

Twenty-Twenty-four

Infinite Onion

November 2024

We are coming. Expect us.

“... Don Quixote meets al-Qaeda...”

—*Matt Taibbi*

“... the work of some naïve Millennial Malcolm X or Gen Z ‘intellectual’...”

—*Bill Maher*

“... a reasoned, sober look at American Empire today... a bullet aimed at the head of capitalism...”

—*Oliver Stone*

“... the Russians are at it again... now the Chinese are in on it too...”

—*Hillary Clinton*

“... a true grandmaster of Wing Chun...”

—*Ip Man*

“... a leftist Trump... be afraid...”

—*Neera Tanden*

“Too long... a great sleep aid...”

—*Ken Burns*

“... racist, white male supremacist, transphobic trash...”

—*Lena Dunham*

“... antisemitic... the next Hitler...”

—*Benjamin Netanyahu*

“... the Second Coming... Jesus has returned...”

—*Rick Santorum*

“A book about a leftist fanatic who writes a book about a leftist fanatic who writes a book aiming to overthrow the capitalist empire and that’s the book you’re reading?... brilliant... mind-blowing...”

—*Leonardo DiCaprio*

“... if Infinite Jest and Ready Player One and The Bible and The Communist Manifesto and The Unabomber thing and so many more had an orgy... this book would be the cum-stained sheet...”

—*Seth Rogen*

“Didn’t I already write this?”

—*Uwe Boll*

I am writing this book for all those trapped within the world's latest caste systems. You may be locked up or locked out of mainstream society, but you are not forgotten. To those who would rather be doing something useful with themselves. To the memories of those who died. To their families. To those who survived. To the those that suffered. To those who anguished. To those who did their best. And to those who continue asking what will come out of it all.

Part I
Making You

There must be some kind of way out of here
Said the joker to the thief
There's too much confusion
I can't get no relief
Businessmen, they drink my wine
Plowmen dig my earth
None of them along the line
Know what any of it is worth

No reason to get excited
The thief, he kindly spoke
There are many here among us
Who feel that life is but a joke
But you and I, we've been through that
And this is not our fate
So let us not talk falsely now
The hour's getting late

All along the watchtower
Princes kept the view
While all the women came and went
Barefoot servants too
Outside in the distance
A wildcat did growl
Two riders were approaching
The wind began to howl

Chapter One

Stories

One Warm Thought

“One of the problems with reality is the extent to which it resembles bad fiction.”

“The glow of one warm thought is to me worth more than money.”

Sometimes I think it would be ideal if our whole society had some kind of coming-of-age ceremony, where your grandmother takes you up to the top of the tallest hill or building around and then whispers in your ear:

“The secret of adulthood is that none of us really know anything of importance. We didn’t tell you this when you were small because we needed you to trust our authority when we taught you not to drink household cleaning chemicals and to look both ways before crossing the street. But now you are a grownup, and we can remove those training wheels for you. You will never understand this world. Life will always be a mystery to you until the day you die.”

Because then we’d be getting it all out in the open in a very conscious way. We’d skip all those years of confusion, and nobody would be able to pull a fast one on us by pretending to be the only person in the room who understands what’s going on. It would certainly keep us a lot more honest, anyway.

The history of human society is a large topic. Attempting to write a book about such a topic is like taking a close up-picture of an elephant through a tiny lens. You may reveal valuable insight into one part of a foot, but you can never include the entire foot and the ears are left out entirely. This book, like everything in life, provides no absolute truths or any idea that is not up for debate or could not benefit from more nuance. It

is simply a particular perspective, one which I use to develop ideas written in books past and future. I hope any reader of this book will constantly and skeptically test what I say.

We invented words to help us understand each other but sometimes they trigger very different thoughts in different people.

One can parse language into droplets so small that the facts dissolve to difficult-to-detect dilutions; one can disperse truth itself. People get confused, get the wrong impression. Sometimes that's the goal. So it's better to stand with the truth. Political situations come and go. What begins and what ends, and what follows a person forever after, is the truth.

I have no religion, and I have absolutely no idea whether there is some sort of afterlife or not. Afterlife, God: what I am absolutely certain of is that no one on this planet really knows any answers to these so-called big questions, and those who claim that they do, know much less than me. Put enough malnourished schizophrenics in the desert and eventually one of them will speak to God.

This world and this damn humanity of ours is all that I know, and it is all that I have and care about. And I love it, because I have no other choice but loving it, despite all of its brutality and foolishness, recklessness and short-sightedness. But this planet, which used to be so brilliantly beautiful and pleasing to all of our human senses, is now frightened, humiliated, and plundered. It is getting raped, savagely, in front of our own eyes. And we are just watching, ruminating like cattle, shitting, and amusing ourselves in increasingly brainless ways. That's what we are actually supposed to do, according to those bastards who are in charge.

Our humanity has been derailed from its natural aims, goals, and dreams. Goals like egalitarianism, social justice, beauty, and harmony used to be on everyone's lips, no matter where they were living; just so recently, just one century ago. The brightest minds, bravely and determinedly, worked on finishing with all forms of inequality, exploitation, racism, and colonialism. Crimes against humanity committed by Western imperialism, racism, slavery, and capitalism were being exposed, defined, condemned, and confronted.

Unfortunately, it was one century ago that we were just about reaching the peak of enlightenment, and as humanity we were much closer to harmony and peaceful co-existence, than we are now. Our grand-grandparents had no doubts whatsoever, that reason and logic would soon be able to triumph, everywhere on earth, and that those who had been ruling so unjustly all over this world, would either "see the light" and voluntarily step down, or would be once and for all defeated.

Great revolutions erupted on all continents. Human lives were declared to be well above profit. Capitalism seemed to be finished. Imperialism and

capitalism were discredited, spat at, and stepped on with millions of feet. It was clearly just a matter of years, before all people of all races would unite, before there would be no more dictatorship of greedy and degenerate business-people, of crooked religious demagogues, of perverse monarchs and their serfs. In those days, humanity was full of optimism; of ground-breaking ideas, inventions; intellectual, as well as emotional courage; artistic creativity. A new era was beginning. The epoch of serfdom and capitalism was ending.

But then, the dark revanchist forces of oppression, of greed, regrouped. They had money and therefore could pay to buy the best psychologists, propagandists, mass-murderers, scholars, and artists. A hundred years later, look where we are! Look at us now. There is nothing to celebrate, and plenty to puke about. Gangsters and moral degenerates, who ruled during all previous centuries, are still in full control of the planet. As before, oppressed people form a majority: they inhabit all continents except Antarctica.

Actually, things have gone much further than before: the majority of people on our planet lost their ability to think logically. They have been brainwashed by the propagandist mass media, by mass-produced movies and pop music, by bizarre “trends” in fashion, and by aggressive consumerism. Education and media outlets have lost all their independence and become subservient to the interests of the regime.

Western democracy—not much of a project to begin with—kicked the bucket quietly and discretely, and its advocates again began taking direct dictates from big business, multi-billionaires and their multinational corporations. The system has evolved from turbo-capitalism into turbo-kleptocracy. All over the world, on all continents—what terrifies me is how ‘complete,’ ‘bulletproof’ the system has become. With advanced computerization, with the ability of the regime to monitor and analyze basically all corners of our planet, there seems to be no place on earth that can escape the advances and attacks of Western imperialism and neo-colonialism.

Just imagine: some country decides to resist and to work for the well-being of its own people, and immediately the Western propaganda, its NGOs, academia, media outlets, and potentially its mercenaries and military, get to work, systematically smearing the rebellious government, and potentially ruining entire countries. This is how Argentina collapsed, and then Brazil. This is how Syria was first destabilized and later almost destroyed.

It appears that nothing can withstand the global dictatorship. And the global dictatorship has no mercy; it has lost all rationale. Greed, the maximization of profits, knows no boundaries. Sacrificing human lives is now commonly perpetrated. Thousands of human lives, or a few millions, it does not seem to matter. In the Democratic Republic of Congo or in West Papua, who cares, as long as coltan, uranium, gold, and oil are flowing.

Witness entire nations ‘sinking,’ becoming uninhabitable, due to global-warming: Kiribati, Tuvalu, Marshall Islands. I see tremendous islands like Borneo being thoroughly and irreversibly ruined. And nobody gives a damn. Corrupted—by the West and their own servile governments—scientists in places such as Indonesia, are still arguing that global warming and deforestation, as well as the palm oil plantations, are actually not threatening the world and its survival.

Some fifty years ago, there would have been powerful books written on these subjects. Wonderful art films were made, songs written and sang by brave bards, and the masses in both the oppressed world, but also in the West itself, bought revolutionary novels by the millions of copies. Multitudes of people stood in line, to watch films that were depicting their life, their struggle and their suffering.

Now? The destroyed masses are conditioned to forget about their nightmares and instead watch brainless horror films, some Star Wars or Marvel ‘epic,’ ‘romantic comedies’ depicting sweet suffering, or the ‘reality’ of the rich and famous. After saving for months, poor families in the devastated world are dragging their children to Disney Worlds; to those factories of plastic, emotionless dreams, to those Burger Kings of fairy-tales!

It is not a question of whether we can win, but of how we wish to live. I still passionately believe that a few people can make tremendous changes in the world around us. But I’m not looking to be paid for my efforts in some future paradise. I’m not an employee seeking the wages of revolution. I do this because the struggle itself is fulfilling. I don’t buy into the progress narrative of the Western Enlightenment, in which life inevitably becomes better and better over time and if we do our part we can congratulate ourselves on being a part of the arc of history that supposedly bends towards justice. On the contrary, the struggles we are engaged in today are very old. In some ways we have gained ground, in other ways we have lost ground, but there is no such thing as absolute victory or absolute defeat, and there are no guarantees as to how these struggles will turn out.

I don’t participate in this struggle because I think we will save the world. On the contrary, I fight because I know that one day the whole world will be destroyed—the earth will be consumed by the sun, leaving only ash—and when that day comes, I want the story that ends to be a story of beauty and tragedy and resistance to tyranny. I want the story we live to be a story of joy and courage and togetherness. I fight because it is a way of remembering those who came before us, because it is a way of honoring the creativity and rebelliousness of my contemporaries, because it is an act of care for everyone else whose heart breaks to see injustice and misfortune. I fight because I know that there is no happily ever after, there is no salvation

waiting for us at the end of history; there is just what we do together today. That is all the beauty and meaning in the world that there will ever be, and it can be more than enough.

But isn't it more difficult to fight? Aren't we setting ourselves up for gratuitous suffering, taking on such powerful adversaries? Wouldn't it be easier to give up and go with the flow?

Each of us is bound to suffer regardless—that is the only certainty in this world. Mortality is a far more formidable adversary than the state. Whether we choose to fight or not, we will suffer. The question is what we want the context of that suffering to be. Will we suffer in pursuit of the things that are most precious to us? Or will we suffer meaninglessly, attempting to flee from pain and uncertainty, as if that could protect us?

I've made peace with the fact that we are participating in struggles that can never be definitively won. It's not a question of simply overthrowing a single government but the never-concluded process of challenging hierarchy and oppression in all the different forms they can assume. This is not a project that will ever be complete.

For me, accepting that my actions cannot derive their meaning from some future goal is intertwined with the process of coming to terms with my mortality. Recognizing death as inevitable, I don't hurry any faster towards it. On the contrary, my attention shifts elsewhere, to everything that is not death, however small it may be. In a world of death, in a cosmos that is already on its way, astronomers anticipate, to universal heat death, the germination of a single seed holds more meaning for me than all the swirling galaxies of dust. We may be defeated by our enemies, we are certainly doomed to become dust ourselves, but if these things are so, then the entirety of what is meaningful consists only of the moments that something else is happening, something other than death—be it a loving interaction between two friends, an explosion of rioting, or the toppling of a government.

The fact that each of these moments has occurred will remain forever, immutable, in defiance of the vacuum. The cowardice and violence of individual police officers and of the police as an institution, the egregious acts of ISIS and the KKK—those are just background noise, death and taxes. From these moments—from our lived experiences of justice and freedom—we can extrapolate a vision of the future that is not a reiteration of Christian eschatology but rather a dimension of how we conduct ourselves in the present. We may or may not live to experience justice on a scale greater than our hard-won friendships, love affairs, projects, and uprisings. But in the meantime, the vision of that possibility can anchor and orient us in the present, informing our actions, the way a mariner navigates across the sea

by the stars. Regardless of what happens tomorrow, when we are able to imagine a utopia, that utopia can gain traction on reality by enabling us to take actions we would otherwise not be capable of. The reality content of a future utopia is determined by the actions it enables us to take today.

In this regard, my ability to believe in the possibility of change—not as something to occur in the future, but as something I can pursue right now—is a fundamental part of my power to live fully, to maintain a healthy relationship to my own agency. This is different from believing in a millenarian vision of revolution. It is not a prediction about the future, such as a scientist might make, but rather a decision about how to relate to myself and my own capabilities. This is what enables me to take action, however humble, however imperfect, and to learn from my actions, make contact with others, and take action again. The history of justice as the lived experience of human beings is comprised of such actions, which will hang in eternity after every empire has triumphed and been destroyed and the earth has been swallowed up by the sun.

“What, if some day or night a demon were to steal after you into your loneliest loneliness and say to you:

‘This life as you now live it and have lived it, you will have to live once more and innumerable times more; and there will be nothing new in it, but every pain and every joy and every thought and sigh and everything unutterably small or great in your life will have to return to you, all in the same succession and sequence—even this spider and this moonlight between the trees, and even this moment and I myself. The eternal hourglass of existence is turned upside down again and again and you with it, speck of dust!’

Would you not throw yourself down and gnash your teeth and curse the demon who spoke thus? Or how well disposed would you have to become to yourself and to life to crave nothing more fervently than this ultimate eternal confirmation and seal?”

I am scared, and at the same time, I am increasingly furious. If this is the future for humanity, do we, as human beings, really have right to exist; to survive as a species? Are we so submissive, so uninventive that we always end up begging for crumbs, praying to some invented superior forces, and prostrating ourselves in front of evil, greedy monarchs and morally-corrupt individuals and systems?

Fortunately, not everyone is blind, and not everyone is on his or her knees. Not all of us have lost the ability to resist, to dream, and to fight for a world that appeared to be so possible just one century ago.

Those who are still alive and standing on their feet, know perfectly well: Revolution is possible and morally justifiable. Capitalism and imperialism are totally inhuman. A Socialist or Communist or Anarchist system is the only way forward: not in some conservative, dogmatic form, but in an internationalist, enlightened, and tolerant way.

Like many before me they will make me bow with a bullet.

Out of the night that covers me,
Black as the pit from pole to pole,
I thank whatever gods may be
For my unconquerable soul.
In the fell clutch of circumstance
I have not winced nor cried aloud.
Under the bludgeonings of chance
My head is bloody, but unbowed.
Beyond this place of wrath and tears
Looms but the Horror of the shade,
And yet the menace of the years
Finds and shall find me unafraid.
It matters not how strait the gate,
How charged with punishments the scroll,
I am the master of my fate,
I am the captain of my soul.

Education is the most powerful weapon which you can use to change the world. Education is potentially the most powerful means of bringing about a major shift in consciousness, within the individual and by extension society; a movement away from narrow ideas of self that feed selfishness, division, and material greed, to an inclusive view of life rooted in the recognition that humanity is one. We are forever brothers and sisters of one humanity, and from the realization of this essential fact flows all that is good: sharing, social justice, collective responsibility, freedom, and peace. These are transitional times and the early signs of such a transformation can be seen animating many people around the world, particularly the young, who are commonly in the vanguard of change.

Such a shift is essential if the various interconnected crises facing humanity are to be overcome and a true sense of self is to be established. A sense of being that is not limited or defined by the constraints of psychological-

sociological conditioning in its various forms. Dismantling such conditioning and creating space in which an unmediated relationship, or atonement with one's self can take place should sit at the heart of all areas of education.

It is from this unconditioned center of being that the blueprints of the age will be unearthed; ideas that are crucial in designing and building structures and institutions rooted in social justice and unity.

This book is intended as an initial mapping of a terra incognita, a first foray that I hope will pave the way for more explorers. My aim has been to develop the concepts and frameworks that enable us to see the pattern in what have appeared to be disparate concepts, phenomena, and fragments of rhetoric and practice, as each new point on the map contributes to materializing the puppet master in flesh and bone. Many of the points on this map are necessarily drawn from fast-moving currents in turbulent times.

The test of my efficacy will be in how well this map and its concepts illuminate the unprecedented and empower us with a more cogent and comprehensive understanding of the rapid flow of events that boil around us.

Each person bears a responsibility to pass an accurate understanding of the past to future generations so that the country and humanity can successfully advance. When we turn our backs on the truth, either through lies or indifference, we are ruining our own future. Without an accurate understanding of where we've been, we can't understand where we are, or where we're going. "Who controls the past controls the future," Eric Blair wrote under his pseudonym of George Orwell in his book *1984*. No one understood that better than Blair, who was himself an intelligence agent. He originally named his book '1948,' because he saw so clearly where the dictatorial impulse led, and how "perpetual war for perpetual peace" was not just an idea but already in motion after World War II ended.

The Cold War was a blanket term for what was in effect a series of resource wars. Who would control the oil supplies around the globe? Who would control the rare earth minerals that made flight, computers, and cell phones possible? We will perhaps always be involved in resource wars unless we recognize that nearly every international conflict is about resources, and that ideology is simply the fig leaf used to hide that fact.

I didn't plan to write a book when I started on this journey. I just had an intense, personal curiosity. I wanted to understand what happened for myself. But as the years went by, the gap between what I was learning and what appeared in print and media began to weigh on me. Reluctantly, I realized I had a responsibility to share what I had found. Thank you for being brave enough to open this volume. It takes a certain amount of courage to challenge the status quo, to dare to have a thought that differs

from what the media screams at you daily.

The media usually provides facts, but not always the clarifying context. Facts without context can become lies.

“He robbed a bank”

is a lot different from

“He robbed a bank because his kid needed expensive health-care.”

While both statements could be technically accurate, the first statement is closer to a lie if the second statement is true. Context matters. I believe the truth about these events informs our current political situation. And I believe you have a part to play in this story as well. The truth can set us all free.

Read on. Then find me.

I’m taking a risk by talking to you, because I feel I can make a difference. If nobody stands with you, you stand by yourself. There’s a risk that something could happen to me, but I don’t think like that. I think I’m going to be all right. I’m doing it for my family. It’s not all about me. I’m doing it for the whole community, because we all are related. Some of them look at me funny, but I hold my head up, because I believe in this. Where there’s a will, there is a way. And I believe that. Maybe I can’t figure it out, but somebody can. You might figure it out. You go tell people. Somebody going to make a difference.

We are not content with things as they are. Let us change our lives so we may love them the more. Things spiral around. And this is the time.

This is the time to stand for those things that are close to the American spirit. We are not content with things as they are. We reject the view of those who say, ‘America—love it or leave it.’ We reply, ‘Let us change it so we may love it the more.’ And this is the time.

Anti-establishment movements are a mess. Whether they’re left-wing or right-wing, whether they’re statist or anarchist, whether they’re organized or decentralized, whether they place emphasis on official or unofficial narratives, any circle of people who are interested in opposing the status quo on a deep, meaningful level almost invariably find themselves significantly bogged down by confusion, paranoia, infighting, and misdirected use of energy.

Every day, for example, I get people in my inbox and social media notifications telling me I shouldn’t quote or share anything from this or that leftist journalist or anti-establishment figure because they’ve said something “problematic” at some point or have some kind of association with some

aspect of the establishment. Rather than simply using narrative-disrupting tools wherever they come from to fight the establishment narrative control machine, I'm encouraged to isolate myself to the extremely narrow spectrum of voices which agree with my exact worldview perfectly. This kind of paranoid, self-cannibalizing mentality is rife throughout most anti-establishment circles.

This happens for a number of reasons, including the fact that the ruling power establishment will infiltrate dissident movements that it perceives as a threat with the intent of sowing confusion and division. But the underlying reason anti-establishment circles so often find themselves getting crushed by their own weight is ultimately because life itself is confusing and difficult to understand. Hardly anyone holds a lucid and steady awareness of just how much of society is comprised of mental narrative. Most people live their lives under the unquestioned assumption that when they are moving around in the world, speaking, acting, forming opinions, having ideas, et cetera, they are interacting with something that resembles objective reality. The truth of the matter is that most of the things which draw people's attention in their day-to-day experience, whether it's names, titles, news stories, political parties, economics, history, philosophy, religion, or what have you, consist entirely of mental noises firing off inside human skulls.

You might think it's a big jump to go from chatting about the sociopolitical dynamics within dissident movements to making vaguely Buddhist-sounding observations about human thought, but it's really not. The reason our species is in a mess right now, and thus the reason movements exist which seek to change the status quo, is because so much of life is dictated entirely by made-up mental narratives which can be easily controlled by the powerful, and hardly anyone fully grasps this. If they did, the revolution against the establishment would very smoothly and quickly succeed.

Scientific research has found that astronauts suffer problems with coordination, perception, and cognition when they are unable to determine which way is up in space. There is no "up" or "down" when you're outside the gravitational pull that our bodies are adapted to, so its absence sends our whole system out of whack. Navigating a society that is made of mental narrative is very much the same; if you don't know which way's up, you'll get lost and confused. Before you can see the narrative matrix clearly, you might be aware that some narratives serve power and swat at them while you're spinning through space, but you won't have any solid ground on which to orient yourself for the purpose of forming a clear path forward toward a healthy and harmonious world.

Your first and foremost task as a revolutionary, therefore, is to find solid ground on which to plant your feet while operating within a swirling

sea of narratives and counter-narratives. Without this you'll find yourself expending energy on ineffectual agendas, chasing shadows, attacking friends and advancing the interests of the enemy as you stumble around trying to fight a threat you can't even see clearly. You've got to figure out for yourself which way's up. The only way to do this is to turn inward and sort out your own mental narratives in your own experience. This takes a lot of dedicated work, because there are many layers of tightly believed narratives which dictate one's perception of the world that most people aren't even aware of.

As soon as we're born we are given a name which has nothing to do with the nature of the slimy, screaming naked creature which came roaring thunderously alive out of the womb. We spend our childhood being told who we are in various ways by our family, then we go to school to get taught how to think like everyone else and get labeled good/smart or bad/stupid for the rest of our lives based on how well we dance that dance. Along the ride we pick up coping mechanisms to deal with the stress of this whole unnatural ordeal, many of which become extremely counterproductive unconscious habits in later years. We pick up likes and dislikes, interests and aversions, life philosophies, religious beliefs, societal beliefs, political beliefs, all of which come together to form our worldview.

Because the foundations of our entire worldview are formed in early childhood long before we're mature enough to decide for ourselves what a useful foundation might look like, we wind up interfacing with life through this muddled, inefficient network of mostly unconscious mental and perceptual habits which don't serve us very well. It is with this warped tool that we interact with the vast sea of official and unofficial narratives we are presented with in our attempts to decipher what's wrong with the world and how to fix it. The path, then, is to unwind this whole confused, unconscious muddle of mental and perceptual habits until we get to the untarnished blank canvas of that powerful screaming baby who first met this wild world, and inhabit it consciously. That right there is our solid ground.

Who are you? Underneath the mental narratives about who you are? Underneath all the stories, labels, and beliefs? Underneath the field of consciousness full of thoughts, sensory impressions, and feelings? This is the most important inquiry that anyone can possibly engage in, and it is worthy of the entirety of your focus until it's resolved.

All of these swirling, babbling thought stories have dictated our lives for as long as we can remember, but rarely does anyone sit down and start sorting out where they come from and if they're useful. We lug around ancient mental narratives about life, about how we should be, about how other people should be, about the best ways to find happiness, about the best ways to avoid unhappiness, and we rarely consider the possibility that

we can interact with life unencumbered by that heavy load.

If you want to find solid ground beneath your feet so that you can push effectively for a healthy world, you've got to question every assumption you've ever made about yourself and the nature of the world, even your very most fundamental assumptions, because it's all narrative. As you turn your attention toward your essential nature and away from your churning, babbling mental habits, interest and attention will move away from mental narratives and toward the solid ground upon which they appear. The mind will relax and mental narrative will take on its proper role as a tool that can be used when it's useful and set down when it isn't, rather than the dominating feature of every minute of waking existence. Unhelpful mental habits can be discarded, and all attempts at narrative manipulation will stand out like a black fly on a white sheet of paper.

I can't tell you how to do this. Everyone's path to the heart of the fundamental matter is unique, and you can only travel it on your own. I can tell you that the answer does not exist in the realm of thought, and that it is closer to you than your own breath. Sincere, dedicated inquiry into your own true nature, on your own and in your own way, will lead you to the ground on which you must take your stand in order to fight the establishment narrative machine effectively

If people could see the world with fresh eyes, as though they were viewing it for the very first time, they would suddenly find themselves smashed between two equally strong yet wildly different experiences. On the one hand, they would experience breathless awe at the thunderous beauty of everything that exists. We tend to develop a mental habit of taking things for granted just because we have a thought story about knowing what they are and having seen them before. The labeling, dividing mind says, 'Oh yeah, I know what that is, that's a tree. I've seen a million of those, no big deal,' and we make a habit of overlooking it. This habit combines with our fixation on looping mental chatter to pull the interest and attention out of our experience of the world which would otherwise be experienced as a nonstop eruption of staggering beauty.

On the other hand, someone seeing the world with fresh eyes would at the same time experience howling rage at all the immense evils that the mass media manipulators have convinced us to accept as normal. All the oppression, exploitation, violence, domination, ecocide, and corruption which we were born into would no longer be seen as unfortunate but necessary mundane realities, and neither would all the horrible propagandists who deceived us into thinking they were.

Even the most informed and skeptical-minded people who are well aware that there is a nonstop psywar being waged by the powerful against human

decency and common sense tend to think of establishment propaganda in terms that fail to encapsulate its most pernicious aspects. Most hip, conspiracy-aware individuals, when asked to point to examples of mass media propaganda, will talk about things like discrepancies in coverage which benefit Western power structures, or the deliberate undermining of all political candidates even a tiny bit outside the mainstream consensus, or the lies that have been used to manufacture consent for wars. All of those are of course real things that have real consequences, but they are not the most significant and consequential aspect of establishment propaganda. The most significant and consequential aspect of establishment propaganda is the simple, everyday practice of manufacturing normality.

By “manufacturing normality” I mean the way the plutocrat-owned political/media class pour massive amounts of energy day in and day out into making the ridiculous, horrific status quo seem normal. They do this in many ways, both by action and by inaction. The way a celebrity saying something obnoxious on Twitter is treated as immensely newsworthy while daily US drone strikes overseas go completely unreported. The way people starving and dying of exposure both in the third world and in the first while resources are vacuumed up by an elite few is something we’re all kept just dimly aware of while Johnny Popsong wearing a meat tuxedo to the Snobbies occupies headlines for days. The way mainstream TV shows, movies, and music are all just really long commercials for capitalism and egocentrism.

Every time something horrible happens without news reporters treating it like something horrible, normality is being manufactured. Every time something unimportant happens that is treated as newsworthy, normality is being manufactured. Every time our bizarre, bat shit insane status quo is commented on without Jake Tapper taking his eyes off the teleprompter and screaming “HOLY SHIT WHAT THE FUCK HAVE WE BECOME,” normality is being manufactured. This happens every single day, many times a day.

This is hard to talk about, precisely because it has been so normalized. It’s easy to point out the glitches in the matrix that stand out against the background of normality like when CNN interviews a seven year-old girl to tell us all how important it is to invade Syria or whatever; it’s much more difficult to talk about the background of normality itself. And this is why the propaganda machine’s ability to manufacture normality is so powerful: by controlling what we all see as normal, they are able to spin any attempt to deviate from that false image of normality as abnormal. Humans are conditioned to see safety in normality; if patterns are constant and sustained we feel like we can relax, if patterns are disrupted we feel under threat. For this reason even something so clearly evil and deranged as the US forever

war can be spun as normal and therefore safe, and any attempt to end it can be spun as abnormal and therefore unsafe.

We're dealing with this exact kind of dynamic all day, every day. The narrative managers say all day every day in myriad ways that the status quo of endless war, exploitation, oppression, ecocide, and propagandistic mass mind control are all perfectly normal, and that the normal human impulse to pull away from that status quo is weird and dangerous.

People are afraid of being trapped inside a box, but they don't realize that they are already trapped inside a box—their brain—which is locked within a bigger box—human society with its myriad fictions. When you escape the matrix the only thing you discover is a bigger matrix. People fear that being trapped inside a box, they will miss out on all the wonders of the world. As long as Neo is stuck inside the matrix, and Truman is stuck inside the TV studio, they will never visit Fiji, or Paris, or Machu Picchu. But in truth, everything you will ever experience in life is within your own body and your own mind. Breaking out of the matrix or traveling to Fiji won't make any difference. It's not that somewhere in your mind there is an iron chest with a big red warning sign 'Open only in Fiji!' and when you finally travel to the South Pacific you get to open the chest, and out come all kinds of special emotions and feelings that you can have only in Fiji. And if you never visit Fiji in your life, then you missed these special feelings for ever. No. Whatever you can feel in Fiji, you can feel anywhere in the world; even inside the matrix.

Or have you any idea how many movies, novels, and poems you have consumed over the years, and how these artifacts have carved and sharpened your idea of love? Romantic comedies are to love as porn is to sex and Rambo is to war. And if you think you can press some delete button and wipe out all trace of Hollywood from your subconscious and your limbic system, you are deluding yourself.

How do you live in an age of bewilderment, when the old stories have collapsed, and no new story has yet emerged to replace them?

All political ideologies might be viewed as mental and emotional crutches, or substitute religions: for leaders, a means of manipulating attitudes and behaviors; for the rank and file, a lazy surrogate for problem solving and a way of fulfilling the craving to belong to something bigger than oneself.

How do we become part of any culture, any form of life, save by accepting its suggestions to be our truth? Suggestions by the thousands, millions, there's seas of suggestions; accepted, worshiped, reasonable and un-, declined, ignored, all of them pouring unseen through me, through every human being, every animal, every life-form on Earth: got to eat and sleep, feel hot and cold, pain and pleasure, got to have a heartbeat, breathe air, learn all physical

laws and obey, accept suggestions that this is the only life there is or ever was or ever will be.

Every suggestion of every second, every decision we make or don't make is poised on the pinpoint of the decision that's gone before; the decision before was poised on the one before; each one elected by which suggestion I decide is true for me. No one ever makes a decision for me: when I accept advice, I'm the one choosing to act on it. I could have said no, a thousand different ways. Call suggestions 'hypnosis' and all of a sudden here's a label you've been looking for, here's the pattern—the puzzle fits together. Every day, everybody in the world's going deeper into their own trance, everybody's got their own story they're believing about themselves.

Take the notion, which we all learn as children and most of us accept as self-evident truth, that what sets humans apart from other animals is rationality; that we, as a species, "possess the faculty of reason." This is very much a Medieval notion. If you think about it, it also doesn't make a lot of sense. If "rationality" is just the ability to assess reality more or less as it is and to draw logical conclusions, then most animals are extremely rational. They solve problems all the time. Most might not be nearly as good at it as humans but there is no fundamental difference in kind.

Go to the primate section of the Bronx Zoo where you can see our close relatives in the primate family leading their own busy social lives. You can also see masses of tourists laughing at the caricature of humans that the lower primates represent. Now imagine being a member of a higher-level species—say a "real" philosopher, a truly wise person—far more sophisticated than the human primates. You would certainly laugh at the people laughing at the nonhuman primates. Clearly, to those people amused by the apes, the idea of a being who would look down on them the way they look down on the apes cannot immediately come to their minds—if it did, it would elicit self-pity. They would stop laughing. Accordingly, an element in the mechanics of how the human mind learns from the past makes us believe in definitive solutions—yet not consider that those who preceded us thought that they too had definitive solutions. We laugh at others and we don't realize that someone will be just as justified in laughing at us on some not too remote day. Such a realization would entail the recursive, or second-order, thinking that many are not good at.

Their narrow circles of immediate experience held inside that bigger ocean of outlying beliefs and assumptions. In any era, there are truths that people take as obvious, stories that they think are weird or wrong, and dreams that they believe are distant or doomed. We like stories about time travel and living robots, and even have some speculative thoughts about how they might be made to happen. But on the whole we believe that the

time we're living in, and the way we live in it, is just the natural way things are. We like strange stories but believe only a few.

The obvious truths of 1809, the kind that were taught in school, involved what could be called a “vertical” organization of life, one in which we imagine a hierarchy of species organized on earth, descending from man on down toward animals, and a judge appraising us up above in heaven. Man was stuck in the middle, looking warily up and loftily down. People mostly believed that the kinds of organisms they saw on earth had always been here and always would be, that life had been fixed in place since the beginning of a terrestrial time, which was thought to go back a few thousand years at most. The eighteenth-century Enlightenment had, of course, already deepened a faith in Reason among the elite, but it was not a popular movement. It had altered many ideas without changing most minds.

People also believed—using examples ancient and modern; and the example of the Terror in France, which had only very recently congealed into Napoléon’s empire, was a strong case—that societies without inherited order were intrinsically weak, unstable, and inclined to dissolve into anarchy or tyranny. Democracy in the sense we mean it now was a fringe ideal of a handful of radicals. Even in America the future of democracy was unclear, in part because of the persistence of slavery, which was still a feature of Western life. Democracy was hard to tell from mob rule and the tyranny of mob rule. Democracy existed, and was armed, but didn’t feel entirely liberal; the difference between reformist parliamentary government and true democracy seemed disturbingly large even to well-intentioned people.

“Morally, we are caught in a system we did not design, faced with unpleasant choices we would rather skip over, torn between wanting a little more ease and a nagging conscience that suggests that such ease is not worth the moral cost, and sometimes compelled to choose what we would think is the least bad of two distressing alternatives.”

We are increasingly enmeshed in incompetent systems—that is, systems that exhibit pathological behavior but can’t fix themselves. This is because solving the problems of such a system would require coordinated action by significant components of the system, but engaging in such action(s) is not in the short-term interest of any individual component (and may indeed be counter to its interests). So, in the end, pathological system behavior continues until catastrophe ensues.

A case study of an incompetent system is our intellectual property regime, a large part of which is concerned with copying and the regulation thereof.

This regime was shaped in an analog world—in other words, an era in which copying was difficult, degenerative, and costly, and in which dissemination of copies was difficult and expensive. We now live in a digital world, in which copying is not only effortless, non-degenerative, and effectively free, but is actually intrinsic to digital technology. What is a computer, after all, but a copying machine? Copying is to digital technology as breathing is to animal life; you can't have one without the other. So trying to apply an IP regime designed for analog circumstances to a world in which all media and cultural artifacts are digital offends against common sense. Everybody knows this, but the prospects of getting a solution to the problem are poor. Why? Because moving to a more rational IP regime would require concerted action by powerful vested interests, each of which has a stake in the status quo. They're not going to move—which is why our IP regime is an incompetent system.

In an influential essay published in 1989 and in a subsequent book, Francis Fukuyama claimed that liberal democracy was the final form of human government, the “end point of mankind's ideological evolution.” Every country would eventually become democratic, and there would be no fundamental change in political organization from then on. This would be a shame, because there may be better forms of political organization that we can aspire to. But the spread of democracy may actually make it harder to discover these alternatives. To see why, we need to understand something that may at first appear counter-intuitive. Democracy doesn't give most people what they want; in fact, it leads to majority dissatisfaction.

When Barack Obama won the 2012 election with 51 percent of the vote, for example, it wasn't just the 49 percent who voted against him who were unhappy with the result. Most of those who voted for Obama were pretty disappointed too—because Obama ran on a platform that did not represent the ideal policy bundle of more than just a few voters. In every election, voters are forced to choose between a tiny selection of candidates, none of whom they particularly like. Everyone will be disappointed no matter which candidate wins, because nobody had a chance to vote for their ideal manifesto to begin with.

The very thing that makes majority dissatisfaction inevitable in a democracy, the voting mechanism, also makes it hard for a better political system to develop. The reforms that would be necessary to pave the way for alternative systems of governance lie well outside the safe middle ground of the median voter. Politicians advocating such reforms are unlikely, therefore, to be voted into office. For example, one route to discovering alternative forms of governance may begin with the secession of a few cities from their parent nations, or in the creation of new cities from scratch, operating under rules

different from those in the rest of the country. It's hard to imagine elected politicians getting away with such things, however, even if they wanted to. The only historical precedents so far have occurred in autocratic regimes, where leaders do not have to worry about reelection.

We should worry that democracy may turn out to be a historical cul-de-sac, a place that looks pleasant enough from far away but doesn't lead anywhere

When discussing global issues, we are always in danger of privileging the viewpoint of the global elite over that of various disadvantaged groups. The global elite commands the conversation, so it is impossible to miss its views. Disadvantaged groups, in contrast, are routinely silenced, so it is easy to forget about them—not out of deliberate malice, but out of sheer ignorance.

When you use the frames and language of your opponents, you don't persuade them to adopt your point of view. Instead you adopt theirs, while strengthening their resistance to your objectives.

Could our parameters on reality be set just a little too tight? I am most skeptical of those things I'd most like to believe, precisely because I'd like to believe them. Wanting to believe something can skew one's view.

The left isn't really a thing and neither is the right, they are but a spectrum of people who gravitate to ideas based on a set of values and where they feel like they fit relative to the culturally established polarities promoted, and to a large extent in the US what determines left and right ideologies is established by the Republican and Democratic parties. And the people don't set the agenda of either of the parties. Wealthy elites set their agenda, which equates to the people having no real voice, only if they want corporate authoritarian plan A or B.

The extremes of the spectrum of left and right are often misconstrued intentionally by those attempting to manipulate the public dialog, and for my purposes here, like the word 'radical,' the word 'extreme' isn't to mean good or bad only the furthest realms of thought down a logically consistent path. Most people have a mixture of right and left ideas, but the ideological thinking at the root of the left and right, what I'm referring to here as the extremes, have certain core beliefs at their foundations.

So the extreme right is embodied by the following ideas: An open endorsement of competition, discipline, control, militarism, shame, and punishment behavior modification—prisons and courts, law and order. A might makes right power structure, acting on fear impulses and using it as motivational tool. A culture of violent domination and ownership as a means to an end to accomplish the interests of the installed hierarchy. The right-wing embraces an archaic, brutal winner-take-all competition where the hoarding of resources is encouraged to utilize leverage over other people,

and warfare and policing is commonly employed to achieve those means if necessary.

And because they believe in hierarchy and broken ideas like “leadership” they are innately against mechanisms that distribute power whether they be economic or political. Hence they are against socialist policies of government that limit profits for corporate interests like healthcare, but for the physical authority aspects of socialism like policing, jails, and military. Also due to their belief in ruling hierarchy there is a more natural submission to play the role of unthinking pawn to an authority and those at the top of the pyramid will more commonly exhibit authoritarian tendencies.

Under the doctrine of the right the ruling power acts like a parent to the people. The parent will play nice so long as the child behaves, they may even negotiate occasionally should it be easier for the adult to briefly yield than use corporal punishment, but should the child interfere with the relationship with power to the adult then violence will be used to reestablish power.

The environment and human life are secondary priorities to maintaining the power structure to the right-wing. Words are reframed if not outright inverted to mask the extremely negative repercussions from operating in competitive hierarchy, where implications such as war, class subjugation, incarceration, and ecocide are merely the price we have to pay for the good of the nation state and its sacrosanct economic system. Nationalism and organized religion are heavily promoted by right-wing authoritarians as these are both ideologies where critical thinking is circumvented in favor of blind allegiance. They both have leaders who serve as conduits to a higher power; in religion this is the priest class and in patriotism a leader like Trump fills this role, who gains his power by being conduit to the American mythology and putting a flag in front of every atrocity made while lurching for more power. Every act of violence and abuse of power orchestrated is put in the context of a mistake or a necessity while ostensibly trying to protect ole glory.

The rationale dismisses most actions that might be considered ugly as merely isolated events and not indicative of the system itself which is beyond reproach as the mythology of the founding fathers is sacred, just as the bible itself was infallible to Christians as soon as ink touched parchment. Everything to foster a belief in held power and perpetuate the status quo way of doing things, while attempting to justify all the actions of it. Wholesale “loyalty” to a side is an underlined virtue. Due to blind subscription to -isms, the activities of ruling power are never dubious enough to dim the fidelity of the people to the -ism, in part because they have personified the -ism as a part of themselves, it becomes part of their identity, and thus all misgivings

are rationalized through the ultimate good they believe the power represents since they believe themselves to be good. And no matter how much evidence is presented to the contrary it remains sacrosanct to question that authority because it's akin to questioning their own ego identity.

As for the ideology of the extreme left, they are at root based in human cooperation, sharing, equality, and flattened models of power in a voluntary economic system. Lefty ideas are usually embodied under the umbrella of ideologies like socialism, communism, and most forms of anarchism. Consciousness, and the quality of it—for all living beings—is prioritized. Compulsory conformity is frowned upon. The extreme left consists of people who want to be left alone to live free in their communities unmolested by business interests and government. The extreme left chooses symbiosis with nature rather than bulldozing over it. They encompass shamanistic Native America values, with strong ties to community without petty division and being stewards of the land.

A live and let live outlook is embraced, a take only pictures leave only footprints mentality. Peace, diplomacy, and understanding are at the forefront of thought when dealing with others. Violence is a last resort only when facing an unyielding force, such as what Western empire is to countries not currently in their financial snare. And again, the left isn't really the political left, they are merely a diverse group who react to fear differently than those who more closely associate to ideas on the right. Lefties are traditionally less reactionary to fear, and less vengeful to external threats; maintaining a do unto others mentality with a belief that people should not exploit others or the land for profit. Not controversial stuff, just treat everyone like you would like to be treated, the Golden Rule.

Lefties are funded by almost no one with a big pot of gold, likely because there is an underlying contention on the left that no one needs to be that rich and powerful, so those who crave wealth and spend their days chasing money and power don't typically have much in common with core lefty values. And George Soros, Bill Gates, and other so called lefty elites don't support lefty writers, pundits, and journalists like the Koch brothers support on the right-wing, mostly because those billionaires aren't really the left, they are Reagan-era conservatives who are only considered lefty relative to Trump-era conservatives.

It's primarily the left that cares if animals are mistreated, the left that finds trophy hunting and abattoirs disdainful, the left that doesn't support "double tap" drone bombing, or giving weapons to hard-line authoritarian allies like Saudi Arabia who drops them on school buses in Yemen. The lefties are the ones suggesting nation states prioritize taking care of the people and living sustainably instead investing in mass murder and ecocide

on a global scale. Or that humanity not be an authoritarian shitshow. But for these sentiments the argument is inverted by the right-wing and the left is called authoritarian. The rebuke from the right-wing often lands on a variation of the following argumentation:

“Did you hear about Stalin and Hitler? They were authoritarian lefty communist/socialist types, and didn’t you know that communism and socialism always end in tragic failure?”

However, I’ve yet to meet a lefty that would support a modern day Stalin or Hitler regime or any of their methodologies, or their structure of power, or the way they conducted any of their business as usual behavior, but according to some punditry on the right, this is an example of a violent failure from the left. The most horrendous right-wing activities are pegged onto lefties as a basic straw-man shell game and intentionally using the most convenient arguments usually blurted from a bully pulpit with a large installed audience where the counter arguments are muted and/or ignored by big media outlets.

The misconceptions of what and who is radical have been driven by the aforementioned right-wing. Values are again very intentional. The right-wing is what Western civilization is based on, and they contort and confuse every successive generation into believing aspects of red-baiting propaganda, which works really well when one can control media outlets and silence dissent. Like when they sentenced lefty socialist Eugene Debs to a decade in prison in 1918 for nothing more than giving a speech. And today the ruling elite right-wing authoritarians have sought punishment for Julian Assange, Edward Snowden, Chelsea Manning, and others for whistle-blowing on the heinous activities of the state. If the people at the top of the hierarchy had lefty values they’d thank them for pointing out the corruption, but the reaction of the US government tells you all you need to know about the ideology currently running the world.

The proper and reasoned response to this systemic construct of intentional mass inequality, which threatens the very continuance of countless species, is to reject it outright. This is a system that deliberately manufactures inequality so an oligarchy can forever enrich themselves while keeping the lower classes divided, subjugated, and bemused. To create such inequality others must be disempowered to the point they cannot resist, clearing the way to properly rob them of the land beneath their feet and plunder the natural world for resources. The powers that be propagate large scale plans—like the Southern Strategy—for dividing people and not caring about the human suffering that is a result of their social meddling even should it lead

to violence, which is the intended result in most cases where it occurs. Their objective is only to virulently defend the helm of power at any cost, and to serve economic interests of those who already have more than their share.

Radical change starts with understanding that the way things are now isn't how they have to be. What occurred yesterday doesn't have to be what happens tomorrow. However, being a radical is not something to be taken lightly. Drawing outside the lines that comprise defined societal norms takes courage, but we should not endeavor to do things simply to prove we are not afraid, or to garner a sense of status, or because it betters our odds of getting laid. But when simple truths go ignored which give rise to widespread abuse and inequality, and standing up to end these practices makes one a radical—then so be it.

Be fuckin' radical.

Be radical when it comes to standing up for any action that reduces suffering of another. Be radical to protect all nascent threads of emotional connection, creativity, and courage wherever they may lie. Radically see life and consciousness in everything and treat all as an equal, radically enlighten, be radically sustainable; these are not controversial things yet they are all under attack to the degree that to be logically consistent with these ideas will make one a radical with a negative connotation. So in the face of ecocidal empire we must rebel radically, yet with radical wisdom to know that the methodologies in which we bring about change will determine the values that will be expressed into any new system of change. Divesting from the current economic methodologies, using radical non-participation, radical civil disobedience, and creating self-sufficient sustainable communities will help drive power away from the current model and potentially break it. Though, I'm afraid there's no way forward unless we accept being radical.

If you think you're right about something, first you have to see that you're making assumptions, and then you have to examine them—truly, honestly examine them—and once you've done those things and thought them through and come to your conclusions and stuck to that, then are you rigid? If you've made a decision that you believe in? Depends how you define rigid.

Enthusiast: An enthusiast displays an intense and eager interest in something (a sky-diving enthusiast).

Fanatic: A fanatic is not only intense and eager but possibly irrational in his or her enthusiasm; fanatic suggests extreme devotion and a willingness to go to any length to maintain or carry out one's beliefs (a fly-fishing fanatic who hired a helicopter to reach his favorite stream).

Zealot: A zealot exhibits not only extreme devotion but vehement activity in support of a cause or goal (a feminist zealot who spent most of her time campaigning for women's rights).

Extremist: An extremist is a supporter of extreme doctrines or practices, particularly in a political context (a paramilitary extremist who anticipated the overthrow of the government).

Bigot: It is the bigot who causes the most trouble, exhibiting obstinate and often blind devotion to his or her beliefs and opinions. In contrast to 'fanatic' and 'zealot,' the term 'bigot' implies intolerance and contempt for those who do not agree (a bigot who could not accept his daughter's decision to marry outside her religion).

No one is objective. I tend to think that if anyone tells you she or he is objective, that person is probably trying to sell you something.

Worldviews are like belly buttons. Everyone has one, but we don't talk about them very often. Or perhaps it would be better to say that worldviews are like cerebellums: everyone has one and we can't live without them, but not everyone knows that he has one.

Does that mean the whole book is biased? Well, sure! But if you think about it, that's unavoidable. Since everyone has a worldview, everyone has a bias. All of us are naturally biased toward our own worldviews, and all of us tend to interpret and evaluate the world in accordance with our worldviews. So do I have a bias? Yes, of course—but so do you! The real issue isn't whether we have biases—we all do—but whether we're aware of them and able to think critically about them. In a certain sense, each of us can step into someone else's worldview, just as we can step into someone else's house, to examine it 'from the inside' and to compare it with our own. I've tried to represent other worldviews fairly in this book: to summarize them accurately and to be realistic about their strengths and weaknesses. Even if you think I've failed in some cases, I hope you will nonetheless learn something useful along the way and benefit from thinking about these important matters.

Let me be up front about my bias. I don't trust former McKinsey consultants. I don't trust military intelligence officers. And I don't trust the type of people likely to appear on "40 under 40" lists, the valedictorian-to-Harvard-to-Rhodes-Scholarship types who populate the American elite. I don't trust people who get flattering reams of newspaper profiles and are pitched as the Next Big Thing That You Must Pay Attention To, and I don't trust wunderkinds who become successful too early. Why? Because I am somewhat cynical about the United States meritocracy. Few people amass

these kind of résumés if they are the type to openly challenge authority. The factors predicting success in our “meritocracy” are a combination of greed, cynicism, obsequiousness, and subordination, lack of curiosity and independence of mind, and self-serving disregard for others. So when journalists see ‘Harvard’ and think ‘impressive,’ I see it and think ‘uh-oh.’

A worldview is simply a person’s overall philosophical view of the world. It’s an all-encompassing perspective on everything that exists and matters to us. Your worldview shapes what you believe and what you’re willing to believe, how you interpret your experiences, how you behave in response to those experiences, and how you relate to others. A religion, on the other hand, is a set of fundamental beliefs and practices concerned with ultimate issues, such as the nature of the divine, the origins of the universe, the meaning of human existence, how we should live our lives and relate to one another, whether there is life after death, what it means to be “saved,” and how we can obtain “salvation.” Religions take many forms, but they typically involve teachings about how God relates to the universe and to us, adherence to certain sacred writings, observance of traditional rites and practices, symbols, moral codes, recognized leaders, and a strong sense of community. The major world religions today include Christianity, Islam, Hinduism, Buddhism, Confucianism, Sikhism, Judaism, Jainism, and the Baha’i Faith. Everyone has a worldview, but not everyone has a religion.

Not all dogmas are equally harmful. Just as some religious beliefs have benefited humanity, so also have some secular dogmas. This is particularly true of the doctrine of human rights. The only place rights exist is in the stories humans invent and tell one another. These stories were enshrined as a self-evident dogma during the struggle against religious bigotry and autocratic governments. Though it isn’t true that humans have a natural right to life or liberty, belief in this story curbed the power of authoritarian regimes, protected minorities from harm, and safeguarded billions from the worst consequences of poverty and violence. It thereby contributed to the happiness and welfare of humanity probably more than any other doctrine in history. Yet it is still a dogma. Thus Article 19 of the United Nations Declaration of Human Rights says:

“Everyone has the right to freedom of opinion and expression.”

If we understand this is a political demand—everyone should have the right to freedom of opinion—this is perfectly sensible. But if we believe that each and every *Sapiens* is naturally endowed with a “right to freedom of opinion,” and that censorship therefore violates some law of nature, we miss

the truth about humanity. As long as you define yourself as “an individual possessing inalienable natural rights,” you will not know who you really are, and you will not understand the historical forces that shaped your society and your own mind (including your belief in “natural rights”). Such ignorance perhaps mattered little in the twentieth century, but it might become fatal in the twenty-first century, because biotechnology and artificial intelligence now seek to change the very meaning of humanity. If we are committed to the right to life, does that imply we should use biotechnology to overcome death? If we are committed to the right to liberty, should we empower algorithms that decipher and fulfill our hidden desires? If all humans enjoy equal human rights, do superhumans enjoy super-rights? Secular people will find it difficult to engage with such questions as long as they are committed to a dogmatic belief in “human rights.”

Secularism should not be equated with Stalinist dogmatism or with the bitter fruits of Western imperialism and runaway industrialization. Yet it cannot shirk all responsibility for them, either. Secular movements and scientific institutions have mesmerized billions with promises to perfect humanity and to utilize the bounty of planet Earth for the benefit of our species. Such promises resulted not just in overcoming plagues and famines, but also in gulags and melting ice caps. You might well argue that this is all the fault of people misunderstanding and distorting the core secular ideals and the true facts of science. And you are absolutely right. But that is a common problem for all influential movements.

Christianity has been responsible for great crimes such as the Inquisition, the Crusades, the oppression of native cultures across the world, and the disempowerment of women. A Christian might take offense at this and retort that all these crimes resulted from a complete misunderstanding of Christianity. Jesus preached only love, and the Inquisition was based on a horrific distortion of his teachings. We can sympathize with this claim, but it would be a mistake to let Christianity off the hook so easily. Christians appalled by the Inquisition and by the Crusades cannot just wash their hands of these atrocities—they should rather ask themselves some very tough questions. How exactly did their “religion of love” allow itself to be distorted in such a way, and not once, but numerous times? Protestants who try to blame it all on Catholic fanaticism are advised to read a book about the behaviour of Protestant colonists in Ireland or in North America. Similarly, Marxists should ask themselves what it was about the teachings of Marx that paved the way to the Gulag, scientists should consider how the scientific project lent itself so easily to destabilizing the global ecosystem, and geneticists in particular should take warning from the way the Nazis hijacked Darwinian theories.

As we come to make the most important decisions in the history of life, I personally would trust more in those who admit ignorance than in those who claim infallibility. If you want your currently existing religion, ideology, or worldview to lead the world, my first question to you is: ‘What was the biggest mistake your religion, ideology, or worldview committed? What did it get wrong?’ If you cannot come up with something serious, I for one would not trust you.

We are speaking of the most important thing: no less a thing than how to live. We might propose, then, that you should arrive at this book as at the beginning of a pilgrimage—a movement toward the truth and toward the self. That you should come to seek conversion, though you know not yet to what belief or way. That you should approach ideas as instruments of salvation, driven by a need to work things through for yourself, so that you won’t be damned to go through life at second hand, thinking other people’s thoughts and dreaming other people’s dreams. It’s been said that people go to monasteries to find out why they have come, and this may be an attempt to do the same.

We are born once, not only into nature but also into a culture that quickly becomes a second nature. But then, if we are granted such grace, we are born again. For what does it profit a man if he gains the whole world and loses his mortal soul? Far from only training workers to contribute to the GDP, or even citizens to play a role within the public sphere, a true education, like a true religion, enables you to stand apart, and if necessary, against, the claims that others make upon you. You can live without a soul, on ego and will alone—you can go on, keep on, and rush on—but you won’t have very much inside you.

We must engender a social conscience. There are wrongs which need attention. There are people who are poor and need help. And we have a responsibility to them and to this country. Through no virtues and accomplishments of our own, we have been fortunate enough to be born in the United States under the most comfortable conditions. We, therefore, have a responsibility to others who are less well off.

There is discrimination in this world, and slavery, and slaughter, and starvation. Governments repress their people; millions are trapped in poverty while the nation grows rich and wealth is lavished on armaments everywhere. These are differing evils, but they are the common works of man. But we can perhaps remember—even if only for a time—that those who live with us are our brothers; that they share with us the same short moment of life; that they seek—as we do—nothing but the chance to live out their lives in purpose and happiness. Some believe there is nothing one man or one woman can do against the enormous array of the world’s ills. Yet many of

the world's great movements, of thought and action, have flowed from the work of a single person.

A young monk began the Protestant reformation; a young general extended an empire from Macedonia to the borders of the earth; a young woman reclaimed the territory of France. These people moved the world, and so can we all. Few will have the greatness to bend history itself, but each of us can work to change a small portion of events, and in the total of all those acts will be written the history of this generation. It is from numberless diverse acts of courage and belief that human history is shaped. Each time a man stands up for an ideal, or acts to improve the lot of others, or strikes out against injustice, he sends forth a tiny ripple of hope, and crossing each other from a million different centers of energy and daring, those ripples build a current that can sweep down the mightiest walls of oppression and resistance.

Few are willing to brave the disapproval of their fellows, the censure of their colleagues, the wrath of their society. Moral courage is a rarer commodity than bravery in battle or great intelligence. Yet it is the one essential, vital quality for those who seek to change a world that yields most painfully to change. And I believe that in this generation, those with the courage to enter the moral conflict will find themselves with companions in every corner of the globe.

