's energy to be adequate, affordable, technologically advanced, and environmentally-sound. Energy must be reliable – provided when and where needed and with minimal environmental risks and impacts. Energy must be affordable to households, businesses and industry, and motorists – and in particular to disadvantaged customers who rely on California government to ensure that they can afford this fundamental commodity. EAP actions must be taken with clear recognition of cost considerations and trade-offs to ensure reasonably priced energy for all Californians.

The EAP accomplishes these goals in the electricity sector by calling for a "loading order" specifying the priority order for how to balance electricity supply and demand. The loading order identifies energy efficiency and demand response as the state's preferred means of meeting growing electrical energy needs. After cost-effective efficiency and demand response, it relies on renewable sources of power and distributed generation, such as combined heat and power applications. To the extent efficiency, demand response, renewable resources, and distributed generation are unable to satisfy increasing energy and capacity needs or provide services needed to reliably operate the electricity system, the loading order supports clean and efficient fossil-fired generation.

The Role of HECA in Energy Displacement

As electricity demand is largely independent of the generation resources used to meet it, the construction and operation of a new power plant results in displacement of energy from another generation source in an amount equal to that provided by the new facility. This section discusses the energy sources that would likely be displace by the construction and operation of HECA.

HECA can be expected to displace energy from other fossil-fueled resources:

- California's Renewable Portfolio Standard (RPS) calls for an amount equal to 33 percent of their retail sales to be purchased by the state's load-serving entities from qualifying renewable energy facilities by 2020. Similar albeit less ambitious standards have been established in other states. The development of HECA would not affect the obligation of load-serving entities to procure this amount of renewable energy. Nor would HECA affect the output of those few renewable generators that do not sell energy to entities with RPS obligations, as these plants have very low variable costs of generation and are thus able to sell into spot and short-term energy markets at nearly $0. Accordingly, HECA would not be expected to displace renewable energy.

- Both large hydroelectric facilities and nuclear plants have very low variable costs of production as well. Moreover the latter are not designed to cycle up and down. Both of these resources would be unaffected by the development of HECA.

If HECA were a conventional natural-gas fired plant, it would be possible to say that it would displace less-efficient gas fired generation and might or might not displace coal-fired generation, depending upon the latter's variable cost of production. In any case, the development of HECA would represent an unambiguous reduction in system-wide GHG emissions.

The role of HECA in energy displacement is complicated by several factors. When (new) fossil generation alternatives are limited to those combusting natural gas, both the new facility and the facility potentially displaced use the same fuel unless the latter combusted coal, and thus had a unambiguously higher GHG emissions rate. Accordingly, it has been reasonably assumed that the natural gas-fired generation units dispatched first–those with the lowest variable operating cost per MWh–would be those that combusted natural gas most efficiently in the production of electricity and, thus, would be those with the lowest GHG emissions per unit of electricity. As a result, when new facilities produce electricity they would replace higher GHG-emitting facilities and reduce system-wide GHG emissions. In combusting gasified coal, however, the fuel cost per unit of electricity produced may be lower for HECA than for a natural gas fired combined cycle. As such, it may be dispatched first despite – in its early years of operation - having a higher GHG emissions rate.

Furthermore, unlike conventional natural gas-fired generation, HECA produces products other than electricity and ancillary services. Even if fuel costs per MWh are higher for HECA than for a natural gas-fired combined cycle, HECA might choose to produce electricity at a price below that at which new combined cycles are willing to operate as generation may produce revenue streams for HECA other than those resulting from the sale of electricity and ancillary services. If HECA receives sufficient revenue for fertilizer production or for its CO_2 used for enhanced oil recovery, etc., and generation is a necessary component of these production processes, HECA may have sufficient financial incentives to generate electricity at prices below those at which new natural gas-fired combined cycles would be dispatched. Again, this could result in HECA being dispatched before a natural gas-fired combined cycle which, during the early years of HECA's operation, would have a lower GHG emissions rate.

The Role of HECA in Capacity Displacement

HECA would provide up to 160 MW of new electrical capacity and associated electrical energy to the grid[20]. Electricity demand in California reaches its peak during mid- to late-afternoons on the hottest weekdays of the summer. Dependable capacity–the amount of capacity that can be counted upon to be available during the peak demand for electricity–is needed to reliably serve loads; the generation fleet, in conjunction with

[20] This value represents the power generation under average annual ambient conditions and includes the parasitic loads of the fertilizer plant and the air separation unit.

demand response programs, must provide a sufficient amount of dependable capacity to meet demand on the highest load day of the year.[21] Load-serving entities in the California (Independent System Operator) ISO control area, for example, are required by the California ISO to procure dependable capacity in amounts determined by their peak load forecast.

The dependable capacity provided by HECA could assist in replacing that lost due to the EPS and the SWRCB's OTC policy, both discussed more fully below. Given uncertainties regarding load growth, the contribution of renewable resources to capacity needs over the next ten years, the availability of the San Onofre Nuclear Generating Station, etc., the amount of new dispatchable capacity that will be needed to serve loads reliably is presently uncertain. It should be noted, however, that required new capacity needs may largely be limited to and satisfied by projects in specific locations (e.g., the Los Angeles Basin) to meet local capacity requirements or be required to have operating characteristics that HECA is lacking (cycling ability, fast ramp rate, ability to operate over a wide output range).

Replacement of High GHG-Emitting Generation

High GHG-emitting base load electricity generation resources, such as conventional coal facilities, are effectively prohibited from entering into new, long-term contracts for California electricity deliveries as a result of the EPS adopted in 2007 pursuant to SB 1368. Between now and 2020, 1,549 MW of coal-fired generation capacity will have to reduce GHG emissions or be replaced; these contracts are presented in **Carbon Sequestration and Greenhouse Gas Emissions Table 11**.

Carbon Sequestration and Greenhouse Gas Emissions Table 11
Expiring Long-term Contracts with Coal-fired Generation 2013 – 2020

Utility	Facility	Contract Expiration	MW
Department of Water Resources (DWR)	Reid Gardner	2013 [a]	213
San Diego Gas and Electric (SDG&E)	Boardman	2013	84
Southern California Edison (SCE) [b]	Four Corners	2016	720

Notes:

[a] Contract not subject to EPS, but the Department of Water Resources has stated its intention not to renew or extend.

[b] The sale of SCE's share of Four Corners to Arizona Public Service was approved by the CPUC and subsequently by Federal Energy Regulatory Commission (FERC) in November 2012.

[21] This is usually the hottest weekday in the summer, when residential and commercial cooling loads are at their highest.

Retirement of Generation Using Once-Through Cooling

The State Water Resources Control Board (SWRCB) policy on cooling water intake at coastal power plants has led to the retirement and replacement of several plants that use once through cooling (OTC). Numerous others are likely to retire on or prior to assigned compliance dates,[22] some of which will require replacement.[23] The units with compliance dates on or before the end of 2020 are presented in **Carbon Sequestration and Greenhouse Gas Emissions Table 12.**

Carbon Sequestration and Greenhouse Gas Emissions Table 12
OTC Units with SWRCB Compliance Dates on or before December 31, 2020[24]

Plant Name & Unit	Local Reliability Area	Capacity (MW)
Alamitos 1 – 6	LA Basin	2,010
El Segundo 3 & 4	LA Basin	670
Encina 1 – 5	San Diego	950
Huntington Beach 1 & 2	LA Basin	430
Mandalay 1 & 2	Ventura	436
Morro Bay 3 & 4	None	650
Moss Landing 6 & 7	None	1,510
Moss Landing 1 & 2	None	1,020
Ormond Beach 1 & 2	Ventura	1,516
Pittsburg 5 - 7	SF Bay	1,311
Redondo Beach 5 – 8	LA Basin	1,356
Total		**11,859**

Note: Pittsburg Unit 7 (682 MW) does not use once-through cooling but would be required to shut down if Units 5 and 6 retire.

CO_2 EOR AND SEQUESTRATION ANALYSIS – Tad Patzek and Abdel-Karim Abulaban

HECA would generate larger amounts of CO_2 per gross megawatt-hour than permitted by the EPS for base load power plants. To achieve compliance with the EPS, HECA proposes to store excess production permanently in the geologic formation at the Elk Hills Oil Field (EHOF) where oil was extracted for the past several decades. The idea is that if these formations had the capacity to hold the oil for millions of years under the tremendous pressures known to exist in oil-bearing formations, they should be a

[22] Most of the OTC units are aging facilities, for which extensive retrofits would be uneconomical. While compliance using operational and structural controls is allowed, the ability of units to comply in this manner and still operate in a fashion that yields a sufficient revenue stream is questionable.

[23] The California ISO, CPUC and the Energy Commission are studying amount of OTC capacity that will require replacement.

[24] **Carbon Sequestration And Greenhouse Gas Emissions Table 12** does not include OTC units that retired prior to January 1, 2012, resources with compliance dates through 2020 that have already been slated for replacement (e.g., LADWP units at Haynes and Scattergood), or units with post-2020 compliance dates (the remaining units at Haynes and Scattergood, LADWP's Harbor combined cycle, and the nuclear facilities at San Onofre [which Southern California Edison announced on June 7, 2013 that they would close rather than repair it] and Diablo Canyon).

suitable place to store the CO_2 gas. The EHOF site has been used for decades to extract oil by the federal government and Occidental Petroleum, leaving a huge amount of pore space empty and hence capable of storing the excess amounts of CO_2 produced by the HECA project. The site is characterized by the presence of a syncline and an anticline that form a dome-like cap that makes it an excellent candidate to store the CO_2 gas. The dome-like formation is also comprised of several alternating layers of sand and shale, which is a favorable sequence of layers for the purpose of storing the CO_2 gas and preventing leaks. In addition, the presence of the shale layers offers a relatively elastic medium that acts as an elastic seal that would be useful in preventing the propagation of any fractures that might be caused by the high pressures needed to keep the CO_2 gas in a liquid state and to overcome the formation pressures during the injection process.

REGIONAL SETTING

The EHOF is located along the southwest edge of the San Joaquin Valley, approximately 26 miles (42 Kilometers [km]) southwest of Bakersfield in western Kern County, California. The entire EHOF is approximately 48,000 acres. The EHOF was originally developed as part of the federal Naval Petroleum Reserves. This area is situated immediately south of, and contiguous with, the Lokern Area of Critical Environmental Concern (ACEC) a part of which (3,111 acres) is controlled by the Bureau of Land Management (BLM). Portions of this surrounding area (2,050 acres) are managed as conservation areas by the Center for Natural Lands Management (CNLM) and OEHI (formerly Plains Exploration and Production Company and Nuevo Energy Company) Habitat Management Lands (200 acres). The remainder is owned by Chevron Corporation and others. The city of Buttonwillow is located directly to the north. McKittrick Valley and portions of Buena Vista Valley, with Highway 33 running NW-SE, are to the west. The cities of McKittrick and Derby Acres are located along Highway 33. Approximately ten miles to the west and across the Temblor Range is the Carrizo Plain National Monument (199,030 acres).

To the south of the EHOF is the Buena Vista Valley, the majority of which is within another Naval Petroleum Reserve oil field. The City of Taft is located approximately seven-miles to the south. Mostly undeveloped areas are located along Highway 119 to the southeast of EHOF. Lands to the immediate east include Coles Levee Ecological Preserve (6,059 acres), Kern Water Bank Authority (19,900 acres), Tule Elk Reserve State Park and the Kern River. The California Aqueduct and the West Side Canal converge and flow along the north and eastern boundary of EHOF, as does the Kern River. The Buena Vista Lake Bed is located immediately southeast of Highway 119. Bakersfield is approximately 26 miles to the northeast. The EHOF is circumscribed by Highway 5 to the north and east, Highways 119 and 33 to the south, Highway 33 to the west and Highway 58 to the north. Elk Hills Road runs north and south and bisects the Project area.

GEOLOGIC SETTING

The EHOF is located in the Great Valley geomorphic province. The Great Valley Province is characterized by a large northwest trending valley bounded by the Sierra Nevada province to the east and south, the Klamath Mountains province to the north, the Cascade Range province to the northeast, and the Coast Range province to the west. The Great Valley Province is filled with thick sediments eroded from the surrounding mountain ranges. The Great Valley province is underlain by a thick (up to 80,000 feet thick) sequence of sedimentary units (the Great Valley Sequence) which are Jurassic age or younger. The valley is an asymmetrical synclinal trough with a more gently dipping eastern limb. The Great Valley is divided into two halves. The northern half is the Sacramento Valley (containing the Sacramento Rivers) and the southern half is the San Joaquin Valley (containing the San Joaquin River). These rivers converge at the Sacramento/San Joaquin Delta and eventually flow into San Francisco Bay.

The project site is located on the western side of the San Joaquin Valley. The San Joaquin Valley is filled with thick Mesozoic and Tertiary marine and non-marine sediments covered by a relatively thin veneer of Quaternary alluvial sediments (Bailey 1966). Kettleman Hills, Elk Hills, and Buena Vista Hills provide the only significant topographic relief in the San Joaquin Valley portion of the Great Valley province (Stantec 2012).

Prior to the early Eocene epoch the bulk of the province was covered by seas. As the seas withdrew, increasing terrestrial sediments were deposited from the erosion of the Sierra Nevada to the east. During the Eocene there was uplift on the margins of the province causing the seas to gradually recede. During this time the Stockton Arch (the division between the northern and southern parts of the province) was also rising. Subsidence of the valley during late Eocene time caused the seas to again inundate the province. As the valley continued to fill with sediments, the seas occupied smaller areas. By the end of the Pliocene the seas had finally withdrawn for the last time from the southwestern portion of the province, the last area to be submerged. The last large lake to occupy the Great Valley Province was Lake Corcoran, about 600,000 years ago (URS, 2008). Lake Corcoran covered much of the western part of the San Joaquin Valley. The resulting Corcoran Clay (composed of fine clays, volcanic ash, and diatomite) covers more than 5,000 square miles and forms an extensive aquaclude creating a major confined aquifer (Stantec 2012).

The EHOF is located near the south-western edge of the San Joaquin Valley, approximately 25 miles southwest of the city of Bakersfield in Kern County, California. At the surface, the EHOF is manifest as a large WNW-ESE trending anticlinal structure, approximately 17 miles long and over 7 miles wide. With increasing depth, the structure sub-divides into three distinct anticlines, separated at depth by high-angle reverse faults. The anticlines are believed to have formed in a transpressional regime associated with formation of the San Andreas Fault, beginning in the Middle Miocene, which began approximately 16 million years ago (Callaway and Rennie Jr., 1991).

The highest elevation in the Elk Hills is 1,551 feet above mean sea level, which is between 1,000 and 1,200 feet above the floor of the San Joaquin Valley. The Tertiary (Tulare Formation) and Quaternary-aged deposits underlying the Elk Hills and nearby areas are up to 24,000 feet thick (U.S. Department of Energy [DOE], 1997).
The Tulare Formation lies at the surface of Elk Hills and consists of gravel, sand, and silt derived from erosion of the Monterey Formation exposed in the Temblor Range to the west. (Stantec 2012). Lithologically, the Tulare Formation consists of argillaceous sand and silt deposits with lenses of coarse sand and gravel. Conglomerate units do occur, but are rare overall.

The Monterey formation includes the Stevens oil-saturated sands targeted in Elk Hills for miscible-CO_2 oil recovery. Major Stevens reservoirs include the Main Body B (MBB), 26R, W31S, 24Z, 2B, A1A6, and T&N pools. Reservoir properties of the Stevens sands are good, and have led to many decades of oil production. The 24Z sand fills an anticline between 4,500 and 6,000 ft BGL (Below Ground Level) and is overlain by the Reef Ridge shale which is over 500 ft thick. The sand porosity is about 20–25 percent, and its permeability averages 150 millidarcy. The Stevens sands have net reservoir thickness of up to 1,000 ft, making them in principle a good target for CO_2 injection, if the residual oil saturation is sufficiently high (OXY, 2010a).

The Monterey Formation is overlain by the thick “Maricopa” or “Monterey Shale” or “Reef Ridge Shale” that was described in (USGS, 1932, Pages 39 and 40) for the first time:

> The Maricopa shale unconformably underlies the Etchegoin formation along the mountain front. It is the "brown shale" of drillers and is regarded by many as the source of the oil in the fields along the west and south sides of the valley. On the flanks and crest of the Temblor Range it is divided, as mapped and described by Pack,4 into a lower part consisting principally of mud shales, siliceous shale, and diatomite and an upper part comprising chiefly soft, punk diatomite and coarse detrital deposits. Many of the beds carry diatoms, radiolarians, and sponge spicules, and others carry foraminifers. At its type locality near Maricopa the thickness of the Etchegoin formation and Maricopa shale in the Sunset-Midway field. Many of the oil operators prefer to use the terms " Monterey shale" and "Santa Margarita formation," as used by Arnold and Johnson in an early report, for the beds lumped by Pack as Maricopa shale. The coarse detrital beds in the Santa Margarita formation indicate a pronounced change of some kind, presumably an elevation of the adjoining mountains. The sea began to withdraw as these beds were laid down. There is some evidence that during Santa Margarita time minor folds had begun to form. Maricopa shale is 4,800 feet, but the maximum thickness at the south end of the valley is undoubtedly considerably greater….

Staff notes that based on the above quote from USGS, Etchegoin is stratigraphically located above the Monterey. The name “Reef Ridge Shale” was proposed by Barbat and Johnson (1933, p. 239, 1934, p. 3-5) for a distinctive soft blue (brown weathering) clay shale poorly exposed on the northeast side of Reef Ridge, stratigraphically above the brown siliceous shale of the McLure Shale Member. These workers noted that the distinctive character of the strata was first recognized by Arnold and Anderson (in the quote above), who included the rocks as an upper division of the Santa Margarita (see Siegfus, 1939 and references therein).

EOR COMPONENT DESCRIPTION

The original Project Description provided by ManageTech (2010) identified a projected total of 550 injection and production wells. Upon additional evaluation, OEHI increased the number of projected wells to 720 (309 injection wells and 411 production wells). OEHI has designed the project to utilize existing wells to the maximum extent feasible. OEHI estimated that 570 of the 720 wells necessary for the proposed project will utilize pre-existing well locations. The remaining 150 wells will be new installations. The wells would be utilized in an alternating fashion to inject the CO_2 gas and to extract oil. The permit application submitted by OEHI to DOGGR for Class II wells included wells in 25 patterns. Applications to permit new wells would be submitted as the need arises for them to be installed.

According to OEHI, approximately 1,231 wells penetrate the Stevens reservoirs. Currently 1,021 active wells penetrate the Reef Ridge Shale in the 31S structure; 128 wells are permitted by California's Division of Oil, Gas and Geothermal Resources (DOGGR) as underground injection control (UIC) Class II injection wells and 749 wells are permitted by DOGGR as production wells. In addition there are 144 wells that can be both producers and injectors at the completion level within different reservoirs, or have been "plugged and abandoned" in one reservoir, but are active in another, or have changed well type. There are 178 inactive injection and production wells, 22 injection and production wells that have been "plugged and abandoned" according to regulatory requirements, and 10 wells that are shut in.

The presence of such a large number of well bores in the area as seismically active as the project site raises the potential for seismic activities to damage some of those well bores, thereby creating leak pathways for the injected CO_2. The structural integrity of existing and proposed new wells for injection and extraction for EOR is also a concern because relatively high pressures will be used.

Carbon Capture & Storage (CCS) projects around the world

OEHI believes the combination of multiple sandstone reservoirs interbedded with impermeable shale seals within the three large anticlines make the EHOF one of the most suitable locations in North America for the extraction of hydrocarbons and sequestration of CO2. Staff notes there are a number of other projects around the world that are currently underway in the design and construction process for CCS. The MIT website, sequestration.mit.edu/, keeps track of most existing and planned CCS projects around the world, and divides them into two classes: (1) electric power plant projects and (2) non-electric power plant projects that are mostly CO_2 injection EOR projects or CO_2 removal from methane projects.

In the first category, six projects are listed in the U.S., two in Canada, 12 in the European Union, two in Norway, three in the rest of the world, and there are 18 pilot projects.

Among the U.S. projects, a 65 percent sequestration project for a 582 MW lignite and natural gas power plant in Mississippi is under construction and may become operational in 2014. The project will sequester 3.5 MT/y of CO_2 for 22 years at an estimated cost of \$2.4 billion. This cost excludes Allowance for Funds Used During Construction (AFUDC) and includes incentives. Mississippi Power has received a \$270 million grant from the Department of Energy for the project (CCPI Phase 2) and \$133 million in investment tax credits approved by the Internal Revenue Service. HECA and four other projects are in planning stages.

When completed in 2014, the Canadian Boundary Dam 110 MW project will export its CO_2 to an EOR project via a 100 km pipeline. The total cost of the project is estimated to be \$1.24 billion. The Boundary Dam project received \$240 million from the federal government in 2011, of which about \$180 million has already been spent. The provincial government in Saskatchewan is also supporting the project. Revenue from the sale of CO_2 is expected to offset the project costs. Sulfur dioxide (SO_2) will also be captured and sold.

In EU, a small pilot project in England injects 100 T/y of CO_2 and may be expanded to 1.7 MT in the future.

In Norway, an up to 100,000 T/y Mongstad pilot project has been in operation since May 2012. This project may be expanded to 1.7 Mt/y in the future at a cost estimated to be 6 billion kroner (\$1.02 billion).

Among the 18 small pilot projects (Mongstad is listed again), 14 were operated in the past, or are operational now.

In summary, among the 42 unique CCS projects around the world designated as electric power generation, none are operational, 3 may be expanded in the future from the pilot to full scale, and all but one will be smaller than HECA.

In the second category, CCS/EOR projects, 10 projects are listed in the US (HECA excluded), six in Canada, five in Europe, and five in the rest of the world.

Of the U.S. projects, four to six are either operational or were operated. The La Barge, Wyoming project, operated by Exxon Mobil, is designed to inject 6 MT/y of CO_2. Production of natural gas from the La Barge field began in 1986. This gas contains high concentrations of CO_2. The Shute Creek Treating Facility (SCTF) processes the gas produced from the La Barge field. The gas composition entering Shute Creek is 65 percent CO_2, 21 percent methane, 7 percent nitrogen, 5 percent hydrogen sulfide (H_2S) and 0.6 percent helium. The SCTF separates CO_2, methane, and helium for sale and removes hydrogen sulfide for disposal. This ongoing project is three times larger than the HECA project would be.

In Canada of the six projects, two are operational. The Weyburn project is injecting 1 MT/y of CO_2 into a depleted oilfield.

In Europe, the oldest CO_2 separation project in Sleipner, Norway, started in 1996. This project injects 1 MT/y of CO_2 separated from natural gas.

In the rest of the world, of the five listed projects, four were either operated or are operational. The Shell Gorgon project in Australia is under development and will inject 3.3 MT/y. This is the world's largest sequestration project and is supported by Australia's Government. The Australian Government accepted liability for Gorgon project (August 2009). Construction started November 2009. All necessary permits and approvals have been obtained (October 2010).

In October 2012, Australian's energy minister Martin Ferguson, announced that the Gorgon project was still on track for injection to start in 2015. At this time the project was 55 percent complete.

METHOD FOR DETERMINING SIGNIFICANCE OF IMPACTS

Injection of CO_2 can have impacts in terms of induced seismic activity, contamination of underground sources of drinking water (USDW) and/or air quality. For seismic impacts, staff uses the prevailing seismic activity in the region as the background conditions and compares the induced seismic activity with the prevailing activity to determine if there would be significant impact. If the magnitude of the induced seismic activity exceeds the prevailing magnitudes then staff concludes that the impact is significant. For impacts to USDWs staff considers any leak that has the potential to reach a USDW as a significant impact. For air quality impacts, any potential leaks of CO_2 would contribute to the greenhouse gas emissions. Since one of the purposes of the injection of the CO_2 is to reduce the total emissions to comply with the SB1368 EPS any potential leaks could lead to violation of the compliance requirements of SB1368.

GEOLOGIC CHARACTERIZATION AND LEAKAGE PATHWAYS

In the presence of the numerous surface faults in the region staff is concerned that increased pore pressure associated with the injection of the carbon dioxide can cause increased stresses on faults, which can cause those faults to slip and the apertures to dilate and allow for leakage of CO_2. In addition to the surface faults, and given the nature of the area and the fact that it is composed of anticlinal formation on one side and synclinal formation on the opposite side, it is likely that there exist numerous subsurface faults and fractures beneath the ground surface. Staff analyzed whether faults and fractures in the EHOF could be conduits for leakage of CO_2 to the surface. Two anticline structures (31S and NWS) would be used as primary injection structures by the OEHI CO_2 EOR project and a third anticline structure (29R) will be used as a backup. These structures form bathymetric highpoints on the deep inland marine surface (seafloor location and extent of four faults that helped to form these anticlines. Four faults penetrate the Reef Ridge Shale and one of them, 5R (which is outside the Oxy CO_2 EOR component area), fully transects this formation. Based on site-specific studies, OEHI has concluded that the vertical extent of faults 1R, 2R and 3R is limited and any penetration of the confining zone of the Reef Ridge Shale is minimal and does not present a likely pathway for leakage to the surface.

Further discussion of this analysis is presented in Section 3.1.2.2 of the OEHI MRV (Oxy, 2012), which discusses the Reef Ridge Shale characterization studies conducted by OEHI. OEHI's 3-D seismic data provides further evidence of the sealing characteristics of the Reef Ridge Shale. The data were processed using pre-stack depth migration which produces superior imaging in steeply dipping beds, such as on the flanks of the Stevens structures. Analysis of these data indicates that faults above and below the Reef Ridge Shale terminate before penetrating the seal.

The Stevens reservoirs are contained within three geologic structures that are completely overlain by the Reef Ridge Shale, which serves as the primary seal. OEHI used the following methods as evidence to confirm the sealing characteristics of the Reef Ridge Shale:

1. *Physical Rock Characteristics of the Reef Ridge Shale,*
2. *Fluid Contacts and Reservoir Pressure Depletion,*
3. *Core Analysis of the Reef Ridge Shale,*
4. *Seismic Control,*
5. *Geochemical Analysis, and*
6. *Geomechanical Analysis.*

OEHI's methods are summarized below:

1. Physical Rock Characteristics of the Reef Ridge Shale

The significant areal extent and vertical thickness of the Reef Ridge Shale are the two main factors in its effectiveness as a seal for containing injected CO_2. The Reef Ridge Shale covers an area that is many times larger than the planned areal extent of the OEHI CO_2 EOR component. The Reef Ridge Shale is also very thick, ranging from 750 to 1,400 feet in thickness over the injection zones in the NWS and 31S structures.

2. Waterflooding and Fluid Contacts Analysis

Waterflooding is currently being conducted under a set of Class II UIC permits issued by DOGGR. To date, more than 830 million barrels of water have been injected and there are currently about 150 active water-injection wells and 580 active oil and gas production wells in the Stevens reservoirs. OEHI indicated that it has not detected any evidence of communication between zones. This lack of communication between the zones, confirmed by publicly-available production and pressure records reported to DOGGR, indicates that they are separated from each other even when both reservoirs are pressured for production.

3. Core Analysis

In 2000, Reef Ridge Shale core samples were collected from the 31S structure. These core samples demonstrated two important features. First, X-ray diffraction of the core indicated that the predominant secondary mineral is clay, which inhibits the Reef Ridge Shale's ability to fracture. Second, low permeability was verified by the absence of oil saturation. This may indicate that as zones below the Reef Ridge Shale were being charged with hydrocarbons, the permeability of the Reef Ridge Shale was sufficiently low to prevent hydrocarbon migration through the shale.

4. Seismic Control

A 3-D seismic survey was performed from 1999 – 2000, and covered nearly 70 square miles in the Elk Hills Unit (EHU). The data were processed using pre-stack depth migration which produces superior imaging in steeply dipping beds, such as on the flanks of the Stevens structures. Analyzing these data, OEHI concluded that faults above and below the Reef Ridge Shale terminate before penetrating the seal.

Since 1990, 129 naturally occurring earthquakes have been recorded with a magnitude greater than 3.0 within a 60-mile (100-km) radius of the EHOF. The vast majority of these have occurred along the White Wolf Fault approximately 30 miles southeast of the EHOF (Southern California Earthquake Data Center web site). The historical data (long-term and short-term) indicate that naturally occurring seismic activity throughout history has not compromised the sealing integrity of the Reef Ridge Shale.

5. Geochemical Analysis

Geochemical data collected by OEHI revealed five distinct oil families sourced from the Miocene Monterey Formation and tied to stratigraphic intervals. The differences between the distinct geochemical compositions of the Stevens and shallow oil zone (SOZ) oils among the other oil "families" identified corresponds to separate reservoir horizons and suggests "minimal upsection, [and] cross stratigraphic migration." OEHI concludes that the hydrocarbons present in the SOZ reservoirs are from "another Monterey source facies (perhaps the youngest) with charging of Pliocene reservoirs" and not the result of upward movement from the older Miocene reservoirs.

6. Geomechanical Analysis

OEHI developed a full-field simulation model which allowed OEHI to assess the integrity of the Reef Ridge Shale under various injection-volume and pressure scenarios over extended periods of time.

Staff believes this is significant evidence that suggest the likelihood there would be reactivation of faults or dilation of fractures that would extend to the surface is low.

The EHOF is in a compressive tectonic stress field generated by the San Andreas Fault (Patzek 2011). Since no principal stress measurements are available for the OEHI project area, staff had to rely on information from two nearby analogs, the South Belridge Diatomite and Brown Shale, and the Lost Hills Diatomite and Shale oil and gas fields for analysis of field stresses. Due to the nature of the geology of the formation at the site and the distribution of different types of forces, stresses in these two fields cross-over, meaning that the vertical stress is larger than the horizontal stress for some depth and then the situation reverses and the horizontal stress becomes larger than the vertical stress below that depth. Thus, with increasing depth the vertical stress becomes the minimum principal stress. Therefore, the fault character in Elk Hills ought to change with depth from strike-slip faulting to reverse or thrust faulting.

When vertical stress is the minimum principal stress and the injection pressure is very high (higher than the overburden pressure), this can lead to the creation of horizontal fractures. At shallower depths, possible fractures created by injection would be vertical. Therefore, the injection pressures of CO_2 and water must be monitored carefully by OEHI over the duration of the project to avoid unwanted fractures that might compromise the reservoir seals. It should be pointed out, however, that thick layers of the more elastic shales overlying the OEHI CO_2 injection interval act as elastic sheets that effectively prevent substantial fracture extensions beyond the reservoir interval. Therefore, the only place where the geologic seal might fail is through the preexisting faults that extend vertically above the injection interval and become activated by the high injection pressure.

A fault might slide if the ratio of the shear stress resolved onto the sliding fault plane and the effective normal stress on the fault is equal to the coefficient of friction, which almost universally is about 0.6 (Hubbert and Rubey, 1959). Note that for faults where the cohesive strength is small, their slip criterion can be deduced directly from the Mohr-Coulomb law (Patzek 2011). Therefore, with the increasing injection pressures of CO_2 and water, some faults may slip, causing seismic activity. Most, if not all, of this seismic activity would be so weak that it is unlikely, if not impossible, to be noticed by a surface observer. It is therefore extremely unlikely that the integrity of the overlying shales would be compromised by the injection activities. Also, when injection activities are completed and the excess pore pressure dissipates through the formation, most of the faults that might have been caused to open by the injection activities would close and reseal.

In addition, staff agrees with OEHI that natural seismicity is not likely to impact field operations and is highly unlikely to lead to leakage to the surface of any injected CO_2 from the EHOF. This assessment is based on decades of historical data for earthquake effects on wells in oil and gas operations in Southern California. It is also based on the geological setting of the EHOF, which is in relatively soft and shallow sediments.

With respect to natural seismic events, abundant historical data and information indicate that such events do not constitute a significant threat of leakage to the surface. The southern San Joaquin Valley area has a 100-year history of being a prolific oil and gas producing region with about 70 medium-to-very-large-scale oil and gas fields. There are more than 58,000 deep production and injection wells in Kern and Inyo Counties. These existing wells have experienced decades of seismic activity with no significant release of gas, oil or water to the surface during earthquakes.

Furthermore, the drilled thickness of the Reef Ridge Shale in well 324-19R is 633 feet. The Reef Ridge Shale is also shown in Figures 14.3 and 14.4 in USGS (2007). It is unlikely that this thick pliable shale will fail across the CO_2 injection site in the EHOF, unless there is a failure of a large fault caused by severe overpressurization (significantly above the overburden pressure) of the sands into which CO_2 would be injected. Such overpressurization is illegal and is unlikely to happen over a prolonged time and large reservoir area. Staff concludes that given the nature of the faults and fractures and the geology of the EHOF, CO_2 leakage from the EOR component in terms of fault mobilization and dilation of fractures would be less than significant.

Natural and Induced Seismicity

The EHOF is located in the most seismically active area in the US. The San Andreas Fault is located only about 12 miles southwest of the EOR site. As discussed in detail in the **Geology and Paleontology** section, there are a number of major faults within 70 miles of the oil field. There are several faults of type A and type B, where type A faults have a slip rate greater than 5mm/year and are capable of producing an earthquake of magnitude 7.0 or greater and type B faults which have a slip rate of 2 to 5 mm/year and are capable of producing an earthquake of magnitude 6.5-7.0 on the Richter scale. There are also type C faults with slip rates less than 2 mm/year that are more than 20 miles away from the EOR and sequestration site and would have no effect on the site.

The applicant believes that natural seismicity is not likely to impact field operations and is highly unlikely to lead to leakage to the surface of any injected CO_2 from the EHOF. As indicated by the applicant, this assessment is based on decades of historical data for earthquake effects on wells in oil and gas operations in Southern California. It is also based on the geological setting of the EHOF, which is in relatively soft and shallow sediments. They also note that the southern San Joaquin Valley area has a 100-year history of being a prolific oil and gas producing region with about 70 medium-to-very-large-scale oil and gas fields. There are more than 58,000 deep production and injection wells in Kern and Inyo counties. These existing wells have experienced decades of seismic activity with no significant release of gas, oil or water to the surface during earthquakes.

Staff concurs that most earthquakes with a magnitude 6 and above in California occur at depths of 6 miles or more in brittle basement rock. Since the proposed injection zones at EHU are less than 2 miles deep there would appear to be a significant separation between major earthquake sources and the injection reservoirs. The Los Angeles Basin contains more than 80 oil and gas fields and several natural gas storage fields. The fact that it has experienced more than 20 major earthquakes (greater than magnitude 6), some directly adjacent to major gas fields and natural gas storage fields, with no damaging release of gas to the surface is compelling evidence that potential impacts could be limited.

Fluid and gas injection is known to induce microscopic seismic activities. However, the risk of induced seismicity from CO_2 EOR has been assessed to be very low. Injection operations have been observed to cause low level seismic occurrences at a limited number of oil and gas fields around the world, including some in California (most notably the Geysers geothermal operations).

Generally, the low risk of induced seismicity is supported by the results of a comprehensive study that reviewed data on low-level seismic effects related to underground injection operations designed to hydraulically fracture shale formations. Warpinski et al. 2012), The study covered several thousand shale fracture treatments in various North American shale basins and the largest micro earth tremor recorded had a measured magnitude of about 0.8. A deep earthquake of this magnitude would not be felt at the surface of the earth, and would not cause surface damage.

McGarr et al., 2002, have analyzed dozens of earthquakes causes by dams, liquid waste injection, mines, and production/injection in oil and gas reservoirs. They note that the upper bound of the correlation between the characteristic size of a human activity and the associated anthropogenic earthquakes has the slope of two. This correlation suggests that for an activity 10 km in extent, the maximum credible earthquake would have a magnitude near 6. They also caution that no seismic activity is recorded in many instances where human activities affect the earth stresses over large areas, such as below many impounded water reservoirs.

The Nature Journal (www.nature.com/news/method-predicts-size-of-fracking-earthquakes-1.9608) wrote about McGarr's approach and published the following rule of thumb:

> The researchers found a proportional relationship between the volume of fluid injected and the magnitude of the earthquake.
>
> "If you inject about 10,000 cubic meters, then the maximum sized earthquake would be about a magnitude 3.3," says McGarr. Every time the volume of water doubles, the maximum magnitude of any quake rises by roughly 0.4. "The earthquakes may end up being much smaller, but you want to be prepared for the worst-case scenario," says McGarr. The relationship is straightforward, but it is the first time that anyone has quantified it, he adds."

The annual injection of CO_2 in the EHOF will be 2 million tons, equivalent to 1 million cubic meters of water. This is 7 doublings from 10,000 cubic meters of water. Thus the maximum earthquake magnitude might be 3.3+7x0.4 = 6. It should be noted, however, that oil, water and gas will be produced at the same time, and therefore the maximum possible magnitude will be much less, likely less than 3.3.

It should be stressed here that the calculation above provides an estimate of a remote possibility, not of a real earthquake. Magnitude 6.0 earthquakes do occur in the Parkfield area in California, not far from the EHOF. Such earthquakes have occurred on the Parkfield section of the San Andreas fault at fairly regular intervals - in 1857, 1881, 1901, 1922, 1934, and 1966. While little is known about the first three shocks, available data suggest that all six earthquakes may have been "characteristic" in the sense that they occurred with some regularity (mean recurrence period of about 22 years) and may have repeatedly ruptured the same area on the fault. (earthquake.usgs.gov/research/parkfield/hist.php). The last magnitude 6 earthquake occurred in Parkfield in 2004, which was long overdue. In summary, staff believes that it is very unlikely, if not impossible, that anthropogenic earthquakes will exceed natural earthquakes in the EHOF.

While there is no history of induced seismicity at Elk Hills, the possibility cannot be ruled out completely. As discussed above, any such induced seismicity events would likely be less than magnitude 4, considering the geologic setting, areal extent and depth of proposed operations, and anticipated pressure and stress changes. Seismic events of magnitudes between 3 and 4 would be felt in the local area but should not cause structural damage to facilities and buildings.

Furthermore, as discussed in the **Geology and Paleontology** section, the maximum anticipated peak acceleration produced by the injection is on the order of 0.01 g, which is at least an order of magnitude less intense than site accelerations associated with maximum credible earthquakes on major faults mapped in the vicinity of the project site. Since induced seismic events are not large enough to cause structural damage, staff agrees with the conclusion reached by OEHI that a release of CO_2 from the subsurface due to induced seismicity is unlikely.

Lateral Spill

When a liquid is poured into a container it starts to fill it from the bottom up until it reaches the lowest spill over point on the edge of the container where the container would not hold any more of the liquid. However, if a fluid is buoyant (lighter than the ambient fluid) then it will rise to the top, and unless there is a barrier that prevents it from rising it would it would dissipate up into the ambient fluid. And in the presence of a lid (an inverted bowl) that holds the fluid in place it would keep filling the space from the top down until it reaches a point where it can escape out of the lid. This point is known as the lateral spill point (LSP).

The CO_2 injected in the EHOF would be held in place by the dome-shaped shale formation. Since the injected CO_2 is more buoyant than formation fluids it tends to rise in the target formation until it reaches the ceiling of the structural or stratigraphic trap. This trap has held hydrocarbons for millions of years. Hypothetically, more CO_2 could be injected into a structural or stratigraphic trap than that trap could hold, filling the space from the top downward until the CO_2 flows out of the trap through the lowermost “spill point.” However, given the physical characteristics of the 31S and NWS structures and the relatively small volume of CO_2 to be injected compared to the capacity of the Stevens reservoirs on the 31S and NWS structures, there are no reasonable injection scenarios that would lead to overfilling the Stevens reservoir with CO_2 to result in leakage at lateral spill points.

As was shown in the MRV plan submitted by OEHI, the oil bearing layers within the Stevens reservoirs in the 31S structure are above the free water levels. Beneath the free water level there is no residual oil saturation (i.e. no oil to be recovered through CO_2 EOR). The left lateral spill point (LSP) was shown to be on the left flank of the 31S structure. The right LSP is located very far away from the injection point. However, both LSPs were shown by OEHI to lie below the free-water level, which means that water would act as a barrier for the CO_2 to escape even if the amount injected was large enough to fill the whole available pore space and reach the water surface.

With respect to the volume of the CO_2 to be injected, the OEHI CO_2 EOR Project would produce roughly the same quantity of fluids as are injected. As stated by OEHI, this operating practice prevents overfilling of the reservoir to the spill point with CO_2. Moreover, the quantity of CO_2 to be injected over the 20-year life of the OEHI CO_2 EOR project is equivalent to less than five percent (approximately) of the useable reservoir pore volume, (i.e., the pore volume located above the free-water levels). As the full field simulation conducted by OEHI indicated, it is predicted that a majority of the injected CO_2 would be contained in the MBB portion of the Stevens reservoirs which is the main target zone for injection.

In addition to the foregoing, the Reef Ridge Shale extends hundreds of miles beyond the EHOF. If CO_2 were to migrate beyond the LSP's, it would be sequestered because of the influence of other natural trapping mechanisms including mineralization and residual trapping.

In light of the preceding analysis, staff concurs with OEHI that the risk of overfill through lateral spill points is less than significant.

Ground Subsidence

Ground subsidence can result from activities that cause a lowering of the total reservoir pressure. Oil and gas extraction, as well as groundwater pumping are examples of activities that have been known to cause ground subsidence. However, the magnitude of subsidence depends on several factors including the geologic structure of the subsurface domain.

Oil and gas extraction operations have been taking place at the EHOF for decades. However, there has been no documented evidence that significant subsidence has occurred at the site. This could be attributed to the dome shape and large thickness of the shale formations overlying the extraction zones. The dome shape offers resistance to deflection under increased vertical loading that can cause increases in the net downward forces acting on the formation when the pressure below the formation is decreased by extraction activities.

While conventional oil and gas extraction activities remove more fluids from a reservoir than is put back, EOR activities are more likely to result in replacing all volumes of fluids extracted with other fluids such as water and carbon dioxide. This means that it is likely that no net decrease will be experienced by reservoir pressures. If anything, there might even be a slight increase in reservoir pressure after equilibrium has been attained since injection pressures have to be higher than native pressures for the injected fluids to enter the formation. Thus staff concludes that it is unlikely for the CO_2 EOR activities at the EHOF to result in any significant ground subsidence.

Regulations Governing the Injection Activities

OEHI would be injecting the CO_2 pursuant to the Class II permit for the existing wells and would obtain new Class II permits from DOGGR for new wells. However, Class II well requirements are not intended for injecting CO_2 for sequestration purposes.

Since leaks of injected CO_2 have the potential to contaminate underground sources of drinking water (USDW), the U.S. EPA, with mandate under the Clean Water Act, has issued regulations to control injection wells intended for long term storage of CO_2 in terms of construction, operation, monitoring, plugging, post-injection site care (PISC), and closure, as well as financial responsibility for any maintenance and correction action plans. The U.S. EPA regulations were codified under 40 CFR part 146 subpart H commencing with subsection 146.81. The Class VI regulations include specific requirements for the construction of new wells and retrofitting of existing wells, and also for the operation and monitoring of the wells during and after termination of the injection activities. Some of the prominent differences in the requirement for the wells in the two classes are listed below in **Carbon Sequestration and Greenhouse Gas Emissions Table 13.**

Carbon Sequestration and Greenhouse Gas Emissions Table 13

Comparison of Requirements for Class II and Class VI Wells

Requirement Type	Class VI Regulatory Citations	Class II Requirements (Summary) and Regulatory Citations	Additional Class VI Requirements
Required permit information	40 CFR 146.82	Information is required on the local geologic structure and faults; maps and cross sections of the regional geology, including the Area of Review (AoR); planned formation testing, construction, operating, and monitoring procedures; and a demonstration of financial responsibility to close the well. (40 CFR 146.24)	Class VI regulations require information on baseline geochemistry and seismic history. Class VI requirements include several project-specific plans not required for Class II (e.g., post-injection site care and site closure, and comprehensive emergency and remedial response plans). Class VI requirements include periodic updates to certain plans.
Minimum criteria for siting	40 CFR 146.83	Demonstrate the presence of injection and confining zones. Confining zone must be free of known open faults or fractures within the AoR. (40 CFR 146.22)	Class VI regulations permit the UIC Program Director to require characterization of additional confining zones.

Requirement Type	Class VI Regulatory Citations	Class II Requirements (Summary) and Regulatory Citations	Additional Class VI Requirements
Area of review and corrective action	40 CFR 146.84	Define the AoR (based on the zone of endangering influence) as a fixed radius of at least ¼ mile or calculate by a formula. (40 CFR 146.6) Identify and address improperly completed or plugged wells in the AoR. (40 CFR 146.24(c)(6))	Class VI regulations require computational modeling for AoR and periodic reevaluation of the AoR and Corrective Action Plan. Class VI regulations require the use of carbon dioxide-compatible materials for corrective action. Class VI regulations permit phased corrective action.
Financial responsibility	40 CFR 146.85	Demonstrate and maintain financial responsibility to close, plug, or abandon the well. (40 CFR 146.24(a)(9))	Class VI regulations have requirements for financial responsibility to address corrective action, post-injection site care and site closure, or emergency and remedial response. Class VI regulations have requirements for allowable instruments.
Injection well construction	40 CFR 146.86	Wells must be constructed to prevent movement of fluids into or between USDWs. Casing and cementing must be designed for the life expectancy of the well. (40 CFR 146.22)	Class VI regulations specify the depths of casing strings and cementing to the surface. Class VI regulations require compatibility of well materials with fluids with which they would come into contact.
Logging, sampling, and testing prior to injection well operation	40 CFR 146.87	Class II and Class VI regulations include similar requirements for logging, sampling and testing (40 CFR 146.22 (f)).	Class VI regulations require cores to be taken and a log analyst's report to be submitted. Class VI regulations require tests to verify the hydrogeologic characteristics of the injection zone (e.g., pressure fall-off test and pump test or injectivity tests). The owner or operator must provide the UIC Program Director the opportunity to witness all logging and testing for a Class VI project.

Requirement Type	Class VI Regulatory Citations	Class II Requirements (Summary) and Regulatory Citations	Additional Class VI Requirements
Injection well operating requirements	40 CFR 146.88	Injection between the outermost casing protecting USDWs and the well bore is prohibited. (40 CFR 146.23(a)(2)) Injection pressures may not initiate or propagate fractures in the confining zone or cause injection or formation fluid movement into USDWs. (40 CFR 146.23(a)(1))	Class VI regulations include a pressure limitation. Class VI regulations include a requirement to install continuous recording devices, alarms, and surface or down-hole shut-off systems or other safety devices. Class VI regulations require specific procedures if a loss of mechanical integrity is discovered or a shutdown (i.e., down-hole or at the surface) is triggered.
Mechanical integrity testing (MIT)	40 CFR 146.89	Conduct internal and external MIT at least once every five years (40 CFR 146.23(b)(3))	Class VI regulations require continuous monitoring to demonstrate internal mechanical integrity. A Class VI project must conduct annual external mechanical integrity testing.
Testing and monitoring requirements	40 CFR 146.90	Monitor injected fluids. Observe injection pressure, flow rate, and cumulative volume at least once every 30 days (40 CFR 146.23(b)(1-2))	In addition to the requirements for Class II wells, Class VI regulations require: • Continuous monitoring of injected fluids, injection pressure, flow rate, and cumulative volume; • Plume and pressure front tracking; • Surface air monitoring and soil monitoring, at Director's discretion; and • Corrosion monitoring and ground water quality monitoring.
Reporting requirements	40 CFR 146.91	Submit semi-annual monitoring report. (40 CFR 146.23(c))	Class VI require: • Semi-annual monitoring report; • Electronic reporting; and • Record-keeping.
Injection well plugging	40 CFR 146.92	Well must be plugged in a manner which will not allow the movement of fluids either into or between a USDW. (40 CFR 146.10(a)(1))	Class VI regulations require compatibility of the plugging material with fluids with which the plugs may be expected to come into contact. Class VI regulations specify pre-plugging activities, notice of intent to plug, and a plugging report.
Post-injection site care and site closure	40 CFR 146.93	None.	Class VI regulations require post-injection site care or monitoring; no such requirements exist for Class II.

Requirement Type	Class VI Regulatory Citations	Class II Requirements (Summary) and Regulatory Citations	Additional Class VI Requirements
Emergency and remedial response	40 CFR 146.94	Submit contingency plans to cope with well failures so as to prevent migration of fluids into a USDW. (40 CFR 146.24(b)(4))	Class VI regulations address other potential risks in the AoR, such as risks from the pressure front.

As can be seen from the table above, there are significant differences between the requirements for wells in the two classes, particularly in the following areas:

a. Area of Review (AoR) requirements,

b. Casing and Cementing requirements,

c. Monitoring requirements.

d. Plugging and post-injection site care requirements, and

e. Financial responsibility requirements.

The more stringent requirements of the class VI permit are intended to store CO_2 in the ground and ensure that the injected CO_2 remains sequestered and also to keep track of any movement of the CO_2 underground. While the injected CO_2 is intended for EOR purposes by OEHI, HECA's goal is to reduce the total emissions to be in compliance with SB 1368 emission regulations requiring that CO_2 emissions associated with power generation not exceed 1100 lbs/MWh. In order to achieve that goal, HECA is required to demonstrate that the sequestered CO_2 remains sequestered during and after the plugging of wells and closure of the injection site. Therefore, CEC staff believes that compliance with the Class VI well requirements would ensure that the injected CO_2 would remain sequestered on a long term basis. Compliance of the project owner with the regulations for injection wells as required by Condition of Certification **GHG-3**, with the exception that the project owner would not have to obtain the actual permit, would ensure compliance with SB1368 and also that impacts from the injection of the carbon dioxide would have no significant impacts on USDWs.

Some or most of the injected CO_2 gas would come out with the extracted oil but would be separated and injected back with fresh CO_2 from HECA. The applicant proposes that any amounts of the injected CO_2 that remain in the formation, less any amounts that are detected to leak using a rigorous monitoring program, would be considered to have been permanently sequestered.

Staff believes that in order for the applicant to ensure CO_2 is being sequestered, the applicant should ensure that injection wells are constructed and operated in accordance with the more stringent requirements of Class VI wells, as detailed in COC **GHG-3**, though the applicant/user would not have to obtain the actual permits. Furthermore, if Occidental Petroleum decides to terminate EOR activities during the life time of the project while continuing to inject the CO_2 on behalf of the applicant then the injector shall be required to obtain Class VI permits for the injection wells that would be used for injection. However, if the injecting party chooses not to inject the CO_2 on behalf of the applicant then the applicant would be required to find another party to inject the CO_2

and who would be willing to comply with the requirements of **GHG-3**. Otherwise, the applicant would either have to seek permission to develop their own Class VI permitted site for sequestration and seek to amend the project to store the carbon at the alternate site, or otherwise halt operation of the power facility.

Project Operations

OEHI is expected to receive a daily maximum rate of 130 million standard cubic feet per day (mmscfd) and an annual average rate of 107 mmscfd of CO_2 or 2.2 million tons per year for use in its EOR activities. The use of this CO_2 would last for 20 years. This volume is equal to 6 percent of the 35 million tons per year of CO_2 currently injected in the U.S. by more than 100 EOR projects, mostly in Texas. This would make the OEHI CO_2 EOR component very large in comparison to existing EOR projects, equivalent to approximately 6 current CO_2 EOR projects on average.

Assuming 160 injection and extraction patterns will be used for CO_2 EOR, and that the patterns are 20 acres in size (some patterns may be only 10 acres), an upper bound on the reservoir pore volume in the EOR project area can be calculated as follows:

> 160 patterns × 20 acres/pattern × 43,560 square feet/acre × 1,000 foot depth of formation × 0.225 pore fraction / 5.615 cubic feet/barrel = 5.6 billion barrels.

The numbers used in the calculation above are approximate numbers that were chosen to be in the ball park of the OEHI's numbers. Data provided by OEHI indicated that 1.3 billion barrels of oil have been extracted from the reservoir whose pore volume has been estimated at 7.5 billion barrels. Therefore, in order to refine the calculation above to represent the numbers for the OEHI field, the result has to be scaled using numbers provided by OEHI. Scaling the rough estimate of the pore volume with the more detailed OEHI estimates of the pore volume and cumulative fluid injection, 5.6/7.5 × 1.3 = 1.0 billion reservoir barrels of fluid would have been produced from the assumed project area. This number is slightly less than the net 1.1 billion reservoir barrels of CO_2 and water injection needed for the project. However, more oil and water would be produced, which would make more pore space available for the storage of the CO_2. (OEHI made no allowance for the injected water volume.)

OEHI proposes to follow the standard field practice and use one injection well in each pattern for CO_2/water injection. A 1:1 water-alternating-gas (WAG) ratio is assumed, that is the injection of a volume of water followed by injection of the same volume of CO_2. The cycle duration would be on the order of 60 or 90 days of water injection, followed by an equal time of CO_2 injection. Because the CO_2 would be injected as slugs followed by water slugs, and a portion of the injected CO_2 would be recovered with the oil and recycled, the actual injection rate would be much higher than the amount of CO_2 received from HECA. It would take some time for the injected CO_2 to fill up some of the reservoir pore space and dissolve in oil. With time, the accumulating CO_2 would break through in almost all production wells and a new steady state would be reached, whereby the accumulated CO_2 would be produced at one end of the system, while fresh CO_2 would be injected at the same constant rate at the other end. The applicant has estimated that the maximum CO_2 injection rate (HECA import plus recycle) could be as high as 685 mmscfd near the end of production in each pattern, which is about five times the amount of CO_2 imported from HECA. (This ratio is double of the actual CO2 injected, because ½ of the wells will be injecting water, not CO2 at any given time.). The high-rate CO_2 injection over 20 years would require significant repressuring of the reservoir, which might reopen some existing critically-stressed faults, and might require an extension of the project to divert the produced CO_2 to new injection wells.

Therefore, the existing and new wells might provide potential conduits for CO_2 leaks at the surface either outside of the surface conductor casing (because of poor cement jobs), or through well annular spaces and wellheads, pumps, injection tubings and packers, joints, valves, couplings, separators, and surface pipelines. The potential for leaks would increase with project time, because of the increasing reservoir pressure and acidic conditions developing in the reservoir around the wells, as well as inevitably progressing corrosion and wear-and-tear of the field equipment.

Relying on observations made at dozens of ongoing field projects that involve CO_2 and water injection, it can be noted that the probability of a major equipment leak is very small. Furthermore, as was discussed above, and due to the presence of several thick layers of shale the potential for leaks through the geologic formation is extremely small to nonexistent. Therefore, the only significant potential for leaks that remains is through existing well bores, active and abandoned. Given the presence of a large number of well bores, OEHI would be required to create an extensive monitoring network of CO_2 sensors that would be able to detect any leaks through the well bores. OEHI stated in the Monitoring, Reporting, and Verification (MRV) plan that it has in place a sophisticated centrally controlled network to monitor for any leaks of gases that may accidentally leak through the well bores. OEHI further stated that the same network is capable of and would be utilized to detect potential leaks of injected CO_2 through the well bores, both through the casings and also through the annular space.

Staff recommends that HECA enter into an agreement with OEHI that requires installation of a robust monitoring network that is capable of detecting potential leaks of injected CO_2 from all well bores, active, shut-in, plugged, or abandoned to ensure any leaks that may occur through those well bores would be detected in accordance with condition of certification **GHG-3**. This network will provide detection of significant CO_2 leaks, which should be isolated and repaired or plugged if repair is not possible. The monitoring network should remain active for several decades.

Spill-Over Area (Injection for storage with no EOR)

In the event that injection capacity for EOR at a pattern is less than the rate of delivery of CO_2 OEHI might need to store the delivered CO_2 in a spill-over area (or back-up injection area). However, OEHI had informed EPA and DOGGR that it would not need a spill-over area since it would be doing EOR at alternating sites and thus would always have a place to inject the imported CO_2 and do EOR at the same time. Any injection of CO_2 would have to be performed in areas designated for EOR as long as the injection is done pursuant to a Class II UIC. Any storage in an area not associated with EOR would be strictly prohibited. In the event that HECA decides to inject CO_2 for sequestration purposes only, whether on its own or by exporting it to a third party, HECA would have to file a petition to amend the project to allow it to do that.

Drilling Through CO_2 Areas

Conditions might arise that might require drilling a new well into or through a CO_2 injection zone, such as emerging better technology in the future that would enable extraction of crude oil from depleted oil formations or that crude oil prices might rise to levels that would justify increased cost of extraction from depleted oil reserves. Drilling through CO_2 areas could create a leakage pathway for the stored CO_2. This is especially important if enough time has not passed since the cessation of previous injection activities for the CO_2 plume to have dissipated enough that no significant amounts would leak through the new drilling. There are existing state and federal regulations that are intended to mitigate this risk. Several regulations and guidelines specifically address zonal isolation during well construction. These regulations and guidelines are designed to ensure that wellbores pose no significant risk of leakage of fluids, including CO_2, to the surface. For example, the production well permit issued by DOGGR has specific requirements for the construction of the wells in terms of cementing requirements to ensure that there is no cross contamination between zones and also that no contaminants will find their way to USDW. Further, the whole UIC program promulgated by the U.S. EPA is intended to protect USDW.

MONITORING, REPORTING AND VERIFICATION

Since the purpose of the EOR component from HECA's perspective is to result in the permanent storage of the CO_2 produced in excess of SB1368 limits, a robust monitoring, reporting and verification (MRV) plan is essential to give assurance that the injected CO_2 will remain stored, any potential future leaks, even after the plugging of injection wells will be detected and mitigated appropriately, and that the amounts of stored CO_2 are accounted for accurately. A good MRV plan should include the following elements at a minimum:

1- Thorough Site Characterization;

2- Monitoring and Remediation Plans for Potential Leaks;

3- Tracking of Injected CO_2 Plume;

4- Quantification of Sequestered CO_2 Volumes.

1. Site Characterization:

A good and thorough site characterization is essential for the understanding of the injection zones and the assessment of their potential for storing the injected CO_2. Site characterization should cover geologic setting, faults and fractures in the site, and logs of well bores that show the original stratigraphy of the wells and the final construction showing casings and cementing conditions. A thorough site characterization means the operator is aware of weak points in the system so that it can anticipate locations of future issues, which gives the operator a heads-up in isolating problematic areas.

OEHI conducted a three-dimensional (3-D) seismic survey over approximately 400 square kilometers (155 square miles) within the Elk Hills Unit (EHU) from 1999-2000. These 3-D data were computer processed to allow for an accurate interpretation of the EHU's complex structure. Information gleaned from this 3-D seismic program has been integrated with data acquired from drilling and well workover operations. This wealth of data has been used to complete a detailed structural and stratigraphic characterization of the reservoirs within the EHU. OEHI has used this information for years to develop and implement drilling, completion, and pumping innovations to manage the reservoir and maximize production throughout the field. This same information will enable OEHI to successfully meet the goals of the OEHI CO_2 EOR component.

A study of regional geology by Fiore et al showed two anticline structures (31S and NWS) that are part of the OEHI CO_2 EOR component and a third anticline structure (29R). The structures shown formed bathymetric highpoints on the deep inland marine surface (seafloor), affecting geometry and lithology of the contemporaneously deposited turbidite sands and muds generated as subaqueous turbidite flows. The study also showed the location and extent of four faults that helped to form these anticlines. Based on site-specific studies, OEHI has concluded that the vertical extent of three of the four faults, 1R, 2R and 3R, minimally penetrate the confining zone of the Reef Ridge Shale and do not present a likely pathway for leakage to the surface.

Analysis of OEHI's 3-D seismic data provides further evidence of the sealing characteristics of the Reef Ridge Shale. A 3-D seismic survey was performed from 1999 – 2000, and covered nearly 70 square miles in the EHU. The data were processed using pre-stack depth migration which produces superior imaging in steeply dipping beds, such as on the flanks of the Stevens structures. Analysis of these data indicates that faults above and below the Reef Ridge Shale terminate before penetrating the seal.

OEHI would inject CO_2 into the Stevens reservoirs on the 31S and NWS structures. The Stevens reservoirs of the Monterey Formation are considered the best CO_2 EOR targets within the EHOF. They have been developed on 10 - 20 acre pattern spacing and have produced over 500 million barrels of oil to date. Data collected from these operations have refined OEHI's understanding of the subsurface geology in the Stevens reservoirs. The Stevens reservoirs comprise both sandstone and shale lithologies.

Within the Main Body B (MBB) formation, fining-upward turbidite deposits known as Bouma Sequences stack to form lenticular sheet sands, channels, and levee deposits within a submarine fan complex (Reid, 1990). The sands have porosities between 20 and 25 percent, permeabilities that average 150 millidarcy, and net reservoir thickness that can exceed 1,000 feet. Pressure in the MBB is already near the minimum miscibility pressure (MMP), indicating that it is an ideal initial candidate for CO_2 EOR.

Overlying the Reef Ridge Shale above the 31S structure is the oil-producing shallow oil zone (SOZ). The SOZ is extensively layered with hydrocarbon containing sands and impermeable clay, forming many local traps. The SOZ itself is topped by a cap rock known as the San Joaquin Formation which is mainly comprised of continuous clay and shales interbedded with the lenticular Mya sands. There is extensive evidence supporting the vertical isolation between the Stevens reservoirs, and the SOZ and that the OEHI CO_2 EOR Project will not breach that isolation, including the following:

1- Distinct oil-water contacts, pressures, and temperatures of the Stevens and the overlying SOZ reservoirs indicate that there are no transmissive faults across the Reef Ridge Shale in the area of the OEHI CO_2 EOR component.

2- Employment of concurrent hydrocarbon development programs, some of which resulting in significant pressure changes, without causing interference in either the SOZ or Stevens reservoirs.

3- Volumes and pressures computed through reservoir simulation show that it would be nearly impossible to operate the OEHI CO_2 EOR component in a way that would compromise the seal. The capacity of the Stevens reservoirs is vast compared to the planned injection volumes, and the equipment that would be used to deliver HECA CO_2 physically limits the rate of injection below the injectivity of the Steven reservoirs, thereby not harming the integrity of the seal.

Furthermore, OEHI conducted a four-month pilot study in 2005 that produced data that provided additional confidence that the 31S structure is an attractive target for CO_2 EOR. The pilot study was designed to assess how much oil could be mobilized from the Stevens reservoirs, how much CO_2 would be required to mobilize that oil, and how quickly the oil would be mobilized. Information showed that the Stevens reservoirs selected for the OEHI CO_2 EOR component are ideal for EOR.

Beneath the Reef Ridge Shale is the NWS structure, which contains two reservoirs, A1 and A2. The NWS structure comprises stacked upper Miocene Stevens sands, which are the product of two coalescing turbidite channels. One channel contains the "T" turbidite medium to coarse-grained sands (thickness ~500 to 1000 feet), which form offlapping geometries and structural/stratigraphic traps due to deposition across the rising northwest-plunging nose of the NWS anticline. They contain an abundance of mudstone interbeds and are interpreted to represent a depositional channel fill which grades laterally to less permeable finer grained overbank deposits along the east side of NWS.

The second channel forms a 1700-foot sequence of 80 to 500-foot thick sandstone intervals having high net-to-gross ratios with abundant conglomeratic interbeds. These intervals have lenticular geometries at the top of the sequence and offlapping geometries at the base. The A1/A2 reservoirs on the NWS structure are currently at a very low reservoir pressure (<90 psig), having been pressure depleted during earlier operations. They will need to be re-pressurized to MMP before miscible EOR can begin and are able to accept CO_2 at lower pressure than will be required to inject CO_2 into the reservoirs in the 31S structure. The A1/A2 reservoirs within the NWS will be both an EOR target as well as an excellent source of “backup” storage capacity in the event of power outages, scheduled maintenance periods, or emergency shutdowns, or when injection into the MBB is not possible.

In addition to the characterization of the target storage reservoirs, OEHI also presented detailed information characterizing the properties of the sealing formation, the Reef Ridge (RR) Shale, which will act as the cap that will prevent leaks of injected CO_2. The information presented detailed the properties of the sealing formation in terms of physical rock characteristics of RR Shale, fluid contacts and reservoir pressure depletion, core analysis of the formation, seismic control, geochemical, and geomechanical analysis. The information provided indicate that the RR Shale would likely act as a competent seal to prevent the leakage of the injected CO_2.

Lastly, the areas above the RR Shale sealing formation were also covered in the 3-D simulation and field mapping and analysis provided by OEHI. These include the SOZ and non-productive area above the Stevens reservoirs in the NWS. Both of these areas would be used for monitoring of any potential, though unlikely, leaks that might occur through the sealing formation.

In light of the information provided by OEHI and briefly discussed above, describing the extensive characterization of the EHOF and the target injection zones as well as the seals that would prevent the injected carbon dioxide from escaping, staff believes that OEHI has adequately characterized the reservoir for the purpose of the sequestration activities.

2. Monitoring and Tracking of Injected CO_2:

Tracking the amounts of CO_2 that are injected as well as amounts leaked at the surface and those that occur during and after the injection process is essential for the determination of the net amounts that get sequestered. Another aspect of tracking the CO_2 is the tracking of the CO_2 plume in the ground to ensure that it would not migrate to sensitive areas where it could leak to the surface or to USDWs.

Tracking could be achieved using field measurements if there are enough wells that penetrate the formation which can be used to track CO_2 concentrations and pressures. Since the number of wells that penetrate the formation is typically not large enough to give enough details about the CO_2 plume, it is often necessary to use numerical modeling techniques to simulate the behavior of the CO_2 plume during and after injection. Quality of results of numerical models is dictated by how accurately the geophysical and geochemical properties of the formation parameters are represented in the numerical model. With the extensive characterization information about EHOF that OEHI is in possession, numerical modeling results should be quite representative.

OEHI proposes a monitoring program that includes simultaneous monitoring of:

- CO_2 injection and fluid production during operations of the OEHI CO_2 EOR component;
- A tiered approach to monitoring in the subsurface and at the surface to detect migration, if any, of injected CO_2; and,
- An approach to monitoring after CO_2 injection operations cease.

The previously mentioned centrally controlled monitoring network that OEHI has in place, which is referred to as the Central Control Facility (CCF) is used to make operational control decisions on a real-time basis throughout the EHOF to assure the safety of field operations and to comply with monitoring and reporting requirements in current permits. OEHI uses the CCF in its ongoing operations to collect flow, pressure, and gas composition data in a centralized data management system on a continuous basis 24 hours a day. OEHI has trained technicians who follow OEHI response and reporting protocols when the system delivers notifications if data exceed pre-determined statistically acceptable boundaries. The collected data can be accessed for immediate analysis. OEHI also will use the same CCF to collect and analyze data from the OEHI CO_2 EOR component.

OEHI intends to install and use custody transfer meters at points of custody transfer from HECA to the OEHI component and from OEHI to parties that purchase OEHI's products. The custody transfer meters would measure the fractions of the different gases that would be present in varying concentrations in the transferred products. The meters would be calibrated on a regular basis and by an independent party.

For injected CO_2, OEHI is required Under Class II UIC permits to report volumes of fluids injected. Following the manner in which injection volumes are reported under existing Class II UIC permits at the EHOF, OEHI would allocate aggregate injected volume from data collected at the meters going into the CO_2 facility (the custody-transfer meter and the two flow meters measuring recycled CO_2 from the production wells) to individual wells based on a ratio established by reviewing individual injection volume data as measured by in-field operations flow meters.

For CO_2 recovered with extracted fluids, OEHI is required under DOGGR regulations to report volumes of produced fluids (oil, water, and gas). Similar to the approach implemented under current DOGGR requirements for reporting produced fluid volumes, OEHI would be using two operations meters at each satellite gathering station to determine flow rates. One would be used to measure the aggregate volume of the produced fluid from all wells. The second meter would be used to measure the oil/water/gas rate of each production well on a rotating basis at least once a month. OEHI would use the total volume data gathered at each satellite gathering station and the results from each individual test of a production well to calculate total produced volumes from each production well.

For fugitive CO_2 amounts from surface equipment and venting processes, OEHI anticipates reporting those amounts pursuant to recently adopted federal regulations 40 CFR Part 98, Mandatory Reporting Rule for GHGs, and the analogous state provisions at Division 3, Chapter 1, Subchapter 10 of Title 17 of the California Code of Regulations, as applicable. Under the rules, OEHI would be required to report the total CO_2 and methane (CH4) emissions from the many source types, including those listed below, as they apply to the OEHI CO_2 EOR component:

- For onshore petroleum and natural-gas production: fugitive emissions from valves, connectors, open-ended lines, pressure-relief valves, compressor-starter gas vents, pumps, flanges, well work, and other fugitive sources (such as instruments, loading arms, pressure relief valves, stuffing boxes, compressor seals, dump lever arms, and breather caps for crude services);

- For onshore natural-gas processing: fugitive emissions from valves, connectors, open-ended lines, pressure-relief valves, meters, and centrifugal compressor dry seals; and
- For onshore natural-gas transmission: fugitive emissions from connectors, block valves, control valves, compressor blowdown valves, pressure-relief valves, orifice meters, other meters, regulators, and open-ended lines.

Monitoring to detect surface leakage of injected CO_2:

As discussed earlier, the only likely pathways for leakage of injected CO_2 to the ground surface are the well bores, both through the casing and production tubing and in the annular space between the casing and the formation. OEHI proposes to use a monitoring program that it designed to focus first on detecting unanticipated migration of the CO_2 out of the injection zone in the subsurface and, second, if such migration is detected, determining if leakage of CO_2 to the surface is occurring.

It is noteworthy that the OEHI CO_2 EOR activities would be conducted in an active and very productive oil field and is much like the existing waterflood project. Both the CO_2 injection and the water flooding are designed to enhance the recovery of existing oil that is left over from previous extraction processes using conventional methods. Although not currently a regulatory requirement, it is OEHI's current practice to monitor on a real-time basis the performance of producing oil reservoirs for differences between expected and observed performance and movement of fluids, a practice that OEHI plans to continue for the OEHI CO_2 EOR component. It is in OEHI's interest to keep accurate accounting of the amounts of fluids expected to be produced and those actually produced. Any difference in the two quantities tends to indicate inefficiencies in oil-production operations, and it is in OEHI's interest to address them quickly for improved performance. Typically, OEHI initially investigates wells or surface equipment to address such differences and it is standard practice to conduct further investigation of the subsurface if warranted. For the same reasons and to ensure the optimal use of purchased CO_2 during the CO_2 EOR component, OEHI would assess injection and production performance to identify and address anomalies that could identify opportunities to improve performance of the CO_2 EOR component or the possibility of leakage to the surface, even if not required to do so. OEHI would ensure that these procedures also meet all regulatory requirements and make any necessary modifications.

OEHI proposes to adopt a monitoring plan based on an iterative approach for both the monitoring and the resulting follow-up actions, if warranted. This monitoring plan includes four tiers. Tier 1 is monitoring in the injection zone to ensure operations are proceeding as expected. Tier 2 is the monitoring of the subsurface above the Reef Ridge Shale to ensure early detection in the unlikely event that injected CO_2 migrates through the Reef Ridge Shale. Tier 3 is the monitoring of well bores to ensure their integrity. Tier 4 is the monitoring of surface equipment and the areal surface over the injection zones to detect leakage at the surface. Before injection begins, OEHI would develop statistically reliable baselines for key parameters used in Tier 1 and Tier 2. Staff concludes that this is a reasonable approach to keep track of lost CO_2 amounts.

For detecting and dealing with leakage to the surface, Tiers 3 and 4 seem to be the most relevant. In Tier 3 OEHI proposes measures for the preparation of well bores using standards adopted by the American Petroleum Institute (API) as well as California regulatory requirements for well maintenance and monitoring. In addition, OEHI proposes to apply a corrosion protection program to establish and maintain a barrier between the steel used in wells and any CO_2-enriched fluids. Furthermore, OEHI plans to place a column of cement between the formation and the casing from total depth of the well bore from the bottom of the bore up to 500 feet above the shallowest open perforation of newly drilled wells to protect the well casing from corrosion and prevent injected CO_2 from leaking through the annular space. As an added measure, OEHI would also employ a cathodic protection system, which is already in place, to help in protecting steel well casings against corrosion by carbonic acid. If done properly, the cement column along with the cathodic system should be an effective way to prevent leakage and also to protect casings against corrosion.

In such a vast operation with hundreds of wells for injection and production, let alone the thousands of well bores that abound at the site for different purposes and at varying depths of penetration, leaks are prone to happen at some of the well bores. Tier 4 of the monitoring plan is for dealing with leaks when they are detected. OEHI's proposed procedure to deal with detected leaks involves immediate isolation of the leaking well, depressurizing the zone, and repairing the leaking well. While most likely the repair process would involve injecting a plug of cement to seal the place of the leak, the locations of these leaks are not always accessible to inject a plug of cement. In case the leaking spot in a well is not accessible for plugging, OEHI would have to abandon that well and drill another well.

Condition for Certification **GHG-5** is proposed by staff to account for lost amounts of injected CO_2, detection of leaks, and repairing leaks.

3. Tracking of Injected CO_2 Plume:

OEHI proposes to use a combination of modeling and best available data to demonstrate the magnitude and extent of the injected CO_2 within the Stevens reservoir. This will validate that the injected CO_2 is contained by the Reef Ridge Shale. Monitoring and full-field modeling conducted throughout the operational life of the project would be used to demonstrate that there continues to be no communication between the Stevens reservoirs and the areas above the Reef Ridge Shale and that the full volume of injected CO_2 is contained below the Reef Ridge Shale. Further, OEHI would use information regarding CO_2 in produced fluids from the 31S and NWS structures to demonstrate the reliability of the full-field simulation model in predicting movement of CO_2.

Furthermore, OEHI also proposes to use a combination of modeling and best available data to track the location of injected CO_2. OEHI would use measured data at the production wells to validate OEHI's full-field simulation model. After all injection and production operations in the Stevens reservoirs have ceased, movement of the injected fluids, including CO_2 would be driven by natural forces and would be countered by structural trapping (vertical movement mitigated by intervening shale layers and ultimately stopped at the physical boundary of the Reef Ridge Shale), capillary trapping and long-term mineralization processes.

OEHI has already used a full-field simulation model to predict the location and movement of CO_2 20 years from the start of injection as well as 118 years after closure. Model results showed that some of the injected CO_2 is projected to migrate to the top of the MBB within 20 years before it encounters the interbedded North American (NA) Shale within the Stevens reservoirs. Model results also showed that after 118 years after injection has stopped the concentration of CO_2 at mid-depth would be lower than it was after 20 years, showing some movement away from the injection point. However, predicted concentrations at the top of the MBB showed that the main movement of the injected CO_2 would be in the vertical direction since it was shown that there would be more areas with a higher concentration of CO_2 towards the top of MBB than is predicted after 20 years. CO_2 plume vertical movement was shown by the model to be slowed or trapped by the interbedded NA Shale. This gives further evidence that staff finds to be assuring that the target zone for storage would remain isolated and no substantial movement of the injected plume would occur.

4. Quantification of Sequestered CO_2 Volumes:

OEHI would apply mass balance principles to determine the amounts of CO_2 that would get sequestered as a result of the EOR operation. The amount of CO2 sequestered is simply the difference between the amounts received and the amounts of losses, as in the following equation:

$$C_s = C_t - C_p - C_l - C_{fv}$$

where C_s is sequestered CO_2, C_t is total CO_2 received from HECA, C_p is CO_2 measured at the custody-transfer points in products sold offsite, C_l is CO_2 emitted through leakage, and C_{fv} is fugitive and vented CO_2 associated with injection and production.

All the quantities in the mass balance equation can be readily determined, except for the amount associated with leakage. To estimate this amount, both flow rate (either volumetric or mass) and concentration of CO_2 involved will have to be known. Because the amount of CO_2 leaked to the surface will depend on the nature of the equipment and an estimation of the duration and concentration of the leak, OEHI says that it would not be able to predict in advance the approach that would be appropriate to use to determine the amount until after the leakage has been detected. Staff finds this to be an anomaly. After the leak has been detected it would be too late to determine how much has leaked as some of the CO_2 has already escaped. OEHI should find a way to be able to assess the volumes of fugitive gases in advance of the detection of leaks. Staff believes that such a setup might be simply a tent over the well head which would be instrumented to measure volumes of fugitive gases right after a leak has been detected. Since it would take some time for the fugitive gas to travel from the location of the leak to the ground surface, the system operator would have an early warning to activate the system in the tent to be ready to capture those fugitive gases.

Since OEHI has not provided detailed information on the approach it would apply to assess the amounts of CO_2 leaked to the surface, staff cannot assess the effectiveness of the approach. OEHI should decide on one or more approaches to be used for assessing the amounts of fugitive CO_2 ahead of the detection of leaks and provide details of those approaches to staff for assessment.

Staff has recommended conditions of certification that would require the facility owner or operator to ensure effective CO_2 sequestration, monitor for and fix CO_2 leaks, and mitigate the potential for geologic/seismic impacts from the EOR project. If after completion of the proposed CO_2 injection project all wells are plugged and abandoned in accordance with the requirements of Class VI UIC, downwind monitoring of CO_2 concentrations at a few strategic points would be sufficient. If some or all of the wells are not plugged and abandoned, periodic monitoring of casing pressures, as well as surface monitoring of CO_2 concentration would be necessary. Additionally, according to the Class VI regulations, the Area of Review (AoR) associated with Class VI wells is required to be revised continually until site closure. Revision of the AOR requires continuous modeling of the CO_2 plume through the post injection period until site closure.

Closure and Decommissioning

After HECA shuts down, there exist different paths forward for the OEHI CO_2 EOR component. For example, (1) all wells are plugged and abandoned and a CO_2 emission monitoring program is continued for many decades; (2) some or most of the CO_2 injected into the proposed project is produced and re-injected into the adjacent reservoirs, or (3) CO_2 from another source is obtained and is injected into a project expansion. Regardless of what option is chosen, eventually the wells would need to be closed and decommissioned in a manner that retains the sequestered CO_2.

The U.S. EPA issued regulations specifically designed for plugging and post plugging site care for injection wells used for long term storage of CO_2 that are found at 40 CFR part 146 subpart H. In order to ensure that plugging and PISC are done properly, staff recommends that the applicant comply with U.S. EPA's requirements for well plugging and PISC through compliance with Condition of Certification **GHG-3**. Specific requirements of the U.S. EPA Class VI rule for plugging and PISC are summarized in **Carbon Sequestration and Greenhouse Gas Emissions Table 13**. In addition to requirements that the plugging be done following standard plugging procedures, the rule also requires that the injector should allow a representative from an agency with jurisdiction to witness the plugging procedure. Also, Class VI rule requires specific monitoring of plugged wells during the period from well plugging until the closure of the site, referred to as PISC, which include the preparation of a corrective action plan to deal with potential leaks from plugged wells and demonstration of financial preparedness to cover the expenses to implement the corrective action plan.

Cumulative Impact

Cumulative impacts are defined as “two or more individual effects which, when considered together, are considerable or . . . compound or increase other environmental impacts” (CEQA Guidelines § 15355). “A cumulative impact consists of an impact that is created as a result of a combination of the project evaluated in the EIR together with other projects causing related impacts” (CEQA Guidelines § 15130[a][1]). Such impacts may be relatively minor and incremental, yet still be significant because of the existing environmental background, particularly when one considers other closely related past, present, and reasonably foreseeable future projects.

There are no other projects in the vicinity that currently engage or will engage in the foreseeable future in injecting CO_2 for EOR or sequestration purposes. Therefore, the OEHI EOR CO_2 component would not be expected to cause any cumulative environmental impacts either by itself or in combination with other projects.

RESPONSE TO AGENCY AND PUBLIC COMMENTS

A number of public comments have been received regarding GHG emissions/climate change and carbon sequestration.

RESPONSE TO GHG EMISSIONS/CLIMATE CHANGE COMMENTS

The table below contains staff’s responses to comments received pertinent to GHG emissions/climate change topics addressed in this section submitted by government agencies, intervenors, and the public. This comment response includes responses to comments provided to the Energy Commission and to the DOE.

Submitted by:	*COMMENT and RESPONSE*
AGENCY: U.S. Environmental Protection Agency (U.S. EPA)	
Agency – U.S. EPA (TN-66381) 7/26/2012	Comment: (summarized) The DEIS should include an estimate of the quantities of greenhouse gases both generated and sequestered by the project, and a discussion of the indirect impacts from the extended oil production that will occur at the Elk Hills Unit because of the project. We suggest including a graphical illustration showing the mass balance of carbon for clarity and comparison of alternatives. Response: This section does provide estimates of the quantities of the emissions generated by HECA and by the OEHI CO_2 EOR component. These estimates include traffic and secondary electricity consumption. Additionally, to better describe the EOR component the range of potential petroleum production is provided. However, the GHG emissions from the EOR component’s produced oil use are not considered to be relevant in the discussion of the project’s impacts. With or without EOR necessary oil

	production to meet petroleum product demand will occur, at the Elk Hills site using other means, domestically, or overseas. It can also be argued that production closer to demand, similar to the greenhouse reduction concept of using local products, actually reduces overall GHG emissions by reducing transportation emissions.
Agency – U.S. EPA (TN-66381) 7/26/2012	Comment: (summarized) The following are suggested for inclusion in the greenhouse gases/climate change discussion: • General climate change causes and effects. • Project sector contribution to GHG emissions. • Description of applicable GHG LORS • Discussion of the Energy Policy Act of 2005 and EO 13423. • Identification of local and regional climate change initiatives. • GHG emissions inventory. • Context of emissions by EPA's GHG equivalency calculator. • GHG emission reduction measures discussion. • Project impacts on CO_2 sinks and land albedo. Response: This section has attempted to include discussions related to all of the above U.S. EPA identified GHG/climate change topics that are relevant to this project. Comparing the project's emissions to equivalent passenger vehicles or other units provided by the EPA's GHG equivalency calculator is not considered directly relevant to the impact assessment of a power plant project. EO 13423 is not relevant and does not apply to this project. That executive order applies to the internal operation of federal agencies. While Hydrogen Energy International, LLC will be obtaining funds from a federal agency it is not itself a federal agency nor is agency funding of this type covered under EO 13423. Also, the relevance of the Energy Policy Act of 2005 is not clear. Parts of that Act may be relevant in terms of the project description discussion; however, we need further clarification regarding what parts of this act EPA considers specifically relevant to the greenhouse gases/climate change discussion for this project.
Agency – U.S. EPA (TN-66381) 7/26/2012	Comment: Impacts of climate change on the project. The DEIS should identify how the project could be affected by climate change. This could include changes to water availability, temperature increases, increased extreme weather events (flooding, etc.). Adaptation strategies should be identified and discussed, as appropriate. Response: Water availability issues are discussed in the Water Resources Section. Staff believes that the project will be appropriately designed for extreme

	weather events and given the project type, location, and the expected project life, no climate change adaptation strategies are necessary for this project.
Agency – U.S. EPA (TN-66381) 7/26/2012	Comment: Cumulative climate change impacts on resources also affected by the project. The DEIS should also include a discussion on cumulative climate change impacts to resources also affected by the project. If there are project impacts on environmental justice (EJ) communities, the cumulative impacts from climate change on public health and environmental justice communities should be discussed. Response: Staff does not believe that the project will have measurable localized climate change impacts, such as impacts from climate change on public health or environmental justice communities. Staff has preliminarily concluded that the project would reduce GHG emissions as a whole when considering the electricity sector within the WECC and the balance of the project's fertilizer manufacture and EOR component's oil production, and therefore create a beneficial climate change impact. Additionally, staff has concluded that the project would also demonstrate both CO_2 emissions reduction for coal power plants and also demonstrate plant design flexibility, with the inclusion of the fertilizer manufacturing plant that increases the plant's energy dispatchability, which is desirable as non-dispatchable renewable energy's role increases over time.
INTERVENOR: Association of Irritated Residents (AIR)	
Intervenor – AIR (TN-66342) 7/27/2012	Comment: (summarized) Total pollution and GHG emissions must be analyzed from cradle to grave for this project. Response: This section includes a GHG emission estimate for construction emissions and operation emissions for both HECA and the associated OEHI CO_2 EOR component that includes all project related stationary sources, mobile sources, and area sources including the fuel feedstock (i.e. coal) transportation emissions that occur from the mine to the project site.
Intervenor – AIR (TN-66342) 7/27/2012	Comment: (paraphrased) Electricity used in the EOR process uses an inappropriate baseline for GHG emissions, which should be the state average emission rate. Response: Staff agrees with this comment, and determined that the current WECC California emissions factors values recommended for use by The Climate Registry (658.68 lbs CO_2/MWh and 661.2 lbs CO2E/MWh) provides a better emission factor for the indirect electricity GHG emissions factor for this new base load electricity consumption source, and staff revised the GHG emission estimates for the OEHI CO_2 EOR component shown in the emissions tables using these values.

INTERVENOR: Sierra Club	
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) NEPA requires governmental agencies to consider impacts on the global environment including global climate change, as well as local and regional impacts. Response: The DOE has determined that this section adequately addresses global climate change per NEPA requirements.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) Action to reduce emissions is warranted as the EPA states that GHGs endanger the public health and welfare of the current and future generations. Response: This project includes the geologic sequestration of CO_2 emissions from coal/coke derived power generation. This emissions reduction technology would cause a significant reduction in emissions from high-carbon content fuel use.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) DOE should consider total CO_2 emissions from the project including transportation emissions and EOR component emissions including oil recovery. Response: The direct and indirect GHG emissions, including transportation emissions, from both HECA and the OEHI CO_2 EOR component have been considered and tabulated in this analysis.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) Even with sequestration, HECA is a large source of GHG emissions with almost a half million tons of CO_2 per year from stationary source alone. DOE must consider how the lifecycle GHG emissions compare on a megawatt basis to a natural gas plant, and other renewable energy alternatives. Response: This section provides a comparison of the emissions of this project and other fossil fuel alternatives, including natural gas combined-cycle projects. We are not aware of an acceptable reference source that provides comparable lifecycle emission estimates for other fossil fuel alternatives, nor are lifecycle emissions estimates available for HECA. However, we have provided emissions estimates and noted what is included in each estimate to identify where the comparisons are not equivalent. This project would clearly emit more CO_2 than most renewable energy facilities, whether or not lifecycle emissions are considered. However, low CO_2 emitting renewable energy sources (solar, wind) cannot be used for base load power generation, and higher CO_2 emitting renewable energy sources (waste-to-energy, geothermal) cannot generally provide any

	dispatchable power, so these type of resources do not meet the same project goals and objectives as HECA and so are not comparable technologies/projects.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) Since the CO_2 is being used to extract more oil from the ground that will be combusted to produce more CO_2 emissions, DOE must analyze the lifecycle of the oil combustion including transport of the crude oil produced in the field, crude oil refining, and the combustion of the refined petroleum products. Response: The GHG emissions from the EOR component's produced oil use are not considered to be relevant in the discussion of HECA's impacts. With or without this project, necessary oil production to meet petroleum product demand will occur, at the Elk Hills site using other means, or otherwise at other North American or overseas sources. It can also be argued that oil production that occurs closer to demand, similar to the greenhouse reduction concept of using local products, actually reduces overall GHG emissions.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) The EIS should examine alternatives and mitigation measures designed to eliminate or minimize CO_2 equivalent emissions. Response: This section includes the evaluation of the geologic sequestration of CO_2 emissions which is considered the project's primary GHG emissions mitigation measure. The project also provides for alternative use of the project's fuel source that would allow the project to be partially dispatchable which would also reduce emissions from electricity generation; through the reduction of the use of higher GHG emitting dispatchable resources such as simple cycle peaking gas turbines. Additionally, the District's GHG BACT determination considered applicable and appropriate technology alternatives and found that the project's design met GHG BACT requirements. Please also see the Alternatives section for additional project alternatives discussion.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) DOE should assess the impacts of global warming on different environmental receptors in Kern County. The EIS should analyze the local, regional, global environmental impacts of CO2E emissions from the HECA facility, focusing to the impact of global warming on California's and Kern County's water resources and existing air quality problems. Response: This section does describe the potential regional impacts of climate

	change. However, HECA would be globally and regionally a very small contributor to overall GHG emissions, and unlike criteria pollutant emissions, would not by itself create any localized global climate change impacts. The DOE also believes that demonstrating the feasibility of large scale GHG emission reduction technologies, such as the carbon separation and sequestration technology that is proposed to be employed by HECA, will foster greater change in current power generation technologies and help contribute to future globally significant reductions of GHG emissions from coal power plants, both within and outside of the United States.
PUBLIC COMMENTS	
Public – Arthur Unger (TN-66357) 7/26/2012	Comment: (summarized) How much GHG will the cars, trucks and trains that bring employees, fuel, equipment and waste to and from the plant during construction and operation make? Response: The GHG emissions from the sources noted in this comment are included in **Carbon Sequestration and Greenhouse Gas Emissions Tables 3** and **4**.
Public – Arthur Unger (TN-66357) 7/26/2012	Comment: (summarized) How much GHG will the oil recovered in the course of the HECA project emit? Response: The air pollutant and GHG emissions from the EOR component's produced oil use are not considered to be relevant in the discussion of the projects' impacts. With or without this project, necessary oil production to meet petroleum product demand will occur, at the Elk Hills site using other means, domestically, or overseas. It can also be argued that production closer to demand, similar to the greenhouse reduction concept of using local products, actually reduces overall GHG emissions.
Public – Trudy Douglass, et. al. (TN-66389) 7/30/2012	Comment: (summarized) In return for HECA taking our air, land, water and peace of mind, we receive a rise in GHGs because of inadequate diligence in the carbon sequestration process. Response: Staff has concluded that this project would not cause a rise in GHG emissions from the electricity sector, and staff has provided Conditions of Certification **GHG-1** through **GHG-5** that would provide adequate monitoring and verification to assure that the proposed carbon sequestration would provide the GHG emission reductions necessary to reduce GHG emissions overall from electricity generation.

RESPONSE TO CARBON SEQUESTRATION COMMENTS

The table below contains staff's responses to comments received pertinent to carbon sequestration topics addressed in this section submitted by government agencies, intervenors, and the public. This comment response includes responses to comments provided to the Energy Commission and to the DOE.

Submitted by:	*COMMENT and RESPONSE*
AGENCY: U.S. Environmental Protection Agency (U.S. EPA)	
Agency – U.S. EPA (TN-66381) 7/26/2012	Comment: (summarized) The DEIS should evaluate the increased risk of seismic activity resulting from proposed CO_2 injection. Response: This section provides an evaluation of the potential increased risk of CO_2 injection induced seismic activity. Long-term gas injection works entail a risk of induced seismic activity. However, most of the seismic events will be too weak to be felt by people. There might be some stronger events, 3-3.5 on the Richter scale. Given that Elk Hills is in a seismically active area, these minor injections and production related tremors will be negligible.
INTERVENOR: Sierra Club	
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) The EIS must consider whether the CO_2 emissions will indeed be permanently sequestered underground pursuant to enforceable permits. Currently, it is unclear which agency and which permits will ensure that carbon emissions from the facility are not ultimately emitted into the atmosphere. Response: The Energy Commission is taking control of the enforcement of the geologic carbon sequestration through proposed Conditions of Certification **GHG-1** through **GHG-5** and will retain control of assuring carbon sequestration throughout the project life and beyond. Additionally, ARB is responsible for drafting the regulations that will cover the monitoring method requirements and enforceability of geologic carbon sequestration, and depending on the pending legislation, either they or DOGGR may also be responsible for ongoing enforcement and assurance of geologic carbon sequestration under the Cap and Trade regulations.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) DOE must consider the potential impacts of sequestering 3 million tons of CO_2 per year and analyze the potential for surface leaks, induced seismic activity from injecting the large amount of carbon underground and groundwater contamination. Response: This section includes an analysis of the geologic feasibility and

	implications of the OEHI CO_2 EOR component including the potential for induced seismicity. Staff's proposed conditions of certification, particularly **GHG-3**, are designed to monitor and control CO_2 leakage, both short and long-term, to assure permanent carbon sequestration.
Intervenor – Sierra Club (TN-66370) 7/27/2012	Comment: (summarized) DOE must ensure that Elk Hills has adequate financial mechanisms in place for long-term stewardship of the Elk Hills site. Response: Staff's proposed condition of certification **GHG-3** is designed to ensure that there is a financial instrument in place to assure long-term stewardship of the Elk Hills site that will ensure permanent carbon sequestration.
PUBLIC COMMENTS	
Public – Trudy Douglass (TN-66245) 7/12/2012	Comment: (summarized) Our site is farm land, at the closed end of a valley, with porous shale to hold the CO_2 until holes are drilled through our protective barrier for oil recovery. The CO_2 will make our air quality worse. Response: It is extremely unlikely that the injected CO_2 will ever flow through the natural geological barriers, especially given the large number of alternating layers of sand and shale present at the site, which is a very favorable arrangement of geologic features for sequestration of the CO_2. CO_2 is a colorless and odorless gas that will be monitored at the surface for potential, but unlikely, leaks along the wellbore casings, and leaks in the surface piping. Staff's proposed conditions of certification, particularly **GHG-3**, are designed to monitor and control CO_2 leakage, both short and long-term, to assure permanent carbon sequestration. The carbon dioxide will not make local air quality worse.
Public – Daniel Bell (TN-66248) 7/16/2012	Comment: (summarized) What is the estimated space currently available in the Elk Hills? What data is the 3 million tons of CO_2 per year based on? Is this based on start-up quantities or lifetime estimates? Response: The annual CO_2 injection rate of 3 million tons is based on the amount of CO_2 that would be separated and transported from the HECA site to the OEHI CO_2 EOR site assuming the permitted maximum annual operation at HECA. In terms of reservoir management, it is the volume of injected fluids, not mass, that counts. The project would have a net volume requirement of 1.1 billion reservoir barrels of CO_2 and water injection over the project's life. So, that needs to be compared with the available reservoir pore volume. Assuming 160 patterns × 20 acres/pattern × 43,560 square feet/acre × 1000 feet depth of formation × 0.225 (pore space fraction)/5.615 cubic feet/barrel = 5.6 billion barrels. Scaling this number with Occidental Petroleum's production estimate, (5.6 billion barrels /7.5

	billion barrels within the reservoir × 1.3 billion barrels net fluid volume produced from the reservoir = 1 billion reservoir barrels of fluid will have been produced from the proposed project area. This number representing the currently available pore space is somewhat less than the net 1.1 billion reservoir barrels of CO_2 and water injection required by the project, but the amount of additional oil and water that will be produced during the project will more than compensate for the difference. Therefore, there is ample pore volume into which the CO_2 and water will be injected. The total CO_2 volume to be injected over the lifetime of the project is expected to occupy only about five percent of the total pore volume of the reservoir.
Public – Dean Clason (TN-66349) 7/26/2012	<u>Comment:</u> (summarized) The concept of "trapping" CO_2 in ground formation is unproven and the local leaks from high pressure injection wells that were supposed to trap drilling fluids instead wound up polluting the local aquifer resulting in the City of Bakersfield having to abandon local wells. <u>Response</u>: Physical CO_2 trapping, which is a slow accumulation of free CO_2 in the reservoir pore volume, is a real, relatively short term process resulting in the retention of 5-30 percent of the injected CO_2 per pass. Trapping has been observed to occur even in situations where it is undesirable to be trapped, such as enhanced oil recovery where recovery of injected CO_2 is desirable so that it can be used in subsequent injections to minimize CO_2 purchases. The injection zone is known to have stored oil and gas under pressure for millions of years, and that's why it is believed to be capable of holding the injected CO_2. A strict monitoring plan, as outlined in Condition of Certification **GHG-3**, will be required to monitor any potential, albeit unlikely, leakage of the injected CO_2 at the surface along the wellbore casings; and to monitoring the leakage from the above ground piping components, which are the most likely, albeit low volume, leak outlets for any potential CO_2 emissions leaks to atmosphere. The CO_2 that is trapped in the Stevens reservoir cannot penetrate the geological barriers at the EOR site. The Stevens reservoir is located below a thick shale layer that itself underlies several additional alternating layers of shale and sandstone that provide an impermeable barrier. Therefore, there is little or no potential for groundwater contamination except through the well bores. The wells will have to meet UIC regulation requirements that are designed to protect groundwater.
Public – Kathleen Parsa (TN-66385) 7/23/2012	<u>Comment:</u> (summarized) Burying 2.5 million tons of CO_2 a year may pose a higher risk of seismic activity. <u>Response</u>: It is not the amount of CO_2 purchased that matters, but the duration of the injection process and changes of stresses in the reservoir because of the changing pore pressure. California is a place with a high risk of seismic activity, but the additional potential risks from CO_2 injection and fluid withdrawal for the OEHI CO_2 EOR component have been determined to be negligible.

Public – Trudy Douglass, et. al. (TN-66389) 7/27/2012	Comment: (summarized) The CO_2 to be sequestered is going into oil shale and the sandstone barrier expected to hold it has been drilled for oil exploration for more than 100 years. Response: Approximately 1,231 wells penetrate the Stevens reservoir. Currently 1,021 active wells penetrate the Reef Ridge Shale in the 31S structure; 128 wells are permitted by DOGGR as UIC Class II injection wells and 749 wells are permitted by DOGGR as production wells. In addition, there are 144 wells that can be both producers and injectors at the completion level within different reservoirs, or have been “plugged and abandoned” in one reservoir, but are active in another, or have changed well type. There are 178 inactive injection and production wells, 22 injection and production wells that have been “plugged and abandoned” according to regulatory requirements, and 10 wells that are shut in. The risk of CO_2 leakage from the Stevens reservoir through the wells drilled down through the Stevens reservoir will have to be monitored for decades. Staff’s recommended Conditions of Certification, particularly **GHG-3**, address these well field monitoring requirements.
Public – Trudy Douglass, et. al. (TN-66389) 7/27/2012	Comment: (summarized) The defined purpose of sequestration is the permanent removal of greenhouse gases. SCS’s proposal gives millions of tons of CO_2 to Occidental Petroleum to use without restrictions. This proposal does not meet DOE guidelines for the permanent removal of GHGs. Response: The Energy Commission is responsible for the enforcement of the geologic carbon sequestration through proposed Conditions of Certification **GHG-1** through **GHG-5**, which are designed to assure permanent carbon sequestration. Staff will require SCS to pass along these requirements to the well field operator via contract, and provide that contract prior to completion of the FSA/FEIS.
Public – Trudy Douglass, et. al. (TN-66389) 7/27/2012	Comment: (summarized) If all of HECA’s gasification, storage, sequestration, and transfer processes work perfectly, they will add only 520 tons of pollution and particulates a year to Kern County air. This does not include the millions of tons of CO_2 it is supposed to permanently sequester. Response: Please see the response provided above, and the comment responses in the Air Quality section.
Public – Trudy Douglass, et. al. (TN-66389) 7/27/2012	Comment: (summarized and edited) The process of sequestration is unclear. An added problem for the HECA project factory is that we aren’t even being given a valid form of sequestration. SCS said the CO_2 will crystallize but, how long will that take? Will the gas be in the ground long enough for it to happen or just come right up though the perforated sandstone?

	Response: The CO_2 cannot penetrate the geological barriers at the EOR project site. The Stevens reservoir is located below a thick shale layer that itself underlies several additional alternating layers of shale and sandstone that provide an impermeable barrier. The only expected possible escape pathways will be through the wells, but these wells will be required to be cemented in and sealed ("plugged & abandoned") after they have completed their active life, and then monitored for CO_2 leaks. Requirements for monitoring active and abandoned wells are included in staff's proposed conditions of certification. Chemical CO_2 trapping by mineralization is a mechanism that operates on a time scale of decades and centuries. It is rather irrelevant when a 20-year time scale is considered. Physical CO_2 trapping, which is a slow accumulation of free CO_2 in the reservoir pore volume, is a real relatively short term process resulting in the retention of 5-30 percent of the injected CO_2 per pass. While there will eventually be mineralization of the CO_2 that is physically trapped in the formation, that process is not required to occur in order to ensure long-term CO_2 sequestration in the formation.
Public – Trudy Douglass (TN-66427) 7/27/2012	Comment: (summarized) The Tupman facility will not even sequester the CO_2. HECA will turn it over to Occidental Petroleum to play with. Response: Staff's is requiring that there is a contract in place between HECA and OEHI that ensures that the CO_2 ownership issue does not impact the assurance of carbon sequestration prior to publication of the FSA/FEIS.
Public – Cindy Stiles (TN-66497) 8/3/2012	Comment: (summarized) Sequestering large volumes of CO_2 may very well stimulate seismic activity and this plant is very near to the San Andreas Fault as well as the California Aqueduct, the water lifeline for much of Southern California. Response: As was noted above, the seismic impacts of CO_2 injection into a sandstone reservoir will be infinitesimal compared with the already existing strong seismic activity. Therefore, the proposed project would not result in any impacts to the California Aqueduct.

CONCLUSIONS

Staff analyzed the proposed carbon sequestration plans for impacts to the environment in terms of geologic impacts and impacts to USDWs. Staff concludes that the proposed injection site conditions are favorable to inject the projected amount of CO_2 over 20 years. Given geologic lifetimes of natural CO_2 domes, and many long-lasting CO_2 injection projects, staff believes that it is likely that the injected CO_2 would be stored permanently in the Elk Hills Oil Field.

The conclusion above is supported by the fact that the formations where the CO_2 would be stored are separated from the surface by 5,000 to 7,000 vertical feet of other formations, including thick and continuous shale layers. In order to ensure that the injected CO_2 would remain sequestered, staff recommends that the project wells be plugged and abandoned in accordance with the plugging requirements for wells intended for long term storage of CO_2, as specified in Condition of Certification **GHG-3**. The injected CO_2 might possibly leak through the geologic formation and the well bores. The presence of the several thick and continuous shale layers above the injection zones makes it very unlikely, if at all possible, for the CO_2 to leak through the formation. However, since there are a large number of well bores at the project site, both active and abandoned, the potential for leaks through those well bores could be quite significant. OEHI stated that it already has in place a sophisticated monitoring system to detect gases that come out through active well bores, which would be utilized to detect potential CO_2 leaks. In addition to the monitoring network at active wells, staff recommends that the monitoring network should be extended to include plugged and abandoned wells. The CO_2 monitoring program must be maintained throughout the project life and also for the period between plugging of the wells and the site closure in accordance with the requirements for well plugging and PISC as specified in Condition of Certification **GHG-3**.

In the unlikely event of a major leak due to a well-control incident, leak-specific measures would have to be undertaken, including but not limited to, depressurizing the reservoir, isolation of the offending well, and the drilling of a relief well that would intercept and quell the leaking well if necessary. In light of the information available for the proposed sequestration field, staff believes the likelihood of such an event is very low.

As long as CO_2 sequestered in the oil field remains under ground, HECA would emit considerably less GHG than existing coal-fired power plants, but would have GHG emissions efficiency that is somewhat worse than current natural gas fired combined cycle plants. The proposed project would be subject to the state's cap and trade regulation that will enforce sector wide GHG emission reductions to meet state planning goals. While the proposed project's operation may not result in a cumulative overall reduction in GHG emissions from in-state power generation and out-of-state imported power, like a cogeneration facility it would have additional benefits to consider, namely the production of 1 million tons of nitrogen-based fertilizers and the production of crude oil and natural gas. Considering the entirety of the project, staff has preliminarily determined that the project would not result in an overall increase in global GHG emissions, and would thus not result in CEQA impacts that are cumulatively significant.

Staff concludes that the GHG emission increases typical from construction and decommissioning activities would not be significant for several reasons. First, the periods of construction and decommissioning would be short-term and not ongoing during the life of the proposed project. Second, the best practices control measures that staff recommends, such as limiting idling times and requiring, as appropriate, equipment that meets the latest emissions standards, would further minimize greenhouse gas emissions since the use of newer equipment would increase efficiency and reduce GHG emissions and be compatible with low-carbon fuel (e.g., bio-diesel and ethanol) mandates that will likely be part of the ARB regulations to reduce GHG from construction vehicles and equipment. Finally, the construction and decommissioning emissions are miniscule when compared to the reduction in fossil-fuel power plant greenhouse gas emissions during operation. For all these reasons, staff concludes that the short-term emission of greenhouse gases during construction would be sufficiently reduced and would be offset during proposed project operations and, therefore, would be less than significant.

HECA would be subject to EPS since it would operate more than 60 percent of capacity and since for economic viability it would need to obtain a base load energy contract with an investor owned utility (IOU) or a publicly owned utility (POU). HECA, with an appropriate binding contract with OEHI and appropriate conditions of certification, would likely meet the requirements of SB 1368. However, to finalize this finding, staff needs the applicant to provide a comprehensive MWh energy balance for the HECA facility, including the air separation unit, that shows all of the energy production and use at the HECA site. Staff is requiring that the binding contract between HECA and OEHI regarding CO_2 use, sequestration CO_2 emission reduction use, and CO_2 sequestration monitoring and recordkeeping requirements be provided prior to publication of the FSA/FEIS. Additionally, HECA would comply with GHG PSD requirements, as determined by the District's PDOC, and would comply with the state's cap and trade regulations.

OUTSTANDING INFORMATION REQUIRED FOR COMPLETION OF THE FSA/FEIS

Staff requires the following information to complete the FSA/FEIS:

1. A binding contract between SCS Energy LLC and Occidental of Elk Hills, Inc., provided to the Energy Commission that:
    a) Identifies the responsibilities of each party to demonstrate and document permanent sequestration of the supplied carbon dioxide.
    b) Documents Hydrogen Energy California's rights to the entire carbon dioxide sequestration emissions reductions as necessary for SB 1368 EPS and other regulatory compliance.
    c) Clearly states that the carbon dioxide sequestration emissions reductions shall not be used for any other purpose than providing for the compliance obligation needs for HECA.
    d) This contract shall also require Occidental of Elk Hills, Inc. to provide a Carbon Dioxide Emissions Sequestration Plan to the Energy Commission for review and approval as detailed under the preliminary staff Condition of Certification **GHG-3**.
    e) Clearly states the duration of the contract agreement.

2. A complete electrical energy balance estimate for HECA that includes the complete gross electrical production and complete parasitic load for the plant by major functional area, including the air separation unit, in MWh for both hydrogen rich fuel and natural gas operation. Staff cannot complete its determination of compliance with the SB 1368 EPS without this information.

3. A revised greenhouse gases emissions estimate for HECA that matches the current project description, including but not necessarily limited to: the removal of the ammonia product shipping emissions; the addition of the limestone fluxant shipping and use; and that addresses the shipping emissions for potential alternative shipping locations for the gasifier solids.

4. The District's FDOC that addresses staff's comments on the PDOC, specifically revising the combined-cycle power generating permit unit condition 86 to be based on the District's CO_2 BACT determination rather than the SB 1368 EPS.

5. Further information describing how OEHI would abate CO_2 if it leaks to the surface and escapes into the atmosphere.

6. Please provide information detailing how the applicant would comply with the proposed allowable CO_2 venting hours without a back-up CO_2 injection zone.

7. Please provide all of the following:

   BACKGROUND
   Since the Amended AFC was filed there have been a number of changes to project design including a change to the power output of the combustion turbine, the addition of fluxant to the gasification process and the discontinuation of exporting ammonia as a stand-alone product. In addition, the applicant presented revised SB 1368 emission calculations in an e-mail sent to staff on May 10, 2013. Therefore Energy Commission staff needs additional information to revise air quality and greenhouse gas (GHG) emissions for consistency with the assumptions and data provided in these new calculations and to account for all revisions to the project design and operation assumptions that have occurred since the Amended AFC was submitted. The following information is still needed to complete the analysis for the Final Staff Analysis/Final Environmental Impact Report. Some of the terms below such as "Power", Fertilizer" and "Common" refer to computations in the new material presented in spreadsheets provided by e-mail on May 10, 2013.

   A. Please provide a carbon balance for HECA demonstrating the complete flow of carbon from the introduction of feedstock to the coal dryer to the products (including carbon dioxide [CO_2]) and waste streams. Please provide this carbon balance for both the On- and Off-Peak operating cases. This carbon balance should be more detailed than what was previously provided in the Amended AFC and data responses, clearly identifying the carbon in all the streams between major processes and process units where carbon flows change.

B. Please provide detailed background information supporting the latest applicant- sponsored SB 1368 calculations. Please provide the following:

- A detailed list of the project equipment indicating each piece of equipment's power consumption value; and
- Project equipment allocation (Power, Fertilizer or Common) for each listed piece of project equipment.

C. Please provide the gross and net megawatt (MW) assumptions for the three available ambient cases (39, 65 and 97 degrees F). Include the On-Peak, Off-Peak and Daily Average categories.

D. Please describe how the fertilizer power generation values, which appear to be different than the previously presented 5 MW value, were determined for the On-Peak and Off-Peak Cases.

E. Please provide detailed calculations and rationale for the Syngas Allocation percentages allocated to power block and fertilizer in the HECA Power Generation for SB 1368 Emission Performance Standard Table for each project case (On-Peak, Off-Peak, and Daily Average).

F. Please provide detailed calculations and rationale for the calculations used to determine the Syngas Allocation to Power and Fertilizer that were used to determine the CO_2 emissions by emissions source. Please confirm this value is for the Daily Average case, and provide the values for the On-Peak and Off-Peak cases.

G. Please provide additional background information explaining the syngas allocation method used to determine CO_2 emissions from the fertilizer plant. This additional detail should explain the methodology sufficiently to ensure that CO_2 emissions from the fertilizer plant are not double counted when CO_2 emissions are sequestered in the urea produced.

H. The syngas allocation by section (see spreadsheet provided by applicant for May 10, 2013 meeting, attached to TN 70829) does not include a value for the Common allocation. The CO_2 emissions from components identified elsewhere in the spreadsheet designated as "Common" are calculated using the Power Allocation percentage in the spreadsheet. Please confirm or provide the correct Common allocation percentage.

I. Please provide the air separation unit's power consumption value expected for the On-Peak, Off-Peak, and Daily Average cases. This can be presented with apportionment to the power block and fertilizer plant if detailed calculations and rationale for that apportionment basis (based on use of the produced oxygen and nitrogen and its later products, hydrogen and CO_2, used for power and fertilizer production) are provided.

J. The applicant stated that the power consumption for initial CO_2 compression that is completed at the HECA site was sufficient to provide CO_2 at a pressure necessary for geologic sequestration.

- Please confirm that means that the compression completed at the HECA site and the power consumed by the compressors on the HECA site is adequate to provide a level of compression that is sufficient to provide pressure necessary for geologic sequestration, or if the power consumption calculations include additional compression power consumption beyond that which is actually done at the HECA site that would be needed to obtain the desired pressure.
- Please indicate if the assumed pressure necessary for geologic sequestration is the same pressure that is required by Oxy Elk Hills (OEHI) to inject the CO_2 into the Stevens formation.
- Please indicate how much pressure is lost in terms of equivalent power consumption from the CO_2 custody transfer point to the point of receipt at the OEHI central EOR facility for initial injection into the oil reservoir.

K. A review of the emissions tables indicates that there are changes to some of the emissions calculation assumptions provided in Appendix E, such as the fuel consumption in the gas turbine and duct burners.

- Please update Appendix E as necessary to include all of these changes as well as the other recent changes to project (addition of fluxant, removal of ammonia export).
- Please provide emissions calculation (AQ and GHG) for both the on-peak and off-peak cases clearly showing fuel flow to the combustion turbine and duct burners for each case.
- Please show how HECA off-peak operations would impact other emission sources and provide information on changes to the major component stream flows that may occur during these operating conditions (such as, does amount of CO_2 shipped to OEHI go up during off-peak operations, or does the CO_2 concentration in the hydrogen rich fuel go up to maintain a constant CO_2 emissions profile for the HRSG and coal dryer stacks for On- and Off-Peak operations?).

L. Based on Table 2-10 provided in the Amended AFC, during maximum ammonia production, referred to as off-peak operation, production of the other fertilizer components do not increase.

- Please provide data/calculations confirming the plant will have adequate ammonia storage facilities capable of handling the increased ammonia that would be produced during off-peak operations.
- Please indicate if the rate of ammonia consumed by the plant varies with respect to the fertilizer products during on-peak and off-peak operations, and if so please provide the on- and off-peak operation case production rates for nitric acid, urea, and UAN production.
- Please clearly indicate if HECA's ammonia use is higher than its production rate during on-peak operations, or if other components of fertilizer production, including the intermediate products like nitric acid, would increase with the increase in ammonia production during off-peak periods of operation.

M. Please provide a detailed list of the monitoring and recordkeeping methods and procedures that are proposed to be used to demonstrate ongoing compliance with the SB 1368 emission performance standard (EPS) during facility operations. This should include:

- Monitoring methods and locations to establish CO_2 emissions from all onsite project sources, including fugitive emissions sources.
- Monitoring methods and locations to establish net electricity generation values for all electricity consumed and generated.
- Recordkeeping measures to ensure completeness and accuracy of data collected.
- Coordination with OEHI to obtain necessary data on carbon sequestration to support the value of the sequestered CO_2 that can be used to account for the amount of CO_2 shipped to OEHI.

N. As an adjunct to GHG, please confirm the current planned and unplanned outage as the basis for reliability. Currently, our understand is as follows:

- Planned: Two 1-week planned maintenance outages with 15-hour ramping allowance for 351 hours
- Planned: Two cold-start cycles, each 4 days long for a total of 192 hours
- Unplanned: 219 hours of outage based on 91.3% equivalent availability factor (EAF), calculated as follows: (1-0.913) x 8760 = 762 hours of total outage. 762 (hours of total outage) –351 (maintenance outage hours) –192 (cold start-up hours) = 219 hours (unplanned outage hours).

PROPOSED CONDITIONS OF CERTIFICATION

Staff proposes the following preliminary Conditions of Certification **GHG-1** through **GHG-5** to ensure proper recordkeeping and monitoring for GHG emissions and CO_2 sequestration as required for compliance with LORS. These conditions outline the requirements that staff is recommending; however, staff is continuing to work on the detailed requirements that need to be added to these conditions. The FSA/FEIS will include the final versions of these conditions.

STAFF PROPOSED CONDITIONS OF CERTIFICATION

GHG-1 The project owner shall prepare a CO_2 Emissions Performance Compliance Plan (EPCP). This plan shall include the operating, monitoring and recordkeeping methods used to demonstrate the onsite CO_2 emissions from HECA. This plan shall:

- Detail the methods used to monitor the operating parameters and CO_2 emissions and CO_2 quantities exported from the site as required to show compliance with the EPS.
- Detail the measures used to minimize onsite CO_2 emissions "leakage" from venting and other upset events.
- Detail the methods to compute and document the amount of CO_2 sequestered by the CO_2 user receiving the exported CO_2.
- Define the steps to be undertaken to demonstrate compliance with SB 1368.
- Detail the methods used to document all GHG emissions of the stationary and mobile emissions sources not subject to SB 1368 compliance but subject to ARB's GHG emissions reporting regulations, the AB32 Cap and Trade regulation, and other federal or state regulations.

<u>Verification:</u> The project owner shall provide a copy of the CO_2 EPCP to the compliance project manager (CPM) for review and approval at least six months prior to the initial commissioning of the project's gasification unit. Any updates to the CO_2 EPCP necessitated by project owner initiated changes to the monitoring and recordkeeping methods, or those necessary to maintain regulatory compliance, shall be provided to the CPM for review and approval at least 30 days prior to the initiation of any changes to the plan. Additionally, this plan shall be re-approved every two years, with the project owner providing a plan re-approval request letter with a copy of the current CO_2 EPCP for review and approval to the CPM at least 30 days before the end of every other calendar year after the project has started commercial operation. The plan re-approval letter shall document any changes to the CO_2 EPCP that have occurred over the period since its last approval by the Energy Commission and shall state the reasons for any needed changes.

GHG-2 The project owner shall operate the facility in compliance with the CO_2 Emissions Performance Compliance Plan after its approval. The project owner shall cease operations of the gasifier if: 1) the project owner cannot demonstrate compliance with the CO_2 Emissions Performance Compliance Plan; or 2) if OEHI permanently stops accepting the CO_2 for sequestration; or 3) temporarily as necessary for ongoing compliance with CO_2 venting limits provided in Air Quality Condition of Certification **AQ-11-85**.

<u>Verification:</u> The project owner shall provide documentation of compliance with this condition to the CPM in the annual report required by Condition **AQ-SC8**. This report shall verify compliance with SB1368 regulations.

GHG-3 The project owner shall obtain from the CO_2 user a CO_2 Emissions Sequestration Plan (CO_2 ESP) that identifies the preparation of injection wells either by retrofitting existing ones or drilling new wells to meet requirements for injection wells intended for the purpose of long term storage, operating, monitoring, recordkeeping, and closure methods used to demonstrate the quantity of CO_2 that is sequestered annually. The CO_2 ESP shall also identify and update as needed the long-term plan for future petroleum production and the financing instrument for post injection site care (PISC) including a corrective action plan, and eventual well closure to assure permanent CO_2 sequestration. The project owner/CO_2 supplier shall also obtain from the CO_2 user records of the annual CO_2 emission sequestration quantities from the CO_2 user and maintain these records for the life of the project. This plan shall:

- Detail plans to retrofit existing wells and construct new wells in compliance with the requirements for Class VI injection wells found at 40 CFR § 146.86 and related articles, which include requirements for casing and cementing of injection wells, except that the injector would not have to obtain the actual permits for Class VI wells and also that any mention of "Director" in those requirements must be replaced with compliance project manager (CPM).
- Detail the methods used to monitor the operating parameters and CO_2 emissions directly and indirectly related to the CO_2 sequestration process, including fugitive emissions and indirect emissions from electricity use, and the quantity of supplied CO_2 that has been sequestered annually. This shall include a leak detection and repair (LDAR) program for all EOR piping components not regulated by an SJVAPCD LDAR requirement that are in CO_2 service.
- Detail the design measures used to minimize and the monitoring methods used to measure potential CO_2 emissions "leakage" from the injection and production wellheads/well casings, including the monitoring of wells that are in production surrounding the EOR component's well field pattern areas and monitoring aboveground ambient CO_2 concentrations to detect surface leakage.

- Detail the design measures used to minimize and the monitoring methods used to measure potential CO_2 emissions “leakage” from tank venting for all tanks that contain CO_2 in gas phase or dissolved in liquids in the EOR component’s tanks.
- Detail the methods used to detect whether there is underground formation leakage of CO_2 emissions related to the CO_2 injection process that could be due to unknown faults or cracks in the cap rock, including the monitoring methods that will be used for determining CO_2 leakage in all of the petroleum and groundwater bearing formations located above the Steven’s formation.
- Detail the physical and chemical methods used to show how much CO_2 is sequestered during and after EOR and the monitoring methods used to ensure the CO_2 remains sequestered.
- Detail the physical and chemical methods used to show how much CO_2 is contained in products moved off site.
- Detail the methods used to monitor the operating parameters and CO_2 emissions of the stationary and mobile emissions sources subject to ARB’s GHG Mandatory Reporting regulations, the AB32 Cap and Trade regulation, or other federal or state regulations.
- Detail the long term plan for future petroleum production and eventual well closure to assure that the CO_2 is permanently sequestered. This part of the plan shall include a financial instrument, such as a bond or other financial assurance that will assure that funds will be available for well plugging, PISC, and closure whenever that may occur, and ongoing maintenance of the oil field to ensure long term geologic sequestration.

Verification: The project owner/CO_2 supplier shall provide a copy of the CO_2 ESP to the CPM for review and approval prior to the start of the initial commissioning of the project’s gasification unit. Any updates to the CO_2 ESP necessitated by CO_2 user initiated changes to the monitoring and recordkeeping methods, or necessitated to maintain regulatory compliance, shall be provided to the CPM for review and approval at least 30 days prior to the initiation of any changes to the CO_2 ESP. Additionally, this plan shall be re-approved every two years, with the project owner providing the CO_2 users plan re-approval request letter with a copy of the current CO_2 ESP for review and approval to the CPM by December 1st of every other calendar year once HECA starts commercial operation. The plan re-approval letter shall document any changes to the CO_2 ESP that has occurred over the period since its last approval by the Energy Commission and shall state the reasons for any needed changes. The ESP update can be combined with the EPCP update as appropriate.

GHG-4 The project owner shall complete GHG emissions estimates as required by federal and state mandatory reporting and AB 32 Cap and Trade regulations, shall obtain copies of the GHG emissions estimates and CO_2 sequestration records of Occidental Petroleum and shall provide annual emissions data to the California Air Resources Board (ARB) under their GHG Mandatory Reporting requirements. The project owner shall maintain copies of all of these records, including copies of required GHG emissions verifications by an independent GHG verifier as certified by the ARB, at the project site for a period of at least five years, or longer if required by regulation.

Verification: The project owner shall provide annual GHG emissions and CO_2 sequestration record data as required by the ARB's Mandatory Reporting regulation and Cap and Trade regulation to the ARB by April 10 of each year. The project owner shall provide to the CPM a letter certifying that the data has been properly reported and accepted by the ARB within 30 days of receiving such notification from ARB. The project owner shall provide copies of the detailed GHG emissions estimates and CO_2 sequestration records required by this condition to the CPM when requested and shall make copies available at the project site at the request of representatives of the Energy Commission, San Joaquin Valley Air Pollution Control District, California Air Resources Board, or the United States Environmental Protection Agency.

GHG-5 The project owner must adopt industry standard and verified methodologies to keep an accurate count of the amounts of CO_2 transferred to OEHI, the amounts injected underground, the amounts recovered with extracted fluids, the amounts reinjected, the amounts lost through surface equipment, and the amounts leaked to the surface after injection. The difference between the amounts transferred and all the losses constitutes the amount of CO_2 that has been sequestered. Both measured and calculated amounts shall be reported on an annual basis. The project owner shall demonstrate compliance with California's Environmental Performance Standard by annually accounting for annual MWh sold and all carbon dioxide generated at HECA, received at OEHI, vented, stored underground, and leaked as described in the equation in the portion of the staff assessment dealing with quantification of sequestered CO_2 volumes.

Verification: No later than 60 days before commencement of injection, the owner shall present to the CPM for approval the methods used to detect and quantify any amounts of CO_2 lost. These include losses through surface equipment, losses though exported fluids, and losses from leaks of injected CO_2 to the surface. Measured and calculated quantities shall be included in the Annual Compliance Report (ACR).

DISTRICT DOC CONDITIONS OF CERTIFICATION

The Determination of Compliance (DOC) conditions related to GHG emissions are included with the other DOC conditions in the **Air Quality** section of this document.

CULTURAL RESOURCES

Gabriel Roark, M.A., Thomas Gates, Ph.D., Melissa Mourkas, M.A., ASLA, and Elizabeth A. Bagwell, Ph.D.[1]

SUMMARY OF CONCLUSIONS

Staff tentatively concludes that the proposed Hydrogen Energy California project may have a significant direct impact on historical resources and historic properties, as defined by the California Environmental Quality Act and Section 106 of the National Historic Preservation Act. Impacts may be incurred upon known, significant archaeological and historic built environment resources. Additionally, the proposed project could result in significant adverse changes to an unknown number of as-yet-unidentified, buried archaeological resources. Such potential impacts include the removal or destruction of archaeological materials during trenching for linear project facilities as well as grading and mass excavation of the proposed project site. The applicant has not assessed portions of the area in which the proposed project may affect cultural resources as of the time of this writing, preventing California Energy Commission and United States Department of Energy staff from conducting a complete impact analysis under State and federal environmental laws. Energy Commission staff will continue to work with the applicant, Occidental of Elk Hills, Inc., and Department of Energy to resolve all outstanding information needs prior to publication of the Final Staff Assessment/Final Environmental Impact Statement. Although Energy Commission staff has proposed conditions of certification for the proposed project, additional conditions are likely to be needed because of the incomplete nature of the information currently available to staff. The additional information that staff requires to prepare and complete a Final Staff Assessment/Final Environmental Impact Statement is discussed in this section under the heading “Unresolved Areas Relating to Cultural Resources”.

Although the adoption and implementation of Conditions of Certification **CUL-1** through **CUL-8** would reduce the currently identifiable potential impacts of the proposed project on cultural resources to a less-than-significant level, the incompleteness of the cultural resources analysis available to staff requires staff to tentatively conclude that the proposed project would result in one or more significant impacts/adverse effects on cultural resources. The level of significance after mitigation of significant impacts/adverse effects is currently unknowable.

As a result of ethnographic studies, staff concludes that there are no ethnographic resources that will be impacted by the proposed project. The ethnographic information provided in this assessment is intended to support prehistoric archaeological findings known in the project vicinity or likely to be discovered during construction should the project be approved. Specifically, staff concludes that burials would likely be encountered should the proposed project be built and it is intended that the ethnographic section should be used to support monitoring efforts in a proactive fashion to identify burial features at the earliest opportunity and point of discovery.

[1] Roark: historic archaeology; Gates: ethnography; Mourkas: historic built environment; Bagwell: prehistoric archaeology.

Staff has considered environmental justice populations in its analysis of the proposed project. Staff has not identified significant adverse direct, indirect, or cumulative cultural resources impacts that would affect environmental justice populations. However, receipt of the cultural resources information specified under the heading “Unresolved Areas Relating to Cultural Resources” could result in the identification of such impacts on environmental justice populations. Staff will disclose any cultural resources-related impacts on environmental justice populations in the final staff assessment/final environmental impact statement.

INTRODUCTION

This cultural resources assessment identifies the potential impacts of the proposed Hydrogen Energy California (HECA) project on cultural resources, including historic properties, historical resources, and unique archaeological resources, as defined under federal and state laws and regulations. The term “cultural resource” means any tangible or observable evidence of past human activity, regardless of significance, found in direct association with a geographic location, including tangible properties possessing intangible traditional cultural values. Under California state law, historical resources may include buildings, sites, structures, objects, areas, places, records, and manuscripts that are historically or archaeologically significant, or are significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. See Title 14, California Code of Regulations, sections 4852(a) and 15064.5(a)(3); and Public Resources Code, sections 5020.1(h, j) and 5024.1(e)(2, 4). Under federal and state historic preservation law, cultural resources generally must be at least 50 years old to have sufficient historical importance to merit consideration of eligibility for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR). A resource less than 50 years of age must be of exceptional historical importance to be considered for listing. Three broad classes of cultural resources are considered in this assessment: prehistoric, ethnographic, and historic.

Prehistoric archaeological resources are those materials relating to prehistoric human occupation and use of an area. These resources may include sites and deposits, structures, artifacts, rock art, trails, and other traces of Native American human behavior. In California, the prehistoric period began over 12,000 years ago and extended through the eighteenth century until 1769, when the first Europeans settled in California.

Ethnographic resources are those materials important to the heritage of a particular ethnic or cultural group, such as Native Americans or African, European, or Asian immigrants. They may include traditional resource collecting areas, ceremonial sites, topographic features, value-imbued landscapes, cemeteries, shrines, or ethnic neighborhoods and structures. Ethnographic resources are variations of natural resources and standard cultural resource types. They are subsistence and ceremonial locales and sites, structures, objects, and rural and urban landscapes assigned cultural significance by traditional users. The decision to call resources "ethnographic" depends on whether associated peoples perceive them as traditionally meaningful to their identity as a group and the survival of their lifeways.[2]

Historic-period resources are those materials, archaeological and architectural, usually associated with Euro-American exploration and settlement of an area and the beginning of a written historical record. They may include archaeological deposits, sites, structures, traveled ways, artifacts, or other evidence of human activity. Under federal and state requirements, historical cultural resources must be greater than 50 years old to be considered of potential historic importance. A resource less than 50 years of age may be historically important if the resource is of exceptional importance.

For the HECA project components, staff provides an overview of the environmental setting and history of the project area, an inventory of the cultural resources identified in the project vicinity, and an analysis of the potential impacts from the proposed project using criteria from the California Environmental Quality Act (CEQA). The primary concern is to ensure that all potential impacts are identified and that conditions are set forth that ensure that impacts are mitigated below the level of significance.

If cultural resources are identified, staff determines whether there may be a project-related impact to them. If the cultural resources cannot be avoided, staff determines whether any of the impacted resources qualify as historical resources or unique archaeological resources under CEQA, or, in conjunction with United States Department of Energy (DOE) personnel (hereafter included under the term "staff" for the purposes of this joint document), qualify as a historic property under Section 106 of the National Historic Preservation Act (NHPA). If impacted resources are eligible for the register, staff recommends conditions of certification (Conditions)—which the Commission may or may not adopt—on the portion of the proposed project that is under the Energy Commission's permitting purview: the proposed HECA components. These conditions will be purposed to reduce cultural resource impacts to a less-than-significant level. For the proposed enhanced oil recovery (EOR) project components on Occidental of Elk Hills, Inc. (OEHI) property, staff recommends mitigation measures that ensure that impacts to the identified cultural resources are reduced to a less-than-significant level. In these recommended mitigation measures, staff identifies the agency that would be responsible for implementing and monitoring them.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Projects licensed by the Energy Commission are reviewed to ensure compliance with all applicable local, state, and federal laws, ordinances, regulations, and standards (LORS). The LORS applicable to the project are listed in **Cultural Resources Table 1**.

As discussed in the Introduction to this preliminary staff assessment/draft environmental impact statement (PSA/DEIS), this document analyzes the project's impacts pursuant to both the National Environmental Policy Act (NEPA) and CEQA. The two statutes are similar in their requirements concerning analysis of a project's impacts. Therefore,

[2] A "lifeway," as used herein, refers to any unique body of behavioral norms, customs, and traditions that structure the way a particular people carry out their daily lives.

unless otherwise noted, staff's use of, and reference to, CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

Cultural Resources Table 1
Laws, Ordinances, Regulations, and Standards

Applicable Law	**Description**
Federal	
Historic Sites, Buildings, Objects, and Antiquities Act of 1935, as amended 16 U.S.C., §§461–467	Establishes national policy of acquisition, preservation, and management of historic and archaeological properties, including survey, recordation, research, and public education; establishes the National Park System Advisory Board and the National Park Service Advisory Council.
Protection of Historic Properties 36 C.F.R., part 800	An implementing regulation of the NHPA, Title 36, Code of Federal Regulations, part 800 requires federal agencies to consider the effects that federally permitted, funded, or approved projects would have on historic properties; consult with tribes, state historic preservation officers, and other parties; involve the public in the consultation proceedings; and afford the Advisory Council on Historic Preservation (ACHP) the opportunity to comment.
National Environmental Policy Act (NEPA) Public Law 91-90, 42 U.S.C., §§4321–4347; NEPA regulations	Establishes environmental policy for the nation; provides for an interdisciplinary approach for federal environmental planning; requires federal decision-makers to take environmental effects of federal actions into account; requires disclosure of environmental impacts to the public; obligates federal agencies to seek solutions to environmental impacts; mandates cooperation with other agencies; and directs federal agencies to involve the public.
Executive Order (EO) 11593 of May 13, 1971; 36 *Federal Register*, 8921	Provides for the protection and enhancement of the cultural environment; requires federal agencies to inventory their cultural resources and to record, to professional standards, any cultural resource that may be altered or destroyed.
Archaeological and Historic Preservation Act of 1974 16 U.S.C., §469 et seq.	Addresses impacts on cultural resources resulting from federal activities that would significantly alter the landscape. The focus of the law is data recovery and salvage of scientific, prehistoric, historic, and archaeological resources.
Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation [1983], as revised 48 *Fed. Reg.,* 44716–44742	Establishes qualifications standards for historic preservation professionals, evaluation standards for cultural resources, and guidelines for technical reports and the documentation of cultural resources.
American Indian Religious Freedom Act 42 U.S.C., §1996 et seq.	Protects the right of Native Americans and other indigenous groups to exercise their traditional religions.
EO 13287 Preserve America	Where consistent with executive branch department and agency missions, governing law, applicable preservation standards, and where appropriate, executive branch departments and agencies ("agency" or "agencies") shall advance this policy by pursuing partnerships with state and local governments, Indian tribes, and the private sector to promote the preservation of the unique cultural heritage of communities and of the nation and to realize the economic benefit that these properties can provide.

Applicable Law	Description
Use of Human Subjects, 46 C.F.R., §101	Provides for non-disclosure of confidential information that may otherwise lead to harm of the human subject divulging confidential information.
DOE Management of Cultural Resources, Policy DOE P 141.1	Establishes the DOE's responsibility to comply with federal historic preservation laws, regulations, and polices; focus is on tribal consultation and cultural resource management at DOE-owned facilities.
DOE American Indian & Alaska Native Tribal Government Policy DOE Order 144.1	Policy Principle IV. Identifies DOE's commitment to consult with Indian tribes about the effects of DOE undertakings on historic properties of concern to tribes. Specifies that this commitment ranges from the identification of historic properties through managing adverse effects.
State	
Pub. Resources Code, §5097.98(b) and (e)	Requires a landowner on whose property Native American human remains are found to limit further development activity in the vicinity until s/he confers with the Native American Heritage Commission (NAHC) and identifies Most Likely Descendents (MLDs) to consider treatment options. In the absence of MLDs or of a treatment acceptable to all parties, the landowner is required to reinter the remains elsewhere on the property in a location not subject to further disturbance.
Pub. Resources Code, §§5097.99 and 5097.991	Section 5097.99 establishes as a felony the acquisition, possession, sale, or dissection with malice or wantonness of Native American remains or funerary artifacts. Section 5097.991 establishes a state policy requiring the repatriation of Native American remains and funerary artifacts.
California Health and Safety Code, §7050.5	Makes it a misdemeanor to disturb or remove human remains found outside a cemetery. It also requires a project owner to halt construction if human remains are discovered and to contact the county coroner.
California Civil Code §1798.24	Provides for non-disclosure of confidential information that may otherwise lead to harm of the human subject divulging confidential information
California Public Records Act California Government Code, §6250.10	Provides for non-disclosure of records that relate to archaeological site information and reports maintained by, or in the possession of, the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the NAHC, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a California Native American tribe and a state or local agency.
Local	
County of Kern General Plan, Land Use/Conservation/ Open Space Element (Chapter 1.10.3), Cultural Resources Policy 25	The county will promote the preservation of cultural and historic resources which provide ties with the past and constitute a heritage value to residents and visitors. Implementation Measures: K. Coordinate with the California State University, Bakersfield's Archaeology Inventory Center. L. The county shall address archaeological and historical resources for discretionary projects in accordance with CEQA. N. The county shall develop a list of Native American organizations and individuals who desire to be notified of proposed discretionary projects. This notification will be accomplished through the established procedures for discretionary projects and CEQA documents. O. On a project specific basis, the county planning department shall evaluate the necessity for the involvement of a qualified Native American monitor for grading or other construction activities on discretionary projects that are subject to a CEQA document.
Western Rosedale Specific Plan, Cultural Resources Goal 1.	Goal 1. Protect areas of significant cultural or archaeological potential for future use. Policy 1. Require developers to demonstrate the cultural/archaeological potential for the project sites.

Applicable Law	Description
	Policy 2. Encourage preservation of any known sites of cultural or archaeological significance. Policy Implementation 1. In conjunction with the processing of discretionary permits developers shall be responsible for the preparation of site-specific cultural/archaeological studies unless this requirement is waived by the planning director. Recommendations contained in the studies shall be incorporated into the project. Policy Implementation 2. Alternatives to development, such as open space easements, shall be encouraged where cultural resources are known or suspected.
Interstate 5 at Highway 58 Rural Community Plan	General Provisions, Implementations and Policies 8. Should any archaeological or historical resource be unearthed during construction, work should be halted for not less than a 72-hour period in the area of the discovery until the finds can be assessed by an archaeologist and appropriate mitigation measures can be carried out.
Oglesby Specific Plan	General Provisions, Implementations and Policies 8. Should any archaeological or historical resource be unearthed during construction, work should be halted for not less than a 72-hour period in the area of the discovery until the finds can be assessed by an archaeologist and appropriate mitigation measures can be carried out.
Metropolitan Bakersfield General Plan	No cultural resources requirements.