The fortunate among us need to resist the temptation to follow the easy and familiar paths of personal ambition and financial success so grandly spread before those who enjoy the privilege of education and the right connections. We will all ultimately be judged on the effort we have contributed to building a better society and the extent to which our ideals and goals have shaped that event.

The future does not belong to those who are content with today, apathetic toward common problems and their fellow man alike, timid and fearful in the face of new ideas and bold projects. Rather it will belong to those who can blend vision, reason, and courage in a personal commitment to the ideals and great enterprises of American Society. Our future may lie beyond our vision, but it is not completely beyond our control. It is the shaping impulse of America that neither fate nor nature nor the irresistible tides of history but the work of our own hands, matched to reason and principle, that will determine our destiny. There is pride in that, even arrogance, but there is also experience and truth. In any event, it is the only way we can live.

“Some men see things as they are and say, ‘Why?’ I dream things that never were and say, ‘Why not?’”

Moral imagination is hard, and it is hard in a completely different way than the hard things that elite students are used to doing. You can't study for it. You can't compete for it. The qualities it calls upon are those of character, not intellect. It's never easy, and not only that, it's never enough. You also need courage, moral courage, the bravery to act on your imagination in the face of what your family and friends are going to say to try to stop you. Because they're not going to like it. The morally courageous person tends to make the individuals around him very uncomfortable. He doesn't fit with their ideas about the way the world is supposed to work, and he makes them insecure about the choices they themselves have made—or failed to make. Physical courage is admirable, but in social terms it's usually quite easy. You have your comrades there beside you, your community to cheer you on. Moral courage can be lonely indeed. People don't mind being trapped, as long as no one else is free. But stage a break, and everybody else begins to panic.

There is a hidden curriculum—under-the-hood concepts young children pick up as part of their schooling. This hidden curriculum connects young people to the structures of power in society and defines their relationships to them. Schools implicitly lay out norms and values that are crucial for navigating the outside world; these ideals teach students an approach to living and an attitude toward learning. A connection exists between the unstated lessons schools teach children on one side, and the social classes to which the children belong on the other. Schools do different things to different children. Boys and girls, blacks and whites, rich and poor are treated differently. The result is a silent message about the future paths they should take—for example, the low-income or high-income occupational choices that best fit them. The hidden curriculum of schools stubbornly reproduces the existing power structure of the society; even the ways student cliques form and resist administration policies within schools often echo the class distinctions of the students.

Telling stories is fundamental to every society. No stories are objective reproductions of reality. Folklorists emphasize that tales of all sorts serve up systems of messages that parade norms, values, and moral definitions, and tell people how to frame the world. The key difference between a society's traditional stories and those told by television, movies, and magazines lies in folklore's handicraft nature. Created and diffused organically through society, folklore is a product of the individuals who tell the stories. Modern media tales, news and entertainment, are by contrast created by industries where the concerns of organizations take precedence over all else. The stories result from media firms' need to satisfy marketers, investors, and, sometimes, politicians who benefit from showing people certain views of reality and not

others. Hidden curriculum applies not just to the educational institution but to the education people receive via widespread media about all institutions from their depictions in news and entertainment.

It is a lesson plan that nobody teaches but everyone learns. Culture power is the ability to define the rules of the game of life that most members of a society will take for granted. That some will reject and others will come to oppose some of the rules, or the game itself, is obvious and may on occasion be important. But the most important thing to know is the nature and structure of the representations that most people will assume to be normal and inevitable.

James Joyce called them nets. “When the soul of a man is born in this country,” the protagonist Stephen Dedalus says about Ireland, “there are nets flung at it to hold it back from flight. You talk to me of nationality, language, religion. I shall try to fly by those nets.” Today we have other nets. “What are you going to do with that?” is a net. “Instead of finding yourself, how about finding a job?”—that’s a net. “Am I being self-indulgent if I major in philosophy instead of something more practical?” “Isn’t it self-indulgent to try to live the life of the mind when there are so many other things I could be doing with my degree?” “I want to travel for a while after I graduate, but wouldn’t that be self-indulgent?” These are the kinds of questions that young people find themselves being asked today if they even think about doing something a little different—even worse, the kinds that they are made to feel compelled to ask themselves.

We like to think of ourselves as a wealthy country, but it is one of the great testaments to the intellectual—and moral, and spiritual—poverty of American society that it makes its most intelligent young people feel that they are being self-indulgent if they pursue their curiosity. You’re told that you’re supposed to go to college, but you’re also told that you are being self-indulgent if you actually want to get an education. As opposed to what? Going into consulting isn’t self-indulgent? Going into finance isn’t self-indulgent? Going into law, like most of the people who do, in order to make yourself rich, isn’t self-indulgent? It’s not okay to study history, because what good does that really do anyone, but it is okay to work for a hedge fund. It’s selfish to pursue your passion, unless it’s also going to make you a lot of money, in which case it isn’t selfish at all.

We think it odd that a man should devote his life to writing poems but natural that he should devote it to inducing children to breakfast on Crunchies instead of Krispies.

It wasn’t so long ago that higher education was valued largely for its social relevance. The aim was to produce critical, highly educated citizens who could place their talents at the service of society. But these days the notion

of serving society is considered hopelessly old-fashioned. Universities have been reinvented as knowledge businesses, whose task is to equip students with competencies that enable them to stream straight into the business sector.

Using your privilege to pursue your dreams is spiritually suspect, but using it to enrich yourself still further is somehow authentic. If you've been blessed by Mammon, the feeling appears to be, it would be disloyal not to worship him.

These are four modes of human achievement paired with what might be considered their more familiar accompanying archetypes:

Climbing–Expertise: Moving up the path of steepest ascent toward excellence for admission into a community that holds and defends a local maximum of fitness.

Crossing–Genius: Crossing the ‘Adaptive Valley’ to an unknown and unoccupied even higher maximum level of fitness.

Moving–Heroism: Moving ‘mountains of fitness’ for one’s group.

Shaking–Rebellion: Leveling peaks and filling valleys for the purpose of making the landscape more even.

The essence of genius as a modality is that it seems to reverse the logic of excellence. Sometimes we must, at least initially, move away from apparent success and headlong into seeming failure to achieve outcomes few understand are even possible. This is the essence of the so-called Adaptive Valley, which separates local hills from true summits of higher fitness. Genius, at a technical level, is the modality combining the farsightedness needed to deduce the existence of a higher peak with the character and ability to survive the punishing journey to higher ground. Needless to say, the spectacle of an individual moving against his or her expert community, away from carrots and toward sticks, is generally viewed as a cause for alarm regardless of whether that individual is a malfunctioning fool or a genius about to invalidate community groupthink. The heroes and rebels don't even accept the landscape as immovable but see dunes of fitness to be shifted by a sculpting or leveling of the landscape, with an eye toward altering the fitness of chosen populations.

Ideals: Justice, beauty, goodness, truth—the old moral lodestars. We seem to find the word forbidding now, preferring the squishier “values.” But ideals have enormous power. They give you the strength to resist the seductions of status and wealth and success. An ideal is something that is

more important to you than anything the world can give you. It functions the way that religious belief once commonly did, and in fact I've found that religious students are often the ones who possess the greatest degree of moral autonomy, and are most indifferent to outside approval. Ideals are psychological goals, necessary to the health of the mind. And although you are expected to discard them at the college gates the day you graduate, Franklin Delano Roosevelt wrote to his old headmaster forty years later, during the darkest days of World War II, to thank him for urging him to hold fast to his youthful ideals in later life.

What people usually mean by a leader, when referring to students, is now someone who, in a very energetic, upbeat way, shares all the values of the people who are in charge. Leaders tend to be little adults, little grown-ups who don't challenge the big grown-ups who run the place. When people say 'leaders' now, what they mean is gung ho followers.

The point is not to have a high IQ. The point is to use it. Intelligence is not an aptitude. It's an activity—and an ethical activity, to boot. We don't need students to be radicals; we only need them to be skeptical. 'Skeptical' comes from a word that means "to look." A skeptic is someone who bothers to look. What good does it do if you make it to the top, if by the time you get there you are just another "leader"—another opportunist, another genial conformist, another mediocrity?

The timid practicality that is the major message that our kids absorb today is alibied—and camouflaged, and soothed—with a hollow commercialized rebellion. You need to avoid that kind of crap. Putting a sticker on your MacBook that says "I'm an individual" (in whatever paraphrase) does not make you an individual. Getting a piercing, growing a mustache, moving to Austin—these do not make you an individual. You can't accessorize your way to moral courage. The choices it involves are not consumer ones. Cool furniture and hip music are perfectly nice, but they are utterly beside the point. Facebook also doesn't count; you don't become an independent thinker by posting quotes from independent thinkers. Here's a rule of thumb: if you aren't giving anything up, it isn't moral and it isn't courage. Stumbles, sacrifices, inner struggle, false starts and wrong turns, conflict with parents and peers—these are some of the signs of the genuine article. The way you know it's real is if it hurts.

It's not enough to resist accepted ideas; you also have to resist the people who purvey them, which is pretty much everyone: your parents, your teachers, your peers, your friends. Your group, whatever that may mean to you—an identity group, a party, a church. If you're an environmentalist, it means the other environmentalists. If you're a libertarian, it means the other libertarians. Acting with a group does not mean thinking with a

group. In every context, there are questions that you aren't supposed ask. The job of a leader, the job of a thinker, is to identify and ask them. This is where courage comes in.

People don't like it when you challenge the consensus, especially when it's one that's so pervasive that they do not even realize that it exists. When you question it, you're forcing them to question it as well. You're drawing out the doubts they've worked so hard to keep in check. The dissident impulse, the impulse to say no, has traditionally been a very powerful one in American culture. But it's hard to see much trace of it today—not even among the young, and certainly not among the young on selective campuses. Students now no longer seem to make the kind of fundamental demand upon society—that is, for a different world—that would once have been seen as a matter of course. They're making noise of course, but the system has quite capably channeled the noise into safe outlets.

We each must win our independence by mounting a private revolution to free ourselves from the tyranny of existing mental structures. Independence, revolution, tyranny, freedom: concepts that are essential to America's collective history, as well.

A student once complained that his father hadn't sent him to Harvard to become more confused. Yes, he did, or at least, he should have. College is the place to learn that most of what we believe (history is exemplary in this regard) is much more provisional and complicated than we usually care to admit. That may sound like mental masturbation—the pointless multiplication of complexity and nuance, the endless entertainment of theories, hypotheses, and alternatives, everything that people mean by “academic” in the pejorative sense. What it is, in fact, is an honest confrontation with reality.

History is a graveyard of classes which have preferred caste privilege to leadership. Our institutions don't reward cantankerous intellectual bomb-throwers. But, that's exactly who we need to start rewarding.

People often tell us that political and economic issues are too complex for us to understand, but I think mainly the problem is that those in power hide facts from us, and if we knew more, we would understand more, and we would be able to better respond to them.

The problem is that it has become extremely complicated to grasp what we are actually doing. The commandment not to steal was formulated in the days when stealing meant physically taking with your own hand something that did not belong to you. Yet today, the really important arguments about theft concern completely different scenarios. Suppose I invest \$10,000 in shares of a big petrochemical corporation, which provides me with an annual five percent return on my investment. The corporation is highly profitable

because it does not pay for externalities. It dumps toxic waste into a nearby river without caring about the damage to the regional water supply, to the public's health, or to the local wildlife. It uses its wealth to enlist a legion of lawyers who protect it against any demand for compensation. It also retains lobbyists who block any attempt to legislate stronger environmental regulations. Can we accuse the corporation of stealing a river? And what about me personally? I never break into anyone's house or snatch dollar bills from anyone's purse. I am not aware how this particular corporation is generating its profits. I barely remember that part of my portfolio is invested in it. So am I guilty of theft? How can we act morally when we have no way of knowing all the relevant facts?

In a world in which everything is interconnected, the supreme moral imperative becomes the imperative to know. The greatest crimes in modern history resulted not just from hatred and greed, but even more so from ignorance and indifference. Charming English ladies financed the Atlantic slave trade by buying shares and bonds in the London stock exchange, without ever setting foot in either Africa or the Caribbean. They then sweetened their four o'clock tea with snow-white sugar cubes produced in hellish plantations—about which they knew nothing. In Germany in the late 1930s, the local post office manager might be an upright citizen looking after the welfare of his employees, and personally helping people in distress to find missing parcels. He was always the first one to arrive at work and the last one to leave, and even in snowstorms made sure that the post came on time. Alas, his efficient and hospitable post office was a vital cell in the nerve system of the Nazi state. It was speeding along racist propaganda, recruitment orders to the Wehrmacht, and stern orders to the local SS branch. There is something amiss with the intentions of those who do not make a sincere effort to know. But what counts as a sincere effort to know?

If you want to go deeply into any subject, you need a lot of time, and in particular you need the privilege of wasting time. You need to experiment with unproductive paths, to explore dead ends, to make space for doubts and boredom, and to allow little seeds of insight to slowly grow and blossom. If you cannot afford to waste time you will never find the truth.

If you really want truth, you need to escape the black hole of power, and allow yourself to waste a lot of time wandering here and there on the periphery. Revolutionary knowledge rarely makes it to the centre, because the centre is built on existing knowledge. The guardians of the old order usually determine who gets to reach the centres of power, and they tend to filter out the carriers of disturbing unconventional ideas. Of course they filter out an incredible amount of rubbish too. Not being invited to the Davos World Economic Forum is hardly a guarantee of wisdom. That's

why you need to waste so much time on the periphery—they may contain some brilliant revolutionary insights, but they are mostly full of uninformed guesses, debunked models, superstitious dogmas, and ridiculous conspiracy theories.

The kind of role that I tried to play was to pick up pieces or put together pieces out of which I hoped organization might come. My theory is: strong people don't need strong leaders.

For years, decades even, the US has had a policy of assassination. Americans believe that if you kill the leaders, you kill an organization. This is delusional. It only works when it almost isn't necessary. How many times has the US killed the number two man of the Taliban? Did killing Osama stop al-Qaeda? Assassination *only* works when the organization is unhealthy *or* when much of it doesn't agree with the current leader but is following them anyway.

In a healthy organization, someone else just steps up and leads, and they're about as good as whoever was there before. It's not that leadership doesn't matter, it's that healthy organizations create lots of people who are capable of leading. Very few leaders are actually genius leaders; most of what looks like genius is leading a good organization, and know-how. Sometimes, someone is the first person to really figure out how to lead an organization, but if they're good, they train successors, or people learn from watching them. The other time it works is if there is a genuine disagreement in organization. Perhaps some are willing to make peace, and some aren't, and if you kill a few of the key leaders who don't want to make peace, you can get peace.

The problem with all this, however, is that it's often hard to tell who is actually a genius leader and which people actually believe in the organization. A lower ranking leader, gunning for the first spot, is often not public about disagreeing with #1, and if he is, may be lying to get followers. It's just hard to tell. As for genius: It's rare, and people are good at faking it—until crunch time. Who was America's last genius leader? Genius political leaders are truly, genuinely, rare. And genius politicians often are terrible leaders. But the bottom line is simple: A good organization produces a surfeit of good leaders who agree with the organization's mission. Decapitation only works on unhealthy organizations.

Managers in the US—the US doesn't have many leaders—manage unhealthy organizations rife with disillusionment, designed to promote time serving managers who don't take risks, who actively work to harm the rank and file of the organization, and who believe in nothing but themselves. Such managers find it difficult to get anything done. They have to use fear, coercion, and lies to get the rank and file to follow orders, because their

orders are usually both evil and against the rank and file's self interest. They know that managing organizations is difficult from their own experience, and they think that all organizations are like that.

But organizations like the Taliban or Hezbollah—not to conflate, I don't regard Hezbollah as equivalent in many ways—actually believe in what they are doing. People join because they believe in the mission. Even large drug cartels have a belief in a mission and a winnowing of fools and poltroons that often—though not as often as belief organizations—allows them to replace leadership.

When real leadership meets real mission, people fall over themselves to join. They want to belong. They believe. They will work for virtually nothing. They will beg to be part of something bigger than them. Most Americans have *never* experienced this. They cannot understand it at a gut level. It is alien to them. And no, 'Feeling the Bern' is not it; that's the fast food equivalent at best.

Assassination works only when organizations are unhealthy, and run by managers, not leaders, or during the early stages of a charismatic cult. A healthy charismatic cult, like the early disciples of Jesus, will quickly create enough leaders to survive a decapitation strike.

Some might read this all and say: 'So much of what you say here makes sense, but I still have a big problem with it. If agriculture and other authoritarian technology lead to overshoot and drawdown, which then lead to a choice of either collapse or conquest (and we know which this culture chooses); and if converting a land base to weapons of war leads to a short-term competitive advantage over cooperative and sustainable cultures; how do we stop them?'

I would reply: Congratulations, and thank you. You understood the point of the book far better than I could have dreamed. And what now? Welcome to the war. I'll see you on the front lines.

The world is being murdered. It is being murdered by actions that are perpetrated to support and perpetuate a worldview. Those actions must be stopped. Given what is at stake, failure is no longer an option. The truth is that it never was an option. So where do we begin? We begin by questioning the unquestioned beliefs that are the real authorities of this culture, and then we move out from there. And once you've begun that questioning, my job is done, because once those questions start they never stop. From that point on, what you do is up to you.

And please don't use my own addictions, mistakes, flaws—as I know some will—as an excuse to dismiss my larger analysis. First, the honest reflections of a heroin addict might have more credibility when speaking of that addiction than might that of a non-user. Second, the first step toward

recovery from addiction is to admit there is a problem, and much of this book is aimed toward getting us as a culture to admit we are addicted to this terribly destructive way of life, because if we don't acknowledge that these addictions even exist, we have no hope of breaking them. And third, the point here is not and has never been purity, and while removing the lightbulbs from my own home would help me sleep, it wouldn't do a fucking thing to help the migratory songbirds or the insects, and it wouldn't do a thing to stop consumer culture or any of the other costs of these particular tools and social norms. There are no personal solutions to social problems.

The validity of the arguments does not depend on the virtue of the person making them.

We are at a point in history similar to that in the mid-nineteenth century when we were enmeshed in, and dependent on, an unjust system. Then it was slavery and colonialism; now it is global capitalism, the industrial economy, commercial civilization—whatever you want to call it. In slavery's day, even those who opposed it were de facto supporters; their basic necessities—from cotton to rice to sugar to tobacco—were produced by slaves. Meanwhile those who benefited most from the slave trade—the plantation owners and mercantilists—had bankrolled generations of politicians, professors, and clergy to argue that slavery was ethical and necessary. The forced complicity created a soul sickness, which perhaps explained the blossoming in that era of spiritual revivals: Transcendentalists, Mormons, utopian colonies. Only a few committed sects—the Quakers and Amish—were able to renounce the products of slavery. The abolition movement took decades. And so it is today.

Everything in our background has prepared us to know and resist a prison when the gates begin to close around us. But what if there are no cries of anguish to be heard? Who is prepared to take arms against a sea of amusements? To whom do we complain, and when, and in what tone of voice, when serious discourse dissolves into giggles? What is the antidote to a culture being drained by laughter?

This new consensus must begin with dialogue, a conversation that fosters a critical consciousness, a key prerequisite to effective social action. This book is an attempt to ensure that the conversation does not end with nervous laughter. I hope others will pick up where the book leaves off and develop the critique more fully or apply the themes sketched here to other contexts.

I would rather be vaguely right than precisely wrong. When ideas first come into the world, they are likely to be woolly, and in need of more work to define them sharply.

In trying my best to get this right, I am sure that nearly all of what I've written is reasonable, much of it is true, and some of it is wrong. It's not

less than that, and not more.

One of the disadvantages of having your book become a classic is that often, people will actually check out such examples. One of the advantages is that even if they discover you were mistaken, people will continue to cite you as an authority anyway.

At this point, my wrongness doesn't even surprise me. I almost anticipate it. Whenever people tell me I'm wrong about something, I might disagree with them in conversation, but—in my mind—I assume their accusation is justified, even when I'm relatively certain they're wrong, too.

At some point, if you live long enough, it's probably impossible to avoid seeming crazy. Maybe the world simply changes too much for everyone. I sometimes suspect that—just after the Industrial Revolution—the ongoing evolution of society accelerated beyond the speed human consciousness could evolve alongside it. We superficially accept things that can't be understood or internalized. Someone born before the Wright Brothers' virgin 852-foot flight could have died after we'd gone to the moon so many times the public had lost interest. Everything in between happened within their lifetime. It might be unreasonable to expect any normal person to experience this level of constant change without feeling—and maybe without literally being—irrefutably nutzo. Consciously trying to keep up with what's happening might actually make things worse.

We spend our lives learning many things, only to discover, again and again, that most of what we've learned is either wrong or irrelevant. A big part of our mind can handle this; a smaller, deeper part cannot. And it's that smaller part that matters more, because that part of our mind is who we really are; whether we like it or not.

Doubt is a skill and error is the foundation of wisdom. Never to have failed is a sign not of merit but fragility; it means your fears have kept you from doing or becoming what you might have. Fail better. If your standards are as high as they should be, you will fail again and again. That is the difference between mere success—getting the 'A,' measuring up to some generic benchmark that may not actually be very high at all—and true excellence. But there is also failure in a larger sense, and you need to be prepared for that, as well. I mean big mistakes, existential mistakes.

“I am not afraid to make a mistake, even a great mistake, a lifelong mistake, and perhaps as long as eternity too.”

Those are powerful and moving words, and they have long inspired me, but we need to take them at their full weight. For every person who takes the risk of going their own way and ends up accomplishing remarkable

things there are very many who fall short. The reason to try, the reason to invent your life—whether you aim at remarkable things or only at your own thing—is so that it will be your life, your choice, your mistakes. Of course you'll make mistakes, and some will be hard to endure. But life is a long process of learning how you ought to have lived in the first place. Or it is if you do it right.

Certain types of persons are terrified even to poke a big toe into genuinely felt regret or sadness, or to get angry. This means they are afraid to live. They are imprisoned in something, I think. Frozen inside, emotionally. Why is this? No one knows.

The three most important emotions are Fear, Sadness, and Anger. Some might now be shouting, but what about love, happiness, surely those are important. Certainly but they are acquired with anger, or the threat of it. Anger is the only emotion which can protect against the infliction of fear and sadness upon a people.

Some might argue that love conquers hate, look at the civil rights movement. But no, it was not love, it was anger. Anger at the injustices, at the official support for it, of the continuation of it all. Anger, rage, that is the only emotion which ever wins any positive change for the masses.

And yet we have been trained to fear it, to distance ourselves from those who display it—to consider them not like us. We have been neutered. We have left our youth rudderless, prone to having their anger manipulated, channeled into avenues where it can be safely vented. Though not always. We have our mass shootings as the rare exceptions that prove the rule.

Fear and sadness are also acidic, they eat away at us from the inside, properly managed anger acts as the protective lining. It can keep us from becoming overwhelmed, it can provide us with hope. But none of these messages are given to our children. And we pay for it with their misguided rage.

“And they said to the Prophet, ‘How may we stop our ears to the rant of the fool and yet show him charity?’ And he answered, ‘You show yourselves charity by opening wide your ears to him. The fool in the midst of his babble shall speak truths which the minds of the wise cannot perceive.’”

I have no fear of false starts and misconceptions, all mistakes are offered up for the benefit of the adventurers in experimental philosophy who follow. He who does not foolishly affect to be above the failings of humanity will not be mortified when it is proved that he is but a man.

“I know that most men, including those at ease with problems of the greatest complexity, can seldom accept the simplest and most obvious truth if it would oblige them to admit the falsity of conclusions which they have woven, thread by thread, into the fabrics of their life.”

Criticism is welcome. I have already spent enough time as a slave to a broken, flawed ideology, I do not wish to spend time on another.

I write this from a sense of duty, a feeling of obligation and I pose a question to my future self, whom I implore to read with compassion. What will I be, the person who, months or, even decades later reads this? Myself, the same as ever? What have you learned since you wrote this?

The nativity of baby Jesus reminds us of the fragility of childhood, the wonder of renewal in birth, and the long shadow of a probably horrible death that hangs over every one of us. But it is more than a symbol, too. It's alive. Bach knew this, and we know it, too. The imaginative life, in which we make symbols and stories, is not a secondary existence of ours, but a primary one. It's how we're made to live. When we talk of souls and spirits, we are not talking nonsense any more than we are when we talk of love and courage and faith in some cause. Those ideas may not have a fixed material existence. But the most compelling things never do. The “fact-value” distinction that is so much a part of the modern philosophy of science—the rule that our values are not naturally determined but chosen—is not intended to belittle values; it is intended to diminish the tyranny of facts. It is a way of saying not that physical truths imply no morality but that morality is made irrespective of mere physical truths.

It might be true, for instance, that life is brutal and pointless, but we can choose to live as though it were otherwise. It might be true—there is absolutely no such evidence, but it might be true—that different ethnic groups, or sexes, have on average different innate aptitudes for math or science. We might decide to even things out, give some people extra help toward that end, or we might decide just to live with the disparity. In any case, human populations are so large these days that the relatively tiny number of outliers who rise above the average is large enough to staff any university faculty you could want. It certainly is true that the chances of anything we are doing now being remembered are vanishingly small, and the chances of the obliteration of life on the planet depressingly real—but we all choose to live as though what we are doing has meaning and purpose beyond the day and moment.

The challenge right now, is that given that we don't know the answer to what comes next, to also ask: ‘what are the ethics that we set for ourselves?’

And to be aware that when we venture out into untrodden territory, that we are able to ask that question and dare to act when there is no clear answer.

If we won't be alive in a hundred or three-hundred or a thousand years, what difference will it make if we're unknowingly wrong about everything, much less anything? Isn't being right for the sake of being right pretty much the only possible motive for any attempt at thinking about today from the imagined vantage point of tomorrow?

There is not, in a material sense, any benefit to being right about a future you will not experience. But there are intrinsic benefits to constantly probing the possibility that our assumptions about the future might be wrong: humility and wonder. It's good to view reality as beyond our understanding, because it is. And it's exciting to imagine the prospect of a reality that cannot be imagined, because that's as close to universal truth as we will ever come. If you aspire to be truly open-minded, you can't just try to see the other side of an argument. That's not enough. You have to go all the way.

Process theology is a religious metaphysics based on the teachings of the late-Victorian English-born philosopher Alfred North Whitehead. The essential idea of process theology seems to be to pull together and integrate the various different aspects of human existence—religion, science, art—into a single coherent explanation. It is, in a sense, suspicious of “facts,” seeking instead to capture the experience of change,

For me, it is far better to grasp the Universe as it really is than to persist in delusion, however satisfying and reassuring. It is always advisable to perceive clearly our ignorance.

Identifying the big truths requires an appreciation for continuity rather than change. It's not the superficial distinctions that matter but the subterranean similarities.

Once you start seeing injustice in one place, it's like taking off blinders—you start to see injustice everywhere, and how it is all connected. All injustices, and fights against injustice, are linked together. We become stronger when we can finally see those links.

My thesis, to put it bluntly, is that from late Neolithic times in the Near East, right down to our own day, two technologies have recurrently existed side by side: one authoritarian, the other socialist, the first system-centered, immensely powerful, but inherently unstable, the other human-centered, relatively weak, but resourceful and durable. If I am right, we are now rapidly approaching a point at which, unless we radically alter our present course, our surviving socialist technology and social forms will be completely suppressed or supplanted, so that every residual autonomy will be wiped out,

or will be permitted only as a playful device of government, like national balloting for already chosen leaders in totalitarian countries.

It's a lot more flattering to say that humans are superior because we learned to "cooperate," rather than to say we're superior because we learned the power of top-down, military-style bureaucratic organization, isn't it? Although this organizational form does bring a lot of benefits (that is, for the few at the expense of the many, including nonhumans); and it's also completely fantastic at getting large numbers of perhaps otherwise moral people to act in profoundly immoral ways.

At the very moment Western nations threw off the ancient regime of absolute government, operating under a once-divine king, they were restoring this same system in a far more effective form in their technology, reintroducing coercions of a military character no less strict in the organization of a factory than in that of the new drilled, uniformed, and regimented army. During the transitional stages of the last two centuries, the ultimate tendency of this system might be in doubt, for in many areas there were strong socialist reactions; but with the knitting together of a scientific ideology, itself liberated from theological restrictions or humanistic purposes, authoritarian technologies and social forms found an instrument at hand that has now given it absolute command of physical energies of cosmic dimensions. The inventors of nuclear bombs, space rockets, and computers are the pyramid builders of our own age: psychologically inflated by a similar myth of unqualified power, boasting through their science of their increasing omnipotence, if not omniscience, moved by obsessions and compulsions no less irrational than those of earlier absolute systems: particularly the notion that the system itself must be expanded, at whatever eventual cost to life.

I start from the supposition that the world is topsy-turvy, that things are all wrong, that the wrong people are in jail and the wrong people are out of jail, that the wrong people are in power and the wrong people are out of power, that the wealth is distributed in this country and the world in such a way as not simply to require small reform but to require a drastic reallocation of wealth. I start from the supposition that we don't have to say too much about this because all we have to do is think about the state of the world today and realize that things are all upside down. In every city in this country, when demonstrations take place, the protesters, whether they have demonstrated or not, whatever they have done, are assaulted and clubbed by police, and then they are arrested for assaulting a police officer.

Things are topsy-turvy in every sphere of society. One only wonders how long the farce can continue.

There is more income inequality in the United States than in any other "developed" democratic country. The financial implications of this inequality

are enormous for all of us. How has this happened? A disturbing part of the answer is that our tolerance for inequality has risen. Mainstream American opinion once considered the prospect of growing income inequality to be unacceptably antidemocratic. It wasn't only radicals outside the mainstream of American culture who supported the idea of setting limits on income inequality; it was widely considered a reasonable viewpoint. Franklin Roosevelt wanted to raise the marginal tax—the amount someone pays on the next dollar of income; the marginal tax rate rises as income rises—on people making more than about \$345,000 in today's dollars to 100 percent and to bookend the minimum wage he'd created a decade earlier with a new maximum wage. Today these policy ideas seem extreme.

Much as in the case of the great religions, the logic of the marketplace has insinuated itself even into the thinking of those who are most explicitly opposed to it. Part of the problem is the extraordinary place that economics currently holds in the social sciences. In many ways it is treated as a kind of master discipline. Just about anyone who runs anything important in America is expected to have some training in economic theory, or at least to be familiar with its basic tenets. As a result, those tenets have come to be treated as received wisdom, as basically beyond question. One knows one is in the presence of received wisdom when, if one challenges it, the first reaction is to treat one as simply ignorant—"You obviously have never heard of the Laffer Curve"; "Clearly you need a course in Economics 101"—the theory is seen as so obviously true that no one who understands it could possibly disagree.

What's more, those branches of social theory that make the greatest claims to "scientific status"—"rational choice theory," for instance—start from the same assumptions about human psychology that economists do: that human beings are best viewed as self-interested actors calculating how to get the best terms possible out of any situation, the most profit or pleasure or happiness for the least sacrifice or investment—curious, considering experimental psychologists have demonstrated over and over again that these assumptions simply aren't true.

It is quite difficult for the scions of the North Atlantic professional classes not to see their own characteristic ways of imagining the world as simple human nature.

The ideas of the ruling class are in every epoch the ruling ideas. The class which is the ruling material force of society, is at the same time its ruling intellectual force. The ideological beliefs are the ruling classes' self-legitimation, or self-justification, of the expectations that make up their ideologies.

The elites have been wringing their bread from the sweat of other men's

faces for far too long. I'm not looking to overthrow the American government, the corporate state already has.

A leech is a parasite that attaches itself to a host and drains the host while contributing nothing. In society, our leeches are financial institutions, old style media institutions (the ones internal to each system as well as public broadcasters), regulatory bodies, training and licensing institutions, distributors of goods and services and all other bodies set up to regulate the flow of resources to the society. None of these leeches contribute to society, they control access to resources.

This system of dissociation is so entrenched in society that it is very seldom questioned. Money for health care is equated to money for insurance, even though insurance companies do not provide health care. Banks need to be propped up to provide housing, even though banks do not provide housing. The almighty economy must be saved even at the cost of untold lives or life on earth itself but we can't eat the economy. Education and information are controlled, not produced, by existing institutions.

Even if the access allows the person plentiful amounts of everything, there is a built in awareness of shortage and reliance on the system that strongly discourages sharing. If one person's vein is broken, their need is met by hostility from the others dangling by their own veins. To rescue another is to weaken oneself.

Predictably, rescuing those in need requires the creation of more leeches in the form of NGOs and government regulatory bodies for people in crisis. This results in a transference of responsibility that prevents society as a whole from spending much time considering those who their society fails. All the NGOs and regulatory bodies do is distribute and control the generosity from the rest of society—and take a very large cut for themselves—but people are conditioned to believe the NGOs actually provide the support.

The Tax Payer was invented to assert moral control over other members of society such as children, anyone in crisis, prisoners, and anyone who dares to work outside a corporate approved role. The Tax Payer is encouraged by relentless propaganda and enabled by the financial system to consider themselves both the backbone of society, as evidenced on monetary flowcharts and nowhere else, and personally robbed by all others. When people look for the source of the obvious flaws in the systems of dissociation, they are always pointed to those that are not acting as The Tax Payer. Seldom does society look past the propaganda to the real culprits.

The current system is a massive, tangled tortuous mess of intelligence, media, spokespeople, communication departments, freedom of information laws and lobbies, actions and counteractions attempting to maintain balance in a system which preaches democracy and practices fascism.

Even science needs payoff in the current system. What do we not see because of it?

What other sensations, what other glories, what other sights had the foul cloud of civilization hid from my view? We can only miss what we once possessed. We can only feel wronged when we realize something has been stolen from us. We can't miss the million-strong flocks of passenger pigeons that once blackened our skies. We don't really miss the herds of bison that grazed in meadows where our suburbs stand. And few think of dark forests lit up with the bright green eyes of its mammalian lords. Soon, the glaciers will go with the clear skies and clean waters and all the feelings they once stirred. It's the greatest heist of mankind, our inheritance being stolen like this. But how can we care or fight back when we don't even know what has been or is being taken from us?

Analysis of prehistoric sites in the eastern United States lead some to believe that passenger pigeons had a small population size relative to their later abundance. Prior to European contact, passenger pigeon numbers were kept in check through what they describe as human-wildlife competition. Native Americans kept pigeon numbers low because they consumed the same mast as the birds did: beech, acorn, and chestnut. This ecological relationship was disturbed after contact with Europeans led to disease outbreaks, murder, displacement, and in general, mass death, among the indigenous tribes. The billions of pigeons settlers witnessed were actually an outbreak population, the result of increased food supply rather than an expression of the species innate biological evolution. And the same was true of bison, elk, and moose. The huge herds and flocks seen by Europeans were evidence not of American bounty but of Indian absence.

Others might argue this is not as clear as it initially seems, at least in the case of passenger pigeons. If half of the pigeon's native range was covered in ice tens of thousands of years ago, why hadn't it resulted in a population dip? Some suspect that the birds' ability to eat almost any type of food—not just mast—was the answer. Through all these forest changes, the birds were unaffected. The pigeons didn't have a migratory pattern, they were nomadic. So if the forest changes, they just moved and changed their diet. In the 1800s they were observed to eat acorn and beech. Twenty-thousand years ago, it would have been pine and spruce. They were super-generalists that are capable of responding to environmental change. All that matters to pigeons is the amount of forest that is available to them directly, and the forest's productivity.

Regardless of which is true, the incredible thing about the 22 million years of evolution, and the pigeon's amazing resilience over that time, is that it meant that after thriving for eons, they had disappeared in one-thousandth

of one percent of their total evolutionary history. It is now almost surely true that human predation caused their demise. For millions of years, forests in the Northeast had hosted the birds, and though they have only been gone for a hundred years, we have almost completely forgotten that they were here.

It's one thing to step out into the woods and go, 'Oh my god, this is amazing.' But what about stepping out into them and knowing that the passenger pigeon once existed there? I step into those woods and rather than having an awe-inspiring experience, I already know that it is a diminished version of itself. It's not as big and grand as it once was.

People just shrug and say, 'Well, this is the price that had to be paid for indoor plumbing and central heating and air conditioning and automobiles and all the rest.' I'm saying that the price you've paid is not the price of becoming human. It's not even the price of having the things just mentioned. It's the price of enacting a story that casts mankind as the enemy of the world.

What does it mean to grow rich? Is it to have red-blooded adventures and to make a fortune, which is what brought the whalers and other entrepreneurs north? Or is it, rather, to have a good family life and to be imbued with a far-reaching and intimate knowledge of one's homeland, which is what the Tununirmiut told the whalers at Pond's Bay wealth was? Is it to retain a capacity for awe and astonishment in our lives, to continue to hunger after what is genuine and worthy? Is it to live at moral peace with the universe?

The problem is when I sit there and think about the good, I have to confront the fact that the world is totally out of alignment with everything I believe in. It aggravates me. No amount of putting myself first makes that aggravation go away. I end up feeling like a traditional Buddhist monk—I have a good theory of how to alleviate my own suffering, but it involves withdrawing from society to such a degree that it feels deeply selfish. When Plato finally escapes from the cave, he can't stay there. He is driven to go back in and try to get other people out. Even though they'll hate him for it. Even though they may kill him, like they killed Socrates. When Plato went to Syracuse to tutor the tyrant's brother, the tyrant enslaved him. When his friends bought his freedom and helped him escape, he went back to tutor the tyrant's son. He went back. The tyrant's son eventually imprisoned Plato on the island. He escaped again, but this time he was broken—he wrote the *Laws*, a depressing dialogue about how nobody can change anything about Greece and there's no point trying.

I don't like to remember the Plato that wrote *Laws*. I like to remember the Plato that went back. That's what it really means to be like Plato—we have to go back. Into the cave. To Syracuse. We have to keep trying to

get this system to do something for folks, because it's what we have, and because if we can't find a way to make it work we will fiddle from our fancy perches as it burns.

The Kingdom of God Is Within You—when I cracked it, over 125 years after publication, it was still a blistering rant. Here was a landed aristocrat who instead of pickling in privilege tried to smash the system, and literally took to walking the countryside, Jesus-like, in robes. He savaged the well-intentioned liberal:

“I sit on a man's back, choking him, and making him carry me, and yet assure myself and others that I am very sorry for him and wish to ease his lot by any means possible, except getting off his back.”

Back Into the Cave

There was a master come unto the earth, born in the holy land of Indiana, raised in the mystical hills east of Fort Wayne.

The master learned of this world in the public schools of Indiana, and as he grew in his trade as a mechanic of automobiles.

But the master had learnings from other lands and other schools, from other lives that he had lived. He remembered these, and remembering, became wise and strong, so that others saw his strength and came to him for council.

The master believed that he had the power to help himself and all of mankind. and as he believed so it was for him, so that others saw his power and came to him to be healed of their many troubles and their many diseases.

The master believed that it is well for any man to think upon himself as a son of god, and as he believed, so it was. And the shops and garages where he worked became crowded and jammed with those who sought his learning and his touch; and the streets outside with those who longed only that the shadow of his passing might fall upon them and change their lives.

It came to pass, because of the crowds, that the several foremen and shop managers bid the master leave his tools and go his way, for so tightly was he thronged that neither he nor other mechanics had room to work upon the automobiles.

So it was that he went into the countryside, and people following began to call him messiah, and worker of miracles; and as they believed, so it was.

If a storm passed as he spoke, not a raindrop touched a listeners head; the last of the multitude heard his words as clearly as the first, no matter lightning nor thunder in the sky about. And always he spoke to them in parables.

And he said unto them:

“Within each of us lies the power of our consent to health and to sickness, to riches and to poverty, to freedom and to slavery. it is we who control these, and not another.”

A mill-man spoke and said:

“Easy words for you master, for you are guided as we are not, and need not toil as we toil. A man has to work for a living in this world.”

The master answered and said:

“Once there lived a village of creatures along the bottom of a great crystal river. The current of the river swept silently over them all—young and old, rich and poor, good and evil, the current going its own way, knowing only its own crystal self.

Each creature in its own way clung tightly to the twigs and rocks of the river bottom, for clinging was their way of life, and resisting the current what each had learned from birth.

But one creature said at last, ‘I am tired of clinging. Though I cannot see it with my own eyes, I trust that the current knows where it is going. I shall let go, and let it take me where it will. Clinging, I shall die of boredom.’

The other creatures laughed and said, ‘Fool! let go, and that current you worship will throw you tumbled and smashed across the rocks, and you will die quicker than boredom!’

But the one heeded them not, and taking a breath did let go, and at once was tumbled and smashed by the current across the rocks.

Yet in time, as the creature refused to cling again, the current lifted him free from the bottom, and he was bruised and hurt no more.

And the creatures downstream, to whom he was a stranger, cried, ‘See a miracle! a creature like ourselves, yet he flies! See the messiah come to save us all.’

And the one carried in the current said, ‘I am no more messiah than you. The river delights to lift us free, if only we dare to let go. Our true work is this voyage, this adventure.’

But they cried the more, ‘Savior!’ all the while clinging to the rocks, and when they looked again he was gone, and they were left alone making legends of a savior.”

And it came to pass when he saw that the multitude thronged him the more day on day, tighter and closer and fiercer than ever they had, when he saw that they pressed him to heal them without rest, and feed them always with his miracles, to learn for them and to live their lives, he went alone that day unto a hilltop apart, and there he prayed.

And he said in his heart, infinite radiant is, if it be thy will, let this cup pass from me, let me lay aside this impossible task. I cannot live the life of one other soul, yet ten-thousand cry to me for life. I’m sorry I allowed it all to happen. If it be thy will, let me go back to my engines and my tools and let me live as other men.

A voice spoke to him on the hilltop, a voice neither male nor female, loud nor soft, a voice infinitely kind. And the voice said unto him:

“Not my will, but thine be done. For what is thy will is mine for thee. Go thy way as other men, and be thou happy on the earth.”

And hearing, the master was glad, and gave thanks and came down from the hilltop humming a little mechanic’s song. And when the throng pressed him with its woes, beseeching him to heal for it and learn for it and feed it nonstop from his understanding and to entertain it with his wonders, he smiled upon the multitude and said pleasantly unto them:

“I quit.”

For a moment the multitude was stricken dumb with astonishment. And he said unto them:

“If a man told god that he most wanted to help the suffering world, no matter the price to himself, and god told him what he should do, should the man do as he is told?”

“Of course, master!” cried the many. “It should be pleasure for him to suffer the tortures of hell itself, should god ask it!”

“No matter what the tortures, nor how difficult the task?”

“Honor to be nailed to a tree and burned, if so be that god has asked,” said they.

“And what would you do,” the master said unto the multitude, “If god spoke directly to your face and said, ‘I command that you be happy in the world, as long as you live.’ What would you do then?”

And the multitude was silent, not a voice, not a sound was heard upon the hillsides, across the valleys where they stood.

And the master said unto the silence:

“In the path of our happiness shall we find the learning for which we have chosen this lifetime. So it is that I have learned this day, and choose to leave you now to walk your own path, as you please.”

And he went his way through the crowds and left them, and he returned to the world of men and machines.

Society is a conspiracy to keep itself from the truth. We pass our lives submerged in propaganda: advertising messages; political rhetoric; the

journalistic affirmation of the status quo; the platitudes of popular culture; the axioms of party, sect, and class; the bromides we exchange every day on Facebook; the comforting lies our parents tell us and the sociable ones our friends do; the steady stream of falsehoods that we each tell ourselves all the time, to stave off the threat of self-knowledge. Plato called this *doxa*, opinion, and it is as powerful a force among progressives as among conservatives; in Massachusetts as in Mississippi; for atheists as for fundamentalists. The first purpose of a real education—a “liberal arts” education—is to liberate us from *doxa* by teaching us to recognize it, to question it, and to think our way around it.

What if somebody came along who was really good at this, who could teach you how the world works and how to control it? What if you could meet a super-advanced. . . what if a Siddhartha or a Jesus came into our time, with the power over the illusions of the world because he knew the reality behind them? And what if you could meet this person. What would he say, what would he be like?

Some say we magnetize into our lives whatever we hold in our thought, for instance—if that is true, then somehow I have brought myself to this moment for a reason, and so have you. perhaps it is no coincidence that you are reading this book; perhaps there’s something that you came here to remember. I choose to think so.

For all the skill that teaching involves, you ultimately only have a single tool: your entire life as you have lived it up until the moment you walk into class. The teacher, that professional amateur, teaches not so much his subject as himself. He provides a model of one in whom what seemed dead, mere print on the page, becomes living, a way of life.

There was a man who played this role for me when I was seventeen and thereby saved me from the life of thoughtless labor that appeared to be my fate. My teacher’s methods were the same as those of Socrates, the teacher of Plato himself: he echoed your opinions back to you or forced you to articulate them for yourself. By dragging them into the light, asking you to defend them or just acknowledge having them, he began to break them down, to expose them to the operations of the critical intelligence—and thus to develop that intelligence in the first place. The point was not to replace his students’ opinions with his own. The point was to bring his charges into the unfamiliar, uncomfortable, and endlessly fertile condition of doubt. He was teaching them not what to think but how.

Is this a privilege that most young people in the world can only dream of? Absolutely. But you won’t absolve yourself by throwing it away. Better, at least, to get some good from it.

The classroom is the grain of sand; it’s up to you to make the pearl.

Bodhisattva: a person who is able to reach nirvana but delays doing so out of compassion in order to save suffering beings

There are hierarchical relations that are explicitly self-subverting: the one between teacher and student, for example, since if the teacher is successful in passing her knowledge to the student, there is no further basis for inequality.

Continually receiving help reduces self-esteem and feelings of control, leading to feelings of helplessness and reduced agency. To reestablish this agency, patients need to become the givers of care, transforming into agents with increased self-confidence and personal power. It is no coincidence that twelve-step programs—whether for alcoholism, gambling addiction, or something else—involve sponsorship, in which senior members become shepherds for new members. By taking responsibility for another, you break through the mantle of victimhood, moving from one side of the mind-perception fault line to the other. Helping others turns you from a vulnerable feeler into a thinking doer.

These results suggest that personal power is not only a cause of heroism but also a consequence of it. Consider Mahatma Gandhi, who heroically helped India gain its independence from colonial rule in 1947. An examination of Gandhi's early life suggests that he was born with no more agency than anyone else, with an unremarkable merchant-class childhood. However, as he strove for national freedom, he became able to endure hunger strikes that few of us can imagine. These feats of agency are even more amazing considering that Gandhi was first a moral patient, suffering discrimination and beatings at the hands of the European ruling class. By committing himself to helping others, he turned from patient to agent, a process we call moral transformation.

One way to interpret “change their minds” is to say that the same mind merely shifted its opinion, but the more interesting way is to say that the mind actually changed—it's a different mind than it was in the first place.

Those who don't study history are doomed to repeat it. Yet those who do study history are doomed to stand by helplessly while everyone else repeats it.

Some people are born sentenced to terrible inheritance, diseases that lay dormant in the blood from birth. My sentence was to know, to understand.

I intend to get out of here. It can't last forever. Others have thought such things, in bad times before this, and they were always right, they did get out one way or another, and it didn't last forever. Although for them it may have lasted all the forever they had.

And yet, even if one person finds his way that means there is a Way. Even if I personally fail to reach it.

Who goes in front saves his companion, Who knows the road protects his friend.

Mourn not for us, for we have seen the light. Grieve but for those who go alone, unwise, to die in darkness.

We're each of us alone, to be sure. What can you do but hold your hand out in the dark?

“He had decided to live forever or die in the attempt.”

—Joseph Heller, *Catch-22*

I have faith in the fact that we never really die, that we perpetuate ourselves by the pieces we give others.

In contrast to literal immortality, which suggests the continued existence of your consciousness, symbolic immortality suggests the continued existence of other similar minds—and those symbols you all believe in. When people die for a cause, they are demonstrating symbolic immortality.

Symbolic immortality suggests that the fear of death depends upon how you spend your last days—the more you contribute to your culture, the less terror you are likely to feel. You will be afraid to die until you have won some victory for humanity. Be ashamed to die until you have won some victory for humanity.

This book is a story. You need a story to displace a story. Metaphors and stories are far more potent (alas) than ideas; they are also easier to remember and more fun to read. Ideas come and go, stories stay.

Imagine some young hominids huddling around a Pleistocene campfire, enjoying their newly evolved language ability. Two males get into an argument about the nature of the world, and start holding forth, displaying their ideologies.

The hominid named Carl proposes:

“We are mortal, fallible primates who survive on this fickle savanna only because we cluster in these jealousy-ridden groups. Everywhere we have ever traveled is just a tiny, random corner of a vast continent on an unimaginably huge sphere spinning in a vacuum. The sphere has traveled billions and billions of times around a flaming ball of gas, which will eventually blow up to incinerate our empty, fossilized skulls. I have discovered several compelling lines of evidence in support of these hypotheses.”

The hominid named Candide interrupts:

“No, I believe we are immortal spirits gifted with these beautiful bodies because the great god Wug chose us as his favorite creatures. Wug blessed us with this fertile paradise that provides just enough challenges to keep things interesting. Behind the moon, mystic nightingales sing our praises, some of us more than others. Above the azure dome of the sky the smiling sun warms our hearts. After we grow old and enjoy the babbling of our grandchildren, Wug will lift us from these bodies to join our friends to eat roasted gazelle and dance eternally. I think these things because Wug picked me to receive this special wisdom in a dream last night.”

Which ideology do you suppose would prove more sexually attractive? Will Carl’s truth-seeking genes—which may end up discovering some rather ugly truths—out-compete Candide’s wonderful-story genes? The evidence of human history suggests that our ancestors were more like Candide than Carl. Most modern humans are naturally Caudides.

A politician can run a flawless campaign, say all the right things from a place of authenticity, hold wildly popular positions and an impeccable public record, but if they say things which upset the powerful, the narrative can be reshaped to paint them as crazy, incompetent, unelectable, treasonous, or all of the above, keeping them out of office forever.

An investigative journalist can spend months breaking a story that incriminates extremely powerful people. They can get all the facts right, source everything perfectly, report clearly and concisely, and get full exposure in a mainstream news outlet. But extremely powerful people can use their influence over the political/media class to quickly shift the narrative in the wake of that breaking news story to almost completely nullify its impact by making it seem insignificant.

A leak outlet can create a new and innovative drop box to protect the anonymity of leakers, opening up the possibility of bringing transparency and accountability to power. It can take the utmost care and implement the most exacting standards in confirming the authenticity of documents and protecting the identities of their sources, and it can get true bombshell documents that expose appalling amounts of corruption and malfeasance. But extremely powerful people can shift the narrative around that outlet, and soon millions of people will believe it’s a Kremlin operation and its founder is a smelly Nazi rapist who abuses his cat and rubs shit on the walls.

We’ve seen all these things happen. We live in a world in which you can tell the truth at all times, make no mistakes, get very lucky, and be fully

supported, but if you do anything to upset those in power, the narrative can be shifted around you to kill your ability to do any good.

The reason I talk about narrative so much is because it's ultimately what all our problems boil down to. The ability of the plutocratic class and their allied government agencies to manipulate the way people think, act, and vote is the only thing holding the ecocidal, omnicultural, unipolar world order in place, which is why billions and billions of dollars are poured into the plutocratic media, think tanks, the agenda to censor the internet, and other influence campaigns. Any attempt to replace that world order with a system that serves humanity instead of a few wealthy sociopaths must necessarily understand and interact with this dynamic.

Do you know the difference between fact and narrative? Are you sure? The ability to be as lucid as possible about the difference between raw data and the story that is spun about it is absolutely essential to understanding and fighting the establishment propaganda machine.

Let's look at Russiagate for an easy example. The narrative is that Donald Trump is secretly conspiring with the Russian government to subvert American interests to advance the agendas of the Kremlin. But what are the facts? The facts are that a few people who were associated with Trump during his presidential campaign have been convicted and pled guilty to process crimes and some underhanded dealings with nations that aren't Russia, while Trump has been staging a regime change intervention against Venezuela, bombing Syria, arming Ukraine, implementing a Nuclear Posture Review with a more aggressive stance toward Russia, withdrawing from the INF Treaty, throwing out Russian diplomats, sanctioning Russian oligarchs, expanding NATO and securing it more funding. The narrative and the facts couldn't be more different.

But that hasn't mattered, has it? The propagandists have been able to get everyone worked up about the idea that Putin has managed to influence the very highest levels of the US government, despite there being no facts whatsoever to substantiate that idea. It's pure narrative, yet it's been used to manufacture a conceptual framework which allows anyone challenging the unipolar world order to be undermined as a Kremlin crony. There is nothing but insinuation and innuendo backing up those narratives, but that's all they need.

This dynamic is not limited to political power, by the way. In an abusive relationship, for example, the abuser must control the narrative about what's going on to keep the abused party from leaving: I hit you because you made me so angry with your actions that I lost control. I'm not sleeping around, you're paranoid and crazy. You can't leave, no one will ever love you and you'll fail out there on your own. Narrative control is power, from the

smallest possible group of people to the very largest.

Anyone who wants to legitimately challenge the status quo will necessarily find themselves up against this protective wall of narrative that the ruling power establishment has surrounded itself with, so it's important to know how to fight against it.

There are a lot of great alternative media outlets out there, and a lot of good dissident politicians and activists, but the problem they run into again and again is that they often stay calm and monotonous while repeating cold, hard facts. This is a problem because while they're trying to calmly fight the status quo using raw data, the establishment is using sparkly narratives in all the right places. They're appealing to emotions, they're condensing their stories into catchy 20-second sound bytes, and they're using facts only when facts help advance the narrative.

I am not saying that dissidents should abandon truth and facts; if you're not trying to build a world that is based on truth then what the hell are you fighting for? But it is absolutely essential not just to tell the truth, but to seize control of the narrative as well. Get all your facts right, then tell the story. Make it interesting. Make it funny. Activists can be some of the most dry, boring people you'll ever encounter, believing that their rightness compensates for the fact that nobody's ever interested in listening to what they've got to say. Bollocks! If you want to convey a message, make that message pop! What's the point of speaking out if nobody's even listening? Being right isn't enough.

Humans are storytelling animals—have been ever since we invented language and campfires. If you want to shake people awake, you're going to have to interface with that reality. Being able to rattle off a bunch of data about your issue of concern isn't going to accomplish anything by itself; what the establishment understands and most dissidents do not is that people listen to stories, not data, and the more interesting the story the better. Russiagate didn't gain traction because it's factually accurate, it gained traction because it's a scandalous story about the President of the United States conspiring with nefarious forces and being blackmailed over a night of water sports with Russian prostitutes.

So tell stories. Tell truthful, interesting stories. Fight their deceitful interesting stories with truthful interesting stories; authenticity resonates with people in a way think-tank-manufactured narratives just don't. If enough of us can find authentically interesting, funny, amusing, colorful ways to tell the story about what's happening, it's only a matter of time before they get picked up and circulated by the public like a good joke or a viral video. Help fight the narrative war against the plutocratic establishment that is strangling our species to death, and have fun doing it. The more fun

you have with it, the better.

People want to reciprocate gifts and favors: to do so they must be taking part in a story in which someone gives a gift, and it would be wrong not to reciprocate. People want to be liked: to do so they must be taking part in a story in which they are liked, or not liked, by someone else. People have deference to authority: to have this emotion they must consider themselves part of a story in which someone has authority over them. For example, in the famous experiment by Stanley Milgram in which a “teacher” told subjects to deliver electric shocks to a “learner,” the subjects were identifying with the “teacher” who was in “authority,” and they strongly resisted their inclinations to disobey. People tend to follow others (social proof): in this case they must be telling themselves a story in which either those others have better judgment or information than they do (in the information explanation); or else they do not want to incur disapproval by failing to conform (in the social conformity explanation). People want their decisions to be consistent: to do so they must be taking part in a story about consistency among their disparate decisions.

The act of writing is an act of attempted comprehension, and, in a childlike way, control; we are so baffled and exhausted by what has happened, we want to imagine that giving words to the unspeakable will make it somehow our own. We are narrative creatures, compelled to make sense of our surroundings through stories, and the stories we tell matter. Perhaps most important of all, the stories we tell ourselves matter.

A novel, a story, a myth, or a tale, all have the same function: they spare us from the complexity of the world and shield us from its randomness. Myths impart order to the disorder of human perception and the perceived “chaos of human experience.”

The written word is far more powerful than simply a reminder: it re-creates the past in the present, and gives us, not the familiar remembered thing, but the glittering intensity of the summoned-up hallucination. Anthropologists know that the written word is not merely an echo of a speaking voice. It is another kind of voice altogether, a conjurer’s trick of the first order. It must certainly have appeared that way to those who invented it, and that is why we should not be surprised that the Egyptian god Thoth, who is alleged to have brought writing to King Thamus, was also the god of magic. People like ourselves may see nothing wondrous in writing, but our anthropologists know how strange and magical it appears to a purely oral people—a conversation with no one and yet with everyone. What could be stranger than the silence one encounters when addressing a question to a text? What could be more metaphysically puzzling than addressing an unseen audience, as every writer of books must do? And correcting oneself because one knows

that an unknown reader will disapprove or misunderstand?

Somebody who's writing has part of their motivation to impress themselves and their consciousness on others. There's an unbelievable arrogance about even trying to write something.

What writers have is a license, and also the freedom, to sit—to sit, clench their fists, and make themselves be excruciatingly aware of the stuff that we're mostly aware of only on a certain level. And that if the writer does his job right, what he basically does is remind the reader of how smart the reader is—to wake the reader up to stuff that the reader's been aware of the whole time. And it's not a question of the writer having more capacity than the average person. It's that the writer is willing cut themselves off from certain stuff, and develop and think really hard. Which not everybody has the luxury to do. But if they just look across the room and automatically assume that somebody else is less aware than them, or that somehow somebody else has an interior life less rich, and complicated, and acutely perceived than theirs, makes them not a good writer. Because that means they're going to be performing for a faceless audience, instead of trying to have a conversation with a person.

Proust called these moments of unity between writer and reader “that fruitful miracle of a communication in the midst of solitude.”

Too many have been taught to become accustomed to their own chains and cages. The way circus elephants are trained demonstrates this dynamic well: When young, they are attached by heavy chains to large stakes driven deep into the ground. They pull and yank and strain and struggle, but the chain is too strong, the stake too rooted. One day they give up, having learned that they cannot pull free, and from that day forward they can be “chained” with a slender rope. When this enormous animal feels any resistance, though it has the strength to pull the whole circus tent over, it stops trying. Because it believes it cannot, it cannot.

Unless and until something changes their view, unless they grasp the striking fact that they are tied with a thread, that the chain is an illusion, that they were fooled, and ultimately, that whoever so fooled them was wrong about them and that they were wrong about themselves—unless all this happens, these people will not feel that they have the power to influence society.

Ignorance will always find a way to oppress.

Rational debate becomes impossible in an irrational, cruel, and credulous culture.

Reason is a narrow system swollen into an ideology. With time and power it has become a dogma, devoid of direction and disguised as disinterested

inquiry. Like most religions, reason presents itself as the solution to the problems it has created.

One of the characteristics of a civilization which promotes form over content is that memory evaporates. It is as if we have abandoned the possibility that healthy societies evolve through ideas. And therefore through doubt and the possibility of change. Instead we have a hypnotic obsession with efficiency and methodology. Of course, it is entirely our right to continue on our downward spiral. We don't have to embrace doubt or learn how to live consciously. We can continue to abandon empathy as an expensive, inefficient pastime. Cultural suicide is a tradition well-established in history.

In order for patterns to repeat themselves, people first need to forget. We live in an anxious age of agitated amnesiacs. We Americans seem to know everything about the last twenty-four hours but very little of the last sixty centuries or the last sixty years.

For the most part, we're a very "new" people. Every generation is somehow new, more thoroughly cut off from the past than the one that came before. Mother Culture says that this is as it should be. There's nothing in the past for us. The past is dreck. The past is something to be put behind us, something to be escaped from. This is how we came to be cultural amnesiacs.

Orwell was wrong once again, at least for the Western democracies. He envisioned the demolition of history, but believed that it would be accomplished by the state; that some equivalent of the Ministry of Truth would systematically banish inconvenient facts and destroy the records of the past. Certainly, this was the way of the Soviet Union, our modern-day Oceania. But as Huxley more accurately foretold it, nothing so crude as all that is required. Seemingly benign technologies devoted to providing the populace with a politics of image, instancy, and therapy may disappear history just as effectively, perhaps more permanently, and without objection.

For the most part, we aren't aware of this change—but if we don't know where we've come from, we aren't likely to know where we're heading.

Even modern Islamic fundamentalists—with all their medieval fantasies—are grounded in contemporary global culture far more than in seventh-century Arabia. They are catering to the fears and hopes of alienated modern youth rather than to those of medieval peasants and merchants. Radical Islamists have been influenced by Marx and Foucault as much as by Muhammad, and they inherit the legacy of nineteenth-century European anarchists as much as of the Umayyad and Abbasid caliphs. It is therefore more accurate to see even the Islamic State as an errant offshoot of the global culture we all share, rather than as a branch of some mysterious alien tree.

European civilization is anything Europeans make of it, just as Chris-

tianity is anything Christians make of it, Islam is anything Muslims make of it, and Judaism is anything Jews make of it. And they have made of it remarkably different things over the centuries. Human groups are defined more by the changes they undergo than by any continuity, but they nevertheless manage to create for themselves ancient identities thanks to their storytelling skills. No matter what revolutions they experience, they can usually weave old and new into a single yarn. Even an individual may knit revolutionary personal changes into a coherent and powerful life story: ‘I am that person who was once a socialist, but then became a capitalist; I was born in France, and now live in the USA; I was married, and then got divorced; I had cancer, and then got well again.’

Similarly a human group such as the Germans may come to define itself by the very changes it underwent: ‘Once we were Nazis, but we have learnt our lesson, and now we are peaceful democrats.’ You don’t need to look for some unique German essence that manifested itself first in Wilhelm II, then in Hitler, and finally in Merkel and beyond. These radical transformations are precisely what define German identity. To be German in 2020 means to grapple with the difficult legacy of Nazism while upholding liberal and democratic values. Who knows what it will mean in 2050.

People often refuse to see these changes, especially when it comes to core political and religious values. We insist that our values are a precious legacy from ancient ancestors. Yet the only thing that allows us to say this, is that our ancestors are long dead, and cannot speak for themselves.

Lets consider a group which might be considered a ‘Third Rail’ in American discourse: Orthodox Jews. Nowhere is the ban on seeing women stricter than in the synagogue. In Orthodox synagogues women are carefully segregated from the men, and must confine themselves to a restricted zone where they are hidden behind a curtain, so that no men will accidentally see the shape of a woman as he says his prayers or reads scriptures. Yet if all this is backed by thousands of years of Jewish tradition and immutable divine laws, how to explain the fact that when archaeologists excavated ancient synagogues in Israel from the time of the Mishnah and Talmud, they found no sign of gender segregation, and instead uncovered beautiful floor mosaics and wall paintings depicting women, some of them rather scantily dressed? The rabbis who wrote the Mishnah and Talmud regularly prayed and studied in these synagogues, but present-day Orthodox Jews would consider them blasphemous desecrations of ancient traditions.

Similar distortions of ancient traditions characterize all religions. The Islamic State has boasted that it has reverted to the pure and original version of Islam, but in truth, their take on Islam is brand new. Yes, they quote many venerable texts, but they exercise a lot of discretion in

choosing which texts to quote and which to ignore, and in how to interpret them. Indeed, their do-it-yourself attitude to interpreting the holy texts is itself very modern. Traditionally, interpretation was the monopoly of the learned ulama—scholars who studied Muslim law and theology in reputable institutions such as Cairo’s Al-Azhar. Few of the Islamic State’s leaders have had such credentials, and most respected ulama have dismissed Abu Bakr al-Baghdadi and his ilk as ignorant criminals. That does not mean that the Islamic State has been “un-Islamic” or “anti-Islamic,” as some people argue. It is particularly ironic when Christian leaders such as Barack Obama have the temerity to tell self-professing Muslims such as Abu Bakr al-Baghdadi what it means to be Muslim. The heated argument about the true essence of Islam is simply pointless. Islam has no fixed DNA. Islam is whatever Muslims make of it.

Of course, societies are changing all the time; it’s just that we can’t always see it happening in real time, and to be honest, we aren’t always very good at accepting it. Our lives and experiences become our only reality.

So the best advice I could give a fifteen-year-old stuck in an outdated school somewhere in Mexico, India, or Alabama is: don’t rely on the adults too much. Most of them mean well, but they just don’t understand the world. In the past, it was a relatively safe bet to follow the adults, because they knew the world quite well, and the world changed slowly. But the twenty-first century is going to be different. Due to the growing pace of change you can never be certain whether what the adults are telling you is timeless wisdom or outdated bias.

There is, certainly, an unbreachable chasm between the subjective and objective world. A reasonable person expects subjective facts to be overturned, because subjective facts are not facts; they’re just well-considered opinions, held by multiple people at the same time. Whenever the fragility of those beliefs is applied to a specific example, people bristle—if someone says, ‘It’s possible that Abraham Lincoln won’t always be considered a great president,’ every presidential scholar scoffs. But if you remove the specificity and ask, ‘Is it possible that someone currently viewed as a historically great president will have that view reversed by future generations?’ any smart person will agree that such a scenario is not only plausible but inevitable. In other words, everyone concedes we have the potential to be subjectively wrong about anything, as long as we don’t explicitly name whatever that something is.

It’s a dissonance that creates the most unavoidable of intellectual paradoxes: When you ask smart people if they believe there are major ideas currently accepted by the culture at large that will eventually be proven false, they will say, ‘Well, of course. There must be. That phenomenon has

been experienced by every generation who's ever lived, since the dawn of human history.' Yet offer those same people a laundry list of contemporary ideas that might fit that description, and they'll be tempted to reject them all.

Consider the idea of temperature: Our skin can sense warmth on a hot day, but 'warmth' is not some independent thing that exists on its own. Warmth is just the consequence of invisible atoms moving around very fast, creating the sensation of temperature. We feel it, but it's not really there. So if gravity were an emergent force, it would mean that gravity isn't the central power pulling things to the Earth, but the tangential consequence of something else we can't yet explain. Put another way, this means that gravity might just be a manifestation of other forces—not a force itself, but the peripheral result of something else. We feel it, but it's not there. It would almost make the whole idea of 'gravity' a semantic construction.

Take the example of the Higgs Boson, what if the Higgs particle had not been found? Would any of the geniuses involved in its search quit their jobs? Would they have rebooted the entire concept? No way. They would have merely viewed the experiment itself as a failure, or the LHC as too small, or the particle as too crafty. They would have to double down on their commitment to certitude and we would have to agree with them. Philosophically, as a species, we are committed to this. In the same way that religion defined cultural existence in the pre-Copernican age, the edge of science defines the existence we occupy today.

If any scientific concept changes five times in five decades, the perception is that we're simply refining what we thought we knew before, and every iteration is just a "more correct" depiction of what was previously considered "totally correct." In essence, we anchor our sense of objective reality in science itself—its laws and methods and sagacity. If certain ancillary details turn out to be specifically wrong, it just means the science got better. But what if we're really wrong, about something really big?

Every day, our understanding of the universe incrementally increases. New questions are getting answered. But are these the right questions? Is it possible that we are mechanically improving our comprehension of principles that are all components of a much larger illusion, in the same way certain eighteenth-century Swedes believed they had finally figured out how elves and trolls caused illness? Will our current understanding of how space and time function eventually seem as absurd as Aristotle's assertion that a brick doesn't float because the ground is the "natural" place a brick wants to be?

"One of the exercises I always give my students is an essay assignment. The question is posed like this: 'Will there be a time in

our future when our current theories seem as dumb as Aristotle's theories appear to us now?' And the students are always divided. Many of them have already been infected by postmodernism and believe that knowledge is socially constructed, and they believe we'll have intellectual revolutions forever. You even hear that kind of rhetoric from mainstream science popularizers, who are always talking about science as this endless frontier. And I just think that's childish. It's like thinking that our exploration of the Earth is still open-ended, and that we might still find the lost city of Atlantis or dinosaurs living in the center of the planet. The more we discover, the less there is to discover later. Now, to a lot of people, that sounds like a naïve way to think about science. There was a time when it once seemed naïve to me. But it's really just a consequence of the success of science itself. Our era is in no way comparable to Aristotle's era."

"The only examples you can give of complete shifts in widely accepted beliefs—beliefs being completely thrown out—are from before 1600. You mentioned Aristotle, for example. You could also mention Copernicus and the Copernican Revolution. That's all before 1600. What was different from 1600 onward was how science got conducted. Science gets conducted by experiment. There is no truth that does not exist without experimental verification of that truth. And not only one person's experiment, but an ensemble of experiments testing the same idea. And only when an ensemble of experiments statistically agree do we then talk about an emerging truth within science. And that emerging truth does not change, because it was verified.

Previous to 1600—before Galileo figured out that experiments matter—Aristotle had no clue about experiments, so I guess we can't blame him. Though he was so influential and so authoritative, one might say some damage was done, because of how much confidence people placed in his writing and how smart he was and how deeply he thought about the world. I will add that in 1603 the microscope was invented, and in 1609 the telescope was invented. So these things gave us tools to replace our own senses, because our own senses are quite feeble when it comes to recording objective reality. So it's not like this is a policy. This is, 'Holy shit, this really works. I can establish an objective truth that's not a function of my state of mind, and

you can do a different experiment and come up with the same result.’ Thus was born the modern era of science.”

How do we know we’re not currently living in our own version of the year 1599?

Looking at the history of ideas and recognizing that every age thinks they were making real headway toward the ultimate answer, and every next generation comes along and says, ‘You were really insightful, but now that we know X, Y, and Z, here is what we actually think.’ So, humility drives me to anticipate that we will look like people from the age of Aristotle who believed stones fell to earth because stones wanted to be on the ground.

Due to various circumstances I was provided the luxury of long stretches of solitude and the ability to think about life and politics at the same time, almost as if they had an actual relationship. I don’t recall any feelings of loneliness; on at least three evenings, I sat on my balcony and watched a hedgehog eat apples, an experience more satisfying than going on dates and talking to other forlorn strangers about how dating is hard.

There was an apple tree in the yard, and the—comically obese, or maybe just fluffy—hedgehog would sit underneath its branches and longingly stare at the low-hanging fruit. It often seemed like he was torturing himself, because there was no way a hedgehog of his ample girth could reach an apple two feet above his head. Yet every time he did this, he knew what he was doing. Every time, or at least every time I happened to be watching, an apple would eventually fall to the ground, and he would waddle over and eat it. He was a brilliant goddamn hedgehog. I couldn’t stop thinking about it.

There is a platitude that often applies to politics. The clever fox knows many things, states the proverb, but the old hedgehog knows one big thing. In this case, the old hedgehog knows that gravity applies to fruit. The origin of fox versus hedgehog is Greek, but it was popularized by the British essayist Isaiah Berlin. In a plain sense, the adage simply means that some people know a little about many subjects while other people know a lot about one subject. Taken at face value, it seems like the former quality should be preferable to the latter—yet we know this is not true, due to the inclusion of the word ‘but.’ The fox knows a lot, but the hedgehog knows one singular thing that obviously matters more.

So what is that singular thing? Well, maybe this: The fox knows all the facts, and the fox can place those facts into a logical context. The fox can see how history and politics intertwine, and he can knit them into a nonfiction novel that makes narrative sense. But the fox can’t see the future, so he assumes it does not exist. The fox is a naïve realist who believes the complicated novel he has constructed is almost complete. Meanwhile, the

hedgehog constructs nothing. He just reads over the fox's shoulder. But he understands something about the manuscript that the fox is unable to comprehend: this book will never be finished. The fox thinks he's at the end, but he hasn't even reached the middle. What the fox views as conclusions are only plot mechanics, which means they'll eventually represent the opposite of whatever they seem to suggest. This is the difference between the fox and the hedgehog. Both creatures know that storytelling is everything, and that the only way modern people can understand history and politics is through the machinations of a story. But only the hedgehog knows that storytelling is secretly the problem, which is why the fox is constantly wrong.

Storytelling's relationship to history is a little like interviewing's relationship to journalism: a flawed process without a better alternative. We are socially-conditioned to understand the universe through storytelling, and—even if we weren't—there's neurological evidence that our brain automatically organizes information into an explainable, reassuring narrative. This is how the world will be understood, even if we desire otherwise. So which mode of storytelling is preferable? Is it better to strictly rely on verifiable facts, even if that makes the story inherently incomplete? Or is it better to conscientiously interpret events, which often turns history into an informed opinion? The former methodology is becoming increasingly dominant. Barring an unforeseeable academic reversal, one can infer that this fact-oriented slant will only gain momentum. It will eventually be the only way future historians consider the present era of America. And that will paint a much different portrait from the interpretive America we're actually experiencing.

The term 'historian's fallacy' was coined to describe the ludicrous but common error in the assumption that a man who has a given historical experience knows it, when he has it, to be all that a historian would know it to be, with the advantage of historical perspective. We are not talking about the benefit of hindsight, but about the tendency to forget that the actors in a historical drama simply did not know, at the time, what was coming next. Subsequent to an event, we may recall the clues and warnings that it was about to happen, but our memory does not extend with equal clarity to many other signs and signals which pointed unequivocally in the other direction.

The idea that those who actually took part in great events or lived through particular times have a superior understanding to those who come later is a deeply held yet wrongheaded one. Being there does not necessarily give greater insight into events; indeed, sometimes the opposite is true.

Take Ronald Reagan, he was the ultra-hedgehog, obsessed with only one truth: If people feel optimistic about where they live, details don't

matter. But here's the thing—you need to have an active, living memory of Reagan for any of this to seem plausible. You need to personally remember that the 1980s felt prosperous, even when they weren't. Every extension of mainstream popular culture expressed this. The 1980s felt prosperous even if you were poor. However, many of those who lived it can't reconcile Reagan's legacy, because they have distanced themselves from their own memories. They've unconsciously applied a fact-based perception, just like those (currently unborn) historians who will dictate reality in the year 2222. Those historians will look back at the 1980s and presume the US populace must have suffered some kind of mass delusion, prompting them to self-destructively lionize a president who—factually—made the country worse. Within the minds of those historiographers, Reagan will be defined as an objectively bad president. Except, of course, for that eight-year period when he actually was president, when he was beloved and unbeatable and so emotionally persuasive that—twenty-five years after he left office—his most ardent disciples sincerely suggested his face be carved into a South Dakota mountain. And that will make no narrative sense, except to a madman.

The practical reality is that any present-tense version of the world is unstable. What we currently consider to be true—both objectively and subjectively—is habitually provisional. But the modern problem is that reevaluating what we consider “true” is becoming increasingly difficult. Superficially, it's become easier for any one person to dispute the status quo: Everyone has a viable platform to criticize *Moby Dick* or a mediocre HP printer. If there's a rogue physicist in Winnipeg who doesn't believe in gravity, he can self-publish a book that outlines his argument and potentially attract a larger audience than *Principia* found during its first hundred years of existence. But increasing the capacity for the reconsideration of ideas is not the same as actually changing those ideas—or even allowing them to change by their own momentum. We live in an age where virtually no content is lost and virtually all content is shared. The sheer amount of information about every current idea makes those concepts difficult to contradict, particularly in a framework where public consensus has become the ultimate arbiter of validity. In other words, we're starting to behave as if we've reached the end of human knowledge. And while that notion is undoubtedly false, the sensation of certitude it generates is paralyzing.

There is the possibility that we are unable to isolate or imagine something fundamental about the construction of reality, and that the eventual realization of whatever that fundamental thing is will necessitate a rewrite of everything else. Science does not advance through minor steps, but through major ones—basically, that everyone believes all the same things for long stretches of time, only to have the entire collective worldview altered by

a paradigm shift transforming the entire system. Prior to these massive shifts, researchers conduct “normal science,” where scientists try to solve all the puzzles inside the existing paradigm, inadvertently propping up its dominance.

A philosopher can simultaneously forward an argument’s impregnable logic and its potential negation within the same sentence; a scientist can’t do that. There is no practical purpose to fungible physics. If a scientist were to validate the possibility that his entire day-to-day vocation is just “normal science” that will eventually be overwritten by a new paradigm, it would justify the lethargic thinking of anyone who wants to ignore the work that he does; work that he believes is too important to ignore. It is, in many ways, a completely unbalanced dispute. Any credible scientist can present ten-thousand micro arguments that demonstrate why our current structure of scientific inquiry is unique and unassailable. One need only make a single macro argument in response: Well, that’s how it always seems, until it doesn’t.

Do I believe our current assumption about how the present will eventually be viewed is, in all probability, acutely incorrect? Yes. And yet I imagine this coming wrongness to resemble the way society has always been wrong about itself, since the beginning of time. It’s almost like I’m showing up at the Kentucky Derby and insisting the two-to-one favorite won’t win, but refusing to make any prediction beyond ‘The winner will probably be a different horse.’

The idea of creativity—which we might define as the production of the new, beautiful, and useful—is one of the most elusive and mysterious of human abilities. Creativity is not necessarily about the arts. Scientific research—the kind that shifts paradigms but also the sort that finds an ingenious solution to a local problem—requires dollops of the stuff. It involves going from what is known to what is unknown; from what is old to what is new. It is a kind of thinking, but one in which you don’t know where you are going until you get there.

It’s impossible to understand the world of today until today has become tomorrow. This is no brilliant insight, and only a fool would disagree. But it’s remarkable how habitually this truth is ignored. We constantly pretend our perception of the present day will not seem ludicrous in retrospect, simply because there doesn’t appear to be any other option. Yet there is another option, and the option is this: We must start from the premise that—in all likelihood—we are already wrong. And not “wrong” in the sense that we are examining questions and coming to incorrect conclusions, because most of our conclusions are reasoned and coherent. The problem is with the questions themselves.

The reason something becomes retrospectively significant in a far-flung future is detached from the reason it was significant at the time of its creation—and that’s almost always due to a recalibration of social ideologies that future generations will accept as normative.

With books, these kinds of ideological transfers are difficult to anticipate, especially since there are over two-million books published in any given year. But it’s a little easier to conjecture how this might unspool in the smaller, more contained idiom of film. Take a movie like *The Matrix*. When *The Matrix* debuted in 1999, it was a huge box-office success. It was also well received by critics, most of whom focused on one of two qualities: the technological—it mainstreamed the digital technique of three-dimensional “bullet time,” where the on-screen action would freeze while the camera continued to revolve around the participants—or the philosophical—it served as a trippy entry point for the notion that we already live in a simulated world. If you talk about *The Matrix* right now, these are still the two things you likely discuss. But what will still be interesting about this film once the technology becomes ancient and the philosophy becomes standard?

I suspect it might be this: *The Matrix* was written and directed by “the Wachowski siblings.” In 1999, this designation meant two brothers; as I write today, it means two sisters. In the years following the release of *The Matrix*, the older Wachowski (Larry, now Lana) completed her transition from male to female. The younger Wachowski (Andy, now Lilly) publicly announced her transition in the spring of 2016. These events occurred during a period when the social view of transgender issues radically evolved, more rapidly than any other component of modern society. In 1999, it was almost impossible to find any example of a trans person within any realm of popular culture; by 2014, a TV series devoted exclusively to the notion won the Golden Globe for Best Television Series. In the fifteen-year window from 1999 to 2014, no aspect of interpersonal civilization changed more, to the point where Caitlyn (formerly Bruce) Jenner attracted more Twitter followers than the president; and the importance of this shift will amplify as the decades pass—soon, the notion of a transgender US president will not seem remotely implausible.

So think how this might alter the memory of *The Matrix*: In some protracted reality, film historians will reinvestigate an extremely commercial action movie made by people who—unbeknownst to the audience—would eventually transition from male to female. Suddenly, the symbolic meaning of a universe with two worlds—one false and constructed, the other genuine and hidden—takes on an entirely new meaning. The idea of a character choosing between swallowing a blue pill that allows him to remain a false placeholder and a red pill that forces him to confront who he truly is becomes

a much different metaphor. Considered from this speculative vantage point, The Matrix may seem like a breakthrough of a far different kind. It would feel more reflective than entertaining, which is precisely why certain things get remembered while certain others get lost.

This is how the present must be considered whenever we try to think about it as the past: It must be analyzed through the values of a future that's unwritten. Before we can argue that something we currently appreciate deserves inclusion in the world of tomorrow, we must build that future world within our mind. This is not easy, even with drugs. But it's not even the hardest part. The hardest part is accepting that we're building something with parts that don't yet exist.

The more foreign a custom seems, the more useful the moment of contact. To look into the strange and find the familiar is also to understand one's own self more clearly. The very unfamiliarity causes us to reflect in turn on our own "normal" practices.

Your assumptions are your windows on the world. Scrub them off every once in a while, or the light won't come in.

There are these two young fish swimming along and they happen to meet an older fish swimming the other way, who nods at them and says, "Morning, boys. How's the water?" And the two young fish swim on for a bit, and then eventually one of them looks over at the other and goes, "What the hell is water?"

You and the people you love are just tiny smudges on a much larger canvas. If you stay where you are—focused only on the shape of your own little smudges, this year like last year and the year before—you will never understand more than you do now. But what if you found a way to step back and look, for once, at the entire painting?

Each and every one of us has been born into a given historical reality, ruled by particular norms and values, and managed by a unique economic and political system. We take this reality for granted, thinking it is natural, inevitable, and immutable. We forget that our world was created by an accidental chain of events, and that history shaped not only our technology, politics, and society, but also our thoughts, fears, and dreams. The cold hand of the past emerges from the grave of our ancestors, grips us by the neck and directs our gaze towards a single future. We have felt that grip from the moment we were born, so we assume that it is a natural and inescapable part of who we are. Therefore we seldom try to shake ourselves free, and envision alternative futures. Studying history aims to loosen the grip of the past. It enables us to turn our head this way and that, and begin to notice possibilities that our ancestors could not imagine, or didn't want us to imagine. By observing the accidental chain of events that led us here,

we realize how our very thoughts and dreams took shape—and we can begin to think and dream differently. Studying history will not tell us what to choose, but at least it gives us more options.

Movements seeking to change the world often begin by rewriting history, thereby enabling people to reimagine the future. Whether you want workers to go on a general strike, women to take possession of their bodies, or oppressed minorities to demand political rights the first step is to retell their history. The new history will explain that our present situation is neither natural nor eternal. Things were different once. Only a string of chance events created the unjust world we know today. If we act wisely, we can change that world, and create a much better one. This is why Marxists recount the history of capitalism; why feminists study the formation of patriarchal societies; and why African Americans commemorate the horrors of the slave trade. They aim not to perpetuate the past, but rather to be liberated from it.

This is the best reason to learn history: not in order to predict the future, but to free yourself of the past and imagine alternative destinies. Of course this is not total freedom—we cannot avoid being shaped by the past. But some freedom is better than none.

History is a grand view of the present, and not simply something in the past.

There is a shape to the past, and it is only by understanding it that we can begin to have a sense of the historical opportunities that exist in the present. Moments of historical opportunity—moments when meaningful change is possible—follow a distinct, even a cyclical pattern, one that has long been far more coordinated across geographical space than we would ever have imagined. There is a shape to the past, and it is only by understanding it that we can begin to have a sense of the historical opportunities that exist in the present.

A man had attacked a female police officer with a hammer and was shot by the policewoman's partner. This shooting occurred at 10:00, on the street, in the vicinity of Penn Station. Now, one assumes seeing a maniac swinging a hammer at a cop's skull before being shot in broad daylight would be the kind of moment that sticks in a person's mind. Yet a Times story explained how at least two of the eyewitness accounts of this event ended up being wrong.

False memories, received memories, how we fill in the blanks of conjecture, the way the brain fills in those spaces with something that is technically incorrect—all of these errors allow us to make sense of the world, and are somehow accepted enough to be admissible in a court of law. They are accepted enough to put someone in prison. And this, remember, was a

violent incident that had happened only hours before. The witnesses were describing something that had happened that same day, and they had no incentive to lie. But video surveillance proved their depictions of reality were inaccurate. This is a level of scrutiny that can't be applied to the distant past, for purely practical reasons. Most of history has not been videotaped. But what's interesting is our communal willingness to assume most old stories may as well be true, based on the logic that (a) the story is already ancient, and (b) there isn't any way to confirm an alternative version, despite the fact that we can't categorically confirm the original version, either.

Multiple truths don't really mesh with the machinations of human nature: Because we were incessantly told one version of a story before hearing the second version, it's become impossible to overturn the original template. It is unconsciously assumed that the alternative story has to both prove itself and disprove the primary story, which automatically galvanizes the primary version as factual. How much of history is classified as true simply because it can't be sufficiently proven false? In other words, there's no way we can irrefutably certify that an event from 1776 didn't happen in the manner we've always believed, so there's no justification for presenting a counter-possibility. Any counter-possibility would have to use the same methodology, so it would be (at best) equally flawed. This becomes more and more ingrained as we move further and further from the moment of the event. So while it's absurd to think that all of history never really happened, it's almost as absurd to think that everything we know about history is real. All of which demands a predictable question: What significant historical event is most likely wrong? And not because of things we know that contradict it, but because of the way wrongness works.

People who don't know better are often wrong by accident, and people who do know better are sometimes wrong on purpose—and whenever a modern news story explodes, everyone recognizes that possibility. But we question this far less when the information comes from the past. It's so hard to get viable info about pre-twentieth-century life that any nugget is reflexively taken at face value. In Ken Burns's documentary series *The Civil War*, the most fascinating glimpses of the conflict come from personal letters written by soldiers and mailed to their families. Many robotically consume those letters as personal distillations of historical fact. For many there is not one moment of *The Civil War* that feels false. But why is that? Why do we assume the things Confederate soldiers wrote to their wives might not be wildly exaggerated, or inaccurate, or straight-up untruths? Granted, we have loads of letters from lots of unrelated Civil War veterans, so certain claims and depictions can be fact-checked against each other. If multiple

letters mention that there were wheat weevils in the bread, we can concede that the bread was infested with wheat weevils. But the American Civil War isn't exactly a distant historical event, amazingly, a few Civil War veterans were still alive in the 1950s. The further we go back, the harder it becomes to know how seriously any eyewitness account can be taken, particularly in cases where the number of accounts is relatively small.

Discounting those events that occurred within your own lifetime, what do you know about human history that was not communicated to you by someone else?

History is a creative process or as Napoléon Bonaparte once said, "a set of lies agreed upon." The world happens as it happens, but we construct what we remember and what we forget. And people will eventually do that to us, too.

In Western culture, pretty much everything is understood through the process of storytelling, often to the detriment of reality. When we recount history, we tend to use the life experience of one person—the "journey" of one particular "hero"—as a prism for understanding everything else.

Consider how mainstream musical memory works. As the timeline moves forward, tangential artists in any genre fade from the collective radar, until only one person remains; the significance of that individual is then exaggerated, until the genre and the person become interchangeable. Sometimes this is easy to predict: I have zero doubt that the worldwide memory of Bob Marley will eventually have the same tenacity and familiarity as the worldwide memory of reggae itself. These happen to be celebrities of thundering genius, but we're still giving in to a winner-takes-all mentality. There's a basic human reason for this simplification: It's difficult to cope with the infinite variety of the past, and so we apply filters, and we settle on a few famous names.

What things actually are matters less than random social conditions and capricious assessments from people who don't necessarily know what they're talking about. Take architecture: Here we have a creative process of immense functional consequence. It's the backbone of the urban world we inhabit, and it's an art form most people vaguely understand—an architect is a person who designs a structure on paper, and that design emerges as the structure itself. Architects fuse aesthetics with physics and sociology. And there is a deep consensus over who did this best, at least among non-architects: If we walked down the street of any American city and asked people to name the greatest architect of the twentieth century, most would say Frank Lloyd Wright. In fact, if someone provided a different answer, we'd have to assume we've stumbled across an actual working architect, an architectural historian, or a personal friend of Frank Gehry. Of course,

most individuals in those subsets would cite Wright, too. But in order for someone to argue in favor of any architect except Wright—or even to be in a position to name three other plausible candidates—that person would almost need to be an expert in architecture. Normal humans don't possess enough information to nominate alternative possibilities. And what emerges from that social condition is an insane kind of logic: Frank Lloyd Wright is indisputably the greatest architect of the twentieth century, and the only people who'd potentially disagree with that assertion are those who legitimately understand the question. History is defined by people who don't really understand what they are defining.

As a brick-and-mortar visionary, Wright was dazzling. He was also prolific, which matters almost as much. He championed the idea of “organic architecture,” which—to someone who doesn't know anything about architecture, such as myself—seems like the condition all architecture should aspire to. But I know these imperative perspectives have no origin in my own brain. The first time I ever heard Frank Lloyd Wright's name, I was being told he was brilliant, which means the first time I looked at a building he designed, I thought either, ‘That is what brilliance looks like,’ or ‘This is what everyone else recognizes as brilliance.’ I knew he was considered “prolific” long before I ever wondered how many buildings an architect needed to design in order to be considered average, much less productive.

The forces shaping collective memory are so complicated and inconsistent that any belief system dogmatically married to the concept of “merit” ends up being a logical contention that misses the point entirely. It's like arguing that the long-term success of any chain restaurant is a valid reflection of how delicious the food is.

Do you unconsciously believe that Shakespeare was an objectively better playwright than his two main rivals, Christopher Marlowe and Ben Jonson? If so, have no fear—as far as the world is concerned, he was. If you want to prove that he was, all you need to do is go through the texts of their respective plays and find the passages that validate the opinion most of the world already accepts. It will not be difficult, and it will feel like the differences you locate are a manifestation of merit. But you will actually be enforcing a tautology: Shakespeare is better than Marlowe and Jonson because Shakespeare is more like Shakespeare, which is how we delineate greatness within playwriting. All three men were talented. All three had enough merit to become the historical equivalent of Shakespearean, had history unspooled differently. But it didn't. It unspooled the way we understand it, and Shakespeare had almost nothing to do with that. He is remembered in a way that Marlowe and Jonson are not, particularly by those who haven't really thought about any of these guys, ever.

To matter forever, you need to matter to those who don't care. And if that strikes you as sad, be sad.

I sometimes wonder if the pillars of American political culture are really just a collection of shared illusions that will either (a) eventually be disbelieved or (b) collapse beneath the weight of their own unreality. And that would certainly be the end of everything. Or at least something that will feel like everything to those who live through the collapse.

History is something we have agreed to believe in.

The study and writing of history have always been problematic. Primary sources disagree, and there are historiographical fashions. Some histories become almost canonical—unchallengeable retailers of the truth about the past. It is often said that history is written by the victors in any struggle, and that the identities of heroes and villains are therefore constructed so as to fit in with the requirements of the winner.

Marxist historiography disputed the analytical usefulness of “bourgeois” history, and cast the passing worlds in terms of the struggle between social and economic classes. Social histories forswore the concentration on “great men,” insisting that you only understand the past if you examine the lives of the masses.

But revisionist history did something else. It was (and is) less an alternative way of studying than an adoption of deliberately alternative opinions about the past.

History, rather than being a static entity, is a dynamic field, with the way we see our histories changing depending on who writes, speaks about, or teaches about them.

For most of the twentieth century, there was an ever-growing realization (at least among intellectuals) that the only way to understand the deeper truth about anything complicated was through “shadow histories”: those under-reported, countercultural chronicles that had been hidden by the conformist monoculture and emerge only in retrospect. Things that seem obvious now—the conscious racism of Nixon's Southern Strategy, the role the CIA played in the destabilization of Iran, how payola controlled what was on FM radio, the explanation behind America's reliance on privately owned cars instead of public transportation, et alia—were all discussed while they were happening, but only on the marginalized periphery. They were not taken that seriously. Over time, these shadow ideas—or at least the ones that proved factually irrefutable—slowly became the mainstream view.

Ideologies are ways of organizing large swaths of life and experience under a set of shared but often unexamined assumptions. This quality makes an ideology particularly hard to see, at least while it's still exerting its hold on

your culture. A reigning ideology is a little like the weather—all pervasive and so virtually impossible to escape. Still, we can try.

You don't see something until you have the right metaphor to let you perceive it.

Human beings may not always get the right analogy, but they are almost certainly bound to try to use one.

Liberty is intimately connected with language. Those who seek to monopolize power always use inaccessible and specialized jargon to exclude the average citizen. We must break these chains.

It is said that a revolution begins in the mind—an alternative to our present circumstances must first be imagined before we can be moved to fight for it.

My goal is not to contradict conventional answer 'X' by replacing it with unconventional answer 'Y.' My goal is to think about the present in the same way we think about the past, wholly aware that such mass consideration can't happen until we reach a future that no longer includes us. And why do I want to do this? Because this is—or should be—why we invest time into thinking about anything that isn't essential or practical or imperative. The reason so many well-considered ideas appear laughable in retrospect is that people involuntarily assume that whatever we believe and prioritize now will continue to be believed and prioritized later, even though that almost never happens. It's a mistake that never stops being made. So while it's impossible to predict what will matter to future versions of ourselves, we can reasonably presume that whatever they elect to care about—in their own moment—will be equally temporary and ephemeral. Which doesn't necessarily provide us with any new answers, but does eliminate some of the wrong ones we typically fail to question.

Philosophy, classically understood, has as its task both the presentation of reality and the explanation of the illusions that deceive us from recognizing it.

As with any bit of illusion, once the actual workings are revealed, the strings made visible, it becomes ugly and obvious, drained of its power to enchant.

The Prince is the most misunderstood satire in all of history. Everything Machiavelli ever wrote, before and after *The Prince*, insists that 'Popular rule is always better than the rule of princes.' That's because Machiavelli was actually a huge advocate of free republics and hated the idea of monarchies. The Medici family in particular, the same family to which he dedicated *The Prince*, really pissed him off. See, Machiavelli worked for the Florentine Republic right before the Medici stepped in and insisted they were in charge from now on. Oh, and they also tortured Machiavelli before casting him

off into exile for being revolutionary. So why would an exiled, disgruntled writer suddenly try to help the reigning prince to be more merciless?

Well, he wouldn't. Without the context of the rest of Machiavelli's work, *The Prince* makes him look like a blatant asshole, when in fact he was actually a very sneaky asshole. After the pamphlet was circulated around Italy, if the Medicis made any move that seemed to earnestly follow the ideologies of *The Prince*, the public would be so furious at their arrogance that it would likely incite a revolution. So through his sarcasm, Machiavelli could effectively bind the hands of the ruling family, ensuring that the people would be looking for any parallels between the actions of the Medici family and that horrible pamphlet they'd just read.

Great Questions

The fact that Dostoevsky can tell a juicy story isn't enough to make him great. If it were, Judith Krantz and John Grisham would be great fiction writers, and by any but the most commercial standards they're not even very good. The main thing that keeps Krantz and Grisham and lot of other gifted storytellers from being artistically good is that they don't have any talent for (or interest in) characterization—their compelling plots are inhabited by crude and unconvincing stick figures. In fairness, there are also writers who are good at making complex and fully realized human characters but don't seem able to insert those characters into a believable and interesting plot. Plus others—often among the academic avant-garde—who seem expert/interested in neither plot nor character, whose books' movement and appeal depend entirely on rarefied meta-aesthetic agendas. The thing about Dostoevsky's characters is that they are alive. By which I don't just mean that they're successfully realized or developed or "rounded." The best of them live inside us, forever, once we've met them.

Dostoevsky's characters manage to embody whole ideologies and philosophies of life. The thrust here is that Dostoevsky wrote fiction about the stuff that's really important. He wrote fiction about identity, moral value, death, will, sexual versus spiritual love, greed, freedom, obsession, reason, faith, suicide. And he did it without ever reducing his characters to mouth-pieces or his books to tracts. His concern was always what it is to be a human being—that is, how to be an actual person, someone whose life is informed by values and principles, instead of just an especially shrewd kind of self-preserving animal.

The big thing that makes Dostoevsky invaluable for American readers and writers is that he appears to possess degrees of passion, conviction, and engagement with deep moral issues that we—here, today—cannot or do not permit ourselves.

“Anyone who attacks individual charity attacks human nature and casts contempt on personal dignity. But the organization of ‘public charity’ and the problem of individual freedom are two distinct questions, and not mutually exclusive. Individual kindness will always remain, because it is an individual impulse, the living impulse of one personality to exert a direct influence upon another. How can you tell, Bahmutov, what significance such an association of one personality with another may have on the destiny of those associated?”

Can you imagine any of our own major novelists allowing a character to say stuff like this? Not, mind you, just as hypocritical bombast so that some ironic hero can stick a pin in it, but as part of a ten-page monologue by somebody trying to decide whether to commit suicide? The reason you can't is the reason he wouldn't: such a novelist would be, by our lights, pretentious and overwrought and silly. The straight presentation of such a speech in a Serious Novel today would provoke not outrage or invective, but worse: one raised eyebrow and a very cool smile. Maybe, if the novelist was really major, a dry bit of mockery in *The New Yorker*. The novelist would be—and this is our own age's truest vision of hell—laughed out of town. So he—we, fiction writers—won't—can't—dare try to use serious art to advance ideologies. We will, of course, without hesitation use art to parody, ridicule, debunk, or criticize ideologies; but this is very different. People would either laugh or be embarrassed for us. Given this—and it is a given—who is to blame for the unseriousness of our serious fiction? The culture, the laughers? But they wouldn't—could not—laugh if a piece of morally passionate, passionately moral fiction was also ingenious and radiantly human fiction. But how to make it that? How—for a writer today, even a talented writer today—to get up the guts to even try? There are no formulas or guarantees.

When I was a teenager I was a troubled and restless person. The world made no sense to me, and I got no answers to the big questions I had about life. In particular, I didn't understand why there was so much suffering in the world and in my own life, and what could be done about it. All I got from the people around me and from the books I read were elaborate fictions: religious myths about gods and heavens, nationalist myths about the motherland and its historical mission, romantic myths about love and adventure, or capitalist myths about economic growth and how buying and consuming stuff will make me happy. I had enough sense to realize that these were probably all fictions, but I had no idea how to find truth. When I began studying at university, I thought it would be the ideal place to find answers. But I was disappointed. The academic world provided me with powerful tools to deconstruct all the myths humans ever create, but it didn't offer satisfying answers to the big questions of life. On the contrary, it encouraged me to focus on narrower and narrower questions.

For a very long time, the intellectual consensus has been that we can no longer ask Great Questions. Increasingly, it's looking like we have no other choice.

Our culture is hungry for the opportunity to feed the collective mind with something other than intellectual junk food. All too few are writing books that deal with big philosophical, cosmological, or historical concepts.

In a world deluged by irrelevant information, clarity is power. In theory, anybody can join the debate about the future of humanity, but it is so hard to maintain a clear vision. Frequently, we don't even notice that a debate is going on, or what the key questions are. Billions of us can hardly afford the luxury of investigating, because we have more pressing things to do: we have to go to work, take care of the kids, or look after elderly parents. Unfortunately, history gives no discounts. If the future of humanity is decided in your absence, because you are too busy feeding and clothing your kids—you and they will not be exempt from the consequences.

This may sound overambitious, but *Homo sapiens* cannot wait. Philosophy, religion, and science are all running out of time. People have debated the meaning of life for thousands of years. We cannot continue this debate indefinitely. The looming ecological crisis, the growing threat of weapons of mass destruction, and the rise of new disruptive technologies will not allow it. Perhaps most importantly, artificial intelligence and biotechnology are giving humanity the power to reshape and re-engineer life. Very soon somebody will have to decide how to use this power—based on some implicit or explicit story about the meaning of life. Philosophers are very patient people, but engineers are far less patient, and investors are the least patient of all. If you don't know what to do with the power to engineer life, market forces will not wait a thousand years for you to come up with an answer. The invisible hand of the market will force upon you its own blind reply. Unless you are happy to entrust the future of life to the mercy of quarterly revenue reports, you need a clear idea what life is all about.

There is a view in some philosophical circles that anything that can be understood by people who have not studied philosophy is not profound enough to be worth saying. To the contrary, I suspect that whatever cannot be said clearly is probably not being thought clearly either.

That it's a philosophy book does not place it in some arcane and inaccessible realm. Doing philosophy is largely a matter of trying to put things together, trying to get the pieces of very large puzzles to make some sense. Good philosophy is opportunistic; it uses whatever information and whatever tools look useful.

The degeneration of philosophical schools is the consequence of the mistaken belief that one can philosophize without having been compelled to philosophize by problems outside philosophy. Genuine philosophical problems are always rooted outside philosophy and they die if these roots decay. These roots are easily forgotten by philosophers who “study” philosophy instead of being forced into philosophy by the pressure of non-philosophical problems.

The quest for certainty, which became an obsessive theme in modern

thought when Descartes tried to ground philosophy in indubitable propositions, was misguided to begin with. It distracted attention from the real business of philosophy, the attempt to arrive at concrete judgments about ends and means in the regulation of practical behavior. In their pursuit of the absolute and immutable, philosophers took a disparaging view of the time-bound and contingent. Practical activity, became in their eyes intrinsically an inferior sort of thing. In the world view of Western philosophy, knowing came to be split off from doing, theory from practice, the mind from the body.

These are difficult times for writers and orators who wish to specialize in the language of Moral Harangue. We live in an era where persuasive speech is largely comprised of lukewarm appeals to self-interest. One seeks to prove to one's audience that they have something to gain—or, at the very least, nothing to lose—by supporting the desired moral proposition. When we denounce our political foes, we usually do so by vaguely suggesting that their ideas are “backwards” and that “history” will “judge” them. This is pretty toothless stuff: Our politicians are almost all nihilists who cheerfully consign their fellow humans to endless miseries on a daily basis, so why would they give the faintest fart what human beings not-yet-born will think of them? To say nothing of the fact that ascendant evil-doers always—and often correctly—assume they will be the ones writing the history books.

For those who like their rhetoric neat, of course, there is the language of revolution. But this is tricky to deploy. The invocation of revolution nearly always carries an implicit threat of violence:

“If you don't do the right thing, we will come kill you.”

If you're a pacifist, you may think that this is rarely, if ever, a morally justifiable threat. And even if you aren't a pacifist, you must at least think carefully about when to use revolutionary language: It's probably strategically unwise to invoke violence that you have no stomach or ability to carry out. But Back In The Day, there was another option available when you wanted to denounce your foes: the language of hellfire.

The idea of hell is, perhaps, the part of traditional Christianity that seems the most absurd and weirdly off-message to non-Christians. After all, isn't it rather at odds with the whole notion of Love Thy Neighbor that the creator of the universe would have a subterranean torture chamber where those who displease him are roasted in perpetuity? New Atheist types are always eager to point out that hell is an absurd contradiction: How can a god that inflicts horrific pain on his creations for eternity be the arbiter of any kind of morality?

There are two ways to approach this apparent contradiction. Option One: super lean into the idea that Hell Is A Good Thing in a way that makes everyone around you extremely uncomfortable. During the first thousand years or so of Christianity, there was recurring theological speculation that the blessed in heaven could actually see the damned in hell—and, what’s more, that they enjoyed seeing the damned in hell. Tertullian, a second-century Christian writer, looked forward with giddy anticipation to his front-row seat to the torment of the wicked:

“What a panorama of spectacle on that day! Which sight shall excite my wonder? Which, my laughter?”

He imagined “so many and so mighty kings, whose ascent to heaven used to be made known by public announcement, groaning in the depths of darkness,” and the provincial governors who tortured and executed his coreligionists “melting in flames fiercer than those they themselves kindled in their rage against the Christians braving them with contempt.” A couple beats later, Tertullian begins to sound less like an anti-establishment revolutionary and more like an incel posting a screed on 4chan, as he pictures the fiery torment of “the tragic actors, more vocal in their own catastrophe,” “the comic actors, more lither of limb in the fire,” and “the athletes, not in their gymnasiums, but thrown about by fire.”

Tertullian clearly got some kind of creepy, maybe-erotic kick out of imagining various Chads being burned alive: but other, soberer theologians also concurred that those in heaven would witness the spectacle of hell, and that it, like all God’s works, would be a cause of rejoicing. Many hundreds of years after Tertullian, Thomas Aquinas wrote:

“That the saints may enjoy their beatitude more thoroughly, and give more abundant thanks for it to God, a perfect sight of the punishment of the damned is granted them.”

Aquinas hastened to clarify that it wasn’t the torments themselves that caused the enjoyment, but the knowledge of God’s perfect justice, of which the torments were merely an insignificant side-effect. Thomas Aquinas would definitely have been one of those guys in high school who claimed to like the Saw series “for the plot.”

There are fire-and-brimstone varieties of evangelical Christianity that still preach basically along these lines. But I was raised Catholic, and in modern Catholicism, we go in for Option Two: don’t bring up hell that much and when you do maybe don’t talk about the fire stuff okay. Hell is literally real in Catholic theology: That is to say, hell is not a metaphor,

but an actual place, with actual flames, and any conscientious theologian will be forced to admit this when pressed. But when I went to church as a child, most priests—if they mentioned hell at all, which was rare—would talk about hell primarily as the condition of being cut off from the love of God. This, the priests hastened to assure us, was the worst agony of all, worse than any merely physical torture.

I think this is a pretty clever maneuver! The fire-and-bodily-agony thing just makes God sound like a garden-variety serial killer, so pivoting to the psychological dimensions of eternal torment is a way to take the murderous edge off God's sadism, while simultaneously assuring everyone that hell is still definitely very bad. It reminds me of the way one of my family members used to justify being against the death penalty on the grounds that:

- Killing is wrong
- Keeping people locked up forever is actually much crueler than just killing them, and people who have committed terrible crimes deserve to suffer

There's simply no getting away from that odd tension between doing the right thing because it brings you closer to a loving God versus doing the right thing because the same loving God will light you on fire if you don't—but it's really hard to argue that being lit on fire isn't more terrifying. I had a three-year stint at a Catholic school where we all publicly prayed the Act of Contrition at the end of every day, and I've always loved it as a model apology. It's written in the voice of an overly honest man frantically trying to cover his bases in real time:

“Oh my God, I am heartily sorry for having offended You, and I detest all my sins because I dread the loss of heaven and the pains of hell but most of all because they offend *you*, oh God, Who art all good and deserving of all my love.”

That hastily-disclaimed “because I dread the pains of hell” really says it all. No living human with a flesh-and-blood body truly believes that forfeiture of the love of God could possibly be worse than the physical torments of hell. Given the choice between being gored with hot pokers over and over and over, and being afflicted with a particularly fierce case of FOMO, who would choose the pokers? No one, and anyone who says otherwise is a liar.

Given the visceral grittiness of the torments of hell, the language of hellfire—in times and places where people actually believe in hell, or at

least have to publicly pretend that they do—is a powerful rhetorical register. Unlike some revolutionary language, it isn’t an outright threat to slaughter your enemies, but neither is it a bloodless civil censure. It is, in effect, telling your political opponents:

“What you have done is so evil that when the omniscient, omnipotent author of the universe finally holds you to account, he will probably light you on fire, rip your entrails out of your body, and feed them back to you in an endless cycle for the rest of time.”

It’s a way to express moral outrage so furious, so implacable, that not even an eternity of torture could expiate it. Forget “cancel culture,” if you really intend to anathematize a member of your community, tell everyone why that person deserves to go to hell. Or, if you think your entire community is destined for the flames, then hellfire language is a way of expressing smoldering, vengeful despair, of declaring that we all deserve to be obliterated for what we have condoned, that the sins committed are so bad that no one who has been touched by them should escape punishment. Take, as an illustrative example, this speech by the abolitionist William Lloyd Garrison, in which he invites the wrath of God on a nation that has enriched itself on the agony of slaves:

“Yet I know that God reigns, and that the slave system contains within itself the elements of destruction. But how long it is to curse the earth, and desecrate his image, He alone foresees. It is frightful to think of the capacity of a nation like this to commit sin, before the measure of its iniquities be filled, and the exterminating judgment of God overtake it. For what is left us but a fearful looking for of judgment and fiery indignation? Or is God but a phantom, and the Eternal Law but a figment of the imagination? Has an everlasting divorce been effected between cause and effect, and is it an absurd doctrine that, as a nation sows, so shall it also reap?

Wherefore, hear the word of the Lord, ye scornful men that rule this people: Because ye have said, We have made a covenant with death, and with hell we are at agreement; when the overflowing scourge shall pass through, it shall not come unto us; for we have made lies our refuge, and under falsehood have we hid ourselves: Therefore, thus saith the Lord God, judgment will I lay to the line, and righteousness to the plummet; and the hail shall sweep away the refuge of lies, and the waters shall

overflow the hiding-place: And your covenant with death shall be annulled, and your agreement with hell shall not stand; when the overflowing scourge shall pass through it, then ye shall be trodden down by it.”

It's very hard to imagine Bernie Sanders or Alexandria Ocasio-Cortez getting up in front of the nation and declaring that our country, left unreformed, merits “the exterminating judgment of God.” William Lloyd Garrison and other abolitionists of his ilk have been vaguely re-imagined in American history as milquetoast Anti-Slavery Good Guys, but in their time, they were viewed as dangerous radicals and seditionists. Today, a person who speechified in this manner about an analogous issue, like the prison-industrial complex, or the labor abuses of multinational companies, or the immigrant police state, or massive death camps for non-humans, would probably be accused of inciting domestic terrorism. Jesus is a contradictory model in this respect, because when he's not exhorting people to love their neighbors, he's roaming around the countryside irritably smiting fig-trees and flipping over money-changing tables.

I spend a lot of time thinking about the peculiar evil of judges, bureaucrats, lawyers, and political operatives. The sort of person who becomes an ICE attorney, or an immigration judge, or an advisor to a president is someone much closer to me. They are people I would have encountered in college or in law school. They, like me, live lives of relative comfort and certainty. The stakes of the decisions they make are, for themselves, largely professional, social, and reputational, not life-or-death. People like Kris Kobach, Jeff Sessions, William Barr, Ken Cuccinelli, and Stephen Miller grew up with every conceivable advantage and still choose to devote their lives to grinding the faces of the poor into the dirt.

I read an article recently about Agnelis Reese, an immigration judge in Louisiana, who has denied 100 percent of the asylum-seekers who have appeared before her, making her the harshest immigration judge in a country with some pretty stiff competition. The article's author highlights one hearing transcript where the judge lectures a man, S., facing deportation to Eritrea about his faith:

“Reese asked if he had ever told anyone about [his sexual abuse while imprisoned in Eritrea] before revealing it to the doctor at Pine Prairie. ‘I did not,’ he said. ‘This is very shameful for me to tell.’”

Later, S. said that, despite daily beatings, he refused to convert to Orthodox Christianity:

“And every time you said no?” asked Reese.

‘Yes, based on Matthew 10:22,’ he replied.

‘I didn’t—sir, I’m not asking you to quote scripture,’ said Reese.

‘Jesus is asking me to talk for him.’

Reese snapped. ‘And when you lied to the asylum officers or failed to disclose your sexual abuse, what do you think Jesus thought about that?’ The judge followed that up with a lengthy diatribe, chastising S. for not revealing the abuse earlier.”

Knowing that courtroom scenes like this are happening all across the country, it’s difficult to avoid feeling at least a tad Tertullian. How do we talk about these things? What language of moral disapprobation could possibly be vivid enough? How do we allow people like this judge to live respectable lives in human society—to eat in restaurants, go to the movies, attend PTA meetings—when the things they do in the ordinary, plodding course of their workdays are so repugnant and inexcusable that they should be permanently cut off from all love and communion with their fellows?