SETTING

Information provided regarding the setting of the proposed project places it in its geographical and geological contexts and specifies the technical description of the project. Additionally, the archaeological, ethnographic, and historical, backgrounds provide the contexts for the evaluation of the historical significance of any identified cultural resources within the project area of analysis.

REGIONAL SETTING

The proposed HECA project is located in western Kern County within the southern San Joaquin Valley, a north–south trending valley within the Great Valley Geomorphic Province. The valley is bordered on the east by the Sierra Nevada mountain range and on the west by the South Coast Ranges. On the north end, the San Joaquin Valley is delimited by the confluence of the Sacramento and San Joaquin rivers and on the south end by the Tehachapi and San Emigdio mountains (Jennings and Strand 1969; Smith 1964). The valley is a vast trough filled with sedimentary deposits, the oldest of marine origin and the youngest resulting from the erosion of the surrounding mountains and deposition of the eroded material as alluvium deep beneath the proposed project site. As with the rest of the southern San Joaquin Valley, the project site is situated between two seismically active regions. The closest known faults classified as active by the State of California Geologic Survey are the San Andreas Fault located approximately 21 miles to the west, the White Wolf fault located approximately 23 miles to the southeast, and the Pleito Thrust located approximately 27 miles south of the proposed project site. (URS 2012a:5.15-3, 5.15-4.)

The proposed HECA project's carbon dioxide (CO_2) pipeline extends into the Elk Hills, which are near the western border of the San Joaquin Valley. The South Coast Ranges flank this area to the west and form a natural barrier to coastal moisture and winds, creating a rain shadow on the eastern side of the range that encompasses the current project site and linear alignments. The local climate is characterized by hot dry summers and mild winters with precipitation almost exclusively in the winter. The annual rainfall in the project area is less than 4.7 inches and mostly occurs September through April. (URS 2012a:5.3-4.) Because of the arid nature of this portion of the Coast Ranges–Great Valley interface, the nearby slopes are drained only by intermittent creeks, including numerous unnamed gullies and drainages which cross the flank of the Elk Hills. These small intermittent drainages have maintained a low but fluctuating discharge for much of the Pleistocene and Holocene, building a series of small alluvial fans along the northeastern side of the Elk Hills (URS 2012a:5.15-3).

PROJECT, SITE, AND VICINITY DESCRIPTION

The project site and the HECA project's valley floor linear components bear the signs of 140 years of farming and ranching. These activities are evident by the crops, grain silos, and sparse residential settlement in the area. The struggle to keep the land sufficiently watered for crop and stock-raising but protected from floods is manifested in the project vicinity by the numerous canals, ditches, and levees (JRP 2012:8, 20–22). Expectable historical archaeological resources associated with farming, ranching, and residence include filled outhouse pits (privy pits) and wells, refuse scatters, buried trash pits, structural remnants, and buried, filled water conveyance features.

The HECA project's CO_2 pipeline and enhanced oil recovery (EOR) activities in the Elk Hills are sited in a different historical environment from the project site and other linear features. Discoveries of oil and asphalt in the Buena Vista Lake area and McKittrick, respectively, during the late 1890s sparked oil exploration of the Elk Hills in the early 1900s. In 1912, President William H. Taft created the Naval Petroleum Reserve No. 1 (NPR-1) by executive order. (Nachmanoff et al. 1999:20–21.) NPR-1 passed into private ownership about 1999. The 110 years of oil development in Elk Hills has dotted the area with well heads, derricks, pumps, underground and aboveground pipelines, storage tanks, and control buildings. These built environment features are a mix of historic (at least 50 years old) and recent builds. Oil and gas development in Elk Hills resulted in numerous historic archaeological sites, which mainly consist of structural foundations, abandoned industrial equipment, and refuse scatters. Ranching features, such as corrals, have also been found in the EOR area. (Stantec 2012a:4.5-4, 4.5-5.)

<u>Environmental Setting</u>

Identifying the kinds and distribution of resources necessary to sustain human life in an environment, and the changes in that environment over time, is central to understanding whether and how an area was used during prehistory and history. During the time that humans have lived in California, the region in which the proposed project is located, the southern San Joaquin Valley, has undergone several climatic shifts. These shifts have resulted in variable availability of vital resources, and that variability has influenced the scope and scale of human use of the project vicinity. Consequently, it is important to consider the historical character of local climate change, or the paleoclimate, and the effects of the paleoclimate on the physical development of the area and its ecology. The following discussion relies heavily on the applicant's geotechnical study and geoarchaeological literature review (Hale et al. 2012:46–59; URS 2009a).

Despite the low precipitation in the project vicinity, several large lakes occupied the southern San Joaquin Valley throughout the late Pleistocene and Holocene epochs. The largest of these lakes was Tulare Lake, approximately 30 miles north of the project site. Tulare Lake has now been drained for agricultural purposes, but it formerly extended over as much as 617 square miles in area, supporting a large and productive marshland around its margins. The smaller Buena Vista basin lies at the southern margin of the San Joaquin Valley, bordered on the north by the Kern River alluvial fan and by the Elk Hills on the northwest. Two shallow lakes, Buena Vista and Kern, formerly lay in this basin and usually received most or all of the flow of the Kern River. During wet years these lakes merged into a single body of water and drained into Buena Vista Slough at the base of the Elk Hills, which in turn flowed northwest into Tulare Lake. Historically, both of these lakes were also known to be partially or completely dry. Both lakes have now been reclaimed for agricultural purposes, but a small portion of Buena Vista Lake remains along its former northern shore, at the base of Elk Hills (Jackson et al. 1999). The project site is located within the former Buena Vista Slough near the foot of the Elk Hills. The proposed process water line would follow the route of the Kern River and Buena Vista Slough north. The proposed CO_2 line would cross the Buena Vista Slough and the Kern River west into the Elk Hills. The proposed natural gas line would head north and cross the Buena Vista Slough, extensive Kern River alluvial fans, and multiple branches of Kern River.

The environmental setting of the HECA project vicinity has changed dramatically over the last 200 years, primarily due to channelization of streams and deep ground water pumping for irrigated agriculture. Many of the plants and animals associated with the wetland habitats are extinct or rare. The setting described here is a discussion of the landscape as it likely appeared during prehistoric and protohistoric occupations of the valley, drawing heavily from historic records.

The historic plant and animal communities in project vicinity can be divided into two general categories: wetland habitats on the valley floor and dryer habitats on the floodplain and foothills. The proposed project site and process water line are located in former lake and marsh wetland habitats. The proposed CO_2 line passes through both marsh and foothill habitats. Finally, the proposed natural gas line would begin in a former marshy wetland setting then extend north, crossing the historic setting of dryer floodplains and former streambank riparian wetlands.

Plants associated with the historic Buena Vista Slough and the margins of Buena Vista and Kern lakes included common tule, sedge, cat-tail, water plaintain, and black and sandbar willows. The riparian habitat along the Kern River was characterized by Fremont and black cottonwood, red and yellow willow, oak, buttonwillow, Oregon ash, Canadian waterweed, and duckweed plant. Migratory waterfowl and fish were common in these wetland habitats. Some of these species included coots, ducks, geese, swans, cormorants, and pelicans. In the slower moving water Tule and Sacramento perch, Thicktail chub, and minnows such as the splittail and Sacramento blackfish were present. Also present in the faster-moving water in parts of Kern River the Sacramento sucker and Sacramento squawfish. Other important water dwelling species were the western pond turtle and freshwater mussel. Mammals that occupied the wetland areas included raccoon, river otter, mink, tule elk, and beaver. (Hartzell 1992:63–80.)

The alluvial fans and floodplains of the valley floor are characterized by Lower Sonoran Grassland plant communities. Some of the plants noted here include greasewood, fescue, alkali pepperweed, California goldfields, goosefoot, and iodine bush. The foothills, including the Elk Hills, support little plant growth, primarily low shrubs and sparse grasses. Common birds in these dry environments are quail, mourning doves, hawks, and Golden eagle. The ornate shrew, broad-footed mole, black-tailed jackrabbit, Audobon's cottontail and brush rabbit were common rodents. The grasslands supported large mammals such as tule elk, black-tailed and mule deer, pronghorn antelope, and bighorn sheep. Notable predators of these smaller animals included coyote, kit fox, ringtails, striped and spotted skunks, long-tailed weasels, badger, grizzly and black bears, mountain lion, and bobcat. (Hartzell 1992.)

The proposed project would be located 17 mi southwest of Bakersfield and 1.5 mi northwest of Tupman. For the past 200 years until the present day, this part of Kern County has been used for agricultural purposes and resource-based oil exploration and production. The proposed project site is currently used for farming purposes, including cultivation of alfalfa, cotton, and onions. Land within the proposed controlled area to the northwest of the project site is currently used for grain storage and organic fertilizer production. Land surrounding the site footprint is also used primarily for farming purposes, particularly the cultivation of alfalfa, cotton, wheat, and pistachios. Local irrigation canals—including the West Side Canal/Outlet Canal, Kern River Flood Control Canal, and California Aqueduct (State Water Project)—are located to the south. Other nearby land uses include oil production, public utilities, and undeveloped areas. The Tule Elk State Natural Reserve is located east of the proposed project site.

Paleoclimate and Paleoecology

The proposed project is located in the southern San Joaquin Valley, a large interior valley composed of alluvial plains and river channels. Over the last 20 years pollen studies from lakes and marshes have provided a picture of the paleoclimate and paleoecology of this region. During prehistoric times, this region fluctuated between cool-and-moist and warm-and-dry periods. These fluctuations in temperature and moisture were influential to the character of human occupation of the region. Environmental changes also had important implications for the project vicinity specifically, because of its proximity to Buena Vista Lake and Slough. As the climate shifted, different kinds of resources were available, resulting in corresponding shifts in human settlement and subsistence patterns.

Recent pollen core analysis (Davis 1999) and synthesis of available information (Negrini et al. 2006) at Tulare Lake have resulted in a relatively well-defined history of lake highstands and associated environmental perturbations. The history of Buena Vista Lake fluctuations, however, has yet to be determined (Meyer et al. 2009:26). Given the hydrologic connection between the Tulare Lake and Buena Vista Lake basins, a similar Southern Sierra Nevada water sources, and the similarity in climate records from throughout the region, some scholars assume that Buena Vista Lake and Slough experienced perturbations in water level similar to Tulare Lake (Hale et al. 2012:49; Hartzell 1992:53; Meyer et al. 2006:26.)

These studies suggest that during the Late Pleistocene and Early Holocene (18,000 to 8000 B.P.) conditions in the southern San Joaquin Valley were cool and wet. In the uplands vegetation was dominated by juniper-pinyon-oak woodland, while giant sequoia lined the Sierra streams. The salt flats near lakes were characterized by greasewood. In the Early Holocene between 8500 and 7500 B.P. oaks gradually became the dominant tree species, suggesting a warming trend. On the valley floor, between 7000 and 4000 B.P. greasewood was replaced by shrub steppes also suggesting a long period of warmer and dryer weather. In contrast, the Late Holocene between 4000 and 2000 B.P. was colder and wetter. From 1000 B.P. to the present, the dry pattern has been dominant, interrupted only by increasing precipitation towards the end of the Medieval Climatic Anomaly and during the Little Ice Age (ca. 650 B.P.) (Culleton 2006; West et al. 2007:25.)

These changes were accompanied by changes in water levels within the local lakes and wetlands, throughout the late Pleistocene and Holocene. Scholars have proposed at least seven major fluctuations in lake levels during the past 11,500 years. Lake levels were higher during the early Holocene. Three highstands were identified at 9500–8000 B.P., 6900–6200 B.P. and 750–150 B.P. In addition, three lowstands were identified at approximately 9700, 6100, and 2750 B.P. (Hale et al. 2012:49.)

The timing of these lake level highstands and lowstands correlate with more widespread periods of landscape instability throughout the Central Valley. Several recent reviews of Central Valley geoarchaeology and geomorphology have identified local depositional events that have buried stable Holocene landforms and associated archaeological sites (Meyer et al. 2009; Rosenthal et al. 2007). Several major periods of deposition seem to have co-occurred throughout the greater region (Hale et al. 2012:50).

Periods of alluvial deposition are associated with both lake highstands and lowstands. During wetter periods, the carrying capacity and sediment load of watercourses is increased. During dryer periods, reduced vegetation cover may lead to increased erosion of formerly stable landforms (Hale et al. 2012:50).

Geology

The HECA project is located within the Great Valley Geomorphic Province of California. The Great Valley Province is an asymmetric trough filled with a thick sequence of sediments from Jurassic[3] to Recent age. The sediments within the valley range up to ten kilometers in thickness and were mostly derived from erosion of the Sierra Nevada mountain range to the east, with lesser material from the Coast Range Mountains to the west. The southern portion of the Great Valley Province is characterized as being a nearly flat surfaced north trending trough bounded by the Coast Ranges to the west and Sierra Nevada Provinces to the east. Tertiary[4] rocks, which were deposited nearly continuously from Cretaceous to Pleistocene time, are largely of marine origin and underlie a relatively thin cover of Quaternary[5] alluvium. The Tertiary rocks overlie

[3] The Jurassic Period (199.6±0.6–145.5±4 million years ago) spanned the end of the Triassic to the beginning of the Cretaceous periods. The Jurassic constitutes the middle period of the Mesozoic Era.

[4] The Tertiary period (65–1.8 million years ago) covered the Secondary and Quaternary periods.

[5] The Quaternary period is the youngest period of the Cenozoic era in the geologic time scale, spanning 2.588±0.005 million years ago to the present. It includes two geologic epochs: the Pleistocene (2.588 million years–11,700 B.P.) and the Holocene (the current epoch, 11,700 B.P. to the present). (Cohen et al. 2012.)

Jurassic-Cretaceous marine sedimentary rocks in the west side of the valley. Northwest-trending anticlines in the Tertiary strata are reflected by the gas and oil fields and by low hills in the valleys. (URS 2009a:8–9.)

Geomorphically, the proposed project is situated above, on, and near the northeastern face of the Elk Hills, which is an anticlinal[6] uplift along the western periphery of the San Joaquin Valley. The Elk Hills form the surface expression of an anticlinal fold composed of gravel and mudstone derived from the South Coast Ranges to the west. The Elk Hills are dissected by numerous streams that redeposit the material on an apron of small coalescing fans along the northeast flank of the hills, which abuts the much larger Kern River fan to the north. The surface deposits at the HECA project site and proposed linear alignments are described as Quaternary age alluvial gravel and sand of valley areas. Sediments underlying the Quaternary alluvium belong to the Pliocene- to Pleistocene-age Tulare Formation, which consists of alternating beds of sand and mudstone. These deposits are described as stream-laid, pebble gravels, sands, and clays; and are light gray in color. Pebbles are composed chiefly of Monterey siliceous shale and debris from bedrock in the adjacent Temblor Range. (Hale et al. 2012:48; URS 2009a:8–9.)

Geomorphology

Geomorphology is the scientific study of landforms and the processes that shape them. Geomorphologists seek to understand why landscapes look the way they do, reconstruct landform history and dynamics, and predict future changes through a combination of field observation, physical experiment, and modeling. Archaeologists use geomorphology to understand how archaeological resources were formed and to predict where archaeological material of various types can be found. Over time, objects, sites, and other constructed works are moved, buried, or exposed by wind, water, plant growth, animal activity, and other natural processes. Geomorphology is a technique that helps archaeologists to interpret physical clues in order to understand the specific nature of these changes. In the case of the proposed project, geomorphology can be used to estimate the preservation potential of geologic formations and the likely condition of preserved archaeological resources.

Two geomorphological investigations were completed by the applicant for the proposed project vicinity: a geotechnical field exploration program at the HECA project site and a geoarchaeological literature review (Hale et al. 2012:46–59; URS 2009a). While evaluating the previous HECA Application for Certification (AFC), a request for a primary geoarchaeological field study was the subject of six data requests:

- Data requests 78 and 79 (October 12, 2009)
- Data requests 143 (January 13, 2010)
- Workshop Data Request 23 (April 12, 2010)
- Data Requests 172 and 173 (October 26, 2010). (CEC 2009, 2010a, 2010b.)

In the April 2010 workshop, the applicant agreed to develop a plan for the combined geotechnical/ geoarchaeological investigations once a “development plan has been

[6] In structural geology an anticline is a fold that is convex up and has its oldest beds at its core.

finalized for the Project Site" and an "engineering and design (including the proposed depths of the linear components under consideration) have been finalized." Staff considers the current project description and data responses to provide an adequate amount of project definition to conduct a geoarchaeological study, although the proposed project has not reached final design. Accordingly, in Data Request A195, staff requested that the applicant meet with staff to discuss the data needed to complete the staff impact analysis with respect to buried archaeological resources (CEC 2012a). As of March 2013, the proposed plan is not complete and the proposed field work has not taken place. The applicant, however, has provided staff with a draft geoarchaeological work plan (URS 2013d) and is revising the plan pursuant to staff comments.

Geotechnical Field Exploration

URS conducted a subsurface geotechnical study as part of the original AFC in order to determine what kinds of foundations would be needed for the proposed HECA facility. The Amended AFC mentions the geotechnical study briefly (Hale et al. 2012:5.3-22), citing the geotechnical report from the 2009 HECA AFC. The URS study included a site reconnaissance, field exploration, and laboratory testing of selected soil samples. As part of the field exploration, five geotechnical borings were drilled using a truck-mounted, hollow-stem drill rig to depths of 61.5–101.5 feet below the existing ground surface. Detailed profiles of the sediments were drawn. (URS 2009a:14.)

The results of the geotechnical study show that the project site is immediately underlain by approximately 10 feet of fine-grained soils comprising predominantly clays and silty clays. These upper soils are further underlain by granular soils to the maximum depth explored in the borings of 100 feet below the existing ground surface. The upper clayey soils are observed to possess a medium stiff consistency, although the top half (about 5 feet) is generally soft and wet as a result of recent agricultural use. The underlying sandy soils consist of interbedded layers of sands, silty sands, and sandy silts of the Tulare Formation with varying degrees of consistencies from medium dense to very dense. Below 30 feet, the sandy soils become dense, grading denser to the maximum depth explored in the borings (100 ft). (URS 2009b:17.) An archaeologist was present during these excavations, but no archaeological materials were identified (URS 2012a:5.3-22).

Geoarchaeological Literature Review

The applicant completed a detailed review of existing geomorphological literature and a comparison with high-resolution aerial photography for the project vicinity. This study was based on previous research by (Meyer et al. 2009). It establishes a relational database of mapped soil series and landform age for the California Department of Transportation (Caltrans), Districts 6 and 9 (including Kern County) which includes mapped surface soil units, field observations, soil profile descriptions, and radiocarbon dates. This information was largely compiled from existing studies, primarily the Soil Survey Geographic (SSURGO) database. In the project vicinity, the database is a digital duplication of the original Soil Conservation Service soil survey maps (Hale et al. 2012:51).

Meyer et al.'s (2009) main assumption is that specific soil types are typically associated with particular depositional environments and landforms of a definite age. The degree of soil profile development provided by published soil series descriptions was used to make initial relative age estimates. Age estimates were also based on the geomorphic position of associated landforms, cross-cutting relationships, degree and extent of erosional dissection, radiocarbon dates, and correlation with other dated deposits. A combination of soil profile development, horizontal crosscutting relationships, and radiocarbon dating was used to place similar soil series and landforms into particular temporal groups. This cross-comparison effort resulted in SSURGO soil-map units that were associated with landforms that occupy similar geomorphic positions on the landscape. These units were then grouped into major time periods that were assigned a relative sensitivity for buried archaeological resources. The results indicate that the older the landform, the less likely it is to harbor buried archaeological deposits. (Meyer et al. 2009:123, 128.)

While the SSURGO soil maps provide a level of detail that is appropriate for a regional scale study, some specialists do not consider them to provide a useful resolution of data for the analysis of a particular project area. In fact, (Meyer et al. 2009) concludes that "depending on the nature and scope of a proposed project, areas of Moderately High through Very High potential will often require additional attention, perhaps leading to more focused geoarchaeological studies. These might include additional archival background research, field checking and examinations, subsurface explorations (e.g., trenching or coring), or more detailed modeling efforts" (Meyer et al. 2009:142). Only one landform within the project vicinity, the Quaternary alluvial fans (Qa) forming the lower elevations of the Elk Hills, has been explored at this resolution (see Weber 1998).

The applicant has not conducted the additional sub-surface sampling which staff considers necessary to complete an analysis of the potential cultural resource impacts of the proposed project. However, the applicant did supplement the SSURGO soil maps with a consideration of high-resolution aerial photography and geomorphological work associated with previous archaeological projects. There are five major landforms in the HECA project vicinity: Tulare Formation (QTt), Elk Hills Alluvial Fan (Qa), Buena Vista Slough (Qb), Kern River Alluvial Fan (Qya), and Older Alluvium (Qoa). These landforms are generally coincident with the Quaternary geology units noted on the SSURGO soil-maps by (Dale et al. 1966). These five units, their distribution in the project vicinity, their estimated age, approximate depths and sensitivity for cultural resources, are described in detail below (see **Cultural Resources Figure 1**).

QTt: Tulare Formation

This unit is present in the higher elevations of the Elk Hills along the southern end of the HECA CO_2 pipeline. The Elk Hills are formed by a structural anticline which has elevated older deposits above the surrounding valley floor and exposed them to erosion. These deposits are made up of the Tulare Formation which consists of up to 2,200 ft of interbedded, oxidized to reduced sands and gypsiferous (containing gypsum) clays and gravels derived predominantly from sources in the South Coast Ranges. Surface expressions of this unit are early to middle Pleistocene in age and have been stable or erosional since well before the first movement of humans into California (ca. 13,000 years ago). Within the study area, local portions of the Tulare Formation may be capped by younger Pleistocene deposits, such as the Elk Hills Quaternary Alluvial fans (Qa) and Buena Vista Slough (Qb) units. (Hale et al. 2012:51.)

Staff considers this stratigraphic unit to have a low to moderate potential for archaeological materials on its upper surface. Relatively high-energy alluvial and eolian movement of sediments would not be conducive to the preservation of archaeological materials and the spatial associations among them. Given the age and erosional nature of this upper portion of the Elk Hills, staff considers this stratigraphic unit to have a very low potential for intact buried archaeological deposits.

Qa: Quaternary Alluvial Fans—Elk Hills

This unit forms the lower elevations of the Elk Hills, which would be crossed by a portion of the proposed CO_2 pipeline. These multiple coalescing alluvial fans are composed of sand and gravel which were originally part of the Tulare Formation. Alluvial fan deposits can be distinguished from Buena Vista Slough deposits by their by oxidized red and yellow hues. These soils are latest Holocene in age with a potential for buried surfaces spanning most of human history in California (ca. 13,000 years ago). Elk Hills Alluvial Fan (Qa) deposits may be underlain by the Tulare Formation (QTt) and overlain by Buena Vista Slough (Qb) deposits. Geotechnical investigations conducted for the HECA Project on the lower portions of the Qa coalescing fans found that these sediments transitioned to the Tulare Formation at various depths, from approximately 8–18 ft below ground surface. (Hale et al. 2012:52–53.)

Additional geomorphic information was generated in conjunction with archaeological testing at CA-KER-3080, a prehistoric site in the Elk Hills (Weber 1998). Weber identified three major stratigraphic units within the Qa fan. The lowest level, Unit I, consists of fluvial sand and gravel eroded from the Elk Hills during a portion of the Pleistocene (100,000–40,000 years ago). This unit is overlain by Unit II, an unconsolidated, poorly sorted sandy soil deposited during the last 1,000 years and riddled with rodent burrows. Archaeological sites are frequently deposited on the surface. Unit II is overlain by Unit III, a coarse sandy soil of recent to modern age (Hale et al. 2012:53.)

Staff considers this stratigraphic unit to have a low-to-moderate potential for containing buried deposits. The potential for buried deposits is expected to increase with proximity to Buena Vista Slough. Relatively low-energy alluvial and eolian movement of sediments would be conducive to the preservation of archaeological materials and the spatial associations among them. Poorer preservation of these spatial associations is expected in sites located along the steeper slopes of Elk Hills which are characterized by higher-energy movement of water through these sediments.

Qb: Basin Deposits—Buena Vista Slough

The proposed project site, process water pipeline, electrical transmission line, part of the rail spur, and part of the natural gas line are located within this geologic unit. This Holocene-age unit was formed by progressive sedimentation of the structural syncline[7] between the Elk Hills and Buttonwillow Ridge anticlines. In the Tulare and Buena Vista basins the unit consists of silt, silty clay, sandy clay, and clay interbedded with poorly permeable sand layers. These lacustrine basin sediments are distinguished by blue

[7] In structural geology, a syncline is a downward-curving fold, with layers that dip toward the center of the structure.

hued patterns in the soil formed by the oxidation and reduction of iron and/or manganese in water-saturated conditions.

These sediments are latest Holocene in age and have a potential for paleosols[8] spanning most of human history in California (ca. 13,000 years ago). Previous research in the area suggests that Buena Vista Slough (Qb) sediments of this age can be expected up to 35 ft below the modern ground surface. Specifically, these studies have identified at least three distinct stratigraphic units within Qb sediments along the shore of Buena Vista Lake (Fredrickson 1986; Fredrickson and Grossman 1977; Wedel 1941). The deepest unit is found at depths ranging from approximately 10 to 15 ft. Archaeological deposits in this unit have been dated as approximately 8,000 years old. The middle unit is found between 5 and 10 ft deep, while the shallowest unit is found near the modern ground surface and reaches as far as 10 ft deep. Two drill sites along the Buena Vista Slough produced fossil wood at 20 and 35 ft below ground surface. Radiocarbon dating of these samples produced latest Pleistocene ages of ca. 13,500 and 14,000 ^{14}C years B.P., respectively (Manning 1968). A similar depositional environment can be expected for the western portion of the Buena Vista Slough basin deposits (Qb), which interfaces with the toe of the Elk Hills alluvial fan piedmont (Qa). (Hale et al. 2012:55–56.) This evidence suggests that buried resources may be present in this stratigraphic unit from the modern ground surface to a depth of approximately 35 ft. However, given the interfingering of geologic units and the potential for rise and dip of geologic formations, the depth of this unit may be variable and should be confirmed.

Buena Vista flood basin deposits can be difficult to distinguish from underlying fine-grained older alluvium (Qoa). Buena Vista Slough (Qb) and Alluvial fan deposits (Qa and Qya) interfinger, the result of seasonal overflows of Buena Vista Lake and the Kern River. The contact between the Elk Hills coalescing alluvial fans (Qa) and the Buena Vista Basin deposits (Qb) is generally coincident with the West Side/Kern River Flood Canal. (Hale et al. 2012:56.)

Staff considers this stratigraphic unit to have a high potential for containing buried archaeological deposits associated with human utilization of resources associated with Buena Vista Lake and Buena Vista Slough. Relatively low-energy alluvial movement of sediments would be conducive to the preservation of archaeological materials and the spatial associations among them.

Qya: Recent/Young Quaternary Alluvium—Kern River Alluvial Fan

The proposed natural gas pipeline would cross this geologic unit. The unit consists of a fine sandy loam which is part of the Kern River alluvial fan which stretches over 20 mi from the base of the Sierra foothills, across the valley, to the western terminus at the Elk Hills. This landform is latest Holocene in age and may interfinger or overlay fine-grained older alluvium (Qoa). (Hale et al. 2012:57.)

Staff considers this stratigraphic unit to have a high potential for containing buried deposits. This sensitivity is a product of the young age and actively accreting nature of the Kern River Alluvial Fan, as well as the proximity to the Buena Vista Lake outlet

---

[8] A term used in geology and geoarchaeology to refer to a former soil or stable surface preserved by burial underneath either natural or cultural deposits.

channel and the distinct environmental resources provided by both the Buena Vista Slough and Lake.

Qoa: Older Alluvium

The proposed natural gas pipeline and the rail spur would cross this geologic unit. This unit is coincident with Buttonwillow Ridge (Interstate 5 [I-5] and vicinity). The ridge was likely formed by a structural anticline which has uplifted and preserved older valley deposits above the surrounding younger basin and fan deposits. This unit is largely composed of up to 250 ft of Pleistocene-age lenticular deposits of clay, silt, sand, and gravel that are loosely consolidated to cemented, and which is often indistinguishable from the Tulare Formation (QTt). The landform is latest Pleistocene to earliest Holocene in age and has been stable to slightly erosional for most of the past 13,000 years. (Hale et al. 2012:58.)

Staff considers this stratigraphic unit to have a low to moderate potential for archaeological materials on its upper surface. However, given the age and predominantly stable nature of these older valley deposits, staff considers the potential for buried archaeological deposits to be very low.

Overall, the HECA project site and proposed linear alignments are proposed to be built in deposits of Holocene age. Staff considers these deposits to have a high potential to contain well-preserved, buried cultural materials. These materials would be expected within 35 ft of the modern ground surface. Therefore, all of the HECA project's proposed ground-disturbing activities have the potential to substantially and adversely change the NRHP- and CRHR-eligibility of archaeological deposits that may lie buried in proposed construction areas. Geoarchaeological field explorations will be required in order to establish a factual basis for the assessment of potential effects to buried deposits within the project limits. Such field explorations involve excavating trenches in strategic locations across the project vicinity to observe and document subsurface conditions that affect the potential occurrence and preservation of buried archaeological resources in the area. Additionally, samples from the trenches will be obtained for radiocarbon dating and other analyses, and a report of methods and conclusions prepared.

Prehistoric Setting

Human populations have occupied the Southern San Joaquin Valley for at least 10,000 years (Moratto 1984). However, little is known about the prehistory of the region. In part, this is the result of natural processes which have buried or eroded many sites. Agricultural development and levee construction has also played a part in the destruction of the archaeological record. No single chronological framework exists for the whole valley and many are poorly defined, based on few—if any—radiocarbon dates. A basic cultural-historical outline for the Southern San Joaquin Valley was established in the early part of the twentieth century (Frederickson and Grossman 1977; Gifford and Schenk 1926; Wedel 1941). However, these early attempts were based on surface finds, limited test excavations, and small sample sizes rather than large-scale data recovery projects or regional surveys. These early studies focused on artifact and burial recovery, while ignoring dietary remains and technological features making modern reanalysis difficult, if not impossible. More recent studies in the area are characterized by reworking old data, which is problematic given the limitations described above.

Regional Chronological Sequence

The most recent synthetic discussion of the archaeology and culture-historical sequence of the Southern San Joaquin Valley is contained in (Rosenthal et al. 2007). These authors propose a variation on the chronological sequence originally established by James Bennyhoff and David Fredrickson (Hughes 1994; Moratto 1984). In this original sequence, the prehistory of the San Joaquin Valley was divided into three periods: Paleo-Indian (Early), Archaic (Middle), and Emergent (Late). The following sequence is based on this general structure, but is elaborated using recent radiocarbon dates and Hartzell's (1992) study of sites along the edge of Buena Vista Lake and Slough.

Paleo-Indian (13,550–10,550 B.P.)

The Paleo-Indian period begins with the first human occupation of California. Sites from this time period are characterized by "lanceolate bifaces, usually with an edge-ground concave base, that exhibits a large central flake scar running from the basal end up the middle of at least one face toward the tip" (Rondeau et al. 2007:64). These projectile points have a wide geographic spread and are referred to by many names including: Folsom Points, Clovis Points, and Paleo-Indian Points. At the regional level the people who made them are also referred to as Folsom and Clovis, and in California have been referred to as the "Fluted Point Tradition" (Morratto1984:79–81).

Paleo-Indian finds are rare and mostly have been found as isolated artifacts without clear stratigraphic associations, but are understood to represent the earliest occupants of the New World. The lack of information has made this period difficult to understand. Originally the first immigrants were thought to have avoided an ice covered Pacific coast. However recent research has demonstrated that the California coast was largely deglaciated by approximately 16,000 years ago and supported a diverse and productive array of plants and animals. Dates from newly excavated sites on islands off Alta and Baja California confirm that coastal sites are roughly contemporary with Paleo-Indian sites in the interior of California. On the coast, Paleo-Indians were diverse hunters and gatherers with sea-worthy boats capable of hunting sea mammals and fishing. Shellfish and other shore resources were also utilized. Paleo-Indian sites in the interior primarily date to around 10,000 years ago and are located near lakes and marshes. In contrast the economy of the interior emphasized seed collection and the use of milling stones. *Olivella* (olive snail) shell beads have also been found, indicating trade connections between the interior and the coast. (Erlandson et al. 2007.)

The earliest accepted evidence of human occupation of the San Joaquin Valley consists of basally thinned and fluted projectile points found at scattered surface locations at Tracy Lake, Woolfsen Mound (CA-MER-215), and Tulare Lake basin. The Witt site (CA-KIN-32) on a Late Pleistocene remnant shoreline of Tulare Lake is the best known. Present at this site are concave base points, and three uranium series (230^{Th}) dates from human bone ranging from 11,000 to 15,000 years ago. The bones of extinct fauna have also been found on this shoreline, but not in clear association with artifacts. (Rondeau et al. 2007:68; Rosenthal 2007:151.)

Lower Archaic (10,550–7550 B.P.)

The Paleo-Indian period or Fluted Point Tradition (Moratto1984:90–103) was followed by the Lower Archaic. The Lower Archaic has also been referred to as the “Western Pluvial Lakes Tradition” in interior California and the “Paleo-Coastal Tradition” along the coast. This time period is characterized by widespread erosion which created a clear stratigraphic boundary between the Late Pleistocene and Holocene. It is primarily represented by isolated finds of distinctive stemmed projectile points and other flaked stone tools such as stone crescents. Compared to other time periods, obsidian is relatively rare. The common occurrence of large heavily worked projectile points has led to the interpretation that hunting artiodactyls was the focus of Early Archaic economies. Interestingly, this is not supported by contemporary faunal remains. Nevertheless, milling tools are mostly absent from valley floor assemblages, but are present in foothill contexts. The relationship between valley floor and foothills sites is unclear but may have been seasonal expressions of the same adaptation.

Hartzell (1992:297) identifies this period as the Early Holocene (8000–7000 B.P.) based on her work at CA-KER-116. This site is located on the shore of Buena Vista Lake, near the proposed project. Characteristic artifacts from this site and time period include chipped stone crescents and large stemmed projectile points. In addition, two samples of freshwater mussel shell were radiocarbon dated to be approximately 9,000 years old. Isolated artifacts thought to date from this time period have also been found in the area. Stemmed projectile points were found near Tulare Lake, and *Tivela* (Pismo clam) disk beads approximately 8,000 years old were found at an Elk Hills site, CA-KER-3168 (Jackson et al. 1998; Rosenthal et al. 2007:152).

Middle Archaic (7550–2550 B.P.)

The Middle Archaic is marked by a dramatic increase in temperatures which resulted in the shrinking and complete disappearance of regional lakes. Rising ocean waters pushed inland creating the much larger Sacramento-San Joaquin River Delta. In general, this time period is associated with a shift to mortar and pestle, more intensive subsistence practices, greater residential stability, the increasing importance of fishing, basketry, simple pottery and clay objects, and the establishment of extensive exchange networks for obsidian and for olive snail shell beads. During this time there were two distinct settlement-subsistence patterns in the San Joaquin Valley: the valley floor pattern and the foothill pattern. Archaeological sites associated with the foothill pattern are common, especially in buried contexts. These sites are characterized flaked and ground stone tools used in food procurement and processing of acorns and pine nuts, tabular pendants, incised slate, and rarely perforated stone plummets. Middle Archaic projectile points include notched, stemmed, thick-leaf and narrow concave base darts. Common features found are rock filled cooking features and graves capped with cairns of rocks and milling equipment. Middle Archaic sites on the valley floor are rare, probably due to natural geomorphic changes. One of the few named components from this period is the Windmiller Pattern, which occurs mainly in the Sacramento area. These sites have evidence of year-round occupation and a distinct pattern of burial treatment which includes western orientation of ventrally or dorsally extended remains. (Rosenthal et al. 2007.)

Hartzell identifies this period as belonging to the Middle (7000–4000 B.P.) and Late Holocene (4000–2000 B.P.). Her analysis of sites along the Buena Vista Lake and Slough found a lack of sites during the Middle Holocene. This pattern may reflect changing settlement patterns in response to a variable climate (Hartzell 1992:300). The first portion of the Late Holocene, in contrast, is characterized by a return to lakeshore and slough locations, large Pinto and Elko series projectile points, extended burials, and a wider range of faunal species than utilized during the Early Holocene (Hartzell 1992:301). There are few examples of sites in the project vicinity from this time period. Only two Elk Hills sites of this age (CA-KER-3166/H and CA-KER-5404) are known to possess examples of wall-cut and grooved-rectangle olive snail shell beads which suggest that these sites have Middle Archaic components. Other sites may be buried along the local river courses. (Jackson et al. 1999.)

Upper Archaic (2550–900 B.P.)

The Upper Archaic was cooler and wetter than the Middle Archaic. The increased rainfall that gradually filled the lakes renewed fan and floodplain deposition. The archaeological record of the Upper Archaic is better represented and understood than any of the previous time periods. This period was characterized by the development of distinct sociopolitical entities, marked by contrasting burial postures and artifact styles. Subsistence practices within the delta and adjacent portions of the Sacramento and San Joaquin valleys emphasized a heavy reliance on acorns; at the margins of the valley acorns were supplemented with pine nuts. Specialized craft production became more common and expanded to include production of bone tools, shell beads, obsidian tools, and ground stone. Upper Archaic sites in the Sacramento Delta have been referred to as the Middle Horizon and the Berkeley Pattern. These sites are characterized by large mounded villages, flexed burials and a long term residential pattern which may have replaced the earlier Windmiller Pattern (Rosenthal et al. 2007:156).

Hartzell identifies this period as the second portion of the Late Holocene (2000–1000 B.P.). This period is characterized by the adoption of the bow and arrow, year-round villages at Buena Vista Lake (CA-KER-39 and CA-KER-116), a deep and highly productive lake, and faunal remains that indicate the utilization of a wide variety of species. Some of the Upper Archaic features at these sites include intact house floors and extensive dietary debris.

Emergent (900 B.P.–Historic)

The Upper Archaic was followed by the Emergent Period, which is characterized by the onset of cultural patterns similar to those existing at the time of European contact. During this time, large populous mound villages were established along river channels and sloughs. These communities invested in the construction of fish weirs and became increasingly dependent on fishing, small seeds, and plant harvesting in general over time. The local production of shell beads also became common, indicating the adoption of beads as a monetized system of exchange. Emergent Period grave offerings are characterized by shell beads, shell ornaments, and “killed” ground stone tools. Between 850 and 650 B.P. the bow and arrow replaced the atlatl. Archaeological sites from this period are more likely to have well preserved features, especially in the case of residential structures. In the Sacramento Delta this period is associated with the Augustine Pattern and in western California with the Pacheco Complex, but in general there are few named Emergent components or phases. Archaeological sites from the Emergent Period can be divided into upper and lower phases. The lower phase is distinguished by the use of banjo *Haliotis* (abalone) ornaments, incised bird bone whistles and tubes, flanged soapstone pipes, rectangular olive snail sequin beads, serrated projectile points, and cremations for high status individuals only. The upper phase is characterized by the use of small corner-notched and desert series arrow points, olive snail lipped and clam disk beads, drill beads, magnetite cylinders, hopper mortars, and the widespread use of cremation (Rosenthal et al. 2007:157–158).

Hartzell identifies this period as the third portion of the Late Holocene (1000 B.P. to Historic). This period is characterized by a decline in the use of the lake and slough, exclusively short-term occupation along the lake and slough, and environmental indicators suggesting a warm and dry trend with a receding shoreline (Hartzell 1992:311).

Previous Research: Buena Vista Basin

The region in the project vicinity has been subject to more than 100 years of archaeological inquiry. Much of this work has focused either on the exploration of the large prehistoric midden sites along the edges of Buena Vista Lake and Buena Vista Slough or on cultural resources within the Elk Hills Oil Field (EHOF), formerly the Elk Hills Naval Petroleum Reserve No. 1 (NPR-1). The following is a brief overview of this previous research, with an emphasis on work most relevant to the proposed project. The CO_2 pipelines and processing facilities planned by Occidental of Elk Hills, Inc. (OEHI), and considered part of the proposed action in this document, will take place within the EHOF. Therefore, the history of the archaeology of EHOF is also discussed.

A number of surveys and excavations were conducted in Kern County beginning as early as 1899. These were summarized and published by Gifford and Schenck (1926). Some of the earliest work was conducted by P. M. Jones in the 1890s, who directed fieldwork in the Buena Vista-Tulare Lake area. He investigated 150 prehistoric mound sites, and trenched several of these, including CA-KER-53. Nelson (in 1909) and Kroeber (in 1910) also explored sites along Buena Vista Lake. Gifford and Schenck (1926) synthesized these reports into some of the first artifact descriptions and typologies for the region. Further they defined an elaborate culture complex for the late prehistoric period, which they ascribed to the Yokuts.

One of the first full-scale archaeological excavations in the region took place in the 1930s as part of the Civil Works Administration. Strong, Wedel, and others directed 200 unemployed oil workers in the excavation of two large midden sites along the southwest edge of Buena Vista Lake. The California Project #SLF-76, Tulamniu Excavations (Wedel 1941), is considered the most comprehensive work written on the archaeology of the Southern San Joaquin Valley. This report describes in detail the focused excavations at Sites #1 and #2 (since renamed CA-KER-39 and CA-KER-60), and more limited explorations at three nearby cemeteries (sites #3–5). The excavations were conducted with an unusually high level of detail for the era. Each site was excavated using a grid, arbitrary levels, exploratory trenching, screening of all sediment, large horizontal exposures to explore residential features, and sidewall profiles. Wedel identified two distinct occupation phases with both of these sites. The earliest was characterized by manos, millingstones, hearths, and at site #2 four fully extended caliche-encrusted burials. The later occupation was characterized by asphaltum, steatite, shell beads, flexed burials, stone-filled hearths, and circular patterns of post-holes representing structures. Although the original purpose of the project was to use the direct historic approach to find a connection between the rancheria of Tulamniu mentioned in several Spanish accounts, and the archaeological record, Wedel's work never conclusively proved that sites #1 and #2 were Tulamniu. Walker (1947), in his work at a nearby cemetery site, also encountered historic period trade beads. This discovery suggested that CA-KER-64 was Tulamniu.

The next major excavation in the region took place at CA-KER-116 as part of the construction of the California Aqueduct in the 1960s. Like CA-KER-39 and CA-KER-60, this prehistoric midden is located on the southwest shore of Buena Vista Lake (Frederickson and Grossman 1977). Survey and testing by the California Department of Parks and Recreation resulted in the identification of three occupation phases. The site is particularly well known for its deepest deposit, which contains the clearest evidence of early Holocene occupation in the southern San Joaquin Valley. Material from this deposit was radiocarbon dated to 8000 B.P. and is characterized by stone crescents and large stemmed projectile points. A Late Holocene occupation, characterized by extended burials and large Pinto and Elko series projectile points, is also present at CA-KER-116. This deposit resulted in an obsidian hydration date of approximately 3000 B.P., and may be contemporary with deepest deposit at Wedel's Site #2. The third occupation is the most recent and appears to be contemporary with the upper levels of CA-KER-39 and CA-KER-60 dating to approximately 1350 B.P. The artifacts from this deposit are characterized by Cottonwood series projectile points.

Since these early projects, local researchers have continued to explore the prehistoric sites at the intersection of Buena Vista Lake and Buena Vista Slough. One of the two dissertations written about the San Joaquin Valley was focused here, and years of projects led by California State University, Bakersfield (CSUB) and the Kern Valley Archaeological Society have taken place here (Barton et al. 2010; Dieckman 1977; Hartzell 1992; Sutton 1996).

Hartzell (1992) is a reanalysis of collections and notes from CA-KER-39, CA-KER-60, and CA-KER-116 (Frederickson and Grossman 1977; Wedel 1941). She supplemented this work with a short field season to collect radiocarbon dates from Wedel's sites and to survey a portion of Buena Vista Slough in the Tule Elk State Reserve. The lakeside sites were found to have been severely damaged by looting and agricultural activities in the years since the original excavations took place. In contrast, the Reserve sites were comparatively well preserved. Multiple prehistoric sites were found on low rises next to historic slough meanders. Two of the sites in the Tule Elk Reserve, CA-KER-160 and CA-KER-1611, were further subject to testing and surface collection. Hartzell's study emphasizes faunal remains and the information they provide about prehistoric utilization of lake resources over time.

In the project vicinity, the Kern Valley Archaeological Society and CSUB have focused on salvage archaeology at the Bead Hill site (CA-KER-450). This site is another midden site on the southwest edge of Buena Vista Lake. Burials from this site contained ammunition, buttons and other historic artifacts which suggest that this site may have been the actual location of Tulamniu (Dieckman 1977; Sutton 1996). Dieckman worked at this site in the 1970s and CSUB conducted research there for most of the last decade. The results of recent research at the site suggest that the site functioned as a temporary habitation site (Barton et al. 2010), which is consistent with the settlement patterns Hartzell (1992) identified for the protohistoric period along Buena Vista Lake.

Beginning in the 1930s most of the geographic feature named the Elk Hills was owned by the US Navy and was referred to as NPR-1. In 1998 the Navy sold it to OEHI. A number of cultural resources projects took place in the Elk Hills both prior to and as part of the transfer of ownership (Farmer 1997; Hamusek-McGann et al.1997; Jackson et al 1997; Jackson et al. 1999; Parr 1996; Peak & Associates 1991). These surveys have helped characterize both the historic and prehistoric site types present within the Elk Hills, and their patterns of distribution across the landscape. NPR-1 incorporates 47,409 acres (ac). Approximately 50 percent of NPR-1 has been subject to archaeological survey and inventory of cultural resources. Sites are distributed over a wide area, but are present in the greatest density in the northern portions of NPR-1. Prehistoric sites tend to occur in geomorphic environments characterized by soil deflation; most sites had cultural remains re-deposited by eolian, alluvial and colluvial processes. Most of these sites date to the late prehistoric period (post-450 B.P.) and are characterized by sparse accumulations of artifacts and fresh water shell remains distributed over a wide area. The average site area is approximately 1.4 acres but can be in excess of 12.4 acres. Eight prehistoric sites in NPR-1 (CA-KER-3079, CA-KER-3080, CA-KER-3082, CA-KER-3085/H, CA-KER-3168, CA-KER-5373/H, CA-KER-5392, and CA-KER-5404) have been recommended as eligible for the National Register of Historic Places (Jackson et al. 1999).

Ethnographic Setting

The proposed project is located within the vast traditional territory claimed by the California Native American group known as the Yokuts. Anthropologists use this name to refer to a large and diverse group who inhabit the San Joaquin Valley and portions of the Sierra Nevada foothills of central California. The Yokuts languages belong to the Yok-Utian branch of the Penutian linguistic stock or phylum[9]. (Golla 2007:75–76; Kroeber 1976:477; Shipley 1978:89.) The Yokuts are divided into three groups based on geographical location; these groups differ significantly in their cultural patterns and dialects. The Northern Valley Yokuts are known to have occupied the area along the San Joaquin River and its tributaries, as well as west of the river, which abutted and overlapped with Costanoan and Miwok lands (Kroeber 1976:476; Milliken 1994:177, Figure 5.1; Wallace 1978a:462, Figure 1). The Foothill Yokuts are associated with the western slopes of the Sierra Nevada from the Fresno River south (Spier 1978:471, Figure 1). The Southern Valley Yokuts territory was centered near the basins of the Tulare, Buena Vista, and Kern lakes, their connecting sloughs, and the lower portions of the Kings, Kaweah, Tule, and Kern rivers (Wallace 1978b:448, Figure 1). It is the Southern Valley Yokuts that occupied the project vicinity during the ethnographic past.

[9] Linguists classify groups of languages based on linguistic similarities, using structures similar to biological classification (Driver 1961:571). Above the level of the individual language are the following groupings: sub-family, family, sub-branch, branch, and stock or phylum.

Southern Valley Yokuts

The southern group of Yokuts was made up of 16 subgroups, each speaking a different dialect of the Yokuts language. Five of the Southern Valley Yokuts subgroups are located in the project vicinity. The Tulumne (Tulamni) Yokuts occupied Buena Vista Lake, with the Yowlumne (Yawelmani) Yokuts and Tuhoumne (Chuxoxi) Yokuts living in the channels and sloughs of the Kern River Delta. The Halaumne (Hometwoli) Yokuts occupied the area surrounding Kern Lake, while the Paleumne Yokuts lived to the northeast near Kern River and Poso Creeks. (Kroeber 1976:Plate 47; Latta 1999:back cover; Wallace 1978b:Figure 1; **Cultural Resources Figure 2**.) A known village site, Telúmneu, was located near the proposed project. Located on the western shore of Buena Vista Lake, this village site was likely at the foot of the Elk Hills or just south of Buena Vista Creek (Latta 1999:back cover; Wallace 1978b:Figure 1). Another village site, Shuquoiu, known to have been located on the west side of Buena Vista Lake and the eastern tip of the Elk Hills, was situated on a trail which went around the lake, and continued north. The exact location of this village site is unknown. (Latta 1999:315.) Additionally, several archaeological investigations and illicit collectors have uncovered other villages, cemeteries, and mounds with burials in the project vicinity (see Gifford and Schenck 1926; Walker 1947; Wedel 1941).

The subgroups constituting the Southern Valley Yokuts not only maintained dialectical differences, but inhabited delineated territories wherein these groups maintained their traditional cultural patterns. Although Kroeber (1976:474) used the term “tribelet” to describe most similar California Indian communities, he believed the Yokuts to be unique in comprising true tribes, as they had their own group names corresponding to territory and language. Kroeber (1976:474) estimated that there could have been as many as 50 different Yokuts tribes throughout the San Joaquin Valley. Each tribe collectively “owned” the land from where they managed their resources, claiming an area around 250 square miles. These tribes were self-governing entities with a hereditary chief, *winatuns* (assistants to the chiefs), about 350 people, and their own name for themselves. (Kroeber 1976:474; Wallace 1978b:454.) Relationships between tribes varied; some were intimate enough with each other that they freely entered each other’s areas while other tribes were more hostile toward outsiders (Kroeber 1976:497; Wallace 1978b:454).

Tribal groups persist to this day. However, due to various historic events and federal governmental Indian policies, tribes no longer exactly represent the discrete tribal units of the ethnographic past. Seven distinct tribal governments, with varying affiliations to the project vicinity were consulted regarding the proposed project. Tribes were invited to participate based upon a list of affiliated tribes provided by the Native American Heritage Commission (NAHC). The seven invited tribal governments represent eight different cultural affiliations. From north to south, these affiliations are: Tachi (Yokuts), Tubatulabal, Yowlumne (Yokuts), Yokuts, Kawaiisu, Koso, Kitanemuk, and Southern Paiute. Information concerning specific consultation efforts is described further in this document (see “Historical Resources Inventory/Background Research/Native American Consultation”).

The remainder of this ethnographic context describes the Yokuts cultural practices in more detail. To provide comprehensive coverage of the Yokuts and to provide the reader with a succinct yet informative summary, this section will discuss the following aspects of Yokuts culture; settlement patterns, mortuary treatments, resource exploitation, and ceremonies, shamans and totems.

Settlement Patterns

Archaeological evidence indicates that humans have been present in the southern San Joaquin Valley for about 12,000 years (Rosenthal et al. 2007:151). During most of this period, they had access to vast lake and slough resources, and consequently were able to obtain most necessary resources in their immediate vicinity[10]. Therefore, these groups established relatively permanent settlements, which only needed to be moved when the lakes and sloughs rose so high that their villages became inundated with water. Village inundation happened both due to flooding from the rivers that fed the lakes, but also from high winds which could move the shoreline. Because the land surrounding the lakes in the southern valley was relatively level, even a rise or fall of 1 foot in lake level could cause the shoreline to move as much as 2 miles. Consequently, when the shoreline moved, the villages often moved along with it. (Latta 1999:245.) It was critically important that groups were located close to permanent, or at least semi-permanent water sources as the San Joaquin Valley only receives 5–10 inches of rain annually, almost all of which falls in the winter months (Wallace 1978b:448). The most favorable areas for permanent settlement were likely around Goose Lake and both ends of the Goose Lake slough, and in the southern 20–25 miles of Buena Vista Slough in the project vicinity, because these areas received an ample supply of consistent water which helped to facilitate the growth of trees (Gifford and Schenck 1926:12).

In order to avoid inundation by rising lake waters, groups often placed houses on artificial mounds. Yokuts excavated soil from low areas with digging sticks, placed it in baskets, and then piled the dirt at the desired location to make house foundations. (Latta 1999:71.) This practice was more common in the Sacramento–San Joaquin River Delta areas farther north, but it is likely that some settlements in the southern valley also maintained this practice. On some older topographic maps of the area, these locations are marked as “Indian mounds”. Latta (1999:235) believed that these residential mounds were generally separate from burial mounds, which is consistent with the prevailing Yokuts practice of burying their dead in a dedicated graveyard, although cremations are also recorded[11] (Kroeber 1976:499; Wallace 1978b:455).

After marriage, most of the Southern Valley Yokuts adhered to a patrilocal residential pattern, where the newlyweds would move into the home of the husband’s family and live there for about one year before they either established their own residence nearby, or, if all the families were living in a communal home, they would remain there (Gayton 1948:11). However, this practice was not universal among the Yokuts; some tribes are known to have followed a matrilocal residence pattern (Latta 1999).

[10] Gayton (1946:256–257) states that some groups, especially those in the foothills, left their permanent homes in the late spring/early summer and established temporary residences in areas to gather seeds and other non-local resources.

[11] Among the Tachi Yokuts the bodies of deceased people “of account” were burned (Kroeber 1976:499).

The Yokuts constructed six different types of dwellings, single family dwellings, communal houses, winter houses, bark houses, granaries and sweat houses, although only four of these, the single family house (two types), the communal house, granaries, and sweat houses, are known to have been used by those tribes in the southern San Joaquin Valley. Single-family residences were permanent year-round constructions with an oval floor plan, and tule (bulrush or cattail) mats covering the wooden framework. (Gayton 1948:11; Wallace 1978b:450–451.) Gayton (1948:13) provides a description of this type of structure:

> Two forked posts linked by a tie-beam formed the basis of this structure. Upright poles of willow were set into the ground in an oval line around the center posts and the tips pulled inward and downward and tied to the center beam. Strengthening horizontal withes were tied around this framework. Large mats of tule were hung on the frame and pegged down to the ground. A slot was left along the center beam for the smoke to escape.

Kroeber (1976:522) indicates that the center ridge pole was not always present in these smaller oval structures. Other single-family dwellings were long wedge-shaped structures, or elliptical or oblong houses with rounded vertical ends, and similarly the wooden framework was covered with tule mats (Kroeber 1976:521). Archaeological investigations of habitation sites suggest that because houses were constructed of tule and grasses, preservation of materials other than charred remains are difficult to distinguish in the archaeological record (Wedel 1941:31).

The communal house was a mat-covered gabled structure with a tule mat door and a shade porch, large enough to accommodate 10 families (Wallace 1978b:451). Gayton (1948:11) suggests that the communal house was simply an extension of the single family oval frame. Inside the communal house, tule mats partitioned sections of the house, each family having its own fireplace, and sometimes their own door (Gayton 1948:13). Generally, the house was used to store food stuffs, but granaries and separate storage structures were also built. Acorn granaries were constructed by most groups. Because there were few acorns in the valley, valley groups traded with the foothill tribes for acorns. Granaries were constructed of tule, about 3 feet across and 8–9 feet high, each family needing three to five granaries to supply them with enough acorns for the winter months. They were lined with grasses which would repel moths and squirrels, and could hold 10–30 bushels of acorns in each structure. (Latta1999:400.) Other food stuffs stored in granaries included dried fish, roots, and seeds (Wallace 1978b:451).

The sweat house was the third type of dwelling built by the Southern Valley Yokuts. This was a 15-feet oblong sudatory,[12] dug into the ground and covered with earth. The sweathouse was restricted to men, who sweated in the house daily and regularly slept there when at their home village. The sweathouse was never used for other purposes, such as a dance house or an assembly chamber, and was always located downstream from the village so as not to contaminate the water used for the village. (Kroeber 1976:521–523; Latta 1999:388; Wallace 1978b:451–453.)

---

[12] Comparable to a sauna.

Other dwellings constructed by Yokuts outside of the southern San Joaquin Valley include a bark house, and a winter house made of tule, conical in shape, with a hoop at the top to attach and separate poles, leaving a smoke hole (Kroeber 1976:521). While the bark houses were not constructed in the valley itself, Kroeber (1976:522) notes that when in the hills or travelling, Yokuts made these bark houses as short-term shelters. Groups from the project vicinity travelling to the Elk Hills may have adhered to this practice. Those dwellings in the vicinity of the lake areas did not have an excavated floor so as to prevent water and moisture from coming into the house. In fact, if a house could not be constructed on a plot of land slightly higher than the surrounding area, the floor was slightly elevated by piling dirt to stay dry. Similarly, areas where people slept were also raised up, often on a willow framework (Gayton 1948:13).

The arrangement of village structures generally followed an established pattern.[13] The chief was allocated the most desirable location, often near the center of the village. The chief's assistant, the *winatun,* lived at one end of the village; if there were two, they would live at either end of the village (Kroeber 1976:497). In cases where only one winatun was present, Powers (1976:370–371) suggests that the "village captain" (likely referring to the winatun) lived at one end of the village, and a shaman lived at the other end. The houses in a village were erected in a straight line (Powers 1976:370; Wallace 1978b:451), with a permanent fire burning in the center of the village. This central fire was relatively large, usually measuring several feet across and at least 1 foot deep. If there was rain, the fire would have been placed inside a permanent house. Wedel (1941:32–33) likely found the archaeological remnants of some of these central fires, indicated by a circular charcoal bed measuring 6 feet across and 10 inches deep, with a fire pit 1 foot deep in the center of the charcoal bed and no post molds or other artifacts in the vicinity (Wedel 1941:33). Latta (1999) mentions that central fire pits were places residents would put their trash, corresponding with the large amounts of charcoal found at the central fire pit excavated by Wedel (1941:32–33). However, Hartzell (1992:178) suggests that these large charcoal beds may have been the result of ephemeral shade structures which had burned down.

As mentioned above, the sweathouse was always located downstream from the rest of the village so as not to contaminate the water, and bathing and washing were likewise performed at a downstream location (Latta 1999:388). Some villages in the valley near the lakes were constructed so that they were surrounded by tules 10–20 feet high, providing good cover against potentially hostile Europeans and Americans. In order to see those approaching the village, sun shades were constructed high enough so that one could use them as a look-out post. (Latta 1999:235.)

Villages were usually built along trails, often where two trails intersected. Trail networks connected the Yokuts to their neighbors in all directions, with whom they frequently engaged in trade. One of the most prominent trade trails in the vicinity of the project area connected the Chumash—located on the west side of the South Coast Ranges—with the Yokuts. This west-side trail skirted Buena Vista and Tulare lakes, along which the known village sites of Tulumneu and Shuquoiu were located. (Latta 1999:314–315.)

[13] One of Gayton's (1948:13) Wechihit informants (near Fresno) suggested that her tribes' villages did not adhere to any set pattern and that houses were placed in any order along the river.

Implications for the Archaeological Record Based on Settlement Patterns

As indicated by the ethnographic references above, one could expect to find a Yokuts village on land that is naturally higher than the surrounding area, or on artificially raised lands. Structures and villages could be expected to be found along lakes and sloughs, likely in a linear pattern. Lake levels in the southern San Joaquin Valley were subject to significant fluctuations, affecting the location and permanence of most settlement sites. It has been suggested that lake levels would not have risen much higher than 300 feet above mean sea level (amsl) (Gifford and Schenck 1926:15; Wedel 1941:19), and that those sites located at this elevation are likely to represent more permanent occupations. However, it should be noted that high winds could have moved the shoreline even higher than 300 feet amsl. Conversely, it should not be assumed that Yokuts occupation sites would not be found within the bounds of former lake beds, the fluctuations of which ensure that villages have been flooded in the past, the remnants now contained in sediments of the former lakes.

The Yokuts constructed various types of structures, and these structures present themselves differently in the archaeological record. One of the most significant indicators of a structure is the presence of post molds (soil discolorations resulting from decayed wood used as wall posts). These are often distinguishable in the archaeological record, and Wedel (1941:31–33) provides descriptions of houses that were excavated on the western shores of Buena Vista Lake. He states that post molds were found in sub-circular and irregularly oval shaped arrangements. One of the houses described by (Wedel 1941:31–32) contained 19 post molds, measuring 8 inches deep and 4–6 inches in diameter. These post molds were sloped inward at the top indicating the conical or domed framework suggested by the ethnographic description given by Gayton (1948:13). Within the post mold arrangement, four other post molds were identified, likely indicating the central supporting poles also described by Gayton (1948:13). A centrally located fire pit was identified, measuring 2 feet across, and relatively shallow in depth. The floor was somewhat ill-defined, but consisted of clay with about 1 foot of loose shell mixed with soil. The greatest diameter within the house was measured at 21 feet (Wedel 1941:31). Other houses identified during Wedel's investigations include a small, elliptically shaped house, 9 feet by 15 feet, and others which were more circular, not exceeding 21 feet in diameter. The post molds for these houses ranged from 2 to 8 inches across at 1–3 feet intervals. Fireplaces were located either near the center of the structure or at one side near a ring of post molds[14] (Wedel 1941:31, 84). Archaeological evidence of a communal structure was likely indicated by four ash pits in a curving line enclosed by a roughly oval double series of post molds of various sizes, and measuring about 22 feet by 25 feet with a 4-feet break at the south side, which may have indicated a door (Wedel 1941:32). Small bits of waddle-and-daub were found in association with some of the houses; however, Wedel suggests that because of the light materials used for construction, only a very thin layer of waddle-and-daub would have been practical on these dwellings (Wedel 1941:31). Moreover, the light materials used for construction of these structures are not likely to preserve well in the archaeological record, creating potential problems in discerning and correctly interpreting archaeological features.

[14] Wedel (1941:32) suggests that the fireplaces may not have been located directly next to the wall but centrally located, and only appear to be adjacent to the wall because of overlapping post molds.

It has been suggested that granaries appear in the archaeological record as indiscriminately scattered post molds (Wedel 1941:84). Identified during Wedel's archaeological investigations were clay-lined pits measuring about 16 inches in diameter respectively, about 2 inches deep and lined with 1 inch of hard greenish clay. Wedel (1941:34) suggests these may have been acorn leaching basins, but they also may have been used for storage. Cache pits were also identified, one measuring 8 inches across and 19 inches deep; it contained a pestle, steatite bowl fragments, and several stones (Wedel 1941:34).

Mortuary Treatment

Burial was the main method of treatment for the dead among those groups living in the southern San Joaquin Valley. For many of the Southern Valley Yokuts, cremation was practiced only in cases where one died away from home, or if the deceased was a shaman; however, the Tachi Yokuts cremated everybody "of account" (Kroeber 1976: 499). It has been suggested that Northern Valley Yokuts and Tachi Yokuts practiced cremation, likely because they had better access to wood than other valley groups (Gifford and Schenck 1926:50; Kroeber 1976:499; Wallace 1978b:455). Bodies were usually interred in low mounds.

The dead were handled almost exclusively by *tongochim* or *tunosim*, male transgendered individuals, although some women also were involved in the process (Gayton 1948:46; Kroeber 1976:497; Wallace 1978b:455). The *tongochim* prepared the bodies for burial by washing the body and wrapping the limbs with tule, flexing the bodies such that the knees were bent up to the torso, and hands placed to the sides of the face or temples (Gayton 1948:107; Kroeber 1976:499). The bodies were then wrapped with tule mats, or deer skins if the person was wealthy, and placed in the grave at dawn of the day following death, the morning after the second day if death occurred late the night before. The body was carried to the grave in a net by the strongest of the grave diggers who walked around the grave three times before placing the body down, and stated, "You're going where you're going, don't look back for your family"[15]. If, when the body was being interred, another burial was disturbed, the *tongochim* were required to break open the skull of the disturbed body and taste the brains to prevent themselves from dying. Once the body was placed in the ground, relatives and the *tongochim* would throw earth onto the body and then run home without looking back, for fear that the spirit would follow them home. (Gayton 1948:46, 107.)

Other than preparation of the body by flexing, there seems to have been little else that was standard practice in terms of the alignment of burials (Gifford and Schenck 1926:52). Archaeological evidence suggests that the orientation of the head of the body and the direction in which the face was aligned do not appear to have been standardized (Walker 1947:10, Table 1). Some bodies had abalone shells covering the eyes, ears and/or mouth in order that they would be able to see, hear, and talk well in Pahn Land, the Yokuts afterworld (Latta 1999:321). Pismo clam shells were sometimes placed in the mouth of the deceased so that, on the journey across the narrow bridge to Pahn Land, they would be able to pay the bad-fish people who guarded the bridge (Latta 1999:322; Wallace 1978b:456). Personal effects of the deceased were often

[15] The exact wording of this statement varied by tribe, but the general sentiment remained the same (see Kroeber 1976:509).

interred with the body, and sometimes the dog of the deceased would be sacrificed to be buried with its owner (Wallace 1978b:455). The tongochim were permitted to take possession of any of the personal effects while preparing the body (Kroeber 1976:497).

The various Yokuts tribes maintained different burial practices. There are indications that bodies were placed in separate burial grounds (Latta 1999:235), cremation generally reserved for deaths that occurred away from home (Wallace 1978b:455). The archaeological record indicates that both methods of internment were practiced (see Walker 1947 for separate burial grounds, Wedel 1941 for burials in residences). It is possible that prehistoric burials are those which were placed near residences and then burned because as Western notions of ownership and possession were acquired or forced on the Yokuts in more recent time, they would have been less likely to destroy their homes. Additionally, reduced residential opportunities as a result of Euroamerican territorial circumscription would have forced the Yokuts to be less likely to destroy their homes.

Implications for the Archaeological Record Based on Mortuary Practices

Southern Valley Yokuts practiced different types of mortuary treatments based on tribal affiliation, status of the deceased, or place of death. Both cremation and burial were practiced, and consequently both types of graves could be encountered. Burials are known to have sometimes been placed in larger cemeteries and in mounds.

Gifford and Schenck (1926:50) suggest that the soil stratification from the excavation of mounds in the project vicinity is indicative of a process wherein the body was likely placed on top of the mound and then dirt heaped over the body; however, sometimes the height of the mound was increased artificially prior to interment (Gifford and Schenck 1926:50). Because of this method, burials are usually found at the highest point of the mounds in convex rather than concave contexts, and tend to be relatively shallow and subject to bioturbation[16] (Gayton 1948:34; Gifford and Schenck 1926:37, 50). In some cases, burials have been found with cedar or juniper posts erected in the immediate vicinity (Gifford and Schenck 1926:39), notably in burials south and east of the proposed project site in the Elk Hills (Walker 1947:4). These posts are presumed to have been grave markers or supports for funeral offerings, and likely extended above the surface; however, during Walker's excavations, the posts were found 5 inches below the surface. Native Americans may have intentionally cut down the posts when the Europeans realized that the posts denoted burials and looted the graves, or the posts may have been destroyed in a brush fire. (Walker 1947:4.)

Preservation of bodies in the project vicinity tends to be poor because local soil chemistry, together with weather conditions varying from cold winter rains to intensely hot summer drought, enhances disintegration of bone. Among the hundreds of burials excavated in the Elk Hills, the remains of adults are most common, likely because greater mass and amounts of lime in the bones of adults allows for better preservation than smaller adolescent and juvenile skeletons, which contain correspondingly lower amounts of lime. Archaeological evidence suggests that bodies were usually placed lying on the side, and covered with tule mats or fabrics woven of milkweed fiber. (Walker 1947:4–5, 11).

[16] Bioturbation refers to the churning of soil by burrowing and digging animals.

Items that have been excavated with burials include broken stone bowls and other objects of steatite, fabrics made of milkweed (more common in burials with no European objects), basket fragments, varieties of shell beads (olive snail, clam, columella[17], limpet, *Saxidomus* [Washington clam], and abalone), various objects fashioned from bone and horn, gaming sticks and walnut dice, carved wooden bowls, obsidian and chert artifacts, soapstone beads, bowls, and vessels, sandstone pestles and bowls, granitic pestles and "charmstones", arrow-shaft straighteners, stone knives, scrapers, small stone "footballs", lumps of asphaltum (sometimes placed over the eyes, and sometimes made into a larger "death mask"), pebbles covered in asphaltum, various articles of clay, bear claw pendants, whistles of bird bone, and yellow and pink ochre. (Gifford and Schenck 1926:55–57; Hodgson 2004:7; Walker 1947:5–7; Wedel 1941:36, 40, 45, 48, 87.)

The presence or absence of European articles can provide relative information on when burials occurred. Glass trade beads are frequently found in burials, sometimes on strings around the neck of the bodies (Walker 1947:2, 7). European blankets were sometimes used to replace the tule mats which wrapped and covered the bodies (Gayton 1948:107). Other European objects included with burials in the project vicinity include various articles of metal (buttons, thimbles, crosses, and utensils), china, and objects of porcelain (Gifford and Schenck 1926:56; Walker 1947:7–8).

Several burials have been located in the project vicinity. A large cemetery was excavated in the Elk Hills in the 1930s. Consisting of an area about 40 feet by 50 feet, there were at least hundreds, if not thousands of burials. This cemetery contained both prehistoric and historic burials, and may have been associated with the village of *Tulamniu* (Walker 1947:2, 5). Other burials have been found near the southern end of the Buena Vista Hills, about 7 miles south of the proposed project (Wedel 1941). As indicated by the information above, burials are likely to be located on top of low lying mounds, in relatively shallow graves. Burials have also been found at house sites on the valley floor and slightly higher elevations. Because the land around the project area was one of the most ideal for permanent settlement in the southern San Joaquin Valley, it is highly probable that human remains could be inadvertently discovered during ground disturbing activities.

Resource Exploitation

The Southern Valley Yokuts maintained a mixed economy of fishing, hunting, and collecting, taking advantage of the resources at their disposal on the valley floor and surrounding areas. The lakes and sloughs of the area provided lacustrine and riparian resources such as fish, waterfowl, shellfish, roots and seeds. Acorns, the staple food of most California tribes, were not prevalent on the valley floor, so valley tribes would travel to select valley locations or the foothills to obtain them, either by trade or by collecting the nuts themselves. (Wallace 1978b:449–450.)

[17] Columella is part of a seashell, specifically the central column or axis of a spiral univalve shell, and not a species type like the other listed items. There is the dove snail (*Columbella* spp.), for which several sub species occur along the California coastline. It is not known if Walker meant to list the shell part or misspelled a species name. Other ethnographers writing about the Southern Yokuts simply list "seashells" as important cultural materials.

Tules were used for many different purposes by the Yokuts living near the lakes; they were plentiful and were used for both food and material objects. Tule roots were more often obtained by men (Gayton 1948:11) and were used to make a starchy mush or bread (Latta 1999:205; Wallace 1978b:450). Tule seeds were ground into meal, often with seeds of grasses and flowering herbs (Wallace 1978b:450). Tules were fashioned into myriad objects, including the aforementioned houses, as well as boats, mattresses, baby cradles, bags, skip rings, sunshades, windbreaks, sails on boats, clothing, mats, blankets, disposable diapers (made of pounded tule fibers), fuel, hunting blinds, baskets, shrouds, rope, and string (Latta 1999:205). Dried tules were used for firewood because of the lack of hardwoods in the valley and because willow, the most common wood in the valley, produced poor fires (Gayton 1948:16).

Fishing was a viable enterprise year-round; lake trout were the most prized fish, but chubs, greaser fish, brook trout, minnows, crayfish, mussels, clams, perch, and suckers were also taken (Gayton 1948:14; Latta 1999:248; Wallace 1978b:450). Occasionally steelhead salmon and sturgeon would enter the rivers and lakes as well. Fish were taken using nets attached to poles and drug in an arc towards the shore by men on a raft, by collective drives where the fish were herded into stick pens, or gathered by hand in nets or baskets. Gayton (1948:4–15) noted that some tribes also used a pointed harpoon with a hooked point made from a pelican wing bone to take fish, or made a poison out of a pulverized white flower to stupefy the fish. Wallace (1978b:450) also notes that turkey mullein (*Eremocarpus setigerus*), was crushed and used to stun fish; this may be the plant (white flower) referred to earlier in this paragraph. Boats made of tule were the most prevalent form of non-bipedal transportation, and a raft with a mud hearth could be used for extended fishing expeditions of three or four men for 7–10 days during times of a full moon (Latta 1999:245). Fish were usually broiled on hot coals, but in instances where a large catch was obtained, sun-drying of fish also occurred (Wallace 1978b:450).

Waterfowl and terrestrial birds were prevalent throughout the lake and slough regions in the southern San Joaquin Valley, and the Yokuts used a variety of methods to obtain them. Snares or long handled nets were used by some groups while hiding in the tules. Duck decoys, spring pole traps with underwater triggers, and boats were also used; groups would slowly pole their boats to their prey while covered with tules, and then use bows and arrows to take the waterfowl (Wallace 1978b:450). Avian species known to have been taken include geese, mudhens, swans, blue herons, egrets, pelicans, coots, grebes, ruddy ducks, mallards, stiff-tailed ducks, dabbling ducks, mergansers, and diving ducks (Hartzell 1992:185, 251, 279; Latta 1999:205).

Various mammals and aquatic reptiles were also taken. Turtles, fresh and salt water otters, beavers, raccoons, rodents, jackrabbits, cottontail rabbits, antelope, elk, ground squirrels, deer, and snakes are known to have been taken in the valley area (Hartzell 1992:184, 188, 254, 259, 280, 283; Latta 1999:229; Wallace 1978b:450). Other prey animals include dogs, which were raised to be eaten, horsefly and bee grubs, and wasp and caterpillar larvae[18] (Gayton 1948:14; Wallace 1978b:450). Smaller mammals were often taken using snares and traps or bows and arrows; larger mammals such as

[18] Wallace (1978b:450) suggests little or no insect foods were eaten, contrary to Gayton’s (1948:14) informants.

antelope and elk were not frequently pursued outside of the valley, but when these species made their way to the lake and slough areas, they were taken by the use of surrounds or snares (Latta 1999:490–491; Wallace 1978b:450). Rabbits were occasionally taken in collective drives, sometimes involving multiple tribes (Latta 1999:515). Small burrowing animals were smoked or drowned out of their burrows, or a twisted stick was used which would have been put into the burrow and then twisted, snaring the animal's fur or skin (Latta 1999:256; Wallace 1978b:450). Valley tribes stalked deer and elk. In doing so, these groups would wash themselves prior to hunting to obscure their scent, and wore deer heads in pursuit of the animals. (Latta 1999:497.) Animals which were not taken include coyotes, weasels, rattlesnakes, bats, and frogs (Gayton 1948:14; Wallace 1978b:450).

Other vegetal foods besides tules and acorns that were eaten include grass nuts (which were roasted or mashed whole into a meal), clover (popular in the spring), brodiaea bulbs, sugar (either from sugar pines or cane sugar), iris seeds, sopa seeds (possibly arrowhead), mustard greens, fiddleneck, filaree, horehound (which was cooked and the liquid drunk for relieving coughs), and salt (taken from salt grass) (Gayton 1948:14–16; Latta 1999:255; Wallace 1978b:450). Other uses for plants included smoking of tobacco in cane pipes; the tobacco, which was not cultivated or pruned, but grew wild nearby, was also often eaten or drunk. Jimsonweed was used for medicine and inducing hallucinations (Gayton 1948:16, 22, 38).

As mentioned, Yokuts tribes occupied a delineated territory of about 250 square miles. Almost all resources were obtained within this territory. Women were the primary vegetal food gatherers, and they always returned to the same areas where they obtained various seeds. Delineated by stakes placed in the ground, each seed or food gathering area encompassed about 40 square feet, and the area was passed down from mother to daughter, or sister to sister. Women felt strong ownership over these areas, and quarrels would occur if one gathered from another person's plot. Men did not have this same sense of ownership over fishing or hunting grounds, as there were not delineated areas where men consistently fished or hunted. (Gayton 1948:11.)

Yokuts material culture consisted of various types of baskets, and items crafted from steatite, granite, sandstone, bone, horn, clay, lithics, shell, and asphaltum. Baskets were used for many purposes, including cooking, gathering, storing, and fishing. Stitched together using bunchgrass (*Epicampes rigens)* as the coiled material and swamp grass (*Cladium mariscus)* for the stitching, baskets became watertight after soaking in water (Latta 1999:533). Wicker baskets were also constructed, and Yokuts used black willow or cottonwood shoots for their construction. Basketry designs generally were patterned after snakes, especially rattlesnakes, king snakes, gopher snakes, garter snakes and water snakes. Some of Latta's informants suggested that designs for baskets came to them in dreams or in jimsonweed hallucinations. (Latta 1999:547, 571, 589.)

Archaeological evidence suggests that one of the most prevalent items made from steatite were vessels, but highly polished ornaments and small beads were also common, along with arrow straighteners, tubular pipes, discs, groove-edged objects, and reel-like[19] objects (Wedel 1941:53–60, 95–97, 113–114). Granitic and sandstone objects include spheroid objects (possibly used for games), charmstones, knives, mortars, grinding stones and metates, pestles, and hammerstones. Objects fashioned from bone and horn include awls, bi-pointed objects, cut bone, horn flakers, needles, pins, sweat scrapers, tubes, whistles, and pierced fish vertebrae. (Wedel 1941:40–45, 68–72, 89–92, 100–104, 115.)

Yokuts ceramics tended to be crude and un-tempered, likely fashioned by lumping clay (Kroeber 1976:537). Baskets were a more popular form of storage and cooking than ceramics, leading to a paucity of clay objects in the archaeological record. Types of fired clay objects found in the archaeological record include beads, decorated pellets, fillets, molded circular and cylindrical objects, and pottery (Wedel 1941:45–48).

Lithics fashioned by Yokuts include objects made from chert, jasper, chalcedony, and obsidian. Obsidian was likely obtained in trade or on expeditions to the Coso Range immediately east of the southern Sierra Nevada. The stream boulders on the lower slopes of nearby mountains, possibly the Elk Hills, Lost Hills, and the South Coast Range foothills were likely the source of chert, jasper and chalcedony stone (collectively referred to as cryptocrystalline silicate rocks). Types of lithics found during archaeological investigations include projectile points, disks, gravers, knives, perforators, saws, crescentic flints, and scrapers. Projectile point types found during archaeological investigations include non-stemmed triangular points with a concave base, non-stemmed leaf-shaped points pointed at one end with a convex base, non-stemmed triangular points with a straight base, contracting stem points with no shoulders or barbs, contracting stem points with shoulders, contracting stem points with shoulders and barbs, parallel-sided stem points with no shoulders or barbs, parallel-sided stem points with shoulders and barbs, and expanding stem points with shoulders and a convex, straight or concave base. (Wedel 1941:61–68, 97–99.)

The only types of shell that were obtained locally by Yokuts were freshwater mussels and clams. However, several different types of shells were obtained in trade from coastal groups. Shells were the form of money, *chok*, used by the Yokuts prior to the arrival of Europeans, and worked shells were more valuable than whole shells. To the Yokuts, labor represented money (Latta 1999:318). Shells have been found in archaeological contexts that were fashioned into beads, ornaments, disks, and pendants (Wedel 1941:50–52). When used as money, multiple shells were strung together and their value determined by the length of the strand. The most valuable shells were Pismo clam shells, followed by keyhole limpets, abalone, periwinkle and olive snail shells. Abalone was also understood to have supernatural power, *tripne*, and consequently its use was more restricted than other types of shells. Abalone shells were often attached to ceremonial clothing, and were worn around the neck on a string in the hopes that the sun glinting off of the shell would scare away rattlesnakes; however, during thunderstorms abalone shells were not worn for fear that lightning would strike the shells. (Gayton 1948:37–38; Latta 1999:312, 320, 321.)

---

[19] "Flat and usually elongate with a deep groove or notch at each end, which gives the general shape of the capital letter H" (Wedel 1941:57).

Asphaltum, or bitumen, can be found in crude surface petroleum deposits in both liquid and solid form. It is highly probable that those groups residing along the base of the Elk Hills would have obtained asphaltum in the petroleum deposits in the Elk Hills as this would have been the closest area of rich asphaltum deposits (Hodgson 2004:3–4; Wedel 1941:37). Asphaltum was used to waterproof baskets, for black paint when mixed with bear grease and elk tallow, as inlay for decorative objects, as cement for mounting scrapers, cutting tools, and projectile points, for medicinal use, as weights for women's skirts to keep the skirt hanging correctly, on Pismo clam shell money as decoration, as a material for making black smoke for smoke signals, and for securing basket hoppers to stone mortars. (Hodgson 2004:6–13; Wedel 1941:37–39.) During archaeological investigations asphaltum has been found in ball shapes and irregularly shaped lumps (which may have been the method of storing it), on pebbles coated with asphaltum (likely from being used to spread the asphaltum evenly in baskets), on a bundle of yucca fibers (which may have been used as an asphaltum brush), and on hopper mortars to hold baskets on while grinding (Wedel 1941:37–39, 88–89).

The Yokuts were "professional traders", and were the major facilitators of change in eastern and central California (Arkush 1993:620, 623). The Yokuts were located in an advantageous position for trade; they connected the groups west of the South Coast Ranges with those in the Sierra Nevada region and farther east. Generally, east–west trade trails followed major waterways (Arkush 1993:623), and at least one trail is known to have been in the project vicinity. This trail connected the South Coast Ranges to a west-side trail, which skirted Buena Vista and Tulare lakes (Latta 1999:315). Many different items were traded. The primary items the Yokuts offered for trade were asphaltum (in solid or liquid form), elk skins, deerskins, pronghorn skins, baskets, steatite, and acorn flour (Arkush 1993:622–623; Hodgson 2004:5). From the coast, the Yokuts obtained various marine shells, sea otter skins, and other marine resources. From the Sierra Nevada and immediately adjacent regions, acorns and obsidian were popular traded items, especially obsidian sourced from Inyo, Mono, Napa, and Lake counties (Latta 1999:308).

The prominent role of the Yokuts as traders facilitated their political and social complexity; however, when the Europeans arrived, many things changed. Pedro Fages, the first European known to have ventured into the valley, was the first to distribute large quantities of mass-produced European goods. Glass beads were one of the most favored European articles, and the Yokuts were responsible for much of the early historic period change into the eastern Sierra by facilitating this trade. The introduction and spread of glass beads reduced the use of shell beads and ornaments; this was a result of the popularity of glass beads, but also the missionization and destruction of coastal groups from whom the shells were obtained. Other popular European items included metal objects, blankets, and horses. In fact, the Yokuts became very fond of horse meat and frequently stole horses from the missions and ranchos in the area, eventually being referred to as the "horsethief Indians" (Arkush 1993:619–632). European items (other than horses) often were placed with the deceased in burials (Walker 1947:7–8).

Smoke signals were a form of communication used by Yokuts throughout the San Joaquin Valley. Smoke signals and fires told of strangers in Yokuts territory. Details such as the size of the party, the kind of people in the party, the direction of travel and their actions were all communicated through these smoke signals and fires. Latta estimates that it would have taken four hours for a message to reach the Cosumnes River from the lower end of the San Joaquin Valley via the South Coast Ranges and Sierra Nevada foothills (Latta 1999:338–339). Gayton (1948:9) suggests that smoke signals also were used for arranging battles between tribes. Smoke signals would have been sent from the highest area near a village, and it is likely that the Elk Hills would have been the location from where these smoke signals were sent for those villages around Buena Vista Lake and slough. Details of these smoke signals is limited, but it is known that a small, hot fire partially smothered by green weeds, green grass or asphaltum would give off sufficient signaling smoke. The fire was built in a hole in the ground, about 2 feet in diameter and 2 feet deep, and was covered with a wet *tiwon* (woman's game tray), wet blanket, wet cloth, wet tule mat, wet skin or a large cooking basket in order to catch the smoke. A long series of short puffs was the signal of an alarm, while a series of widely separated puffs gave an all-clear message. Communication at night occurred through the use of light signals. Fires were built and a blanket raised and lowered between the fire and the people with whom one was communicating provided flashing signals. (Hodgson 2004:12; Latta 1999:338–389).

In addition to trade goods, Europeans brought diseases—to which natives had no immunity—to Yokut territory. Diseases ravaged the Yokuts and evidence of mass deaths due to smallpox and malaria can be seen in burials throughout the San Joaquin Valley (Gayton 1948:9). The Spanish established several missions on the coast, and forced Native Americans to leave their homes and live at the missions. Some Native Americans escaped the missions, and the southern San Joaquin Valley became a haven for escaped mission Indians. These non-Yokuts lived among the valley Yokuts, and the Spanish, who had previously not spent much time in the San Joaquin Valley, chased down the runaway mission Indians, raiding Yokuts villages. (Wallace 1978b: 460). Some Yokuts moved their villages to riparian areas so that open-field battles with mounted soldiers could be avoided, and also built trench systems fortified by timber stockades. When non-Yokuts and Yokuts began living with each other, customs and traditions were shared, as evidenced by changes in burial practices and material objects. (Arkush 1993:630, 633).

Ceremonies, Shamans, and Totems

Several different Yokuts ceremonies have been documented, the largest being the public mourning ceremony, *lonewis*. This was a tribal-wide, sometimes with other Yokuts tribes, ceremony conducted yearly—sometimes less often—usually in summer or fall. The *lonewis*, also referred to as *lakinan*, *lakinanit*, or *tawadjnawash*, lasted for six days, and groups traveled long distances to attend. During the ceremony, groups danced, sang, and cried for the dead, and on the last day of the ceremony effigies of the deceased were burned along with other property. (Kroeber 1976:500; Latta 1999:216, 674.)

The *lonewis* was a separate ceremony from the private mourning ceremony. The private mourning ceremony was conducted by the immediate kin of the deceased, and occurred in the third month following death. During the three months of private mourning, kin cut their hair, refrained from washing their face, observed taboos against meat and salt, and secluded themselves until the ceremony. (Wallace 1978b:455–456.)

There were two types of Yokuts doctors who were called upon to heal. *Ahntru* were men or women who healed through the application of roots and herbs, although some claimed magical powers. The *tripne* or shaman was called upon after traditional medicine had failed. The shaman sang and chanted over the body in a manner which was only intelligible to him in order to drive away evil spirits, and also used burning aromatic herbs, bloodletting, pounding on the patient, and cutting and sucking out pain (Latta 1999:621). Shamans would sometimes hold ceremonies in which they demonstrated their magical skills to the tribe (Kroeber 1976:506; Wallace 1978b:456–457). There were specialized shamans as well. Some shamans were rain dancers, and they used “charmstones”, polished plumb-bob shaped stones, to induce rain. These rain-dancer shamans were less common in the valley, but American settlers employed these shamans to conduct rain-making ceremonies in order to help their crops. Other shamans were rattlesnake doctors who conducted an annual rattlesnake ceremony in the spring to overcome the supernatural power of the rattlesnakes and to insure against snake bites over the coming summer. This reverence for rattlesnakes is the reason why killing them was considered taboo. (Latta 1999:637, 639, 647, 649.) Bear shamans did not claim to cure disease, but were exhibitors of skill and had the ability to survive bear attacks. The Tachi Yokuts, however, generally attributed healing powers to bear shamans. Among other Yokuts tribes, the bear shamans did have the power to relieve symptoms, including one recorded instance of a bear shaman giving bear hair to drink during childbirth to make the labor easier. (Kroeber 1976:516–517.) Some shamans were understood to have caches of accumulated wealth, which if disturbed, resulted in swarms of insects killing the intruder (Gayton 1948:33).

Other ceremonies conducted by the Yokuts were a jimsonweed ritual for the initiation of boys, a ceremony for a girl at her first menses, and a tribal feast and dance, *haishat*, likely conducted for secular reasons. The jimsonweed ritual is unique to Penutian language-speakers[20] and was conducted either when the boy was ready, or in larger tribes annually when several boys would be initiated. Some tribes required a boy to single-handedly kill a deer before his initiation; other tribes required a chilly early morning swim in the winter. During the ceremony, boys were paired with an elder mentor, who made sure that the boy was safe during his hallucinogenic trance from drinking the jimsonweed root tea. Sometimes this mentor relationship extended beyond the initiation ceremony and lasted into adulthood. During the ceremony, men lived in the sweathouse and listened to the chief and other elders instruct them in the history and traditions of the tribe. (Gayton 1948:30; Kroeber 1976:502–507; Latta 1999:627.)

Yokuts groups adhered to a patrilineal totemic lineage; that is, the totem of a child’s father was also the totem of the child.[21] The mother’s totem was not ignored and was respected within the family. Totems were usually birds or animals, the totem of each group was revered and never intentionally killed or eaten, and the totem was regarded as a “dog” or pet (Kroeber 1976:494; Wallace 1978b:451–452). Totems were grouped into moieties, and were symbolically associated with social divisions; each moiety contained several different totemic species. Moieties were exogamous, that is, members of one moiety married outside of their own moiety, and similarly, those of the

[20] Not all Yokuts tribes practiced the jimsonweed ritual (Gayton 1948:38).

[21] Gayton (1948:28) states that in large families, sometimes the mother’s totem was passed on to one or two of the children.

same totem were not permitted to marry. (Gayton 1948:27; Kroeber 1976:493–494.) During games and ceremonies, notably the *lonewis*, moiety members were reciprocally opposed, and this opposition between totems is reflected in traditional stories which pitch totems of different moieties against each other (Gayton 1948:27; Kroeber 1976:495). Some Yokuts, and especially shamans, also respected a dream totem, an animal guide during dreams. This was sometimes the same totem as one's social totem. (Kroeber 1976:495).

The Yokuts are a culturally rich and diverse group. Their lifeways are preserved by the descendants of those Yokuts who live in the area, as well the ethnographic and archaeological records. The ethnographic record is never totally complete as long as contemporary cultures are there to provide information. It is hoped that through additional consultation efforts this ethnographic context will be expanded and clarified to better understand the potential impacts of the proposed project on cultural resources.

Historic Background

The major themes related to the historic period include Spanish explorations, the Mission period, pioneer development and ranching, water projects in the San Joaquin valley, transportation, and development of the EHOF. Spanish explorations in the project region began with the travels of Pedro Fages in 1773 and Father Francisco Garces in 1776, followed by the two expeditions in 1806 by Father Antonio Zalvidea and Lieutenant Moraga in search of mission locations. Fages visited at least one Yokuts village on the shore of Buena Vista Lake. No missions were established, and some of the subsequent expeditions between 1808 and the 1820s were conducted to capture Indians who had fled from missions. These efforts would have left little physical evidence in the region.

Pioneer Settlement and Ranching

Visits by European explorers increased in the early 1800s, but the southern San Joaquin Valley remained relatively sparsely settled for some time. Beginning in the 1830s, toward the end of the Spanish period and into the Mexican period, large tracts of land were granted to Mexican and other European settlers and used primarily for cattle grazing in support of the trade for hides and tallow. Although such Kern County ranchos as El Tejon and San Emigdio employed some of the mission Indians, they were still beset by cattle and horse raids from the nearby native communities. The most profound effect on the environment was the replacement of native vegetation by exotic grasses and forbs introduced by the new animals. Culturally, there ensued severe disruption of the Native American populations (Nachmanoff et al. 1999).

The first waves of pioneer settlement and population growth, which took place elsewhere in California after the mid-nineteenth century, largely bypassed this part of the San Joaquin Valley because of the unfavorable climate and lack of timber and potable water. Hispanic Californios carried on small-scale cattle and sheep ranching and horse trading on the west side of the valley, joined by some Basque and Portuguese herders. The first private landowner in the Elk Hills was Alice J. Miller (or Muller) in 1905, and by 1910, nearly all of the Elk Hills, not owned by the government, had been claimed (Nachmanoff et al. 1999).

Agricultural Development and Water Conveyance Systems

As the old Mexican land grants and small holdings were gradually aggregated into major ranches, such as the Miller & Lux Land Company of the 1850s, which ultimately acquired 700,000 acres, irrigation canal projects proliferated and conflicting claims to Kern River water were only settled by the California Supreme Court in 1886. Miller & Lux acquired the Kern Valley Water Company (KVWC), leader in irrigation projects in the southern San Joaquin Valley through the 1920s. The Miller & Lux system of canals later was absorbed into the Buena Vista Water Storage District (**Cultural Resources Figure 3**). After that time, the large-scale development of more efficient hydroelectric power made it economically feasible to pump groundwater for irrigation, contributing to greater expansion of farm production.

Transportation

Since prehistoric times, the Valley has served as a route of travel and trade for Native Americans, fur traders, ox cart and wagon roads (El Camino Viejo, the Old Los Angeles Trace or Old West Side Road), and parallel paths for the Stockton-Visalia and Butterfield overland stages. Construction of the Southern Pacific Railroad along the east side of the Valley in 1877 led to expansions in wheat farming and ranching, and in 1893, the Southern Pacific opened a branch line through the Elk Hills from Bakersfield to Asphalto (now McKittrick) to serve the growing asphalt industry there (Nachmanoff et al. 1999). These transportation improvements facilitated industrial growth and prosperity, expanded markets for the local products, brought about a population increase of 45 percent between 1900 and 1930, and stimulated interest in the exploration for oil.

Oil Discovery

Petroleum extraction in the region had begun with the Buena Vista Petroleum Company's refinery north of McKittrick in the 1860s, but the cost of transportation at the time made this a minor effort. The railroad, coupled with major discoveries in the McKittrick, Sunset, Kern River, and Elk Hills oil fields in the early 1900s, led to a rush to develop oil fields on the west side of the valley. Three companies acquired control of the resource and refineries: Standard Oil, Southern Pacific, and the cooperative called Associated Oil.

The Dust Bowl Migration

One of the most notable migrations to California occurred during the 1930s and 1940s when over one million people living in the Southern Plains states of Oklahoma, Texas, Missouri and Arkansas travelled to California in their search for work during the Great Depression (Gregory 1989:xiv). Already by the mid-1920s these "Southwesterners", as they were sometimes referred to, had begun migrating to the San Joaquin Valley primarily to work in the agricultural industry that was so prevalent there.

The San Joaquin Valley was a natural draw to which Southwesterners would wish to relocate. The economic focus on the oil and agricultural industries, primarily cotton, closely mirrored the prevalent industries in the Southwest, especially in the panhandles of Texas and Oklahoma. With family members already established in the region (by the 1930s at least half of the Southwestern migrants had family in California) and stories of a plethora of work in California reaching their ears, it was only a matter of time before

Southwesterners would migrate in larger numbers as their economic and physical situations in their home states deteriorated (Gregory 1989:28, 40).

The migrants came from a region that had been subject to extreme drought and over-farming, a combination that resulted in massive dust storms which swept over the plains. Referred to as the “Dust Bowl”, these environmental effects made it practically impossible to conduct agriculture in the most heavily hit areas (the Oklahoma and Texas panhandles, eastern Colorado and Kansas). The impact of the dust storms was only exacerbated by the Great Depression. California was seen as the only option for some of these people.

Once the Southwesterners arrived in California they quickly found out that work was not as easy to come by as the stories their friends and family had relayed to them made it seem. For those migrants without established family in California, living situations were very poor. Most migrants lived in squatter’s camps on the outside of cities, camped along irrigation ditches, or were lucky enough to have housing on the farm on which they worked. The government began constructing 13 Farm Security Administration camps in the mid-1930s (the closest one located to the proposed project site was located south of Bakersfield), camps which were designed to be more sanitary and comfortable than road-side housing.

The Southwesterners were slow to be absorbed into the social fabric of California, especially in the San Joaquin Valley. Because they lived in camps on the outskirts of town, referred to as “Okievilles” or “Little Oklahomas”, they were physically separated from the local populations, and the “plain-folk Americanism” culture they brought from the Southwest was not well received by many in the local populations (Gregory 1989:72, 141).

Often called “Okies” or “Arkies” by local Californians, the migrants were surprised that they were subject to discrimination that had heretofore been saved for minority groups (Stein 1979:60). As the Southwesterners continued to live in these regions, their cultural influences became more and more a part of the local community. Country music, saloons, and churches which reflected Southwestern cultural elements eventually came to be accepted institutions in the San Joaquin Valley by the 1940s (Gregory 1989:142).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

Regulatory Context

California Environmental Quality Act

Various laws apply to the evaluation and treatment of cultural resources. CEQA requires the Energy Commission to evaluate resources by determining whether they meet several sets of specified criteria. These evaluations then influence the analysis of potential impacts to the resources and the mitigation that may be required to ameliorate any such impacts.

CEQA and the State CEQA Guidelines define significant cultural resources under two regulatory definitions: historical resources and unique archaeological resources. A historical resource is defined as a "resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the CRHR", or "a resource listed in a local register of historical resources or identified as significant in a historical resource survey meeting the requirements of Section 5024.1 (g) of the Public Resources Code," or "any object , building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California, provided the agency's determination is supported by substantial evidence in light of the whole record." (14 Cal. Code Regs., §15064.5[a].) Historical resources that are automatically listed in the CRHR include California historical resources listed in or formally determined eligible for the NRHP and California Registered Historical Landmarks from No. 770 onward (Pub. Resources Code, §5024.1[d]).

Under CEQA, a resource is generally considered to be historically significant if it meets the criteria for listing in the CRHR. These criteria are essentially the same as the eligibility criteria for the NRHP. In addition to being at least 50 years old,[22] a resource must meet at least one (and may meet more than one) of the following four criteria (14 Calif. Code Regs., §15064.5[a][3]):

- Criterion 1, is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Criterion 2, is associated with the lives of persons significant in our past;
- Criterion 3, embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative person, or possesses high artistic values; or
- Criterion 4, has yielded, or may be likely to yield, information important in prehistory or history.

In addition, historical resources must also possess integrity of location, design, setting, materials, workmanship, feeling, and association (14 Cal. Code Regs., §4852[c]).

Even if a resource is not listed or determined to be eligible for listing in the CRHR, CEQA allows the lead agency to make a determination as to whether the resource is a historical resource as defined in Public Resources Code, sections 5020.1(j) or 5024.1.

In addition to historical resources, archaeological artifacts, objects, or sites can meet CEQA's definition of a unique archaeological resource, even if it does not qualify as a historical resource (14 Cal. Code Regs., §15064.5[c][3]). Archaeological artifacts, objects, or sites are considered unique archaeological resources if "it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

[22] The Office of Historic Preservation (OHP 1995:2) endorses recording and evaluating resources over 45 years of age to accommodate a five-year lag in the planning process.

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person." (Pub. Resources Code, §21083.2[g].)

To determine whether a proposed project may have a significant effect on the [cultural resources] environment, staff analyzes the proposed project's potential to cause a substantial adverse change in the significance of historical or unique archaeological resources. The significance of an impact depends on:

- The cultural resource affected;
- The nature of the resource's historical significance;
- How the resource's historical significance is manifested physically and perceptually;
- Appraisals of those aspects of the resource's integrity that figure importantly in the manifestation of the resource's historical significance; and
- How much the impact will change those integrity appraisals.

At Title 14, California Code of Regulations, section 15064.5(b), the State CEQA Guidelines define a substantial adverse change as "physical demolition, destruction, relocation or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired".

Section 106 of the National Historic Preservation Act

The NHPA of 1966 authorized the creation of the NRHP, which contains the federal government's list of buildings, structures, objects, sites, and districts that it considers significant in American history, architecture, engineering, archaeology, and culture (16 U.S.C., §470[a][1][A]). Properties eligible for inclusion in the NRHP must meet one or more of the significance criteria defined below:

- Criterion A: Properties associated with events that have made a significant contribution to the broad patterns of American history.
- Criterion B: Properties associated with persons significant in the American past.
- Criterion C: Properties that embody distinctive characteristics of a type, period, or method of construction, or are the work of a master, or possess high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction.
- Properties that yield or may yield information important in prehistory or history. (36 C.F.R., §60.4.)

In addition to meeting one of the criteria listed above, a property must retain historical integrity. The NRHP assesses seven aspects of historical integrity:

- Location: The place where the historic property was constructed or the place where the historic event occurred.

- Design: The combination of elements that create the form, plan, space, structure, and style of a property.
- Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- Workmanship: The physical evidence of the crafts of a particular culture of people during any given period in history or prehistory.
- Setting: The physical environment of a historic property.
- Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.
- Association: The direct link between an important historic event or person and a historic property. (36 C.F.R., §60.4.)

It is unnecessary for a property to retain all seven aspects of integrity, but a property must retain those essential aspects that convey its significance. When the integrity of a property is being evaluated, the property should also be compared with similar properties. Such comparisons may be important for determining the physical features that are essential for conveying the historical significance of a property. (Little et al. 2000:35–36).

Definition of Direct and Indirect Impacts

In the abstract, direct impacts to cultural resources are those associated with project development, construction, and co-existence. Construction usually entails surface and subsurface disturbance of the ground, and direct impacts to archaeological resources may result from the immediate disturbance of the deposits, whether from vegetation removal, vehicle travel over the surface, earth-moving activities, excavation, or demolition of overlying structures. Construction can have direct impacts on historic standing structures when those structures must be removed to make way for new structures or when the vibrations of construction impair the stability of historic structures nearby. New structures can have direct impacts on historic structures when the new structures are stylistically incompatible with their neighbors and the setting, and when the new structures produce something harmful to the materials or structural integrity of the historic structures, such as emissions or vibrations.

Generally speaking, indirect impacts to archaeological resources are those which may result from increased erosion due to site clearance and preparation, or from inadvertent damage or outright vandalism to exposed resource components due to improved accessibility. Similarly, historic structures can suffer indirect impacts when project construction creates improved accessibility and vandalism or greater weather exposure becomes possible.

Ground disturbance accompanying construction at a proposed plant site, along proposed linear facilities, and related facilities has the potential to directly impact archaeological resources, unidentified at this time. The potential direct, physical impacts of the proposed construction on unknown archaeological resources are commensurate with the extent of ground disturbance entailed in the particular mode of construction.

This varies with each component of the proposed project. Placing the proposed plant into this particular setting could have a direct impact on the integrity of association, setting, and feeling of nearby standing historic structures.

Historical Resources Inventory

The development of the inventory of historical resources in and near the proposed project area is the requisite first step in the assessment of whether the project may, under Public Resources Code, section 21084.1, cause a substantial adverse change in the significance of a historical resource, and may, therefore, have a significant effect on the environment. The effort to develop the inventory has involved conducting a sequence of investigatory phases that includes doing background research, consulting with local Native American communities, conducting primary field research, interpreting the results of the inventory effort, as a whole, and evaluating whether found cultural resources are historically significant. This section discusses the methods and the results of each inventory phase, develops the historical resources inventory for the analysis of the proposed project, and interprets the inventory to assess how well it represents the archaeology of the project area of analysis.

Project Area of Analysis and Area of Potential Effects

The project area of analysis (PAA) is a concept that staff uses to define the geographic area in which a proposed project has the potential to affect cultural resources. The effects that a project may have on cultural resources may be immediate, further removed in time, or cumulative. They may be physical, visual, auditory, or olfactory in character. The geographic area that would encompass consideration of all such effects may or may not be one uninterrupted expanse. It may include the project area, which would be the site of the proposed plant (project site), the routes of requisite transmission lines and water and natural gas pipelines, and other offsite ancillary facilities, in addition to one or several discontiguous areas where the project could be argued to potentially affect cultural resources.

Federal agencies use an identical concept, termed the “area of potential effects” (APE), to account for the effects that federal undertakings might have on historic properties, or significant cultural resources (36 C.F.R., §§800.4[1], 800.16[d]). Staff has defined the PAA in coordination with DOE. The DOE plans to use staff’s PAA as the basis for their APE when consulting under Section 106 of the NHPA. Throughout this PSA/DEIS, the PAA and APE are discussed as a single entity, the PAA/APE.

Staff presently define the PAA/APE as containing the proposed project site, controlled area, natural gas pipeline, railroad spur alignment, railroad laydown yard, process water pipeline, electrical transmission line, potable water line and well field, natural gas meter/valve station, CO_2 pipeline, and horizontal directional drilling (HDD) entry/exit pits (see URS 2012a:1-1–1-3, 2-11, 2-17, 2-19, Figures 2-4, 2-7, 2-8; URS 2012a:Appendix. C[23], Figures 2-4, 2-7, 2-8 [sheets 4–7]; Pozzuto 2012a:2, Area Map, Historic Architecture Area of Potential Effects, Archaeological Area of Potential Effects; Stantec 2012a:1.0-1, 1.0-4, 1.0-5, 3.0-1 through 3.0-13, Figure 4.1-1; Stantec 2012b:Figures 2A, 2B). The PAA/APE also includes the future switchyard to which the 230-kV electrical

[23] Confidential Appendix to the Amended AFC: Railroad and Natural Gas Linears.

transmission line would be connected. See **Cultural Resources Figure 4** for an overview of the PAA/APE. **Cultural Resources Figures 5a–5k** shows the PAA/APE in detail.

Staff also includes in the PAA/APE four intersection improvement areas, which the Amended Application for Certification (Amended AFC) identifies as needing improvements to mitigate traffic impacts (URS 2012a:5.10-19, 5.10-20). Additionally, the PAA/APE includes the proposed EOR infrastructure within the EHOF. This infrastructure includes the CO_2 processing facility, about 562 miles of above- and below-ground pipelines (oil producing lines, injection lines, gathering lines, CO_2 trunk line, oil lines, natural gas lines, water lines, fuel gas lines residue gas line, nitrogen line, and propane line), about 570 well work-overs (conversion of existing wells to EOR), about 150 new wells, and 13 satellite gathering stations (Pozzuto 2012a:2, Area Map, Historic Architecture Area of Potential Effects, Archaeological Area of Potential Effects; Stantec 2012a:1.0-7, 1.0-8, 3.0-1 through 3.0-10, Figure 4.1-1).

The PAA/APE consists of archaeological and historic built environment components (**Cultural Resources Figures 5a–k**). The archaeological components of the PAA/APE consist of the proposed footprint of the facilities listed in the previous three paragraphs. In addition, the archaeological PAA/APE includes buffers surrounding all of these proposed facilities in accordance with the Energy Commission's Siting Regulations (20 Cal. Code Regs., §1704(b)(2), App. B[g][2][C]). These buffers permit staff to account for the possibility of additional staging and laydown areas as well as minor project design changes. Staff includes a 200-feet buffer around the following proposed project features:

- Project site
- Controlled area
- Railroad laydown yard
- Natural gas meter/valve station
- HDD entry/exit pits
- CO_2 processing facility
- Water wells (well field serves as the buffer)
- Satellite gathering stations
- 150 well sites (work-overs and new well pads)
- Intersection improvement areas
- Electrical switching station

Also consistent with Title 20, California Code of Regulations, section 1704, Appendix B(g)(2)(C), staff includes a 50-feet buffer surrounding the following project elements:

- Process water line
- Natural gas pipeline
- Potable water line

- Electrical transmission line
- Railroad spur
- CO_2 pipeline from the project site to the CO_2 processing facility
- above- and below-ground pipelines in the EHOF:
    - oil producing lines
    - injection lines
    - gathering lines
    - CO_2 trunk line
    - oil lines
    - natural gas lines
    - water lines
    - fuel gas lines
    - residue gas line
    - nitrogen line
    - propane line

The depth of excavation required for construction varies among the project elements (**Cultural Resources Table 2**). The depths of excavation tabulated below present the vertical or subsurface component of the PAA/APE.

Cultural Resources Table 2
Depth of Excavation by Project Element

Project Element	Maximum Depth of Excavation[1]	References
HECA Project Elements		
Project site	5–50 ft—grading 6 ft—structural foundations	URS 2012d:A150-1
Controlled area	2.5 ft	URS 2012b:A89-1, A89-2
Railroad laydown area	Surficial	
Railroad spur	0.5–3.0 ft	URS 2012d:A150-1
Natural gas meter/valve station	6 ft (100-ft-by-100-ft footprint)	URS 2012a:2-61, 2012d:A150-2
Natural gas pipeline (12-inch diameter)	7 ft (13-mi-long, 50-ft-wide corridor)	URS 2012a:2-61, Table 2-1; URS 2012d:A150-1
HDD entry/exit pits	Up to 50–100 ft (100-ft-by-200-ft footprint)	URS 2012a:2-64, 2-65
Process water line	5 ft (within 15-mi-long, 50-ft-wide corridor)	URS 2012a:5.3-27, Table 2-1
Water wells	300–400 ft (100-ft-by-150-ft footprint)	URS 2012a:5.9-13
Potable water line	6 ft (within 1-mi-long, 10-ft-wide corridor)	URS 2012a:2-62, Table 2-1; URS 2012d:A150-2
Electrical transmission line	28 ft (26 tubular steel poles, 6-ft diameter within 2-mi-long, 100-ft-wide permanent right of way [ROW]); turning towers will be drilled 35 ft deep	URS 2012a:2-61, 5.9-14, 5.15-1; URS 2012d:A150-2; Western 2012

Project Element	Maximum Depth of Excavation[1]	References
Electrical switching station	9 ft (4-ac footprint)	URS 2013a:2-2

CO_2 trunk line, 6-inch	4.5–6.5 ft (59-ft ROW)	Stantec 2012a:Tables 3-2, 3-3
CO_2 trunk line, 4-inch	4.3–6.3 ft (40-ft ROW)	Stantec 2012a:Tables 3-2, 3-3
Oil tie-in lines, 8-inch	Surface	Stantec 2012a:Table 3-2
Natural gas lines, 3-inch	Surface	Stantec 2012a:Table 3-2
Water lines, laterals, 10-inch	Surface	Stantec 2012a:Table 3-2
Fuel gas lines, 6-inch	Surface	Stantec 2012a:Table 3-2
Residue gas line, 6-inch	Surface	Stantec 2012a:Table 3-2
Nitrogen line, 8-inch	Surface	Stantec 2012a:Table 3-2
Propane line	Unknown	

Notes: 1. Depth below current ground surface. Abbreviations: ac = acre(s); ft = foot/feet

Background Research

The background research for the present analysis employs information that the applicant and staff gathered from literature and record searches, and information that the DOE and staff obtained as a result of consultation with local Native American communities. The purpose of the background information is to help formulate the initial cultural resources inventory for the present analysis, to identify information gaps, and to inform the design and the interpretation of the field research that will serve to complete the inventory.

Literature and Records Search

The literature and records search portion of the background research attempts to gather and interpret documentary evidence of the known cultural resources in the project area of analysis. The source for the present search was the Southern San Joaquin Valley Information Center (SSJVIC) of the California Historical Resources Information System (CHRIS).

CHRIS Search

Methods

URS, the cultural resources consultant to the applicant, requested records searches from the SSJVIC for several iterations of the proposed project on the following dates: in 2008 (three records searches on undisclosed dates), February 11 and 19, 2009 (RS # 09-019, 09-056). URS cultural resources staff also conducted supplemental records searches at the SSJVIC on January 12 and February 13, 2012 (RS #09-056). The 2008 and 2009 records searches covered the then-proposed project area and a 1-mile radius surrounding the project area. The 2012 records searches covered the project area and a 1-mile radius surrounding it, as well as a 0.5-mile radius from the linear project elements. The 2008 records searches comprised examinations of the SSJVIC's base maps of previous cultural resources studies and known cultural resources, as well as the following sources:

- NRHP listings.
- The Office of Historic Preservation's (OHP) Archeological Determinations of Eligibility (2006 and 2012 listings).
- OHP Directory of Historic Properties (2006, October 10, 2008, February 4, 2009, and 2012 listings).
- California State Historical Landmarks listings (1988 listings).
- CRHR listings.
- California Inventory of Historic Resources listings.
- Five Views: An Ethnic Sites Survey for California (OHP 1988).
- California Points of Historical Interest listings (1988 listings). (Farmer 2008:2-8; Hale and Laurie 2009:H3-27; Hale et al. 2012:G-3-25; HEI, with URS 2008:5.3-12; URS 2009c:5.3-18, 5.3-19; URS 2010; URS 2012a:5.3-19; URS 2013a:3-5).

At the request of Stantec Consulting Corporation, SSJVIC staff conducted a records search of the proposed CO_2 pipeline south of the California Aqueduct to the proposed CO_2 processing facility on February 21, 2011 (RS # 11-057). The records search covered the project area and a 0.5-mile radius. In conducting the records search, SSJVIC staff consulted their base maps of previous cultural resources studies and known cultural resources in the records search area. The SSJVIC also consulted the following sources of information:

- NRHP listings.
- Historic Property Data File listings (October 5, 2010).

- California State Historical Landmarks listings.
- CRHR listings.
- California Inventory of Historic Resources listings.
- California Points of Historical Interest listings. (Stantec 2011:2, Appendix A.)

OEHI's cultural resources consultant, Stantec Corporation, has completed a cultural resources inventory of the defined EOR components of the proposed HECA project. The reporting and other documentation associated with this work, however, was not submitted to the Energy Commission in time for incorporation into this PSA/DEIS. According to OEHI staff, the study has been completed, but staff has not yet received the resulting inventory report or the records search results. Staff will discuss Stantec's cultural resources inventory and findings in the Final Staff Assessment/Final Environmental Impact Statement (FSA/FEIS).

Results

The SSJVIC records searches found that 66 investigations have been wholly or partially conducted in the records search area (**Cultural Resources Table 3**).

The records searches indicate that while 59 cultural resources are known for the record search area, only 12 are located in the PAA/APE (**Cultural Resources Table 4**).

Cultural Resources Table 4
Known Cultural Resources Located in the Vicinity of the Proposed HECA Project

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
Prehistoric Archaeological Resources						
CA-KER-52 (P-15-52)	Lithic scatter		Previously known	Near Midway Substation	Not evaluated	URS 2013a:Table 3.3-1
CA-KER-86 (P-15-86)	Midden/Long term habitation	"Indian Burial Mound." No other information recorded.	Previously known	Near process water line	Not evaluated	Fenenga 1954a
CA-KER-88 (P-15-88)	Midden/Long term habitation	"Indian Burial Mound." No other information recorded.	Previously known	Near process water line	Not evaluated	Fenenga 1954b
CA-KER-124 (P-15-124)	Midden/Long term habitation	Midden with shell and lithics.	Previously known	Controlled area	Not evaluated	Payen 1963a
CA-KER-125 (P-15-125)	Multi-constituent/Short term habitation	Shell and lithic scatter. No other information recorded.	Previously known	Near project site and controlled area	Not evaluated	Payen 1963b
CA-KER-126 (P-15-126)	Midden/Long term habitation	Site not relocated: Large midden (5 ac +) gray soil, FCR, high density shell, shell ornaments, lithic flakes and tools. Likely damaged by California Aqueduct construction.	Previously known	Near project site, controlled area	Not evaluated	Payen et al. 1963
CA-KER-171 (P-15-171)	Midden/Long term habitation	Site not relocated: Occupation site near Dover Well. No other information recorded. Likely damaged by California Aqueduct construction.	Previously known	Process water well field	Not evaluated	Latta 1950

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
CA-KER-179 (P-15-179)	Midden/Long term habitation	Burial mound	Previously known	Near process water line	Not evaluated	Pilling 1950
CA-KER-325 (P-15-325)	Midden/Long term habitation	Dense shell, 32 olive snail shell beads, steatite reel and other artifacts, chert and obsidian debitage and projectile points	Previously known	Near railroad spur	Not evaluated	WJW and ETW 1970; URS 2013a:Table 3.3-1
CA-KER-358 (P-15-358)	Midden/Long term habitation	Dark midden soil, diffuse shell and lithic scatter, chert, basalt and obsidian debitage and tools, groundstone, soapstone. Tule Elk State Reserve.	Previously known	Near controlled area	Not evaluated	Olsen 1974a; Parr 2002a; Reinoehl 1991; Woodward 1983
CA-KER-1493 (P-15-1493)	Multi-constituent/Short term habitation	Light scatter of shell, chert debitage, groundstone. Likely disturbed by transmission line construction.	Previously known	Near process water line	Not evaluated	Moore 1982
CA-KER-1611 (P-15-1611)	Multi-constituent/Short term habitation	Light scatter of shell, chert, obsidian debitage and tools, slate, hammerstone, burned bone. Surface collection by Hartzell. Tule Elk State Reserve.	Previously known	Near project site, controlled area, transmission line, potable water line	Not evaluated	Hartzell 1992; Mealy 2004; Parr 2002b
CA-KER-1612 (P-15-1612)	Lithic scatter	Lithic scatter, low density scatter of chert debitage. Tule Elk State Reserve.	Previously known	Near project site, controlled area	Recommended ineligible	Reinoehl 1991; Woodward 1983
CA-KER-2329 (P-15-2329)	Multi-constituent/Short term habitation	Temporary camp site. Dispersed scatter of shell and chert debitage. Very dense at the center. Shovel probes excavated in 1997. Damage from firebreak. NPR-1.	Previously known	Near controlled area, CO_2 line	Recommended ineligible	Jackson et al. 1998
CA-KER-2414 (P-15-2414)	Multi-constituent/Short term habitation	Dispersed scatter of shell, chert debitage, burned bone, groundstone. Tule Elk State Reserve.	Previously known	Near project site, controlled area, CO_2 line	Not evaluated	Mealy 2004; Reinoehl 1991
CA-KER-2415 (P-15-2415)	Lithic scatter	Low density chert debitage. Part of CA-KER-359? Tule Elk State Reserve.	Previously known	Near project site, controlled area	Not evaluated	Reinoehl 1991

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
CA-KER-2416 (P-15-2416)	Lithic scatter	Low density chert debitage. Mostly destroyed by bulldozer. Tule Elk State Reserve.	Previously known	Near project site, controlled area, CO_2 line	Not evaluated	Reinoehl 1991
CA-KER-2417 (P-15-2417)	Multi-constituent/Short term habitation	Low density shell and chert debitage, burned mammal bone. Two loci. Tule Elk State Reserve.	Previously known	Near project site, controlled area, transmission line, potable water line	Not evaluated	Reinoehl 1991
CA-KER-2419 (P-15-2419)	Multi-constituent/Short term habitation	Low density scatter of shell, chert, basalt, and obsidian debitage and tools. Tule Elk State Reserve.	Previously known	Near project site	Not evaluated	Reinoehl 1991
CA-KER-2420 (P-15-2420)	Lithic scatter	Low density chert and obsidian debitage scatter. Tule Elk State Reserve.	Previously known	Near project site	Not evaluated	Reinoehl 1991
CA-KER-2464 (P-15-2464)	Midden/Long term habitation	Buried midden soil containing lithics and shell.	Previously known	Near project site	Not evaluated	Schulte 1988
CA-KER-2485 (P-15-2485)	Multi-constituent/Short term habitation	Partially destroyed by a bulldozer. Groundstone, flaked stone tools. Two unusual intact projectile points.	Previously known	Near process water line, near BS-IF-003	Not evaluated	Hale and Laurie 2009; Hale et al. 2012; Jackson 1989
CA-KER-2718 (P-15-2718)	Midden/Long term habitation	Several small mounds of midden deposit with scattered shell and lithics.	Previously known	Near process water line	Not evaluated	Laframboise 1990a
CA-KER-2719 (P-15-2719)	Midden/Long term habitation	Midden soil, obsidian and shell and flakes, shell, and bead scatter. Three olive snail shells: wall, spire-ground, and split-punched.	Previously known	Near process water line	Not evaluated	Laframboise 1990b
CA-KER-2720 (P-15-2720)	Midden/Long term habitation	Midden mound shell, chert debitage and cores. Test excavations revealed cache of charmstones, burial, shell beads, and projectile points. Site dates to between 3500 B.P. to the modern era.	Previously known	Near process water line	Not evaluated	Haas 1997; Jackson and Shapiro 1999; Laframboise 1990c; Sutton 1996

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
CA-KER-2721 (P-15-2721)	Midden/Long term habitation	Midden soil with a lithic, groundstone and shell scatter. Testing and surface collection by CSUB. Steatite bowl fragment, Cottonwood Triangular point, Elko projectile point, 12 olive snail shell beads.	Previously known	Near process water line	Not evaluated	Jackson and Shapiro 1999; Laframboise 1990d
CA-KER-3077 (P-15-3077)	Multi-constituent/Short term habitation	Temporary habitation: three loci. Excavated 1992 and 1997. Two ^{14}C dates between 910 and 575 B.P. NPR-1.	Previously known	Near controlled area, CO_2 line, EOR facilities	Recommended ineligible	Jackson et al. 1998; Peak & Associates 1991
CA-KER-3079 (P-15-3079)	Multi-constituent/Short term habitation	Sparse prehistoric shell and lithic scatter, 5.5 ac. Excavation produced flaked and ground stone tools, obsidian, steatite and olive snail shell beads, shell, debitage, faunal remains, and suspected cemetery.	Previously known	Near CO_2 line	Recommended eligible	Hale and Laurie 2009; Henshaw 1997; Peak & Associates 1991, 1992
CA-KER-3088 (P-15-3088)	Lithic scatter		Previously known	Near electrical switching station	Not evaluated	URS 2013a:Table 3.3-1
CA-KER-3163 (P-15-3163)	Multi-constituent/Short term habitation	Sparse scatter of shell, chert flakes and tools. NPR-1.	Previously known	Near EOR pipeline	Recommended ineligible	Peak & Associates 1991
CA-KER-3861 (P-15-3861)	Multi-constituent/Short term habitation	Sparse shell and chert debitage scatter. Disturbed by oil well construction. NPR-1.	Previously Known	Near CO_2 line	Recommended ineligible	Clift 1993; Jackson et al. 1998
P-15-6026	Unknown	Unknown	Previously Known	Near electrical switching station and transmission line	Unknown	
CA-KER-5362 (P-15-6734)	Multi-constituent/Short term habitation	Temporary campsite. Sparse shell scatter. No diagnostic artifacts. NPR-1.	Previously Known	Near controlled area, CO_2 line	Recommended ineligible	Jackson et al. 1998

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
CA-KER-5363 (P-15-6735)	Multi-constituent/Short term habitation	Temporary campsite. Sparse shell scatter. No diagnostic artifacts. NPR-1.	Previously Known	Near controlled area, CO_2 line	Recommended ineligible	Jackson et al. 1998
CA-KER-5392 (P-15-6767)	Multi-constituent/Short term habitation	Continuous, sparse chert lithic and shell scatter with two dense loci. Test excavations revealed olive snail shell beads, ground stone, lithic tools and baked clay. Rectangular mussel beads. Locus A: 1350–1050 B.P. Locus B: 3150 B.P.	Previously known	CO_2 Line; near controlled area	Recommended ineligible	Jackson et al. 1998; Nachmanoff et al. 1999; Peak & Associates 1991
CA-KER-5393 (P-15-6768)	Multi-constituent/Short term habitation	Temporary campsite. Sparse shell scatter. No diagnostic artifacts. NPR-1.	Previously known	Near project site, controlled area, EOR pipeline	Recommended ineligible	Jackson et al. 1998
CA-KER-5394 (P-15-6769)	Multi-constituent/Short term habitation	Temporary campsite. Sparse shell scatter. No diagnostic artifacts. NPR-1.	Previously known	Near EOR pipeline	Recommended ineligible	Jackson et al. 1998
CA-KER-5396 (P-15-6771)	Multi-constituent/Short term habitation	Temporary campsite. Sparse shell scatter. Testing revealed some chert debitage and olive snail shell beads. ^{14}C-dated to between 950 and 750 B.P. NPR-1.	Previously Known	Near controlled area, EOR facilities	Recommended ineligible	Jackson et al. 1998
P-15-9734	Lithic scatter	Previously four isolates. Sparse chert debitage and tool scatter.	Previously Known	Near process water line	Not evaluated	Jackson and Shapiro 1999
P-15-9818	Isolate	Shaped pestle	Previously known	Near process water line	Not eligible	URS 2009b:Figure 1, Sheet 5
P-15-9819	Unknown	Unknown	Previously known	Near process water line	Unknown	URS 2009b:Figure 1, Sheet 5
P-15-10238	Isolate	Chert interior flake and burnt bone	Previously known	Near process water line	Not eligible	Aviña 1999; Hale and Laurie 2009:Figure 1, Sheet 5

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
CA-KER-6504 (P-15-11157)	Multi-constituent/Short term habitation	Shell, chert debitage, burned bone, steatite ornament, obsidian biface, groundstone scatter. Tule Elk State Reserve.	Previously Known	Near project site, controlled area, transmission line, potable water line	Not evaluated	Mealy and Pettus 2004
Historical Archaeological Resources						
CA-KER-3253H (P-15-3253)	Habitation and trash scatter	Two loci of historic domestic refuse scatter and structural remains. A residence for oil well workers, possibly Pacific Oil Lease. Artifacts date to 1930 and 1950. NPR-1.	Previously known	Near controlled area	Recommended ineligible	Hamusek-McGann et al. 1997; Peak & Associates 1991
Multi-Component Resources						
CA-KER-34/H (P-15-34) CA-KER-35/H (P-15-35) CA-KER-36/H (P-15-36)	Midden/Long term habitation	Remains of three midden mounds (~6 ft high); nine burials with FCR, beads, bone tools, and charmstones, excavated in 1920s. Mounds since leveled. Shell, lithic flakes and tools, groundstone. Likely long-term occupation. Remains of historic Elk Grove Ranch: glass, ceramic, metal.	Previously known	Near process water line	Not evaluated	Gifford and Schenck 1926; Hale and Laurie 2009; Hale et al. 2012; Jackson and Shapiro 1999
CA-KER-89/H (P-15-89)	Midden/Long term habitation	10–12-ft-high mound with human bone, shell beads, chert debitage, turtle and rabbit bone. Purple glass.	Previously known	Near process water line	Not evaluated	Hale and Laurie 2009; Hale et al. 2012; Laframboise 1990e
CA-KER-359/H (P-15-359)	Multi-constituent/Short term habitation	Diffuse shell scatter with four dense loci, chert, basalt and obsidian debitage and tools, steatite bowl, groundstone, Northern side notched point, 19th-century artifacts (metal, glass, ceramics).	Previously known	Near project site, controlled area	Not evaluated	Hale and Laurie 2009; Hale et al. 2012; Olsen 1974b; Parr 2002c; Reinoehl and Hartzell 1987
CA-KER-3105/H (P-15-3105)	Lithic and historic refuse scatter	Chert debitage, basalt core, granitic handstone, fire-affected rock, olive	Previously known	Near natural gas line	Not evaluated	Hale and Laurie 2012; Hale et al. 2012

Resource Designation	Type	Description	Previously Known/ New	Project Component	NRHP/ CRHR Status	Source
		snail shell bead, amethyst glass, solder-top cans, ceramics, license plate				
CA-KER-5356/H (P-15-6725)	**Multi-constituent/ Short term habitation**	**Sparse prehistoric shell and chert debitage scatter. Glass and ceramic scatter.**	**Previously known**	**Near process water line, near P-15-7176**	**Not evaluated**	**Hale and Laurie 2009; Hale et al. 2012; Jackson and Shapiro 1999**
Notes: CSUB = California State University, Bakersfield; FCR = fire-cracked rock						

Additional Archival Research

The applicant conducted additional archival research using print, online, and library/repository sources. Standard online and print sources included the online listings of the NRHP, the CRHR, *California Historical Landmarks*, and *California Points of Historical Interest* (California Department of Parks and Recreation 1992, 1996, cited in URS 2012a:5.3-20). Research concerning the history of the project vicinity and identified historic built environment resources was conducted at the following locations in 2009 and 2012: California State Library, Sacramento; Shields Library, University of California, Davis; Bancroft Library, University of California, Berkeley; Water Resources Center Archives, University of California, Berkeley; Beale Memorial Library, Bakersfield; and the Kern County Museum, Bakersfield (URS 2012a:5.3-24).

The applicant also reviewed historic maps and aerial photographs of the proposed project area to identify potential cultural resource locations (URS 2012a:Tables 5.3-1, 5.3-2). The consulted materials included U.S. Geological Survey (USGS) topographic maps, a county survey map, and General Land Office (GLO) survey plats.

In 2012, staff conducted additional research at the California History Room of the California State Library in Sacramento, the Cadastral Survey Office at the Bureau of Land Management in Sacramento, and online sources. The research was conducted to improve the historic map coverage acquired by the applicant. All consulted historic maps and aerial photographs are presented in **Cultural Resources Table 5**.

Native American Consultation

Native American Heritage Commission

The Governor's Executive Order B-10-11, executed on September 19, 2011, directs state agencies to engage in meaningful consultation with California Indian tribes on matters that may affect tribal communities. The Energy Commission Siting Regulations require applicants to contact the NAHC for information on Native American sacred sites and a list of Native Americans interested in the project vicinity. The applicant is then required to notify the Native Americans on the NAHC list about the project. The applicant must also provide to the Energy Commission in the AFC a copy of all correspondence with the NAHC and Native Americans and any written responses received, as well as a written summary of any oral responses (20 Cal. Code Regs., §1704(b)(2), App. B(g)(2)(D)). The applicant conducted Native American outreach multiple times over three years (2008–2010). A summary of the applicant's Native American outreach efforts can be found at Table 5.3-5 of the Amended AFC (URS 2012a:5.3-63 through 5.3-65) and immediately following this introduction.

The NAHC is the primary California government agency responsible for identifying and cataloging Native American cultural resources, providing protection to Native American human burials and skeletal remains from vandalism and inadvertent destruction, and preventing irreparable damage to designated sacred sites and interference with the expression of Native American religion in California. It also provides a legal means by which Native American descendants can make known their concerns regarding the need for sensitive treatment and disposition of Native American burials, skeletal remains, and items associated with Native American burials.

The NAHC maintains two databases to assist cultural resource specialists in identifying cultural resources of concern to California Native Americans, referred to by staff as Native American ethnographic resources. The NAHC's Contacts database has the names and contact information for individuals, representing a group or themselves, who have expressed an interest in being contacted about development projects in specified areas. The NAHC's Sacred Lands File has records for places and objects that Native Americans consider sacred or otherwise important, such as cemeteries and gathering places for traditional foods and materials. However, the Sacred Lands File only contains those resources that tribes are willing to disclose to the NAHC and cannot be considered a comprehensive list of areas, places, objects, or sites that Native Americans consider sacred or otherwise important.

Staff requested that the NAHC perform a Sacred Lands File check. On June 12, 2012, the NAHC responded that the Sacred Lands File did not contain any information that pertained to the area. A list of tribal contacts was also provided. The NAHC response to the Energy Commission request was similar to NAHC responses to the applicant's Sacred Lands File search requests.

General Tribal Government Background

At the time of PSA/DEIS publication, three tribal governments out of the seven invited tribal governments and one tribal organization are engaged with staff concerning the proposed project (**Cultural Resources Table 6**). General information concerning these contemporary tribal governments is presented below. Essentially, the proposed project is in the traditional territory of the Southern Valley Yokuts and the ethnographic context included in this document, focuses on Southern Valley Yokuts cultural practices. Other tribal affiliations are included here because these tribes also maintain traditional ties to the project vicinity.

By way of background, federal recognition is the process through which the federal government establishes a relationship with a sovereign Native American tribal government, or Indian tribe. Federal recognition status allows tribes to receive certain financial and cultural benefits, such as grant money and repatriation of some cultural materials. Not all of the tribes with which the Energy Commission consults are recognized by the federal government, but because the Energy Commission is a state agency, recognition by the federal government is not necessary for tribes to participate in consultation with the Energy Commission.

Cultural Resources Table 6
Summary of Tribal Participation

Tribe	Cultural Affiliation	Project Participation
Santa Rosa Rancheria	Tachi (Yokuts), Yokuts	Yes
Tejon Indian Tribe	Yowlumne (Yokuts), Kitanemuk, Kawaiisu	Yes
Kitanemuk and Yowlumne Tejon Indians	Yowlumne (Yokuts), Kitanemuk	Yes
Kawaiisu Tribe of the Tejon Reservation	Kawaiisu	No
Tule River Indian Tribe	Yokuts	No
Kern Valley Indian Council	Southern Paiute, Kawaiisu, Tubatulabal, Koso, Yokuts	No
Tubatulabals of Kern Valley	Tubatulabal	No

Yokuts

The reservation period for the Yokuts began with the influx of white settlers in the mid-nineteenth century, and the push by the settlers for more land. As a result, treaties were negotiated in 1851 and 1852 between the extant Yokuts tribes of the San Joaquin Valley and the United States government. The Native Americans negotiated in good faith and agreed to cede their lands for 10 reservations throughout Central California and payments in goods. The U.S. Senate did not ratify the treaties. Consequently, some of the Native American groups stayed on their traditional lands, while others relocated to one of the reservations that had already been established near the base of the Tehachapi range, or the Fresno reservation near Madera. Life was difficult for Native Americans in the San Joaquin Valley at this time, and many people became destitute and dependent upon white people who employed them as day laborers. (Wallace 1978b:460).

Santa Rosa Rancheria

The Santa Rosa Rancheria is the federally recognized reservation of the Tachi Yokuts. It was established in 1934[24] on 40 acres of land near Lemoore, California, and close to the site of an old Indian village, Wiu (Cummins 1978:55). The Tachi-Yokuts traditionally resided around Tulare Lake, from the southwest portion of the lake clockwise to the northern edge (Latta 1999:back cover). The initial reservation was small, and only 40 people lived there, in relative destitution. By the 1980s, the reservation had been expanded to 170 acres and by then about 200 people resided there. The Santa Rosa Rancheria remained relatively impoverished until 1988 when the Indian Gaming Regulatory Act was passed, allowing tribes to own and operate their own casinos. Today, the Santa Rosa Rancheria is governed by a six-member tribal council, consisting of a chairman, vice-chairman, secretary, treasurer, and two delegates. The tribe does not have a Tribal Historic Preservation Officer (THPO), but does have a director of their Cultural and Historical Preservation Department. (Tachi-Yokut Tribe 2012a, 2012b, 2012c).

Kitanemuk and Yowlumne Tejon Indians

The Kitanemuk are a small group of Native Americans who traditionally resided in the Tehachapi Mountains at the southern end of the San Joaquin Valley. They spoke a dialect of the Serran language, a branch of the Takic family group and were primarily mountain dwellers, but occasionally during cooler months would range into the lowlands to the south. They had an antagonistic relationship with the Yokuts to the north and the Tataviam to the south, but were on friendly terms with the Chumash to the west and Tubatulabal to the northeast. Culturally, the Kitanemuk were influenced by the Yokuts and Chumash, especially in their ritual, mythology, and shamanism. (Blackburn and Bean 1978:564).

The Kitanemuk and Yowlumne Tejon Indians Tribe is not federally recognized, and does not have an established reservation or cultural resources management department. However, Chairperson Delia Dominguez has been working for 16 years to gather the necessary information for the U.S. government and petition them for federal recognition. (Hedlund 2009).

Tule River Indian Tribe

The Tule River Reservation was established by an executive order issued by President Ulysses S. Grant on January 9, 1873. The reservation originally comprised about

[24] Cummins (1978:55) suggests that the reservation was established in 1921; the 1934 date comes from the Tachi Yokuts Tribe’s website.

48,000 acres of land located about 20 miles east of Porterville. Today the reservation covers about 54,400 acres with about 850 tribal members in the area. (White 2012). The federally recognized Tule River Tribe maintains a nine-member tribal council, consisting of a chairman, vice-chairman, treasurer, secretary, and five elected members. The tribe does not currently have a THPO, but does maintain an archaeological resource protection program. (Tule River Indian Tribe 2011a, 2011b).