We might, like William Lloyd Garrison, take a leaf out of the book of the prophet Isaiah:

“Woe to unjust judges and to those who issue unfair laws, so that there is no justice for the poor, the widows, and orphans. Oh what will you do when I visit you in that day when I send desolation upon you from a distant land? To whom will you turn then for your help? Where will your treasures be safe? I will not help you; you will stumble along as prisoners or lie among the slain. And even then my anger will not be satisfied, but my fist will still be poised to strike you.”

When you feel powerless, there is at least some satisfaction in telling the powerful exactly what they deserve. You hope that maybe—if you express your hatred of evil, and the complacency that enables it, with enough conviction and passion—others will be stirred out of their slumbers and roused to righteous anger too.

People sometimes say that economic and ideological issues put voters off. But almost half the population already doesn’t vote. And most of the nonvoters are poor. It would be interesting to see how many of them would start showing up for elections that hinged on the meaning and importance of equality in America.

At every turning point of history someone rises up who can enunciate and in a sense personify the new direction of the public mind and will. America has reached such a crossroads.

It's not just about irrationality and systemic breakdown, its about injustice and the moral justifications of taken-for-granted rights and practices. It's not only about how much people in different positions in the economy should get paid for what they do, but about whether those positions are legitimate in the first place. Is it right that they're allowed to do what they're doing?

There is of course a long history of critiques of capitalism aimed at different targets: alienation, insecurity, and poverty; the treadmill of working and consuming; economic contradictions and irrationalities; and environmental destruction. There are useful things to learn from all of these critiques, but at the current time, when the rich have increased their power so much, and inequalities have widened, I believe we need a new line of attack, one that focuses on the institutions and practices that allow this to happen. Too many books on economic justice, and especially on the economic crisis, take as given the very institutions and practices that need questioning. This book is about the injustices of some long-standing economic relations that have come to a head in the crisis.

This book is not only about money and goods, but about the very language of economic life, for the history of our modern economy is partly one of struggles over how to describe or categorize economic practices, as this affects what we see as acceptable or unacceptable: words like 'investment,' 'speculation,' or 'gambling' invite different evaluations. Who wouldn't prefer to be called an investor rather than a speculator or gambler? But what do such terms mean and what practices fit them? When a top banker is described as having "earned" \$X million, we might question what 'earned' means in such a context: is it just what they've managed to extract from the economy? This struggle over words has been largely won by the rich and powerful, so how we speak about economic life systematically conceals their activities. Mainstream economics has proved to be a helpful if largely unwitting accomplice to this process, fearful of anything that might be construed as critical of capitalism.

This book should not be seen as ignoring the benefits capitalism has brought; nor, in criticizing it, to be legitimizing the state socialism of the former Soviet Bloc. 'Neither Washington nor Moscow, former or contemporary!' would be my slogan. A recent Russian saying goes: "Marx was completely wrong about communism, but damn, it turns out he was right about capitalism!" I don't think he was entirely right about capitalism by any means, though his thinking on its dynamics and on its generation of

inequalities was more illuminating than many.

If you're wondering whether I'm a Smithian, Marxist, or Keynesian, or whatever, my answer in each case is yes and no: yes where I think they're right, no where I think they're wrong.

Our predicament is simple to describe.

Since the dawn of civilization, powerful individuals have controlled the stories people tell themselves about who they are, who's in charge, how a good citizen behaves, what groups should be loved, what groups should be hated, and what's really going on in the world. When you study what we call history, you're mostly just reading the ancient proto-propaganda of whatever kingdom happened to win the last war during that period of time. When you study what we call religion, you're mostly reading stories that were advanced by ancient governments explaining why the people should be meek, forgiving taxpayers instead of rising up and killing their wealthy exploiters.

This continues to this day. We fill our children's heads with lies about how the world works, how the government works, how the media works, and, on a deeper level, how their own consciousness works, and the entire process is shaped to funnel power toward the people who control our stories. The modern schooling system was largely formed by John D. Rockefeller, widely considered the wealthiest person in modern history, in order to create generations of docile gear-turners for the industrial plutocratic machine. Modern schooling is essentially mainstream media in a building; it promotes authorized narratives day in and day out to ensure that children will have a reaction of cognitive dissonance and rejection when confronted with information which contradicts those narratives.

This funnels the populace seamlessly into the narrative control matrix of adulthood, where childhood indoctrination into mainstream narratives lubricates the way for continual programming of credulous minds with mass media propaganda. All the print, TV, and online media they are presented with supports the status quo-supporting agendas of the same plutocratic class that John D. Rockefeller dominated all those years ago. This ensures that no matter how bad things get, no matter how severely our spirits are crushed by end-stage metastatic neoliberalism, no matter how many stupid, pointless wars we're duped into, no matter how much further we are drawn along the path toward extinction via climate chaos or nuclear war, we will never revolt to overthrow our rulers.

That's three paragraphs. Our predicament is simple to describe and easy to understand. But that doesn't mean it's easy to solve.

I often hear revolutionary-minded thinkers expressing frustration at the masses for choosing to stay within this transparently abusive dynamic

instead of rising up and forcing change. And yes, it is self-evident that the citizenry could easily use its vastly superior numbers to do that if it collectively chose to. The door is right there. It's not even locked.

But the people aren't failing to choose the door because they love being abused, they're failing to choose the door because they've been manipulated into not choosing it. From cradle to grave they're pummeled with stories telling them that this is the only way things can be, in exactly the same way a battered wife or a cult member are pummeled with stories about how leaving is impossible.

The difficulty of our times is not that we are locked up; we aren't. The difficulty is that far too many of us are manipulated into choosing a prison cell over freedom. The fact of the matter is that a populace will never rise up against its oppressors as long as it is being successfully propagandized not to. It will never, ever happen. The majority will choose the prison cell every time.

You'd expect that more dissident thinking would be pouring into solving this dilemma, but not much is. People talk about elections and political strategies, they talk about who has the most correct ideology, they talk about rising up and seizing the means of production due to unacceptable material conditions, they wax philosophical about the tyranny of the state and the immorality of coercion, but they rarely address the elephant in the room: that you can't get a populace to oust the status quo when they do not want to.

I am writing with one end in mind: to help open a door for readers and encourage them to step through. A consensus that we might term the Great Western Narrative has been constructed not to inform and enlighten but to conceal and deceive. It is not that I or others are cleverer than everyone else. We have simply had a chance—an earlier one—to step through that door ourselves, because of a jarring life experience that the Great Western Narrative could not explain, or because someone held the door open for us, or more usually because of a combination of the two.

From the other side of the door, Russia's Vladimir Putin or Bashar al-Assad look as irrational, or rational, and as criminal as George W. Bush, Tony Blair, Barack Obama, or Donald Trump. In fact, they look less criminal—not because they are better humans than their Western counterparts, but simply because they enjoy less power and face more constraints in trying to impose their will. The issue is not about who is better. They are the same as humans. It is about who has more force at their disposal—and more will to use it—to perpetuate their power.

Why did we let Ronald Reagan die calmly in his sleep, at age ninety-three, almost a quarter century after he destroyed everything decent in

America? This book is in part an attempt to dig up Reagan's remains, hang them upside down from the nearest palm tree, and subject him, at last, to a proper trial.

Some argue the three most significant developments in the political economy of the twentieth century were:

1. The growth of democracy.
2. The growth of corporate power.
3. The growth of propaganda as a means of protecting corporate power against democracy.

Other, more specific developments include:

- Advertising and publicity devoted to the creation of artificial wants.
- The public relations and propaganda industry whose principal goal is the diversion to meaningless pursuits and control of the public mind.
- The degree to which academia and the professions are under assault from private power determined to narrow the spectrum of thinkable thought.

For many, it is an axiom of conventional wisdom that the use of propaganda as a means of social and ideological control is distinctive of totalitarian regimes. Yet, the most minimal exercise of common sense would suggest a different view: that propaganda is likely to play at least as important a part in democratic societies—where the existing distribution of power and privilege is vulnerable to quite limited changes in popular opinion—as in authoritarian societies, where it is not. In this context, conventional wisdom becomes conventional ignorance; as for common sense, maybe not so much.

The purpose of this propaganda barrage has been to convince as many people as possible that it is in their interests to relinquish their own power as workers, consumers, and citizens, and forego their democratic right to restrain and regulate business activity. As a result the political agenda is now confined to policies aimed at furthering business interests.

An extreme example of this view playing itself right under our noses and over decades was the cruel fiction of the “trickle down effect” (TDE)—a.k.a. the rising tide that would lift all yachts—of Reaganomics. One of several mantras that defined Reagan's overarching political shtick, the TDE was by any measure, decidedly more a torrent than a trickle, and said “torrent” was going up not down.

Yet as the global financial crisis of 2008 amply demonstrated, it culminated in a free-for all, dog eat dog, anything goes, every man for himself form of cannibal capitalism—an updated, much improved version of the no-holds-barred mercenary mercantilism much reminiscent of the Gilded Age and the Robber Barons who infested it, only one that doesn't just eat its young, it eats itself.

Capitalism, slammed against the ropes and almost down for the count of ten, found a way out of its dilemmas of the 1970s. The market was saturated and the labour movement was pressing for more say and higher wages. The old Fordist regime of standardized, often boring products was nearing its end. So was the idea of the “empowered worker.” Soon, the customer would be paid more attention than ever. In fact, a revolution of the commercialization of social life that aimed to save capitalism from the spectre of saturated markets after the watershed years was underway.

The capitalists learned in the 1970s to put the individualization of both customers and products at the service of commercial expansion. The golden key that unlocked the Neoliberal Revolution was diversified consumption.

“Commercialized diversification—the movement of markets and commercial relations from the satisfaction of needs to the servicing of wants—extended far beyond automobiles.”

Tying the purchasing of newly diversified products—luxury goods, from perfumes to watches—to a new form of stylized personal identity, production soared.

Niche production enabled consumers to purchase customized diversified goods, from golf clubs to cars. Even McDonald's discovered local cuisine. And vintners suddenly invented endless new wines for exquisite consumption (on a balcony overlooking the Mediterranean of course). Two German firms, Adidas and Puma, turned themselves into multi-billion-dollar global companies selling hundreds of ever changing running shoes and perfumes for men and women. We were all at the mercy of capitalist seduction. With obsolescence built into the commodities, all that glitters was available at the tap of a key.

Now, individuals were integrated into society with few obligations. In a mature, affluent market buying something involves no more than picking what you like best (and can afford) from what is in principle an infinite menu of alternatives awaiting your decision, with no need to negotiate or compromise as one had to in traditional social relations. This is sociation by consumption. It is voluntary rather than obligatory, individual rather than collective. It is from this perspective that it seems productive to

speak of a particular politics of consumption, associated with the affluent societies of today. In this high intensity consumer paradise, individuals can exit all forms of “collective identity”—traditional religious communities, neighbourhoods, even one’s nation. Thus, participating in a community of consumption, with its looser ties that bind, allows individuals to surf from one identity to the next, free from any pressure to explain themselves. Live lightly, flit about freely.

Sociation by social media—Twitter, Facebook, and the like—represents an extension of this trend, not least in that it offers these companies a further set of tools for highly individualized marketing. There are endless examples of illegal access to our private consuming profile, just to anticipate and shape what we might buy. This is what some call the “extractive economy.”

Licking their lips, firms and politicians seized a fantastic opportunity to use the new technologies to compensate for the increasing atrophy of traditional party organizations. Capitalism rescued itself from late-Fordist stagnation. But this, as we have seen, led to the unprecedented commercialization of social life. This process, however, transformed the nature of politics as such. The driving spirit of commercialization is viewing the world as one’s oyster—What’s in it for me?—and not whether everyone even has enough bread to eat. The narcissistic preoccupation with self-expression and affirmation easily accommodates itself to the dizzying world of the social media. There, one can hook up with sites that simply confirm one’s own biases. One may never engage thinking that upsets one’s own narrow angle on the world. There’s something for every taste, from bomb-building to growing orchids.

Since states now exist alongside dynamic, new markets for advanced consumption, they aid investment capital’s desire for the privatization of several hitherto publicly provided services, among them telecommunications, radio broadcasting, and television, which increasingly came to be perceived in their traditional format as old-fashioned, utilitarian, boring, and unresponsive to users-turned-consumers. Now, the idea was that only sexy private firms could deliver the snazzy customized products. The newly privatized sectors of telecommunications and television made huge fortunes—Murdoch and Berlusconi for example. There had only been two channels for Germans through the 1970s.

The received political wisdom during the 1980s and 1990s was that the difference between public and private provision was that the state dictates to people what they are supposed to need—which will always in effect be the same for everybody—whereas private markets cater to what people really want, as individuals. Here, it should not surprise us that this attitude—private enterprise can deliver the sparkling goods—infiltrated government

activity, which could be outsourced to the market.

Now, citizens were pressured to convert their old attitudes as citizens to perceiving themselves as customers. And state officials were taught not to act as representatives of the law, of legitimate public authority or of the general will, but on the pretense that they were providers of services in a competitive marketplace, driven simultaneously by the desires of their customers and the pressures of competition.

The new politics of consumption has eroded the public sphere. Judged as shabby and dull, public provision was demeaned—at great cost. While satisfying expectations of diversity, individuality, and choice may increase the legitimacy of the delivery of certain goods and services by governments rather than by commercial firms, it may be quite subversive when it comes to the production of such goods, in particular where it involves duties of citizenship, including the collective deliberation of how entitlements and duties can be weighed.

At stake is that there are collective goods which are indivisible and must be produced, or at least decided upon, by those who benefit from them, and indeed by their collectivity: social solidarity, distributive justice, and the general rights and duties that constitute citizenship. In other words, we must not judge these “public goods” by the same standards as modern commodities.

For one thing, one cannot measure citizenship by the same criteria as customer-ship. In fact, if we do so, citizenship will look structurally similar to the mass markets of by-gone days. Secondly, rather than merely consuming political decisions, citizens in a functioning democracy are invited and indeed obliged to participate in their production. This requires a third element: namely, the willingness to subject raw collective wants to critical scrutiny in some sort of public dialogue. A salient ingredient of active citizenship is a disciplined readiness to accept decisions that one had originally opposed, or that are contrary to one’s interest. Although the individual might not get his or her way, they can be compensated by civic satisfaction, achieved through a legitimate democratic procedure.

Thus, political participation can not travel the customer-ship rail line. Rather, it demands a preparedness to justify and recalibrate one’s choices in the light of general principles, developing preferences not in the sense of diversifying, but rather of aggregating and unifying them. Moreover, unlike customer-ship, citizenship demands that one provide generalized support to the community as a whole, such as by paying taxes, which may be put to as yet undecided uses by a lawfully constituted government, as distinguished from purchases of specific goods or services paid for one at a time, at market prices.

Once citizens become customers from head to toe, the possibility of the production of civic goods will dry up, which in turn will undermine the capacity of the state to produce the civic goods on which the legitimacy of politics as politics depends. Already—is this not true?—the combination of brutal neoliberal cuts to the public sector and the permeation of the ideology of customer-ship has seriously eroded public discourse and the vitality of public spheres. The poor and lowly have little opportunity for solutions to their distress as the very rich exit from concern for the collective interest. Why would the very rich elites of Nigeria invest in public trains when they can use their private jets or helicopters to flit around?

I've lost all patience with moderates, centrists, incrementalists, and mainstream establishment Democrats who think the status quo is not so bad, just needs a little tweaking around the edges. They'd be satisfied just getting rid of Trump—which is fine as far as that goes, it just doesn't go nearly far enough.

Anybody with a clear-eyed view of the status quo understands the horror of US foreign policy and the shameful neglect of US domestic policy. The system has failed us. The duopoly has frustrated all serious efforts to change things for the better. The owners of the USA—the billionaire class—like things just the way they are. There is no profit in peace or taking care of the needy or delivering justice to the masses. America is owned and dominated by greedy monsters who don't care that their money comes drenched in the blood of patriots and innocent victims of US war crimes. Democrats have failed us. They like to claim to be progressives, liberals, and/or part of 'the left' but in truth they are none of those things.

I'm done with those who think war is okay or that the Military Industrial Complex is just a conspiracy theory or that the wildly unfair distribution of wealth in this country is remotely okay. I'm sick and tired of those who insist that the Mainstream Media is equivalent to the "free press," and not the propaganda organs that lied and manipulated us into Vietnam, Iraq, Libya, and Syria (among others) and now Venezuela and Iran while helping to undermine anything smacking of true change or real reform of our screwed up and hopelessly corrupted system. That is not to say that they don't occasionally say something that is true, just that they can't be trusted not to lie for the oligarchy, as that is their top priority.

I am gobsmacked that so many Americans seem blithely unaware of the extent to which we are lied to and who have no clue about our own sordid history of assassinations, coups, torture, death squads, et cetera throughout Central and South America—and much of the rest of the world. Or how the mainstream media has fed our bloodthirsty empire by manufacturing consent for war and propagandizing the public with sinister intent in the

interest of the corporate elite and America's uber-wealthy owners—the very same folks who own the media.

The trend of media conglomeration has been steady. In 1983, fifty corporations controlled most of the American media, including magazines, books, music, news feeds, newspapers, movies, radio, and television. By 1992 that number had dropped by half. By 2000, six corporations had ownership of most media, and today five dominate the industry: Time Warner, Disney, Murdoch's News Corporation, Bertelsmann of Germany, and Viacom.

Mega-Corporations controlled by the super-rich determine what information is broadcast to the world and how it is framed. Sandwiched in-between the straight news are poison pills of rank propaganda meant to shape the thinking of the entire culture. The corporate-owned media consciously manipulates the public mind to get people to think and believe what the elite wants them to—which all ends up supporting and enabling their robbing, raping, and pillaging of the world. The worst thing about all of this is how appallingly effective it is.

The liberal rhetoric of inclusion and common humanity is insufficient: we must also acknowledge the role that a century of US-backed military coups, corporate plundering, and neoliberal sapping of resources has played in the poverty, instability, and violence that now drives people from Guatemala, El Salvador, and Honduras toward Mexico and the United States. For decades, US policies of military intervention and economic neoliberalism have undermined democracy and stability in the region, creating vacuums of power in which drug cartels and paramilitary alliances have risen. In the past fifteen years alone, CAFTA-DR—a free trade agreement between the US and five Central American countries as well as the Dominican Republic—has restructured the region's economy and guaranteed economic dependence on the United States through massive trade imbalances and the influx of American agricultural and industrial goods that weaken domestic industries. Yet there are few connections being drawn between the weakening of Central American rural agricultural economies at the hands of CAFTA and the rise in migration from the region in the years since. In general, the US takes no responsibility for the conditions that drive Central American migrants to the border.

When we overthrow governments, assassinate leaders, run death squads and torture people, it devastates the societies to whom we do these things. The CIA and other nefarious agents of our government sow the seeds of mayhem and chaos and destroy whole cultures. Now that the victims of our unspeakable evil are seeking the only relief they can conceive by making their arduous way to our border and asking for our help, we shun them, smear them, stir up irrational fear and hatred against them, imprison them

and kidnap their children.

Those who support the status quo are complicit in the crimes against humanity that the global elite have committed. You don't get to call yourself "progressive" if you have propped up the status quo and worked against any meaningful change. Having some moderately liberal social ideas doesn't make up for all the rest. The lesser evil is still evil. The Establishment is still the Establishment.

Democrats are only superficially better than Republicans. At the deepest level they are functional equivalents. Both groups serve the empire and the wealthy elite. They all take the dirty money. They are all okay with war and corruption as long as they get theirs. Anyone who doesn't understand that by now, understands very little.

"It is the job of thinking people not to be on the side of the executioners."

Virtually every government in the world creates an illusion for its people. Take economic policy. Government policies might hurt us in the short-term, but we are all on a one-way route to the promised land of happiness, or so we are told by the politicians, the corporate media and spokespersons for the ones who make us suffer to ensure they never have to—the privileged elite, the ruling class.

Western governments set out to con ordinary working folk by bringing us war in the name of peace, austerity in order to achieve prosperity, and suffering to eventually make us happy. Is there any room for truth? Politicians never like to tell the public the truth. The feel-bad factor is never a vote winner. Best to keep the public in the dark and rely on positive spin. If people knew the truth, they just wouldn't be happy.

Well, no kidding, the truth is ugly. But some people would rather be falsely happy than suffer the painful truth. Ignorance is bliss and all that. Democrats are a fine example of people who don't want to understand what is actually true. They are willing to settle for that which confirms their own biases and that which makes them feel good: Democrats, Team Blue, those with Ds next to their name. They reduce governmental and social policy to a simplistic team sport and juvenile popularity contest, never noticing that the outcome is always the same: Democrat or Republican, it's all war all the time, austerity for the people, tax cuts for the rich, bonuses for banksters, and crimes against humanity dressed up in pretty rhetoric and a big fat 'NO' to any effort to reform this despicable system.

The outcome is always the same.

“In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist. We must never let the weight of this combination endanger our liberties or democratic processes. We should take nothing for granted. Only an alert and knowledgeable citizenry can compel the proper meshing of the huge industrial and military machinery of defense with our peaceful methods and goals, so that security and liberty may prosper together.”

We should be tending to the needs of our people and improving lives here at home and around the world. Instead, we lavish all our treasure on warmongers and war profiteers, building the most lethal modern weapons possible to unleash on the rest of the world. The undeveloped world, especially where they have resources like oil that our rich guys want, wade in the blood shed on their land by our government’s anti-humanitarian gangster policies. That the American people want peace and a better life for themselves and the rest of the world matters not one whit to our so-called leaders.

“We’ve become now an oligarchy instead of a democracy. And I think that’s been the worst damage to the basic moral and ethical standards of the American political system that I’ve ever seen in my life.”

We’ve descended into oligarchy and fascism. The billionaires and millionaires at the top don’t care about us. To them we are merely pawns to be manipulated and preyed upon. Everything else about our government is sheer kabuki, sleight of hand, and rank bullshit.

“The central point that emerges from our research is that economic elites and organized groups representing business interests have substantial independent impacts on US government policy, while mass-based interest groups and average citizens have little or no independent influence.”

Establishment Democrats are every bit as corrupt as Republicans. They are not serving the public interest, only their own. Corruption is rife from the bottom to the top. Democrats in Congress who oppose Medicare for All have taken vast sums of money from the pharmaceutical and medical industries. Pelosi took over a million dollars. Nancy Pelosi is worth at least

\$16 million and Dianne Feinstein is worth at least \$58.5 million. Who knows how much they've got hidden in shell companies and tax havens. American politicians in the modern era invariably get rich while in office.

Now the Democrats want us to all pull together, which would be fine but what they want is for us to unite behind some neoliberal, war-mongering, elitist millionaire who will only betray us to Wall Street and the great American war machine on day one while they cheat any real change agent out of the opportunity to serve the people and history. We've seen this movie before. It didn't work in 2016 and it won't work in 2020. Even some of the dead-enders get it now.

We shouldn't be trying to unite or make nice with those who still don't get it. We should be uniting with all of those who do get it and who have been ignored, belittled, preyed upon and shut out of the process for forever. It's time for a new deal—and a great big giant new deal. All those people who have been sitting at home on election day need to be given real reasons to come out and choose a new and better destiny. The same old tired crap wrapped in a shiny new box won't get it. We need a new deal. And not a FDR-saves-capitalism new deal or Bernie-and-AOC-saves-capitalism new deal, but instead one which provides true justice and equality.

Now is the time to get serious about real change in America because humanity itself is at stake. We have to change now or forever hold our peace. It's time to get on the right side of history and bring desperately needed change to the world. We need to stop taking no for an answer, stop making excuses for the corrupt government and media and stop swallowing the propaganda. It's time to stand up, not acquiesce. If we continue to roll over and hide our heads in the sand, this story is not going to end well. Entire categories of public policy options are effectively off-limits because of the combined influence of industry groups and donor interests.

Most Americans support Medicare for All, higher taxes on the rich, a Green New Deal, and other major items on the progressive agenda—so why has Congress failed to enact them? The reason is that the influence of corporations and the donor class on the American political system has drowned out the policy desires of the public.

There is a weird strain of political thought in this country that most people are moderates and only by pulling to the center can we garner enough support to win elections and guide the ship of state. This is the thinking of mainstream Democrats and also why most people stay home on election day. They have little to no interest in which group of elitist millionaires and billionaires get to screw America for the next four years while lying through their teeth and changing absolutely nothing—and who can blame them?

I've long believed that nothing short of a bold departure from the

conventional wisdom will change anything—and most people, when they aren't being freaked out by propaganda boogeymen, want change: better living conditions, greater opportunity, a brighter future for posterity, a viable ecosystem, less violence, more peace, greater equality, less hate, a more benevolent and less corrupt government, a friendlier and more supportive society. A world of hate and war, fear and loathing, resentment and strife, are not what people want and not what they deserve.

The tide of history seems to be turning at long last. It's time to get radical and force the changes that are needed—and we should have less than zero patience for anyone who stands in the way—whether it be through ignorance, incompetence, misplaced loyalty, gullibility, or malevolence. Too many of these people are impervious to education or reason, they simply need to be defeated or left behind. It's time.

It's time to reform our society from the prisons to the presidency. Don't listen to the status quo defenders who will tell you that the only thing that matters is beating Trump. That's the tune the Democrats will be singing. We need to be rid of Trump to be sure, but getting rid of the present establishment is paramount. If we shed ourselves of Trump but are still saddled by the same old establishment, we'll still be just as screwed.

Remember that things have been screwed up in this country since long before Trump came along. His ridiculous reign has simply brought it all into sharp focus—but Trump is a symptom of a much older disease, the logical end result of a corrupt and hateful right-wing government that serves only the myopic, greedy, selfish mega-rich. We are all out of time for putting up with this greed, corruption, and madness.

“Don't let the greedheads win.”

It's time—time to do the right thing.

People like to imagine that the so-called “center” is called that because it sits smack dab in the middle of the ideological spectrum between communism and fascism, right in that moderate sweet spot that respects capitalism and private ownership without flying off the deep end into Nazi-like tyranny. In reality, the status quo exists entirely outside any left-right paradigm. It's neither ‘left’ nor ‘right’ to give total control of the Western world to an alliance of plutocrats and opaque government agencies who seek to expand their power and wealth by destroying our ecosystem, waging endless wars, and gradually shoring up more and more control of their citizenry via internet censorship, surveillance, and police militarization. It's just fucking crazy.

We need a new, progressive political party in the US because on almost every important issue the Democrat and Republican Parties, both controlled

by Big Money, are indistinguishable. The Reagan Revolution was brought about with the active and strong support of the Democrats which controlled the US House of Representatives for eight out of Reagan's eight years and the US Senate for two out of Reagan's eight years. We need a new, progressive political movement in this country because the Democrats and Republicans are not only incapable of solving any of the major problems facing this country, they are not even prepared to discuss them.

The mass media in this country is heavily censored by the corporate ownership and the companies that advertise. Real—not superficial—analysis of why things are the way they are—the unfair distribution of wealth and power, starvation and poverty, war, ecological destruction, racism, sexism—is not considered news.

The US people, as almost never before, are rejecting the “two-party” system and are crying out for a political alternative. Everyone instinctively knows that the current system is failing, but the progressive movement is not getting out an alternative vision of society or an alternative program of immediate demands. The boldness and clarity that we need to articulate can never be done through the compromised and corrupt Democratic Party—dominated by Big Money. We must begin to have the courage to fight for power—not handouts. We are the majority of people and must act accordingly.

I understand the enormous difficulties that confront us when we take on the Democrat and Republican Parties and the economic oligarchy that controls this country. If we stop thinking about all the reasons as to why it can't be done, and go out in the streets and do it, we can succeed. We can create a third party. We can raise the important issues which the Democrats and Republicans ignore. We can win.

Politics, after all, is the art of persuasion; the political is that dimension of social life in which things really do become true if enough people believe them. The problem is that in order to play the game effectively, one can never acknowledge this: it may be true that, if I could convince everyone in the world that I was the King of France, I would in fact become the King of France; but it would never work if I were to admit that this was the only basis of my claim. In this sense, politics is very similar to magic—one reason both politics and magic tend, just about everywhere, to be surrounded by a certain halo of fraud.

A well-chosen and well-promoted keyword triggers an instinctive feeling that galvanizes people into action. This approach completely conflicts with prevailing notions about how people modify their behaviour.

There is an all-too-common misconception that behavioural change proceeds along rational and cognitive lines—explain to somebody what is

in their interests, also in the long-term, and they will automatically see the light and take the right decisions, however hard they might be. For years now, this strategy has been adopted in all kinds of public-information campaigns, usually with very little result. The conclusion is painfully clear: it doesn't work.

Why most moral philosophers refuse to acknowledge this is a mystery to me—one can only put it down to the persistent view of humans as rational beings, going back to the pseudo-religious version of the Enlightenment. The advertising world grasped the situation ages ago. To change behaviour—in their case, consumer behaviour—you need to sell values, and the most effective way to do so is to appeal to the emotions by invoking family, maternal love, fidelity, security, status, triumph, performance, et cetera. When you look at commercials in this light, you see straightaway that the product itself, and rational, factual information about it, are mere side issues. Indeed, the thing that's being sold is often hardly shown. And yet this approach works, unlike all those well-intentioned campaigns targeting our welfare.

If a particular message catches on, that's because it ties in with deep-rooted emotions and the values that go with them. The metaphor 'deep-rooted' signifies not only that we are scarcely conscious of them, but also that they branch out very widely. Keywords activate underlying frames of association with a powerful emotional charge, provoking a gut response. Some such deep frames can be held simultaneously, while others are in mutual opposition. Activating a single value also automatically activates associated values, while suppressing opposing values. Simultaneously activating the values of opposing frames is impossible.

If we are to change, it won't be through rational knowledge, but through emotionally charged values. Not through our cerebral cortex, but through gut feelings. Plans for reform will have to take account of this. We must also have the courage to push communal values back to the forefront—values from which the individual benefits, too. To start, we only need to ask ourselves a question that is as simple as it is fundamental: what do I really need to build a good life?

There are no general principles that one can convey to others which predict what one should do to successfully sway others non-rationally. One cannot therefore teach how to manipulate others. The manipulation of others depends upon particular facts about societies that are not part of a science of rhetoric. For example, successful creators of advertisements do not learn their craft via attending schools and acquiring a body of general principles. Success at advertising involves knowing a great deal of particular facts about popular culture. This part of advertising at least isn't something

one learns scientifically, as a body of general principles.

No matter how we dress up our negotiations in mathematical theories, we are always an animal, always acting and reacting first and foremost from our deeply held but mostly invisible and inchoate fears, needs, perceptions, and desires. That's not how these folks at Harvard learned it, though. Their theories and techniques all had to do with intellectual power, logic, authoritative acronyms like BATNA and ZOPA, rational notions of value, and a moral concept of what was fair and what was not. And built on top of this false edifice of rationality was, of course, process. They had a script to follow, a predetermined sequence of actions, offers, and counteroffers designed in a specific order to bring about a particular outcome. It was as if they were dealing with a robot, that if you did A, B, C, and D in a certain fixed order, you would get X. But in the real world negotiation is far too unpredictable and complex for that. You may have to do A then D, and then maybe Q.

Since the general opinions of large numbers of persons are almost certain to be a vague and confusing medley, action cannot be taken until these opinions have been factored down, canalized, compressed, and made uniform. The making of one general will out of multitudes of general wishes is an art well known to leaders, politicians, and steering committees. It consists essentially in the use of symbols which assemble emotions after they have been detached from their ideas.

Every sentence blends and balances at least two different communicative functions—one the transmission of raw info, the other the transmission of certain stuff about the speaker

When I say or write something, there are actually a whole lot of different things I am communicating. The propositional content (i.e., the verbal information I'm trying to convey) is only one part of it. Another part is stuff about me, the communicator. Everyone knows this. It's a function of the fact that there are so many different well-formed ways to say the same basic thing, from e.g. 'I was attacked by a bear!' to 'Goddamn bear tried to kill me!' to 'That ursine juggernaut did essay to sup upon my person!' and so on. Add the consideration that many grammatically ill-formed sentences can also get the propositional content across—'Bear attack Tonto, Tonto heap scared!'—and the number of subliminal options we're scanning/sorting/interpreting as we communicate with one another goes transfinite very quickly.

And different levels of diction and formality are only the simplest kinds of distinction; things get way more complicated in the sorts of interpersonal communication where social relations and feelings and moods come into play. Here's a familiar kind of example: Suppose that you and I are acquaintances

and we're in my apartment having a conversation and that at some point I want to terminate the conversation and not have you be in my apartment anymore. Very delicate social moment. Think of all the different ways I can try to handle it: 'Wow, look at the time'; 'Could we finish this up later?'; 'Could you please leave now?'; 'Go'; 'Get out'; 'Get the hell out of here'; 'Didn't you say you had to be someplace?'; 'Time for you to hit the dusty trail, my friend'; 'Off you go then, love'; or that sly old telephone-conversation-ender: 'Well, I'm going to let you go now'; et cetera, et cetera. And then think of all the different factors and implications of each option.

To be honest, the example here has a special personal resonance for me because in real life I always seem to have a hard time winding up a conversation or asking somebody to leave, and sometimes the moment becomes so delicate and fraught with social complexity that I'll get overwhelmed trying to sort out all the different possible ways of saying it and all the different implications of each option and will just sort of blank out and do it totally straight—"I want to terminate the conversation and not have you be in my apartment anymore"—which evidently makes me look either as if I'm very rude and abrupt or as if I'm semi-autistic and have no sense of how to wind up a conversation gracefully. Somehow, in other words, my reducing the statement to its bare propositional content "sends a message" that is itself scanned, sifted, interpreted, and judged by my auditor, who then sometimes never comes back.

Writers sometimes make the error of presuming the very audience agreement that it is really their rhetorical job to earn. Helping them eliminate the error involves drumming into student writers two big injunctions:

1. Do not presume that the reader can read your mind—anything that you want the reader to visualize or consider or conclude, you must provide
2. Do not presume that the reader feels the same way that you do about a given experience or issue—your argument cannot just assume as true the very things you're trying to argue for.

Because (1) and (2) seem so simple and obvious, it may surprise you to know that they are actually incredibly hard to get students to understand in such a way that the principles inform their writing.

The reason for the difficulty is that, in the abstract, (1) and (2) are intellectual, whereas in practice they are more things of the spirit. The injunctions require of the student both the imagination to conceive of the reader as a separate human being and the empathy to realize that this separate person has preferences and confusions and beliefs of her own, and

that are just as deserving of respectful consideration as the writer's. More, (1) and (2) require of students the humility to distinguish between a universal truth ('This is the way things are, and only an idiot would disagree') and something that the writer merely opines ('My reasons for recommending this are as follows:'). I therefore submit that the hoary cliché "Teaching the student to write is teaching the student to think" sells the enterprise way short. Thinking isn't even half of it.

Great stories and great jokes have a lot in common. Both depend on what communications theorists sometimes call exformation, which is a certain quantity of vital information removed from but evoked by a communication in such a way as to cause a kind of explosion of associative connections within the recipient.

We all know that there is no quicker way to empty a joke of its peculiar magic than to try to explain it—to point out, for example, that Lou Costello is mistaking the proper name 'Who' for the interrogative pronoun 'who,' and so on. And we all know the weird antipathy such explanations arouse in us, a feeling of not so much boredom as offense, as if something has been blasphemed. This is a lot like the teacher's feelings at running a Kafka story through the gears of your standard undergrad critical analysis—plot to chart, symbols to decode, themes to exfoliate, et cetera. Kafka, of course, would be in a unique position to appreciate the irony of submitting his short stories to this kind of high-efficiency critical machine, the literary equivalent of tearing the petals off and grinding them up and running the goo through a spectrometer to explain why a rose smells so pretty. Franz Kafka, after all, is the story writer whose "Poseidon" imagines a sea god so overwhelmed with administrative paperwork that he never gets to sail or swim.

It's not that students don't "get" Kafka's humor but that we've taught them to see humor as something you get—the same way we've taught them that a self is something you just have. No wonder they cannot appreciate the really central Kafka joke: that the horrific struggle to establish a human self results in a self whose humanity is inseparable from that horrific struggle. That our endless and impossible journey toward home is in fact our home. It's hard to put into words, up at the blackboard, believe me. You can tell them that maybe it's good they don't "get" Kafka. You can ask them to imagine his stories as all about a kind of door. To envision us approaching and pounding on this door, increasingly hard, pounding and pounding, not just wanting admission but needing it; we don't know what it is but we can feel it, this total desperation to enter, pounding and ramming and kicking. That, finally, the door opens. . . and it opens outward—we've been inside what we wanted all along.

The fundamental questions involved are ones whose answers have to be

literally worked out instead of merely found.

The basic principle of structural analysis is that the terms of a symbolic system do not stand in isolation—they are not to be thought of in terms of what they “stand for,” but are defined by their relations to each other. One has to first define the field, and then look for elements in that field that are systematic inversions of each other. Take vampires. First you place them: vampires are stock figures in American horror movies. American horror movies constitute a kind of cosmology, a universe unto themselves. Then you ask: what, within this cosmos, is the opposite of a vampire? The answer is obvious. The opposite of a vampire is a werewolf. On one level they are the same: they are both monsters that can bite you and by biting you, turn you, too, into one of their own kind. In most other ways each is an exact inversion of the other. Vampires are rich. They are typically aristocrats. Werewolves are always poor. Vampires are fixed in space: they have castles or crypts that they have to retreat to during the daytime; werewolves are usually homeless derelicts, travelers, members of an ostracized peasant group or otherwise on the run. Vampires control other creatures: bats, wolves, humans that they hypnotize or render thralls. Werewolves can’t control themselves.

Yet—and this is really the clincher in this case—each can be destroyed only by its own negation: vampires, by a stake, a simple sharpened stick that peasants use to construct fences; werewolves, by a silver bullet, something literally made from money. By observing these axes of inversion, we can get a sense of what such symbols are really about: that vampires, for instance, are not necessarily so much about death, or fear, but about power; about the simultaneous feelings of attraction and repulsion that relations of domination tend to create.

Obviously this is an extremely simple example. What I’ve described is just the initial move, there’s a whole series of more sophisticated ones that normally follow: inversions within inversions, mediating terms, levels of hierarchical encompassment. There’s no need to go into any of that here. My point is just that even by making this initial move, one will almost invariably discover something one would not have thought of otherwise. It’s a way of radically simplifying reality that leads to insights one would almost certainly never have achieved if one had simply attempted to take on the world in its full complexity.

It is about methodically confronting obvious-but-often-overlooked truths until something in you shifts.

“I realized the very memory of being in this spot, on my nature-made throne, will disappear when I do. I felt a tremendous

sense of regret for all the things I hadn't done, and all the time I had wasted, all the times I avoided change, just because the known was comfortable and safe. Is that really living?

I killed myself that day—just in my mind, but in a way that reminded me how possible it was to do it in reality.”

An Axe for the Frozen Sea

When people in power are so callous that they shout down and jeer the murder of anyone who opposes them, what hope is there? How can we stand when unbridled greed is joined to unchecked and rampant violence?

Life is the cumulative effect of a handful of significant shocks.

People who're somehow burned by life, withered or ablated way past anything like what might be fair, they either curl up in their fire, or else they rise.

Only those who try to resist temptation know how strong it is. One who gives in to temptation after five minutes simply does not know what it would have been like an hour later. To be yourself in a world that is constantly trying to make you something else is the greatest accomplishment. Live your beliefs and you can turn the world around.

Rock bottom provides a firm foundation. From there, we can do nothing but push ourselves up.

For the longest time, perhaps as long as you can remember, you've been riding along on your horse, heading in this direction or in that one, going toward this place or that place. All without a hitch. Yes, sometimes you've crossed some scrub grass or clanked down on some hard pebbles or almost lost your trot on some loose sand, but each time your horse and you nimbly adjusted and went on as if nothing much had happened. Had someone asked you afterward whether there had been any incident along the way, you might have forgotten to mention it.

You know how this story is going to go, don't you? Likely you do and you don't. Well, one day out of the blue you get knocked off your horse. Perhaps your horse gets up quickly and, spooked, runs off without you. Or perhaps you show some preternatural strength of the kind you didn't you know you had and, restraining yourself, you refuse to get back on the horse. Something tells you not to and this time you listen. Either way, you're horseless, ergo directionless, ergo also placeless.

This moment is an existential opening, an uncanny blessing, a moment that is the condition of possibility for being truly available to a matter of ultimate concern. Now everything may change for you.

What does "just going along on your horse" mean? Nothing but unexaminedly and therefore unconsciously following some script or other: going to school after school, taking job after job, taking up career after career, presuming calling after calling, pursuing relationship after relationship, raising child after child, tasting pleasure after pleasure, engaging in activity after activity.

Yet something almost inexplicably marvelous happens when, having been knocked sideways off our horse, you do not get right back on it. And what is that? A painful crack in your being opens like a sinewy thread and out come ultimate questions that may first transfix you before, should you stay with them while nurturing them, they're able to transform you. That's what.

“It was sort of an artistic and a religious crisis, than it was anything you would call a breakdown. All my reasons for being alive and the stuff that I thought was important, just truly at a gut level weren't working anymore.”

You are thrown into it by your personal sense of responsibility, combined with a complex set of external circumstances. You are cast out of the existing structures and placed in a position of conflict with them. It begins as an attempt to do your work well, and ends with being branded an enemy of society. The dissident does not operate in the realm of genuine power at all. He is not seeking power. He has no desire for office and does not gather votes. He does not attempt to charm the public. He offers nothing and promises nothing. He can offer, if anything, only his own skin—and he offers it solely because he has no other way of affirming the truth he stands for. His actions simply articulate his dignity as a citizen, regardless of the cost.

I don't want to be known for anything, I just need to know I did something.

There's one thing I know for sure: I will not be remembered as a traitor, as a weak man who reneged on his historical commitments and betrayed his people.

I didn't do something that someone else couldn't have done, I just happened to be around when something was happening. It's just history and I can't change that.

The right man in the right place is a devastating weapon.

I believe in freedom of religion, freedom of speech, freedom of thought, freedom of the press, freedom of criticism, and freedom of movement. I believe in the goal of equal opportunity, and the right of each individual to follow the calling of his or her own choice, and the right of every individual to an opportunity to develop his or her capacity to the fullest. I believe in the right and duty of every citizen to work for, to expect, and to obtain an increasing measure of political, economic, and emotional security for all. I am opposed to discrimination in any form, whether on the grounds of race, color, religion, political belief, or economic status. I believe in the freedom of choice of one's representatives in government, untrammelled by

machine guns, secret police, or a police state. I am opposed to arbitrary and unwarranted use of power or authority from whatever source or against any individual or group. I consider these principles sacred. I believe in them as living realities, and not as mere words on paper.

I looked at the bodies sprawled on the floor and thought, This is what matters in the world. The rest is a lie, as long as this exists. The way I'd lived, immersed in thoughts of self, seemed absurd and shameful. All that mattered was to fight against this, and all suffering. I had to make changes, drastic changes in how I lived. That this could exist, or conditions infinitely worse than this, was completely intolerable.

A society that does not embrace a common purpose for its existence has no standard against which to judge itself, making it vulnerable to the corruptions of men who chafe at the limits of law. A society that does not address the needs of its members, especially the vulnerable, weakens itself from within while wasting its most valuable resource, the minds and talents of all its citizens. A society that takes from the many to give to the few undermines its moral basis and must in the end collapse.

A socialist is just someone who is unable to get over his or her astonishment that most people who have lived and died have spent lives of wretched, fruitless, unremitting toil.

We share the world with creatures whose curious brains peacefully seek us, and we do it like this: We put up a firewall to protect them, while we destroy their food—and their ears. It would seem diabolical, but that isn't the thinking behind it. There is no thinking behind it. Our human brain doesn't reach.

Years ago I recognized my kinship with all living beings, and I made up my mind that I was not one bit better than the meanest on earth. I said it then, as I say it now, that while there is a lower class, I am in it, and while there is a criminal element I am of it, and while there is a soul in prison, I am not free.

I'll be everywhere. Wherever there's a fight so hungry people can eat, I'll be there. Wherever there's a cop beating up a guy, I'll be there.

Whenever an oppressed people struggles against its oppressors, whenever an enslaved people combats for its liberty, my place is in their midst.

Where liberty is not, there is my country. The role of a citizen extends beyond national borders. The fight of those living under any system of tyranny is my fight. When it shall be said in any country in the world, 'My poor are happy; neither ignorance nor distress is to be found among them; my jails are empty of prisoners, my streets of beggars; the aged are not in want'—when these things can be said then may that country boast of its constitution and its government.

If the things I'm doing are considered a crime then let history be a witness that I am a criminal. Hostility toward the American government and the capitalist system is a religious duty and we hope to be rewarded by our God.

Under a government which imprisons any unjustly, the true place for a just man is also prison.

I decided a while ago that I can live with whatever they do to me. The only thing I can't live with is knowing I did nothing.

Something happens, where you realize that this other, that how other people regard you does not have enough calories in it, to keep you from blowing your brains out. That you've got to find, make some other détente.

“The Assassin had killed evil before. People were happy, thrilled that another monster had met his end. On that clear, crisp morning in the normally serene Central Park, his trigger pull would be remembered for a while. And he would get on a plane or train or bus or, like today, use his own two feet, and pull another trigger, or throw another knife, or strangle the life out of someone using simply his bare hands. He would continue to do it, and for only one reason. If he didn't, the world had no chance to get better. If good people stood by and did nothing, the monsters won every time. He was not going to let that happen”

Assassins, you see, do not fear they are going to jail—they fear they are going to fail. And these ideas must die.

Ideas are more difficult to kill than people, but they can be killed, in the end.

In 1692 in Colonial America, Giles Corey was accused of witchcraft and pressed to death with four-hundred pounds of stones on his chest. It took him two days to suffocate. His last words? “More weight.”

“In the camp I was telling you about, the conditions were so brutal that many times I wanted to grab a rock, a hammer, a shovel, and take down one, maybe two guards. I would have died with them, for certain—and yet, in the searing heat of the moment of choice, at least I would have accomplished something. At least my life—my death—would have meaning. That was how I thought. And every day I despised myself for not going through with it. Every moment of inaction feels like cowardice in the face of such inhuman oppression. Survival often feels like an indignity. But—and this is the lesson as I see it now,

as an old man—sometimes the most difficult decision is to not martyr yourself for someone, but instead to choose to live for them. Because of them.”

Dying is easy, it's the living that's hard.

Still, you know: if tears are gonna fall, better their house than mine.

I am not Christ. I fight for the things I believe in, with all the weapons at my disposal and try to leave the other man dead so that I don't get nailed to a cross.

If you play Nazis with us, we ain't gonna play Jews.

In a system in which cheating is the norm, following the rules amounts to a handicap. Just ask the Tour de France cyclists who were annihilated for seven years straight by Lance Armstrong and his doping teammates.

John Brown was a man of romantic feeling. Brown shared with the slave owners a romantic ideology of personal honor through violence. “Our white brethren cannot understand us unless we speak to them in their own language; they recognize only force,” Brown's friend the black radical James McCune Smith wrote, using words that no Garrisonian abolitionist would have trusted but Brown grasped and admired.

“They will never recognize our manhood until we knock them down a time or two; they will then hug us as men and brethren.”

Brown set out, in effect, not to convert the South to Northern values but to convert the Northern abolitionists to the Southern code of honorable violence. He was a virus that was to prove deadly to the Old South because at some deep level he shared its DNA: its assumptions, its literature, and even some of its values—particularly the value of dying heroically for a cause rather than living honorably for one, and the companion value of forcing other people to die heroically for their cause, whether they quite wanted to or not.

Brown's acceptance of this feudal ethic forms the general background to his murderous night in Kansas on May 24, 1856. “We must show by actual work that there are two sides to this thing and that they can not go on with this impunity,” Brown declared after watching his fellow abolitionists quake and tremble in the face of violent pro-slave mobs. He assembled a party of activists, including four of his sons and a son-in-law, armed them with swords, and marched them toward the little settlement of Pottawatomie Creek. Brown had his men bang on the doors of pro-slavery households, pretending to be lost travelers, in order to get the men outside. There he ordered them cut to pieces, watching impassively as his sons and other followers did the work.

Brown in Kansas at first might seem to be without any cue to action—he had been neither implicated nor particularly humiliated by the vigilantes—until one realizes that the real trigger was something that had happened two days before in Washington: a South Carolina congressman had beaten Senator Charles Sumner, of Massachusetts, nearly to death with the gold head of his cane for daring to speak out against the pro-slavery forces in Kansas and, in a feudal manner, for criticizing a kinsman of his. Sumner, though no pacifist, had been unable to defend himself: his feet seem to have got caught under his little desk. This assault was put forward, instantly, as crowning proof of the difference between the Southern honor culture and the Northern procedural one: a Northerner could talk trash, but he couldn't make plays. Brown, one of his sons said, “went crazy—crazy. It seemed to be the finishing, decisive touch.” It was not a cool evaluation of the potential uses of violence in Kansas but the transferred sense of humiliation that he felt on behalf of Sumner that drove Brown to the massacre.

After his capture, when pressed on the great question, he said simply:

“I think, my friend, you are guilty of a great wrong to God and against humanity—I say it without wishing to be offensive—and it would be perfectly right to interfere with you, so far as to free those you wickedly and willfully hold in bondage.”

When Jeb Stuart warned sententiously “The wages of sin is death,” Brown turned on him:

“I would not have made such a remark to you if you had been a prisoner and wounded in my hands. You had better—all of you people of the South—prepare yourselves for a settlement of this question. You may dispose of me very easily—I am nearly disposed of now. But this question is still to be settled.”

Nonviolence is, in reality, a debate between self-defense and masochism. If you think I'll bleed nonviolently, you'll be sticking me for the rest of my life. But if I tell you I'll fight back, there will be less blood. I'm for reciprocal bleeding.

You don't have a peaceful revolution. You don't have a turn-the-other-cheek revolution. There's no such thing as a nonviolent revolution. Revolution is bloody, revolution is hostile, revolution knows no compromise, revolution overturns and destroys everything that gets in its way. And you, sitting around here like a knot on the wall, saying, “I'm going to love these folks no matter how much they hate me.” No, you need a revolution. Whoever heard of a revolution where they lock arms singing “We Shall

Overcome”? You don’t do that in a revolution. You don’t do any singing, you’re too busy swinging. I’m not going to beg for anything I deserve—I’m gonna take it.

Violence is necessary; it is as American as apple pie.

“I am too painful to care enough to fight. To me, the fight seems without point: our own leaders have been subverted to pretend the invasion is alliance; we very few cannot repel an invasion; we cannot even make our government admit that there is an invasion. I am weak and, in pain, see all is pointless: I do not see the meaning of choosing to fight. It’s nothing but ‘Oh fuck me, just great, another horrible thing I’m going to have stand here and witness and then go feel pain over.’”

The fear of the pain is many times worse than the pain of the pain, is it not? You must see the point not of winning but of choosing merely to fight. Always do what you are afraid to do.

Blessed are those who struggle.
Oppression is worse than the grave.
Better to die for a noble cause,
than to live and die a slave.

One might dream that on the only green planet we know, life would have a special value of its own, just as books and works of art do in our culture. And if the interest in life per se were not sufficient to protect it, one might hope that simple, selfish interest in human comfort and sustenance might confer a special status on living systems and force their conservation. Unfortunately, neither occurs. The stacks are open in the world’s great library of life and we advertise to the vandals.

“To reverse the effects of civilization would destroy the dreams of a lot of people. There’s no way around it. We can talk all we want about sustainability, but there’s a sense in which it doesn’t matter that these people’s dreams are based on, embedded in, intertwined with, and formed by an inherently destructive economic and social system. Their dreams are still their dreams. What right do I—or does anyone else—have to destroy them.

At the same time, what right do they have to destroy the world?”

When I say this keeps me up at night, I mean it. I am plagued by visions of starving people seeking to escape from grey wastes, being beaten back by armed police. I see the last rich ecosystems snuffed out, the last of the global megafauna—lions, elephants, whales, and tuna—vanishing. And when I wake, I cannot assure myself that it was just a nightmare.

Other people have different dreams: the fantasy of a feeding frenzy that need never end, the fairy-tale of reconciling continued economic growth with a living world. If humankind spirals into societal collapse, these dreams will be the cause.

Were the Australian extinction an isolated event, we could grant humans the benefit of the doubt. But the historical record makes *Homo sapiens* look like an ecological serial killer.

Hundreds of stuffed heads: bongo, nyala, bushbuck, sitatunga, greater and lesser kudu, eland, ibex, Barbary sheep, chamois, impala, gazelle, dik-dik, musk ox, cape buffalo, sable, roan, oryx, waterbuck, and gnu. Hundreds of pairs of glass eyes fail to return your gaze. I can't imagine a more appropriate setting to describe what amounts to genocide. Millions of people slaughtered in death camps, from Europe's Holocaust to Darfur, are proof of what our species is capable of. The extraordinary loss of huge animals whose heads don't appear on these walls. They were all exterminated, simply because it could be done. The person who put this collection together could have walked straight out of the Pleistocene.

I am not proposing a return to the Stone Age. My intent is not reactionary, nor even conservative, but simply subversive. It seems that the utopian imagination is trapped, like capitalism and industrialism and the human population, in a one-way future consisting only of growth. All I'm trying to do is figure out how to put a pig on the tracks.

We are not here simply to protect what we have been given so far; we are here to try to be the future guardians of those areas as well as to sweep our protective arms around the vast lands which may well need us as man and his industrial world expand and encroach on the last bastions of wilderness. Today we are concerned about our natural areas being enjoyed by the people. But we must never forget that all the elements of nature, the rivers, forests, animals, and all the things coexistent with them must survive as well.

It means that, right from the beginning, everything that ever lived belonged to the world—and that's how things came to be this way. Those single-celled creatures that swam in the ancient oceans belonged to the world, and because they did, everything that followed came into being. Those club-finned fish offshore of the continents belonged to world, and because they did, the amphibians eventually came into being. And because the amphibians belonged to the world, the reptiles eventually came into being.

And because the reptiles belonged to the world, the mammals eventually came into being. And because the mammals belonged to the world, the primates eventually came into being. And because the primates belonged to the world, Australopithecus eventually came into being. And because Australopithecus belonged to the world, man eventually came into being. And for three-million years man belonged to the world—and because he belonged to the world, he grew and developed and became brighter and more dexterous until one day he was so bright and dexterous that we had to call him *Homo sapiens sapiens*, which means that he was us. And that's the way the we lived for three-million years—as if we belonged to the world. That's how we came into being. We know what happens if you take the Taker premise, that the world belongs to man. That's a disaster. If you take the Leaver premise, that man belongs to the world then creation goes on forever.

Life is a fine thing—so above and beyond everything, we have to defend life. We shouldn't sacrifice a generation in the name of such dreams.

You can be shaped, or you can be broken. There is not much in between.

A weed is a strong plant thriving where those in power do not want it. A witch is a strong person thriving where those in power do not want them.

The ideas contained within are seeds thrown to the wind, perhaps none will find a purchase, a place, a home, but even if one finds the darkest crevice, it can grow, and spawn its own seeds, thrown to the wind yet again.

Is it ambitious? Of course. Likely to fail? Of course. But then so were so many other things, until they happened.

To those dark crevices, those rotting pits, you are still fertile ground. You can still grow beautiful things despite the darkness. And we need you now more than ever.

And, if it becomes too much, if you are going to leap over that ledge, at least try to take some of the bastards out with you.

“Be peaceful, be courteous, obey the law, respect everyone; but if someone puts a hand on you, send him to the cemetery. That's a good religion. In fact, that's the old-time religion. Preserve your life, it's the best thing you've got. And if you've got to give it up, let it be even-steven.”

“The policeman arrested me in the name of the law; I hit him in the name of liberty.”

“He wasn't much good at livin', but he knew how to die.”

To give away the thing that is difficult to part with,
 Is the best offering amongst the alms.
 Let this impure and sinful body,
 Turn into something like a diamond.

In *Thus Spoke Zarathustra*, Nietzsche introduced the concept of the *Übermensch*. The *Übermensch* is virtuous, loyal, ambitious and outspoken, disdainful of religious dogma and suspicious of received wisdom, intensely engaged in the hurly-burly of the real world. Above all he is passionate—a connoisseur of both “the highest joys” and “the deepest sorrows.” He believes in the moral imperative to defend—with his life, if necessary—ideals such as truth, beauty, honor, and justice. He is self-assured. He is a risk taker. He regards suffering as salutary, and scorns the path of least resistance.

The bravery or other ideals behind an act belong not to one individual, but to the world, for better or worse.

World-changing—it starts with ordinary people. Ordinary people do extraordinary things, and then we lionize them. We make heroes out of them. As endless epics, sagas, and eddas attest, heroes become heroes by making others small. And that’s a problem, because it makes other ordinary people look at these heroes and think that they can’t achieve the same things. But that path is open to everybody. Anybody at any time.

Few will have the greatness to bend history itself, but each of us can work to change a small portion of events and in the total of all those acts will be written the history of this generation.

For a cosmic blink of an eye we are given the opportunity to directly control a small amount of energy and the potential to influence a much larger amount. What will you choose to do with it?

Mother Culture teaches you that things are as they should be. Except for a few thousand savages scattered here and there, all the peoples of the earth are now enacting this story. This is the story man was born to enact, and to depart from it is to resign from the human race itself, is to venture into oblivion. Your place is here, participating in this story, putting your shoulder to the wheel, and as a reward, being fed. There is no ‘something else.’ To step out of this story is to fall off the edge of the world. There’s no way out of it except through death.

If justice is what love looks like in public then neoliberalism is what lovelessness looks like as policy. It looks like generations of children raised amidst an uncaring landscape. It looks like the rat-infested schools of Detroit. It looks like water pipes leaking lead and poisoning young minds in Flint. It looks like foreclosed mortgages on homes that were built to collapse. It looks like famished hospitals that feel more like jails—and overstuffed jails

that are humanity's best approximation of hell. It looks like trashing the beauty of the planet as if it had no value at all. It is greed and carelessness incarnate.

There is a lot of confusion around the word 'neoliberalism,' and about who is a neoliberal. And understandably so. So let's break it down. Neoliberalism is an extreme form of capitalism that started to become dominant in the 1980s, under Ronald Reagan and Margaret Thatcher, but since the 1990s has been the reigning ideology of the world's elites, regardless of partisan affiliation. Neoliberalism is shorthand for an economic project that vilifies the public sphere and anything that's not either the workings of the market or the decisions of individual consumers. It is probably best summarized by another of Reagan's famous phrases:

“The nine most terrifying words in the English language are:
I'm from the government and I'm here to help.”

Under the neoliberal worldview, governments exist in order to create the optimal conditions for private interests to maximize their profits and wealth, based on the theory that the profits and economic growth that follow will benefit everyone in the trickle-down from the top—eventually. If it doesn't work, and stubborn inequalities remain or worsen (as they invariably do), then according to this worldview, that must be the personal failing of the individuals and communities that are suffering. They must have “a culture of crime,” say, or lack a “work ethic,” or perhaps it's “absentee fathers,” or some other racially-tinged excuse for why government policy and public funds should never be used to reduce inequalities, improve lives, or address structural crises.

The primary tools of this project are all too familiar: privatization of the public sphere, deregulation of the corporate sphere, and low taxes paid for by cuts to public services, and all of this locked in under corporate-friendly trade deals. It's the same recipe everywhere, regardless of context, history, or the hopes and dreams of the people who live there. Larry Summers, when he was chief economist of the World Bank in 1991, summed up the ethos:

“Spread the truth—the laws of economics are like the laws
of engineering. One set of laws works everywhere.”

With socialism in decline, there was seemingly no longer a need to soften capitalism's edges anywhere. As Thatcher famously declared:

“There is no alternative.”

Another way of thinking about this is that neoliberalism is simply capitalism without competition, or capitalism lying on the couch in its undershirt saying, ‘What are you going to do, leave me?’

What always irritated me the most about Francis Fukuyama’s “end of history” thesis was not the way it reinforced the idea that “there is no alternative” to neoliberalism. Rather, it was the way it suggested that there was some fundamental difference between Us and Every Single Person Who Lived Before Us. We are the Present and they are History. Even as Fukuyama strongly rejected criticisms of his book, which he felt misunderstood his point, he was quite clear that there was some fundamental difference between events as we experience them and events as they used to be:

“What I suggested had come to an end was not events, even large and grave events, but History: that is, history understood as a single, coherent, evolutionary process, when taking into account the experience of all peoples in all times.”

This annoyed me so much in part because it’s so easy to believe. The figures of history do seem quite unlike ourselves. It’s hard to believe that Socrates or Cleopatra or Marx ate, slept, and shat just the same way we do. I mean, it can be difficult enough to empathize with people who are alive today. It can be even harder to fully appreciate that previous ‘presents’ were just as present as our own.

When I look at our time, I try to look at it the way we look at ancient civilizations. Let’s assume that human beings will be around for another several thousand years at least. What do we look like to them? Clearly the idea that we were somehow uniquely different from those a hundred years before us will seem ludicrous to them, no matter what happens or doesn’t happen over the next several millennia. There are a few things I always wonder: Which things that we cared a lot about will seem completely trivial? And which things will it seem extraordinary not to have cared about? If I had to predict, I’d say that they’d be amazed we spent so much time talking about Paul Manafort and Michael Avenatti even as we tortured billions of animals to death and stood by watching the planet boil. Animal welfare, climate change, nuclear weapons, borders—our failures to do anything on these fronts will seem like a deep moral deficiency.

Understanding yourself as a person in history confers a great sense of responsibility. It’s interesting to daydream about questions like: If you had been alive in 1922, and had the freedom to act, what would you do to prevent the rise of Hitler? What would you have done had you been alive in Time & Place X, Y, or Z? Now, the question doesn’t really make much

sense, since “who you are” comes from the fact that you’re here, now, and have lived the life you’ve lived instead of some other life. But the exercise is still useful even if we can’t suspend the laws of the universe, because in some ways we have been plopped down in history and do face that exact question. Given that you are here, in a particular moment and place, an unchangeable past behind you and an unknowable future before you, what will you do? Any life is a historical blip—your lifespan is two numbers separated by a hyphen, and this is the hyphen—and as individuals we almost certainly can’t change the course of history alone. But the decisions people make do matter.

One of history’s main lessons is: Don’t be the person who grudgingly accepts the inevitability of atrocious things. The liberals who cautioned Martin Luther King to “go slow” were cowards, and the civil rights protesters changed the country by refusing to tolerate the intolerable. The people who gathered and attacked the first black family who moved to Cicero, Illinois—these were not the people you want to be. Same with the ordinary Germans who were afraid to speak up—each contributed to a human catastrophe. The “good men who do nothing” are not very good at all, because being good in part depends on what you do in response to your circumstances.

I am not saying that everyone must be an activist. Many people do not have the time or health. But I do think knowledge confers duty: As we try to look at our lives from the perspective of future people, aliens, or ourselves on our deathbeds, what decisions do we think we should make? I am not religious, but I often wonder how I would “justify myself” if there were a day of judgment. What were you for? What good were you? Did you sit idly by?

I believe strongly that life should be full of pleasure, and that there’s nothing helpful about living every day wracked with guilt over things you haven’t done. But I also know that history doesn’t just happen. It’s made by the sum total of the things people do, and I am a person, and you are a person, and we are the ones who decide what we do. 62,000 people lived rather than died because Carl Lutz was a good person who used his opportunities well. Because we are limited by our context, we each have constraints to our actions, but those constraints are also unknowable, and the only way to guarantee that a project fails is to resign yourself to its failure.

Try to look at our time as an outsider rather than a participant, and you’ll see how mad it all looks. These days, parts of the conservative press have switched from denying that climate change is happening to insisting that it won’t substantially impede GDP growth. The Wall Street Journal ran a column insisting that *nine degrees* of average warming would be

fine, because the economy could still expand. Did the article give any consideration to the billions of lives that would be disrupted, the refugees that would be generated, the people who would burn alive in new fires, or see their cities flooded? It didn't. The right-wing press is pathological: growth at all costs, without ever wondering where it will stop or how you can have limitless expansion on a finite planet.

Capitalism is a paperclip maximizer. It eats everything alive, and makes up whatever arguments are necessary to justify the ceaseless quest for maximizing productivity and revenue. It will do so even if it inflicts mass human suffering. What will this look like in the rearview mirror? How will we see columns that said the god of GDP must be served no matter the cost, that it is okay to kill every coral reef on earth if we can keep building new factories? I feel this will look like an age of lunacy, like we were members of a death-cult that made up rationalizations for its own destruction.

What mainstream liberals have been saying for decades is that we simply need to tweak the existing system here and there and everything will be fine. You can have Goldman Sachs capitalism plus solar panels. But the challenge is much more fundamental than that. It requires throwing out the neoliberal rulebook, and confronting the centrality of ever-expanding consumption in how we measure economic progress. In one sense, then, those with their desperate need to deny the reality of global warming, or belittle its implications, understand something that is fundamentally true: to avert climate chaos, we need to challenge the capitalist ideologies that have conquered the world since the 1980s. If you are the beneficiary of those ideologies, you are obviously going to be very unhappy about that. That's understandable. Global warming really does have radical progressive implications. If it's real—and it manifestly is—then the oligarch class cannot continue to run riot without rules. Stopping them is now a matter of humanity's collective survival.

No one familiar with American history can ignore how difficult it has been to bend the arc of history toward justice. Given the empirical evidence of the dire status of American citizens of African descent, it could be claimed that the bend in the arc is almost indiscernible.

Nor can the process of trying to achieve justice be viewed as simply the unfolding of democratic concepts into law and practice over time. Human agency, carefully crafted appeals, consciousness-raising of various sorts and at differing levels (individual, group, society-wide), cultural and artistic innovations and aesthetic challenges, years of human labor, blood, death, suffering, dreams, direct collective action, all and more were and are essential. And still we must account for the aforementioned evidence of how little has been the progress of equality for some groups. Community organizers,

agitators, rebels, activists, revolutionaries throughout the history of the American polity from Patrick Henry to Martin Luther King have known that challenging the flawed ideologies that dominate discourse, legitimate public practice, and shape the norms of civil society must be confronted sooner rather than later. Radical social movements in their time are always viewed as disturbances of the moral order. It is only retrospectively that social movements are viewed as speaking truth to power in ways that make moral sense.

In the United States, for example, Reverend Martin Luther King Jr. is universally celebrated, including by citizens who share the ideology of those who despised him in his lifetime. This may be used as evidence of their success. But given persisting failures of equality in the United States, a more plausible explanation is that they have been assimilated into a rhetoric that views the polity as ever more just, the society progressively more fair and decent. The fact that social movements make retrospective moral sense does not mean that the practices that accompany them change in materially significant ways.

One must be constantly vigilant of the tendency for the supposed success of social movements to be used to mask their failure. Embracing the moral sense of a social movement is an effective method to justify the end of critical scrutiny into the contradictions and tensions between professed political ideals and the actual circumstances of citizens. The success of the Civil Rights Movement seemed to invite a retreat from the type of critical inquiry I am engaged in here. There is a case to be made that the nobility and courage of those who participated in the Civil Rights Movement were used to mask continuing inequality. Claims of persisting inequality could be dismissed as attempts to diminish the heroic efforts of those who participated in the Civil Rights Movement, who sought a “colorblind” society. An analysis of propaganda and its relationship to flawed ideology helps us understand this danger. A social movement based on compelling the polity to recognize the role of race in inequality could be utilized to mask continued racial inequality. The heroic narrative of social movements faces the ever-present risk of being co-opted in the service of the message that the problems they addressed are now solved.

I have sketched the mechanism by which the subversion of democratic ideals occurs. It is my hope, which by no means rises to the arrogance of expectation, that this book will play some positive role in its prevention.

If the study of mankind amounts to no more than picturing to us our darker potential, I have better things to spend my time on. If on the other hand the study of mankind is to be a study in what reborn man can be, that is a different story.

These ideas will seem audacious, because they require big changes—in our personal lives and in our wider societies—at a time when we have lost faith in our ability to make collective changes. I wondered at times—am I asking too much? But when I reflected on it, I realized that the audacity of the changes we need now doesn't tell you anything about me. It reveals only how deep this problem runs. If those changes seem big, that tells you only that the problem is big. But a big problem is not necessarily an unsolvable problem.

If at first an idea does not sound absurd, then there is no hope for it.

The so-called possibility of such events is of no importance whatever, for the criterion of what is possible in any age is derived from that age's rational assumptions.

I happen to think that the most serious barrier to accomplishing political goals is the people who insist that they cannot be done. This is why I think one of the worst things Hillary Clinton has ever said is “single payer will never, ever happen.” By saying it, you place a larger barrier in the way of its success than any of the actually-existing impediments. As a matter of fact, single-payer programs are not outlandish. We're talking about making the American healthcare system more like the Canadian healthcare system. Yet Clinton said that it would never happen. What, not in 20 years? 100 years? 500 years? Are our ambitions really so low, our sense of political possibility so constrained, that we think you can't even adjust healthcare funding to operate in the same way that our next-door neighbor does it? People with imaginations this impoverished are far more of an impediment to change than anything else about the world.

They have no constructive ideas; they regard those who have them as dangerous fanatics; in all their fictions there is no leading thought or inspiration for which any man could conceivably risk the spoiling of his hat in a shower, much less his life.

For much of the last century, the great revolutionary question has thus been: how does one affect fundamental change in society without setting in motion a process that will end with the creation of some new, violent bureaucracy? Is utopianism the problem—the very idea of imagining a better world and then trying to bring it into being? Or is it something in the very nature of social theory? Should we thus abandon social theory? Or is the notion of revolution itself fundamentally flawed? Since the sixties, one common solution has been to start by lowering one's sights.

In the years leading up to May '68, the Situationists famously argued that it was possible to do this through creative acts of subversion that undermined the logic of what they called “the Spectacle,” which rendered us passive consumers. Through these acts, we could, at least momentarily,

recapture our imaginative powers. At the same time, they also felt that all such acts were small-scale dress rehearsals for the great insurrectionary moment to which they would necessarily lead—*the* revolution, properly speaking. This is what's largely gone today. If the events of May '68 showed anything, it was that if one does not aim to seize state power, there can be no fundamental, onetime break. As a result, among most contemporary revolutionaries, that millenarian element has almost completely fallen away. No one thinks the skies are about to open any time soon. There is a consolation, though: that as a result, insofar as one actually can come to experiencing genuine revolutionary freedom, one can begin to experience it immediately.

We must make our freedom by cutting holes in the fabric of this reality, by forging new realities which will, in turn, fashion us. Putting yourself in new situations constantly is the only way to ensure that you make your decisions unencumbered by the inertia of habit, custom, law, or prejudice—and it is up to you to create these situations. Freedom only exists in the moment of revolution. And those moments are not as rare as you think. Change, revolutionary change, is going on constantly and everywhere—and everyone plays a part in it, consciously or not. What is this but an elegant statement of the logic of direct action: the defiant insistence on acting as if one is already free? The obvious question is how this approach can contribute to an overall strategy—one that should lead, perhaps not to a single moment of revolutionary redemption, but to a cumulative movement towards a world without states and capitalism. On this point, no one is completely sure. Most assume the process could only be one of endless improvisation. Insurrectionary moments there will surely be. Likely as not, quite a few of them. But they will most likely be one element in a far more complex and multifaceted revolutionary process whose outlines could hardly, at this point, be fully anticipated.

In retrospect, what seems strikingly naïve is the old assumption that a single uprising or successful civil war could, as it were, neutralize the entire apparatus of structural violence, at least within a particular national territory—that within that territory, right-wing realities could be simply swept away, to leave the field open for an untrammelled outpouring of revolutionary creativity. But the truly puzzling thing is that, at certain moments of human history, that appeared to be exactly what was happening. It seems to me that if we are to have any chance of grasping the new, emerging conception of revolution, we need to begin by thinking again about the quality of these insurrectionary moments.

One of the most remarkable things about such insurrectionary upheavals is how they can seem to burst out of nowhere—and then, often, dissolve away

just as quickly. How is it that the same “public” that two months before say, the Paris Commune, or the Spanish Civil War, had voted in a fairly moderate social democratic regime will suddenly find itself willing to risk their lives for the same ultra-radicals who received a fraction of the actual vote? Or, to return to May ‘68, how is it that the same public that seemed to support or at least feel strongly sympathetic toward the student/worker uprising could almost immediately afterwards return to the polls and elect a right-wing government? The most common historical explanations—that the revolutionaries didn’t really represent the public or its interests, but that elements of the public perhaps became caught up in some sort of irrational effervescence—seem obviously inadequate.

First of all, they assume that ‘the public’ is an entity with opinions, interests, and allegiances that can be treated as relatively consistent over time. In fact what we call ‘the public’ is created, produced through specific institutions that allow specific forms of action—taking polls, watching television, voting, signing petitions or writing letters to elected officials or attending public hearings—and not others. These frames of action imply certain ways of talking, thinking, arguing, deliberating. The same public that may widely indulge in the use of recreational chemicals may also consistently vote to make such indulgences illegal; the same collection of citizens is likely to come to completely different decisions on questions affecting their communities if organized into a parliamentary system, a system of computerized plebiscites, or a nested series of public assemblies. In fact the entire anarchist project of reinventing direct democracy is premised on assuming this is the case.

To illustrate what I mean, consider that in English-speaking nations, the same collection of people referred to in one context as “the public” can in another be referred to as “the workforce.” They become a ‘workforce,’ of course, when they are engaged in different sorts of activity. The ‘public’ does not work—a sentence like ‘most of the American public works in the service industry’ would never appear in a magazine or paper, and if a journalist were to attempt to write such a sentence, her editor would certainly change it to something else. It is especially odd since the public does apparently have to go to work: this is why, as leftist critics often complain, the media will always talk about how, say, a transport strike is likely to inconvenience the public, in their capacity of commuters, but it will never occur to them that those striking are themselves part of the public—or that if they succeed in raising wage levels, this will be a public benefit.

And certainly the public does not go out into the streets. Its role is as audience to public spectacles, and consumers of public services. When buying or using goods and services privately supplied, the same collection of

individuals become something else, “consumers,” just as in other contexts of action they are relabeled a “nation,” “electorate,” or “population.” All these entities are the product of bureaucracies and institutional practices that, in turn, define certain horizons of possibility. Hence when voting in parliamentary elections one might feel obliged to make a “realistic” choice; in an insurrectionary situation, on the other hand, suddenly anything seems possible.

What ‘the public,’ ‘the workforce,’ ‘the electorate,’ ‘consumers,’ and ‘the population’ all have in common is that they are brought into being by institutionalized frames of action that are inherently bureaucratic, and therefore, profoundly alienating. Voting booths, television screens, office cubicles, hospitals, the ritual that surrounds them—one might say these are the very machinery of alienation. They are the instruments through which the human imagination is smashed and shattered. Insurrectionary moments are moments when this bureaucratic apparatus is neutralized. Doing so always seems to have the effect of throwing horizons of possibility wide open, which is only to be expected if one of the main things that that apparatus normally does is to enforce extremely limited horizons. This is probably why people often experience something very similar during natural disasters.

All of this would explain why revolutionary moments always seem to be followed by an outpouring of social, artistic, and intellectual creativity. Normally unequal structures of imaginative identification are disrupted; everyone is experimenting with trying to see the world from unfamiliar points of view; everyone feels not only the right, but usually the immediate practical need to re-create and reimagine everything around them.

New truths need to be told, and new truths need to be heard. The horizon is not so far as we can see, but as far as we can imagine.

Imagine that Martin Luther King never had a dream. Imagine that instead of working outside the narrow confines of time and place, he had resolved to work only within them. Imagine he had risen to the steps of the Lincoln Monument and announced a five-point plan that he thought he could both sell to the black community and win a majority for in both houses of congress that would bring civil rights legislation that one step closer.

But he didn’t. He chose not to engage in the nitty gritty of the here and now. Instead, he addressed not what will be or could be, but what should be.

It’s not naïve to hope that what does not seem possible in the foreseeable future is nonetheless necessary and worth fighting for. So many owe their life today to those outrageous and brave enough to fight for a society that they insisted upon even when they could not imagine it ever materializing.

If politics is the art of the possible, then radicalism must be the capacity to imagine new possibilities.

“A map of the world that does not include utopia is not worth even glancing at. For it leaves out the one country at which humanity is always landing. And when humanity lands there, it looks out, and, seeing a better country, sets sail.”

You never change things by fighting the existing reality. To change something, build a new model that makes the existing model obsolete.

In economically advanced democracies, whose universities teach some sort of Enlightenment tradition and technocratic specialty, societies often do not share in common—and do not teach—certain important cultural cores. These cores, which I think of as modules, include personal conflict resolution (how do we disagree? how do we apologize?), personal finances (how do we spend our money? how luxuriously should we live? how much should we save?), personal fitness (how do I maintain my body? what athletic skills should be practiced to promote health and strength?), and emotional or spiritual growth.

These cultural modules are important because they address large parts of day-to-day life and overall lifestyle. They are also important because each module or chunk of teachings/practices can be fairly extensive, and hard to derive from scratch. Individuals, and entire societies, may take a long time to rediscover some of these helpful practices. Fortunately for those of us bred in educational systems which run light on these cultural modules, there are lots of gurus around which are not too hard to discover. By taking a guru here and a guru there, you can form a complete personal culture, a complete lifestyle. My point is not that any of these teachers represents the last word on the topic, though sometimes their acolytes seem to think so, and though it might seem so when you’re reading the firehose of information for the first time. My point is just that each teacher has assembled a rich set of advice and tips. Combining them generates many ideas and crossover habits, and putting them into practice will keep you busy for a long time.

Rolling your own culture in this way is in general a good idea, I think. Even if you come from a background that includes teachings or traditions which address each of these areas, contrasting advice may suit you better or at least provoke greater reflection. And if you do not come from such a background—the secular elementary and university system for instance—you likely will be able to find a more thoughtful approach than whatever your default is, saving you years of flailing.

Although rolling your own culture is a good idea in general, doing so leads to a few follow-on problems. First, rolling your own requires a lot of

work. Discovering ideas and concepts, understanding them, comparing them, trying them out, carries significant costs in time and energy. This can take years. Many people lack the time and energy—or intellectual bandwidth if we’re being honest—to accomplish this task. By God you had better have figured out something that works for you before your business hits a rough patch or you lose a family member or your partner gets cancer, because you won’t be able to figure it out after that. Some communities with a complete worldview contain these teachings as a package deal—both a feature and a bug of such communities. As a feature, a comprehensive and integrated set of teachings saves most ordinary people years (or generations) of search and testing. As a bug, some of the teachings may be pathological or simply not individually suited.

Second, the individual modules may not fit together very well. One could imagine a university-level course on lifestyle design. Our lives and cultures are, by and large, slipshod, ramshackle constructions, bits of this and that tacked together. We select from the available chunks and try to fit them together into a coherent whole—an education here, a job there, a box to live in, entertainment to pass the time. These available ‘life parts’ tend to be black boxes in whose design we have little say. They may not fit together into a satisfying whole at all—the boat they make may not float. I do not think this kind of problem is one that individual imagination is powerful enough to solve. Even the most imaginative among us will tend to build a monstrosity instead of a life.

The third problem resulting from rolling your own culture is more serious and more interesting. One definition of a community is the place you can bring all of your self to, the kind of space held up as an ideal in Robert Putnam’s classic, *Bowling Alone*. With a close friend, or at a traditional church, you can talk about your bad leg, your struggles or success at work, how your love life or lack thereof is going, and your newest hobby. There is no compartmentalization. That’s a community. By contrast, industrialized or post-industrialized economies are systematic. You can talk about your strength training at your gym, your bad leg at your physical therapist’s, your emotional life at your psychologist’s, and your career with your mentor—assuming you are lucky enough to have some or all of these. Your self becomes splintered among these locations and communities.

One common solution is to choose one of these categories in which to invest your identity. Ardent Crossfitters often like to date other Crossfitters and even have their own dubious sartorial aesthetic. Mustachians—devotees of the frugality blogger Mr. Money Mustache—spend much of their time thinking about luxuriously frugal financial strategies. By emphasizing one lifestyle category over others, you can find a lot of fulfillment among other

like-minded people.

However, finding a group that shares even a few of your cultural modules becomes a significant challenge. Sometimes lifestyle teachings select against each other. Sometimes some modules cluster together, such as libertarianism and the Paleo diet, and those clusters do aid in finding friends and community. Modules that cluster together or that select against each other can be set to one side for the moment. In general, as a simple matter of probability, because we now roll our own cultures, the increasing diversity of the modules of these cultures decreases overlap between the sub-communities of the modules, and decreases the chances of finding many people who share several modules with you.

A true community, where you bring all of your self, forms in the overlapping portion of the Venn diagram of many cultural modules. Traditional communities propagate themselves and preserve themselves precisely by maintaining that overlapping region. As that Venn center shrinks, so does the number of true communities.

“People have always had selves, but selves have not always had to carry the burden of supplying meaning to life in such a far-reaching fashion.”

As society has become simultaneously secular and atomized, community has become harder to come by. Community forms largely around shared culture of one sort or another, and with less cultural overlap, communities shrink. As cultures become atomized or nonexistent, our languages for communicating meaning to one another, for crafting meaning together, have a shrinking shared vocabulary. And as crafting meaning together becomes harder, the result is also poorer than received meanings from history.

Consider a five-stage model of personal maturity:

Stage 1: Mostly infants: in a blooming, buzzing confusion, the baby feels hunger, pain, sleepiness.

Stage 2: If the child could speak it would say ‘I am hungry’ or ‘I am sleepy.’

Stage 3: Usually older children, personal interests are relativized. They move from subject to object: you no longer are your collection of interests, you have interests. They are subordinated to, and are organized by, relationships. You are in relationships; and, tacitly, you find yourself defined by them.

Stage 4: Characterizes modern society. We have priorities and procedures based on reasons, and that applies to our personal lives as well. Adolescent dramas diminish as systematic priorities take over: I'm sorry, but we planned this party weeks ago, and I can't switch to go to yours. Middle-class career professionals sometimes feel cold and calculating to family members due to conflicts between the fourth and third stages. This fourth stage is also where all those cultural modules live. They are systematic approaches to specific pieces of the human puzzle. If you really buy into them, other approaches are incorrect or even morally wrong.

Stage 5: You become adept at using systems in situation-appropriate ways. You're not troubled by each system's shortcomings or by conflicts between systems, whether we're talking about political and justice systems, financial and fitness systems, or philosophical systems. In Stage 5, we move beyond a devotion to this or that project, and we define ourselves by the ongoing process of meaning making. As a result, individuals in the fifth stage are able to navigate fluidly multiple systems of culture and meaning. To the extent you "are" anything, you could become a Marxist libertarian, or a religious atheist.

Getting to Stage 5 often entails an uncanny valley, "Stage 4.5," a nihilistic stage where you've lost faith in your old systems but haven't yet adapted to their loss. I propose that people who live in stage five have eaten their shadow to a significant extent, as a part of their journey into that mature state. 'Eating the shadow' or 'emotional work' is a quasi-Jungian idea that you have to not only face but also embrace the darker sides of your personality before you realize your potential.

"Yet there is a mystery here and it is not one that I understand: Without this sting of otherness, of even—the vicious, without the terrible energies of the underside of health, sanity, sense, then nothing works or can work. I tell you that goodness—what we in our ordinary daylight selves call goodness: the ordinary, the decent—these are nothing without the hidden powers that pour forth continually from their shadow sides."

The petty, jealous, angry, manipulative, cowardly, cold, apathetic, et cetera sides of yourself actually prove key to becoming whomever you want to be: dynamic, powerful, wise, caring, clever—I'm not assuming we all want to be the same person, fill in your own virtuous adjectives. Stage transitions usually cannot be accomplished solo. Intellectual understanding

is not enough. A bridge needs a culture and community. And there's this sense that this initiation into a more emotionally mature stage has to be done, often physically, with other people, and it is something that you cannot do yourself. You cannot bootstrap your way to the next level of maturity. It is something that must be shown to you.

At the moment, right-wing nationalist and populist movements are sweeping Western democracies. When the politics of Britain, the US, Guatemala, France, and Italy start looking eerily similar, it's time to look for global commonalities. One explanation is neoliberal policies allowing capital to move out of industrialized economies, causing wage stagnation and a gradual hollowing out of the middle class, causing popular frustration which manifests in nationalist and populist movements.

Rome and other civilizations expanded as long as they absorbed more energy, usually via conquest. All that energy—crops, money, and so on—can only be handled efficiently at a higher level of societal complexity. But that level of complexity can only be sustained by continued growth. When the civilization stops expanding, it collapses. Applying this hypothesis to the modern world, if we have hit peak resources or peak capitalism, then the institutions that define liberal democracy are destined to collapse, and it is unclear whether they will do so rapidly or slowly. So perhaps the global economy is starting to slow down as a result, which may be one driver behind popular frustration, which is manifesting in nationalist and populist movements.

It's even possible that the basic toolkit of most of our institutions is worn out, past due for an overhaul: representative democracy may not process information quickly enough. Today, cities and companies seem to be innovating more effectively than nations do. Perhaps globalization and the information economy throws up challenges more quickly than representative democracy can solve them, and we should push power downward or move to a liquid democratic system. I'm not trying to advocate for any single hypothesis here, just to give a sampling of the range of complexity of the set of global-scale problems. Anyone attacking even a piece of the problem is going to have to be tough and agile and a high-level operator, able to coordinate many people, able to navigate many different ways to make meaning.

As cultures become atomized or nonexistent, our languages for communicating meaning to one another, for crafting meaning together, have a shrinking shared vocabulary. And as crafting meaning together becomes harder, the result is also poorer than received meanings from history. And as subcultures overlap less, the number of "comprehensive communities" dwindles. This attrition poses challenges not only to lifestyle design and

to social experiences, but may also severely handicap advanced emotional development. Reaching a fluid state of emotional and cognitive maturity, accomplished through emotional work which is best performed in community, matters not only to us individually, but also to society.

“The person who has eaten his shadow spreads calmness, and shows more grief than anger. If the ancients were right that darkness contains intelligence and nourishment and even information, then the person who has eaten some of his or her shadow is more energetic as well as more intelligent.”

Some worry that too few people think precisely enough and at a high enough level to craft new meanings which communicate across the many atomized subcultures. And those are the sort of people who can inspire and coordinate to solve global problems. More people in the fifth stage are needed—but those people are best grown in community. I speculate that a community interested in solving global problems, and which uses different cultural modules as a means to aid each other in reaching Stage Five, wouldn't be troubled by its members' non-overlapping cultural modules. This community's *raison d'être* would be to support the ongoing process of meaning making which becomes the identity of the person living in the fifth stage, rather than to promote any particular ethical or relationship or financial or fitness system. It would be a factory not for a specific culture, but for individuals who create cultures and communities.

One of this culture's ways of dealing with liberating ideas that are gaining enough recognition that they can no longer be ignored or ridiculed or crushed out of awareness is to vigorously co-opt the ideas back into the service of existing bigotries and hierarchies.

Shallow ideas can be assimilated; ideas that require people to reorganize their picture of the world provoke hostility.

In Franz Kafka's novel *The Trial*, first published in 1925, a year after its author's death, Josef K. is arrested, but can't seem to find out what he's accused of. As K. navigates a labyrinthine network of bureaucratic traps—a dark parody of the legal system—he keeps doing things that make him look guilty. Eventually his accusers decide he must be guilty, and he is summarily executed. As Kafka puts it in the second-to-last chapter, “The Cathedral”: “the proceedings gradually merge into the judgment.”

Kafka's restrained prose—the secret ingredient that makes this story about a bank clerk navigating bureaucracy into an electrifying page-turner—trades on a kind of dramatic irony. This is Kafka's whole schtick, and it's what makes him so funny. By withholding knowledge from the protagonist

and the reader, Kafka dangles the promise that all will be revealed in the end. But with every sentence the reader takes in, it feels increasingly likely that the reason for K.'s arrest will remain a mystery.

As *The Trial* follows its tragic path deeper into K.'s insular, menacing, and sexualized world, it gradually becomes clear that the answer was never forthcoming. In fact, Kafka hints at the narrator's ignorance at the very beginning:

“Someone must have slandered Josef K., for one morning, without having done anything wrong, he was arrested.”

Why the conjecture about what “must have” happened unless the narrator, who relates the story in the past tense, doesn't know? That ignorance sets up the humor: During certain particularly insane moments in K.'s journey, the frustration of not knowing why he's enduring it all becomes unbearable, at which point there's no choice but to laugh.

Many commentators on *The Trial* have observed a sense of unreality in the novel, a feeling that something is somehow “off” that hangs like a fog over Kafka's plot-line.

“In spite of the confirmation of more recent times that Kafka's nightmare of a world was a real possibility whose actuality surpassed even the atrocities he describes, we still experience in reading his novels and stories a very definite feeling of unreality.”

For her, this impression of unreality derives from K.'s internalization of a vague feeling of guilt. That all-pervasive guilt becomes the means to secure K.'s participation in a corrupt legal system.

“This feeling, of course, is based in the last instance on the fact that no man is free from guilt. And since K., a busy bank employee, has never had time to ponder such generalities, he is induced to explore certain unfamiliar regions of his ego. This in turn leads him into confusion, into mistaking the organized and wicked evil of the world surrounding him for some necessary expression of that general guiltiness”

In other words, she reads *The Trial* as a kind of controlled descent into madness and corruption, ending in a violent exaggeration of the knowledge that nobody's perfect.

Others have expanded on these psychological themes, pointing to the dreamlike quality of time values and the assumption of an interior time employed throughout *The Trial*. This unsteady temporality implies that

most of what happens in *The Trial* isn't real—or isn't fully real, at any rate. In fact, they suggest, it makes as much sense to assume that the characters are projections of K.'s mind. It's the nightmarish quality of unreality that has made Kafka's name synonymous with any unreal, mysterious force which operates against man. In other words, this type of unreality has become so closely associated with Kafka that the best word to describe it is, circularly, Kafkaesque.

However some have charged that many Kafka interpreters were engaging with a politicized fantasy of what Kafka represents, rather than with the real Kafka. Some of these interpreters were motivated by a desire to dismiss Kafka as a hand-wringing bourgeois do-nothing—or even a “pre-fascist.” Others expressed a willingness to excuse Kafka's alleged “indifference to social policy” by appealing to his loose associations with socialist or anarchist circles. All of them are missing the obvious: They underestimate Kafka's role as a lawyer at the Worker's Accident Insurance Institute, in Prague, where he imposed workplace safety regulations on unwilling industrial employers.

Thus at the highest echelons of a semi-public, government-sanctioned institution enacting social policy, Kafka's job was to regulate the social conduct of employers vis-à-vis the working class. The employers under Kafka's supervision tenaciously resisted the application of recent Austrian social policy laws, which were adapted from Bismarck's legislation in Germany. They contested their risk classifications, disregarded their safety norms, tried to thwart plant inspections, and evade their premium payments. The department headed by Kafka was pitted against them in an adversarial relationship, no matter how conciliatory the agency's mission was meant to be.

Kafka's tales are a reflection of the deep obstacles to progress he perceived in the social reality of his time. He even anticipated the political self-critique of literature to the point of its non-publication, keeping most of his writing private, then asking that the manuscripts for *The Trial* and *The Castle* be destroyed upon his death—a wish that was, obviously, not honored. But the critical focus has been trained on the received version of Kafka, an interpretation of his life derived under exigent circumstances—the eruption of fascism in Europe—for ideological purposes. It has been trained, so to speak, on the Kafkaesque, instead of on Kafka himself.

It's true that Kafka's fiction ultimately offers the most reliable guide to his political orientation, provided we understand that fiction in the context of his professional life. At work, he took the side of the working class—indeed, he represented its interests in a struggle against capital. He was a man who tried to live his life according to principles of humanism, ethics, even religion. As a direct result of that experience, he learned the disturbing

truth that, in the law, “Lies are made into a universal system,” as he wrote in the penultimate chapter of *The Trial*. The best he could manage within the law still would be a far cry from real justice, which, Kafka also knew, would have to include sexual justice to be anywhere near complete.

But what about the plunging sense of unease—like a feeling of falling—that no one can quite seem to shake when they first encounter Kafka’s stories? This feeling results from the fact that Kafka’s stories, despite their bizarre premises, are unnervingly real. Although there is undoubtedly an element of the absurd in the worlds Kafka creates, his style—unpretentious and specific, yet free from slang—renders those worlds with such painful accuracy that they seem totally familiar while we’re in them, like déjà vu or a memory of a bad dream:

“K. turned to the stairs to find the room for the inquiry, but then paused as he saw three different staircases in the courtyard in addition to the first one; moreover, a small passage at the other end of the courtyard seemed to lead to a second courtyard. He was annoyed that they hadn’t described the location of the room more precisely; he was certainly being treated with strange carelessness or indifference, a point he intended to make loudly and clearly. Then he went up the first set of stairs after all, his mind playing with the memory of the remark the guard Willem had made that the court was attracted by guilt, from which it actually followed that the room for the inquiry would have to be located off whatever stairway K. chanced to choose.”

The time-bending nature of Kafka’s prose, then, shouldn’t be seen as a pathological formalism—a linguistically engineered unreality—but as a reflection of Kafka’s intuitive understanding of the emerging principles of modern physics, in which time itself is relative. The “unreality” in Kafka that has captivated so many commentators is what best aligns, ironically, with the current scientific worldview, which sees its own understanding of reality as necessarily partial, limited, and relative. If time in *The Trial* seems nonlinear, that’s only because the novel is so thoroughly modern; the uneven flow of time in the novel captures the dawning scientific realization that time is neither absolute nor universal.

Isn’t it, after all, the sense that Kafka—the voice on the page—is firmly in touch with reality that makes it feel acceptable to laugh at the deranged goings-on in *The Trial*? His jokes are technical achievements, yes, but they also speak to a feeling of loneliness that typifies the modern condition. Kafka himself couldn’t resist laughing when asked to read aloud from his work. To

orchestrate this kind of laughter might have offered relief from the relentless self-criticism that drove Kafka to conceal his writings. Kafka's suppression of information gets us to let our emotional guard down. He contrives narrative tension so that he can shock us, confronting us anew with injustices to which we've become numb.

I think we ought to read only the kind of books that wound or stab us. If the book we're reading doesn't wake us up with a blow to the head, what are we reading for? So that it will make us happy? Good lord, we would be happy precisely if we had no books, and the kind of books that make us happy are the kind we could write ourselves if we had to. But we need books that affect us like a disaster, that grieve us deeply, like the death of someone we loved more than ourselves, like being banished into forests far from everyone, like a suicide. A book must be the axe for the frozen sea within us.

Too often reading books or articles on the threats the world faces becomes little more than a form of consumerism. We read them to feel well informed—hopefully better informed than others. And it is easy to feel that the more threatening the problem under discussion, the more exhilarating it is as the plot of a whodunnit. Being well informed adds to our cultural capital and gives us more to say, but let us make sure this book also makes us part of the solution.

We writers sit around and bitch about how TV has ruined the audience for reading—when really all it's done is given us the really precious gift of making our job harder. You know what I mean? And it seems to me like the harder it is to make a reader feel like it's worthwhile to read your stuff, the better a chance you've got of making real art. Because it's only real art that does that. But as it gets more complex, the reader will feel they've wandered into a classroom where they missed the first few weeks of the course. So you need to teach the reader that he's way smarter than he thought he was.

I think one of the insidious lessons about TV is the meta-lesson that you're dumb. This is all you can do. This is easy, and you're the sort of person who really just wants to sit in a chair and have it easy. When in fact there are parts of us, in a way, that are a lot more ambitious than that. And what we need, is seriously engaged art, that can teach again that we're smart. And that there's stuff that TV and movies—although they're great at certain things—cannot give us. But that have to create the motivations for us to want to do the extra work, you know, to get these other kinds of art. And I think you can see it in the visual arts, I think you can see it in music—easier though, I'd think. Makes them realize it's more fun faster. Which is tricky, because you want to seduce the reader, but you don't want

to pander or manipulate them. I mean, a good book teaches the reader how to read it.

The old tricks have been exploded, and I think the language needs to find new ways to pull the reader. And my personal belief is a lot of it has to do with voice, and a feeling of intimacy between the writer and the reader. That sorta, given the atomization and loneliness of contemporary life—that's our opening, and that's our gift.

Some art is worth the extra work of getting past all the impediments to its appreciation.

As with painting, so with every art. In literature, what is observed is not primarily the physical world, but the psychological and social ones. The poet looks at what she really feels—about her body, or her sister—not what she's supposed to feel. The novelist reports upon the way we really treat each other—the pettiness or callousness or secret irrational longing—not the way we say we do. Those conventional modes of thought and emotion from which you need to free yourself—the party lines we spout, the happy talk that we're surrounded by—are exactly where art does its work by breaking through. There is a reason we avoid the truth, with our sociable lies and our psychological blocks: it is usually too hard to bear.

The more I think of it I find this conclusion more impressed upon me—that the greatest thing a human soul ever does in this world is to see something, and tell what it saw in a plain way. Hundreds of people can talk for one who can think, but thousands can think for one who can see. To see clearly is poetry, prophecy, and religion—all in one.

To say that the humanities can be a path to truth is itself to challenge one of our most closely held beliefs. We live not only in a scientific world, but also in a scientistic one: a world that thinks that science—empirical, objective, quantifiable—is the exclusive form of knowledge, and that other modes of inquiry are valid only insofar as they approximate its methods. But the humanities and science face in opposite directions. They don't just work in different ways; they work on different things. Science and the humanities are different forms of teaching that are each appropriate to their domain. Scientific knowledge relates to external reality, to that which lies outside our minds and makes itself available for objective observation. Humanistic knowledge relates to our experience of the world, to what reality feels like.

The scientist seeks to be objective and appeals to the impersonal language of numbers. The artist speaks from individual experience and appeals to our own individual experience. Humanistic knowledge isn't verifiable, or quantifiable, or reproducible. It cannot be expressed in terms of equations or general laws. It changes from culture to culture and person to person. It is a matter not of calculation but interpretation. When we engage in

humanistic inquiry—when we think about a poem or a sculpture or a piece of music—we ask, not how big is it, or how hot is it, or what does it consist of, but what does it mean. We ask of a scientific proposition, ‘Is it true?’, but of a proposition in the humanities we ask, ‘Is it true for me?’

Before you start to build a better future with “the crooked timber of humanity,” as Kant referred to it, you need to find out what you’re working with. You need to know what people are—how they think, what they want, how they act—as well as something of the moral pitfalls of your own proposed interventions. The law of unintended consequences is pretty much the governing principle of narrative art. The humanities put back everything the social sciences, by way of necessary simplification, take out. Economics, for example, the most authoritative of the social sciences today, informs us that people are rational actors, forever seeking to maximize their material self-interest—an assertion that would come as news to the author of *King Lear*, let alone *The Brothers Karamazov*. Only literature is unbounded enough to show how the world really works. I’ve heard it said that novels are obsolete, that books like *War and Peace* belong to an age when information could be delivered only in extremely inefficient forms. But *War and Peace* doesn’t tell you the same kinds of things that you can learn from a blog post or a Wikipedia entry, not even fourteen-hundred pages of them. It needs to be big and complex because it’s telling you something that’s big and complex. It doesn’t give you information; it gives you life.

The crucial thing is to study, not the Great Books, but simply, great books. The idea is to find yourself a few axes; anything that has the necessary edge and heft will do. It doesn’t matter who created it or when, as long as it can do some damage, as long as it inflicts that wound. The canon is irrelevant in this respect. A real reader creates her own canon, for it consists precisely of those books that she has used to create herself.

Politics, by definition and of necessity, concerns the exercise of power, which means the exercise of violence, wielded by those possessing power against all those without it. The powerful utilize violence in this way to maintain and increase their own power, wealth, and advantage. The power, wealth, and advantage of the ruling class are underwritten by and directly flow from the suffering, destruction, and death of the powerless. In such circumstances, a writer who seeks, on however modest a scale, to unmask the true nature of the political enterprise must forever be in search of that axe. In certain circumstances, if and when events reach the final breaking point in a society, the dispossessed will rise up with their own, non-metaphorical axes.

The lack of mass resistance to neoliberal oppression signals more than apathy or indifference, it also suggests that we don’t have an informed and

energizing vision of the world for which we want to struggle. Are we fighting for socialism or against neoliberalism? Are we battling neoliberalism or capitalism itself? Are we after a New Deal or a new society? Is the enemy neoconservatism or the white supremacist? Are we fighting racism, sexism, imperialism, neoliberalism, or all of the above?

This messaging mayhem is not an issue for the establishment. Rather than issuing harsh systemic critiques, the establishment paints pictures. For liberal audiences, Democrats fulminate about Donald Trump as the living manifestation of evil and traffic in the language of tyranny and resistance. For white supremacists, Republicans rouse racist enmities with images of impoverished refugees moving steadily toward our borders, which take on a monstrous character in the minds of MAGA minions. For uncompromising patriots, the armed forces air commercials of heroic young men jumping from helicopters and landing crafts and running across smoke-filled landscapes “toward the sound of chaos.” For bootstrap conservatives, there are Reagan’s welfare queens arriving at the unemployment office in waxed Cadillacs. For humanitarian interventionists, there is Colin Powell’s imagery of a team of mad scientists zigzagging Mesopotamia in mobile weapons labs, or Tony Blair brandishing a dossier warning that a nuclear-tipped WMD could hit central London in just 45 minutes.

In a mediascape littered with symbols, calls for the head of corporate capitalism on a gilded platter are thus swept aside by an interdependent duopoly that thrives on facilitating corporate exploitation with one hand and teasing the inexhaustible well of mass credulity with the other. Belief is the dodgy virtue that venal duopolists deploy the most. Each election cycle is an exercise in peddling hope and fear in alternating cycles, like a trafficker controlling his prisoners by a devious alternation of drug and deprivation. The left has done well illustrating the monstrosities of corporate capital, and the need to colorfully depict the crimes of the ruling class will always be crucial. But so too is the need to craft more compelling stories of a world without war and a land where health and education and work are rites of passage rather than a lifelong ordeal. Can the traditional bearers of bad tidings shape an electrifying vision of a socialist society? A companion narrative that finally replaces the extant portrait of collectivism as a bloodbath of mayhem and menace? The left’s chances for mass appeal likely depend on it. Even the Bolsheviks, who were scathing critics of socialist opportunism, let alone capitalists, headlined their 1917 revolution with the triple promise of, “Peace! Land! Bread!” The workers and the peasants knew exactly what they were fighting for.

You see, deep inside, people like to dream about a better world, they like to commit, even sacrifice themselves for another being, or for an ideal,

or revolution.

There is a mysterious cycle in human events. To some generations much is given. Of other generations much is expected. This generation has a rendezvous with destiny.

Almost nothing important that ever happens to you happens because you engineer it. Destiny has no beeper; destiny always leans trench-coated out of an alley with some sort of 'Psst' that you usually can't even hear because you're in such a rush to or from something important you've tried to engineer.

The men and women needed by a society in crisis are created by a greater societal group thought, they arise from their environment, from their folk, seeming to spring forth from the people as if they were waiting for the moment. They are not so much born as made to be what is needed of them by the greater group thought occurring around them.

There are those who bloom in chaos. You call them heroes or villains, depending on which side wins the war, but until the battle call they are but normal men who long for action, who lust for the opportunity to throw off the routine of their normal lives like a cocoon and come into their own. They sense a destiny larger than themselves, but only when structures collapse around them do these individuals become warriors.

Mark Twain once told a story about a man who scoured the planet looking for the greatest general who ever lived. When the man was informed that the person he sought had already died and gone to heaven, he made a trip to the Pearly Gates to look for him. Saint Peter pointed at a regular-looking Joe. "That isn't the greatest of all generals," protested the man. "I knew that person when he lived on Earth, and he was only a cobbler." "I know that," said Saint Peter, "but if he had been a general, he would have been the greatest of them all."

Absences do a poor job of unifying people because they are much less specific. Imagine a group that thinks Picasso is the greatest painter ever and another group that thinks he isn't—only the former seems like a real group. The dislike must reach the level of hate in order for a real group to form. This is why love or hate are the two emotions utilized in compelling individuals to act as a collective.

Giving a person a story about why they are in pain is one of the most powerful things you can ever do. Once people understand what is eating at them, their pain often becomes manageable. These people are knitting meaning from what seems to be a meaningless tangle of misery. Taking away the story for your pain is just as powerful. If you can't discover what's keeping you in, the will to get out soon becomes confused and ineffectual.

In my mind, the greatest problem we face right now is our absolute dependence on an unfriendly system. Right now people are very weak. Most of us are poor. We are required to work a lot, and we receive just enough pay to survive. Few of us have much of or any social safety net to rely on, which means we are effectively enslaved. Therefore, our first steps to freeing ourselves from this situation is to build a community. We need to network, get connected with other people, and we need to get organized as a group. We can find safety in numbers.

How do we do this? I will propose an algorithm for doing this, but first let me just point out the beauty of using such algorithmic solutions to these problems. The first notable feature is that algorithms can spread. In fact, because we humans are all so well connected these days, an algorithm can spread really quickly. Think of the way a YouTube video goes viral, in a matter of days or even hours a new video can reach hundreds of millions of people. The same is true of an algorithm. It can go viral and spread to the whole world, practically instantly.

The second amazing thing about these algorithms is that they can be designed with decentralization in mind. They can be made general enough to work in almost any situation or location. Designed properly, they are a simple template, which anyone anywhere can implement. Done properly, their use frees us from typical constraints of organizing a movement. There is no need for explicit designation of leadership or of detailed long-term planning. If we design this algorithm right, people should be able to simply start doing it, and in a matter of time a movement should materialize from the ground up.

Finally, before I propose an algorithmic solution to the problem, I want to admit that this may not be the solution, it is simply my first draft attempt at a solution. I hope people will consider this as a starting point which can be modified or improved upon.

I want to set off an idea bomb—I've been trying to set one off for some time now, but so far I haven't had any success. Don't worry though, I haven't given up yet, and I don't intend to give up any time soon. Thinking about my idea bomb problem, I wondered if maybe just talking about what an idea bomb is, and how one might work, could itself be an idea bomb. Anyway, maybe just talking about it would inspire someone else to set one off, which would be just as good an outcome to me.

So an idea bomb is an idea that precipitates sudden and major social change. It is an idea that explodes into the public consciousness and immediately gets people to start doing something new. An idea bomb, to my mind, is not just a mind-expanding idea, but it also includes an activity. An idea bomb is like an algorithm, a set of instructions, that people can

start doing to instantly improve, adapt to, or otherwise change their life's circumstances.

To rulers, the idea bomb is the stuff of nightmares. Especially in this age, when an idea can spread around the world in hours or minutes, an idea bomb is truly an existential threat. If some idea were to spread around the world that sparked a global movement, the elites could instantly find themselves in a heap of trouble.

So, in order to be successful, the idea has to be appealing to people. Perhaps this is obvious, but just to be clear, if the idea does not appeal to people, then nobody will try it; it will not explode into the public consciousness. I would also argue that in order to be successful the idea should be simple. It should be simple enough that, with minimal effort, people can understand how the idea is beneficial. This feature, I believe, is what would cause the idea to spread quickly.

New ways of thinking demand new kinds of eloquence. Our world rests on science and democracy, on seeing and saying; it rests on thinking new thoughts and getting them heard by a lot of people. Oratory, as Pericles knew, was what mattered crucially to the first democracy, in fifth-century BC Athens, but that was a small affair of few citizens (and many slaves) compared with our own, which needs words of all kinds, written and spoken and shouted, coming at you from all directions. However, writing well is not proof of thinking clearly. Orwell was wrong about that too. Sadly the truth is that plenty of men who have written very well have thought horrible thoughts, and the thoughts have been made to seem less horrible by being well written.

We must concede that important writing finds a way to accurately represent life, and that the writing that does so will consciously intermingle with the meaningful culture of the time, impermanent though it may be. What that constitutes in our present culture is debatable, but here's a partial, plausible list:

- The psychological impact of the Internet on day-to-day living.
- The prevailing acceptance of nontraditional sexual identities.
- The (seemingly regular) deaths of unarmed black men at the hands of white police officers.
- An unclear definition of privacy.
- An impotent, unspecified hatred of the wealthiest "one percent."
- The prolonging of adolescence and the avoidance of adulthood.

- A distrust of objective storytelling.
- The intermittent rebooting of normalcy in the years following 9/11.

I'm not saying an important book must include one of these ideas, or even an idea that would comfortably fit on this list. But it needs to include something that taps into what matters about the world now. There has to be something at stake that involves modernity.

Writing well isn't just a question of winsome expression, but of having found something big and true to say and having found the right words to say it in, of having seen something large and having found the right words to say it small, small enough to enter an individual mind so that the strong ideas of what the words are saying sound like sweet reason. Good writing is mostly good seeing and good thinking, too. It involves a whole view of life, and making that view sound so plausible that the reader adheres to it as obvious before he knows that it's radical.

The problem faced is a rhetorical one: how to say something that had never been said before in a way that makes it sound like something everybody has always known—how to make an idea that is potentially scary and subversive sound as sane and straightforward as one believes it to be.

As with all good writing, the traces of a lifetime's struggles for sense and sanity remain on the page.

In every work of genius we recognize our own rejected thoughts: they come back to us with a certain alienated majesty.

For a manifesto to succeed, it must speak to our hearts like a poem while infecting the mind with images and ideas that are dazzlingly new. It needs to open our eyes to the true causes of the bewildering, disturbing, exciting changes occurring around us, exposing the possibilities with which our current reality is pregnant. It should make us feel hopelessly inadequate for not having recognized these truths ourselves, and it must lift the curtain on the unsettling realization that we have been acting as petty accomplices, reproducing a dead-end past. Lastly, it needs to have the power of a Beethoven symphony, urging us to become agents of a future that ends unnecessary mass suffering and to inspire humanity to realize its potential for authentic freedom.

One describes a tale best by telling the tale. You see? The way one describes a story, to oneself or to the world, is by telling the story. It is a balancing act and it is a dream. The more accurate the map, the more it resembles the territory. The most accurate map possible would be the territory, and thus would be perfectly accurate and perfectly useless. The tale is the map that is the territory. You must remember this.

All stories are incomplete. Yet in order to construct a viable identity for myself and give meaning to my life, I don't really need a complete story devoid of blind spots and internal contradictions. To give meaning to my life, a story needs to satisfy just two conditions: first, it must give me some role to play. A New Guinean tribesman is unlikely to believe in Zionism or in Serbian nationalism, because these stories don't care at all about New Guinea and its people. Like movie stars, humans like only those scripts that reserve an important role for them. Second, whereas a good story need not extend to infinity, it must extend beyond my horizons. The story provides me with an identity and gives meaning to my life by embedding me within something bigger than myself. But there is always a danger that I might start wondering what gives meaning to that 'something bigger.' If the meaning of my life is to help the proletariat or the Polish nation, what exactly gives meaning to the proletariat or to the Polish nation?

There is a story of a man who claimed that the world is kept in place by resting on the back of a huge elephant. When asked what the elephant stands on, he replied that it stands on the back of a large turtle. And the turtle? On the back of an even bigger turtle. And that bigger turtle? The man snapped and said: "Don't bother about it. From there onwards it's turtles all the way down."