Tejon Indian Tribe

The Tejon Indian Tribe is a recent federally re-recognized tribe consisting of members from the Yowlumne, Kitanemuk, and Kawaiisu groups. After having spent several years with their status as a federally recognized tribe in question, the Tejon Indian Tribe received confirmation of their status as a federally recognized tribe on January 3, 2012. Due to an administrative error, the Tejon Indian Tribe was not listed for several years on the Federal Register as having a relationship with the federal government. However, in a letter to the tribe from the Assistant Secretary of Indian Affairs, confirmation of their status was given, and in the Federal Register published August 10, 2012, the Tejon Indian Tribe was listed as a federally recognized tribe (USDOI 2012). Due to their newly confirmed status, details regarding the Tejon Indian Tribe's tribal government are limited.

Kawaiisu

Located in the area southeast of the Kern River in the Sierra Nevada foothills, these Native Americans speak a dialect of the Ute-Chemehuevi division of the Shoshonean language (Kroeber 1976:601). Consisting of about 250 members, the Kawaiisu tribe maintains the Kawaiisu Language and Cultural Center in Bakersfield where they offer the opportunity to learn more about the Kawaiisu culture (Kawaiisu Language and Cultural Center 2012).

Kawaiisu Tribe of the Tejon Reservation

The Kawaiisu Tribe of the Tejon Reservation is not a federally recognized tribe. However, they do maintain a tribal council with elected members; chair, vice-chair, secretary, treasurer, and a member at large. They have adopted a constitution which lays out their territory, jurisdiction, membership rules, what the governing body is and its powers, the rights of members, how elections are conducted, how one is removed from office, and other aspects relevant for conducting tribal affairs. (Kawaiisu Tribe 2012).

Tubatulabal

Residing in the southern Sierra Nevada in the vicinity of the Kern Valley, the Tubatulabal tribe spoke a dialect of the Uto-Aztecan language, Tubatulabal. Little is known of the Tubatulabal prior to 1850, but during historic times the Tubatulabal moved in small bands to exploit local area resources and then would return to their larger settlements along the rivers. (Voegelin 1941:2.) During the early twentieth century, many Tubatulabal members moved to the Tule River Indian Reservation, and others remained in the Kern Valley where they obtained employment through white settlers (Smith 1978:437–438).

Tubatulabals of Kern Valley

The Tubatulabals of Kern Valley are a non-federally recognized tribe based out of Lake Isabella, California. Today there are about 400 Tubatulabal people living in the Kern River Valley, with estimates of about 500 Tubatulabal outside of the area, some residing on the Tule River Indian Reservation. (White 2012).

Kern Valley Indian Council

The Kern Valley Indian Council is a non-federally recognized Native American entity. The council was established in 1984 to protect the interests of their members and consists of people belonging to the Southern Paiute, Kawaiisu, Tubatulabal, Koso, and Yokuts tribes. In 1986 the Council established the Foundation for the Kern Valley Indian Community. (National Geographic Society 2009).

Applicant's Methods and Results

URS, consultant to the applicant, contacted the NAHC seven times as the project footprint changed over the course of the last five years (2008–2013). The last effort at URS–NAHC contact and related outreach to tribal entities was initiated in the summer of 2010. On August 2, 2010 the NAHC responded to URS requests that the NAHC search its Sacred Lands File to determine whether there are any reported Native American cultural resources in the proposed project area, and to request that the NAHC provide a list of Native American contacts that may have knowledge of cultural resources in the project area. This response letter also indicated that the Sacred Lands File did not indicate the presence of any Native American cultural resources within 0.5 mi of the project site. The NAHC also provided a list of tribal entities to contact. On August 3 and 4, 2010, URS sent letters to the NAHC-listed tribal entities. On August 26 and 27, URS cultural resources staff conducted follow-up phone calls. The cultural resources representative of the Santa Rosa Rancheria and a tribal individual both advised URS that the general area was known to contain burials and that a tribal monitoring program with sensitivity be developed. The Santa Rosa Rancheria went as far as to suggest that a burial agreement be considered. (URS 2012a:5.3-63, Table 5.3-5).

Department of Energy Consultation

Pursuant to direction under federal regulations, policies, and orders, DOE consulted with Indian tribes regarding HECA's potential effects on historic properties (16 U.S.C., §470a(d)(6)(B); 36 C.F.R., §§800.2(c)(2)(ii), 800.3(f)(2), 800.4(a)(4), et seq.; DOE Policies 141.1 and 1230.2[25]). DOE identified three Indian tribes (as defined at 36 C.F.R., §800.16[m]) in the proposed project vicinity: Santa Rosa Rancheria, Tule River Indian Tribe, and Tejon Indian Tribe. DOE mailed informal consultation letters to these tribes on May 10, 2012. The letters provided a summary of the proposed project, maps of the proposed project and APE, and requested to "initiate informal government-to-government consultation" (Pozzuto 2012b, 2012c, 2012d). Tejon Indian Tribe responded to DOE by letter on June 5, 2012. The letter states, "Tejon Indian Tribe has no conflict with this project nor do we know of any cultural resources that might be impacted at this site. However, we ask that you notify us immediately if any site/s and / or artifacts are discovered during your project in the area." (Montes Morgan 2012).

[25] DOE 1992:Attachment 1, 2001:3.

These items of correspondence are reproduced in Appendix CUL-1 to this PSA/DEIS. Tejon Indian Tribe, however, elected to have further involvement in environmental impact review for the proposed project, as discussed below and in the subsection, “Energy Commission Native American Consultation”.

DOE coordinated with Energy Commission cultural resources staff to conduct a face-to-face, government-to-government meeting with Indian tribes in August 2012 and participated in a field review of the proposed EOR project elements on September 26, 2012 with representatives of Tejon Indian Tribe (see discussion under “Energy Commission Native American Consultation” below.

DOE followed up conversation with the Tejon Indian Tribe on October 3, 3012, in which the tribe requested additional mapped cultural resource locations from the Energy Commission. The information and instructions for petitioning to receive copies of confidential information was mailed to the Tejon Indian Tribe on October 3, 2012.

Energy Commission Native American Consultation

In conducting due diligence tribal outreach and information gathering, staff initiated a NAHC request for a search of the Sacred Lands File and a list of tribal contacts for the project vicinity. NAHC responded on June 13, 2012, stating that the Sacred Lands File contained no indication of Native American cultural resources in the project area. The NAHC also provided a list of tribal contacts.

On June 21, 2012, staff sent letters to the seven NAHC-listed tribal governments, one tribal organization, and one individual. On July 9, staff attempted to make verbal contact with all listed tribal entities. Six tribes, the organization, and individual responded. Of the tribes that responded, three requested a meeting to learn more about the project, and the other three tribes said they might request further information later in the process. The individual was interested in being notified of any meetings that might be scheduled to handle information exchange and tribal concerns. This correspondence between Energy Commission cultural resources staff and Native American entities is docketed and available for public review under Docket Unit 08-AFC-8A, TN #65894.

As a result of initial tribal contact, a tribal meeting was planned and scheduled for August 22, 2012. On August 21, 2012, staff was notified that tribes would not attend the scheduled meeting due to a critical issue arising from a non-Energy Commission project. The August 22 meeting was cancelled. Staff attempted to reschedule the meeting, but as a result of additional tribal calls it was determined that a tribal site visit would be more appropriate than a meeting.

During a project field visit on September 26, 2012, two representatives of the Tejon Indian Tribe participated in the visit. During the visit, the Tejon Indian Tribe made a verbal request to receive a copy of a confidential map depicting cultural resources locations that was originally provided to staff by the applicant. The tribe was informed of the Energy Commission’s petitioning process and was provided information on how to petition for confidential information in the possession of staff.

Based upon the level of correspondence and direct communications, a minimal research design, provided in the ethnographic model section below, was developed that generated a few research questions or directives. Staff had identified that the largest tribal issue with other projects in the vicinity is a tribal concern with exposure of unknown Native American burials.

Consultation with Others

Pursuant to its responsibilities under Title 36, Code of Federal Regulations, parts 800.3(a–c) and 800.4(a)(1), DOE initiated informal consultation concerning HECA with the California State Historic Preservation Officer (SHPO) by letter dated May 8, 2012. DOE's consultation letter briefly described the project and defined the proposed project's APE narratively and graphically. DOE requested that the SHPO provide input on or concur with DOE's definition of the APE. (Pozzuto 2012a). The SHPO responded by letter on May 25, 2012, stating that he was unable to concur with DOE's definition of the APE and citing the need for additional information on that subject (Donaldson 2012). On April 24, 2013, DOE mailed a letter to the SHPO, seeking concurrence on its revised APE[26] (Pozzuto 2013). DOE has not received a response from the SHPO as of the date of this PSA/DEIS. (Appendix CUL-2).

Environmental Justice/Socioeconomic Methods

In accordance with federal and state law, regulations, policies, and guidance, staff considered the proposed project's potential to cause significant adverse impacts on environmental justice populations (E.O. 12898; 40 C.F.R., §§1508.8, 1508.14; 14 Cal. Code Regs., §§15064(e), 15131, 15382; 20 Cal. Code Regs., §1704(b)(2), App. B(g)(7); CEQ 1997). **Socioeconomics Figure 1** indicates that an environmental justice population exists within a 6-mile buffer of the proposed project area (see the **Socioeconomics** section of this PSA/DEIS for a discussion of methods and composition of the environmental justice population). In addition, staff reviewed the ethnographic and historical literature, and corresponded with Native American tribes, to determine whether any additional environmental justice populations use or reside in the project area. These efforts are documented in the "Ethnographic Setting" and "Native American Consultation" subsections of this PSA/DEIS.

Cultural Resources Distribution Models

One critical use of the information drawn together during the background research for a cultural resources analysis is to inform the design and the interpretation of the field research that will complete the cultural resources inventory for the analysis. The background research for the present analysis has identified five previously recorded cultural resources in the PAA/APE (see "California Historical Resources Information System Search" section above), and found that little of the PAA/APE has been subject to cultural resources survey. A further role of background research is to help develop predictive or anticipatory models of the distribution of cultural resources across a project area of analysis. Such models of the types of archaeological, ethnographic, and built-environment resources, and the patterns of their distribution across and beneath the surface of the landforms of the PAA/APE, provide the means to tailor more appropriate

[26] While drafting the consultation letter, DOE received more specific information from OEHI concerning the proposed EOR facilities. Consequently, the figures that accompany DOE's letter present an APE that is smaller than the PSA/APE analyzed in this PSA/DEIS. Staff will consider OEHI's revised project components in the FSA/FEIS.

research designs for the field investigations that will complete a cultural resources inventory, and help gauge the degree to which the results of those investigations may reflect the actual population of archaeological, ethnographic, and built-environment resources in the PAA/APE. Such models also provide important contexts for the ultimate interpretation of the results of those investigations.

Models of the distribution of prehistoric archaeological sites, of ethnographic resources, and of historical archaeological sites and built-environment resources are developed here and draw on information above in the “Environmental Setting,” “Prehistoric Setting,” “Ethnographic Setting,” and “Historic Setting” subsections, in addition to the above information in the “Background Research” subsection. Staff formulated data requests during the discovery phase of the present certification process on the basis of these models to ensure the collection of enough information to factually support the conclusions of this analysis. The discussions in the “Interpretation of Results” subsection below also employ the models.

Model of Prehistoric Archaeological Resources

The analysis of the information in the “Environmental Setting,” “Prehistoric Setting,” and “Literature and Records Search” subsections suggests that five site types will be identified within the PAA/APE: Midden (long term habitation) sites, Multi-constituent (short term habitation) sites, lithic scatters, lithic procurement sites, rock feature sites, and cemeteries (Jackson et al. 1998).

Midden or Long Term Habitation Sites

Midden or long term habitation sites consist of deep accumulations of dark midden soil, often forming mounds. The full range of artifact types can be found at these sites including: *Anodonta* (freshwater clam) shell, flaked stone debitage and formed tools, groundstone tools, bird and mammal faunal remains, fire-affected rock, mortuary remains, and marine shell beads. When excavated, features such as hearths and habitations have been found. Evidence of long term occupation of the same location is also possible. Sites of this type are typically located immediately adjacent to bodies of water such as Buena Vista Lake or Buena Vista Slough. Although not within the HECA records search area or PAA/APE, staff places Wedel’s (1941) sites 1 and 2 and CA-KER-116 in this category.

Multi-Constituent or Short Term Habitation Sites

Multi-constituent or short term habitation sites are primarily characterized by spatially extensive distributions of freshwater clamshell. Marine shell beads of olive snails*, Tivela* (Pismo clam), and abalone are also common. Lithic flaked and ground stone artifacts are rare but consistently present. Faunal remains, fire-affected rock and human remains can also be present. These appear to be short-term habitation sites where the full range of domestic activities took place. Discrete activity loci may be identified. Sites of this type have been identified both on the northern slopes of the Elk Hills, along the historic meanders of the Buena Vista Slough, and the Buena Vista Lake shoreline (CA-KER-450) (Barton et al. 2010). The majority of the prehistoric sites in the EOR area fall into this category.

Lithic Scatters

Lithic scatters consist primarily of flaked stone debitage with few, if any, formed tools. In a region where most prehistoric sites are characterized by shell scatters, these sites lack these faunal remains. They appear to be located only along historic meanders of the Buena Vista Slough. A more limited number of tasks appear to have taken place at these sites.

Rock Feature Sites

Rock feature sites are distinguished by concentration of fire-affected rocks. Few, if any, other artifact classes are present. Three sites within the EHOF are classified as rock feature sites. Seven others are known on the boundary or within 1 mi of the EHOF.

Lithic Procurement Sites

Lithic procurement sites consist of large concentrations of chert raw materials and associated flaked stone debris. Occasionally small amounts of shell are present as well. The Temblor chert is usually found in the form of cobbles or pebbles surrounded by a loose sandy matrix. At least four sites within the EHOF have been classified as lithic procurement sites, but all have been severely damaged by road construction.

Cemeteries

Cemeteries are prehistoric sites representing discrete burial grounds. Midden sites that also contain mortuary components are not included in this category. Sites of this type were not identified within the HECA records search area or within the PAA/APE. However, several sites in the immediate vicinity are recognized cemeteries, such as Wedel's (1941) hilltop sites CA-KER-40 and CA-KER-41.

Summary

The analysis of the "Environmental Setting" subsection leads to the conclusion that the likelihood of prehistoric archaeological deposits across the surface of the proposed HECA project site and linear alignments is moderate. Such sites are likely to have been disturbed by industrial and agricultural activities. The likelihood of subsurface prehistoric archaeological deposits ranges from very low to high depending on the geomorphic context. The highest site density is expected near the boundaries of the former slough, anywhere from 0 to 32 feet below the modern ground surface. Buried deposits are likely to be well preserved below the plow zone.

The likelihood of prehistoric archaeological deposits across the surface of the EOR area is also moderate, with higher density to the north along the former slough. The depth of these deposits ranges from 0 to 3 feet below the modern ground surface. These sites are likely to have been disturbed by rodent burrowing, agricultural activities, and oil and gas exploration. However, the likelihood of buried prehistoric archaeological deposits is low.

Method for Ethnographic Resources identification

Methods

Ethnography is a term that refers to a discipline of anthropology, a method, and a type of document. As a discipline, ethnography is the prime focus of cultural anthropology. As a method, ethnography is an endeavor to understand other cultural groups from their point of view. There is significant overlap with ethnography as a general method and Native American consultation as a method and legal requirement. Most human beings are ethnocentric—that is, they tend to think about the world and others in terms of their own cultural experiences. In contrast, as one conducts ethnographic investigations, ethnocentrism, the practice of assessing others only in terms of what we know from our own culture, is to be avoided. In order to understand other cultural groups, ethnographers must first understand their own cultural assumptions, biases, and ways of understanding the world. Cultural self-awareness allows an ethnographer to understand other cultures from the other's point of view. As a type of document, ethnography provides readers with a written account that presents an understanding of another culture as the ethnographer came to understand that other culture from its people's perspectives or world view.

Ethnographers employ some of the following methods to understand other cultures:

- **Ethnographic research**: a review of previous ethnographies concerning the culture to be understood.
- **Historic research**: a review of historic literature about the people, events, and places of cultural importance.
- **Kinship charts**: a method for charting human relations among a culture, clan, community, or family.
- **Extended interviews**: representative individual and group interviews that seek responses to a number of research questions concerning the culture as a whole or sub-areas of the culture.
- **Life history interviews**: documentation of the events that chronicle a person's life story as that person presents their personal history within a broader cultural context.
- **Participant observation**: participating in and observing cultural events as if one were from the culture that one is studying.
- **Journalistic witnessing**: witnessing and documenting a cultural event at face value in descriptive terms without interpretation.

Ethnography fulfills a supporting role for other anthropological disciplines and provides contributions on its own merits. Ethnography supports the discipline of archaeology by providing a cultural and historic context for understanding the people that are associated with the material remains of the past. By understanding the cultural milieu in which archaeological sites and artifacts were manufactured, utilized, or cherished, this additional information can provide greater understanding for identification efforts; for example in making significance determinations per the NHPA or CEQA; eligibility determinations for the NRHP or CRHR; and for assessing if and how artifacts are subject to other cultural resources laws, such as the Native American Graves Protection and Repatriation Act.

In terms of its contributions to other anthropological disciplines, ethnography provides information concerning resources that tend to encompass physical places, areas, elements or attributes of a place or area. Such ethnographic resources have overlap and affinity to historic property types referred to as cultural landscapes, traditional cultural properties, sacred sites, and heritage resources. Studies that focus on specific ethnographic resource types may also take on names such as ethnogeography, ethnobotany, ethnozoology, ethnosemantics, ethnomusicology, etc.

Ethnography draws upon a variety of sources: published literature, archaeology, and living people. Each of these sources presents the information in different tenses because sometimes cultural practices and ideas are expressed as things that *have* happened, and sometimes as things that *are* happening. Consequently, the ethnographer is presented with an “ethnographic present” problem, wherein cultural practices are current yet they are referenced in the text as happening in the past. Therefore, in order to provide a clear understanding of the ethnography the author has used the tense that is presented in the available sources.

The following research design provided general guidance for preliminary archival research and allowed staff to prepare an ethnographic setting section that would be useful for informing the archaeological analysis of the proposed project.

- Research specific Southern Valley Yokuts history and culture beyond what is generally provided in the Amended AFC.
- Research and understand tribal ceremonies performed in the project vicinity. Determine to what extent these ceremonies are still practiced today and to what extent the proposed project would impact such ceremonies.
- Research traditional and current Southern Yokuts burial practices and related ceremonies.
- Research traditional Yokuts settlement patterns and structures.
- Research Southern Valley Yokuts subsistence practices, including trade and trail systems.

Staff made efforts to seek, obtain, and assess culturally relevant information from various archival and other sources.

- Documents were obtained via various internet searches and subsequent downloads.
- Books were obtained from used book stores in the project area and from on-line book purchasing venues.
- Books and manuscripts from the California State Archives were obtained and reviewed.
- Books and manuscripts from the California State Library were obtained and reviewed.

- Books and manuscripts from the Sacramento State University Library were obtained and reviewed.
- Books and manuscripts from the University of California at Davis Library were obtained and reviewed.
- Books and manuscripts from the University of California at Berkeley Anthropology Library were obtained and reviewed.
- Books and manuscripts from the University of California at Berkeley Bancroft Library were obtained and reviewed.

Ethnographic Method Constraints

No constraints to the ethnographic research described above were identified or encountered.

Results

The ethnographic setting provided earlier in this PSA/DEIS was synthesized from archival research. The focus of the research was to provide ethnographic information that supported the archaeological information also presented in the Amended AFC and in this PSA/DEIS. Anticipating that burials may be encountered inadvertently as a result of project ground disturbance, the ethnographic research focused on specific information related to Southern Valley Yokuts burial, settlement, and subsistence practices. While some ethnographic sites (villages) were identified as a result of ethnographic research, these locations are outside the project area. No traditional cultural properties (places) or ethnographic landscapes were identified from reviewing available ethnographic literature. Further, no ethnographic landscapes were identified through literature review or as a result of project site visitation. Affiliated tribal entities have not suggested that such ethnographic landscapes exist. In addition, the project area is radically altered from agricultural and oil extraction activities, leading staff to conclude that were an ethnographic landscape present, its integrity would be severely compromised.

Staff finds that no known ethnographic resources would be affected by the proposed project.

Model of Historic Archaeological Resources

The analysis of the information in the “Environmental Setting,” “Historic Setting,” and “Literature and Records Search” subsections leads to the conclusion that subsurface historic archaeological deposits are most likely present in the PAA/APE and that historic archaeological deposits are likely present in low to moderate frequency across the surface of the PAA/APE.

Background research and windshield and pedestrian surveys of the PAA/APE suggest that the majority of historic archaeological resources would be associated with rural domestic activities, agriculture, and oil extraction. Additionally, some Native American archaeological sites in the records search area contain historic-period materials, some of which might have been deposited after the cessation of Native American occupation of the site.

The earliest historic archaeological materials known in the project vicinity date to as early as the end of the eighteenth century, by which time Southern Valley Yokuts began to acquire goods from Spaniards, mission Indians, and native traders (Wallace 1978b:459). Such goods included glass trade beads, blankets, glass bottles, china, scissors, pocketknives, and European religious icons (Moratto 1984:189; Walker 1947:7–8). The most common distribution of European-manufactured goods in the project vicinity is expected to be among midden sites, other long-term occupation sites, and cemeteries (see “Model of Prehistoric Archaeological Resources”, above).

Locally, archaeological resources originating from rural residential and domestic activities take the form of structural ruins (former homes, barns, and other outbuildings), refuse scatters, privy pits (outhouses), and landscaping. The distribution of many historical archaeological resources is easily discerned by comparing historic archaeological resource locations to both present cultural and landscape features (such as roads and water bodies) and the historic locations of natural and cultural features.

The major class of historic archaeological resource in the proposed EOR area consists of archaeological sites and structures relating to oil extraction. These constitute artifact scatters associated with now-demolished residences and other structures; artifact scatters resulting from household, commercial, and industrial discard; structural remnants; and infrastructure (oil and water pipes). The distribution of residential resources is expected to correspond closely with flat or gently sloping terrain. Other oilfield features are likely to have a wider, more eclectic—if ubiquitous—presence in the EOR area, owing to the limitations of topography, which necessitated the placement of surface piping over dissected or undulating terrain.

Cultural Resources Inventory Fieldwork

The field efforts to identify the cultural resources in the PAA/APE include an initial geoarchaeology study and intensive pedestrian surveys (**Cultural Resources Table 7**). While the complete results of these efforts are not yet available, 34 new cultural resources have been found to date in the PAA/APE, not including the discovery of 19 isolated finds. Additionally, previously known cultural resources have been updated. On the basis of the background research for the present analysis and the results of the field efforts that are presently available, the total cultural resources inventory for the project area of analysis includes 21 non-isolate archaeological resources, no ethnographic resources, and 21 built-environment resources. (**Cultural Resources Tables 8–10**.)

[28] This resource was submitted with the 2009 Amended AFC but was not resubmitted with the 2012 Amended AFC and is not indicated on the current project maps (JRP 2012:Map 2, Sheet 5). The resource lies partially within the current PAA/APE and therefore is included in staff's analysis.

[29] This resource was not included in the Amended AFC.

Cultural Resources Table 10
NPR-1/OEHI Built Environment Resources Eligibility

Resource Designation	Type	Project Element	Eligibility
NPR-1	Rural historic landscape important in local and state history for development of the petroleum industry. Unknown number of contributors subject to impacts.	CO_2 line and processing facility, EOR area	Not eligible
KRM-010H	Soil and gravel road	CO_2 line and processing facility, EOR area	Unknown
WW II Military Sites	Military earthworks and structures	CO_2 line and processing facility	Unknown
Check Dams	Surface water control structures	CO_2 line and processing facility	Unknown

This section discusses the methods and the results of each field inventory phase and interprets the resultant inventory relative to the cultural resources distribution models above to assess how well the inventory represents the archaeology of the project area. Descriptions of each cultural resource in the inventory, evaluations of the eligibility of each resource for inclusion in the CRHR and NRHP, assessments of project impacts on each known historical resource, consideration of and potential impacts on archaeological resources that may lie buried on the project site, and proposed mitigation measures for significant impacts may be found in the "California Register of Historical Resources Eligibility" and "Identification and Assessment of Direct Impacts on Built-Environment Resources and Proposed Mitigation" subsections below.

Geoarchaeology Study

Staff made requests to the applicant to provide information that would facilitate the assessment of the project's potential to encounter buried archaeological deposits during the construction, operation, and maintenance of the project. The response from the applicant was a geoarchaeology[30] study that, on the basis of background research, spatial analysis, and primary field research, provides a thorough discussion of the historical geomorphology of the project area and an assessment of the likely presence of buried archaeological deposits there.

Only one subsurface investigation has taken place within the PAA/APE. Five geotechnical borings were placed in the proposed project site. An archaeologist monitored these borings and examined the sediment that was removed. No cultural materials were observed. (URS 2009a:13–14; URS 2009c:5.3-29.)

Staff requested that the applicant conduct subsurface investigations in the form of geoarchaeological field sampling at the October Data Response Workshop as well as in Data Requests A151–152 and A195 (CEC 2012a:9–10; CEC 2012b:15–19). In addition,

[30] Geoarchaeology is a subdiscipline of archaeology that uses the techniques and approaches of earth sciences such as geology, geomorphology, sedimentology, pedology, and stratigraphy to identify, investigate, and interpret the history of the human use of present and former landscapes.

while evaluating the previous HECA AFC (08-AFC-8), a request for a fieldwork-based geoarchaeological study was the subject of six data requests since October 2009: DR 78 and 79 (October 12, 2009), DR 143 (January 13, 2010), Workshop DR 23 (April 12, 2010), and DR 172 and 173 (CEC 2009:19–20; CEC 2010c:6). In their October 2012 data response (URS 2012d:151-1 through 152-2), the applicant questions the need for further geoarchaeological analysis beyond what has already been submitted. Staff understands this argument to consist of five main points: 1) monitoring will provide sufficient protection for buried resources; 2) a geoarchaeological field study would cause a lengthy project delay; 3) focusing the monitoring effort is not necessary because monitoring is likely to be required across the entire PAA/APE; 4) trenching to find specific resources in areas determined to be especially sensitive is not necessary; and 5) a Cultural Resources Monitoring and Mitigation Plan (CRMMP) should be required as a condition of certification rather than a geoarchaeological field study. Staff addresses each of these points in turn, below.

First, staff does not agree that monitoring provides sufficient protection for buried resources during construction. Resources are often inadvertently damaged by heavy construction equipment during the discovery process, resulting in a substantial adverse change in the significance of the resource. If the resource is later determined to be a historical resource or unique archaeological resource, a significant effect to the environment under CEQA will have already occurred. In addition, construction schedules rarely allow sufficient time for the development of a resource specific research design or the careful exploration and documentation of the resource. The Energy Commission’s responsibility to identify measures to mitigate significant adverse change in the significance of a historic resource is best served by a CRMMP that is supported by facts specific to the project area. Although specific resources cannot be identified in advance, a well-designed and implemented geoarchaeological study will help identify the age and character of the sites that may be found. These project-specific facts can be used to develop the most appropriate research design and mitigation strategies possible.

Second, staff does not agree that conducting a geoarchaeological field study would cause a lengthy project delay. Staff established the need for this study in October of 2009. Although the project now has a new applicant, the cultural resources contractor (URS) remains the same. The current applicant has the advantage of knowing some of staff’s requirements in advance. Any concerns over the project schedule could have been proactively addressed by the applicant by submitting a geoarchaeological research plan with the Amended AFC.

Third, as discussed in detail above, staff maintains that a focused monitoring effort is essential for the appropriate evaluation and mitigation of any resource accidentally discovered during construction. A focused effort consists of the development of a CRMMP based on project specific information, provided in part by a geoarchaeological field study. Staff’s emphasis here is both on the knowledge and preparation of the monitoring team, as well as the intensity of the monitoring effort. While staff agrees that much of the PAA/APE is located in areas which have high sensitivity for buried resources, staff thinks it is inappropriate to make decisions about monitoring intensity in advance of data to support that decision. The updated geoarchaeological report provided in Hale et al. (2012) provides general information about the geoarchaeological context of the project vicinity based on the well-regarded work by Meyer et al. (2009) for Caltrans Districts 6 and 9. The applicant suggests that this initial step provides sufficient information about the project area. However, Meyer and his colleagues contradict this suggestion, concluding in their report that "depending on the nature and scope of a proposed project, areas of Moderately High through Very High potential will often require additional attention, perhaps leading to more focused geoarchaeological studies. These might include additional archival background research, field checking and examinations, subsurface explorations (e.g., trenching or coring), or more detailed modeling efforts" (Meyer et al. 2009:142). These are exactly the sorts of studies that staff has requested. Only one landform within the project area, the Quaternary alluvial fans (Qa) forming the lower elevations of the Elk Hills, investigated during Weber's (1998) study at CA-KER-3080, has been explored at the appropriate resolution. The other landforms still require additional attention.

Fourth, following Meyer et al. (2009), staff maintains that subsurface exploration may indeed be necessary for this project in areas where geoarchaeological field studies suggest that cultural resources may be present. When designed and conducted in an informed fashion, subsurface explorations help satisfy the requirement of Section 106 of the NHPA that "a reasonable and good faith effort to carry out appropriate identification efforts" is made (36 Code Fed. Regs., part 800.4(b)(1)). In their data response, the applicant points out that subsurface explorations will not result in a full inventory of the resources buried within the project area, and will not reduce the need for monitoring elsewhere. Staff agrees. Our intention is not to make a full inventory or reduce monitoring, but rather to make a good faith effort to identify buried resources in those landforms which are most likely to contain them.

Finally, staff does not agree that a CRMMP is a suitable substitute for a geoarchaeological field study. A CRMMP is a standard requirement for Energy Commission projects, and one of its primary roles is to ensure that the applicant is well prepared for inadvertent discoveries. A geoarchaeological field study is one of several project specific data sets that are required to develop a CRMMP which can adequately mitigate adverse changes in the significance of a historic resource. As such, a field study informs a CRMMP, but cannot be replaced by one.

In the April 2010 workshop, the applicant agreed to develop a plan for the combined geotechnical/ geoarchaeological investigations. In Data Request A195, staff requested that the applicant meet with staff to discuss the data needed to complete the staff impact analysis with respect to buried archaeological resources, so that the development and implementation of the plan can move forward. The applicant has since submitted a geoarchaeological work plan, which is presently under staff review (URS 2013d). Staff has provided comments and requested revisions to the plan; the applicant is presently addressing staff comments.

Intensive Pedestrian Surveys

The applicant undertook an intensive pedestrian cultural resources survey of the originally proposed project area to comply with the Energy Commission's siting regulations. The purpose of the survey was to provide information on the location and the character of the cultural resources that may lie on the surface of the project area.

The results contribute to the compilation of the cultural resources inventory of the proposed project area.

Methods

Consultants to the applicant conducted intensive pedestrian surveys of the PAA/APE between 2008 and 2012 (Farmer 2008; Hale and Laurie 2009, 2010, 2012; Hale et al. 2012; JRP 2009, 2012). Survey dates are shown in **Cultural Resources Table 11**.

Nitrogen line, 8-inch	Survey data unavailable as of June 2013	
Propane line	Survey data unavailable as of June 2013	

Methods: HECA—2008

Survey of the proposed process water line was accomplished by the survey crew walking parallel north–south or east–west transects spaced 50 feet apart. Survey transects were narrowed to 15 feet upon discovery of archaeological materials in a given area. (Farmer 2008:4-1.) Ground surface visibility in the proposed process water line's corridor was about 50 percent (Hale and Laurie 2009:36).

Methods: HECA—2009–2012

The project site and controlled area was surveyed by walking alternating, parallel transects spaced 50–65 feet between surveyors. The survey area included a 200-feet buffer surrounding the project site and controlled area, as required at Title 20, California Code of Regulations, section 1704(b)(2), Appendix B(g)(2)(C). Ground surface visibility was generally greater than 80 percent in the project site and controlled area. Where nonagricultural vegetation obscured the ground surface, the survey crew cleared 8-inch-by-8-inch squares using hand tools or footwear. (Hale and Laurie 2009:34, 36; URS 2012a:5.3-21, 5.3-22.) These scrapes were employed when surface visibility was less than 50–60 percent, and were made at 50–100-feet intervals across the vegetated portion of the survey area (URS 2012b:A83-2).

The proposed linear HECA facilities were surveyed by walking parallel transects spaced 50–65 feet between surveyors. The survey corridor for proposed linear facilities also included a 50-feet buffer from the linear routes, per Title 20, California Code of

Regulations, section 1704(b)(2), Appendix B(g)(2)(C). Ground surface visibility along the proposed linears was generally 50 percent or better. Surface scrapes were employed as described in the previous paragraph. (Hale and Laurie 2010:3-9; Hale et al. 2012:33,37; URS 2012a:5.3-21, 5.3-22; URS 2012b:A83-2).

A portion of the proposed natural gas pipeline corridor along SR 58 just west of I-5, inaccessible during earlier survey efforts, was examined by walking transects spaced 33–50 feet apart. The surveyed area included a 50-feet buffer from the proposed corridor. Ground surface visibility was excellent (75–100 percent). In addition, the proposed railroad laydown area and a 200-feet buffer were surveyed using identical methods. The southern portion of this survey area had fair ground surface visibility (25–50 percent) owing to alfalfa row crops. Surface scrapes were not conducted so that damage would not occur to the crops. (Hale and Laurie 2012:9–10, Figure 1).

The proposed electrical transmission switching station was surveyed by walking parallel transects spaced 33–50 feet apart. The surveyed area included a 200-feet buffer surrounding the proposed facility site. Ground surface visibility was good to excellent (50–100 percent) across the survey area, being impeded by the presence of alfalfa plants. (Hale and Laurie 2013:8–9:Figure 1).

Archaeological sites recorded as a result of the surveys were assigned temporary numbers (e.g., HECA-1). The survey crew plotted site locations onto 7.5-minute topographic quadrangle maps with the assistance of a global positioning system (GPS) receiver. Site recordation consisted of mapping and completion of appropriate Department of Parks and Recreation (DPR) 523 forms. (Hale and Laurie 2013:9; Hale et al. 2012:37; URS 2012a:5.3-21).

Methods: EOR

Portions of the EOR project elements were surveyed in 2008, 2009, and 2011 (Farmer 2008; Hale and Laurie 2009; Hale et al. 2012; Stantec 2011). The only recently surveyed EOR project element is the proposed CO_2 pipeline from the project site to the proposed CO_2 processing facility in Elk Hills. The portion of CO_2 pipeline north of the California Aqueduct was effectively surveyed during the cultural resources inventory of the controlled area (Hale and Laurie 2009; Hale et al. 2012). The survey methods are discussed in the previous section, “Methods: HECA—2009–2012”.

The portion of CO_2 pipeline south of the California Aqueduct was surveyed in part by Farmer (2008:4-1) on March 2–7 and June 28–30, 2008, and in its entirety on February 23–24, 2011 (Stantec 2011:8). Survey methods in 2008 entailed walking systematic, parallel transects as described in the section entitled, “Methods: HECA—2008”. Stantec (2011:8) surveyed the proposed CO_2 pipeline by walking systematic parallel transects spaced 50 ft between surveyors across a 150-feet-wide corridor. Dense grasses and shrubs reduced ground surface visibility to 10–20 percent (Stantec 2011:1). Efforts were not expended to improve the ground surface visibility.

Results

Consultants to the applicant identified 31 new archaeological resources in the PAA/APE. Of these, 13 are archaeological sites and 18 are isolated archaeological finds. Of the archaeological sites, eleven are prehistoric sites and two are historic. The isolates are all prehistoric finds.

As of the date of this PSA/DEIS, several portions of the PAA/APE have not been surveyed for the presence of cultural resources (see **Cultural Resources Table 11** above). Until such a time as the full PAA/APE is surveyed, staff cannot completely analyze the potential impacts of the proposed project on cultural resources. The applicant has informed staff that they will complete pedestrian surveys and report on their findings in time to inform staff's FSA/FEIS for the proposed project.

Historic Built Environment Surveys

JRP (2009, 2012) conducted a historic built environment survey on February 2 and March 9–12, 2009, as well as April 2010, January 2011, and February and March 2012. A total of 21 historic built environment resources were identified, two of which were previously recorded.

Interpretation of Results

The total cultural resources inventory for the project area of analysis includes 23 built-environment resources and 31 archaeological resources (see **Cultural Resources Tables 8–10**). The comparison and interpretation of the results of the efforts to develop the project inventory are made here, relative to the cultural resources distribution models above, to assess the reliability of the results.

Model of Prehistoric Archaeological Resources

Although all of the required pedestrian surveys are not complete, the results of the efforts to identify prehistoric archaeological resources in the PAA/APE conform well in some ways and poorly in others to the predictions of the above model for this resource class. The highest density of sites was expected near the boundaries of the Buena Vista Slough. Fourteen of the 15 sites with prehistoric components were identified in this area, along the proposed process water line, controlled area, and CO_2 line. Also as predicted these sites were initially categorized as midden (long term habitation) sites, multi-constituent (short term habitation) sites, and lithic scatters. In contrast, a very low density of prehistoric sites was found on the valley floor along the proposed transmission, gas, and rail lines. These findings conflict with the expectations of the model which predicted a low to moderate probability of surface archaeological sites in this area. The effectiveness of the model for this region may have been hampered by the small number of previous projects upon which the model is based. Alternatively, years of agricultural activities may have destroyed the majority of prehistoric sites in this portion of the PAA/APE. Finally, the pedestrian survey of the EOR area is incomplete, and so it is uncertain if the model for the Elk Hills will be effective.

The prehistoric sites identified within the PAA/APE require evaluative test-excavation to determine whether the sites retain the potential to yield information important to prehistory and therefore qualify as historic properties, historical resources, or unique archaeological resources. Staff requested this primary field data in the form of evaluative test excavation. Until staff receives this information, an interpretation of the spatial patterning of prehistoric archaeological sites across the PAA/APE can only be provisional.

Model of Historic Archaeological Resources

Despite the fact that the entire PAA/APE has not yet been surveyed for the presence of historic archaeological resources, sufficient information is available for comparison with expectations about the types and distribution of such resources in the PAA/APE. A total of four historic archaeological resources and archaeological sites with historic materials have been identified in the PAA/APE (**Cultural Resources Table 8**). Additionally, historic archaeological resources are likely associated with four historic built environment resources identified in the EOR area of the PAA/APE (**Cultural Resources Table 10**). The results of the cultural resources inventory generally corroborate the model of historic archaeological resources presented earlier in this PSA/DEIS.

With regard to Euroamerican historic archaeological resources, HECA-2010-2 represents the expected collection of early twentieth-century farmhouse remnants. The structural materials and household goods found at HECA-2010-2 are typical of such sites, and the site is located at a crossroads where historic maps document buildings and structures since the late 1920s (see HECA-2010-2 under “HECA Project Elements/Historic Archaeological Resources” below). Expectations for historic archaeology in the EOR area was partially met as well, in that site CO2-2012-1 consists primarily of structural and industrial discards, as befits an active oil field (see CO2-2012-1 under “EOR Project Elements/Historic Archaeological Resources” below). The historic artifacts identified at CA-KER-89/H and CA-KER-5356/H are commensurate with expectations for local resources. The only surprising result of the historic archaeological inventory of the HECA portion of the PAA/APE is the small number of historic archaeological resources identified. This appears to be a consequence of wide-ranging land modifications to support agriculture and salvage or demolition of older, failing structures. Staff cannot presently assess the distribution of historic archaeological sites in the EOR portion of the PAA/APE because survey results are unavailable for the bulk of the area.

Reliability of Cultural Resources Inventory

Staff finds, on the basis of the above analysis, that the cultural resources inventory for the PAA/APE is not yet a reliable body of information on which the Siting Committee can, in part, base its decision on the potential for the construction, operation, and maintenance of the proposed project to have a significant effect on the environment, as such an effect would relate to cultural resources. As will be seen in this analysis, the cultural resources inventory currently leaves a number of issues unresolved: the significance status of certain archaeological resources is undetermined, the potential for buried archaeological deposits to be present in the PAA/APE has not been adequately assessed, and inventory of the proposed EOR elements has not been reported to the Energy Commission. Staff understands that the applicant is working to fill these data gaps and expects to have the necessary information for completion of the FSA/FEIS.

Cultural Resource Descriptions and Significance Evaluations

HECA Project Elements

Prehistoric Archaeological Resources

At present, staff is able to conclude that a total of 18 prehistoric archaeological resources would be subject to direct impacts from the proposed project elements. Insufficient data are available to staff, however, to determine whether these archaeological sites are significant cultural resources (historic properties, historical resources, or unique archeological resources). Because Section 106 and CEQA require that impacts be evaluated only for significant cultural resources, staff needs the applicant to conduct significance evaluations of these archaeological sites in order to complete this impact analysis.

CA-KER-171

CA-KER-171 is a prehistoric site of unknown size located in the proposed process water well field and process water line. It was originally recorded as an “occupation site” by Frank Latta in 1950. A relative site location is plotted on the Lokern 7.5-minute USGS quadrangle; however, no other information about the site was provided. (Hale et al. 2012:39.) This location has been disturbed by various agricultural activities and construction of the West Side Canal. CA-KER-171 was not relocated by the applicant. However, a lithic scatter (HECA 2009-9) was identified approximately 900 feet to the south, raising the possibility that CA-KER-171 may have been misplotted.

The more particular physical context for site CA-KER-171, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

The site description suggests that the site can be classified as either a midden (long-term habitation) or a multi-constituent (short-term habitation) site. The applicant has not conducted the fieldwork required to resolve the confusion over the location of CA-KER-171 or evaluate the site to determine whether it qualifies as a historical resource, unique archaeological resource, or historic property. Staff requested that the applicant acquire the necessary data by conducting an archaeological test excavation at the mapped location of CA-KER-171 (Data Requests A192–194) or by demonstrating that the applicant could avoid damaging CA-KER-171 (Data Request A147) (CEC 2012a:7–9; CEC 2012b:13–14). In the applicant’s response to Data Request A147, they indicate that the vicinity of CA-KER-171 is covered by 1.4–4.1 feet of fill dirt. Because the proposed pipeline would be installed in a trench 5 feet deep, there is insufficient fill in the vicinity of CA-KER-171 to protect the site from damage. The applicant, however, proposes an avoidance measure to protect CA-KER-171 (see “Direct/Indirect Impacts and Mitigation”). (URS 2013b.) Staff considers CA-KER-171 to be a historical resource under CEQA and a historic property under Section 106 of the NHPA, for the purposes of this project only.

CA-KER-179

CA-KER-179 is a site located along the proposed process water line. It has been described as a "burial mound," suggesting that it might be a midden (long-term habitation) site. However, no additional information was provided (Hale et al. 2012:43; URS 2012a:5.3-30, 5.3-31). The site was not relocated by the applicant, but four isolates (BS-IF-02, -03, -04, and -05) were found near CA-KER-179 along the proposed process water line. These materials consist of three chert flakes, two chert tools, and one mussel shell. (Farmer 2008:Table 5-1).

The more particular physical context for site CA-KER-179, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

Given the site record, the recent isolated finds, and the possibility of intact buried deposits, a site may be present in the vicinity. The applicant has not conducted the fieldwork required to resolve the confusion over the location of CA-KER-179 or evaluate the site sufficiently to determine whether the site constitutes a historical resource, unique archaeological resource, or historic property. Staff requested that the applicant acquire the necessary data by conducting archaeological test excavation at the mapped location of CA-KER-179 (Data Requests A192–194) or demonstrate that the applicant could avoid damaging CA-KER-179 (Data Request A147) (CEC 2012a:7–9; CEC 2012b:13–14). In the applicant's response to Data Request A147, they indicate that the vicinity of CA-KER-179 is covered by 2.2–2.8 feet of fill dirt. Because the proposed pipeline would be installed in a trench 5 feet deep, there is insufficient fill in the vicinity of CA-KER-171 to protect the site from damage. The applicant, however, proposes an avoidance measure to protect CA-KER-171 (see "Direct/Indirect Impacts and Mitigation"). (URS 2013b.) Staff considers CA-KER-171 to be a historical resource under CEQA and a historic property under Section 106 of the NHPA, for the purposes of this project only.

CA-KER-2485 (P-15-2485) and BS-IF-003

CA-KER-2485 an archaeological deposit approximately 0.6 acre in area. The surface component of the site measures approximately 150 feet from north to south and 150 feet from east to west. (Jackson 1989:1.) It is located along the proposed process water line, primarily on the southwest side of the West Side Canal. Vegetation at the site consists of desert scrub. The soil is light brown sand with intermittent clay deposits. Modern disturbance, including seasonal flooding, modern trash disposal, and bulldozer activity, is extensive. The site was not relocated by the applicant. However, the 1989 site form describes the site as consisting of lithic debitage, lithic tools, and groundstone fragments (Hale et al. 2012:43; URS 2012a:5.3-31). Two unusual, very large chert projectile points were also collected from this site. The point types were not specified, but were noted to be extremely rare in the Southern San Joaquin Valley. (Jackson 1989.) Further, the presence of a piece of lithic debitage (BS-IF-003) on the northeast side of the West Side Canal (Farmer 2008:Table 5-1) suggests that the canal cuts through CA-KER-2485 and that plowing east of the West Side Canal may have obscured most surface evidence of the site in the PAA/APE.

The more particular physical context for site CA-KER-2485, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

The site description suggests that CA-KER-2485 can be classified as a multi-constituent (short-term habitation) site. The applicant has not conducted the fieldwork required to determine if CA-KER-2485 extends into the PAA/APE or constitutes a historical resource, unique archaeological resource, or historic property. Staff requested that the applicant acquire the necessary data by conducting archaeological test excavation at the mapped location of CA-KER-2485 (Data Requests A192–194) or demonstrate that the applicant could avoid damaging the site (Data Request A147) (CEC 2012a:7–9; CEC 2012b:13–14). In the applicant's response to Data Request A147, they state that CA-KER-2485 is outside of the PAA/APE, BS-IF-003 is merely an isolated find, neither resource warrants further treatment (URS 2013b). Staff finds this view, in light of the information provided in the first paragraph of this subsection, overly simplistic. Considering that these two separately recorded archaeological resources are adjacent to the same water conveyance feature directly across from one another, an assertion that the two resources are not elements of the same resource without any factual basis of support other than the results of surface finds made in separate cultural resource surveys seems an inadequate foundation on which to agree with the applicant's findings. Accordingly, staff requests that the applicant either demonstrate that BS-IF-003 is a find unrelated to CA-KER-2485 by conducting a test excavation, or place a sufficient quantity of fill at BS-IF-003's location to preclude construction-related damage, as the applicant proposes at CA-KER-171 and CA-KER-179. Until then, staff assumes that CA-KER-2485 and BS-IF-003 is a historical resource under CEQA and a historic property under Section 106 of the NHPA.

CA-KER-3108 (P-15-3108)

CA-KER-3108 is an archaeological deposit approximately 0.9 acre in area. The surface component of the site measures approximately 150 feet from north to south and 225 feet from east to west. It was originally recorded as a low density lithic scatter of chert and obsidian flakes with several possible pieces of groundstone. (Everson 1991:1.) It is located along the proposed natural gas supply line. The Southern Pacific Railroad tracks cut through the northern half of the site. (Hale et al. 2012:39.) The vegetation at the site consists of saltbush, thistle, and assorted grasses. Soil on the site is described as fine grained silt. Modern disturbance includes the construction of the SR 58 and the railroad tracks. (Everson 1991.) The site was not relocated by the applicant.

The more particular physical context for site CA-KER-3108, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buttonwillow Ridge of the Qoa unit. Staff considers the Qoa unit to have a low to moderate potential for archaeological materials on its upper surface, while the possibility for buried deposits is expected to be very low.

The site was first recorded in 1991 as a low density artifact scatter. When it was revisited in 1992, only a single possible piece of groundstone was found. During the survey for the current project the applicant was unable to relocate the site, suggesting the possibility that the site was misplotted (URS 2012a:5.3-27, 5.3-28). The applicant has not conducted the fieldwork required to determine if a buried archaeological site is present at this location. Without primary field data on the presence of a subsurface component for the site, staff cannot evaluate whether CA-KER-3108 constitutes a historical resource, unique archaeological resource, or historic property.

Staff requested that the applicant conduct presence/absence and test excavation at the location of CA-KER-3108 (Data Requests A192–194) (CEC 2012a:7–9). The applicant's response to Data Requests A192–194 states that they intend to avoid CA-KER-3108, they do not have access or permission to excavate the site, and a subsurface testing plan is not warranted currently. The applicant also points out that two survey efforts after the initial discovery of CA-KER-3108 failed to turn up evidence of the site as support for dispensing with conducting a test excavation at the site location. The applicant identified discrepancies between the reported site description and map coordinates, which they see as casting doubt on whether CA-KER-3108 was ever at the mapped location. (URS 2013a:A192-2, A192-3).

Hale et al. (2012:5.3-27, 5.3-28) note that the mapping (Universal Transverse Mercator, or UTM) coordinates on the original CA-KER-3108 site record form corresponds to a location about 755 ft southeast of the location plotted on the Buttonwillow 7.5-minute USGS topographic map. Staff has examined this site record as well as the archaeological survey report that generated the record, and disagrees with this suggestion. UTM coordinates for a given location are calculated in one of two ways: (1) manually, by reading and measuring coordinates based on a map plot directly from the map, or (2) by taking coordinates with a GPS receiver. Staff believes it is clear that the UTM coordinates for CA-KER-3108 were calculated based on a field-map plot that accurately reflects the site's location, not from a GPS reading taken at another place. First, CA-KER-3801 was identified in 1991 (Everson 1991:1), a time when the use of GPS equipment in archaeological surveys was uncommon. Second, the survey crew—led by Everson and others—did not use a GPS receiver to record site locations; rather, they were "plotted on the appropriate USGS 7.5' topographic quadrangles." (Parr and Osborne 1992:1, 51–52.) Additionally, the site sketch map ties the site location to a dirt road adjacent to SR 58 and the Southern Pacific Railroad tracks (Everson 1991:3); a location 755 feet to the southeast would not place CA-KER-3108 near the railroad tracks or SR 58. Therefore, the method of determining UTM coordinates was measuring from the map plot, and the numbers were simply miscalculated when reported on the site record form. Furthermore, it should be noted that Parr and Osborne (1992:52) reported that numerous archaeological sites that were identified during the initial survey and revisited for additional work were found in some cases to exhibit fewer artifacts than were initially observed (as with CA-KER-3108). In other cases, rain or wind had exposed previously unidentified artifacts at archaeological sites. Staff finds that the weight of evidence and CA-KER-3108's proximity to SR 58 places the site squarely within the natural gas line portion of the PAA/APE. This site has not been test excavated and evaluated for qualification as a historical resource, unique archaeological resource, or historic property under CEQA or Section 106 of the NHPA. Staff again requests that the applicant address Data Requests A192–194 (CEC 2012a:7–9) or demonstrate how the applicant intends to avoid damaging CA-KER-3108, considering its location within the PAA/APE. In the interim, staff assumes that CA-KER-3108 is a historical resource under CEQA and a historic property for Section 106 purposes.

HECA-2008-1 (JM-BVWD-1)

HECA-2008-1 (originally recorded as JM-BVWD-1) is a buried prehistoric site which would be directly impacted by the proposed process water line. Construction and upkeep of the West Side Canal has cut into this deeply stratified site. Prehistoric artifacts are evident 6 feet below the modern ground surface and extend 515 feet along the canal. The size, shape, and overall depth of the site are undetermined. However, the presence of the artifacts suggests that the remainder of the site may be preserved intact well below the levels of modern agricultural disturbances. In modern times vegetation in the vicinity of the site consists of salt-bush scrub to the west and wheat fields to the east. The site sediment type is unspecified. The sparse scatter of artifacts includes lithic debitage, a projectile point tip fragment, and three pieces of burnt faunal bone. The debitage comprises Monterey and Franciscan chert. (Hale et al. 2012:40, Figure 1, Sheet 2; URS 2012a:5.3-28).

The more particular physical context for site HECA-2008-1, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The presence of this site demonstrates the high possibility of buried cultural resources within portions of the PAA/APE situated within slough deposits.

The Amended AFC offers no temporal association or functional interpretation for the site (Hale et al. 2012:40; URS 2012a:5.3-28). However, the lack of groundstone and midden soil suggests this site may have been a multi-constituent (short-term habitation) site. The applicant has not conducted the fieldwork required to gather data for site eligibility determinations, and no eligibility recommendation was provided. Without primary field data on the subsurface component of HECA-2008-1, staff cannot determine whether the archaeological site constitutes a historical resource, unique archaeological resource, or historic property. Staff requested this primary field data in Data Requests A192–194 (CEC 2012a:7–9), but has not yet received this information. In the absence of this information, staff assumes that HECA-2008-1 is a historical resource and historic property for CEQA and Section 106 purposes, respectively.

HECA-2009-2

HECA-2009-2 is a prehistoric archaeological deposit approximately 3496 square feet in area. The surface component of the site measures approximately 76 feet north–south and 46 feet east–west. It is located along the proposed CO_2 line. The site is located adjacent to a flat agricultural field on the eastern slope of a berm that parallels the Outlet Canal. There is no native vegetation present at the site. The soil is a light brown silty loam with pea-size gravels. Modern disturbances in the site vicinity include the grading of two dirt roads, and construction of the Outlet and West Side canals. The site consists of a low density (less than one artifact/11 square feet) scatter of lithic artifacts including two chert bifaces, a steatite groundstone fragment, and three yellow-brown cryptocrystalline silicate (CCS) reduction flakes. The artifacts were encountered primarily within the road berm and within the adjacent dirt road. (Hale et al. 2012:40; URS 2012a:5.3-28.)

The more particular physical context for site HECA-2009-2, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the

Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

The Amended AFC does not suggest temporal associations or functional interpretations for the site (Hale et al. 2012:40; URS 2012a:5.3-28). However, the lack of groundstone and freshwater mussel shell indicates that this site was a special function site that can be classified as a lithic scatter. In addition the presence of steatite suggests the site may date to the Emergent Period (850 B.P.–Historic). The applicant has not conducted the fieldwork required to gather data for site eligibility determinations, and no eligibility recommendation was provided. Without primary field data on the presence of a subsurface component for the site, staff cannot determine whether HECA-2009-2 qualifies as a historical resource, unique archaeological resource, or historic property. Staff requested these primary field data in Data Requests A192–194 (CEC 2012a:7–9), but has not yet received this information. Staff assumes for the purposes of the present analysis that HECA-2009-2 is a historical resource under CEQA and a historic property for the purposes of Section 106 of the NHPA.

HECA-2009-9

HECA-2009-9 is a prehistoric archaeological deposit approximately 1.5 acres in area. The surface component of the site measures approximately 246 feet north–south and 262 feet east–west. It is located along the proposed process water line and process water well field, northeast of the West Side Canal. The site is situated in an agricultural field; no native vegetation is present at the site or its vicinity. The present site surface is composed of dark brown clay loam with pea size gravels. Further details about the site surface are unspecified. This site consists of a low density (less than one artifact/11 square feet) scatter of lithic debris, including a CCS core and approximately 25 CCS reduction flakes. Modern disturbances in the site vicinity include the construction of the West Side Canal, two dirt roads, and the development of an orchard (Hale et al. 2012:40–41; URS 2012a:5.3-28, 5.3-29).

The more particular physical context for site HECA-2009-9, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

The Amended AFC does not suggest temporal associations or functional interpretations for the HECA-2009-9. However, this site can be classified as a lithic scatter, which may have served a special function. The applicant has not conducted the fieldwork required to gather data for a site significance evaluation, and no significance recommendation was provided. Without primary field data on the presence of a subsurface component for the site, staff cannot determine whether HECA-2009-9 qualifies as a historical resource, unique archaeological resource, or historic property. Staff requested this primary field data in Data Requests A192–194 (CEC 2012a:7–9), but has not yet received this information. Therefore staff was unable, on the basis of the information provided, to determine if HECA-2009-9 is eligible for the CRHR or qualifies as a historic property for Section 106 purposes. In the absence of this information, staff assumes that HECA-2009-9 qualifies both as a historical resource and historic property.

HECA-2009-10

HECA-2009-10 is an oblong prehistoric archaeological deposit approximately 17 acres in area. The surface component of the site measures approximately 591 feet north–south and 1247 feet east–west. It is located along the proposed process water line and process water well field, northeast of the West Side Canal. The site is situated in an agricultural field; no native vegetation is present at the site or its vicinity. The present site surface is composed of dark brown clay loam with pea size gravels. Further details about the site surface are unspecified. This site consists of a single artifact concentration surrounded by a low density (less than one artifact/11 square feet) scatter of lithic debris. Both the concentration and the scatter consist entirely of debitage, including approximately 100 CCS reduction flakes. Besides plowing, other modern disturbances in the site vicinity include the construction of the West Side Canal, a graded dirt road, and other associated agricultural activities. (Hale et al. 2012:41, Figure 1, Sheet 1; URS 2012a:5.3-29).

The more particular physical context for site HECA-2009-10, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the Qb unit. The possibility of buried cultural resources within the slough deposits is expected to be high.

The Amended AFC does not suggest temporal associations or functional interpretations for the HECA-2009-10. However, this site can be classified as a lithic scatter which may have served a special function. The applicant has not conducted the fieldwork required to gather data for a site significance evaluation, and does not provide a significance recommendation. Without primary field data on the presence of a subsurface component for the site, staff cannot determine whether HECA-2009-10 qualifies as a historical resource, unique archaeological resource, or historic property. Staff requested this primary field data in Data Requests A192–194 (CEC 2012a:7–9), but has not received it. For the purposes of this analysis, staff assumes that HECA-2009-10 is a historical resource under CEQA and a historic property for Section 106 purposes.

HECA-2010-1

The applicant identified archaeological site HECA-2010-1 in the 200-feet buffer area defined for the proposed electrical switching station. The applicant's report on the proposed HECA transmission upgrades describes HECA-2010-1 as a “very light scatter of lithic material” and a “lithic scatter.” (URS 2013a:3-4, Table 3.3-1.) The confidential cultural resources survey report for the proposed transmission upgrades contains additional information on the site. HECA-2010-1 consists of four artifacts distributed over a 160-feet-by-66-feet area. The artifacts consist of a CCS flake, a chert flake, a basalt flake, and an obsidian biface fragment. Disturbances in the area include construction of the Midway–Wheeler Ridge Transmission Line and grading for road construction. (Hale and Laurie 2013:10.)

The applicant found no evidence that HECA-2010-1 extends into the proposed electrical switching yard, and ground surface visibility was suitable at the time of survey to make this determination. The applicant concludes that construction of the proposed project would not affect HECA-2010-1 if temporary barriers are put in place to keep construction personnel and equipment off the site. (URS 2013a:3-4, 3-5.) The applicant did not evaluate HECA-2010-1 for significance under CEQA or Section 106 of the NHPA and did not propose further work at the site.

Staff is concerned, however, that the applicant's efforts to describe HECA-2010-1 fall short of what is needed for staff to determine if the site qualifies as a historical resource, unique archaeological resource, or historic property. The applicant demonstrates clearly that the proposed project would not damage the surface expression of HECA-2010-1, but does not address the potential for subsurface archaeological deposits to extend into the footprint of the proposed electrical switching station, neither by test excavation to determine the presence or absence of subsurface archaeological deposits within the recorded site boundaries, nor by presence/absence excavation in the adjacent proposed switching station footprint. The applicant hypothesizes that the site vicinity has low potential for buried archaeological deposits because the area is situated on a Pleistocene-aged landform that developed prior to human habitation of the project vicinity. The applicant further states that the vicinity of HECA-2010-1 consists predominantly of Garces series soils, which the applicant states previous researchers have radiocarbon-dated to the latest Pleistocene/Early Holocene. Accordingly, the applicant views this landform as having been stable to slightly erosional since the latest Pleistocene and therefore is unlikely to harbor buried archaeological resources. (Hale and Laurie 2013:8.)

The argument presented above has intuitive appeal, but suffers from errors of fact. Staff agrees that the landform on which both HECA-2010-1 and the proposed electrical switching station—Wheeler Ridge—was formed in the latest Pleistocene (see Meyer et al. 2009:51). That the vicinity of HECA-2010-1 is predominantly on Garces series soils, however, is false. The proposed electrical switching station and HECA-2010-1 are located on Buttonwillow clay, as depicted in the applicant's Transmission Upgrades report (URS 2013a:Figure 3.9-1). Flanking the proposed electrical switching station to the north and south are Kimberlina fine sandy loam and Lokern clay, drained, respectively; Garces series soils are located a little beyond the Kimberlina soil units. (URS 2013a:Figure 3.9-1.) The presence of Kimberlina soil units in close proximity to HECA-2010-1 is interesting because Meyer et al. (2009:75) reports Late Holocene radiocarbon dates from this soil unit. In fact, archaeological site CA-KER-3085 in the Elk Hills is located atop a buried Kimberlina soil unit and excavations at this site yielded radiocarbon dates of 1265 cal B.P. from the buried soil (3.9–4.1 feet below ground surface) and 720 ± 50 B.P. at 0.5–0.6 feet below ground surface (Culleton 2006:Table 4; Meyer et al. 2009:77). Lacking radiocarbon dates for the Buttonwillow clay and Lokern soil series in the vicinity of HECA-2010-1, and the recent dates obtained from Kimberlina soils, present an unfavorable situation for assuming that surface and near-surface soils on Wheeler Ridge are of latest Pleistocene age. It appears to staff that Kimberlina soils and perhaps Buttonwillow soils are potentially Late Holocene in age and suitable for harboring subsurface or buried archaeological resources. Without the information that would be supplied by test excavation at HECA-2010-1 or presence/absence excavation in the proposed electrical switching station, staff assumes that subsurface or buried archaeological materials extend into the proposed construction area. HECA-2010-1 and any associated materials in the proposed switching station footprint are assumed to constitute a historical resource under CEQA and a historic property under Section 106 of the NHPA. Prior to completion of the FSA/FEIS, staff requests that the applicant prepare a work plan and conduct a presence/absence excavation in the proposed electrical switching station footprint so that staff has a factual basis for establishing the proposed project's likelihood of damaging archaeological resources at this location. The applicant can conduct this excavation in tandem with their proposed geoarchaeological investigation (see URS 2013d).

BS-IF-004

BS-IF-004 was identified along the proposed process water line and recorded as an isolate. The "isolate" consists of a small brow chert flake fragment, bifacially shaped brown chert chopper, and three large freshwater mussel shell fragments. The chopper was found in the bottom of the West Side Canal with the mussel shell in a gravel lens. The flake was located on the dirt access road flanking the canal. (Farmer 2008:Table 5-1; McNutt and Shaw 2008:1.) Staff disagrees with Farmer's (2008:Table 5-1) classification of BS-IF-004 as an isolate. OHP (1989:2) defines a site as consisting of at least three associated artifacts or a single feature. The apparent association between the chopper and freshwater mussel, coupled with the nearby flake fragment, is clearly more than three associated artifacts. Staff therefore considers BS-IF-004 to be an archaeological site and disagrees with the applicant that no further work at this location is warranted. The applicant has not conducted the fieldwork required to gather data for a site significance evaluation for BS-IF-004. Without primary field data on the presence or absence of a subsurface component for the site, staff cannot determine whether the site qualifies as a historical resource, unique archaeological resource, or historic property. For the purposes of this analysis, staff assumes that BS-IF-004 is a historical resource and historic property.

KRM-IF-003

KRM-IF-003 consists of one chert flake and two pieces of chert shatter, all the byproducts of stone-tool manufacture (McLean and Mattiuissi 2008:1). The resource is situated along the proposed process water line about 200 ft from site CA-KER-179. Following OHP's (1989:2) definition of a site, staff classifies KRM-IF-003 as a site, rather than as an isolate as Farmer (2008:Table 5-1) does. The applicant has not conducted the fieldwork required to gather data for a site significance evaluation for KRM-IF-003. Without primary field data on the presence or absence of a subsurface component for the site, staff cannot determine whether the site qualifies as a historical resource, unique archaeological resource, or historic property. For the purposes of this analysis, staff assumes that BS-IF-004 is a historical resource and historic property.

CA-KER-5401 (P-15-6776)

P-15-6776 is a prehistoric archaeological deposit approximately 17 acres in area. The surface component of the site measures approximately 702 feet north–south and 1066 feet east–west. It is located along the proposed CO_2 pipeline south of the West Side Canal and the California Aqueduct. The site area is a gently sloping alluvial piedmont with north aspect and open exposure. The setting provides an overview of the former network of sloughs running along the western margin of the Central Valley. The site has been disturbed by agriculture, livestock grazing, heavy equipment and construction of the California Aqueduct. Currently the site is covered with very sparse low grasses. The present site surface is composed of loosely compacted silty sand with limestone and sandstone inclusions (Farmer 2008:5-20).

The site was originally recorded as an isolated bowl mortar and associated freshwater mussel shell scatter in 1991. In 1997 Pacific Legacy expanded the boundary and tested the site (Jackson et al. 1998:285). They found the site to be a low to moderately dense freshwater mussel shell scatter, faunal bone, and associated artifacts. Some of these artifacts include 12 chert flakes, an obsidian biface, sandstone manos and metates, seven olive snail shell beads and a clam shell disk bead. The shell beads found in 1997 suggest the site dates to the Upper Archaic (2500–850 cal B.P.) and the Emergent Periods (850 cal B.P.–historic). Two radiocarbon dates from freshwater mussel shell excavated in 1997, 925–660 B.P. and 645–480 B.P., support these temporal associations. As a result of these excavations Pacific Legacy recommended that CA-KER-5401 is not eligible for the NRHP or the CRHR because the site does not retain the potential to yield further information important to prehistory.

The site was revisited by URS in 2008 as part of the original HECA project (Farmer 2008:5-21). During this visit URS noted more surface artifacts than reported in 1997, and expanded the site boundary to the south and west. URS reports the presence of two possible house pits; an unspecified number of chert, obsidian, and quartzite flakes, 17 groundstone fragments, three steatite fragments, four lithic tools, and one olive snail shell bead. In addition, the shell density is reported to be moderate to dense, with the highest concentrations reaching 50 or more fragments or more per 10 square feet near the eastern portion of the site. Finally, the site was visited by Stantec in 2011 as part of the current project. They note that the artifact scatter extends to the north and west of the previously mapped boundaries of the site, and recommend further survey and testing prior to construction of the proposed project (Stantec 2011:8).

The more particular physical context for site CA-KER-5401, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Elk Hills Quaternary alluvial fan deposits of the *Qa* unit. The possibility of buried cultural resources within the alluvial fan deposits is expected to be low-to-moderate. However, given the close proximity of the Buena Vista Slough, staff has determined that the potential for buried deposits at this site is moderate. This expectation is supported by the 1997 excavations which noted cultural materials approximately 1.6 feet below the modern ground surface (Jackson et al. 1998:285).

Previous researchers do not agree about the nature of CA-KER-5401. Pacific Legacy considers the site to be a small *Multi-constituent (Short Term Habitation)* site which is not eligible for the NRHP or CRHR. In contrast both URS and Stantec noted additional artifacts and features at the site which suggest that it is a *Midden (Long Term Habitation)* site that may be eligible for the NRHP and CRHR. Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13; URS 2012c). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if CA-KER-5401is eligible for the NRHP or CRHR. Staff will present OEHI’s latest methods and findings, and staff’s analysis, in the FSA/FEIS. For this analysis, however, staff assumes that CA-KER-5401 is a historical resource and historic property.

HECA-2008-6

HECA-2008-6 is a prehistoric archaeological deposit approximately 1.9 acres in area. The surface component of the site measures approximately 384 feet north–south and 220 feet east–west. It is located along the proposed CO_2 pipeline south of the West Side Canal and the California Aqueduct. The site area is a gently sloping alluvial piedmont with north aspect and open exposure. The setting provides an overview of the former network of sloughs running along the western margin of the Central Valley. The site was previously used for agriculture and livestock grazing and has been impacted by a large equipment track which cuts through the center of the site from north to south. Currently the site is covered with low grasses. The present site surface is composed of loosely compacted silty sand with limestone and sandstone inclusions. Further details about the site surface are unspecified. This site consists of a sparse scatter of lithic debris and freshwater mussel shell including nine pieces of Monterey chert and basalt representing early core and tool finishing reduction stages. One sandstone metate with a single bi-directional use face is also present. The site resembles numerous others of similar constituents and various sizes recorded on the north flank of the Elk Hills. Several other sites are recorded within a mile radius. Separations between sites are based on the presence and absence of cultural remains and topography. HECA-2008-6 was recorded in 2008 by URS as part of the original HECA project (Farmer 2008:5-7). However, OEHI did not mention it in their technical report (Stantec 2011).

The more particular physical context for site HECA-2008-6, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Elk Hills Quaternary alluvial fan deposits of the *Qa* unit. The possibility of buried cultural resources within the alluvial fan deposits is expected to be low-to-moderate. However, given the close proximity of the Buena Vista Slough, staff has determined that the potential for buried deposits at this site is moderate. This expectation is supported by field observations which note shell midden in animal burrow back dirt, indicating a subsurface component to the site (Farmer 2008:5-7). The actual depth of the site has not been determined, however.

The 2008 site description suggests that the site was a limited use resource area used for processing seeds, plants, and fresh water mussels. However, a temporal association was not identified. Staff agrees with this functional characterization, and suggests that this site can be classified as a *Multi-constituent site.* In addition, the original recorders of the site recommend that it is not eligible for the NRHP and CRHR because of its lack of ability to yield information important to prehistory (Farmer 2008:5-7). However, staff notes that OEHI has not conducted the fieldwork required to gather data for formal site eligibility determinations. Without primary field data on the presence and nature of a subsurface component for the site, beyond the anecdotal observations provided, staff cannot evaluate the site sufficiently to determine if the site may retain the potential to yield information important to prehistory. Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if HECA-2008-6 is eligible for the NRHP or CRHR. Staff will present OEHI's latest methods and findings, and staff's analysis, in the FSA/FEIS. For the purposes of this analysis, staff assumes that HECA-2008-6 is a historical resource and historic property.

HECA-2008-7

HECA-2008-7 is a prehistoric archaeological deposit approximately 7 acres in area. The surface component of the site measures approximately 899 feet north–south and 338 feet east–west. It is located along the proposed CO_2 pipeline south of the West Side Canal and the California Aqueduct. The site is located on a broad, north trending, terrace finger ridge that is bound on the east and west by deeply incised north trending drainages. The setting provides an overview of the former network of sloughs running along the western margin of the Central Valley. Formerly an agricultural field, the soil is now fallow and denuded of vegetation, although occasional Salt Bush and grasses are present. The present site surface is composed of loosely compacted silty sand with limestone and sandstone inclusions. This site consists of two house depressions, multiple dense concentrations of freshwater mussel shell fragments, Monterey and Franciscan chert debitage, and one groundstone fragment. The house depressions, Feature 1 to the west and Feature 2 to the east, are located in the southern portion of the site. They are being eroded by a small wash, flowing through the depressions to the east. Feature 2 contains a dense fresh water mussel shell midden. No further information about the features was provided. Artifacts present at the site include 10 pieces of chert debitage which represent early to late stage core reduction. Also present is a sandstone bowl fragment which has been ground through the bottom of the bowl. This is known as “killing” the bowl, a process tied to Yokut funerary practices. This artifact suggests that human burials may be present at the site. The shell concentrations range from moderate (2–3 fragments per 10 square feet) to very dense (20–30 fragments per 10 square fee). HECA-2008-7 was recorded in 2008 by URS as part of the original HECA project (Farmer 2008:5-8). However, OEHI did not mention it in their technical report (Stantec 2011).

The more particular physical context for site HECA-2008-7, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Elk Hills Quaternary alluvial fan deposits of the *Qa* unit. The possibility of buried cultural resources within the alluvial fan deposits is expected to be low-to-moderate. However, given the close proximity of the Buena Vista Slough, staff has determined that the potential for buried deposits at this site is moderate. This expectation is supported by field observations which note shell midden in animal burrow back dirt and eroded areas, indicating a subsurface component to the site (Farmer 2008:5-8). The actual depth of the site has not been determined, however.

The 2008 site description suggests that the site was a habitation site dating to the “Middle Period” (Ruelas 2008). Staff agrees with this functional characterization, and suggests that this site can be classified as either a *Midden (Long Term Habitation)* or a *Multi-constituent (Short Term Habitation) site.* However, staff disagrees with the proposed temporal affiliation. “Killed” groundstone is characteristic of the Emergent Period (850 B.P.–historic). In addition, the original recorders of the site recommend that it is potentially eligible for the NRHP and CRHR because of its ability to yield information important to prehistory, and recommended evaluation phase excavation be conducted in order to explore the integrity of the resource (Farmer 2008:Table 5-1). Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if HECA-2008-7 is eligible for the NRHP or CRHR. Staff will present OEHI's latest methods and findings, and staff's analysis, in the FSA/FEIS. For this analysis, however, staff assumes that HECA-2008-7 is a historical resource and historic property.

HECA-2008-11

HECA-2008-11 is a prehistoric archaeological deposit approximately 1.7 acres in area. The surface component of the site measures approximately 243 feet north–south and 312 feet east–west. It is located along the proposed CO_2 pipeline south of the West Side Canal and the California Aqueduct. The site is located on a low terrace which gently slopes to the northeast. It is bounded by seasonal drainages on the east and west sides. The eastern drainage has been used for modern trash disposal. The setting provides an overview of the former network of sloughs running along the western margin of the Central Valley. Formerly an agricultural field, the soil is now fallow and denuded of vegetation, although occasional salt bush, sagebrush and low grasses are present. The site surface is composed of loosely compacted silty sand with limestone inclusions. Site disturbances include a dirt road which cuts through the center of the site from north to south, and an ephemeral drainage also cutting through the center of the site from southwest to northeast. This site consists of a light scatter of freshwater mussel shells (1 fragment per 10 square feet), two flakes of Monterey chert, a groundstone fragment, and a large Pismo clam shell bead. This shell bead is a traditional funerary object of the Southern Valley Yokuts. This artifact suggests that human burials may be present at the site. HECA-2008-11 was recorded in 2008 by URS as part of the original HECA project (Farmer 2008:5-9). However, OEHI did not mention it in their technical report (Stantec 2011).

The more particular physical context for site HECA-2008-11, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Elk Hills Quaternary alluvial fan deposits of the *Qa* unit. The possibility of buried cultural resources within the alluvial fan deposits is expected to be low-to-moderate. However, given the close proximity of the Buena Vista Slough, staff has determined that the potential for buried deposits at this site is moderate. The actual depth of the site has not been determined, however.

The 2008 site description suggests that the site was a limited use resource area used for processing seeds, plants, and fresh water mussels. Staff agrees with this functional characterization, and suggests that this site can be classified as a *Multi-constituent site.* However, a temporal association was not identified. Staff notes that clam disk beads are associated with both the Middle Archaic (7450–2500 cal B.P.) and the Emergent Period (cal 850 B.P.–historic) (Gibson 1992). In addition, the original recorders of the site recommend that it is potentially eligible for the NRHP and CRHR because of its ability to yield information important to prehistory, and recommended evaluation phase excavation be conducted in order to explore the integrity of the resource (Farmer 2008:Table 5-1). Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if HECA-2008-11 is eligible for the NRHP or CRHR. Staff will present OEHI's latest methods and findings, and staff's analysis, in the FSA/FEIS. For the present analysis, staff assumes that HECA-2008-11 is a historical resource and historic property.

HECA-2008-12

HECA-2008-12 is a prehistoric archaeological deposit approximately 4 ac in area. The surface component of the site measures approximately 262 ft north–south and 656 ft east–west. It is located along the proposed CO_2 pipeline south of the West Side Canal and the California Aqueduct. The site is located on a low terrace which gently slopes to the north. It is bounded by a seasonal drainage which wraps around the southern and eastern perimeter. The setting provides an overview of the former network of sloughs running along the western margin of the Central Valley. Formerly an agricultural field, the soil is now fallow and denuded of vegetation, although occasional low grasses are present. This site consists of a light scatter of freshwater mussel shells, one quartzite core tool, two sandstone groundstone fragments, and two steatite bowl fragments. HECA-2008-12 was originally recorded in 2008 by URS as part of the original HECA project (Farmer 2008: 5-10). Stantec did not mention HECA-2008-12 in their initial technical report (Stantec 2011).

The more particular physical context for site HECA-2008-12, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Elk Hills Quaternary alluvial fan deposits of the *Qa* unit. The possibility of buried cultural resources within the alluvial fan deposits is expected to be low-to-moderate. However, given the close proximity of the Buena Vista Slough, staff has determined that the potential for buried deposits at this site is moderate. The actual depth of the site has not been determined, however.

The 2008 site description suggests that the site was a habitation site (Farmer 2008:5-10). Staff agrees with this functional characterization, and suggests that this site can be classified as either a *Midden (Long Term Habitation)* or a *Multi-constituent (Short Term Habitation) site.* In addition, the original recorders of the site recommend that it is potentially eligible for the NRHP and CRHR because of its ability to yield information important to prehistory, and recommended evaluation phase excavation be conducted in order to explore the integrity of the resource (Farmer 2008:Table 5-1). Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if HECA-2008-12 is eligible for the NRHP or CRHR. Staff will present OEHI's latest methods and findings, and staff's analysis, in the FSA/FEIS. For the present analysis, staff assumes that HECA-2008-12 is a historical resource and historic property.

Multi-component Archaeological Resources

CA-KER-89/H (P-15-89)

CA-KER-89/H is a multi-component archaeological deposit approximately 0.2 acre in area. The surface component measures approximately 148 feet north–south and 49 feet east–west. It is located along the proposed HECA process water line, primarily on the southwest side of the West Side Canal. However, the presence of an isolated chert flake (KRM-IF-006) on the northeast side of the canal suggests that the prehistoric component may extend to the east. Vegetation present at the site consists of salt bush and low grasses, growing in sandy alluvium. The site was originally recorded in 1950 as an "Indian Burial Mound." A relative site location is plotted within the Lokern 7.5-minute USGS quadrangle, however no other information about the site was provided. When the site was revisited in 1990 it was recorded as a multi-component site. The prehistoric component consists of a midden mound three to four meters high. Cultural materials at the site include a scatter of lithic debitage, turtle and rabbit bones, various human bones, and an olive snail split-punched bead. The historic component consists of purple glass and other historic artifacts. Additional information about this component is unspecified.

The more particular physical context for site CA-KER-89/H, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the *Qb* unit. As the presence of this site demonstrates, the possibility of buried cultural resources within the slough deposits is expected to be high.

Previous researchers suggest no temporal association or functional interpretation for the site. However, staff suggests that the midden, faunal remains, human remains, and shell beads indicate that this site can be classified as a *Midden (Long Term Habitation)* site. In addition, staff notes that olive snail split-punched beads date to the Middle (7500–2500 cal B.P.) and Upper Archaic periods (cal 2500–850 B.P.) (Gibson 1992). The applicant has not conducted the fieldwork required to determine if an intact buried component of CA-KER-89/H extends to the east side of the West Side Canal. Without primary field data on the presence of a subsurface component for the site, staff cannot evaluate the site sufficiently to determine if the site may retain the potential to yield information important to prehistory. Staff requested this primary field data in Data Requests A192–194 (CEC 2012a:7–9). The applicant responded that it intended to avoid damaging archaeological resources along the proposed process water line, including CA-KER-89/H (URS 2013b:A192-2). In addition, the applicant stated elsewhere that test excavation was not warranted at CA-KER-89/H or KRM-ISO-006 because the former is not located in the PAA/APE and the latter is simply an isolated find (URS 2013c:147-1). Staff believes that the applicant is taking an overly particularistic view of archaeological resource boundaries in the vicinity of CA-KER-89/H. Staff agrees that CA-KER-89/H, as currently mapped, is located west of the PAA/APE. Staff also agrees that KRM-IF-006 may be an isolated find. However, the proximity of these two resources, both of which have not witnessed test excavation and are separated by a water conveyance that was built after the archaeological resources were formed, begs the question whether the two resources constitute a single site that has been bisected by the West Side Canal. On the basis of the information provided to date, staff is unable to determine if CA-KER-89/H extends into the PAA/APE and, if so, whether it is eligible for listing in the CRHR or NRHP. For the present analysis, staff assumes that CA-KER-89/H is a historical resource and historic property.

CA-KER-5356/H (P-15-6725)

CA-KER-5356/H is a multi-component archaeological deposit approximately 0.02 acre in area. The surface component measures approximately 361 feet north–south and 318 feet east–west. It is located along the proposed HECA process water line, primarily on the southwest side of the West Side Canal. However, the presence of an isolated chert flake (P-15-7176) on the northeast side of the canal suggests that the prehistoric component may extend to the east. Artifacts are visible in a graded dirt road and in an agricultural field to the north. The site may extend to the south as well, but dense Tamarisk thickets prevented exploration in this direction. Soil at the site is dark grey to whitish sand. Modern disturbances include construction of the West Side Canal, road construction and agricultural activities. The prehistoric component consists of four pieces of white Temblor chert debitage. The historic component consists primarily of glass and ceramic fragments. The glass includes clear, sun colored amethyst, amber, green and white fragments. Also present are blue ceramic fragments which may be "Fiesta Ware", as well as multiple fragments of glazed earthenware in light blue, and red with brown. (Scott 2000; Wear and Frazier 1998:1–2).

The more particular physical context for site CA-KER-5356/H, extrapolating information from **Cultural Resources Figure 1** to the location of the site, appears to be within the Buena Vista Slough deposits of the *Qb* unit. As the presence of this site demonstrates, the possibility of buried cultural resources within the slough deposits is expected to be high.

Previous researchers suggest no temporal association or functional interpretation for either site component. In addition, no eligibility recommendation was made. However, subsurface excavation was conducted as part of the La Paloma Generating Project in 1999. One 33-feet-long trench paralleling the levee road was excavated approximately 66 ft north of the artifacts observed in the road. No buried component was identified in this trench (URS Greiner Woodward Clyde 1999:L-9). Nonetheless, subsurface archaeological deposits may exist on the east side of the West Side Canal. Without primary field data on the presence of a subsurface component for the site on the east side of the canal, staff cannot evaluate the site sufficiently to determine if the site may retain the potential to yield information important to prehistory. Staff requested this primary field data in Data Requests A192–194 (CEC 2012a:7–9) or evidence from the applicant that P-15-7176 would not be affected by the proposed project (Data Request 147; CEC 2012b:13–14). The applicant responded that CA-KER-5356/H is not in the PAA/APE and that P-15-7176 is an isolate that does not require further treatment. Therefore, the applicant reasons that neither avoidance measures nor an archaeological test excavation at P-15-7176 is warranted (URS 2013b:A192-2, 2013c:147-1). Staff disagrees with the applicant's conclusion, as the applicant has not determined whether subsurface deposits are present at P-15-7176, which appears to be an eastern extension of CA-KER-5356/H. Staff requests that the applicant either conduct a test excavation to determine whether significant subsurface deposits are present at P-15-7176 or propose measures that would prevent subsurface disturbance during construction in this area. In the interim, staff assumes that P-15-7176 is a historical resource for the purposes of CEQA and a historic property under Section 106 of the NHPA.

Ethnographic Resources

No CRHR-eligible ethnographic resources have been found in the PAA/APE.

Historic Archaeological Resources

To date, one historic archaeological resource has been identified in the HECA portion of the PAA/APE: HECA-2010-2.

HECA-2010-2

Historic archaeological site HECA-2010-2 was first recorded on July 29, 2010. A subsequent visit and DPR 523 form update was made on February 29, 2012. (Hale et al. 2012:41–42, Appendix C; URS 2012a:5.3-29, 5.3-30).

HECA-2010-2 consists of the remnants of a demolished farmhouse. The site covers an area approximately 220 feet north–south and 135 feet east–west. It contains a single feature, nonnative trees, and a scatter of historic artifacts. Feature 1 comprises a partial, concrete house foundation. A cinderblock addition to the house is evident along the north side of the foundation. Also evident in Feature 1 are the remains of clay, cast-iron, and polyvinylchloride (PVC) sanitary (septic) and water pipes. (Hale et al. 2012:41; URS 2012a:5.3-29).

Artifacts present at HECA-2010-2 consist of structural debris (concrete rubble) and approximately 35 specimens of complete and fragmentary metal cans, bottle glass, and ferrous metal fragments. Time-sensitive artifacts included an aqua-colored glass bottle top and two hole-in-top, match-filled, crimped-seamed evaporated milk cans. The two evaporated milk cans are types manufactured between 1917 and 1929 (URS 2012e:A68-3.) Most aqua-colored bottle glass predates 1910 (University of Utah et al. 1992).

The applicant surmises that the historic residence was likely built between the 1920s and 1930s, based on a "review of archival sources, including aerial photographs and topographic maps" (Hale et al. 2012:41; URS 2012a:5.3-29). Staff concurs that this is a reasonable inference, although the archival records examined by the applicant's cultural resource consultants provide a sufficient basis to narrow the construction date down further.

Historic-period occupation of the property on which HECA-2010-2 is located was unlikely prior to the 1890s–1919 because historic maps and documents indicate that the site location was in swamp and overflowed land. Additionally, it was not until 1919 that all of the lands between the West and East Side canals were reclaimed and farmed by Miller & Lux. (GLO 1856d, 1868d; URS 2012a:5.3-14.) Furthermore, no buildings or structures are evident at the location of HECA-2010-2 on historic maps dating between 1853 and 1918 (Aubury 1904; Buffington 1912; Congdon 1898; GLO 1856d, 1868d; Hall 1885; Punnett Bros. 1914; Stegman 1918; von Leicht and Kaufman 1875). A historic topographic map, however, depicts a building at the location of HECA-2010-2 in 1927 or 1929 (USGS 1932a). Therefore, the former residence at HECA-2010-2 would have been built between 1919 and 1929. Dateable historic artifacts found at the archaeological site, albeit few in number, generally support a construction interval of 1919–1929.

The historic record reveals that the land on which HECA-2010-2 is located was part of Miller & Lux's Buttonwillow Ranch from the 1870s till 1927, when Miller & Lux began to subdivide and sell the 52,000-acre ranch. About this time, Chatsworth, California farmers George W. and Dedo S. Olsen purchased the property, although they did not move to the Buttonwillow area with their sons until 1935. Son Leland K. and his wife Ruth B. lived at HECA-2010-2 from 1936 to the 1990s. (URS 2012a:5.3-29; Webb and Miller 2012:2.) The occupation of HECA-2010-2 can therefore be defined as spanning the interval of 1919–1927 to the 1990s.

The condition of HECA-2010-2 is poor. Between 2010 and 2012, the landowner or the landowner's agent graded the parcel on which HECA-2010-2 is located, removing all evidence of the former residence, artifact scatter and structural debris alike. (URS 2012a:5.3-30.) The property now contains a newly planted orchard.

On the basis of its apparent destruction, the applicant does not evaluate HECA-2010-2 for NRHP eligibility or for historical significance under CEQA. Discounting the potential for subsurface archaeological deposits in the form of privy pits (outhouses) or refuse pits, the applicant states that since structural remnants and artifacts are no longer evident at the archaeological site, construction of the proposed project would not damage HECA-2010-2 (URS 2012a:5.3-30, 5.3-39). Staff disagrees with this assessment.

The applicant downplays the probability of a privy having been used at HECA-2010-2 because the foundation remnant included clay, cast-iron, and PVC pipes, suggestive of indoor plumbing that debouched into a septic system (URS 2012a:5.3-30). Given that the residence was occupied from as early as 1919–1927 through the 1990s, an addition was made to the house at an unknown time, and more than one septic/water technology is evident in the pipes observed in 2010 (URS 2012a:5.3-29), there is ample potential for the occupants of HECA-2010-2 to have shifted from privy waste disposal to septic waste disposal. The latter is the prevailing household waste disposal method used in the project vicinity today (URS 2012a:5.14-24). For rural residential properties occupied through the 1930s, it was commonplace for waste disposal to depend on an outhouse or privy:

> *Although there was a rising awareness of proper sewerage techniques in small towns across California, these small communities rarely had the capital necessary to make the costly improvements in their sewage or water supply systems without raising taxes or securing bonds for such improvements. Instead, a number of the more rural communities relied upon well water and vault privies through the Great Depression of the 1930s. (Caltrans 2010:64, emphasis added).*

Privies would likely be located north and east of the house so that the prevailing westerly and northwesterly winds would blow unwanted odors away from the residence. Therefore, the proposed natural gas pipeline has the potential to intersect any privy pits that might be present. Privy pits frequently contain archaeological materials that qualify archaeological resources for listing in the NRHP or CRHR. It is therefore critical to a cultural resources impact assessment to determine whether a privy pit is present at HECA-2010-2. Accordingly, staff has issued data requests to the applicant to prepare a work plan for determining—through metal detection, probing, or other methods—whether a privy is present in the PAA/APE in the vicinity of HECA-2010-2 and implement the work plan. If a privy is located as a result of the field investigation, the resource would have to be evaluated for NRHP eligibility and historical significance under CEQA or avoided through project design. The applicant is working on this request. (CEC 2012c:17–20; URS 2012b, 2012f.) An assessment of HECA-2010-2's historical significance and potential project impacts on it cannot be conducted until the applicant completes and implements the work plan described previously in this paragraph. For the present analysis, staff assumes that HECA-2010-2 is a historical resource and historic property.

The archaeological site is associated with a Quonset hut, which was recorded separately as Map Reference No. 5 (Olsen Property) in February 2012 (JRP 2012:23, 29–30, Table 1, Appendix B). Staff evaluates the historical significance of Map Reference No. 5 in the "Built-Environment Resources" subsection below.

Built-Environment Resources

The Amended AFC included 15 identified and recorded historic built environment resources (some are multiple resources) within the PAA/APE. These consist of a variety of resources, including rail lines, water conveyance systems and structures, transmission lines, agricultural complexes, residential properties, water storage facilities and a wildlife reserve. Resources within the proposed project footprint and controlled area are residential and agricultural complexes. **Cultural Resources Table 9** summarizes the identified resources and their eligibility for listing on the NRHP/CRHR as determined by the applicant's historical consultant and recorded on DPR 523 forms, submitted with the application. **Cultural Resources Table 9** also includes eight historic built environment resources within the PAA/APE which were not included in the current application.

The Amended AFC included some resources that were recorded in 2009 and based upon the 2009 project PAA. The PAA/APE for the current project has changed for the linear routes. Data Requests A181, 182,184,185 and 191, issued by staff on November 2, 2012 (CEC 2012a), requested new or updated DPR 523 Forms and evaluations of these resources based on the current PAA/APE. Responses have been received for most of these data requests; others are pending under the applicant's request for additional time. The applicant objected to several staff data requests, including A181(b), A186 (a–c) and A187(a–c). Responses to data requests will be integrated and analyzed with the appropriate resources.

Most of the Buena Vista Water Storage District (BVWSD) resources are evaluated on one DPR 523 form and listed as Map Reference 14 (MR 14). The exceptions are the structure known as Old Headquarters Weir (MR 10) and KRM-001H, which are evaluated separately. Other than the California Aqueduct (MR 11), the Old Headquarters Weir was the only other historic built environment resource within the PAA/APE found by the applicant to be eligible for listing on the NRHP/CRHR.

Map Reference No. 1 (MR 1) Agricultural Buildings

The collection of agricultural buildings known as MR 1 is located in the PAA/APE for the proposed railroad spur. The buildings are located north of SR 58 and east of Tracy Road. The DPR 523 form includes a photograph of the property taken facing the northwest. Transmission lines and towers are visible in the background of the photograph. Staff has not visited this resource and bases the analysis upon information provided by the applicant and images from Google Earth 2012. Google Earth historic aerial images dating back to 1994 indicate the same basic arrangement of buildings and site features as they exist today. The applicant's evaluation finds there are six dilapidated buildings that were moved to this location after 1973 and that previously the property was undeveloped. Buildings are described as wood-frame construction with sidings of stucco, vertical wood or corrugated metal. Roof forms are described as having either shed or gable forms of shingles or metal.

A building not shown or discussed on the DPR form appears to be a grain storage type building. As seen from Google Earth's 2011 imagery, it is a circular building with a roof that may be opened. It is not clear that this structure is seen in the 1994 aerial imagery but it is seen in the Google Earth 2004 image. There appears to be a structure in that location in the 1994 image, but the resolution of the image is so poor as to be indeterminate.

Google Earth imagery from 2009 actually provides the clearest view of the property. In addition to the afore-mentioned structures, there is evidence of a fenced livestock pen and another grain storage structure. A dinghy or small rowboat is visible on the ground near the livestock pen. The quality of the 2011 aerial makes it difficult to determine if the livestock pen is still extant.

The applicant concluded that the property is not eligible for listing on the NRHP/CRHR for any of the criterion and, based upon available analysis and evidence, staff concurs with this conclusion. Staff will make a site visit prior to publication of the FSA/FEIS to confirm this conclusion and will provide an expanded evaluation.

Map Reference No. 2 Southern Pacific McKittrick (Asphalto) Branch Railroad Line

Energy Commission staff Data Request A181, issued by staff on 11/2/2012 (CEC 2012a), requested an updated DPR 523 Form and evaluation of this resource based on the current project PAA/APE. DR A181a requested the updated evaluation and 181b requested a discussion of how the proposed railroad laydown yard would impact either the existing rail line or the historic spur. The applicant objected to providing additional information on the railroad construction laydown area on the grounds that the resource was not found to be eligible for listing on the CRHR or NRHP, and therefore not a historical resource under CEQA. The applicant concluded that no discussion regarding potential impacts on this property is necessary in determining the significance of environmental effects to cultural resources under CEQA. While staff tentatively concurs that this resource is not eligible, staff notes that until the DPR 523 Form was updated to evaluate the portion of the rail road within the current PAA/APE, that determination was premature.

MR 2 (CA-KER-2050-H/JRP-HECA-26) is a segment of the McKittrick Branch of the Southern Pacific Railroad extending between I-5 and Buttonwillow and originally constructed in 1893. The line originally connected Bakersfield to Asphalto and McKittrick to the west. By 1905, the branch line was delivering both materials and people to the oil fields of McKittrick and returning with oil to be shipped to market. Originally intended to run all the way to Sunset and to the asphalt and oil production fields of Solomon Jewett and Hugh Blogget, the branch line was formed in an agreement between these men and the Southern Pacific Railroad, creating the Standard Asphalt Company. The partnership was dissolved in 1893 amidst the Great Panic. Later partnerships formed the Sunset Railway. The McKittrick Branch was retained by Southern Pacific and extended to Olig in 1901 (Brewer 2001). The Southern Pacific Railroad removed the line from Buttonwillow to western points in 1960 (URS 2012a). None of the original stations, such as the Buttonwillow Station, are extant from Buttonwillow to the west.

A 1.3-mile segment is located within the PAA/APE for the proposed HECA transmission line. The portion of the Southern Pacific McKittrick track along the southern edge of SR 58 is described in the updated DPR 523 form (December, 2012) for MR 2 as light weight rails with rock ballast and wood ties. The tracks are raised above grade along much of SR 58 frontage. The rails are connected with bolted plates. For most of its length, the line is a single track. Sidings are located in Buttonwillow crossing Mirasol Avenue in central Buttonwillow and at the J.G. Boswell cannery. Three spurs serve the Murray Cotton Gin, an industrial complex south of Meadow Street in Buttonwillow, Farmer’s Cooperative Gin buildings east of Wasco Way, and the J.G. Boswell cannery. Spurs are located near a large storage facility near Old Tracy Road, not far from I-5. While the line was constructed in 1893, it was shortened in 1982 and had tie replacement and reballasting in 1990–1991. Staff observed a Carnegie 1899 imprint stamped on the spur line near the Farmer’s Cooperative Gin, east of Wasco Way (not located in the current PAA/APE). The line is in use and operated by the San Joaquin Valley Railroad, a railroad in the short-line business group of Union Pacific railroad and carries agricultural products and other freight[31].

The segment of the railroad line that falls within the PAA/APE is located in the vicinity of the intersection of SR 58 and Tracy Lane. Staff has not conducted a survey of this intersection but has driven the SR 58 roadbed adjacent to the railroad and stopped at other locations nearby. Staff does not believe that conclusions would change based upon first hand observation but does expect to make a site visit before publication of the FSA/FEIS.

Staff agrees with the eligibility evaluation provided in the Amended AFC and concludes that MR 2 is not eligible for inclusion in the CRHR or NRHP. As summarized in the DPR 523 form provided in the Amended AFC, the Southern Pacific McKittrick Branch, previously the Southern Pacific Asphalto Branch, does not appear to meet the criteria for listing in the CRHR or NRHP because it does not have historical significance or integrity. The branch line does not have significant associations with the development of petroleum production in the fields surrounding McKittrick; therefore, it is not eligible under Criterion 1/A. Additionally, its integrity is impaired by the removal of the section

[31] http://www.uprr.com/customers/shortline/lines/sjvr.shtml

extending west from Buttonwillow to the asphalt/oil production areas. While Southern Pacific constructed the branch in cooperation with Solomon Jewett and Hugh Blogget, early oil and asphalt producers in the area, oil production had begun before the railroad agreement. The branch line is not associated with a significant individual; therefore, it is not eligible under Criterion 2/B. When considered under Criterion 3/C, staff finds that the railroad branch does not embody distinctive architectural characteristics of a period, type, or method of construction as little of the original materials exist and the replacement materials do not have significance. This resource is also not eligible under Criterion 4 because it is not likely to yield information important to history. In rare instances, structures can serve as sources of important information about historic construction materials or technologies Criterion 4/D; however, the railroad segment does not appear to be a principal source of important information in this regard. In addition to a lack of historic significance, the resource lacks historic integrity to 1893, its original date of construction and possible period of significance.

Map Reference No. 3 Pacific Gas & Electric (PG&E), Southern California Edison (SCE) Transmission Lines and Towers

The information submitted on the DPR 523 Form (updated December 2012) documents two sets of transmission lines and towers. Lines A & B were constructed by SCE and PG&E, respectively. The applicant dates the construction to between 1943 and 1956. Lines A & B originate at the Midway Substation at the eastern edge of Buttonwillow, cross SR 58 in a southeasterly direction and then turn easterly, paralleling, about three-quarters of a mile away, SR 58 to Bakersfield. Lines C & D, also built by SCE and PG&E respectively, were built between 1956 and 1973. These lines also originate at the Midway Substation, cross SR 58 in a southeasterly direction and continue in a southeasterly route roughly paralleling the East Side Canal.

Lines A & B are steel lattice towers, according to the DPR 523 form, carrying single or double circuits. Lines A & B appear to consist mostly of four-legged, three-armed steel lattice towers. Lines C & D are composed of similar three-armed towers and towers with a strong horizontal within an upright V-shape. Each of these designs is reflective of the power companies that constructed them.

The applicant's evaluation concludes that none of the transmission lines or their related structures is eligible for listing on the NRHP/CRHR. Staff concurs with this conclusion. None of the lines and towers appears to be significant for their association with development of electrical transmission in Kern County and are constructed well after the period of electrical development in California. Therefore, they are not eligible for listing on the CRHR or NRHP under Criterion 1/A. Under CRHR/NRHP Criterion 2/B, these lines do not appear to be eligible as they are not associated with any significant people in history. They do not possess distinctive characteristics of construction or high artistic value and are therefore ineligible under Criterion 3/C. These towers are not a source of important information regarding human history and are therefore ineligible under Criterion 4/D.

Map Reference 4 6010 Buerkle Road Residence

This residential property is located on Buerkle Road approximately 700 feet west of the East Side Canal. While it falls within the historic built environment period, the building has been remodeled and does not convey any sense of recognized style dating either to the period of construction or any later discernible style. The date of construction provided on the DPR 523 Form is 1964, with remodeling and pool construction taking place in 1997, 2007 and 2008. Landscape improvements also appear to be fairly recent. The resource does not appear to be eligible for listing on the NRHP/CRHR.

MR 4 is a residential property built in 1964 and located at 6010 Buerkle Road within the PAA/APE for the proposed HECA rail road line. The property was originally part of the Miller and Lux holdings. Martin L. Snow purchased the property in the 1950s. Martin L. Snow was one of the pioneers in developing cotton in the Buttonwillow area. He was joined by his son, Martin, in an agricultural enterprise and the two owned and developed many parcels, of which this property was one. By 1963, D. Snow owned the property and was likely the builder of the residence. Ownership changed again several times after 1973. Since its original construction in 1964, the residence has undergone significant modifications resulting in an indiscernible architectural style. The house has undergone renovations including the addition of a swimming pool and replacement windows. The stucco and roof also appear to have been updated during one of the recent modernizations of the residence. It is difficult to determine the original architecture style of the house due to the extensive remodeling and the addition or extension of a front gable porch with classically-inspired columns. These renovations have severely affected the integrity of the original structure.

Staff concurs with the conclusion reached by the applicant that site MR 4 is not eligible for inclusion in the CRHR or NRHP. The applicant provides the following significance evaluation in a confidential appendix to the Amended AFC (JRP 2012:Appendix B).

> *The property…is associated with the post-World War II, continued agricultural growth of Buttonwillow; however, this property was constructed well after other similar farmsteads, and does not represent a significant example of post-World War II building trends. By the time the residence was built, numerous farmsteads were developed throughout the eastern countryside of Buttonwillow. The multiple additions and remodeling of the building in addition to the separation of this parcel from its original larger agricultural parcel further contribute to the property's loss of integrity in association to the agricultural history of Buttonwillow. The residence does not appear to have important associations with historically significant events (NRHP Criterion A/CRHR Criterion 1). Furthermore, available evidence does not suggest that individuals associated with this property, have made significant contributions to our history. While the Snow family was a prominent landowner in the Buttonwillow area, their contribution alone is not significant to local, state, or national history (NRHP Criterion B/CRHR Criterion 2).*
>
> *Under Criterion C (Criterion 3), the parcel is a typical example of farmstead residential development when it was originally constructed on part of a larger agricultural parcel. Since the residence can no longer be classified under a specific architectural style due to significant modifications…it does not embody distinctive architectural characteristics of a period, type, or method of construction, and it is not the work of a master. In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies (NRHP Criterion D/CRHR Criterion 4). The construction methods for the residence at 6010*

Buerkle Road are otherwise documented in a wide body of historical documents and literature; the building, therefore, does not appear to be a principal source of important information in this regard.

Map Reference 5 Quonset Hut 35034 Stockdale Highway

The property containing the Quonset Hut has been altered significantly in the last few years. The property, known as the Olsen Farm, at one time contained a collection of farm buildings, a residence and landscape trees. Everything except the Quonset Hut had been removed from the property prior to filing of the Amended AFC (URS 2012a). The site has since been planted with pistachio saplings in an orchard[32] (**Cultural Resources Figure 6**). The residence, which appears in Google Earth Aerial Imagery dated April 29, 2008, was removed prior to July 29, 2010. URS recorded that only structural remains and refuse existed by July 29, 2010 (Laurie and Kile 2010:1).

The 81-acre Olsen Farm was purchased by George Olsen in 1935 and the land was transferred to his sons. Leland Olsen and his wife, Ruth B., took up residence on the property in 1936. According to the DPR 523 Form for MR 5, the Olsens lived there until Leland died in 1993, followed by Ruth's death in 2002. Historic aerial imagery depicts a typical farmstead arrangement of buildings, with a residence surrounded by trees nearest the road and outbuildings primarily along the west side of the cleared area around the residence.

The DPR 523 form describes the farm purchased by George Olsen as likely a subdivided portion of the Buttonwillow Ranch owned by Miller & Lux. However, the resource does not retain the association with the historic land ownership of Miller & Lux, and now that the residence and outbuildings have been razed and the farm replanted as an orchard, the association with the Olsen Farm is also lost. While the Quonset Hut itself is an apparently intact representative of the circa 1940s portable military building type, it no longer has any contextual association with either the Olsen Farm or the military uses for the building. Staff agrees that the Quonset Hut has lost integrity of feeling, association, and setting even while maintaining its integrity of design, workmanship, materials and location. Staff therefore concludes that the resource MR 5 is not eligible for listing on the NRHP/CRHR.

Map Reference 6 Works Project Administration (WPA)-Era Culvert Headwalls along Dairy Road

MR 6 consists of four individual structures located along Dairy Road at the intersection of or north of Adohr Road. The DPR 523 forms identify the four structures as Points 1–4, with Point 1 being the northernmost feature. Point 1 consists of culvert headwalls on both sides of Dairy Road and a culvert, presumably under the roadbed. The Main Drain connects to an unnamed lateral drain where Point 1 is located, as seen in photographs on DPR 523 MR 6 and described in the resource description. As of September 2012, Point 1 no longer appears to be in use as there is fill dirt on either side of the road and

[32] Staff site visit September 18–20, 2012.

the culvert is not visible[33]. Both headwalls are stamped with WPA 1940 engravings (**Cultural Resources Figure 6**).

Point 2 is located mid-way between Point 1 to the North and Adohr Road to the south. Point 2 is a headwall on the east side of Dairy Road and is broken into three pieces. It is also stamped WPA 1940. Like Point 1 headwalls, this no longer appears to be usable or provide any drainage. There is fill next to the structure and no visible culvert. Like Point 1, existing conditions as of September 2012, are different from those recorded for the DPR 523 in February 2012. (JRP 2012:Appendix B).

Point 3 is located at the intersection of Dairy and Adohr roads and has headwalls on either side of Dairy Road. The eastern headwall and drainage channel includes a valve of some kind but it is not apparent that it is operable or in use. It is a valve structure usually seen in conjunction with a gate, to allow water to flow or to prevent it from flowing. On the east side, the top of a culvert is just visible and appears to lead to or from the west side. The west side headwalls of Point 3 appear to house culverts that lead to both the east side of Dairy Road and to the south side of Adohr Road. Point 4 consists of two headwall structures on the south side of Adohr Road. Point 3 would appear to connect to the easternmost headwall and culvert. As reflected in the DPR 523 form description, the eastern Point 4 headwall and culvert would connect to a drain leading to the West Side Canal. From Google Earth aerial imagery, it can be seen that this connector drain runs along the western boundary of the Adohr/Palm Farms, turns east at the southern boundary of the farms' residential area and then once again turns in a southerly direction through agricultural fields and presumably connects to the West Side Canal as stated in the DPR 523 forms. The western headwall and culvert at Point 4 may no longer be in use. (JRP 2012:Appendix B.) This may be confirmed by staff in a future site visit to the PAA/APE.

It would seem that in spite of the WPA-era construction and documentation as such on several of these headwall structures, there does not appear to be any known connection to a significant WPA construction project in this area. The DPR 523 forms state that WPA projects were underway generally in the Buttonwillow region and that the Chamber of Commerce made road building a priority. The integrity of several of the structures is badly compromised and some are no longer in use. The connection to the broader WPA-era construction activities and its important contribution to American history is limited by the very pedestrian nature of the structures, their design, placement along secondary drains and the localized activity they represent. Therefore, it is unlikely they are eligible for listing on the NRHP/CRHR under Criterion A/1. (JRP 2012:Appendix B.) Staff concurs with the evaluator's conclusion that the structures are not eligible under any of the criteria for listing on the NRHP/CRHR.

Adohr Farms/Palm Farms

In 1916, Merritt Huntley Adamson Sr. and his heiress wife, Rhoda Rindge Adamson, whose parents were the last owners of a vast Spanish land grant in Malibu, founded a state-of-the-art dairy in Tarzana called Adohr Farms; Adohr was Rhoda spelled backward. Dozens of dairies sprang up in Southern California in the early years of the

[33] Staff site visit September 18–20, 2012.

twentieth century as the population grew. Swan, Supreme, Excelsior, Crown City, Carnation, Driftwood and Alta Dena, to name a few, offered Southern California customers home-delivery of dairy products. Eventually, Adohr Farms had hundreds of delivery routes and customers in the new suburbs depended upon Adohr Farms for special deliveries (Rasmussen 1998).

A decade after establishing their dairy farm, when Adohr's famous reddish-golden brown Guernseys were known worldwide for their quality, size and productive capacity, the family opened a subsidiary, Adohr Creamery Company, on a 20-acre parcel in what was then the country. The new plant processed and distributed the dairy products produced on the Tarzana farm. For more than 40 years, the company's landmark, a life size statue of a little girl stopping a milkmaid who is posed by her grazing cow stood at La Cienega Boulevard and Sawyer Street. The statue is attributed to Herman Schultheis, circa 1937. (Rasmussen 1998; Ryerson 2012.) Around the pedestal of the statue is written "The largest Guernsey herd in the world" and "Guernsey Certified Milk." The statue is in storage at a processing plant in Tulare County, as the Adohr operations all ended by 1948 in the San Fernando Valley and what remained moved to Camarillo. The Camarillo farm was sold for the Westview Park subdivision in 1969.

In 1930, the Adamsons purchased 1,500 acres from Miller & Lux in the area northwest of Tupman near Buttonwillow. At that time, they built what is described as a farm headquarters building, dining hall and dormitory and completed other property improvements including wells. Three warehouse buildings were added between 1937 and 1942, which still exist on an adjacent parcel once part of the farm. By May, 1933, the total acreage of the Buttonwillow operation was 2,600 acres. This Buttonwillow farm was considered a satellite and supporting operation to the main San Fernando Valley farm. Apparently, the Buttonwillow farm supplied alfalfa to the primary dairy operation and also supported a herd of cattle. Adohr Farms operated the farm until the 1940s. The Adamson’s sold the Buttonwillow farm in 1948 to new owners, the Banducci and Anton families. Fred Banducci and his brother Joe operated what was known as Palm Farms at the location of the former Adohr Farms satellite operation.

By the 1950s, rice was grown in the Buttonwillow area. A rice dryer was added to Palm Farms. The rice dryer is in existence today. A 1954 Elk Hills Quadrangle clearly shows the existing landing field and hangar. The applicant suggests in their analysis that the landing field was developed concurrently with the introduction of rice fields as the airplanes would have been used to plant seed, apply fertilizer and conduct weeding.

At some point in the recent past, the property and its facilities were operated as the Port Organics fertilizer plant. There is some confusion on the part of the cultural resources and visual resources descriptions of the current and former buildings on the property. The Visual Resources section of the Amended AFC describes the former Port Organics plant as adjacent to the northwest of the project site (URS 2012a:5.11-3). It goes on to describe “the structures associated with the organic fertilizer production, such as the large grain elevators and metal storage tanks, contribute to the landscape character of the area”. Only in reviewing the Amended AFC’s Land Use section (URS 2012a:5.4-4, Figure 5.4-2[4]), does the implication become clear that the former Port Organics fertilizer plant, an industrial use, is the same property as MR 7–9, the former Adohr and

Palm Farms Complex described in the Cultural Resources section of the Amended AFC, and the large grain elevators are the aforementioned rice dryers.

According to the Amended AFC, the property is currently owned by Jomistro properties. The HECA project footprint and proposed laydown area are located on parts of what was known as Adohr/Palm Farms. An area designated as the controlled area would be located on the site of three of the remaining Adohr/Palm Farms buildings and related landscape elements. The Amended AFC does not specify what activities would take place within the controlled area. These areas are shown in URS (2012a:Figure 2-9), which is a general site plan for the proposed project. Construction disturbance is referred to in Section 2.7.1.8 and described more fully in Section 2.7.1, Project Site Construction and 2.7.1.2, Site Mobilization. It states that construction activities and site preparation work will include clearing and grubbing, site grading, stormwater/erosion control, and installation of gravel and road base for temporary roads. No specific mention is made of what existing structures or landscape features are proposed to remain, be removed or demolished. Some clarification was provided in a data response to Visual Resources Data Request No. A213 (CEC 2012a). The data request asked the applicant to “confirm whether the Plant (and all related structures, palm trees surrounding the Plant, etc.) would be removed”. The applicant responded that the “former Port Organics fertilizer manufacturing plant and all related structures will not be demolished. The surrounding palm trees will not be removed”. In fact, JRP (2012:Map 2, Sheet 4) indicates that the construction laydown area will occupy eastern portions of the site that do not have any structures or any of the resources evaluated for this project. No mention is made of the existing landing strip and hangar, or the continuation of the Main Drain, which passes through the proposed project site and the controlled area south of the project site.

The applicant divided the discussion of the built environment resources for the Adohr Farms and Palm Farms complexes into three distinct resources and recorded them separately as MR 7–9. MR 7 (Adohr Farms) and MR 8 (Palm Farms) are on the same 33.04-acre parcel. MR 9 (Adohr Farms Buttonwillow Headquarters) is on a separate 4.28-acre parcel. Staff has endeavored to relate the history and context of all three resources as a single unit while also following the individual evaluations provided by the applicant in an effort to simplify the analysis for the reader.

Historical maps have not been obtained by staff but a general outline of the boundaries of the original Adohr Farms and subsequent Palm Farms begins to emerge. On the 2,600 acres were residential buildings (**Cultural Resources Figure 7**), a collection of various agricultural buildings, a landing strip and hanger, a segment of the BVWSD Main Drain, fields, and possibly additional canals and levees. The most distinguishing feature of the farm is the perimeter plantings of Mexican Fan Palm (*Washingtonia robusta*) trees (see **Cultural Resources Figure 8**). These can be seen for miles and clearly identify the location of the farm in the flat terrain of the valley. In addition to the perimeter palms, there exists an allée of a different species of palm tree flanking Building B on the Adohr Farms property. These are likely a type of Date Palm (*Dactylifera* spp.). These mature tree plantings were not recorded on the DPR 523 forms and staff issued a data request to obtain more information about their age and history as part of the farm’s landscape. Data Request A186, issued by staff on November 2, 2012 (CEC 2012a), asked specifically for a) identification by an arborist of the genus, species and age of the trees, b) historical maps or photographs showing the farm layout, including the trees from the period of significance to the present, and c) an evaluation of the landscape features (i.e., trees and placement) significance to the site as potential character-defining features. It is, after all, known as Palm Farms.

The applicant objected to Data Request A186 on the grounds that the property was not found to be eligible and that the additional evaluation requested would not alter the eligibility conclusions drawn by the applicant. However, the objection goes on to state "while a description and estimated date for the landscape features should be included in an evaluation of an eligible property…for the trees to be contributors to the Adohr Farms property, the property as a whole must meet one of the National Register or California register Criteria and retain integrity. JRP (applicant) evaluated this property…and concluded that not only do these properties lack significance they also lacked integrity."

Staff disagrees with the notion put forward that the additional extant features, such as the distinctive palm trees on the property, should be evaluated as contributors only if the property is deemed eligible. Staff believes that a complete evaluation and recording would have included these distinctive features that may very well date to the origins of the Adohr Farm and the construction of the buildings. In fact, had the three properties making up Adohr Farms, MR 7–9, been evaluated as a district, these landscape features would have been a primary element considered in the determination of significance and integrity of the resource. The perimeter palms and the driveway allée of palms are characteristic of many California Central Valley farm landscapes, whereby the farm house and property is often marked with a boundary of planted trees and a driveway allée. Central Valley farmsteads also often feature a dense cluster of trees surrounding the primary buildings, which may include the residence, a water tower, and utility buildings. These developments and the characteristic tree plantings associated with them are often visible from several miles away, as is the case with the Adohr Farm property. The perimeter palms form a pronounced, unique silhouette that is discernible from several miles away in the open agricultural landscape. The other mature trees on the property, located adjacent to the Dairy Road extension and in the vicinity of the electric line servicing the property, are spaced in such a way that they may have at one time flanked a path or other entryway. There is another tree on the Adohr Farm property which has been heavily pollarded in the past, now appears to be dead or dying, and may be similar to the two trees with the full canopies. Staff considers the tree plantings to be character-defining features of the property and will include them in the significance evaluation.

Current parcel maps at the County of Kern Assessor's Office indicate that the driveway allée of date palms are located on Assessor Parcel Number (APN) 159-040-18-7 or 7307 Adohr Road, which includes MR 7 and MR 8.

Staff had the opportunity to tour the Adohr/Palm Farms property on September 20, 2012, with a HECA employee whose family once lived on the farm[34]. She related that her father and maternal grandparents lived and worked on the farm. He arrived circa 1950 at the age of 12 or 13. The father has a recollection of a first visit to the farm in approximately 1942 and that it was a cattle ranch at that time. This would be consistent

[34] Oral history provided by Darlena Alvidrez.

with the operation of Adohr Farms at the time. Travelling with another family from New Hope, Arkansas, the family was part of the major migration of dust-bowl refugees from Arkansas and Oklahoma (see the general history of the “Okie-Arkie” migration earlier in this section). Both families settled on the farm. The farm was known as Palm Farms or alternately, as “The Camp”. It was all one property at the time and the rice dryers were part of the complex. The white house (Building B) was the foreman’s quarters and office space. The other house (Building A) was occupied by the family members who lived and worked on the farm. It was primarily a cotton farm during this time period.

A house was removed from the property in the 1980s, possibly in July 1983. The property is described as once having a rose garden where the fence separating the two adjacent properties is now. There were more trees and many of them were suitable for climbing by the children living on the farm. Lawn areas once surrounded the residences on the property. Sanitary plumbing consisted of a septic system of which some evidence is seen on the ground in between Buildings A and B. Other household refuse was disposed of in 55-gallon barrels and burned.

Oilfield Architecture

The applicant identified the residential buildings on Adohr Farms (Buildings A & B) and Palm Farms (Residence) as similar to oilfield houses or oilfield style of architecture (Herbert and Norby 2009:4). Staff requested and received an expanded discussion of the type and style of buildings found in the oilfields of Kern County and other oil-producing regions in California. Oilfield houses were built for workers, often located on the grounds within the oil production area. The time period associated with the construction of these houses is from the late 1910s through the 1920s, and they often remained on-site until the 1930s and beyond (Mikesell and Herbert 1995). The houses were small, sometimes in a shotgun-house configuration, and were generally wrapped with porches on multiple sides. The house would typically have a pyramidal hipped roof. The upper roof covering the building would have a steep slope while the porch roof would have a shallower slope. A photograph posted on an online genealogy site shows an oilfield residence belonging to Thomas Larkins and Genevieve Erb who lived in the house from 1921 to 1933. Located in the Kern River Oilfields, the house exhibits a very steeply pitched gable roof with what appears to be a continuous open porch or veranda on all four sides. The porch roof has a very shallow pitch[35]. Oil derricks are seen in the background. This form, while it does not have a hipped roof, is otherwise in conformance with the description put forward by the applicant. Mikesell and Herbert (1995) found in their research that houses of this type were built at Kern River Oil Fields near Oildale, Camp 11-C near Taft and in the EHOF. Interestingly, Mikesell and Herbert (1995) note that the oilfield houses were very often moved once an oilfield was shut down and that they can be found all over the region.

Map Reference 7 Adohr Farms

MR 7 is a farm-related property located at 7307 Adohr Road in the PAA/APE for the proposed natural gas line, controlled area, and railroad spur. The resource includes three period buildings described in the DPR 523 form as a dormitory (Building A), dining hall (Building B) and garage (Building C), all constructed in 1930 and associated with

[35] http://freepages.genealogy.rootsweb.ancestry.com/~larkins/photos/photos13.html

the Adohr Ranch[36] (see **Cultural Resources Figure 7**). The buildings can be characterized as vernacular in style. Building A, the easternmost building, has a T-shaped footprint in a generally north-south alignment with an east-facing cross gable. Building B has a square footprint and the gabled ends above a hipped roof are aligned east-west. Building B is fronted by the date palm allée. Vertical wood paneling with battens sheath the exterior of both structures. The most distinctive feature of Buildings A and B is a central gable monitor roof above shed roofs covering porches. The monitor roofs also have clerestory ventilation slats, and in the case of Building A, gable end ventilation slats. Building B has a hipped roof. Monitor roofs are frequently found in barns throughout interior California and also in the Midwest, Appalachia, southeastern Unites States, Louisiana Cajun areas and the Winooski River area in Vermont (Noble and Cleek 1995).[37]

Both buildings' monitor roof design and side porches present a building design well-adapted to the extremes of the climate in the Central Valley. The ventilation provided by the slats in the clerestory below the main roof would have allowed heat to rise and escape from the living areas. By the same token, a blanket of cold air above the living spaces contains heat in the winter. The porches provide much needed shade in the hot, dry summer and allowed the sun, low in the sky in the winter, to provide light to the interiors. The porches also provide transition space during rainy weather.

Both buildings have fenestration in a variety of window styles including fixed pane, one-over-one, four-over-four and six-over-six double hung sashes. Building A's east wing features three sets of double French doors featuring four panes of glass in each individual door. While some of the glass is missing or broken, the windows generally appear to be original with a few later-period replacements.

The porches on Buildings A and B differ markedly in their respective railing designs. Building A has solid, vertical board siding as railings with no apparent cap or hand-rail. In places where the porch has been enclosed, there are battens placed on the vertical boards, mimicking the battens on the vertical siding of the building. As the shed gables are also treated in this way, it begs the question as to whether the railings are replacements in this case. The original design may have been the same open X-design as seen on Building B. The X pattern may be seen on at least one exterior elevation and from the interior.

Building B porch railings are an open, X-design. The cross pieces form an X boxed by a top and bottom rail. There is some deterioration of the railing on Building B in one corner; otherwise it appears intact. Screening mesh was added at some time and partially covers the porch. Building B's porch wraps around three sides of the square building.

The applicant's discussion of the buildings' style found it to be reminiscent of the style of oilfield houses, discussed above. This is due primarily to the distinctive porches and that they often had a gable on hip roof configuration, which Building B exhibits. The applicant found that the oilfield style generally predates the vernacular farm buildings on

[36] Building B has also been characterized in another account as a foreman's home and office.

[37] An example of a California barn with this configuration is seen in Caltrans (2007:Figure 82).

Adohr Farms and was limited to oilfield locations in the 1910s and 1920s. The Adohr Farms buildings A and B date to 1930.

Staff concurs that the buildings at Adohr and Palm Farms are reminiscent of the oilfield style of architecture, though the raised monitor roofs are also reflective of California barn design, as noted above. However, the stylistic similarity seems to end there as the Adohr Farms houses are larger and have more complex detailing in the eave patterns and porch designs. Therefore, Buildings A and B cannot be linked to a particular high-artistic style or broad pattern of building design. While the buildings are associated with the initially prosperous Adohr Farms operation and their owners in Southern California, this does not rise to the level of being associated with a significant person in history, locally or in California.

Staff concurs with the conclusions of the applicant for MR 7 that the property is ineligible for listing in the CRHR and NRHP. Under Criterion 1/A, the Adohr Farms buildings at 7307 Adohr Road are not significant for their association with agricultural development or settlement of the Buttonwillow area, including the immigration of dust-bowl migrants in the 1930s and 1940s. Constructed in 1930, the buildings and farm property post-date any association with Miller & Lux's ranches, even though carved out from the Miller & Lux Ranch holdings. While Adohr Farms is associated with the historical themes of agricultural development in the region and in Southern California, it alone did not make a significant contribution. Rather, it is one of numerous farming operations in the post-Miller & Lux period. Under Criterion 2/B, the buildings do not appear to be significant for their associations with any historically significant people. While Rhoda Rindge Adamson and Merritt Adamson gained recognition within the dairying industry due to the success of Adohr Farms, the Buttonwillow satellite was peripheral to their main operation in the San Fernando Valley and not representative of their holdings or dairy operation at large. The significance of Adohr Farms's commercial success is not represented in these buildings or on the property as a whole.

Under Criterion 3/C, while these buildings have some identifiable architectural details, they do not possess any distinctive characteristics or high artistic value or indication that they are the work of a master that would render them eligible under this criterion. As discussed previously, the style of the buildings is reminiscent of "Oilfield" architecture. However the construction date and function preclude them from being identified as this class of architecture. Rather, it is a modified version of this regional style. The garage (Building C) is of common utilitarian style and material. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. Buildings themselves can serve as sources of important information about historic construction materials or technologies. The Adohr Farms buildings do not appear to be a principal source of important information relative to historic building technology.

<u>Map Reference 8 Palm Farms</u>

MR 8 includes a collection of warehouse buildings, four rice dryers and rice processing facility and a landing strip (**Cultural Resources Table 12**). Current (2013) imagery from Google also reveals the outlines of a former rectangular building and what appears to be the remains of the airplane hangar adjacent to the landing strip. The property is open to the Adohr Farms (MR 7) but the Adohr Headquarters Building property (MR 9) is fenced off. MR 8 was most recently home to the Port Organics fertilizer plant. As discussed earlier in the Adohr Farms history, the rice dryers and processing facility were added to the Banducci Farm in 1953. At the time the Banduccis purchased the property from the Adohr Farms, they also acquired the warehouses on the site as well as the Adohr Farms buildings (MR 7 and MR 9). The landing strip and hangar were likely added at the same time as the rice dryers to aid in the management of rice growing. Google aerial imagery also reveals an unidentified canal, drain or ditch running alongside the landing strip in a southeast to northwesterly alignment. The unnamed canal then turns to the south and proceeds through the proposed project site to the Short Main Canal south of the farm. At one time it appeared the Main Drain may have run through the project site but a conversation with the applicant’s consultant indicated that BVWSD officials stated that it stopped at a point west of Dairy Road and no longer continues[38]. Staff is not certain of the functionality or name of the canal described above and will attempt to clarify the matter for the FSA/FEIS.

The most distinctive of the buildings is the rice dryer with elevator and storage silos. Following is a list of structures associated with MR 8 and a brief description.

[38] Telephone conversation with Toni Webb, JRP Historical Consulting, January 18, 2013.

Cultural Resources Table 12
MR 8 Structures

Structure (s)	Purpose	Description
Rice processing facility	Rice drying, storage and packaging	Tall building flanked by storage silos. Metal siding, roofing and elevator. 2 metal silos and 4 concrete silos located adjacent to main structure.
Warehouse No. 1	Storage	Single-story rectangular building. Corrugated metal siding and roof. 45 ft x 150 ft
Warehouse No. 2	Storage	Single-story rectangular building. Corrugated metal siding and roof. Large open bays on south elevation. 45 ft x 150 ft
Warehouse No. 3	Storage	Single-story rectangular building. Corrugated metal siding and roof. 45 ft x 150 ft
Warehouse No. 4	Storage	Two single-story buildings joined together. Corrugated metal siding and roof. 45 ft x 300 ft
Landing Strip & Hangar	Crop-duster and other small airplanes	Dirt surface with a thin layer of asphalt. Approximately 2000 ft long by 55–60 ft wide. Hangar’s wood frame appears to be on the ground.
Shed	Storage/Other	Wood outbuilding with gabled roof with 1 window and 1 door.
Canal	Unknown	20–25 ft wide of unknown length.
Weigh Station & Warehouse No. 5[39]	Weights and measures/office/storage	Irregular rectangular footprint with front walkway and lawn and trees.

Notes: ft = feet

The names given to the structures in the table above differ from those provided by the applicant on the DPR Form for MR 8. This was done to avoid confusion with the nomenclature used for MR 7. They also provide a descriptive element that staff hopes helps the reader envision the buildings and structures being discussed. Minimal description is provided as none of the structures manifest any distinctive design details or materials that warrant a lengthy description.

Staff concurs with the applicant’s conclusion that the agricultural complex MR 8 is not eligible for listing on the CRHR or NRHP. Considering Criterion 1/A, MR 8 is not significant for its association or contribution to agricultural development in the area. While it contains one of two rice driers in the Buttonwillow area, the cultivation and production of rice in the area was short-lived and not a major agricultural development. Other than its initial association as part of the Adohr Farms complex, MR 8 is not associated with any significant historical figures under Criterion 2/B. To be eligible under Criterion 3/C, the property and its associated structures would have to possess high artistic value or be associated with the work of a master. These utilitarian buildings do

[39] Weigh station and warehouse no. 4 are later than 1973 and not of the historic period.

not meet the level required for Criterion 3/C. These buildings do not qualify under Criterion 4/D as there is no distinctive building technology employed that would lend knowledge about the history of building construction or technology.

Map Reference 9 Adohr Farms Buttonwillow Headquarters

MR 9 is a farm-related residential property located at 7345 Adohr Road. The property was originally part of the Adohr Farms complex and contains the headquarters building and a few remaining other accessory buildings. The main structure, now a residence, was constructed in 1930 as the headquarters building for Adohr Farms and has been heavily modified through conversion to a Ranch-style house. Evidence remains that the headquarters building once shared common architectural traits with the previously evaluated Buildings A and B on the MR 7 Adohr Farms property. This can be seen in the raised monitor roof, the replacement of ventilation slats with clerestory windows and the original brick chimneys. The applicant provided a historical photograph on the DPR 523 forms from 1930 which clearly shows the similarity to Buildings A and B next door[40]. Two perpendicular sections of the house form an L-shaped footprint, which appears to be the original alignment. The stucco walls enclose what originally consisted of open-air porches, shown in the historical photograph with the same open X-design of railing detail as Building B. Fenestration consists primarily of aluminum replacement windows not of the historic period. Narrow, horizontal rectangular windows are between the two rooflines as clerestory windows, replacing the original ventilation slats. There is a wide brick chimney built in almost flush with the exterior wall at each end of the house. The east side of the house has a gabled roof that extends over the driveway, forming a carport. A driveway extends from the carport north to the fence line and the access road from the Dairy Road extension. The house has taken on a ranch-style appearance from all the modifications. A small modern stucco rectangular shed with a gabled, composition shingle roof and porch on each end is on the property, west of the home. As mentioned earlier, there was apparently another house on the property that was removed in the 1980s.

This property does not possess integrity of design, workmanship, association, feeling or materials as it pertains to its original use as a farm property. It retains its location but association with the original Adohr Farms and later Palm Farms complex is not retained.

Staff concurs with the applicant and concludes that MR 9 is not eligible for inclusion in the CRHR or NRHP. While associated with the larger Adohr Farms dairy operation, the buildings at 7345 Adohr Road are not significant for their association with agricultural development or settlement of the Buttonwillow area or as a satellite operation of the dairy. The buildings post-date any association with Miller & Lux’s ranches. While Adohr Farms is associated with the historical themes of agricultural development in the region, the farm itself did not make a significant contribution. Therefore, MR 9 is not eligible under Criterion 1/A. Under Criterion 2/B, the building does not appear to be significant for its associations with any historically significant people. Although Rhoda Rindge Adamson and Merritt Adamson gained recognition within the dairying industry due to the success of Adohr Farms, the Buttonwillow satellite was subsidiary providing support to their main operation in the San Fernando Valley.

[40] *Los Angeles Times*, November 9, 1930.

When considered under Criterion 3/C, staff finds that these buildings do not possess any distinctive architectural characteristics or high artistic value that would render them eligible under this criterion. Like Buildings A and B next door, the style of the former headquarters is reminiscent of “Oilfield” architecture. The construction date and function preclude it from being of this class of architecture. The remaining outbuilding is of common utilitarian style and material, with no significant architectural features. Even if the main residence were historically significant, its historic integrity has been so heavily compromised by modifications, including enclosure of the open porch and ventilation slats, replacement windows and doors and stucco exterior cladding which all affect the original design, workmanship, materials and feeling. The building is also not likely the work of a master. Finally, the resource is not eligible under Criterion 4/D because it is unlikely to yield information important to history. Buildings can serve as sources of important information about historic construction materials or technologies. These buildings do not appear to be a principal source of important information about building technology.

Map Reference 10 Old Headquarters Weir

The Old Headquarters Weir is located southwest of the intersection of Tupman and Adohr roads, is within the proposed controlled area and process water line route. The weir is described in the DPR 523 forms completed by the applicant in 2009 and updated in December 2012. This structure, constructed in 1911, serves as both weir and bridge and crosses the Kern Valley Water Company Canal (KVWCC) at the point where that canal historically began and Outlet Canal ended.

> *Designed by consulting engineers Leonard & Day, it was constructed entirely of reinforced concrete. The structure has a flat deck, 163 feet in length and 19 feet across. Thirteen evenly spaced solid benchwalls separate 14 seven-foot-wide bays…Low walls approximately two feet high line each side of the roadway crossing the structure. A modern metal walkway was installed in the 1980s on the west side of the structure but was removed (likely pilfered for scrap metal) around 2010. Concrete patches are visible where the walkway was attached to the top of the bench walls. In numerous places the concrete has spalled revealing the rebar within…Exposed twisted steel rebar runs the length of the side walls, and notched rebar protrudes vertically near the roadway entrance on the north side. The spalling also reveals different concrete compositions on different parts of the structure. The façade is finished with a smoother finish coat than the layer beneath. (URS 2013b:Attachment A183-1.)*

In addition to the integrity issues noted above, two other changes to the weir took place over time. The weir originally was lined on both sides of the road bed with short rectangular concrete columns. On the southern exposure, each end of the bridge featured a larger square column that may have been a base for a decorative pot or other container (it is not clear from historical photographs). This square column also aligns with a concrete protrusion below it on the weir structure. Nubs of concrete still exist where the columns once were. Additionally, staff believes the roadbed may have been lowered to accomplish the creation of a low sidewall for the bridge. This is based on the observation that the original concrete column remnants (nubs mentioned above) are extant and that the side elevation view of the weir has retained the same proportions as the original seen in the historical photographs.

The weir's 14 bays were designed for the insertion of wooden slats, known as flashboards, at a roughly 30-degree angle from top to bottom to control water flow (see **Cultural Resources Figure 9**). There is a channel cut in each sidewall of the bays to accommodate the flashboards. It is a little frightening to consider how these slats would have been inserted and removed with the original configuration of the walkway having no handrail or support visible in the early photographs.

The substantial historical context provided in the DPR 523 forms includes discussion of the changes noted above. The discussion recounts a flood in the 1940–1941 rainy season that damaged the Old Headquarters Weir. It was during the repairs that followed that the concrete columns were removed and the sidewall created. The other repair documented was the replacement of the original wooden apron on the west bank with a concrete apron. A timber apron still exists on the east bank. The weir is no longer in use by BVWSD, decommissioned in 1986. It is however, still used as a bridge, providing access to the levees and canals and to other property in the area.

The DPR 523 forms provided by the applicant included a lengthy discussion of the role of Miller & Lux in establishing a system of canals and the KVWC. The Old Headquarters Weir (MR 10) and KVWCC (MR 14) are located on what was part of Miller & Lux's 52,440-ac Buttonwillow Ranch.

<u>Integrity</u>

Caltrans (2000:95) discusses the assessment of integrity as it pertains to water system elements. First, it is useful to establish a period of significance. In the case of the Old Headquarters Weir, the period of significance would be the year it was built, 1911. This is due in large part to fact that it was an early reinforced concrete combination structure designed by the well-known engineering firm of Leonard & Day in San Francisco. It is also important that Miller & Lux commissioned the weir and that it may be one of only two hybrid weir/bridge designs attributed to Leonard & Day.

The historical photographs provide a good understanding of the configuration of the Old Headquarters Weir during the period of significance. The changes made over time have been attributed to repairs made after a flood in 1941–1942. These changes in design, workmanship and materials did remove some original fabric and replaced some original materials. However, overall, there is a majority of historic fabric in place so that the integrity of materials, design and workmanship remains at a modestly high level. The setting and location have not changed. It retains the association with a water conveyance even though it is no longer in use as a weir. It continues to be used as a bridge, maintaining the association with its original purpose in that respect. It is difficult to gauge the feeling of the structure but as it retains its original location spanning a large drainage without any intrusive structures or other major changes to the surrounding landscape, it appears to have retained much of the feeling of the original structure. Where there has been some loss in feeling is in the badly deteriorated concrete walls of the structure and the neglect by its disuse. It has suffered from some graffiti and the drainage channel is used unofficially as a shotgun range, so the trash of spent shotgun shells and beer cases that adorn the channel does alter the feeling somewhat.