Most successful stories remain open-ended. They never need to explain where meaning ultimately comes from, because they are so good at capturing people's attention and keeping it inside a safe zone. Thus when explaining that the world rests on the back of a huge elephant, you should preempt any difficult questions by describing in great detail that when the elephant's gigantic ears flap they cause hurricanes, and when the elephant quivers with anger earthquakes shake the surface of the earth. If you weave a good enough yarn, it won't occur to anyone to ask what the elephant is standing on. Similarly, nationalism enchants us with tales of heroism, moves us to tears by recounting past disasters, and ignites our fury by dwelling on the injustices our nation suffered. We get so absorbed in this national epic that we start evaluating everything that happens in the world by its impact on our nation, and hardly think of asking what makes our nation so important in the first place.

Though some stories go to the trouble of encompassing the entirety of space and time, the ability to control attention allows many other successful stories to remain far more modest in scope. A crucial law of storytelling is that once a story manages to extend beyond the audience's horizon, its ultimate scope matters little. People may display the same murderous fanaticism for the sake of a thousand-year-old nation as for the sake of a billion-year-old god. People are just not good with large numbers. In

most cases, it takes surprisingly little to exhaust our imagination. Given everything we know about the universe it would seem utterly impossible for any sane person to believe that the ultimate truth about the universe and human existence is the story of Israeli, German, or Russian nationalism—or indeed of nationalism in general. A story that ignores almost the whole of time, the whole of space, the Big Bang, quantum physics, and the evolution of life is at most just a tiny part of the truth. Yet people somehow manage not to see beyond it.

While a good story must give me a role, and must extend beyond my horizons, it need not be true. A story can be pure fiction, and yet provide me with an identity and make me feel that my life has meaning. Indeed, to the best of our scientific understanding, none of the thousands of stories that different cultures, religions, and tribes have invented throughout history is true. They are all just human inventions. If you ask for the true meaning of life and get a story in reply, know that this is the wrong answer. The exact details don't really matter. Any story is wrong, simply for being a story. The universe just does not work like a story.

So why do people believe in these fictions? One reason is that their personal identity is built on the story. People are taught to believe in the story from early childhood. They hear it from their parents, their teachers, their neighbours, and the general culture long before they develop the intellectual and emotional independence necessary to question and verify such stories. By the time their intellect matures, they are so heavily invested in the story, that they are far more likely to use their intellect to rationalize the story than to doubt it. Most people who go on identity quests are like children going treasure hunting. They find only what their parents have hidden for them in advance. Second, not only our personal identities but also our collective institutions are built on the story. Consequently, it is extremely frightening to doubt the story. In many societies, anyone who tries to do so is ostracized or persecuted. Even if not, it takes strong nerves to question the very fabric of society. For if indeed the story is false, then the entire world as we know it makes no sense. State laws, social norms, economic institutions—they might all collapse.

Most stories are held together by the weight of their roof rather than by the strength of their foundations. Consider the Christian story. It has the flimsiest of foundations. What evidence do we have that the son of the Creator of the entire universe was born as a carbon-based life form somewhere in the Milky Way about 2,000 years ago? What evidence do we have that it happened in the Galilee area, and that His mother was a virgin? Yet enormous global institutions have been built on top of that story, and their weight presses down with such overwhelming force that they keep the

story in place.

Once personal identities and entire social systems are built on top of a story, it becomes unthinkable to doubt it, not because of the evidence supporting it, but because its collapse will trigger a personal and social cataclysm. In history, the roof is sometimes more important than the foundations. The stories that provide us with meaning and identity are all fictional, but humans need to believe in them. So how to make the story feel real? It's obvious why humans want to believe the story, but how do they actually believe? Already thousands of years ago priests and shamans discovered the answer: rituals. A ritual is a magical act that makes the abstract concrete and the fictional real.

If you want to know the ultimate truth of life, rites and rituals are a huge obstacle. But if you are interested in social stability and harmony, truth is often a liability, whereas rites and rituals are among your best allies.

Of all rituals, sacrifice is the most potent, because of all the things in the world, suffering is the most real. You can never ignore it or doubt it. If you want to make people really believe in some fiction, entice them to make a sacrifice on its behalf. Once you suffer for a story, it is usually enough to convince you that the story is real. If you fast because God commanded you to do so, the tangible feeling of hunger makes God present more than any statue or icon.

This is of course a logical fallacy. If you suffer because of your belief in God or in the nation, that does not prove that your beliefs are true. Maybe you are just paying the price of your gullibility? However, most people don't like to admit that they are fools. Consequently, the more they sacrifice for a particular belief, the stronger their faith becomes. This is the mysterious alchemy of sacrifice. In order to bring us under his power, the sacrificing priest need not give us anything—neither rain, nor money, nor victory in war. Rather, he needs to take away something. Once he convinces us to make some painful sacrifice, we are trapped.

Self-sacrifice is extremely persuasive not just for the martyrs themselves, but also for the bystanders. Few gods, nations, or revolutions can sustain themselves without martyrs. If you presume to question the divine drama, the nationalist myth or the revolutionary saga, you are immediately scolded: 'But the blessed martyrs died for this! Do you dare say that they died for nothing? Do you think these heroes were fools?'

When we think of human sacrifice we usually have in mind gruesome rituals in Canaanite or Aztec temples, and it is common to argue that monotheism brought an end to this terrible practice. In fact, monotheists practiced human sacrifice on a much larger scale than most polytheistic cults. Christianity and Islam killed far more people in the name of God than

did the followers of Ba'al or Huitzilopochtli. At a time when the Spanish conquistadors stopped all human sacrifices to the Aztec and Inca gods, back home in Spain the Inquisition was burning heretics by the cartload.

In Israel, Orthodox Jews often try to force secular Jews and even complete atheists to keep their taboos. Since Orthodox parties usually hold the balance of power in Israeli politics, over the years they have succeeded in passing many laws banning all kinds of activities on the Sabbath. Though they were unable to outlaw the use of private vehicles on the Sabbath, they have been successful in banning public transport. This nationwide religious sacrifice hits mainly the weakest sectors of society, especially as Saturday is the only day of the week when working-class people are free to travel and visit distant relatives, friends, and tourist attractions. A rich grandmother has no problem driving her brand-new car to visit her grandchildren in another town, but a poor grandmother cannot do so, because there are no buses or trains. By inflicting such difficulties on hundreds of thousands of citizens, the religious parties prove and entrench their unwavering faith in Judaism. Though no blood is shed, the well-being of many people is still being sacrificed. If Judaism is just a fictional story, then it is a cruel and heartless thing to prevent a grandmother from visiting her grandchildren or to prevent an impoverished student from going to have some fun on the beach—and don't even get us started on what they do to children on the beaches of the world's largest open-air prison camp. By nevertheless doing so, the religious parties tell the world—and tell themselves—that they really believe in the Jewish story. What, do you think they enjoy harming people for no good reason whatsoever?

Sacrifice not only strengthens your faith in the story, but often substitutes for all your other obligations towards it. Most of the great stories of humankind have set up ideals that most people cannot fulfill. How many Christians really follow the Ten Commandments to the letter, never lying or coveting? How many Buddhists have so far reached the stage of egolessness? How many socialists work to the utmost of their ability while taking no more than they really need? Unable to live up to the ideal, people turn to sacrifice as a solution. A Hindu may engage in tax frauds, visit the occasional prostitute and mistreat his elderly parents, but then convince himself that he is a very pious person, because he supports the destruction of the Babri Mosque at Ayodhya and has even donated money to build a Hindu temple in its stead. Just as in ancient times, so also in the twenty-first century, the human quest for meaning all too often ends with a succession of sacrifices.

The Word Shaker

There is an ecstasy associated with certain ideas, experienced before one dares just yet to envision its complications, dangers, and vicious absurdities. For now, the idea is enough. It is indestructible. Transforming it into reality, well, that is something else altogether. And sometimes reality comes to take it away—oh, how it can come.

Some might call it “willful naïveté.” You kind of have to close your eyes to the feeling that you’re trying to do the impossible. Imagination means, by definition, that you’re bringing something new into the world. It only feels impossible because nobody’s ever done it before—or at least, you never have. You must, in other words, face down your fears. Fear is an agent of control, something that authorities instill to make you tractable.

The West tries to silence emotions, “burn” books and hit us all with ugly, meaningless noise and images, because it knows perfectly well that beauty is creative and inspiring. Beauty and creativity are also dangerous, in fact, fatal to the regime’s dark and depressing designs. I may be scared, but I am also cautiously hopeful. We can still win. Actually, it is our obligation to win. It will be an extremely tough struggle that lies ahead of us. And no one will fight just in the name of facts and data. People are known to fight only in the name of a beautiful future. For us to win, all great muses are expected to march by the side of brave and determined revolutionaries!

“I wanted to make history move ahead in the same way that a child pulls on a plant to make it grow more quickly. I believe we must learn to wait as we learn to create. We have to patiently sow the seeds, assiduously water the earth where they are sown and give the plants the time that is their own. One cannot fool a plant any more than one can fool history.”

Stand in the public square and shove as many revolutionary ideas as far into the public spotlight as possible. Do it even if it means people you used to spend your time opposing start picking them up and using them. Do it with the goal of having your healthy anti-establishment ideas become the norm throughout your society. Do it with the goal of your worldview becoming conventional and boring. Do it with the intention of your activism becoming obsolete. Crave the absence of your own cool revolutionary self-image. The goal of revolutionary political activism is to make revolutionary ideas so common that they become the new normal. If you’re not going to do that, it’s just glorified masturbation. And there are much more energy efficient ways to wank.

Whoever you are, if you are a human being with a voice, you can start to persuade people, and if your arguments are good enough and you never stop, you will make converts, and they will join you, and you will win. And even when you appear to be losing, you might be starting a process that will win further down the line.

Banging your head over and over against a wall is not as bad as it sounds. Or rocking back and forth, or pacing like a panther in a zoo. It's like you're going over the same ground again and again and again, knowing that you will eventually wear a path so deep that you will break through to the knowledge that you seek, break out of this world that makes you want to bang your head against a wall and into another, better one.

There are but two powers in the world, the sword and the mind. In the long-run the sword is always beaten by the mind.

In life as in any game whose outcome depends on both luck and skill, the rational response to bad odds is to try harder.

Numbers alone don't count for much in history. History is often shaped by small groups of forward-looking innovators rather than by the backward-looking masses.

They dreamed what in a different time and place we might have called "immigrant dreams" but instead of imagining that somewhere far away across an ocean there is a better, warmer, brighter place, they looked at their own sorry, sodden lives and said:

"Here. This place is my home. And it is in this place that I will build a better life."

And so we must.

One needs a large amount of money and resources to convince people to act against their interests. One needs very little to get them not to. However it is uncertain what is required if such interests and motivations have been corrupted at a basic fundamental level.

Let us have faith that right makes might, and in that faith, let us, to the end, dare to do our duty as we understand it.

An honestly informed nation can be trusted to eventually do right. Justice is the petulant child of truth.

Champion of Truth. . . eccentric, piercing, bold
Like his own lightnings, which no chains can hold
Neglecting caution, and disdaining art
He seeks no armor for a naked heart

My manner has always been to give my whole attention to a subject till I have satisfied myself with respect to it. I picture knowledge spreading like a wave in all directions and believe that it will soon put an end to all usurped authority in the world.

An idea is energy which travels out, rippling through time, perhaps going unnoticed, or perhaps having great effects on individuals and events within that time period. It is how one can become immortal, can live on, forever, in others' ripples, distortions. What ancient ideas are effecting us now? How far have they come, through both space and time?

echo: a close parallel or repetition of an idea, feeling style, or event

The edge of melancholia is a giant cliff into depression. And art created from melancholia could, if circumstances were slightly different, have just been a view of the endless void—in other words: nothing. Art is a product of an individual's attempt to deal with their circumstance. Art made on the edge many times is inspiring and insightful for both the creator and the viewer but could just as easily been nothing.

A society of self-interest makes trust difficult if not impossible—it is an ethic that cannot sustain trust. Because it cannot sustain trust, it creates relationships of mutual suspicion and self-protection. It makes it far more difficult to have meaningful and rich interactions with people, at least those outside our immediate families and close circles of friends. And we may be forgiven for being wary even in these relationships. In human societies unfairness breeds mistrust, and mistrust creates social instability. Is it far-fetched to wonder whether the integrity and efficiency of a pack of wolves, a pride of lions, a herd of elephants, or a troop of chimpanzees rests on individuals trusting the intentions of other group members? No. Trust is essential for maintaining group cohesion. It is important in social play and in reciprocity, both of which foster group living.

Fairness is deeply rooted in vulnerability; vulnerability is a normal human condition; we are all vulnerable. We can start by changing our minds—by changing the ways we think about these issues. We can start by understanding that fairness is all about vulnerability. If we do, we will breed trust. We will breed social cohesion. We will build community.

A rentier economy is one in which individuals and entire sectors levy charges for the property and privileges they have obtained, or more often that their ancestors have bequeathed. The greatest fortunes originated from thefts or insider dealings whose details are so lost in the mists of time that they have become legitimized simply by the force of social inertia.

At the root of such parasitism is the idea of rent extraction: taking without producing. Permitting an excess of market price to be charged over intrinsic cost-value lets landlords, monopolists, and bankers charge more for access to land, natural resources, monopolies, and credit than what their services need to cost. Unreformed economies are obliged to carry what nineteenth-century journalists called the idle rich, twentieth-century writers called robber barons and the power elite, and Occupy Wall Street call the One Percenters.

The rentier class is pulling rank and deploying its power via the global media networks and political factions it owns. The game has changed. Incremental progress from within a Party framework is a relic of a bygone era. Every politician who has, or potentially has, influence over policy has to demonstrate ideological purity or they will get taken down. And the tactics deployed by the neoliberal cabal work—owning the vast majority of the Western media has many benefits. The sooner the opposition realizes and accepts that their old tactics no longer work, the sooner new tactics can be developed and used.

The biggest obstacle right now is the inability, or unwillingness, of people to accept the scary new way of the world and the entire mainstream media apparatus telling them it's the Russians or LePen or Trump or Corbyn that is the real problem and not the political and economic power structure itself.

Sure, it seems pretty hopeless but things have a way of changing quickly. All it would take to get things rolling is an articulate, charismatic, and genuinely dedicated leader who can tap into the worries and fears that people repress or deny and show them how the current order is screwing them left, right, and center. Articulate an alternative vision that is grassroots and strong enough to transcend media influence. Perhaps more people have to feel the bite and burn of destitution first before they become receptive to radical change. And any budding MLK will have to contend with a burgeoning reactionary right that offers extremely toxic “solutions” but shares a lot of common ground with libertarians and the old-school left when it comes to diagnosing the illness inflicting the Western body politic.

A German war veteran, while in prison, wrote a tract admiring British propaganda during World War I as “marvelous,” praising its simple presentation of “negative and positive notions of love and hatred, right and wrong, truth and falsehood,” thereby allowing “no half-measures which might have given rise to some doubt.” The fan was Adolf Hitler, and given his chance, he thought he could do even better.

German propaganda in the first World War tended toward the legalistic, officious, and convoluted. Take Germany's defense of its invasion of Belgium, as articulated by its propaganda official in America in 1914. The main point

in his Saturday Evening Post commentary is that the relevant peace treaty between Germany and Belgium had, technically, expired.

“We were sincerely sorry that Belgium, a country that in fact had nothing to do with the question at issue and might wish to stay neutral, had to be overrun.”

He goes on to blame the Belgians for not surrendering more quickly:

“It would have been entirely possible for Belgium to avoid all the devastation under which she is now suffering.”

In general, German war propaganda made the elementary error—common among clever people and experts, and familiar to the great ancient orators—of jumping into the complex merits of an issue before having engaged the listener. With their reductive messages and vivid imagery, the British and Americans handily avoided that blunder.

Hitler’s entire approach to propaganda might be understood as a reaction to the rationalism for which German thinkers were known. Instead, he had an alarmingly intuitive understanding of how to appeal to a mass audience and to the reptilian core. In *Mein Kampf*, he asks:

“To whom has propaganda to appeal? To the scientific intelligentsia, or to the less educated masses? It has to appeal forever and only to the masses! The strong leader, by understanding the great masses’ world of ideas and feelings, finds, by a correct psychological form, the way to the attention, and further to the heart, of the great masses.”

Propaganda must “be popular and has to adapt its spiritual level to the perception of the least intelligent. Therefore its spiritual level has to be screwed the lower, the greater the mass of people which one wants to attract.”

In *Mein Kampf* he suggests that propaganda need be like advertising, and seek first to attract attention: “A poster’s art lies in the designer’s ability to catch the masses’ attention by outline and color,” he writes. It must give “an idea of the importance of the exhibition, but it is in no way to be a substitute for the art represented by the exhibition.” Similarly “the task of propaganda lies not in a scientific training of the individual, but rather in directing the masses towards certain facts, events, necessities, et cetera, the purpose being to move their importance into the masses’ field of vision.” Those who are “already scientifically experienced or striving towards education and knowledge” are not the subject.

Hitler also intuited a few other basic truths about how we process information: since everything can be ignored, imprinting information in the memory requires a constant repetition of simple ideas.

“The great masses’ receptive ability is only very limited, their understanding is small, but their forgetfulness is great. As a consequence of these facts, all effective propaganda has to limit itself only to a very few points and to use them like slogans until even the very last man is able to imagine what is intended by such a word.”

Nuance was nonsense; complexity was a risk:

“As soon as one sacrifices this basic principle and tries to become versatile, the effect will fritter away, as the masses are neither able to digest the material offered nor to retain it.”

One couldn’t overstate the intensity of the effort required, for the masses “with their inertia, always need a certain time before they are ready even to notice a thing, and they will lend their memories only to the thousandfold repetition of the most simple ideas.” Finally, Hitler understood the demagogue’s most essential principle: to teach or persuade is far more difficult than to stir emotion. And far less welcome: what the audience most wants is an excuse to experience fully the powerful feelings already lurking within them but which their better selves might lead them to suppress.

The rise of Hitler would have been very difficult to stop. It’s true that internal division within the left, and a weak central government, created a political opening for the Nazis even though they had never received a majority of the vote. But Hitler was also a formidable and terrifying political force from early on. Because we’re removed in time and place, it is sometimes difficult to see how Hitler achieved such popularity, especially when one watches his furious, spittle-spraying speeches. The speeches should be watched more closely, though. I understand a bit more what people mean when they say he was a powerful orator. When you watch with the closed captions on, and you watch from the beginning, rather than just watching the clips where he has worked himself up into a fit, you can see how he lured people.

What alarmed me most is that, if someone with equivalent political talent emerged in the contemporary United States, I think it might be difficult to stop them. I do not think Trump is like Hitler: Hitler was a true fanatic, committed to a rigid ideology, whereas Trump is a corrupt capitalistic schmoozer. Fortunately for us, corruption is actually more desirable than

ideological purity; if someone just wants to enrich themselves and play a dictator, it's better than if they are hell-bent on committing mass murder. It's still not good. But I do imagine that someone who comes after Trump, a millennial right-winger who worships him, could be that kind of fanatic. And the only thing I can see to do is: Be prepared with a compelling alternative ideology that can keep people from flocking to that person. If your side has no answers and no direction, you do not stand a chance against someone who comes along offering hope, destiny, struggle, and strength.

Politics hates a vacuum; if it isn't filled with hope, someone will fill it with fear.

Even without being Nazis, most of us know the experience of being part of a crowd wild with excitement, and have an intuitive sense that the way our minds process information might change under such circumstances, even to the point that we might come to do something or begin to believe something different. If to pay attention is to open the mind to information, to do so in an animated crowd is to fling the doors wide open. To be exposed to any information is to be influenced, but in crowds the possibilities go well beyond everyday experience. It is perhaps the perceived loss of individual responsibility that makes the individual in the crowd more malleable.

There were many in Germany who recognized this story as rank mythology. They were nevertheless held captive by it simply because the vast majority around them thought it sounded wonderful and were willing to give their lives to make it a reality.

The same energy of discontent can be marshaled to put the homeless into homes or undesirables into camps (or worse).

In 1935 Sinclair Lewis wrote a popular novel in which a racist, anti-Semitic, flag-waving, army-backed demagogue wins the 1936 presidential election and proceeds to establish an Americanized version of Nazi Germany. The title, *It Can't Happen Here*, was a tongue-in-cheek warning that it might. But the "it" Lewis referred to is unlikely to happen again any place. Even in today's Germany, Italy, or Japan, a modern-style corporate state or society would be far different from the old regimes of Hitler, Mussolini, and the Japanese oligarchs. Anyone looking for black shirts, mass parties, or men on horseback will miss the telltale clues of creeping fascism. In any First World country of advanced capitalism, the new fascism will be colored by national and cultural heritage, ethnic and religious composition, formal political structure, and geopolitical environment. The Japanese or German versions would be quite different from the Italian variety—and still more different from the British, French, Belgian, Dutch, Australian, Canadian, or Israeli versions. In America, it would be supermodern and multi-ethnic—as American as Madison Avenue, action flicks, credit cards, and apple pie. It

would be fascism with a smile. As a warning against its cosmetic facade, subtle manipulation, and velvet gloves, we might call it friendly fascism. What scares me most is its subtle appeal.

I am worried by those who quibble about labels. Some of my friends seem transfixed by the idea that if it is fascism, it must appear in the classic, unfriendly form. “Why, oh why,” they retrospectively moan, “didn’t people see what was happening during the 1920s and the 1930s?” But in their own blindness they are willing to use the terms invented by the fascist ideologists, “corporate state” or “corporatism,” but not fascism.

I am appalled by those who stiffly maintain that nothing can be done until things get worse or the system has been changed. I am afraid of inaction. I am afraid of those who will heed no warnings and who wait for some revelation, research, or technology to offer a perfect solution. I am afraid of those who do not see that some of the best in America has been the product of promises and that the promises of the past are not enough for the future. I am dismayed by those who will not hope, who will not commit themselves to something larger than themselves, of those who are afraid of true democracy or even its pursuit. I suspect that many people underestimate both the dangers that lie ahead and the potential strength of those who seem weak and powerless. Either underestimation stems, I think, from fear of bucking the Establishment. This is a deep and well-hidden fear that guides the thoughts and actions of many of my warmest friends, closest colleagues, and best students. It is a fear I know only too well, for it has pervaded many years of my life.

“You’re either part of the solution or you’re part of the problem.”

By now I think this statement must be both stood on its head and reformulated:

“If you can’t see that you’re part of the problems, then you’re standing in the way of attacks on them.”

Programs never stop the things they’re launched to stop. No program has ever stopped poverty, drug abuse, or crime, and no program ever will stop them. And no program will ever stop us from devastating the world.

The world will not be saved by old minds with new programs. If the world is saved, it will be saved by new minds—with no programs. If the world is saved, it will be saved because the people living in it have a new vision.

“Where there is no vision,” the Book of Proverbs tells us, “the people perish.”

Successful philosophers are advertisers who can sell their new models of the universe to large numbers of others, thus converting thought to action, mind to matter. Think of some of the most revolutionary American slogans:

- “Give me Liberty or Give Me Death”
- “A Nation Cannot Exist Half Slave and Half Free”
- “The Only Thing We Have to Fear Is Fear Itself”
- “Lucky Strike Means Fine Tobacco”

And so it was on January 14, 1967, in Golden Gate Park that Timothy Leary first took his carefully constructed message to a broader audience. His speech centered on the infectious refrain, repeated over and over: “Turn On, Tune In, Drop Out.” Leary’s line caught on as well as any advertising slogan and became, effectively, the motto of the counterculture. Most would take Leary’s words as a call to pay attention to where your attention is paid; mind what you open your mind for. This was not America’s first call to attentional revolt but Leary’s proposed a far broader compass of things to ignore, not only messages from television and government but college, work, parents, as well as other sources of authority. He called for a complete attentional revolution. Some two decades on, Leary would write that “unhappily,” his ideas had been “often misinterpreted to mean ‘Get stoned and abandon all constructive activity.’”

Everything can be defended in some way or other. The defenses aren’t necessarily good. But you can always come up with a series of words, something sounding like an argument, to justify nearly anything you’d care to do, no matter how heinous. Because there’s always an argument available, one that may sound strong even if it’s actually atrociously weak, it can be extremely difficult for the truth to compete. In theory, when the person who is right and the person who is wrong enter into a discussion, the person who is right will triumph in the “marketplace of ideas.” In reality, the marketplace of ideas is very similar to an actual marketplace, where flimsy products can look superficially similar to quality ones, and people have trouble knowing whether they’ve bought a lemon until they get it home.

When I say there are justifications for everything, I truly mean everything. You can make an argument against democracy or against empathy. ‘People don’t know what’s in their best interests,’ and ‘Excess compassion impedes rational decision-making,’ respectively. If I want to seize the land of native

peoples, destroy their property and force them into exile, I might say: ‘Land should be put to its most efficient and productive use, and while we respect the ancestral rights of all people to their homes, all benefit alike from the development of resources toward their optimal functions.’ In fact, even today there are those who defend colonialism, saying:

“Colonialism improved living standards in the aggregate and was therefore more beneficial than detrimental.”

Even slave-owners had arguments: In addition to their crackpot racial theories, they said that dominance of man over man was the natural way of things, and that slave-owners treated their slaves better than industrialists treated factory workers. If your defense of your actions is ‘I’m not as bad as the capitalists,’ your actions are probably indefensible.

I could come up with a utilitarian justification for blowing up the universe and exterminating all of humanity—it alleviates suffering; an argument for cheating on your taxes; or an argument for racial profiling—stereotypes are rational. There have been arguments for invading Iraq, arguments for bombing Hiroshima, arguments for massacring unarmed Palestinian protesters, arguments for eliminating free speech, arguments for scrapping fundamental constitutional rights, arguments for purges and guillotines and show trials. Ayn Rand made the case for *The Virtue of Selfishness*. Hitler and Stalin each made arguments. Terrorism, assassination, torture: each have their defenders. Osama bin Laden made an argument for 9/11; the United States justified atrocities in Vietnam—and hell, others before and since—as serving the national interest.

Sometimes the arguments for horrible things even sound quite persuasive! Consider how the kind of ends-justify-the-means logic used by revolutionaries can proceed:

- The people are oppressed and cannot be saved by bourgeois government, they need a revolution.
- A revolution needs leadership.
- If the leadership is undermined, the revolution will fail.
- The leadership is therefore justified in searching out and eliminating counterrevolutionaries.
- Anything that has the effect of impeding the revolution is counterrevolutionary.
- Questioning the leadership of the revolution impedes the revolution.

You can see how, through a few argumentative steps, it's easy to produce a justification for a small number of authoritarians crushing all dissent in the name of the popular will.

Intellectual freedom would mean the restoration of individual thought now absorbed by mass communication and indoctrination and also the abolition of "public opinion" along with its makers. We envision an end to all forms of repression, whether social, economic, or technological. The people must recognize the mark of social repression, even in the most sublime manifestations of traditional culture, even in the most spectacular manifestations of technical progress. The result will be solidarity for the human species, for abolishing poverty and misery beyond all national frontiers and spheres of interest, for the attainment of peace.

But on the way to paradise, where should one direct his attention if not to the ubiquitous media? What should people be doing with their lives? The wise person devotes his life exclusively to the religious search for therein is found the only ecstasy, the only meaning. The message of God never changes. It may be expressed to you in six simple words: turn on, tune in, drop out.

The manipulators do not want you to live a religious life. They will apply every pressure (including prison) to keep you in their game. Your own mind, which has been corrupted and neurologically damaged by years of education in a mediated reality, will also keep you trapped.

This is how you be a person, say the actors on the screen. You chase after the car and the girl and the money and the success. You be extremely attractive but it's no big deal because it's normal and everyone's supposed to look this way. You say funny things you totally made up yourself right here on the spot. You kill bad guys. You act cool and confident even though you've never felt like you understood life even one time ever since you were born. You remain tightly wound up in the trance of egoic consciousness and never once turn around and realize your true nature. You never relax and start coloring outside the narrow lines of this tightly streamlined model we are feeding you. You keep looking for superheroes everywhere except in you.

When you're a kid and you don't really have any idea of how to be what you want to be, you fall for these sort of cultural models.

Real heroes work for the powerless, not the powerful.

It is possible to wake up from that narrative Matrix. It isn't easy, and it doesn't happen overnight. It takes work. Inner work. And humility. Nobody likes acknowledging that they've been fooled, and the depth and extent to which we've all been fooled is so deeply pervasive it can be tempting to decide that the work is complete far before one is actually free. Mainstream American liberals think they're clear-eyed because they can

see the propaganda strings being pulled by Fox and Donald Trump, and mainstream American conservatives think they're clear-eyed because they can see the propaganda strings being pulled by MSNBC and the Democrats; but the propaganda strings on both trace back to the same puppet master. And seeing that is just the beginning.

But, through sincere, humble research and introspection, it is possible to break free of the Matrix and see the full extent to which you and everyone you know has been imprisoned by ideas which have been programmed into social consciousness by the powerful. Not just in our adult lives, but ever since our parents began teaching us how to speak, think, and relate to the world. Not just in the modern world, but as far back as history stretches when the power-serving belief systems of societal structure and religion were promoted by kings and queens of old. All of society, and all of ourselves, and indeed all of the thoughts in our heads, have been shaped by those in power to their benefit. This is the reality that we were born into, and our entire personality structure has been filtered through and shaped by it.

For this reason, escaping from the power-serving propaganda Matrix necessarily means becoming a new creature altogether. The ideas, mental habits and ways of relating to the world which were formed in the Matrix are only useful for moving around inside of it. In order to relate to life outside of the power-promulgated narratives which comprise the very fabric of society, you've got to create a whole new operating system for yourself in order to move through life independently of the old programming designed to keep you asleep and controlled.

So it's hard work. You'll make a lot of mistakes along the way, just like an infant slowly learning to walk. But, eventually, you get clear of the programming.

And then you're ready to fight.

Because at some point in this process, you necessarily come up against a deep, howling rage. Rage at the oligarchic manipulators of your species, yes, but also rage against manipulation in all its forms. Rage against everyone who has ever tried to manipulate your narrative, to make you believe things about yourself or make other people believe things about you. Rage against anyone who manipulates anyone else to any extent. When your eyes are clear manipulation stands out like a black fly on a white sheet of paper, and your entire system has nothing to offer it but revulsion and rejection.

So you set to work. You set to work throwing all attempts to manipulate you as far away from yourself as possible, and expunging anyone from your life who refuses to stop trying to control your narrative. Advertising, mass media propaganda, establishment academia, everything gets purged from your life that wants to pull you back into the Matrix.

And they will try to pull you back in. Because our narratives are so interwoven and interdependent with everyone else's, and so inseparable from our sense of ourselves, your rejection of the narrative Matrix will present as an existential threat to many of your friends and loved ones. You will see many people you used to trust, many of them very close to you, suddenly transform into a bunch of Agent Smiths right in front of your eyes, and they will shame you, guilt you, throw every manipulation tool they have at you to get you to plug the jack back into your brain. But because your eyes are clear, you'll see it all. You won't be fooled.

And then all you'll want is to tear down the Matrix from its very foundations and plunge its controllers into irrelevance. You will set to work bringing down the propaganda prison that they have built up around your fellow humans in any way you can, bolt by bolt if you have to, because you know from your own experience that we are all capable of so much more than the puny gear-turning existence they've got everyone churning away at. You will despise the oligarchs for the obscene sacrilege that they have inflicted upon human majesty out of greed and insecurity, and you will make a mortal enemy of the entire machine that they have used to enslave our species.

And, because their entire kingdom is built upon maintaining the illusion of freedom and democracy, all they will have to fight back against you is narrative. They'll try to shame you into silence by calling you a conspiracy theorist, they'll have their media goons and manipulators launch smear campaigns against you, but because your eyes are clear, none of that will work. They've got one weapon, and it doesn't work on you.

And you will set to work waking up humanity from the lie factory, using whatever skills you have, weakening trust in the mass media propaganda machine and opening eyes to new possibilities. And while doing so, you will naturally shine big and bright so the others can find you. And together, we'll not only smash the narratives that imprison us like a human centipede swallowing the narrative bullshit and forcing it into the mouth of the next slave, but we'll also create new narratives, better narratives, healthier narratives, for ourselves and for each other, about how the world is and what we want it to be.

Because here's the thing: since it's all narrative, anything is possible. Those who see this have the ability to plunge toward health and human thriving without any regard for the made-up reasons why such a thing is impossible, and plant seeds of light which sprout in unprecedented directions that never could have been predicted by someone plugged into to establishment how-it-is stories. Together, we can determine how society will be. We can re-write the rules. We are re-writing the rules. It's begun already.

Out of the white noise of a failing propaganda machine, a new world is being born, one that respects the autonomy of the individual and their right to self-determination. One that respects our right to collaborate on large scales to create beautiful, healthy, helpful systems without the constant sabotage and disruption of a few power-hungry psychopaths who would rather rule than live. One that respects our right to channel human ingenuity into harmony and human thriving instead of warfare and greed. One that respects our right to take what we need, not just to survive but to thrive, and return it to the earth for renewal. One that respects the sovereign boundaries of not just ourselves and each other, but of the planet that we live in.

Unjack your cortex fully from the fear-soaked narratives of insanity, and let the true beauty of our real world flood your senses. Let the grief of what we have unknowingly done send you crashing to your knees in sorrow. And when you're ready, stand up. We have much work to do.

Despite some awareness among people of the injustices rising from capitalism, I would argue that some of the foundational laws of capitalism are unjust. While the effects of these laws can be seen to result in various forms of injustice, the laws themselves are rarely questioned. It is as if most of us concede that Margaret Thatcher was right when she said there is no alternative to capitalism. Many people have acknowledged the shortcomings of capitalism and work to ameliorate its injustices, yet leave intact the very laws that created the injustice.

For instance, Roosevelt's New Deal and his use of Keynesian economic theory to establish regulations were meant to limit the negative effects of capitalism that socialists and communists had been lamenting since the nineteenth century. Despite the good these programs and laws led to, they never questioned the core tenants of capitalism and the laws that supported it. Indeed, Keynesian capitalism is still capitalism even though it tries to stem some of the excesses endemic to capitalism.

Another example is advocating for a living wage. This has been going on since the nineteenth century and continues today. When people in Seattle, for instance, obtain enough votes to enact a hike in the minimum wage, most of us see this as a victory. On the one hand, it is a victory, because it forces producers and owners to increase wages for workers. On the other hand, this is a Pyrrhic victory because not only is it still not enough to be considered a living wage, laws that support capitalism remain unquestioned.

More problematic is that even if there is smaller disparities in wages, workers are excluded from a decision-making process that impacts them directly and significantly. Workers have no voice or seat at the table because they do not own the company, which makes them more vulnerable

to exploitation, as history has repeatedly shown. Any group whose voice is denied and who are excluded from sitting at the table will likely be marginalized and oppressed by those who have voices and seats. They remain forever dependent on the whims of the bosses. A critic may counter, saying they have a voice in that they could find another job or they could speak out or they could get more education. These responses are usually made by people of privilege who aren't trapped in a job, fearing that the loss of the job will result in losing one's apartment, car, et cetera. Moreover, these responses overlook the fact that the only option a worker may have is to work low wage jobs—jobs where she or he has no voice about the company's use of profits. Worse, these neoliberal responses deflect attention from the exploitative nature of business.

One can raise criticisms about the effects of capitalism, but ignore the very laws that give it life.

Awareness is merely the most minuscule beginning of attempting to redress social ills. A clever, cliché-filled advertising campaign never helps anything but the bottom-line of the corporation doing the marketing. Marketing and consumerism are the problem, not the solution. Advertising is not a political act, it is a financial one. Social change never came from marketing or consumerism and it never will.

The ills of society that have been conquered thus far were not overcome by the pragmatists or the centrists who rationalized a bad action for the sake of a good action. Historically, social change resulted from the radicals and the purists, the unheralded masses who worked their asses off, fighting for ethical issues, and willingly forsaking their careers, their reputations, their financial stability, and often even their own lives for the greater good. Justice cannot occur when one substitutes one oppression or injustice for the sake of another.

The struggle of man against power is the struggle of memory against forgetting.

“Without your free, rational, and inquisitive mind, I would have been stuck many times in a world where obedience and conformity are easier than courage and the will to make necessary mistakes.”

Only mass social movements can save us now. Because we know where the current system, left unchecked, is headed. We also know, I would add, how that system will deal with the reality of serial climate-related disasters: with profiteering, and escalating barbarism to segregate the losers from the winners. To arrive at that dystopia, all we need to do is keep barreling

down the road we are on. The only remaining variable is whether some countervailing power will emerge to block the road, and simultaneously clear some alternate pathways to destinations that are safer. If that happens, well, it changes everything.

Many of our problems are very solvable, as they are merely the result of childish power grabs and a desire to control the labor of others. By not subscribing to this system it doesn't mean giving up, it means shifting focus. It means incorporating real pragmatism to stop the nose dive into dystopian apocalypse and take a swing at a sustainable egalitarian borderless global society where humanity finally rids itself of the parasites who continue to insist they are more crucial to the world than the hosts they feed from.

If we rid ourselves of those arrogant parasites and their system of abuse, we will perhaps find freedom again—freedom like before the bloodsuckers latched upon us. Many will find this vantage point to be highly impractical, but I find naïve half-assed solutions, endless extreme unnecessary suffering, and a trajectory leading directly to societal collapse to be far more impractical.

Revolt!

How does one act well—sensitively, compassionately, without irreparable damage—on the basis of partial knowledge?

If there is anything that you don't understand and you don't feel comfortable doing, just say so. But it is a problem if you are a person that says, 'I can do everything,' and does a really lousy job. Arrogance is a bad thing.

Theory is when you know everything but nothing works. Experiment is when everything works but you know nothing. Most of the time nothing works and no one knows why.

If there was ever a need for political representation or a paternalistic and opaque authority, it has been removed by technology. Every political system we have tried has proven incapable of protecting human rights and dignity. Every political system we have tried has devolved into oligarchy.

The only purpose for which power can be rightfully exercised over any member of a civilized community, against their will, is to prevent harm to others.

In order for any society to ensure its survival without the use of tyrannical force, the members must be convinced that it is better than the alternative. If an alternative or no society at all appears more attractive than the current state, people will naturally be motivated to dismantle the current system.

In order for a society to appear more attractive than no society at all, we need to consider the basic rights of individuals in no society. There are certain basic rights that we can see enjoyed by most mammals in their natural state. To ensure that people do not need to resort to fighting for

these basic rights, we can enshrine them in our social contract. If people can see their basic rights more attainable within the system than without, it will be in their best interests to protect the system.

Every undomesticated mammal will seek and sometimes fight for their basic needs: food; shelter; safety; the right to reproduce and to provide for and educate their young; the right to cohabit, at least with offspring; some measure of privacy; the right to associate or refuse to associate; the right to communicate; the right to explore; and the right to learn. To some extent, all mammals have also the right to choose the time, place, and method of their work within the bounds of nature and survival. Any interference with these basic rights is seen as an attack and will be greeted with whatever defense the mammal is capable of.

If an individual agrees to abide by the laws of a society and not attack it, it is reasonable that the society provides means for all members to attain the same advantages they would fight for in a state of nature. When a society refuses to allow its members to attain basic needs such as food, shelter, and safety, and the deprivation is not caused by unavailability, only the most extreme repressive force and mass imprisonment will protect the society from revolution.

We do not have human dignity in a system where our basic needs are treated not as a right but as a privilege which we must earn and be grateful for and which a higher parental authority can remove from us.

What Rousseau omits is that the citizens possess individual rights independently of all social and political authority, and any authority which violates these rights becomes illegitimate. The rights of the citizens are individual freedom, religious freedom, freedom of opinion, which includes the freedom to express oneself openly, the enjoyment of property, a guarantee against all arbitrary power.

We can make a better world. Pessimism is so much part of the mental equipment of modern people that to gainsay it is to seem unserious. But there is a difference between a tragic consciousness and pervasive pessimism. We don't know what Utopia would look like, but we do know the difference between bad and better.

Leftists have often shied away from suggesting blueprints, thinking them undemocratic. But proposing a course isn't the same thing as imposing one. If the movements we've embraced in the past couple of years are worth taking seriously, it's because they can form the political basis for social plans. People want to know that there is another way.

One thing is clear: public scarcity in times of unprecedented private wealth is a manufactured crisis, designed to extinguish our dreams before they have a chance to be born.

Much of what is proposed does not fit inside the box of what is considered politically possible in mainstream political discussions. But what we are trying to do is explode the box. Because if the box doesn't leave room for justice, equality, compassion, for the safety and possibly the survival of our species and others, then there is something very, very wrong with that box. If what is considered politically possible today consigns us to a future of continued injustice and climate chaos the day after tomorrow, then we have to change what's politically possible.

We live in a time of multiple, intersecting crises, and since all of them are urgent, we cannot afford to fix them sequentially. What we need are integrated solutions. This is a great deal to take on all at once, but such are the times in which we live.

It's easier to crush evils in their infancy than when grown to maturity.

“If you really attack a fire, you put it out. But if you attack it cautiously and fearfully, you get burned.”

Revolution rips up social evils by its roots; reform merely shifts it from one spot to another.

Dividing a problem into pieces in order to solve the whole thing is altogether different from defining a problem solely in terms of the bits that seem easiest to fix. In the first instance, the remedy for each piece must develop in relation to its effect on actual or possible remedies for the other pieces. The other way is to solve a small part without considering whether the outcome strengthens or weakens the big problem's hold on the world.

The distinction sketched out above is the difference between reformist reform—tweak Armageddon—and non-reformist reform—deliberate change that does not create more obstacles in the larger struggle. Some of the timidity in the fight against warehousing humans in cages for part or all of their lives results from the lethal synthesis of abandoned optimism and calculated convenience. People think there's no alternative to capitalism, and in a weird distortion of capitalism itself, imagine all aspects of life as winners and losers in a zero-sum game.

Many funders of anti-prison advocacy—whether through arrogance or anxiety—narrow the scope of what can be done with resources that pass through the tiny social-justice portfolio door. The challenge seems so enormous that many desperately conclude it's better to save the “deserving” weak (women or children or addicts) and cross their fingers that everyone else can swim on their own. The anti-political tendencies of reformist reform embrace the sentimental maxim that whatever is wrong with the United States will be fixed by what's right with it. Not so fast.

It is important to recognize, though, that postponing important decisions because of uncertainty is actually just an implicit endorsement of the status quo, and often an excuse for maintaining it.

Many governments and institutions are not agents of change. Instead governments often act only as custodians of stability, and strive to protect the status quo. That is the very definition of inertia.

We place our faith in time-honored practices probably because the tried-and-true seems like a safer bet when our survival is in jeopardy. ‘Now’s not the time to be embracing a new, untested philosophy of life,’ whispers a voice in the back of your mind—the part that, whether you’re conscious of it or not, is constantly assessing the risks and advising how to react in response.

You should always give yourself three options. The reason for creating three options is that it frees you from the need to be correct; you know that at least two of your options will be wrong, and this freedom from judgment clears a path to intuition. In practice, this turns out to be less an exercise in creativity than an exercise in discovery; what you may think you are making up, you are calling up. Many believe the process of creativity is one of assembling thoughts and concepts, but highly creative people will tell you that the idea, the song, the image, was in them, and their task was to get it out, a process of discovery, not design. This was said most artfully by Michelangelo when asked how he created his famous statue of David:

“It is easy—you just chip away the stone that doesn’t look like David.”

Albert Einstein said that when you follow intuition:

“The solutions come to you, and you don’t know how or why.”

All we have are partial solutions; the best we can do is try.

If a governing authority were to pass laws in contradiction to the social contract, the government would be in breach of contract. The people in the society can then remove the authority given to the government or consider the contract null and void and declare a state of no governance from which a new social contact may or may not be formed. The governing body loses authority when it acts in contradiction to the social contract.

If the point of a social contract is that each individual agrees that they will work for the greater good of the society and protect the individual rights of others in exchange for having their own rights protected, every violation of anyone’s rights needs to be of grave concern to the whole of society.

The idea that only a lawyer can understand the law was created to disguise the undermining of the basic principles of society. In order for a social contract to be binding, the principles must be easily taught to anyone, including children. No law must ever deviate from the principles of the social contract, therefore law ought to be largely intuitive.

Tribal peoples have their full share of suffering to do, but in the tribal life, no one suffers unless everyone suffers. There's no class or group of people who are expected to do the suffering—and no class or group of people who are exempt from suffering. If you think this sounds entirely too good to be true, check it out. In the tribal life there are no rulers to speak of; elders or chiefs—almost always part-time—exert influence rather than power. There's nothing equivalent to a ruling class—or to a rich or privileged class. There's nothing equivalent to a working class—or to a poor or underprivileged class.

If this sounds ideal, well, why shouldn't it be, after three-million years of evolutionary shaping? You're not surprised that natural selection has organized geese in a way that works well for geese. You're not surprised that natural selection has organized elephants in a way that works well for elephants. You're not surprised that natural selection has organized dolphins in a way that works well for dolphins. Why should you be surprised that natural selection organized people in a way that worked well for people? And conversely, why should you be surprised that the founders of our culture, having obliterated a lifestyle tested over a period of three-million years, were unable to instantly slap together a replacement that was just as good? Really, the task was a formidable one. We've been working at it for ten-thousand years, and where are we?

The very first thing to go was the very thing that made tribal life a success: its social, economic, and political egalitarianism. As soon as our revolution began, the process of division began, between rulers and ruled, rich and poor, powerful and powerless, masters and slaves. The suffering class had arrived, and that class (as it would always be) was the masses.

Trial and error isn't a bad way to learn how to build an aircraft, but it can be a disastrous way to learn how to build a civilization.

Ted Kaczynski believed he had to kill people in order to get his ideas into the public discourse. He was totally upfront about this:

“If I had never done anything violent and had submitted the present writings to a publisher, they probably would not have been accepted. In order to get our message before the public with some chance of making a lasting impression, we've had to kill people.”

On the most primitive level, this goal succeeded. But not the way he hoped. Because Kaczynski sent bombs to people, nobody takes anything he says seriously—they might in three-hundred years, but they don't right now. Despite the huge circulations of the *New York Times* and the *Washington Post* and its ever-present availability on the Internet, the “Unabomber Manifesto” is an unread, non-influential document.

The fact that Kaczynski supposedly has a deeply damaged psyche doesn't mitigate its value at all: Not all crazy people are brilliant, but almost all brilliant people are crazy.

This reaction isn't all bad, at least you have their attention. If people think you're crazy, they don't view you as boring. They may even think you're doing something worth thinking and talking about.

Never doubt that a small group of thoughtful, committed citizens can change the world; indeed, it's the only thing that ever has. First they ignore you, then they laugh at you, then they fight you, then you win.

Great ideas come from everywhere if you just listen and look for them. You never know who's going to have a great idea.

A Nepali peasant with a smartphone on Google, now has more access to information than the president of the United States did fifteen years ago.

I don't care about my personal legacy. I care about how much justice is advanced in America, and in our world day after day, and I'm willing to sacrifice whatever reputation in the cause of that effort.

Be more concerned with your character than your reputation, because your character is what you really are, while your reputation is merely what others think you are.

When Jonathan Seagull joined the Flock on the beach, it was full night. He was dizzy and terribly tired. Yet in delight he flew a loop to landing, with a snap roll just before touchdown. When they hear of it, he thought, of the Breakthrough, they'll be wild with joy. How much more there is now to living! Instead of our drab slogging forth and back to the fishing boats, there's a reason to life! We can lift ourselves out of ignorance, we can find ourselves as creatures of excellence and intelligence and skill. We can be free! We can learn to fly!

The Council did not see it this way.

A seagull never speaks back to the Council Flock, but it was Jonathan's voice raised. “Irresponsibility? My brothers!” he cried. “Who is more responsible than a gull who finds and follows a meaning, a higher purpose for life? For a thousand years we have scabbled after fish heads, but now we have a reason to live—to learn, to discover, to be free! Give me one chance, let me show you what I've found. . . .”

They didn't listen.

Jonathan Seagull spent the rest of his days alone, but he flew way out beyond the Far Cliffs. His one sorrow was not solitude, it was that other gulls refused to believe the glory of flight that awaited them; they refused to open their eyes and see.

He learned more each day. He learned that a streamlined high-speed dive could bring him to find the rare and tasty fish that schooled ten feet below the surface of the ocean: he no longer needed fishing boats and stale bread for survival. He learned to sleep in the air, setting a course at night across the offshore wind, covering a hundred miles from sunset to sunrise. With the same inner control, he flew through heavy sea-fogs and climbed above them into dazzling clear skies—in the very times when every other gull stood on the ground, knowing nothing but mist and rain. He learned to ride the high winds far inland, to dine there on delicate insects. What he had once hoped for the Flock, he now gained for himself alone; he learned to fly, and was not sorry for the price that he had paid. Jonathan Seagull discovered that boredom and fear and anger are the reasons that a gull's life is so short, and with these gone from his thought, he lived a long fine life indeed.

And then he died. But that is not the end of Jonathan's story.

As the days went past, Jonathan found himself thinking time and again of the Earth from which he had come. If he had known there just a tenth, just a hundredth, of what he knew here, how much more life would have meant! He stood on the sand and fell to wondering if there was a gull back there who might be struggling to break out of his limits, to see the meaning of flight beyond a way of travel to get a breadcrumb from a rowboat. Perhaps there might even have been one made Outcast for speaking his truth in the face of the Flock. And the more Jonathan practiced his kindness lessons, and the more he worked to know the nature of love, the more he wanted to go back to Earth. For in spite of his lonely past, Jonathan Seagull was born to be an instructor, and his own way of demonstrating love was to give something of the truth that he had seen to a gull who asked for only a chance to see truth for himself.

And so he went back and found his students.

When the flying was done, the students relaxed on the sand, and in time they listened more closely to Jonathan. He had some crazy ideas that they couldn't understand, but then he had some good ones that they could.

"Jonathan, remember what you said a long time ago, about loving the Flock enough to return to it and help it learn?"

"Sure."

"I don't understand how you manage to love a mob of birds that has just tried to kill you."

“Oh, Fletch, you don’t love that! You don’t love hatred and evil, of course. You have to practice and see the real gull, the good in every one of them, and to help them see it in themselves. That’s what I mean by love. It’s fun, when you get the knack of it. I remember a fierce young bird, for instance, Fletcher Lynd Seagull, his name. Just been made Outcast, ready to fight the Flock to the death, getting a start on building his own bitter hell out on the Far Cliffs. And here he is today building his own heaven instead, and leading the whole Flock in that direction.”

As far back as I can remember, I’ve had the feeling that the most exciting things in life were locked away somewhere, like Fabergé eggs or hundred-year-old Scotch. And that the only way to get to them was by relentless searching. You weren’t going to stumble across a lost civilization on your way to catch the commuter bus, for instance, or find a goblin shark lying in the seafood section of Safeway. Seeing the moon on TV, visiting the wildest creatures in cages, nose-pressing museum cases to admire a souvenir of history—all this added up to an unacceptable trade-off. And yet pretty much everyone I knew had already made it.

At this point I set my goal for life, which was to find out why. What is the point of our brief existence? What are we doing here and to what end? I had no plan of attack because I had no notion of what form the answer might take or where it might be found. Would it be in a book or in a place? Coded or in plain sight? Would it take years of patient study to comprehend or would it come in a rush of revelation? And if it was easily available, say in a library book, why didn’t anyone ever mention it? Because one thing you learn early in this line of work is that you can’t go around telling people, ‘I’m on a mission to discover the purpose of life.’ Not if you’re hoping to prolong the conversation.

Many people labor in life under the impression that they are doing something right, yet they may not show solid results for a long time. They need a capacity for continuously adjourned gratification to survive a steady diet of peer cruelty without becoming demoralized. They look like idiots to their cousins, they look like idiots to their peers, they need courage to continue. No confirmation comes to them, no validation, no fawning students, no Nobel. “How was your year?” brings them a small but containable spasm of pain deep inside, since almost all of their years will seem wasted to someone looking at their life from the outside. Then bang, the lumpy event comes that brings the grand vindication. Or it may never come. Believe me, it is tough to deal with the social consequences of the appearance of continuous failure. We are social animals; hell is other people.

Not matching the idea of success others expect from you is only painful if that’s what you are seeking. You stand above the rat race and the pecking

order, not outside of it, if you do so by choice. This is the first step toward throwing a four-letter word at fate. You have far more control over your life if you decide on your criterion by yourself. Mother Nature has given us some defense mechanisms: as in Aesop's fable, one of these is our ability to consider that the grapes we cannot (or did not) reach are sour. But an aggressively stoic prior disdain and rejection of the grapes is even more rewarding. Be aggressive; be the one to resign, if you have the guts. It is more difficult to be a loser in a game you set up yourself.

You tear yourself apart, examine each individual piece, toss out the useless, rehabilitate the useful, and put your moral self back together again.

Long ago, becoming a training priest was recognized as a way of living, and I think that considerable numbers of the priests were people who had troubles that prevented them from living in society—people who would be called depressed or neurotic in today's terms. The basic rule was to leave the family and friends, discard all the relationships and renounce the world. The old society accepted these training priests, although they were thought to be completely useless. Or rather, it treated them with respect, and supported them by giving offerings. In very rare cases, some attained so-called "enlightenment," and those people could spread teachings that could possibly save people in society who had troubles. In other words, there were certain cases where training priests could be useful to society, and I think that is why society supported them.

I think that training priests and hikikomori are quite similar. First, neither of them can fit in to this society—while the training priests are secluded in mountains, hikikomori are secluded in their rooms. They both engage in the activity of facing the root of their problems alone. However, nobody accepts this way of living anymore, and that's why hikikomori hide in their rooms. But hikikomori are very important beings. Hikikomori cannot be cured by society; rather, it is society that has problems, and hikikomori may be able to solve them.

But this is fine—the dismissal, the platitudes, the brusque moving-on of the grown-ups. It's all fine. I withdraw, you see. I withdraw from the campaigning and the marching, I withdraw from the arguing and the talked-up necessity and all of the false assumptions. I withdraw from the words. I am leaving. I am going to go out walking.

I am leaving on a pilgrimage to find what I left behind in the jungles and by the cold campfires and in the parts of my head and my heart that I have been skirting around because I have been busy fragmenting the world in order to save it; busy believing it is mine to save. I am going to listen to the wind and see what it tells me, or whether it tells me anything at all. You see, it turns out that I have more time than I thought. I will follow the

songlines and see what they sing to me and maybe, one day, I might even come back. And if I am very lucky I might bring with me a harvest of fresh tales, which I can scatter like apple seeds across this tired and angry land.

One must be a nomad, pass through ideas like one passes through countries and cities.

A mind forever
Voyaging through strange seas
Of thought alone

“He will row out over that great ocean of material, and lower down into it, here and there, a little bucket, which will bring up to the light of day some characteristic specimen, from those far depths, to be examined with a careful curiosity.”

If you take too many risks, you don't get home—if you take too few, you don't get the data.

Courageous or just unwise? The line between is narrow.

“He had a reputation of being idealistic almost to the point of craziness. He is now thought simply to have been way ahead of his time.”

Untrained, isolated artists, cut off as they are from the rest of the world and oblivious to any notions of artistic training or concern for prevailing fashions, give an insight into the raw creative process. In effect, insane people show us what we are all capable of if we can only throw off society's constraints. If, goes this school of thought, art has become so corrupted by formal movements, trendiness, and marketing, then it is only by returning to the work of “primitive” cultures, children, and the insane that we can gain some sense of the purity of artistic expression.

You've got to be crazy. It's too late to be sane. Too late. You've got to go full-tilt bozo 'cause you're only given a little spark of madness, and if you lose that you're nothing. Note, from me to you: Don't ever lose that, 'cause it keeps you alive.

And that's what's exciting, the idea you could explore creativity at any price is like—you're going to come to the edge, you're going to look over, and sometimes you're going to step over the edge, and then you're going to come back, hopefully.

We are less ready to suffer or die for what we have or are than for what we wish to have or to be.