Even though it is badly deteriorated, staff concludes in concurrence with the applicant that the Old Headquarters Weir retains enough of the qualities of location, design, setting, materials, workmanship, feeling and association to convey its original purpose and therefore has enough integrity in addition to its association with a master engineer of the period to meet the standards for a nomination to either the CRHR or the NRHP under Criterion 3/C. It does not appear to be eligible for listing on either register under Criterion 1/A, 2/B or 4/D, as it is not associated with events contributing to the broad patterns of history, significant person(s) or yielding information on prehistory/history, even in terms of architectural or engineering developments.

Map Reference 11 California Aqueduct

The California Aqueduct is a 444-mile concrete canal that begins in the San Joaquin Valley, climbs over the Tehachapi Range and terminates in Riverside County. It is a product of the State Water Project (SWP), approved in November 1960 by a narrow margin of voters in California. The SWP originates with the Oroville Dam on the Feather River, combining flood control and water storage. The water is then moved through the Sacramento and Feather rivers to the Sacramento-San Joaquin Delta (Delta). From the Delta, water is conveyed by the California Aqueduct to Southern California. It makes water deliveries along the way through branch canals.

The first phase of the SWP, including the California Aqueduct, was constructed between 1961 and 1972, placing it within the 50-year historic period for the NRHP and the 45-year period for the CRHR. A later construction phase included the Cross Valley Canal (1973–1976).

The California Aqueduct is a concrete-lined, trapezoidal canal, measuring up to 140 feet in width and up to 40 feet deep. It is managed by the California Department of Water Resources (CDWR). In the vicinity of the project, it runs along the west side of the San Joaquin Valley, and is located approximately 1.2 miles from the center of the proposed project site and adjacent to the BVWSD West Side Canal and KVWCC. It sits at the base of the Elk Hills and is visible from portions of the OEHI property (**Cultural Resources Figure 10**). The aqueduct is located within a portion of the PAA/APE for the proposed project as well as the CO_2 pipeline.

Sections 2-63 to 2-65 of the Amended AFC describes the method of crossing for the CO_2 pipelines at the California Aqueduct, the Outlet Canal and the KVWCC (URS 2012a). HDD would be employed to pass under these canals. The HDD crossings may reach 100 feet below grade. Discussion of any possible impacts to these resources will also be discussed in the FSA/FEIS. The HDD would meet the restrictions of the CDWR California Encroachment Permit Guidelines, June 2005, which is where minimum standard of 25 feet is set for the distance between the bottom of the aqueduct channel and the top of pipe. Additionally, the construction of the CO_2 pipeline would necessitate 100-feet-by-200-feet laydown area for each crossing on either side of the water course. This laydown area would take the form of a pit of undetermined depth.

Documentation provided by the applicant includes a previously recorded inventory and evaluation by Carey & Company (2007). The applicant further updated the inventory and evaluation in December 2012 to include the segment in the PAA/APE.

Staff concurs with the conclusions of Carey & Company that the California Aqueduct is eligible for listing on the CRHR and NRHP. The period of significance extends from 1961, when construction began, through 1972, when the aqueduct was completed. It is significant for its association with SWP as a central component. This makes it eligible for listing under Criterion 1/A. It also appears to be eligible for listing in the CRHR/NRHP under Criterion 3/C as a significant engineering accomplishment.

The aqueduct does not appear eligible for listing under either Criterion 2/B or 4/D. It does not appear to be directly associated with persons who have had a significant impact at the local, state or national level, nor does it have the potential to yield information important to prehistory or history of the local area, state or nation.

Map Reference 12 6122 Tule Park Road Residence

MR 12 is the Adams' residence, a private single-family home located at 6122 Tule Park Road. It is located within the PAA/APE for the proposed HECA transmission line. The parcel is immediately west of the East Side Canal and a canal access road. Adjacent to the north is another residential property. This vernacular cottage-style house was constructed in 1941 with side-gabled roof and boxed eaves. A separately gabled lower roof on the west side of the building suggests an entrance or later addition; however, the main entrance door is located on the south side. There is one other entrance door on the east side. A gabled carport is attached to the south side of the building, above the front door. The applicant described the structure as having replacement vinyl windows and clad in vertical siding. An HVAC system is mounted on the north-facing composition-shingle roof. A newer utility structure (ca. 2008 according to Google Earth Historical Imagery) the size of a small barn is located east of the main residence. A few small trees are located on the property and the perimeter is fenced with paddock-style metal fencing.

The residence is part of a small area near the intersection of Station and Tupman roads developed sometime between 1933 and 1941, after the subdivision of the Miller & Lux holdings. Although it is located in the former Buttonwillow Ranch of land owners Henry Miller and Charles Lux, this building, constructed in 1941, post-dates any association with that period in the region's history. Martin L. Snow arrived in Buttonwillow in the mid-late 1920s. The Snow family owned a 95-acre parcel that included the property at 6122 Tule Park Road from approximately 1954 until the current owner purchased it in approximately 1994. The property changed hands between his sons, Martin Jr., and Mason from the 1950s through the 1970s. The Snows were engaged in cotton farming although it is not known whether this property was part of that activity. The applicant's survey suggests that the relatively small parcel (95 acres) on Tule Road served primarily as a residence, and not the nucleus of their farming operation. Today, 6122 Tule Park Road is a small, residential parcel owned and occupied by Thomas N. Adams.

Staff concurs with the applicant's conclusion that MR 12 is not eligible for inclusion in the CRHR or the NRHP. The building at 6122 Tule Park Road is not significant for its association with agricultural development or settlement of the Buttonwillow area. Constructed in 1941, it post-dates any association with Miller & Lux's ranches.

Staff summarizes the applicant's evaluation of MR 12, documented in a confidential appendix to the Amended AFC (JRP 2012:Appendix B) as follows.

While the residence is associated with the historical themes of agricultural development and settlement in the region, it is one of numerous farm residences built in this period and is not eligible under Criterion 1/A. The building does not appear to be associated with any historically significant people. The historical owners, the Snow family, represent one of many families who have a long history of farming in the area. Their contribution alone is not significant to local, state, or national history. Thomas N. Adams, the current owner, does not appear to be historically significant; therefore, the building is not significant or eligible under Criterion 2/B.

When considered under Criterion 3/C, the building does not possess any distinctive characteristics or high artistic value that would render it eligible. Rather it is a modest example of a popular style of house built in the mid-twentieth century. Even if the smaller building was historically significant, its historic integrity has been compromised with replacement windows and doors, composition-shingle roofing, and the reorientation of the entrance to the south, which all affect original design, workmanship, materials and feeling. The building is also not likely the work of a master. Finally, this resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies; however, this building does not appear to be a principal source of important information in this regard.

Map Reference 13 Tupman Water Plant

Staff has not had the opportunity to conduct a site visit to the Tupman Water Plant (MR 13) and therefore includes the survey information provided by the applicant below for the PSA/DEIS (JRP 2012:Appendix B). Staff will complete a survey of the property prior to publication of the FSA/FEIS. Staff has driven by the resource to confirm its location. Using Google Earth aerial and street view imagery, staff has determined that a structure of significant size has been added to the property since the property was recorded by the applicant in 2009. Staff has confidence in the balance of the current and historical information provided by the applicant.

Located on the north side of Station Road, the property is between the East Side Canal and Morris Road. It is located directly across the street from the Tule Elk State Reserve. Structures on the site include a pump house, a new shed-type structure (ca. 2011–2012) and a water tank located on the south end of the property near Station Road. As reported on the DPR 523 forms, Getty Oil Company operates the water plant, including two wells, and it is referred to as the Tupman Water Plant. Kern County Assessor's Map No. 159-05 confirms that the parcel on which the structures are located, APN 159-050-09, is 228.98 acres total, though the structures are clustered at the southern portion of the property. There is a chain-link fence enclosing the area with the buildings and wells. The DPR 523 forms describe the pump house as having a gabled roof and corrugated metal siding. Two sliding doors and two small windows face east. The water tank is north of the pump house. The circular tank is clad with metal panels. The two wells are located in the northern part of the fenced area. An above-ground system of pipes connects the wells to the water tank. Transmission lines enter the property from Station

Road and connect to several onsite poles and to the well pumps. (JRP 2012:Appendix B.)

Like MR 12, MR 13 was developed after the dissolution of the Miller & Lux Buttonwillow Ranch. The parcel was purchased by J. S. Potter circa 1936. A residence and the metal shed (pump house) can be seen in a historical aerial photograph dating to 1937. Sometime between 1937 and 1959, the property came under ownership of oil companies (51 percent Honolulu Oil Company/49 percent Standard Oil Company). The residence was removed under the oil companies' ownership. By 1973, Getty Oil had sole ownership. An earlier tank structure was removed and the current circular tank was installed in 1981 per historical aerial imagery. (JRP 2012:Appendix B.) As mentioned above, a new building has been added to the property ca. 2011–2012.

The applicant has concluded that the property is not eligible for listing on the CRHR or NRHP under any criteria (JRP 2012:Appendix B). Staff agrees with that conclusion as the property is not associated with major historical events or people, nor does it represent any historically-recognized style or work of a master or convey any important historical information.

Map Reference 14 Buena Vista Water Storage District Features

Buena Vista Water Storage District Canals

BVWSD formed in 1924 and assumed ownership and management of the canal system developed by Miller & Lux between 1876 and 1918. The system stretches from the second point of measurement on the Kern River to Buena Vista Lake and then northwest along the former Buena Vista Slough to Tule Lake. **Cultural Resources Figure 3** exhibits the drains, canals, ditches and Old Headquarters Weir associated with the district and within the PAA/APE. This figure also shows the California Aqueduct, which is part of the SWP, discussed above under MR-11.

The canals, drains and ditches still in use in the BVWSD have generally northwesterly flows. This follows the original natural flow direction of Buena Vista Slough on the west side of the valley. The canals, ditches and drains are maintained by BVWSD by grading twice per year and excavation every 5–10 years. These features are summarized in **Cultural Resources Table 13**.

Cultural Resources Table 13
Buena Vista Water Storage District Features

Name	Description	Materials	Size[41]
Cass Ditch	Trapezoidal earthen canal (lateral).	Earthen with culverts.	Top: 20 ft Bottom: 5 ft Depth: 5 ft Length: 1.5 mi
Depot Drain	Trapezoidal earthen canal (lateral).	Earthen with structures, culverts, etc.	Top: 15 ft Bottom: 3 ft Depth: 3 ft Length: 5.9 mi
Deep Wells Ditch	Trapezoidal earthen ditch (lateral).	Earthen ditch with steel structures, delivery gates, headwalls, etc.	Top: 30 ft Bottom: 9 ft Depth: 9 ft Length: 4.7 mi
East Side Canal (Miller & Lux)	Trapezoidal canal.	Earthen with steel structures, check gates, etc.	Top: 45–60 ft Bottom: 25–27 ft Depth: 10–12 ft Length: 24.1 mi
Kern Valley Water Company Canal (KVWCC)	Irregular trapezoidal/rounded earthen canal/flood channel.	Vegetated earthen canal, crossed by Old Headquarters Weir. West Side Canal Inlet.	Top: 220 ft Bottom: 150 ft Depth: 12–15 ft Length: 26.8 mi
Outlet Canal	U-shaped earthen canal.	Mostly dry, vegetated earthen canal crossed by Tupman Road Bridge.	Top: 220 ft Bottom: 120–150 ft Depth: 15 ft Length: 9 mi
Short Main Canal	Trapezoidal earthen ditch (lateral).	Earthen ditch with control gate ca. 2010-2011, Tupman Road Bridge.	Top: 50–60 ft Bottom: 25–36 ft Depth: 12 ft Length: 1.3 mi
West Side Canal (Miller & Lux)	Trapezoidal earthen ditch.	Earthen ditch with miscellaneous structures.	Top: 60 ft Bottom: 33 ft Depth: 8 ft Length: 26.4 mi
KRM 001H[42]	Ditch and water gates	Concrete lined ditch with miscellaneous structures.	Top: 5 ft Bottom: 1 ft Depth: unknown Length: 2,780 ft

Abbreviations: ft = feet; mi = mile(s)

The following text provides historic context for the system extending north of the Old Headquarters Weir northwest to SR 58 bounded by the East Side Canal on the east and West Side Canal on the west. An overall description of each canal is included in the

[41] Sizes are taken from the DPR 523 Form submitted by the applicant and are approximate.

[42] Recorded by Farmer (2008).

following evaluation discussions for each point surveyed, grouped by canal. These structures were built between1876–1918; alterations and improvements are made every one to two years up to the present. The historic context below was provided by the applicant in the DPR 523 forms for MR 14, BVWSD (URS 2013b:Attachment A185-1).

<u>Lux v. Haggin</u>

Miller & Lux's attempts to control the Buena Vista Slough through construction of the KVWCC played a role in the events that led to the landmark water rights case, Lux v. Haggin. Canal construction was completed in 1878, and Miller & Lux found themselves with a massive canal bed that had no water and 10,000 head of cattle facing starvation. Although 1876–1877 had been a drought season, they quickly identified upstream diversions of water from the Kern River as the cause of their water scarcity. In the years just prior to the arrival of the railroad, irrigationists diverting water from the Kern River had a number of canals either planned or under construction to water their lands in western Kern County.

[Miller & Lux] formed the Riparian Suits Association as their legal arm and began filing actions against Haggin, Carr, and other upstream diverters to stop their consumption of the river's flows before it reached lands Miller & Lux et al. claimed to be riparian lands. [The Lux v. Haggin] case at first was a far-reaching conflict that included, as either plaintiff or defendant, what appeared to be most of the principal landowners and water users in the region. Ultimately, control of Kern River water was hammered out in an 1888 compromise that became known as the Miller-Haggin agreement. Amendments have been made to the agreement over the years, but it is still a basic document regarding division of water in the area.

The system [of canals] created during the Miller & Lux period consisted of canals dug and maintained by Miller & Lux, and a system of laterals dug and maintained by individual tenant farmers. After constructing a main flood control canal [KVWCC] along the west side of the swamp, Miller & Lux also constructed East Side and West Side canals for distribution, sometime prior to the early 1890s. As their names indicate, these canals bordered the east and west sides of Buttonwillow Ranch, with West Side Canal running closely parallel to the KVWCC. Much smaller than the flood canal, the West Side Canal was only 30 feet wide and two feet deep, and the East Side Canal was 25 feet wide and three to five feet deep. [Between 1916 and 1918,] Miller & Lux also constructed a drainage canal, called Main Drain, from the southern end near the old headquarters northerly through the center of the ranch, generally along the line of the original Buena Vista Slough. Farmers used the water from Main Drain, collected primarily by seepage, for irrigation. The remainder of the canals and laterals in the area, like Deep Wells Ditch, [Weed Island Ditch, and Arizona Canal (formerly Poplar Grove Ditch),] were primarily works of individual farmers and Miller & Lux farm divisions in the area, who connected to the main canal system for irrigation of their crops.

The canal system allowed Miller & Lux to support settlement in the area. By 1919, Miller & Lux farmed the entire area south of Buttonwillow between the East Side and West Side canals south to Old Headquarters. Four ranches were established in the area adjoining major canal works.

Miller & Lux, Incorporated had accumulated valuable land and water rights. However, neither was profitable without the other. [To] sell the land, a means of attaching water…to the land was necessary. In 1920 the California State Engineer released a report on the water resources of the Kern River and recommended that a large district, including the Haggin and Miller & Lux water rights, be formed to manage water distribution. Despite the effective implementation of the Miller-Haggin agreement, the two parties chose to protect their interests by forming separate districts. Miller & Lux's holdings became the nucleus for the BVWSD. The district submitted a petition for formation to the State Engineer in 1922 and received approval in 1924. As a part of the district formation, Miller & Lux allocated water rights to the land within the district, making future sales possible. The district exchanged bonds with Miller & Lux for the existing canals and sold additional bonds for construction of new canals…The district acquired all the canals in the study area, including flood water canals, irrigation canals, drainage canals, and associated water control features.

Despite the changing crops in the study area, the extensive network of canals constructed during the Miller & Lux period remained a largely sufficient source. With the advent of groundwater pumping, farmers used the canals to move water from the wells to their fields, a practice that continues today. Between 1943 and 1944, 4.8 miles of new drains were constructed in the water storage district…Culverts and bridges added as the road system developed were insufficient to keep the water flowing. Redwood culverts and corrugated metal pipe culverts, some installed by Miller & Lux, began to be replaced. The BVWSD also instituted a canal maintenance program in 1943 that called for regular hand maintenance, and mechanized maintenance every four years.

Below is an evaluation of each of the water conveyance features within the PAA/APE identified in **Cultural Resources Table 13**. The bulk of the following analysis was provided by the applicant (JRP 2012; URS 2013b) with modifications by staff.

Cass Ditch (CD)

Cass Ditch is a lateral with an unknown construction date. BVWSD acquired Cass Ditch from Miller & Lux and others, in 1936. When the ditch was acquired by BVWSD, it was over 2 miles long and extended from the East Side Canal to present-day Dunford Road, then turned north. There have been abandonments and realignments to the portion north and west of Dunford Road since 1964.

Staff concurs with the applicant's conclusion that the Cass Ditch is not eligible for the CRHR or NRHP under Criterion 1/A. It is not significant for its association with irrigated agriculture around Buttonwillow. It is not significant for its association with Miller & Lux or others under Criterion 2/B. It is representative of its time period but it lacks integrity, does not display any high artistic values and is not related to the work of a master, therefore it is not eligible under Criterion 3/C. Lastly, Cass Ditch does not yield any important design or construction techniques that would inform history or prehistory. It is ineligible under Criterion 4/D.

Depot Drain (DD)

The Depot Drain is a farmer-dug lateral on the eastern side of BVWSD. Depot Drain was not one of the existing canals acquired by BVWSD in 1926. Rather, portions of its current route appear as two separate ditches in mapping from the early 1930s. The path of the drain meandered through the east side of the district. By 1942, the ditches were joined, the drain named, and the path of the ditch was closer to its modern route, cutting in straight diagonals through fields and following roads along cardinal directions. Additional straightening has occurred through the period between 1954 and 1973. Currently, the ditch is 5.9 miles long. It cuts a 1-mile path directly west before heading northwest for the remainder of its length. When the drain reaches SR 58 to the north, it heads west and feeds into Main Drain. The ditch is conveyed under roadways via round culverts and water is deposited into the canal by corrugated pipes that collect water in the fields. A short segment of the Depot Drain is located within the PAA/APE for the proposed railroad spur.

The portion of the drain within the PAA/APE is between Dairy Road and Dunford Road to the west. DD as documented by the applicant is a point where the ditch intersects with Dunford Road, approximately 0.25 mile north of Stockdale Road. This segment of Depot Drain is a narrow trapezoidal earthen canal. The north side is higher than the south. The drain is conveyed under Dunford Road via a round corrugated metal pipe.

Staff concurs with the applicant's conclusion that the Depot Drain is not eligible for the CRHR or NRHP. Under Criterion 1/A, the drain is not significant for its association with irrigated agriculture around Buttonwillow. The drain is one of several laterals constructed by BVWSD following the subdivision of Miller & Lux holdings. At that time, irrigated agriculture had already been practiced in the area for more than 40 years. Under Criterion 2/B, the drain is not significant for its association with any individual, having been constructed by BVWSD. Under Criterion 3/C, the canal was constructed using standard methods of the time period. One could argue that this canal lacks integrity to any historical period of significance, owing to its regular realignment, reshaping, and replacement of control structures. However as discussed earlier with the headquarters weir, maintenance and upgrades alone are not enough to disqualify the resource if it still conveys its intended use and design, feeling and location. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In rare instances, structures can serve as sources of important information about historic construction materials or technologies; however, the water conveyance does not appear to be a principal source of important information in this regard.

Deep Wells Ditch (DWD)

Deep Wells Ditch, historically also known as Deep Wells Canal, was associated with the irrigation of Miller & Lux' Deep Wells Ranch. It originated from the East Side Canal and between Stockdale Highway and Brite Road it divided into three paths, one of which connected to Depot Ditch near Deep Wells Ranch. When the BVWSD acquired the canal in 1926, it was approximately 6 miles long. The ditch was originally consolidated along its eastern path, connecting with Depot Drain and then Main Drain. Between 1937 and 1952, it was rerouted along its western route paralleling Main Drain. Today, the canal ends closer to the point of the former Deep Wells Ranch and measures approximately 4.7 miles long. Two small farm bridges cross the canal along Stockdale Highway, providing access to residential homes. As the canal continues northwest of Stockdale Highway, a few farm bridges cross it, and there are a few concrete check gates along the length. One segment of the Deep Wells Ditch along Stockdale Highway between Dairy Road and Dunford Road is located within the PAA/APE for the proposed railroad spur.

Staff concurs with the applicant's conclusion that the Deep Wells Ditch is not eligible for either the CRHR or NRHP. The canal is one of many farm-dug laterals constructed during the Miller & Lux era, providing needed drainage and irrigation. Deep Wells Ranch was one of several satellite ranches in the Buena Vista Slough under the management of the Buttonwillow headquarters. Therefore, under Criterion 1/A, the canal is not significant for its association with irrigated agriculture around Buttonwillow. Under Criterion 2/B, the ditch is not significant for its association with any individual, having been constructed by the company of Miller & Lux rather than the individuals themselves. Under Criterion 3/C, the canal was constructed using standard methods of the time period. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In rare instances, structures can serve as sources of important information about historic construction materials or technologies; however, the water conveyance does not appear to be a principal source of important information in this regard.

East Side Canal (ES)

The East Side Canal was constructed by the KVWC under the direction of S. W. Wible in the late 1870s. Initially, the East Side Canal was to serve as the primary irrigation canal for the Buttonwillow Ranch, while the KVWCC was to drain the slough on the western side. In 1898, the canal was 25 feet wide and 3–5 feet deep. At its intake from the Buena Vista Slough, a regulating gate with vertical flashboards controlled water flow and also functioned as a road bridge. As of 1920, the East Side Canal had a 25-feet-wide timber flash board head gate that served as an intake from Outlet Canal. Starting in 1918 through at least 1920, Miller & Lux had extensive work done to the canal. A levee was constructed along the East Side Canal north of the Southern Pacific Railroad tracks running through Buttonwillow. Extensive excavation was performed on the canal to increase the working capacity of the canal from 100 feet per second to 300 feet per second throughout. When BVWSD acquired East Side Canal in 1926, the canal was 27 miles long and served as the main artery on the east side of the district, supplying, with few eastern exceptions, irrigation canals on its west side. The wooden control features constructed by Miller & Lux have been replaced with concrete structures.

The East Side Canal forms the eastern boundary of BVWSD and also borders the western boundary of the Tule Elk Reserve. It feeds laterals and receives drainage water from the ditches on the eastern side of the district. It runs in a northwesterly direction for approximately 24.1 miles from its origin at a diversion weir to its terminus at Goose Lake Canal. Concrete check gates are located along its width and culverts transport it under roads. The East Side Canal is located within the PAA/APE for the proposed transmission line and railroad spur.

Staff concurs with the applicant's conclusion that the East Side Canal is not eligible for the CRHR/NRHP. Like the KVWCC (evaluated below), the East Side Canal was one of several contributing factors for the litigation. Under Criterion 1/A, the East Side Canal lacks historical significance for its association with the Lux v. Haggin litigation. Under Criterion 2/B, the ditch is not significant for its association with any individual, having been constructed by the company of Miller & Lux rather than the individuals themselves. The canal was constructed using standard methods of the time period and is not a master work of S. W. Wible. Therefore, this resource is not significant under Criteria 3/C. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In some instances, structures can serve as sources of important information about historic construction materials or technologies; however, the water conveyance does not appear to be a principal source of important information in this regard.

<u>Kern Valley Water Company Canal (KVWCC)</u>

The KVWCC is an earthen canal constructed in 1874. After KVWC was organized for the reclamation of the Buena Vista Slough, S. W. Wible was put in charge as engineer. The massive size of the canal he engineered for them was intended to drain the water of the Kern River from the slough and also feed irrigation laterals. When first constructed, it extended 26 miles northwesterly up the slough from Old Headquarters, had a top width of 250 feet, bottom width of 125 feet, and a depth of 7 feet. By 1893, the canal was 12 feet deep. A series of four numbered timber weirs built on the KVWCC regulated the flow of water. Approximately 4 miles apart, each weir could be closed, forming a reservoir whose water could then be channeled into canals for distribution. The weirs also functioned to slow the flow of water down the canal as it proceeded northwesterly up the slough. In the early years of the canal, flood waters from the Kern River posed a constant threat to the canal's water control features. In 1878, within three months of the canal's completion, water split its head gates. An 1898 map indicates four weirs along the canal, but Grunsky's 1898 water supply report that year states that three of the four weirs were washed out, leaving only one remaining. These were subsequently replaced by the Old Headquarters Weir, discussed in detail previously as MR-10. In 1914, Miller & Lux and the Carmel Cattle Company collaborated to improve the irrigation system on the Buttonwillow Ranch. Their primary concern was the northern 6-mile stretch of the KVWCC that had been deemed inadequate for proper flood control. The new section of canal became known as the Kern Valley Reclamation Company's Canal. When BVWSD acquired the canal and its associated water control features, they identified the KVWCC as both asset and liability because floodwaters had eroded the channel to hundreds of feet wide in places.

Today this waterway is known as the Flood Channel, which accurately describes its current use. No longer used for drainage or irrigation, the channel only receives overflow waters in years of heavy flooding. The channel begins at Old Headquarters Weir and follows a winding path for approximately 26.8 miles in a northwesterly direction along the western boundary of BVWSD, paralleling the West Side Canal. The canal is bounded on the east by the West Side Canal. Flooding in the 1970s and 1980s required substantial maintenance of the canal to remove debris and control vegetation.

The western side is levied above the surrounding topography with soil removed from the channel. Reshaping by bulldozers traveling perpendicular to the canal has resulted in a U-shaped cross section. Floodwaters have cut meandering paths in the bottom of the canal and left silt in other areas. Staff has made site visits to the KVWCC in the vicinity of Old Headquarters Weir and found the channel to be full of vegetation and some debris.

The KVWCC is located within the PAA/APE for the proposed CO_2 line, at the southern end of Dairy Road. This segment is a roughly U-shaped canal that is 180 feet wide at the top, 100 feet wide at the base, and 15 feet deep. The path of the canal is irregular. The southern side is built up and resembles a levee or sand bar in areas. The height of this southern side is irregular and undulating, with a gentler slope into the canal. The Old Headquarters Weir crosses the canal at this point. East of the weir is an inlet to the West Side Canal, via the Short Main Canal. The inlet has a concrete head wall and flanking walls. A square metal gate is raised and lowered by a screw mechanism. The gate leads to an underground culvert connecting the two canals.

Staff concurs with the applicant's conclusion that the KVWCC is not eligible for the CRHR or NRHP. The KVWCC, East Side Canal, and West Side Canal, constructed in 1876, along with the Kern Island Canal (ca. 1870) and Calloway Canal (1874–1875), precipitated the seminal Lux v. Haggin litigation, which has shaped California water rights. However, on their own the KVWCC, East Side Canal, and West Side Canal are not significant for their role in the litigation. The upstream canals diverting water before it reached Miller & Lux' property also had a crucial role in setting the scene of the conflict. One particular canal or water diversion alone could not have been entirely responsible for Lux v. Haggin. Numerous conditions converged in Kern County to produce this fierce litigation over water. Some of these include: the shifting course of the Kern River, the construction of numerous canals and ditches diverting water from the river, and the competing interests of two large-scale landholders combined produced lengthy litigation. For these reasons, the KVWCC is not eligible under Criterion 1/A.

While the canal was constructed under the auspices of Miller & Lux, it is not directly associated with either of those individuals. Miller & Lux constructed numerous canals throughout their holdings to irrigate feed crops. While Henry Miller did visit most of his holdings, including Buttonwillow, most of his time was spent in San Francisco or his home ranch, which are more appropriately associated with him and the business. Therefore, the canal is not significant under Criterion 2/B. The canal was designed by S. W. Wible, a civil engineer who designed mines in El Dorado, Amador, and Calaveras counties before coming to Kern County, where he designed the Pioneer and Wible canals before designing the KVWCC. Despite his engineering knowledge, the KVWCC is not an engineering success and is not significant for its design or construction. Therefore, the canal is not significant under Criterion 3/C. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In some instances, structures can serve as sources of important information about historic construction materials or technologies; however, the water conveyance does not appear to be a principal source of important information in this regard.

<u>Outlet Canal</u>

To convey water from Buena Vista Lake to KVWCC, Miller & Lux constructed the Outlet Canal. Upon completion of the East and West Side Canals, the Outlet Canal became a source of water for those two canals as well. The Outlet Canal followed the general alignment of the Buena Vista Slough, meandering northward to the original Weir No. 1 at the old headquarters. In 1919 the flow of the Outlet Canal was controlled by two wooden weirs, one near Buena Vista Lake and the other at the East Side Canal. The Outlet Canal ceased its function in the 1970s as a source for the East and West Side canals and the KVWCC. It is normally dry and occasionally used for groundwater recharge.

Staff concurs with the applicant's conclusion that the Outlet Canal is not eligible for the CRHR or NRHP. The canal lacks historical association with Lux v. Haggin litigation, although it was one of several contributing factors for the litigation. The lack of direct association makes it ineligible under Criterion 1/A. Under Criterion 2, the Outlet Canal is not directly associated with a significant person. The Outlet Canal is not an example of a type, period or method of construction nor an example of the work of a master, making it ineligible under Criterion 3/C. This property is not likely to be a source of important information regarding history, and therefore not eligible under Criterion 4/D.

Short Main Canal

The Short Main Canal crosses east to west at the southern edge of the proposed project boundary. It was originally constructed in the nineteenth century as an addition to the Main Canal by KVWC. BVWSD obtained the right-of-way from Miller & Lux in 1929. Delivering water from the East Side Canal to the West Side Canal, it is also a source of irrigation water for adjacent farmlands. Control gates located at the east and west confluences are of modern design.

The canal lacks historical association with Lux v. Haggin litigation, therefore it is not eligible under Criterion 1/A. Not being associated with a significant person, Short Main Canal is not eligible under Criterion 2/B. Neither representative of a type, period or method of construction, nor associated with the work of a master, Short Main Canal is ineligible under Criterion 3/C. The canal does not appear to be source of important information regarding human history and therefore is ineligible under Criterion 4/D.

West Side Canal (WS)

The West Side Canal was built by Miller & Lux in the 1890s to collect, distribute and drain water. The canal was wide and shallow, approximately 30 feet wide and 2 feet deep. Miller & Lux records indicate problems with the planned system in 1916. A rapid program of expansion, lengthening the canal north of its former terminus and reconstructing the wooden head gates, was undertaken to provide enough water for the 1917 crops. Additional construction and maintenance under the control of BVWSD has replaced the weirs and head gates of the canal with modern concrete structures. The water supply for the canal has also been altered. Water entered the canal from the Outlet Canal to the southeast. However, after 1973, the Outlet Canal was removed as a source and water now enters the canal from the Short Main Canal that connects the East Side and West Side canals.

Currently, the West Side Canal is a main canal of BVWSD. It is a trapezoidal earth-lined irrigation canal that runs approximately 26.4 miles in a northwesterly direction from its origin where it branches off from Short Main. It parallels the flood channel that forms the western boundary of BVWSD. The canal acts as a main artery for the system, receiving water from drainage ditches, and supplying water to irrigation laterals. The canal slowly narrows along its path. Near its origin, it is approximately 60 feet wide and 12 feet deep.

West Side Canal also receives water at two points from the California Aqueduct, which runs nearby to the south. With the exception of Eighty-Foot Ditch, which West Side Canal feeds directly into, the canal supplies the laterals through diversion gates. Few roads cross the canal over bridges and the canal is supplied with concrete check gates. There is a short segment of the West Side Canal located within the PAA/APE for the proposed CO_2 line and the process water line is proposed to run alongside the canal.

At the southern end of Dairy Road and at the intersection with Short Main Canal, the West Side Canal is a well maintained, earth lined ditch with trapezoidal cross-section. A concrete check gate with three bays controls the flow of water into the canal and also serves as a bridge. From here, the canal flows in a northeasterly direction alongside the KVWCC.

Staff concurs with the applicant's conclusion that the West Side Canal is not eligible for the CRHR or NRHP. Under Criterion 1/A, the West Side Canal lacks historical significance for its association with the Lux v. Haggin litigation. Like the KVWCC, it was one of several contributing factors for the litigation. Under Criterion 2/B, the canal is not significant for its association with the individual partners of Miller & Lux. The canals are a result of the organization, not the individuals. Under Criterion 3/C, the canal was constructed using standard methods of the time period and is not a master work of S. W. Wible. This resource is also not eligible under Criterion 4/D because it is unlikely to yield information important to history. In some instances, structures can serve as sources of important information about historic construction materials or technologies; however, the water conveyance does not appear to be a principal source of important information in this regard.

<u>KRM-001H</u>

KRM-001H is a historic period ditch segment adjacent to the West Side Canal. Originally recorded by Farmer (2008), the information was not resubmitted for the current project. It appears to fall within the PAA/APE. It is described as a ditch mostly lined with weathered concrete. At the time of its recording the ditch appeared to be in use. Modern water gates have been added to the ditch and it appears to be connected to other canals. Staff observed this ditch on a site visit in September 2012, but did not survey it as it had not been identified as a resource in the current application. The 2008 recording draws no conclusions as to its eligibility for listing on the CRHR or NRHP. The significance of KRM-001H will be fully analyzed for the FSA/FEIS.

Map Reference 15 Tule Elk State Reserve

Tule Elk State Reserve was established as a State Parks unit in 1954. But its history goes back to the Civilian Conservation Corps (CCC) in the 1930s and the damming of the Kern River at Lake Isabella. In 1930, Miller & Lux provided 600 acres to establish a temporary holding area for the tule elk, which had developed a sizable herd in the area. Then, a 958-acre reserve was established by the California State Park Commission in 1932.

In 1934–1935, CCC cleared the land, built a road, an adobe house and various amenities suitable for a ranger's residence and park headquarters. The reserve operated at this location for the next three decades. Construction of the Isabella Dam had the effect of greatly limiting seasonal flooding in the Buena Vista Slough at the southern edge of the reserve. The habitat in which the elk had thrived disappeared and the elk suffered as a result.

California State Parks constructed replacement facilities closer to Station Road in 1956. The circular drive, ranger's residence, office/shop, Quonset hut, sheds, picnic shelters, and restroom building appear in a 1974 aerial photograph. The viewing platform and equipment shelter appear after 1991. It is not known when the prefabricated visitor center building was added. **Cultural Resources Table 14** summarizes the structures constructed on the property after the 1956 move of operations to the north end of the property.

Cultural Resources Table 14
Tule Elk State Reserve Structures

Structure	Purpose	Description
Office/Shop Building	Office/Shop	Rectangular footprint, concrete foundation, board and batten siding, gable asphalt sheathed roof, wide boxed eaves with exposed purlins. Windows have six-light awning pane over three-light fixed pane.
Shed	Equipment Shelter	Attached to Office/Shop. Three bays and a corrugated metal shed roof.
Shed	Flammables Storage	Concrete block walls with overhanging gable roof with open ventilation. Door centered on north side.
Shed	Storage	Board and batten siding, overhanging roof with open eaves. Louvered vents in gable ends and a door centered on south side.
Quonset Hut	Storage	Corrugated metal with full-height panel sliding door on the flat side and a four-light steel awning window on each end.
Residence Building	Ranger’s residence	Wide rectangular footprint, board and batten siding, shallow pitched side gable roof with boxed eaves and exposed purlins. The front entry is recessed and centered on the primary façade. Windows are vinyl sliders. South end has a single car garage with a tilt-up aluminum door.
Visitor’s Center	Visitor’s center with displays	Prefabricated trailer on a raised pedestal with Americans with Disabilities Act (ADA)-accessible ramp entry. Plywood siding and aluminum sliding windows.
Viewing Platform	Covered platform for viewing elk herd	Steel and wood open platform with shingled roof. Raised above ground. ADA accessible ramp. Interpretive panels.
Restroom Building	Bathrooms and large covered patio	Board and batten siding. Large mural of an elk on east side. Roof extends over concrete open area likely used for interpretive talks.
Picnic Shelters	Shade shelters	Steel side poles in a V-pattern support steel beam supports for solid roof cover. Sited on a concrete pad with adjacent barbeque grill. Shelters are located in a shaded lawn area.

The CCC-era adobe is extant on the property at the southern end but has deteriorated physically. The amenities and recreational facilities constructed by the CCC are concealed by the overgrowth that has taken place in the last 50–60 years. The adobe itself, however, retains a great deal of its design details, location and materials. The adobe and related landscape elements might have local significance in the context of land conservation efforts and CCC activities. However, since the adobe and the associated grounds are outside of the PAA/APE, staff will not complete an evaluation for the resource.

Staff concurs with the applicant's conclusion that the resources within the PAA/APE are not eligible for listing as historic resources on the CRHR or NRHP. While some of the structures date to 1956, placing them within the historic period, they are not associated with the original conservation efforts of the reserve and therefore not eligible under Criterion1/A. The property does not inform or illustrate the significance of the land owners Henry Miller and Charles Lux and has been managed by California State Parks since 1954. Therefore, it is not associated directly with persons of significance and ineligible under Criterion 2/B. The structures within the PAA/APE do not appear to be the work of a master nor do they represent a recognizable style or trend in architecture or park design. The mid-century overtones are nothing more than vernacular building styles. Therefore, none of the structures are eligible under Criterion 3/C. Lastly, the structures within the study area do not appear likely to be a source of information about history and are not eligible under Criterion 4/D.

JRP-HECA-4 Landing Strip and Hangar

This resource lies partially within the PAA/APE for the proposed railroad spur, but was not submitted with the 2012 amended application. Staff became aware of the previous evaluation late in the discovery period and has not had the opportunity to review the DPR 523 forms and evaluation for the PSA/DEIS. In its evaluation, the applicant does not find it eligible for listing on the NRHP/CRHR. Staff analyzed the resource in 2011 and concluded that site JPR-HECA-04, the airfield and hangar, is not eligible for inclusion in the CRHR.

Site JRP-HECA-04 is an airfield and a hangar located just east of 2534 Wasco Way and was constructed between 1954 and 1973. The site is on the remnant of a dirt airfield dating from the late 1950s. The prefabricated steel hanger has an arched roof. The wall away from the former airstrip is covered with corrugated metal and has a single personnel door set near the north edge. The opposite end has two sliding doors that were once supported by a top beam extending beyond the top width of the arch. Other buildings that had occupied the site were victims of a recent fire.

Air travel developed as a form of transportation and a means of managing crops during the 1920s. Kern County developed a municipal airport in 1925 outside of Bakersfield. Continuing enthusiasm for aircraft and flight led to the development of a countywide system of airfields approved by the Civilian Aviation Administration in 1946. In 1958 the system included 15 airfields across the county. Companies and large landholders also found it convenient to develop their own airfields. Five airfields, including the Buttonwillow-Kern County Airfield (off Elk Hills Road), were constructed between 1954 and 1973. These airfields supported crop dusting and private aircraft. This airfield is among the smallest and is not paved. The airfield has a single metal arch hanger manufactured by several manufacturers.

Typically, industrial properties that are evaluated as CRHR-eligible achieve that status by way of their association with important events or movements or unique or breakthrough engineering or technologies or architecture (that is, eligibility under Criterion 1 or 3). They rarely are associated with a person important in California history and typically do not have scientific value under Criterion 4 that is not included in Criteria 1 or 3.

Staff concludes that site JPR-HECA-04, the airfield and hangar, is not eligible for inclusion in the CRHR. Evaluated under Criterion 1, the airfield is not significant for its association with the development of flight, an event important in the broad pattern of California history. The airfield is a common rural resource used for crop management and private flights and is one of many built in the county during the same period. The airfield is not associated with a significant individual and is a construct of a large company; therefore, it does not appear to be eligible under Criterion 2. Under Criterion 3, the site does not embody a distinctive type, period or method of construction. The field is unpaved and the hangar is a prefabricated building of common construction. This resource is also not eligible under Criterion 4 because it is unlikely to yield information important to history. In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies; however, the airfield does not appear to be a principal source of important information in this regard.

Summary of CRHR-Eligible Built Environment Cultural Resources for the HECA Project

Staff found that one built environment resource (California Aqueduct) had already been determined eligible for both the NRHP and the CRHR. Staff concurs with this previous determination. Staff considers one built environment resource, the Old Headquarters Weir (HECA-JRP-24/MR 10), to be eligible for the CRHR and NRHP, making it a historical resource under CEQA and a historic property under Section 106 of the NHPA. (see **Cultural Resources Table 15**.) However, staff finds the remaining 21 built environment resources ineligible for the CRHR and NRHP.

Cultural Resources Table 15
CRHR/NRHP-Eligible Cultural Resources Potentially Subject to Impacts from the Proposed Project

Resource	Type	Project Element	Eligibility
Built-Environment Resources			
Old Headquarters Weir (MR 10)	Bridge and Weir over KVWCC	CO_2 line	Eligible
California Aqueduct	Canal	CO_2 line	Eligible

Isolated Finds

A total of 18 isolated finds have been identified in the HECA portion of the PAA/APE (**Cultural Resources Table 16**). Isolated finds are rarely considered historical resources, unique archaeological resources, or historic properties under CEQA and Section 106 of the NHPA. This PSA/DEIS, therefore, does not assess the proposed project's impacts on the isolated finds identified in **Cultural Resources Table 16**.

Cultural Resources Table 16
Isolated Finds within the PAA/APE: HECA Project Elements

Resource Number	Description	Location	CRHR and NRHP Status	Siting Case Report Reference
BS-IF-001	Two pieces of debitage	Process water line	Ineligible under CEQA & NRHP	Farmer 2008:Table 5-1; HEI, with URS 2008:5.3-46
BS-IF-002	Flake	Process water line	Ineligible under CEQA & NRHP	Farmer 2008:Table 5-1; HEI, with URS 2008:5.3-46
BS-IF-003	Flake	Process water line	Ineligible under CEQA & NRHP	Farmer 2008:Table 5-1; HEI, with URS 2008:5.3-46

HECA-2009-ISO-8	Flake	Controlled area	Ineligible under CEQA & NRHP	Hale and Laurie 2009:39, Appendix C
HECA-2009-ISO-9	Handstone	Controlled area	Ineligible under CEQA & NRHP	Hale and Laurie 2009:39, Appendix C

EOR Project Elements

Prehistoric Archaeological Resources

Staff considered five individual prehistoric archaeological resources that would be subject to direct impacts from the OEHI CO_2 line, and finds that all five could not be evaluated because the applicant provided insufficient data for staff to make significance determinations. In Data Requests A85–88 staff requested additional cultural resources information regarding the OEHI CO_2 line, processing facility, associated processing satellites, 150 new wells and 652 miles of pipeline. This additional information includes: a record search, a literature review, copies of site forms for previously recorded sites, copies of reports describing previous cultural resources studies in the project vicinity, a pedestrian survey, and a technical report presenting the results of the survey. Staff understands that OEHI is in the process of collecting the requested information. Evaluations of any resources identified during these surveys, if any, will be presented in the FSA/FEIS.

CA-KER-5401 (P-15-6776), HECA-2008-6, HECA-2008-7, HECA-2008-11, and HECA-2008-12

These archaeological sites are situated in the proposed CO_2 line alignment and have been described in the previous subsection, “HECA Project Elements”.

Ethnographic Resources

No NRHP/CRHR-eligible ethnographic resources have been found in the PAA/APE.

Historic Archaeological Resources

During the September 19–20, 2012 site visit to the proposed project, staff examined the vicinity of the proposed CO_2 processing facility. Here, staff identified a historic archaeological site consisting of disarticulated fire bricks, glass fragments, milled lumber, and metal artifacts. Staff temporarily designated the site CO2-2012-1 and drew it to OEHI personnel’s attention to ensure that the site was recorded and evaluated. Staff understands that OEHI has conducted additional fieldwork in the proposed EOR components and may have resolved this issue, per Data Requests A141–146 (CEC 2012b:8–13). At the time of this writing, however, staff has not received this information. Therefore staff was unable, on the basis of the information provided, to determine if CO2-2012-1 is eligible for the NRHP or CRHR. Staff will present OEHI’s latest methods and findings, and staff’s analysis, in the FSA/FEIS.

Built-Environment Resources

Staff has reviewed previous Energy Commission Cultural Resources analysis for the Elk Hills Power Project (EHPP), which is located on the OEHI property (CEC 2000a). The following historic setting discussion is excerpted from this previous record. Early in the twentieth century the U.S. Navy expressed to Congress their concern for the strategic security of the nation's oil supply, and requested creation of defined petroleum reserves. In September, 1912, an executive order signed by President Taft created NPR-1, covering about 38,000 acres in the Elk Hills. Leases were acquired from the Navy by Standard Oil and speculators, and as the industry expanded in this remote area, families of many workers relocated to privately owned camps in the Elk Hills. Standard Oil's facility at Tupman not only supported field activities, but provided many residential amenities.

Concerned that such growth would deplete the government's reserve, the Navy undertook to drain the leased fields from offset wells, and to reclaim the leased resources. All claims had reverted to the government by 1938. Production was greatly increased during World War II, both to generate revenue and to supply naval needs. The Navy's Construction Battalions (Sea Bees) moved onto NPR-1 to operate the wells, make improvements, and conduct wartime readiness drills, digging foxholes and building bunkers. These features survive on the northeast and northwest flanks of the oil and gas field (Nachmanoff et al. 1999). Additional episodes of oil development followed in 1945, 1951, and 1976. The DOE operated NPR-1 (now the EHOF) until February 1, 1998.

The Section 106 consultation process for the transfer of NPR-1 from DOE to private hands culminated in the execution of a programmatic agreement (PA) and Cultural Resources Management Plan (CRMP), both in force for approximately three years from the time of execution. The CRMP devotes a single page to the historical resources and does not offer a research design. Section 2 of the CRMP lists three historic era properties (three Hay wells) that are eligible for listing in the NRHP. Section 2.1 identifies further research to be done, and Section 2.2 refers to a historical publication to be prepared for public distribution. The maps provided as Appendix 2 to the CRMP depict the prehistoric sites exclusively. (Jackson and Shapiro 1998.) As described in the EHPP AFC, known historic era built environment cultural resources of potential interest or concern would include transportation corridors and facilities; oil and gas production locations and installations; homesteads; commercial and residential communities, as represented by buildings, other structural elements and discards; work camps; sites; districts; landscapes; and objects (EHPP 1999; Nachmanoff et al. 1999).

Built Environment Reconnaissance and Survey of NPR-1/OEHI

NPR-1, now operated by OEHI, is the location of the proposed EOR, and staff analyzed it as part of the proposed project. In preparing this PSA/DEIS, staff reviewed the research, evaluations and conclusions of previous Energy Commission Cultural Resources staff for the EHPP, which is located on the OEHI property (CEC 2000a). At that time staff noted that the EHPP AFC did not contain any architectural or engineering analysis of evidence remaining of the long history of oil production or the work camps which supported industrial activities. Although much of the oil and gas production equipment in the project vicinity was older than 45 years at the time of the EHPP AFC, and at least one historic site within the EHPP project area contained materials dating back at least to the 1920s and probably older, based on the presence of sun-colored amethyst glass, the structural elements, artifact deposits and research potential of historical remains were not assessed. The EHPP AFC described a work camp site, for example, that contained a complex of foundations, roads and trails, privies, at least three trash deposits, railroad grades, walls and fences. This site, which included comparable examples with both industrial and residential remains, and numerous wells spudded in during the 1920s were regarded as disturbed because superstructures were fragmentary or missing. Seemingly for this reason alone, these sites were evaluated as failing to meet the criteria for significance. The archaeological and engineering/technological aspects of such sites were not addressed, and historical landscape was not considered.

Naval Petroleum Reserve No. 1 (NPR-1)

NPR-1 was the subject of a historical resources evaluation and assessment report (Hamusek-McGann et al. 1997) at the time of the transfer of the property from DOE to Occidental Petroleum, parent company of OEHI. The report assessed both historic archeological resources and built environment resources. Several periods of significance were found in the report, including Early Exploration (1910–1918), Initial Development Rush (1918–1930), Depression Years (1930–1941) and the War Years (1941–1946). The report authors identified the Elk Hills Rural Historic Industrial Landscape as a historic property eligible for the NRHP under Criterion A. The SHPO took issue with this conclusion, calling into question the landscape's integrity. The SHPO wrote, "For no period of significance does the property today exhibit enough integrity in all applicable categories to readily convey its historic appearance…" (Widell 1997:1). Apparently, the report lacked identification of the landscape's character-defining features, which would have bolstered Hamusek-McGann et al.'s (1997) contention that it is NRHP-eligible.

Staff visited the NPR-1/EOR area on September 19, 2012. Many of the early period (1910–1941) built environment features which might have been contributors to a district appear to be missing, damaged or altered. However, there are two areas that appear to have integrity and warrant further survey and evaluation: World War II Military Sites and Check Dams.

World War II Military Sites

Hamusek-McGann et al. (1997) provides some documentation of Navy activity during the war years and the activities of the Sea Bees (Construction Battalions or CBs) in particular. According to Hamusek-McGann et al. (1997), the Sea Bees constructed roads, drill pads, wells and military trenches, bunkers and other defensive earthworks on the north and west flanks of the landscape. Of these activities, the trenches, bunkers and other earthworks appear to be intact (**Cultural Resources Figure 11**). These earthworks seem to be located in primarily in the low oil-production areas of Elk Hills and this may contribute to their high degree of integrity. Hamusek-McGann et al. (1997) found that the relationship of the trenches to the topography offers an insight into the military's approach to defensive positions on the ground during this period. The report states that physical evidence of defensive infrastructure during WWII is rapidly disappearing, increasing the value of NPR-1 military sites, which may be eligible as historic properties under NRHP Criterion A.

Check Dams

During staff's site visit, OEHI staff pointed out a series of check dams constructed on the property meant to control the flow of water off the site to the valley below. These check dams appear to have a design that incorporates a metal pipe that siphons the water through an earthen dam, at a point below the water level of the dam, allowing water to pass through the pipe and leaving any oily residue to collect at the bottom of the basin. This in effect reduces the potential for oil to flow beyond the property boundary during a rain event or a spill. These check dams are prevalent throughout the site and it is not known when these dams were constructed or by whom. Hamusek-McGann et al. (1997) report that WPA crews were on site during the Depression years constructing culverts, laying pipeline, repairing equipment and constructing roads. The check dams are not discussed in the report and their origin is not known by staff. They are a landscape element specifically relating to this site's topography and function and require evaluation to determine their contribution to the overall landscape, their association with one of the historic periods noted above and if they qualify as historic resources under CRHR or NRHP.

KRM-010H Soil and Gravel Road

KRM-010H is a historic period oil-road traversing the southeastern portion of the OEHI property, not far from the toe of the slope and the path of the California Aqueduct. It was recorded by Farmer (2008) for the original HECA AFC. It is described as an oil-topped road running diagonally in a northeast to southeast direction. It may have been associated with the Sea Bees due to artifacts found nearby. The road is approximately 1 mile long and 24 feet wide. The segment seems to channelize water along its length and had been badly eroded when recorded in 2008. Staff was unaware of this potential historic built environment resource as it was not included in the current project application. Staff will gather more information for the FSA/FEIS.

Isolated Finds

Two isolated finds have been identified in the EOR portion of the PAA/APE (**Cultural Resources Table 17**). Isolated finds are rarely considered historical resources, unique archaeological resources, or historic properties under CEQA and Section 106 of the NHPA. This PSA/DEIS, therefore, does not assess the proposed project's impacts on the isolated finds identified in the table.

Cultural Resources Table 17
Isolated Finds within the PAA/APE: EOR Project Elements

Cultural Resource Type	Description	Location	CRHR and NRHP Status	Siting Case Report Reference
HECA-ISO-2	Two pieces of debitage	CO_2 line	Ineligible under CEQA & NRHP	Farmer 2008:Table 5-1; HEI, with URS 2008:5.3-46
Isolated Artifact 1	Biface	CO_2 line	Ineligible under CEQA & NRHP	Stantec 2011:8

Summary of NRHP/CRHR-Eligible Resources for EOR Project Elements

As stated earlier in this subsection of the PSA/DEIS, the results of the cultural resources inventory of the EOR project elements has not yet been provided to staff. This prevents staff from providing a full analysis of the proposed project's likelihood of causing significant adverse effects to historical resources, unique archaeological resources, and historic properties in the PAA/APE. Nevertheless, staff is able to offer a provisional analysis based on the information gathered so far.

Currently, six archaeological resources are known to exist in the PAA/APE: CA-KER-5401 (P-15-6776), HECA-2008-6, HECA-2008-7, HECA-2008-11, HECA-2008-12, and CO2-2012-1. Each requires a significance evaluation that takes into account the sites' current degree of historic integrity as well as the close proximity of the sites to one another. Based on information provided to date, staff considers these six archaeological sites to be historical resources under CEQA and historic properties for the purposes of Section 106 of the NHPA.

Additionally, staff has identified two previously unrecognized sets of historic built environment resources that are associated with Hamusek-McGann et al.'s (1997) proposed Elk Hills Rural Industrial Historic Landscape and a historic road, all of which may constitute historical resources under CEQA and historic properties for Section 106 purposes.

Staff will make firm significance determinations upon receipt of the EOR cultural resources inventory report and backing documentation. Staff will present its findings in the FSA/FEIS.

As stated previously in this PSA/DEIS, isolated finds are rarely considered historical resources, unique archaeological resources, or historic properties. The EOR isolated finds are no exception in this regard.

DIRECT/INDIRECT IMPACTS AND MITIGATION

Construction Impacts and Mitigation

Identification and Assessment of Direct Impacts on Archaeological Resources and Proposed Mitigation: HECA Project Elements

Surface Archaeological Resources

Staff has concluded that 18 prehistoric resources, one historic archaeological site, and two multi-component archaeological sites will be subject to direct impacts from the proposed HECA project elements. The applicant has not conducted the fieldwork required to gather data for site eligibility determinations for prehistoric sites which would be impacted by the proposed project. Without primary field data on the presence of a subsurface component for these sites, staff cannot evaluate them sufficiently to determine if they may retain the potential to yield information important to prehistory. Therefore, staff was unable to determine if these 21 known sites are eligible for the CRHR or NRHP, assess the impacts of the proposed project on known and unknown resources, or propose mitigation for any significant effects.

The applicant proposes to avoid damaging the following archaeological resources by placing the proposed process water pipe on the ground surface next to the northeastern side of the West Side Canal's levee in the vicinity of the sites and covering the pipeline (and a portion of the archaeological resources) with fill dirt.

- HECA-2009-10
- P-15-171 (CA-KER-171)
- HECA-2009-09
- HECA-2008-1 (JM-BVWD-1)
- P-15-179 (CA-KER-179) and KRM-IF-003
- (URS 2013c:147-1)

To this list staff adds:

- BS-IF-004
- P-15-7176/P-15-6725
- CA-KER-2485 and BS-IF-003

The applicant assumes that placing the pipe on the ground surface, burying it in fill, and burying or capping a portion of known archaeological sites in the process would negate any significant impacts on the resources. Although capping the sites in fill sediment would afford some protection to the sites, burial in fill has the potential to compromise archaeological (or historical) integrity. In the context of archaeological resources along the proposed process water line, potential sources of impacts on archaeological resources include damage to and displacement of artifacts from construction traffic, artifact damage from compression as heavy equipment crosses the sites, and damage to archaeological materials resulting from scarification (usually accomplished by disking), should such preparation be required to properly anchor the placed fill (Thorne 1991:6). In addition, mitigation measures like intentional site burial need to be done with a mind toward long-term resource management, which requires knowledge of a site's character-defining features before a firm decision can be made to bury the archaeological site under fill (Thorne 1991). Presently, the applicant does not have these data. In many cases, obtaining these data would require presence/absence test excavation, and possibly test and data recovery excavations. Therefore, staff finds that the proposed project would likely result in damage to the archaeological resources in the two bullet lists immediately above. Accordingly, staff has requested that the applicant provide information that permits to determine the significance of these archaeological resources. Supplying this information would be a multi-step process that would inform staff's analysis in the FSA/FEIS. The first step would entail the applicant preparing and submitting to staff an archaeological research design for scientific excavation and documentation of the known archaeological resources in the PAA/APE. Upon staff review and approval of the research design, the applicant would implement the research design and prepare an excavation report containing their significance recommendations to staff. Once the applicant provides an excavation report that is acceptable to staff, Energy Commission staff will have information sufficient to analyze the proposed project's impacts on the subject archaeological resources in the FSA/FEIS.

CEQA advises a lead agency to make provisions for archaeological resources unexpectedly encountered during construction, and a project owner may be required to train workers to recognize cultural resources, fund mitigation, and delay construction in the area of the find (Pub. Resources Code, §21083.2; 14 Cal. Code Regs., §§15064.5(f) and 15126.4(b)). Consequently, staff recommends that procedures for identifying, evaluating, and possibly mitigating impacts to archaeological resources discovered during construction be put in place through conditions of certification to reduce those impacts to a less than significant level.

Buried Archaeological Resources

The proposed project would be built in areas considered to have a moderate to high potential to contain well-preserved, buried cultural materials. These materials would be expected within 35 feet of the modern ground surface on the valley floor and within 3 feet of the modern ground surface in the Elk Hills. Therefore, all proposed HECA ground-disturbing activities have the potential to substantially and adversely change the CRHR/NRHP-eligibility of archaeological deposits that may lie buried in the PAA/APE. The applicant will conduct additional geoarchaeological field explorations to establish a factual basis for the assessment of potential effects to buried deposits within the project limits. Staff and the applicant are working on a geoarchaeological research design to address this data gap and expect that the data will be available for the FSA/FEIS.

Identification and Assessment of Direct Impacts on Ethnographic Resources

Neither the applicant nor staff has identified ethnographic resources in the PAA/APE. Staff tentatively concludes that the proposed project would not result in impacts on ethnographic resources. No conditions of certification (conditions) or mitigation measures are recommended with respect to ethnographic resources.

Identification and Assessment of Direct Impacts on Built-Environment Resources and Proposed Mitigation

One built environment resource (California Aqueduct) has previously been determined eligible for both the NRHP and the CRHR. Staff concurs with this previous determination. Staff considers one built environment resource, the Old Headquarters Weir (HECA-JRP-24/MR 10), to be eligible for the CRHR and NRHP (**Cultural Resources Table 18**). However, the remaining 21 built environment resources are not eligible for the CRHR or NRHP.

Cultural Resources Table 18
Affected CRHR/NRHP-Eligible Historic Built Environment Resources

Resource	Type	Project Element	Eligibility
Built-Environment Resources			
Old Headquarters Weir (MR 10)	Bridge and Weir over KVWCC	CO_2 line	Eligible
California Aqueduct	Canal	CO_2 line	Eligible

Staff concludes that there appears to be less-than-significant impacts to the two eligible historic properties listed in **Cultural Resources Table 18** above. The only potential for direct impacts to the Old Headquarters Weir and the California Aqueduct is through the construction of the CO_2 pipeline leading from the HECA project site to the OEHI CO_2 processing facility.

Section 2-63 to 2-65 of the Amended AFC describes the method of crossing for the CO_2 pipelines at the California Aqueduct, the Outlet Canal and the KVWCC (URS 2012a). HDD would be used to build underneath the aforementioned canals. These HDD crossings may reach 100 ft below grade. The HDD would meet the restrictions of the CDWR California Encroachment Permit Guidelines, June 2005, which sets a minimum standard of 25 ft for the distance between the bottom of the aqueduct channel and the top of pipe to prevent damage to the conveyance. Additionally, the construction of the CO_2 pipeline would necessitate 100-ft-by-200-ft laydown area for each crossing on either side of the watercourse. This laydown area would take the form of a pit of undetermined depth.

As the CO_2 pipeline crossings would take place underground, it is unlikely to impact the Old Headquarters Weir, which spans the KVWCC in the immediate vicinity of the proposed crossing. The construction laydown areas which would accompany the HDD drilling on either side of the crossings would be finalized in the maps submitted as compliance with Condition of Certification **CUL-2**. The proposed crossing under the California Aqueduct would not damage this historical resource/historic property if the best practices as set forth in the CDWR California Encroachment Permit Guidelines, June 2005, are followed. Implementation of these best practices is required in Condition of Certification **CUL-2.**

Identification and Assessment of Direct and Indirect Impacts on Cultural Resources and Recommended Mitigation: EOR Project Elements

Surface Archaeological Resources

An unknown number of prehistoric sites (minimally CA-KER-5401, HECA-2008-6, HECA-2008-7, HECA-2008-11, and HECA-12) are located in the EOR portion of the PAA/APE and may be subject to direct or indirect impacts. The applicant has not conducted the fieldwork required to gather data for site eligibility determinations for prehistoric sites that may be impacted by the proposed EOR facilities. Without primary field data on the presence of a subsurface component for these sites, staff cannot evaluate them sufficiently to determine if they may retain the potential to yield information important to prehistory. Therefore staff was unable to determine if these sites or others (as-yet-unidentified) are eligible for the CRHR or NRHP, assess the impacts of the proposed EOR facilities on known and unknown resources, or propose mitigation for any significant effects. The applicant is preparing to submit the cultural resources inventory report and supporting documentation to staff; this information will be discussed in the FSA/FEIS.

Buried Archaeological Resources

The proposed EOR facilities would be situated in areas considered to have low to moderate potential to contain well-preserved, buried cultural materials. These materials would be expected within 3 feet of the modern ground surface in the Elk Hills. The erosional nature of the hills renders it unlikely that buried archaeological materials are present in the EOR portion of the PAA/APE without evidence of their presence on the ground surface. Therefore, staff does not recommend further geoarchaeological study of the proposed EOR facilities.

Historic Built Environment Resources

Data responses from the applicant are pending for the OEHI World War II military sites and check dams noted above (also see **Cultural Resources Table 19**). Until that information is received and staff has an opportunity to evaluate the resources and the potential project impacts, staff is unable to assess specific impacts to these resources or propose mitigation if necessary.

Cultural Resources Table 19
EOR Built Environment Resources Eligibility

Resource	Type	Project Element	Eligibility
NPR-1	Rural historic landscape important in local and state history for development of the petroleum industry. Unknown number of contributors subject to impacts.	CO_2 line and processing facility, EOR area	Not eligible
KRM-010H	Soil and gravel road	CO_2 line and processing facility	Unknown
WW II Military Sites	Military earthworks and structures	CO_2 line and processing facility	Unknown
Check Dams	Surface water control structures	CO_2 line and processing facility	Unknown

Indirect Impacts

Construction of the electrical interconnection between the proposed HECA project and the Midway–Wheeler Ridge Transmission Line would require installation of optical control grounding wire along the transmission line between the proposed HECA switching station and Midway Substation in Buttonwillow. Additionally, the proposed project would necessitate installation of a 500/220-kV transformer bank and ten 80-kA breakers at Southern California Edison's Mesa Substation in Pasadena, Los Angeles County. Staff is presently reviewing the cultural resources information (records search results) collected for the Midway–Wheeler Ridge Transmission Line. Staff will present an analysis and conclusions in the FSA/FEIS.

Operation Impacts and Mitigation

With respect to direct impacts, if, during operation of the HECA and OEHI projects, the project owners should plan any changes or additions entailing significant amounts of ground disturbance, the project owner would have to petition the Energy Commission to review the environmental impacts of those activities and approve the plan. Cultural resources staff would then determine if previously undisturbed sediments would be affected by the planned activities and, if so, recommend the application of existing conditions or devise new ones to mitigate any impacts to significant known or newly identified cultural resources. Consequently, at this time staff has recommended no conditions of certification addressing operation direct impacts.

Environmental Justice Impacts

Staff has identified minority environmental justice populations in the 6-mile HECA buffer; the Buttonwillow, Bakersfield, and Wasco census designated places; and the Bakersfield, Buttonwillow, Shafter, Wasco, and West Kern census county divisions (see **Socioeconomics Table 2**). According to the 2010 U.S. Census, the minority populations in these areas are Hispanic or Latino populations (U.S. Census 2010). Staff has not identified historic properties, historical resources, or unique archaeological resources in the PAA/APE that are culturally important to Hispanic or Latino populations. As stated in the "Environmental Justice/Socioeconomic Methods" of this PSA/DEIS section, staff has not identified a Native American environmental justice population in the PAA/APE. Staff cannot conclude at this time, however, that the proposed project would not cause environmental justice impacts related to cultural resources because the applicant has not completed its efforts to identify cultural resources in the PAA/APE. Staff will complete its environmental justice impacts analysis for cultural resources after receipt of reports on a complete cultural resources inventory and present the analysis in the FSA/FEIS.

Cumulative Impacts and Mitigation

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (14 Cal. Code Regs., §15130; see also 36 C.F.R., part 800.5[a][1]; 40 C.F.R., §1508.7). Cumulative impacts to cultural resources in the project vicinity could occur if any other existing or proposed projects, in conjunction with the proposed project, had or would have impacts on cultural resources that, considered together, would be significant. The previous ground disturbance from prior projects and the ground disturbance related to construction of the proposed project and other proposed projects in the vicinity could have a significant cumulative effect on subsurface archaeological deposits, both prehistoric and historic. The alteration of the setting which could be caused by the construction and operation of the proposed project and other proposed projects in the vicinity could also have a significant cumulative impact to cultural resources.

Staff has proposed conditions of certification providing for identification, evaluation, and avoidance or mitigation of impacts to previously unknown archaeological resources that may be discovered during the construction of the proposed project and qualify as historical or unique archaeological resources under CEQA, or historic properties under Section 106 of the NHPA.

For the purposes of this cumulative impacts analysis, staff has determined that the cumulative area of analysis comprises that portion of the upper San Joaquin Valley that the Buena Vista Slough once drained, as well as the Elk Hills. This area stretches from Wasco south to Maricopa, and from the Temblor Range east to the eastern edge of Bakersfield and the Kern Lake vicinity, approximately a 20-mile radius from the proposed project site (see **Cultural Resources Figure 12**). Staff selected this area for cumulative impact analysis because it forms a geographic unit that was probably meaningful to the prehistoric human inhabitants of the project vicinity and encompasses a similar range of cultural resource types throughout: agricultural properties, oil extraction and processing, water conveyance, and occupation sites. Accordingly, the 20-mile radius from the project site forms a useful basis for assessing cumulative impacts on related resource types. In selecting projects that could contribute to cumulative impacts, staff identified those projects in the 20-mile radius that would result in ground disturbance because excavation is the primary vehicle for cultural resources impacts for the proposed projects. Staff presents its list of cumulative projects for cultural resources in **Cultural Resources Table 20**.

Cultural Resources Table 20
Summary of Cumulative Projects—Cultural Resources

Project Title	Location	Project Description	Resources Affected/Level of Significance	References
Maricopa Sun Solar Complex Project	East of Maricopa	At least two photovoltaic power generating stations on 9,027 ac; possible construction of a weather station	14 cultural resources/LTS	Armstrong et al. 2010; Kern County 2010
FRV Valley Solar Project	Bakersfield, Arvin, and Lamont	Construct and operate three solar photovoltaic power generating facilities on three sites totaling 1,063 ac in unincorporated portions of Kern County	Three cultural resources affected, none significant/LTS	Crawford 2012; Holm 2011a, 2011b; Holm and Jackson 2011; Kern County 2012a; Planning Commission 2012a; Tejada 2012
General Plan Amendment/Zone Change 12-0372	Bakersfield: Rosedale Highway and Van Buren Place	General Plan Amendment and Zone Change on approximately 20.41 ac. Develop multifamily housing with a maximum of 225 dwelling units	Unknown, although ground-disturbance during construction could damage cultural resources/Potentially significant impact	
Northern Area Project	Kern County: Between Imperial Road and SR 46	Convert ~18 linear miles of canal with ~25 mi of pipeline from open earthen canals to a closed or semi-closed system	At least three known prehistoric sites and conversion of canals and pipelines could affect historic canals and irrigation features/Potentially significant impact	Staff records search map
Old River Solar Project	Bakersfield: Shafter Road, between Gosford Road and Ashe Road	Construct and operate contiguous solar facilities on two parcels. The Old River One solar facility would be located on ~ 188 ac, while the Old River Two facility	No cultural resources affected/LTS	Hudlow 2011; Kern County 2012b; Planning Commission 2012b

Project Title	Location	Project Description	Resources Affected/Level of Significance	References
		would be located on ~ 33 ac		
Strand Ranch Integrated Banking Project	Kern County: Stockdale Highway and Enos Lane (SR 43)	Deliver up to 6,5000 acre-feet of SWP water to the Strand Ranch Integrated Banking Project in Kern County	No cultural resources affected/LTS	ESA 2008
Berry Petroleum Company Project	Kern County	Install gas fired steam generators and five steam generators at the existing McKittrick Oilfield (21Z Lease)	No cultural resources affected/No impact	SJVUAPCD 2012
General Plan Amendment/Zone Change 12-0349	Bakersfield Region: Panama Lane and Stine Road	General Plan Amendment and Zone Change on approximately 56.19 ac; develop duplex and multifamily housing with a maximum of 617 dwelling units	Unknown, although construction-related digging could affect cultural resources/Potentially significant impact	
North Shafter Project	Wasco: SR 46 and Root Avenue, SR 46 and Leonard Avenue	Drill and test four exploratory oil/gas wells near the community of Wasco outside the Rose Oil Field	No cultural resources affected/LTS	Brunzell 2011; DOGGR 2012
Pioneer Green Solar Project	McCombs Road and Corcoran; Starrh (private road) and Lokern Road	Construct and operate three solar electrical generating facilities on 720 ac	Five isolated artifacts, non-significant/LTS	Kern County 2013; Planning Commission 2013; Shaver 2012; Shaver and Baksh 2011
San Joaquin Rail Corridor 2035 Vision Project	Kern, Sacramento, San Joaquin, San Francisco, Los Angeles, Merced counties	San Joaquin Rail Corridor infrastructure upgrades	Potentially significant impact	Caltrans 2012a
SR 58 Gap Closure	Bakersfield: Between SR 99 and Cottonwood Road	Road widening	No cultural resources affected/No impact	Caltrans 2012b

Project Title	Location	Project Description	Resources Affected/Level of Significance	References
SR 58 Widening Project	Bakersfield: West of Allen Road to SR 99	Road widening and restriping	15 cultural resources (historic built environment) affected, none NRHP/CRHR-eligible/No impact	Caltrans and City of Bakersfield 2012
Westside Parkway Project	Bakersfield: Allen Road, Calloway Drive, Coffee Road, Mohawk Street	Site preparation, planting of vegetation and installation of minimal irrigation	30 cultural resources affected, one NRHP/CRHR-eligible/LTS	USDOT et al. 2006
Zone Change 15, Map 140; PD Plan 5, Map 140; Exclusion from Ag Preserve 10; Tentative Parcel Map 11235	Bakersfield: Enos Lane, Taft Highway (SR 119)	Development of an oilfield equipment staging/storage area and warehouse of two portions of an 80-ac vacant parcel	Unknown; two cultural resources located near SW corner of intersection/Potentially significant impact	Staff records search map

Note: ac = acre(s); LTS = less than significant; mi = mile(s); SR = State Route

The cultural resources information for the 15 projects identified in **Cultural Resources Table 20** varied significantly: staff was unable to locate environmental documents or other cultural resources information on two projects, possess partial records search data for two projects[43], and located environmental and cultural resources documents for 11 of the cumulative projects. As the table shows, environmental reviews found that three of the projects would not result in impacts on cultural resources. Environmental impact assessments concluded that seven of the tabulated projects would result in a less-than-significant impact on cultural resources, with the implementation of resource-specific mitigation measures and standard conditions on the proposed projects. The remaining five cumulative projects have the potential to result in a significant impact to cultural resources. Of these, only the proposed San Joaquin Rail Corridor project is the subject of an environmental document that finds a significant environmental impact on cultural resources. Concerning the general plan amendment and zone changes for the project at Rosedale Highway and Van Buren Place and Panama Lane at Stine Road, staff assumes that the proposed projects have the potential to result in significant impacts on cultural resources because of the lack of information available to staff at the time of this writing. Staff's consultation of its records search map of the HECA vicinity resulted in the identification of recorded and unrecorded cultural resources in or near the Northern Area Project and proposed oilfield equipment staging at Enos Lane and Taft Highway. With the assessment of HECA's potential impacts on cultural resources currently incomplete, staff is unable to conclude whether incremental effects on cultural resources would be cumulatively considerable when viewed in conjunction with the projects in **Cultural Resources Table 20**. The FSA/FEIS will have a complete cumulative impacts analysis.

[43] Staff's records search map for these two cumulative projects consists of drawn boundaries and basic identifying labels for previous cultural resources studies and known cultural resources.

COMPLIANCE WITH LORS

At the present state of impact analysis, if the conditions of certification (below) are properly implemented, the proposed HECA project would tentatively result in a less-than-significant impact on known and newly identified CRHR/NRHP-eligible resources. However, as discussed in "Summary of Conclusions" and "Unresolved Areas Related to Cultural Resources", applicant-provided cultural resources information leaves staff with considerable data gaps, such as a near-absence of project-specific analysis for the EOR project elements. Nevertheless, staff understands that a cultural resources inventory of the EOR project elements has been completed and the results will be submitted to the Energy Commission. Additionally, staff continues to work with the applicant to resolve other data gaps in the present analysis, such as geoarchaeological assessment of the proposed project and significance evaluations of archaeological resources. The scope of studies underway and planned is consistent with the requirements of applicable LORS. Staff therefore tentatively concludes that the project would be in compliance with all applicable LORS listed in **Cultural Resources Table 1**. Specific justification for staff's conclusions in this regard is contained in the following two paragraphs.

Concerning federal LORS, Energy Commission staff has worked with DOE personnel to consult with tribes, identify and evaluate cultural resources, assess impacts, and determine appropriate mitigation measures. Staff's activities were conducted in concert with the DOE to maintain compliance with federal requirements. Specifically, DOE personnel have initiated consultation with federally recognized tribes by letter and participated in an EOR site visit with the Tejon Indian Tribe, as described previously in this document (see the "Historical Resources Inventory/Native American Consultation" subsection). The DOE has also initiated consultation with the SHPO ("Historical Resources Inventory/Consultation with Others"). Cultural resources identification work for the proposed project was conducted at the direction of personnel who meet the Secretary of the Interior's standards for professional archaeologists, historians, and ethnographers; all staff responsible for preparation of this PSA/DEIS also meet the Secretary of the Interior's professional standards. Staff's proposed conditions of certification (see "Conclusions and Recommendations"), drafted in coordination with the DOE, further comport with federal preservation objectives. Therefore, if HECA implements these conditions, its actions would accord with the cultural resources management priorities of the federal government.

Kern County's General Plan and the Western Rosedale Specific Plan have language promoting the general county-wide preservation of cultural resources, CEQA compliance for discretionary projects, and notification of Native Americans about discretionary projects of concern to them. Additionally, the Interstate 5 at Highway 58 Rural Community Plan and Oglesby Specific Plan contain requirements for developers to stop work for not less than 72 hours in the event of inadvertent archaeological discoveries during construction, to facilitate assessment of the discovery and mitigation of impacts. (City of Bakersfield 2007; Kern County Department of Planning and Development Services 1986:30; Kern County Planning Department 1994:II-13, II-14; Kern County Planning Department 2009:66–67; Rickett, Ward and Delmarter 1985:14, 15.) Staff's proposed conditions of certification here will require specific actions not just to promote but to effect historic preservation and mitigate impacts to all cultural resources in order to ensure CEQA compliance. Consequently, if HECA implements these conditions, its actions would be consistent with the cultural resources-related goals of Kern County.

DEPARTMENT OF ENERGY (DOE) FINDINGS REGARDING DIRECT AND INDIRECT IMPACTS OF THE NO-ACTION ALTERNATIVE

Under the No-Action Alternative, DOE would not provide financial assistance to the applicant for the HECA Project. The applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative. Accordingly, the No-Action Alternative would have no impacts associated with this resource area.

RESPONSE TO COMMENTS

Staff has not received any comments on cultural resources from the public. Staff has identified several comment letters from other agencies where some mention is made of cultural resources. Of these, only the NAHC and SHPO provided specific comments on staff's efforts to assess the proposed project's effects on cultural resources. The NAHC indicated to staff that the NAHC's Sacred Lands File does not contain record of Native American cultural resources in the project vicinity (see ”Energy Commission Native American Consultation”, earlier in this document). During the course of DOE's ongoing Section 106 (of the NHPA) consultation, the SHPO commented on DOE's preliminary definition of the APE and acknowledged that DOE had initiated consultation with the SHPO (see discussion under “Consultation with Others”, earlier in this document). The federal Environmental Protection Agency summarized the DOE's consultation responsibilities with Indian tribes and the SHPO in a letter dated July 26, 2012 (Vitulano 2012:9–10). The DOE's consultations with Indian tribes and the SHPO are documented in the subsections, “Department of Energy Consultations” and “Consultation with Others”.

CONCLUSIONS AND RECOMMENDATIONS

This cultural resources analysis is presently unable to definitively conclude that the proposed project would have no significant impact on known, CRHR/NRHP-eligible archaeological, ethnographic, or built-environment resources. URS (2012a) provides recommendations for mitigation in their archaeological reconnaissance report. Some of these measures include:

- Hiring a qualified professional archaeologist who will be responsible for the implementation of mitigation measures;
- Site avoidance as a post-certification mitigation strategy;
- Testing as a post-certification mitigation strategy;
- Conducting data recovery if a resource cannot be avoided;

- Having a qualified archaeologist monitor all ground-disturbing project activities and train project personnel on-site regarding the importance of archaeological resources and the legal basis for their protection;
- Having archaeological monitors keep daily field logs, with photographs as appropriate;
- Giving archaeological monitors the authority to halt construction in the vicinity of a discovery;
- Having a qualified archaeologist examine and recommend whether a discovery is potentially significant [CRHR-eligible];
- Submitting written monthly reports on monitoring to the Energy Commission; and
- Notifying the Kern County Coroner, the Energy Commission, and the project owner if human remains are discovered, and notifying the NAHC if the coroner determines the remains are Native American.

UNRESOLVED AREAS RELATING TO CULTURAL RESOURCES

Staff believes the HECA and related OEHI components would result in direct and indirect impacts to NRHP/CRHR-eligible cultural resources. However, staff requires additional information about cultural resources in order to complete its analysis. Without this information, staff cannot make a determination whether project impacts to sensitive cultural resources would be reduced to less than significant levels.

Staff will continue to work with the applicant, OEHI, and the DOE to resolve all outstanding information needs prior to the FSA/FEIS. Additional conditions of certification or modifications to currently proposed conditions of certification are likely to be necessary based on further consultation with agency personnel and information provided by the applicant. In summary, staff requires the following information in order to prepare and complete a FSA/FEIS:

- For the EOR components: all of the information required for cultural resources in the Energy Commission Siting Regulations, Appendix B (20 Cal. Code Regs., §1704(b)(2), App. B).
- Complete pedestrian survey results for all of HECA's linear alignments.
- Results of test excavations and evaluations of CRHR/NRHP eligibility for all archaeological sites that staff has identified as having the potential to be directly impacted by HECA or OEHI.
- Results of geoarchaeological field sampling.

These four categories of information need are discussed in detail below. In addition to these considerable data gaps, staff also needs to determine the function of the unidentified canal on MR 8, Adohr/Palms Farm.

Cultural Resources Data for Enhanced Oil Recovery Components

OEHI personnel informed staff in January 2013 that their environmental consultant, Stantec Corporation, completed a cultural resources inventory and report on the EOR components of the proposed project. Staff has yet to receive the cultural resources inventory report and records search materials, however. From conversations with OEHI, staff understands that the records search materials fill at least one paper-ream box, indicating that there is much information to review in concert with the inventory report. In order to have adequate time to review the cultural resources inventory report and records search materials—and meet the presiding committee's scheduling order—staff requests that the applicant provide this documentation to staff 8 weeks prior to the filing date for the FSA/FEIS. Assuming that the inventory report and records search materials adequately answer outstanding data requests concerning cultural resources in the proposed EOR components, staff would be able to incorporate the new information into and analyze it in the FSA/FEIS by the current filing date of July 15, 2013. Outstanding data requests concerning cultural resources in the proposed EOR components include A141–146, A189, and A190.

Complete Pedestrian Survey Results for Project Linears

The applicant has not completed pedestrian cultural resource survey of the proposed HECA linears outside of the EOR components. Specifically, portions of the proposed natural gas pipeline/railroad spur alignment and buffer area surrounding the controlled area have not been surveyed for cultural resources. Staff addressed the issue of survey completion along the proposed project linears and buffer areas in Data Requests A139–A140. Staff requires survey of these areas and adequate reporting on the surveys to incorporate into its analysis in the FSA/FEIS. In order to review the resulting survey report(s) and supplement its analysis within timeframe specified in the presiding committee's scheduling order, staff requests that the applicant provide the report to staff 6 weeks prior to the filing date for the FSA/FEIS. Assuming that the inventory report(s) are adequate to staff's information needs, staff would be able to incorporate the new information into and analyze it in the FSA/FEIS by the current filing date of July 15, 2013.

Significance Evaluations of Identified Archaeological Resources

Staff has identified 13 archaeological resources in the PAA/APE that require significance evaluations in order for staff to analyze the proposed project's impacts on cultural resources. Staff has reviewed the applicant's *Responses to CEC Data Requests – Set Three (45-Day Extension)* (January 16, 2013) to Data Requests A192–A194 (November 2, 2012) for the proposed project. Data Request A192 asked the applicant to prepare a subsurface testing plan for archaeological resources that the project would not avoid. Data Requests A193 and A194 ask for the approved plan to be implemented and for a report of the results to be submitted for review and approval. Staff differs with the applicant over whether the subject archaeological resources can be avoided through project modifications and has reiterated the need for the applicant to provide the information requested in Data Requests A192–A194. Without significance evaluations of these 13 archaeological resources, staff is unable to determine whether they constitute historical resources, unique archaeological resources, or historic properties, as defined in CEQA and Section 106 of the NHPA. In order to complete its cultural resources analysis in the FSA/FEIS by the current filing date of July 15, 2013, staff requests that the applicant satisfy all of the stipulations contained in Data Requests A192–A194 no later than 6 weeks prior to the scheduled FSA/FEIS filing date. Accordingly, the applicant is advised to submit the archaeological research design no later than 8 weeks prior to July 15 for staff review and approval. The archaeological resources subject to Data Requests A192–A194 are:

- KRM-IF-006/P-15-89
- BS-IF-003/P-15-2485
- P-15-7176/P-15-6725
- P-15-171
- P-15-179/KRM-IF-003/KRM-IF-004/KRM-IF-005
- P-15-3108
- HECA-2008-1
- HECA-2009-2
- HECA-2009-9
- HECA-2009-10
- HECA-2010-1
- HECA-2010-2[44]
- BS-IF-004

Geoarchaeological Investigation

The proposed project is located predominantly on landforms that have been subject to the accumulation of sediments[45] over the last 12,000 years, a context that increases the likelihood that older land surfaces are buried under the current ground surface and that archaeological resources were left and preserved on now-buried landforms. Assessing the potential for a proposed project to encounter and damage buried archaeological resources in depositional environments is an important component of cultural resources impact analysis, which in turn determines the character of a project's mitigation and monitoring program. The applicant completed an initial assessment of buried archaeological resources sensitivity for the proposed project as well as a research design for collecting and analyzing the data that staff needs to determine the proposed project's likelihood of damaging buried archaeological resources. Staff is presently reviewing the latter document. Once staff approves the research design, the applicant is responsible to implement it, excavating trenches to document, describe, and interpret subsurface geologic and soil conditions in the project area; taking and submitting samples for radiocarbon dating and other analyses; and reporting on their methods and conclusions. In order to have adequate time to review the resulting geoarchaeological report and supplement its analysis by the July 15, 2013 filing date, staff requests that the applicant provide the report to staff 6 weeks prior to the filing date for the FSA/FEIS.

[44] See Data Requests A69–A71.

[45] Earth scientists and archaeologists often refer to such contexts as "depositional landforms" or "depositional environments".

PROPOSED CONDITIONS OF CERTIFICATION

Staff has not received all of the information necessary to design mitigation measures for the proposed project. What staff presents here is a series of standard measures that would mitigate some, but not all, of the potential impacts of the project to cultural resources. Although staff concurs with many of the applicant's suggested mitigation measures, staff has added additional recommendations or expanded upon the applicant's suggestions to ensure that all impacts to cultural resources are mitigated to below the level of significance. The applicant's suggested mitigation measures and staff's additional recommendations are incorporated into the proposed Conditions **CUL-1** through **CUL-8**, below, intended to provide for the contingency of discovering archaeological resources during HECA construction and related activities. Staff's proposed **CUL-1** requires a Cultural Resources Specialist (CRS) to be retained and available during HECA construction-related excavations to evaluate any discovered buried resources and, if necessary, to conduct data recovery as mitigation for the project's unavoidable impacts on them. **CUL-2** requires the project owner to provide the CRS with all relevant cultural resources information and maps. **CUL-3** requires the CRS to write and submit to the Energy Commission compliance project manager (CPM) a Cultural Resources Mitigation and Monitoring Plan (CRMMP). **CUL-4** requires the CRS to write and submit to the CPM a final report on all HECA cultural resources monitoring and mitigation activities. **CUL-5** requires the project owner to train workers to recognize cultural resources and instruct them to halt construction if cultural resources are discovered. **CUL-6** prescribes the monitoring, by an archaeologist and, possibly, by a Native American, intended to identify buried archaeological deposits. **CUL-7** requires the project owner to halt ground-disturbing activities in the area of an archaeological discovery and to fund data recovery, if the discovery is evaluated as NRHP/CRHR-eligible. **CUL-8** would cover the possibility that the proposed project would need to make use of a soil borrow site that had not been surveyed for cultural resources in the past five years.

Additional conditions of certification will be developed when all of the required cultural resources information is received.

Staff would likely recommend a suite of mitigation measures similar to the conditions presented below for the proposed EOR components of HECA. Staff believes, however, that it is premature to formally make such recommendations, as very little information was available to staff concerning cultural resources in the EOR portion of the PAA/APE. Upon receipt of the cultural resources inventory report and supporting documentation for the proposed EOR facilities, staff will analyze the potential project impacts and present conclusions and proposed mitigation measures in the FSA/FEIS.

PROPOSED CONDITIONS OF CERTIFICATION

CUL-1 Prior to the start of ground disturbance (as defined in the General Conditions section); post-certification cultural resources activities (including but not limited to "survey", "in-field data recording," "surface collection," "testing," "data recovery" or "geoarchaeology"); surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the site and for access roads and linear facilities, the project owner shall obtain the services of a Cultural Resources Specialist (CRS) and one or more alternate CRS. The project owner shall submit the resumes and qualifications for the CRS, CRS alternates, and all technical specialists to the CPM for review and approval.

The CRS shall manage all cultural resources monitoring, mitigation, curation, and reporting activities, and any post-certification cultural resources activities (as defined in the previous paragraph), unless management of these is otherwise provided for in accordance with the cultural resources conditions of certification (Conditions). The CRS shall serve as the primary point of contact on all cultural resources matters for the Energy Commission. The CRS may elect to obtain the services of Cultural Resources Monitors (CRMs), Native American Monitors (NAMs), and other technical specialists, if needed, to assist in monitoring, mitigation, and curation activities. The project owner shall ensure that the CRS makes recommendations regarding the eligibility for listing in the NRHP/CRHR of any cultural resources that are newly discovered or that may be affected in an unanticipated manner.

No construction-related ground disturbance or grading, boring, and trenching, as defined in the General Conditions for this project; post-certification cultural resources activities (as defined in the first paragraph of this condition); surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the site, access roads, and linear facilities, shall occur prior to CPM approval of the CRS and alternates, unless such activities are specifically approved by the CPM.

Approval of a CRS may be denied or revoked for reasons including but not limited to non-compliance on this or other Energy Commission projects and for concurrent service as CRS on an unmanageable number of Energy Commission projects, as determined by the CPM. After all ground disturbance is completed and the CRS has fulfilled all responsibilities specified in these cultural resources conditions, the project owner may discharge the CRS, after receiving approval from the CPM.

If, during operation of the proposed power plant, circumstances develop that would require ground disturbance in soils or sediments previously undisturbed during project construction, no surface grading or subsurface soil work shall occur prior to submission of a Petition to Modify and CPM review and approval of project-specific protocol for addressing unanticipated discoveries, consistent with the approved CRMMP.

CULTURAL RESOURCES SPECIALIST

The resumes for the CRS and alternate CRS(s) shall include information demonstrating to the satisfaction of the CPM that their training and backgrounds conform to the U.S. Secretary of the Interior’s Professional Qualifications Standards, as published in 36 C.F.R., part 61. In addition, the CRS and alternate CRS(s) shall have the following qualifications:

1. Qualifications appropriate to the needs of the project, including a background in anthropology, archaeology, history, architectural history, or a related field;

2. At least 10 years of archaeological or historical experience (as appropriate considering the nature of predominant cultural resources on the project site), with resources mitigation and fieldwork;

3. At least one year of field experience in California; and

4. At least three years of experience in a decision-making capacity on cultural resources projects in California and the appropriate training and experience to knowledgably make recommendations regarding the significance of cultural resources. The resumes of the CRS and alternate CRS shall include the names and telephone numbers of contacts familiar with the work of the CRS/alternate CRS on referenced projects and demonstrate to the satisfaction of the CPM that the CRS/alternate CRS has the appropriate training and experience to implement effectively the Conditions.

CULTURAL RESOURCES MONITORS

CRMs shall have the following qualifications:

1. B.S. or B.A. degree in anthropology, archaeology, historical archaeology, or a related field; and one year of archaeological field experience in California; or

2. A.S. or A.A. degree in anthropology, archaeology, historical archaeology, or a related field, and four years of archaeological field experience in California; or

3. Enrollment in upper division classes pursuing a degree in the fields of anthropology, archaeology, historical archaeology, or a related field, and two years of archaeological field experience in California.

NATIVE AMERICAN MONITORS

The project owner shall ensure that the CRS obtains the services of qualified NAMs. Preference in selecting NAMs shall be given to Native Americans with:

1. traditional ties to the area that shall be monitored, and

2. the highest qualifications as described by the Native American Heritage Commission (NAHC) document entitled: *Guidelines for Monitors/Consultants Native American Cultural, Religious, and Burial Sites* (NAHC 2005).

CULTURAL RESOURCES TECHNICAL SPECIALISTS

The resume(s) of any additional technical specialist(s), e.g., geoarchaeologist, historical archaeologist, historian, architectural historian, and/or physical anthropologist, shall be submitted to the CPM for approval.

The resume of each proposed specialist shall demonstrate that their training and background meet the U.S. Secretary of Interior's Professional Qualifications Standards for their specialty (if appropriate), as published in 36 C.F.R., part 61, and show the completion of appropriate graduate-level coursework. The resumes of specialists shall include the names and telephone numbers of contacts familiar with the work of these persons on projects referenced in the resumes and demonstrate to the satisfaction of the CPM that these persons have the appropriate training and experience to undertake the required research. The project owner may name and hire any specialist prior to certification. All specialists are under the supervision of the CRS.

Verification:

1. At least 45 days prior to the start of construction-related ground disturbance, the project owner shall submit the resume for the CRS and alternate CRS(s) (if proposed), to the CPM for review and approval.

2. At least 10 days prior to a termination or release of the CRS, or within 10 days after the resignation of a CRS, the project owner shall submit the resume of the proposed new CRS to the CPM for review and approval. At the same time, the project owner shall also provide to the proposed new CRS the same documents given to the previous CRS, plus all cultural resources documents, field notes, photographs, and other cultural resources materials generated during the compliance phase of the project to that date. If there is no alternate CRS in place to conduct the duties of the CRS, a previously approved CRM may serve in place of a CRS so that construction-related ground disturbance may continue up to a maximum of three days without a CRS. If cultural resources are discovered, construction-related ground disturbance will remain halted until there is a CRS or alternate CRS to make a recommendation regarding significance.

3. At least 20 days prior to construction-related ground disturbance, the CRS shall provide a letter naming anticipated CRMs, NAMs, and additional specialists, for the project. The letter shall state that the identified monitors and specialists meet the minimum qualifications for cultural resources monitoring and resource management required by this Condition.

4. If efforts to obtain the services of a qualified NAM are unsuccessful, the project owner shall inform the CPM of this situation in writing at least 30 days prior to the beginning of post-certification cultural resources field work or construction related ground disturbance.

5. At least 5 days prior to additional CRMs or NAMs beginning on-site duties during the project, the CRS shall provide for the CRS's review and approval additional letters to the CPM identifying the monitors and attesting to their qualifications.

6. At least 10 days prior to any technical specialists beginning tasks, the resume(s) of the specialists shall be provided to the CPM for review and approval.

7. At least 10 days prior to the start of construction-related ground disturbance, the project owner shall confirm in writing to the CPM that the approved CRS will be available for onsite work and is prepared to implement the cultural resources conditions.

CUL-2 Prior to the start of construction-related ground disturbance or grading, boring, and trenching, as defined in the General Conditions for this project; or surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the project site, access roads, and linear facilities, if the CRS has not previously worked on the project, the project owner shall provide the CRS with copies of the AFC, data responses, confidential cultural resources reports, all supplements, the Energy Commission staff's cultural resources FSA/FEIS, and the cultural resources conditions of certification from the Final Decision for the project. The project owner shall also provide the CRS and the CPM with maps and drawings showing the footprints of the power plant, all linear facility routes, all access roads, and all laydown areas. Maps shall include the appropriate USGS quadrangles and a map at an appropriate scale (e.g., 1:24,000 and 1 inch = 200 feet, respectively) for plotting cultural features or materials. If the CRS requests enlargements or strip maps for linear facility routes, the project owner shall provide copies to the CRS and CPM. The CPM shall review map submittals and, in consultation with the CRS, approve those that are appropriate for use in cultural resources planning activities. No ground disturbance shall occur prior to CPM approval of maps and drawings, unless such activities are specifically approved by the CPM.

Maps shall include the NRHP/CRHR-eligible historic built environment resources identified in the FSA/FEIS. Maps shall indicate how horizontal directional drilling crossings under the California Aqueduct comply with the best practices set forth in CDWR California Encroachment Permit Guidelines, June 2005.

If construction of the project would proceed in phases, maps and drawings not previously provided shall be provided to the CRS and CPM prior to the start of each phase. Written notice identifying the proposed schedule of each project phase shall be provided to the CRS and CPM.

Weekly, until ground disturbance is completed, the project construction manager shall provide to the CRS and CPM a schedule of project activities for the following week, including the identification of area(s) where ground disturbance will occur during that week.

The project owner shall notify the CRS and CPM of any changes to the scheduling of the construction phases.

Verification:

1. At least 40 days prior to the start of ground disturbance, the project owner shall provide the CPM notice that the AFC, data responses, confidential cultural resources documents, all supplements, FSA/FEIS, and Final Commission Decision have been provided to the CRS, if needed, and the subject maps and drawings to the CRS and CPM. The CPM will review submittals in consultation with the CRS and approve maps and drawings suitable for cultural resources planning activities.

2. At least 15 days prior to the start of ground disturbance, if there are changes to any project-related footprint, the project owner shall provide revised maps and drawings for the changes to the CRS and CPM.

3. At least 15 days prior to the start of each phase of a phased project, the project owner shall submit the appropriate maps and drawings, if not previously provided, to the CRS and CPM.

4. Weekly, during ground disturbance, a schedule of the next week's anticipated project activity shall be provided to the CRS and CPM by letter, e-mail, or fax.

5. Monthly, during ground disturbance, email progress report to the CPM, interested Native Americans and other interested parties.

6. Within 5 days of changing the scheduling of phases of a phased project, the project owner shall provide written notice of the changes to the CRS and CPM.

CUL-3 Prior to the start of construction-related ground disturbance or grading, boring, and trenching, as defined in the General Conditions for this project; or surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the project site, access roads, and linear facilities, the project owner shall submit the Cultural Resources Mitigation and Monitoring Plan (CRMMP), as prepared by or under the direction of the CRS, to the CPM for review and approval. The CRMMP shall follow the content and organization of the draft model CRMMP, provided by the CPM, and the authors' name(s) shall appear on the title page of the CRMMP. The CRMMP shall identify measures to minimize potential impacts to sensitive cultural resources. Implementation of the CRMMP shall be the responsibility of the CRS and the project owner. Copies of the CRMMP shall reside with the CRS, alternate CRS, each CRM, and the project owner's on-site construction manager. No ground disturbance shall occur prior to CPM approval of the CRMMP, unless such activities are specifically approved by the CPM. The CRMMP shall be designated as a confidential document if the location(s) of cultural resources are described or mapped.

The CRMMP shall include, but not be limited to, the following elements and measures:

1. The following statement included in the Introduction: “Any discussion, summary, or paraphrasing of the conditions of certification in this CRMMP is intended as general guidance and as an aid to the user in understanding the conditions and their implementation. The Conditions, as written in the Commission Decision, shall supersede any summarization, description, or interpretation of the conditions in the CRMMP. The Cultural Resources conditions of certification from the Commission Decision are contained in Appendix A.”

2. A proposed general research design that includes a discussion of archaeological research questions and testable hypotheses specifically applicable to the project area, and a discussion of artifact collection, retention/disposal, and curation policies as related to the research questions formulated in the research design. The research design shall specify that the preferred treatment strategy for any buried archaeological deposits is avoidance. A specific mitigation plan shall be prepared for any unavoidable impacts to any CRHR/NRHP-eligible (as determined by the CPM) resources. A prescriptive treatment plan may be included in the CRMMP for limited data types.

3. Specification of the implementation sequence and the estimated time frames needed to accomplish all project-related tasks during the ground-disturbance and post-ground–disturbance analysis phases of the project.

4. Identification of the person(s) expected to perform each of the tasks, their responsibilities, and the reporting relationships between project construction management and the mitigation and monitoring team.

5. A description of the manner in which Native American observers or monitors will be included, the procedures to be used to select them, and their role and responsibilities.

6. A description of all impact-avoidance measures (such as flagging or fencing) to prohibit or otherwise restrict access to sensitive resource areas that are to be avoided during ground disturbance, construction, and/or operation, and identification of areas where these measures are to be implemented. The description shall address how these measures would be implemented prior to the start of ground disturbance and how long they would be needed to protect the resources from project-related effects.

7. A statement that all encountered cultural resources over 50 years old shall be recorded on DPR 523 forms and mapped and photographed. In addition, all archaeological materials retained as a result of the archaeological investigations (survey, testing, data recovery) shall be curated in accordance with the California State Historical Resources Commission’s (SHRC) *Guidelines for the Curation of Archaeological*

Collections (SHRC 1993), into a retrievable storage collection in a public repository or museum.

8. A statement that the project owner will pay all curation fees for artifacts recovered and for related documentation produced during cultural resources investigations conducted for the project. The project owner shall identify three possible curation facilities that could accept cultural resources materials resulting from project activities.

9. A statement demonstrating when and how the project owner will comply with Health and Human Safety Code, section 7050.5(b) and Public Resources Code, section 5097.98(b) and (e), including the statement that the project owner will notify the CPM and the NAHC of the discovery of human remains.

10. A statement that the CRS has access to equipment and supplies necessary for site mapping, photography, and recovery of any cultural resource materials that are encountered during ground disturbance and cannot be treated prescriptively.

11. A description of the contents, format, and review and approval process of the final Cultural Resource Report (CRR), which shall be prepared according to *Archaeological Resource Management Report* (ARMR) guidelines.

<u>Verification:</u>

1. Upon approval of the CRS proposed by the project owner, the CPM will provide to the project owner an electronic copy of the draft model CRMMP for the CRS.

2. At least 30 days prior to the start of ground disturbance, the project owner shall submit the CRMMP to the CPM for review and approval.

3. At least 30 days prior to the start of ground disturbance, in a letter to the CPM, the project owner shall agree to pay curation fees for any materials generated or collected as a result of the archaeological investigations (survey, testing, and data recovery).

4. Within 90 days after completion of ground disturbance (including landscaping), if cultural materials requiring curation were generated or collected, the project owner shall provide to the CPM a copy of an agreement with, or other written commitment from, a curation facility that meets the standards stated in SHRC (1993), to accept the cultural materials from this project. Any agreements concerning curation will be retained and available for audit for the life of the project.

CUL-4 The project owner shall submit the final CRR to the CPM for approval. The final CRR shall be written by, or under the direction of, the CRS and shall be provided in the ARMR format. The final CRR shall report on all field activities including dates, times and locations, results, samplings, and analyses. The final CRR shall be a confidential document if it describes or maps the location(s) of cultural resources. All survey reports, DPR 523 forms, data recovery reports, and any additional research reports not previously submitted to the CHRIS and the SHPO shall be included as appendices to the final CRR.

If the project owner requests a suspension of ground disturbance and/or construction activities, then a draft CRR that covers all cultural resources activities associated with the project shall be prepared by the CRS and submitted to the CPM for review and approval on the same day as the suspension/extension request. The draft CRR shall be retained at the project site in a secure facility until ground disturbance and/or construction resumes or the project is withdrawn. If the project is withdrawn, then a final CRR shall be submitted to the CPM for review and approval at the same time as the withdrawal request.

Verification:

1. Within 30 days after requesting a suspension of construction activities, the project owner shall submit a draft CRR to the CPM for review and approval.

2. Within 90 days after completion of ground disturbance (including landscaping), the project owner shall submit the final CRR to the CPM for review and approval. If any reports have previously been sent to the CHRIS, then receipt letters from the CHRIS or other verification of receipt shall be included in an appendix.

3. Within 10 days after CPM approval of the CRR, the project owner shall provide documentation to the CPM confirming that copies of the final CRR have been provided to the SHPO, the CHRIS, the curating institution, if archaeological materials were collected, and to the tribal chairpersons of any Native American groups requesting copies of project-related reports.

CUL-5 Prior to and for the duration of construction-related ground disturbance or grading, boring, and trenching, as defined in the General Conditions for this project; or surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the project site, access roads, and linear facilities, the project owner shall provide Worker Environmental Awareness Program (WEAP) training to all new workers within their first week of employment at the project site, along the linear facilities routes, and at laydown areas, roads, and other ancillary areas. The cultural resources part of this training shall be prepared by the CRS, may be conducted by any member of the archaeological team, and may be presented in the form of a video. The CRS is encouraged to include a Native American presenter in the training to contribute the Native American perspective on archaeological and ethnographic resources. During the training and during construction, the CRS shall be available (by telephone or in person) to answer questions posed by employees. The training may be discontinued when ground disturbance is completed or suspended, but must be resumed when ground disturbance, such as landscaping, resumes.

The training shall include:

1. A discussion of applicable laws and penalties under law;

2. Samples or visuals of artifacts that might be found in the project vicinity;

3. A discussion of what such artifacts may look like when partially buried, or wholly buried and then freshly exposed;

4. A discussion of what prehistoric and historical archaeological deposits look like at the surface and when exposed during construction, and the range of variation in the appearance of such deposits;

5. Instruction that the CRS, alternate CRS, and CRMs have the authority to halt ground disturbance in the area of a discovery to an extent sufficient to ensure that the resource is protected from further impacts, as determined by the CRS;

6. Instruction that employees, if the CRS, alternate CRS, or CRMs are not present, are to halt work on their own in the vicinity of a potential cultural resources discovery, and shall contact their supervisor and the CRS or CRM, and that redirection of work would be determined by the construction supervisor and the CRS;

7. An informational brochure that identifies reporting procedures in the event of a discovery;

8. An acknowledgement form signed by each worker indicating that they have received the training; and

9. A sticker that shall be placed on hard hats indicating that environmental training has been completed.

No ground disturbance shall occur prior to implementation of the WEAP program, unless such activities are specifically approved by the CPM.

Verification:

1. At least 30 days prior to the beginning of ground disturbance, the CRS shall provide the cultural resources WEAP training program draft text, including Native American participation, and graphics and the informational brochure to the CPM for review and approval.

2. At least 15 days prior to the beginning of ground disturbance, the CPM will provide to the project owner a WEAP Training Acknowledgement form for each WEAP-trained worker to sign.

3. Monthly, until ground disturbance is completed, the project owner shall provide in the Monthly Compliance Report (MCR) the WEAP Training Acknowledgement forms of workers who have completed the training in the prior month and a running total of all persons who have completed training to date.

CUL-6 Prior to the start of construction-related ground disturbance or grading, boring, and trenching, as defined in the General Conditions for this project; or surface grading or subsurface soil work during pre-construction activities or site mobilization; or mowing activities and heavy equipment use in loose or sandy soils, at the project site, access roads, and linear facilities, the project owner shall notify the CPM and all interested Native Americans of the date on which ground disturbance will ensue. The project owner shall ensure that the CRS, alternate CRS, or CRMs monitor full time all of the above specified ground disturbance at the project site, along the linear facilities routes, and at laydown areas, roads, and other ancillary areas, to ensure there are no impacts to undiscovered cultural resources and to ensure that known cultural resources are not affected in an unanticipated manner.

Full-time archaeological monitoring for this project shall be the archaeological monitoring of the ground-disturbing activities specified in the previous paragraph, for as long as the activities are ongoing. Where excavation equipment is actively removing dirt and hauling the excavated material farther than 50 feet from the location of active excavation, full-time archaeological monitoring shall require at least two monitors per excavation area. In this circumstance, one monitor shall observe the location of active excavation and a second monitor shall inspect the dumped material. For excavation areas where the excavated material is dumped no farther than 50 feet from the location of active excavation, one monitor shall both observe the location of active excavation and inspect the dumped material.

In the event that the CRS believes that the required number of monitors is not appropriate in certain locations, a letter or e-mail detailing the justification for changing the number of monitors shall be provided to the CPM for review and approval prior to any change in the number of monitors.

The project owner shall obtain the services of one or more NAMs to monitor construction-related ground disturbance in areas where Native American artifacts may be discovered. Contact lists of interested Native Americans and guidelines for monitoring shall be obtained from the NAHC. Preference in selecting an NAM shall be given to Native Americans with traditional ties to the area that shall be monitored. If efforts to obtain the services of a qualified NAM are unsuccessful, the project owner shall immediately inform the CPM. The CPM will either identify potential monitors or will allow construction-related ground disturbance to proceed without an NAM.

The research design in the CRMMP shall govern the collection, treatment, retention/disposal, and curation of any archaeological materials encountered. On forms provided by the CPM, CRMs shall keep a daily log of any monitoring and other cultural resources activities and any instances of non-compliance with the Conditions and/or applicable LORS. The daily monitoring logs shall at a minimum include the following:

- First and last name of the CRM and any accompanying NAM.
- Time in and out.
- Weather. Specify if weather conditions led to work stoppages.

- Work location (project component). Provide specifics—.e.g., transmission ROW, solar unit A, power block.
- Proximity to site location. Specify if work conducted within 1000 feet of a known cultural resource.
- Work type (machine).
- Work crew (company, operator, foreman).
- Depth of excavation.
- Description of work.
- Stratigraphy.
- Artifacts, listed with the following identifying features:
  - Field artifact #: When recording artifacts in the daily monitoring logs, the CRS shall institute a field numbering system to reduce the likelihood of repeat artifact numbers. A typical numbering system could include a project abbreviation, monitor's initials, and a set of numbers given to that monitor: e.g., HECA-MB-123.
  - Description.
  - Measurements.
  - UTM.
- Whether artifacts are likely to be isolates or components of larger resources.
- Assessment of significance of any finds.
- Actions taken.
- Plan for the next work day.

A cover sheet shall be submitted with each day's monitoring logs, and shall at a minimum include the following:

- Count and list of first and last names of all CRMs and of all NAMs for that day.
- General description (in paragraph form) of that day's overall monitoring efforts, including monitor names and locations.
- Any reasons for halting work that day.
- Count and list of all artifacts found that day: include artifact #, location (i.e., grading in Unit X), measurements, UTMs, and very brief description (i.e., historic can, granitic biface, quartzite flake).
- Whether any artifacts were found out of context (i.e., in fill, caisson drilling, flood debris, spoils pile).

Copies of the daily monitoring logs and cover sheets shall be provided by email from the CRS to the CPM, as follows:

- Each day’s monitoring logs and cover sheet shall be merged into one PDF document
- The PDF title and headings, and emails shall clearly indicate the date of the applicable monitoring logs.
- PDFs for any revised or resubmitted versions shall use the word “revised” in the title.

Daily and/or weekly maps shall be submitted along with the monitoring logs as follows:

- The CRS shall provide daily and/or weekly maps of artifacts at the request of the CPM. A map shall also be provided if artifact locations show complexity, high density, or other unique considerations.
- Maps shall include labeled artifacts, project boundaries, previously recorded sites and isolates, aerial imagery background, and appropriate scales.

From the daily monitoring logs, the CRS shall compile a monthly monitoring summary report to be included in the MCR. If there are no monitoring activities, the summary report shall specify why monitoring has been suspended.

- The Cultural Resources section of the MCR shall be prepared in coordination with the CRS, and shall include a monthly summary report of cultural resources-related monitoring. The summary shall:
  - List the number of CRMs and NAMs on a daily basis, as well as provide monthly monitoring-day totals.
  - Give an overview of cultural resource monitoring work for that month, and discuss any issues that arose.
  - Describe fulfillment of requirements of each cultural mitigation measure.
  - Summarize the confidential appendix to the MCR, without disclosing any specific confidential details.
  - Include the artifact concordance table (as discussed under the next bullet point), but with removal of UTMs.
- Each MCR, prepared under supervision of the CRS, shall be accompanied by a confidential appendix that contains completed DPR 523A forms for all artifacts recorded or collected in that month. For any artifact without a corresponding DPR form, the CRS shall specify why the DPR form is not applicable or pending (i.e. as part of a larger site update).
  - A concordance table that matches field artifact numbers with the artifact numbers used in the DPR forms shall be included. The sortable table shall contain each artifact’s date of collection and UTM numbers, and note if an artifact has been deaccessioned or otherwise does not

have a corresponding DPR form. Any post-field log recordation changes to artifact numbers shall also be noted.

- DPR forms shall be submitted as one combined PDF.
  - The PDF shall organize DPR forms by site and/or artifact number.
  - The PDF shall include an index and bookmarks.
- If artifacts from a given site location (in close proximity of each other or an existing site) are collected month after month, and if agreed upon with the CPM, a final updated DPR for the site may be submitted at the completion of monitoring. The monthly concordance table shall note that the DPR form for the included artifacts is pending.

The CRS or alternate CRS shall report daily to the CPM on the status of the project's cultural resources-related activities, unless reducing or ending daily reporting is requested by the CRS and approved by the CPM.

In the event that the CRS believes that the current level of monitoring is not appropriate in certain locations, a letter or e-mail detailing the justification for changing the level of monitoring shall be provided to the CPM for review and approval prior to any change in the level of monitoring.

The CRS, at his or her discretion, or at the request of the CPM, may informally discuss cultural resources monitoring and mitigation activities with Energy Commission technical staff.

Cultural resources monitoring activities are the responsibility of the CRS. Any interference with monitoring activities, removal of a monitor from duties assigned by the CRS, or direction to a monitor to relocate monitoring activities by anyone other than the CRS shall be considered non-compliance with these Conditions.

Upon becoming aware of any incidents of non-compliance with the Conditions and/or applicable LORS, the CRS and/or the project owner shall notify the CPM. The CRS shall also recommend corrective action to resolve the problem or achieve compliance with the Conditions. When the issue is resolved, the CRS shall write a report describing the issue, the resolution of the issue, and the effectiveness of the resolution measures. This report shall be provided in the next MCR for the review of the CPM.

Verification:

1. At least 30 days prior to the start of ground disturbance, the CPM will notify all Native Americans with whom Energy Commission staff communicated during the project review of the date on which the project's ground disturbance will begin.
2. At least 30 days prior to the start of ground disturbance, the CPM will provide to the CRS an electronic copy of a form to be used as a daily monitoring log and information to be included in the cover sheet for the daily monitoring logs.
3. While monitoring is on-going, the project owner shall submit each day's monitoring logs and cover sheet merged into one PDF document by email within 24 hours.

4. The CRS and/or project owner shall notify the CPM of any incidents of non-compliance with the Conditions and/or applicable LORS by telephone or email within 24 hours
5. The CRS shall provide daily maps of artifacts along with the daily monitoring logs if more than 10 artifacts are found per day, or as requested by the CPM.
6. The CRS shall provide weekly maps of artifacts if there more than 50 artifacts are found per week, or as requested by the CPM. The map shall be submitted within two business days after the end of each week.
7. Within 15 days of receiving from a local Native American group a request that a NAM be employed, the project owner shall submit a copy of the request and a copy of a response letter to the group notifying them that a NAM has been employed and identifying the NAM.
8. Monthly, while monitoring is on-going, the project owner shall submit MCRs and accompanying monthly summary reports. The project owner shall attach any new DPR 523A forms, under confidential cover, completed for finds treated prescriptively, as specified in the CRMMP.
    a. Final updated DPRs with sites (where artifacts are collected month after month) can be submitted at the completion of monitoring, as agreed upon with the CPM.
9. At least 24 hours prior to implementing a proposed change in monitoring level, the project owner shall submit to the CPM, for review and approval, a letter or e-mail (or some other form of communication acceptable to the CPM) detailing the CRS's justification for changing the monitoring level.
10. At least 24 hours prior to reducing or ending daily reporting, the project owner shall submit to the CPM, for review and approval, a letter or e-mail (or some other form of communication acceptable to the CPM) detailing the CRS's justification for reducing or ending daily reporting.
11. Within 15 days of receiving them, the project owner shall submit to the CPM copies of any comments or information provided by Native Americans in response to the project owner's transmittals of information.

CUL-7 The project owner shall grant authority to halt ground disturbance to the CRS, alternate CRS, and the CRMs in the event of a discovery. Redirection of ground disturbance shall be accomplished under the direction of the construction supervisor in consultation with the CRS.

In the event that a cultural resource over 50 years of age is found (or if younger, determined exceptionally significant by the CPM), or impacts to such a resource can be anticipated, ground disturbance shall be halted or redirected in the immediate vicinity of the discovery sufficient to ensure that the resource is protected from further impacts. If the discovery includes human remains, the project owner shall comply with the requirements of Health and Human Safety Code, section 7050.5(b) and notify the CPM and the NAHC of the discovery of human remains. No action with respect to the disposition of human remains of Native American origin shall be initiated without direction from the CPM. Monitoring, including Native American monitoring, and daily reporting, as provided in other conditions, shall continue during the project's ground-disturbing activities elsewhere, while the halting or redirection of ground disturbance in the vicinity of the discovery shall remain in effect until the CRS has visited the discovery, and all of the following have occurred:

1. The CRS has notified the project owner, and the CPM has been notified within 24 hours of the discovery, or by Monday morning if the cultural resources discovery occurs between 8:00 AM on Friday and 8:00 AM on Sunday morning, and provided a description of the discovery (or changes in character or attributes), the action taken (i.e., work stoppage or redirection), a recommendation of CRHR/NRHP eligibility, and recommendations for data recovery from any cultural resources discoveries, whether or not a determination of CRHR/NRHP eligibility has been made.
2. If the discovery would be of interest to Native Americans, the CRS has notified all Native American groups that expressed a desire to be notified in the event of such a discovery.
3. The CRS has completed field notes, measurements, and photography for a DPR 523 "Primary Record" form. Unless the find can be treated prescriptively, as specified in the CRMMP, the "Description" entry of the DPR 523 "Primary Record" form shall include a recommendation on the CRHR/NRHP eligibility of the discovery. The project owner shall submit completed forms to the CPM.
4. The CRS, the project owner, and the CPM have conferred, and the CPM has concurred with the recommended eligibility of the discovery and approved the CRS's proposed data recovery, if any, including the curation of the artifacts, or other appropriate mitigation; and any necessary data recovery and mitigation have been completed.

Ground disturbance may resume only with the approval of the CPM.

<u>Verification:</u>

1. At least 30 days prior to the start of ground disturbance, the project owner shall provide the CPM and CRS with a letter confirming that the CRS, alternate CRS, and CRMs have the authority to halt ground disturbance in the vicinity of a cultural resources discovery, and that the project owner shall ensure that the CRS notifies the CPM within 24 hours of a discovery, or by Monday morning if the cultural resources discovery occurs between 8:00 AM on Friday and 8:00 AM on Sunday morning.
2. Unless the discovery can be treated prescriptively, as specified in the CRMMP, completed DPR 523 forms for resources newly discovered during ground disturbance shall be submitted to the CPM for review and approval no later than 24 hours following the notification of the CPM, or 48 hours following the completion of data recordation/recovery, whichever the CRS decides is more appropriate for the subject cultural resource.
3. Within 48 hours of the discovery of a resource of interest to Native Americans, the project owner shall ensure that the CRS notifies all Native American groups that

expressed a desire to be notified in the event of such a discovery, and the CRS must inform the CPM when the notifications are complete.

4. No later than 30 days following the discovery of any Native American cultural materials, the project owner shall submit to the CPM copies of the information transmittal letters sent to the chairpersons of the Native American tribes or groups who requested the information. Additionally, the project owner shall submit to the CPM copies of letters of transmittal for all subsequent responses to Native American requests for notification, consultation, and reports and records.
5. Within 15 days of receiving them, the project owner shall submit to the CPM copies of any comments or information provided by Native Americans in response to the project owner's transmittals of information.

CUL-8 If fill soils must be acquired from a non-commercial borrow site or disposed of to a non-commercial disposal site, unless less-than-five-year-old surveys of these sites for archaeological resources are provided to and approved by the CPM, the CRS shall survey the borrow or disposal site(s) for cultural resources and record on DPR 523 forms any that are identified. When the survey is completed, the CRS shall convey the results and recommendations for further action to the project owner and the CPM, who will determine what, if any, further action is required. If the CPM determines that significant archaeological resources that cannot be avoided are present at the borrow site, the project owner must either select another borrow or disposal site or implement **CUL-7** prior to any use of the site. The CRS shall report on the methods and results of these surveys in the final CRR.

<u>**Verification:**</u>

1. As soon as the project owner knows that a non-commercial borrow site and/or disposal site will be used, he/she shall notify the CRS and CPM and provide documentation of previous archaeological survey, if any, dating within the past five years, for CPM approval.
2. In the absence of documentation of recent archaeological survey, at least 30 days prior to any soil borrow or disposal activities on the non-commercial borrow and/or disposal sites, the CRS shall survey the site(s) for archaeological resources. The CRS shall notify the project owner and the CPM of the results of the cultural resources survey, with recommendations, if any, for further action.

CULTURAL RESOURCES ACRONYM GLOSSARY

ac	acre(s)
ACHP	Advisory Council on Historic Preservation
ADA	Americans with Disabilities Act
AFC	Application for Certification
amsl	above mean sea level
ARMR	Archaeological Resource Management Report
APE	area of potential effects
APN	Assessor parcel number
B.P.	Before present (A.D. 1950)
BVWSD	Buena Vista Water Storage District
CA	California
Caltrans	California Department of Transportation
CB	Construction Battalion
CCC	Civilian Conservation Corps
CCD	Census County Division
CCS	Cryptocrystalline silicate (rock)
CDP	Census Designated Place
CDWR	California Department of Water Resources
CEC	California Energy Commission
CEQ	Council on Environmental Quality
CEQA	California Environmental Quality Act
C.F.R.	Code of Federal Regulations
CHRIS	California Historical Resources Information System

Conditions	Conditions of Certification
CO_2	carbon dioxide
CPM	Compliance Project Manager
CRHR	California Register of Historical Resources
CRM	Cultural Resources Monitor
CRMP	Cultural Resources Management Plan
CRMMP	Cultural Resources Monitoring and Mitigation Plan
CRR	Cultural Resource Report
CRS	Cultural Resources Specialist
CSUB	California State University, Bakersfield
DOE	Department of Energy (United States)
DPR 523	Department of Parks and Recreation cultural resources recordation form
E	east
EHOF	Elk Hills Oil Field
EHPP	Elk Hills Power Project
EO	Executive Order
EOR	enhanced oil recovery
FCR	fire-cracked rock
FSA/FEIS	Final Staff Assessment/Final Environmental Impact Statement
ft	foot, feet
GLO	General Land Office
GPS	global positioning system
HDD	horizontal directional drilling
HECA	Hydrogen Energy California
I-5	Interstate 5

KE	Kern [county]
KER	Kern [county]
KIN	Kings [county]
KVWC	Kern Valley Water Company
KVWCC	Kern Valley Water Company Canal

U.S. DEPARTMENT OF ENERGY

May 10, 2012

Ms. Kathy Morgan, Chairperson
Tejon Indian Tribe
2234 – 4th Street
Wasco, CA 93280

SUBJECT: Proposed Hydrogen Energy California Project in Kern County, California

Dear Ms. Morgan:

The purpose of this letter is to inform you of the proposed Hydrogen Energy California Project (HECA or the Project) in Kern County, California that is under consideration for approval and potential future funding by the U.S. Department of Energy (DOE). HECA is proposed by Hydrogen Energy California LLC. The Project is part of DOE's Clean Coal Power Initiative, a cost-shared collaboration between the federal government and private industry to increase investment in low-emission coal technology by demonstrating advanced coal-based power generation technologies at commercial scale. DOE has determined that the Project is a federal undertaking as defined in 36 Code of Federal Regulations § 800.16(y). The HECA is supported in part by DOE with a $408 million grant in a cost-shared arrangement. Total project costs are estimated to be approximately $4 billion. In compliance with Section 106 of the *National Historic Preservation Act of 1966* (NHPA), DOE would like to initiate informal government-to-government consultation with the Tejon Indian Tribe.

The Project consists of an Integrated Gasification Combined Cycle power facility, with an integrated manufacturing complex, which will produce low-carbon nitrogen-based products, such as fertilizer. The Project will utilize a blend of coal and petroleum coke as a feedstock in order to produce hydrogen-rich syngas fuel through a gasification process. This fuel will be used in a combustion turbine to produce a nominal 300 megawatts (MW) of electricity, and in the manufacturing complex to produce low-carbon nitrogen-based products such as fertilizers. The production of electricity, low-carbon nitrogen-based products, and carbon dioxide (CO_2) for enhanced oil recovery (EOR) enables the operational flexibility to meet market demand. Because it produces several products, HECA is sometimes referred to as a "polygeneration" project.

The electricity and other products produced by the Project will have a smaller carbon footprint than similar products produced from traditional fossil fuel sources. This is accomplished primarily by capturing approximately 90 percent of the CO_2 from the gasification process. Captured CO_2 will be transported (via a pipeline) for use in EOR, which results in sequestration of the CO_2 in secure geologic formations, at the nearby Elk Hills Oil Field (EHOF). EHOF is owned and operated by Occidental of Elk Hills, Inc. (OEHI) which will obtain necessary permits for the EOR operations.

The 453-acre Project site is located approximately 7-miles west of the outermost edge of the city of Bakersfield and 1.5-miles northwest of the unincorporated community of Tupman in western Kern County, California. The majority of the Project site is presently used for agricultural purposes, including

3610 Collins Ferry Road, P.O. Box 880, Morgantown, WV 26507
fred.pozzuto@netl.doe.gov • Voice (304) 285-5219 • Fax (304) 285-4403 • www.netl.doe.gov

cultivation of cotton, alfalfa, and onions. Temporary construction activities, including equipment storage, construction laydown, parking and offices, will be located on the Project site and within an adjacent 91-acre construction laydown area.

The Project also includes the following off-site facilities:

- Rail Spur – A new rail spur will be constructed to the Project site in order to facilitate feedstock and equipment delivery, as well as product and by-product off-take. The rail spur will extend approximately 4.6-miles from the existing San Joaquin Valley Railroad to the Project site.
- Electrical Transmission Line – An electrical transmission line will interconnect the Project to a future Pacific Gas & Electric (PG&E) switching station to the east of the Project site (adjacent to the existing Midway-Wheeler Ridge transmission lines). The electrical transmission line is approximately 3.5-miles long, of which 1.5-miles will be located within the Project site.
- Natural Gas Supply Line – A natural gas interconnection will be made with an existing PG&E natural gas pipeline that is located north of the Project site. The natural gas pipeline is approximately 11.1-miles in length.
- Water Supply Pipelines – The Project will utilize brackish groundwater supplied from the Buena Vista Water Storage District located northwest of the Project site. The raw water supply pipeline will be approximately 14.4-miles in length. Potable water for construction, drinking, and sanitary use will be delivered from a new West Kern Water District potable water production site approximately 1.3-miles east of the Project site.
- CO_2 Pipeline – The CO_2 pipeline will transfer the CO_2 captured during gasification from the Project site south to the EHOF for EOR and sequestration (storage). The CO_2 pipeline is approximately 3.4-miles in length.

As indicated above, DOE wishes to initiate informal consultation with the Tejon Indian Tribe in compliance with Section 106 of the NHPA. For your additional information, for the purposes of initiating informal consultation with the California Office of Historic Preservation on the delineation of the area of potential effects (APE), DOE is defining the APE for archaeological resources as all areas where ground-disturbing activities will occur in relation to the Project. More specifically, 200-feet from the Project site and Construction Laydown Area, and 50-feet from the right of way of all Project linears. The APE for historic architecture is defined as 0.5-miles around the Project site and 0.5-miles from the electric transmission and rail spur right of ways to account for potential indirect effects. Attached are copies of the proposed APEs for both archaeological and historic architectural resources.[1] The APEs for archaeological and historic architectural resources are consistent with the requirements of the California Energy Commission (CEC), which has exclusive authority for licensing thermal power plants in California with a generating capacity of 50-MW or more.

DOE's Section 106 consultation under the NHPA for the undertaking with the California State Historic Preservation Office is to further seek concurrence on the delineation of APEs for both archaeological

[1] Note that the identified APEs may be over-inclusive in the sense that they include the sites of the EOR to be undertaken by OEHI, which is not a recipient of federal funding in connection with its EOR activities.

and historic architectural resources. A joint CEC/DOE environmental impact statement (EIS) is currently being prepared for the project, and the draft version will be made available to you at a later date where you may again respond to any specific concerns you may have. DOE will include correspondence with your office in an appendix to the EIS. HECA's full application to the CEC can also be viewed at:
http://www.energy.ca.gov/sitingcases/hydrogen_energy/documents/index.html#applicant

For any overall environmental project questions please contact me at 304-285-5219. Should you have any technical questions please contact the Office of National Environmental Policy Act (NEPA) contractor, Mr. Dale Shileikis at 415-243-3708, or by email @ dale.shileikis@urs.com.

Sincerely,

Fred Pozzuto
Environmental Manager / NEPA Compliance Officer

Re: Proposed Hydrogen Energy California Project in Kern County, California

Dear Fred Pozzuto,

Thank you for the letter and the opportunity to comment on this project. Tejon Indian Tribe has no conflict with this project nor do we know of any cultural resources that might be impacted at this site. However, we ask that you notify us immediately if any site/s and / or artifacts are discovered during your project in the area.

Sincerely,

Kathryn Montes Morgan

Cultural Resources

Appendix CUL-2: Department of Energy's Correspondence with the State Historic Preservation Officer

April 24, 2013

Ms. Carol Roland-Nawi
State Historic Preservation Officer
California State Department of Parks and Recreation
P.O. Box 942896
Sacramento, CA 94296-0001

Dear Ms. Roland-Nawi:

The purpose of this letter is to provide supplemental information on the Hydrogen Energy California (HECA) Project in Kern County, California, and to seek concurrence on the delineation of the Area of Potential Effects (APE) for both archaeological and historic architectural resources in compliance with Section 106 of the National Historic Preservation Act of 1966 (NHPA).

On May 8, 2012, U.S. Department of Energy (DOE) transmitted a letter to your predecessor, Milford W. Donaldson, initiating Section 106 consultation under the NHPA. In addition, DOE sought concurrence from your office for the HECA Project's proposed APE for both archaeological and historic architectural resources. On May 25, 2012, Ms. Jenan Saunders, on behalf of Mr. Donaldson, indicated by reply letter that the State Historic Preservation Officer was unable to concur on the delineation of the proposed APE, citing a lack of sufficient information. This letter is intended to provide the required information

Background on the HECA Project

The HECA Project proposed by Hydrogen Energy California LLC consists of an Integrated Gasification Combined-Cycle (IGCC) project, with an Integrated Manufacturing Complex that will produce low-carbon nitrogen-based fertilizer. The HECA Project will gasify a 75 percent coal and 25 percent petroleum coke fuel blend to produce synthesis gas. Syngas produced via gasification will be purified to hydrogen-rich fuel, which will be used to generate low-carbon baseload electricity in a Combined-Cycle Power Block, low-carbon nitrogen-based fertilizers in an integrated manufacturing complex, and carbon dioxide (CO_2) for use in enhanced oil recovery (EOR).

The electricity and other products produced by the HECA Project will have a smaller carbon footprint than similar products produced from traditional fossil fuel sources through a conventional combustion process. This is accomplished primarily by capturing approximately 90 percent of the CO_2 from the gasification process. Captured CO_2 will be transported (via a pipeline) for use in EOR, which results in the sequestration of the CO_2 in secure geologic formations, at the nearby Elk Hills Oil Field (EHOF). EHOF is majority owned and operated by Occidental of Elk Hills, Inc. (OEHI), which will obtain necessary permits for the EOR operations.

The DOE is providing financial assistance to the HECA Project under the Clean Coal Power Initiative Round 3 via a cost-sharing agreement with HECA LLC, covering project construction and a "Demonstration Period" for the first 2 years of project operations. DOE financial assistance for the construction and operation of the HECA Project during the Demonstration Period constitutes the DOE undertaking for purposes of Section 106 of the NHPA. OEHI's EOR facility discussed above is a necessary component of the Demonstration Period; therefore, it is also subject to compliance with Section 106.

The HECA Project requires certification from the California Energy Commission (CEC). The DOE and CEC will prepare a joint Environmental Impact Statement/Staff Assessment to satisfy the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act.

Description of the Federal Undertaking

The 453-acre HECA Project Site is approximately 7 miles west of the outermost edge of the city of Bakersfield and 2 miles northwest of the unincorporated community of Tupman in western Kern County. The HECA Project Site is currently used for farming, including cultivation of cotton, alfalfa, and onions.

The majority of the excavations (approximately 90 percent) required for construction of the HECA IGCC polygeneration facility are expected to be in the range of 5 to 10 feet below existing grade. Excavation in areas such as the gasification structure, the cooling tower pump basin, and the feedstock unloading bunker will be in the range of 15 to 50 feet below existing grade. Shallow soil-bearing foundations will be used for the majority, if not all, of the foundations. Pile foundations may be used in selected high-load applications, with piles extending approximately 40 feet below existing ground elevations. Temporary construction activities, including equipment storage, offices, construction laydown, parking and offices, will be located on the HECA Project Site and within an adjacent 91-acre Construction Laydown Area. A fence will be constructed around the HECA Project Site and adjacent agricultural lands that will also be purchased by HECA.

The HECA Project also includes the following offsite components:

- Rail Spur – A new rail spur will be constructed to the HECA Project Site to facilitate feedstock and equipment delivery, as well as product and by-product off-take. The rail spur will extend approximately 5.3 miles from the existing San Joaquin Valley Railroad to the HECA Project Site. The excavation for the rail spur will be between 6 inches and 3 feet, with an average depth of less than 2 feet. The exception being where the rail spur is proposed to cross the East Side Canal.

- Electrical Transmission Line – An electrical transmission line will interconnect the HECA Project to a future Pacific Gas and Electric Company (PG&E) switching station to the east of the HECA Project Site (adjacent to the existing Midway–Wheeler Ridge transmission lines). The electrical transmission line is approximately 3.6 miles long, of which 1.5 miles will be located within the HECA Project Site. The foundations of tangent towers (straight line towers) will be approximately 28 feet in depth. The foundations of turning towers will be approximately 35 feet in depth.

- PG&E Switching Station – A new 230-kilovolt (kV) switching station will be constructed, allowing the Midway–Wheeler Ridge 230-kV Lines No. 1 and 2 to loop into and out of the switching station, and providing interconnection positions for the HECA generator tie line. The electric transmission switching station will be designed, constructed, owned, and operated by PG&E. The area for the switching station is approximately 4 acres in size. The maximum excavation depth is expected to be 9 feet. It is anticipated that dead-end structures would be required on the western and eastern ends of the station to terminate the transmission line from the HECA Project Site, incoming lines from the Midway Substation, and outgoing lines to the Wheeler Ridge Substation.

- Natural Gas Supply – A natural gas interconnection will be made with an existing PG&E natural gas pipeline north of the HECA Project Site. The natural gas pipeline is approximately 13 miles in length. The excavation for the natural gas pipeline is expected to be approximately 7 feet. At the interconnection, a metering station will be constructed. The metering station will be up to 100 feet by 100 feet, and will be surrounded by a chain link fence. The metering station will be excavated to approximately 6 feet.

- Water Supply Pipelines – The Project will use brackish groundwater supplied from the Buena Vista Water Storage District, northwest of the HECA Project Site. The raw water supply pipeline will be approximately 15 miles in length. The process water line will be in a trench expected to be up to 5 feet in depth, with the trench being excavated in the road atop the levee adjacent to the West Side Canal. Potable water for construction, drinking, and sanitary use will be delivered from a new West Kern Water District potable water production site approximately 1 mile east of the HECA Project Site. The potable water pipeline will be placed in a trench excavated to a depth of 6 feet.

The OEHI Project will include construction and operation of the following three primary EOR components during the Demonstration Period:

- CO_2 Pipeline – The CO_2 pipeline will transfer the CO_2 captured during gasification from the plant at the HECA Project Site south to the EHOF for EOR and resulting simultaneous sequestration (storage). The CO_2 pipeline is approximately 3.4 miles in length. Most of this pipeline will be installed in a trench excavated to an average depth of approximately 7 feet. Some sections will require the use of horizontal directional drilling (HDD) to avoid interference with water conveyance features, including the California Aqueduct and the West Side Canal. The depth of these HDD crossings is expected to be 50 to 100 feet below current ground surface elevations.

- CO_2 EOR Processing Facility – The CO_2 EOR processing facility will permanently occupy approximately 61 acres in the EHOF. Up to 50 feet of excavation may be required in some areas for grading associated with the CO_2 EOR processing facility. The maximum depth of excavation for associated equipment foundations is expected to be approximately 6 feet below grade.

- Satellite Gathering Stations – Three Satellite Gathering Stations (satellites) will provide primary separation of the oil/water and gas from the production well stream during the Demonstration Period. The satellites will use existing pipelines as well as existing producing and injection wells. New pipelines may also be installed in certain locations, however no detailed design information is available at this time. Each Satellite Gathering Station is expected to be 230 by 200 feet. The maximum depth of excavation for the Satellite Gathering Stations is expected to be 10 feet.

Proposed Area of Potential Effects

For purposes of the Section 106 consultation, DOE proposes to define the APE for archaeological resources as all areas where ground-disturbing activities will occur in relation to the HECA and OEHI Projects. More specifically, the APE includes all Project components as well as all areas within 200 feet from Project facilities and 50 feet from the construction right-of-way of all Project linears (i.e., process/potable water, natural gas, electrical transmission, rail spur, and carbon dioxide). DOE proposes to define the APE for historic "built environment" resources as inclusive of the footprint of all HECA and OEHI Project components and an additional 0.5 mile around all aboveground Project components.