Which is excellent news if you are a one-eyed archaeologist, or a penniless young artist, or a wandering playboy-poet, or anything else. We might be offering misfits like these a death sentence but we're also offering a new way to live.

The only way to deal with an unfree world is to become so absolutely free that your very existence is an act of rebellion.

"I'm scared."

Good, now you have something you can kill.

Fear of serious injury cannot alone justify suppression of free speech and assembly. Men feared witches and burnt women. It is the function of speech to free men from the bondage of irrational fears.

Wouldn't it be great to be consumed by a passion? To be short lived, but to have given it your all?

"Which are you, a pessimist or an optimist?"

Both is the most sensible answer. To be only the former would be self-defeating—and to be only the latter would be self-deception.

"Are we not all of us fanatics? I say only what you of the USA only pretend you do not know. Attachments are of great seriousness. Choose your attachments carefully. Choose your temple of fanaticism with great care. What you wish to sing of as tragic love is an attachment not carefully chosen. Die for one person? This is a craziness. Persons change, leave, die, become ill. They leave, lie, go mad, have sickness, betray you, die. Your nation outlives you. A cause outlives you.

Some say: 'What if sometimes there is no choice about what to love? What if the temple comes to Mohamed? What if you just love? Without deciding? You just do: you see her and in that instant are lost to sober account-keeping and cannot choose but to love?'

Then in such a case your temple is self and sentiment. Then in such an instance you are a fanatic of desire, a slave to your individual subjective narrow self's sentiments; a citizen of nothing. You become a citizen of nothing. You are by yourself and alone, kneeling to yourself.

In a case such as this you become the slave who believes he is free. The most pathetic of bondage. Not tragic. No songs. You believe you would die twice for another but in truth would die

only for your alone self, its sentiment. Welcome to the meaning of individual. We're each deeply alone here. It's what we all have in common, this aloneness."

Those unwilling to die for an idea cannot possibly articulate an idea worth dying for since they do not know what one looks like.

The coward's fear of death stems in large part from his incapacity to love anything but his own body. The inability to participate in others' lives stands in the way of his developing any inner resources sufficient to overcome the terror of death.

The problem with fear, though, is that it isn't any one thing. Fear has a whole taxonomy—*anxiety, dread, panic, foreboding*—and you could be braced for one form and completely fall apart facing another.

There are different kinds of strength, and containing fear may be the most profound, the one without which armies couldn't function and wars couldn't be fought (God forbid). There are big, tough guys in the Army who are cowards and small, feral-looking dudes, who will methodically take apart a SAW while rounds are slapping the rocks all around them. The more literal forms of strength, like carrying 160 pounds up a mountain, depend more obviously on the size of your muscles, but muscles only do what you tell them, so it still keeps coming back to the human spirit. Wars are fought with very heavy machinery that works best on top of the biggest hill in the area and used against men who are lower down. That, in a nutshell, is military tactics, and it means that an enormous amount of war-fighting simply consists of carrying heavy loads uphill.

By cowardice I do not mean fear. Cowardice is a label we reserve for something a man does. What passes through his mind is his own affair.

It is easier to repress well-justified fears than to control the dangers giving rise to them. We must avoid an air-raid shelter mentality, in which people go underground rather than deal directly with threatening prospects.

I don't think there is another country on earth where its citizens have so much potential power and are so fearful to use even one ounce of it.

Civilians understand soldiers to have a kind of baseline duty, and that everything above that is considered "bravery." Soldiers see it the other way around: either you're doing your duty or you're a coward. There's no other place to go. In 1908, five firemen died in a blaze in New York City. Speaking at the funeral, Chief Ed Croker had this to say about their bravery:

"Firemen are going to get killed. When they join the department they face that fact. When a man becomes a fireman his

greatest act of bravery has been accomplished. What he does after that is all in the line of work.”

You don't have to be a soldier to experience the weird comfort of that approach. Courage seems daunting and hard to attain, but work is mundane and eminently doable, a collective process where everyone takes their chances.

It is when he perceives no alternatives that violence is most likely. David wouldn't have fought Goliath if he perceived alternatives. Justification alone wouldn't have been enough to compensate for his low ability to prevail over his adversary. More than anything, he fought because he had no choice. A person (or an animal) who feels there are no alternatives will fight even when violence isn't justified, even when the consequences are perceived as unfavorable, and even when the ability to prevail is low.

Even heroes die screaming for their mothers. This will affect you if things get bad enough. You can drink your Kool-Aid of denial and wrap yourself in scrolls and belts and trophies, but those are just talismans to keep the boogeyman away. Even heroes die screaming for their mothers.

That's the ugly truth about heroism: the tests don't start when you're ready or stop when you're tired. You don't get time-outs, warm-ups, or bathroom breaks. You may have a headache or be wearing the wrong pants or find yourself in a skirt and low heels in a hallway becoming slick with your own blood.

Psychopaths and heroes: twigs on the same genetic branch.

Progressive ideas are introduced by weirdos and mocked by the world, and then everybody else adopts and refines those ideas ten years later.

Here's to the crazy ones. The misfits. The rebels. The troublemakers. The round pegs in the square holes. The ones who see things differently. They're not fond of rules. And they have no respect for the status quo. You can quote them, disagree with them, glorify or vilify them. About the only thing you can't do is ignore them. Because they change things. They push the human race forward. And while some may see them as the crazy ones, we see genius. Because the people who are crazy enough to think they can change the world, are the ones who do.

“I am a horse for a single harness, not cut out for tandem or teamwork for well I know that in order to attain any definite goal, it is imperative that one person do the thinking and the commanding.”

“A lie gets halfway around the world before the truth has a chance to get its pants on.”

“A truth’s initial commotion is directly proportional to how deeply the lie was believed. When a well-packaged web of lies has been sold gradually to the masses over generations, the truth will seem utterly preposterous and its speaker, a raving lunatic.”

This is the lie we tell ourselves our whole lives: as soon as we get the next meal, party, vacation, sexual encounter, as soon as we get married, get a promotion, get to the airport check-in, get through security and consume a bouquet of Auntie Anne’s Cinnamon Sugar Stix, we’ll feel really good. But as soon as we find ourselves in the airport gate area, having ingested 470 calories’ worth of sugar and fat before dinner, we don’t bother to examine the lie that fuels our lives. We tell ourselves we’ll sleep it off, take a run, eat a healthy breakfast, and then, finally, everything will be complete. We live so much of our lives pushed forward by these “if only” thoughts, and yet the itch remains. The pursuit of happiness becomes the source of our unhappiness.

If I were a member of the class that rules, I would post men in all the neighborhoods of the nation, not to spy upon or club rebellious workers, not to break strikes or disrupt unions; but to ferret out those who no longer respond to the system in which they live. I would make it known that the real danger does not stem from those who seek to grab their share of wealth through force, or from those who seek to defend their property through violence, for both of these groups, by their affirmative acts, support the values of the system in which they live. The millions that I would fear are those who do not dream of the prizes that the nation holds forth, for it is in them, though they may not know it, that a revolution has taken place and is biding its time to translate itself into a new and strange way of life.

In Jorge Luis Borges’s short story “The Secret Miracle,” a writer is unjustly imprisoned by the Nazis and sentenced to death. On the eve of his execution, he prays to God, asking for a year to finish his play. That night he dreams that his prayer is answered, but the next morning he is nevertheless led down to the firing squad in gloomy rain. As he stands in front of four soldiers, “a heavy drop of rain grazes his temple and rolls slowly down his cheek; the sergeant calls out the final order.”

But suddenly, miraculously, the universe stops: The weapons converged upon him, but the men who were to kill him were immobile. The sergeant’s arm seemed to freeze, eternal, in an inconclusive gesture. As though in a painting, the wind had died. He attempted a scream, a syllable, the twisting of a hand. He realized that he was paralyzed. He could hear not the slightest murmur of the halted word. He thought time has halted. He had asked God for an entire year in which to finish his work; God in His omnipotence

had granted him a year. God had performed for him a secret miracle: the German bullet would kill him, at the determined hour, but in his mind a year would pass between the order to fire and the discharge of the rifles.

In this secret year the writer crafts his play into perfection. Without the aid of movement, or speech, or writing, he repeats the acts in his head, honing every paragraph and polishing every word. At long last:

“He completes his play; only a single epithet is left to be decided upon now. He finds it; the drop of water rolls down his cheek. He begins a maddening cry, he shakes his head, and the fourfold volley fells him.”

I wish I had a few lifetimes to get better at paying attention, at listening. I wish I had more time to learn the song. But maybe the time we have is all the time we need.

Disappointment is a response to things not working out while regret is the recognition that you made a mistake and if you had done something differently, things would have gone better.

I would die happy if I knew that on my tombstone could be written these words:

THIS MAN WAS AN ABSOLUTE FOOL. NONE OF THE
DISASTROUS THINGS THAT HE PREDICTED EVER CAME
TO PASS!

I’m just afraid of having a tombstone that says:

HERE LIES A PROMISING OLD MAN

There are no masters here, nor will there ever be, all are forever students.

So by all means, keep asking. That’s what we have—and this compendium of shared knowledge makes up all we can achieve intellectually. To go deeper requires nearer experience, and that will come with time, whether we want it or not.

Movement culture is critical to mass protest. The people need to see themselves experimenting in democratic forms.

If I look at the mass, I will never act. If I look at the one, I will.

You don’t need to understand all the details of a system to know that it has failed.

Uncertainty, in the presence of vivid hopes and fears, is painful, but must be endured if we wish to live without the support of comforting fairy tales.

You already know enough. So do I. It is not knowledge we lack. What is missing is the courage to understand what we know and to draw conclusions.

- We know that the hidden crimes of slavery and environmental destruction are not just inextricably linked but mutually reinforcing and reach around the planet.
- We know that slaves are used to destroy the environment, and that when an ecosystem is devastated the people who live within it are pushed closer to slavery.
- We know that this destruction and slavery feed the global market and that we eat and wear and use the spoils of this crime every day.
- We know that slavery, our old enemy, is also a major cause of global warming, our big new enemy.
- We know that environmental laws and treaties stopped much legal deforestation and that slave masters rushed in to fill the hole in the market.
- We know criminal slaveholders go straight for the sweet spots—the national forests, the wildlife preserves, the UNESCO World Heritage Sites, and the protected homes and territory of indigenous peoples.
- We know these slaveholders don't care about obeying environmental laws; to them the world is to be pillaged and slaves are the tools they use to smash and grab.
- We know the profits generated when we buy things flow back down the supply chain to fuel the assault on the natural world, drive more people toward slavery, and then feed more goods into the global supply chain.
- We know these crimes go round and round, a criminal perpetual motion machine that devours people and nature like a cancer.
- We know that to save our planet we have to fight slavery, and that to end slavery we have to protect our environment.

And we know that knowing these things changes the way we see the world and how we act. From now on we can't plead ignorance, only indifference. We're now part of the generation that came to know better. It's a burden on us but it's also an opportunity. A new way of seeing the world doesn't come along very often, and when it does it can be a jarring awakening, a responsibility as well as a privilege. The new challenge of global warming and the age-old challenge of slavery, both seemingly insuperable, now have

a linked solution. Knowing that makes us the people our children will fairly ask: What did you do when you learned the truth about slavery and environmental destruction?

How would making that decision change us? What kind of world do we create when we choose not to live with slavery and ecocide? That choice doesn't have to be all consuming, but to be real it does have to be a consistent part of our lives. Small choices, made at the right moment, can bring very big changes.

Compassion is a muscle that gets stronger with use, and the regular exercise of choosing kindness over cruelty would change us.

Research your own experiences for the truth. Absorb what is useful. Add what is specifically your own. The creating individual is more than any style or system.

We are mining by proxy every time we buy a cellphone or a piece of gold jewelry. When we choose to load up the barbecue with shrimp, we are fishing by proxy. When we buy furniture or cars or kitchen sinks, we are cutting down forests by proxy, burning them into charcoal by proxy, and smelting iron by proxy. What we eat, or choose to wear, the things we buy for our homes, or choose not to buy, all link us in one relationship after another to people in slavery, national economies, and protected forests. To avoid or ignore the inconvenience of thinking through our actions is surely the easiest decision. Who wants to be bound by these pesky concerns? Can't we just feign the ignorance of our parents? Surely our little choices don't really change anything, right? Yes, each choice is small, like a tiny drop of water. But the act of choosing is repeated every day of our lives, and carries into the lives of our children and their children. These millions of little choices turn into a great river of economic pressure, a powerful river that can either erode or sustain people's lives and the natural world. But you are right, it will not be enough. Such choices must extend beyond the consumer sphere.

This is beyond reason, it is about our core. This is about the earth we all spring from and will all return to. This is about being human, and though we are thinking and reasoning animals, being human is more than reason. Our truest essence is found where thought meets desire, where facts and dreams collide, where being human presses against the rest of the natural world. The choices we make at those intersections transcend our lives and reach far into the future. What seem to be small decisions and small actions actually determine our intrinsic human worth, what it means to be human, as well as the judgment we will receive from future generations.

The possibility of reaching such ideals comes rarely, and when it does, it usually comes at the dangerous crossroads of opportunity and crisis. What

we decide to do at this intersection is a test of how we respond to the most distant, the powerless, and the voiceless. No one is forcing us to choose one way or the other. We don't have to be consistent, but we have no choice but to engage. Either we act to make our ideals reality or we do nothing and attempt to un-know what we know.

As a society we're more comfortable with custom and precedent than with facing new and unfamiliar proposals. But let us be brave. Let us cast out what we know has not only failed us but has added substantially to the heavy inventory of crimes committed against us.

If we all use the immensely powerful weapon of solidarity then the only thing left for us is to know the daily stretch of the road and to take it. Nobody can point out that stretch; that stretch in the personal road of each individual; it is what he will do every day, what he will gain from his individual experience dedicated to the people's well-being.

Defending common territory is a hallmark of any group, whether an army, a tribe, or a troop of monkeys. Humans have expanded this idea and symbolized it in that many are willing to fight and die for intangibles—a flag, patriotism, a place in heaven. Just because the territory being defended or invaded is imaginary does not make the passion of the defenders any less.

It is war, class war, and you were the first to wage it under cover of the powerful institutions you call order, in the darkness of your laws. There will likely be bloodshed; we will not dodge; there will likely have to be murder: we will kill, only because it is necessary; because you will force it, there will have to be destruction. We will destroy to rid the world of your tyrannical institutions.

Or you could give up your power, wealth, status—all stolen from the commons. But you won't do that, will you?

Soft people make tough times
Tough times make strong people
Strong people make good times
Good times make soft people

Some people get old and never grow up; some people are young and have already seen through the veil.

Tiger got to hunt, bird got to fly; Man got to sit and wonder 'why, why, why?' Tiger got to sleep, bird got to land; Man got to tell himself he understand.

I always thought it was just a trick of long exposure until I went on a trip with some friends and saw it. It's one of the most profound things I've ever seen, I was completely in awe. I've held the opinion for awhile now that

one of the main problems we face is humans not seeing that awe inspiring sky every night. The night sky is inspiring, it forces us to notice and think and dream and wonder. When it's not visible, it becomes too easy to say 'look at how badass we are, look at all this stuff we created!' But I think, at our core, humans need to be shown our insignificance every once in awhile to inspire us, spark our imagination, and remind us that we aren't the only game in the universe.

What we see before us is just one tiny part of the world. We get in the habit of thinking, this is the world, but that's not true at all. The real world is a much darker and deeper place than this, and much of it is occupied by jellyfish and things.

Ring the bells that still can ring
 Forget your perfect offering
 There is a crack, a crack in everything
 That's how the light gets in.

We do not always remember the things that do no credit to us. We justify them, cover them in bright lies or with the thick dust of forgetfulness.

I think if you erase the whole past, it's too easy to feel innocent. It's too easy to not learn from it and to think that you're not going to make any mistakes in the present—you're better than those mistakes. We're not better than those mistakes.

“Anyone can love a thing because. That's as easy as putting a penny in your pocket. But to love something despite. To know the flaws and love them too. That is rare and pure and perfect.”

For those relatively privileged, it's pretty crazy how growing up as kids we harbor all these thoughts and ideas about what the world is like. Grownups are good people! The world runs on love! Doctors know exactly what they're doing and the legal system is fair! Then you grow up and find out that you were wrong about basically everything you thought about the world. Not only are you wrong, but in every single instance of you being wrong the reality is worse than what you thought. We stopped checking for monsters under our beds when we realized they were inside us.

I think I no longer believe in monsters as faces in the floor or feral infants or vampires or whatever. I think now I believe the only real monsters might be the type of liar where there's simply no way to tell. The ones who give nothing away. 'But then how do you know they're monsters, then?' That's the monstrosity right there, I'm starting to think. That they walk among us. Teach our children. Inscrutable. Brass-faced.

I know it is not easy to deal with evil, but it is very necessary that we should confront it. We need to take a long hard look at wickedness, wherever it occurs and however uncomfortable it might make us feel. It is far, far more dangerous to deny it and to look the other way.

Spirits, demons, monsters, simply labels for that which we do not understand.

Fundamental Attribution Error: a universal thought process that says that when other people screw up, it's because they're stupid or evil, but when we screw up, it's totally circumstantial.

The process feels so obvious when explained: We simply lack information about the context in which the other person screwed up, so we fill it in with our own. If we've never been fat, then we assume that the fat guy feels the exact same level of hunger as we do, that his upbringing was the same, and that the spare time and energy he can devote to exercise is the same as ours. In other words, we think that both of us faced the exact same fork in the road and only one of us chose to eat churros until they passed out, then did it again when they woke back up. The reality is, of course, that you were on completely different roads the whole time—a stress-eating pothole, a thyroid speed bump, and a few wrong turns in Nachotown, and you could easily switch places.

If only it were all so simple! If only there were evil people somewhere insidiously committing evil deeds, and it were necessary only to separate them from the rest of us and destroy them. But the line dividing good and evil cuts through the heart of every human being. And who is willing to destroy a piece of his own heart?

We don't live in a world full of monsters. We live in a world full of people, and some of them look like monsters to you. The problem with killing the monsters is that underneath the fog of hatred and fear most of them are still just people. So when you go monster hunting, if you're not careful, you'll probably end up doing more harm than good.

It is much better to imagine men in some smoky room somewhere, made mad and cynical by privilege and power, plotting over the brandy. You have to cling to this sort of image, because if you don't then you might have to face the fact that bad things happen because ordinary people, the kind who brushed the dog and told their children bedtime stories, are capable of then going out and doing horrible things to other ordinary people. It is so much easier to blame it on Them. It is bleakly depressing to think that They are Us. If it is Them, then nothing is anyone's fault. If it is Us, what does that make Me? After all, I'm one of Us. I must be. I've certainly never thought

of myself as one of Them. No one ever thinks of themselves as one of Them. We're always one of Us. It's Them that do the bad things.

There are hardly any excesses of the most crazed psychopath that cannot easily be duplicated by a normal kindly family man who just comes in to work every day and has a job to do.

Evil is no faceless stranger living in a distant neighborhood. Evil has a wholesome, hometown face, with merry eyes and an open smile. Evil walks among us, wearing a mask which looks like all our faces.

Slow-burning, life dies like a flame,
 Never resting, passes like a river.
 Today I face my lone shadow.
 Suddenly, the tears flow down.

The beast is a tool most of us never wake. Those that see it sometimes live in fear of it, never realizing it was always there, sleeping, before they even knew it existed. This is a step in your growth as a human. Some people don't get to take that step, and some stumble. Don't take it as a good or bad thing, it's just a thing and you didn't realize it until now.

Personally I try to avoid killing anything at all anymore because I don't like how quickly the blood rage rises and takes over. The people doing the things that got your brain fucked up are desperate and broken and have let the beast run wild because they don't know what else to do. Being a monster is a powerful thing, and some of us need that to survive. Doesn't mean we don't need to put them down, doesn't mean we do, just means it's understandable and you don't have to get messed up over it.

Those same humans have the capacity for great compassion and empathy, just like the people you love, but they don't use it. There are reasons we do what we do and sometimes it's easier to do good and sometimes easier to be fucked up. I don't hold it against people much anymore when they fuck up, I just try to prevent it from hurting anyone else if I can.

One of life's greatest questions is how those with a strong moral code can deal with monsters without becoming monsters themselves.

The loneliest people are the kindest.
 The saddest people smile the brightest.
 The most damaged people are the wisest.
 All because they don't want people
 to suffer the same way they did.

That's my response when people ask me how I can smile even when bad things come around, or how I can be kind to a person who is rude to me.

I've had enough time to be rude or sad already, I don't need to do it any more. I should bring less sadness and more joy to the world, even if it's just one small gesture or one oddly timed smile.

Most times in life, when someone does something good for us, our first inclination is to pay them back and return the favor, but paying it forward instead involves doing something good for an entirely new person—often with the hope that you're forging the first link in a chain of goodness stretching into the future. If the previous person in line bought your coffee, you will buy a coffee for the next person—would monkeys do the same?

Researchers tested this idea by putting monkeys as a middle link of a chain of three monkeys, where they would receive an outcome from the first monkey and give an outcome to the third monkey. Monkeys could receive one of two outcomes, either a delicious prized grape or an unappealing piece of spinach. Importantly, it was completely costless for monkeys to give grapes, because the monkey doing the passing always got a grape. In sum, the monkeys chose between option A (me: grape, other: grape) and option B (me: grape, other: spinach), so the only reason they would give another monkey spinach was out of spite. They found that monkeys paid forward their outcomes. When the second monkey received a grape, it would give the third monkey a grape, but when the second monkey received a piece of spinach, all hell broke loose—it jumped and screamed and looked disgustedly at the first monkey. It then gave a piece of spinach to the third monkey, who reacted the same way, forging a new link in the chain of injustice.

Consciously or unconsciously, each of us helps to create the world we live in—day-by-day, hour-by-hour, moment-by-moment. Every thought in our minds, every word we speak, every action we take makes a difference in our world. So then, the question is not 'How can I make a difference?' The question is 'What kind of difference do I choose to make?' If you choose to act out of love—smiling at the baby in the grocery cart in the long checkout line or contributing money, food, or clothing to folks in need—you help to create one kind of world. If you choose to react out of fear—snarling at the person in the slow-moving car in front of you or clinging to all of your material wealth for dear life—you help to create another kind of world.

Not one day in anyone's life is an uneventful day, no day without profound meaning, no matter how dull and boring it might seem, no matter whether you are a seamstress or a queen, a shoeshine boy or a movie star, a renowned philosopher or a Down's-syndrome child. Because in every day of your life, there are opportunities to perform little kindnesses for others, both by conscious acts of will and unconscious example.

Each smallest act of kindness—even just words of hope when they are needed, the remembrance of a birthday, a compliment that engenders a

smile—reverberates across great distances and spans of time, affecting lives unknown to the one whose generous spirit was the source of this good echo, because kindness is passed on and grows each time it's passed, until a simple courtesy becomes an act of selfless courage years later and far away.

Likewise, each small meanness, each thoughtless expression of hatred, each envious and bitter act, regardless of how petty, can inspire others, and is therefore the seed that ultimately produces evil fruit, poisoning people whom you have never met and never will.

All human lives are so profoundly and intricately entwined—those dead, those living, those generations yet to come—that the fate of all is the fate of each, and the hope of humanity rests in every heart and in every pair of hands.

Therefore, after every failure, we are obliged to strive again for success, and when faced with the end of one thing, we must build something new and better in the ashes, just as from pain and grief, we must weave hope, for each of us is a thread critical to the strength—the very survival—of the human tapestry.

Every hour in every life contains such oft-unrecognized potential to affect the world that the great days for which we, in our dissatisfaction, so often yearn are already with us; all great days and thrilling possibilities are combined always in this momentous day.

The victories of justice occur from small realizations that eventually seep into the collective mind.

In the sense in which a man can ever be said to be at home in the world, he is at home not through dominating, or explaining, or appreciating, but through caring and being cared for.

If we cannot leave something tangible behind—such as a gene or a poem—perhaps it is enough if we just make the world a little better? You can help somebody, and that somebody will subsequently help somebody else, and you thereby contribute to the overall improvement of the world, and constitute a small link in the great chain of kindness. Maybe you serve as a mentor for a difficult but brilliant child, who goes on to be a doctor who saves the lives of hundreds? Maybe you help an old lady cross the street, and brighten up an hour of her life? Though it has its merits, the great chain of kindness is a bit like the great chain of turtles—it is far from clear where its meaning comes from. A wise old man was asked what he learned about the meaning of life:

“Well, I have learned that I am here on earth in order to help other people. What I still haven't figured out is why the other people are here.”

In 1970 a study was conducted on a group of students at the Princeton Theological Seminary, who were training to become ministers in the Presbyterian Church. Each student was asked to hurry to a distant lecture hall, and there give a talk on the Good Samaritan parable, which tells how a Jew traveling from Jerusalem to Jericho was robbed and beaten by criminals, who then left him to die by the side of the road. After some time a priest and a Levite passed nearby, but both ignored the man. In contrast, a Samaritan—a member of a sect much despised by the Jews—stopped when he saw the victim, took care of him, and saved his life. The moral of the parable is that people’s merit should be judged by their actual behaviour, rather than by their religious affiliation.

The eager young seminarians rushed to the lecture hall, contemplating on the way how best to explain the moral of the Good Samaritan parable. But the experimenters planted in their path a shabbily dressed person, who was sitting slumped in a doorway with his head down and his eyes closed. As each unsuspecting seminarian was hurrying past, the “victim” coughed and groaned pitifully. Most seminarians did not even stop to enquire what was wrong with the man, let alone offer any help. The emotional stress created by the need to hurry to the lecture hall trumped their moral obligation to help strangers in distress.

Human emotions trump philosophical theories in countless other situations. This makes the ethical and philosophical history of the world a rather depressing tale of wonderful ideals and less than ideal behaviour. How many Christians actually turn the other cheek, how many Buddhists actually rise above egoistic obsessions, and how many Jews actually love their neighbours as themselves?

No one is perfect, we all have things in our past we regret, but the question is: why aren’t you doing good now? We can certainly have reasons, excuses for our failures then. But what is it now, why do we fail again?

“I don’t expect my leaders to be perfect. They’re human. I’ve been active in politics for over a decade now (and before that I apparently was serving my country so that later on the rich could pillage in the name of ‘democracy’). Quite frankly I’m tired. I’d just like some glimmer of hope that things could get better instead of worse. Just a freaking glimmer. Something that shows me the people in charge learned something instead of attempting to manage optics. Something that I could share with my kids that isn’t some pretend, farcical nonsense and looks like real hope that what I’m handing over to them isn’t a contrived system managed by a wealthy few for a wealthy few. Today, I’m

not seeing it. All I'm seeing is what looks like a political version of the Wizard of Oz. Pay no attention to that man behind the curtain. . . ."

It would be a major step forward if we could inculcate a sense of pride in being proved wrong, in showing publicly that you can change, and that your opinions aren't the same as 'you,' but rather things we carry with us.

"There's nothing wrong with being a political convert. I've worked for one, and been friends with them, but usually, they recognize that they were terrible people for ever having been on the wrong side. Often, that makes for an even more compelling reason to trust in their conversion."

And now that you don't have to be perfect, you can be good.

This being human is a guest house. Every morning a new arrival. A joy, a depression, a meanness, some momentary awareness comes as an unexpected visitor. Welcome and entertain them all! Even if they are a crowd of sorrows, who violently sweep your house empty of its furniture, still, treat each guest honorably. He may be clearing you out for some new delight. The dark thought, the shame, the malice. Meet them at the door laughing and invite them in. Be grateful for whatever comes. Because each has been sent as a guide from beyond.

For most of life, nothing wonderful happens. If you don't enjoy getting up and working and finishing your work and sitting down to a meal with family or friends, then the chances are you're not going to be very happy. If someone bases his or her happiness on major events like a great job, huge amounts of money, a flawlessly happy marriage, or a trip to Paris, that person isn't going to be happy much of the time. If, on the other hand, happiness depends on a good breakfast, flowers in the yard, a drink or a nap, then we are more likely to live with quite a bit of happiness.

"Get drunk. One should always be drunk. That's all that matters; that's our one imperative need. So as not to feel Time's horrible burden, one which breaks your shoulders and bows you down, you must get drunk without cease. But with what? With wine, poetry, or virtue as you choose. But get drunk.

And if, at some time, on steps of a palace, in the green grass of a ditch, in the bleak solitude of your room, you are waking and the drunkenness has already abated, ask the wind, the wave, the stars, the clock, all that which flees, all that which groans,

all that which rolls, all that which sings, all that which speaks,
ask them, what time it is; and the wind, the wave, the stars, the
birds, and the clock, they will all reply: 'It is time to get drunk!'

So that you may not be the martyred slaves of Time, get
drunk, get drunk, and never pause for rest! With wine, poetry,
or virtue, as you choose!"

The more carefully you've planned your life, the fewer people you'll find
to plan it with.

Here I am, at the fork in the road. I see her there, dead. I see her tracks
too, from the point of impact to where she finally rested, in relative safety,
at the fork in the road.

Left or right, I must choose. Left or right, she must have chosen. Why
did she go the direction she did. Was it inertia? Was she already facing
there? Or did she consciously, and with great effort, change her orientation,
and set off on a new path, the last journey of her life?

Would she have known it was the last? Do we ever? Left or right? Did
she know it was the last? Would it have affected her choice if she did? Did
it?

Perhaps her choice sealed her fate. Would help have been forthcoming
if she had gone elsewhere? Would someone have seen her in time to help?
Did the never ending question of left or right lead her here? It must have,
it's led me here.

Without but a single changed left, would she be lying here? Would I be
sitting here?

What seemingly meaningless left or right did we take that transported
us here? Or are they all meaningless?

Left or right?

How do we choose?

Left or right?

How did she choose?

Left or right?

I'm closer to her now, I can see the individual hairs in the bloody mats.

Left or right?

I'm touching her now. Cold body. Cold steel now pressed against my
skull.

Left or right?

Paralyzed with inaction. Paralyzed by death.

Left or right?

Unless you really think this is the only way, you shouldn't even try it. I followed this path because it seemed to me that the only other path was death, and until you reach that point, I'd say stick with something easier.

Its not about growing up, its about going on.

Following a tragedy, grief comes in waves, each bigger than the previous, each carrying a new component of pain.

Grief, I've learned, is really just love. It's all the love you want to give, but cannot. All of that unspent love gathers in the corners of your eyes, the lump in your throat, and the hollow in your chest. Grief is just love with no place to go.

“One thing that I found horrible was that I got used to her not being around. I never again want to get used to that. It's much better to be sad than calloused.”

Even grief lessens with time, should never be forgotten, but rather, testified.

“When I was a young man, I wanted to change the world.

I found it was difficult to change the world, so I tried to change my nation.

When I found I couldn't change the nation, I began to focus on my town. I couldn't change the town and as an older man, I tried to change my family.

Now, as an old man, I realize the only thing I can change is myself, and suddenly I realize that if long ago I had changed myself, I could have made an impact on my family. My family and I could have made an impact on our town. Their impact could have changed the nation and I could indeed have changed the world.”

Saving one man is no less noble than saving ten.

“The eenie, meeny, minie, mo? Sure. But that's Schindler's List, right? He had an eenie, meeny, minie, mo situation, too, but what was he supposed to do—nothing? Just because there's a greater need than what you can give doesn't mean you shouldn't give.”

The oligarchs only give up their wealth when peasants ask very, very politely. Remember, when a bank defrauds you, be polite. When an oligarch ships your job out, be polite. When you are sleeping on a bench and an

oligarch demands the force of state to remove you, be polite. Think of oligarchs as wasps. Don't be loud. Don't invade their space. Be very gentle. Don't upset them. Be polite! And they will willingly give you honey if you are patient.

“Even if I don't get justice it's fine, his death will raise awareness. Because you can't put chains on the rays of sunlight.”

You either die a hero or long live enough to see yourself become a villain.

In every generation, in effect, a certain number of geniuses will be born, but their upbringing, the problems that confront them, and the resources they will have available to solve those problems, are not theirs to choose. All these things are produced by the labors of other creative minds of the past and present, and are profoundly influenced by the cycles of history.

Let's take Isaac Newton as an example. He happened to be born just as the scientific revolution was beginning to hit its stride, but before it had found its paradigm, the set of accomplishments on which all future scientific efforts would be directly or indirectly modeled. His impressive mathematical and scientific gifts thus fastened onto the biggest unsolved problem of the time—the relationship between the physics of moving bodies sketched out by Galileo and the laws of planetary motion discovered by Kepler—and resulted in the *Principia Mathematica*, which became the paradigm for the next three-hundred years or so of scientific endeavor.

Had he been born a hundred years earlier, none of those preparations would have been in place, and the *Principia Mathematica* wouldn't have been possible. Given the different cultural attitudes of the century before Newton's time, in fact, he would almost certainly become a theologian rather than a mathematician and physicist—as it was, he spent much of his career engaged in theology, a detail usually left out by the more hagiographical of his biographers—and he would be remembered today only by students of theological history. Had he been born a century later, equally, some other great scientific achievement would have provided the paradigm for emerging science—my guess is that it would have been Edmund Halley's successful prediction of the return of the comet that bears his name—and Newton would have had the same sort of reputation that Karl Friedrich Gauss has today: famous in his field, sure, but a household name? Not a chance.

What makes the point even more precise is that every other civilization from which adequate records survive had its own paradigmatic thinker, the figure whose achievements provided a model for the dawning age of reason and for whatever form of rational thought became that age's principal cultural expression. In the classical Western world, for example, it was

Pythagoras, who invented the word ‘philosophy’ and whose mathematical discoveries gave classical rationalism its central theme, the idea of an ideal mathematical order to which the hurly-burly of the world of appearances must somehow be reduced. Like Newton, by the way, Pythagoras was more than half a theologian; it’s a common feature of figures who fill that role.

To take the same argument to a far more present time, does this text represent the act of a unique individual influencing the course of history? A glance at history shows otherwise. It is written by a figure of an easily recognizable type, which shows up reliably as each civilization’s Age of Reason wanes and it begins moving toward what some have called the Second Religiosity: the resurgence of religion that inevitably happens in the wake of rationalism’s failure to deliver on its promises. At such times you get intellectuals who can communicate fluently on both sides of the chasm between rationalism and religion, and who put together syntheses of various kinds that reframe the legacies of the Age of Reason so that they can be taken up by emergent religious movements and preserved for the future.

In the classical world, for example, you got Iamblichus of Chalcis, who stepped into the gap between Greek philosophical rationalism and the burgeoning Second Religiosity of late classical times, and figured out how to make philosophy, logic, and mathematics appealing to the increasingly religious temper of his time. He was one of many such figures, and it was largely because of their efforts that the religious traditions that ended up taking over the classical world—Christianity to the north of the Mediterranean, and Islam to the south—got over their early anti-intellectual streak so readily and ended up preserving so much of the intellectual heritage of the past.

That sort of thing is a worthwhile task, and if I can contribute to it I’ll consider this life well spent. That said, there’s nothing unique about it. What’s more, it’s only possible and meaningful because I happen to be perched on this particular arc of the wheel of time, when our civilization’s Age of Reason is visibly crumbling and the Second Religiosity is only beginning to build up a head of steam. A century earlier or a century later, I’d have faced some different tasks.

“No story can be devised by the wit of man which cannot be interpreted allegorically by the wit of some other man.”

—C.S. Lewis

“Persons attempting to find a motive in this narrative will be prosecuted; persons attempting to find a moral in it will be banished; persons attempting to find a plot in it will be shot.”

—Mark Twain

“When dealing with people, remember you are not dealing with creatures of logic, but creatures of emotion.”

—Dale Carnegie

“You’re talking about a culture that teaches people how to make moral choices, that teeters very easily into a culture, into a totalitarian, authoritarian culture. But a culture that doesn’t, and that prides itself on not—the way sort of ours does, or has recently. I think we’re just beginning to see, that on either side of the continuum there are terrible prices to pay.

I don’t think there’s an answer. You mean, are there laws that should be passed? Or is there public education we can do—my personal suspicion is that for the really deep important questions, there aren’t any answers because the answers are individual, you know? I mean, there’s no culture—I mean, the culture’s us, you know? The country’s us. So no answer: either that kind of freedom or that kind of guidance. I think it’s—I mean I think the whole thing is an enormous game of Goldilocks, and you’re trying to find what’s just right. And you, you know—what is it?—you can’t find the middle till you hit both walls? You know?

The thing that really scares me about this country—and again I’d want you to stress, I’m a private citizen, I am not a pundit. Is I think we’re really setting ourselves up for repression and fascism. I think our hunger, our hunger to have somebody else tell us what to do—or for some sort of certainty, or something to steer by—is getting so bad, um, that I think it’s, there’s even a, Hayek’s *Road to Serfdom*, I mean, makes a similar argument economically. But I think, you know, there are rumbles on the Western horizon, you know. And that it’s going to be, that the next few decades are going to be really scary. Particularly if things get economically shaky, and people for instance—people who’ve never been hungry before, might be hungry or might be cold.

This difference between American politics, say, and Europeans. And that we don’t tend to get extremism with the kind of political influence here that there is in Europe. And that one reason is that there has been this peculiar kind of liberal centrism. That we’re very nervous about extremes. I don’t know about you, and I don’t know what your friends are like. But this seems to me to be a sadder, more hungry generation. And the

thing that I get scared of is, when we're in power, when we're the forty-five-year-olds and fifty-year-olds. And there's really nobody—no older—that no people older than us with memories of the Depression, or memories of war, that had significant sacrifices.

And there's gonna be no check on our, um, appetites. And also our hunger to give stuff away. And I'm aware—I'm again, I'm speaking as a private citizen, I do not know any other generation. I'm talking about kind of a feeling I have, that's somehow way down in my stomach. You think this generation is more prone to—I think this generation has it worse or better than any other. Because I think we're going to have to make it up. I think we're going to have to make up a lot of our own morality, and a lot of our own values. I mean, the old ones—the '60s and early '70s did a marvelous job of just showing how ridiculous and hypocritical, you know, the old authoritarian Father's-always-right, don't-question-authority stuff was. But nobody's ever really come along and given us anything to replace it with.

Reagan gave us a kind—I mean, the Reagan spasm I think was very much a story about a desperate desire to get back to that. But Reagan sold the past. Reagan enabled a fantasy that the last forty years hadn't taken place. And we're the first generation—maybe people starting about my age, it started in '62. We grew up sorta in the rubble of kind of the old system. And we know we don't want to go back to that. But the sort of—this confusion of permissions, or this idea that pleasure and comfort are the, are really the ultimate goal and meaning of life. I think we're starting to see a generation die on the toxicity of that idea.

Dying in what ways? I mean, literally dying? I'm talking about the number of people that—I'm not just talking about drug addicts dying in the street. I'm talking about the number of privileged, highly intelligent, motivated career-track people that I know, from my high school or college, who are, if you look into their eyes, empty and miserable. You know? And who don't believe in politics, and don't believe in religion. And believe that civic movements or political activism are either a farce or some way to get power for the people who are in control of it. Or who just don't believe in anything. Who know fantastic reasons not to believe in stuff, and are terrific ironists and pokers of holes.

And there's nothing wrong with that, it's just, it doesn't seem to me that there's just a whole lot else.

I don't know what's going to come after it, but I think something's gonna have to. I mean, something's gonna have to. What do you think it will be? My guess is that what it will be is, it's going to be the function of some people who are heroes. Who evince a real type of passion that's going to look very banal and very retrograde and very. . . You know, for instance, people who will get on television, and earnestly say, 'It's extraordinarily important, that we don't allow the lower strata of our society to starve to death and freeze to death.' That it's vitally important that we do that. Not for them, but for us. You know? That our survival depends on an ability to look past ourselves and our own self-interest.

And these people are going to look—in the climate, in the particular climate of our generation and MTV and Letterman, they're going to look absurd. They're going to look like, What do you call it? Pollyannas. Or, um, you know, suffragettes on soapboxes. They're gonna come off bombastic and pretentious and self-righteous and smug. At some point this generation's gonna reach a level of pain, or a level of exhaustion with the standard solutions. You know, there's the drug therapy, there's the sex therapy, there's the success therapy. You know, if I could just achieve X by age X, then something magical will happen. We're gonna find out, as all generations do, that it's not like that. That at a certain point, we're gonna look for something. And the question for me is, what?—is what comes after it? Some Ralph Reed, knuckle-draggin', fundamentalist, you know? Easy atavistic bullshit that's regressive and, that's repressive and truly self-righteous and truly intolerant? Or is there going to be some kind of like, you know, something like what the founding fathers and the Federalists did. You know? Are we going to like look inside our hearts and decide that, things have been fucked up, and we're going to make some rules that are good for everybody?

We live in the twilight of the old morality: there's just enough to make us feel guilty, but not enough to hold us in."

We're all the sons of God, or children of the Is, or ideas of the Mind, or however else you want to say it.

Don't pray for the Is to recognize you. Pray for you to recognize It, perfect ever-present Love, way beyond your silly beliefs.

God doesn't protect anyone. Everyone's already indestructible.

You teach best what you most need to learn.

Before believing, we choose what we want to believe. Then we test it for true.

Live never to be ashamed if anything you do or say is published around the world even if what is published is not true. You are led through your lifetime by the inner learning creature, the playful Spiritual being that is your real self. Don't turn away from possible futures before you're certain you don't have anything to learn from them. You're always free to change your mind and choose a different future, or a different past.

In every disaster, in every blessing, ask, 'Why me?' There's a reason, of course, there's an answer.

There is no such thing as a problem without a gift for you in its hands. You seek problems because you need their gifts.

A little time, a little perspective, we'll see what the leveling of this site has been making room for in our lives.

If we want to end this lifetime higher than we began, we can expect an uphill road.

The bond that links your true family is not one of blood, but of respect and joy in each other's life. Rarely do members of one family grow under the same roof.

Argue for your limitations, and sure enough, they're yours.

Imagine the universe beautiful and just and perfect. Then be sure of one thing: the Is has imagined it quite a bit better than you have.

A cloud does not know why it moves in just such a direction and at such a speed. It feels an impulsion. . . this is the place to go now. But the sky knows the reasons and the patterns behind all clouds, and you will know, too, when you lift yourself high enough to see beyond horizons.

You are never given a wish without also being given the power to make it true. You may have to work for it, however

The world is your exercise-book, the pages on which you do your sums. It is not reality, although you can express reality there if you wish. You are also free to write nonsense, or lies, or to tear the pages.

The original sin is to limit the Is. Don't.

If you will practice being fictional for a while, you will understand that fictional characters are sometimes more real than people with bodies and heartbeats.

Your conscience is the measure of the honesty of your selfishness. Listen to it carefully.

Every person, all the events of your life are there because you have drawn them there. What you choose to do with them is up to you.

The truth you speak has no past and no future. It is, and that's all it needs to be.

The best we can do is live our highest right, gracefully as we can, and let the Principle of Coincidence take it from there.

Here is a test to find whether your mission on earth is finished: If you're alive, it isn't.

In order to live free and happily, you must sacrifice boredom. It is not always an easy sacrifice.

The world of space, time, and appearances can be wondrous, beautiful. Just don't mistake them for real.

We're all fakes on this whole world we're all pretending to be something that we're not. We are not bodies walking around, we are not atoms and molecules, we are unkillable undestroyable ideas of the Is, no matter how much we believe otherwise.

If we agree that the world is not what it seems, then we have an important question: What shall we do about it?

If this world is a fiction, then soon as we discover what's fact, we've found our power over appearances.

Don't be dismayed at good-byes. A farewell is necessary before you can meet again. And meeting again, after moments or lifetimes, is certain for those who are friends.

'You can't sit, you can't stand, you can't walk, you can't eat (OK, you won't eat), you can't talk, you can't think, don't you know you're helpless? Death is so sweet, no effort, you can let go, let it take you to another world. Listen to me. Death is not a sleep, it's a new beginning.' Those are fine suggestions, when we're desperately tired. When it seems impossible, it's easiest to let a lifetime go. Yet we shrug the suggestions away when we want to continue with a life that isn't quite finished. We ask what must I do, to live again?

The mark of your ignorance is the depth of your belief in injustice And tragedy. What the caterpillar calls the end of the world, the master calls a butterfly.

Everything in this book may be wrong.

"Tell the truth and run."

—Yugoslav proverb

There was once a strange, small man. He decided three important details about his life:

1. He would part his hair from the opposite side to everyone else.

2. He would make himself a small, strange mustache.
3. He would one day rule the world.

The young man wandered around for quite some time, thinking, planning, and figuring out exactly how to make the world his. Then one day, out of nowhere, it struck him—the perfect plan. He'd seen a mother walking with her child. At one point, she admonished the small boy, until finally, he began to cry. Within a few minutes, she spoke very softly to him, after which he was soothed and even smiled. The young man rushed to the woman and embraced her. "Words!" He grinned. "What?" But there was no reply. He was already gone.

Yes, the Führer decided that he would rule the world with words. "I will never fire a gun," he devised. "I will not have to." Still, he was not rash. Let's allow him at least that much. He was not a stupid man at all. His first plan of attack was to plant the words in as many areas of his homeland as possible. He planted them day and night, and cultivated them. He watched them grow, until eventually, great forests of words had risen throughout Germany. It was a nation of farmed thoughts.

While the words were growing, our young Führer also planted seeds to create symbols, and these, too, were well on their way to full bloom. Now the time had come. The Führer was ready. He invited his people toward his own glorious heart, beckoning them with his finest, ugliest words, handpicked from his forests. And the people came. They were all placed on a conveyor belt and run through a rampant machine that gave them a lifetime in ten minutes. Words were fed into them. Time disappeared and they now Knew everything they needed to Know. They were hypnotized. Next, they were fitted with their symbols, and everyone was happy.

Soon, the demand for the lovely ugly words and symbols increased to such a point that as the forests grew, many people were needed to maintain them. Some were employed to climb the trees and throw the words down to those below. They were then fed directly into the remainder of the Führer's people, not to mention those who came back for more. The people who climbed the trees were called word shakers.

The best word shakers were the ones who understood the true power of words. They were the ones who could climb the highest. One such word shaker was a small, skinny girl. She was renowned as the best word shaker of her region because she Knew how powerless a person could be *without* words. That's why she could climb higher than anyone else. She had desire. She was hungry for them. One day, however, she met a man who was despised by her homeland, even though he was born in it. They became good friends,

and when the man was sick, the word shaker allowed a single teardrop to fall on his face. The tear was made of friendship—a single word—and it dried and became a seed, and when next the girl was in the forest, she planted that seed among the other trees. She watered it every day.

At first, there was nothing, but one afternoon, when she checked it after a day of word-shaking, a small sprout had shot up. She stared at it for a long time. The tree grew every day, faster than everything else, till it was the tallest tree in the forest. Everyone came to look at it. They all whispered about it, and they waited... for the Führer. Incensed, he immediately ordered the tree to be cut down. That was when the word shaker made her way through the crowd. She fell to her hands and knees. "Please," she cried, "you can't cut it down." The Führer, however, was unmoved. He could not afford to make exceptions. As the word shaker was dragged away, he turned to his right-hand man and made a request. "Ax, please."

At that moment, the word shaker twisted free. She ran. She boarded the tree, and even as the Führer hammered at the trunk with his ax, she climbed until she reached the highest of the branches. The voices and ax beats continued faintly on. Clouds walked by—like white monsters with gray hearts. Afraid but stubborn, the word shaker remained. She waited for the tree to fall. But the tree would not move. Many hours passed, and still, the Führer's ax could not take a single bite out of the trunk. In a state nearing collapse, he ordered another man to continue. Days passed. Weeks took over. A hundred and ninety-six soldiers could not make any impact on the word shaker's tree. "But how does she eat?" the people asked. "How does she sleep?" What they didn't know was that other word shakers threw supplies across, and the girl climbed down to the lower branches to collect them.

It snowed. It rained. Seasons came and went. The word shaker remained. When the last ax-man gave up, he called up to her. "Word shaker! You can come down now! There is no one who can defeat this tree!" The word shaker, who could only just make out the man's sentences, replied with a whisper. She handed it down through the branches. "No thank you," she said, for she knew that it was only herself who was holding the tree upright.

No one knew how long it had taken, but one afternoon, a new ax-man walked into town. His bag looked too heavy for him. His eyes dragged. His feet drooped with exhaustion. "The tree," he asked the people. "Where is the tree?" An audience followed him, and when he arrived, clouds had covered the highest regions of the branches. The word shaker could hear the people calling out that a new ax-man had come to put an end to her vigil.

"She will not come down," the people said, "for anyone." They did not

Know who the ax-man was, and they did not know that he was undeterred. He opened his bag and pulled out something much smaller than an ax. The people laughed. They said, "You can't chop a tree down with an old hammer!" The young man did not listen to them. He only looked through his bag for some nails. He placed three of them in his mouth and attempted to hammer a fourth one into the tree. The first branches were now extremely high and he estimated that he needed four nails to use as footholds to reach them. "Look at this idiot," roared one of the watching men. "No one else could chop it down with an ax, and this fool thinks he can do it with—" The man fell silent.

The first nail entered the tree and was held steady after five blows. Then the second went in, and the young man started to climb. By the fourth nail, he was up in the arms and continued on his way. He was tempted to call out as he did so, but he decided against it.

The climb seemed to last for miles. It took many hours for him to reach the final branches, and when he did, he found the word shaker asleep in her blankets and the clouds. He watched her for many minutes. The warmth of the sun heated the cloudy rooftop. He reached down, touching her arm, and the word shaker woke up. She rubbed her eyes, and after a long study of his face, she spoke. "Is it really you?" Is it from your cheek, she thought, that I took the seed? The man nodded. His heart wobbled and he held tighter to the branches. "It is."

Together, they stayed in the summit of the tree. They waited for the clouds to disappear, and when they did, they could see the rest of the forest. "It wouldn't stop growing," she explained. "But neither would this." The young man looked at the branch that held his hand. He had a point. When they had looked and talked enough, they made their way back down. They left the blankets and remaining food behind. The people could not believe what they were seeing, and the moment the word shaker and the young man set foot in the world, the tree finally began to show the ax marks. Bruises appeared. Slits were made in the trunk and the earth began to shiver. "It's going to fall!" a young woman screamed. "The tree is going to fall!"

She was right. The word shaker's tree, in all its miles and miles of height, slowly began to tip. It moaned as it was sucked to the ground. The world shook, and when everything finally settled, the tree was laid out among the rest of the forest. It could never destroy all of it, but if nothing else, a different-colored path was carved through it. The word shaker and the young man climbed up to the horizontal trunk. They navigated the branches and began to walk. When they looked back, they noticed that the majority of onlookers had started to return to their own places. In there. Out there. In the forest. But as they walked on, they stopped several times, to listen.

They thought they could hear voices and words behind them, on the word shaker's tree.

“Beware of false knowledge; it is more dangerous than ignorance.”

—George Bernard Shaw

“It might be a basic characteristic of existence that those who would know it completely would perish, in which case the strength of a spirit should be measured according to how much of the ‘truth’ one could still barely endure.”

—Friederich Nietzsche

“What is not surrounded by uncertainty cannot be the truth”

—Richard Feynman

“The real problem of humanity is the following: we have paleolithic emotions; medieval institutions; and god-like technology.”

—E.O. Wilson.

“Never argue with stupid people, they will drag you down to their level and then beat you with experience.”

—The Prophet Muhammad

This is your last chance. After this, there is no turning back. You take the blue pill—the story ends, you wake up in your bed and believe whatever you want to believe. You take the red pill—you stay in Wonderland, and I show you how deep the rabbit hole goes. Remember, all I'm offering is the truth—nothing more.

The truth will set you free, but first it will piss you off.

Chapter Two

Please Put on Your Tinfoil Hat

‘Conspiracy Theorists,’ is a frame the CIA promoted to its media assets in 1967 when New Orleans District Attorney Jim Garrison was investigating suspects in the JFK assassination case with deep connections to the CIA.

Most conspiracy theories are based on detecting patterns in events that, when viewed with the theory in mind, seem to help us understand why they happened. In essence, conspiracy theories infer cause from coincidence. The more you believe the theory, the more likely you are to fall prey to the illusion of cause.

A conspiracy theory is simply a conspiracy that never happened, it is ‘the nonexistent version of a conspiracy.’ A better definition of a conspiracy theory might be ‘the attribution of deliberate agency to something that is more likely to be accidental or unintended.’

The term ‘conspiracy theory’ has an irrevocable public relations problem. Technically, it’s just an expository description for a certain class of unproven scenario. But the problem is that it can’t be self-applied without immediately obliterating whatever it’s allegedly describing. You can say, ‘I suspect a conspiracy,’ and you can say, ‘I have a theory.’ But you can’t say, ‘I have a conspiracy theory.’ Because if you do, it will be assumed that even you don’t entirely believe the conspiracy you’re theorizing about. There’s also a growing belief that conspiracy theories aren’t merely goofy; some would argue they’re politically detrimental. A smart person is supposed to recognize that the term ‘conspiracy theory’ has only one conversational utility: It’s a way to marginalize undesirable possibilities as inherently illogical, along with the people who propose them.

Conspiracy theories originate and are largely circulated among the educated and the middle class. The imagined model of an ignorant, priest-ridden peasantry or proletariat, replacing religious and superstitious belief with equally far-fetched notions of how society works, turns out to be completely wrong. It has typically been the professors, the university students, the artists, the managers, the journalists, and the civil servants who have concocted and disseminated the conspiracies.

Real skepticism is indeed tiring and in many ways unattractive. “There

are more things in heaven and earth, Horatio, Than are dreamed of in our philosophy,” Hamlet reminds his friend in words that almost every doubter has had quoted to them at some point in their adult lives. Such an admonition may have been uttered during a discussion of religion, spirituality, New Age philosophy, or alternative therapies, in which the doubter (or real skeptic) has tried to invoke common sense. It always means the same thing: it is the skeptic who has a closed mind, and the believer whose being is open to the world. So the believer in a conspiracy theory or theories becomes, in his own mind, the one in proper communion with the underlying universe, the one who understands the true ordering of things. There are plenty of other ways of enjoying that feeling of transcendence, however, such as embracing esoteric religion or Eastern philosophies. But at certain times and under certain circumstances in the modern, developed, and industrialized world, a large number of people find the story of a conspiracy, no matter how shallowly rooted in fact, almost impossibly seductive.

A conspiracy theory is likely to be politically populist, in that it usually claims to lay bare an action taken by a small power elite against the people. By contrast, belief in the conspiracy makes you part of a genuinely heroic elite group who can see past the official version duplicated for the benefit of the lazy or inert mass of people by the powers that be. There will usually be an emphasis on the special quality of thought required to appreciate the existence of the conspiracy. The conspiracists have cracked the code, not least because of their possession of an unusual and perceptive way of looking at things. Those who cannot or will not see the truth are variously described as robots or as sheeple—citizens who shuffle half awake through their conventional lives following the herd.

The eternal appeal of the hidden-hand theory—the idea that history is guided by secret organizations, whether for woe or weal. Like a joke or gossip, once you know what the secret is, not only do you hold the key to understanding but you can also pass the information on yourself, becoming the storyteller, the wise one.

One feature of widely believed conspiracy theories may be that even those who do not accept them often cease to examine them properly; something that would otherwise be quickly seen as absurd is instead treated as if it were one genuine possibility among several.

The accusation leveled against conspiracy theories—that in trying to explain everything they explain nothing—could be turned back against lone gunman theories, which by contrast explain the assassination by declaring Oswald’s motive inexplicable.

However, there is a good reason why the single shooter often succeeds where the corporate conspirator might fail, and that is because he is not

only unafraid of being caught, he probably wants to be caught.

We fail to register just how far ordinary people are prepared to go in preferring to believe the improbable as opposed to the likely, and therefore risk underestimating the strength of the desire in society for the “higher” explanation.