The APEs for archaeological and historic architectural resources defined above, in particular the inclusion of buffer areas, are consistent with the requirements of the CEC, which has exclusive authority for licensing thermal power plants in California with a generating capacity of 50 megawatts or more.

Table 1 lists the Project components and the areas used to establish both the vertical and lateral extent of the APEs.

Attached are figures depicting the proposed APEs for both archaeological and historic architectural resources.

Cultural Resource Inventory Results to Date

As of the date of this letter, several efforts to inventory cultural resources within the APEs proposed for the HECA and OEHI Project components have been conducted. Table 2 provides the archaeological resources currently identified within the HECA Project components and their physical relationship to the proposed APE as defined for archaeological resources. The applicant's intent is to avoid all identified archaeological resources. DOE is actively working with CEC and the Applicant to develop appropriate avoidance measures.

Table 1
APE by Project Component

Project Component	Maximum Depth of Disturbance (feet)	Approximate Acres/ Length	Archaeological Buffer per CEC Guidelines (feet)	Historic Architecture per CEC Guidelines Buffer (miles)
HECA IGCC Polygeneration Facility	**50**	**453 acres**	**200**	**0.5**
Rail Spur	**3**	**5.3 miles**	**50**	**0.5**
Electrical Transmission Line	**35**	**2.1 miles**	**50**	**0.5**
PG&E Switching Station	**9**	**4 acres**	**200**	**0.5**
Natural Gas Supply	**7**	**13 miles**	**50**	**0 (none required)**
Process Water Pipeline	**5**	**15 miles**	**50**	**0 (none required)**
Potable Water Pipeline	**6**	**1 mile**	**50**	**0 (none required)**
CO_2 Pipeline	**7 (trenching) 50 to 100 (HDD)**	**3.4 miles**	**50**	**0 (none required)**
CO_2 EOR Processing Facility	**50**	**61 acres**	**200**	**0.5**
Three Satellite Gathering Stations	**10**	**1 acre each**	**50**	**0.5**

Note: Per CEC Guidelines, below ground installations do not require a buffer area to be added to the Historic Architecture APE.

Cultural resources inventory efforts conducted to date have also included surveys for historic architectural resources. Table 3 lists the historic architectural resources currently identified within the HECA Project components and their relationship to the APE as defined for historic architectural resources. Two of the identified historic architectural resources have been found eligible for inclusion to the National Register of Historic Places and/or California Register of Historical Resources. However, neither of these resources will be affected by Project implementation.

Cultural resources inventory efforts within the APE as defined for the OEHI Project components are on-going and the results of these investigations along with those completed for the HECA Project will be forwarded to you when a formal finding of effects has been developed.

Table 2
Archaeological Resources Currently Identified Within the Proposed APE

Primary # (P-15) or Temporary Designation	Site Type	Prehistoric/ Historic	Associated Project Component	NRHP/ CRHR Status	Within APE per CEC Guidelines	Within Close Proximity to APE
89	Lithic and Trash Scatter with Human Remains	Prehistoric/ Historic	Process Water Pipeline	Not Evaluated	No	Yes
171	Burial Mound	Prehistoric	Process Water Pipeline	Not Evaluated	Yes	No
179	Burial Mound	Prehistoric	Process Water Pipeline	Not Evaluated	No	Yes
2485 and BS-IF-003	Lithic Scatter	Prehistoric	Process Water Pipeline	Not Evaluated	No	Yes
3108	Lithic Scatter	Prehistoric	Natural Gas Pipeline and Rail Spur	Not Evaluated	Yes	No
HECA-2008-1	Lithic and Shell Scatter	Prehistoric	Process Water Pipeline	Not Evaluated	Yes	No
HECA-2009-2	Lithic Scatter	Prehistoric	CO_2 Pipeline	Not Evaluated	Yes	No
HECA-2009-9	Lithic Scatter	Prehistoric	Process Water, Well Field	Not Evaluated	Yes	No
HECA-2009-10	Lithic Scatter	Prehistoric	Process Water, Well Field	Not Evaluated	Yes	No
HECA-2010-1	Lithic Scatter	Prehistoric	Electrical Transmission/ Switching Station	Not Evaluated	Yes	No
HECA-2010-2	Foundation and Trash Scatter	Historic	Natural Gas Pipeline and Rail Spur	Not Evaluated	Yes	No

Notes:
APE = Area of Potential Effects
CO_2 = Carbon Dioxide
CRHR = California Register of Historical Resources
HECA = Hydrogen Energy California
NRHP = National Register of Historic Places

Table 3
Historic Architectural Resources Currently Identified Within the Proposed APE

Address or Resource Name	Year Built	Associated Project Component	NRHP/CRHR Status
Relocated Structures North of SR 58	Unknown, moved to site after 1973	Natural Gas Pipeline and Rail Spur	Ineligible
Southern Pacific McKittrick (Asphalto) Branch	1893	Natural Gas Pipeline and Rail Spur	Ineligible
Pacific Gas & Electric/Southern California Edison Transmission Lines & Towers	ca. 1943-53 ca. 1956-68 ca. 1968-73	Natural Gas Pipeline and Rail Spur	Ineligible
6010 Buerkle Road	1964	Natural Gas Pipeline and Rail Spur	Ineligible
35034 Stockdale Highway	ca. 1940s	Natural Gas Pipeline and Rail Spur	Ineligible
Works Projects Administration Culverts	1940	Project Site, Natural Gas Pipeline, and Rail Spur	Ineligible
7307 Adohr Road (Adohr Farms)	1930	Project Site, Natural Gas Pipeline, and Rail Spur	Ineligible
7307 Adohr Road (Palm Farms)	1953	Project Site, Natural Gas Pipeline, and Rail Spur	Ineligible
7345 Adohr Road	1930	Project Site, Natural Gas Pipeline, and Rail Spur	Ineligible
Old Headquarters Weir	1911	Project Site and Process Water Pipeline	Eligible
California Aqueduct	1961-72	Project Site and CO_2 Pipeline	Eligible
6122 Tule Park Road	1941	Project Site and Electrical Transmission/ Switching Station	Ineligible
Tupman Water Plant	ca. 1935, 1974-81	Electrical Transmission/Switching Station	Ineligible
Canals	1876-1918	Various	Ineligible

Notes:

APE = Area of Potential Effects
CO_2 = Carbon Dioxide
CRHR = California Register of Historical Resources
HECA = Hydrogen Energy California
NRHP = National Register of Historic Places

As discussed at the beginning of this correspondence, DOE is providing supplemental information on the proposed federal undertaking and is requesting your concurrence on the delineation of the respective APEs for both archaeological and historic architectural resources. DOE looks forward to working with you as part of the Federal Section 106 consultation process. For overall environmental project questions, please contact me at (304) 285-5219 or by email at fred.pozzuto@netl.doe.gov. Should you have technical questions, please contact the NEPA contractor, Mr. Dale Shileikis at (415) 243-3826, or by email at dale.shileikis@urs.

Sincerely,

Fred Pozzuto
Environmental Manager/
NEPA Compliance Officer

Subject: Proposed Hydrogen Energy California Project in Kern County, California

Dear Mr. Donaldson:

The purpose of this letter is to inform you of the proposed Hydrogen Energy California Project (HECA or the Project) in Kern County, California; to initiate Section 106 consultation under the *National Historic Preservation Act of 1966* (NHPA); and to seek concurrence and input on the delineation of Area of Potential Effects (APE) for both archaeological and historic architectural resources (*See Attached Area Map and Area of Potential Effects Map*).

HECA is proposed by Hydrogen Energy California LLC. The Project is part of U.S. Department of Energy's (DOE) Clean Coal Power Initiative, a cost-shared collaboration between the federal government and private industry to increase investment in low-emission coal technology by demonstrating advanced coal-based power generation technologies at commercial scale. The HECA is supported in part by DOE with a $408 million grant in a cost-shared arrangement. Total project costs are estimated to be approximately $4 billion. DOE has determined that the proposed Project is a federal undertaking as defined in 36 Code of Federal Regulations § 800.16(y).

The Project consists of an Integrated Gasification Combined Cycle power facility, with an integrated manufacturing complex which will produce low-carbon nitrogen-based products, such as fertilizer. The Project will utilize a blend of coal and petroleum coke as a feedstock in order to produce hydrogen-rich syngas fuel through a gasification process. This fuel will be used in a combustion turbine to produce a nominal 300 megawatts (MW) of electricity and allow the manufacture of low-carbon nitrogen-based products such as fertilizers. The production of electricity, low-carbon nitrogen-based products, and carbon dioxide (CO_2) for enhanced oil recovery (EOR) enables the operational flexibilities to meet market demands. Because it produces several products, HECA is sometimes referred to as a "polygeneration" project.

The electricity and other products produced by the Project will have a smaller carbon footprint than similar products produced from traditional fossil fuel sources through a conventional combustion process. This is accomplished primarily by capturing approximately 90 percent of the CO_2 from the gasification process. Captured CO_2 will be transported (via a pipeline) for use in EOR, which results in sequestration of the CO_2 in secure geologic formations, at the nearby Elk Hills Oil Field (EHOF). EHOF is owned and operated by Occidental of Elk Hills, Inc. (OEHI), which will obtain necessary permits for the EOR operations.

3610 Collins Ferry Road, P.O. Box 880, Morgantown, WV 26507
fred.pozzuto@netl.doe.gov • Voice (304) 285-5219 • Fax (304) 285-4403 • www.netl.doe.gov

The 453-acre Project site is located approximately 7-miles west of the outermost edge of the city of Bakersfield and 1.5-miles northwest of the unincorporated community of Tupman in western Kern County, California. The majority of the Project site has been repetitively tilled and is presently used for agricultural purposes, including cultivation of cotton, alfalfa, and onions. Temporary construction activities, including equipment storage, construction laydown, parking and offices, will be located on the Project site and within an adjacent 91-acre Construction Laydown Area.

The Project also includes the following off-site facilities:

- Rail Spur – A new rail spur will be constructed to the Project site in order to facilitate feedstock and equipment delivery, as well as product and by-product off-take. The rail spur will extend approximately 4.6-miles from the existing San Joaquin Valley Railroad to the Project site.
- Electrical Transmission Line – An electrical transmission line will interconnect the Project to a future Pacific Gas & Electric (PG&E) switching station to the east of the Project site (adjacent to the existing Midway-Wheeler Ridge transmission lines). The electrical transmission line is approximately 3.5-miles long, of which 1.5-miles will be located within the Project site.
- Natural Gas Supply Line – A natural gas interconnection will be made with an existing PG&E natural gas pipeline that is located north of the Project site. The natural gas pipeline is approximately 11.1-miles in length.
- Water Supply Pipelines – The Project will utilize brackish groundwater supplied from the Buena Vista Water Storage District located northwest of the Project site. The raw water supply pipeline will be approximately 14.4-miles in length. Potable water for construction, drinking, and sanitary use will be delivered from a new West Kern Water District potable water production site approximately 1.3-miles east of the Project site.
- CO_2 Pipeline – The CO_2 pipeline will transfer the CO_2 captured during gasification from the Project site (plant) south to the EHOF for EOR and sequestration (storage). The CO_2 pipeline is approximately 3.4-miles in length.

For the purposes of initiating informal consultation with the Office of Historic Preservation on the delineation of the APE, DOE is defining the APE for archaeological resources as all areas where ground-disturbing activities will occur in relation to the Project. More specifically, 200-feet from the Project site and Construction Laydown Area, and 50-feet from the right of way of all Project linears. The APE for historic architecture is defined as 0.5-miles around the Project site and 0.5-miles from the electric transmission and rail spur right of ways to account for potential indirect effects. Attached are copies of the proposed APEs for both archaeological and historic architectural resources.[1] The APEs for archaeological and historic architectural resources are consistent with the requirements of the California Energy Commission (CEC), which has exclusive authority for licensing thermal power plants in California with a generating capacity of 50-MW or more.

[1] Note that the identified APEs may be over-inclusive in the sense that they include the sites of the EOR to be undertaken by OEHI, which is not a recipient of federal funding in connection with its EOR activities.

DOE seeks to initiate informal Section 106 consultation under the NHPA for the undertaking and seek concurrence on the delineation of APEs for both archaeological and historic architectural resources. A joint CEC/DOE environmental impact statement (EIS) is currently being prepared for the project, and the draft version will be made available to you at a later date where you may again respond to any specific concerns you may have. DOE will include correspondence with your office in an appendix to the EIS. HECA's full application to the CEC can also be viewed at: http://www.energy.ca.gov/sitingcases/hydrogen_energy/documents/index.html#applicant

For any overall environmental project questions please contact me at 304-285-5219. Should you have any technical questions please contact the Office of National Environmental Policy Act (NEPA) contractor, Mr. Dale Shileikis at 415-243-3708, or by email @ dale.shileikis@urs.com.

Sincerely,

Fred Pozzuto
Environmental Manager / NEPA Compliance Officer

Re: Section 106 Consultation for Hydrogen Energy California Project, Kern County, CA

Dear Mr. Pozzuto:

Thank you for initiating consultation regarding the Department of Energy's (DOE) efforts to comply with Section 106 of the National Historic Preservation Act of 1966 (16 U.S.C. 470f), as amended, and its implementing regulation found at 36 CFR Part 800.

The DOE is proposing to construct an Integrated Gasification Combined Cycle power facility in Kern County and are requesting my concurrence and comments with their Area of Potential Effect determination for historic architecture and archeology. Due to a lack of sufficient information I am presently unable to concur with these determinations. I look forward to reviewing additional information on this undertaking as it becomes available.

Thank you for seeking my comments and considering historic properties as part of your project planning. I look forward to continuing this consultation with the DOE. If you have any questions or concerns, please contact Ed Carroll of my staff at (916) 445-7006 or ecarroll@parks.ca.gov.

Sincerely,

Jenan Saunders
(for) Milford Wayne Donaldson, FAIA
State Historic Preservation Officer

HAZARDOUS MATERIALS MANAGEMENT

Alvin Greenberg, Ph.D.

SUMMARY OF CONCLUSIONS

Staff's evaluation of the proposed Hydrogen Energy California (HECA) project, along with staff's proposed mitigation measures, indicates that hazardous materials use at the site would not present a significant impact to the public if all the applicant's mitigation measures are implemented and if staff's proposed conditions are adopted and implemented. Also, with adoption of the proposed conditions of certification, the proposed project would comply with all applicable laws, ordinances, regulations, and standards.

The proposed HECA project is a complex industrial facility similar in scope to a small refinery. The proposed project is a complex chemical processing facility that includes many different types of reactor vessels, storage vessels, treatment units, piping, valves, and flanges as well as transfer and transport facilities which would, if considered separately, each constitute a stand-alone industrial plant. The project proposes to use, store, create, and transport large volumes of several highly toxic hazardous materials. Furthermore, in addition to the actual facilities owned and operated by Hydrogen Energy California, this Preliminary Staff Assessment/Draft Environmental Impact Statement (PSA/DEIS) also includes an environmental review of the high-pressure CO_2 pipeline and enhanced oil recovery and carbon sequestration facility to be owned and operated by Occidental of Elk Hills, Inc.

The different processes and large volumes of hazardous materials that staff has assessed in this PSA/DEIS include the following:

1. A coal/pet coke gasification plant
2. An air separation unit producing cryogenic materials
3. A syngas scrubber, sour shift, low-temperature gas cooling, sour water treatment facility
4. A mercury removal unit
5. An acid gas removal (Rectisol process) unit
6. An ammonia synthesis unit
7. A urea unit
8. A urea pastillation unit
9. A urea pastille handling and transfer unit
10. A urea ammonium nitrate complex that produces nitric acid, ammonium nitrate, and urea
11. A sulfur recovery unit
12. A 13-mile natural gas pipeline
13. A 3-mile pressurized CO_2 pipeline
14. An Enhanced Oil Recovery Facility

15. Additional storage of large volumes of hazardous materials including:
    a. sodium hydroxide
    b. sodium hypochlorite
    c. diesel fuel
    d. gasoline during construction

The presence of these chemical processes -- specifically the larger gasification unit and sulfur recovery unit will process large quantities of hazardous materials in closed tanks and piping at elevated temperature and pressure – could potentially pose significant risks if not managed properly. Staff has not encountered such a complex power generation facility in the history of the Energy Commission. In order to properly review the hazardous materials proposed for use at this project, as well as those hazardous materials that will be produced by the project, staff spent considerable time evaluating the entire process and even visited a similar gasification facility in Polk County, Florida. As a result of staff's efforts to understand the process and the risks involved, staff determined that all of these processes must be managed and monitored carefully, regardless of quantities or the fact that hazardous materials present are below the federal or state thresholds that would trigger this increased level of management if stored.

Therefore, staff is proposing that the project owner be required to develop a Process Safety Management Plan (PSM Plan) which includes a Hazard and Operability analysis to address several different processes, a Risk Management Plan (RMP) which would include several new Offsite Consequence Analyses, and a Spill Prevention Control and Countermeasures (SPCC) Plan for many of the 15 processes identified by staff above. Although these plans and analyses are not necessary for staff to understand and assess the project's impacts under CEQA, staff believes that these plans will identify potential system failures before failure can occur and indicate/implement mitigation to reduce the risk of on-site and off-site consequences to less than significant. This does not mean that staff believes that this project will be 100% free of upsets or accidental releases of hazardous materials. Rather, staff believes that establishing and implementing a strict code of process safety management above and beyond the requirements of existing regulations and implementing engineering and administrative controls to prevent accidents -- followed by quick and effective spill containment, control, and cleanup should an accidental release occur -- will reduce both the chance and severity of an impact to a less than significant level.

As discussed in the **Socioeconomic Resources** section, the minority population in the six-mile buffer of the project site constitutes an environmental justice population as defined by *Environmental Justice: Guidance Under the National Environmental Policy Act*. Staff has not identified any significant adverse direct or Cumulative **Hazardous Materials Management** impacts resulting from the construction or operation of the proposed project, including impacts to the environment justice population. Therefore, there are no **Hazardous Materials Management** environmental justice issues related to this project and no environmental justice populations would be significantly, adversely, or disproportionately impacted.

INTRODUCTION

The purpose of this hazardous materials management analysis is to determine if the proposed Hydrogen Energy California (HECA) project has the potential to cause significant impacts on the public as a result of the use, handling, storage, or transportation of hazardous materials at the proposed site. If significant adverse impacts on the public are identified, Energy Commission staff must also evaluate the potential for facility design alternatives and additional mitigation measures to reduce those impacts to the extent feasible.

The original AFC (08-AFC-8) was filed with the Energy Commission on July 31, 2008; and a Revised AFC was submitted in 2009 to reflect a change of the project site to an alternative location. In 2011, Hydrogen Energy California, LLC, (HECA) was acquired from the previous owners by SCS Energy California, LLC. On May 2, 2012, SCS Energy, LLC, submitted an Amended Application for Certification (08-AFC-8A) reflecting several changes to the original project design.

The new Amended Application for Certification (AFC; HECA 2012e) has been assigned a separate distinguishing docket number, 08-AFC-8A. The Amended AFC for the project supersedes and replaces all previous submissions, and incorporates all relevant information from the previous versions of the HECA proceedings. The applicant intends to construct and operate an Integrated Gasification Combined Cycle (IGCC) power generating facility called Hydrogen Energy California (HECA).

The proposed HECA project would gasify blends of 75 percent western coal and 25 percent petroleum coke from California refineries to produce hydrogen to fuel a combustion turbine operating in combined-cycle mode. The amended project incorporates a proposed manufacturing complex that would produce urea in both liquid and pellet form, and other byproducts for agricultural use. For power generation, a Mitsubishi Heavy Industries MHI 501GAC® CT combustion turbine has been selected. The combined cycle power block would generate approximately 430 MW of gross power and would produce about 300-megawatts of electricity. The gasification unit would separate the carbon from the raw syngas (the direct end product of the gasification process) at steady-state operation, which would be transported by pipeline to a custody transfer point at Elk Hills Oil Field for CO_2 enhanced oil recovery (EOR) and sequestration. Due to the complex gasification and sequestration (storage) process, there is a larger than usual parasitic electrical load.

Highlights of the project include:

- The Amended HECA facility proposes to operate with 25 percent petroleum coke from California refineries blended with 75 percent western bituminous coal. Transportation of coal to the project would be by either a truck route, or via an alternative rail spur proposed to be built and owned by the applicant.
- The feedstock (coal and petroleum coke) would be gasified to produce a synthesis gas (syngas) that would be processed and purified to produce a hydrogen-rich gas, which would be used to fuel the combustion turbine for electric power generation and burners that provide supplemental fire to heat the recovery steam generator (HRSG) that produces steam from the combustion turbine exhaust heat. At least 90 percent of the carbon in the raw syngas would be captured in a high-purity carbon

dioxide stream during steady-state operation, and would be sold to Occidental Petroleum, compressed and transported by pipeline off-site to the nearby Elk Hills Oil Field for injection into deep underground oil reservoirs for enhanced oil recovery (EOR) and sequestration.

- State-of-the-art emission controls are included in the design.
- Zero Liquid Discharge technology is used in the project design for process and waste water.
- Liquid oxygen and nitrogen are produced in the air separation unit, and supplied to the gasification unit, the combustion turbine, sulfur recovery unit and other process components of HECA.

Some notable project changes are proposed in the Amended AFC, including the following:

- Mitsubishi Heavy Industries (MHI) oxygen-blown dry feed gasification technology has been selected.
- A MHI 501GAC® Combustion Turbine and Steam Turbine has been selected.
- A new, integrated manufacturing complex (IMC) will produce approximately 1 million tons per year of low-carbon nitrogen-based products, including urea and urea ammonium nitrate fertilizer, to be used in agricultural applications.

HECA proposes to use two alternatives for delivering coal to the project site:

Alternative 1, Rail Transportation: An approximately 5-mile new industrial railroad spur would connect the project site to the existing San Joaquin Valley Railroad, Buttonwillow railroad line, north of the project site. This railroad spur would also be used to transport some IMC products to customers.

Alternative 2, Truck Transportation: Truck transport would be via existing roads from an existing coal transloading facility northeast of the project site. The truck route distance is approximately 27 miles.

The routes of the natural gas pipeline, potable water pipeline, and electrical transmission have been refined as follows:

- An approximately 13-mile new natural gas pipeline will interconnect with an existing Pacific Gas and Electric Company (PG&E) natural gas pipeline located north of the project site.
- Potable water will be delivered via an approximately 1-mile pipeline from a new West Kern Water District potable water production site east of the project site.
- An approximately 2-mile electrical transmission line will interconnect with a future PG&E switching station east of the project site.
- An approximately 15-mile process water pipeline.

If approved, construction of the project is proposed to begin 2013 or 2014, with completion of construction in 2017, and commencement of commercial operation by the end of 2017.

This analysis does not address the potential exposure of workers to hazardous materials used at the proposed facility. Employers must inform employees of hazards associated with their work and provide them with special protective equipment and training to reduce the potential for health impacts associated with the handling of hazardous materials. The **Worker Safety and Fire Protection** section of this document describes applicable requirements for the protection of workers from these risks.

Anhydrous ammonia and nitric acid are the hazardous materials proposed to be either used or stored at the HECA project in quantities that exceed the reportable amounts defined in Health and Safety Code §25531 et seq and in the California Accidental Release Prevention Program (CalARP) regulations (19 CCR §2770.5). Anhydrous ammonia will be used mainly in the production of UAN (Urea Ammonium Nitrate) fertilizer for shipment off-site. It will also be used to control oxides of nitrogen by selective catalytic reduction (SCR). [The applicant has indicated that their previous plan to ship anhydrous ammonia off-site as a commercial product has been removed from the project.] Anhydrous ammonia has high internal energy and is usually stored as a liquefied gas at high pressure. The high internal energy associated with this stored form of anhydrous ammonia can act as a driving force in an accidental release, which can rapidly introduce large quantities of the material to the ambient air and result in high down-wind concentrations. However, in this case, the applicant has indicated that it will store anhydrous ammonia at close to atmospheric pressure as a refrigerated liquid. If a leak or high internal tank pressure occurs, the anhydrous ammonia will first fill the interstitial space between the inner and outer walls of the double-walled storage tank. When the pressure builds up to a certain point, a pressure relief valve at the top of the tank will release ammonia as a vapor and not as a jet release of liquid anhydrous ammonia. Should both walls of the double-walled tank fail or should the piping fail, anhydrous ammonia will flow as a refrigerated liquid into the third line of defense, a concrete containment structure that would allow the refrigerated anhydrous ammonia to flow into a subsurface vault.

Nitric acid, even though it is an intermediate substance produced and then used in a chemical process, will be temporarily stored in extremely large volumes (5,200,000 lbs) of highly concentrated acid (~60 percent by wt.) for up to three days on-site. Staff therefore believes that nitric acid will also be subject to the Cal-ARP program. Other hazardous materials such as mineral and lubricating oils, methanol, syngas, acid gas, sulfuric acid, and welding gasses will be stored and used or will be generated by the processes of the HECA project.

Hazardous materials used during construction would include gasoline, diesel fuel, motor oil, hydraulic fluid, welding gases, lubricants, solvents, paint, and paint thinner. No extremely hazardous materials will be used on site during construction. None of these materials pose significant potential for off-site impacts as a result of the quantities on site, their relative toxicity, their physical state, and/or their environmental mobility. Handling of hazardous materials during construction would comply with all applicable regulations and would be guided by a Hazardous Materials Business Plan (HECA 2012e).

Although no natural gas is stored, the project will also involve the handling of large amounts of natural gas. Natural gas poses some risk of both fire and explosion. HECA would connect to one of two potential pipeline systems, provided by either Southern

California Gas Company or Pacific Gas and Electric (HECA 2012e). HECA would also require the transportation of some hazardous materials to the facility but will be limited to methanol and sodium hydroxide (HECA 2012e, §5.12.3). This document addresses all potential impacts associated with the transport, use, handling, and storage of hazardous materials.

However, staff wishes to note that many other hazardous materials would be generated and "stored", albeit temporarily in reactor vessels and piping, including extremely hazardous materials such as hydrogen sulfide (H_2S) and carbonyl sulfide (COS). Since H_2S is a by-product of the gasification process and it is removed from the enclosed process system and mostly converted to elemental sulfur (a solid powder with low potential for migration or adverse impacts on people) for sale off-site as liquid sulfur, staff addresses the emissions of H_2S into the atmosphere due to an accidental release in this section and as fugitive emissions from the process system in the **Public Health** section of this PSA/DEIS.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The following federal, state, and local laws and policies apply to the protection of public health and hazardous materials management. Staff's analysis examines the project's compliance with these requirements.

Hazardous Materials Management Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
The Superfund Amendments and Reauthorization Act of 1986 (42 USC §9601 et seq.)	Contains the Emergency Planning and Community Right To Know Act (also known as SARA Title III).
The Clean Air Act (CAA) of 1990 (42 USC 7401 et seq. as amended)	Established a nationwide emergency planning and response program and imposed reporting requirements for businesses that store, handle, or produce significant quantities of extremely hazardous materials.
The CAA section on risk management plans (42 USC §112(r)	Requires states to implement a comprehensive system informing local agencies and the public when a significant quantity of such materials is stored or handled at a facility. The requirements of both SARA Title III and the CAA are reflected in the California Health and Safety Code, section 25531, et seq.
49 CFR 172.800	The U.S. Department of Transportation (DOT) requirement that suppliers of hazardous materials prepare and implement security plans.
49 CFR Part 1572, Subparts A and B	Requires suppliers of hazardous materials to ensure that all their hazardous materials drivers are in compliance with personnel background security checks.
The Clean Water Act (CWA) (40 CFR 112)	Aims to prevent the discharge or threat of discharge of oil into navigable waters or adjoining shorelines. Requires a written spill prevention, control, and countermeasures (SPCC) plan to be prepared for facilities that store oil that could leak into navigable waters.

Federal Register (6 CFR Part 27) interim final rule	The Chemical Facility Anti-Terrorism Standard (CFATS), a regulation of the U.S. Department of Homeland Security, requires facilities that use or store certain hazardous materials to submit information to the department so that a vulnerability assessment can be conducted to determine what certain specified security measures shall be implemented.
State	
Title 8, California Code of Regulations, section 5189	Requires facility owners to develop and implement effective safety management plans that ensure that large quantities of hazardous materials are handled safely. While such requirements primarily provide for the protection of workers, they also indirectly improve public safety and are coordinated with the Risk Management Plan (RMP) process.
California Health and Safety Code, section 41700	Requires that "No person shall discharge from any source whatsoever such quantities of air contaminants or other material which causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property."
California Safe Drinking Water and Toxic Enforcement Act (Proposition 65)	Prevents certain chemicals that cause cancer and reproductive toxicity from being discharged into sources of drinking water.
Hazardous Material Business Plan, Cal HSC Sections 25500 to 25541; 19 CCR Sections 2720 to 2734	Requires the submittal of a chemical inventory and planning and reporting for management of hazardous materials.
The California Accidental Release Prevention Program (CalARP) is found within Health and Safety Code Sections 25531 - 25543.3 (19 CCR §2770.5).	Requires a Risk Management Plan (RMP) that includes air dispersion modeling of an accidental release of certain hazardous materials to determine the off-site consequences of such a release.
Hazardous Substance Information and Training Act, 8 CCR Section 339; Section 3200 et seq., 5139 et seq., and 5160 et seq.	Requires listing and implementation of specified control measures for management of hazardous substances.
California HSC Sections 25270 through 25270.13	Requires the preparation of a Spill Prevention, Control, and Countermeasures (SPCC) Plan if 10,000 gallons or more of petroleum is stored on-site. The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the Certified Unified Program Authority (CUPA).
Process Safety Management: Title 8 CCR Section 5189	Requires facility owners to develop and implement effective process safety management plans when toxic, reactive, flammable, or explosive chemicals are maintained on site in quantities that exceed regulatory thresholds.
Local	
County of Kern EHSD	Requires new/modified businesses to complete an HMBP prior to final plan/permit approval.

The Certified Unified Program Agency (CUPA) with the responsibility to review Risk Management Plans (RMPs) and Hazardous Materials Business Plans (HMBPs) is the Kern County Environmental Health Services Department (EHSD) (HECA 2012e, Section 5.12.6.3). With regard to seismic safety issues, the site is located in Seismic Risk Zone 4. Construction and design of buildings and vessels storing hazardous materials will meet the seismic requirements of the 2007 California Building Code and the American Society of Civil Engineers standards ASCE 7-05 (HECA 2012e, Section 2.7.1).

SETTING

Several factors associated with the area in which a project is to be located affect the potential for an accidental release of a hazardous material that could cause public health impacts. These include:

- local meteorology;
- terrain characteristics; and
- location of population centers and sensitive receptors relative to the project.

METEOROLOGICAL CONDITIONS

Meteorological conditions, including wind speed, wind direction, and air temperature, affect both the extent to which accidentally released hazardous materials would be dispersed into the air and the direction in which they would be transported. This affects the potential magnitude and extent of public exposure to such materials, as well as their associated health risks. When wind speeds are low and the atmosphere stable, dispersion is severely reduced but can lead to increased localized public exposure.

Recorded wind speeds and directions are described in the **Air Quality** section (5.1.1.1) and **Appendix E-1** of the Application for Certification (AFC) (HECA 2012e). Staff agrees with the applicant that use of F stability (stagnated air, very little mixing), wind speed of 1.5 meters per second, and an ambient temperature of 115°F are appropriate for conducting the worst-case off-site consequence analyses (HECA 2012e, Appendix L).

TERRAIN CHARACTERISTICS

The location of elevated terrain is often an important factor in assessing potential exposure. An emission plume resulting from an accidental release may impact high elevations before impacting lower elevations. The site topography is predominantly flat (about 282 to 291 feet above mean sea level), with elevated terrain existing about 2 miles south and southwest (HECA 2012e, Section 5.12).

LOCATION OF EXPOSED POPULATIONS AND SENSITIVE RECEPTORS

The general population includes many sensitive subgroups that may be at greater risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. In addition, the location of the population in the area surrounding a project site may have a major bearing on health risk. Sensitive receptors and residences in the project vicinity are shown in Figure 5.6-1 of the AFC (HECA 2012e). The nearest sensitive receptor is the Tule Elk State Natural Reserve, which begins about 1,700 feet east of the project site. The only other sensitive receptor within a 6-mile radius of the project site is the Elk Hills Elementary School, located approximately 1.3 miles southeast of the site boundary (HECA 2012e, Section 5.6.1). The nearest residences are located approximately 370 feet northwest of the project site and several hundred feet east of the project site fence line (near the intersection of Tupman Rd and Station Rd). Additional residences are located approximately 1,400 feet to the east and 3,300 feet to the southeast of the project site fence line. The unincorporated community of Tupman is about 1.5 miles southeast of the project site. (HECA 2012e, Sections 5.6 & 5.6.1). The applicant has stated that it will purchase the nearest residence (370 feet from the facility fenceline). Staff believes that this residence's proximity to the facility would place any resident at a significant risk of harm if allowed to continue to reside at that location. If this residence is purchased and demolished this risk would be eliminated.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

Staff reviewed and assessed the potential for the transportation, handling, and use of hazardous materials to impact the surrounding community. All chemicals and natural gas were evaluated. Staff's analysis addresses the potential impacts on all members of the population including the young, the elderly, and people with existing medical conditions that may make them more sensitive to the adverse effects of hazardous materials. In order to accomplish this goal, staff utilized the most current public health exposure levels (both acute and chronic) that are established to protect the public from the effects of an accidental chemical release.

In order to assess the potential for released hazardous materials to travel off site and affect the public, staff analyzed several aspects of the proposed use of these materials at the facility. Staff recognizes that some hazardous materials must be used at power plants. Therefore, staff conducted its analysis by examining the choice and amount of chemicals to be used, the manner in which the applicant will use the chemicals, the manner by which they will be transported to the facility and transferred to facility storage tanks, and the way the applicant plans to store the materials on site.

Staff reviewed the applicant's proposed engineering and administrative controls concerning hazardous materials usage. Engineering controls are the physical or mechanical systems, such as storage tanks or automatic shut-off valves, that can prevent the spill of hazardous material from occurring, or which can either limit the spill to a small amount or confine it to a small area. Administrative controls are the rules and procedures that workers at the facility must follow that will help to prevent accidents or to keep them small if they do occur. Both engineering and administrative controls can act as methods of prevention or as methods of response and minimization. In both cases, the goal is to prevent a spill from moving off site and causing harm to the public.

Staff reviewed and evaluated the applicant's proposed use of hazardous materials as described by the applicant (HECA 2012e, Section 5.12). Staff's assessment followed the five steps listed below:

Step 1: Staff reviewed the chemicals and the amounts proposed for on-site use as listed in **Tables 5.12-1 through 5.12-4** of the AFC (HECA 2012e) and determined the need and appropriateness of their use.

Step 2: Those chemicals proposed for use in small amounts or whose physical state is such that there is virtually no chance that a spill would migrate off site and impact the public were removed from further assessment.

Step 3: Measures proposed by the applicant to prevent spills were reviewed and evaluated. These included engineering controls such as automatic shut-off valves and different-sized transfer-hose couplings and administrative controls such as worker training and safety management programs.

Step 4: Measures proposed by the applicant to respond to accidents were reviewed and evaluated. These mitigation measures also include engineering controls such as catchment basins and methods to keep vapors from spreading and administrative controls such as training emergency response crews.

Step 5: Staff analyzed the theoretical impacts on the public of a worst-case spill of hazardous materials, as reduced by the mitigation measures proposed by the applicant. When mitigation methods proposed by the applicant are sufficient, no further mitigation is recommended. If the proposed mitigation is not sufficient to reduce the potential for adverse impacts to an insignificant level, staff will propose additional prevention and response controls until the potential for causing harm to the public is reduced to an insignificant level. It is only at this point that staff can recommend that the facility be allowed to use hazardous materials.

Also, as discussed in the Introduction, this PSA/DEIS analyzes the project's impacts pursuant to both the National Environmental Policy Act (NEPA) and CEQA. The two statutes are similar in their requirements concerning analysis of a project's impacts. Therefore, unless otherwise noted, staff's use of, and reference to, CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

DIRECT/INDIRECT IMPACTS AND MITIGATION

The proposed HECA project would consist of a complex industrial facility containing numerous chemical processes that will require large amounts of hazardous materials in closed tanks and piping at elevated temperature and pressure. This has the potential to pose significant risks if not managed properly. Therefore, in order to properly review the hazardous materials proposed for use at this project, as well as those that will be produced by the project, staff reviewed the entire gasification system and ancillary processes and visited a similar gasification facility, the Polk Power Station near Tampa, Florida. During that visit, staff discussed routine and accidental emissions, frequency of flares and upset conditions, fugitive emissions from piping, flanges, valves, and pumps, the Process Safety Management analysis for a potential syngas explosion, fire detection and suppression systems, waste streams, and general operating information. According to the owners of the Polk Power Station, there have been no significant accidental releases of hazardous materials or significant fires or explosions in the history of the power plant (commercial operations started in September 1986). There has been, however, frequent incidences of small syngas fires/explosions during start-ups and shut-downs. If the explosion occurs in the gasifier, the vessel contains the explosion.

Nevertheless, as a result of staff's efforts to understand the process and the risks involved, staff determined that the number and large volumes of hazardous materials and the processes that use these hazardous materials must be assessed and managed in greater detail than usual, regardless if the quantities of materials present are below federal or state thresholds for regulation. The procedure staff used was modified to address the volumes and elevated temperature and pressures that the facility would operate under. Staff therefore reviewed the entire list of hazardous materials provided by the applicant and will require strict adherence to HAZ-1 so that any deviation from this list is reviewed and approved in advance by the CPM.
The reasons staff made the decisions to require additional mitigation measures beyond standard administrative and engineering controls for certain hazardous materials can be found in **Hazardous Materials Management Table 2.**

Hazardous Materials Management Table 2
Additional Mitigation Needs

Material	Application	Maximum Quantity On Site	Further Review and Mitigation	Reasons for Yes/No Mitigation
Anhydrous Ammonia	Emissions control (SCR), fertilizer feedstock	3,8000,000 gallons	**Yes**	High vapor pressure; high volume; high danger
Boiler Feedwater Chemicals (e.g., Morpholine, Cyclohexamine and Sodium Sulfite)	Boiler feedwater pH/corrosion / dissolved oxygen/biocide control	< 500 gallons	No	Very small quantity and low vapor pressures; aqueous mixtures.
Chemical Reagents (acids/bases/ standards)	Lab	< 5 gallons	No	Very small quantities.
Compressed Gases (Ar, He, & other lab gases)	Lab	Minimal	No	Very small volumes.
Cooling Water Chemical Additives (e.g., Magnesium Nitrate, Magnesium Chloride)	Corrosion inhibitor/biocides	< 500 gallons	No	Very small volumes; pose little risk off-site.

Material	Application	Maximum Quantity On Site	Further Review and Mitigation	Reasons for Yes/No Mitigation
CTG and HRSG Cleaning Chemicals (e.g., HCl, Citric Acid, EDTA Chelant, Sodium Nitrate)	HRSG chemical cleaning	Intermittent cleaning requirement/ temp storage only	No	Intermittent use; standard admin and engineering controls adequate to prevent off-site impacts.
Diesel Fuel	Emergency generator/fire water pump fuel	2,000 gallons	No	Standard admin and engineering controls adequate to prevent off-site impacts.
Flammable/Hazardous Gases (H_2S, COS, Syngas and Hydrogen-Rich Gas)	Primary power generation fuel	All would be present as process quantities only with no storage on site except that within pipes and reactor vessels.	**Yes**	Highly flammable, explosive, or toxic. PSM Plan and other plans needed to control and minimize accidents
Hydrogen (H_2)	STG & CTG generator cooling	30,000 standard cubic feet	No	Small volume stored on commonly-used storage trailer.
Methanol	AGR solvent make-up	300,000 gallons	**Yes**	Toxic; flammable at elevated temp & pressure
Methyldiethanolamine (40%)	Solvent for sulfur removal	220,000 pounds	No	Low vapor pressure.
Miscellaneous Industrial Gases – Acetylene, Oxygen, Other welding Gases, Analyzer Calibration Gases	Maintenance welding/ instrumentation calibration	Minimal	No	Very small volumes and low toxicity; little risk of off-site impacts.
Liquid Sulfur	By-product for sale and to be de-gassed and then shipped off-site	1,400,000 lbs (air space in storage tank truck or rail car can contain high levels of H_2S and COS)	**Yes**	Solid and non-volatile; low toxicity yet off-gases sig quantities of H_2S and can be a fire and explosion hazard at high temp

Material	Application	Maximum Quantity On Site	Further Review and Mitigation	Reasons for Yes/No Mitigation
Natural Gas	Startup/backup/ auxiliary fuel	Utility supplies on demand via pipeline	**Yes**	Highly flammable
Nitric Acid ~60 % by wt.	Intermediate, produced/used in UAN Plant	5,200,000 lbs (~3 day supply)	**Yes**	Very toxic, corrosive, and reactive
Nitrogen (95%) Liquid	For production of anhydrous ammonia	100,000 lbs	**Yes**	Inert gas but poses a danger as a cryogenic
Oxygen (95%), Liquid	Gasification, SRU	24,000,000 lbs	**Yes**	Highly corrosive and high risk of accelerating a fire.
Paint, Thinners, Solvents, Adhesives, etc.	Shop/warehous e	< 20 gallons	No	Very low volumes and low toxicity.
Sodium Hydroxide (5% - 50%)	Plant wastewater, sour water treatment, gasification, caustic scrubber	150,000 gallons	No	Very low vapor pressure and aqueous solution.
Sulfuric Acid	Plant wastewater, Cooling water pH control	14,000 gallons	No	Very low vapor pressure.
UAN soln.	product	126,000,000 lbs	**Yes**	Very low vapor pressure, aq. soln., but can be explosive if allowed to dry

Source: HECA 2012e, Tables 5.12-3 & 5.12-4

Staff also looked at the various process operations and researched the accident history of similar operations at other locations. The applicant also provided some information on this subject in response to a staff data request (HECA 2012kk). A summary of each operation and potential for upsets/releases follows. This information was used by staff to determine the need for precautionary preventative measures to mitigate potential significant impacts.

Coal/pet coke Gasification Plant

The Gasification Plant converts solid feedstock (blended coal and petcoke which has been ground and dried) to syngas. The gasifier process involves two stages. In the first stage the feed enters the gasifier into a lower stage with oxygen where it is gasified at high temperature to produce CO, CO_2 and water vapor. These gases rise to the second stage, more feed is added without oxygen, and the gasification of char to CO and shifting of CO and water to hydrogen and CO_2 occurs, producing syngas. The syngas passes through a cooler, generating steam which is used in power generation. Staff visited a similar gasification facility located in Polk County, Florida and discussed upsets and accidental releases from the gasifier and other processes. Staff also reviewed reports of operations from another similar gasification facility in Terra Haute, Indiana (the Wabash River facility) that included assessments of problems (U.S. DOE 2002a and 2002b; Keeler 1999). In all cases, the releases, upsets, and problems were minor and gases did not migrate off-site and thus there was no significant threat to the off-site public. However, the fact that minor explosions and releases from the gasifier and attached piping in one of the facilities examined has occurred supports staff's contention that increased controls and safety management plans are indeed warranted for the proposed HECA facility.

Air Separation Unit (ASU)

The ASU filters, compresses, dries and cools ambient air to cryogenic temperatures for separation of oxygen (high-pressure, high-purity O_2 for use in the Gasifier and low-pressure, low-purity O_2 for use in the SRU) and nitrogen (high-purity for use in the Ammonia Synthesis Unit and other processes). Staff could find no records of accidents or releases from ASUs in the literature.

Syngas Scrubber, Sour Shift, Low-temperature Gas Cooling, Sour Water Treatment Facility.

Syngas from the Gasifier is treated in the Syngas Scrubber to remove chlorides. The scrubbed syngas is converted to CO_2 and hydrogen in the Sour Shift Unit and then sent to the ammonia wash column to remove any ammonia present in the syngas. From there the syngas is sent to the Mercury Removal Unit.

Accident experience at similar units

ExxonMobil Baton Rouge Refinery, LA, March 24-25, 2006

A leak was discovered on the ammonia gas line to the No. 100 Sulfur Plant due to a corrosion hole under the edge of a clamp. When tightening the clamp did not stop the leak, the Sour Water Stripper (SWS) was shut down. A new clamp was installed which also leaked. The old clamp was reinstalled with a new gasket but this did not stop the leak. Feed spheres to the SWSs became full and SWSs were started-up to the flare system; ammonia acid gas was flared for over 8 hours. Air monitoring was conducted offsite for ammonia, H_2S and SO_2; all readings were below detection level.

(Source: Louisiana Bucket Brigade, "Louisiana's Worst Refinery Accidents 2005-2008.")

Phillips 66, CA, June 15, 2012

Sour water tank over-pressured causing split in roof and release of vapors. Strong sulfur odors detected by Hazmat personnel at Interstate-80 and surrounding communities. Highest reading was about 1 ppm H2S on I-80 (a few hundred feet from the storage tank).

(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Mercury Removal Unit

Mercury is removed from the syngas using activated carbon and then the syngas is sent to the AGR Unit. Staff could find no records of accidents or releases from mercury removal units in the literature.

Acid Gas Removal (Rectisol process) Unit (AGR)
Acid gases are removed from the syngas to produce hydrogen-rich fuel that feeds the combined cycle power block. A portion of this fuel serves as a feedstock to the Ammonia Synthesis Unit. CO_2 is separated in this step, compressed and transported for enhanced oil recovery (EOR) and sequestration. Staff could find no records of accidents or releases from Rectisol units in the literature.

Ammonia Synthesis Unit
High-purity hydrogen from the AGR and high-purity nitrogen from the ASU are compressed to high pressure, heated and fed to the ammonia synthesis converter where, over an iron-based catalyst, conversion to ammonia occurs. This unit contains a natural gas-fired start-up heater. The ammonia produced is used onsite to produce urea pastilles and UAN solution, which are both shipped offsite.

Accident experience at similar units

Accidental Releases of Anhydrous Ammonia, United States
Houston, Texas, 1976: tanker drove off elevated road and burst. Grass burned in all directions around the crash.

Pensacola, Florida, 1977: Train derailed and ammonia tank car punctured. About 4 minutes after the crash air traffic control at nearby Pensacola airport (directly upwind) observed ammonia cloud on radar, about 1 mile in diameter and 125 feet high. Cloud remained visible on radar for an hour and travelled 9 miles (it did not lift off the ground).
(Source: Kaiser GD and RF Griffiths. 1982. "The Accidental Release of Anhydrous Ammonia to the Atmosphere: A Systematic Study of Factors Influencing Cloud Density and Dispersion." Journal of the Air Pollution Control Association. Vol. 32, No. 1. January.)

Accidental Releases of Anhydrous Ammonia, Minnesota, 1995-2005
459 accidental releases of anhydrous ammonia reported in Minnesota from 1995-2005. 47 of the 459 events caused injury with 136 people injured.

- >593,000 lbs released (some during illegal drug activities),
- 27% of these events resulted in evacuations and/or injuries,
- ≈ 4,150 people evacuated during 96 of these events,
- 391 (85%) of these events occurred at fixed facilities (above ground storage, piping, ancillary process equipment, transportation within fixed facility, material handling),
- 265 of these events due to equipment failure, 93 due to human error, 43 were intentional or illegal, 6 were weather related and 52 unknown,

Examples of accidental releases:

- ≈ 1,000 gallons released when nurse tank rolled over on a road. 1 injury requiring treatment at a hospital, road closed for about 4 hours, 5 nearby residences evacuated for 2 hours,
- 9000 lbs released in a leak from a refrigeration system, 18 employees sought medical evaluation, 9 required treatment,

- Ammonia stored in makeshift containers for illegal methamphetamine production released when containers failed. 11 people injured (chemical burns, respiratory irritation), 15 residences evacuated,
- Tanker truck full of anhydrous ammonia overturned on a busy highway near a city. Highway closed for more than 9 hours while tanker offloaded (only a small amount ammonia was released). 375 people evacuated from homes.

(Source: "An Overview of Accidental Anhydrous Ammonia Releases in Minnesota." Environmental Health Information, Minnesota Department of Health. January 2007.)

Ammonia Incidents, Minnesota

- October 20, 2005: tanker truck holding 20 tons anhydrous ammonia rolled over off Highway 169. Portions of highway closed, local residences evacuated. Ammonia pumped into another tanker, very little released.
- June 6, 2005: Non-code weld weakened the shell of an anhydrous ammonia nurse tank and caused rupture. Tank propelled about 250 feet. Extensive ammonia vapor cloud drifted away from populated areas; some nearby residents treated for exposure.
- January 18, 2002: Freight train derailed 31 of its 112 cars about a half-mile from Minot, North Dakota. 15 of the 31 cars contained anhydrous ammonia. 240,000 gallons released to soil and air creating a vapor plume that drifted toward Minot. One resident died, 11 people had serious injuries and 322 people were seen by medical personnel.

Urea Unit

Some of the compressed CO_2 from the AGR is treated in the CO_2 Purification Unit, producing high quality CO_2 for urea synthesis. CO2 is combined with ammonia from the Ammonia Synthesis Unit in the Urea Reactor, producing urea solution to be used in the Urea Pastillation Unit and the Urea Ammonium Nitrate (UAN) Complex.

Accident experience at similar units

Urea Production Plant, France, March 27, 1998

- Ammonia leak occurred between 4:50 – 6:25 am on a liquid ammonia pipe running from medium-pressure storage zone to urea synthesis unit due to defective safety rupture disc. 10 tons ammonia released over 90 minutes from a 100 m stack. Technicians misinterpreted alarms.
- Nearby residents woke up to smell of ammonia; highly unfavorable weather conditions (slight wind and temperature inversion) amplify the effects of the ammonia leak. Ammonia concentrations near the olfactory threshold (5 ppm) were measured at several locations in the city. Population told to remain indoors. No medical impacts reported.
- Ammonia concentrations measured in the city (north of the plant) between 7:30 – 9 am at 3-5 ppm. Local atmospheric monitoring sensors recorded maximum level of 3 ppm. Ammonia detectors installed at periphery of plant were detrimental since the release occurred from a 100 m stack.
- Accident occurred due to equipment malfunction and human error.

(Source: "Ammonia Leak in a Urea Production Plant. March 27, 1998. Toulouse (Haute-Garonne) France." French Ministry for Sustainable Development. September 2010.)

Urea Pastillation Unit and Urea Pastille Handling and Transfer Unit
Droplets of urea solution are deposited onto a moving belt, the droplets solidify to produce a uniform pastille product, and this product is then collected for storage and export off-site. Staff found no reports of incidences in the data bases searched.

Urea Ammonium Nitrate Complex
Several intermediate products are produced during UAN synthesis (nitric acid, ammonium nitrate and urea). Nitric acid production first involves catalytic oxidation of ammonia from the Ammonia Synthesis Unit at high temperature to yield nitric oxide and water. Nitric oxide reacts non-catalytically with oxygen to produce nitrogen dioxide, which is cooled and sent to an absorption tower to react with water to produce nitric acid and nitric oxide. Gaseous ammonia and aqueous nitric acid undergo an exothermic reaction to produce ammonium nitrate, which is mixed with urea to produce UAN.

Accident experience at similar units

Terra International, Port Neal Complex, Iowa, December 13, 1994
[Staff believes that this facility is perhaps the most similar to the UAN production plant proposed for the HECA facility. The Terra plant produced an 83% ammonium nitrate (AN) solution by reacting ammonia and nitric acid in a vessel called a neutralizer. The nitric acid plant supplied the nitric acid. Also onsite was anhydrous ammonia stored in two pressurized storage vessels. The AN solution was sold or mixed with urea to form a urea-ammonium nitrate solution.]
Explosion occurred in the ammonium nitrate plant releasing about 5,700 tons of anhydrous ammonia to the air and secondary containment, about 25,000 gallons nitric acid to the ground and lined chemical ditches and sumps and liquid ammonium nitrate solution into secondary containment. Offsite ammonia released continued for about 6 days. Released chemicals caused groundwater contamination under the facility. Four employees were killed as a direct result of the explosion and 18 others were injured and required hospitalization. The investigation team concluded that the explosion resulted from a lack of written, safe operating procedures that lead to in unsafe conditions in the AN process at the plant. The specific process conditions that caused the explosion were: excess acid levels in the neutralizer and rundown tank, prolonged application of 200 psig steam to the neutralizer nitric acid spargers, creation of bubbles and low density zones in the neutralizer, lack of flow in the neutralizer and rundown tank, presence of chloride contamination in the neutralizer and rundown tank, and lack of process monitoring after the plant was shut down. Plumes and clouds of ammonia were monitored as far away as 5 miles from the facility.

Sulfur Recovery Unit (SRU)
Acid gas from the AGR, sour gas from the sour water strippers and various plant vents feed the SRU. H_2S in the feed is oxidized to sulfur dioxide in a reaction furnace. The SO_2 reacts with remaining H_2S to produce elemental sulfur, which is stored and then shipped offsite.

Accident experience at similar units

Big West, Bakersfield, CA, September 2008

A release of sulfur dioxide above the reportable quantity occurred due to failure in the sulfur recovery system. Amount released unknown, no fires, injuries or evacuation reported.

CITGO Lake Charles Refinery, LA, June 19, 2006
Heavy rainfall caused shutdown of the Central Amine Unit and subsequent shutdown of SRUs due to lack of feed. SRU shutdown caused the Sour Water Stripper off-gas to be flared. Air monitoring during the release showed ERPG-2 (Emergency Response Planning Guidance Level 2) values were never exceeded. No SO_2 or H_2S was detected at the location of odor complaints.
(Source: Louisiana Bucket Brigade, "Louisiana's Worst Refinery Accidents 2005-2008.")

CITGO Lake Charles Refinery, LA, June 4-5, 2007
Short duration rain event with winds gusting over 60 mph and hail resulted in loss of power at one of CITGO's substations. This caused loss of amine flow and H_2S absorption in amine contactors at the Light Ends Recovery Unit resulting in heavy smoking from refinery boiler stacks, excess SO_2 emissions from heaters and boilers and upset to the Sulfur Recovery Plant (SRP) with subsequent excess H_2S emissions from tail gas units at the SRP. Air monitoring during the release showed ERPG-2 values were never exceeded.
(Source: Louisiana Bucket Brigade, "Louisiana's Worst Refinery Accidents 2005-2008.")

Placid Refining Co., LLC, Port Allen, TX
Equipment failure incidences:

- September 2008: SRU out of service, sour water off-gases with H_2S flared while SRU down
- June 2009: Sulfur unit malfunction due to overheating, resulting in flaring of acid gas and sour water (over 11,000 lbs SO_2 released)
- February 2012: SRU shutdown caused product to be incinerated rather than converted (900 lbs SO_2 released)

(Source: Louisiana Bucket Brigade, database of incidents)

Conoco Phillips, Contra Costa County, CA, March 18, 2007
Sulfur plant shutdown due to power failure causing excess sulfur to flare. No complaints received from community.
(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Shell Oil Products, Martinez Refinery, CA, March 26, 2006
Community Warning System sirens were sounded due to release of SO_2 gas from SRU #3. Elevated temperatures in one of the catalyst beds may have resulted in production of SO_2 gas. Visible plume was seen across Shell Avenue which was believed could pose a health hazard and Shell Avenue was closed for 25 minutes. Visible pluming stopped within 15 minutes. Event downgraded to level 0 within 40 minutes. Hazardous Materials Program staff responded within 10 minutes of event start. Hand-held monitoring equipment did not detect any SO_2 or H_2S although a slight SO_2 odor was reported at Shell Avenue and Marina Vista.
(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Tesoro Golden Eagle Refinery, CA, October 26, 2005

Partial power outage resulted in ammonia recovery unit shutdown to reduce acid gas load to sulfur plant. Plume visible off-site (potentially containing SO_2). No odor impact reported by odor patrol in nearby Clyde. Ground level monitors did not detect SO_2 or H_2S.

(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Sunoco's Oregon Refinery, OR, October 16, 2004

Excess SO_2 emissions from the Sulfur Recovery Unit occurred over a 24-hour period. SRU was out of compliance due to Hydrocracker unit and Sour Water Stripper startup. No offsite air monitoring conducted.

(Source: "Sunoco's Oregon Refinery: 21 accidents in the last 6 months." March 10, 2005)

Exxon Mobil Refinery, Torrance CA, December 2004

Sulfur dioxide was released from the sulfur recovery unit when the analyzer maxed out because the facility was in the middle of switching the sour water strippers. No fires, injuries or evacuation reported.

Valero Refining CO, Benicia CA, June 2003

A flaring incident of sulfur dioxide occurred; the release was caused by an upset in the sulfur recovery unit. Amount released: 630 pounds. No fires, injuries, or evacuation reported.

Shell, Martinez, CA, April 2002

Sulfur Recovery Unit #3 was being shut down on the morning of 4/23/02 to address concerns about SO_2 stack emissions, which were approaching the BAAQMD limit of 250 ppm/hr. SRU#3 converts acid gas consisting of SO_2 and H_2S to elemental sulfur in a catalytic reactor utilizing the "Claus" process, the same process proposed for the HECA project. The SRU#3 vent gas is routed through a Shell Claus Offgas Treatment (SCOT) plant for additional treatment. The SCOT-3 vent gas is routed through a catalytic oxidizer to convert remaining H_2S to SO_2. By 11:00 am all acid gas feed had been removed from SRU#3. Approximately an hour later, the catalytic oxidizer experienced a temperature excursion (most likely resulting from burning sulfur), which led to a plume from the SCOT-3 stack by 12:30 p.m. At 12:30 p.m., Shell called the incident a Level 1 alert. At 12:35 am, Shell upgraded the incident to a Community Warning System Level 3 alert and sounded sirens. Steam and nitrogen were used to cool the catalytic oxidizer. Contra Costa County Health Services field observations identified a black plume, which dissipated very quickly and no plume was visible after about 10 or 15 minutes. Shell secured the unit at 12:57 pm.

(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Chevron, Richmond, CA, January 2002

Release of sulfur dioxide from the #3 SRU plant. A high vapor/liquid flow condition was created by the Isomax #4 H2S plant when a normal heat exchanger backwash was being performed, which caused an interlock plant shutdown at #3 SRU. The momentary release occurred while restarting the plant (Level 3 initiated by CCHS). A few calls were reported to the facility expressing concern or inquiring as to the activity taking place. People in Richmond were asked to shelter-in-place.

Chevron Richmond, CA, January 31, 2002

SO_2 released from #3 SRU Plant during start-up. The facility received calls from the community expressing concern or inquiring as to what was happening. People in Richmond asked to shelter-in-place.

(Source: "Major Accidents at Chemical/Refinery Plants in Contra Costa County", summaries since 1992)

Tosco (now Conoco Phillips) Crockett, CA, April 1997

An upset in the distillation unit sent hydrocarbons to the sulfur recovery units. Parts of the refinery were shut down until the problem was found. People were asked to shelter-in-place at Tormey and Crockett.

Natural Gas Pipeline

A new natural gas pipeline will be about 13 miles long, connecting the project with an existing PG&E natural gas pipeline located north of the site. Expected delivery pressure is 335 psig (minimum). Gas pipelines are subject to internal and external cathodic degradation, seam leaks, backhoe attacks, rust, and seismic rupture. However, building and inspecting the gas pipeline as per existing codes and regulation would render risks posed to the public insignificant.

CO_2 pipeline

CO_2 from the AGR is compressed and will be transported by an approximately 3-mile pipeline to Elk Hills Oil Field for enhanced oil recovery and sequestration. Minimum pressure for the CO_2 pipeline is 2,500 psig.

Accident experience at similar units

Dakota Gasification Company

Pipeline 328 km, capacity 5 million tons/year. The gas stream averages 95.95% CO_2 with an average of 0.8% H_2S. Operations began in 2000 and since then only one minor leakage accident occurred due to component failure.

(Source: Duncan IJ et al. 2008. "Risk Assessment for Future CO_2 Sequestration Projects Based on CO2 Enhanced Oil Recovery in the US. Presented at the 9th International Conference on Greenhouse Gas Control Technologies, Washington DC. November.)

Denbury Pipeline Complex

Pipeline 562 km, longest section constructed in 1980s. Five accidental releases of CO2 have occurred; two leaks were due to manufacturing imperfections in welds, one leak occurred when an excavator accidentally cut the line, one leak occurred when cement lined pipe ruptured due to inadequate weld pre-heating and one leak occurred at a pump station. Leaks were short in duration.

(Source: Duncan IJ et al. 2008. "Risk Assessment for Future CO_2 Sequestration Projects Based on CO2 Enhanced Oil Recovery in the US. Presented at the 9th International Conference on Greenhouse Gas Control Technologies, Washington DC. November.)

US Pipelines

Currently about 2,400 km of large CO_2 pipelines in operation, most in the US, many operating since the early 1980s. From 1990 to 2001, 10 pipeline incidents occurred in the US, four caused by relief valve failure, three by weld/gasket/valve packing failure, two by corrosion and one due to outside force (which includes human error accidents). No injuries or fatalities have occurred due to CO_2 pipeline incidents.

(Source: Gale J and Davison J. 2005. "Transmission of CO_2: Safety and Economic Considerations." Energy. 29: 1319-1328.)

Enhanced Oil Recovery Facility

CO_2 from HECA will be transported to Elk Hills Oil Field for enhanced oil recovery and sequestration. EOR involves injection and reinjection of CO_2, which reduces viscosity and enhances other properties of trapped oil to improve extraction. In this process the injected CO_2 becomes trapped or sequestered underground. Staff could find no records of accidents or releases from EOR units that use CO_2 in the literature.

Construction Phase Analysis

Various hazardous materials, liquid, gaseous, and solid, would be used during the construction of the project. Hazardous materials such as welding gases, lead acid batteries, paints, solvents, cleaning acids, lubricating oils, etc. are stored in low volumes while fuels such as diesel and gasoline with be stored on-site in moderate volumes (4000 gallons each; HECA 2012e Table 5.12-1 and 5.12-2). In staff's experience at other power plant sites under construction, the amounts and nature of these materials pose an insignificant risk to off-site public if a spill were to occur since fuels must be stored and dispensed with spill containment around the storage tank and the dispensing nozzles. However, because of the very large amounts of diesel fuel and gasoline that would be stored on the site for the duration of construction, staff proposes Condition of Certification **HAZ-8** to reduce the risk of fires and/or explosion involving fuels or the risk of a spill to an insignificant level.

Operations Phase Analysis

Small Quantity/Low Risk Hazardous Materials

Hazardous chemicals such as hydrogen, sulfuric acid, mineral and lubricating oils, cleaning detergents, welding gasses, and other various chemicals would be used and/or temporarily stored at the HECA site. (See **Hazardous Materials Appendix B** for a list of all chemicals proposed for use and storage at HECA). In conducting the analysis, staff determined in Steps 1 and 2 that these materials, although present at the proposed facility, pose a minimal potential for off-site impacts since they will be stored either in small quantities, used in an enclosed system, have low mobility/volatility, or have low levels of toxicity. These hazardous materials are eliminated from further consideration. [note: A large amount of carbon dioxide will be transported via pipeline to the Elk Hills Field and federal regulations (49 CFR 195) required the applicant to prepare a risk analysis for the pipeline. The risk analysis determined that the risk of pipeline failure was less than significant.]

After removing from consideration those chemicals that pose no risk of off-site impact in Steps 1 and 2, staff continued with Steps 3, 4, and 5 to review the remaining large quantity hazardous materials:

1. natural gas
2. syngas
3. methanol
4. liquid oxygen
5. molten and liquid sulfur
6. anhydrous ammonia.

The project will be limited to using, storing, and transporting only those hazardous materials listed in Appendix B of this document as per staff's proposed condition **HAZ-1**.

Large Quantity Hazardous Materials

Natural Gas

Natural gas poses a fire and/or possible explosion risk because of its flammability. Natural gas is composed mostly of methane, but also contains ethane, propane, nitrogen, butane, isobutene, and isopentane. It is colorless, odorless, and tasteless and is lighter than air. Natural gas can cause asphyxiation when methane is 90% in concentration. Methane is flammable when mixed in air at concentrations of 5 to 14%, which is also the detonation range. Natural gas, therefore, poses a risk of fire and/or possible explosion if a release occurs under certain specific conditions. However, it should be noted that, due to its tendency to disperse rapidly (Lees 1998), natural gas is less likely to cause explosions than many other fuel gases such as propane or liquefied petroleum gas, but can explode under certain conditions (as demonstrated by the July 2004 natural gas detonation in Belgium).

While natural gas would be used in significant quantities, it would not be stored on site. It would be delivered via a 13 mile-long natural gas interconnection with Pacific Gas & Electric (PG&E) natural gas pipelines located north of the project site (HECA 2012e, Section 5.12). The risk of a fire and/or explosion on site can be reduced to insignificant levels through adherence to applicable codes and the development and implementation of effective safety management practices. The National Fire Protection Association (NFPA) code 85A requires both the use of double-block and bleed valves for gas shut off and automated combustion controls. These measures will significantly reduce the likelihood of an explosion in gas-fired equipment. Additionally, start-up procedures would require air purging of the gas turbines prior to start up, thereby precluding the presence of an explosive mixture. The safety management plan proposed by the applicant would address the handling and use of natural gas and would significantly reduce the potential for equipment failure because of either improper maintenance or human error.

Since the proposed facility will require the installation of a new gas pipeline off-site, impacts from this pipeline need to be evaluated. The design of the natural gas pipeline is governed by laws and regulations discussed here. These LORS require use of high quality arc welding techniques by certified welders and inspection of welds. Many failures of older natural gas lines have been associated with poor quality welds, or corrosion. Current codes address corrosion failures by requiring use of corrosion resistant coatings and cathodic corrosion protection. Another major cause of pipeline failure is damage resulting from excavation activities near pipelines. Current codes address this mode of failure by requiring clear marking of the pipeline route. An additional mode of failure is damage caused by earthquake. Existing codes also address seismic hazard in design criteria (see discussion below). Evaluation of pipeline performance in recent earthquakes indicates that pipelines designed to modern codes perform well in seismic events while older lines frequently fail. Staff believes that existing regulatory requirements are sufficient to reduce the risk of accidental release from the pipeline to less than significant levels.

Failures of gas pipelines, according to data from the U.S. Department of Transportation (the National Transportation Safety Board) from the period 1984 – 1991 and data from the National Response Center for the period 1990 - 2004, occur as a result of pipeline corrosion, pipeline construction or materials defects, rupture by heavy equipment excavating in the area such as bulldozers and backhoes, weather effects, and earthquakes. Given the gas line failures which occurred in the Marina District of San Francisco during the 1989 Loma Prieta earthquake, the January 1994 Northridge earthquake in Southern California, the January 1995 gas pipeline failures in Kobe, Japan, the January 19, 1995 gas explosion in San Francisco, the pipeline explosion in Belgium in July 2004, the natural gas storage fire in Texas in August 2004, and the San Bruno gas pipeline explosion and fire in Sept. 2010, the safety of the gas pipeline is of paramount importance. However, it must be noted that those pipelines which failed in 1989 to 1995 were older and not manufactured nor installed to modern code requirements. The February 2001 Nisqually Earthquake near Olympia Washington caused no damage to natural gas mains and there was only one reported gas line leak due to a separation of a service line going into a mobile home park. The Belgium gas pipeline explosion was due to construction equipment rupturing the line, not due to earthquake or structural failure.

If loss of containment occurs as a result of pipe, valve, or other mechanical failure or external forces, significant quantities of compressed natural gas could be released rapidly. Such a release can result in a significant fire and/or explosion hazard, which could cause loss of life and/or significant property damage in the vicinity of the pipeline route. However, the probability of such an event is extremely low if the pipeline is constructed according to present standards. According to DOT statistics, the frequency of reportable incidents is about 0.25 for all pipeline incidents per 1,000 miles per year or 2.5×10^{-4} incidents per mile per year. DOT has also evaluated and categorized the major causes of pipeline failure. To summarize, the four major causes of accidental releases from natural gas pipelines are: Outside Forces – 43 percent, Corrosion -18 percent, Construction/Material Defects -13 percent, and Other - 26 percent. Outside forces are the primary causes of incidents. Damage from outside forces includes damage caused by use of heavy mechanical equipment near pipelines (e.g., bulldozers and backhoes used in excavation activities), weather effects, vandalism, and earthquake-caused rupture as seen in the Marina District of San Francisco during the 1989 Loma Prieta Quake and in Kobe, Japan in January 1995. The fourth category, “Other” includes equipment component failure, compressor station failures, operator errors and sabotage. The average annual service incident frequency for natural gas transmission systems varies with age, the diameter of the pipeline, and the amount of corrosion. Older pipelines have a significantly higher frequency of incidents. These result from the lack of corrosion protection and use of less corrosion resistant materials compared to modern pipelines, limited use of modern inspection techniques, and higher frequency of incidents involving outside forces. The increased incident rate due to outside forces is the result of the use of a larger number of smaller diameter pipelines in older systems, which are generally more easily damaged and the uncertainty regarding the locations of older pipelines.

The safety requirements for pipeline construction vary according to the population density and land use that characterize the surrounding land. The pipeline classes are defined as follows (Title 49, Code of Federal Regulations, Part 192):

Class 1: Pipelines in locations within 220 yards of ten or fewer buildings intended for human occupancy in any 1-mile segment.

Class 2: Pipelines in locations within 220 yards of more than ten but fewer than 46 buildings intended for human occupancy in any 1-mile segment. This class also includes drainage ditches of public roads and railroad crossings.

Class 3: Pipelines in locations within 220 yards of more than 46 buildings intended for human occupancy in any 1-mile segment, or where the pipeline is within 100 yards of any building or small well-defined outside area occupied by 20 or more people on at least 5 days a week for 10 weeks in any 12 month period (the days and weeks need not be consecutive). (The proposed project gas pipeline would fall into this class.)

Class 4: Pipelines in locations within 220 yards of buildings with 4 or more stories above ground in any 1-mile segment.

In the United States, extensive federal and state pipeline codes and safety enforcement minimize the risk of severe accidents related to natural gas pipelines. In November 2000, the DOT Office of Pipeline Safety proposed a program requiring the preparation of risk management plans for gas pipelines throughout the United States. These risk management plans will include the use of diagnostic techniques to detect internal and external corrosion or cracks in pipelines and to perform preventive maintenance. The pipeline owner will be required to develop and implement these plans as per the regulation adopted May 2004 (49 CFR Part 192). The regulations prescribe minimum requirements for a pipeline Integrity Management Program to be prepared and followed by every operator of a pipeline segment located in a high consequence area. A high consequence area is defined as any location where the pipeline traverses a Class 3 or 4 area (see above) or other areas under specified circumstances. The integrity management program must contain the required elements as described in section 192.911, including an identification of all high consequence areas, a baseline assessment plan including methods of assessing pipeline integrity and a schedule for completing the assessment, an identification of threats to each pipeline segment including a risk assessment, an evaluation of mitigation measures, implementation procedures, and monitoring procedures. The regulations also include requirements for reassessment intervals, which range from 7 to 20 years depending on the type of reassessment and the operating percentage of the pipeline.

The following safety features will be incorporated into the design and operation of the natural gas pipeline (as required by current federal and state codes): (1) while the pipeline will be designed, constructed, and tested to carry natural gas at a certain pressure, the working pressure will be less than the design pressure; (2) butt welds will be X-rayed and the pipeline will be tested with water prior to the introduction of natural gas into the line; (3) the pipeline will be surveyed for leakage annually (4) the pipeline will be marked to prevent rupture by heavy equipment excavating in the area; and (5) valves at the meter will be installed to isolate the line if a leak occurs. These requirements will be administered by the federal government and the CPUC.

The natural gas pipeline must be designed to meet all standards of the California Public Utilities Commission General Order 112, Federal Department of Transportation (DOT) regulations, Title 49, Code of Federal Regulations (CFR), Parts 190, 191, and 192, and ASME B31 piping codes. CPUC General Order 112-E, Section 125.1 requires that at least 30 days prior to the construction of a new pipeline, the owner must file a report with the commission that will include a route map for the pipeline. Staff concludes that compliance with existing LORS would be sufficient to ensure minimal risks of pipeline failure.

Furthermore, on June 28 2010 the United States Chemical Safety and Hazard Board (CSB) issued Urgent Recommendations to the United States Occupational Safety and Health Administration (OSHA), the National Fire Protection Association (NFPA), the American Society of Mechanical Engineers (ASME), and major gas turbine manufacturers to make changes to their respective regulations, codes, and guidance to require the use of inherently safer alternatives to natural gas blows for the purposes of pipe cleaning. Recommendations were also made to the fifty states to enact legislation applicable to power plants that prohibits flammable gas blows for the purposes of pipe cleaning. In accordance with those recommendations, staff proposes Condition of Certification **HAZ-12** which prohibits the use of a flammable gas blow for pipe cleaning at the facility either during construction or after the start of operations. All fuel gas pipe purging activities shall vent any gases to a safe location outdoors, away from workers and sources of ignition. Fuel gas pipe cleaning and purging shall adhere to the provisions of most current versions of the National Fuel Gas Code (NFPA 54) including all Temporary Interim Amendments.

Syngas

Syngas poses a fire and/or possible explosion risk because of its flammability. Syngas contains hydrogen (H_2), carbon monoxide (CO), sulfur dioxide (SO_2), and hydrogen sulfide (H_2S). Syngas has a broader flammable and detonation range than natural gas because it is a mixture of chemicals with more diverse properties. Syngas also contains an extremely hazardous material, H_2S, which is scrubbed from the syngas and subsequently removed from the enclosed process system and mostly converted to elemental sulfur, a solid powder with low potential for migration or adverse impacts on the off-site public. It is then transferred for sale off-site. Up to 150,000 gallons of degassed molten sulfur will be stored on site in two sulfur storage pits. The storage pits will also be equipped with pressure-monitoring equipment and ventilation lines while the sulfur-loading equipment will have a vapor recovery system to control fugitive emissions of hydrogen sulfide by returning vapors to the SRU.

A catastrophic loss of the syngas would result in the release of significant amounts of H_2S and thus the applicant modeled a worst-case accidental release. Staff addresses the emissions of H_2S into the atmosphere as an accidental release in this section and as fugitive emissions from the process system in the **Public Health** section of this PSA/DEIS.

The applicant's modeling of an accidental release of hydrogen sulfide shows that the acute Reference Exposure Level (REL) would not be exceeded at off-site locations where the public drives and lives. Staff has also found that the modeling of fugitive emissions of H_2S emitted from the CO_2 vent shows that the acute REL would also not be exceeded, thus indicating no potential for adverse impacts to the public. (See the **Public Health** section for a thorough analysis of this issue.)

Sulfur Recovery Unit (SRU)

Hydrogen sulfide can be released from a failure of the sulfur recovery unit (SRU). Staff reviewed the past accident history of SRUs in California over the past 20 years and found that although there have been numerous releases of sulfurous chemicals at refineries in California (over 1,600 in the past 20 years); only about 80 of the reports specify the sulfur recovery unit as the source of the release. Thus, many of the incidents could involve components of a sulfur recovery system since it is a common system in refineries.

The vast majority of the reports of accidental releases at SRUs in California found in the National Response Center (NRC) database (see discussion above) show that most releases consist of sulfur dioxide (SO_2) and not H_2S. However, SO_2 will be produced in great quantities during the gasification process at the proposed HECA project and then will be combined with H_2S to produce elemental sulfur. (Sulfur dioxide will also be released from several sources into the atmosphere including the main stack, the SRU, and the Tail Gas Thermal Oxidizer). Therefore, because SO_2 will be produced by the HECA process, staff finds the reports of releases from refinery SRUs to be germane to the safety of the proposed process.

Although minor sulfur dioxide releases and other small incidents are common at sulfur recovery units, such incidents rarely produce fires, injuries, significant damage, or a need for evacuation. Sulfur recovery units at California facilities recorded roughly 100 incidents over the past 20 years, most of them without significant consequences. Therefore, staff proposes to address the risk management of this hazardous material by requiring that the Cal-OSHA Process Safety Management standard (8 CCR 5189) be followed and that a process hazard analysis and a Process Safety Management Plan (PSM Plan, which includes a Hazard and Operability analysis) and a Risk Management Plan (RMP, which would include a new Offsite Consequence Analysis different from the one prepared by the applicant in the AFC) be prepared.

In regards to the requirement to conduct a process safety management analysis and prepare a PSM Plan, staff strongly believes that it is imperative that the applicant understands that the entire Cal-OSHA Process Safety Management standard (8 CCR 5189) must be strictly followed and implemented. Towards that, staff believes that when conducting the process hazard analysis required in 8 CCR 5189 (e) (1), the project owner should perform a hazard analysis using at least two different methodologies. One shall be a Hazard and Operability Study (HAZOP) and the other can be chosen from the list in 5189 (e) (1) or one which is recognized by engineering organizations or governmental agencies.

Second, an independent outside third party group of professionals must provide peer review and approval of the plan before the plan is submitted to the Energy Commission compliance project manager (CPM) for approval. The most important part of the hazard review is described in 8 CCR 5189 (e)(3)(A) which requires that “The process hazard analysis shall be performed by a team with expertise in engineering and process operations, and the team shall include at least one operating employee who has experience and knowledge specific to the process being evaluated. The team shall also include one member knowledgeable in the specific process hazard analysis methodology being used. The final report containing the results of the hazard analysis for each process shall be available in the respective work area for review by any person working in that area". Staff proposes Condition of Certification **HAZ-9** which would require two hazard analyses be conducted and that an independent outside third party that also has the required expertise be hired by the project owner to review, evaluate, and sign-off on all process hazard analyses and PSM plans required by Energy Commission conditions. It would further require the project owner to develop and implement a pipeline integrity management plan that is consistent with the U.S. DOT Pipeline and Hazardous Materials Safety Administration (PHMSA) Liquid Pipeline Integrity Management in High Consequence Areas for Hazardous Liquid Operators (49 CFR Parts 195.450 and .452) rule, the recommendations of the U.S. Chemical Safety and Hazard Investigation Board in its report on the August 2, 2012 Chevron Richmond Refinery Fire, and the recommendations of the independent professionals retained as per the requirement mentioned above. This requirement applies not only to the SRU but all other processes identified by staff as needing a PSM Plan.

Methanol

Methanol (methyl alcohol) will be used as a gasifier start-up fuel and in the acid gas remover (AGR) and sulfur recovery unit. This use will be at elevated temperature and pressure thus increasing the potential for an accidental release, explosion, or fire. The applicant addressed the risk and impacts of a vapor cloud explosion and fire of the above-ground storage tank holding 300,000 gallons of methanol. Worst-case modeling indicated that a pressure wave of 1 psi would impact up to 4224 feet distant from the tank location (HECA 2012e Section 5.12.2.3) This impact would be beyond the Controlled Area and may impact the nearest residence (1400 feet from the control area fence line) but would not cause an impact at the school located 1.3 miles (6864 feet) away.

Staff proposes to address the risk management of this hazardous material by requiring a process hazard analysis and Process Safety Management Plan (PSM Plan, which includes a Hazard and Operability analysis) and a Risk Management Plan (RMP, which would require a new Offsite Consequence Analysis addressing explosion and fire). These analyses are conducted on the facility "as built" and thus serve as an extra method to identify potential problems before they occur. Staff believes that these plans will identify potential system failures and mitigation and thus allow for the implementation of additional engineering and administrative controls to further reduce the risk of off-site consequences to the public to less than significant. The applicant also will reduce the risk of fire or explosion at the methanol tank by utilizing an aqueous film forming foam as the fire suppression system. And, as described above, this process hazard analysis shall include at least two different methodologies and be reviewed and approved by an independent third party professional reviewer before submitting to the CPM for review and final approval.

Liquid Oxygen and Liquid Nitrogen

Liquid oxygen and liquid nitrogen are compressed gases stored as cryogenic liquids. As such, both are extremely dangerous and liquid oxygen is extremely corrosive and a potent oxidizer. Should a fire occur near the liquid oxygen tank and the tank or fittings rupture, a conflagration could ensue. Staff researched the incident rates of accidents and releases involving liquid oxygen tanks in the past 20 years and found that although the rate was low, they do occur. A review of the 15 incidents of liquefied oxygen releases in the United States alone found that worker deaths and injuries are not common and thus liquid oxygen storage does not pose a significant risk. Of these 15 incidents, 13 releases were due to the failures of valves, fittings, pipe leaks, gauges, and delivery vehicle hose couplings, or involved a small (20 cu ft) tank rupture due to a fall. In most cases, only a few hundred pounds of liquid oxygen was released, however, in one case, >20,000 pounds escaped. In 1999, in Bristol, MA, an oxygen bulk tank exploded and released 200 gallons. No injuries or evacuation were reported and the cause of the failure was not determined. In February 1978, three persons were killed in New Martinsville, WV when liquid oxygen escaping from a pipe at a chemical plant set off a very large explosion and fire. All land, air and river traffic was halted for about seven hours while officials waited for the 900-ton liquid oxygen tank to exhaust its supply. The cause was determined to be a pipe rupture at an air separation facility when a liquid nitrogen vessel broke and a portion fell on the liquid oxygen pipe.

Staff proposes to address the risk management of this hazardous material by requiring a process hazard analysis and Process Safety Management Plan (PSM Plan, which includes a Hazard and Operability analysis) and a Risk Management Plan (RMP, which includes an Offsite Consequence Analysis). The applicant will also install pressure relief valves and automatic shutdown equipment for the tank and oxygen delivery system that will reduce the likelihood of an accidental release. Staff believes that these plans will identify potential system failures and additional mitigation and thus, when combined with the applicant's proposed controls, will reduce the risk of off-site consequences to the public to less than significant. And, as described above, this process hazard analysis shall include at least two different methodologies and be reviewed and approved by an independent third party professional reviewer.

Molten and Liquid Sulfur

Molten sulfur and cooled liquid sulfur would be produced as a by-product of the gasification and sulfur removal processes and shipped off-site for sale after being de-gassed. Sulfur would be in a liquid suspension and would not, in and of itself, pose a hazard to the off-site public. However, the presence on the site of an extremely high amount (as much as 1,400,000 lbs at any one time) and the fact that the air space in the on-site storage container, tank truck, or rail car can contain high levels of extremely toxic hydrogen sulfide (H_2S) and carbonyl sulfide (COS) presents the potential for very high risk to on-site works and the off-site public. Thus, although liquid sulfur is non-volatile and of low toxicity at low temperatures, it has the potential to off-gas significant quantities of H_2S and can also be a fire and explosion hazard at high temperature. In order to address this matter when shipping this product off-site, staff proposes Condition of Certification **HAZ-10** which would require continual testing of the H_2S levels in the airspace above the shipping vehicle (tanker truck or rail tank car) and prohibit the off-site transport until the levels of H_2S fell below 2 ppm. The project owner would be able to address this matter in several ways including increasing the de-gassing period or adding active vapor removal equipment.

Anhydrous Ammonia

Anhydrous ammonia would be used to control the emission of oxides of nitrogen (NO_x) from the combustion of natural gas at the HECA project and as a feedstock for the production of ammonia-based fertilizer. The accidental release of anhydrous ammonia without proper mitigation can result in significant down-wind concentrations of ammonia gas. HECA would store up to 3,800,000 gallons in two above-ground ammonia tanks with a maximum capacity each of 1,900,000 gallons (HECA 2012e, Sections 5.12.2.2). The tanks will be double-walled (primary containment) and would be surrounded by a secondary containment basin (3-foot high wall) capable of holding the full contents of the tank plus the rainfall associated with a 24-hour 25-year storm. The secondary containment would slope to a drain to allow spilled ammonia to flow into a subsurface sump. (HECA 2012e, Sections 5.12.2.2 and data responses). Both tanks with their separate secondary containments would then be surrounded with a tertiary containment basin with 4-foot high walls.

Based on staff's analysis described above and the applicant's responses to staff's data requests, anhydrous ammonia is one of the hazardous materials that may pose a significant risk of off-site impact. The use of ammonia can result in the release of ammonia vapor in the event of a spill. This is a result of its vapor pressure and the large amounts of ammonia that will be used and stored on site.

To summarize, if the applicant's and staff's proposed conditions are adopted and the project is certified, the applicant would be required to develop and implement several engineering and administrative controls in order to reduce the chances of an accidental release of anhydrous ammonia, and to reduce the impacts of a release should one occur, including the following:

1. use of two double-walled storage tanks
2. secondary containment that drains into a subsurface sump
3. another third containment system that surrounds the tanks and the pumps used to transfer anhydrous ammonia from and to process units
4. the use of strategically fixed and mobile handheld ammonia sensors
5. the preparation and implementation of Process Safety Management Plans, HazOp studies, Safety Management Plans, spill prevention and control plans, and emergency response plans
6. the use of personal protective equipment (PPE) for on-site workers
7. interaction and training with the off-site responders from the Kern County Fire Department (KCFD; see section on Worker Safety/Fire Protection in this PSA/DEIS)

To assess the potential impacts associated with an accidental release of anhydrous ammonia should one occur, staff uses four benchmark exposure levels of ammonia gas occurring off site. These include:

1. the lowest concentration posing a risk of lethality, 2,000 parts per million (ppm);
2. the concentration immediately dangerous to life and health level of 300 ppm;
3. the emergency response planning guideline level 2 of 150 ppm, which is also the RMP level 1 criterion used by U.S. Environmental Protection Agency (EPA) and California; and
4. the level considered by the Energy Commission staff to be without serious adverse effects on the public for a one-time exposure of 75 ppm.

If the potential exposure associated with a potential release exceeds 75 ppm at any public receptor, staff will also assess the probability of occurrence of the release, the severity of the consequences, and the nature of the potentially exposed population in determining whether the likelihood and extent of potential exposure are sufficient to support a finding of potentially significant impact. A detailed discussion of the exposure criteria considered by staff, as well as their applicability to different populations and exposure-specific conditions, is provided in **Hazardous Materials Appendix A**.

Section 5.12.2.3 and **Appendix K** of the AFC (HECA 2012e) describe the modeling parameters used for the worst-case and the alternative accidental releases of anhydrous ammonia in the applicant's off-site consequence analysis (OCA). The OCA was performed for the worst-case release scenario, which involved the failure and complete discharge of the storage tank. The highest average recorded temperature (115°F), a wind speed of 1.5 meters per second, and atmospheric stability class F were used for emission and dispersion calculations to present worst-case conditions. Potential off-site ammonia concentrations were estimated using the ALOHA Gaussian plume model (HECA 2012e, **Appendix K** Section 3.1.1).

Figures showing how far the predicted ammonia concentrations would extend from the anhydrous ammonia tank under different accident release scenarios were provided as confidential information to staff. The applicant's modeling results for the most likely release scenario -- an accident involving the pumps moving ammonia into or out of the tanks and forming a pool of ammonia within the secondary containment area from which a lighter-than-air dispersion of ammonia would occur -- show that ammonia concentrations exceeding 75 ppm extend a little beyond the facility fence line to the east but do not reach any residential receptor. The modeling required by U.S. EPA using the air dispersion model required and assessing the complete rupture of one tank, shows that ammonia concentrations exceeding 75 ppm could extend as far as the town of Tupman. Staff has found in the past that the modeling required by the U.S. EPA using the RMP Comp program is ultra-conservative and provides little useful information for assessing impacts under CEQA. Since this modeling is so very conservative and overestimates the airborne concentration of ammonia should an accidental release occur from the storage tanks, staff concludes that the applicant's alternative modeling of the most likely release scenario demonstrates no off-site impact. Given the number of administrative and engineering controls required by federal, state and local regulations as well as staff's proposed conditions of certification for the anhydrous ammonia tank, piping, and pumps, staff believes that the storage and use of anhydrous ammonia will not result in a significant risk to the off-site public.

Mitigation

The potential for accidents resulting in the release of hazardous materials is greatly reduced through implementation of a safety management program that would include the use of both engineering and administrative controls. Elements of both facility controls and the safety management plan are reiterated and summarized below. Staff met with several representatives of the County Environmental Health Service Department (KCEHSD) and discussed their concerns and views on impacts to the county.

Engineering Controls

Engineering controls help to prevent accidents and releases (spills) from moving off site and affecting communities by incorporating engineering safety design criteria in the design of the project. The engineered safety features proposed by the applicant for use at the HECA project include:

- Storage of containerized hazardous materials in their original containers which are designed to prevent releases and are appropriately labeled.
- Construction of secondary containment areas surrounding each of the hazardous materials storage areas designed to contain accidental releases that might happen during storage or delivery.
- Physical separation of stored chemicals in isolated containment areas in order to prevent accidental mixing of incompatible materials, which could result in the evolution and release of toxic gases or fumes.
- Installation of local level gauges and alarms to prevent overfilling of bulk chemical storage tanks.
- Construction of a containment area surrounding the anhydrous ammonia storage tanks, sodium hydroxide tanks, sulfuric acid tank, sodium hypochlorite tank, diesel fuel tank, and lubricating oil tank capable of holding the entire contents of each tank plus the volume of rainfall associated with a 24-hour 25-year storm.
- The placement of a subsurface vault into which spilled anhydrous ammonia would flow thus reducing the surface area of a spill.
- Process protective systems including continuous tank level monitors, automated leak detectors, ammonia and hydrogen sulfide detectors, temperature and pressure monitors, alarms, and isolation valves.
- Hydrogen shall be stored on site (30,000 standard cubic feet or scf) within a multi-tube trailer and shall be monitored and controlled through the use of flow meters and pressure monitors. The hydrogen system shall also be equipped with pressure relief valves and automatic shutdown.
- Not greater than 150,000 gallons of degassed molten sulfur shall be stored on site within two sulfur storage pits. Both sulfur storage pits shall be constructed of compatible material, shall be structurally sound (free of any cracks or fissures), and shall be equipped with pressure-monitoring equipment and ventilation lines. In addition, sulfur-loading equipment shall have a vapor recovery system to control fugitive emissions by returning displaced vapors to the SRU.
- Methanol in the process unit shall be stored in a single 300,000-gallon AST with secondary containment. An additional 250,000 gallons of methanol will also be contained within process vessels, equipment, and piping of the AGR unit. This process inventory shall be kept geographically remote from the 300,000-gallon AST, and a pump and isolation valve shall be placed on the piping between the storage tank and the AGR unit isolating the AST and AGR unit. The tanks shall also be equipped with leak detectors to identify the presence of any liquid accumulation below the tank bottom or in the containment area. The methanol delivery system shall be equipped with a flow meter and automatic shutdown capabilities. The

methanol transfer pump and piping shall have secondary containment to collect any potential spills.

- Sodium phosphate shall be contained in an AST located at the indoor chemical storage area. The sodium phosphate ASTs shall be equipped with secondary containment and leak detectors to detect the presence of a rupture.
- The closed-loop cooling system of the process equipment that contains propylene glycol as a heat transfer fluid shall be equipped with leak detection equipment.
- The use of an extensive buffer-zone around the actual gasification facility and production processes so as to place distance between the facility and public roads. The perimeter of the buffer zone will also contain an earthen berm on the north and east sides of the entire site fence line.

Administrative Controls

Administrative controls also help prevent accidents and releases (spills) from moving off site and affecting neighboring communities by establishing worker training programs, process safety management programs, and complying with all applicable health and safety laws, ordinances, and standards.

A worker health and safety program will be prepared by the applicant and include (but not be limited to) the following elements (see the **Worker Safety and Fire Protection** section for specific regulatory requirements):

- worker training regarding chemical hazards, health and safety issues, and hazard communication;
- procedures to ensure the proper use of PPE;
- safety operating procedures for the operation and maintenance of systems utilizing hazardous materials;
- fire safety and prevention; and
- emergency response actions including facility evacuation, hazardous material spill clean-up, and fire prevention.

At the facility, the project owner will be required to designate an individual with the responsibility and authority to ensure a safe and healthful work place. The project health and safety official will oversee the health and safety program and have the authority to halt any action or modify any work practice to protect the workers, facility, and the surrounding community in the event of a violation of the health and safety program.

The applicant will also prepare a risk management plan for anhydrous ammonia, as required by both U.S. EPA and CalARP regulations and Condition of Certification **HAZ-2**. This condition also includes the requirement for a program for the prevention of accidental releases and responses to an accidental release of anhydrous ammonia. A hazardous materials business plan will also be prepared by the applicant that would incorporate state requirements for the handling of hazardous materials (HECA 2012e, Section 5.12.2.2). Additional administrative controls are required by **HAZ-2** including preparation of a Hazardous Materials Business Plan, a Process Safety Management Plan for several processes, and a Spill Prevention, Control, and Countermeasure Plan).

Other administrative controls would be required in proposed Conditions of Certification **HAZ-1** (limitations on the use and storage of hazardous materials and their strength and volume) and **HAZ-3** (development of a safety management plan). Proposed Condition **HAZ-9** would require an independent outside professional review and agreement with all process safety management evaluations and plans before the CPM approves them and the development and implementation of a pipeline integrity management plan that is consistent with the U.S. DOT Pipeline and Hazardous Materials Safety Administration (PHMSA) Liquid Pipeline Integrity Management in High Consequence Areas for Hazardous Liquid Operators (49 CFR Parts 195.450 and .452) rule, the recommendations of the U.S. Chemical Safety and Hazard Investigation Board in its report on the August 2, 2012 Chevron Richmond Refinery Fire, and the recommendations of the independent professionals retained. Proposed Condition **HAZ-4** would require that the anhydrous ammonia storage tank be designed to certain specifications.

Proposed condition **HAZ-12** would prohibit the past practice of using natural gas to “blow” debris from piping. And finally, command and control systems in a complex facility such as that proposed here must be protected from failure or damage. Process controls and sensors, fire detection and suppression, and communications are all vital to the safe operation of an industrial facility. Towards that, redundancy is required and all redundant command and control systems that are “hard-wired” must be placed in separate wiring tracks so that if one wiring track is compromised, both command and control systems would not be lost. Therefore, staff proposes Condition of Certification **HAZ-11** that would require the project owner to ensure that all redundant command and control systems that are “hard-wired” are placed in separate wiring tracks.

On-Site Spill Response

In order to address the issue of spill response, the facility will prepare and implement an emergency response plan that includes information on hazardous materials contingency and emergency response procedures, spill containment and prevention systems, personnel training, spill notification, on-site spill containment, and prevention equipment and capabilities, as well as other elements. Emergency procedures will be established which include evacuation, spill cleanup, hazard prevention, and emergency response.

The presence of oil in a quantity greater than 1,320 gallons invokes a requirement to prepare a Spill Prevention Control and Countermeasures (SPCC) Plan. The applicant has indicated that 2000 gallons of diesel fuel will be stored on site. While there are no known waters of the United States immediate adjacent to this site, there are Waters of the State and thus a SPCC Plan is required by 40 CFR 112. State law also applies in that pursuant to California HSC Sections 25270 through 25270.13, the project will store 10,000 gallons or more of petroleum on-site (when the lube oil and the transformers oil are included). The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the Certified Unified Program Authority (CUPA).

Designated plant personnel would be trained as first responders for hazardous materials incidents. In the event of a large spill, the Kern County Fire Department Hazmat Response Unit located in Bakersfield would respond to the project site, and contracted hazardous materials clean-up teams would also be available (HECA 2012e, Section 5.12.6.3 and 5.8.1.3). Staff finds that the available local hazmat teams and clean-up companies are capable of responding to a hazardous materials emergency call from HECA with an adequate response time.

Transportation of Hazardous Materials

Hazardous materials including large volumes of sodium hydroxide and methanol will be transported to the facility by tanker truck during operation of the facility. Diesel fuel and gasoline will also be transported to the site and stored on the site during construction. While many types of small volumes of hazardous materials will be transported to the site, based on staff's knowledge and past experience with the transportation of a wide variety of hazardous materials, staff believes that transport of these two materials would pose an insignificant risk to the off-site public should a spill occur. This is due to the low vapor pressure and low concentration of aqueous sodium hydroxide (5-50%) precluding a spill from spreading very far through the air and due to the very high vapor pressure of methanol resulting in the fast dissipation (volatilization) of methanol in the air.

There would also be large amounts of degassed liquid sulfur along with urea ammonium nitrate fertilizer transported off the site for delivery to distant purchasers. Staff believes that the UAN fertilizer poses an insignificant risk of harm to the off-site public should there be a spill because it is in solid form and is used and transported extensively without mishap in agricultural regions of California and the United States. Liquid sulfur, however, may pose a different problem and may pose an inhalation hazard to the off-site public if it is not thoroughly de-gassed of hydrogen sulfide (H_2S). Liquid sulfur will be transported in rail tank cars or tanker trucks specifically designed and permitted for this type of hazardous material and will be at a temperature of ~284° F (140° C) (HECA 2012e, section 5.12.4.2). In order to ensure that the liquid sulfur is properly degassed and residual levels of H_2S do not pose a hazard to the off-site public in the event of a transportation spill, staff proposes Condition of Certification **HAZ-10** which would require the project owner to ensure through on-site testing that no batch of degassed liquid or molten sulfur loaded into a rail tank car or tanker truck would be allowed to leave the site unless the H_2S levels have been found to be less than 2 ppm.

Staff reviewed the applicant's proposed transportation routes for hazardous materials delivery. Trucks would travel from Bakersfield using Stockdale Highway to Morris Road to Station Road to the project's gate (HECA 2012e, Section 5.12.3 and Figure 5.12-1). Alternative routes will only be used if hazardous materials are transported from non-major suppliers.

A liquid or gaseous hazardous material can be released during a transportation accident and the extent of impact in the event of such a release would depend upon the location of the accident and the rate of dispersion of ammonia vapor from the surface of the aqueous ammonia pool. The likelihood of an accidental release during transport is dependent upon three factors:

1. the skill of the tanker truck driver;
2. the type of vehicle used for transport; and
3. accident rates.

To address this concern, staff evaluated the risk of an accidental transportation release in the project area. Staff's analysis focused on the project area after the delivery vehicle leaves the main highway (Stockdale). Staff believes it is appropriate to rely upon the extensive regulatory program that applies to the shipment of hazardous materials on California highways to ensure safe handling in general transportation (see Federal Hazardous Materials Transportation Law 49 USC §5101 et seq, DOT regulations 49 CFR subpart H, §172–700, and California Department of Motor Vehicles (DMV) regulations on hazardous cargo). These regulations also address the issue of driver competence. See AFC section 5.10 for additional information on regulations governing the transport of hazardous materials.

To address the issue of tanker truck safety, all hazardous materials will be delivered to the proposed facility in DOT-certified vehicles.

To address the issue of accident rates, staff reviewed the technical and scientific literature on hazardous materials transportation (including tanker trucks) accident rates in the United States and California. Staff relied on six references and three federal government databases to assess the risk of a hazardous materials transportation accident. Staff used the data from the Davies and Lees (1992) article, which references both the 1990 Harwood et al. and 1993 Harwood studies, to determine that the frequency of release for the transportation of hazardous materials in the U.S. is between 0.06 and 0.19 releases per 1,000,000 miles traveled on well-designed roads and highways. The short distance from Interstate-5 to the facility is approximately 4 miles (one way). Even using the high number of delivery vehicles coming into the facility to deliver hazardous materials and the number of trucks leaving the site with liquid sulfur (if rail tank cars are not used), the number of miles driven by vehicles transporting hazardous materials of sufficient volume and volatility to pose a risk to the public if spilled is very small, on the order of 4000 miles (1000 trips at 4 miles per trip). Staff believes that the risk over this distance is insignificant. Data from the U.S. DOT show that the actual risk of a fatality over the past five years from <u>all</u> modes of hazardous material transportation (rail, air, boat, and truck) is approximately 0.1 in 1,000,000.

Staff therefore believes that the risk of exposure to significant concentrations of any hazardous material during transportation to the facility is insignificant because of the remote possibility that an accidental release of a sufficient quantity could be dangerous to the public. The transportation of similar volumes of hazardous materials on the nation's highways is neither unique nor infrequent. Staff's analysis of the transportation of aqueous ammonia to the proposed facility (along with data from the U.S. DOT) demonstrates that the risk of accident and exposure is less than significant.

In order to further ensure that the risk of an accident involving the transport of methanol or sodium hydroxide to the power plant or liquid sulfur from the facility are insignificant, staff proposes an additional administrative control in proposed Condition of Certification **HAZ-6** that would require the use of only one specific route to the site, that being the shortest route from and to Interstae-5 using Stockdale Highway, Morris Road, and Station Road.

Based on the environmental mobility, toxicity, the quantities at the site, and frequency of delivery, it is staff's opinion that that the risk associated with the transportation of hazardous materials to or from the proposed project (with the possible exception of liquid sulfur) is below the level of significance. Regarding liquid sulfur, as discussed above, staff believes the risk posed by an accidental release of liquid sulfur can be reduced to a level of insignificance by ensuring that the material is not allowed to leave the site until it is demonstrated that the airspace in the tanker truck or rail tank car does not have a concentration of H_2S above 2 ppm. The project owner would be able to address this matter in several ways including increasing the de-gassing period or adding active vapor removal equipment.

Seismic Issues

It is possible that an earthquake could cause the failure of a hazardous materials storage tank. An earthquake could also cause failure of the secondary containment system (berms and dikes), as well as the failure of electrically controlled valves and pumps but the presence of a back-up power supply would mitigate any loss of primary power. Nevertheless, although a remote possibility, the failure of all of these preventive control measures might then result in a vapor cloud of hazardous materials that could move off site and affect residents and workers in the surrounding community. The effects of the Loma Prieta earthquake of 1989, the Northridge earthquake of 1994, and the earthquake in Kobe, Japan, in January 1995, have all heightened concerns about earthquake safety.

Information obtained after the January 1994 Northridge earthquake showed that some damage was caused both to several large storage tanks and to smaller tanks associated with the water treatment system of a cogeneration facility. The tanks with the greatest damage, including seam leakage, were older tanks, while the newer tanks sustained displacements and failures of attached lines. Therefore, staff conducted an analysis of the codes and standards which should be followed when designing and building storage tanks and containment areas to withstand a large earthquake. Staff also reviewed the impacts of the February 2001 Nisqually earthquake near Olympia, Washington, a state with similar seismic design codes as California. No hazardous materials storage tanks failed as a result of that earthquake. Referring to the sections on **Geologic Hazards and Resources** and **Facility Safety Design** in the AFC, staff notes that the proposed facility will be designed and constructed to the standards of the 2010 California Building Code and the American Society of Civil Engineers standards (ASCE 7-05) for Seismic Zone 4 (HECA 2012e, Section 2.8.1).

Staff has also reviewed reports of the impacts of the earthquakes in Haiti (January 12, 2010; magnitude 7.0) and Chili (February 27, 2010; magnitude 8.8). The building standards in Haiti are extremely lax while those in Chile are as stringent and modern as California seismic building codes. Yet, the preliminary reports show a lack of impact on hazardous materials storage and pipelines infrastructure in both countries. For Haiti, this most likely reflects a lack of industrial storage tanks and gas pipelines; for Chili, this most likely reflects the use of strong safety codes.

Therefore, on the basis of what occurred in Northridge with older tanks and the lack of failures during the Nisqually earthquake (with newer tanks) and in the 2010 Chilean earthquake, staff determined that tank failures during seismic events are not probable and do not represent a significant risk to the public. All structures and hazardous materials storage tanks/structure at the proposed facility must be built to codes for Seismic Zone 4, the highest level possible.

Site Security

Background

The applicant proposes to use hazardous materials identified by the U.S. EPA as requiring the development and implementation of special site security measures to prevent unauthorized access. The U.S. EPA published a Chemical Accident Prevention Alert regarding site security (EPA 2000a), the U.S. Department of Justice published a special report entitled *Chemical Facility Vulnerability Assessment Methodology* (US DOJ 2002), the North American Electric Reliability Corporation published *Security Guidelines for the Electricity Sector* in 2002 (NERC 2002) as well as issued a Critical Infrastructure Protection standard for cyber security (NERC 2009), and the U.S. Department of Energy (DOE) published the draft *Vulnerability Assessment Methodology for Electric Power Infrastructure* in 2002 (DOE 2002). The energy generation sector is one of 14 areas of critical infrastructure listed by the U.S. Department of Homeland Security. On April 9, 2007, the U.S Department of Homeland Security published in the Federal Register (6 CFR Part 27) an interim final rule requiring that facilities that use or store certain hazardous materials conduct vulnerability assessments and implement certain specified security measures. This rule was implemented with the publication of Appendix A, the list of chemicals, on November 2, 2007. This proposed facility plans to store anhydrous ammonia solution in an amount that will place the facility under the requirements of the CFATS regulation.

Analysis

Staff received a needs assessment from the California Highway Patrol and the Kern County Sheriff's Department regarding security (CHP 2012a, CHP 2013a; Kern County 2013a). The CHP indicated that it would serve as a back-up to the Kern County Sheriff's Department on emergency responses to the site with a response time of 5 to 10 minutes, that response times could be effected by the increase of traffic during construction and operations, but that an increase in resources was probably not needed. The Kern County Sheriff indicated that its response time would be 10 to 15 minutes to the site, that response times could be impacted during construction but not during operation, and expressed concerned about theft during construction and possible terrorist attacks during operations, Staff also met with representatives of law enforcement including the Kern County Sheriff's Department, the California Highway Patrol, and the Joint Anti-terrorism Task Force and discussed security requirements for the proposed HECA facility. The goal of the assessments and meeting was to identify the level of security necessary for deterrence and protection from malicious mischief, vandalism, or domestic/foreign terrorist attacks. The level of infrastructure and cyber security needed for the HECA project is dependent upon the threat imposed, the likelihood of an adversarial attack, the likelihood of success in causing a catastrophic event, and the severity of the consequences of that event. The results of the off-site consequence analysis prepared as part of the RMP was used, in part, to determine the severity of consequences of a catastrophic event. Staff also met with the applicant and its consultants and reviewed the security plans proposed by the applicant.

Intentional Destructive Acts

As with any United States energy infrastructure, the proposed HECA Project facilities could potentially be the target of terrorist attacks or sabotage. However, the potential for such attacks on coal-fueled power plants has not been identified as a threat of comparable magnitude to the concerns about the vulnerability of nuclear power plants to terrorist attacks (Behrens and Holt 2005). Although risks of sabotage or terrorism cannot be quantified because the probability of an attack is not known, the potential environmental effects of an attack can be estimated. Such effects may include localized impacts from releases of harmful materials or gases at the HECA project and associated facilities, similar to those that could occur as a result of an accident or a natural disaster. To evaluate the potential impacts of sabotage or terrorism, failure scenarios are analyzed without specifically identifying the cause of failure mechanism. For example, a truck running over an injection wellhead would result in a wellhead failure, regardless of whether this was done intentionally or through mishap. Releases of harmful chemicals can occur due to failure of a component, human error, a combination of both, or from external events such as plane or rail accidents (e.g., delivery of hazardous chemicals to the site), seismic events, or other natural events such as high winds, tornadoes, floods, ice storms, and natural or human-caused fires.

Therefore, the accident analysis conducted for this PSA/DEIS evaluates the outcome of catastrophic events without determining the motivation behind the incident. The accident analyses included potential releases from accidents at the energy center, CO2 pipeline, and injection wells. These accidents could also be representative of the impacts from a sabotage or terrorism event. Release scenarios evaluated included: liquid oxygen tank leaks, pipeline rupture or puncture, and injection well failure as described previously. Evaluations of hypothetical releases indicate the following potential impacts:

- The most likely individuals to be affected by releases from the energy center equipment or tanks are on-site workers. The estimated number of workers during operations is 87 to 115 people, although not all would be present at any given time in proximity to an incident.
- A failure of the liquid oxygen tanks could cause a potential impact to workers due to fires or frostbite. The initial vapor cloud from such a release was estimated to be within the energy center property.
- CO_2 and trace gases could be dispersed into the air and migrate downwind from pipeline ruptures or punctures or injection well failures. The number of individuals from the general population potentially experiencing transient effects from a release event of CO_2 or the trace gases hydrogen sulfide, sulfur dioxide, or sulfur trioxide from the pipeline or injection wells is estimated to be one or less. Under normal operating conditions, the concentration of trace gases are expected to be lower than simulated, in which case there would be no effects from the trace gases to the general public.
- Under the highest consequence scenarios, onsite workers would be the individuals most at-risk of injury or death if near a release at the energy center, pipeline, or injection wells.

As a result of this information and discussions at meetings, staff believes that security would be addressed in a proper and appropriate manner and would be consistent with LORS. In order to ensure that site security is implemented as planned and also that a shipment of hazardous materials to or from the site is not the target of unauthorized access or attack, staff proposes Conditions of Certification **HAZ-6** and **HAZ-7**. These would address both construction security and operation security plans and would require implementation of site security measures consistent with the above-referenced documents. Staff believes that the impacts of sabotage would be similar to that of an accidental release of a hazardous material and thus many of the safety measures employed to address an accidental release would also serve to prevent, control, and mitigate a release caused by an intentional act of sabotage or terrorist attack. Furthermore, staff believes that the level of threat is low due to its remote location.

The security measures required include perimeter fencing and breach detectors, alarms, site access procedures for employees and vendors, site personnel background checks, and law enforcement contacts in the event of a security breach. Site access for vendors shall be strictly controlled. Consistent with current state and federal regulations governing the transport of hazardous materials, hazardous materials vendors will have to maintain their transport vehicle fleet and employ only properly licensed and trained drivers. The project owner will be required, through the use of contractual language with vendors, to ensure that vendors supplying hazardous materials strictly adhere to the U.S. DOT requirements for hazardous materials vendors to prepare and implement security plans (as per 49 CFR 172.802) and to ensure that all hazardous materials drivers are in compliance through personnel background security checks (as per 49 CFR Part 1572, Subparts A and B). The compliance project manager (CPM) may authorize modifications to these measures or may require additional measures in response to additional guidance provided by the U.S. Department of Homeland Security, the U.S. DOE, or the NERC, after consultation with both appropriate law enforcement agencies and the applicant.

ENHANCED OIL RECOVERY FACILITY (EOR)

The Enhanced Oil Recovery (EOR) facility at Occidental of Elk Hills, Inc. (OEHI) is located approximately four miles south of the proposed HECA project site (OXY 2012). Carbon dioxide is a byproduct at HECA and it is proposed to be compressed and delivered by pipeline to the EOR facility where it would be injected in the oil wells to help in the recovery of naturally trapped oil. It is expected to result in the sequestration of approximately three (3) million tons of CO_2 per year during the demonstration phase. This rate of sequestration would also be required for the operational life of the power plant due to the requirements of California law (SB 1368) and the value created by the use of the CO_2 for EOR. The captured CO_2 would be compressed and transported via pipeline to the Elk Hills Oil Field. An additional small amount of the CO_2 produced by the facility would be used to manufacture urea.

The EOR process involves the injection and reinjection of CO_2 to reduce the viscosity and enhance other properties of trapped oil in order to facilitate its flow through the reservoir, improving extraction. During EOR operations, the pore space left by the extracted oil is occupied by the injected CO_2, sequestering it in the geologic formation. EOR operations would be monitored to ensure that the injected CO_2 remains within the formation. (Please see the **Carbon Sequestration And Greenhouse Gas Emissions** section for a more thorough discussion).

Staff met with the environmental and security personnel for Occidental Elk Hills, Inc. and reviewed the hazardous materials that would be used and stored at the EOR site. During operations at the EOR facility, some hazardous materials would be located at the site and would include ~1000 barrels of diesel fuel for an emergency generator and small amounts of chemicals for water treatment. The area is remote with no access to the public. The site would have flow, pressure, and temperature monitoring devices, fire detection system sensing flame, leak detection sensing petroleum products, and have available a fire water supply tank of 1.5 million gallons. The CO_2 pipeline would for the most part be located underground and security at the two parts above ground where valve boxes exist would be surrounded by chain-link fence

Staff concludes that given the small number of hazardous materials and the distance to any public off-site receptor, it is extremely unlikely that any hazardous materials spill at the EOR project site would result in a significant impact to the off-site public. Therefore, staff does not propose any mitigation measures for the EOR component.

CUMULATIVE IMPACTS AND MITIGATION

Staff analyzed the potential for the existence of cumulative impacts. A significant cumulative hazardous materials impact is defined as the simultaneous uncontrolled release of hazardous materials from multiple locations in a form (gas or liquid) that could cause a significant impact where the release of one hazardous material alone would not cause a significant impact. Existing locations that use or store gaseous or liquid hazardous materials, or locations where such facilities might likely be built, were both considered. The nearby area comprises agricultural lands, which frequently use ammonia as a fertilizer and therefore may have mobile ammonia tanks at various locations. Other than these tanks, staff found no existing or proposed facilities within a distance that could possibly contribute to a cumulative impact. Staff believes that while cumulative impacts are theoretically possible, they are not probable because of the many safeguards implemented to both prevent and mitigate an uncontrolled release.

The applicant’s modeling of a worst-case release of aqueous ammonia from the proposed project site predicts that significant levels of ammonia vapors would not occur off-site and therefore no cumulative impacts would be expected even if a nearby mobile ammonia tank would experience an accidental release concurrent with that from the proposed HECA (HECA 2012e, Section 5.12.5). The applicant will develop and implement a hazardous materials handling program for HECA independent of any other projects considered for potential cumulative impacts. Staff believes that the facility, as proposed by the applicant and with the additional mitigation measures proposed by staff, poses a less than significant risk of accidental release that could result in off-site impacts. It is unlikely that an accidental release that has very low probability of occurrence (about one in one million per year) would independently occur at the HECA site and another site at the same time. Therefore, staff concludes that the facility would not contribute to a significant hazardous materials-related cumulative impact.

COMPLIANCE WITH LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Staff concludes that if all proposed conditions were adopted and implemented, the construction and operation of the HECA project would be in compliance with all applicable laws, ordinances, regulations, and standards (LORS) regarding long-term and short-term project impacts in the area of hazardous materials management.

RESPONSE TO AGENCY AND PUBLIC COMMENTS

Comment: A member of the public, in a letter objecting to the Project on July 16, 2012 (TN #66245), included a print out of anhydrous ammonia safety and underlined information specific to health effects that can occur as a result of exposure to this substance, transport of anhydrous ammonia under pressure, and the potential for its escape from transfer hoses or valves, equipment malfunctions and during transportation. The implied question asks what is the potential of an accident occurring involving anhydrous ammonia and what would the effects be to the surrounding area?

Response: Staff examined the proposed storage and use of anhydrous ammonia and has proposed several engineering and administrative controls that, if implemented along with the applicant's proposed controls, would reduce the risk of an impact to the public to less than significant. (Note that since this comment was submitted, the applicant has dropped its plan to transport anhydrous ammonia off-site for sale.)

Comment: AIR (Association of Irritated Residents) provided a status report and data requests in a document dated November 2, 2012 (TN #68076). Residents asked about the dangers of anhydrous ammonia and if it is deadly. Several asked for more information on the possibility of accidents or releases at the project resulting in fatalities to nearby residents or workers, and accidents involving trucks transporting hazardous materials. They asked specifically how safe is it for someone to live or work nearby if there is a release of CO_2 or anhydrous ammonia, and are there other hazardous gases that might be released and cause harm. There was additional concern expressed regarding the potential for materials on-site to cause explosions and what impact that would have on the neighboring area. A question was raised as to whether the chemical factory will produce ammonium nitrate fertilizer and in what quantity and what security will HECA provide for storage and shipping of ammonium nitrate.

Response: Staff assessed these issues and its response can be seen in this section of the PSA/DEIS above.

Comment: The Kern County Public Health Services Department, Environmental Health Division, requested specific mitigation measures be instituted with regards to hazardous materials management (TN #69831, March 6, 2013). Some of the mitigation measures include:

- Crash protection around proposed secondary containment areas;
- Sensors at the site that will sound early notification of an accidental release;
- Compliance with regulations including development of Hazardous Materials Release Response Plan, Chemical Inventory, California Accidental Release Prevention Program (CalARP), underground storage tanks, aboveground petroleum storage tank spill prevention control, Hazardous Materials Business Plan;

- Development of written materials that provide information to residences and businesses within the area of the off-site consequence analysis (OCA) with the findings of the analysis and actions to follow in the event of a release;
- Complete a Process Hazard Analysis (PHA) for all applicable hazardous materials on-site with mitigation measures and issues of concern;
- Documentation of an Emergency Response Plan for accidental release of hazardous materials.

Response: Staff considered all these issues and provides information as follows:

- *Crash protection around proposed secondary containment areas is required by LORS and thus staff felt it was not necessary to include this requirement in a condition of certification;*
- *Sensors and a warning system will be placed at the site. Sensors are required by LORS and staff's proposed Condition **HAZ-3**. An early warning system of an accidental release would be installed pursuant to an agreement between the project owner and the KCFD/KCEHD and staff believes that this type of system is best designed and implemented as part of that agreement. Staff believes that a successful community warning and notification system is one that is developed and implemented as part of a "good neighbor" agreement between HECA, the KCFD, and the community;*
- *Compliance with regulations including development of Hazardous Materials Release Response Plan, Chemical Inventory, California Accidental Release Prevention Program (CalARP), underground storage tanks, aboveground petroleum storage tank spill prevention control, Hazardous Materials Business Plan is required by LORS and would also be required by Condition **HAZ-2**, **HAZ-3,** and **HAZ-9**;*
- *"Development of written materials that provide information to residences and businesses within the area of off-site consequences analysis (OCA) with the findings of the analysis and actions to follow in the event of a release" Staff has recommended preparation of these materials and information because it would not be part of a CEQA analysis and, as stated above, these programs are most successful when developed as part of a "good neighbor" agreement between HECA, the KCFD, and the community. Staff supports the voluntary implementation of such a program;*
- *Completing a Process Hazard Analysis (PHA) for all applicable hazardous materials on-site with mitigation measures and issues of concern is required by LORS for some substances (anhydrous ammonia and nitric acid) and staff proposes to require it for other processes as well in Condition **HAZ-9;***
- *Documentation of an Emergency Response Plan for accidental release of hazardous materials is required by LORS and staff proposes to require it in Conditions **HAZ-2** and **WORKER SAFETY-2**.*

Comment:
Karen Wright very recently commented on the April 17, 2013 fertilizer plant explosion in West, TX. She stated that the proposed HECA facility is planning to "produce large quantities of ammonia and ammonium nitrate" and that after the disaster at the West, TX

fertilizer plant; it would be “a bad idea to produce the same chemicals in California and endanger the citizens”. She requested that the Energy Commission give this matter serious consideration and that “no measure of safety will overcome the risks”.

Response:
It is true that large amounts of anhydrous ammonia would be produced and stored at the proposed HECA facility and that Urea Ammonium Nitrate (UAN) fertilizer would be produced, stored, and shipped off-site if the proposed facility were to be licensed by the Commission and built. However, the processes involved and the fertilizer that would be produced at the HECA facility are not similar to those involved in the accidental explosion at the West, TX fertilizer handling facility. By comparison the West TX plant stored and handled dry (often referred to as “prilled”) ammonium nitrate (AN), a form that has been responsible for nearly all documented AN accidents. At HECA AN would be produced in a process and would only exist as a aqueous solution in a process vessel. While process accidents can occur at AN production facilities as demonstrated by the accident at the TERRA industries facility that occurred in 1994 in Port Neal Iowa, such process accidents are much less frequent than events caused by handling of dry AN.

There are as many as 1,150 small fertilizer plants in Texas alone and the West Fertilizer Company consisted of several buildings and storage tanks. It stored, distributed and blended fertilizers, including large quantities of dry solid ammonium nitrate, for use by farmers around the Central Texas community. There were no sprinklers, no firewalls, no water deluge systems, and safety inspections by federal, state, or local regulatory agencies were rare. Within a four-block area were a school, an apartment complex, a nursing home, and several residential homes. All were either destroyed or severely damaged.

The maximum amount of ammonium nitrate the plant was permitted to store in one container was 90 tons (180,000 pounds) and the most it could legally have on site was 270 tons (540,000 pounds). It appears that between 28 and 34 tons of ammonium nitrate exploded (equivalent to ~20,000 pounds of TNT) and a total of 150 tons were found onsite. It was also authorized to handle and store up to 54,000 pounds of anhydrous ammonia (which did not leak).

The West Fertilizer Company appears to have a history of non-compliance with regulations. In summer 2012, the U.S. Pipeline and Hazardous Materials Safety Administration assessed a $10,000 fine against West Fertilizer for improperly labeling storage tanks and preparing to transfer chemicals without a security plan. The company paid $5,250 after reporting it had corrected the problems. The U.S. EPA also cited the plant for not having an up-to-date Risk Management Plan (RMP). That problem was also resolved, and the company submitted a new plan in 2011. That plan, however, said the company did not believe it was storing or handling any flammable substances and did not list fire or an explosion as a danger. At the time of the preparation of this PSA/DEIS, investigators still do not have a cause for the fire or the explosion but do know that the fire occurred first and suspected causes include an intentional act, an issue with the plant's electrical system, and a golf cart.

In comparison, the proposed HECA facility would also produce and store a large amount of anhydrous ammonia, up to 3.8 million gallons (at 5.15 pounds per gallon that would equate to a maximum of 19.5 million pounds of anhydrous ammonia). However, the means of storage is not similar to storage practice at the West Fertilizer facility. While the precise method of storage at the West Fertilizer site is unknown at this time, it is likely that the 54,000 pounds were stored in pressure tanks. Anhydrous ammonia stored as a liquefied *gas at elevated pressure has high internal energy. The internal energy associated with this stored form of anhydrous ammonia can act as a driving force in an accidental release, which can rapidly introduce large quantities of the material to the ambient air resulting in high down-wind concentrations. A view of the satellite photos taken the year before the blast shows tanks that are similar to the shape and size of typical anhydrous ammonia pressure vessels.*

In contrast, the HECA facility proposes to store anhydrous ammonia in two double-walled tanks (primary containment) which would be surrounded by a secondary containment basin (3-foot high wall) capable of holding the full contents of the tank plus the rainfall associated with a 24-hour 25-year storm. The secondary containment would slope to a drain to allow spilled ammonia to flow into a subsurface sump. Both tanks with their separate secondary containments would then be surrounded with a tertiary containment basin with 4-foot high walls. The anhydrous ammonia in the tanks would also be at near atmospheric pressure as a refrigerated liquid. If a leak or high internal tank pressure occurs, the anhydrous ammonia will first fill the interstitial space between the inner and outer walls of the double-walled storage tank. When the pressure builds up to a certain point, a pressure relief valve at the top of the tank will release ammonia as a vapor and not as a jet release of liquid anhydrous ammonia. Should both walls of the double-walled tank fail or should the piping fail, anhydrous ammonia will flow as a refrigerated liquid into the third line of defense, a concrete containment structure that would allow the refrigerated anhydrous ammonia to flow into a subsurface vault. This type of ammonia storage is both intrinsically much safer and a release would be much better controlled than would be the case in a release from pressurized storage.

Also, the fertilizer involved in the West, TX explosion involved solid ammonium nitrate (AN) while HECA would produce (AN) as an intermediate product used to produce urea ammonium nitrate (UAN) fertilizer. UAN in aqueous solution is intrinsically much safer to handle than dry AN.

Ammonium nitrate is a solid and a strong oxidizing agent and thus can be highly explosive when heated or contaminated. This potential for explosions is well recognized and has prompted the U.S. Department of Homeland Security to regulate ammonium nitrate under the Chemical Facility Anti-Terrorism Standard program (6 CFR Part 27 interim final rule). The West Fertilizer plant could have had as much as 270 tons (540,000 pounds) of solid ammonium nitrate on site.

The fertilizer plant at the proposed HECA project would produce AN only as an intermediate product in the ultimate production of urea ammonium nitrate fertilizer in aqueous (water) solution. Urea ammonium nitrate can also be produced in a solid form but would only exist at HECA in an aqueous solution. When in aqueous solution, UAN is stable and does not pose a high explosion risk. However, evaporating the water from a UAN solution would produce a dry solid consisting of urea and ammonium nitrate posing an explosion risk similar to AN. Thus, precautions must be taken to avoid evaporating the water from this UAN solution. During the manufacturing process, anhydrous ammonia would be combined with nitric acid to produce the intermediate chemical ammonium nitrate. The ammonium nitrate would also be in aqueous solution at a concentration of ~79%. Approximately 25.8 tons (~51,600 pounds) of ammonium nitrate would be produced every hour. A storage tank would contain ~43 tons (~8,600 pounds) which represents about a 100-minute supply at the proposed operation production rate and ~3.2 tons (~6,400 pounds) would exist in system pipes and reactor vessels. Thus, a maximum total of ~ 46.2 tons (~92,400 pounds) of ammonium nitrate would be in the system at any one time. The *entire manufacturing process would take place in a closed system with state of the art process controls. At no time would dry solid ammonium nitrate be produced. In case of a fire, suppression systems would reduce risk to process equipment. This can be contrasted to the West Fertilizer plant which could have had as much as 270 tons (540,000 pounds) of dry solid ammonium nitrate present and had no automated fire detection or suppression systems.*

The following table summarizes the differences between the West Fertilizer plant and the proposed HECA facility.

Table 1 – West Fertilizer / HECA comparison

Issue	***West Fertilizer Plant***	***HECA***
anhydrous ammonia [a] stored in pressurized liquid form	*54,000 lbs liquid*	*---*
anhydrous ammonia [a] in refrigerated liquid form at atmospheric pressure	*---*	*19,500,000 lbs liquid*
ammonia storage tank	*single walled pressure vessel*	*refrigerated double-walled vessel at ambient pressure*
ammonium nitrate in dry solid form	*540,000 lbs*	*---*
ammonium nitrate solution	*---*	*92,400 lbs, intermediate product, in aqueous solution in process vessels*
urea ammonium nitrate (UAN) solution	*---*	*63,000 tons in aqueous solution*
fire protection	*no sprinklers, no fire walls*	*state of the art modern advanced fire detection and suppression systems*
distance to nearest residence	*less than one block*	*approximately 4025 ft. (3/4 mile) from the anhydrous ammonia tank; greater from the fertilizer production facility*
distance to nearest school	*less than 4 blocks*	*1.3 miles from the project boundary; greater distance form the ammonia tank and fertilizer production facility*
distance between AN storage and anhydrous ammonia tank	*estimated at 100 ft.*	*~1025 ft.*
regulatory agency inspections	*appear to have been minimal according to press reports*	*regular inspections and/or oversight during construction, commissioning, and operation by the Energy Commission CPM, the KCFD, the Kern County Environmental Health Service Department, the air district, Cal-OSHA, and the U.S. EPA*

a. Anhydrous (e.g., without water) ammonia is gaseous at room temperature and pressure. However, it is usually stored as a liquid by increasing the pressure and/or refrigerating. Because ammonia is readily miscible in water, ammonia is often stored in aqueous solution (water / ammonia mixture) for ease of handling and storage and improved safety.

CONCLUSIONS

Staff's evaluation of the proposed project (with proposed mitigation measures) indicates that hazardous material use will pose no significant impact to the public. Staff's analysis also shows that there will be no significant cumulative impact. With adoption of the proposed conditions of certification, the proposed project will comply with all applicable LORS. In response to Health and Safety Code, section 25531 et seq., the applicant will be required to develop a Risk Management Plan (RMP). To ensure the adequacy of the RMP, staff's proposed conditions of certification require that the RMP be submitted for concurrent review by the Kern County Environmental Health Services Department (KCEHSD) and by Energy Commission staff. In addition, staff's proposed conditions of certification require the review and approval of the RMP by staff prior to the delivery of any hazardous materials to the facility. Other proposed conditions of certification address the issue of the storage and use of anhydrous ammonia, in addition to site security matters.

Staff recommends that the Energy Commission impose the proposed conditions of certification, presented herein, to ensure that the project is designed, constructed, and operated to comply with all applicable LORS and to protect the public from a significant risk of exposure to an accidental chemical release. If all mitigation proposed by the applicant and staff are required and implemented, the use, storage, and transportation of hazardous materials will not present a significant risk to the public.

Staff proposes ten conditions of certification mentioned throughout the text (above), and listed below. Condition of Certification **HAZ-1** ensures that no hazardous material would be used at the facility except as listed in **Appendix B** of the staff assessment, unless there is prior approval by the Energy Commission compliance project manager. Condition of Certification **HAZ-2** requires that a Hazardous Materials Business Plan (HMBP), a Spill Prevention, Control, and Countermeasure Plan (SPCC Plan), and a Risk Management Plan (RMP) be submitted to the KCEHSD for review and to the CPM for review and approval. Staff believes that an accidental release of hazardous material during transfer to/from a delivery tanker to/from a storage tank is the most probable accident scenario and therefore proposes Condition of Certification (**HAZ-3**) requiring the development and implementation of a safety management plan for the delivery of all liquid or gaseous hazardous materials. The development of a safety management plan addressing the delivery of all liquid or gaseous hazardous materials during construction, commissioning, and operations will further reduce the risk of any accidental release not addressed by the proposed spill-prevention mitigation measures and the required RMP. This plan would additionally prevent the mixing of incompatible materials that could result in toxic vapors. Condition of Certification **HAZ-4** requires that the anhydrous ammonia storage tank be designed to certain specifications. The transportation of hazardous materials is addressed in Conditions of Certification **HAZ-5**. Site security during both the construction and operations phases is addressed in Conditions of Certification **HAZ-6** and **HAZ-7.** The safety of stored hazardous materials on-site during construction is addressed in proposed Condition of Certification **HAZ-8**. **HAZ-9** would require the project owner to prepare and implement the recommendations of a Process Safety Management Plan (PSMP) that includes a Hazard and Operability (HAZOP) Analysis and at least one other hazard analysis plan specifically for the use and storage of anhydrous ammonia, syngas, methanol, molten or liquid sulfur, nitric acid, liquid oxygen/nitrogen storage, and the manufacture, storage, and transport of liquid UAN solution and to obtain the review and signed approval from qualified outside independent experts of all the process safety management evaluations conducted and plans prepared prior to submittal to the CPM for approval. It would also require the development and implementation of a pipeline integrity management plan that is consistent with the U.S. DOT Pipeline and Hazardous Materials Safety Administration (PHMSA) Liquid Pipeline Integrity Management in High Consequence Areas for Hazardous Liquid Operators (49 CFR Parts 195.450 and .452) rule, the recommendations of the U.S. Chemical Safety and Hazard Investigation Board in its report on the August 2, 2012 Chevron Richmond Refinery Fire, and the recommendations of the independent professionals retained. Although these plans and analyses are not necessary for staff to understand and assess the project's impacts under CEQA, staff believes that these plans will identify potential system failures before failure can occur and indicate/implement mitigation to reduce the risk of on-site and off-site consequences to less than significant.

Proposed Condition **HAZ-10** would ensure that tank trucks or rail tank cars leaving the facility with liquid sulfur for distribution and sale would not pose a significant risk to the off-site public if an accidental release occurs by prohibiting the transport vehicle from leaving the facility if the head space about the liquid sulfur contains hydrogen sulfide at a concentration of greater than 2 ppm.

Redundancy of command and control systems is required and staff proposes Condition of Certification **HAZ-11** that would require the project owner to ensure that all redundant command and control systems that are "hard-wired" are placed in separate wiring tracks. And, use of natural gas to "blow" debris from new piping would be prohibited by proposed Condition of Certification **HAZ-12.**

Staff also wishes to note the many data requests filed by the Sierra Club and the community group AIR and thanks them for their input, perspective, and contribution. Staff reviewed the requests and the applicant's responses to these data requests in great detail and although it found them to be informative and interesting, staff chose to focus on the goal of reducing impacts from the project as proposed. Thus, staff has concluded that whatever process refinements could or would be made or whatever root cause of an accidental release existed, the conditions of certification recommended by staff combined with those proposed by the applicant and the adherence to existing LORS would address known contingencies to the greatest extent possible and reduce impacts to a level of less than significance.

Furthermore, as discussed in the **Socioeconomic Resources** section of this PSA/DEIS, the minority population surrounding the project site constitutes an environmental justice population as defined by *Environmental Justice: Guidance Under the National Environmental Policy Act*. Staff has not identified any significant adverse direct or cumulative **Hazardous Materials Management** impacts resulting from the construction or operation of the proposed project, including impacts to the environmental justice population. Therefore, there are no **Hazardous Materials Management** environmental justice issues related to this project and no environmental justice populations would be significantly, adversely, or disproportionately impacted.

PROPOSED CONDITIONS OF CERTIFICATION

HAZ-1 The project owner shall not use any hazardous materials not listed in Appendix B, below, or in greater quantities or strengths than those identified by chemical name in Appendix B, below, unless approved in advance by the compliance project manager (CPM).

Verification: The project owner shall provide to the CPM, in the Annual Compliance Report, a list of hazardous materials contained at the facility, the quantities present, the strengths (concentrations) of solutions, and the locations where they will be stored and used.

HAZ-2 The project owner shall concurrently provide the following to the Kern County Environmental Health Service Department (KCEHSD) and the CPM for review:

a. a Hazardous Materials Business Plan (HMBP);

b. a Spill Prevention, Control, and Countermeasure Plan (SPCC Plan); and

c. a Risk Management Plan (RMP) specifically for the use and storage of anhydrous ammonia, methanol, and liquid oxygen/nitrogen and prepared pursuant to the California Accidental Release Program (CalARP).

After receiving comments from the KCEHSD and the CPM, the project owner shall reflect all recommendations in the final documents. Copies of the final plans shall then be provided to the KCEHSD for information and to the CPM for approval.

Verification: At least thirty (30) days prior to receiving or producing any hazardous material on the site for commissioning or operations, the project owner shall provide a copy of a final Hazardous Materials Business Plan, Spill Prevention, Control, and Countermeasure Plan, a Process Safety Management Plan, and a Risk Management Plan to the CPM for approval. At least thirty (30) days prior to delivery to or production of any hazardous material on the site, the project owner shall provide the final RMP to the CUPA (Certified Unified Program Agency which is the Kern County Environmental Health Service Department) for information and to the CPM for approval.

HAZ-3 The project owner shall develop and implement a Safety Management Plan for the on-site production of or delivery to the site of any liquid, gaseous, or cryogenic hazardous materials. The plan shall include procedures, protective equipment requirements, training, and a checklist. It shall also include a section describing all measures to be implemented to prevent mixing of incompatible hazardous materials including provisions to maintain lockout control by a power plant employee not involved in any delivery or transfer operation. It shall also describe the type, number, locations, and detection limits of hazardous gas monitors for ammonia, carbon monoxide, hydrogen sulfide, and sulfur dioxide. This plan shall be applicable during commissioning and operation of the power plant.

Verification: At least thirty (30) days prior to the production of or delivery to the site of any liquid, gaseous, or cryogenic hazardous material for purposes of commissioning or operation, the project owner shall provide the Safety Management Plan as described above to the CPM for review and approval.

HAZ-4 The two anhydrous ammonia storage tanks shall be double-walled tanks designed to API 620 Appendix R. The storage tanks shall be protected by a secondary containment basin capable of holding 125% of the storage volume and that drains to an underground vault. The final design drawings and specifications for the ammonia storage tanks and secondary containment basin and vault shall be submitted to the CPM for review and approval.

Verification: At least sixty (60) days prior to the planned start of production of anhydrous ammonia, the project owner shall submit final design drawings and specifications for the ammonia storage tanks and secondary containment basin/vault to the CPM for review and approval.

HAZ-5 At least thirty (30) days prior to site mobilization, the project owner shall direct all vendors delivering any hazardous material to the site to use only the route approved by the CPM. Trucks shall travel from Interstate-5 via Stockdale Road, to Morris Road, to Station Road, and to the plant site. The project owner shall obtain approval of the CPM if an alternate route is desired.

Verification: At least thirty (30) days prior to site mobilization, the project owner shall submit to the CPM for review and approval copies of notices to hazardous materials vendors describing the required transportation route.

HAZ-6 Prior to commencing construction, a site-specific Construction Site Security Plan for the construction phase shall be prepared and made available to the CPM for review and approval. The Construction Security Plan shall include the following:

1. perimeter security consisting of fencing enclosing the construction area;
2. security guards;
3. site access control consisting of a check-in procedure or tag system for construction personnel and visitors;
4. written standard procedures for employees, contractors and vendors when encountering suspicious objects or packages on site or off site;
5. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency; and
6. Evacuation procedures.

Verification: At least thirty (30) days prior to commencing construction, the project owner shall notify the CPM that a site-specific Construction Security Plan is available for review and approval.

HAZ-7 The project owner shall also prepare a site-specific security plan for the commissioning and operational phases that will be available to the CPM for review and approval. The project owner shall implement site security measures that address physical site security and hazardous materials storage. The level of security to be implemented shall not be less than that described below. Under no circumstances shall chains or padlocks be used to secure any access gate.

The Operation Security Plan shall include the following:

1. permanent full perimeter fence or wall, at least 8 feet high;
2. motorized main entrance and rail car security gates;

3. evacuation procedures;

4. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency;

5. written standard procedures for employees, contractors, and vendors when encountering suspicious objects or packages on site or off site;

6. A. a statement (refer to sample, **Attachment A**), signed by the project owner certifying that background investigations have been conducted on all project personnel. Background investigations shall be restricted to determine the accuracy of employee identity and employment history and shall be conducted in accordance with state and federal laws regarding security and privacy;

   B. a statement(s) (refer to sample, **Attachment B**), signed by the contractor(s) or authorized representative(s) for any permanent contractors or other technical contractors (as determined by the CPM after consultation with the project owner), that are present at any time on the site to repair, maintain, investigate, or conduct any other technical duties involving critical components (as determined by the CPM after consultation with the project owner) certifying that background investigations have been conducted on contractors who visit the project site;

7. site access controls for employees, contractors, vendors, and visitors;

8. a statement(s) (refer to sample, **Attachment C**), signed by the owners or authorized representative(s) of each hazardous materials transport vendor accessing the project site, certifying that they have prepared and implemented security plans in compliance with 49 CFR 172.802, and that they have conducted employee background investigations in accordance with 49 CFR Part 1572, subparts A and B;

9. closed circuit TV (CCTV) monitoring system, recordable, cameras able to pan, tilt, and zoom and have low-light capability, and viewable in the power plant control room and security station (if separate from the control room) capable of viewing, at a minimum, the main entrance gate, the rail car entrance gate, any man-gates, the anhydrous ammonia storage tank, the liquid oxygen/nitrogen storage tanks, the entrance to the control room, natural gas and CO2 metering location, 100% of the perimeter fence;

10. security guard(s) present 24 hours per day, 7 days per week; and

11. perimeter breach detectors **<u>or</u>** on-site motion detectors.

The project owner shall fully implement the security plans and obtain CPM approval of any substantive modifications to those security plans. The CPM may authorize modifications to these measures, or may require additional measures such as protective barriers for critical power plant components or cyber security measures depending upon circumstances unique to the facility or in response to industry-related standards, security concerns, or additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or the North American Electrical Reliability Council, after consultation with both appropriate law enforcement agencies and the applicant.

Verification: At least thirty (30) days prior to the initial receipt of any hazardous material on site used for the purpose of commissioning or operations, the project owner shall notify the CPM in writing that a site-specific operations site security plan is available for review and approval. In the annual compliance report, the project owner shall include a statement that all current project employee and appropriate contractor background investigations have been performed and that updated certification statements have been appended to the operations security plan. In the annual compliance report, the project owner shall include a statement that the operations security plan includes all current hazardous materials transport vendor certifications for security plans and employee background investigations.

HAZ-8 The project owner shall prepare management plans and implement the following programs during construction:

1. On-site Vehicle Fueling Plan: The following measures shall be implemented related to fueling and maintenance of vehicles and equipment:

- No smoking, open flames, or welding shall be allowed in the fueling/services areas.
- Servicing and fueling of vehicles and equipment shall occur only in designated areas.
- Fuel storage tanks shall have secondary containment.
- Fueling service and maintenance shall be conducted only by authorized personnel.
- Refueling shall be conducted only with approved pumps, hoses, and nozzles.
- All disconnected hoses shall be handled in a manner to prevent residual fuel and fluids from being released into the environment.
- Catch-pans shall be placed under equipment/hose connections to catch potential spills during fueling and servicing.
- Service trucks shall be provided with fire extinguishers and spill containment equipment, such as absorbents, shovels, and containers.
- Service trucks shall not remain on the job site after fueling and service are complete.

2. Bulk Hazardous Materials Management Plan: Bulk hazardous materials shall be managed as described below:

- The 4,000-gallon diesel storage tank and 4,000 gal gasoline storage tank shall be equipped with secondary containment capable of holding 110 percent of the tank volume.
- The 400 gallons of lubricating oil shall be stored in a tank that shall be equipped with a secondary containment capable of holding 100 percent of the tank volume. Liquid detection equipment shall be installed to detect any potential leaks generated and collected in the secondary containment annular space.

The project owner shall provide to the CPM for review and approval a copy of the Vehicle Fueling Plan and the Bulk Hazardous Materials Management Plan.

Verification: At least thirty (30) days prior to site mobilization, the project owner shall provide the Vehicle Fueling Plan to the CPM for review and approval. At least thirty (30) days prior to the initial receipt of any hazardous material on-site for commissioning or operations, the project owner shall provide the Bulk Hazardous Materials Management Plan to the CPM for review and approval.

HAZ-9 The project owner shall:

a. Conduct process hazard analyses and prepare Process Safety Management Plans (PSM Plans) that includes hazard analyses specifically for the production, use, and storage of anhydrous ammonia, syngas, methanol, molten or liquid sulfur, liquid oxygen/nitrogen, nitric acid, and UAN solution. Such PSM Plans shall contain a hazard analysis using at least two different methodologies. One shall be a Hazard and Operability Study (HAZOP) and the other shall be chosen from the list in 8 CCR 5189 (e) (1) or one that is recognized by engineering organizations or governmental agencies and has the approval of the CPM.

b. Retain an independent outside third party group of professionals to provide peer review and approval of the process hazard analyses and the PSM plans before they are submitted to the CPM. The outside third party shall have expertise in engineering and process operations, shall include at least one member who has experience and knowledge specific to the processes being evaluated, and shall also include one member knowledgeable in the specific process hazard analysis methodologies being used.

c. Develop and implement a pipeline integrity management plan that is consistent with the U.S. DOT Pipeline and Hazardous Materials Safety Administration (PHMSA) Liquid Pipeline Integrity Management in High Consequence Areas for Hazardous Liquid Operators (49 CFR Parts 195.450 and .452) rule, the recommendations of the U.S. Chemical Safety and Hazard Investigation Board in its report on the August 2, 2012 Chevron Richmond Refinery Fire, and the recommendations of the independent professionals retained as per the requirement in section “b” above.

The final report containing the results of the hazard analysis for each process, the final PSM Plan, the pipeline integrity management plan, and the review and approval of the outside third party shall be submitted to the Kern County EHSD and Kern County Fire Department for review and to the CPM for approval.

Verification: At least thirty (30) days prior to receiving any hazardous material on the site for commissioning or operations, the project owner shall provide a copy of a final hazard analysis for each process, the final PSM Plan, the final pipeline integrity management plan, and the review, opinions, and approval of the outside third party to the Kern County EHSD and Kern County Fire Department for review and to the CPM for review and approval.

HAZ-10 The project owner shall ensure through testing that no rail tank car or tanker truck leaving the site with molten or liquid sulfur contains hydrogen sulfide (H_2S) at a concentration greater than 2.0 ppm in the truck or tanker airspace above the sulfur.

Verification: The project owner shall provide to the CPM in the Annual Compliance Report a log of each off-site shipment of molten or liquid sulfur via tanker truck or rail tanker showing the levels of Hydrogen sulfide found in the airspace in the tanker truck or rail tank car.

HAZ-11 The project owner shall make sure that all redundant command and control systems that are "hard-wired" are placed in separate wiring tracks.

Verification: At least thirty (30) days prior to receiving any hazardous material on the site for commissioning or operations, the project owner shall provide detailed plans that describe the command and control systems to the CPM for review and approval.

HAZ-12 The project owner shall not allow any fuel gas pipe cleaning activities on site, either before placing the pipe into service or at any time during the lifetime of the facility, that involve "flammable gas blows" where natural (or flammable) gas is used to blow out debris from piping and then vented to atmosphere. Instead, an inherently safer method involving a non-flammable gas (e.g. air, nitrogen, steam) or mechanical pigging shall be used. Exceptions to any of these provisions will be made only if no other satisfactory method is available, and then only with the approval of the CPM.

Verification: At least 30 days before any fuel gas pipe cleaning activities involving fuel gas pipe of four-inch or greater external diameter, the project owner shall submit a copy of the Fuel Gas Pipe Cleaning Work Plan which shall indicate the method of cleaning to be used, what gas will be used, the source of pressurization, and whether a mechanical PIG will be used, to the CBO for information and to the CPM for review and approval.

Basis for Staff's Use of 75 Parts Per Million Ammonia Exposure Criteria

BASIS FOR STAFF'S USE OF 75 Parts Per Million AMMONIA EXPOSURE CRITERIA

Staff uses a health-based airborne concentration of 75 parts per million (PPM) to evaluate the significance of impacts associated with potential accidental releases of ammonia. While this level is not consistent with the 200-ppm level used by the U.S. Environmental Protection Agency and the California Environmental Protection Agency in evaluating such releases pursuant to the Federal Risk Management Program and State Accidental Release Program, it is appropriate for use in staff's analysis of the proposed project. The Federal Risk Management Program and the State Accidental Release Program are administrative programs designed to address emergency planning and ensure that appropriate safety management practices and actions are implemented in response to accidental releases. However, the regulations implementing these programs do not provide clear authority to require design changes or other major changes to a proposed facility. The preface to the Emergency Response Planning Guidelines states that "these values have been derived as planning and emergency response guidelines, **not** exposure guidelines, they do not contain the safety factors normally incorporated into exposure guidelines. Instead they are estimates, by the committee, of the thresholds above which there would be an unacceptable likelihood of observing the defined effects." It is staff's contention that these values apply to healthy adult individuals and are levels that should not be used to evaluate the acceptability of avoidable exposures for the entire population. While these guidelines are useful in decision making in the event that a release has already occurred (for example, prioritizing evacuations), they are not appropriate for and are not binding on discretionary decisions involving proposed facilities where many options for mitigation are feasible. The California Environmental Quality Act requires permitting agencies making discretionary decisions to identify and mitigate potentially significant impacts through feasible changes or alternatives to the proposed project.

Staff has chosen to use the National Research Council's 30-minute Short Term Public Emergency Limit (STPEL) for ammonia to determine the potential for significant impact. This limit is designed to apply to accidental unanticipated releases and subsequent public exposure. Exposure at this level should not result in serious effects but would result in "strong odor, lacrimation, and irritation of the upper respiratory tract (nose and throat), but no incapacitation or prevention of self-rescue." It is staff's opinion that exposures to concentrations above these levels pose significant risk of adverse health impacts on sensitive members of the general public. It is also staff's position that these exposure limits are the best available criteria to use in gauging the significance of public exposures associated with potential accidental releases. It is, further staff's opinion that these limits constitute an appropriate balance between public protection and mitigation of unlikely events and are useful in focusing mitigation efforts on those release scenarios that pose real potential for serious impacts on the public. Table 1 provides a comparison of the intended use and limitations associated with each of the various criteria that staff considered in arriving at the decision to use the 75-ppm STPEL.

Hazardous Materials Appendix A Table 1
Acute Ammonia Exposure Guidelines

Guideline	Responsible Authority	Applicable Exposed Group	Allowable Exposure Level	Allowable* Duration of Exposures	Potential Toxicity at Guideline Level/Intended Purpose of Guideline
IDLH[2]	NIOSH	Workplace standard used to identify appropriate respiratory protection.	300 ppm	30 minutes	Exposure above this level requires the use of “highly reliable” respiratory protection and poses the risk of death, serious irreversible injury, or impairment of the ability to escape.
IDLH/10[1]	EPA, NIOSH	Work place standard adjusted for general population factor of 10 for variation in sensitivity	30 ppm	30 minutes	Protects nearly all segments of general population from irreversible effects.
STEL[2]	NIOSH	Adult healthy male workers	35 ppm	15 minutes, 4 times per 8-hour day	No toxicity, including avoidance of irritation.
EEGL[3]	NRC	Adult healthy workers, military personnel	100 ppm	Generally less than 60 minutes	Significant irritation, but no impact on personnel in performance of emergency work; no irreversible health effects in healthy adults. Emergency conditions one-time exposure.
STPEL[4]	NRC	Most members of general population	50 ppm 75 ppm 100 ppm	60 minutes 30 minutes 10 minutes	Significant irritation, but protects nearly all segments of general population from irreversible acute or late effects. One-time accidental exposure.
TWA[2]	NIOSH	Adult healthy male workers	25 ppm	8 hours	No toxicity or irritation on continuous exposure for repeated 8-hour work shifts.
ERPG-2[5]	AIHA	Applicable only to emergency response planning for the general population (evacuation) (not intended as exposure criteria) (see preface attached)	200 ppm	60 minutes	Exposures above this level entail** unacceptable risk of irreversible effects in healthy adult members of the general population (no safety margin).

1) (EPA 1987) 2) (NIOSH 1994) 3) (NRC 1985) 4) (NRC 1972) 5) (AIHA 1989)

* The (NRC 1979), (WHO 1986), and (Henderson and Haggard 1943) all conclude that available data confirm the direct relationship to increases in effect with both increased exposure and increased exposure duration.

** The (NRC 1979) describes a study involving young animals, which suggests greater sensitivity to acute exposure in young animals. The WHO (1986) warned that the young, elderly, asthmatics, those with bronchitis, and those that exercise should also be considered at increased risk based on their demonstrated greater susceptibility to other non-specific irritants.

Hazardous Materials
Appendix B

Hazardous Materials Proposed for Use and Storage On-site at HECA

Hazardous Materials Appendix B
Hazardous Materials Proposed for Use and Storage On-site at HECA

Material	CAS No.	Application	Hazardous Characteristics	Maximum Quantity On Site
Ammonium Nitrate Solution (75-85wt%)	6484-52-2	Intermediate, produced/used in UAN Plant	Health: irritant	54 tons
Anhydrous Ammonia (liquid)	7664-41-7	Intermediate, produced in and used in Manufacturing Complex	Health: irritation to permanent damage from inhalation, ingestion, and skin contact Physical: reactive, vapor is combustible	≈10,800 tons (≈7 day usage) (3,800,000 gals)
Boiler Feedwater Chemicals (e.g., Morpholine Cyclohexamine Sodium Sulfite)		Boiler feedwater pH/corrosion / dissolved oxygen/biocide control	Health: Physical: corrosive	< 500 gallons
Chemical Reagents (acids/bases)		Laboratory services	Health: Physical: corrosive, reactive	< 5 gallons
CTG and HRSG cleaning chemicals (e.g., HCl, citric acid, EDTA chelant, sodium nitrate)		HRSG chemical cleaning	Health: toxic Physical: reactive	Intermittent cleaning requirement, temporary storage only
Compressed Gases (Ar, He, H_2)		Laboratory services	Health: Physical: ignitable	Minimal
Degassed Liquid Sulfur		Product	Physical: ignitable, reactive	700 tons
Diesel Fuel	Mixture	Emergency generator/fire water pump fuel	Health: Low-toxicity Physical: ignitable	2,000 gallons
Flammable/Hazardous Gases (CO, H_2S), Syngas and Hydrogen-Rich Fuel		Intermediate product used for power generation and nitrogen-based product generation	Health: toxic Physical: ignitable	In process quantities only, no storage on site
Hydrogen	1333-74-0	STG & CTG generator cooling	Health: low toxicity Physical: ignitable	30,000 standard cubic feet
Methanol		AGR solvent make-up	Health: Physical: ignitable	300,000 gallons
Miscellaneous Industrial Gases – Acetylene, Oxygen, other welding gases, analyzer calibration gases		Maintenance welding/ instrumentation calibration	Health: toxic Physical: ignitable	Minimal

Material	CAS No.	Application	Hazardous Characteristics	Maximum Quantity On Site
Natural Gas	74-82-8	Provides fuel service to consumers	Health: Asphyxiant. Effects are due to lack of oxygen. Physical: ignitable	Utility supply on demand via pipeline
Nitric Acid (≈60wt%)	7697-37-2	Intermediate, produced/used in UAN Plant	Health: irritant Physical: corrosive, reactive	2,600 tons (3 days)
Paint, Thinners, Solvents, Adhesives, etc.		Shop/Warehouse	Health: toxic Physical: ignitable	<20 gallons
Sodium Hydroxide (caustic solution)	1310-73-2	Plant wastewater ZLD, sour water treatment, demineralizers, caustic scrubber, desuperheater contact condenser	Health: causes eye and skin burns, hygroscopic, may cause severe respiratory tract irritation with possible burns, hazardous if ingested Physical: corrosive	150,000 gallons (5-50% wt% NaOH)
Spent Caustic		Intermediate storage pending treatment off-site	Health: toxic Physical: corrosive	150,000 gallons
Sulfuric Acid	7664-93-9	Plant waste water treating, cooling water, BFW pH control, demineralizers	Health: irritant to eyes, poisonous if inhaled, extreme irritant, corrosive, and toxic to tissue Physical: corrosive, reactive	14,000 gallons
UAN Solution		Plant product	Physical: corrosive	63,000 tons (45 days of production)

LAND USE

Jonathan Fong

SUMMARY OF CONCLUSIONS

The Land Use section of the Preliminary Staff Assessment (PSA)/ Draft Environmental Impact Statement (DEIS) analyzes the potential effects that would occur by construction and operation of the proposed Hydrogen Energy California project (HECA or project) on land use and applicable laws, ordinances, regulations and standards (LORS).

Kern County has determined that the HECA project modification to restrict chemical manufacturing to fertilizer for agricultural use only addresses the zoning and general plan compatibility issues previously raised by the county (Kern County 2013a). To ensure compliance with Section 19.12.030.A of the Kern County Zoning Ordinance, Kern County requested staff propose a mitigation measure to restrict the chemical manufacturing to fertilizer for agricultural use only. To address Kern County's concerns, staff proposes Condition of Certification **LAND-6.**

The HECA project would permanently convert prime farmland and farmland of statewide importance, as classified by the California Department of Conservation. To mitigate this significant impact, staff is recommending Conditions of Certification **LAND-1** and **LAND-2.**

While the project would be a conditionally permitted use pursuant to the county zoning ordinance, one finding of approval that must be met is that "the proposed use will not be detrimental to the health, safety, and welfare of the public or to property and residents in the vicinity" (19.104.040(E)). Staff cannot determine this finding can be made until the outstanding information identified in other technical areas is provided. To determine compliance with county development standards, the applicant is required to submit a site plan demonstrating compliance with Sections 19.12.070 (setbacks) and 19.12.100 (parking) of the zoning ordinance.

Socioeconomics Table 2 in the **Socioeconomics** section shows that the population within the six-mile buffer constitutes an environmental justice population as defined by *Environmental Justice: Guidance Under the National Environmental Policy Act*. Staff has concluded that with staff's proposed conditions of certification, the project would have no significant or disproportionate land use impacts on any population, including an environmental justice population.

Staff has reviewed the Occidental of Elk Hills, Inc (OEHI) CO_2 Enhanced Oil Recovery (EOR) component for potential impacts to land use. Staff considers the OEHI component as part of the HECA project and therefore subject to review in accordance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). Staff concludes the OEHI EOR component would not result in significant direct, indirect, or cumulative adverse land use impacts.

OUTSTANDING ISSUES

For staff to conclude HECA complies with applicable land use LORS, the applicant is required to submit additional information.

To determine project compliance with Sections 19.12.070 and 19.12.100 of the Kern County Zoning Ordianance, staff requests the applicant provide:

- A site plan drawn to scale of all proposed structures demonstrating compliance with the sections of the zoning ordinance cited above.

The project applicant is also required to submit to Kern County an application for cancellation of Williamson Act contracts for the rail spur lands.

INTRODUCTION

This section of the PSA/DEIS focuses on two main issues with the proposed project: consistency with applicable land use LORS and reasonably foreseeable[1] potential impacts to agricultural uses. Staff has evaluated these potential impacts in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), Appendix G "Environmental Checklist Form." A project and related uses would be incompatible with existing and planned land uses if they are inconsistent with applicable LORS or if they cause significant and unmitigated environmental impacts.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS (LORS)

Land Use Table 1 lists the state and local land use LORS applicable to the proposed project and surrounding lands. There are no federal land use LORS applicable to the proposed project and surrounding lands. Compatibility with each LORS is analyzed below, under "Assessment of Impacts and Discussion of Mitigation."

Land Use Table 1
Applicable Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
State	
California Land Conservation Act of 1965 (Gov. Code § 51200-51297.4)	Enabling statute that allows local governments and private land owners to enter into agreements to restrict land uses on specific parcels. Section 51282 addresses Williamson Act Contract cancellation procedures. In order for a contract to be cancelled, the local elected officials (e.g. a City Council or a County Board of Supervisors) need to make a series of findings and approve the cancellation.
Subdivision Map Act (Pub. Resources Code § 66410-66499.58),§ 66412.1	Subdivision Map Act exempts a project from state subdivision requirements provided that the project demonstrates compliance with local ordinances regulating design and improvements.

[1] Reasonably foreseeable" is defined in the California Environmental Quality Act (CEQA) as approved projects under construction; approved related projects not yet under construction; unapproved (planned) projects, with related impacts, currently under environmental review; and projects under review by the Lead Agency or other relevant public agencies. Planned developments, such as those identified in an airport Master Plan, may also be considered, provided there is evidence that measures are actually being taken to implement the plans. The analysis must also take into consideration the most probable development patterns and future activities that are a reasonably foreseeable consequence of the initial project.

Applicable LORS	Description
Local	
Kern County General Plan	The General Plan is a County-wide document which includes land use maps, goals and policies intended to protect resources and encourage economic development in the County.
Chapter 1- Land Use Conservation, Open Space Element, Resource Chapter 1.9 Policy 2	Provides comprehensive, long-range plans, policies, and goals to guide the physical development of the county. This element of the General Plan provides a variety of land uses for economic growth while assuring the conservation of Kern County's agricultural, natural and resource attributes.
Title 19, Kern County Zoning Ordinance, Chapter 19.12 Exclusive Agricultural (A)	This ordinance provides a framework for development by indicating allowable uses and development standards that support the General Plan. This title is adopted to promote and protect the public health, safety, and welfare through the orderly regulation of land uses throughout the unincorporated area of the County.
Title 18, Kern County Land Division Ordinance, Chapter 18.35 Lot Line Adjustments	County ordinance for implementing the California Subdivision Map Act. The purpose of the ordinance is to promote and protect the public health, safety, and welfare through the orderly regulation of land division throughout the unincorporated area of Kern County.

SETTING

PROJECT SITE

The HECA site would be composed of a 453-acre project site and a 653-acre controlled area. The project site encompasses portions of three separate legal parcels: Assessor's Parcel Number 159-040-02 (part), 159-040-16 (part) and 159-040-18 (part). The controlled area includes four separate legal parcels: 159-040-16 (part), 159-040-17, 159-040-18 (part) and 159-0190-09. The site is located in western unincorporated Kern County. Please refer to the **Project Description Section Figures 1 and 2** for a statewide and regional map of the project site. Bakersfield is the nearest incorporated city located approximately seven miles west of the site. Nearby communities include the unincorporated communities of Tupman, two miles southeast of the site, and Buttonwillow four miles northwest of the site. The project site is bounded to the north by Adohr Road and to the west by Tupman Road which provides access to the site. The site is bounded to the south by an existing irrigation canal. The site is currently in agricultural use producing alfalfa, cotton and onions. The controlled area is also currently in use producing the same crops. A portion of the controlled area southeast of the intersection of Dairy Road and Adohr Road is the site of a fertilizer manufacturing plant which is no longer in operation.

The EOR processing facility and satellites would occupy approximately 135.6 acres within the existing Elk Hills Oil Fields which is part of the Elk Hills Unit consisting of approximately 48,000 acres within Kern County. The EOR processing facility would be located approximately five miles south of the proposed HECA project site as shown in **Land Use Figure 1.** The project site is characterized by disturbed and vacant lands within an operating oil field.

LINEAR INFRASTRUCTURE/ OFF-SITE IMPROVEMENTS

In addition to the generating facilities within the project site, the HECA project would also consist of the off-site linear infrastructure. The linear infrastructure is explained and summarized in **Land Use Table 2** below.

The HECA project is proposed with two alternatives related to the transportation of coal to the project site. Alternative 1 would transport coal via a new rail spur connecting the project site to the San Joaquin Valley Railroad (SJVRR) north of the project site. Alternative 2 would transport coal from the Wasco station via truck along established trucking routes in the project vicinity. Please refer to **Project Description Figures 6 and 7** for a map of the proposed rail spur and truck coal transport route.

Land Use Table 2
Disturbed Acreage

Project Component	Approx-Linear Length (miles)	Temporary Disturbance (acres)	Permanent Disturbance (acres)	Prime Agricultural Land (acres)
Project Site	n/a	453	453	453
Controlled Area	n/a	91	0	0
Electrical Transmission	2.1	7	0.15	0.15
PG& E Switching Station	n/a	4	4	4
Natural Gas Linear	13	79	0.23 (metering station)	0.23**
BVWSD well field and process water pipeline	15	90.25	1.15 (areas around well)	0.29
Potable water pipeline	1	1.25	0	0
Railroad Spur	5.3	51.2	38.4	34.77 2.84**
CO_2Pipeline	3.4	29	0.11	0
OEHI EOR	n/a	63.79	63.79	0
Total Permanent Disturbance		Prime: 492.21 acres Statewide Importance: 3.07 acres		

**Farmland of Statewide Importance
Adapted from Revised Table 11-1 (Revised Table 2-1) Disturbed Acreage, Supplemental Responses to CEC Data Requests: Nos A56 and A211.

- **Electrical Transmission.** A new approximately two-mile transmission line would connect the HECA project to the existing Midway – Wheeler Ridge 230kV power lines via a new PG&E switching station. The new transmission line would require the installation of 15 new transmission poles off-site and would be constructed within new transmission line rights-of-way on private property. The switching station would be a four-acre site approximately two miles east of the project site on privately owned land.

- **Natural Gas.** A new approximately 13-mile natural gas interconnection would be made with existing PG&E gas lines north of the project site. The proposed gas line would follow the proposed rail spur north to Highway 58, and then continue east beyond the Highway 58/ Interstate 5 interchange, extending north to connect with existing pipelines.

- **Water Supply.** The HECA project would utilize brackish water as part of the energy generating process and potable water for personnel activities. The brackish water would be supplied via a new 15 mile long supply line and five new offsite wells and installed by the Buena Vista Water Storage District. The new waterline would extend northwest from the project site and would generally follow the existing Westside Canal. Potable water would be supplied from the Kern Water District via a new one mile supply line extending east from the project site.

- **Railroad Spur.** Alternative 1 of the HECA project would propose to deliver coal to the project site via a new five mile industrial spur which would connect the project site to the existing San Joaquin Valley Railroad (SJVRR) north of the project site along Highway 58. The proposed rail spur would be located adjacent to the East Side Canal on private property within new rights-of-way.

- **OEHI Processing Facility, Wells and Pipeline.** In addition to the CO_2 EOR processing facility, the OEHI component would involve the installation of 652 miles of new pipeline which would be installed within previously disturbed areas. Enhanced Oil Recovery would take place at 309 CO_2 injection wells and 411 oil production wells. Of the 720 required wells, 570 are already established. If approved, 150 new wells would be installed.

- **Transmission System Upgrades.** The HECA project would require electrical network modifications including substation upgrades, work at the electrical interconnection, and site and transmission line upgrades. The required modifications and network upgrades would occur within the fenced area of existing substations or on existing PG&E towers and would not result in new land disturbance or land use impacts.

GENERAL PLAN LAND USE

PROJECT SITE

The Kern County General Plan was adopted by the County Board of Supervisors on June 15, 2005 with the most recent revision adopted in September 2009. The project site is not located within any specific plan area or other project area designated by the general plan. The general plan designation on the HECA project site is Intensive Agriculture (8.1), which is defined as appropriate for areas devoted to the production of irrigated crops or other agricultural uses. Compatible uses include a variety of agricultural uses; cattle feed yards, petroleum exploration, and public utility uses. The Kern County Zoning Ordinance classifies the project site as Exclusive Agriculture (A). Permitted uses within the (A) zone include agricultural operations, breeding and raising animals, and limited residential uses. Electrical power generating plants are considered permitted uses subject to approval of a conditional use permit, but for the Energy Commission's authority.

The general plan designation on the OEHI EOR site is Mineral and Petroleum (8.4) which is defined as appropriate for areas devoted to the production of irrigated crops or other agricultural uses. The zoning ordinance classifies the project site as Exclusive Agriculture (A) and Limited Agriculture (A-1).

SURROUNDING AREA

The project site is located in a predominantly agricultural area. Crops in production located within one mile of the site include cotton, alfalfa, and pistachio. Sensitive receptors in the area include six residences located within one mile of the project site. One residence is located within the controlled area and would be vacated prior to construction and operation of the HECA project. The nearest sensitive visual resource area would be the Tule Elk State Natural Reserve which is located approximately 3,800 feet east of the project site. The natural reserve includes an interpretative center and habitat viewing areas along Station Road. South of the project site is the Kern River Flood Control Channel and the West Side Canal. Beyond the channel and canal south of the site is the Elk Hills Oil Field.

The proposed linear infrastructure would be located within an area similar to the project site. The linears would cross predominantly agricultural lands with similar production crops and scattered residences as found within one mile of the project site.

The nearest recreational use within six miles of the project site is the Tule Elk Reserve State Park which is located on Station Road approximately 2,000 feet east of the project site. The park includes a Visitor Center, picnic areas, and a public viewing area.

Lands in the vicinity of the project site are predominantly in active agricultural use. The corresponding general plan land use designations and zoning designations for the offsite linears and infrastructure are included in **Land Use Table 3**.

Land uses in the area surrounding the OEHI component are predominantly oil and gas extraction and production and agricultural uses. As shown in **Land Use Figures 4 and 5** the primary general plan land use designation is 8.4 Mineral and Petroleum and the primary zoning designation is A-1 Limited Agriculture.

Communities located within six miles of the HECA project site and EOR Processing Facility site include Buttonwillow, Tupman, Dustin Acres and Valley Acres. Tupman is located roughly 3 miles to the northeast of the Processing Facility site, while Dustin Acres and Valley Acres are located around 3 miles directly to the south. Other communities located in proximity to the Elk Hills Oil Field (EHOF) include Fellows, Ford City, Maricopa, McKittrick, Taft, Taft Heights, and South Taft. Primary access to the Processing Facility Site would be from the SR 119 and North Access Road (Gate 2) entrance, the Tupman Road and North Access Road (Gate 1) entrance, the Elk Hills Road and Skyline Road (Gates 3 and 4) entrance, and the McKittrick (Gate 5) entrance.

Lands currently irrigated and in agricultural production are found north of the project area near the California Aqueduct. Lands east, south, and west of the project site are under petroleum exploration and production. Visible elements of industry infrastructure are found in the area including rigs, pumps, pipelines and processing facilities.

Recreational areas in the project vicinity include the Tule Elk Reserve State Park to the east and the Buena Vista Park Golf Course to the south. Both recreational areas directly abut the Elk Hills Oil Field but are approximately five miles from the proposed project site.

Land Use Table 3
General Plan Land Use Designations/ Zone District

Project Component	General Plan Land Use Designation	Acreage	Zone District	Acreage
Project Site	Intensive Agriculture (8.1)	453	Exclusive Agriculture (A)	453
Controlled Area	Intensive Agriculture (8.1)	653	Exclusive Agriculture (A)	653
Electrical Transmission	Intensive Agriculture (8.1)	0.17	Exclusive Agriculture (A)	0.17
PG&E Switching Station	Intensive Agriculture (8.1)	4	Exclusive Agriculture (A)	4
Natural Gas Line* (metering station inlet)	Intensive Agriculture (8.1)	0.23	Exclusive Agriculture (A)	0.23
BVWSD well field	Intensive Agriculture (8.1)	0.29	Intensive Agriculture (8.1)	0.29
Rail spur	Intensive Agriculture (8.1) Resource Management (8.5)	33.4 (8.1) 5.2 (8.5)	Exclusive Agriculture (A)	38.6
OEHI CO_2 Pipeline and EOR processing facility	Intensive Agriculture (8.1) Extensive Agriculture (8.3) Mineral and Petroleum (8.4)	14 (8.1) 27 (8.3) 50 (8.4)	Exclusive Agriculture (A) Limited Agriculture (A-1)	36.8 (A) 55.2 (A-1)

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff has analyzed the information provided in the Application for Certification (AFC) and has acquired information from other sources to determine consistency of the proposed HECA project with applicable land use LORS and the proposed project's potential to have significant adverse land use-related impacts.

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

Significance criteria used in this document are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines and performance standards or thresholds identified by Energy Commission staff, as well as applicable LORS utilized by other governmental regulatory agencies. As discussed in the **Executive Summary**, this document analyzes the project's impacts pursuant to both the NEPA and CEQA. The two statutes are similar in their requirements concerning analysis of a project's impacts. Therefore, unless otherwise noted, staff's use of, and reference to, CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

An impact may be considered significant if the proposed project results in:

- Conversion of Farmland or Forest Land.
    - Conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance (Farmland) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.[2]
    - Conflict with existing zoning for agricultural use, or a Williamson Act contract.
    - Conflict with existing zoning for, or cause rezoning of, forest land [as defined in Pub. Resources Code §12220 (g)), timberland (as defined by Pub. Resources Code §4526), or timberland zoned Timberland Production (as defined by Gov. Code §51104(g)).
    - Result in the loss of forest land or conversion of forest land to non-forest use.
    - Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use[3] or conversion of forest land to non-forest use.
- Physical disruption or division of an established community.
- Conflict with any applicable habitat conservation plan, natural community conservation plan, or biological opinion.
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project adopted for the purpose of avoiding or mitigating environmental effects. This includes, but is not limited to, a General Plan, redevelopment plan, or zoning ordinance.
- Result in incremental impacts that, although individually limited, are cumulatively considerable when viewed in connection with other project-related effects or the

[2] FMMP defines "land committed to non-agricultural use" as land that is permanently committed by local elected officials to non-agricultural development by virtue of decisions which cannot be reversed simply by a majority vote of a city council or county board of supervisors.

[3] A non-agricultural use in this context refers to land where agriculture (the production of food and fiber) does not constitute a substantial commercial use.

effects of past projects, other current projects, and probable future projects.[4]

In general, a power plant and its related facilities may also be incompatible with existing or planned land uses, resulting in potentially significant impacts, if they create unmitigated noise, dust, or a public health or safety hazard or nuisance; result in adverse traffic or visual impacts; or preclude, interfere with, or unduly restrict existing or future uses. Staff has not identified any potentially significant umitigable impacts related to Air Quality Public Health or Worker Safety and Fire Protection that would affect land use.

Construction and operation of HECA has the potential to generate increased traffic which would affect existing agricultural land uses in the project area. Additional truck traffic in the area has the potential to affect slow moving agricultural equipment and disrupt transport of crops from agricultural fields. Staff is proposing Conditions of Certification **TRANS-1, 2, and 4** to ensure construction traffic is minimized and impacts to the roadways due to HECA construction and operation would be mitigated to less than significant. Traffic and Transportation staff is requesting additional information regarding the proposed public and private rail crossings before concluding the project would have no significant traffic impacts.

Traffic generated by HECA would result in additional noise which would impact the adjacent Tule Elk State Natural Reserve. The additional noise may impact biological resources found in the reserve as well as public visitors. Staff is recommending Condition of Condition **NOISE-9** which would require either roadway improvements, construction of sounds walls, or reduction in posted speed limits to reduce noise impacts to less than significant. To minimize the impact of steam blows, pile driving, and other loud construction activities over 60 dBA in and around Tule Elk State Natural reserve, staff has proposed Condition of Certification **BIO-6.**

At this time Biological Resources and Visual Resources staff cannot conclude that impacts in these areas have been fully mitigated. As such, Land Use staff cannot conclude that the project would be compatible with existing and planned land uses.

DIRECT/INDIRECT IMPACTS AND MITIGATION

AGRICULTURE AND FOREST

Would the project convert Farmland to non-agricultural use?

In the assessment of impacts to agricultural resources, CEQA Guidelines allow a lead agency to use the California Agricultural Land Evaluation and Site Assessment (LESA) Model. The LESA Model was development as a tool to provide lead agencies an evaluation method in addition to the Environmental Checklist in Appendix G of the CEQA Guidelines. The LESA Model was developed by the California Department of

[4] Cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects and can result from individually minor, but collectively significant actions taking place over a period of time (CEQA Guidelines §15355; 40 CFR 1508.7)

Conservation (DOC) and incorporates the Farmland Mapping and Monitoring Program (FMMP) maps. The LESA Model assists lead agencies in determining that potentially significant impacts to agricultural resources can be quantified and consistently evaluated during the environmental review process (Pub. Resources Code, §21095).

The LESA Model is comprised of six factors: two Land Evaluation (LE) factors based on measures of soil resource quality; and four Site Assessment (SA) factors that provide quantitative scores based on project size, water resource availability, surrounding agricultural lands and surrounding protected resource lands. The factors are then weighted and combined resulting in a score based on a 100 point scale. The final score indicates the significance of the potential impact as follows:

- 0 to 39 points is not considered significant;
- 40 to 79 points can be significant based on final scoring threshold;
- 80 to 100 points considered significant.

Energy Commission staff applied the LESA Model to determine the impacts to agricultural resources from development of the project site and the proposed rail spur. Factual data provided by the applicant in the AFC and Kern County Geographic Information System (GIS) data was used in the assessment. The LESA score and analysis of these impacts are included below.

Project Site

Energy Commission staff used the LESA Model to determine whether the conversion of 453 acres of farmland for the project would be significant. The calculated LESA score was 79.065 (staff's LESA worksheet is included in **Land Use Appendix A**). Section IV of the LESA manual provides LESA Model Scoring Thresholds Ranges for agricultural impacts. The calculated score falls within the 60 to 79 point range which is "considered significant unless either LE or SA score is less than 20 points." Staff's Final LESA Score Sheet calculated the LE Factor score as 29.815 and the SA Factor score as 49.25, therefore the impact to agricultural resources would be considered significant and mitigation would be required.

Rail spur

Alternative 1 of the proposed coal delivery method would construct an approximately 5-mile long rail spur which would result in the permanent disturbance of 38.6 acres (HECA 2012e). The rail spur is proposed to be located adjacent to the East Side Canal on private property along existing unpaved agricultural access roads. The rail spur would require a permanent disturbance of 60-foot right of way along the entire stretch of the line from the project site to the tie in with the existing SJVRR rail spur along Highway 58. The 60-foot right of way would require the removal of existing row crops along the entirety of the rail spur. Of the disturbed acreage 2.84 acres are farmland of statewide importance and 34.77 acres would be prime farmland.

Staff used the LESA Model to determine if the conversion of farmlands for the rail spur would be significant. The calculated LESA score was 69.01 (staff's LESA worksheet is included in Appendix A). The calculated score falls within the 60 to 79 point range which is "considered significant unless either LE or SA score is less than 20 points."

Staff's Final LESA Score Sheet calculated the LE Factor score as 28.26 and the SA Factor score as 40.75, therefore the impact to farmland of statewide importance and prime farmland would be considered significant and mitigation would be required.

Offsite Linears

As shown above in **Land Use Table 2, Disturbed Acreage**, offsite infrastructure and linears would include: process and potable water wells, electrical transmission lines and natural gas lines. The permanent disturbance resulting from the construction of the linears would impact 0.23 acre of farmland of statewide importance and 0.52 acre of prime farmland. Due to the small amount of lands impacted from the offsite linears, staff did not conduct a LESA analysis for the impacts to farmland. However, because these impacts to farmlands would be permanent, these impacts are considered significant and mitigation would be required. The OEHI component would include an approximately 3.4-mile long CO_2 pipeline which after construction would not impact or disturb agricultural lands.

Construction Laydown Yard

The conversion of 91 acres of the Controlled Area for a construction laydown area was not considered when using the LESA Model to determine the significance of impacts to agricultural lands. The laydown area would be returned to pre-disturbed conditions after construction of the HECA project. Therefore the laydown area impacts to agricultural use would be temporary and not considered a long-term impact.

PG&E Switching Station

The project would require the construction of a new PG&E switching station which would be the first point of interconnect from the project site to the electrical grid. The four-acre switching station would be located on lands under Williamson Act contract and identified as Prime Farmland. Staff did not conduct a LESA analysis for the switching station due to the relatively small amount of land impacted. However, because these impacts to farmlands would be permanent, these impacts are considered significant and mitigation would be required.

OEHI EOR Processing Facility and Wells

The OEHI component and associated infrastructure would not be located on lands classified by the California Department of Conservation as being prime farmland or of local or statewide importance. The Farmland Mapping and Monitoring (FMMP) maps of the project area classified the project site as "grazing land" or "non agricultural and natural vegetation." Southern portions of the site are classified as "vacant disturbed land." There would be no impact.

Conclusion

Staff considers the conversion of prime farmland and farmland of statewide importance a significant impact. To mitigate the loss of agricultural lands, staff proposes Conditions of Certification **LAND-1** and **LAND-2**. Staff is recommending two separate conditions of certifications for agricultural land mitigation in the event the applicant does not construct the rail spur for the transportation of coal to the project site The proposed conditions of certification would require the project owner to mitigate for the loss of Prime and

Statewide Important Farmland on a 1:1 basis either through the payment of mitigation in-lieu fees to either the Kern County or the California Departrment of Conservation or through security agricultural easements. The payment of in-lieu fees would be based on the appraised value of the impacted prime agricultural lands and farmland of statewide importance. The in-lieu fees would be then used to preserve agricultural lands and contribute to preserving the agricultural character in Kern County. The option available to the applicant would be to secure agricultural easements at a 1:1 ratio for the affected agricultural lands. The lands used to mitigate this impact are to be of similar agricultural quality and located within Kern County. This condition of certification has been used on other Energy Commission siting projects (Avenal, Tesla, Salton Sea, Panoche, and Starwood) where agricultural land has been converted to non-agriculture uses. In Kern County's March 6, 2013 letter to the Energy Commission, county staff has also recommended that the Energy Commission include mitigation of impacted farmlands at a 1:1 ratio. The county further recommended that the mitigation lands be within Kern County (Kern 2013a). Staff concludes that upon implementation of Conditions of Certification **LAND-1** and **LAND-2** the impact to farmland would be less than significant. There would be no impact to farmland associated with the OEHI EOR portion of the project.

Would the project conflict with existing zoning for agricultural use?

With the exception of Sections 19.12.070 and 19.12.100 of the Zoning Ordinance, which have yet to be determined because staff needs more information from the applicant, the project would not conflict with existing zoning for agricultural use. Please refer to the discussion in the "Compliance with LORS, Kern County General Plan" and "Title 19 Kern County Zoning Ordinance" subsections below for a determination of the project consistency with the Kern County General plan and zoning.

Would the project conflict with existing Williamson Act contracts?

The California Land Conservation Act, commonly referred to as the Williamson Act, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space uses. (Chapter 7, Agricultural Land, Gov. Code § 51200-51297.4) The 453-acre project site is currently under Williamson Act contract. The applicant has agreed with concurrence from Kern County Planning and California Department of Conservation (DOC) staff to cancel the Williamson Act contracts on the project site (HECA 2012e).

Cancellation of the Williamson Act contract requires approval by the Kern County Board of Supervisors, following a public hearing and the making of certain findings discussed below. In order to grant tentative approval for cancellation of a Williamson Act contract, Government Code section 51282(a) requires the Kern County Board of Supervisors to make one of the following findings:

- The cancellation is consistent with the purposes of the Williamson Act.
- The cancellation is in the public interest.

County planning staff estimates the contract cancellation application to be scheduled for Planning Commission review on June 13, 2013 with final determination to be made by the Board of Supervisors thereafter.

The HECA project would also include offsite linears which would primarily be located on lands under Williamson Act contract. The “Agricultural Preserve Standard Uniform Rules” is a compilation of Resolutions of the Kern County Board of Supervisors adopting standards generally applicable to all Williamson Act contracts within the county. These Uniform Rules govern the administration of the Williamson Act and establish approved agricultural and compatible uses on contracted lands. The County Uniform Rules allow “[t]he erection, construction, alteration, operation and maintenance of gas, electric, water, and communication utility facilities and similar public service facilities by corporations and companies under the jurisdiction of the Public Utilities Commission of the State of California and by public agencies.” The proposed switching station and electrical, process and potable water, and gas lines would fall under the Uniform Rules as compatible uses with Williamson Act contracted lands. However, Kern County has determined that the rail spur would not be a compatible use pursuant to the Williamson Act and would require cancellation of those affected contracts. At this time, Kern County has not indicated that the applicant has submitted an application for cancellation of the rail spur lands.

The proposed construction laydown area would be located on Williamson Act contracted lands. Kern County Planning and Department of Conservation staffs have determined that construction impacts would be temporary and would not require cancellation of the existing Williamson Act contracts.

The OEHI processing facility, wells, and new pipeline would not be located on lands under Williamson Act contract; there would be no impact to Williamson Act contracts for this portion of the project.

Conclusion

Proposed Conditions of Certification **LAND-3** and **LAND-4** would require the project owner to submit proof of cancellation of the Williamson Act contracts to the Compliance Project Manager (CPM) 60 days prior to start of any construction activities for the HECA project. Upon cancellation of the Williamson Act contracts, impacts would be less than significant.

Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Pub. Resources Code §12220(g)), timberland (as defined by Pub. Resources Code §4526), or timberland zoned Timberland Production (as defined by Gov. Code §51104(g))?

The proposed HECA project site, laydown area and OEHI component are not zoned for forest land, timberland, or for timberland production. In addition, there is no land zoned for such purposes within one mile of the project site. Therefore, there would be no conflict with, or cause for, rezoning of forest land or timberland and as a result there would be no impact to forest land or timberland.

PHYSICAL DISRUPTION OR DIVISION OF AN ESTABLISHED COMMUNITY

Would the project divide an established community or disrupt an existing or recently approved land use?

The HECA project site and linears would be located within an active farming community. The project site as designed would not divide the existing community or disrupt access to parcels in the surrounding area. The proposed water, natural gas and CO_2 linears would be buried upon installation and would not pose a land use impact to the surrounding community.

The proposed electrical transmission line would be constructed along existing private roads and would be installed on transmission poles 90-115 feet tall. The location and design of the transmission poles would allow for unobstructed access to existing roads and would not disturb vehicular access or the movement of agricultural machinery under the transmission line.

The proposed rail spur would be located on privately owned lands and would generally follow the East Side Channel and then parallel Dairy Road to the project site. As shown in **Traffic and Transportation Figures 1-3,** the applicant has proposed two public at-grade crossings at Stockdale Highway and six private at-grade crossings. If the rail spur is constructed as proposed, the public and private at-grade crossings would allow for the movement of vehicles and agricultural machinery across the rail spur at the identified crossings, which would result in a less than significant impact to the community in the area.

The OEHI EOR component is not located within an established community. The proposed EOR processing facility, new injection wells and pipeline would all be constructed on vacant or previously disturbed lands within the Elk Hills Oil Field. There are no recently approved land uses in the area that would be disrupted by the construction or operation of the OEHI component. There would be no impact to any existing communities as a result of this part of the project.

Staff concludes that upon the construction of the public and private crossings on the proposed rail spur, the HECA project and linears would not disrupt or divide the existing community and impacts would be less than significant.

CONFLICT WITH ANY APPLICABLE LAND USE PLAN, POLICY OR REGULATION

Would the project conflict with any applicable land use plan, policy, or regulation?

Please refer to the discussion in the “Compliance with LORS, Kern County General Plan” and “Title 19 Kern County Zoning Ordinance” subsections below for a determination of the project consistency with the Kern County General Plan and Zoning Ordinance.

CONFLICT WITH ANY APPLICABLE HABITAT OR NATURAL COMMUNITY CONSERVATION PLAN

Would the project conflict with any applicable habitat conservation plan (HCP) or natural community conservation plan (NCCP)?

There are no adopted HCPs or NCCPs that would be affected by the HECA site, project linears or the OEHI component. Staff concludes there would be no impact.

COMPLIANCE WITH LORS

As required by California Code of Regulations, Title 20, section 1744, Energy Commission staff evaluates the information provided by the applicant in the form of the AFC (and any supplements). Staff reviews project design and operational components to determine if elements of the proposed project would conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project, or that would normally have jurisdiction but for the exclusive permitting authority of the California Energy Commission (Pub. Resources Code, § 25500). As part of the licensing process, the Energy Commission must determine whether a proposed facility complies with all applicable federal, state, regional and local LORS (Pub. Resources Code,§ 25523[d][1]). The Energy Commission must either find that a project conforms to all applicable LORS, either by design or with the implementation of appropriate conditions of certification, or make specific findings that a project's approval is justified even where the project is not in conformity with all applicable LORS (Pub. Resources Code,§ 25525). When determining LORS compliance, staff is permitted to rely on a local agency's assessment of whether a proposed project would be consistent with that agency's zoning and general plan. For past projects, staff has requested that the affected local agency provide a discussion of the findings and conditions that the agency would make when determining whether a proposed project would comply with that agency's LORS, were they the permitting authority.

Kern County General Plan

The Land Use, Open Space, and Conservation (Land Use) Element of the Kern County General Plan adopts a land use map that includes land use designations for all parcels within the unincorporated portions of Kern County. The adopted land use designations establish anticipated land use policies, which are further defined and implemented by standards within the zoning ordinance. The general plan land use designations and zone districts for the project site and off-site linears are identified in **Land Use Table 3** above. The predominant land use designation for the project site and the project linears is Exclusive Agriculture (8.1).

The purpose of this chapter of the general plan is to provide policy direction to allow for future economic growth within the County while also protecting natural, agricultural and resource attributes. The General Plan Land Use Map designates the project site as Map Code 8.1 (Intensive Agriculture) which is one of five resource designations established by the General Plan. The Resource land use designation is designed to encourage safe and orderly energy development within the county, including research and demonstration projects, and to become actively involved in the decision and actions of other agencies as they affect energy development in Kern County.

The County Map Code 8.1 designation is defined as areas devoted to the production of irrigated crops or having a potential for such use. Other agricultural uses, while not directly dependent on irrigation for production, may also be consistent with the intensive agriculture designation. The minimum parcel size is 20 acres gross. In addition to agricultural land uses, allowed uses include but are not limited to: “…. public utility uses; and agricultural industries pursuant to provisions of the Kern County Zoning Ordinance, and land within development areas subject to significant physical constraints.”

General Plan Resource Policy 2 states that in areas with a resource designation on the General Plan map, only industrial activities which directly and obviously relate to the exploration, production, and transportation of the particular resource will be considered to be consistent with this General Plan. This policy is implemented in the Zoning Ordinance in Section 19.12.030(A)(2) which conditionally permits fertilizer manufacturing for agricultural uses only.

The initial AFC submitted by the applicant included a chemical manufacturing complex which would produce products for agricultural, transportation and industrial uses (HECA 2012e). Kern County provided response letters in June and July of 2012 stating that such a manufacturing complex would constitute an industrial land use and would require a General Plan Amendment to a compatible land use designation (Kern County 2012d, Kern County 2012e). To address this issue, the applicant revised the project to restrict production of "nitrogen-based products" (including urea, urea ammonium nitrate and anhydrous ammonia) to manufactured products for the purpose of "fertilizer manufacture and storage for agricultural use only." (HECA 2012jj).

The March 6, 2013 Kern County Planning Department letter stated the revised project description to restrict the chemical manufacturing and storage of fertilizers for agricultural use only, would comply with the Kern County General Plan and Zoning Ordinance (Kern 2013a). Kern County staff recommends that if approved by the Energy Commission, the project “include Mitigation Measure(s) to restrict the items produced on site and in the Manufacturing Complex to "fertilizer manufacture and storage for agricultural use only" per Section 19.12.030.A of the Kern County Zoning Ordinance.” Staff is recommending Condition of Certification **LAND-6** which would restrict the products produced from the chemical manufacturing complex to fertilizer for agricultural use only.

With implementation of Condition of Certification **LAND-6** the HECA project would be consistent with the General Plan and Section 19.12.030.A of the Kern County Zoning Ordinance.

The OEHI component would comply with the Kern County General Plan and Zoning Ordinance. The 8.4 Mineral and Petroleum land use designation establishes that oil exploration and production are compatible uses with the 8.4 land use designation. As discussed above, the OEHI component would be directly related to petroleum exploration through the EOR process.

Portions of the project site include the 2.1 (Seismic Hazard) and 2.4 (Steep Slope) overlay due to the topography of lands within the EHOF. These overlays include additional requirements by the permitting agency prior to issuing site development permits for construction of the processing facility. Please refer to the **Facility Design** section for a discussion of project conformance with these Kern County LORS. Staff is recommending Condition of Certification **GEN-1** which would require the project be designed and built to comply with county LORS.

The Kern County Zoning Ordinance includes an Oil and Gas Production Chapter (Chapter 19.98). The chapter establishes that wells for the exploration or production of oil are permitted by right within the Exclusive Agriculture (A) and Limited Agriculture (A-1) zone subject to conformance with applicable state law. The A and A-1 zones establish that uses permitted by right include oil and gas exploration and production. The proposed processing facility is considered an accessory use to a permitted use (oil and gas production) and would also be permitted within the A and A-1 zones.

As proposed, the OEHI component would not conflict with applicable LORS, therefore staff concludes impacts to land use would be less than significant.

<u>Title 18, Kern County Land Division Ordinance</u>

The purpose of the Kern County Land Division Ordinance is to promote and protect the public health, safety and welfare through the orderly regulation of land divisions in the County. The proposed lot line adjustment would be subject to approval by the Planning Director based on the required findings in Section 18.35.060(c).

The project site is comprised of portions of three separate legal parcels. Portions of Assessor's Parcel Number 159-040-16 and 159-040-18 are included in both the project site and controlled area. The proposed lot line adjustment would result in a single 453-acre parcel encompassing the entire project site area. The site area is shown as Intensive Agricultural (8.1) on the General Plan Land Use Map. The HECA project site is not located within any applicable specific plan or rural community plan areas. The project site is located within the Exclusive Agriculture (A) Zone District. The resulting parcel configuration would meet minimum lot size and setback requirements of the A zone district. Condition of Certification **LAND-5** would require the applicant submit to the CPM proof of recordation of the lot line adjustment with the County Recorder's Office.

<u>Title 19, Kern County Zoning Ordinance</u>

The project site is located within the A zone district. Section 19.12.030 of the zoning ordinance permits electrical power generating plants within the A zone subject to approval of a conditional use permit. Kern County's March 6, 2013 letter states that the revised project, which would restrict the chemical manufacturing complex to fertilizer for agricultural use only, would be compatible with uses in the A Zone District. The Kern County Zoning Ordinance (section 19.12.030.A) lists "fertilizer manufacture and storage for agricultural use only" as a conditionally permitted use in the A District. To ensure compliance with the zoning ordinance, staff proposes Condition of Certification **LAND-6** to restrict the sale of fertilizer for agricultural use only**.**

Section 19.104.040(A-E) of the zoning ordinance establishes required findings of approval for conditionally permitted uses. But for the exclusive permitting authority of the Energy Commission, the approving authority is required to find that:

A. The proposed use is consistent with the goals and policies of the applicable General or Specific Plan.

B. The proposed use is consistent with the purpose of the applicable district or districts.

C. The proposed use is listed as a use subject to a conditional use permit in the applicable zoning district or districts or a use determined to be similar to a listed conditional use in accordance with the procedures set out in Sections 19.08.030 through 19.08.080 of this title.

D. The proposed use meets the minimum requirements of this title applicable to the use.

E. The proposed use will not be materially detrimental to the health, safety, and welfare of the public or to property and residents in the vicinity.

While the project would meet zoning requirements with a conditional use permit, it is unclear whether or not the project is fundamentally compatible with existing land uses and if finding 19.104.040(E) can be met. Staff cannot reach a conclusion on this issue until the outstanding information identified in the technical areas requesting such information is provided.

The Kern County Zoning Ordinance divides the unincorporated area of the county into zone districts. The ordinance identifies permitted uses and established development standards in the districts. The adopted zoning designations for the project site and linears are included in **Land Use Table 3**. The entire project site is located in the Exclusive Agriculture (A) Zone District. Chapter 19.12 of the Zoning Ordinance establishes development standards and permitted uses. An analysis of the project's compatibility with these standards is included below:

<u>19.12.050 Minimum Lot Size:</u> The minimum lot size in the A zone is 2 1/2 acres. Following approval and recordation of the lot line adjustment, the project site parcel would be 453 acres and would be consistent with this requirement.

<u>19.12.060 Minimum Lot Area per Dwelling Unit:</u> Because the existing on-site residences would be demolished as part of the project this section of the Zoning Ordinance would not be applicable to the project.

<u>19.12.080 Height Limit:</u> Because the A Zone District does not place any height restrictions on non-residential structures the project would be consistent with this section of the Zoning Ordinance.

<u>Sections 19.12.070 and 19.12.100</u>: These sections of the zoning ordinance establish setback and parking standards for projects within the A Zone District. In order for staff to determine compliance with these LORS staff is requesting the applicant submit a site plan demonstrating compliance with these requirements.

Staff will address the project's compliance with the applicable development standards and conclude if the project meets the required conditional use permit findings of approval prior to publication of the Final Staff Assessment/Final Environmental Impact Statement (FSA/FEIS).

As shown in **Land Use Table 3**, the offsite linears would be located within the Exclusive Agriculture (A) and Limited Agriculture (A-1) Zone Districts. The offsite linears would be permitted by right within the A and A-1 zones.

The OEHI site and associated infrastructure would be located on lands in the Exclusive Agriculture (A) and Limited Agriculture (A-1) Zone District. Section 19.14.020E of the Kern County Zoning Code establishes that oil exploration and production are permitted uses with the A and A-1 zones. There would be no conflict with the existing zoning as part of the OEHI component.

Land Use Table 4
Project Compliance with Adopted and Applicable LORS

Applicable LORS	Description	Consistency Determination	Basis for Consistency
State			
California Subdivision Map Act	Governs the creation, recognition, consolidation/ reconfiguration, adjustment and elimination of parcels of land within California.	Yes, as conditioned	The project will require a Lot Line Adjustment to create a single parcel for the project site.
California Land Conservation Act (Williamson Act)	Enables local governments to enter into contracts with land owners to restrict parcels for agriculture or open space use in return for lower assessed property taxes.	Yes, as conditioned	The project will require cancellation of the existing Williamson Act contracts on the project site and related non-compatible uses.
Local			
Kern County General Plan	Provides comprehensive, long-range plans, policies and goals to guide development within the County.	Yes	Electrical generating facilities are allowed within the 8.1 General Plan Land Use Designation. The project, as revised would comply with the general plan designation.
Resource Chapter 1.9 Policy 2	Industrial uses are permitted only when directly related to the resource.	Yes	The project, as revised, would produce fertilizer for agricultural use only and is therefore consistent with this policy.
Title 18 Kern County Land Division Ordinance	Implementing County Ordinance of the California Subdivision Map Act.	Yes, as conditioned	The project will require a Lot Line Adjustment to create a single parcel for the project site.
Chapter 18.35 Lot Line Adjustments, 18.35.060(C)1	Prior to approval of a lot line adjustment the county is required to find the adjustment is consistent with the General Plan and Zoning ordinance and will not negatively affect the health, safety and welfare of the public at large.	Yes	The proposed Lot Line Adjustment will merge three existing parcels into a single parcel for the project site. This would comply with applicable General Plan policies and Zoning Ordinance requirements.
Title 19 Kern County Zoning Ordinance, Chapter 19.12 Exclusive Agriculture (A)	Implementing ordinance of the General Plan, established uses and development standards within adopted zoning districts.	Undetermined	Electrical generating facilities and fertilizer manufacturing for agricultural uses are conditionally permitted uses within the A zone.

Land Use Table 4
Project Compliance with Adopted and Applicable LORS

Applicable LORS	Description	Consistency Determination	Basis for Consistency
			Land Use staff cannot determine the required conditional use permit findings can be made until the outstanding information identified in other technical areas have been provided. Staff will make this determination prior to publishing the FSA/ FEIS.
19.12.020(D) PERMITTED USES.	UTILITY AND COMMUNICATION FACILITIES. Transmission lines and supporting towers, poles, and underground facilities for gas, water, electricity, telephone, or telegraph service owned and operated by a public utility company or other company under the jurisdiction of the California Public Utilities Commission pursuant to Section 19.08.090 of this title.	Yes	The proposed off-site linears (wells, waterlines, electrical transmission lines, switching station, and natural gas lines) would be permitted by right within the A zone district.
19.12.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT.	AGRICULTURAL USES. Fertilizer manufacture and storage for agricultural use only.	Undetermined	As discussed above, outstanding information has been identified that will need to be provided prior to determining the project meets the findings of approval for conditional use permits.
	RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES. Electrical power generating plant.	Undetermined	
19.12.070 YARDS AND SETBACKS	Front Yard: 55 feet from centerline of existing or proposed street. Side: 5 feet or 10 feet on corner lots. Rear: 5 feet	Undetermined	Staff will require the applicant submit a site plan demonstrating compliance with these requirements prior to publishing the FSA/ FEIS.
19.12.100 PARKING	Parking shall be in accordance with Chapter 19.82 (Off-Street Parking) of the Zoning Ordinance	Undetermined	

Cumulative Land Use Effects

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. To analyze the cumulative effect of the project with reasonably foreseeable projects, section 15130(b) of the CEQA Guidelines allows a lead agency to analyze cumulative impacts by either:

(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or

(B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect.

The cumulative land use and planning analysis considers past, current and probable future projects within Kern County that would contribute to cumulative land use impacts by converting agricultural lands to non-agricultural uses. The identified projects are listed in **Land Use Table 5 Cumulative Projects** below**:**

Land Use Table 5
Cumulative Projects

Project	Project Description	Conversion of Ag Land	Mitigation of Ag Land	Status of Project
FRV Orion Solar Project	20 MW solar photovoltaic project	158 acres prime 118 acres statewide	1:1 mitigation	3/2012 DEIR
Pioneer Green Solar Project	125 MW solar photovoltaic project	234 acres important farmland	1:1 mitigation	12/2012 DEIR
FRV Valley Solar Project	115 MW solar photovoltaic project	90 prime 70 acres statewide	1:1 mitigation	11/2012 DEIR
Old River Solar Project	20 MW solar photovoltaic project	234 acres prime	1:1 mitigation	BOS Approved 11/13/2012
Kingbird Solar Photovoltaic Project	40 MW photovoltaic project	324 acres prime	Unknown	3/27/2012 NOP
Valley Solar Projects	48 MW solar photovoltaic project	40 acres prime	1:1 mitigation	Approved 2/9/2012
Willow Springs Solar Project	160 MW solar photovoltaic project	1,402 acres prime	Unknown	3/8/2010 NOP
Rosamond Solar Project	155 MW solar photovoltaic project	1,177 acres prime	Unknown	3/8/2010 NOP
RE Distributed Solar Project	174 MW solar photovoltaic project	315 acres prime	None	Withdrawn 1/24/2012
Maricopa Sun Solar Project	700 MW solar photovoltaic project	6,047 acres roll out of Williamson Act	None	BOS Approved 3/29/2011
Beech Ave Industrial Park Project	Industrial Use Specific Plan	78 acres prime agricultural land	1:1 mitigation	BOS approved 6/2010
Antelope Valley Solar	650 MW solar photovoltaic project	4,379 acres prime, 22 acres statewide	1:1 mitigation	BOS Approved 3/12/2012
Reina Ranch Project	253 single-family homes	76 acres prime	1:1 mitigation	7/2009 FEIR

MW: Megawatt
DEIR: Draft Environmental Impact Report NOP: Notice of Preparation
BOS: Kern County Board of Supervisors FEIR: Final Environmental Impact Report

Agriculture Conversion

The projects listed in **Land Use Table 5** have cumulatively converted approximately 8,700 acres of classified farmland to non-agricultural uses. Staff is proposing conditions of certification **LAND-1** and **LAND-2** to mitigate the direct impacts of HECA's conversion of about 458 acres of agricultural land. With implementation of the proposed conditions of certification, HECA would not contribute to cumulative impacts in this area.

Please note that the majority of the agricultural conversion in Kern County is due to solar photovoltaic renewable energy projects. The Kern County Board of Supervisors adopted a Renewable Energy Goal on February 22, 2011 as a means to produce 10,000 MW of renewable energy by 2015. Kern County has permitted 7,885 MW of renewable energy with an additional 3,200 MW in process (Kern 2013a). As part of the anticipated development, the Kern County General Plan EIR includes an override for the loss of agricultural lands. While the conversion of agricultural lands to non-agricultural uses in Kern County is significant, it is consistent with the 2011 Renewable Energy Goal to produce 10,000 MW of renewable energy by 2015.

Forestland Conversion

The project as proposed does not have any impacts to forest lands or conflict with any land that is zoned for forestland purposes and therefore, does not contribute to cumulative impacts related to this land use area.

Physical Disruption or Division of an Established Community

The project would not significantly disrupt the surrounding agricultural community. There would be no direct impacts, therefore the project would not contribute to cumulative impacts to this land use area.

Conflict with any Applicable Habitat or Natural Community Conservation Plan

The project would not conflict with any habitat or natural community conservation plans and would not contribute to any cumulative impacts in this land use area.

Conflict with Any Applicable Land Use Plan, Policy or Regulation

With the exception of compliance with Sections 19.12.070 and 19.12.100 of the zoning ordinance and the required findings of approval for conditional use permits, which have yet to be determined, the HECA project would not conflict with applicable LORS and would not contribute to cumulative LORS conflicts. The OEHI project would not contribute to cumulative LORS conflicts.

FACILITY CLOSURE

At some point in the future, the proposed power plant facility would permanently cease operation and close down. At that time, it would be necessary to ensure that closure is carried out in such a way that public health, safety and the environment are protected from adverse impacts.

The AFC states the planned lifetime of the plant is 25 years; however, if the plant is still economically viable, it can operate longer. It is also possible that the plant could become economically noncompetitive earlier than 25 years and be permanently closed earlier. When the plant is permanently closed, a decommissioning plan would be developed detailing the closure procedure to ensure that public health, safety and the environment are protected. At least 12 months prior to decommissioning, the applicant would prepare a Facility Closure Plan for Energy Commission review and approval. The review and approval process would be publicly noticed and allow participation by interested parties and other regulatory agencies, including Kern County. At the time of closure, all pertinent LORS would be identified and the closure plan would discuss conformance of decommissioning, restoration, and remediation activities with these LORS. All of these activities would be under the authority of the Energy Commission. There are two other circumstances in which a facility closure can occur; unplanned temporary closure or unplanned permanent closure.

An unplanned temporary closure occurs when the facility is closed suddenly and/or unexpectedly, on a short-term basis, due to unforeseen circumstances such as a natural disaster or an emergency. An unplanned permanent closure occurs if the project owner closes the facility suddenly and/or unexpectedly, on a permanent basis. An on-site contingency plan will be required (see **Compliance Conditions** section of the PSA/DEIS) to ensure that all necessary steps to mitigate public health and safety impacts and environmental impacts are taken in a timely manner for such unexpected events.

NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits related to land use.

DOE’S FINDINGS REGARDING DIRECT AND INDIRECT IMPACTS OF THE NO-ACTION ALTERNATIVE

Under the No-Action Alternative, DOE would not provide financial assistance to the Applicant for the HECA Project. The Applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative. Accordingly, the No-Action Alternative would have no impacts associated with this resource area.

RESPONSE TO PUBLIC AND AGENCY COMMENTS

Energy Commission staff has received the following comments on the HECA project related to land use:

ASSOCIATION OF IRRITATED RESIDENTS (AIR)

Thomas Frantz, President of AIR submitted a status report and data request to the Energy Commission which included data requests related to land use and agriculture (AIR 2012a). These data requests include issues related to agricultural land mitigation As discussed in this PSA/DEIS, staff is recommending Conditions of Certification **LAND-1 and LAND-2** to require 1:1 mitigation for all impacted prime and farmlands of statewide importance.

KERN COUNTY PLANNING AND COMMUNITY DEVELOPMENT DEPARTMENT
Lorelei Oviatt, Director of the Kern County Planning and Community Development Department submitted two letters dated June 11, 2012 and July 12, 2012 outlining the county's questions and concerns regarding the project's land use incompatibilities. In Kern County's March 6, 2013 letter, county staff determined that the applicant's revised project description, if conditioned to restrict the chemical manufacturing and storage of fertilizers for agricultural use only, would comply with the County General Plan and Zoning Ordinance (Kern 2013a). Kern County also stated that the revised project would be a conditionally permitted use in the A District. Kern County recommends that mitigation for conversion of agricultural lands be at a 1:1 ratio. Staff is recommending Conditions of Certification **LAND-1** and **LAND-2** requiring the project owner to mitigate the loss of affected farmland at a 1:1 ratio. Staff is also recommending Condition of Certification **LAND-6** requiring the project owner to restrict the chemical manufacturing of fertilizer for agricultural use only.

Kern County staff and residents in the area have expressed concerns regarding the use of eminent domain by the Energy Commission to obtain right-of-way for infrastructure including the rail spur for the project. The Kern County Board of Supervisors made a motion at their February 26, 2013 hearing to oppose the use of eminent domain associated with the HECA project (Kern 2013a). The Energy Commission does not have the power of eminent domain. In the event the applicant is unable to obtain from the adjacent landowners the required right-of-way for the rail spur as proposed, the applicant would have to use the proposed truck delivery route instead or propose an alternative rail spur route for Commission consideration.

KERN COUNTY FARM BUREAU
The Executive Director of the Kern County Farm Bureau, Inc. cited issues with the HECA project regarding agricultural impacts from the proposed rail spur, loss of farmland, disruption of farming activities and impacts to air quality. Staff has addressed the project's impacts to agricultural lands in this section and is recommending Conditions of Certification **LAND-1** and **LAND-2** to mitigate for the conversion of agricultural lands associated with the project site, linears and rail spur. Please refer to the **Traffic and Transportation** section for a detailed discussion of the proposed rail spur design and the **Air Quality** section for a discussion of air quality issues.

SIERRA CLUB
The Sierra Club submitted a letter dated July 27, 2012 identifying land use issues related to the HECA project (Sierra Club 2012b). The Sierra Club provided comments requesting the HECA project be required to mitigate at a 2:1 ratio for the loss of prime agricultural land. As discussed above, Energy Commission staff is recommending Conditions of Certification **LAND-1** and **LAND-2** which require the applicant to mitigate at a 1:1 ratio for impacts to prime agricultural land associated with the project. The requirement to mitigate impacted farmlands at a 1:1 ratio is consistent with Kern County's recommendation for agricultural impact mitigation and past Energy Commission projects for impacts to agricultural lands.

ENVIRONMENTAL PROTECTON AGENCY (EPA)
The EPA Environmental Review Office provided scoping comments regarding agricultural land use issues related to the HECA project. The EPA letter identified the

potential loss of prime agricultural lands associated with the project. As discussed above, Energy Commission staff is recommending Conditions of Certification **LAND-1** and **LAND-2,** which require the applicant to mitigate at a 1:1 ratio for impacts to prime agricultural land associated with the project.

CONCLUSIONS

Staff concludes the HECA project:

- Would convert Farmland (as classified by the Farmland Mapping and Monitoring Program). With implementation of Conditions of Certification **LAND-1** and **LAND-2**, the conversion of prime farmland and farmland of statewide importance would be mitigated at a 1:1 ratio.
- With implementation of Condition of Certification **LAND-6**, would not conflict with existing agricultural zoning.
- With implementation of Conditions of Certification **LAND-3** and **LAND-4** requiring the project owner to cancel affected Williamson Act contracts, would not conflict with the Williamson Act or contracted lands.
- Would not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production.
- Would not result in the loss of forest land or conversion of forest land to non-forest use.
- Would not directly or indirectly disrupt or divide an existing community.
- With implementation of Condition of Certification **LAND-5**, would not conflict with the Kern County Land Division Ordinance.
- Would not conflict with any applicable habitat conservation plan or natural community conservation plan.
- With mitigation, would not result in a significant contribution to a cumulative impact resulting from conversion of farmland when viewed in connection with other past projects, current projects or other probable future projects.

Staff cannot conclude the HECA project:

- Would not conflict with applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project, adopted for the purpose of avoiding or mitigating environmental effects. For staff to determine compliance with LORS, staff is requesting the applicant submit a site plan demonstrating compliance with Sections 19.12.070 and 19.12.100 of the Zoning Ordinance. Staff cannot reach a conclusion that the required conditional use permit findings of approval can be made until the outstanding information identified in other technical areas is provided. Staff will address the project's compliance with setback and parking requirements and findings of approval prior to publication of the FSA/FEIS.

Staff concludes that the Occidental Elk Hills, Inc (OEHI) CO_2 Enhanced Oil Recovery (EOR) component would be consistent with the Kern County General Plan and Zoning

Ordinance and will not cause a significant environmental impact under CEQA with respect to land use in accordance with the CEQA Guidelines Appendix G and no mitigation measures are recommended.

PROPOSED CONDITIONS OF CERTIFICATION

LAND-1 The project owner shall mitigate at a 1:1 ratio for the conversion of 457.44 acres of prime agricultural land and 0.23 acre of farmland of statewide importance associated with HECA project site and associated off-site improvements (except for the rail road spur). The mitigation shall comply with one of the following strategies:

1. Payment of a mitigation in-lieu fee to Kern County or to the California Department of Conservation, along with a prepared Farmlands Mitigation Agreement. The payment shall be determined by contacting the Kern County Assessor's Office or a real estate appraiser selected by the project owner and approved by the CPM, to determine the current assessed value of the impacted prime agricultural farmland and farmland of statewide importance.
2. Securing the acquisition of an agricultural easement or otherwise creating or causing the creation of an agricultural easement for other farmland in the vicinity. Easements for prime farmland and farmland of statewide importance would be acquired based on the California Department of Conservation's FMMP maps, but in no case shall be less than a 1:1 ratio. The project owner shall designate preserved lands of substantially similar agricultural quality as the impacted lands and within Kern County. The project owner shall engage an established Land Trust to assist with the process of determining the location and suitability of lands to be placed in trust or under easement.

Verification: Sixty days prior to the start of construction, the project owner shall provide documentation to the CPM demonstrating compliance with one of these options. For option (1), documentation shall consist of proof of mitigation fee payment and a discussion of any land and/or easements purchased to date by the land trust with the mitigation fee money provided, and the provisions to guarantee that the land managed by the trust will be preserved for farming in perpetuity.

LAND-2 If the rail spur is constructed**,** the project owner shall mitigate at a 1:1 ratio for the conversion of 34.77 acres of prime agricultural land and 2.84 acres of farmland of statewide importance associated with the railroad spur. The mitigation shall comply with one of the following strategies:

1. Payment of a mitigation in-lieu fee to Kern County or to the California Department of Conservation, along with a prepared Farmlands Mitigation Agreement. The payment shall be determined by contacting the Kern County Assessor's Office or a real estate appraiser selected by the project owner and approved by the CPM, to determine the current assessed value of the impacted prime agricultural farmland and farmland of statewide importance.

2. Securing the acquisition of an agricultural easement or otherwise creating or causing the creation of an agricultural easement for other farmland in the vicinity. Easements for prime farmland would be acquired based on the California Department of Conservation's FMMP maps, but in no case shall be less than a 1:1 ratio. The project owner shall designate preserved lands of substantially similar agricultural quality as the impacted lands and within Kern County. The project owner shall engage an established Land Trust to assist with the process of determining the location and suitability of lands to be placed in trust or under easement.

Verification: Sixty days prior to the start of construction, the project owner shall provide documentation to the CPM demonstrating compliance with one of these options. For option (1), documentation shall consist of proof of mitigation fee payment and a discussion of any land and/or easements purchased to date by the land trust with the mitigation fee money provided, and the provisions to guarantee that the land managed by the trust will be preserved for farming in perpetuity.

LAND-3: The project owner shall provide a copy of Kern County's Final Certificate of Cancellation for Cancellation of Williamson Act contract for the project site.

Verification: At least 30 days prior to construction, the project owner shall submit to the CPM a copy of Kern County's Final Certificate of Cancellation of Contract for the Williamson Act contract.

LAND-4: If the rail spur is constructed, the project owner shall provide a copy of Kern County's Final Certificate of Cancellation of Contract for the Williamson Act contract.

Verification: At least 30 days prior to construction, the project owner shall submit to the CPM a copy of Kern County's Final Certificate of Cancellation of Contract for the Williamson Act contract.

LAND-5: The project owner shall file a Lot Line Adjustment application with the Kern County Planning and Community Development Department to merge Assessor's Parcel Numbers 159-040-02 (part), 159-040-16 (part) and 159-040-18 (part) into a single parcel. The resulting approximately 453-acre parcel shall be the location of the proposed project site.

Verification: At least 30 days prior to the start of construction, the project owner shall provide the CPM a copy of the approval letter of the Lot Line Adjustment.

LAND-6: To comply with Section 19.12.030(A)(2) of the Kern County Zoning Ordinance, the project owner shall restrict the chemical manufacturing product to fertilizers for agricultural use only.

Verification: Within sixty days of commencement of commercial operation, the project owner shall submit in the Monthly Compliance Reports documentation demonstrating compliance with this requirement. The documentation shall include an attestation that all products are to be sold for agricultural use only, a list of products produced, and bills of sale.

Land Use

Appendix A: California Agricultural LES Worksheet

Appendix A. California Agricultural LESA Worksheet

The California Agricultural LESA Model is composed of six different factors. Two "Land Evaluation" factors are based upon measures of soil resource quality. Four "Site Assessment" factors provide measures of a given project's size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands. For a given project, each of these factors is separately rated on a 100 point scale. The factors are then weighted relative to one another and combined, resulting in a single numeric score for a given project, with a maximum attainable score of 100 points. It is this project score that becomes the basis for making a determination of a project's potential significance, based upon a range of established scoring thresholds. The California Agricultural LESA Instruction Manual found at the California Department of Conservation, Division of Land Resource Protection website provides detailed instructions on how to complete the LESA worksheet.

Calculation of the Land Evaluation (LE) Score

Part 1. Land Capability Classification (LCC) Score

(1) Determine the total acreage of the project.
(2) Determine the soil types within the project area and enter them in **Column A** of the **Land Evaluation Worksheet** provided on page A-2.
(3) Calculate the total acres of each soil type and enter the amounts in **Column B**.
(4) Divide the acres of each soil type (**Column B**) by the total acreage to determine the proportion of each soil type present. Enter the proportion of each soil type in **Column C**.
(5) Determine the LCC for each soil type from the applicable Soil Survey and enter it in **Column D**
(6) From the LCC Scoring Table below, determine the point rating corresponding to the LCC for each soil type and enter it in **Column E**.

LCC Scoring Table

LCC Class	I	IIe	IIs, w	IIIe	IIIs, w	IVe	IVs, w	V	VIe, s, w	VIIe, s, w	VIII
Points	100	90	80	70	60	50	40	30	20	10	0

(7) Multiply the proportion of each soil type (**Column C**) by the point score (**Column E**) and enter the resulting scores in **Column F**.
(8) Sum the LCC scores in **Column F**.
(9) Enter the LCC score in box <1> of the Final LESA Score Sheet on page A-10.

Part 2. Storie Index Score

(1) Determine the Storie Index rating for each soil type and enter it in **Column G**.
(2) Multiply the proportion of each soil type (**Column C**) by the Storie Index rating (**Column G**) and enter the scores in **Column H**.
(3) Sum the Storie Index scores in **Column H** to gain the Storie Index Score.
(4) Enter the Storie Index Score in box <2> of the Final LESA Score Sheet on page A-10.

Land Evaluation Worksheet
Land Capability Classification (LCC) and Storie Index Scores

A	B	C	D	E	F	G	H
Soil Map Unit	Project Acres	Proportion of Project Area	LCC	LCC Rating	LCC Score	Storie Index	Storie Index Score
123	135.9	21.70%	2S	80	17.36	33	7.161
187	317.1	78.30%	2S	80	62.64	41	32.103
	453						
Totals	453	100.00		***LCC Total Score***	80.00	***Storie Index Total Score***	39.26
		(Must Sum To 1.0)					

Site Assessment Worksheet 1.
Project Size Score

	I	J	K
	LCC Class I - II	LCC Class III	LCC Class IV- VIII
	453		
Total Acres	453		
Project Size Scores	100		
Highest Project Size Score		100	

Part 1. Project Size Score

(1) Using **Site Assessment Worksheet 1** provided on page A-2, enter the acreage of each soil type from **Column B** in the **Column I, J or K** that corresponds to the LCC for that soil. (Note: While the Project Size Score is a component of the Site Assessment calculations, the score sheet is an extension of data collected in the Land Evaluation Worksheet, and is therefore displayed beside it.)

(2) Sum **Column** I to determine the total amount of class I and II soils on the project site.

(3) Sum **Column J** to determine the total amount of class III soils on the project site.

(4) Sum **Column K** to determine the total amount of class IV and lower soils on the project site.

(5) Compare the total score for each LCC group in the Project Size Scoring Table below and determine which group receives the highest score.

Project Size Scoring Table

Class I or II		Class III		Class IV or Lower	
Acreage	Points	Acreage	Points	Acreage	Points
>80	100	>160	100	>320	100
60-79	90	120-159	90	240-319	80
40-59	80	80-119	80	160-239	60
20-39	50	60-79	70	100-159	40
10-19	30	40-59	60	40-99	20
10<	0	20-39	30	40<	0
		10-19	10		
		10<	0		

(6) Enter the **Project Size Score** (the highest score from the three LCC categories) in box <3> of the Final LESA Score Sheet on page A-10.

Part 2. Water Resource Availability Score

(1) Determine the type(s) of irrigation present on the project site, including a determination of whether there is dry land agricultural activity as well.

(2) Divide the site into portions according to the type or types of irrigation or dry land cropping that is available in each portion. Enter this information in **Column B** of **Site Assessment Worksheet 2 - Water Resources Availability** provided on page A-5.

(3) Determine the proportion of the total site represented for each portion identified, and enter this information in **Column C**.

(4) Using the Water Resources Availability Scoring Table provided on page A-6, identify the option that is most applicable for each portion, based upon the feasibility of irrigation in drought and non-drought years, and whether physical or economic restrictions are likely to exist. Enter the applicable Water Resource Availability Score into **Column D**.

(5) Multiply the Water Resource Availability Score for each portion by the proportion of the project area it represents to determine the weighted score for each portion in **Column E**.

(6) Sum the scores for all portions to determine the project's total Water Resources Availability Score.

(7) Enter the Water Resource Availability Score in box <4> of the Final LESA Score Sheet on page A-10.

Site Assessment Worksheet 2.

12	Irrigated production not feasible, but rainfall adequate for dry land production in both drought and non-drought years.						25
13	Irrigated production not feasible, but rainfall adequate for dry land production in non-drought years but not in drought years).						20
14	Neither irrigated nor dry land production feasible.						0

Part 3. Surrounding Agricultural Land Use Score

(1) Calculate the project's Zone of Influence (ZOI) as follows:

(a) a rectangle is drawn around the project such that the rectangle is the smallest that can completely encompass the project area.

(b) a second rectangle is then drawn which extends one quarter mile (1,320 feet) on all sides beyond the first rectangle.

(c) The ZOI includes all parcels that are contained within or are intersected by the second rectangle, less the area of the project itself.

(2) Sum the area of all parcels to determine the total acreage of the ZOI.

(3) Determine which parcels are in agricultural use and sum the areas of these parcels.

(4) Divide the area in agriculture found in step (3) by the total area of the ZOI found in step (2) to determine the percent of the ZOI that is in agricultural use.

(5) Determine the Surrounding Agricultural Land Score utilizing the Surrounding Agricultural Land Scoring Table below.

Surrounding Agricultural Land Scoring Table

Percent of ZOI in Agriculture	Surrounding Agricultural Land Score
90-100	100
80-89	95
70-79	90
65-69	85
60-64	80
55-59	70
50-54	60
45-49	50
40-44	40
35-39	30
30-34	20
20-29	10
<19	0

(6) Enter the Surrounding Agricultural Land Score in box <5> of the Final LESA Score Sheet on page A-10.

Part 4. Surrounding Protected Resource Land Score

The Surrounding Protected Resource Land scoring relies upon the same Zone of Influence information gathered in Part 3, and figures are entered in Site Assessment Worksheet 3, which combines the surrounding agricultural and protected lands calculations.

(1) Use the total area of the ZOI calculated in Part 3 for the Surrounding Agricultural Land Use score.

(2) Sum the area of those parcels within the ZOI that are protected resource lands, as defined in the LESA Instruction Manual (e.g., Williamson Act contracted lands, publicly owned lands maintained as park, forest, or watershed resources).

(3) Divide the area that is determined to be protected in step (2) by the total acreage of the ZOI to determine the percentage of the surrounding area that is under resource protection.

(4) Determine the Surrounding Protected Resource Land Score utilizing the Surrounding Protected Resource Land Scoring Table below.

Surrounding Protected Resource Land Scoring Table

Percent of ZOI Protected	Protected Resource Land Score
90-100	100
80-89	95
70-79	90
65-69	85
60-64	80
55-59	70
50-54	60
45-49	50
40-44	40
35-39	30
30-34	20
20-29	10
<20	0

(5) Enter the Surrounding Protected Resource Land score in box <6> of the Final LESA Score Sheet on page A-10.

Surrounding Agricultural Land and Surrounding Protected Resource Land

A	B	C	D	E	F	G
Zone of Influence					Surrounding Agricultural Land Score (from table on page A-7)	Surrounding Protected Resource Land Score (from table on page A-8)
Total Acres	Acres in Agriculture	Acres of Protected Resource Land	Percent in Agriculture (B/A)	Percent Protected Resource Land (C/A)		
600	100	100	100	100	100	100

Final LESA Score Sheet

Calculation of the Final LESA Score

(1) Multiply each factor score by the factor weight to determine the weighted score and enter in Weighted Factor Scores column.
(2) Sum the weighted factor scores for the LE factors to determine the total LE score for the project.
(3) Sum the weighted factor scores for the SA factors to determine the total SA score for the project.
(4) Sum the total LE and SA scores to determine the Final LESA Score for the project.

		Factor Scores	Factor Weight	Weighted Factor Scores
LE Factors				
Land Capability Classification (see page A-2)	<1>	80	0.25	20
Storie Index Rating (see page A-2)	<2>	39.26	0.25	9.815
LE Subtotal			**0.50**	**29.815**
SA Factors				
Project Size (see page A-2)	<3>	100	0.15	15
Water Resource Availability (see page A-5)	<4>	95	0.15	14.25
Surrounding Agricultural Land (see page A-9)	<5>	100	0.15	15
Surrounding Protected Resource Land (see page A-9)	<6>	100	0.05	5
SA Subtotal			**0.50**	**49.25**
			Final LESA Score	**79.065**

California Agricultural LESA Scoring Thresholds

Total LESA Score		Scoring Decision
0 to 39 points		Not Considered Significant
40 to 59 points		Considered Significant only if LE and SA subscores are each greater than or equal to 20 points
60 to 79 points		Considered Significant unless either LE or SA subscore is less than 20 points
80 to 100 points		Considered Significant

The California Agricultural LESA Model is designed to make determinations of the potential significance of a project's conversion of agricultural lands during the Initial Study phase of the CEQA review process. Scoring thresholds are based upon both the total LESA score as well the component LE and SA subscores. In this manner the scoring thresholds are dependent upon the attainment of a minimum score for the LE and SA subscores so that a single threshold is not the result of heavily skewed subscores (i.e., a site with a very high LE score, but a very low SA score, or vice versa). For additional information on the significance scoring thresholds under the California Agricultural LESA Model, consult Section 4 in the LESA Instruction Manual.

Land Use

Appendix B: California Agricultural LES Worksheet for Proposed Rail Line

Appendix B. California Agricultural LESA Worksheet for Proposed Rail Line

The California Agricultural LESA Model is composed of six different factors. Two "Land Evaluation" factors are based upon measures of soil resource quality. Four "Site Assessment" factors provide measures of a given project's size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands. For a given project, each of these factors is separately rated on a 100 point scale. The factors are then weighted relative to one another and combined, resulting in a single numeric score for a given project, with a maximum attainable score of 100 points. It is this project score that becomes the basis for making a determination of a project's potential significance, based upon a range of established scoring thresholds. The California Agricultural LESA Instruction Manual found at the California Department of Conservation, Division of Land Resource Protection website provides detailed instructions on how to complete the LESA worksheet.

Calculation of the Land Evaluation (LE) Score

Part 1. Land Capability Classification (LCC) Score

(1) Determine the total acreage of the project.
(2) Determine the soil types within the project area and enter them in **Column A** of the **Land Evaluation Worksheet** provided on page A-2.
(3) Calculate the total acres of each soil type and enter the amounts in **Column B.**
(4) Divide the acres of each soil type (**Column B**) by the total acreage to determine the proportion of each soil type present. Enter the proportion of each soil type in **Column C.**
(5) Determine the LCC for each soil type from the applicable Soil Survey and enter it in **Column D**
(6) From the LCC Scoring Table below, determine the point rating corresponding to the LCC for each soil type and enter it in **Column E.**

LCC Scoring Table

LCC Class	I	IIe	IIs, w	IIIe	IIIs, w	IVe	IVs, w	V	VIe, s, w	VIIe, s, w	VIII
Points	100	90	80	70	60	50	40	30	20	10	0

(7) Multiply the proportion of each soil type (**Column C**) by the point score (**Column E**) and enter the resulting scores in **Column F.**
(8) Sum the LCC scores in **Column F.**
(9) Enter the LCC score in box <1> of the Final LESA Score Sheet on page A-10.

Part 2. Storie Index Score

(1) Determine the Storie Index rating for each soil type and enter it in **Column G.**
(2) Multiply the proportion of each soil type (**Column C**) by the Storie Index rating (**Column G**) and enter the scores in **Column H.**
(3) Sum the Storie Index scores in **Column H** to gain the Storie Index Score.
(4) Enter the Storie Index Score in box <2> of the Final LESA Score Sheet on page A-10.

Highest Project Size Score		50	

Part 1. Project Size Score

(1) Using **Site Assessment Worksheet 1** provided on page A-2, enter the acreage of each soil type from **Column B** in the **Column I, J or K** that corresponds to the LCC for that soil. (Note: While the Project Size Score is a component of the Site Assessment calculations, the score sheet is an extension of data collected in the Land Evaluation Worksheet, and is therefore displayed beside it.)

(2) Sum **Column I** to determine the total amount of class I and II soils on the project site.

(3) Sum **Column J** to determine the total amount of class III soils on the project site.

(4) Sum **Column K** to determine the total amount of class IV and lower soils on the project site.

(5) Compare the total score for each LCC group in the Project Size Scoring Table below and determine which group receives the highest score.

Project Size Scoring Table

Class I or II			Class III			Class IV or Lower	
Acreage	Points		Acreage	Points		Acreage	Points
>80	100		>160	100		>320	100
60-79	90		120-159	90		240-319	80
40-59	80		80-119	80		160-239	60
20-39	50		60-79	70		100-159	40
10-19	30		40-59	60		40-99	20
10<	0		20-39	30		40<	0
			10-19	10			
			10<	0			

(6) Enter the **Project Size Score** (the highest score from the three LCC categories) in box <3> of the Final LESA Score Sheet on page A-10.

Part 2. Water Resource Availability Score

(1) Determine the type(s) of irrigation present on the project site, including a determination of whether there is dry land agricultural activity as well.

(2) Divide the site into portions according to the type or types of irrigation or dry land cropping that is available in each portion. Enter this information in **Column B of Site Assessment Worksheet 2 - Water Resources Availability** provided on page A-5.

(3) Determine the proportion of the total site represented for each portion identified, and enter this information in **Column C**.

(4) Using the Water Resources Availability Scoring Table provided on page A-6, identify the option that is most applicable for each portion, based upon the feasibility of irrigation in drought and non-drought years, and whether physical or economic restrictions are likely to exist. Enter the applicable Water Resource Availability Score into **Column D**.

(5) Multiply the Water Resource Availability Score for each portion by the proportion of the project area it represents to determine the weighted score for each portion in **Column E**.

(6) Sum the scores for all portions to determine the project's total Water Resources Availability Score.

(7) Enter the Water Resource Availability Score in box <4> of the Final LESA Score Sheet on page A-10.

Site Assessment Worksheet 2.

13	Irrigated production not feasible, but rainfall adequate for dry land production in non-drought years but not in drought years).						20
14	Neither irrigated nor dry land production feasible.						0

Part 3. Surrounding Agricultural Land Use Score

(1) Calculate the project's Zone of Influence (ZOI) as follows:

(a) a rectangle is drawn around the project such that the rectangle is the smallest that can completely encompass the project area.

(b) a second rectangle is then drawn which extends one quarter mile (1,320 feet) on all sides beyond the first rectangle.

(c) The ZOI includes all parcels that are contained within or are intersected by the second rectangle, less the area of the project itself.

(2) Sum the area of all parcels to determine the total acreage of the ZOI.

(3) Determine which parcels are in agricultural use and sum the areas of these parcels.

(4) Divide the area in agriculture found in step (3) by the total area of the ZOI found in step (2) to determine the percent of the ZOI that is in agricultural use.

(5) Determine the Surrounding Agricultural Land Score utilizing the Surrounding Agricultural Land Scoring Table below.

Surrounding Agricultural Land Scoring Table

Percent of ZOI in Agriculture	Surrounding Agricultural Land Score
90-100	100
80-89	95
70-79	90
65-69	85
60-64	80
55-59	70
50-54	60
45-49	50
40-44	40
35-39	30
30-34	20
20-29	10
<19	0

(6) Enter the Surrounding Agricultural Land Score in box <5> of the Final LESA Score Sheet on page A-10.

Part 4. Surrounding Protected Resource Land Score

The Surrounding Protected Resource Land scoring relies upon the same Zone of Influence information gathered in Part 3, and figures are entered in Site Assessment Worksheet 3, which combines the surrounding agricultural and protected lands calculations.

(1) Use the total area of the ZOI calculated in Part 3 for the Surrounding Agricultural Land Use score.

(2) Sum the area of those parcels within the ZOI that are protected resource lands, as defined in the LESA Instruction Manual (e.g., Williamson Act contracted lands, publicly owned lands maintained as park, forest, or watershed resources).

(3) Divide the area that is determined to be protected in step (2) by the total acreage of the ZOI to determine the percentage of the surrounding area that is under resource protection.

(4) Determine the Surrounding Protected Resource Land Score utilizing the Surrounding Protected Resource Land Scoring Table below.

Surrounding Protected Resource Land Scoring Table

Percent of ZOI Protected	Protected Resource Land Score
90-100	100
80-89	95
70-79	90
65-69	85
60-64	80
55-59	70
50-54	60
45-49	50
40-44	40
35-39	30
30-34	20
20-29	10
<20	0

(5) Enter the Surrounding Protected Resource Land score in box <6> of the Final LESA Score Sheet on page A-10.

Surrounding Agricultural Land and Surrounding Protected Resource Land

A	B	C	D	E	F	G
Zone of Influence					Surrounding Agricultural Land Score (from table on page A-7)	Surrounding Protected Resource Land Score (from table on page A-8)
Total Acres	Acres in Agriculture	Acres of Protected Resource Land	Percent in Agriculture (B/A)	Percent Protected Resource Land (C/A)		

Final LESA Score Sheet

<u>Calculation of the Final LESA Score</u>

(1) Multiply each factor score by the factor weight to determine the weighted score and enter in Weighted Factor Scores column.

(2) Sum the weighted factor scores for the LE factors to determine the total LE score for the project.

(3) Sum the weighted factor scores for the SA factors to determine the total SA score for the project.

(4) Sum the total LE and SA scores to determine the Final LESA Score for the project.

		Factor Scores	Factor Weight	Weighted Factor Scores
LE Factors				
Land Capability Classification (see page A-2)	<1>	78.26	0.25	19.565
Storie Index Rating (see page A-2)	<2>	34.78	0.25	8.695
LE Subtotal			**0.50**	**28.26**
SA Factors				
Project Size (see page A-2)	<3>	50	0.15	7.5
Water Resource Availability (see page A-5)	<4>	95	0.15	14.25
Surrounding Agricultural Land (see page A-9)	<5>	100	0.15	15
Surrounding Protected Resource Land (see page A-9)	<6>	80	0.05	4
SA Subtotal			**0.50**	**40.75**
			Final LESA Score	**69.01**

California Agricultural LESA Scoring Thresholds

Total LESA Score		Scoring Decision
0 to 39 points		Not Considered Significant
40 to 59 points		Considered Significant only if LE and SA subscores are each greater than or equal to 20 points
60 to 79 points		Considered Significant unless either LE or SA subscore is less than 20 points
80 to 100 points		Considered Significant

The California Agricultural LESA Model is designed to make determinations of the potential significance of a project's conversion of agricultural lands during the Initial Study phase of the CEQA review process. Scoring thresholds are based upon both the total LESA score as well the component LE and SA subscores. In this manner the scoring thresholds are dependent upon the attainment of a minimum score for the LE and SA subscores so that a single threshold is not the result of heavily skewed subscores (i.e., a site with a very high LE score, but a very low SA score, or vice versa). For additional information on the significance scoring thresholds under the California Agricultural LESA Model, consult Section 4 in the LESA Instruction Manual.

NOISE AND VIBRATION

Edward Brady and Shahab Khoshamshrab

SUMMARY OF CONCLUSIONS

California Energy Commission staff concludes that the Hydrogen Energy California Project (HECA) can be built and operated in compliance with all applicable noise and vibration laws, ordinances, regulations, and standards and, if built in accordance with the conditions of certification proposed below, would produce no significant adverse noise impacts on people within the affected area, either direct, indirect, or cumulative.

INTRODUCTION

The construction and operation of any large industrial facility creates noise, or unwanted sound. The character and loudness of this noise, the times of day or night that it is produced, and the proximity of the facility to sensitive receptors combine to determine whether the facility would meet applicable noise control laws and ordinances and whether it would cause significant adverse environmental impacts. In some cases, vibration may be produced as a result of project construction practices, such as blasting or pile driving. The groundborne energy of vibration has the potential to cause structural damage and annoyance.

The purpose of this analysis is to identify and examine the likely noise and vibration impacts from the construction and operation of HECA and to recommend procedures to ensure that the resulting noise and vibration impacts would be adequately mitigated to comply with applicable laws, ordinances, regulations, and standards (LORS) and to avoid creation of significant adverse noise or vibration impacts. This analysis evaluates the noise and vibration impacts of both, the HECA project and the Enhanced Oil Recovery facility (EOR). Therefore, for the purposes of this analysis, the project consists of the feedstock handling block, fuel gasification block, power generation block, ammonia production complex, air separation unit, CO_2 transmission system, and EOR. For an explanation of technical terms and acronyms employed in this section, please refer to **Noise and Vibration Appendix A** immediately following.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Noise and Vibration Table 1
Summary of Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Federal (OSHA): 29 U.S.C. § 651 et seq.	Protects workers from the effects of occupational noise exposure.
State (Cal/OSHA): Cal. Code Regs., tit. 8, §§ 5095–5099	Protects workers from the effects of occupational noise exposure.
Local Kern County General Plan Noise Element Policies (5)(a) and (5)(b)	Policy (5) prohibits new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated to (a) reduce noise levels in outdoor activity

Applicable LORS	Description
	areas to 65 dBA L_{dn}[1] or less, and (b) reduce interior noise levels to 45 dBA L_{dn} or less.
Kern County Code of Ordinance, Chapter 8.36 (“Noise Control”)	Subsection H limits hours of noisy construction work.

FEDERAL

Under the Occupational Safety and Health Act of 1970 (29 USC § 651 et seq.), the Department of Labor, Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure (29 CFR § 1910.95). These regulations list permissible noise exposure levels as a function of the amount of time during which the worker is exposed (see **Noise and Vibration Appendix A, Table A4** immediately following this section). The regulations further specify a hearing conservation program that involves monitoring the noise to which workers are exposed, assuring that workers are made aware of overexposure to noise, and periodically testing the workers’ hearing to detect any degradation.

There are no federal laws governing off-site (community) noise.

The only guidance available for evaluation of vibration from large industrial plants is guidelines published by the Federal Transit Administration (FTA) for assessing the impacts of groundborne vibration associated with construction of rail projects. These guidelines have been applied by other jurisdictions to assess groundborne vibration of other types of projects. The FTA-recommended vibration standards are expressed in terms of the “vibration level,” which is calculated from the peak particle velocity measured from groundborne vibration. The FTA measure of the threshold of perception is 65 VdB,[2] which correlates to a peak particle velocity of about 0.002 inches per second (in/sec). The FTA measure of the threshold of architectural damage for conventional sensitive structures is 100 VdB, which correlates to a peak particle velocity of about 0.2 in/sec.

The FTA Transit Noise and Vibration Impact Assessment Manual (FTA-VA-90-1003-06) outlines key environmental impact assessment processes and procedures for mass transit projects. The methodology outlined in this document is widely used to assess potential noise impacts from railway operations and was adopted for HECA to assess potential impacts associated with the rail spur. The noise calculations and impact criteria used by the FTA are based on the change in outdoor noise exposure using a sliding scale with three receiver categories and three degrees of impact. Category 2 applies to the project’s noise-sensitive receivers[3] where people normally sleep, including homes; Outdoor L_{dn} applies to this category. Category 1 applies to Tule Elk State Natural Reserve (Tule Elk Reserve) where there is only daytime use of the facility;

[1] For definitions of the various noise measurement metrics and terminologies used in this analysis, please see **Noise and Vibration Appendix A, Table A1**.

[2] VdB is the common measure of vibration energy.

[3] A sensitive noise receptor, also referred to as a noise-sensitive receptor, is a receptor at which there is a reasonable degree of sensitivity to noise (such as residences, schools, hospitals, elder care facilities, libraries, cemeteries, and places of worship).

Outdoor hourly L_{eq} applies to this category. See the graph in Condition of Certification **NOISE-9** for a visual presentation of these criteria.

This graph presents the criteria for FTA's three degrees of impact: No Impact, Moderate Impact, and Severe Impact. As shown in this graph, the criterion for each degree of impact is on a sliding scale dependent on the existing noise exposure and the increase in noise exposure that could result from the project. NEPA considers a "severe impact" to be "significant". Staff agrees with NEPA's consideration and regards a "severe impact" to be "significant", as well.

STATE

California Government Code Section 65302(f) encourages each local governmental entity to perform noise studies and implement a noise element as part of its general plan. In addition, the California Office of Planning and Research has published guidelines for preparing noise elements, which include recommendations for evaluating the compatibility of various land uses as a function of community noise exposure.

The State of California, Office of Noise Control, prepared the Model Community Noise Control Ordinance, which provides guidance for acceptable noise levels in the absence of local noise standards. This model also defines a simple tone, or "pure tone," as one-third octave band sound pressure levels that can be used to determine whether a noise source contains annoying tonal components. The Model Community Noise Control Ordinance further recommends that, when a pure tone is present, the applicable noise standard should be lowered (made more stringent) by five A-weighted decibels (dBA).

The California Occupational Safety and Health Administration (Cal-OSHA) has promulgated occupational noise exposure regulations (Cal. Code Regs., tit. 8, §§ 5095-5099) that set employee noise exposure limits. These standards are equivalent to federal OSHA standards (see **Noise and Vibration Appendix A, Table A4**).

LOCAL

Kern County General Plan Noise Element

Two policies stated in this noise element (Kern County 2007) impact the construction and operation of a project such as HECA. Policy (5)(a) prohibits new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into the project design to reduce noise levels in outdoor activity areas to 65 dBA L_{dn} or less. Policy (5)(b) prohibits new noise-sensitive land uses in noise impacted areas unless effective mitigation measures are incorporated into the project design to reduce interior noise levels within living spaces or other noise sensitive interior spaces to 45 dBA L_{dn} or less.

Kern County Code of Ordinance

The Noise Control Ordinance (Kern County 2009) in Chapter 8.36 of the Kern County Code states that noise from construction must be limited to the following hours when construction takes place within 1,000 feet of a sensitive receptor:

- Weekdays 6:00 a.m. to 9:00 p.m.
- Weekends 8:00 a.m. to 9:00 p.m.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires that significant environmental impacts be identified and that such impacts be eliminated or mitigated to the extent feasible. Section XI of Appendix G of CEQA Guidelines (Cal. Code Regs., tit. 14, App. G) sets forth some characteristics that may signify a potentially significant impact. Specifically, a significant effect from noise may exist if a project would result in:

1. exposure of persons to, or generation of, noise levels in excess of standards established in the local General Plan or noise ordinance or applicable standards of other agencies;
2. exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
3. substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or
4. substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The Energy Commission staff, in applying item 3 above to the analysis of this and other projects, has concluded that a potential for a significant noise impact exists where the noise of the project plus the background exceeds the background by 5 dBA or more at the nearest sensitive receptor.

Staff considers it reasonable to assume that an increase in background noise levels up to 5 dBA in a residential setting is less than significant; an increase of more than 10 dBA is considered significant. An increase between 5 and 10 dBA should be considered adverse, but may be either significant or less than significant, depending on the particular circumstances of the case.

Factors to be considered in determining the significance of an adverse impact as defined above include:

1. the resulting combined noise level;[4]
2. the duration and frequency of the noise;
3. the number of people affected; and
4. the land use designation of the affected receptor sites.

[4] For example, a noise level of 40 dBA would be considered quiet in many locations. A noise limit of 40 dBA would be consistent with the recommendations of the California Model Community Noise Control Ordinance for rural environments and with industrial noise regulations adopted by European jurisdictions. If the project would create an increase in ambient noise no greater than 10 dBA at nearby sensitive receptors, and the resulting noise level would be 40 dBA or less, the project noise level would likely be less than significant.

Noise due to construction activities is usually considered to be less than significant in terms of CEQA compliance if:

- the construction activity is temporary;
- use of heavy equipment and noisy activities are limited to daytime hours; and
- all industry-standard noise abatement measures are implemented for noise-producing equipment.

Staff uses the above method and threshold to protect the most sensitive populations, including the minority population.

SETTING

HECA would be constructed on a 453 acre site located approximately 1.5 miles northwest of the town of Tupman in western Kern County. The EOR facility would be constructed within the existing Elk Hills Oil Field at a location approximately 1.5 miles southwest of Tupman. The project site and surrounding land are agricultural and residential (HECA 2012a, AFC §§ 2.1, 5.5).

The ambient noise regime in the project vicinity consists of agriculture, wildlife, and vehicular traffic. Adjacent land uses are agricultural. The western border of the Tule Elk Reserve is located approximately 1,700 feet to the east of the project site. The nearest sensitive noise receptor is a residence located approximately 1,400 feet east of the project site (HECA 2012a, AFC § 5.5.1.3).

Ambient Noise Monitoring

In order to establish a baseline for comparison of predicted project noise to existing ambient noise, the applicant has presented the results of an ambient noise survey (HECA 2012a, AFC § 5.5.1.3; Tables 5.5-2 through 5.5-13). The survey was conducted March 2 through March 3, 2009, and again from February 28 to February 29, 2012, and monitored existing noise levels at the following locations. Locations LT-1, LT-2, ST-4 and ST-5 are shown in **Noise and Vibration Figure 1**, and locations LT-7, LT-8, MR-1 and MR-2 are shown in Data Response Figure A199-1, docketed on January 16, 2013.

1. Measuring Location LT-1: Near two residences (a single-family residence and a mobile home) located approximately 375 feet northwest of the project boundary (approximately 3,000 feet northwest of the power block at the project center). The option to purchase this 5-acre parcel adjacent to the project site was acquired subsequent to the 2009 Revised AFC. According to the applicant, these residences will not be in use during project construction and operation.
2. Measuring Location LT-2: Near two single-family residences located approximately 1,400 feet east of the eastern project boundary (approximately 4,000 feet of the project center). This represents the nearest sensitive receptor, the one most likely to be impacted by project noise. Long term monitoring showed ambient noise levels typical of a rural environment, similar to those at measuring location LT-1.
3. Measuring location ST-4: this location is approximately 3,900 feet east of the project site's nearest boundary, and 6,600 feet east of the center of the project site, at the northern extent of the Tule Elk Reserve. Short-term ambient noise-level

measurements were conducted along Station Road near the Tule Elk Reserve and were completed on March 2 and 3, 2009. Four short-term measurements were conducted with two 10-minute measurements occurring back-to-back during daytime and evening hours. An additional 1-hour-and-15-minute short-term ambient noise-level measurement was conducted during nighttime hours on April 28, 2009.

4. Measuring Location ST-5: This location is approximately 3,300 feet southeast of the project boundary and 5,900 feet southeast of the center of the project site, in the vicinity of a single-family residence. Short-term ambient noise-level measurements were completed along Tupman Road near the residence.
5. Measuring Location LT-7 (MR-1): This location is approximately 3 miles north of the project site and immediately south of an existing railroad. The primary purpose for this measurement location was to obtain ambient noise-level data near a single-family residence in close proximity to this railroad. This data is used to evaluate the impacts of the railroad spur at the point of connection to the exiting San Joaquin Valley Railroad line at the residential receptor located at MR-1, near this intersection.
6. Measuring Location LT-8 (MR-2): This location is approximately 2.5 miles northwest of the project site and approximately 3,300 feet southwest of the new railroad that would be used to transport fuel to the project site. The primary purpose for this measurement location was to obtain ambient noise-level data near a single-family residence in close proximity to this railroad. This data is used to evaluate the impacts of the new railroad spur at the nearby residential receptor located at MR-2.

Noise and Vibration Table 2 summarizes the ambient noise measurements at these sensitive receptors (HECA 2012a, AFC Tables 5.5-2 through 5.5-13):

Noise and Vibration Table 2
Summary of Measured Ambient Noise Levels

Noise-Sensitive Location	Measured Noise Levels, dBA	
	L_{eq} – Average	L_{90} – Average of the Lowest Nighttime
LT-2: East Residence	55	30
ST-4: Tule Elk Reserve	51	37
ST-5: Southeast Residence	62	33
MR-1: Near Existing Railroad	58	50
MR-2: Near New Railroad	49	30

DIRECT IMPACTS AND MITIGATION

Noise impacts associated with the project can be created by short-term construction activities and by normal long-term operation of HECA.

Please note that staff uses the same method and threshold for determining significance of an adverse noise and vibration impact on sensitive populations, including the identified environmental justice population. This method and threshold are among the most conservative and restrictive used throughout the country; they typically apply to most sensitive people.

Construction Impacts and Mitigation

Construction noise is usually considered a temporary phenomenon. Construction of HECA is expected to be typical of large scale industrial projects in terms of equipment used and other types of activities, but the construction period would extend beyond what is reasonably considered “a temporary phenomenon” (approximately 3.5 years) (HECA 2012a, AFC § 5.5.2.1, p. 5.5-31).

Compliance with LORS

There are no specific LORS limiting the loudness of construction noise in Kern County, but staff compares the projected noise levels with ambient levels (please see the following discussion under **CEQA Impacts**).

Noisy construction work within 1,000 feet of a noise-sensitive receptor would be allowed only during the daytime hours of 6:00 a.m. to 9:00 p.m. weekdays and 8:00 a.m. to 9:00 p.m. weekends in compliance with the Kern County code. To ensure that these hours are, in fact, enforced, staff proposes Condition of Certification **NOISE-8**. Therefore, the noise impacts of HECA construction activities would comply with the noise LORS.

CEQA Impacts

To evaluate construction noise impacts, staff compares the projected noise levels to the ambient. Since construction noise typically varies continually with time, it is most appropriately measured by, and compared to, the L_{eq} (energy average) metric.

The applicant has predicted the noise impacts of project construction on the nearest sensitive receptors (HECA 2012a, AFC § 5.5.2.1, Table 5.5-19). Assuming peak construction activity, a maximum noise level of 62 dBA L_{eq}, which would be due to pile installation, is projected at LT-2 (nearest receptor) in AFC Table 5.5-12. This level, combined with the average daytime ambient level of 55 dBA L_{eq}, would result in 63 dBA L_{eq}; 8 dBA above the existing ambient (please see **Noise and Vibration Table 3**). Pile driving is a subset of the foundation phase and would only be expected to last 4 to 6 months within the overall foundation construction phase. Thus, because this impact would be temporary in nature, it would be less than significant.

Again, assuming peak construction activity, a maximum noise level of 59 dBA L_{eq}, which would be due to pile installation, is projected at ST-4 (Tule Elk Reserve) in AFC Table 5.5-19. This level, combined with the average daytime ambient level of 51 dBA L_{eq}, would result in 60 dBA L_{eq}; 9 dBA above the existing ambient (please see **Noise and Vibration Table 3**). Pile installation is a subset of the foundation phase and would only be expected to last 4 to 6 months within the overall foundation construction phase. Thus, because this impact would be temporary in nature, it would be less than significant.

Similarly, assuming peak construction activity, a maximum noise level of 61 dBA L_{eq}, which would be due to pile installation, is projected at ST-5 in AFC Table 5.5-19. This level, combined with the average daytime ambient level of 62 dBA L_{eq}, would result in 65 dBA L_{eq}; 3 dBA above the existing ambient (please see **Noise and Vibration Table 3**). This is a less-than-significant impact because it's below the Energy Commission's 5 dBA threshold of potential significance.

Therefore, staff considers the noise effects of project construction at LT-2, ST-4 and ST-5 to be less than significant.

Noise and Vibration Table 3
Predicted Project Construction Noise Impacts

Receptor	Highest Construction Noise Level[1] (dBA L_{eq})	Measured Existing Ambient[2] (dBA L_{eq})	Cumulative (dBA L_{eq})	Change (dBA)
LT-2: East Residence	62	55	63	+8
ST-4: Tule Elk Reserve	59	51	60	+9
ST-5: Southeast Residence	61	62	65	+3

1 Source: HECA 2012a, AFC § 5.5.2.1, Table 5.5-19 (Pile Installation).
2 Source: Noise Table 2

To ensure the project construction would create less than significant adverse impacts at the most noise-sensitive receptors, in addition to Condition of Certification **NOISE-8**, which would restrict construction activities to the daytime hours, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a notification process and a noise complaint process to resolve any complaints regarding construction noise.

Linear Facilities

Linear facilities include a transmission line with approximately 15 steel poles outside of the project site, approximately 13 miles of natural gas supply pipeline, approximately 15 miles of process water supply pipeline, approximately 1 mile of potable water supply pipeline, and approximately 3 miles of pipeline transmitting carbon dioxide offsite for sequestration (HECA 2012a, AFC § 2.7.1.10). A majority of the length of these linear facilities would extend past the project site boundaries. While the construction noise levels for the linear facilities would be noticeable, construction on linears proceeds rapidly, so no particular area is exposed to noise for more than a few days.

Steam Blows

Typically, the loudest noise encountered during construction, inherent in building any project incorporating a steam turbine, is created by the steam blows. After erection and assembly of the feedwater and steam systems, the piping and tubing that comprises the steam path has accumulated dirt, rust, scale and construction debris such as weld spatter, dropped welding rods and the like. If the plant were started up without thoroughly cleaning out these systems, all this debris would find its way into the steam turbine, quickly destroying the machine.

In order to prevent this, before the steam system is connected to the turbine, the steam line is temporarily routed to the atmosphere. High pressure steam is then raised in a heat recovery steam generator (HRSG) or a boiler and allowed to escape to the atmosphere through the steam piping. This flushing action, referred to as a steam blow, is quite effective at cleaning out the steam system. A series of short steam blows, lasting two or three minutes each, is performed several times daily over a period of two or three weeks. At the end of this procedure, the steam line is connected to the steam turbine, which is then ready for operation.

These steam blows can produce noise as loud as 129 dBA at a distance of 100 feet. In order to minimize disturbance from steam blows, the applicant intends to equip steam blow piping with a silencer that will reduce noise levels by 20 to 30 dBA, or to a level of 62 to 72 dBA at the nearest residence, LT-2 (HECA 2012a, AFC § 5.5.2.1, Table 5.5-26). This is still an annoying noise level; staff proposes that, in addition to the use of a steam blow silencer, all steam blows be performed only during restricted daytime hours in order to minimize annoyance to noise-sensitive receptors (see proposed Conditions of Certification **NOISE-6** and **NOISE-7** below).

Alternatively, the applicant could elect to employ a new, quieter steam blow process, variously referred to as QuietBlow™ or Silentsteam™. This method utilizes lower pressure steam over a continuous period of approximately 36 hours. Resulting noise levels reach only about 80 dBA at 100 feet; noise levels at the nearest residence, LT-2, would thus be about 48 dBA, considerably lower than the noise level from the high pressure steam blow.

Regardless of which steam blow process the applicant chooses, staff proposes a notification process (see proposed Condition of Certification **NOISE-7** below) to make neighbors aware of impending steam blows.

Vibration

The only construction operation likely to produce vibration that could be perceived off site would be pile driving, should it be employed. Vibration attenuates rapidly; it is not likely that vibration would be perceptible at any appreciable distance from the project site. Staff therefore believes there would be no significant impacts from construction vibration.

For vibration due to the rail spur, please see the discussion in ***Vibration Due to the Rail Spur***, below.

Worker Effects

The applicant has acknowledged the need to protect construction workers from noise hazards and has recognized those applicable LORS that would protect construction workers (HECA 2012a, AFC § 5.5.2.5). To ensure that construction workers are, in fact, adequately protected, staff has proposed Condition of Certification **NOISE-3**, below, which would require a noise control program to be implemented throughout the construction period.

Operation Impacts and Mitigation

The primary noise sources of HECA include the turbine generators, cooling tower, gasification process equipment, material handling, fertilizer manufacturing complex, air separation unit, and various pumps, compressors and fans (HECA 2012a, AFC § 5.5.2.3, Appendix J-2). Staff compares the projected noise with applicable LORS. In addition, staff evaluates any increase in noise levels at sensitive receptors due to the project in order to identify any significant adverse impacts.

The applicant included the following noise mitigation measures when performing computer modeling of noise impacts from project operation (HECA 2012a, AFC § 5.5.2.3):

- Reduced-noise cooling tower cells;
- Stack silencers on HRSG exhaust;
- Noise abatement for various noise sources associated with the gasifiers;
- Low-noise procurement or shrouded or blanketed pump trains, blowers and dust handlers;
- Silencers on selected gas and steam vents to atmosphere;
- Low-noise package for the combustion turbine train; and
- Low-noise package for the steam turbine train;

The effective noise control treatments that were used in the project design modeling are a combination of vendor specification limits, acoustical designs in specific systems, and/or external treatments on selected equipment items or systems. A detailed list of noise control design features for the project is provided in the AFC (HECA 2012a, AFC Table 5.5-27).

Compliance with LORS

The applicant performed noise modeling to determine the project's noise impacts on sensitive receptors (HECA 2012a, AFC § 5.5.2.3, Tables 5.5-28 and 5.5-29). The project's operating noise levels are expected to attenuate to no more than an exterior level of 43 dBA L_{dn} and an interior level of 26 dBA L_{dn} at the nearest receptor, LT-2. This figure complies with the noise level limits specified in the Kern County General Plan Noise Element, as shown in **Noise and Vibration Table 4**.

Noise and Vibration Table 4
Project Operating Noise LORS Compliance

Receptor	Kern County General Plan Noise Element Standard, L_{dn}	Projected Noise Level, L_{dn}
LT-2 (closest residence)	65 dBA Exterior 45 dBA Interior	43 dBA Exterior 26 dBA Interior
ST-4 (Tule Elk Reserve)		37 dBA Exterior 20 dBA interior
ST-5 (second closest residence)		42 dBA Exterior 25 dBA Interior

Source: Kern County 2007 and HECA 2012a, AFC § 5.5.2.3, Tables 5.5-28 and 5.5-29.

As seen in **Noise and Vibration Table 4** above, operational noise levels would be below County standards at the project's most noise-sensitive receptors. Thus, the project would comply with the noise LORS.

CEQA Impacts

Noise from stationary industrial sources such as power plants and other systems and equipment that would be employed in HECA is unique. Essentially, such sources operate as steady, continuous, broadband noise sources, unlike the intermittent sounds that comprise the majority of the noise environment. As such, the noise from these industrial sources contributes to, and becomes part of, the background noise level, or the sound heard when most intermittent noises cease. Where this noise is audible, it will tend to define the background noise level. For this reason, staff compares the projected facility noise to the existing ambient background (L_{90}) noise levels at the affected sensitive receptors. If this comparison identifies a significant adverse impact, then feasible mitigation must be incorporated in the project to reduce or remove the impact.

For residential receptors, staff evaluates project noise emissions by comparing them with nighttime ambient background levels; this evaluation assumes that the potential for public annoyance from project noise is greatest at night when residents are trying to sleep. Nighttime ambient noise levels are typically lower than daytime levels; differences in background noise levels of 5 to 10 dBA are common. Staff believes it is prudent to average the lowest nighttime hourly background noise levels to arrive at a reasonable baseline for comparison with the project's predicted noise level.

Adverse impacts on residential receptors can be identified by comparing predicted project noise levels with the nighttime ambient background noise levels at the nearest sensitive residential receptors.

The applicant has predicted operational noise levels; they are summarized here in **Noise and Vibration Table 5**.

Noise and Vibration Table 5
Predicted Operational Noise Levels and CEQA

Receptor	Project Alone Operational Noise Level L_{90} (dBA) [1]	Measured Existing Ambient, Average Nighttime L_{90} (dBA) [2]	Project Plus Ambient L_{90} (dBA)	Change in Ambient Level
LT-2	37	30	38	+8
ST-5	36	33	38	+5

[1] Source: HECA 2012a, AFC § Table 5.5-30; staff calculations
[2] Source: **Noise and Vibration Table 2**

Combining the ambient noise level of 30 dBA L_{90} at LT-2 (**Noise and Vibration Table 5**, above) with the project noise level of 37 dBA L_{90} would result in a level of 38 dBA L_{90}, 8 dBA over the ambient. Combining the ambient noise level of 33 dBA L_{90} at ST-5 with the project noise level of 36 dBA L_{90} would result in a level of 38 dBA L_{90}, 5 dBA over ambient. As described above (in **Method and Threshold for Determining Significance**), staff regards an increase of up to 5 dBA as a less-than-significant impact and between 5 dBA and 10 dBA as a potentially significant impact. However, the California Model Community Noise Control Ordinance recommendations specify a noise level of 40 dBA to be typical for rural environments. Given that the project would create an increase in ambient noise less than 10 dBA at the nearby receptors and the cumulative noise level (project plus ambient level) would be within the recommended noise level for rural environments (40 dBA), staff considerers the project noise impact to be less-than-significant.

To ensure these noise levels are not further exceeded, staff proposes Condition of Certification **NOISE-4**, below. This condition of certification requires a noise survey when project becomes operational. If the survey shows the project to be out of compliance with these noise levels, the project owner must then implement effective mitigation measures to bring the project into compliance with these levels.

Tonal Noises

One possible source of disturbance would be strong tonal noises. Tonal noises are individual sounds (such as pure tones) that, while not louder than permissible levels, stand out in sound quality. The applicant would avoid the creation of annoying tonal (pure-tone) noises by balancing the noise emissions of various project features during project design. To ensure that tonal noises do not cause annoyance, staff proposes Condition of Certification **NOISE-4**, below.

Linear Facilities

Natural gas, water and carbon dioxide piping would lie underground and would be silent during operation. Noise effects from the electrical interconnection line typically do not extend beyond the right-of-way easement of the line and would thus be inaudible to any receptors.

Vibration

Vibration from HECA could be transmitted by two chief means; through the ground (groundborne vibration) and through the air (airborne vibration).

The individual components that would be employed in the HECA project have demonstrated a very low probability for either ground-borne or airborne-induced vibration impacts to surrounding land uses. All of these pieces of equipment are carefully balanced in order to operate; permanent vibration sensors are attached to the turbines and generators. Should an imbalance occur, the event will be detected and the equipment will automatically shut down. Also, given the distances from the actual equipment to the nearest receptor locations (on the order of at least 3,000 feet), vibration from HECA would be undetectable by any likely receptor.

Vibration Due to the Rail Spur

The FTA Criteria of Impact for Human Annoyance and Interference due to Ground-Borne Vibration is used to determine the threshold for vibration impacts due to the proposed railroad spur centerline (AFC 2012a, Table 5.5-14). MR-1 and MR-2 are noise-sensitive receptors located west of the proposed railroad spur centerline. MR-2 was not analyzed due to the presence of the canal between the source and the receiver.

Assuming a worst-case scenario for train operations, the train would arrive and leave the project site via the proposed railroad spur once a day for a total of two train events. According to FTA vibration criteria, this is considered to be “infrequent.” The receptor at MR-1 is a Category 2 receptor, and therefore the vibration impact threshold is 80 VdB (HECA 2012a, AFC Table 5.5-14). It is important to note that the threshold for human perception of vibration is 65 VdB. The vibration level at MR-1 would be 67 VdB, slightly perceived, but below the 80 VdB requirement. Thus, the vibration impact due to the rail spur would be in compliance with the applicable LORS.

Worker Effects

The applicant has acknowledged the need to protect the facility’s operating and maintenance workers from noise hazards and has committed to comply with applicable LORS (HECA 2012a, AFC § 5.5.2.5). The project would specify that nearly all components would not exceed a near-field maximum noise level of 80 dBA at 1 meter (3 feet) as the standard for equipment selection and procurement. Additionally, signs would be posted in areas of the facility with noise levels exceeding 85 dBA (the level that OSHA recognizes as a threat to workers’ hearing), and hearing protection would be required. To ensure that operation and maintenance workers are, in fact, adequately protected, Energy Commission staff has proposed Condition of Certification **NOISE-5**, below.

Traffic Noise

HECA is unique from previous power facilities that have gone through the Energy Commission’s siting process in that the need for delivery of fuel feedstock would continue for the life of the project. In addition to the normal medium and heavy truck traffic expected during construction, which would extend for approximately 3.5 years (HECA 2012a, § 2.1.7), the applicant proposes two alternative transportation schemes for delivery of feedstock to the project site: 1. Deliver coal feedstock via rail transport over a new 5-mile spur track (Alternate 1), while delivering the balance of operational materials by truck and on existing transportation routes; or 2. Deliver all project supplies, including coal feedstock from Wasco, via trucks, on existing transportation routes (Alternative 2). Please see Data Response Figure A63-1 for a map showing the routes.

The applicant has analyzed the impact of traffic noise using methods used by the FTA[5] and has analyzed the traffic impact at identified receptors from Wasco to the project site (HECA 2012a, AFC Tables 5.5-33, 5.5-35). Using a traffic density metric called Annual Average Daily Traffic (AADT or ADT), the applicant has used the 2010 ADT for the various transportation routes terminating at the project site. By assuming that the ADT increases at an annual rate of 2%, baseline traffic densities were calculated for a “2016” construction year and “2017” operational year at the intersections along the assumed routes to establish baseline ADTs (HECA 2012b, Response to Data Request A-159, Tables A159-1 through A159-3, October 2012). The project transportation requirements were added to these ADTs to calculate the project’s traffic contribution (HECA 2012a, AFC Tables 5.10-4 and 5.10-5).

Since traffic is analyzed as a 24-hour impact, the noise analysis uses the L_{dn}/CNEL metric, which applies a weighted average to the hourly L_{eq} values, accounting for community sensitivity to nighttime noise when people are trying to sleep, to determine the “without project” baseline and the “with project” construction and operational impacts. All of the sensitive receptors within proximity to the intermediary intersections are evaluated against 65 dBA L_{dn}, the threshold levels defined in the Kern County Noise Element[6] and the City of Wasco Noise Element[7]. The differential threshold of 3 dBA were also selected because it represents a change in noise level perceptible to the ear and is consistent with the FTA-defined value at 65 dBA for moderate to severe impact (HECA 2012a, Figure 5.5-2).

The results of the project impact on traffic are presented in the AFC Tables 5.5-33 “2016 Construction Traffic Noise Results, 5.5-34 “2017 Operational Traffic Noise Results” (Rail Option, or Alternative 1), and 5.5-34 “2017 Industrial Operation Traffic No Rail Scenario Noise Results” (Truck Option, or Alternative 2). Based on the 65 dBA limit and the 3 dBA differential (65/3), there were three impact locations during the construction phase of work, two during the operational/rail option phase, and six during the operational/truck option. These results are summarized in **Noise and Vibration Table 6** below.

Traffic - Project Construction

To determine noise attributable to moving traffic, typical noise levels based on ADT, mixture of vehicle type (auto, medium-duty and heavy-duty trucks) and speed are assessed in terms of the L_{dn}/CNEL metric, which is a 24-hour weighted and cumulative value. The traffic attributable to the project construction activities are added to the vehicular flow going into and out of an intersection or interchange. For this reason, the modeling at each intersection is broken down to north, south, east and west quadrants, which represent traffic density. Thus, the traditional method of identifying sound power levels and calculating the attenuated noise to a sensitive receptor does not adequately

---

[6] Kern County General Plan, Noise Element Chapter 3, § 3.2, Policy 5, p. 148.

[7] City of Wasco General Plan, Noise Element Chapter 8, § 8.1 Project Evaluatio, Policy 1, p. 8.0-1.

represent the noise conditions. Instead, the baseline and projected L_{dn} or CNEL would have to apply at full noise levels to residences, community buildings and other building types along the path of the road.

In the case of construction traffic for HECA, the 65 dBA L_{dn} threshold and 3 dBA increment (65/3) are identified as delineated in the AFC Table 5.5-33. Where the calculated noise levels exceed the 65/3 criterion, the noise levels at any structures along the street or highway path would experience a significant increase in exposure to noise (**Noise and Vibration Table 6** below).

Noise and Vibration Table 6
"With Project" Truck Traffic Noise Levels at Intersections - Alternative 2

Mark	Intersection	Table	Orientation	Speed (mph)	Additional Vehicles	Noise Level (L_{dn}) dBA	Increment (L_{dn}) dBA
OPS-2.1 1	I-5 North/ Stockdale	5.5-35	West	55	490	70	3
OPS-2.2 2	I-5 South/ Stockdale	5.5-35	East	55	490	70	3
C-1 3	I-5 South/ Stockdale	5.5-33	West	55	2024	67	3
OPS-1.1 4	I-5 South/ Stockdale	5.5-34	West	55	457	67	3
OPS-2.3 5	I-5 South/ Stockdale	5.5-35	West	55	490	70	5
OPS-2.4 6	Stockdale/ Morris	5.5-35	South 4300'W LT-3	25	490	65	19
C-2 7	Stockdale/ Morris	5.5-33	East 4300'W LT-3	55	2022	67	3
OPS-1.2 8	Stockdale/ Morris	5.5-34	East 4300'W LT-3	55	456	67	3
OPS-2.5 9	Stockdale/ Morris	5.5-35	East 4300'W LT-3	55	490	70	5
OPS-2.6 10	Tupman/ Station	5.5-35	East 1800'E LT-2	25	490	65	18
C-3 11	Dairy/ Stockdale	5.5-33	West 3200'W LT-9	55	320	67	3

From the applicant's analysis, there are three locations where project construction would have the potential to cause a significant impact: Interstate 5 and Stockdale (C-1), Stockdale and Morris (C-2), and Dairy and Stockdale (C-3) (see **Noise and Vibration Table 6** above) (HECA 2012a, AFC § 5.5.2.8, Table 5.5-33). The west leg of the intersection of Dairy Road and Stockdale Highway would have an increase in L_{dn}/CNEL of 3 dBA with a resulting noise level of 67 dBA L_{dn}/CNEL at 50 feet due to construction traffic related to the project. There are two residences located along the north side of Stockdale Highway that would be impacted during construction. The east leg of the intersection of Stockdale Highway and Morris Road would be impacted and would see an increase in L_{dn}/CNEL of 3 dBA with resulting noise level of 67 dBA L_{dn}/CNEL at a distance of 50 feet due to construction traffic related to the project. There are no residences close enough to this intersection to be considered impacted. The west leg of the intersection of Interstate-5 SB Ramp and Stockdale Highway would be impacted and would see an increase in L_{dn}/CNEL of 3 dBA with a resulting noise level of 67 dBA

L_{dn}/CNEL at 50 feet due to construction traffic related to the project. There are no residences close enough to this leg to be considered impacted.

The applicant concluded that as long as construction traffic is limited to construction noise exempt hours, noise impacts could be considered intermittent and temporary (HECA 2012a, p. 5.5-31). However, the HECA construction period would be approximately 3.5 years long; the period of noise exposure from construction noise extends beyond the reasonable understanding of "intermittent and temporary." For this reason, staff concludes that mitigation measures must be implemented to reduce significant traffic noise at any affected noise-sensitive receptors near the construction traffic pathways. To reduce the impact on noise-sensitive receptors along the pathway to less than significant, staff proposes Condition of Certification **NOISE-9**, which would require reduced speed limits, soundwalls, and/or roadway improvements. With implementation of this Condition of Certification, construction traffic noise would comply with the LORS and would create a less-than-significant impact.

NOISE-9 would require a noise survey once construction is underway, to determine if the noise impact needs to be mitigated at any effected receptor located within 1,000 feet of the transportation route from Wasco, CA to the project site. Although, it may be somewhat premature to, prior to commencement of project-related traffic, identify the receptors where soundwalls would be installed, it would be helpful to at least have a general idea of where these soundwalls might be installed so that the other technical staff could weigh in on whether impacts from their installation could be significant. Therefore, prior to preparing the FSA/FEIS, the applicant needs to inform staff of the potential locations of the soundwalls, including their height and length.

Traffic - Project Operation

Coal by Rail (Alternative 1)

A new 5-mile rail spur would connect the HECA site with an existing San Joaquin Valley Railroad (SJVRR) spur track, which runs in a right of way along side of State Route 58 (Rosedale Highway). This rail spur would provide an average 2-unit trip per week. One train unit would comprise 111 coal cars and five locomotives. The balance of transport would be handled by trucks delivering petcoke from southern and central California, delivering at a rate of 55 trucks per day. The frequency for delivering chemicals, products and parts would vary. Modeling of truck traffic attributable to project operation utilizes the same method as the one used for construction traffic. Material load types and numbers would shift to account for operational activities (HECA 2012a, AFC Tables 5.10-4 and 5.5.34) and an increased ADT would project forward to 2017.

From the applicant's analysis of truck runs, there are two locations where the project exceeds the 65/3 criteria: Interstate 5 South and Stockdale (see OPS-1.1 in **Noise and Vibration Table 6**) and the Stockdale/Morris intersection (OPS-1.2). Both of these locations have a baseline L_{dn} of 64 dBA with a 3 dBA increment for a final L_{dn} of 67 dBA. The Interstate 5/Stockdale interchange is remote to the project. Stockdale/Morris is closer in toward the project site and has sensitive receptor LT-3/ST-3 within its sphere of influence (see **Noise and Vibration Figure 1**). Although the noise levels at the remaining intersections closer to the project site do not exceed the 65 dBA threshold, the incremental increased noise levels are notable: 13 dBA easterly at Tupman and

Station, 10 dBA at Dairy and Stockdale and 15 dBA northerly/20 dBA southerly. As seen here, the potential to create a significant noise impact at some of the receptors would exist. Thus, staff proposes Condition of Certification **NOISE-9** to reduce any significant impacts to less than significant. This condition of certification would require a noise survey at any noise-sensitive receptor within 1,000 feet of the path of travel. If the survey shows the train noise to be out of compliance with the FTA criteria for a severe impact, the project owner must then implement effective mitigation measures to bring the project into compliance with these criteria. These measures include reduced speed limits, soundwalls, and/or roadway improvements.

The applicant assessed the railroad spur using the FTA Noise Impact Assessment Spreadsheet model. The results are summarized in AFC Table 5.5-31. The baseline noise levels were measured at LT-7 at L_{dn} of 65 dBA and applied to MR-1 (see Data Response Figure A199-1, docketed on January 16, 2013). The cumulative effect of the train increased to 67 dBA. The 2 dBA differential was considered moderate impact under FTA guidelines (HECA 2012a, AFC Figure 5.5-2). The existing L_{dn} of 53 dBA was measured at LT-8, which was applied to MR-2. The cumulative L_{dn} of 53 dBA at LT-8 was unchanged from baseline conditions. The cumulative L_{dn} at MR-2 was 59 dBA, a 6 dBA difference having a moderate impact by FTA standards. The LT-9 L_{dn} remained unchanged at 67 dBA, having no impact. The cumulative L_{dn} of 67 dBA derived for MR-1 is the only location that exceeds the 65 dBA criterion. LT-9 remains unchanged at L_{dn} of 67 dBA. Among the measured and derived receptors, MR-1 is the only location to exceed 65 dBA and its differential impact is only “moderate”.

The rail spur would provide an average 2-unit trip per week. There would be 5 private crossings and 2 public crossings, at which the train would initiate a 20-second warning as it approaches a public crossing. Noise analysis for the train, including the whistle noise is covered in AFC § 5.5.2.6 and Table 5.5-31. Based on the train length of 1.3 miles and a speed of 25 mph, the train would signal a 20-second warning, followed by a three-minute travel time between Stockdale Road and Adohr Road along Dairy Road, followed by a 20-second warning as it enters the second public crossing. Based on AFC Table 5.5-31, the whistle noise would be below the existing background noise level at the nearest noise-sensitive receptor, LT-9. Additionally, while the tonal quality of the whistle may make it a distinctive sound separate from other background noise, its characteristics would be intended for the purpose of safety. Therefore, the noise impact of train horn would be less than significant.

Coal by Truck (Alternative 2)

Alternative 2 eliminates the option to construct and operate a railroad spur to deliver coal feedstock directly to HECA. The applicant’s analysis extends all the way back to the city of Wasco, where a coal terminal is located. The truck count for this operational alternative is provided in AFC Table 5.10-5 and the analysis is summarized in Table 5.5-35, using projected ADTs for 2017.

From the applicant’s analysis, the “Truck Only” option would have the potential to cause a significant impact at six locations. Three are located at the Interstate 5/Stockdale Interchange. The west leg of the intersection of the I-5 northbound ramp and Stockdale Highway would be impacted and would have both an increase in L_{dn}/CNEL of 3 dBA and a “with project” L_{dn}/CNEL of greater than 65 dBA at a distance of 50 feet from the centerline. Noise-sensitive residential homes are located as close as 60 feet to the centerline along this leg (see OPS-2.1, OPS-2.2, and OPS-2.3 in **Noise and Vibration Table 6**). Two of the remaining three are located at the intersection of Stockdale and Morris (OPS-2.4 and OPS-2.5), which is 4,300 feet from LT-3. The south orientation measures out at an initial L_{dn} of 46 dbA and a final of 65 dBA (19 dBA difference). In the easterly direction, the noise levels are an L_{dn} of 65 dBA initial, 70 dBA final for a 5 dBA difference. The final significant location is Tupman at Station (OPS-2.6) with an initial L_{db} of 47 dBA and an 18 dBA change to finish at 65 dBA. This location is 1,800 feet from LT-2. Tule Elk Reserve's visitor center is located approximately 300 feet south of Station Road and would likely experience a high level of noise from truck traffic. As seen here, the potential to create a significant noise impact at some of the receptors would exist. Thus, staff proposes Condition of Certification **NOISE-9** to reduce any significant impacts to less than significant.

The EOR Facility

Supplemental Environmental Information (SEI) prepared for the Occidental of Elk Hills, Inc. (OEHI) (SEI 2012) evaluates the noise and vibrations impacts of EOR on the nearest noise-sensitive receptors. Table 4.11-3 of the SEI lists the sensitive receptors in close proximity to EOR. The closest noise-sensitive receptor to EOR is located in the Town of Tupman, approximately 1.5 miles northeast of the EOR site. The existing average ambient noise level at this location is 61.0 dBA L_{dn} (SEI 2012, Table 4.11-7). Project construction noise level would be 61.2 dBA L_{dn} at this location, only 0.2 dBA above existing ambient. Noisy construction work within 1,000 feet of a noise-sensitive receptor would be allowed only during the daytime hours of 6:00 a.m. to 9:00 p.m. weekdays and 8:00 a.m. to 9:00 p.m. weekends in compliance with the Kern County code. Therefore, the noise impacts of EOR construction activities would comply with the noise LORS and would create a less-than-significant impact. To ensure that these hours are, in fact, enforced, staff recommends that the agency with responsibility for OEHI implement mitigation restricting construction to these specified hours (please see **Recommended Mitigation Measures** below). Staff does not know which agency would have jurisdiction over OEHI but will discover that and include it in the FSA/FEIS).

Operation of the EOR facility would have the potential to impact the nearest sensitive receptor in the Town of Tupman. Noise from this facility's operations would result in 61.2 dBA L_{dn} (SEI 2012, Table 4.11-7). This is only 0.2 dBA in excess of existing ambient and is below the county's threshold of 65 dBA L_{dn}. Thus, the noise impacts of EOR operational activities would comply with the noise LORS and would create a less-than-significant impact.

The most likely activity that could result in groundborne vibrations would be the operation of conventional construction equipment involved in installation of pipelines and the EOR processing facility. Vibration from typical earthmoving activity generally dissipates rather quickly above distances of approximately 100 feet. Given the one mile distance of the nearest construction site to a sensitive receptor, excessive groundborne vibration would be very unlikely. Project operation would not include components that have proven to cause vibrations at such a distance.

CUMULATIVE IMPACTS AND MITIGATION

Section 15130 of the CEQA Guidelines (Cal. Code Regs., tit. 14) requires a discussion of cumulative environmental impacts. Cumulative impacts are two or more individual impacts that, when considered together, are considerable or that compound or increase other environmental impacts. The CEQA Guidelines require that the discussion reflect the severity of the impacts and the likelihood of their occurrence, but need not provide as much detail as the discussion of the impacts attributable to the project alone.

There is one project in the vicinity of HECA, a proposed dairy farm and milk production facility that may occupy plots to the west, north and east of the HECA project site (HECA 2012a, AFC § 5.5.3, Appendix J). The onsite noise from the dairy farm is estimated to range from 57 to 67 dBA. Considering the fairly low onsite noise levels from the dairy facility and the relatively long distances to the nearest noise-sensitive receptors, the dairy facility is expected to contribute negligible, if any, additional noise levels to the environment around the project site. Thus, the combined noise from HECA and the farm facility would not pose a potential for significant cumulative noise impacts.

The HECA and EOR facilities would be approximately 2.5 miles apart. The noise-sensitive receptor most likely to be affected by the combined noise from these two facilities is located on the western edge of the Town of Tupman, approximately 1.5 miles northeast of the EOR site and approximately 1.5 miles southeast of the HECA site. Operation of HECA would likely generate a noise level of 25 dBA L_{eq} at this location (**Noise and Vibration Figure 1**). Operation of the EOR facility would likely generate a noise level of 62.2 dBA L_{eq} (SEI 2012, § 4.11.5). The additive noise level of these two sources is 62.2 dBA L_{eq}. This means that the addition of HECA would not increase the impact; or, HECA would not be heard at this receptor. Thus, the combined noise from HECA and EOR would not pose a potential for significant cumulative noise impacts.

FACILITY CLOSURE

In the future, upon closure of HECA, all operational noise from the project would cease, and no further adverse noise impacts from operation of HECA would be possible. The remaining potential temporary noise source would be the dismantling of the structures and equipment and any site restoration work that may be performed. Since this noise would be similar to that caused by the original construction, it can be treated similarly. That is, noisy work could be performed during daytime hours, with machinery and equipment properly equipped with mufflers. Any noise LORS that are in existence at that time would apply. Applicable conditions of certification included in the Energy Commission decision would also apply.

DOE'S FINDINGS REGARDING DIRECT AND INDIRECT IMPACTS OF THE NO-ACTION ALTERNATIVE

Under the No-Action Alternative, DOE would not provide financial assistance to the applicant for HECA. The applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative. Accordingly, the No-Action Alternative would have no impacts associated with this resource area.

CONCLUSIONS AND RECOMMENDATIONS

Staff concludes that HECA, if built and operated in conformance with the proposed conditions of certification below, would comply with all applicable noise and vibration LORS and would produce no significant adverse noise impacts on people within the project area, including the identified environmental justice population, directly, indirectly, or cumulatively.

PROPOSED CONDITIONS OF CERTIFICATION

NOISE-1 At least 15 days prior to the start of ground disturbance, the project owner shall notify all noise-sensitive receptors[8] within 1.5 miles of the HECA site boundaries, and all noise-sensitive receptors within 1,000 feet of the project-related traffic routes, including the personnel at the Tule Elk State Natural Reserve's visitor center by mail or other effective means, of the commencement of project construction. At the same time, the project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project and include that telephone number in the above notice. If the telephone is not staffed 24 hours per day, the project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the project site during construction in a manner visible to passersby. This telephone number shall be maintained until the project has been operational for at least one year.

<u>Verification:</u> Prior to ground disturbance, the project owner shall transmit to the compliance project manager (CPM) a statement, signed by the project owner's project manager, stating that the above notification has been performed and describing the method of that notification, verifying that the telephone number has been established and posted at the site, and giving that telephone number.

NOISE COMPLAINT PROCESS

NOISE-2 Throughout the construction and operation of HECA, the project owner shall document, investigate, evaluate, and attempt to resolve all project-related noise complaints, including complaints due to project-related traffic. The project owner or authorized agent shall:

- Use the Noise Complaint Resolution Form (below), or a functionally equivalent procedure acceptable to the CPM, to document and respond to each noise complaint;

[8] A sensitive noise receptor, also referred to as a noise-sensitive receptor, is a receptor at which there is a reasonable degree of sensitivity to noise (such as residences, schools, hospitals, elder care facilities, libraries, cemeteries, and places of worship).

- Attempt to contact the person(s) making the noise complaint within 24 hours;
- Conduct an investigation to determine the source of noise related to the complaint;
- Take all feasible measures to reduce the noise at its source if the noise is project related; and
- Submit a report documenting the complaint and the actions taken. The report shall include: a complaint summary, including final results of noise reduction efforts, and if obtainable, a signed statement by the complainant stating that the noise problem is resolved to the complainant's satisfaction.

Verification: Within five days of receiving a noise complaint, the project owner shall file a copy of the Noise Complaint Resolution Form with the CPM, documenting the resolution of the complaint. If mitigation is required to resolve a complaint, and the complaint is not resolved within a three-day period, the project owner shall submit an updated Noise Complaint Resolution Form when the mitigation is implemented.

NOISE-3 The project owner shall submit to the CPM for review and approval a noise control program and a statement, signed by the project owner's project manager, verifying that the noise control program will be implemented throughout construction of the project. The noise control program shall be used to reduce employee exposure to high noise levels during construction and also to comply with applicable OSHA and Cal/OSHA standards.

Verification: At least 30 days prior to the start of ground disturbance, the project owner shall submit to the CPM the noise control program and the project owner's project manager's signed statement. The project owner shall make the program available to Cal/OSHA upon request.

NOISE RESTRICTIONS

NOISE-4 The project design and implementation shall include appropriate noise mitigation measures adequate to ensure that the noise levels due to operation of the project alone will not exceed: an hourly average of 37 dBA L_{90}, measured at or near monitoring location LT-2 and an hourly average of 36 dBA L_{90}, measured at or near monitoring location ST-5.

No new pure-tone components shall be caused by the project. No single piece of equipment shall be allowed to stand out as a source of noise that draws legitimate complaints.

A. When the project first achieves full operation, the project owner shall conduct a 25-hour community noise survey at monitoring location LT-2, or at a closer location acceptable to the CPM. This survey shall also include measurement of one-third octave band sound pressure levels to ensure that no new pure-tone noise components have been caused by the project.

   During the period of this survey, the project owner shall conduct a short term survey of noise at monitoring location ST-5, or at closer locations acceptable to the CPM. The short-term noise measurements at this location shall be conducted during the nighttime hours of 10:00 p.m. to 7:00 a.m.

The measurement of project noise for the purposes of demonstrating compliance with this condition of certification may alternatively be made at a location, acceptable to the CPM, closer to the project (e.g., 400 feet from the project boundary) and this measured level then mathematically extrapolated to determine the project noise contribution at the affected residence. The character of the project noise shall be evaluated at the affected receptor locations to determine the presence of pure tones or other dominant sources of project noise.

B. If the results from the noise survey indicate that the power project noise at the affected receptor sites exceeds the above noise limits, mitigation measures shall be implemented to reduce noise to a level of compliance with these limits.

C. If the results from the noise survey indicate that pure tones are present, mitigation measures shall be implemented to eliminate the pure tones.

Verification: The survey shall take place within 30 days of the project first achieving full operation. Within 15 days after completing the survey, the project owner shall submit a summary report of the survey to the CPM. Included in the survey report shall be a description of any additional mitigation measures necessary to achieve compliance with the above listed noise limits, and a schedule, subject to CPM approval, for implementing these measures. When these measures are in place, the project owner shall repeat the noise survey.

NOISE-5 Following the project's first achieving full operation, the project owner shall conduct an occupational noise survey to identify the noise hazardous areas in the facility.

The survey shall be conducted by a qualified person in accordance with the provisions of Title 8, California Code of Regulations sections 5095–5099 and Title 29, Code of Federal Regulations section 1910.95. The survey results shall be used to determine the magnitude of employee noise exposure.

The project owner shall prepare a report of the survey results and, if necessary, identify proposed mitigation measures that will be employed to comply with the applicable California and federal regulations.

Verification: Within 30 days after completing the survey, the project owner shall submit the noise survey report to the CPM. The project owner shall make the report available to OSHA and Cal/OSHA upon request.

STEAM BLOW RESTRICTIONS

NOISE-6 If a traditional, high-pressure steam blow process is employed, the project owner shall perform the steam blow in such a way that noise from steam blows is no greater than 109 dBA measured at a distance of 100 feet. The project owner shall conduct steam blows only during the hours of 8 a.m. to 6 p.m., unless the CPM agrees to longer hours based on a demonstration by the project owner that offsite noise impacts will not cause annoyance. If a low-pressure continuous steam blow process is employed, the project owner shall submit a description of this process, with expected noise levels and projected hours of execution, to the CPM.

Verification: At least 15 days prior to the first high-pressure steam blow, the project owner shall submit to the CPM a projection of the noise levels expected, and a description of the steam blow schedule. At least 15 days prior to any low-pressure continuous steam blow, the project owner shall submit to the CPM drawings or other information describing the process, including the noise levels expected and the projected time schedule for execution of the process.

NOISE-7 Prior to the first steam blow(s), the project owner shall notify all residents or business owners within 1.5 miles of the project site boundaries of the planned steam blow activity, and shall make the notification available to other area residents in an appropriate manner. The notification may be in the form of letters to the area residences, telephone calls, fliers or other effective means. The notification shall include a description of the purpose and nature of the steam blow(s), the proposed schedule, the expected sound levels, and the explanation that it is a one-time operation and not a part of normal project operations.

Verification: This notification shall occur at least 15 days prior to the first steam blow(s). Within five days of notifying these entities, the project owner shall send a letter to the CPM confirming that they have been notified of the planned steam blow activities, including a description of the method(s) of that notification.

CONSTRUCTION TIME RESTRICTIONS

NOISE-8 Operation of heavy construction equipment and noisy construction work relating to any project features, including construction-related traffic, shall be restricted to the times delineated below, if the activity occurs within 1,000 feet of a noise sensitive receptor:

Weekdays:	6:00 a.m. to 9:00 p.m.
Weekends:	8:00 a.m. to 9:00 p.m.

Haul trucks and other engine-powered equipment shall be equipped with mufflers that meet all applicable regulations. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies.

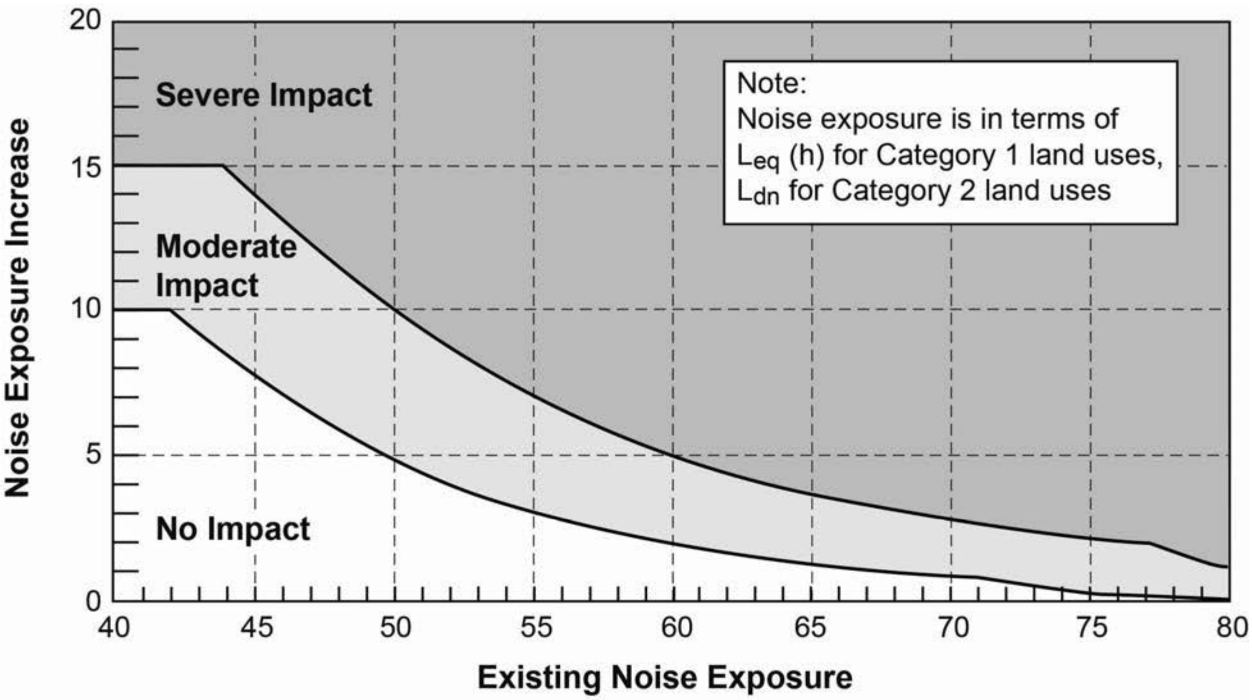
Verification: Prior to ground disturbance, the project owner shall transmit to the CPM a statement acknowledging that the above restrictions will be observed throughout the construction of the project.

TRAFFIC

NOISE-9 The project owner shall measure project-related traffic noise levels at all identified noise-sensitive receptors (or their representative location[s]) within

1,000 feet of the project's transportation routes, from Wasco, CA to the project site, including the Tule Elk State Natural Reserve's visitor center. The measurement of noise for the purposes of demonstrating compliance with this condition of certification may alternatively be made at a location, acceptable to the CPM, closer to the transportation route (e.g., 400 feet from the route) and this measured level then mathematically extrapolated to determine the noise contribution at the affected receptor(s).

If the measurements show noncompliance with the criteria outlined in the following graph, the project owner shall implement one or more of the following mitigation measures, in order to reduce the noise levels propagated by project-related construction and operation traffic at the affected receptor(s), to a level at or below the threshold for a "severe impact" as shown in the following graph.



CALIFORNIA ENERGY COMMISSION - SITING, TRANSMISSION AND ENVIRONMENTAL PROTECTION DIVISION
SOURCE: FTA Manual, Fig. 3.2 "Increase in Cumulative Noise Levels Allowed by Criteria (Land Use Categories 1 and 2)"

Category 1 shown in this graph applies to the Tule Elk State Natural Reserve and Category 2 shown in this graph applies to residences and buildings where people normally sleep, including homes, hospitals and hotels.

Mitigation Measures:

a. The project owner shall request that Kern County reduce posted traffic speeds on the portion of the project's transportation route near the affected receptor. While it is the intent to reduce the noise from project-related traffic, the reduced posted speed limit shall be a part of traffic and congestion management and not create any unsafe conditions on the portions of the roadway that have reduced speeds and the newly created speed limit transitions portions of the roadway. The project owner shall make all reasonable efforts to provide the county the information needed, and to assist the county in evaluating and implementing a reduced speed. The reduced speed limit is intended for the duration of the construction and operation period.

b. The project owner shall construct a soundwall along the portion of the project's transportation route near the affected receptor. The wall shall be of adequate construction and materials to be safe and effective for the duration of project construction and operation.

c. The project owner shall pay for roadway improvements, along the portion of the project's transportation route near the affected receptor. Examples of such improvements include repaving the road, and changing out traffic lights to smooth out the flow of traffic and to eliminate the need for frequent stops and starts.

   After implementing the mitigation measure(s), the project owner shall perform a noise survey at the affected receptor(s) to ensure compliance with the appropriate noise level requirement as determined from the above graph.

Verification: If mitigation measure a. is to be implemented, the project owner shall notify the CPM of a formal request to Kern County to reduce posted speed limits, and provide a copy of the request to the CPM. This notification shall describe the expected noise level reduction at the affected receptor location, resulting from the implementation of this mitigation measure.

If mitigation measure b. is to be implemented, 15 days prior to construction of the soundwall, the project owner shall submit to the CPM for review and approval a portfolio of the soundwall design specifying the expected reduction in noise level at the affected receptor location, resulting from the implementation of this mitigation measure.

If mitigation measure c. is to be implemented, 15 days prior to start of roadway improvements, the project owner shall submit to the CPM a letter specifying the expected reduction in noise level at the affected receptor location, resulting from the implementation of this mitigation measure.

Within 15 days after completing the post-mitigation survey, the project owner shall submit a summary report of the survey to the CPM.

RECOMMENDED MITIGATION MEASURES

Operation of heavy construction equipment and noisy construction work relating to EOR shall be restricted to the times delineated below, if the activity occurs within 1,000 feet of a noise sensitive receptor:

Weekdays:	6:00 a.m. to 9:00 p.m.
Weekends:	8:00 a.m. to 9:00 p.m.

Haul trucks and other engine-powered equipment shall be equipped with mufflers that meet all applicable regulations. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies.

Noise and Vibration Appendix A
Fundamental Concepts of Community Noise

To describe noise environments and to assess impacts on noise sensitive area, a frequency weighting measure, which simulates human perception, is customarily used. It has been found that "A-weighting" of sound intensities best reflects the human ear's reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. Decibels are logarithmic units that conveniently compare the wide range of sound intensities to which the human ear is sensitive. **Noise and Vibration Table A1** provides a description of technical terms related to noise.

Noise environments and consequences of human activities are usually well represented by an equivalent A-weighted sound level over a given time period (L_{eq}), or by average day and night A-weighted sound levels with a nighttime weighting of 10 dBA (L_{dn}). Noise levels are generally considered low when ambient levels are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. Outdoor day-night sound levels vary over 50 dBA depending on the specific type of land use. Typical L_{dn} values might be 35 dBA for a wilderness area, 50 dBA for a small town or wooded residential area, 65 to 75 dBA for a major metropolis downtown (e.g., San Francisco), and 80 to 85 dBA near a freeway or airport. Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, those higher levels nevertheless are considered to be levels of noise adverse to public health.

Various environments can be characterized by noise levels that are generally considered acceptable or unacceptable. Lower levels are expected in rural or suburban areas than would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments are about seven decibels lower than the corresponding average daytime levels. The day-to-night difference in rural areas away from roads and other human activity can be considerably less. Areas with full-time human occupation that are subject to nighttime noise, which does not decrease relative to daytime levels, are often considered objectionable. Noise levels above 45 dBA at night can result in the onset of sleep interference effects. At 70 dBA, sleep interference effects become considerable (U.S. Environmental Protection Agency, Effects of Noise on People, December 31, 1971).

To help the reader understand the concept of noise in decibels (dBA), **Noise and Vibration Table A2** illustrates common noises and their associated sound levels, in dBA.

Noise and Vibration Table A1
Definition of Some Technical Terms Related to Noise

Terms	Definitions
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this testimony are A-weighted.
L_{10}, L_{50}, & L_{90}	The A-weighted noise levels that are exceeded 10%, 50%, and 90% of the time, respectively, during the measurement period. L_{90} is generally taken as the background noise level.
Equivalent Noise Level, L_{eq}	The energy average A-weighted noise level during the noise level measurement period.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 4.8 decibels to levels in the evening from 7 p.m. to 10 p.m., and after addition of 10 decibels to sound levels in the night between 10 p.m. and 7 a.m.
Day-Night Level, L_{dn} or DNL	The Average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10 p.m. and 7 a.m.
Ambient Noise Level	The composite of noise from all sources, near and far. The normal or existing level of environmental noise at a given location.
Intrusive Noise	That noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.
Pure Tone	A pure tone is defined by the Model Community Noise Control Ordinance as existing if the one-third octave band sound pressure level in the band with the tone exceeds the arithmetic average of the two contiguous bands by 5 decibels (dB) for center frequencies of 500 Hz and above, or by 8 dB for center frequencies between 160 Hz and 400 Hz, or by 15 dB for center frequencies less than or equal to 125 Hz.

Subjective Response to Noise

The adverse effects of noise on people can be classified into three general categories:

- Subjective effects of annoyance, nuisance, dissatisfaction.
- Interference with activities such as speech, sleep, and learning.
- Physiological effects such as anxiety or hearing loss.

The sound levels associated with environmental noise, in almost every case, produce effects only in the first two categories. Workers in industrial plants can experience noise effects in the last category. There is no completely satisfactory way to measure the subjective effects of noise or of the corresponding reactions of annoyance and dissatisfaction, primarily because of the wide variation in individual tolerance of noise.

One way to determine a person's subjective reaction to a new noise is to compare the level of the existing (background) noise, to which one has become accustomed, with the level of the new noise. In general, the more the level or the tonal variations of a new noise exceed the previously existing ambient noise level or tonal quality, the less acceptable the new noise will be, as judged by the exposed individual.

With regard to increases in A-weighted noise levels, knowledge of the following relationships can be helpful in understanding the significance of human exposure to noise.

1. Except under special conditions, a change in sound level of 1 dB cannot be perceived.

2. Outside of the laboratory, a 3-dB change is considered a barely noticeable difference.

3. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.

4. A 10-dB change is subjectively heard as an approximate doubling in loudness and almost always causes an adverse community response (Kryter, Karl D., The Effects of Noise on Man, 1970).

Combination of Sound Levels

People perceive both the level and frequency of sound in a non-linear way. A doubling of sound energy (for instance, from two identical automobiles passing simultaneously) creates a 3-dB increase (i.e., the resultant sound level is the sound level from a single passing automobile plus 3 dB). **Noise and Vibration Table A3** indicates the rules for decibel addition used in community noise prediction.

Noise and Vibration Table A3
Addition of Decibel Values

When two decibel values differ by:	Add the following amount to the larger value
0 to 1 dB	3 dB
2 to 3 dB	2 dB
4 to 9 dB	1 dB
10 dB or more	0
Figures in this table are accurate to ± 1 dB.	

Source: Architectural Acoustics, M. David Egan, 1988.

Sound and Distance

Doubling the distance from a noise source reduces the sound pressure level by 6 dB.

Increasing the distance from a noise source 10 times reduces the sound pressure level by 20 dB.

Worker Protection

OSHA noise regulations are designed to protect workers against the effects of noise exposure and list permissible noise level exposure as a function of the amount of time to which the worker is exposed, as shown in **Noise and Vibration Table A4**.

Noise and Vibration Table A4
OSHA Worker Noise Exposure Standards

Duration of Noise (Hrs/day)	A-Weighted Noise Level (dBA)
8.0	90
6.0	92
4.0	95
3.0	97
2.0	100
1.5	102
1.0	105
0.5	110
0.25	115

PUBLIC HEALTH

Alvin Greenberg, Ph.D.

SUMMARY OF CONCLUSIONS

Staff has analyzed potential public health risks associated with construction and operation of the Hydrogen Energy California (HECA) project and does not expect a significant risk of cancer or any adverse short- or long-term noncancer health effects from project toxic emissions. Staff's analysis of potential health impacts from the proposed HECA project was based on a conservative health protective methodology that accounts for impacts to the most sensitive individuals in a given population, including newborns and infants. According to the results of both the applicant's and staff's health risk assessments, emissions of TACs (Toxic Air Contaminants) -- under both the construction periods and routine long-term operations -- from the HECA facility as proposed by the applicant would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area. Staff has also considered the potential for adverse air quality impacts to the minority population surrounding the site. With the adoption of the recommended conditions of certification, the project's direct and cumulative air quality impacts would be reduced to less than significant. Therefore, the project will not result in a significant or adverse impact to an identified environmental justice population.

Staff wishes to note that the proposed HECA project is a complex industrial facility similar in scope to a small refinery. The presence of numerous chemical processes -- specifically the larger gasification process and sulfur recovery process that will require the use of large amounts of hazardous materials in closed tanks and piping at elevated temperature and pressure -- pose significant risks of fugitive emissions and accidental releases of toxic air contaminants if not managed properly. Staff has not encountered such a complex power generation facility in the history of the Energy Commission. In order to properly review the expected – and unexpected – emissions from this project, staff spent considerable time evaluating the entire process and even visited a similar gasification facility in Polk County, Florida. As a result of staff's efforts to understand the process and the risks involved, staff determined that in order to keep source, fugitive, and accidental emissions to a level that would not present a significant risk to public health, several processes must be managed in greater detail than usual, regardless of whether the quantities of hazardous materials present would be below the federal or state thresholds that would trigger a need for this increased level of management. Please refer to the analysis in the **Hazardous Materials Management** section of this PSA for further details.

Staff notes that a similar facility precisely the same as the proposed facility has never been built and operated before in any location in the United States. Thus, the routine and fugitive emissions of TACs (Hazardous Air Pollutants or HAPs in U.S. EPA terms) are necessarily based upon measured emissions at similar – but not exactly the same - facilities. Additionally, the applicant and staff were not able to quantitatively describe and assess the short-term fluctuations of emissions of TACs under start-up, commissioning, or upset operating conditions. Staff notes, however, that short-term fluctuations in TAC emissions are not expected to have long-term (chronic) impacts on public health; only acute (short-term) impacts on public health could be impacted. Yet, the potential for short-term impacts due to start-up or upset conditions will be reduced to below a level of significance by the immediate identification and control of these releases. Modeling and measurements of “indicator” emissions (the criteria pollutants) and other operations by continuous emission monitoring (CEM), on-site measurements of accidental chemical releases, and the monitoring of process efficiency parameters (temperature, feed rates, pressure, flow, etc) will enable the facility to ensure that short-term releases of higher amounts than routine, which will invariably occur, will be kept to a minimum and not result in a significant impact on the nearby public or on-site workers. In order to ensure that long-term routine operating emissions will not, as estimated, pose a significant risk to the off-site public, staff proposes that the testing of certain TACs that pose the greatest potential risk and hazard to the public be required and that a health risk assessment be conducted, as per the requirements and schedule of Conditions of Certification **PUBLIC HEALTH-1** and **2**. If the results of any health risk assessment exceeded the regulatory threshold, the project owner would be required to either refine the risk assessment or reduce emissions for TACs. To protect the public from Legionella bacteria, staff proposes a cooling tower water management plan as specified in Condition of Certification **PUBLIC HEALTH-4**.

Also, as discussed in the **Introduction** section of the PSA, this document analyzes the project’s impacts pursuant to both the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA). The two statutes are similar in their requirements concerning analysis of a project’s impacts. Therefore, unless otherwise noted, staff’s use of, and reference to, CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

INTRODUCTION

The purpose of this Preliminary Staff Assessment/Draft Environmental Impact Statement (PSA/DEIS) is to determine if emissions of toxic air contaminants (TACs) from the proposed HECA would have the potential to cause significant adverse public health impacts or to violate standards for public health protection. If potentially significant health impacts are identified, staff will evaluate mitigation measures to reduce such impacts to less than significant levels.

California Energy Commission (Energy Commission) staff addresses potential impacts of regulated or criteria air pollutants in the **Air Quality** section of this PSA, and impacts on public and worker health from accidental releases of hazardous materials are examined in the **Hazardous Materials Management** section. Health effects from electromagnetic fields are discussed in the **Transmission Line Safety and Nuisance** section. Pollutants released from the project in wastewater streams to the public sewer system are discussed in the **Soil and Surface Water Resources** section. Plant releases in the form of hazardous and nonhazardous wastes are described in the **Waste Management** section.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Public Health Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
Clean Air Act section 112 (Title 42, U.S. Code section 7412)	This act requires new sources that emit more than 10 tons per year of any specified Hazardous Air Pollutant (HAP) or more than 25 tons per year of any combination of HAPs to apply Maximum Achievable Control Technology (MACT).
State	
California Health and Safety Code section 25249.5 et seq. (Proposition 65)	These sections establish thresholds of exposure to carcinogenic substances above which Prop 65 exposure warnings are required.
California Health and Safety Code section 41700	This section states that “no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property.”
California Public Resource Code section 25523(a); Title 20 California Code of Regulations (CCR) section 1752.5, 2300–2309 and Division 2 Chapter 5, Article 1, Appendix B, Part (1); California Clean Air Act, Health and Safety Code section 39650, et seq.	These regulations require a quantitative health risk assessment for new or modified sources, including power plants that emit one or more toxic air contaminants (TACs).
California Health and Safety Code, Sections 44360 to 44366 (Air Toxic Hot Spots Information and Assessment Act)	Establishes acceptable levels for toxic contaminants based on the results of an HRA.
Local	
San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 2520, Section 2.1	This rule requires Federally Mandated Operating Permits for major sources of air toxics.
SJVAPCD Rule 2550	This rule requires the use of Toxics Best Available Control Technology for major sources of hazardous air pollutants in order to achieve MACT.
SJVAPCD Rule 4102, Section 4.1 and Policy APR 1905	This rule requires the preparation of an HRA and prohibits sources from discharging air toxics that are detrimental to public health.

SETTING

This section describes the environment in the vicinity of the proposed project site from the public health perspective. Characteristics of the natural environment, such as meteorology and terrain, affect the project’s potential for causing impacts on public health. An emissions plume from a facility may affect elevated areas before lower terrain areas due to a reduced opportunity for atmospheric mixing. Also, the types of land use near a site influence the surrounding population distribution and density, which, in turn, affect public exposure to project emissions. Additional factors affecting potential public health impacts include existing air quality, existing public health concerns, and environmental site contamination.

SITE AND VICINITY DESCRIPTION

The project site is located in a rural area that is sparsely populated and primarily dedicated to agricultural uses. Land in the general vicinity of the proposed project is designated for agricultural uses as well as some commercial and residential uses. Sensitive receptors in the project vicinity are shown in Figure 5.6-1 of the AFC. The nearest sensitive receptor is the Tule Elk State Natural Reserve[1], located about 1,700 feet east of the project site. The only other sensitive receptor within a 6-mile radius of the project site is the Elk Hills Elementary School, located approximately 1.3 miles southeast of the site boundary. Nearby residences are located approximately 1,400 feet to the east and 3,300 feet to the southeast of the project site. The unincorporated community of Tupman is about 2 miles southeast of the project site (HECA 2012e, Section 5.6.1, Table 5.6-5).

The location of elevated terrain (above the stack height) is important in assessing potential exposure, as an emission plume may impact high elevations before impacting lower elevations. The topography of the site and the surrounding area is essentially flat, about 288.5 feet above mean sea level. The HRSG exhaust stack height would be 213 feet (HECA 2012e, Figure 2-6). Terrain above stack height begins approximately 2 miles south and southwest of the project site where hills begin to rise (HECA 2012e, Figure 2-7).

METEOROLOGY

Meteorological conditions, including wind speed, wind direction, and atmospheric stability, affect the extent to which pollutants are dispersed into ambient air as well as the direction of pollutant transport. This, in turn, affects the level of public exposure to emitted pollutants and associated health risks. When wind speeds are low and the atmosphere is stable, for example, dispersion is reduced, and localized exposure may be increased.

The project region is characterized by a Mediterranean climate; summers are warm and dry and winters are cool with mild precipitation. The average annual rainfall is six inches and 80 percent of it occurs between November and March. Winds flow predominantly from the northwest and north, but some variations occur during fall and winter (HECA 2012e, Section 5.1.1.1).

Atmospheric stability is a measure related to turbulence, or the ability of the atmosphere to disperse pollutants due to convective air movement. Mixing heights (the height above ground level through which the air is well mixed and in which pollutants can be

---

[1] Staff defines sensitive receptors any locations where children or the elderly congregate in large numbers such as schools, day care centers, nursing homes, long-term care facilities, hospitals, parks, and playgrounds. Staff considers this location to be a park.

dispersed) are lower during mornings due to temperature inversions and increase during the warmer afternoons. Staff's **Air Quality** section presents more detailed meteorological data.

EXISTING AIR QUALITY

The proposed site is within the jurisdiction of the San Joaquin Valley Air Pollution Control District (SJVAPCD). By examining average toxic concentration levels from representative air monitoring sites with cancer risk factors specific to each contaminant, lifetime cancer risk can be calculated to provide a background risk level for inhalation of ambient air. For comparison purposes, it should be noted that the overall lifetime cancer risk for the average individual in the United States is about 1 in 3, or 333,000 in 1 million.

The nearest monitoring station that measures PM10 and PM 2.5 is the Bakersfield 5558 California Avenue station located about 20 miles east of the project site. The annual arithmetic mean for PM10 measured at this monitoring station ranged between 53.6 and 32.3 micrograms per cubic meter ($\mu g/m^3$) during the years 2008 to 2010. The annual arithmetic mean for PM2.5 ranged between 21.9 and 14.1 during the same period (HECA 2012e, Section 5.1.1.2 and Tables 5.1-3 - 5.1-4).

The nearest California Air Resources Board (CARB) air toxics monitoring station that actively reports values is located on California Avenue in Bakersfield, approximately 20 miles east of the project site. In 2011, the background cancer risk calculated by CARB for the Bakersfield California Ave monitoring station was 116 in one million (CARB 2012). The pollutants 1,3-butadiene and benzene, emitted primarily from mobile sources, accounted together for almost 40 percent of the total risk. The risk from 1,3-butadiene was about 18 in one million, while the risk from benzene was about 26 in one million. Formaldehyde accounts for about 17 percent of the 2011 average calculated cancer risk based on air toxics monitoring results, with a risk of about 20 in one million. Formaldehyde is emitted directly from vehicles and other combustion sources, such as the proposed facility. Risk due to carbon tetrachloride in air represented a risk of about 24 in one million or 21 percent of the total risk. The risk from hexavalent chromium was about 5 in one million, or ~4 percent of the total risk.

The use of reformulated gasoline, beginning in the second quarter of 1996, as well as other toxics reduction measures, have led to a decrease of ambient levels of toxics and associated cancer risk during the past few years in all areas of the state and the nation. For example, in the San Francisco Bay Area, cancer risk was 342 in 1 million based on 1992 data, 315 in 1 million based on 1994 data, and 303 in 1 million based on 1995 data. In 2002, the most recent year for which data is available, the average inhalation cancer risk decreased to 162 in 1 million (BAAQMD 2004, p. 12).

EXISTING PUBLIC HEALTH CONCERNS

When evaluating a new project, staff sometimes conducts a detailed study and analysis of existing public health issues in the project vicinity. This analysis is prepared in order to identify the current status of respiratory diseases (including asthma and Valley Fever), cancer, and cancer rates in the population located near the proposed project. Assessing existing health concerns in the project area will provide staff with a basis on which to evaluate the significance of any additional health impacts from the proposed HECA project and evaluate any proposed mitigation.

In this case, the applicant has stated that no existing health issues have been reported within a 6-mile radius of the project (HECA 2012e, Section 5.6.1). The average cancer mortality rate in Kern County is 183 per 100,000 people, which is just slightly below the state average. Mortality rates from coronary heart disease in Kern County, however, are nearly 20 percent higher than the California statewide average rate (HECA 2012e, Section 5.6.1). Therefore, given this information and in considering the complexity of the proposed project with multiple sources of multiple pollutants, staff conducted an in-depth analysis of existing health issues in the area of Kern County including asthma, Chronic Obstructive Pulmonary Disease (COPD), Valley Fever, and cancer. This analysis is summarized here and presented in full in **Appendix C** below.

Staff reviewed the available information on the current status of respiratory disease and cancer in Kern County, California with particular attention to the region near the proposed Hydrogen Energy California project. Kern County is ranked one of the lowest of the California counties for overall health outcomes. The city of Bakersfield in Kern County is the most polluted city in the nation for annual and 24-hour particulates in the air (PM2.5) and the third most polluted city for ozone. The asthma mortality rate in Kern County is higher than the rate reported for the State of California in general. Likewise, asthma prevalence in Kern County is higher than the prevalence observed in the State of California. Previously, asthma hospitalization and emergency department visit rates in 2008 were reported to be lower in Kern County than in California but that trend was reversed by data reported for 2009 and 2010. Further, the 2008 data shows that the asthma hospitalization and emergency department visit rates for children and adults under age 64 are less than the target rates recommended by the Healthy People (HP) 2020 objectives. Kern County rates for the elderly, however, exceed the HP 2020 level for asthma hospitalizations by a slight margin and are more than double the HP 2020 level for asthma emergency department visits.

Staff also reviewed the latest information about the recent increase in the incidence of Valley Fever in the San Joaquin Valley and nearby San Luis Obispo County. A February 2013 outbreak of Valley Fever affecting at least 28 workers at a photovoltaic solar plant in eastern San Luis Obispo County, along with an increase in inmates at two San Joaquin Valley prisons coming down with the disease, has sparked renewed interest and concern. (The California Department of Public Health, Cal-OSHA, and San Luis Obispo County are investigating the outbreaks). The Centers for Disease Control and Prevention says the total number of Valley Fever cases nationwide rose by nearly 900 percent from 1998 to 2011. Researchers don't have a good explanation for the dramatic increase even when accounting for growing populations throughout the Southwest, although when soil is dry and it is windy, more spores are likely to become airborne in endemic areas, according to Dr. Gil Chavez, Deputy Director of the Center for Infectious Diseases at the California Department of Public Health. Staff addresses this matter in the section on **Worker Safety and Fire Protection**.

The incidence of adult cancer in Kern County is higher for some cancer sites and lower for others compared to the rates in the State of California. Cancer mortality rates of all cancer sites combined are higher in Kern County than in the State of California. Cancer is the leading cause of death by disease in children in California and the United States, with the most common cancers being leukemia and brain and other central nervous system tumors. Within the past 30 years or so, the incidence of childhood cancer has been rising slightly while the mortality rate is declining. In the 1980s two childhood cancer clusters were identified in Kern County but nothing remarkable has been reported since.

Studies reviewed by staff have shown that Kern County is ranked one of the lowest counties in California for overall health outcomes, with Bakersfield being the most polluted city in the nation for particulates and the third most polluted city in the nation for ozone. The mortality rate for asthmatics in Kern County is higher than the rate in the State of California and the city of Bakersfield was found to have the highest asthma hospitalization and emergency department visit rates of Kern County, with hospitalization of African American asthmatics 2.3 times higher than the rate of hospitalization of whites and 3.6 times greater than the hospitalization rate of Hispanics in Kern County.

Staff has considered this information when assessing the incremental and cumulative risk and hazard posed by emissions from the proposed project and when recommending conditions of certification. Staff found that although the risks and hazard would be less than significant, the existing public health concerns and the level of uncertainty about emissions served as a basis for staff's recommendation of conditions **PUBLIC HEALTH-1, 2,** and **3**.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

The **Public Health** section of this staff assessment discusses toxic emissions to which the public could be exposed during project construction and routine operation. Following the release of toxic contaminants into the air or water, people may come into contact with them through inhalation, dermal contact, or ingestion via contaminated food, soil or water.

Air pollutants for which no ambient air quality standards have been established are called noncriteria pollutants. Unlike criteria pollutants such as ozone, carbon monoxide, sulfur dioxide, or nitrogen dioxide, noncriteria pollutants have no ambient (outdoor) air quality standards that specify levels considered safe for everyone.

Since noncriteria pollutants do not have such standards, a health risk assessment is used to determine if people might be exposed to those types of pollutants at unhealthy levels. The risk assessment consists of the following steps:

- identify the types and amounts of hazardous substances that HECA could emit to the environment;
- estimate worst-case concentrations of project emissions in the environment using dispersion modeling;

- estimate amounts of pollutants that people could be exposed to through inhalation, ingestion, and dermal contact; and
- characterize potential health risks by comparing worst-case exposure to safe standards based on known health effects.

Staff relies upon the expertise of the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) to identify contaminants that are known to the state to cause cancer or other noncancer toxicological endpoints and to calculate the toxicity and cancer potency factors of these contaminants. Staff also relies upon the expertise of the California Air Resources Board and the local air districts to conduct ambient air monitoring of toxic air contaminants and the state Department of Public Health to conduct epidemiological investigations into the impacts of pollutants on communities. It is not within the purview or the expertise of the Energy Commission staff to duplicate the expertise and statutory responsibility of these agencies.

Initially, a screening level risk assessment is performed using simplified assumptions that are intentionally biased toward protection of public health. That is, an analysis is designed that overestimates public health impacts from exposure to project emissions. In reality, it is likely that the actual risks from the proposed facility would be much lower than the risks as estimated by the screening level assessment. The risks for screening purposes are based on examining conditions that would lead to the highest, or worst-case, risks and then using those conditions in the study. Such conditions include:

- using the highest levels of pollutants that could be emitted from the plant;
- assuming weather conditions that would lead to the maximum ambient concentration of pollutants;
- using the type of air quality computer model which predicts the greatest plausible impacts;
- calculating health risks at the location where the pollutant concentrations are estimated to be the highest;
- assuming that an individual's exposure to cancer-causing agents occurs continuously for 70 years; and
- using health-based standards designed to protect the most sensitive members of the population (i.e., the young, elderly, and those with respiratory illnesses).

A screening level risk assessment will, at a minimum, include the potential health effects from inhaling hazardous substances. Some facilities may also emit certain substances that could present a health hazard from noninhalation pathways of exposure (OEHHA 2012, Table E2). When these substances are present in facility emissions, the screening level analysis includes the following additional exposure pathways: soil ingestion, dermal exposure, and mother's milk (OEHHA 2012, p. 1-3).

The risk assessment process addresses three categories of health impacts: acute (short-term) health effects, chronic (long-term) noncancer effects, and cancer risk (also long-term). Acute health effects result from short-term (one-hour) exposure to relatively high concentrations of pollutants. Acute effects are temporary in nature and include symptoms such as irritation of the eyes, skin, and respiratory tract.

Chronic health effects are those that arise as a result of long-term exposure to lower concentrations of pollutants. The exposure period is considered to be approximately from 12 percent to 100 percent of a lifetime, or from 9 to 70 years (OEHHA 2012, p. 1-6). Chronic health effects include diseases such as reduced lung function and heart disease.

The analysis for noncancer health effects compares the maximum project contaminant levels to safe levels called *Reference Exposure Levels*, or RELs. These are amounts of toxic substances to which even sensitive people can be exposed and suffer no adverse health effects (OEHHA 2012). These exposure levels are designed to protect the most sensitive individuals in the population, such as infants, the aged, and people suffering from illness or disease which makes them more sensitive to the effects of toxic substance exposure. The Reference Exposure Levels are based on the most sensitive adverse health effect reported in the medical and toxicological literature and include margins of safety. The margin of safety addresses uncertainties associated with inconclusive scientific and technical information available at the time of standard setting and is meant to provide a reasonable degree of protection against hazards that research has not yet identified. The margin of safety is designed to prevent pollution levels that have been demonstrated to be harmful, as well as to prevent lower pollutant levels that may pose an unacceptable risk of harm, even if the risk is not precisely identified as to nature or degree. Health protection is achieved if the estimated worst-case exposure is below the relevant reference exposure level. In such a case, an adequate margin of safety exists between the predicted exposure and the estimated threshold dose for toxicity.

Exposure to multiple toxic substances may result in health effects that are equal to, less than, or greater than effects resulting from exposure to the individual chemicals. Only a small fraction of the thousands of potential combinations of chemicals have been tested for the health effects of combined exposures. In conformity with the California Air Pollution Control Officers Association (CAPCOA) guidelines, the health risk assessment assumes that the effects of each substance are additive for a given organ system (OEHHA 2012, pp. 1-12). Other possible mechanisms due to multiple exposures include those cases where the actions may be synergistic or antagonistic (where the effects are greater or less than the sum, respectively). For these types of substances, the health risk assessment could underestimate or overestimate the risks.

For carcinogenic substances, the health assessment considers the risk of developing cancer and assumes that continuous exposure to the cancer-causing substance occurs over a 70-year lifetime. The risk that is calculated is not meant to project the actual expected incidence of cancer, but rather a theoretical upper-bound number based on worst-case assumptions.

Cancer risk is expressed in chances per million and is a function of the maximum expected pollutant concentration, the probability that a particular pollutant will cause cancer (called *potency factors* and established by OEHHA), and the length of the exposure period. Cancer risks for each carcinogen are added to yield total cancer risk.

The conservative nature of the screening assumptions used means that actual cancer risks due to project emissions are likely to be considerably lower than those estimated.

The screening analysis is performed to assess worst-case risks to public health associated with the proposed project. If the screening analysis predicts no significant risks, then no further analysis is required. However, if risks are above the significance level, then further analysis, using more realistic site-specific assumptions, would be performed to obtain a more accurate assessment of potential public health risks.

Significance Criteria

Energy Commission staff determines the health effects of exposure to toxic emissions based on impacts to the maximum exposed individual. This is a person hypothetically exposed to project emissions at a location where the highest ambient impacts were calculated using worst-case assumptions, as described above.

As described earlier, noncriteria pollutants are evaluated for short-term (acute) and long-term (chronic) noncancer health effects, as well as cancer (long-term) health effects. The significance of project health impacts is determined separately for each of the three categories.

Acute and Chronic Noncancer Health Effects

Staff assesses the significance of noncancer health effects by calculating a *hazard index*. A hazard index is a ratio comparing exposure from facility emissions to the reference (safe) exposure level. A ratio of less than 1.0 signifies that the worst-case exposure is below the safe level. The hazard index for every toxic substance that has the same type of health effect is added to yield a Total Hazard Index. The Total Hazard Index is calculated separately for acute and chronic effects. A Total Hazard Index of less than 1.0 indicates that cumulative worst-case exposures are less than the reference exposure levels. Under these conditions, health protection from the project is likely to be achieved, even for sensitive members of the population. In such a case, staff presumes that there would be no significant noncancer project-related public health impacts.

Cancer Risk

Staff relied upon regulations implementing the provisions of Proposition 65, the Safe Drinking Water and Toxic Enforcement Act of 1986, (Health & Safety Code, §§25249.5 et seq.) for guidance to determine a cancer risk significance level. Title 22, California Code of Regulations section 12703(b) states that “the risk level which represents no significant risk shall be one which is calculated to result in one excess case of cancer in an exposed population of 100,000, assuming lifetime exposure.” This level of risk is equivalent to a cancer risk of 10 in 1 million, which is also written as 10×10^{-6}. An important distinction is that the Proposition 65 significance level applies separately to each cancer-causing substance, whereas staff determines significance based on the cumulative total risk from all cancer-causing chemicals. Thus, the manner in which the significance level is applied by staff is more conservative (health-protective) than that applied by Proposition 65. The significant risk level of 10 in 1 million is consistent with the level of significance adopted by many air districts. In general, these air districts would not approve a project with a cancer risk exceeding 10 in 1 million. The SJVAPCD also uses 10 in 1 million as the level of “Significant Health Risk” (SJVAPCD 2006).

As noted earlier, the initial risk analysis for a project is typically performed at a screening level, which is designed to overstate actual risks, so that health protection can be ensured. Staff’s analysis also addresses potential impacts on all members of the population including the young, the elderly, people with existing medical conditions that may make them more sensitive to the adverse effects of toxic air contaminants, and any minority or low-income populations that are likely to be disproportionately affected by impacts. To accomplish this goal, staff uses the most current acceptable public health exposure levels (both acute and chronic) set to protect the public from the effects of airborne toxics. When a screening analysis shows cancer risks to be above the significance level, refined assumptions would likely result in a lower, more realistic risk estimate. Based on refined assumptions, if risk posed by the facility exceeds the significance level of 10 in 1 million, staff would require appropriate measures to reduce the risk to less than significant. If, after all risk reduction measures have been considered, a refined analysis identifies a cancer risk greater than 10 in 1 million, staff would deem such risk to be significant and would not recommend project approval.

DIRECT/INDIRECT IMPACTS AND MITIGATION

CONSTRUCTION IMPACTS AND MITIGATION

Potential risks to public health during construction may be associated with exposure to toxic substances in contaminated soil disturbed during site preparation, as well as diesel exhaust from heavy equipment operation. Criteria pollutant impacts from the operation of heavy equipment and particulate matter from earth moving are examined in staff’s **Air Quality** analysis.

Site disturbances occur during facility construction from excavation, grading, and earth moving. Such activities have the potential to adversely affect public health through various mechanisms, such as the creation of airborne dust, material being carried off site through soil erosion, and uncovering buried hazardous substances. The Phase I Environmental Site Assessment conducted for this site in 2009 found several environmental conditions that may have potentially impacted the soil at the project site. Most of the potential contamination at the site is due to underground storage tanks and the historical use of the site for fertilizer manufacturing. The Phase I ESA identified two RECs (Recognized Environmental Conditions) for the project: elevated concentrations of petroleum hydrocarbons and other contaminants found immediately north of the property and stained soils observed during the property visit. Two potential environmental issues were also noted in the ESA: sampling of surficial soils showed the presence of low concentrations of pesticides, consistent with the historical agricultural use at the site, and the possibility that five former underground storage tanks (USTs) may have historically been located on or adjacent to the site according to an agency database (HECA 2012e, Appendix L).

In the event that any contamination is encountered during construction, proposed Conditions of Certification **WASTE-1** and **WASTE-2** (which require a registered professional engineer or geologist to be available during soil excavation and grading to ensure proper handling and disposal of contaminated soil) would ensure that contaminated soil does not affect the public. See the staff assessment section on **Waste Management** for a more detailed analysis of this topic.

The operation of construction equipment would result in air emissions from diesel-fueled engines. Diesel emissions are generated from sources such as trucks, graders, cranes, welding machines, electric generators, air compressors, and water pumps. Although diesel exhaust contains criteria pollutants such as nitrogen oxides, carbon monoxide, and sulfur oxides, it also includes a complex mixture of thousands of gases and fine particles. These particles are primarily composed of aggregates of spherical carbon particles coated with organic and inorganic substances. Diesel exhaust contains over 40 substances that are listed by the U.S. Environmental Protection Agency (U.S. EPA) as hazardous air pollutants and by the California Air Resources Board (ARB) as toxic air contaminants.

Exposure to diesel exhaust may cause both short- and long-term adverse health effects. Short-term effects can include increased coughing, labored breathing, chest tightness, wheezing, and eye and nasal irritation. Long-term effects can include increased coughing, chronic bronchitis, reductions in lung function, and inflammation of the lung. Epidemiological studies also strongly suggest a causal relationship between occupational diesel exhaust exposure and lung cancer.

Based on a number of health effects studies, the Air Resources Board’s Scientific Review Panel on Toxic Air Contaminants recommended a chronic reference exposure level (see discussion of reference exposure levels in Method of Analysis section above) for diesel exhaust particulate matter of 5 micrograms of diesel particulate matter per cubic meter of air ($\mu g/m^3$) and a cancer unit risk factor of $3x10^{-4}$ $(\mu g/m^3)^{-1}$ (SRP 1998, p. 6). The Scientific Review Panel did not recommend a value for an acute Reference Exposure Level since available data in support of a value was deemed insufficient. On August 27, 1998, ARB listed particulate emissions from diesel-fueled engines as a toxic air contaminant and approved the panel’s recommendations regarding health effect levels.

Construction of the HECA project is anticipated to take place over a period of 42 months. Appendix E of the Amended AFC presents monthly and annual maximum construction emissions from construction equipment diesel exhaust. The applicant conducted a health risk assessment for diesel particulate matter from construction activities using the annual emissions associated with the peak construction period to estimate PM10 concentrations and adjusted the exposure period to reflect the 4.1-year duration. As noted earlier, assessment of chronic (long-term) health effects assumes continuous exposure to toxic substances over a significantly longer time period, typically from 9 to 70 years. The applicant’s HRA calculations resulted in a cancer risk of 5.5 in 1,000,000 and a chronic hazard index of 0.046 at the point of maximum impact, both below the level of significance. Health risks calculated at the locations of the nearest worker, nearest residence, and nearest sensitive receptor were all significantly lower (HECA 2012e, Table 5.6-4).

Mitigation measures are proposed by both the applicant and Energy Commission staff to reduce the maximum calculated PM10 emissions. These include the use of extensive fugitive dust control measures. The fugitive dust control measures are assumed to result in 90 percent reductions of emissions. In order to further mitigate potential impacts from particulate emissions during the operation of diesel-powered construction equipment, the use of ultra-low sulfur diesel fuel and the highest Tier level available from the California Emission Standards for Off-Road Compression-Ignition Engines requirements or installation of an oxidation catalyst and soot filters on diesel equipment are required to bring Lower Tiered engines up to emissions equivalent to current Off Road engine requirements. The catalyzed diesel particulate filters are passive, self-regenerating filters that reduce particulate matter, carbon monoxide, and hydrocarbon emissions through catalytic oxidation and filtration. The degree of particulate matter reduction is comparable for both mitigation measures in the range of approximately 85–92 percent. Such filters will reduce diesel emissions during construction and reduce any potential for significant health impacts.

Valley Fever

Coccidioidomycosis or "Valley Fever" (VF) is a disease caused by inhaling spores of the fungus Coccidioides immitis, which is present in the soil of the San Joaquin Valley and other regions of Southern California and Arizona. Kern County, located at the southern end of San Joaquin valley, is where Valley Fever occurs most frequently. The disease usually affects the lungs and can have potentially severe consequences, especially in at-risk individuals such as the elderly, pregnant women, and people with compromised immune systems. Staff has addressed this issue in-depth for onsite workers in the **Worker Safety and Fire Protection** section of this PSA/DEIS. Staff believes that the persons who would have the greatest exposure and thus who would be most at risk are the workers involved in soil disturbance activities or those on the site when soil is moved during grading and excavation. Staff contends that if the workers are protected to the greatest extent possible from contracting Valley Fever, then the off-site public would also be protected. Furthermore, in the Air Quality section, staff proposes several mitigation measures intended to keep fugitive dust emissions from leaving the project site.

OPERATION IMPACTS AND MITIGATION

Emissions Sources

The emissions sources at the proposed HECA are many and include the HRSG combustion turbine, power block cooling towers, gasifier refractory heaters, auxiliary boiler, gasification flare, SRU flare, rectisol flare, tail gas thermal oxidizer, carbon dioxide vent, diesel emergency generator, a diesel fire pump engine, rail delivery and/or heavy truck traffic associated with petcoke, coal, and gasifier solids handling, and fugitive emissions from various plant components (HECA 2012e, Section 5.1.2.3). As noted earlier, the first step in a health risk assessment is to identify potentially toxic compounds that may be emitted from these sources.

Appendix M of the Amended AFC (HECA 2012e, Appendix M), on page 1 of 26, lists noncriteria pollutants that may be emitted from all sources at HECA, along with their anticipated amounts (emission factors). Subsequent to the submittal of the Amended Application for Certification (AFC), revised emission factors were provided by the applicant in January 2013, in documents titled: "Appendix M Public Health 2012-12-28" and "Emission Source Modification List." Emissions from some sources were changed due to project refinements and in response to data requests. These revised emission factors were used in this assessment.

Toxic Air Contaminant emission factors were obtained from the Environmental Protection Agency (EPA) AP-42 database of emission factors and from other sources as noted in the respective table for each project component. Appendix M also provides estimates of fugitive emissions from various plant components such as methanol, propylene, acid gas, and ammonia-laden gas from pumps, valves, and connectors. The applicant will implement a leak detection and repair (LDAR) program to identify and repair leaking equipment and thereby reduce fugitive emissions. The applicant's HRA included total TAC emissions estimated for all sources listed above (including fugitive emissions) as listed on page 1 of 26 in Appendix M Public Health 20121228 (confidential filing).

During the environmental review of the original project in 2008, staff requested that the then-applicant identify and quantify any radioisotopes potentially released from pet coke and coal during gasification. The applicant at that time responded that based on information provided in a National Institute of Occupational Safety and Health (NIOSH) document, coal is typically radioactive to the same extent as sedimentary rock. That is, coal is expected to have only trace amounts of radioisotopes and no significant radiological exposure is expected from coal gasification (URS 2010b, Data Response 150).

Table 5.6-2 of the Amended AFC (2012) lists toxicity values used to characterize cancer and noncancer health impacts from project pollutants. The toxicity values include Reference Exposure Levels, which are used to calculate short-term and long-term noncancer health effects, and cancer unit risks, which are used to calculate the lifetime risk of developing cancer, as published in the OEHHA Guidelines (OEHHA 2012). **Public Health Table 2** lists 36 toxic emissions which would be potentially emitted from 294 sources within the HECA facility and shows how each contributes to the health risk analysis.

Emissions Levels

Once potential emissions are identified, the next step is to quantify them by conducting a “worst case” analysis. Maximum hourly emissions are required to calculate acute (one-hour) noncancer health effects, while estimates of maximum emissions on an annual basis are required to calculate cancer and chronic (long-term) noncancer health effects.

The next step in the health risk assessment process is to estimate the ambient concentrations of toxic substances. This is accomplished by using a screening air dispersion model and assuming conditions that result in maximum impacts. The applicant's screening analysis was performed using the ARB/OEHHA Hotspots Analysis and Reporting Program (HARP). Ambient concentrations were used in conjunction with Reference Exposure Levels and cancer unit risk factors to estimate health effects that might occur from exposure to facility emissions. Exposure pathways, or ways in which people might come into contact with toxic substances, include inhalation, dermal (through the skin) absorption, soil ingestion, consumption of locally grown plant foods, and mother's milk. As an ancillary issue, staff is aware of the concerns expressed by neighbors in the area that persons consuming crops grown in the area, specifically pistachios, might be adversely impacted. While staff did not conduct a risk assessment to determine the precise risk posed to people consuming pistachios, the results of staff's human health risk assessment show that the ground level concentrations of TACs over the area and any uptake into crops in general would be very low and would not result in a significant risk to public health. It is highly likely that the consumption of pistachios would be included in this finding and not pose a significant risk.

The above method of assessing health effects is consistent with OEHHA's Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2012) referred to earlier and results in the following health risk estimates.

Impacts

The applicant's screening health risk assessment for the project including emissions from all sources as presented in the Amended AFC (HECA 2012e, Section 5.6.2.7 and Table 5.6-5) resulted in a maximum acute Hazard Index (HI) of 0.88 and a maximum chronic HI of 0.42 at the point of maximum impact (PMI). The total worst-case individual cancer risk was calculated by the applicant to be 8.97 in 1 million at the PMI. Calculated health risks at the location of the maximum exposed worker, maximum exposed residence, and nearest sensitive receptor were all significantly lower (HECA 2012e, Table 5.6-5). As **Public Health Table 3** shows, both acute and chronic hazard indices are less than 1.0, and cancer risk is less than 10 in 1 million, indicating that no short- or long-term adverse health effects are expected.

Public Health Table 3
Operation Hazard/Risk at Point of Maximum Impact: Applicant Assessment

Type of Hazard/Risk	Hazard Index/Risk	Significance Level	Significant?
Acute Noncancer	0.88	1.0	No
Chronic Noncancer	0.42	1.0	No
Individual Cancer	8.97 in a million	10.0 in a million	No

Source HECA 2012e, Table 5.6-5

Staff conducted a quantitative evaluation of the risk assessment results presented in the Hydrogen Energy California (HECA) Amended AFC (08-AFC-8A). Modeling files provided by the applicant, dated May, August and November 2012, were also evaluated. Emission factors from the Emission Source Modification List were used in this analysis.

The risk assessment appears to be complete, transparent, and the results were verified in staff's analysis. This health risk assessment can be used to support staff's opinion that the proposed project will not result in a significant risk to public health.

Staff has determined that the most significant emission source of the proposed project is the CTG/HRSG train. According to Section 5.6.2.3 of the Amended AFC, emission rates of toxic air contaminants (TACs) from the CTG were determined based on firing of hydrogen-rich fuel under operating conditions determined in Section 5.1, Air Quality, to result in the highest off-site ground-level impacts. It should be noted that Section 5.6.2.3 indicates that emission rates are taken from "Wabash River test data and the National Energy Technology Laboratory, U.S. Dept of Energy, Major Environmental Aspects of Gasification-based Power Generation Technologies, Final Report, December 2002." Staff is not familiar with this facility but queried the applicant about the comparability of the processes and TAC emissions and staff is satisfied that a report prepared by the US Dept. of Energy could serve as the basis for emission factors. Staff has no evidence to refute the validity and appropriateness of this data.

Construction Phase Analysis

For the construction phase analysis, atmospheric dispersion modeling of diesel particulate matter (DPM) emissions from construction equipment and vehicles was conducted by the applicant using AERMOD. The maximum predicted offsite concentration of diesel particulate matter, on a 70-year basis, was reported by the applicant to be 0.228 ug/m^3 (HECA 2012e, Table 5.6-4). Cancer risk and chronic hazard index values obtained by staff are compared to results reported by the applicant in the January 2010 modeling files in **Public Health Table 4**. Cancer risk due to diesel exhaust emissions was determined by multiplying the DPM concentration by the diesel cancer inhalation unit risk of 0.0003 (ug/m^3)$^{-1}$ and adjusting by the estimated construction period of 4.1 years over a 70 year lifetime for residential receptors. The difference between the applicant's assessment and staff's are minor and can be attributed to using slightly different input values. All results are below the level of significance.

Public Health Table 4
Results of Staff's Analysis and the Applicant's Analysis for Cancer Risk and Chronic Hazard during Construction Phase

		Staff's Analysis		Applicant's Analysis	
	Annual PM10 Concentration (ug/m^3)	Cancer Risk (per million)	Chronic HI	Cancer Risk (per million)	Chronic HI
PMI	0.228	4.0	0.046	5.5	0.046
MEIW	0.0244	0.43	0.0049	0.16	0.0049

		Staff's Analysis		Applicant's Analysis	
	Annual PM10 Concentration (ug/m^3)	Cancer Risk (per million)	Chronic HI	Cancer Risk (per million)	Chronic HI
MEIR-1	0.0499	0.88	0.010	1.21	0.010
Nearest school	0.0051	0.089	0.002	0.12	0.001

Note:
PMI = point of maximum impact (or maximally impacted receptor, MIR); the PMI for cancer risk and chronic hazard index is located southeast of the property, Receptor #135 (UTM coordinates 283960E, 3911650N)
MEIW = maximally exposed individual, worker is located east of the property at the Tule Elk State Reserve Ranger Station, Receptor #5495 (UTM coordinates 285170E, 3912389N); evaluated under the worker exposure scenario (10 hours/day, 250 days/year, 35 years)
MEIR-1 = maximally exposed individual, residential is located at the northwest corner of the property, Receptor #5496 (UTM coordinates 282408E, 3913181N)
Nearest school = located at Elk Hills School in Tupman, Rec #5494 (UTM coordinates 285878E, 3908605N)

Operations Phase Analysis

For the operations phase analysis, atmospheric dispersion modeling of facility emissions was conducted by the applicant using AERMOD. Local meteorological data were used, building downwash effects were included for 61 buildings, and 5,047 receptors were modeled.

The 294 emitting units modeled by the applicant include:

Routine Emissions:

- 1 Combustion turbine generator with associated heat steam generator (CTG/HRSG)
- 1 Coal dryer
- 1 Tail gas thermal oxidizer (TGTO) stack
- 1 Auxiliary boiler
- 1 CO_2 vent
- 2 Emergency diesel generators
- 1 Emergency firewater pump diesel engine
- 1 Ammonia heater
- 1 Urea pastillation stack
- 2 Urea plant absorbers
- 1 Nitric acid plant stack
- 4 ASU (air separation unit) cooling tower stacks
- 12 Power block cooling tower stacks
- 13 Process cooling tower stacks

Flares:

- 1 Rectisol flare
- 1 Gasification flare
- 1 SRU (sulfur recovery unit) flare

Transportation:

- 2 Idling incoming coal/coke delivery trucks
- 7 Idling product trucks
- 73 Product trucks
- 34 Coal/coke delivery trucks
- 5 Miscellaneous HHDT diesel trucks
- 10 Onsite diesel operations and maintenance trucks
- 104 Rail

Fugitives:

- 3 Gasification area fugitives
- 2 Shift area fugitives (Shift)
- 1 AGR (acid gas removal) fugitives
- 2 SRU (sulfur recovery unit) fugitives
- 1 UAN fugitives
- 2 Ammonia unit fugitives
- 2 Urea unit fugitives
- 1 SWS (sour water stripper) fugitives

Feedstocks expected to be used in the proposed facility include petroleum coke, western bituminous coal, and natural gas. The modified emission factors provided in January 2013 were used in this analysis and are listed in **Public Health Tables 5** and **6** below.

Staff conducted independent AERMOD modeling and a limited focused risk analysis for the eight specific stationary sources and six receptors listed below. Staff conducted a limited assessment due to the complexity of the facility, the number of TACs, the high number of emission sources, and the complexity of combining stationary source and the high number of mobile sources. Staff's analysis serves as a "spot check" on the applicant's analysis and assesses the TACs that, in staff's opinion, would contribute the most to public health impacts.

Emissions Sources: HRSG, Coal Dryer, CO_2 Vent, Gasification fugitives, Shift area fugitives, AGR fugitives, SRU fugitives, SWS fugitives.

Receptors:

- Point of maximum impact (PMI) for cancer risk, located towards the southeast corner of the proposed project at Tupman Road
- PMI for noncancer chronic hazard, located towards the southeast corner of the proposed project at Tupman Road (close to the cancer PMI)
- PMI for noncancer acute hazard, located northwest of the proposed project

- Maximally exposed individual receptor (MEIR) for cancer risk and noncancer hazard, located at a residence along the southeastern side of the property line on Tupman Road
- MEIR for acute hazard, located at a residence on Tule Park Road near Station Road
- Nearest sensitive receptor, Elk Hills School in Tupman

Air dispersion modeling was conducted by air quality staff using AERMOD with default regulatory settings over five years of meteorological data. The air dispersion modeling results provided ground level airborne concentrations of contaminants normalized to a unit value emission rate (expressed as Chi/Q values (in units of ug/m^3 per g/sec) for each source at each receptor (see **Public Health Table 7**). These values were used with the emission factors listed in **Public Health Tables 5** and **6** (converted to units of g/sec) to determine average annual and 1-hour ground level concentrations of each emitted substance at each receptor. These values were then used in a human health risk assessment (using the most current Cal-EPA OEHHA guidelines published in August 2012) to estimate cancer risk and noncancer hazard at each receptor for emissions from the eight sources evaluated and results are listed in **Public Health Tables 8** and **9**. Only the substances that are emitted from the sources evaluated by staff are included in the tables that accompany this analysis. Modified emission factors were not provided in the Emission Source Modification List (January 2013) for four of the fugitive sources (Shift, AGR, SRU and SWS; see above for definitions). Emissions from these fugitives were combined and presented as a single value whereas fugitive emissions were delineated by source in the Amended AFC. In staff's analysis, the proportionate contribution of each of the four fugitive sources to the total amount of each substance emitted in the Amended AFC was applied to the combined fugitive emissions amount presented in the Emission Source Modification List to estimate the modified emissions from the Shift, AGR, SRU and SWS fugitive sources.

A health risk assessment (HRA) evaluates exposure due to all complete exposure pathways (the exposure assessment component of a HRA), followed by the dose-response assessment component in which dose is quantified, and then cancer risk and noncancer health impacts are assessed in the risk characterization component of the HRA (OEHHA 2012). The most recent exposure methodology developed by Cal-EPA OEHHA and recommended for human health risk assessment was used in this assessment (OEHHA August 2012).

Off-site residents are assumed to be potentially exposed to airborne emissions from the proposed facility as well as emitted particulates that are deposited off-site through the following exposure pathways:

- Inhalation
- Ingestion of soil upon which chemical-containing particulates from the project have been deposited
- Dermal contact with soil upon which chemical-containing particulates from the project have been deposited

This assessment assumes that 100 percent of the soils ingested and 100 percent of the soil available for dermal contact would be impacted by chemical-containing particulates from the project. Although these exposure assumptions are physically impossible – soils carried off-site would undoubtedly mix with existing off-site soils and thus be diluted to some extent - they are used in this assessment to ensure that “conservative health protective” methods are used to calculate the theoretical upper-bound risk and hazard levels, thus also ensuring that the true risks are not underestimated. Also, additivity of risk is assumed throughout this assessment, a health protective method that is required by both Cal EPA and U.S. EPA guidelines.

Exposure parameters and toxicity values are presented in **Public Health Tables 10** and **11**, respectively. Algorithms used in the exposure and risk analysis are presented in **Public Health Appendix A**.

Cancer risk and chronic and acute hazard index values obtained by staff are compared to results reported by the applicant in the May 2012 modeling files in **Public Health Table 12**. Risk and hazard were determined at the point of maximum impact (PMI) for cancer risk, chronic noncancer hazard and acute hazard. Additionally, risk and hazard were determined at the location of the maximally exposed individual resident (MEIR) and at the nearest sensitive receptor, Elk Hills School in Tupman. The analyses for each receptor are included as tables in Appendix B.

The inhalation pathway contributes 43 percent of risk to the total cancer risk estimated by staff for the cancer PMI (Public Health Table B.1-2). Soil ingestion accounts for 54 percent of total risk and dermal contact is 3.5 percent. **Public Health Table 13** presents the contribution to total risk and hazard by individual substances that are emitted from the eight sources that were evaluated in staff’s analysis. Analysis of this table indicates that 62 percent of the cancer risk at the PMI is attributed to arsenic, 24 percent to cadmium, and 13 percent to hexavalent chromium. For chronic hazard, 89 percent is attributed to arsenic with cadmium and manganese at 4 percent and 5 percent, respectively. For acute hazard, the majority of the hazard index is due to hydrogen sulfide (78 percent) and carbonyl sulfide (18 percent). Note that the applicant did not include carbonyl sulfide in its health risk assessment because there are no toxicity values (RfCs or RELs) available to calculate risk or hazard. However, the applicant did provide an emission factor and Cal-EPA and US EPA both state that it is proper risk assessment procedure to use toxicity values of a “surrogate” similar chemical that has toxicity values available for use. Thus, staff included carbonyl sulfide in its HRA by assuming it to have the same toxicity as hydrogen sulfide. Hydrogen sulfide is not carcinogenic and staff has seen no evidence that carbonyl sulfide would be carcinogenic and thus only a non-hazard Hazard Index was calculated for carbonyl sulfide.

A review of staff’s analysis shown in **Public Health Table 12** raises a question about the levels of the Hazard Indices for non-cancer acute and chronic impacts. Both values (0.95 and 0.97 at the location (point) of the chronic maximum impact; PMIc) are very close to the value of 1.0, a level that does not necessarily mean that adverse impacts are expected but rather that further analysis and refinement of the exposure assessment is warranted. Staff, however, believes that based on assessment of the top TACs in toxicity and contribution to potential public health impacts, combined with the results shown in **Public Health Table 13**, if all the remainder TACs were added to the assessment, no significant incremental increase in the Hazard Index would occur. That is, the percent contributions to the HI from all other TACs would be far less than 1 percent and thus the HI might increase from 0.97 in tenths or hundredths of a percent increments.

The differences seen in **Public Health Table 12** between the applicant's results and staff's results are due to several differences in approach. First, staff conducted a focused limited assessment of the stationary sources and TACs it believed would contribute the most to risk or hazard. Mobile (train and truck) sources were not included in staff's assessment. The applicant's assessment included all stationary and mobile sources and thus the cancer risk predicted by the applicant was greater (8.97 in one million at the PMI) than that predicted by staff (3.1 in one million at the PMI). Staff's use of a more sophisticated and recent risk assessment methodology, slight differences in air dispersion modeling inputs, and the inclusion of carbonyl sulfide in staff's assessment also contributed to the differences found for chronic hazard (staff: 0.97; applicant: 0.42) and acute hazard (staff:0.96; applicant: 0.88). However, although values derived by staff differ from those of the applicant, all are below respective significance levels.

An area of uncertainty also exists in the emissions and hence risk/hazard posed by the use of groundwater in the cooling towers. The identity and concentration of chemicals in the groundwater can change and a survey of other wells in the area (internal staff investigation) shows that in addition to the chemicals found in the groundwater proposed to be used for cooling and thus included in the applicant's and staff's risk assessment (see **Public Health Table 5**), chromium+6, mercury, magnesium, and zinc have been found. If these chemicals ultimately prove to be present in the groundwater used for cooling at the HECA facility, the risk/hazard from cooling tower emissions could be higher than both staff and applicant have calculated. However, because the contribution to risk/hazard due to cooling tower emissions has been found by staff to be low at all power plant sites assessed by staff in the past, it is extremely doubtful that even if these additional contaminants were present (with the exception of hexavalent chromium due to its very high cancer potency via the inhalation route of exposure), the risk/hazard would not be significantly greater than already estimated.

Ammonia	-	4%	3%
Mercury	-	1%	-

Mercury

Staff made a special effort to ensure that mercury emissions would not result in a hazard to public health. Mercury would be emitted from the following sources:

- CTG/HRSG
- Coal Dryer

- Auxiliary Boiler
- Tail Gas Thermal Oxidizer
- Ammonia heater
- Rectisol Flare
- Gasifier Flare
- SRU Flare

The emissions of mercury from these sources are estimated by the applicant to be very low, ranging from 9E-9 lbs/year from the SRU flare up to 1.2E-3 lbs/yr from the CTD/HRSG. The average annual airborne concentration predicted to occur at off-site receptors according to staff's modeling would range from 5.6E-7 $\mu g/m^3$ at the Elk Hills School to 3.5E-6 $\mu g/m^3$ at the Point of Maximum Impact (near the SE corner of the facility at Tupman Road). Short-term 1-hour airborne concentration would be equally low and is predicted by staff's modeling to be similar at both the Elk Hills School and the Point of Maximum Impact (near the SE corner of the facility at Tupman Road), around 3E-4 $\mu g/m^3$. The chronic Reference Exposure Level (REL) calculated by the Cal-EPA Office of Environmental Health Hazard Assessment (OEHHA) is 3.0E-2 $\mu g/m^3$ and the acute REL is 6.0E-1 $\mu g/m^3$. The average annual airborne concentration of mercury at the Elk Hills School, therefore, is predicted to be 53,000 times lower than the airborne concentration deemed without hazard and the acute 1-hour airborne concentration of mercury at the Elk Hills School is predicted to be 1935 times lower than the airborne concentration deemed without hazard.

In a data request (number 82) issued by Intervener Sierra Club (Sierra Club 2012c) a question was raised as to whether this project would meet the criteria for required compliance with the recent EPA Mercury and Air Toxics Standards ("MATS", effective April 16, 2012). MATS established emission limits for new IGCC electric generating units (such as the HECA project) for among other emissions, mercury (in lbs/GWh). In response to an earlier data request from the staff (number 135, HECA 2012aa), the applicant stated its position, and provided supporting calculations showing, that mercury emissions would comply with the MATS mercury emission limit for IGCC facilities (40 CFR Part63, Subpart UUUUU). Both Air Quality and Public Health staff have reviewed this response and find the estimate of mercury emissions to be credible. Therefore, staff believes that the MATS mercury emissions limit will be met.

Truck & Rail Transportation

Applicant is proposing two options (scenarios) for coal delivery. One option is by a combination of rail and truck, and the other is by truck alone. In either scenario, petroleum coke delivery would be by truck. Staff conducted a driving survey of the proposed coal transportation routes for the HECA project in July 2012. The survey began at the intersection of Highway 46 and Highway 43 in Wasco, where the trucks will pick up coal arriving by rail. The BNSF rail line was noted to parallel Highway 43 between Wasco and the city of Shafter to the southeast. The proposed truck and rail routes are shown in Figure 1, which also shows sensitive receptors and land use designations in the vicinity of the routes. Staff noted agricultural uses adjacent to the majority of the route, significant dust in the air due to agricultural activities and a school located on the truck route (at the intersection of Enos Lane and Kratzmeyer Road). **Public Health Figures 2, 3** and **4** show schools, daycare centers and medical facilities in Wasco, Shafter and Bakersfield, respectively.

Table 5.1-19 of the Amended AFC (HECA 2012e) lists the anticipated on-site maximum trucks and trains by period for the HECA project – including all truck trips -- and is summarized below. These are the maximum number of truck and train deliveries expected; elimination of one product delivery (anhydrous ammonia) will result in a reduction in-bound and out-bound truck trips; however the applicant has stated in an e-mail to the Energy Commission project managers that the exact reduction will be minor and thus staff should use the numbers below until the applicant refines its assessment. The applicant also indicated that there may be additional materials transported to the site (calcium carbonate flux) and thus this table reflects the best current estimate of all truck trips proposed for project operations:

Truck type	#/hour	#/24 hours	#/year
Petcoke trucks	6	55	15,200
Product trucks	13	130	20,880
Coal trains	1	2	109
Product trains	1	1	153

After driving the coal truck route and other truck routes to/from the proposed facility, staff became concerned about the impacts to public health posed by truck emissions. In a response to a staff data request, the applicant included an assessment of the risk posed to the off-site public located along the transportation routes (HECA 2012dd). This risk would be due to the emissions of diesel particulate matter (DMP) whose toxicity is described earlier in this section. The applicant provided an expanded health risk assessment that included all project stationary and mobile toxic air contaminants (TACs). Emissions from diesel trucks along Station Road were thought by staff to represent the point of greatest emissions of DPM so the applicant assessed impacts at that location and added them to the emissions resulting from stationary sources on the facility site. The risk at other locations along the truck routes would therefore be less than that estimated along Station Road. The maximum estimated risk to a residential receptor along Station Road was calculated by the applicant to be 4.2 in one million under transportation Alternative 1 and 7.2 in a million under transportation Alternative 2 (HECA 2012dd). The Hazard Indices for all non-cancer health impacts was estimated to be much less than 1.0 under both alternatives.

Staff also expressed concern about potential risks posed to sensitive receptors along the truck route transporting pet coke form the Santa Maria area. The applicant, in response to staff's data request, stated that diesel trucks would pass by sensitive receptors on the transportation route between the Conoco Phillips Refinery in Nipomo (near Santa Maria) and the HECA facility, if this option is chosen for the project's petroleum coke (petcoke) needs. According to the applicant (HECA 2012dd), petcoke would not be transported by train for either alternative; therefore, the number of trucks transporting petcoke for either alternative is the same. The route between the Nipomo refinery and the HECA site would include travel on U.S. 101 south to CA 166 east, then to Interstate 5 north, to Stockdale Highway, and finally to Station Road into the HECA facility. Communities passed through would include Nipomo, Cuyama, Maricopa, and southwest Bakersfield. At staff's request, the applicant identified sensitive receptors along the proposed transportation route and the applicant found three schools near an intersection just east of the refinery along the truck route in Nipomo. The schools are

Dana School, Little Bits Preschool, and Dayspring Preschool, all approximately 900 feet southwest of the Pomeroy Road and West Tefft Street intersection in Nipomo. These schools were the closest sensitive receptors located near a signalized intersection along the truck route. Staff felt that idling trucks emitting DPM while stopped at a traffic light near a school along the transportation routed would represent the greatest risk posed to children at any location along the route. The applicant conducted air dispersion modeling and a health risk assessment and estimated that the maximum risk posed to a sensitive receptor along this route would be 0.09 in one million, a level far below the level of significance.

Staff evaluated the applicant’s methodology used in both transportation risk assessments and found it to be consistent with that required by Cal-EPA OEHHA. Staff is thus able to conclude that the applicant’s transportation risk assessment can be relied upon to find that an insignificant risk would be posed to the off-site public by both facility and transportation emissions.

Cooling Towers

In addition to being a source of potential toxic air contaminants, the possibility exists for bacterial growth to occur in the cooling towers, including Legionella. Legionella is a bacterium that is ubiquitous in natural aquatic environments and is also widely distributed in man-made water systems. It is the principal cause of legionellosis, otherwise known as Legionnaires’ Disease, which is similar to pneumonia. Transmission to people results mainly from inhalation or aspiration of aerosolized contaminated water. Untreated or inadequately treated cooling systems, such as industrial cooling towers and building heating, ventilating, and air conditioning systems, have been correlated with outbreaks of legionellosis.

Legionella can grow symbiotically with other bacteria and can infect protozoan hosts. This provides Legionella with protection from adverse environmental conditions, including making it more resistant to water treatment with chlorine, biocides, and other disinfectants. Thus, if not properly maintained, cooling water systems and their components can amplify and disseminate aerosols containing Legionella.

The State of California regulates recycled water for use in cooling towers in Title 22, Section 60303, California Code of Regulations. This section requires that, in order to protect workers and the public who may come into contact with cooling tower mists, chlorine or another biocide must be used to treat the cooling system water to minimize the growth of Legionella and other micro-organisms. This regulation does not apply to the HECA project since it intends to use brackish water provided by the Buena Vista Water Storage District (BVWSD) that would be treated on-site (URS, Section 2.1). However, the potential remains for Legionella growth in cooling water at HECA due to nutrients that are found in groundwater.

The U.S. EPA published an extensive review of Legionella in a human health criteria document (EPA 1999). The U.S. EPA noted that Legionella may propagate in biofilms (collections of microorganisms surrounded by slime they secrete, attached to either inert or living surfaces) and that aerosol-generating systems such as cooling towers can aid in the transfer of Legionella from water to air. The U.S. EPA has inadequate quantitative data on the infectivity of Legionella in humans to prepare a dose-response evaluation.

Therefore, sufficient information is not available to support a quantitative characterization of the threshold infective dose of Legionella. Thus, the presence of even small numbers of Legionella bacteria presents a risk - however small - of disease in humans.

In February of 2000 the Cooling Technology Institute (CTI) issued its own report and guidelines for the best practices for control of Legionella (CTI 2000). The CTI found that 40-60 percent of industrial cooling towers tested were found to contain Legionella. More recently, staff has received a 2005 report of testing in cooling towers in Australia that found the rate of Legionella presence in cooling tower waters to be extremely low, approximately three to six percent. The cooling towers all had implemented aggressive water treatment and biocide application programs similar to that required by proposed Condition of Certification **PUBLIC HEALTH-4**.

To minimize the risk from Legionella, the CTI noted that consensus recommendations included minimization of water stagnation, minimization of process leads into the cooling system that provide nutrients for bacteria, maintenance of overall system cleanliness, the application of scale and corrosion inhibitors as appropriate, the use of high-efficiency mist eliminators on cooling towers, and the overall general control of microbiological populations.

Good preventive maintenance is very important in the efficient operation of cooling towers and other evaporative equipment (ASHRAE 1998). Preventive maintenance includes having effective drift eliminators, periodically cleaning the system if appropriate, maintaining mechanical components in good working order, and maintaining an effective water treatment program with appropriate biocide concentrations. Staff notes that most water treatment programs are designed to minimize scale, corrosion, and biofouling and not to specifically control Legionella.

The efficacy of any biocide in ensuring that bacterial and in particular Legionella growth, is kept to a minimum is contingent upon a number of factors including but not limited to proper dosage amounts, appropriate application procedures and effective monitoring.

In order to ensure that Legionella growth is kept to a minimum, thereby protecting both nearby workers as well as members of the public, staff has proposed Condition of Certification **PUBLIC HEALTH-4**. The condition would require the project owner to prepare and implement a biocide and anti-biofilm agent monitoring program to ensure that proper levels of biocide and other agents are maintained within the cooling tower water at all times, that periodic measurements of Legionella levels are conducted, and that periodic cleaning is conducted to remove bio-film buildup. Staff believes that with the use of an aggressive antibacterial program coupled with routine monitoring and biofilm removal, the chances of Legionella growing and dispersing would be reduced to insignificance.

ENHANCED OIL RECOVERY FACILITY (EOR)

The Enhanced Oil Recovery (EOR) component at Occidental of Elk Hills, Inc. (OEHI) is located approximately four miles south of the proposed HECA project (OXY 2012). Carbon dioxide is a byproduct at HECA and it is proposed to be compressed and delivered by pipeline to the EOR project where it would be injected into the oil wells to help in the recovery of naturally trapped oil. The project is expected to result in the sequestration of approximately three (3) million tons of CO_2 per year during the demonstration phase. This rate of sequestration would also be required for the operational life of the power plant due to the requirements of California law (SB 1368) and the value created by the use of the CO_2 for EOR. The captured CO_2 would be compressed and transported via pipeline to the Elk Hills Oil Field. The CO_2 would enhance domestic oil production, contributing to the nation's energy security. An additional small amount of the CO_2 produced by the facility would be used to manufacture urea.

The EOR process involves the injection and reinjection of CO_2 to reduce the viscosity and enhance other properties of trapped oil in order to facilitate its flow through the reservoir, improving extraction. During EOR operations, the pore space left by the extracted oil is occupied by the injected CO_2, sequestering it in the geologic formation. EOR operations would be monitored to ensure that the injected CO_2 remains within the formation.

Air emissions of TACs would occur during operations at the EOR facility and would come from permitted stationary sources including process heaters, tanks, fugitive, maintenance activities on emergency diesel equipment, emergency flares, and mobile sources. In a response to a data request (OEHI Response to CEC Workshop Request No. A38 Response to CEC Supplemental Questions Regarding Data Request A28), OEHI stated that construction, well workover, and well drilling are ongoing daily activities at Elk Hills and the same basic processes will continue with the development of the CO_2 EOR project and that emissions from the equipment used for conducting these activities will remain controlled as per California regulations. Specifically, they use cleaner (higher Tier) engines in each project year as a result of California and USEPA requirements for off road construction equipment and off road mobile sources.

Therefore, given the small number of sources, the absence of stacks at the EOR facility, the use of cleaner (higher Tier) engines, and the distance to any public off-site receptor, it is extremely unlikely that emissions from the EOR project would result in a significant risk to public health.

Insofar as a cumulative risk from the HECA site and the EOR site combined, since the EOR component is located ~3 miles form the proposed HECA site and the maximum cancer risk and non-cancer hazard index (both acute and chronic) for operations emissions from the HECA project estimated independently by the applicant, staff, and the SJVAPCD are all below the level of significance, it is doubtful that cumulatively a less than significant risk would result in a significant risk when these two parts of the project are added together. Staff has found in the past when evaluating other power plant projects that while air quality cumulative impacts can occur with sources within a 6-mile radius, cumulative public health impacts are not significant unless the emitting sources are extremely close to each other, within a few blocks, not miles. Staff therefore concludes that the proposed HECA project, when combined with the EOR project, would not contribute to cumulative impacts in the area of public health.

AIR DISTRICT PRELIMINARY DETERMINATION OF COMPLIANCE (PDOC)

The SJVUAPCD issued a Preliminary Determination of Compliance (PDOC) on February 17, 2013 and included a health risk assessment (SJVUAPCD 2013a). The SJVUAPCD conducted its assessment using AERMOD and HARP and found that the maximum predicted cancer risk at the PMI would be 8.97 E-6, the maximum chronic HI would be 0.42, and the maximum acute HI would be 0.88. These values are exactly the same as those presented by the applicant (see **Public Health Table 12** above) and serve to confirm that the applicant conducted its health risk assessment properly in accordance with Cal-EPA guidelines. The air district also found that emissions from the HRSG stack/Coal Dryer Unit contributed the most to risk (3.68 E-6) and would be required by district policy to implement T-BACT (Toxics Best Available Control Technology). In this case, T-BACT is defined by the SJVAPCD as the "emission limitation or control technique that is not less stringent than the emission limitation achieved in practice by the best controlled similar source, and reflects the maximum degree of reduction in emissions that the APCO determines is achievable for the new or reconstructed source." In making this determination, the air district considers the "cost of achieving the reduction, non-air quality health impacts, other environmental impacts and energy requirements". According to the PDOC, T-BACT is triggered only for unit S-7616-26-0 which is the Combustion Turbine Generator that will use syngas as the fuel (SJVUAPCD 2013a, Section 10.3 of Appendix K). Particulate matter and VOCs (volatile organic compounds) will thus need to be controlled by the best technology available which reduces emissions to the levels required by the PDOC.

The Air District issued an extensive list of permit conditions which included requirements for source testing of TACs (HAPs) for the project if it is built and operated. Specifically, the project owner would be required to conduct an initial speciated HAPs (TACs) and total VOC source test for the CO_2 recovery and vent and emissions and for the combustion turbine generator. Additionally, the vent stream composition of VOCs (Volatile Organic Chemicals), H_2S (hydrogen sulfide), COS (carbonyl sulfide), and the HAPs identified in the initial speciated HAPs and total VOC source test, would be measured during each venting occurrence exceeding 500,000 scf/day. Ongoing compliance would be determined using mass flow and VOC sampling during venting occurrences as described in another permit condition.

These requirements for testing for HAPs (TACs) are similar to but not the same as staff's recommendations in conditions **PUBLIC HEALTH-1** and **2**. Staff is open to melding the two so as to allow for the same testing to provide both the SJVUAPCD and the Energy Commission the information it needs.

ALTERNATIVES

Staff has reviewed four potential alternative sites from the perspective of public health impacts due to emissions of toxic air contaminants from all the sources identified above. Of all possible alternative site locations, none were environmentally superior to the project site and therefore the project site was selected (HECA 2012e, Section 6.3.1). Because the cancer risk and hazard indices are below the level of significance at the point of maximum impact, staff believes that regardless of the exact location of this facility within this region, the project would not pose a significant risk to public health.

Therefore, staff concludes that there is no preferable alternative location for public health.

CUMULATIVE IMPACTS AND MITIGATION

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code Regulation, Title 14, section 15130). NEPA states that cumulative effects can result from individually minor but collectively significant actions taking place over a period of time (40 CFR §1508.7).

Cumulative impacts of the proposed project and other projects within a 6-mile radius were not quantitatively evaluated in the AFC. The applicant stated that there are no existing or planned TAC emission sources in the project vicinity that could contribute to a public health cumulative impact (HECA 2012e, Section 5.6.4).

COMPLIANCE WITH LORS

Staff has considered the minority population as identified in **Socioeconomics Figure 1** in its impact analysis and has found no potential significant adverse impacts for any receptors, including environmental justice populations. In arriving at this conclusion, staff notes that its analysis complies with all directives and guidelines from the Cal/EPA Office of Environmental Health Hazard Assessment and the California Air Resources Board. Staff's assessment is biased toward the protection of public health and takes into account the most sensitive individuals in the population. Using extremely conservative (health-protective) exposure and toxicity assumptions, staff's analysis demonstrates that members of the public potentially exposed to toxic air contaminant emissions of this project—including sensitive receptors such as the elderly, infants, and people with pre-existing medical conditions—will not experience any acute or chronic significant health risk or any significant cancer risk as a result of that exposure. Staff believes that it incorporated every conservative assumption called for by state and federal agencies responsible for establishing methods for analyzing public health impacts. The results of that analysis indicate that, based upon the best information and data available, there would be no direct or cumulative significant public health impact to any population in the area. Therefore, given the absence of any significant health impacts, there are no disparate health impacts and there are no environmental justice issues associated with **Public Health**. However, because staff recognizes that this exact conglomeration of industrial sources and emissions do not now exist, and to ensure there would be no significant adverse public health impacts, staff recommends Conditions of Certification **PUBLIC HEALTH-1, 2,** and **3.**

Staff concludes that construction and operation of HECA will be in compliance with all applicable LORS regarding long-term and short-term project impacts in the area of **Public Health**.

DIRECT AND INDIRECT IMPACTS OF THE NO-ACTION ALTERNATIVE

Under the No-Action Alternative, DOE would not provide financial assistance to the applicant for the HECA Project. The applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative. Accordingly, the No-Action Alternative would have no impacts associated with this resource area.

RESPONSE TO AGENCY AND PUBLIC COMMENTS

Comment: Trudy Douglass of Bakersfield submitted comments to the Energy Commission and Kern County, dated June 20, July 5 and August 2, 2012. Ms. Douglass raised concerns regarding the existing poor health conditions in Kern County and the poor air quality reported in Kern County.

Response: Staff has researched these issues and our report can be found above in the "Existing Public Health Concerns" section of this section of the PSA.

Comment: Chris Romanini of Buttonwillow raised questions regarding transportation emissions and risks, and the impact of facility emissions on nearby crops. All these concerns were reiterated by the Association of Irritated Residents (AIR) in their "Air Status Report & Data Requests" dated October 24, 2012, which was a compilation of written questions by residents, landowners and employees from the area near the proposed HECA project.

Response: Staff has reviewed the HRA prepared by the applicant which included the assessment of impacts due to mobile emission sources and has determined that the applicant's assessment -- showing that risks due to mobile emissions, both incrementally and cumulatively with stationary sources, would be less than significant -- was conducted appropriately according to Cal-EPA risk assessment guidelines and procedures. Thus, staff agrees that the risks posed by mobile sources would be less than significant.

Comment: The Sierra Club (in scoping comments dated July 27, 2012), suggested using an alternative fuel, such as a higher percentage of petcoke versus coal or the addition of biomass as fuel to reduce emissions of pollutants. Other changes suggested that could reduce emissions included use of an air cooling system rather than the proposed water cooling system and exploring alternatives to elevated flares (such as enclosed ground flare and flare recovery system). The Sierra Club's concerns also encompassed air pollution impacts from rail and truck emissions along the transportation route that would degrade air quality and adversely impact human health and also the potential for high mercury emissions (and subsequent contamination of nearby lands and crops) from coal combustion.

Response: Comments and suggestions noted. However, since the project as proposed would not posed significant risk to the public, no additional assessment of public health impacts was conducted. Please review the Alternatives section of this PSA for further discussion.

CONCLUSIONS

Staff has analyzed potential public health risks associated with construction and operation of the HECA project and does not expect any significant risk of cancer or any short-term or long-term health effects to any members of the public, including low income and minority populations, from project toxic emissions. Staff also concludes that its analysis of potential health impacts from the proposed HECA uses a conservative health-protective methodology that accounts for impacts to the most sensitive individuals in a given population, including a developing fetus, newborns, infants, and the elderly. According to the results of staff's health risk assessment, emissions from HECA would not contribute significantly or cumulatively to morbidity or mortality in any age or ethnic group residing in the project area. Staff has also considered the potential for adverse air quality impacts to the minority population surrounding the site. With the adoption of the recommended conditions of certification, the project's direct and cumulative air quality impacts would be reduced to less than significant. Therefore, the project will not result in a significant or adverse impact to an identified environmental justice population.

However, staff wishes to note that the applicant and staff were not able to quantitatively describe and assess the short-term fluctuations of emissions of TACs under start-up, commissioning, or upset operating conditions. Staff notes, however, that short-term fluctuations in TAC emissions are not expected to impact long-term (chronic) impacts on public health; only acute (short-term) impacts on public health could be possible. Yet, the potential for short-term impacts due to start-up or upset conditions would be reduced to below a level of significance by the immediate identification and control of these releases. Modeling and measurements of "indicator" emissions (the criteria pollutants), measurements of operating conditions by continuous emission monitoring (CEM), onsite measurements of accidental and fugitive chemical releases, and the monitoring of process efficiency parameters (temperature, feed rates, pressure, flow, etc.) would enable the facility to ensure that short-term releases, which will invariably occur, would be kept to a minimum and not result in a significant impact on the nearby public or on-site workers. In order to ensure that long-term routine operating emissions would not, as estimated, pose a significant risk to the off-site public, staff proposes that routine sampling of certain TACs that pose the greatest potential risk and hazard to the public be required and that a health risk assessment be conducted, as per the requirements and schedule of Conditions of Certification **PUBLIC HEALTH-1, PUBLIC HEALTH-2,** and **PUBLIC HEALTH-3**.

Staff believes that this step-by-step approach will serve to inform the project owner, the air district, and the CPM that emissions of TACs and the risks posed to public health remain below the regulatory thresholds. The first step (required in **PUBLIC HEALTH-1,**) is for the project owner to prepare and submit for approval protocols for testing emissions from certain specific sources for the TACs that staff has found contribute the most to risk. The project owner would also have to prepare and submit for approval a protocol for how the human health risk assessments are to be prepared. Once the CPM approves these protocols, testing can take place and the health risk assessment prepared using the test results, as required by **PUBLIC HEALTH-2**. If any human health risk assessment prepared using those source tests should show that the risks to public health are greater than 10 in one million or a Hazard Index is greater than 1.0, the project owner would then be required by **PUBLIC HEALTH-3** to submit plans to address this matter by either submitting a protocol for a more refined health risk assessment or plans for the reduction in the emissions of certain TACs. The allowance for the submission of a more refined health risk assessment is provided for in Cal-EPA OEHHA risk assessment guidelines and is a reflection of the fact that a human health risk assessment over-estimates the true risk posed by a facility but if the risks are less than the regulatory threshold of 10 in one million, no further assessment is needed. A more refined assessment uses better and more accurate air dispersion methods and exposure assumptions. The option to reduce emissions of certain TACs might be the preferred method if the increased calculated risk was the result of a temporary upset condition that can be preventively engineered.

PUBLIC HEALTH-4 would require the project owner to ensure that the cooling water in the cooling tower is free from bacterial contamination to the extent practicable.

PROPOSED CONDITIONS OF CERTIFICATION

PUBLIC HEALTH-1 Not less than sixty (60) days prior to the start of commissioning, the project owner shall prepare protocols describing the sampling and analysis of the Toxic Air Contaminants (TACs) listed below (source tests) and for the preparation of a Human Health Risk Assessments (HRA) and shall submit these protocols to the San Joaquin Valley Air Pollution Control District (SJVAPCD) for review and comment and to the CPM for review and approval. The source testing and HRA shall include the quantitative analysis and assessment of the following toxic air contaminants from all sources at the project site: arsenic, cadmium, hexavalent chromium, mercury, carbon disulfide, and hydrogen sulfide.

Verification: Not later than sixty (60) days prior to the anticipated start of commissioning, the project owner shall provide a copy of the source test and human health risk assessment protocols to the SJVAPCD for review and comment and to the CPM for review and approval.

PUBLIC HEALTH-2 Not later than sixty (60) days after the start of commissioning, the project owner shall conduct source tests as described by the protocol prepared as per the requirement of PH-1. Not later than thirty (30) days after the source test, the project owner shall prepare and submit the results of the source test and the Human Health Risk Assessment (HRA) to the SJVAPCD for review and comment and the CPM for review and approval.

Not later than sixty (60) days after the start of commercial operations, the project owner shall conduct another source test and prepare a new HRA and submit those results to the SJVAPCD for review and comment and the CPM for review and approval thirty (30) days after the source test is completed.

The project owner shall repeat the source test and HRA after 3 years of commencing commercial operations, and then every 5 years thereafter.

Verification: Not later than sixty (60) days after the start of commissioning, the project owner shall provide a letter to the CPM that the source test has been completed and not later than thirty (30) days after the source test, copy of the source test results and the HRA results shall be provided to the SJVAPCD for review and comment and to the CPM for review and approval.

Not later than seven (7) days after every subsequent source test, the project owner shall provide a letter to the CPM that the source test has been completed and not later than thirty (30) days after the source test, copy of the source test results and the HRA results shall be provided to the SJVAPCD for review and comment and to the CPM for review and approval.

PUBLIC HEALTH-3 Not later than sixty (60) days after the submittal to the CPM of the results of any source test and any human health risk assessment prepared using those source test results that shows the risks to be greater than 10 in one million or a Hazard Index of greater than 1.0, the project owner shall submit plans to address this matter by either submitting a protocol for a more refined health risk assessment or plans for the reduction in the emissions of certain TACs to the SJVAPCD for review and comment and to the CPM for review and approval.

The project owner shall repeat this after every source test and HRA preparation.

Verification: Not later than sixty (60) days after any source test and preparation of a HRA, the project owner shall provide a letter to the CPM stating whether or not the HRA results show the risks to be greater than 10 in one million and the Hazard Index to be less than 1.0. If either threshold is exceeded, the project owner shall submit plans to address this matter by either submitting a protocol for a more refined health risk assessment or plans for the reduction in the emissions of certain TACs to the SJVAPCD for review and comment and to the CPM for review and approval.

PUBLIC HEALTH-4 The project owner shall develop and implement a Cooling Water Management Plan to ensure that the potential for bacterial growth in cooling water is kept to a minimum. The Plan shall be consistent with either staff's "Cooling Water Management Program Guidelines" or with the Cooling Technology Institute's "Best Practices for Control of Legionella" guidelines, but in either case, the Plan must include sampling and testing for the presence of Legionella bacteria at least every six months. After two years of power plant operations, the project owner may ask the CPM to reevaluate and revise the Legionella bacteria testing requirement.

Verification: At least 60 days prior to the commencement of cooling tower operations, the Cooling Water Management Plan shall be provided to the CPM for review and approval.

PUBLIC HEALTH APPENDIX A: HEALTH RISK ASSESSMENT ALGORITHMS

A.1 Concentration Algorithms

A.1.1 Air Concentration

Air dispersion effects carry substances emitted from the proposed facility to off-site locations. This effect is quantified through air dispersion modeling (in this case AERMOD) which predicts the ground level concentration at specific off-site receptors, normalized to the g/sec emission rate of each substance from each source. The off-site ground level air concentration is estimated using the algorithm presented below.

$$C_{air} = \text{Chi/Q} \times \text{E-rate}$$

where

C_{air}	=	chemical concentration in air, µg/m^3
Chi/Q	=	concentration normalized to 1 g/sec, µg/m^3 per g/sec
E-rate	=	average annual or 1-hour emission rate for each substance from each source, g/sec

A.1.2 Soil Concentration

Off-site receptors are potentially exposed via soil ingestion and dermal contact to soil due to emitted particulates deposited to the ground off-site. The off-site soil concentration resulting from this process is predicted using the deposition algorithm presented below.

$$C_{soil} = \frac{C_{air} \times Dep \times X \times CF}{K_s \times SD \times BD \times T_t}$$

where

C_{soil}	=	chemical concentration in soil, mg/kg
C_{air}	=	chemical concentration in air, µg/m^3
Dep	=	deposition rate (uncontrolled sources), 0.05 m/sec
CF	=	conversion factor, 86,400 sec/day
K_s	=	soil elimination constant, 0.693/chemical half-life, day^{-1}
SD	=	soil mixing depth, 0.01 m
BD	=	soil bulk density, 1333 kg/m^3
T_f	=	total number of days of soil deposition, 25550 days
T_o	=	initial time of exposure, 0 days
T_t	=	total days of exposure period, $T_f - T_o$, 25550 days
X	=	integral function, 25549 days

$$X = [\{e\text{^}(-K_s \times T_f) - e\text{^}(-K_s \times T_o)\}] + T_t$$

A.2 Dose & Risk Algorithms

A.2.1 Inhalation

The algorithm used under OEHHA 2012 methodology to calculate intake via inhalation is described below. It is assumed that 100 percent of the inhalation dose is absorbed by the body.

$DOSE_{air}$ = C_{air} x BR/BW x EF x CF

where

$DOSE_{air}$	= dose from inhalation of resuspended dusts, mg/kg/day
C_{air}	= concentration of resuspended dusts in air, µg/m^3
BR/BW	= 95th percentile daily breathing rate normalized to body weight, l/kg-day (361 l/kg-day for third trimester of pregnacy, 1090 l/kg-day for ages 0 to <2, 745 l/kg-day for ages 2 to <16, 335 l/kg-day for ages 16-30)
EF	= exposure frequency (350 days/365 days)
CF	= conversion factor, 10^{-6} mg/µg-m^3/l

A.2.2 Soil Ingestion

Dose due to soil ingestion, assuming 100 percent gastrointestinal absorption, is determined according to:

$DOSE_{soil}$ = C_{soil} x SIR x EF x CF

where

$DOSE_{soil}$	= dose from soil ingestion, mg/kg/day
C_{soil}	= concentration in soil, mg/kg
SIR	= 95th percentile soil ingestion rate, mg/kg/day (3 mg/kg/day for third trimester, 40 mg/kg/day for ages 0 to <2, 10 mg/kg/day for ages 2 to <16, 3 mg/kg/day for ages 16-30)
EF	= exposure frequency (350 days/365 days)
CF	= conversion factor, 10^{-6} kg/mg

A.2.3 Dermal Contact

The algorithm to determine absorbed dose via dermal contact is given below. The proposed project is assumed to be in a warm climate area for purposes of the dermal exposure analysis.

$DOSE_{derm}$ = C_{soil} x ADL x ABS x EF x CF

where

$DOSE_{derm}$	= dose from dermal absorption, mg/kg/day
C_{soil}	= concentration in soil, mg/kg
ADL	= 95th percentile annual dermal load for warm climate, mg/kg/yr (2600 mg/kg/day for third trimester, 4300 mg/kg/day for ages 0 to <2, 8500 mg/kg/day for ages 2 to <16, 2600 mg/kg/day for ages 16-30)

EF	= exposure frequency (350 days/365 days)
CF	= conversion factor, 10^{-6} kg/mg

A.2.4 Risk

Risk due to each pathway is calculated according to the following algorithm and total risk is found by adding risks from each pathway:

$$RISK_i = \frac{DOSE_i \times CPF \times ASF \times ED}{AT}$$

where

$RISK_i$	= risk due to each exposure pathway
CPF	= substance-specific cancer potency factor for inhalation and oral exposures, $(mg/kg/day)^{-1}$
ASF	= age sensitivity factor (10 for third trimester, 10 for ages 0 to <2, 3 for ages 2 to <16, 1 for ages 16-30)
ED	= exposure duration, years (0.25 years for third trimester, 2 years for age 0 to <2, 14 years for ages 2 to <16, 14 years for ages 16-30)
AT	= averaging time for carcinogenic effects, 70 yrs

A.3 Dose & Hazard Algorithms

A.3.1 Inhalation

Hazard due to inhalation of substances emitted from the proposed project is calculated using a high-end estimate of dose based on the 95th percentile value for daily breathing rate normalized to body weight for the most sensitive age group, 0 to <2 years old. Consistent with prior guidance, the exposed child is evaluated for an exposure duration of 6 years. Using the daily breathing rate for the 0 to <2 age range for a period of 6 years is a conservative assumption that likely overestimates actual hazard. In this screening assessment, hazard is not delineated by target organ.

$$DOSE_{air} = \frac{C_{air} \times BR/BW \times EF \times ED \times CF}{AT}$$

where

$DOSE_{air}$	= dose from inhalation of resuspended dusts, mg/kg/day
C_{air}	= concentration of resuspended dusts in air, $\mu g/m^3$
BR/BW	= 95th percentile daily breathing rate normalized to body weight, l/kg-day (1090 l/kg-day for ages 0 to <2)
EF	= exposure frequency (350 days/365 days)
ED	= exposure duration (6 years as child)
CF	= conversion factor, 10^{-6} mg/µg-m^3/l
AT	= averaging time for noncarcinogenic effects (6 years as child)

A.3.2 Soil Ingestion

Hazard due to soil ingestion is based on the 95th percentile value for soil ingestion for the most sensitive age group, 0 to <2 years old.

$$DOSE_{soil} = \frac{C_{soil} \times SIR \times EF \times ED \times CF}{AT}$$

where

- $DOSE_{soil}$ = dose from soil ingestion, mg/kg/day
- C_{soil} = concentration in soil, mg/kg
- SIR = 95th percentile soil ingestion rate, mg/kg/day (40 mg/kg/day for ages 0 to <2)
- EF = exposure frequency (350 days/365 days)
- ED = exposure duration (6 years as child)
- CF = conversion factor, 10^{-6} kg/mg
- AT = averaging time for noncarcinogenic effects (6 years as child)

A.3.3 Dermal Contact

Hazard due to dermal contact is based on the 95th percentile value for annual dermal load for the most sensitive age group, 2 to <16 years old.

$$DOSE_{derm} = \frac{C_{soil} \times ADL \times ABS \times ED \times CF_1 \times CF_2}{AT}$$

where

- $DOSE_{derm}$ = dose from dermal absorption, mg/kg/day
- C_{soil} = concentration in soil, mg/kg
- ADL = 95th percentile annual dermal load for mixed climate, mg/kg/yr (8100 mg/kg/day for ages 2 to <16)
- ABS = substance-specific fraction absorbed across skin
- ED = exposure duration (6 years as child)
- CF_1 = conversion factor, 10^{-6} kg/mg
- CF2 = conversion factor, yr/365 days
- AT = averaging time for noncarcinogenic effects (6 years as child)

A.3.4 Noncancer Hazard

The algorithm for determining hazard index via all exposure pathways is:

$$HI = Dose / RfD_i \text{ or } RfD_o$$

where

- HI = hazard index
- Dose = the intake dose (mg/kg/day)
- RfD_i or RfD_o = substance-specific reference inhalation or oral dose, mg/kg/day

PUBLIC HEALTH APPENDIX B: HEALTH RISK ASSESSMENT RESULTS

B.1 Risk Assessment Results for the Cancer PMI Receptor

Risk assessment results for the cancer PMI are presented in the tables below:

Public Health Table B.1-1	Average Annual GLC and Soil Concentration at the Cancer PMI
Public Health Table B.1-2	Determination of Cancer Risk at the Cancer PMI
Public Health Table B.1.3	Determination of Noncancer Chronic Hazard Index at the Cancer PMI

APPENDIX C: EXISTING PUBLIC HEALTH CONCERNS

1.0 Introduction

The purpose of this assessment is to identify the current status of respiratory disease - using asthma as the primary metric and also evaluating COPD and Valley Fever – and cancer in the region near the proposed Hydrogen Energy project and in Kern County so as to enable a comparison of the prevalence of respiratory disease and cancer in this area with such disease in populations located in other parts of California.

2.0 Demographics of Kern County and California

The United States Census Bureau (2012) reports population characteristics with regards to age and racial/ethnic makeup of Kern County and of the State of California:

	Kern County	California
Population, 2010	839,631	37,253,956
Persons <5 years old, 2011	8.6%	6.7%
Persons <18 years old, 2011	29.9%	24.6%
Persons 65 and over, 2011	9.1%	11.7%

	Kern County	California
White persons, 2011	83.0%	74.0%
Black persons, 2011	6.3%	6.6%
American Indian/Alaska native, 2011	2.7%	1.7%
Asian, 2011	4.7%	13.6%
Native Hawaiian/Pacific Islander, 2011	0.3%	0.5%
Hispanic or Latino, 2011	50.0%	38.1%

3.0 Kern County Health Ranking & Air Pollution

According to the County Health Rankings and Roadmaps website (www.countyhealthrankings.org), Kern county is ranked 49th out of the 56 counties in California for overall health outcomes which include premature death and morbidity due to poor or fair health, poor physical health days, poor mental health days and low birth weight). Likewise, Kern County is ranked 55th out of 56 counties for overall health factors which include smoking, obesity, physical inactivity, excessive drinking, motor vehicle crash death rate, STDs and teen birth rate. For its physical environment (air pollution, particulate matter and ozone days[2], access to recreational facilities, limited access to healthy foods

[2] In the context of the County Health Rankings, an “ozone day” is a day in which air quality is unhealthy for sensitive populations. In the comparison with other CA counties, the annual number of unhealthy air quality days due to ozone was compared and that, along with the other aspects of physical environment (air pollution, particulate matter and ozone days, access to recreational facilities, limited access to health foods and fast food restaurants), contributed to the ranking of Kern County as last, 56th out of 56 California counties for "physical environment." This information was obtained from the website www.countyhealthrankings.org/health-factors/environmental-quality. This website says that several measures can be used to represent air quality, the most common being annual average values for fine particulate matter and ozone. In the County Health Rankings, they use two measures to represent environmental quality: annual number of days that air quality was unhealthy for sensitive populations due to (1) fine particulate matter and (2) ozone concentrations. Furthermore, researchers used an air quality model to estimate peak fine particulate matter and ozone concentrations for each day in the year and, by comparing

and fast food restaurants), Kern County ranks last, 56th out of 56 of California counties (County Health Rankings 2012).

The Kern County Public Health Services Department has published a “Call to Action Plan”[3] in order to address the chronic disease rates and issues of overweight and obesity that have reached epidemic levels in Kern County with more than 60 percent of the teens and adult population being overweight or obese. Kern ranks highest in California for deaths from heart disease and second highest for diabetes deaths. The goal of the action plan is to improve the health of Kern County residents through a multi-faceted approach to the problem (Kern County 2012a).

In 2010 the “Kern County Community Health Needs Assessment” was released (www.healthykern.org; Healthy Kern 2010)). This report indicated that the high mortality rates in Kern County are caused, at least in part, by these factors: high suicide death rate, high heart disease death rate, and significant racial and ethnic disparities. The air quality in Kern County during 2006-2008 was rated “F” due to elevated ozone levels while the US standard is a “B” or better. Annual particulate levels in Kern County were also rated “F” during that same time period. The report also states that the quantity (in pounds) of carcinogenic substances released into the air in Kern County is increasing over time.

The American Lung Association (ALA 2012a) ranks Bakersfield-Delano, California as the third most polluted city in the nation for ozone and the first most polluted city in the nation for annual PM2.5 (year-round particle pollution) and first for 24-hour PM 2.5 (short-term particle pollution).

The ALA’s State of the Air 2012 website (ALA 2012b) gave Kern County an “F” grade for ozone, an “F” grade for 24-hour particle pollution and a “Fail” grade for annual particle pollution. In order to determine grades for counties, US EPA data for 2008-2010 at monitoring sites throughout the US was used. In the analysis, air quality is color-coded and reported as Orange (unhealthy for sensitive populations), Red (unhealthy) and Purple (very unhealthy). In the data from 2008-2010, Kern County was coded Orange for 209 days/year for ozone, Red for 48 days/year and Purple for 2 days/year. With regards to 24-hour particulate levels, Kern County was Orange for 126 days/year, Red for 21 days/year and Purple for 2 days/year.

4.0 Asthma

4.1 Asthma Mortality Data

California Breathing, a division of the Environmental Health Investigations Branch of the California Department of Public Health, reported asthma mortality statistics for 2008-2010 in county asthma profiles posted online (www.californiabreathing.org/asthma-data/county-

to NAAQS, they estimated the number of days that the air quality was poor for sensitive populations due to these contaminants.

[3] The Kern County Call to Action Plan is dated November 9, 2010. This plan is a multi-faceted approach to engage county and city governments, healthcare systems and providers, schools and before/after school providers, early childhood educators, community-based organizations, faith-based organizations and youth organizations, media outlets and the marketing industry in advancing strategies to prevent chronic disease.

asthma-profiles; California Breathing 2011). Age-adjusted asthma mortality rates are shown below:

	Age-adjusted asthma mortality rate (in deaths per million)	
Age	Kern County	State of California
0-17 years old	n/a	1.9
18+ years old	18.5	14.3
All ages	14.4	11.1

CDHS reported age-adjusted asthma deaths for counties in California based on 2000-2004 aggregate data from the Behavioral Risk Factor Surveillance System (BRFSS) and the California Health Interview Survey (CHIS). For all counties in California, the asthma death rate in 2000 to 2004 was 15.5 per million and 14.5 per million for Kern County (Milet 2007). An older report by CDHS reported age-adjusted asthma mortality rates in California for all ages, all ethnicities for 1990-1997. The rate in the state was 18.8 per million population and in Kern County it was 19.9 per million (Hernandez 2000).

Asthma mortality data can also be compared to the Healthy People 2020 target levels published by the Centers for Disease Control and Prevention and the National Institutes of Health. The Healthy People 2020 target for asthma deaths is 6.0 per million in ages 35-64 and 22.9 per million for ages 65 and older.

4.2 Asthma Prevalence

Asthma in Kern County is measured using results of California and county health surveys and other data sources. Health surveys report asthma prevalence and asthma hospitalization rates and emergency department visits, among many other parameters. Approximately 13.7 percent of adults and 13.3 percent of children in the State of California have been diagnosed with asthma at some point in their lives (Milet 2007). The 2009 California Health Interview Survey (CHIS) conducted by the University of California Los Angeles Center for Health Policy Research, reports that 15.6 percent of Kern County residents responded yes to whether they had ever been diagnosed with asthma compared to 13.7 percent of California residents.

Data on lifetime asthma prevalence in California residents were collected in the 2009 California Health Interview Survey (CHIS) and are available on-line at www.californiabreathing.org/asthma-data/county-asthma-profiles/kern-county-asthma-profile (California Breathing 2011). Pertinent data collected on lifetime asthma prevalence are summarized below:

Lifetime Asthma Prevalence by Age (2009):

	Kern County	California
Children (0-4 yrs)	n/a	7.7%
Children (ages 5-17)	n/a	16.2%
Adults (ages 18-64)	16.8%	13.8%
Adults (> 65 yrs)	16.0%	11.8%
All Ages	15.6%	13.7%

Active Asthma Prevalence by Age (2007):

	Kern County	California
Children (0-4 yrs)	n/a	6.3%
Children (ages 5-17)	16.1	10.2%
Adults (ages 18-64)	10.4%	7.8%
Adults (> 65 yrs)	14.6%	7.4%
All Ages	11.9%	8.1%

Liu (2010) reports that based on data obtained during the 2007 CHIS, the statewide prevalence of active asthma is 8.1 percent in adults and 10.4 percent in children. In Kern County the rates are 11.4 percent in adults and 14.8 percent in children. Milet (2007) reports lifetime asthma prevalence to be 12.4 percent for all counties in California compared to 14.5 percent for Kern County (based on 2001-2003 data reported by CHIS).

4.3 Asthma Hospitalization and Emergency Department Visit Data

4.3.1 Kern County and California

Asthma hospitalization data provide information on patients with asthma so severe that they are admitted to the hospital for treatment. These data do not provide information on asthma incidence in the population or on how many people visit private doctors, emergency rooms or outpatient clinics for asthma, or on the mortality rate of asthma.

The California Department of Public Health, Environmental Health Investigations Branch (EHIB 2012) provides an online health tracking program, the California Environmental Health Tracking Program (www.ehib.org). This program was used to enter an “Asthma Data Query” to evaluate the most recent data on asthma hospitalizations and emergency department visits for Kern County and the State of California.

Asthma Hospitalizations, all ages, age-adjusted per 10,000 (2009):

	Kern County	California
All ethnicities	10.66	9.42
African American/Black	32.75	29.65
Asian/PI	7.36	6.56
Hispanic/Latino	7.96	9.31
White	11.25	7.90

Emergency Department Visits due to Asthma, all ages, age-adjusted per 10,000 (2009):

	Kern County	California
All ethnicities	49.69	47.99
African American/Black	155.97	163.05
Asian/PI	16.52	18.68
Hispanic/Latino	38.42	44.53
White	47	40.36

Data on lifetime asthma hospitalizations and Emergency Department visits in Kern County and California residents, based on data collected by the California Office of Statewide Health Planning and Development (OSHPD) are available on-line at :www.californiabreathing.org/asthma-data/county-asthma-profiles/kern-county-asthma-profile (California Breathing 2011). Pertinent data are summarized below for hospitalization rates, emergency department visits and by race/ethnicity:

Asthma Hospitalization & Emergency Dept. Visit data for Kern County and California in 2010 (age-adjusted per 10,000 residents)[4]:

	Kern County	California
Asthma Hospitalization Rate		
0-17 yrs old	11.0	11.0
18+ years old	10.1	8.3
All ages	10.3	9.0
Emergency Dept. Visit Rate		
0-17 yrs old	78.4	72.6
18+ years old	38.0	36.9
All ages	48.4	46.1

Asthma Hospitalization & Emergency Dept. Visit data for Kern County and California in 2008 compared to Healthy People 2020 targets (age-adjusted rate per 10,000 residents):

	Kern County	California	HP 2020
Asthma Hospitalization Rate			
0-4 yrs old	16.4	22.0	18.1
5-64 years old	7.8	6.0	8.6
65+ years old	22.7	21.9	20.3
Emergency Dept. Visit Rate			
0-4 yrs old	93.7	102.5	95.5
5-64 years old	38.1	39.8	49.1
65+ years old	32.9	37.7	13.2

Age-adjusted asthma hospitalizations and emergency department visits by Race/Ethnicity (in 2010; per 10,000 Kern County residents):

	Hospitalizations	ED Visits
White	11.9	45.4
African-American	26.9	151.9
Hispanic	7.4	37.9
Asian/Pacific Islander	7.6	15.7

[4] Asthma hospitalization and ED visit data were obtained from the following sources:
Asthma Hospitalization and Emergency Department Visit for Kern & California in 2010) is OSHPD 2010
Asthma Hospitalization and Emergency Department Visit for Kern & California in 2008) is OSHPD 2008.

Data on preventable hospitalizations in California are reported by OSHPD for 1999-2008 (OSHPD 2010). Asthma hospitalizations for children ages 2-17 were 57.3/100,000 persons 2-17 years old in Kern County in 2008 compared to 77.6/100,000 in California for that year. In adults, the rates were 90.4/100,000 adults for Kern County compared to 82.5/100,000 in California.

Age-adjusted asthma hospitalization rates are reported by CDHS in the California County Chart Book for asthma hospitalization rates in California and Kern County for 1998 to 2000 (Stockman 2003). Age-adjusted asthma hospitalization rates by race/ethnicity for all ages and for children (ages 0-14) are presented below (annual rates per 10,000):

	Total	non-Hispanic White	African-American	Hispanic	Asian/Pacific Islander
All Ages:					
California	11.1	9.5	33.0	10.3	7.8
Kern County	8.7	10.6	21.6	5.3	n/a
Children (ages 0-14)					
California	18.1	14.9	57.6	14.9	9.7
Kern County	16.1	22.7	48.2	5.9	n/a

4.3.2 Kern County Zip Codes

Kern County health indicators are available at “Healthy Kern County,” a website that provides a single internet source for current health information. “Healthy Kern County” is a consortium of community, government and health organization partners[5] (Healthy Kern 2012). The website provides a “Community Dashboard” link where data on different diseases can be searched for by zip code.

Using the website www.zipmaps.net, the zip codes for the areas adjacent to the proposed HECA project site were identified and include:

- 93206 – Buttonwillow, north of the project site
- 93263 – Shafter, north of the project site
- 93268 – Taft, south of the project site
- 93301 – Bakersfield, east of the project site
- 93304 – Bakersfield, east of the project site
- 93305 – Bakersfield, east of the project site
- 93306 – Bakersfield, east of the project site
- 93311 – southeast of the project site
- 93312 – northeast of the project site

[5] Participants of “Healthy Kern County” include representatives from Bakersfield Memorial Hospital, Boys & Girls Club of Kern County, Delano Regional Medical, Greater Bakersfield Legal Assistance, Kaiser Permanente, Kern Community Foundation, Kern County Public Health Services Department, Kern Family Healthcare, Mercy Hospitals of Bakersfield, Pacific Health Education Center, Saint Francis Parish, San Joaquin Community Hospital and United Way of Kern County.

The Community Dashboard was queried in order to identify age-adjusted hospitalization and emergency department visit rates for asthma in the zip codes listed above, compared to rates given for the entire county, for the period of 2008-2010:

Age-adjusted Hospitalization Rate due to Asthma:

Zip Code	Adults (per 10,000 adults)	All ages (per 10,000 population)
Kern County	13.5	12.9
93206	n/a	n/a
93263	8.3	7.4
93268	13.9	12.1
93301	24.9	22.8
93304	19.2	17.6
93305	13.8	12.1
93309	10.8	10.3
93311	9.8	10.3
93312	11.2	10.9

Age-adjusted Emergency Room Visit Rate due to Asthma:

Zip Code	Adults (per 10,000 adults)	All ages (per 10,000 population)
Kern County	38.5	49.7
93206	30.5	38.3
93263	22.3	28.4
93268	16.7	21.8
93301	70.9	87.6
93304	57.2	70.3
93305	70.0	75.7
93309	35.0	46.7
93311	31.9	43.5
93312	22.9	29.0

The Environmental Health Investigations Branch of CDPH (EHIB 2012) was queried to obtain data on asthma hospitalizations and emergency department visits by selected zip codes, Kern County and California. The age-adjusted hospitalization rate due to asthma in 2009 for all ages was 9.42 per 10,000 population in California compared to 10.66 per 10,000 in Kern County. For emergency department visits due to asthma in 2009, the rate for California was 47.99 per 10,000 population and in Kern County it was 49.69 per 10,000. Data for selected zip codes in the vicinity of the proposed project are presented below:

Emergency Department Visit Rate due to Asthma per 10,000 (age-adjusted):

Zip Code	Children	Adults	All Ages
93263	40.8	16.35	22.66
93268	37.1	21.63	25.61
93301	144.25	97.03	109.2
93304	127.34	64.33	80.57
93305	102.76	71.02	79.2
93309	94.46	47.91	59.9

Emergency Department Visit Rate due to Asthma per 10,000 (age-adjusted) (continue)

Zip Code	Children	Adults	All Ages
93311	59.49	26.75	35.2
93312	43.7	25.72	30.35

A custom data request was made of California Breathing of the California Department of Public Health to obtain zip code-specific data on asthma hospitalizations and emergency department visits for selected Kern County zip codes (Milet 2012). Sufficient data was not available to compare asthma hospitalization rates in selected zip codes. Asthma emergency department visit rates in 2009, by age group and age-adjusted rates per 10,000 residents are presented below:

Asthma Emergency Department (ED) Visits, 2009, by Age Group, Age-Adjusted Rates per 10,000 Residents for Selected Kern County Zip Codes:

Zip Code	Age 0-4	Age 5-17	Age 0-17	Age 18-64	Age 65+
93263	n/a	46.7	40.8	18.1	n/a
93268	95.2	n/a	37.1	21.0	n/a
93280	54.3	37.4	41.9	30.9	n/a
93311	59.0	59.7	59.5	23.3	43.8
93314	106.1	26.4	57.8	10.3	n/a
All zip Codes Combined	63.7	40.3	46.6	20.9	32.4

4.4 Chronic Obstructive Pulmonary Disease (COPD)

Chronic Obstructive Pulmonary Disease or COPD is a group of lung diseases that includes emphysema and chronic bronchitis. COPDs are characterized by airflow obstruction in the lungs that interferes with normal breathing. 82 percent of deaths due to COPD are caused by cigarette smoking. According to the American Lung Association, COPD is the fourth leading cause of death in the United States with an age-adjusted death rate of 42.2 deaths per 100,000 population in 2001. COPD is the only lung disease with a higher age-adjusted death rate in Whites than in African-Americans (ALA 2004). The Healthy People 2020 target rate for COPD hospitalizations is 50.1 per 10,000 and 55.2 per 10,000 for COPD emergency department visits.

The California Office of Statewide Health Planning and Development reported data on preventable hospitalizations due to COPD in California (OSHPD 2010). In 2008, COPD hospitalizations for adults were 224.5 discharges per 100,000 adults in Kern County compared to 127.7 discharges per 100,000 adults in California.

The Community Dashboard was queried in order to identify age-adjusted hospitalization and emergency department visit rates for asthma in the zip codes listed above, compared to rates given for the entire county, for the period of 2008-2010 (Healthy Kern County 2012):

Age-adjusted COPD Hospitalizations and Emergency Department Visits by Zip Code (per 10,000):

Zip Code	Hospitalizations	ED Visits
Kern County	34.7	26.4
93263	26.3	14.4
93268	42.7	23.1
93301	58.5	59.8
93304	37.9	29.9
93305	31.7	31.5
93309	23.1	15.5
93311	21.6	11.0
93312	22.4	15.3

5.0 Valley Fever (Coccidioidomycosis)

Valley Fever is a fungal infection that is caused by *coccidioides immitis* organisms that are found in the soil of dry, low rainfall areas and is endemic to Kern County. Spores of the fungus can become airborne due to soil disruptions like farming, construction and wind, and can be carried by the wind for miles. If the spores are breathed into the lungs, they can cause Valley Fever. It is estimated that up to half of the people living in areas where Valley Fever is endemic have been infected. Filipinos, Hispanics, African-Americans, Native Americans and Asians are more susceptible to serious infection than whites, as are women in their third trimester of pregnancy, new mothers, people with weakened immune systems and the elderly (Mayo Clinic 2012).

Mild cases of Coccidioidomycosis, with symptoms appearing 1-3 weeks after exposure, present with flu-like symptoms of fever, chest pain and coughing and usually resolve on their own. In cases where these symptoms are more severe, the course of the disease varies and it may take months to fully recover, with the severity of the disease usually depending on the overall health of the exposed person. The initial infection may progress to a chronic pneumonia with symptoms of low-grade fever, weight loss, cough, chest pain and nodules in the lungs. In its most severe form, the infection spreads beyond the lungs to the skin, bones, liver, brain, heart, and membranes that protect the brain and spinal cord (meninges). The most severe and deadly complication is meningitis, an infection of the meninges (Mayo Clinic 2012).

Kern County experienced an epidemic of Valley Fever between 1991-1994 in which the highest annual incidences of Valley Fever that have been recorded since 1930 occurred in 1992 with 599.6 cases per 100,000 population and in 1993 with 435.8 cases per 100,000 population. Prior to the epidemic, the rate was 50.0 per 100,000 in 1990 and following the epidemic the rate fell to 61.2 per 100,000 in 1996 (Kern County 2012b).

The number of reported cases dramatically rose again in 2010 to 244.3 cases per 100,000 from a rate of 71.3 reported for 2009. 2011 has continued to show this trend with 322.2 cases per 100,000 reported (Kern County 2012b). For comparison, the 2010 rate reported for the State of California was 11.5 cases per 100,000 population (CDPH 2011).

In 2011 Kern County and Kings County were reported to have the highest coccidioidomycosis rate in California (Kern County 2012b). It appears that the higher trend for Kern County has continued in 2012, based on the number of cases reported by the Kern County Public Health Services Department (Kern County 2012b) for data collected between 2007-2012 for reporting months January – July:

# cases coccidioidomycosis	
2007	436
2008	514
2009	263
2010	550
2011	1253
2012	1136

Coccidioidomycosis rates have also been reported by city/area in Kern County with the following rates for the cities in the vicinity of the proposed project (Kern County 2012b). These data also show an increase in coccidioidomycosis cases in 2010-2011:

City/Area	2001-2008 Average	2010	2011
Bakersfield	165.2	262.5	347.2
Buttonwillow	211.9	319.3	403.1
Shafter	229.9	458.6	659.2
Taft	415.4	504.5	736.8
Wasco	259.0	526.7	699.0

6.0 Cancer

6.1 Cancer in the United States

Cancer is the second leading cause of death in the United States (following death due to heart disease), and is the cause of 1 of every 4 deaths in the nation (American Cancer Society, ACS 2012a). It has been estimated that in January 2008 there were 12 million Americans alive who were either cancer survivors or current cancer patients. The American Cancer Society estimates that nearly one-third of the 577,190 cancer deaths expected to occur in the United States in 2012 will be due to lifestyle factors related to nutrition, physical inactivity, and obesity and thus could be prevented (ACS 2012a).

The top three leading sites of new cancer cases and deaths for males are prostate, lung/bronchus and colon/rectum. For women the top three leading sites are breast, lung/bronchus and colon/rectum (ACS 2012a).

Incidence rates in the U.S. for all cancers in 2004-2008 were highest among African-American males (626 cases per 100,000 population compared to 545 per 100,000 for white males) and white females (421 cases per 100,000 population compared to 394 per 100,000 for African-American females; ACS 2012a). Incidence rates for cancers of the colon/rectum were highest for African-Americans (males and females) and for lung and prostate cancer in African-American males. White females had the highest breast cancer incidence rate (122 cases per 100,000 compared to 116 per 100,000 for African-American females; ACS 2012a).

Eheman (2012), in the "Annual Report to the Nation on the Status of Cancer, 1975-2008" reported incidence rates in the United States for all cancers and prostate cancer in males/breast cancer in females by sex and race/ethnicity for 2004-2008, per 100,000:

	Males		Females	
	All Cancers	Prostate Cancer	All Cancers	Breast Cancer
All Races	553	153	416	121
White	545	143	421	122
African-American	626	231	394	116
Asian/PI	332	79.7	284	84.9
AI/AN	428	101	362	89.2
Hispanic	423	127	333	92.3
Non-Hispanic	564	155	424	124

PI = Pacific Islander
AI/AN = American Indian/Alaska Native
White, black, API and AI/AN include Hispanic and non-Hispanic; the race and ethnicity categories are not mutually exclusive

The data presented above show that African-American males had the highest cancer incidence rates for all cancers and prostate cancer of all ethnic groups and white females had the highest rates for all cancers and breast cancer.

The American Cancer Society reported cancer mortality rates in the U.S. for 2004-2008. African-American males and females had the highest cancer mortality rates for cancers of all sites (295 per 100,000 for African-American males compared to 220 per 100,000 for white males and 178 per 100,000 for African-American females compared to 153 for white females). Mortality rates were highest for African-American males and females for cancers of the colon/rectum, for lung and prostate cancer in males, and breast cancer in females (ACS 2012a).

Cancer mortality rates were also reported in the "Annual Report to the Nation on the Status of Cancer, 1975-2008" (Eheman 2012). U.S. death rates for all cancers and lung cancer in males/lung and breast cancer in females by sex and race/ethnicity for 2004-2008 per 100,000 were:

	Males		Females		
	All Cancers	Lung Cancer	All Cancers	Lung Cancer	Breast Cancer
All Races	223	67.4	153	40.1	23.5
White	220	66.9	153	41.2	22.8
African-American	295	85.4	178	38.8	32.0
Asian/PI	135	36.7	94.1	18.5	12.2
AI/AN	190	50.5	138	33.9	17.2
Hispanic	149	32.0	102	14.3	15.1
Non-Hispanic	229	70.3	157	42.2	24.2

PI = Pacific Islander
AI/AN = American Indian/Alaska Native

Similar to cancer mortality trends reported by the American Cancer Society (2012a), African-American males had the highest cancer mortality rates for all cancers and lung cancer. African-American women also had the highest mortality rates for all cancers and breast cancer while white women and the highest mortality rate for lung cancer (Eheman 2012).

Trends in cancer mortality over time have shown decreases in rates for all cancers combined and for many of the leading cancers in men and women, as well as in nearly all racial and ethnic groups. Trends show that the incidence of some cancers is increasing, however, including several associated with overweight and obesity (Eheman 2012).

6.2 Cancer in California

Cancer is also the second leading cause of death in California, again, following heart attacks. In 2012 an estimated 144,800 Californians will be diagnosed with cancer and 55,415 people will die of the disease in 2013 (ACS 2012b). The overall cancer incidence rate in California is lower than the rate in the rest of the nation. From 1988-2007 the incidence of cancer in California declined 15 percent among men and 9 percent among women and the rate of cancer deaths declined by 24 percent among men and 19 percent among women (Hofer 2010, Morris 2010).

African American males in California have the highest overall cancer rate, followed by non-Hispanic white males. Non-Hispanic white females have the highest cancer incidence rate among women, although African American women are more likely to die of the disease (ACS 2012b).

ACS (2012b) reports the three leading cancer sites in males and females in California in terms of incidence for the period 2005-2009, by race/ethnicity:

Males:

Rank	Cancer Site	Race/Ethnicity
1st	Prostate	African America, American Indian, Chinese, Filipino, Hawaiian, Hispanic, Japanese, Pacific Islander, South Asian, non-Hispanic White
	Liver	Kampuchean, Laotian
	Lung	Vietnamese
	Colorectal	Korean
2nd	Lung	African American, American Indian, Kampuchean, Chinese, Filipino, Laotian, Pacific Islander, non-Hispanic White
	Colorectal	Hawaiian, Hispanic, Japanese, South Asian
	Liver	Vietnamese
	Prostate	Korean
3rd	Colorectal	African American, American Indian, Kampuchean, Chinese, Filipino, Laotian, Pacific Islander, non-Hispanic White
	Lung	Hawaiian, Hispanic, Japanese, South Asian
	Stomach	Korean
	Prostate	Vietnamese

Females:

Rank	Cancer Site	Race/Ethnicity
1st	Breast	All races/ethnicities
2nd	Lung	African American, American Indian, Hispanic White
	Colorectal	Kampuchean,Chinese, Filipino, Hawaiian, Hispanic, Japanese, Korean, Laotian, South Asian, Vietnamese
	Uterus	Pacific Islander
3rd	Colorectal	African American, American Indian, non-Hispanic White
	Lung	Kampuchean, Chinese, Filipino, Hawaiian, Hispanic, Japanese, Laotian, Pacific Islander, Vietnamese
	Stomach	Korean
	Uterus	South Asian

Cancer incidence and death rates in California are reported by the California Cancer Registry (CCR 2009) for 1988-2009. Rates are age-adjusted to the 2000 U.S. standard population:

Cancer incidence rates in California (per 100,000):

	Total	Male	Female
All sites	412.8	463.3	379.4
Breast	64.9	1.1	121.7
Colon & rectum	40.5	47.1	35.2
Lung & bronchus	47.8	55.7	42.2
Non-Hodgkin Lymphoma	18.1	21.9	15.1
Prostate		126.0	

Cancer death rates in California (per 100,000):

		Male	Female
All sites	158.3	189.4	137.4
Breast	12.2	0.2	22.2
Colon & rectum	14.5	17.6	12.2
Lung & bronchus	37.8	46.9	31.1
Non-Hodgkin Lymphoma	6.0	7.8	4.6
Prostate		22.4	

Cancer incidence and mortality rates by race/ethnicity and sex for California in 2009 are shown below, per 100,000 (CCR 2009):

All sites	Incidence		Mortality	
	Male	Female	Male	Female
All Races	463.3	379.4	189.4	137.4
Non-Hispanic white	502.2	422.5	202.9	146.8
African-American	541.9	405.4	281.7	186.0
Hispanic	362.8	298.8	152.2	118.1
Asian/PI	317.5	293.0	142.0	98.4

6.3 Cancer in the Kern County

Cancer incidence and mortality rates in Kern County are reported by the California Cancer Registry (CCR 2011), the California Department of Public Health (CDPH 2012) and the County of Kern Public Health Services Department (Kern County 2012c). CCR (2011) reports that the Kern County population in 2008 was comprised of 47 percent Hispanics, 42 percent non-Hispanic whites, 6 percent non-Hispanic blacks, 4 percent Asian/Pacific Islanders and 1 percent American Indian/Alaska Native.

Incidence rates and mortality rates for Kern County are compared to state rates for California's most common cancers for 2004-2008; rates are age-adjusted and expressed per 100,000 population (CCR 2011):

Males	Incidence rate		Mortality rate	
	Kern County	California	Kern County	California
All sites	495.0	494.5	224	194.2
Prostate	123.3	143.3	27.9	22.9
Lung & Bronchus	77.4	62.0	64.5	49.7
Colon & Rectum	54.7	50.3	19.9	18.1

Note: Kern County incidence rates for prostate and lung/bronchus cancers are statistically significantly different from the statewide rate. Mortality rates for lung & bronchus, prostate and all sites are statistically different.

Females	Incidence rate		Mortality rate	
	Kern County	California	Kern County	California
All sites	388.8	387.4	153.8	142.1
Breast	116.1	121.6	23.3	22.3
Lung & Bronchus	48.8	45.0	41	33.6
Colon & Rectum	36.8	38.1	13.4	13.1

Note: Kern County mortality rates for lung & bronchus and all sites are statistically different.

The County of Kern Public Health Services Department listed cancer incidence rates in Kern County for 2009 compared to California rates (Kern County 2012c). Age-adjusted rates are listed below:

Cancer incidence rates in Kern County and California (per 100,000):

	Male		Female	
	Kern County	California	Kern County	California
All Sites	470.1	483.94	331.1	390.91
Prostate	94.99	130.88	-	-
Breast (invasive)	-	-	113.8	123.17
Breast (non-invasive)	-	-	18.5	30.93
Lung & Bronchus	74.3	59.37	47.54	49.32
Color & Rectum	46.98	48.19	35.8	36.03
Non-Hodgkin Lymphoma	16.61	22.9	15.12	15.61

Age-adjusted death rates in Kern County are compared with values reported for California and Healthy People 2010 guidelines for the period of 2008-2010 (CDPH 2012):

Cancer death rates in Kern County and California (per 100,000):

	Kern County	California
All sites	167.9	151.7
Colorectal	14.2	14.1
Lung	45.1	36.1
Female Breast	21.8	20.7
Prostate	25.1	21.2

Cancer statistics in Kern County at the zip code level are not available on the Community Dashboard (Healthy Kern County 2012).

6.4 Childhood Cancer

6.4.1 United States

Childhood cancer does not encompass one single disease but rather represents a wide group of different malignancies that vary by histology, origin site, race, sex and age. The causes of cancer in children are unknown. Consistent findings have not been reported that link environmental exposures or parental occupations to childhood cancer. Only a few known conditions or agents have been determined to explain a small percentage of specific cancers in children (Down syndrome, ionizing radiation from accidents or radiation therapy, certain chemotherapeutic agents, AIDS, specific genetic syndromes; National Cancer Institute, NCI 2012).

Cancer is the leading cause of death by disease in children in the U.S; the major types of childhood cancers are leukemia and brain and other central nervous system tumors (NCI 2012). The American Cancer Society (ACS 2012c) estimates that about 12,600 new cases of childhood cancer will occur in the United States among children ages 0-14 in 2012, with an estimated 1,340 deaths. While the incidence of cancer in children has been rising slightly over the past 30 years, the mortality rate has decreased over 50 percent (NCI 2012, ACS 2012c).
The National Cancer Institute's SEER program (Surveillance, Epidemiology and End Results) has published detailed information on the incidence of childhood cancer in the United States (NCI 2009). The following age-adjusted cancer incidence and mortality rates, per 100,000 children, for all races for 2005-2009 were presented:

	Incidence		Mortality	
	Male	Female	Male	Female
All Sites	16.41	4.4	2.4	2.1
Brain & other nervous	3.4	3.1	0.7	0.7
Hodgkin Lymphoma	0.8	0.9	0.1	0.1
Leukemia	5.5	4.5	0.7	0.6

6.4.2 California

In California, the leading cause of death in children is accidents, with the second leading cause of death in children being cancer, with leukemia, central nervous system tumors and lymphomas being the most common types of cancer diagnosed in children and teenagers in California (CDPH no date). According to the American Cancer Society (2012b), more than 1,600 children and young adults under the age of 20 are diagnosed with cancer each year in California. White and Hispanic children in California have a higher incidence of cancer than children of other racial groups (NCI 2012).

Cancer incidence among children ages 0-14 in California in 2009 are given for race/ethnicity, per 100,000 age-adjusted (ACS 2012b):

	Cancer incidence rate
Non-Hispanic White	17.8
African American	13.5
Hispanic	17.6
Asian/PI	14.1

6.4.3 Kern County

The California Department of Health Services (CDHS 2002) reported that in 1975-1984, a cluster of childhood cancers was reported in Rosamond, Kern County. Eight cases of cancer occurred in children ages 0-15 in this city located in the southeastern region of the county, a rate reported to be several times higher than the rate determined for Los Angeles and San Francisco. None of the cancers were leukemia (the most common childhood cancer). Elevated rates were not found in the areas around Rosamond and the incidence of adult cancer was not elevated during the time frame of the childhood cancer cluster. The CDHS investigation did not identify a cause of the cancer cluster, and the rate of childhood cancer in Rosamond has since gone down.

CDHS also investigated a cluster of childhood cancers identified in 1984 in McFarland, Kern County in which a total of 13 cases were diagnosed by 1989, a rate that is 3-4 times what would be expected for a town the size of McFarland (Coye 1991). McFarland is located to the northeast of Bakersfield in a primarily agricultural setting. The cancer cluster was not associated with environmental contamination in the town.

Staff did not discover any current statistics on childhood cancer in Kern County.

7.0 Discussion

Kern County is ranked one of the lowest of the California counties for overall health outcomes. The city of Bakersfield in Kern County is the most polluted city in the nation for annual and 24-hour particulates in the air (PM2.5) and the third most polluted city for ozone.

The asthma mortality rate in Kern County is higher than the rate reported for the State of California. Likewise, asthma prevalence in Kern County is higher than the prevalence observed in the State of California.

Asthma hospitalization and emergency department visit rates in 2008 were reported to be lower in Kern County than in California but that trend was reversed by data reported for 2009 and 2010. Further, the 2008 data shows that the asthma hospitalization and emergency department visit rates for children and adults under age 64 are less than the target rates recommended by the Healthy People 2020 objectives. Kern County rates for the elderly, however, exceed the HP 2020 level for asthma hospitalizations by a slight margin and are more than double the HP 2020 level for asthma emergency department visits.

Within Kern County, the Bakersfield zip codes (93301, 93304, 93305) have higher hospitalizations and emergency department visit rates in adults and all ages compared to the rates reported for the county overall and for the other zip codes in the project vicinity.

Review of asthma hospitalization rates in Kern County by race/ethnicity shows that the hospitalization rate for African-Americans is 2.3 times greater than the rate for Whites and approximately 3.6 times greater than the rate for Hispanics. Similarly, the emergency department visit rate for African-Americans is 3.3 times greater than the rate for Whites and about 4.0 times greater than the rate for Hispanics.

COPD hospitalization rates in Kern County in 2008 were almost double the rate reported for California. Across the county, the highest rates were seen in Bakersfield zip codes.

Valley Fever or Coccidioidomycosis, a potentially serious infection caused by fungi endemic to Kern County soil, is exhibiting increased incidence in Kern County since 2010.

The incidence of adult cancer in Kern County is higher for some cancer sites and lower for others compared to the rates in the State of California. Cancer mortality rates of all cancer sites combined are higher in Kern County than in the State of California.

Cancer is the leading cause of death by disease in children in California and the United States, with the most common cancers being leukemia and brain and other central nervous system tumors. Within the past 30 years or so, the incidence of childhood cancer has been rising slightly while the mortality rate is declining. In the 1980s two childhood cancer clusters were identified in Kern County but nothing remarkable has been reported since.

8.0 Conclusions

This assessment has reviewed available information on the current status of respiratory disease and cancer in Kern County, California with particular attention to the region near the proposed Hydrogen Energy California project.

Studies reviewed have shown that Kern County is ranked one of the lowest counties in California for overall health outcomes, with Bakersfield being the most polluted city in the nation for particulates and the third most polluted city in the nation for ozone.

The mortality rate for asthmatics in Kern County is higher than the rate in the State of California. The city of Bakersfield was found to have the highest asthma hospitalization and emergency department visit rates of Kern County, with hospitalization of African American asthmatics 2.3 times higher than the rate of hospitalization of whites and 3.6 times greater than the hospitalization rate of Hispanics in Kern County. COPD in Kern County is double the rate in the State of California, with the highest incidence in the city of Bakersfield.

Valley Fever appears to be on the rise in Kern County.

The death rate due to cancer in Kern County adults is greater than the death rate in the State of California. In the 1980s two childhood cancer clusters were identified in Kern County but nothing remarkable has been reported since.

SOCIOECONOMICS

Lisa Worrall and Amanda Stennick

SUMMARY OF CONCLUSIONS

Energy Commission staff concludes that construction and operation of the Hydrogen Energy California (HECA) project, with the associated Enhanced Oil Recovery (EOR) component, described in the Amended Application for Certification (AFC), would not result in significant direct, indirect, or cumulative adverse socioeconomic impacts on project area housing, schools, law enforcement services, and parks. The project would therefore have no adverse socioeconomic impacts on an environmental justice population, though staff concludes that the minority population located within the buffer area does constitute an environmental justice population. The project would not induce substantial population growth, displacement of population, or demand for housing and public services. The project would result in substantial economic benefits, including employment opportunities and revenue to local governments. Staff is proposing condition of certification **SOCIO-1** to ensure to the extent possible that sales tax from the project would benefit Kern County.

INTRODUCTION

Staff's socioeconomic impact analysis evaluates the project-induced effects on existing population, employment patterns, housing, and community services (e.g. police protection, schools, and parks and recreation) that would result from construction and operation of the proposed project. Staff also reports estimates of the noteworthy public benefits likely to result from project implementation. Please refer to the **Waste Management**, **Worker Safety and Fire Protection**, and **Water Resources** sections of this document for analysis of impacts on utilities, fire protection, water supply, and wastewater disposal.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Socioeconomics Table 1 outlines the laws, ordinances, regulations, and standards (LORS) that are pertinent for socioeconomic analysis of the proposed projects.

SOCIOECONOMICS Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
State	
California Education Code, Section 17620	The governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement to fund the construction or reconstruction of school facilities.
California Government Code, §§ 65996-65997	Except for a fee, charge, dedication, or other requirement authorized under Section 17620 of the Education Code, state and local public agencies may not impose fees, charges, or other financial requirements to offset the cost for school facilities.

SETTING

The HECA project would be an Integrated Gasification Combined Cycle (IGCC) poligeneration power plant with an integrated manufacturing complex. The HECA power plant would supply carbon dioxide (CO_2), a byproduct of the gasification process, to Occidental of Elk Hills, Inc. (OEHI) for use in an associated enhanced oil recovery (EOR) operation. All project components are proposed for construction and operation in the unincorporated area of western Kern County, California. Activities taking place at the main project site would include power generation and chemical manufacturing. CO_2 generated at the project site would be transported via pipeline to a processing facility in the Elk Hills Oil Field (EHOF) for use in the EOR component.

The main HECA power plant site would be located approximately 2 miles to the northwest of the community of Tupman, 4 miles to the southeast of the community of Buttonwillow, and 7 miles from the western most boundary of the city of Bakersfield. The power plant and manufacturing complex would occupy a 453-acre parcel. Another 653 acres may be purchased adjacent to the project site to function as a controlled area (i.e. a buffer between the project elements and the surrounding land uses). The project site and controlled area are currently engaged in agricultural uses, as are the lands within one-quarter mile of the project linear facilities (i.e. pipelines carrying CO_2, natural gas, process and potable water, and the electrical transmission lines). Primary access to the power plant site would be from Adohr Road.

The EOR component of the proposed project would include construction of a carbon dioxide (CO_2) processing facility with 13 satellite sites, on roughly 136 acres, in the EHOF. The processing facility would occupy 102 acres, roughly 4 miles south of the HECA power plant site. EOR would take place at 309 CO_2 injection wells and 411 oil production wells. Of the 720 required wells, 570 are already established. If approved, 150 new wells would be installed during the 20-year construction phase. The EOR processing facility would be located roughly 3 miles to the northeast of the community of Tupman, and around 3 miles directly to the north of the communities of Dustin Acres and Valley Acres. Other communities located in proximity to the EHOF include Fellows, Ford City, Maricopa, McKittrick, Taft, Taft Heights, and South Taft. Primary access to the processing facility site would be from the SR 119 and North Access Road (Gate 2) entrance, the Tupman Road and North Access Road (Gate 1) entrance, the Elk Hills Road and Skyline Road (Gates 3 and 4) entrance, and the McKittrick (Gate 5) entrance.

To assess the potential socioeconomic impacts of the proposed project, staff defined a number of unique study areas. To evaluate impacts on environmental justice populations, staff estimated a buffer area around the main HECA project site and the CO_2 processing facility site. Staff created the buffer area by merging two distinct six-mile radii, estimated from the center point of each construction site (**Socioeconomics Figure 1**). For impacts on population, housing, and parks, staff defined a study area that includes all of Kern County. To estimate "local workforce" impacts during the project construction period, staff defined a study area equal to a two-hour commute from the project site. For "local workforce" during project operations, staff defined a study area equal to a one-hour commute from the project site. Staff assumed that a two-hour drive time was equal to 120-miles and a one-hour drive time was equal to 60-miles.

Geospatial analysis identified the cities of Arvin, Bakersfield, Corcoran, Delano, Maricopa, McFarland, Porterville, Shafter, Taft, Tehachapi, and Wasco, as well as 66 Census Designated Places (CDP's), within a 60-mile buffer of the main project site. The analysis identified an additional 105 cities and 248 CDPs within a 120-mile buffer of the project site. Staff used Kern County as the primary study area for the noteworthy benefits and cumulative impact portions of the analysis. The cumulative analysis considered projects located in Fresno, Inyo, Kern, Kings, Los Angeles, San Bernardino, and Tulare counties.

USING THE 2010 US CENSUS AND US CENSUS BUREAU'S AMERICAN COMMUNITY SURVEY IN STAFF ASSESSMENTS

The decennial census is a complete 100 percent count, collected once every 10 years, and represents information from a single reference point (April 1). The main function of the decennial census is to provide counts of people for the purpose of congressional apportionment and legislative redistricting. Where the decennial census historically collected detailed information on American populations, including demographics, economics, and housing characteristics, much of this information was not collected for the 2010 Census (US Census 2008). Rather, the Bureau collects detailed descriptive information through the U.S. Census Bureau's American Community Survey (ACS). ACS estimates represent a sample of the population based on information compiled continually and aggregated into one, three, and five-year estimates ("period estimates") released every year. The primary purpose of the ACS is to measure the changing demographic, social, and economic characteristics of the U.S. population. As a result, the ACS does not provide official counts of the population in between censuses. Instead, the Census Bureau's Population Estimates Program will continue to be the official source for annual population totals by age, sex, race, and Hispanic origin.

ACS collects data at a variety of Census defined geographic levels. These range from the nation (largest geographic level) to the block group (smallest geographic level).[1] Census Bureau staff recommends the use of data no smaller than the Census tract level.[2,3] Five-year estimates are used for the following analysis as they provide the greatest detail for the smallest available geographic area. Because ACS estimates come from a sample population, a certain level of variability is expected. This variability is expressed as a margin of error (MOE), which is used to calculate a coefficient of

[1] Census Block Group - A statistical subdivision of a census tract. A block group consists of all tabulation blocks whose numbers begin with the same digit in a census tract; for example for Census 2000, BG 3 within a census tract includes all blocks numbered between 3000 and 3999. The block group is the lowest-level geographic entity for which the Census Bureau tabulates sample data. http://www.census.gov/dmd/www/glossary.html.

[2] Census Tract - A small, relatively permanent statistical subdivision of a county or statistically equivalent entity, delineated for data presentation purposes by a local group of census data users or the geographic staff of a regional census center in accordance with Census Bureau guidelines. Designed to be relatively homogeneous with respect to population, economic status, and living conditions at the time they were established. Census tracts generally contain between 1,000 and 8,000 people, with an optimum size of 4,000 people. Census tract definitions are intended to be stable over time and are considered relatively stable geographic divisions. http://www.census.gov/dmd/www/glossary.html.

[3] Census Workshop: Using the American Community Survey (ACS) and The New American Factfinder (AFF) hosted by Sacramento Area Council of Governments on May 11 & 12, 2011. Workshop presented by Barbara Ferry, U.S. Census Partnership Data Services Specialist.

variation (CV). CVs are a standardized indicator of the reliability of an estimate. While not a set rule, the U.S. Census Bureau considers the use of estimates with a CV of more than 15 percent cause for caution when interpreting the data (US Census 2009). When the CV exceeds acceptable parameters, aggregation can often improve reliability.

PROJECT-SPECIFIC DEMOGRAPHIC SCREENING

Staff's demographic screening method was designed to identify the existence of a minority or below-poverty-level population, or both, within a minimum of 6-miles of the proposed project site. It was designed using guidance from the Council on Environmental Quality (1997) and the US Environmental Protection Agency (1998). Due to changes in the data collection methods utilized by the U.S. Census Bureau, the screening process relies on 2010 Decennial Census data to determine the minority population and five-year estimates from the ACS to calculate the population below-poverty-level. Staff determined that ACS estimates at the census tract level when aggregated, were the most appropriate for use in this analysis, because they were the smallest geographic division that yielded CV values equal to, or less than, the 15 percent reliability threshold.

Minority Populations

According to *Environmental Justice: Guidance Under the National Environmental Policy Act*, minority individuals are defined as members of the following groups: American Indian or Alaskan Native; Asian or Pacific Islander; African-American; or Hispanic. An environmental justice population exists when the minority population of the potentially affected area is greater than 50 percent, or when the minority population percentage is meaningfully greater than the minority population percentage in the general population or in some other appropriate unit of geographic analysis.

Socioeconomics Figure 1 illustrates the geographic distribution of the minority population by census block, as a percentage of the total population, in the project area. To assess the potential presence of an environmental justice population in the project area, staff first estimated two radii encompassing areas equal to 6-miles from the center points of the HECA power plant site and the CO_2 processing facility site, respectively. Staff then merged the two radii to create a combined buffer area. **Socioeconomics Table 2** presents data on the minority population within the buffer area, as well as for a variety of surrounding communities and for an assortment of comparison geographies.

According to the Decennial Census, the 2010 resident population of the census blocks located within the buffer area was 3,663 persons. The minority population was 1,850 persons, which equaled roughly 51 percent of the total population. Notable population centers located within the buffer area include Buttonwillow, Dustin Acres, Tupman, and Valley Acres. Buttonwillow had a total population of 1,508 and a minority population of 1,254, equal to nearly 83 percent minority. Dustin Acres had a total population of 652, with a minority population of 159, or around 24 percent. Tupman had a smaller population with 161 residents, and a minority population of 22 residents, equal to around 14 percent. Valley Acres had a total population of 527, with a minority population of 148, or around 28 percent.

Socioeconomics Table 2
Minority Population of Communities in the Project Area

Area[1]	Total:	White alone	Minority	Percent Minority
Buffer Area **(Socioeconomics Figure 1)**	3,663	1,813	1,850	**50.6**
Buttonwillow	1,508	254	1,254	**83.2**
Dustin Acres CDP	652	493	159	24.4
Tupman CDP	161	139	22	13.7
Valley Acres CDP	527	379	148	28.1
Bakersfield	347,483	131,311	216,172	**62.2**
Derby Acres CDP	322	279	43	13.4
Fellows CDP	106	88	18	17.0
Ford City CDP	4,278	2,140	2,138	**50.0**
Maricopa	1,154	854	300	26.0
McKittrick CDP	115	99	16	13.9
South Taft CDP	2,169	1,139	1,030	47.5
Taft	9,327	5,221	4,106	44.0
Taft Heights CDP	1,949	1,439	510	26.2
Wasco	25,545	3,689	21,856	**85.6**
Kern County	839,631	323,794	515,837	**61.4**
Buttonwillow CCD	3,953	1,326	2,627	**66.5**
West Kern CCD	30,229	19,373	10,856	35.9

Notes: Bold text- minority population 50 percent or greater. [1]CDP- Census Designated Place and CCD - Census County Division.
Source: US Census 2010a.

Other notable communities located in the general project area include Bakersfield, Derby Acres, Fellows, Ford City, Maricopa, McKittrick, South Taft, Taft, Taft Heights, and Wasco. Of these, Bakersfield had a 62 percent minority population, while Ford City was 50 percent minority and Wasco was nearly 86 percent minority. Kern County as a whole showed a minority population equal to more than 61 percent of the total population. The HECA project site and the CO_2 processing site are located within two different Census County Divisions (CCDs). The Buttonwillow CCD had a minority population of nearly 67 percent, while the West Kern CCD had a minority population of only around 36 percent. **Socioeconomics Table 2** provides additional data for these geographies for comparison purposes.

Because the minority population located within buffer area was greater than 50 percent of the total population, staff concludes that the minority population located within the buffer area does constitute an environmental justice population, as defined above. Construction and operation of the proposed HECA project, including the associated EOR operation, could therefore have adverse or disproportionate impacts on an environmental justice population. Please refer to each technical section to identify whether the project has significant, unmitigated impacts on the above identified environmental justice population.

Below-Poverty-Level-Populations

Socioeconomics Table 3 shows estimates of the population living below-poverty-level from the 2007-2011 ACS Five-Year Estimates.[4,5] According to this data, approximately 1,390 people in the combined census tracts intersecting the project buffer area, about 21 percent, lived below the federal poverty threshold between 2007 and 2011 (US Census 2011a, US Census 2013) . The combined Census County Divisions (CCD's) intersecting the project buffer (Buttonwillow CCD and West Kern CCD) and Kern County's poverty data are provided in the table for comparison purposes.

Socioeconomics Table 3
Poverty Data within the Project Area

Area	Total			Income in the past 12 months below poverty level			Percent below poverty level		
	Estimate[1]	MOE	CV	Estimate	MOE	CV	Estimate	MOE	CV
Census Tracts Used to Determine Poverty Status[2]- Total	6,276	±460	4.46	1,390	±346	15.13	22.15	±5.73	15.78
Project Buffer CCD's[3]	30,484	±1,416	2.82	5,454	±910	10.14	17.89	±3.10	10.53

Additional Environmental Justice Population Considerations

Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses (US EPA 1998) also encourages outreach to community-based organizations and tribal governments early in the screening process to identify the presence of distinct minority communities residing within, or in close proximity to, the proposed project site. It also encourages identification of minority groups that utilize or are dependent upon natural and cultural resources that may be affected by the proposed action. For information regarding the Energy Commission's outreach program and consultations with local Native American communities, see the **Executive Summary, Introduction,** and **Cultural Resources** sections of this document.

[4] When projects are proposed in remote locations, the population within a 6-mile radius of the project site is often quite small. The resulting sample size collected for the ACS can be too small to yield estimates with a reasonable CV. For this analysis, staff determined that data for the combined Census tracts that intersect the project buffer (tract 33.04 and 37.00) were the most appropriate, as they were the smallest geographic area with reasonable CV. Please note that the data reported by the ACS are period estimates, meaning the numbers represent the average characteristics attributable to the local population over a specified time period.

[5] According to the 2011 Poverty Thresholds published by the US Census Bureau, the poverty threshold for a single person household who is under 65 years of age is $11,702. The threshold for a family of four with two dependent children was $22,811 (UC Census 2013).

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

METHOD AND THRESHOLD FOR DETERMINING SIGNIFICANCE

As discussed in the Introduction section of the PSA, this document analyzes the project's impacts pursuant to both the National Environmental Policy Act (NEPA) and CEQA. The two statutes are similar in their requirements concerning analysis of a project's impacts. Therefore, unless otherwise noted, staff's reference to and use of CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

CEQA defines a significant effect on the environment as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project" (CEQA Guidelines Section 15382). Thresholds of significance serve as the benchmark for determining if a project would result in a significant adverse impact when evaluated against existing conditions (e.g., "baseline" conditions). CEQA Guidelines do not provide specific, quantifiable thresholds of significance for socioeconomic impact determinations. CEQA Guideline Section 15064(e) specifies that: "[e]conomic and social changes resulting from the project shall not be treated as significant effects on the environment." However, Section 15064(e) continues by stating that when "a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, the economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect."

According to Appendix G of the State CEQA Guidelines, a project may have a significant effect on population, housing, and public services if it would:

- Induce substantial population growth in an area, either directly or indirectly;
- Displace substantial numbers of people and/or existing housing, necessitating the construction of replacement housing elsewhere; or
- Adversely impact acceptable levels of service for police protection, schools, parks and recreation, and hospitals and emergency medical response.

Staff's assessment of the significance of impacts on population, housing, police protection, schools, and parks and recreation are based on professional judgments, input from local and state agencies, and the industry-accepted two-hour commute range for construction workers and one-hour commute range for operations workers. Impacts on fire safety and emergency medical services are assessed in the **Worker Safety and Fire Protection** section of this document.

DIRECT/INDIRECT IMPACTS AND MITIGATION

Induce Substantial Population Growth

To determine whether the project would directly or indirectly induce substantial population growth, first staff analyzed the historic and projected population growth trends in the project area. Staff then evaluated whether the labor force in the surrounding region would be sufficient to meet the needs of the HECA project, including associated actions, and whether workers would need to relocate, either permanently or temporarily, to the project area. In those cases where workers would likely relocate, staff assessed whether the scope of this relocation would be sufficient to induce the construction of new housing and government facilities, or expansion of existing facilities.

Historic and Projected Population Growth

To assess long-term population growth trends in the project area, staff collected data from the U.S. Census Bureau and the California Department of Finance (DOF). **Socioeconomics Table 4** reports historic and projected population data for communities located in proximity to the project. According to this data, the population within the buffer area increased by 31 percent, from 2,789 residents in the year 2000 to 3,663 residents in 2010. The community of Buttonwillow grew by 176 persons, around 19 percent. Dustin Acres grew by 67 persons, around 11 percent. The community of Tupman lost 66 persons, or 29 percent of its total population, and Valley Acres grew by 15 persons, around 3 percent, during the same period.

Outside of the buffer area, the city of Bakersfield grew by 100,426 persons, or 41 percent. The city of Wasco grew by 4,282 persons, or 20 percent. The McKittrick CDP lost roughly 45 persons, or 28 percent of its 2000 population. The city of Taft grew by 2,927 persons, or 46 percent. Considered along with adjacent communities, the Taft urban area grew by 4,048 persons, or around 30 percent. The two CCDs of Buttonwillow and West Kern, grew by 915 persons and 2,847 persons respectively. This was equal to around 30 percent growth in the Buttonwillow CCD and 10 percent growth in the West Kern CCD. Note that these geographies include both the HECA project site and the EOR processing facility site, as well as a variety of established communities located throughout western Kern County. For this reason, population estimates reported for the Buttonwillow CCD differ significantly from the reported for the Buttonwillow CDP. Kern County reportedly grew by 177,986 persons, or 27 percent, during this period. Population projections from the California Department of Finance (DOF) indicate that the county may expect to grow by another 983,646 persons to total population of 1,823,277 persons by 2050. This would equal around 117 percent population growth over 40 years, which is equal to a compound annual average growth rate of 2 percent.

Project Labor Requirements, Workforce Availability, and Growth Inducement

Due to the complexities associated with analysis of the proposed project (such as the diverse workforce requirements of the different project components), staff assessed labor requirements, workforce availability and potential population growth inducement of the two main project components independently. Staff then combined the results of the analyses to identify potential impacts from the whole of the project.

Socioeconomics Table 4
Historical and Projected Population Growth Trends in the Project Area

Area[1]	2000	2010	Percent Change 2000-2010	2020	2030	2040	2050	Percent Change 2010-2050

Labor Requirements for Construction of the HECA Component

The AFC states that construction of the HECA power plant and manufacturing complex component (from site preparation and grading to commercial operation) would take approximately 49 months. Based on the Commission's current schedule, publication of the Final Staff Assessment (FSA) should occur in July of 2013 (CEC 2013a). The Commission would likely make a decision in the four to five months following publication. If approved, pre-construction of the proposed project could begin as early as November of 2013 (HECA 2012a). This represents a delay of approximately five months from the original commencement date of June 2013. As such, Truck deliveries and ground disturbance would likely begin in January of 2014 and would conclude around July of 2017. Pre-commissioning and commissioning would begin in August of 2016 and commercial operation would begin in February of 2018. As shown in Table 5.9-11 of the AFC, the number of workers required for construction of this component would range from a low of 34 during pre-construction to a high of 2,461 at peak construction in the thirty-first month. The average number of on-site workers during the 49-month construction period would be around 1,160 (including construction workers and contractor staff), which is equal to roughly 4,700 job-years.[6] These estimates include both construction craft workers and other construction staff. Craft workers would make up the majority of the workforce throughout the construction period. The craft workforce would encompass a variety of occupations ranging from boilermakers and carpenters to pipefitters, sheet metal workers, and teamsters. The number of craft workers required during construction would range from a low of 16 workers during pre-construction to a high of 2,090 at peak construction. Construction would require an average of around 930 on-site craft workers throughout the 49-month construction period. This would be the equivalent of roughly 3,800 job-years. Construction staff would make up a smaller portion of the construction workforce and would include management, engineering, document control occupations, as well as assorted subcontractor's staff, commissioning staff, and some administrative and operating staff. The number of construction staff would range from a low of 18 during pre-construction to a high of over 417 during month-32. There would be an average of 230 staff on site during construction, equal to roughly 900 job years. Note that in month-32 the number of construction staff would begin to decline, corresponding to an increase in the number of commissioning and operating staff.

Workforce Availability for Construction of the HECA Component

The applicant anticipates that 60 percent of the construction workforce for the power plant component would come from within Kern County, with the remainder coming from Los Angeles County. According to a representative of the Building Trades Council (BTC) for Kern, Inyo, and Mono counties, the project contractor has signed a Project Labor Agreement (PLA) with local BTC affiliates (CEC 2012a). Due to the structure and hiring hall procedures of the participating unions, the BTC expects that between 65 and 75 percent of the construction workforce would come from Kern County. The remainder

[6] One job-year is the equivalent of one full-time job held for a period of one year. For example, this could equal one full-time job held for 12 months, two full-time jobs held for six months, three full-time jobs held for four months, or two half-time jobs held for one-year, and so on.

would primarily come from the area around Lancaster and Palmdale in Los Angeles County. Additional workers would also come from Fresno County, as some of the participating local unions have existing offices there. The representative from the BTC noted existing high unemployment among Kern County construction workers and emphasized that many have needed to travel outside of Kern County to find work over the past few years. Construction of the HECA component would represent a substantial increase in the availability of local employment and the existence of a PLA helps to ensure that local workers would benefit to the greatest extent possible.

Socioeconomics Table 5 provides occupational employment estimates published by the California Employment Development Department (EDD) for Kern County. The occupations listed roughly correspond to those reported under construction craft employment in Table 5.8-11 of the AFC (HECA 2012a) and Table A25-1 of the applicant's Responses to CEC Workshop Requests – Nos. A1 through A32 (HECA 2012b). Although data were not available for all occupational categories, staff confirmed that the existing labor force in Kern County would be sufficient to accommodate most of the craft labor requirements of the HECA component. The occupational categories most likely to experience a shortfall of local craft workers during peak demand include reinforcing iron and rebar workers, as well as plumbers and pipefitters. Data were unavailable for two of the 14 occupational employment categories due to data suppression.[7] These include boilermakers and insulation workers. Since suppressed data are often an indicator of low levels of employment, workers in these occupations would likely be in short supply. For carpenters and millwrights, peak labor demand during project construction would equal 30 to 40 percent of the local workforce in each category. This could result in shortages during peak construction, if there is competition from other projects. Local labor unions can respond to craft labor shortages in a number of ways. These include outreach to unemployed residents, enrollment of new apprentices into craft training programs, and the recruitment of workers from outside the local area.

The employment estimates for construction staff reported in Table 5.8-11 of the AFC lack the specificity required to match project labor requirements with occupational employment estimates (HECA 2012a). At the data response workshop held on September 27, 2012, staff requested clarification regarding the types of occupations associated with construction staff employment. The applicant, in their response to the workshop data requests, provided clarification of the occupations associated with construction staff (HECA 2012b). Although the clarification was solely qualitative and did not facilitate quantitative comparison, staff confirmed that the existing labor force in Kern County would be sufficient to accommodate most of the staff labor requirements of the HECA project. This is because the project would require a relatively small number of construction staff in any given occupational category. For example, the project would require only six staff in document control, six in off-plot construction, 15 in engineering, and 40 in commissioning. Each of these employment categories would include workers from an assortment of occupations. For example, engineering staff would include

[7] Data are suppressed for a variety of reasons, including failure to meet Bureau of Labor Statistics (BLS) quality standards, or the need to protect the confidentiality of survey respondents. The BLS is unable to provide the specifics on why an estimate was not released.

mechanical engineers, civil engineers, structural engineers, electrical engineers, instrument and control engineers, quality engineers, and surveyors. Construction staff employment would thus require a very small number of workers within each occupational category. This would increase the likelihood that the project could find qualified workers within the local area and would decrease the need to recruit workers from outside of Kern County.

Growth Inducing Impacts from Construction of the HECA Component

Based on the construction labor requirements reported in the AFC and estimates of labor availability from the BTC and EDD, staff determined that the HECA component of the project would likely achieve a 60 to 75 percent local workforce. With peak construction labor demand estimated at nearly 2,500 workers, staff estimated that between 600 and 1,000 workers would need to relocate, temporarily or permanently, to the project area to participate in construction activities. Note that temporary relocation may entail commuting to the project area on a daily or weekly basis. While daily commuters would have little to no impact on residential housing and services, this analysis assumes a worst-case scenario in which all non-local workers would relocate permanently or would commute on a weekly basis, thus affecting residential housing availability and municipal service provision.

To evaluate the relative ability of the surrounding communities to absorb this influx of population, staff developed a gravity model for migration, similar to that used by the applicant. The model does not provide a precise forecast. Rather it offers a general indication of the attractiveness of different communities and helps quantify worker relocation preferences. Gravity models rely on the assumption that the propensity to relocate to a given location is directly proportional to population size and inversely proportional to the square of the distance from the project site. Population size is a proxy for the relative utility or desirability of a given location, as defined by the quality and variety of community amenities. Staff used the inverse of the squared driving distance because the relative attractiveness of a location typically diminishes with distance from one's place of work. The results of the gravity model suggest that of those workers that would relocate to the project area, over 50 percent would prefer to relocate to the city of Bakersfield. The remainder would prefer to locate in more than 30 other cities, towns, and CDPs located throughout Kern County. Around 8 percent of the non-local workforce, for example, would prefer to locate in the Rosedale CDP, while roughly 5 percent would prefer the communities of Oildale, Wasco, or Shafter. Despite the close proximity of the communities of Buttonwillow or Tupman to the project site, only 2 percent of the non-local workforce would likely seek to live in either community. Staff presumes this would be due to their relatively small size and lack of amenities, compared to the nearby city of Bakersfield.

To estimate the total population change that could occur due to construction, staff multiplied the estimated number of workers who would relocate to each community by the average household size for Kern County from the 2010 Census of 3.15. Based on these estimates and a total non-local workforce equal to 40 percent of labor demand, a maximum of around 500 workers and their families could relocate to the city of Bakersfield. This would equal around 1,650 people and a 0.5 percent increase in the population. The Rosedale CDP could also experience a sizable increase in population of around 75 workers and 230 people, equal to a 1.7 percent increase in the population. Other notable population impacts could occur in the communities of Buttonwillow and Tupman. Due to its proximity to the project site, Buttonwillow could experience an increase in population of around 70 people, including 20 project construction workers. This would equal an increase in the existing population of more than 4.5 percent. Likewise, the community of Tupman could experience an increase of nearly 55 people, including almost 20 project construction workers, for a total increase of over 30 percent.

Labor Requirements for Construction of the OEHI/EOR Component

The supplemental environmental analysis provided in Appendix A of the AFC states that construction of the OEHI EOR operation is scheduled to take place incrementally over a 20-year implementation schedule. Pending certification of the HECA power plant, construction associated with the EOR component would begin in 2014 and would continue through 2033. Table 3-4 of Appendix A reports that the number of workers required for the project would range from a low of seven to a high of 385. The number of workers would fluctuate substantially from year to year. Years with the highest average workers per day are those that include construction activities related to the CO_2 processing facility, as well as the satellite stations and pipelines. Throughout the 20-year construction period, the applicant anticipates ongoing installation and conversion of new and existing well sites.

Page 3.0-13 of Appendix A describes that OEHI currently employs around 345 workers and 2,650 contract personnel in the EHOF. The applicant anticipates that 75 percent of the labor required for the well and pipeline installations can be accommodated using the existing employed workforce. They also estimate that 25 percent of the labor required for construction of the processing facility and satellite stations would come from the existing employed workforce. The construction labor requirements reported in Appendix A do not differentiate between the number of workers required for construction of the processing facility and satellite stations, compared to the number required for well installation and conversion. Because of this, staff requested that the applicant provide a breakdown of the personnel required for installation of the various facilities (CEC 2013b). As illustrated in **Socioeconomics Table 6**, the EOR component could require up to 218 workers, in addition to those already employed or contracted in the EHOF, for construction of the main CO_2 processing plant and satellite facilities. Up to 50 new workers would also be required to accommodate pipeline construction and well installations. Combined, this could equal up to around 240 new workers. As noted earlier, the number of workers would fluctuate substantially from year-to-year.

Socioeconomics Table 6

Local Workforce Availability for Construction of the OEHI/EOR Component

As noted earlier, the applicant anticipates that 75 percent of the workforce required for construction of new wells and pipelines would come from the existing OEHI workforce, including contract personnel. An additional 25 percent of the workforce required for construction of the processing facility and satellite stations would come from these

Socioeconomics Table 7

Source: CEC 2013b.

sources. Based on these estimates of labor force utilization, construction of the EOR facilities would require up to 240 additional workers, beyond those already employed or contracted with OEHI. According to data published by the California Employment Development Department (EDD), there were roughly 14,850 workers employed in Kern County in the construction and extraction trades as of May 2010. The maximum number of workers that OEHI would need to hire to meet their projected labor requirements would equal only about 2 percent of this total (CA EDD 2011).

Socioeconomics Table 7 reports the average number of workers, per day, per year, that would be required in the 10 major occupational categories used by the project. During peak construction in 2015, the project would require up to 23 carpenters, 69 equipment operators, 69 welders, 47 pipefitters, 69 mechanical workers, 77 electrical workers (including 46 electricians, 23 electrical technicians, and eight other electrical workers), and 31 other construction workers. **Socioeconomics Table 8** provides occupational employment estimates published by EDD for Kern County. The occupations listed roughly correspond to those reported in Table 7 above. Based on this data, staff confirmed that the existing labor force in Kern County would be sufficient to accommodate the craft labor requirements of the OEHI/EOR project component.

Source: CA EDD 2001, CA EDD 2011, HECA 2012c.

In the event that trained workers were not available within the local area, one option would be for the project to hire existing unemployed residents. As of November 2012, Kern County had a total unemployed population of 47,400 residents, equal to around 12.4 percent of the total labor force (CA EDD 2012). The maximum number of workers that OEHI would need to hire would equal only 0.5 percent of the existing unemployed population. As was described for the HECA project, employers can respond to labor shortages in a number of ways. These include outreach to unemployed residents, enrollment of new apprentices into craft training programs, and the recruitment of workers from outside the local area.

Growth Inducing Impacts from Construction of the OEHI/EOR Component

Based on the construction labor requirements discussed above, staff determined that construction of the OEHI/EOR component could temporarily require up to 240 workers, beyond those currently employed or contracted with OEHI. Given the large number of existing Kern County workers employed in the construction and extraction trades, as well as the high unemployment currently present in Kern County, staff believes that the OEHI would be able to satisfy the additional labor requirements through the recruitment of existing Kern County residents. To the degree that some workers would need to relocate into the project area from outside of Kern County, staff anticipates that most would do so on a temporary basis. This is because the number of workers required for construction of the EOR facilities would fluctuate substantially from year-to-year, providing little incentive for workers to relocate permanently to the project area.
The temporary relocation or workers would entail commuting to the project area on a daily or weekly basis. While daily commuters would have little to no impact on residential housing and services, this analysis assumes a worst-case scenario in which all non-local workers employed in construction of EOR facilities would commute on a weekly basis, thus affecting housing availability and public service provision.

To evaluate the relative ability of the surrounding communities to absorb this influx of population, staff utilized a gravity model for migration, comparable to that used for analysis of the HECA component. The results of the gravity model suggest that of those workers that would temporarily relocate to the project area during the construction period, around 59 percent would prefer housing in the city of Bakersfield. This could equal more than 140 workers, resulting in a temporary 0.04 percent increase in the city's population. The remainder would prefer to locate in some 25 other cities, towns, and CDPs located throughout western Kern County. More than 4 percent of the workforce, for example, would prefer to locate in the greater Taft area, including the city of Taft, Taft Heights, South Taft, and Ford City. This could equal more than 20 workers, resulting in a temporary increase in the population of about 0.13 percent. Roughly 4 percent would prefer to locate in Rosedale and Oildale. Meaning that up to 10 workers could seek housing in Rosedale, while another nine could seek residence in Oildale. This would translate into temporary population increases of 0.07 and 0.03 percent, respectively. Despite the close proximity of the community of Tupman to the EHOF, only a little over 1 percent of the temporary workforce would be expected to look for housing there. This would equal a maximum of only three workers, resulting in a population increase of less than 2 percent.

Growth Inducing Impacts from Construction of the Whole of the Project

To ascertain whether construction of the whole of the project, including both the HECA power plant and the EOR components, would result in substantial induced population growth, staff combined the results of the two gravity models described above. The combined results suggest that of those workers that would temporarily relocate to the project area during the initial construction period (i.e. the period during which the two construction schedules would overlap), around 54 percent would prefer housing in the city of Bakersfield. This could equal more than 650 workers, resulting in a temporary increase in the city's population of up to 0.6 percent, if workers are assumed to relocate with their families. The remaining workers would likely prefer to locate in around 40 other cities, towns, and CDPs throughout western Kern County. Most notably, the model indicates that around 20 workers might prefer to temporarily locate in Tupman, resulting in an increase in the resident population of up 12 percent. If those workers were to relocate with their families (which is unlikely for workers hired to construct the EOR facilities), this could result in the introduction of more than 60 people, or around 39 percent of the 2010 resident population. Another 24 workers could seek residence in Buttonwillow, resulting in a population increase of around 1.6 percent. If these workers were to relocate along with their families, this could represent closer to five percent population growth. Around 10 workers could relocate to Dustin Acres CDP, increasing the population by between 1.5 and 4.5 percent. Valley Acres, by comparison, might see around five construction workers, increasing the population by around one to three percent. Another 75 construction workers could relocate to the greater Taft area – including Ford City, Taft, Taft Heights, and South Taft – increasing the population by between two and five percent.

Labor Requirements for Operation of the HECA Component

Table 5.8-11 of the AFC indicates that hiring for operation of the HECA power plant and manufacturing component would begin in month 32 of project construction and would conclude around 18 months later on commencement of commercial operations in February of 2018 (HECA 2012a). The project would require an annual average of 200 full-time permanent employees. Page 5.8-16 of the AFC states that the operations workforce would include 88 operating technicians working in four teams of 22 workers on 12-hour shifts. Operating staff would also include 65 contract maintenance workers, nine administrative support staff , nine material coordination and procurement staff, eight health and safety staff, five production planning staff, three laboratory staff, two training staff, one human resources person, and six management and administration staff (HECA 2012b).

Workforce Availability for Operation of the HECA Component

The applicant expects 60 percent of the operations workforce to come from within Kern County. The remainder would relocate or commute from surrounding areas, such as the County of Los Angeles. **Socioeconomics Table 9** provides employment estimates for select occupations associated with the operations crews and equipment maintenance staff. Based on these estimates, staff concludes that the existing labor force in Kern County would be sufficient to accommodate most of the operational labor requirements of the HECA project. Staff estimates that there were approximately 1,700 workers in Kern County in 2011 with skills appropriate for employment on the HECA operations crews. These include power plant operators, stationary engineers and boiler operators, wastewater treatment plant operators, chemical plant operators, gas plant operators, petroleum pump and refinery operators, and other plant and system operators. Kern County also has over 1,000 workers with skills appropriate for employment as contract based equipment maintenance staff. These include industrial machinery maintenance workers and other general maintenance and repair workers. Staff does not anticipate a shortfall of workers in the remaining nine employment categories reported in Table 26 of the applicant's Response to CEC Workshop Requests – Nos. A1 through A32 (HECA 2012b). This is due to the relatively small number of workers required in each employment category. The applicant states on Page 5.8-16 of the AFC that the HECA, LLC, would provide local preference for hiring (HECA 2012a). Given the large labor pool, staff expects that, in the absence of cumulative labor impacts from other projects, the HECA project could achieve greater than 60 percent local hiring.

Socioeconomics Table 9
Operations Staff Labor for Select Occupations, Kern County, 2000 and 2011

SOC Code	Occupation Type	Estimated Workforce		Peak Demand
		2000	2011	
	Operations Crew	**1,180**	**1,690**	**88**

Growth Inducing Impacts from Operation of the HECA Component

Staff agrees with the applicant's assumptions about the HECA power plant operations workforce and expects that, at most, 40 percent of operations employees would need to relocate or commute to the project area, given the robust regional workforce. While the project could likely achieve a greater than 60 percent local workforce, the use of the 40 percent non-local figure represents a more conservative, worst-case scenario. Based on this estimate, around 80 workers would relocate to Kern County, translating into a total population increase of over 250 people, based on an average household size of 3.15. Applying this estimate to the gravity model described above, roughly 40 workers and their families, or around 135 people in total, could relocate to the city of Bakersfield. Another 19 people would relocate to Rosedale. Only two workers and their families would relocate to Buttonwillow. This would equal a population increase of only around 0.4 percent. One worker and their family would likely locate in Tupman, which would equal a 2 percent increase in the resident population.

Growth Inducing Impacts from Operation of the OEHI/EOR Component

On page 4.12-6 of Appendix A of the AFC, the applicant indicates that the OEHI EOR component of the HECA project would generate up to 25 full-time operations jobs over its 20-year implementation period. Hiring would likely occur over time, coinciding with build-out. The applicant expects that a majority of these positions would go to existing Kern County residents. Based on the occupational employment estimates, and the unemployment data reported earlier, staff believes that the existing Kern County labor force would be sufficient to accommodate labor demand associated with operation of the EOR component of the project. For analytical purposes, the applicant assumed that all 25 of the operations workers would be non-local and would permanently relocate to Kern County. For this analysis, staff used the same worst-case scenario in which operation of the EOR component would result in the permanent relocation of 25 workers and their families to Kern County.

To estimate the total population change that would occur due to the permanent relocation of worker households, staff first applied the gravity model for migration described above to the total operations workforce estimate of 25 workers. Staff then multiplied the estimated number of workers who would relocate to each community by the average household size for Kern County from the 2010 Census of 3.15. Based on these estimates, the majority of households, around 15 in total, would prefer to relocate to the city of Bakersfield. This would translate into a total of 47 new residents and a 0.01 percent increase in the city's population. The remaining households would relocate to communities located throughout western Kern County, resulting in no greater than a 0.02 percent increase in the population of each affected community.

Growth Inducing Impacts from Operation of the Whole of the Project

To ascertain whether operation of the whole of the project, including both the HECA power plant and the EOR components, would result in substantial induced population growth, staff combined the results of the two gravity models described above. The combined results suggest that of those workers that would relocate to the project area during the initial construction period (i.e. the period during which the two construction schedules would overlap), around 55 percent would prefer housing in the city of Bakersfield. This could equal around 60 workers, resulting in a temporary increase in the city's population of up to 0.05 percent, if workers are assumed to relocate with their families. The remaining 45, or so, households would relocate to communities located throughout western Kern County, resulting in no greater than a 0.2 percent increase in the population of each affected community. Tupman could be the only exception to this trend, wherein the relocation of one household could increase the population by around 2 percent.

Displace Existing Housing and Substantial Numbers of People, Necessitating the Construction of Replacement Housing Elsewhere

Socioeconomics Table 10 reports data on the existing housing stock in the project area and Kern County, including data for the two effected CCDs. As of April 1, 2010, there were around 406 housing units in Buttonwillow, 144 in Derby Acres, 73 in Tupman, and 193 in Valley Acres. This equaled 816 housing units located in urban areas within the project buffer area. Around 10 percent of those units were vacant, equal to 84 total units. Note that the vacancy rates in Buttonwillow and Valley Acres were only 7 percent and 9 percent, respectively. By comparison, vacancy rates in Derby Acres and Tupman were equal to around 15 percent and 25 percent. Around 20 units in the buffer area were reported for-rent, while 12 units were listed for-sale.

Socioeconomics Table 10
Housing Supply and Vacancy Status

Area[1]	Total	Occupied		Vacant		For Rent	For Sale	Other[2]
		Number	Percent	Number	Percent			
Buffer Area	816	732	90%	84	10%	20	12	52

Notes: [1]CDP - Census Designated Place and CCD - Census County Division; [2]Other includes units that are rented or sold, but not occupied, as well as units that are vacant due to recreational or occasional use, use by migratory laborers, and units that were vacant for other miscellaneous reasons.
Source: US Census 2010c.

More than 50 additional units were vacant due to occasional use, use by migratory laborers, or were vacant for other reasons.

Outside the buffer area, the city of Taft had 2,525 housing units, of which 11 percent were vacant. Of those 271 total vacant units, 108 were for-rent and another 126 were for-sale. When combined with the communities of South Taft, Taft Heights, and Ford City, the greater Taft area had a total of 5,460 housing units. Of these, 666 were reported vacant, which equals a vacancy rate of 12 percent. Roughly 212 units were reported for rent in the area and another 69 units reported for-sale, with an additional 385 units vacant for other reasons. The city of Wasco had 5,477 housing units, of which 6 percent were vacant. Of the 346 total vacant units, 103 were for-rent and another 143 were for-sale. The city of Bakersfield had 120,725 housing units in 2010. With a vacancy rate of roughly 8 percent, Bakersfield had 9,593 vacant units. Of those, 4,428 units were for-rent and 2,187 were for-sale, with another 2,978 units vacant for other reasons. Kern County had 284,367 units, with a vacancy rate of 10 percent. This equaled 29,757 vacant housing units, including 9,743 rental units and 5,072 for-sale units.

As many construction workers are likely to commute to the project area on a daily or weekly basis, staff also investigated the availability of temporary housing options. According to the Bakersfield Convention and Visitors Bureau, there are around 5,400 hotel rooms in the city of Bakersfield, another 600 in surrounding communities, and 196 rooms in Buttonwillow (CEC 2012b). For the 2011 calendar year, the average occupancy for these rooms was around 63 percent. This translates to an average of 3,900 occupied rooms, with around 2,300 vacancies. A report by Smith Travel Research estimated that there are nearly 10,000 hotel rooms at 128 properties in the greater Bakersfield metropolitan area (STR 2012). The report estimates an average nightly occupancy rate of 65 percent from January through June of 2012, up from 60 percent for the same period a year earlier. Based on these estimates, there would be more than sufficient temporary housing to accommodate workers seeking to commute to the project on a weekly or semi-weekly basis.

To identify the available accommodations for temporary construction workers that might prefer to camp, rather than rent a hotel room, staff identified a variety of recreational vehicle (RV) and primitive camping options. **Socioeconomics Table 11** identifies 10 RV parks located near the cities of Bakersfield and Taft. These facilities offer over 1,000 sites with electrical hookups and waste disposal facilities. The Kern County Department of Parks and Recreation also operates five campground facilities in the unincorporated area (Kern County 2012a). The Buena Vista Aquatic Recreational Area is located only 7.5 miles southeast of Tupman. It offers 112 campsites and allows up to 15 people per site. Kern River Campground located northeast of Oildale has 50 campsites and allows eight people per site. While located some distance from the project site, the Tehachapi Mountain Park offers 61 family campsites and two group facilities. The Tehachapi Mountain Camp accommodates a minimum of 40 persons and the Sierra Flats Camp can accommodate up to 150 persons. The Greenhorn Mountain Park located 50 miles to the northeast of Bakersfield has 70 family campsites and two group facilities that can accommodate a combined total of 175 people. Of the four state parks located in Kern County, only Red Rock Canyon State Park in the far eastern corner of the county offers

50 primitive campsites with no RV hookups. Based on this information, staff estimates that there would be sufficient resources available to accommodate those construction workers who would prefer camping to other forms of accommodation.

Displacement Impacts from Construction for the Whole of the Project

Compared to the worker relocation estimates described above, staff estimates that the existing housing stock in the project area would be sufficient to accommodate demand for housing generated by construction of the whole of the proposed project. For example, if staff assumes that 40 percent of the construction workforce for the HECA component, and 25-75 percent of the construction workforce for the EOR component, would be non-local, the project area would need to absorb a maximum of around 1,250 workers and their families during the project construction period. According to data from the Decennial Census, the city of Bakersfield alone could absorb nearly 9,600 households in a combination of rental and for-sale housing, and over 4,400 households in rental housing alone. Thus, the available housing supply within one-half hour of both the HECA and OEHI EOR project sites would be more than sufficient to accommodate the non-local project labor force.

The gravity model developed by staff suggests that a maximum of around 60 households may prefer to locate in communities in the buffer area during construction. While census data indicate that there were around 84 vacant housing units within the four constituent communities, roughly 50 of them were vacant for reasons other than being for-rent or for-sale. This suggests that those 50 units may not be available for occupancy by households associated with the proposed project. However, due to the preponderance of available housing in and around the cities of Bakersfield and Taft, it is likely that these households would be able to find sufficient accommodation in other nearby communities. As a result, staff does not anticipate that project construction would result in displacement of existing housing or substantial numbers of people, necessitating the construction of replacement housing.

Displacement Impacts from Operation for the Whole of the Project

Furthermore, staff estimates that the existing housing stock in the project area would be sufficient to accommodate demand for housing generated by the whole of the proposed project, once in full operation. Based on the applicant's assumption that 40 percent of the HECA power plant workforce, and 100 percent of the EOR operations workforce, would be non-local, around 105 households could relocate to the project area. The gravity model indicates that around 60 households would relocate to the city of Bakersfield, which could easily be accommodated by the available housing stock. Likewise, two households could relocate to Buttonwillow and one to Tupman. Even with limited housing availability in these two communities, the introduction of these new households would be insufficient to displace the existing population and would not necessitate the construction of new or replacement housing.

Result in Substantial Physical Impacts to Government Facilities

As discussed under the subject headings below, the HECA project would not cause significant impacts with regard to service ratios, response times, or other performance standards associated with law enforcement, education, and parks and recreation facilities. The systems and procedures proposed by the applicant to provide occupational safety and health protection for project employees are discussed in the **Worker Safety and Fire Protection** section of this document.

Law Enforcement

The HECA power plant site and EOR processing facility site are located within the jurisdiction of the Kern County Sheriff's Office. Staff contacted the Kern County Sheriff's Office to discuss the proposed project components, ascertain their ability to provide law enforcement services to the project, and to solicit comments or concerns they might have about the project. Communications with Lieutenant Steve Hansen, Sergeant Marc Haiungs, and Sergeant Martin Downs indicated that the two substations located in Buttonwillow and Taft would provide direct services to the two project sites (CEC 2012c). The boundary between the service areas of the two substations roughly corresponds to the course of the California Aqueduct. Subsequently, the HECA power plant site would be served primarily by the Buttonwillow substation, while the OEHI EOR operation would be served by the Taft substation.

The North County Substation in Buttonwillow is the closest station to the proposed HECA power plant site at approximately 10 miles and would be the most likely to provide direct service to the site. The station covers a service area of 1,500 square miles and is staffed by 13 sworn deputies and two civilian clerks. The response time to the power plant site would be between 10 and 40 minutes for priority calls and 15 to 60 minutes for non-priority calls. The range of response times is due to variation in where deputies would respond from. Deputies would not typically respond from the substation, as they are usually on-patrol elsewhere in the service area.

The Taft Substation is located 20 miles from the HECA power plant site and 13 miles from the OEHI EOR CO_2 processing facility site (CEC 2013c). The substation serves an area of roughly 790 square miles. Existing staffing includes 11 deputies, two detectives, one sergeant, and one office clerk. There are currently two vacancies for Deputy Sheriff positions at the Taft Substation. At current staffing, the station provides approximately one deputy per 1,500 residents. The response time from the Taft substation to the power plant site would be between 15 and 25 minutes for priority calls and 25 to 35 minutes for non-priority calls. Response times to the processing facility site would be between 10 and 15 minutes for priority calls and more than 20 minutes for non-priority calls.

The Sheriff's Office indicated that oil field and rural crime is prevalent in the project area. This places both components of the project at risk for vandalism and theft, particularly during the construction phase. While this could create a need for extra patrols by on-duty deputies and would require deputies to conduct theft and vandalism investigations, the overall increase in demand for law enforcement services would be negligible. The Sheriff's Office also identified potential impacts on traffic circulation during periods of heavy construction activity. The main point of concern would be on Highway 119, which is a two-lane road connecting Interstate 5 and city of Taft. The Sheriff's office does not anticipate significant traffic impacts resulting from project operation. Other concerns voiced by law enforcement include the vulnerability of the power plant and EOR facilities, including the CO_2 pipeline, to terrorist attack. Protests and demonstrations related to climate change could also occur due to the project. Sergeant Downs expressed significant concern over the possible exposure of Sheriff's Deputies to dangerous gases, such as carbon dioxide. Recommended mitigation measures to be implemented that could further reduce the impact on law enforcement from the HECA power plant component include 24-hour private security patrols, chain link perimeter fencing, large motion sensor lights, video monitoring and recording systems, and alarm systems (CEC 2012c). Suggested mitigation measures for the OEHI EOR component include private security patrols, security fencing, good lighting, and the securing of costly equipment and materials (CEC 2013c). The **Hazardous Materials Management** section of the PSA includes recommended Condition of Certification **HAZ-6** addressing security provisions for construction and operation of both project components. With mitigation, the project would not necessitate the provision of new or physically altered law enforcement facilities or the recruitment of additional law enforcement personnel.

The California Highway Patrol (CHP) is the primary law enforcement agency for state highways and roads. The agency is predominately concerned with traffic safety, motoring services, and protection of state property. The CHP does not have the legal authority to be the lead agency for general law enforcement and does not contract for general law enforcement duties. When appropriate, CHP officers can provide law enforcement assistance, if the Kern County Sheriff's Department requests such aid. Both project sites are located within the Central Division District. The closest CHP office is located around 3.5 miles east of the power plant site at 2944 Stockdale Highway at the Interstate 5 interchange. Staff contacted the Buttonwillow Office of the CHP to discuss the proposed project and ascertain their ability to provide traffic and motor vehicle law enforcement services to the project area (CEC 2012d, CEC 2013d). The office is currently staffed with one lieutenant commander, three sergeants, 31 officers, and four civilian staff. The estimated response time to the power plant site for priority calls would be between five and 10 minutes. For non-priority calls, the response time would be between 10 and 20 minutes. Response times to the CO_2 processing facility site would be roughly the same. CHP anticipates that response times could be affected by increased traffic congestion. The project could also result in additional traffic incidents, collisions, and violations. CHP anticipates, however, that the impact on CHP facilities, equipment, and staffing needs would be minimal (CEC 2012d, CEC 2013d).

Based on multiple communications with affected local law enforcement agencies, and the suggested mitigation measures described above, staff concludes that the project would not necessitate the alteration of existing law enforcement facilities, the construction of a new police substation, or the hire of additional law enforcement officers. Thus, the project would have a **less than significant impact on law enforcement**.

Education

Both the power plant and CO_2 processing facility sites are located in the Elk Hills Elementary (EHESD) and the Taft Union High (TUHSD) school districts. The EHESD provides kindergarten through eighth grade education to approximately 140 students at the Elk Hills Elementary School located in Tupman, which represents the school's primary service area (CEC 2012e). The school has nine regular education classrooms and one intervention/resource class. The TUHSD, by comparison, is a comprehensive four-year secondary school that offers ninth through 12th grade education to around 1,060 students (CEC 2012f). The district serves nine communities. These include Derby Acres, Dustin Acres, Fellows, Ford City, McKittrick, South Taft, Taft, Taft Heights, Tupman, and Valley Acres. It operates three campuses including Taft Union High School, Buena Vista High School, and Westside Independent Study High School. Buena Vista High is a small independent study program that houses roughly 120 students. Westside Independent Study High is an adult opportunity program affiliated with the Westside Regional Occupational Program (WSROP). In addition to the EHESD and TUHSD, portions of the EHOF are also located in, or near, the Belridge, Buttonwillow Union, McKittrick, Midway, and Taft City elementary school districts, as well as the Kern Union High School District.

Socioeconomics Table 12 presents data on enrollment, average pupil-to-teacher ratio, and average classroom size for schools located in the EHESD and TUHSD, as well as for other school districts in the project area. As of the 2011-2012 academic year, the EHESD had nine full-time equivalent teachers, a pupil-to-teacher ratio of 21, and an average classroom size of 13 students. The TUHSD schools had around 72 full-time equivalent teachers, a pupil-to-teacher ratio of 14.5, and an average classroom size of around16 students. The majority of students in the TUHSD were located at the Taft Union High School, which had around 960 students, 66 full-time equivalent teachers, a pupil-to-teacher ratio of 14.5, and an average classroom size of around 17. Roughly 80 additional students were enrolled in the Buena Vista continuation program, which had six full-time equivalent teachers, a pupil-to-teacher ratio of 13.3, and an average classroom size of only seven students.

Socioeconomics Table 12
Enrollment and Staffing by School District (2011-2012)

School District	2011-2012 Enrollment	FTE Teachers	Pupil-to-Teacher Ratio	Ave. Class Size

Source: CDE 2012.

Impact of Construction on Schools

Based on the assumption that 25 to 40 percent of the construction workforce for the HECA power plant component would be non-local, staff estimates that up to 17 worker households could relocate to Tupman during peak construction. To estimate the number of school age children associated with these households, staff used an estimate of the average number of children, ages five to 17, per household in Kern County from the 2010 Decennial Census. Based on these figures, the EHESD could receive up to 12 new students during the project construction phase. At 2011-2012 staffing levels, this would increase the pupil-to-teacher ratio from 21 to 23, and the average class sizes from 13 to 14 students. The District Superintendent for the EHESD indicated that the school works to maintain a maximum pupil-to-teacher ratio of 20 to 1 for the lower grade levels and 25 to 1 for the higher grades (CEC 2012e). The district was out of conformity with these standards in the 2010-2011 school year, but reportedly came back into conformity in the 2011-2012 school year. The superintendent noted that Elk Hills is a "District of Choice" which means that parents located outside of the district can apply to have their child admitted to the district. The district currently transports 155 students by bus from outside of the district. While the majority of these students come from the Taft area, at least one bus currently serves families located in and around Buttonwillow, Rosedale, and Bakersfield. The school's choice status is significant, because in the event that project induced population growth in Tupman were to push the pupil-to-teacher ratio out of conformity with the accepted standard, the school would be required to accept the new local students and to reassess the number of seats made available to out-of-district students. While this could preclude some out-of-district students from attending the EHESD, it lessens the likelihood that project induced population growth would necessitate the construction of new school facilities.

Using the same gravity model and conversion factors described above, staff estimates that up to 75 worker households associated with construction of the HECA power plant component could relocate to communities within the TUHSD. This could equal up to 54 new school age children. If all of these children were to enter the TUHSD system, at 2011-2012 staffing levels, the pupil-to-teacher ratio would remain essentially unchanged, going from 14 to 15. Likewise, the average classroom size, district wide, would only increase from 15 to 16 students. According to a representative from the TUHSD, the district lost 10 teachers during the past year and has only filled two of the vacant positions (CEC 2012f). The district expects to leave the remainder unfilled, as the district is in a deficit and currently has excess staff capacity. With pupil-to-teacher ratios in the mid-teens, the district is well below its maximum pupil-to-teacher ratio of 30, as set forth in the district's labor agreement. Staff concludes that induced population growth associated with the HECA power plant component of the proposed project would not constitute a substantial increase in the school age population within the EHESD and TUHSD, and that the construction of the proposed facilities would not necessitate the provision of new or physically altered facilities.

During construction, staff and the applicant expect the majority of the workforce necessary for construction of the OEHI EOR facilities, including the CO_2 processing site and ancillary facilities, would be existing OEHI employees and contractors. Staff estimates that up to 240 additional workers could be required during peak construct, although most of these would come from within Kern County. Due to fluctuations in the number of workers required for construction of the EOR project facilities, staff anticipates that most of the non-local workers would likely commute on a daily or weekly basis to the project area. It is therefore unlikely that workers would relocate with their families. As a result, staff does not anticipate a significant adverse impact to the Kern County schools from construction of the EOR component of the proposed project.

Impact of Operations on Schools

Staff assumes that 40 percent of the 200 full-time workers needed to operate the HECA power plant would relocate from outside of Kern County. This would translate into 80 new worker households. Staff estimates that of the 80 workers that would relocate to Kern County, only one worker household would likely relocate to Tupman during the project operations phase. This could result in the introduction of up to one additional student to the EHESD. Likewise, staff estimates that up to three worker households could relocate to communities within the TUHSD, possibly introducing up to three new students to the TUHSD system. The possible addition of one to three students to the EHESD and TUHSD systems, given existing enrollment and staffing levels, would not constitute a substantial increase in the school age population and, by extension, would not necessitate the provision of new or physically altered facilities in order to maintain acceptable service ratios.

The applicant anticipates that operation of the EOR component would generate up to 25 full-time jobs, maintained over the 20-year implementation period. A majority of these workers would be existing Kern County residents. For analytical purposes, the applicant assumed that all 25 workers would relocate into Kern County with their families. To estimate the number of school age children associated with these households, staff used an estimate of the average number children, ages five to 17, per household in Kern County of 0.71 from the 2010 Decennial Census. This would translate into around 18 new school age children. The majority of these, around 11 in total, would likely reside in the city of Bakersfield and would attend schools in that area. The remaining households would relocate to communities throughout western Kern County, resulting in the addition of one or two school age children in each affected community. Based on these estimates, and those reported above, staff concludes that project induced population growth would not constitute a substantial increase in the school age population and that the project would not necessitate the provision of new or physically altered school facilities. Therefore, the project would have a **less than significant impact on schools**.

Parks and Recreation

In addition to the Kern County Parks and Recreation Department, there are many different cities, independent park districts, and state and federal agencies, that provide parkland and recreational facilities for use by Kern County residents. Although the project site is located in an area of unincorporated Kern County served by the County Parks and Recreation Department, the majority of the impacts on parks and recreation facilities would occur in and around incorporated communities, such as the city of Bakersfield, due to project induced population growth. To assess the likelihood and severity of project related impacts on parks and recreation facilities, staff utilized the results of the gravity model for migration to identify those park districts that would experience the greatest induced population growth. For each park district, staff identified existing service standards and inventoried existing facilities and park acreages. Staff used Geographic Information Systems (GIS) to estimate the existing population located within each parks district based on census block estimates from the 2010 Decennial Census. The existing and planned park facility inventories were then compared to the population estimates to assess whether induced population growth would result in a breach of service standards. **Socioeconomics Table 13** reports the 2010 population and existing park acreages for the seven parks districts that would be most affected by project induced population growth.

According to the Kern County Parks and Recreation Master Plan (Kern County 2010), the goal of the county is to provide a total of five acres of parkland per 1,000 residents. The minimum service standard according to the Kern County General Plan is 2.5 acres per 1,000 residents (Kern County 2009). While most of the affected park districts, such as the Wasco Recreation and Parks District, have no formally adopted service standard, many already conform to the 2.5-acre standard. Some districts, such as the Westside Recreation and Parks District, have adopted standards that are lower than the existing county minimum. According to the data provided in **Socioeconomics Table 13**, four of the seven affected parks districts are currently in compliance with the minimum county service standard. These include the Buttonwillow Recreation and Parks District, the North Bakersfield River Recreation and Parks District (also known as the North of the River Recreation and Parks District), the Wasco Recreation and Parks District and the Westside Recreation and Parks District. The city of Bakersfield appears slightly out of compliance with the existing county standard with a total of 700 acres of dedicated parkland. This equals an estimated 2.4 acres per 1,000 residents. However, in addition to the 700 acres of dedicated parkland, the city also maintains an estimated 700 acres of public medians and other landscaping that, if included, would bring the ratio to 4.9 acres of open space per 1,000 residents. There are no adopted service standards in the McFarland and Shafter Recreation and Parks District.

Socioeconomics Table 13
Park Acreage in Select Districts

Park and Recreation Department/District	2010 Population	Park Acreage	Acres per 1,000 Persons
Buttonwillow	2,130	20	9.4
Bakersfield	347,483	700	2.4
McFarland	13,560	25	1.8
North Bakersfield[1]	128,270	317	2.5
Shafter	19,620	30	1.5
Wasco	26,290	72	2.7
Westside	20,040	50	2.5

Note: [1]The North Bakersfield Recreation and Parks District (also known as the North of the River Recreation and Parks District) serves part of the city of Bakersfield and parts of unincorporated Kern County.

To assess whether induced population growth would result in a breach of service standards, staff added the induced population estimates for the communities located within each park district to the existing 2010 Decennial Census estimates. The greatest estimated increase in population would occur in the Buttonwillow Recreation and Park District, which would experience up to a 3.5 percent increase in its service population. The Shafter, Wasco, and Westside districts would each experience an increase in their service populations of roughly 1 percent. The Bakersfield, McFarland, and North Bakersfield districts would experience increases of less than 1 percent. Based on these estimates, staff concludes that project induced population growth would be insufficient to appreciably reduce the ratio of park acreage to population in any of the seven affected parks districts. The project would therefore have a **less than significant impact on parks and recreation facilities**.

CUMULATIVE IMPACTS AND MITIGATION

According to CEQA Guidelines, proposed projects can have cumulatively considerable effects on the environment, even when the project has anticipated environmental impacts that are independently less than significant. This means that the incremental contribution of a project can still be significant, when viewed in conjunction with other past, present, and probable future projects. An analysis of potential cumulative impacts should identify the likelihood that cumulative effects would occur, and if so, determine the potential severity of those effects. The cumulative analysis does not require the same level of detail provided for the impacts of the proposed project alone. Staff is simply required to make all practical and reasonable efforts to discover, disclose, and discuss related projects, as they pertain to the impacts in question. Even when staff identifies a significant cumulative impact, the project’s incremental contribution can be less than cumulatively considerable, if the project implements all measures necessary, and feasible, to avoid, or substantially reduce, the project’s cumulative effects [Public Resources Code Section 21083; California Code of Regulations, Title 14, Sections 15064(h); 15065 (c); 15130; and 15355].

Staff evaluates cumulative socioeconomic impacts based on the above guidance, using the thresholds of significance identified in Appendix G of the CEQA Guidelines. For assessment of cumulative impacts to emergency medical services and response times, please refer to the section on **Worker Safety and Fire Protection**. For socioeconomics, cumulative impacts can occur when multiple projects within the same labor market area have overlapping construction schedules. If cumulative labor demand is greater than the existing and projected local labor supply, projects would need to rely, to a greater extent, on other non-local labor sources. The resulting influx of non-local workers and their dependents, whether relocating temporarily or permanently, can place a strain on local housing, public services, and recreation facilities.

Due to the proposed location of the HECA project site, staff identified Kern County as the area most likely affected by cumulative socioeconomic impacts. The Bakersfield-Delano Metropolitan Statistical Area, defined to include Kern County and its constituent communities, represents a reasonably cohesive market area for housing and public services. As such, non-local workers relocating, temporarily or permanently, to participate in project construction or operation, would likely reside within this area. Non-local labor, which staff anticipates could account for up to 40 percent of the total workforce, would likely originate from one of six surrounding counties, including Fresno, Inyo, Kings, Los Angeles, San Bernardino, and Tulare. Staff defined this labor market area based on the information reported in the AFC, the industry standard one- and two-hour commute sheds for operation and construction labor, and through conversations with the BTC for Kern, Inyo, and Mono counties. While the cumulative analysis reported in the AFC uses a list of projects located within six-miles of the project site, staff believes this area is too small and is not representative of the local labor market area.

Socioeconomics Table 14 lists the projects considered as part of the HECA power plant cumulative scenario, from a socioeconomic resources perspective. Staff compiled the list based on environmental reports and notices submitted to the state clearinghouse. Staff also reviewed planning and environmental documents available on city and county websites and contacted local planning agencies. As of November 2012, the BTC for Kern, Mono, and Inyo counties was unaware of any projects planned, proposed, or under development in the region that could have an impact on labor availability for both the HECA power plant and OEHI EOR components (CEC 2013e). According to the BTC, most small-scale projects can be excluded from the cumulative list due to their relatively short construction schedules and small labor force requirements. Construction workers and contractors typically give preference to projects with longer construction schedules and larger workforce requirements, as these provide more stable employment opportunities. The cumulative impacts of multiple small-scale developments, if any, would be of low severity and short duration. Most residential and commercial development projects can also be excluded. They require less skilled labor that is easily supplemented by existing apprenticeship programs. These projects also rely on non-union labor, meaning that they draw on labor supplies that are distinct and separate (i.e. not represented by participating local unions) from those utilized for the HECA project.

Socioeconomics Table 14
Cumulative Project List for Socioeconomics

Project Name	Location	Description
Abajo Transmission	Kern County	Installation of 18-inch diameter pipeline along Abajo Avenue connecting Sage Land and Santa Lucia water tanks.
Barren Ridge Transmission	Kern County; Los Angeles County	Expansion of Barren Ridge Switching Station; and construction of Haskell Canyon Switching Station; construction of 230 kV transmission lines and reconductoring of existing lines.
Berry Petroleum Steam Injection	Kern County	Construction of cyclic steam injection facilities for enhanced oil recovery.
Biodiesel Refinery	City of Fresno	Three phase construction of industrial biodiesel refining facility.
Borax Co-gen Plant Replacement	Kern County	Construct replacement co-generation plant with two natural-gas-fired turbine generators and steam recovery system.
California High Speed Rail	Fresno County; Kern County; Los Angeles County	Construction of dedicated, electrified high-speed rail system. If developed, Merced to Palmdale sections may utilize area labor.
Calnev Pipeline Expansion	San Bernardino County	Construction of a new 233-mile 16-inch diameter pipeline.
Crystal Geyser Bottling Plant	Inyo County	Construct water-bottling facility with associated warehouse and 8.3-acre solar photovoltaic power array.
Fremont Valley Preservation	Kern County	Construction of tertiary wastewater treatment and disinfection facility.
Fresno Tertiary Water Treatment	City of Fresno	Construct tertiary wastewater treatment and disinfection facility.
Lehigh Alternative Fuels	Kern County	Install equipment necessary to use alternative fuels to provide heat for cement production.
Liberty Energy Center	Kern County	Construct 19.5-megawatt gasification facility to supplement existing composting operation.
Northern Area Water	Kern County	Convert 18-miles of earthen canals to 25-miles of pipeline in Buttonwillow Service Area.
Red Rock Bridge Replacement	Kern County	Replace existing bridge on SR 14 at Red Rock Canyon Wash.
Sierra View Hospital Laboratory	City of Porterville	Construct new hospital laboratory facility.
Tulare County Sherriff Detention Facility	Tulare County	Construct new Tulare County detention facility.

Sources: Fresno County 2012, Kern County 2012b, Kern County 2012c, Kern County 2012d, OPR 2012.

In addition to the projects listed below, staff identified 132 solar photovoltaic power projects and 11 wind power projects that are planned, proposed, or under development in the defined labor market area. Over half of the solar projects are proposed in Kern County, while the remaining projects are primarily in Fresno County. The photovoltaic projects range in size from one megawatt or less, to over 1,000 megawatts, in the case of the Kern Solar Ranch project. The majority of the proposed wind power projects are located in eastern Kern County. They range in size from 40 to 750 megawatts. Given the unique labor force requirements of these projects, staff does not expect substantial overlap with the HECA project. Construction of photovoltaic power projects mostly requires general construction labor, with limited usage of electricians for installation of power inverters and essential wiring. Wind projects, by comparison, require general laborers, crane operators, and workers who have received special training on the installation of wind turbine generators. In the event that a local labor shortage were to occur among workers in these occupational categories, the Kern Community College District has partnered with the Clean Energy Center to offer training and certification for construction laborers and electricians on the handling and proper installation of photovoltaic and wind power systems (Energy Center 2012).

Staff identified a total of 17 industrial, infrastructure, and natural resource projects with labor needs that could potentially overlap with those of the HECA power plant component. Where possible, staff collected information on anticipated construction schedules and workforce requirements. As discussed earlier, construction of the HECA power plant component would take approximately 49-months, beginning with pre-construction activities in September of 2013. The number of workers required for the project would increase gradually from only 34 workers during pre-construction to 2,461 at peak employment. In month-32 of project development, the number of construction workers would begin to decline, corresponding to an increase in the number of commissioning and operating staff. Although it is likely that some of the cumulative projects listed would break ground during the HECA power plant construction period, staff does not anticipate that these labor demands would overly conflict with those of the HECA project, such that the applicant could not achieve 60 percent or greater local employment during construction of the power plant component of the proposed project.

The primary basis for the above conclusion is the high unemployment rate and large number of unemployed residents in Kern County. As of November 2012, the county had an unemployment rate of 12.4 percent and around 47,400 residents without work. While this was an improvement over the 15.9 percent unemployment rate experienced in March of 2012, or the 17.8 percent rate from March 2010, it remains substantially higher than the state average in November of 9.6 percent (CA EDD 2012). Anecdotal evidence suggests that unemployment remains a problem among construction craft workers of various types, with Kern County workers commuting to Los Angeles County, and elsewhere, to find work (CEC 2013e). Although the applicant may face labor shortfalls in some key occupational categories (i.e. boilermakers), the gradual increase in employment levels anticipated during project construction should allow participating unions to locate and train prospective workers through existing apprenticeship programs and the community college system.

In summary, **Socioeconomics Tables 5** and **6** report that the labor force in Kern County would be more than sufficient to accommodate the HECA power plant component of the proposed project. For the reasons described above, none of the cumulative projects identified would likely constrain labor availability for the proposed HECA project, beyond the assumed 60 percent local hiring assumption. The estimates of housing availability reported in **Socioeconomics Table 10** shows a vacancy rate of more than 10 percent, and over 14,800 housing units for sale or rent in Kern County. As a result, staff does not anticipate that induced population growth, resulting from both of the proposed project components, as well as other cumulative developments, would constrain local housing availability. Because the provision of public services is tied to new housing development, staff believes that the introduction of new households, who would occupy existing housing units, would not place undue strain on area services and infrastructure. Staff, thereby concludes, that the construction of the HECA power plant component of the proposed project would not result in any significant and adverse cumulative socioeconomic impacts on population, housing, schools, parks and recreation, or law enforcement.

As discussed earlier, the applicant anticipates that around 75 percent of the labor required for the well and pipeline installations necessary for the EOR component of the proposed project would be employees or contractors already working on behalf of OEHI. Another 25 percent of the labor required for construction of the processing facility and satellite stations would come from the existing OEHI workforce. Based on these estimates, staff estimates that the project would require a maximum of 240 additional workers, beyond those already employed or contracted with OEHI. For the purpose of this socioeconomic impact assessment, staff assumes that all of the 240 additional non-OEHI workers would be non-local and would commute to the project area on a daily or weekly basis. The project would also require up to 25 workers for operation of the EOR facilities. While the applicant anticipates that most of these workers would come from within Kern County, the impact analysis assumes a worst-case scenario, in which these workers would be non-local and would permanently relocate, with their families, to communities within Kern County. As described above, staff was unable to identify any projects with the potential to increase reliance on non-local workers. Therefore, none of the projects considered together with the HECA power plant and EOR operation would create cumulative impacts with regard to labor supply. Staff, thereby, concludes that the proposed OEHI EOR component of the proposed project would not result in any significant and adverse cumulative impacts on population, housing, schools, parks and recreation, or law enforcement.

NOTEWORTHY PUBLIC BENEFITS

For the purpose of this analysis, staff defines noteworthy public benefits to include the changes in local economic activity and tax revenue that would result from project construction and operation. The anticipated economic impacts of proposed projects are typically estimated using quantitative economic models. The economic model most commonly used is the IMPLAN input-output model, developed by the Minnesota IMPLAN Group (MIG). The model relies on complex input-output tables and social accounting matrices. These are quantitative representations of the purchaser-supplier relationships between producers, and intermediate and final consumers. Based on these tables, the analyst can estimate the economic activity that would result from a given expenditure, or other economic event. The resulting economic impact estimates are divided into three categories. These are the Direct, Indirect, and Induced economic impacts. Within each of these categories, the model estimates associated changes in employment, labor income, and economic output.[8] Direct economic effects represent the

[8] The Minnesota IMPLAN Group (2012) defines Economic Output as “the value of industry production.” In the manufacturing sector, output is equal to total sales, minus inventory changes. For the

employment, labor income, and spending associated with construction or operation of the project itself. Indirect economic effects represent the expenditures on intermediate goods made by suppliers who provide goods and services to the project. Induced economic effects represent household spending that occurs due to the increased wages, salaries, and proprietor's income generated in the direct and indirect rounds.

There are several important caveats to note with regard to input-output analysis and the IMPLAN model. The purpose of the analysis is to construct a reasonable profile of the project related investments and to demonstrate the overall magnitude and direction of the economic impacts that would accrue to the surrounding economy. The resulting impact estimates do not represent a precise forecast, but rather an approximate estimate of the overall economic effect. The IMPLAN model is a static model, meaning that it relies on inter-industry relationships, institutional spending patterns, and household consumption patterns, as they exist at the time of the analysis. The model assumes that prices remain fixed, regardless of changes in demand, and that industry purchaser-supplier relationships operate in fixed proportions. The model does not account for substitution effects, supply constraints, economies of scale, demographic change, or other structural adjustments. Impact estimates represent gross impacts and do not account for opportunity costs, such as the construction of other types of power generation facilities. The model also does not account for various intangible effects, such as grid reliability or renewable versus non-renewable energy.

One concern when using modeling programs, such as IMPLAN, to estimate the economic impacts of power plant construction and operation, is that the standard industry classifications provided by the software may not be representative of the types of activities that are proposed. For example, Sector 31 in the IMPLAN software represents the average spending pattern for the electrical power generation, transmission, and distribution industry. The details of the industry spending pattern for a given study area depend on what power plants are already located there. As a result, the analyst can expect that the spending pattern for Sector 31 will typically reflect conventional power generation technologies, such as coal and natural gas. For a project like HECA, that uses an innovative hydrogen-based technology, the default spending patterns associated with Sector 31 may not be representative of how the proposed project would actually operate. Likewise, Sector 35 represents the spending pattern associated with construction of new nonresidential manufacturing structures. While the HECA facilities may broadly fall within this category, the IMPLAN sector would more accurately model general manufacturing construction, of the type that might occupy large warehouse type structures. Likely excluded from the default Sector 35 spending pattern are purchases unique to power plant construction, such as natural gas turbines or, in this case, the Mitsubishi Heavy Industries (MHI) dry feed gasifier and 501GAC® generator. Staff was, therefore, careful to evaluate the available information on anticipated project budgets for construction and operation, in order to assess whether the default industry spending patterns will provide reasonably reliable impact estimates.

On pages 5.8-15 through 5.8-18 of the amended AFC, the applicant reports estimates of the direct, indirect, and induced economic impacts of the proposed project, including

---

service sectors, output is equal to total sales. In the retail and wholesale trade sectors, output is equal to the gross margin (i.e. total sales, minus the cost of goods sold).

both the HECA power plant and OEHI EOR components, developed using the IMPLAN economic model. The applicant used Kern County as the unit of analysis. The economic data used was from the year 2009 and was presumably the most recent data available at the time of the analysis. Staff requested that the applicant provide a detailed list of assumptions and input values used in the IMPLAN model (CEC 2012g). In Data Response A163 the applicant explained that the primary input used in the model was direct employment, measured by the maximum number of jobs per calendar year (HECA 2012d). The employment estimates include figures for the HECA power plant, the OEHI EOR operation, and the rail spur. The construction scenario used IMPLAN Sector 35. The applicant edited the industry data for this sector to reflect average employee compensation of $85 per hour and a 50-hour workweek. The applicant assumes that 60 percent of the construction labor force would come from Kern County. The applicant extends this assumption to other non-labor construction costs, assuming that 60 percent of the construction materials and supplies would be purchased from within Kern County (HECA 2012a, page 5.8-16). The operations scenario used IMPLAN Sector 31 for Electric Power Generation, Sector 130 for Fertilizer Manufacturing, Sector 20 for Extraction of Oil and Natural Gas, and Sector 333 for Transport by Rail (HECA 2012d). According to the AFC, the applicant assumes that 30 percent of the non-labor expenditures made during project operations would occur within Kern County, while operations labor would be 100 percent local (HECA 2012a, page 5.8-17).

Based on the IMPLAN model specifications described above, the applicant estimated that the total construction cost for the whole of the project would be around $3.15 billion (HECA 2012a, page 5.8-16).[9] The total direct labor costs for construction would equal roughly $1.37 billion. The remaining $1.78 billion includes other non-labor expenditures, such as project engineering and materials procurement. Note that these are gross figures, which do not account for economic leakage.[10] Based on these direct expenditures, the applicant anticipates that the project would generate roughly $843 million in indirect and induced economic output, as well as $294 million in additional labor income (HECA 2012a, page 5.8-17). Note that these are gross estimates, and that some unidentified portion of these benefits would accrue to areas located outside of Kern County.

For operations, the applicant estimated that the project as a whole would generate around $30 million in direct labor income (HECA 2012a, Page 5.8-17). While the AFC does not provide an estimate of non-labor direct spending for operations, the applicant assumes that 30 percent of all materials and supply purchases would occur within Kern County. The indirect and induced impacts of project operations, including both HECA and the OEHI EOR projects, would reportedly include the annual maintenance of 430

[9] Because the applicant used Sector 35 of the IMPLAN model to estimate direct construction costs, rather than using independently derived construction cost estimates, staff is concerned that the applicant's estimates may exclude the costs associated with some high-value, specialized equipment used to construct the Gasification and Power Blocks. Examples include the Mitsubishi Heavy Industries (MHI) dry feed gasifier and 501GAC® generator. While these expenditures would likely occur outside of Kern County, and would therefore not represent a local economic impact, their exclusion may significantly under represent the total value of project construction.

[10] Economic leakage represents the value of expenditures and economic activity that occurs outside of the local area.

jobs, $21 million in labor income, and $68 million in economic output (HECA 2012a, Page 5.8-18). Note, again, that these are gross estimates, which do not account for economic leakage. While the applicant expects a majority of these impacts to accrue to Kern County, some unspecified amount will accrue to areas outside of Kern County.

In order to develop a more comprehensive profile of project related investments, staff requested that the applicant provide more detailed information on anticipated construction and operations costs and employment levels (CEC 2012g). The purpose of this request was to ensure that staff had sufficient information to confirm the accuracy and reliability of the estimates provided by the applicant, or to independently model the economic impacts of the proposed project. To prevent disclosure of proprietary business information, staff encouraged the applicant to submit a request for confidential treatment of the information. In response to staff's initial request, the applicant filed a formal objection (HECA 2012c). Following continued discussions between the applicant and staff, the applicant filed a response under cover of confidentiality (HECA 2012b). However, because the project is only in its preliminary stages, the applicant indicated that much of the requested information is not yet available. Staff, therefore, cannot fully confirm the accuracy or reliability of the economic impact estimates reported in the AFC. Staff can, however, confirm that the economic impacts of the whole of the project, including both the power plant and EOR operation, would represent a substantial economic benefit to Kern County.

PROPERTY TAX

Article XIII, Section 19, of the California Constitution gives the Board of Equalization (BOE) jurisdiction over the assessment of properties owned or operated by electrical corporations. Sections 118, 721, 721.5, and 722.5 of the Revenue and Taxation Code clarify that the BOE is responsible for assessment of electrical generation facilities with capacity of 50 megawatts or more, that are operated by electric corporations or public utilities, as defined in Subsections (a) and (B) of Section 218 of the Public Utilities Code. For electrical generation facilities with capacities of less than 50 megawatts, the assessor's office for the each county is responsible for property tax assessments.

The property tax rates for parcels associated with the construction of the power plant and manufacturing complex are set by the Kern County Auditor-Controller's office. The base rate for Kern County is 1 percent, with an additional percentage levied within certain tax rate areas. The current property tax rate for the power plant site is 1.06 percent (Kern County 2012e). This includes the two parcels with Assessors Tax Numbers (ATNs) 159-040-18-00-2 and 159-040-16-00-6. Both properties are located in the Elk Hills (067-007) Tax Rate Area and neither is subject to any special assessments. The assessed values for the parcels for the 2012-2013 Fiscal Year was around $2.5 million combined (Kern County 2012f). Based on the above tax rate, these parcels have a combined tax liability of just over $26,000.

In the response to staff's Data Request A169, the applicant reported ATNs and property tax rates for the 26 parcels associated with the proposed railroad spur (HECA 2012d). A total of 15 parcels have tax rates of 1.09 percent. One parcel has a rate of 1.07 percent, while the remainder have rates of 1.06 percent. One parcel, ATN 103-100-37-00-7, was reported as an "Assessors Utility Parcel," which is not subject to property taxes (Kern

County 2012f). The total assessed value of the affected parcels for the 2012-2013 Fiscal Year is $8.2 million, with a total tax liability of roughly $92,850.

Various techniques can be used to estimate value and to otherwise assess property for tax purposes. These include the comparable sales approach, replacement cost approach, and capitalized income method, among others. Section 721 of the Revenue and Taxation Code indicates that the BOE follows a policy of valuing public utility properties based on reproduction cost, minus depreciation. However, it has the authority to use other methods as necessary to maintain fairness and uniformity. Reassessment of property takes place when new construction or a change of ownership occurs. For the purpose of this analysis, staff assumes that assessment of the project related properties would occur post-construction and that the value would be determined using the reproduction cost method. Note that the estimates reported below do not represent a formal assessment of property value or property tax liability.

The applicant estimates on page 5.8-16 of the amended AFC that the total cost for project development would equal roughly $3.15 billion. This includes the estimated cost for improvements to the project site, construction of the rail spur, and the first three years of development associated with the OEHI EOR project. For the reasons discussed earlier, staff cannot confirm whether this cost estimate is an accurate or complete representation of the proposed project's development costs. However, for this analysis, staff allocated the total estimated development cost between the two main project components (i.e. HECA power plant and OEHI EOR operation), plus the rail spur, based on the percentage of the construction workforce utilized for each component, to provide an estimate of the amount of property tax revenue that the project might generate. Employment estimates for construction of the HECA power plant were taken from Table 5.8-11 of the amended AFC. Employment estimates for the first four years of construction of the OEHI EOR component were taken from Table 3-4 of Appendix A of the amended AFC. Employment estimates for construction of the rail spur were from Table A163-1 in the applicant's *Responses to CEC Data Requests Set Two*. Based on this distribution, staff estimates that the capital cost attributable to the construction of the HECA power plant would equal roughly $2.6 billion. At the applicable 1.09 percent property tax rate, this would generate nearly $28.7 million in annual property tax revenue. The rail spur, likewise, would account for around $26 million in capital costs, which would translate to between $278,000 and $285,900 in annual property tax revenue. Together, the HECA power plant and rail spur could generate upwards of $28.9 million in annual property tax revenue.

According to the California Department of Conservation (CDC), the State of California does not levy severance taxes on oil and natural gas production (CDC 2012a). The state does levy an assessment on the value of oil and natural gas produced. The Oil and Gas Assessment rate for fiscal year 2012-2013 is 14.06207 cents per barrel of oil or 10 million cubic feet (Mcf) of natural gas produced (CDC 2012b). An increase in the amount of oil produced due to implementation of the EOR project would correlate to an increase in the assessed value of oil and natural gas production and in the revenues received by the CDC's Division of Oil, Gas, and Geothermal Resources.

Kern County also levies ad valorem taxes on property used for oil and natural gas production. Staff used parcel data to identify the Assessor's Parcel Numbers (APNs) and property tax rates for parcels located within the EHOF (Kern County 2012e). According to the assessor's records, 2012-2013 tax rates for properties in the EHOF range from 1.03 to 1.09 percent (Kern County 2012d). The AFC does not identify the Assessor's Parcel Numbers (APNs) associated with the EOR project, nor does it identify the anticipated value of new construction that would occur solely in the EHOF. As construction of the OEHI EOR component would occur over a 20-year implementation schedule, the assessed value of the EOR affected properties would fluctuate from year-to-year. As a result, staff was unable to estimate the property tax impacts associated with the OEHI EOR project.

In addition to the property tax and ad valorem tax on oil and gas holdings, construction spending on materials, equipment, and fixtures would result in payment of sales and use tax that would accrue to the community designated as the "point of sale" or "point of first use" for each transaction.

POINT OF SALE AND USE TAX

In its March 6, 2013 letter to the Energy Commission, Kern County identifies potential impacts to Kern County property owners, residents, and county services if HECA is built. To address such impacts, the Kern County Board of Supervisors requests a mitigation measure be imposed requiring HECA to identify its place of origin as an address within an unincorporated area of Kern County and register that address with the State Board of Equalization, such that the purchase of project equipment and other materials that generate sales tax would benefit Kern County residents. Kern County has proposed the following language for use as a condition of certification for the HECA project. The county stated that this mitigation has been implemented in over 15 other projects with no objection from applicants, including international and out-of-state companies.

> *Prior to the issuance of building permits for the HECA project, the Project Proponent/Operator shall comply with the following: The Project Proponent shall work with the appropriate Kern County Staff to determine how the receipt of sales and use taxes related to the construction of the project will be maximized. This process shall include, but is not necessarily limited to: the Project Proponent/Operator obtaining a street address within the unincorporated portion of Kern County for acquisition, purchasing and billing purposes, registering this address with the State Board of Equalization, using this address for acquisition, purchasing and billing purposes associated with the proposed project. The Project Proponent/Operator shall allow the County to use this sales tax information publicly for reporting purposes.*

In response to Kern County's comment letter, staff is proposing Condition of Certification **Socio-1**. This condition is drafted based on the mitigation measure the county proposed and includes specifics to clarify how the mitigation measure can be more customized to the HECA power plant and OEHI EOR operation facility. This condition would require a good faith effort to ensure the receipt of sales and use tax revenue in the unincorporated area of the Kern County. Terms that would ensure the receipt of sales and use tax could include, but are not be limited to, registration of the two main construction sites, or project office in Buttonwillow, with the California Board of Equalization as the official point of sale, or first use, for tax purposes.

DEPARTMENT OF ENERGY (DOE) FINDINGS REGARDING DIRECT AND INDIRECT IMPACTS OF THE NO-ACTION ALTERNATIVE

Under the No-Action Alternative, DOE would not provide financial assistance to the applicant for the HECA Project. The applicant could still elect to construct and operate its project in the absence of financial assistance from DOE, but DOE believes this is unlikely. For the purposes of analysis in the PSA/DEIS, DOE assumes the project would not be constructed under the No-Action Alternative. Accordingly, the No-Action Alternative would have no impacts associated with socioeconomics.

PROPOSED CONDITIONS OF CERTIFICATION

SOCIO-1 The project owner shall use best efforts to ensure as much sales and use tax revenue resulting from project construction and operation is attributed to Kern County. The project owner shall do the following:

1. Make a good-faith effort to have all transactions that will generate sales and use taxes, including transactions of project owner's contractors, occur in the unincorporated area of the county;
2. Encourage the contractors to establish a business location and tax resale account, and take other reasonable steps, to maximize receipt of sales and use tax revenues for the county;
3. Include in a master contract and any other contract for construction, language ensuring that the county will receive the benefit of any sales and use tax generated by the project to the fullest extent permitted by law;
4. Include the following provision from California Board of Equalization, Regulation 1806(b), in all construction contracts:

   The jobsite is regarded as a place of business of a construction contractor or subcontractor and is the place of sale of "fixtures" furnished and installed by contractors or subcontractors. The place of use of "materials" is the jobsite. Accordingly, if the jobsite is in a county having a state administrated local tax, the sales tax applies to the sale of the fixtures, and the use tax applies to the use of the materials unless purchased in a county having a state-administrated local tax and not purchased under a resale certificate.
5. In all agreements related to the project, identify the jobsite as the project address, which is located within the unincorporated area of Kern County
6. If the project owner enters into a joint venture or other relationship with a contractor, supplier, or designer, the project owner shall either

establish a buying company within Kern County under the terms and conditions of Board of Equalization Regulation 1699(h), to take possession of any goods on which sales and use taxes are applicable but are not defined by Regulation 1806 and shall include in it their requests for bids, procurement contracts, bid documents, and any other agreement whereby California Sales and Use Taxes may be incurred, that the sale occurs at that place of business in the unincorporated area of Kern County; or, alternatively, any entity that may sell goods on which sales taxes are applicable may establish its own place of business within the unincorporated area of Kern County where delivery is ultimately made to the project owner; principle negotiations for all such sales shall be carried on in Kern County;

7. Provide notice to all out-of-state suppliers of goods and equipment, no matter where originating, that Kern County is the jurisdiction where the first functional use of the property is made.

Verification: At least 30 days prior to the start of any project-related pre-construction site mobilization, the project owner shall provide to the CPM (for review and approval, and to Kern County for review and comment), a signed and notarized statement from someone authorized to sign on behalf of the company, with language acceptable to the company and the CPM specifying the terms related to sales and use taxes

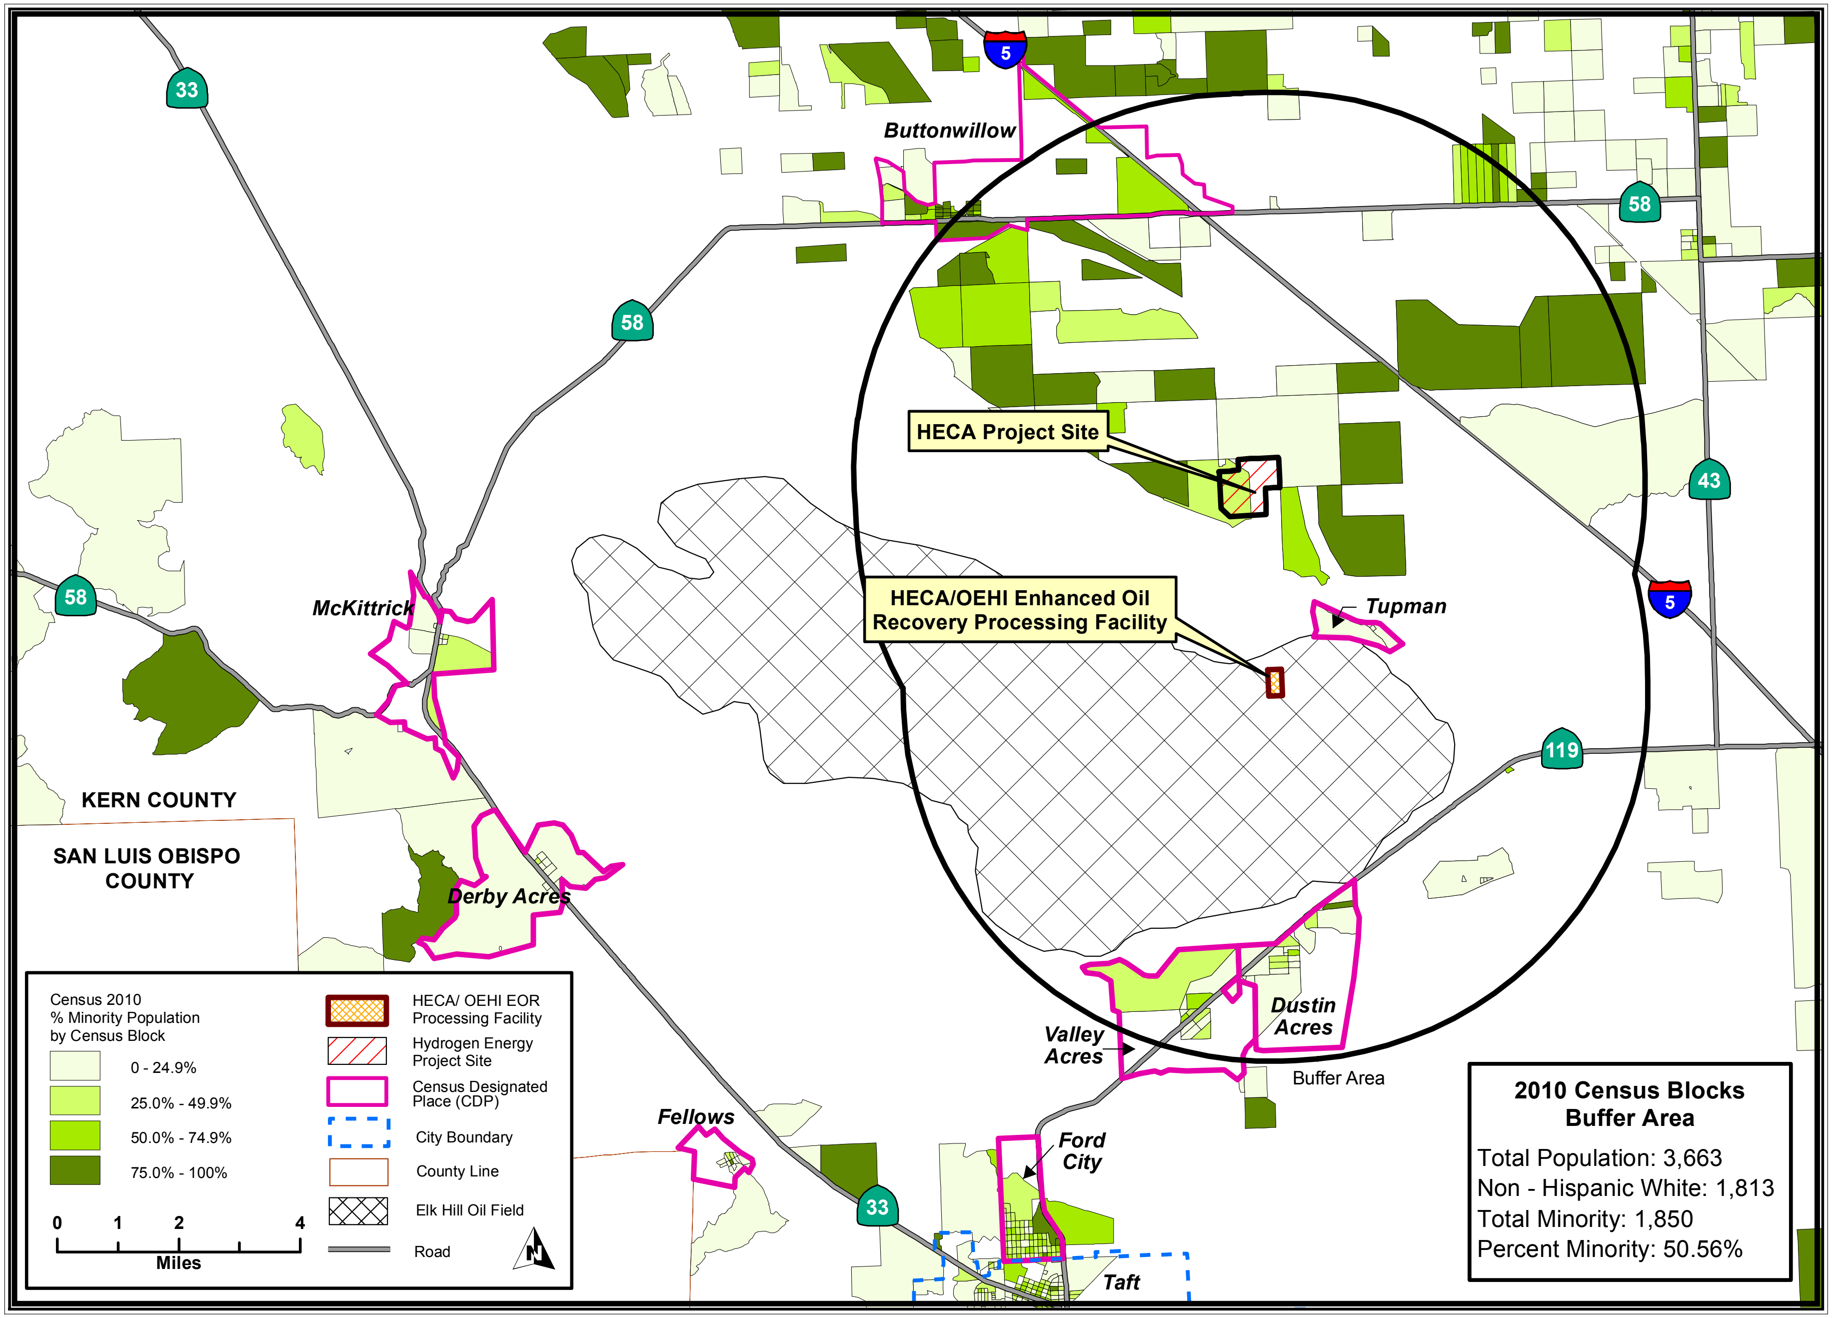
SOCIOECONOMICS - FIGURE 1
Hydrogen Energy California - Census 2010 Minority Population by Census Block



CALIFORNIA ENERGY COMMISSION, ENERGY FACILITIES SITING DIVISION
SOURCE: California Energy Commission, URS - Census 2010 PL 94-171 Data

SOIL AND SURFACE WATER

Marylou Taylor, PE

SUMMARY OF CONCLUSIONS

Hydrogen Energy California LLC (the applicant) proposes to construct an Integrated Gasification Combined-Cycle polygeneration project, referred to as the Hydrogen Energy California (HECA) project. This assessment analyzes the potential impacts on soil and surface water resources by HECA and Occidental of Elk Hills, Inc (OEHI) carbon dioxide, enhanced oil recovery (CO_2-EOR) component. Refer to the **Water Supply** section of this Preliminary Staff Assessment/ Draft Environmental Impact Statement for a detailed analysis of the potential impacts on groundwater supplies and groundwater quality.

California Energy Commission (Energy Commission) staff evaluated the potential impacts to: accelerated wind or water erosion and sedimentation; flood conditions in the vicinity of the project; surface water supplies; surface water quality; and compliance with all applicable laws, ordinances, regulations, standards (LORS) and state policies. The affect of these impacts to environmental justice populations are included in this analysis. Staff concludes that construction and operation of the HECA and OEHI CO_2-EOR component would not result in any significant adverse impacts to soil and surface water resources, and would comply with applicable LORS and state policies, provided that the measures proposed in the Application for Certification (AFC) and staff's proposed conditions of certification are implemented.

The HECA site is located outside the designated 100-year floodplain and would not impede or redirect these flood flows. Compliance with staff proposed Conditions of Certification **SOILS-1** through **-6** would reduce or avoid impacts to less than significant of soil erosion, contact runoff, and discharge wastewater during construction and operations. In addition, staff has not identified any significant impacts that would occur as a result of the proposed OEHI CO_2-EOR component. Staff has also concluded that there will be no direct or disproportionate impact to an environmental justice population as identified for the HECA project (see page 51 of this section).

INTRODUCTION

This section of the Preliminary Staff Assessment/Draft Environmental Impact Statement (**PSA/DEIS**) analyzes potential impacts to soil and water resources from the construction and operation of HECA and OEHI CO_2-EOR component. Where the potential of a significant impact is identified, staff proposes mitigation to reduce the significance of the impact and, as appropriate, recommended conditions of certification.

As discussed in the **Introduction** section of this **PSA/DEIS**, this document analyzes the project's impacts pursuant to both the National Environmental Policy Act (NEPA) and CEQA. The two statutes are similar in their requirements concerning analysis of a project's impacts. Therefore, unless otherwise noted, staff's use of, and reference to, CEQA criteria and guidelines also encompasses and satisfies NEPA requirements for this environmental document.

For purposes of the Department of Energy (DOE), this section complies with Executive Order 11988, “Floodplain Management,” which requires federal agencies, while planning their actions, to avoid to the extent possible adverse impacts associated with the modification of floodplains and to avoid support for development in a floodplain when there is a better practicable alternative. This section describes floodplains potentially affected by the construction and operation of the proposed project, and analyzes the potential direct and indirect effects of the proposed project on these resources. This section provides the required floodplain assessment and this PSA/DEIS provides an opportunity for public review in compliance with regulations promulgated at “Compliance with Floodplain and Wetland Environmental Review Requirements” (10 Code of Federal Regulations, Part 1022).

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The following federal, state, and local environmental LORS were established for HECA and similar facilities to ensure the best and appropriate use and management of both soil and water resources. Additionally, the requirements of these LORS are specifically intended to protect human health and the environment. The potential for project compliance with these LORS is a major component of staff’s determination regarding the significance and acceptability of HECA with respect to the use and management of soil and water resources.

Soil & Surface Water Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Federal LORS	
Clean Water Act (33 U.S.C. Section 1257 et seq.)	The Clean Water Act (CWA) (33 USC § 1257 et seq.) requires states to set standards to protect water quality, which includes regulation of storm water and wastewater discharges during construction and operation of a facility. California established its regulations to comply with the CWA under the Porter-Cologne Water Quality Control Act. The CWA also establishes protection of wetlands through section 401 and protection of navigable waters of the U.S. from discharges of dredge and fill material through section 404. Navigable waters can include perennial and ephemeral drainages, streams, washes, ponds, pools, and wetlands. If a discharge would impact navigable waters, then the impacts need to be quantified and mitigated. Section 401 is administered by the states, and in California, through the State Water Resources Control Board/Regional Water Quality Control Boards (SWRCB/RWQCBs). The RWQCB maintains the quality of the State’s water by protecting the function and value of its use. Section 404 is administered and enforced by the U.S. EPA and Army Corps of Engineers (ACOE). Individual permit decisions and jurisdiction determinations are made by the ACOE.

State LORS	
The Porter-Cologne Water Quality Control Act of 1967, California Water Code Section 13000 et seq.	Requires the State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCBs) to adopt water quality criteria to protect state waters. Those regulations require that the RWQCBs issue waste discharge requirements (WDRs) specifying conditions for protection of water quality as applicable. Section 13000 also requires the state to be prepared to exercise its full power and jurisdiction to protect the quality of the waters of the state from degradation. Although Water Code 13000 et seq. is applicable in its entirety, the following specific sections are included as examples of applicable sections.
California Water Code Section 13240, 13241, 13242, 13243, & Water Quality Control Plan for the Sacramento and San Joaquin River Basin (Basin Plan)	The Basin Plan establishes water quality objectives that protect the beneficial uses of surface water and groundwater in the region. The Basin Plan describes implementation measures and other controls designed to ensure compliance with statewide plans and policies and provides comprehensive water quality planning.
California Water Code Section 13260	This section requires filing, with the appropriate RWQCB, a report of waste discharge that could affect the water quality of the state unless the requirement is waived pursuant to Water Code section 13269.
California Code of Regulations (CCR), Title 20, Division 2, Chapter 3, Article 1	The regulations under Quarterly Fuel and Energy Reports (QFER) require power plant owners to periodically submit specific data to the California Energy Commission, including water supply and water discharge information.
Title 23, CCR, Division 3 — SWRCB and RWQCBs	These regulations implement provisions of the CWC and the Porter-Cologne Water Quality Control Act. Among other things, the regulations address water rights, implementation of the federal Clean Water Act, discharges to land, underground tanks, and waste discharge requirements/NPDES permits.
SWRCB Order 2009-0009-DWQ	The SWRCB regulates storm water discharges associated with construction affecting areas greater than or equal to 1 acre to protect state waters. Under Order 2009-0009-DWQ, the SWRCB has issued a National Pollutant Discharge Elimination System (NPDES) General Permit for storm water discharges associated with construction activity. Projects can qualify under this permit if specific criteria are met and an acceptable Storm Water Pollution Prevention Plan (SWPPP) is prepared and implemented after notifying the SWRCB with a Notice of Intent (NOI).
SWRCB Order 2003-0003-DWQ	The SWRCB regulates storm water discharges to land that has a low threat to water quality. Categories of low threat discharges include piping hydrostatic test water.
SWRCB Order 97-03-DWQ	The SWRCB regulates storm water discharges associated with several types of facilities, including steam electric generating facilities. Under Order 97-03-DWQ, the SWRCB has issued a NPDES General Permit for storm water discharges associated with industrial activity. Projects can qualify under this permit if specific criteria are met and an acceptable SWPPP is prepared and implemented after notifying the SWRCB with a Notice of Intent.

California Water Code Section 12899	Department of Water Resources (DWR) is authorized to issue encroachment permits to allow outside parties to construct works within the State Water Project right of way. The permit program is in place to deter the draining or diverting of water that can result in damage to the State Water Project.
Local LORS	
Kern County General Plan-Land Use Element: Resource Goals, Objectives, and Policies Policy LU 1.9.11	Requires that development plans include controls to minimize erosion and sedimentation through utilization of grading and flood protection ordinances.
Kern County General Plan-Land Use Element: Resource Goals, Objectives, and Policies Policy LU 1.9.20	Areas along rivers and streams will be conserved where feasible to enhance drainage, flood control, recreation, and other beneficial uses.
Kern County General Plan-Land Use Element: Resource Goals, Objectives, and Policies Policy LU 1.10.6.34	Ensures that adequate water storage, treatment, and transmission facilities are constructed.
Kern County General Plan-Land Use Element: Resource Goals, Objectives, and Policies Policy LU 1.4.6	Provides a healthful and sanitary means of collecting, treating, and disposing of sewage and refuse.
Kern County Zoning Ordinance 17.28	Regulations that control excavation, grading and earthwork construction, including fills and embankments; establishes the administrative procedure for issuance of permits; and provides for approval of plans and inspection of grading construction.
Kern County Zoning Ordinance 17.48	Prohibits land uses which are dangerous to health, safety, and property loss due to water or erosion hazards, or which result in damaging increases in erosion or in flood heights or velocities.
State Policies and Guidance	
State Water Resources Control Board Resolution No. 68-16	The “Antidegradation Policy” mandates that: 1) existing high quality waters of the State are maintained until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial uses, and will not result in waste quality less than adopted policies; and 2) requires that any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters, must meet WDRs which will result in the best practicable treatment or control of the discharge necessary to assure that: a) a pollution or nuisance will not occur and b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

PROPOSED PROJECT

SETTING AND EXISTING CONDITIONS

The proposed Hydrogen Energy California (HECA) project would be constructed on a 453-acre site located in western Kern County, seven miles west of Bakersfield and a mile and half northwest of the unincorporated community of Tupman. The applicant has an agreement to purchase the proposed project site from the current land owner, as well as an additional 653 acres adjacent to the site, referred to as the Controlled Area (see **Soil & Surface Water Figure 3**), which the applicant would control access and future land uses (HECA 2012e, §2.1.6). The HECA site is approximately 286 feet above mean sea level (amsl) (HECA 2012bb, §A116). The proposed Occidental of Elk Hills, Inc (OEHI) carbon dioxide, enhanced oil recovery (CO_2-EOR) component would be constructed within the Elk Hills Oil Field on approximately 102 acres located about 3.4 miles south of the HECA site. The Elk Hills Oil Field is approximately 74 square miles and characterized as mountainous terrain with slopes averaging 30 percent or greater. The topography slopes from southwest to northeast towards the California Aqueduct. The elevation of the project area ranges from 1,500 to 300 feet amsl at the Aqueduct (HECA 2012e, Vol. II).

The Central Valley climate is semi-arid, creating hot dry summers and mild winters. Based on the period 1971 to 2000, the average winter temperature in Buttonwillow (located approximately 4 miles northwest of the HECA site) is 47.8 degrees Fahrenheit (°F) and the average summer temperature is 94.9 °F. Precipitation in the area is characterized by long, dry summers and intermittent wet periods. Over the same time period, the average annual precipitation at Buttonwillow was 6.41 inches[1].

Agriculture is the primary land use at the HECA site and local vicinity, with onions, cotton, and alfalfa currently being cultivated on the proposed project site (HECA 2012bb, §A116). Because the climate is semi-arid, almost all crops in the western portion of Kern County must be irrigated. The Elk Hills Oil Field has been producing oil and gas for 100 years[2]. The CO_2-EOR component would be located on a portion of the oil field where primary and secondary phases of oil recovery were employed to retrieve oil and/or gas from the field's underground reservoir[3]. The CO_2-EOR component is a tertiary phase method that would retrieve additional product that previous phases were not able to recover.

As discussed in the **Socioeconomic Resources** section of this **PSA/DEIS**, the minority population in the six-mile buffer around the HECA site and CO_2-EOR component constitutes an environmental justice population as defined by *Environmental Justice: Guidance Under the National Environmental Policy Act*. As a result, this analysis must identify whether the construction and operation of the proposed HECA project, including the associated EOR operation, could therefore have significant, unmitigated impacts or disproportionate impacts on an environmental justice population.

---

[1] Climate Narrative for Kern County, California (www.wcc.nrcs.usda.gov/cgibin/soil-nar-state.pl?state=ca)

[2] The oil field was originally developed as part of the federal Naval Petroleum Reserves with the U.S. Navy being the original operator. In 1998, the oil field was acquired by OEHI.

[3] During primary recovery, the natural pressure of the reservoir or gravity drive oil into the wellbore, combined with artificial lift techniques (such as pumps) which bring the oil to the surface. But only about ten percent of a reservoir's original oil in place is typically produced. Secondary recovery techniques extend a field's productive life generally by injecting water or gas to displace oil and drive it to a production wellbore, resulting in the recovery of 20 to 40 percent of the original oil in place (http://fossil.energy.gov/programs/oilgas/eor/).

Regional Setting

HECA would be built on the southwestern side of the San Joaquin Valley, contained between the Coast Ranges to the west, the Emigdio and Tehachapi Mountains to the south, and the Sierra Nevada to the east. California's Central Valley is filled with up to 32,000 feet of sedimentary rock eroded from the adjacent mountain ranges. The proposed site is approximately three miles north of the Elk Hills oil field, the proposed location of carbon dioxide injection. The Elk Hills form the surface expression of an anticline composed of gravel and mudstone (HECA 2012e, §2.1).

Watershed

The primary responsibility for the protection of water quality in California rests with the State Water Resources Control Board (SWRCB) and nine Regional Water Quality Control Boards. This portion of Kern County falls under the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB). The Water Quality Control Plan for the Tulare Lake Basin (Basin Plan) designates beneficial uses for water bodies within the region, and establishes water quality objectives and implementation plans to protect beneficial uses. The identified beneficial uses define the resources, services, and qualities of these aquatic systems that are the ultimate goals of protecting and achieving high water quality.

The Central Valley Region is divided into three basins: the Sacramento River Basin, the San Joaquin River Basin, and the Tulare Lake Basin. The proposed HECA site and CO_2-EOR site are located in the Tulare Lake Basin, which is essentially a closed basin situated at the south end of the Central Valley. The region is the driest of the Central Valley, but once contained the largest single block of permanent and seasonal wetlands in California. Today, these areas are heavily farmed, with all the region's streams diverted for irrigation or other purposes, except in the wettest years (DWR 2009). As irrigation infrastructure was built, the historical Tulare Lake was gradually cut off from its sources of inflow. The Tulare Lakebed was first reported to be dry in 1899 (ECORP 2007).

Historically, the streams drained runoff from the surrounding mountain range into natural depressions on the valley floor, Kern (dry) Lake, Buena Vista (dry) Lake and Tulare (dry) Lake, which receive flood water from the major rivers during times of heavy runoff (see **Soil & Surface Water Figure 1**). Historic floods through the HECA site typically resulted from excess flows that exceeded the banks of the Kern River. During extremely heavy runoff, flood flows north in the Kings River to reach the San Joaquin River (see **Soil & Surface Water Figure 2**). These occasional northbound flood flows represent the only significant outflows from the basin. Normally all native surface water supplies, imported water supplies, and direct precipitation percolate into valley ground water if not lost through consumptive use, evaporation, or evapotranspiration[4] (RWQCB 2004).

[4] Evapotranspiration is the return of water vapor to the atmosphere by evaporation from land and by transpiration from plants.

The Elk Hills Oil Field has relatively limited surface water resources, with a terrain of numerous, rounded divides and smooth slopes. The drainage divide follows the crest of Elk Hills, causing runoff to flow generally to the north and south. A large number of ephemeral/intermittent streams draining the hills have created a highly dissected stream pattern of gullies and channels. The primary drainage channels do not merge into an integrated network. The natural course of some of the channels in the northern flank is interrupted by the California Aqueduct, and many terminate naturally due to infiltration, and others terminate in gully plugs. Drainage channels in the central portion of the southern flank join Buena Vista Creek in Buena Vista Valley. Watersheds draining the western part of Elk Hills convey runoff in the direction of McKittrick Valley, which slopes towards the northwest (OXY 2012b).

Canals

HECA would be built within 0.5 miles of the California Aqueduct and the proposed groundwater supply would be pumped within approximately 2 miles of the aqueduct (HECA 2012e, §5.14.1). The California Aqueduct is a significant conveyance component of the State Water Project (SWP) managed by the California Department of Water Resources (DWR), which begins at the Sacramento-San Joaquin River Delta and continues south through the Central Valley, over the Tehachapi Mountains, and into southern California. The State Water Project provides a water supply for up to 25 million Californians and up to 750,000 acres of irrigated agriculture and is a vital water supply for many southern Californians. The aqueduct is 444 miles long and is mostly an open concrete-lined canal. The canal width and depth vary along the length of the aqueduct, but it is generally approximately 50 feet wide and approximately 30 feet deep[5].

Long-held water rights determine the amount of water that can be delivered to any particular user in any particular year based on projected volume of runoff. Water districts in the western area of the valley floor depend heavily on contracts for imported water from the State Water Project (SWP) via the California Aqueduct and the Central Valley Project (CVP) via the Friant-Kern Canal. These two projects follow a coordinated operation agreement for water shortages, water quality, and environmental requirements (DWR 2009). Another source of irrigation water is the Kern River, which is fed by the annual snowmelt from the Southern Sierra Nevada Mountains and stretches to the City of Bakersfield. Except during very wet years, there is no river flow downstream of Bakersfield due to upstream canal diversions (KJC 2011).

Several regional irrigation and water supply canals are located in the vicinity of the HECA site. The Outlet Canal and West Side Canal are located approximately 0.1 mile and 0.2 mile south of the site, respectively. The East Side Canal is located approximately 0.3 mile east of the project site boundary. Closer to the site, an irrigation canal extends generally from the east to the west from Tupman Road along the site's southern border. This irrigation canal connects the East Side Canal with the West Side and Outlet Canal (HECA 2012bb, §A116).

[5] www.water.ca.gov/swp/

Currently existing on the proposed HECA site, an irrigation ditch crosses approximately three-quarters of the site from south to north, runs diagonally northwest through the former natural fertilizer manufacturing plant area, and ends just south of Adohr Road. This ditch is approximately 7 feet deep and feeds the smaller irrigation ditches that traverse the site from north to south and east to west around the crop fields. These irrigation ditches are fed with water pumped from the canal south of the site, which is supplied by the West Side Canal and the East Side Canal (HECA 2012bb, §A116).

Flood Management

To lessen the flood risk to life and property, a combination of Federal, State, and local agencies have responsibilities in the overall effort to manage floods. The Federal Emergency Management Agency (FEMA) prepares 100-year flood maps for flood insurance purposes and for floodplain management use by local agencies to reduce the impact of flooding. FEMA map 06029C2225E indicates that the entire Elk Hills Oil Field is designated Zone X[6]. The U.S. Army Corp of Engineers (USACOE) was contracted to perform a floodplain study of the Elk Hills Oil Field which was completed in 1993. The results show that the 100-year floodplain boundaries are confined to isolated areas immediately adjacent to a few drainage channels. In every instance the floodplain widths are approximately 100 feet wide, with only four exceptions where flows fan out at the very northern and southern stretches to widths ranging from 440 to 1600 feet (OXY 2012b).

FEMA maps 06029C-2225E and 06029C-2220E cover the proposed HECA site and the surrounding area. The entire HECA site is designated Zone X, which has very little risk of encountering flood flows. The nearest area subject to 100-year floodplain Zone A[7] is along the Kern River Flood Control Channel located approximately 500 feet southwest of the project site (see **Soil & Surface Water Figure 3**). The levees of this flood control channel, which were constructed to protect the surrounding areas from the 100-year flood, prevent these flood flows from inundating the proposed HECA site.

In 1953, the USACOE built earthen dams across the north and south forks of the Kern River to create the Isabella Reservoir. Isabella Dam (referring to both the Main Dam and Auxiliary Dam) is located approximately 42 miles northeast of Bakersfield. It was designed to help reduce flood risk for Bakersfield and the surrounding region, and is a primary water source for water users throughout Kern County (ACOE 2012). The Kern River continues downstream of Isabella Dam and flows southwest toward Bakersfield (see **Soil & Surface Water Figure 2**) at the valley floor where various diversions and weirs distribute water through a total of seven canals that pass through the City of Bakersfield. Except during very wet years, the river is dry or near dry downstream of

[6] Zone X is defined by FEMA as an area determined to be outside the 0.2% annual chance flood also known as the 500-year flood (the flood that has a 0.2% chance of being equaled or exceeded in any given year). See www.fema.gov.

[7] Zone A is defined by FEMA as special flood hazard area subject to inundation by the 1% annual chance flood also known as the 100-year flood (the flood that has a 1% chance of being equaled or exceeded in any given year). Because detailed analyses are not performed for Zone A, no depths or base flood elevations are shown within these zones. See www.fema.gov.

Bakersfield due to upstream canal diversions[8]. When flows in the Kern River exceed the capacity of these diversion canals, water continues southwest past Bakersfield to the Buena Vista (dry) Lakebed, located approximately eight miles southwest of the HECA site near Tupman (KJC 2011).

The Buena Vista Aquatic Recreational Area occupies a portion of the Buena Vista (dry) Lakebed, a natural depression on the valley floor. Two separate aquatic lakes, Lake Evans and Lake Webb, provide the primary attraction for boating, skiing, sailing, and fishing (KJC 2011). The historic Buena Vista (dry) Lakebed is heavily farmed, but up to 30,000 acre-feet of Kern River floodwater can be stored in this area, per agreements between the landowners and Buena Vista Water Storage District (ECORP 2007).

In addition to inundating the Buena Vista (dry) Lakebed, excess flows could be directed north to the Tulare (dry) Lake via the Kern River Flood Control Channel or directed to the California Aqueduct via the Kern River-California Aqueduct Intertie (Intertie) located near Tupman (see **Soil & Surface Water Figure 4**). The Intertie is a structure built by the USACOE in 1977 to convey Kern River flood water into the aqueduct. Its purpose is to avoid damage to lands downstream, especially the farmland in the Tulare Lake Basin. In years when potentially damaging flow to the Tulare Lake Basin may occur, all or a portion of the excess flow is diverted to the California Aqueduct via the Intertie[9] (ECORP 2007). The Kern River Flood Control Channel is under the jurisdiction of Central Valley Flood Protection Board and the Intertie is under the jurisdiction of Kern County Water Agency.

Groundwater Resources

For a detailed discussion of the regional groundwater resources, refer to the **Water Supply** section of this **PSA/DEIS**.

PROPOSED PROJECT DESCRIPTION