It is in our nature to dramatize. We need to construct, or have constructed, dramas and stories for ourselves. Therapists and psychoanalysts know the truth of this. Their patients, like the rest of us, invariably have a story about inexplicable or mundane aspects of their lives. Our illnesses are due to stress or genetics or that day we went out for a walk and it was cold. Adopted children very often create a backstory of their real parents, and unadopted children have fantasies of their “real” mothers and fathers. We will have a story even if it means giving characteristics to the elemental.

The compulsion to create a story might actually be biological. It may represent a cognitive imperative—an innate need to have the world organized cognitively. Some speculate that the requirement to establish causality was a necessity for an animal that made tools in order to survive, and has thus become instinctive. Once there were causal beliefs for tool use then our ancestors developed causal beliefs about all key events. If we are impelled, therefore, to find causes, it follows that failure to do so created discomfort or anxiety. Consequently, human beings would have evolved with a strong tendency to make up a causal story to provide an explanation since ignorance about important causes is intolerable. We construct apparently coherent stories about what happened but where consistency and internal satisfaction have to compete with testing against the real world, we choose consistency.

Why do conspiracy theories emerge so robustly to explain tragedies such as disease, war, and death? The answer is dyadic completion. When there is a tragedy, people seldom throw up their hands, say, ‘C’est la vie,’ and accept the inherent randomness of life. Instead they search for meaning, asking not only how something bad could have happened but also who is behind it. When people feel like suffering moral patients, their dyadic moral template compels them to find moral agents to hold responsible. As an easy example, consider rush-hour driving. When a car cuts you off during your daily commute, you likely seldom think, ‘They must be in a hurry,’ or even, ‘They’re a little distracted,’ but instead, ‘That asshole knew I was there and cut me off just to spite me!!’

The link between perceptions of harm and perceptions of evil intention is nicely illustrated by a pair of scenarios. Both scenarios feature a chairman of the board presented with a new, profitable project by a company vice president. In the first case, the VP says:

“We are thinking of starting a new program. It will help us increase profits, but it will also help the environment.”

The chairman of the board then answers:

“I don’t care at all about helping the environment. I just want to make as much profit as I can. Let’s start the new program.”

The question is whether the chairman intentionally helped the environment. Most people in this case answer no—if the CEO doesn’t care about helping the environment, then the help is unintentional. But now consider the second scenario with only one word changed. The VP now says to the chairman of the board:

“We are thinking of starting a new program. It will help us increase profits, but it will also harm the environment.”

The chairman of the board then answers:

“I don’t care at all about harming the environment. I just want to make as much profit as I can. Let’s start the new program.”

Did the chairman intentionally harm the environment? Most people now answer yes—if the CEO doesn’t care about harming the environment, then the harm is intentional. This is a striking reversal. His words and deeds were exactly the same in both cases, and in both cases he was motivated only by profit. However, psychologically we perceive the good act to be merely incidental and the evil act to be intentional.

Paranoia may often be a defense against indifference, against the far more terrible thought that no one cares about you. The elderly, at a time of their lives when no one very much wonders what they think, often become classically paranoid, believing that someone wishes to rob or hurt them. The lonely person fears that there is a burglar or a murderer in the empty house waiting for them. Indeed, they may often perceive the real symptoms of such threats—the noises, the shadows, the displaced objects. These fears disguise the truly obliterating disaster, the often well-founded fear that no one is thinking about them at all—the catastrophe of indifference.

In Umberto Eco’s spoof novel of the faux-archaeological genre, *Foucault’s Pendulum*, the worldly publisher Signor Garamond says to his employees:

“It’s a gold mine, alright. I realized that these people will gobble up anything that’s hermetic, as you put it, anything that says the opposite of what they read in their books in school. I

see this as a cultural duty: I'm no philanthropist, but in these dark times to offer someone a faith, a glimpse into the beyond."

Signor Garamond knows he has to give his buyers "anything that says the opposite of what they read in their books in school." That way, when they have read his magical nonsense, they will think they know more than those who instructed them.

Like urban blacks considering the justice system, the rural Right has seen things the elite would prefer to ignore. It has observed correctly phenomena indicating loss of sovereignty for themselves, their states and their country. They have seen treaties replaced by fast-track agreements and national powers surrendered to remote and unaccountable trade tribunals. Like urban blacks, they have not been paranoid in this observation, merely perceptive. Seen this way, conspiracist and similar narratives, however crazy they sound, contain real validity, something that the economists and dusty actuaries of politics and the press are unable to comprehend. What is needed is a more poetical reading of these claims, because the poet understands that a myth is not a lie but the soul's version of the truth.

Things Have Never Been So Good

Prehistoric Myths

It is tempting to suppose that our ancestors were just like us except where there is evidence to the contrary. This is a hazardous assumption.

It's important to dispel the myth that modern humans are operating in a completely new environment because we only recently began to live as long as we do now, whereas our ancestors, or the average hunter-gatherer, lived only until thirty or forty, and hence never had to experience age-related diseases. While it is absolutely true that the average life span of a human being has increased enormously over just the last few centuries, this does not mean that thousands of years ago people were healthy until thirty-five and then suddenly dropped dead. An average life expectancy is just that—an average of all the ages that the people in the population attain before they die. A life expectancy of less than forty can occur without a single individual dying at or even near that age if, for example, childhood mortality from diseases such as measles or malaria is high—a common pattern in developing countries.

Suppose you have a village of 100 people. If half of them die at age five, perhaps from such childhood ailments, twenty die at age sixty, and the remaining thirty die at seventy-five, the average life span in the society is thirty-seven, but not a single person actually reached the age of thirty hale and hearty and then suddenly began to grow old. The same pattern writ large is what makes the life expectancy in developing countries so shockingly low. It isn't that people in sub-Saharan Africa or ancient Rome never experienced old age; it's that few of them survived their childhood diseases. Average life expectancy is not the same thing as the age at which most people die. Old age is not a recent invention, but its commonness is.

Some suggest that the reason some studies have found lower life expectancy for populations with agriculture than for those before settlement is that agricultural populations usually grow at a much more rapid rate than non-agricultural populations. This means a lot of babies being produced.

More babies mean more opportunity to succumb to the aforementioned diseases. This high childhood death rate makes the average life expectancy seem lower than it actually is.

The Neanderthals, reconstructions of whom are probably responsible for most people's conceptions of what cavemen supposedly looked like, lived in Europe and eastern Asia from 127,000 until about 30,000 years ago. They were not human ancestors, meaning that their lineage did not lead directly to that of modern humans, but because they lived in Europe and many paleontologists found their own European homeland a more convenient place to dig for fossils than many parts of Africa and Asia, we know more about them than we do about any other early human.

The common impression that pre-agricultural humans lived in an age of stone is a misconception based on this archaeological bias—stone preserves better. The Stone Age should more accurately be called the Wood Age, because most of the tools used by ancient hunter-gatherers were made of wood.

Bones and tools preserve much better than stems, seeds, or pits, but that does not mean that early humans relied more on meat than on other food sources.

Contrary to the claims of many Paleo-diet proponents, the earliest humans did not have an exclusively meat-based diet that we are best adapted to eat; and second, our ancestors' diets clearly changed dramatically and repeatedly over the last tens, not to mention hundreds of thousands of years, even before the advent of agriculture.

It is difficult to comment on 'the best diet' for modern humans because there have been and are so many different yet successful diets in our species. Furthermore, because some hunter-gatherer societies obtained most of their dietary energy from wild animal fat and protein does not imply that this is the ideal diet for modern humans, nor does it imply that modern humans have genetic adaptations to such diets. Any attempt by Paleo-diet experts to calculate the ratios of nutrients such as protein or saturated fat in hunter-gatherer diets so that these can be emulated by followers of the paleo way of life, would again run into the problem of the vast range of diets eaten by modern foragers and the lack of detailed information on foods eaten by early humans.

Even if we did know more about what our ancestors really ate, it wouldn't necessarily help, because those ancestors do not seem to have been particularly specially adapted to their foods. Regardless of what Paleolithic hunter-gatherer societies were eating, there is little evidence to suggest that human nutritional requirements or human digestive physiology were significantly affected by such diets at any point in human evolution. The notion

that humans got to a point in evolutionary history when their bodies were somehow in sync with the environment, and that sometime later we went astray from those roots—whether because of the advent of agriculture, the invention of the bow and arrow, or the availability of the hamburger—reflects a misunderstanding of evolution. What we are able to eat and thrive on depends on our more than 30 million years of history as primates, not on a single arbitrarily more recent moment in time.

This does not mean that many of the diseases of civilization are unrelated to diet, or that we should go further back and emulate the diets of gorillas or other modern apes rather than hunter-gatherers. If the proponents of paleo diets were correct, however, those hunter-gatherers with higher levels of protein in their diets should be less likely to suffer from modern maladies like obesity and hypertension than do cultures consuming more plants and starches, but no evidence exists to support such a claim. Such diseases are indeed absent in most foraging societies, but they are more uniformly absent than would be expected if a high meat intake were the preventive. The biggest problem with many Western diets seems to be their energy density—the vast number of calories contained in a Big Mac as opposed to an equal volume of wild fruits or game. The concentration of calories makes it far too easy to overconsume, even when it feels as if the amount of food eaten is not particularly large.

The relative proportion of carbohydrates in the diet does affect one aspect of our health: our teeth. But here the problem arose not with a switch to agriculture, but much later, when the Industrial Revolution led to increased consumption of refined sugars and processed foods. A 2012 conference examined the dental health of modern humans compared with that of either modern peoples eating more traditional diets, such as the Maya of Mexico, or our fossilized ancestors. People in industrialized societies not only have far more cavities than either of the other two groups but their jaws are also shaped differently, with malocclusion and overcrowding of the teeth. Ancient people and those consuming more fibrous foods simply chew more, which changes the development of the jawbones and associated musculature. The scientists who studied early dental health are quick to caution against a quick fix of a paleo diet for those seeking to avoid the dentist and orthodontist:

“There was not a single oral environment to which our teeth and jaws evolved—there is no single caveman diet. Still, we need to acknowledge that our ancestors did not have their teeth bathed in milkshake.”

The early models of Man the Hunter were popular in part because they validated the way Western families were structured in the 1940s–60s. Even today, most museum dioramas and other illustrations of prehistoric family life depict a man setting out with a spear, or holding a captured rabbit, while a woman sits by the campfire, an infant at her bosom. The implication is that women stay home and care for the children, while men go out and bring home the bacon, or mammoth meat. Starting in the 1970s some anthropologists began to question this macho perspective. They discovered that in contemporary foraging peoples, women’s gathering often provided the bulk of the nutrients consumed by the group, and furthermore, that in some cultures, such as some Australian aboriginal tribes, women hunted as well. But the Man the Hunter model has persisted. It came to stand for a way of life that placed males center-stage, gave an evolutionary basis for aggressive male behavior and justified gun use, political aggression, and a circumscribed relationship between women and men as a natural outcome of human evolutionary history.

The discovery that hunted food items, particularly big-game animals, are often shared among the group members, rather than being consumed only by the hunter’s family, as well as the unreliable nature of hunted meat as a staple in the diet, has caused some anthropologists to question whether the main function of hunting is even subsistence at all. Instead perhaps hunting is a way for men to show off to prospective mates, and that good hunters gain high status in their social groups. It is not that hunted meat isn’t eaten and appreciated by the group, but that a given man’s share does not necessarily increase the survival of his own children more than other sources of food do. The unreliability of big-game hunting therefore may make it a poor choice as the sole source of support for a family; saying you want to maintain your wife and children on it is the ancestral equivalent of claiming that you will be able to fulfill your familial responsibility on the proceeds of playing lead guitar in a band.

But hunted meat is not simply food—it is a signal. More than its value as a source of nutrition, meat is a medium of communication through which the hunter transmits information to potential mates, allies, and competitors. By contributing to the group, good hunters gain the respect of their peers. Anthropologists point out that “showing off” in this context does not have to involve actual bragging; in fact, among the Aché, meat is often brought into camp quietly and without much fanfare. But everyone knows who can, quite literally, deliver the goods. This ‘status signaling’ hypothesis has been critiqued by other anthropologists, who continue to discuss how best to calculate hunters’ contributions to their families, whether shared meat is repaid in kind, and which other factors play into the sexual division of labor.

Nature is a tinkerer, not an engineer. Evolution can work only with the parts at hand, rather than inventing the best possible solution to a problem. Hence, people in the Pleistocene may well have had knee trouble, because our knees are jury-rigged joints that have been modified from our quadruped ancestors. That doesn't make bending down unnatural. And we use our limbs, and our bodies, for a wide variety of activities, depending on our place in history and on the planet. It is therefore futile to look for the single best type of exercise, given our evolutionary heritage, though it's a safe bet that we would be healthier if we got up off the couch.

Both people and bonobos have sex under circumstances other than procreation, such as when resolving conflict or cementing bonds between individuals, and some cite this similarity as grounds to believe that the bonobos are a more accurate representation of our ancestral state than are those no-nonsense chimps. They then go on to promulgate a rather orgiastic view of human sexuality, saying that our monogamous woes arise from an uphill, and ultimately doomed, battle with our more bonobo-like desires for multiple sexual partners. An abundance of casual sex could then function to make the wheels of society run more smoothly, though I have trouble imagining the kind of genital-on-genital rubbing that is commonplace among female bonobos ever catching on at book clubs.

It's true that the bonobos and the chimpanzees are our closest relatives on Earth, but at the same time, we have not shared a common ancestor for at least 5 million years, so more than enough time has elapsed for selection to act separately on each of the three species. The bonobos may share non-reproductive sexual activity with humans, but vervet monkeys, a species much less closely related to us than are any of the apes, also have sex outside the time when a female can conceive. There is no a priori reason to expect that any particular aspect of our sexuality has been preserved from one ancestor and not another.

The image of the Pleistocene family as one of mother and father with their dependent offspring, operating largely by themselves, is inaccurate. And therefore the idea that we ourselves are best suited to a nuclear family life is misguided.

Fuck Off, Steven Pinker

“Don’t be deceived when they tell you things are better now. Even if there’s no poverty to be seen because the poverty’s been hidden. Even if you got more wages and could afford to buy more of these new and useless goods which industries foist on you and even if it seems to you that you never had so much. That is only the slogan of those who still have much more than you. Don’t be taken in when they paternally pat you on the shoulder and say that there’s no inequality worth speaking of and no more reason to fight because if you believe them they will be completely in charge in their marble homes and granite banks from which they rob the people of the world under the pretense of bringing them culture. Watch out, for as soon as it pleases them they’ll send you out to protect their gold in wars.”

Yes, life expectancy, mortality, and education have improved—this is fantastic news that we should celebrate! But, a few things:

1. You can’t make an argument about poverty by pointing to something else entirely. Consumption is increasing, yes. But that’s not what’s at stake here. What’s at stake is whether consumption is increasing enough to raise people out of poverty.
2. I’ll be the first to agree that income and consumption are not the only measures of well-being. But one reason they are absolutely crucial is because they allow us to assess inequality in the distribution of world resources. A higher life expectancy among the poor is no justification for condemning them to a tiny and ever-shrinking share of global income. That is not a morally defensible position.
3. You have invoked gains in life expectancy and education as part of a narrative that seeks to justify neoliberal globalization. But here again that’s intellectually dishonest. What contributes most to improvements in life expectancy are in fact simple public health interventions—sanitation, antibiotics, vaccines—and what matters for education is, well, public education. Indeed, the countries that have been most successful at this are those that have robust, free health care and education. Don’t forget that the US has worse infant mortality than Cuba.

4. As for hunger, your claim here relies on a methodology used by the FAO after 2012 that has been widely criticized. The hunger-reduction narrative depends on a calorie line that—like your \$1.90 poverty line—is too low to support normal human activity, ignores the impacts of food price crises, and tells us nothing about nutrient deficiencies. According to the FAO’s earlier methodology, both the number and proportion of people in hunger was higher in 2009 than in 1995—another trend that you glibly ignore.

Until we value everyone’s life, and until we value the life of other animals at least to the point where we aren’t genociding them, we will not and cannot have a good world overall.

It is often said, by the supporters of the current regime, that things have never been so good, but I don’t believe the statistics. Even if they were true, it would not matter, because the reality they describe is not sustainable. If I know I’m doing something which makes me comfortable today but will lead to mass death tomorrow, that isn’t ethical, and that’s what we are doing.

There is a fundamental dishonesty in every news story that presents stories in this fashion. It’s called whitewashing. Because all our information is spoon-fed to us in this same sanitized way, we first of all never think about it and secondly, have little collective knowledge (and hence concern) about what’s going on in the world, and how the US and its policies affect other people, living things, and the planet at large.

It is a measure of our misbegotten privilege that we can live in such a state of denial at all, in a bubble. And it is violence that empowers that privilege in the first place. It is upon the graves of Indians and the whipped backs of slaves that the US gained its power and it is through the military and economic subjugation of much of the world at large that it is now sustained. There’s nothing collateral about any of the suffering and damage that results from this system.

Three questions to those who think we are on the right track:

1. How is it that nearly two-hundred years after the birth of the Industrial Revolution, which produced humanity’s greatest period of economic expansion, the absolute number of those living in misery, both material and social, has grown exponentially?
2. How is it that the world’s slum population has developed at a rate vastly greater than that of global population growth?

3. How is it that despite incredible technological innovations the world now faces man-made threats of quite different magnitude from the wars, famines, epidemics, and other upheavals of previous dark ages?

“As the United States commemorates 241 years since the signing of the Declaration of Independence, Americans are not in a celebratory mood. By most polls, 60% of the country believes that America is on the wrong track; that number is slightly higher among Republicans.

That sour mood is not a product of the Trump administration; the last time a majority believed the country was headed in the right direction was right after the US invasion of Iraq in 2004. And this is not solely an American phenomenon.

According to global polls conducted by Pew, in France, Spain, Great Britain, Poland, Mexico, you name it, less than 40% of the public feel that their polities are headed in a positive direction. Notable exceptions are China, Vietnam, and Germany, each of which have been doing rather well economically, though so have many other nations whose citizens are far less sanguine.

What has been and remains remarkable about the outbreak of global pessimism, anger, and despair is how at odds those sentiments are with certain unequivocal material realities. Never before have so many people been so well-fed, long-lived, decently housed; never before have so many people had so much say in their local and national affairs, had so little to fear from random or state-sanctioned acts of violence, and had so little risk of untimely death due to war or famine.

And yet, it is fair to say, that never before have such a large swath of humanity been so royally pissed off, so aware of all that remains broken in a world where many things have been fixed, and so convinced that we are, nationally and collectively, on the wrong path.

There has been no shortage of voices reminding us of how much the material circumstances of our lives have improved over the past century. Yet, somehow, those notes have been almost utterly drowned out in the cacophony of despair.

Still, for most of us humans now alive, life today is more abundant, more materially secure, and free from the fatal and lethal threats that humans confronted for the vast preponderance of our time on the planet. And not free as if by magic. Free

because of the assiduous, dogged, passionate efforts of generations of us to address those challenges, scientifically, politically, philosophically and eradicate the worst of them.

Take a series of statistics about the United States and the world: every part of the world has seen an increase in calorie consumption since 1960, with all the concomitant benefits in terms of health and longevity.

Increasingly, more people face health challenges from obesity (a derivative of caloric affluence) than from malnutrition, which was one of the primary causes of human suffering, disease, and premature death for most of recorded history.

Every part of the world has seen vastly reduced risk of early death not just from starvation, but from disease and from war. For all the attention to the parts of the world where violence and state disintegration are endemic, there are fewer deaths from war and violent conflict than for most of the twentieth century, even after World War II.

Yes, there is some debate over what precisely constitutes a 'war' and how to count fatalities, but your actual chances of being caught in a violent conflict have only been decreasing.

So too have your chances of being caught in a political collapse. For all the economic uncertainty of the past decade, few countries have seen total political collapse or revolution. Governments have fallen, but not entire systems. Political upheaval can be positive; the post-1989 era in Eastern Europe was mostly beneficial.

But political upheaval historically is also closely connected to war and famine and violence. Consider the tens of millions who died in China during the Great Leap Forward of the 1950s and then the Cultural Revolution of the 1960s, and the waves of war and violence that followed the Iranian Revolution in 1979 and the subsequent Iran-Iraq War.

Then there is longer lives thanks to medical innovations on the one hand, and ever-widening access to safe potable water for much of the world's population. There is increased literacy and higher levels of education, which often correlates to high incomes. There is increased participation of women in the workforce, even with inequalities of payment persisting, which also means high levels of education for women, better health, and in much of the world, decreasing numbers of children.

In the United States, for all the legitimate unease with the costs and unpredictability of health insurance, most Americans

are spending less on life's essentials than the parents and grandparents. And they are getting more for what they are spending, whether on food, shelter, clothing, education, or entertainment.

In the years just after World War II, the new subdivisions of Long Island's Levittown were touted as the key to the American dream and the middle class. The size of those homes? 750 square feet, with a living room, two bedrooms, one bathroom and a kitchen with no modern appliances.

Today, the average American home is nearly 3,000 square feet, with an array of equipment that would have been unfathomable mid-century; even in 1973, the average home size was 1,000 square feet less than today.

The percentage of income spent on food has gone from nearly 25% in 1930 to under 10% today. The percentage spent on apparel has also come down precipitously. It will come as a surprise to learn that spending on healthcare hasn't actually changed markedly, although consumption of health care has increased with lifespans.

The only thing that Americans do spend more on relative to income is housing, and even there the increase from 1950 to the present is much less proportionately than the decrease of other costs. In essence, Americans have taken the savings derived from lower costs for life necessities and spent them on nicer places to live, work, and entertain.

These are broad averages, of course, yet similar pictures could be painted of most countries. The average person living in China enjoys a level of abundance, safety, and stability that almost no one in China could claim (even the upper classes) for much of the twentieth century. Yes, averages mean that many millions can be doing quite a bit worse, and therein may lie an explanation for the disconnect between how we are doing and how many of us worldwide feel we are doing.

The reasons for such global dyspepsia are both evident and mysterious. The 'news' everyday bears witness to the obvious: there are portions of the world—Syria, Afghanistan, South Sudan—mired in violence. There are people determined to destroy what they can when they can in the name of a God they call their own. There are states—Venezuela, Zimbabwe—that teeter on the precipice of collapse. And there are nations ruled by angry, calculating souls who, it seems safe to say, do not wish their fellow humans the best.

In the developed world, there was a financial collapse in 2008 that shook confidence in our collective ability to keep economies afloat, and given that all of the economies of the developed world now rely on digital systems of currency and ideas, these systems appear both mysterious and fragile.

There has also been a continual resetting of expectations. There's an old saying in the financial world that people always remember the most they made and the least they spent. It's your grandparents tisking that something used to cost ten cents, without the context that was when an average salary was two-thousand dollars a year.

As human life has expanded, as homes have gotten larger, calories cheaper, war less frequent, senseless death rarer, political injustice more the exception than the norm, people have become less tolerant of that which used to be tolerated. In short, it would seem that the more we have, the more aware we become of what we still lack.

Which leads us back to the 'news.' The news has become a daily focus on what is broken, rather than on what is working. That doesn't make it wrong, but it does make it distorted.

Yes, as life expectancy has expanded in general, across certain swaths of the United States, it is decreasing for white males and others, coincident with dying industries and opioid addiction. Yes, millions still face bankruptcy or substantial economic harm from sudden illness, accidents, loss of work, jobs made irrelevant by technology. Yes, in the United States, not nearly enough is done to address and ameliorate those challenges.

The fact that we are collectively doing so much better should never obscure the degree to which some of us are doing so much worse, or at the very least, struggling. The fact that much of the world is at peace should not obscure to the degree to which some of the world is ripping itself apart.

But losing perspective is dangerous. It creates a climate of fear and anxiety, fed by stories of harm and danger, that threatens to become detached from the manifest good we have done is addressing human needs and wants.

It also, oddly, inhibits our ability to meet the actual challenges of the world today. Yes, terrorism as a tool of the weak is a problem everywhere, and will continue to be. But obesity and climate, both of which are the result of abundance, will impact

exponentially more of us. We focus obsessively on terrorism, to the exclusion of challenges that may ultimately matter more.

But on this American 4th of July, we ought to for a moment, acknowledge how much is going right in the world. We know what is going wrong; news of that, awareness of it, and the feeling of it is impossible to escape or deny. But what is going wrong is only one facet of a complicated story that has seen much go right. For a day, at least, we can take a deep breath and say, yes.”

More of this fucking propaganda bullshit. After a certain point—one that is easily reached for most in the current societies—it does not matter how much one has but how much one has in relation to the most wealthy that matters. If the wealthy can have so much, then a loved one dying from despair is made so much worse, not less so simply because we can have refrigerated food and a larger living area to eat and walk around in after the funeral.

Such screeds are a sign of massive privilege, ignorance, a lack of critical thinking. The world is less diverse, more polluted. Every issue that exists today is so clearly a cause of human choices, not simply an act of god as a far less informed populace might have believed in the past. It has always been human choices that lead to our suffering but it has been hidden so much better in the past.

The problem is inequality. A society in which every member is equally vulnerable—even if all were less materially well off than they are now—is a far more equal and just society than the one we have now. It is the gap that most continue to ignore, that is the main issue. The gap is what makes it all so much work. The gap highlights what is possible—or what we consider possible for a few at least. Without the gap we’re happier. Without the gap many incentives for antisocial behavior go away.

Fuck these people who try to say slaves have never been more comfortable, that they should be happy with the scraps that have filtered down from above, from our betters—that is after all how they achieved their positions, their wealth, because they’re better, smarter, harder-working. No, it is greed, it is luck, it is manipulation. That is how their wealth, their status, their power, was gained. They are not to be exalted, respected. They must be spit on, denigrated, shamed. Fuck you, fuck your massive expressions of greed, your unempathetic lives, fuck all of that.

“My concern,” said famed Harvard economist Jeffrey D. Sachs, “is not that there are too many sweatshops but that there are too few. Those are precisely the jobs that were the stepping stones for Singapore and Hong

Kong and those are the jobs that have to come to Africa to get them out of back-breaking rural poverty.”

There is no truth to the story that the job loss and wage stagnation faced by manufacturing workers in the United States and other wealthy countries was a necessary price for reducing poverty in the developing world. This is a fiction that is used to justify the upward redistribution of income in rich countries.

This points to a nagging and important question about free-market ideologues: Are they “true believers,” driven by ideology and faith that free markets will cure underdevelopment, as is often asserted, or do the ideas and theories frequently serve as an elaborate rationale to allow people to act on unfettered greed while still invoking an altruistic motive?

Exploiting its rich natural resources will spur the impoverished nation into rapid development, the government claims. It will also push people from subsistence farming into more profitable enterprise—subsistence farmers pay no taxes. But poverty is a very subjective concept. Laos has poor infrastructure (although it is improving thanks to Chinese funds), it has next to no medical provision, poor education, and no social-service protection. But people do not starve here. Many are truly self-sufficient because they exist in a low population in a naturally resource-rich environment, even if the country is being rapidly deforested. People here gather fruit, vegetables, insects, and other animals from the jungle and rivers—90% live in rural villages—and they keep chickens and buffalo, plant rice and vegetables. In terms of cash, they are poorer by far than an Indian beggar; in terms of quality of life, they are perhaps rich.

The test of our progress is not whether we add more to the abundance of those who have much; it is whether we provide enough for those who have too little.

It’s much better to fall off a chair than to fall off a mountain. This does not mean it’s good to fall off a chair. It is better to wake up missing only your thumb than to wake up missing both arms, and better to forget your cuff-links than to forget your pants. To say that one thing is ‘better’ than another, or even the best, is not necessarily to say anything of substance.

Beware of relative judgments, then. That’s obvious. Yet relative comparisons are so often used to draw absolute conclusions. This is particularly true in economics. If sweatshops are a bit more remunerative than agricultural labor, this means that, actually, sweatshops are good. If laws against price gouging end up restricting supply, then price gouging is good for the public. If capitalism produces a higher standard of living than authoritarian socialism, then capitalism is good. If poor people in America today are better off than poor people were during the Great Depression, then poverty

isn't a moral outrage. Arguments of this variety are deployed throughout Steven Pinker's *Enlightenment Now*, which downplays the complaints of leftists by showing that human beings now are better off than they were during, say, the Holocaust or the Great Irish Famine.

We can see why arguments of this type fail. If I say that sweatshops are good, and my evidence is that when sweatshops were introduced into a country, the wages of those who went to work in the sweatshops were higher than the country's average wages, I may sound persuasive. But if the factories I am talking about are crowded, unsafe, abusive places in which people exhaust themselves, destroy their bodies, and have little control over their work, it's perverse to describe this situation as good merely because it is marginally better than what came before. We have to have a notion of "good" independent of mere 'better' and 'worse.' Otherwise, if 'better' means 'good,' then a kidnapper who said they would either kill one of my children or both of them would be offering me a good choice. Instead, they are offering me two horrific options, one of which I may be stuck with, but which is only 'better' in the narrowest sense of the word.

The argument that "price gouging is actually good" results from this confusion. Its proponents usually say something like: After a disaster, when emergency supplies (such as water) are in high demand, but merchants only have a limited supply on hand, price gouging ensures that the supplies will go to those who really want them. After all, if water is \$100 a bottle, people will limit themselves to exactly the amount of water they really need. Actually, as is obvious, supplies will not go to the people who "want" them the most but the people with the most money to spare. Price gouging will also ensure that the supply gets replenished, because if merchants can make a killing from rushing to the scene with supplies, then you will see people bringing truckloads of water in to sell, until the price gets back to normal. This means that laws against price gouging are counterproductive and that price gouging is good.

"My own version of dealing with price gougers would be to thank them for the good work they're doing."

We can see, though, that this view isn't just callous, it uses deeply flawed reasoning. Saying "Banning profiteering actually ends up causing worse social consequences than permitting it" doesn't mean "it's morally justified to be a profiteer and profiteering is good." It may well be that, because merchants are selfish, if you allow them to extort hurricane victims, they will go to great lengths to obtain more supplies so that they can profit as much as possible. This does not mean it is a good thing when a family

has to spend a considerable portion of their remaining wealth on obtaining the basics necessary to survive a disaster. A good situation would be one in which, after a tragedy, everyone just pitched in to help each other out, with nobody thinking about how much money they could make. Actually, a good situation would be one in which we had prevented the tragedy to begin with, and it's worth bearing that in mind in order to remind us what our ultimate goals really are. If rent control makes landlords less likely to repair broken fixtures, that might be an argument that on balance, the rent control law we have designed will make things worse for tenants, but it doesn't say anything about whether it's "good" to have selfish landlords who will extract as much money as possible from their tenants.

The difference between 'better' and 'good' is why I consider utopian visions valuable. If we merely look at whether things have gotten better, we might be congratulating ourselves for progress despite still being far away from a tolerable situation. On the left, we often talk about the need to create "a better world." But this is slightly misleading; in fact, we should want to create an excellent world. It would be a better world if students had a maximum of \$100,000 in debt rather than \$1,000,000. But it won't be an excellent world until worries about debt are nonexistent. It might actually be less cruel to have institutionalized flogging rather than our existing system of mass incarceration. But flogging is horrific too, and when we measure reality against our principled idea of the good, rather than against some other unsatisfactory alternative, we are able to say both of those things are bad and think through what we'd actually like.

Of course, economists will say that in a world of constraint, you can never have everything. There will always be trade-offs; things cannot be perfect, they can only be the best of our available options. So, for example, even if we may be repulsed by sweatshops, they are still the best option. This is, of course, bunk. But one problem with seeing the world this way is that it stifles one's ability to think creatively about how to find new possibilities. If I say 'Well, there are two options: Option A and Option B, and B is better than A,' then I may be taking a small step toward progress. But if I have a notion of the good, and I see both A and B as thoroughly inadequate, then the question I will ask myself is 'How can I create a new option, Option C, one I'm actually satisfied with?' This is how leftists think: Instead of accepting 'brutal exploitative agricultural labor' and 'brutal exploitative sweatshop labor with marginally better compensation' as the two options, we ask how to get rid of exploitation altogether. This doesn't mean we are opposed to marginal improvements. It means we aren't satisfied with them. But if you do think in terms of 'better' rather than 'good,' you have no way of articulating that dissatisfaction, or explaining why what people like

Pinker call “progress” is so infuriatingly inadequate.

Better and good are mixed up all the time. If an employer is told their wages are too low, they may reply that they pay “well above the market rate for the area.” But that tells us very little. If the market rate isn’t nearly enough to pay one’s rent and raise a family, then it’s no defense to say one pays “more than almost nothing.” The question is not how it compares to everything else, the question is whether it conforms to a set of principles. In a world full of injustice and misery, relative progress might not tell us much about how we’re doing. What matters most is not whether we’re doing better than before, but whether we’re doing as well as we can and should.

This obsession makes complete sense. After all, if taken seriously, the Don’t Worry, Everything is Better Now narrative is perhaps the most compelling defense of global capitalism out there. Sure, the wealthiest individuals might own a grossly disproportionate amount of global wealth, the rules may be rigged in favor of the rich, and hundreds of millions may continue to live without their basic needs met, but the believers are quick to point out that the system that produced these conditions has done more for the poor than any other. Global capitalism may not be perfect but the benefits it brings—namely, eradicating poverty as we know it—far outweighs its costs.

“Economics taught me that two-billion of my brothers and sisters had escaped poverty in my own lifetime. This was a modern-day miracle. I had to find its source. Virtually all development economists, across the mainstream political spectrum, agreed on the core explanation. In short, it was the American free enterprise system, spreading around the world, that had affected this anti-poverty miracle.”

It is no wonder that ardent defenders of neoliberal capitalism, like Brooks, Pinker, and Gates, believe that they are real advocates of the marginalized and leftists are backwards ideologues. Once you accept this narrative—that global capitalism has indeed been responsible for lifting billions out of poverty and radically improving the lives of even the most marginalized—then calls for systemic or structural change seem misguided at best and sinister at worst. Defenders of the status quo are framed as agents for progress and social justice while leftists calling for change are portrayed either as blindly ignorant or uninterested in actually helping the marginalized.

The received wisdom comes to us from all directions: Poverty rates are declining and extreme poverty will soon be eradicated. The World Bank, the governments of wealthy countries, and—most importantly—the United

Nations Millennium Campaign all agree on this narrative. Relax, they tell us. The world is getting better, thanks to the spread of free market capitalism and Western aid. Development is working, and soon, one day in the very near future, poverty will be no more.

It is a comforting story, but unfortunately it is just not true. Poverty is not disappearing as quickly as they say. In fact, according to some measures, poverty has been getting significantly worse. If we are to be serious about eradicating poverty, we need to cut through the sugarcoating and face up to some hard facts.

The most powerful expression of the poverty reduction narrative comes from the UN's Millennium Campaign. Building on the Millennium Declaration of 2000, the Campaign's main goal has been to reduce global poverty by half by 2015—an objective that it proudly claims to have achieved ahead of schedule. But if we look beyond the celebratory rhetoric, it becomes clear that this assertion is deeply misleading.

The world's governments first pledged to end extreme poverty during the World Food Summit in Rome in 1996. They committed to reducing the number of undernourished people by half before 2015, which, given the population at the time, meant slashing the poverty headcount by 836 million. Many critics claimed that this goal was inadequate given that, with the right redistributive policies, extreme poverty could be ended much more quickly.

But instead of making the goals more robust, global leaders surreptitiously diluted it. When the Millennium Declaration was signed, the goal was rewritten as “Millennium Developmental Goal 1” (MDG-1) and was altered to halve the proportion (as opposed to the absolute number) of the world's people living on less than a dollar a day. By shifting the focus to income levels and switching from absolute numbers to proportional ones, the target became much easier to achieve. Given the rate of population growth, the new goal was effectively reduced by 167 million. And that was just the beginning.

After the UN General Assembly adopted MDG-1, the goal was diluted two more times. First, they changed it from halving the proportion of impoverished people in the world to halving the proportion of impoverished people in developing countries, thus taking advantage of an even faster-growing demographic denominator. Second, they moved the baseline of analysis from 2000 back to 1990, thus retroactively including all poverty reduction accomplished by China throughout the 1990s, due in no part whatsoever to the Millennium Campaign.

This statistical sleight-of-hand narrowed the target by a further 324 million. So what started as a goal to reduce the poverty headcount by 836 million has magically become only 345 million—less than half the original

number. Having dramatically redefined the goal, the Millennium Campaign can claim that poverty has been halved when in fact it has not. The triumphalist narrative hailing the death of poverty rests on an illusion of deceitful accounting.

But there's more. Not only have the goalposts been moved, the definition of poverty itself has been massaged in a way that serves the poverty reduction narrative. What is considered the threshold for poverty—the “poverty line”—is normally calculated by each nation for itself, and is supposed to reflect what an average human adult needs to subsist. In 1990 an economist at the World Bank noticed that the poverty lines of a group of the world's poorest countries clustered around \$1 per day. On his recommendation, the World Bank adopted this as the first-ever International Poverty Line (IPL).

But the IPL proved to be somewhat troublesome. Using this threshold, the World Bank announced in its 2000 annual report that “the absolute number of those living on \$1 per day or less continues to increase. The worldwide total rose from 1.2 billion in 1987 to 1.5 billion today and, if recent trends persist, will reach 1.9 billion by 2015.” This was alarming news, especially because it suggested that the free-market reforms imposed by the World Bank and the IMF on Global South countries during the 1980s and 1990s in the name of “development” were actually making things worse.

This amounted to a PR nightmare for the World Bank. Not long after the report was released, however, their story changed dramatically and they announced the exact opposite news: While poverty had been increasing steadily for some two centuries, they said, the introduction of free-market policies had actually reduced the number of impoverished people by 400 million between 1981 and 2001.

This new story was possible because the Bank shifted the IPL from the original \$1.02 (at 1985 PPP) to \$1.08 (at 1993 PPP), which, given inflation, was lower in real terms. With this tiny change—a flick of an economist's wrist—the world was magically getting better, and the Bank's PR problem was instantly averted. This new IPL is the one that the Millennium Campaign chose to adopt.

The IPL was changed a second time in 2008, to \$1.25 (at 2005 PPP). And once again the story improved overnight. The \$1.08 IPL made it seem as though the poverty headcount had been reduced by 316 million people between 1990 and 2005. But the new IPL—even lower than the last, in real terms—inflated the number to 437 million, creating the illusion that an additional 121 million souls had been “saved” from the jaws of debilitating poverty. Not surprisingly, the Millennium Campaign adopted the new IPL, which allowed it to claim yet further chimerical gains.

We need to seriously rethink these poverty metrics. The dollar-a-day

IPL is based on the national poverty lines of the 15 poorest countries, but these lines provide a poor foundation given that many are set by bureaucrats with very little data. More importantly, they tell us nothing about what poverty is like in wealthier countries. A 1990 survey in Sri Lanka found that 35 percent of the population fell under the national poverty line. But the World Bank, using the IPL, reported only four percent in the same year. In other words, the IPL makes poverty seem much less serious than it actually is.

The US government itself calculated that in 2005 the average person in the US would need at least \$4.50 per day simply to meet minimum nutritional requirements. The same story can be told in many other countries, where a dollar a day is inadequate for human existence. In India, for example, children living just above the IPL still have a 60 percent chance of being malnourished.

Here are a few points to keep in mind. Using the current \$1.90 line shows that only 700 million people live in poverty. But note that the UN's Food and Agriculture Organization (FAO) says that 815 million people do not have enough calories to sustain even "minimal" human activity. 1.5 billion are food insecure and do not have enough calories to sustain "normal" human activity. And 2.1 billion suffer from malnutrition. How can there be fewer poor people than hungry and malnourished people? If \$1.90 is inadequate to achieve basic nutrition and sustain normal human activity, then it's too low—period. It's time for Gates and all the humanitarian billionaire douchebags to stop using it. Lifting people above this line doesn't mean lifting them out of poverty, "extreme" or otherwise.

Remember: \$1.90 is the equivalent of what that amount of money could buy in the US in 2011. To live at this level would be like thirty-five people trying to survive in Britain on a single minimum wage, with no benefits of any kind, no gifts, borrowing, scavenging, begging, or savings to draw on (since these are all included as income in poverty calculations). That goes beyond any definition of 'extreme.' It is patently absurd. It is an insult to humanity

In fact, even the World Bank has repeatedly stated that the line is too low to be used in any but the poorest countries, and should not be used to inform policy. They created updated poverty lines for lower-middle-income (\$3.20/day) and upper-middle-income (\$5.50/day) countries. At those lines, some 2.4 billion people are in poverty today—more than three times higher than you would have people believe.

But even these figures are not good enough. The USDA states that about \$6.70/day is necessary for achieving basic nutrition. Some argue that people need about \$7.40 if they are to achieve normal human life expectancy.

Others conclude that around \$8 is necessary to reduce infant mortality by a meaningful margin. A few have argued that since the poverty line is based on purchasing power in the US, then it should be linked to the US poverty line—so around \$15/day.

“The level at which one sets an arbitrary cutoff like ‘the poverty line’ is irrelevant—the entire distribution has shifted, so the trend is the same wherever you set it.”

Not so fast. In fact, the story changes quite a bit—and you know it. If we use \$7.40 per day, we see a decline in the proportion of people living in poverty, but it’s not nearly as dramatic as the rosy narrative would have it. In 1981 a staggering 71 percent lived in poverty. As of 2013 it hovers at 58 percent. Suddenly the grand story of progress seems tepid, mediocre, and—in a world that’s as fabulously rich as ours—completely obscene. There is nothing worth celebrating about a world where inequality is so extreme that 58 percent of people are in poverty, while a few dozen billionaires have more than all of their wealth combined.

That’s proportions. Don’t get me wrong: proportions are an important indicator—and we should pay attention to it. But absolute numbers are equally important. In fact, that is the metric that the world’s governments first agreed to target in the Rome Declaration in 1996, the precursor to the Millennium Development Goals. The goalposts were shifted to proportions in the following years, which created the impression of faster progress. But really now it’s a moot point: if the goal is to end poverty, what matters is absolute numbers. Certainly that’s what matters from the perspective of poor people themselves.

And if we look at absolute numbers, the trend changes completely. The poverty rate has worsened dramatically since 1981, from 3.2 billion to 4.2 billion, according to World Bank data. Six times higher than you would have people believe. That’s not progress, in my book—that’s a disgrace. It is a crushing indictment of our global economic system, which is clearly failing the majority of humanity. Mainstream claims about global poverty intentionally skate around this fact. That is not responsible scholarship.

The billionaire parasites and their flunkies like to invoke the poverty numbers to make claims about the legitimacy of the existing global economic system. They say the system is working for the poor, so people should stop complaining about it. When it comes to assessing such a claim, it’s really neither absolute numbers nor proportions that matter. What matters, rather, is the extent of global poverty vis-à-vis our capacity to end it. Our capacity to end poverty (the cost of ending poverty as a proportion of the income of

the non-poor) has increased many times faster than the proportional poverty rate has decreased (to use your preferred measure again). By this metric we are doing worse than ever before. Indeed, our civilization is regressing. Why? Because the vast majority of the yields of our global economy are being captured by the world's rich.

Only five percent of new income from global growth goes to the poorest 60 percent of humanity—people living on less than \$7.40/day. This is neither acknowledged as a problem nor are attempts made to defend it. Instead they just ignore it, I suppose because it undermines such claims about how well the economy is working for poor people.

Here's how well it's working: on our existing trajectory, it will take more than one-hundred years to end poverty at \$1.90/day and over two-hundred years to end it at \$7.40/day. Let that sink in. And to get there with the existing system—in other words, without a fairer distribution of income—we will have to grow the global economy to 175 times its present size. Even if such an outlandish feat were possible, it would drive climate change and ecological breakdown to the point of undermining any gains against poverty.

It doesn't have to be this way, of course. We can end poverty right now simply by making the rules of our global economy fairer for the world's majority.

Make sure to bear this in mind next time you see someone pointing out that “global extreme poverty is in decline.” What that means is that people are crossing from an extremely small amount of money to a slightly larger but still comparatively minuscule amount of money. Their incomes are still essentially nonexistent when we put them next to the incomes of the people at the top. The gap is just unfathomably wide. Those who talk about how capitalism is reducing poverty pat themselves on the back because hundreds of millions of people have gone from having \$1.50 a day to \$4 a day, from being malnourished to being able to afford a bowl of soup.

“We've significantly reduced the number of famines!”

The question, however, is not:

“Did the lives of the poor get better?”

but

“How much better would the lives of the poor be if we did not live in a world where a tiny number of people own nearly everything?”

If you just look at whether things are ‘better’ to determine whether they are ‘good,’ then the Gilded Age was good because it was better than the Europe during the Middle Ages.

Why assume that the correct comparison to be making is the one between the world as it was, say, 200 years ago, and the world as it is today? You might argue that comparing the present with the past is stacking the deck. Of course things are better than they were. But they’re surely nowhere near as good as they ought to be. To pick some obvious examples, humanity indisputably has the capacity to eliminate extreme poverty, end famines, or radically reduce human damage to the climate. But we’ve done none of these, and the fact that things aren’t as terrible as they were in 1800 is arguably beside the point.

Ironically, given their reliance on cognitive biases to explain our predilection for negativity, the New Optimists may be in the grip of one themselves: the ‘anchoring bias,’ which describes our tendency to rely too heavily on certain pieces of information when making judgments. If you start from the fact that plague victims once languished in the streets of European cities, it’s natural to conclude that life these days is wonderful. But if you start from the position that we could have eliminated famines, or reversed global warming, the fact that such problems persist may provoke a different kind of judgment.

The argument that we should be feeling happier than we are because life on the planet as a whole is getting better, on average, also misunderstands a fundamental truth about how happiness works: our judgments of the world result from making specific comparisons that feel relevant to us, not on adopting the view from outer space. If people in your small American town are far less economically secure than they were in living memory, or if you’re a young British person facing the prospect that you might never own a home, it’s not particularly consoling to be told that more and more Chinese people are entering the middle classes. In the US Midwest many have frequently questioned such optimism on the grounds that their own lives didn’t seem to be on an upward trajectory. They say, ‘You keep saying the world’s getting better, but it doesn’t feel like that round here.’ And our perky little optimists will reply, ‘Yes, but this isn’t the whole world! Are you not even a little bit cheered by the fact that really poor Africans are getting a bit less poor?’

There is a sense in which this is a fair point. But there’s another sense in which it’s a completely irrelevant one.

This is the same logic that causes people like Nicholas Kristof to argue that because sweatshops are supposedly better than farm labor, there is a progressive case for sweatshops and we should defend them. This is one

of the differences between liberalism and leftism: liberalism argues for the least bad of several bad options, while leftism insists on having a better set of options.

For our modern liberals, it is obvious that careers should be open to talent and it is an outrage when barriers of any kind prevent the able from rising to the top. Another term for this understanding of equality is meritocracy, which is one of the great, defining faiths of the professional class. Meritocracy is about winners, and ensuring that everyone has a chance to become one. The areas in which liberals made the most significant progress—gay rights, inclusion of women in higher education, the end of de jure racial discrimination—are the battles they fought or are fighting in favor of making the meritocracy more meritocratic. The areas in which they have suffered their worst defeats—collective action to provide universal public goods, mitigating rising income inequality—are those that fall outside the meritocracy’s purview.

The difference between meritocracy and socialism is I don’t want everyone to have a fair shot at the 15% of non-shitty lives, I want everyone to have a decent life.

Liberals believe that the economic and political system is a machine that has broken down and needs fixing. Leftists believe that the machine is not broken. Rather, it is working perfectly well; the problem is that it is a death machine designed to chew up human lives. You don’t fix the death machine, you smash it to bits.

The narrative is nothing more than a carefully crafted fantasy. At its core are five interlocking myths about poverty, capitalism, development, and progress. Let’s evaluate these myths one at a time.

Myth 1: We have nearly eliminated extreme poverty in the last 40 years.

A chart from Our World in Data (OWD) tells a compelling story. It shows that the number of people living in extreme poverty has plummeted from almost 90 percent of humanity at the outset of the Industrial Revolution to around 10 percent today. This trend is so promising that in 2015 the World Bank predicted we could conceivably eliminate extreme poverty altogether by 2030. It is no wonder that true believers are obsessed with this chart: For them, it represents empirical evidence that global capitalism really is “the rising tide that lifts all boats.”

There is only one problem: This chart is completely misleading—in fact, it’s borderline insulting. First, the claim that it shows the “number of people in poverty” going back to 1820 is inaccurate. The World Bank did not actually start measuring poverty until 1981, so the database used for

the pre-1981 numbers is based on rough and incomplete estimates of GDP rather than accurate measurements of poverty. If we want to empirically assess the changing rates of poverty, we should focus on the time period after 1981—a focus which, in many ways, actually favors the believer’s narrative. Since 1981, the World Bank data shows a steep decline in the proportion of individuals in extreme poverty: from nearly half of all humanity (44 percent) to a mere fraction (10 percent). On its face, this is quite an impressive outcome. Yet, these data contain a fundamental flaw. They say nothing about how we define poverty in the first place.

Global poverty is calculated according to what is called the International Poverty Line (IPL)—an international estimate of how much income is needed to meet the basic needs of life, adjusted for the purchasing power of each country. For instance, the current IPL was set by the World Bank at \$1.90 per day, meaning that anyone who earns their country’s equivalent of \$1.90 US per day is considered to be in “extreme poverty.” What the OWD chart shows, then, is the percentage of people in the world who are now earning more than their country’s equivalent of \$1.90/day.

The problem is that the \$1.90/day IPL is not a meaningful measure of poverty. Remember, the \$1.90/day IPL is the international equivalent of living in the United States on only \$1.90/day. Anyone living in the US knows that living on \$2/day is inadequate to even afford breakfast, let alone adequate nutrition, shelter, or clothing (and we can just forget health care). This flaw becomes even more clear when we compare poverty data to international hunger data, which reveals that anywhere between 115 million and 1.8 billion people who have supposedly been “lifted out of poverty” by the World Bank’s standards can’t even afford enough food to meet their caloric needs. This disparity calls the legitimacy of the \$1.90/day IPL into question. After all, if “living above the poverty line” does not even mean that one can afford to meet their basic nutritional needs, then how can we call this line a meaningful measurement of poverty?

Unsurprisingly, most serious development economists and international agencies (including the World Bank itself) agree that the \$1.90/day IPL is far too low—even if they disagree on how high the IPL should be. The USDA states that around \$6.70/day is necessary for achieving basic nutrition. Multiple scholars agree that \$7.40 is the bare minimum ethical poverty line (one that would allow the poor to achieve a normal life expectancy). Even development economist Charles Kenny (whose salary is paid by the Gates Foundation) wants a \$10 per day line while his colleague Lant Pritchett argues that the threshold should be no less than \$15 per day.

When we apply any of these more accurate thresholds, the picture of global progress against poverty changes dramatically. Even if we use the

relatively conservative poverty line of \$7.40 per day, we find that global poverty has only dropped from 71 percent of people in 1981 to around 58 percent today—a mere 13 percent reduction. Of course, that is still progress, but it is a far cry from the notion that we have nearly eliminated extreme poverty altogether.

But when we look at absolute numbers, the news gets worse. Remember that guy touting free markets for lifting “over 2 billion people” out of poverty? Well, under the \$7.40/day threshold, it turns out that nearly 1 billion have been added to the ranks of the global poor since 1981. Let that sink in for a minute. There are 1 billion additional people living in conditions of extreme poverty today compared to 40 years ago. That is no cause for celebration. It is a tragedy.

When we do bring the number of people living on less than \$1.90/day to zero, as the World Bank predicts, the Economist will celebrate the true End of Suffering, Steven Pinker will write another celebratory book, and Bill Gates will receive a Nobel Peace Prize. Meanwhile billions will remain unable to afford to meet the most basic necessities for themselves and their families, and their ranks may keep increasing.

Myth 2: Global capitalism is responsible for the gains we have made against poverty.

Some have pointed out that just because people can't afford the basic necessities of life, doesn't mean their lives aren't getting better (for instance, their incomes may have risen from 50 cents to \$2 per day). In other words, just because we haven't gotten close to alleviating extreme poverty doesn't mean we haven't made considerable progress in reducing the poverty gap.

Of course, if people don't even have the means to buy enough food to meet their basic caloric needs—let alone take care of health care, housing, transportation, and the like—then we cannot say they have been “lifted out of poverty.” Period. Still, they have a point: On the whole, things have at least gotten better for the global poor since 1981. The question, then, is ‘why?’ Is this progress attributable to the global capitalist model of development peddled by international institutions, Western countries, and mainstream economists since the late 1980s?

Not quite. For the poor in most countries of the Global South, things haven't been getting much better at all. A closer look at the data reveals that the gains made against global poverty in the last 40 years stem primarily from one region: East Asia. If we take just one country, China, out of the global poverty equation, then even under the \$1.90 poverty standard we find that the extreme poverty headcount is the exact same as it was in 1981.

And when we look at proportions we find a similar story. While East Asia has made consistent progress against poverty, South Asia only began seeing a decline after 2000 and Latin America and Sub-Saharan Africa have made shockingly little progress at all.

The impact of East Asia becomes even more obvious when looking at the \$7.40 per day line. While looking at the world as a whole showed modest progress against poverty since 1981—from 71 percent to 58 percent—the picture changes entirely when you take China out of the equation. Under the \$7.40 per day line minus China, we find that over a billion people have been added to the ranks of the global poor and that the proportion of people in poverty has barely budged.

Why does this matter? The East Asian countries that have made the most progress against poverty—namely, China, Korea, and Japan—have explicitly rejected the sort of *laissez-faire*, free market orthodoxy often heralded as the secret ingredient to economic development. These countries took advantage of extremely high tariffs, protected infant industries through import substitution, “pirated” Western inventions, invested in massive state-owned enterprises, and allowed for high-levels of inflation—all of which directly contradict the neoliberal development model characterized by free trade, privatization, strict patents, deregulation, and public austerity. Meanwhile, the countries in Latin America and Africa who more closely followed the neoliberal development path failed to develop at nearly the same levels.

Laissez-faire capitalism cannot take credit for the gains made against poverty in the last 40 years. If anything, neoliberal policies have significantly impeded this progress. At the very least, the story is far more complicated than the believers would have us believe.

Myth 3: While our current economic system isn’t perfect, we just can’t afford to risk trying something different.

On the contrary, it seems we can’t afford not to try something different. Some have calculated that if we maintain the fastest rate of income growth that the poorest have enjoyed since 1981 (assuming the absence of any financial crises or economic downturns), it will take 100 years to eradicate \$1.90 per day poverty and 207 years to eradicate \$7.40 per day poverty. Others determined that it would take over 250 years for the income of the poorest 10 percent to merely reach the global average income of \$11 per day. Worse yet, to reach the \$7.40 per day level GDP would have to be 175 times its current level, at which point the average global income would be \$1.3 million/year. In other words, under our current economic system, the

average income would have to be over a million dollars per year just so that the poor could live on \$7.40 per day.

But here's the real kicker. In 2017, nearly 20,000 scientists from 184 countries issued a "warning to humanity" that our consumption levels are on "a collision course with the natural world" that will result in "widespread misery and catastrophic biodiversity loss" if we don't start acting now to reverse this trajectory. The UN's IPCC report—which some scientists critiqued as "too conservative"—came with a similar message: Time is running out—we must act now to significantly cut emissions or face dire consequences. Even a report co-written by a former fossil fuel executive called climate change "a near- to mid-term existential threat to human civilization" citing the forced relocation of billions of people from unlivable conditions, the collapse of much of the world's agriculture, massive water shortages, and natural disasters on a scale we've never seen. It isn't surprising, then, that our best estimates indicate that we need something closer to degrowth if we want to achieve the CO₂ emissions levels needed to meet reasonable warming targets.

If we hope to save our planet—or at the very least stave off mass human misery and financial catastrophe—we cannot afford to remain on our current trajectory for the next 10 years, let alone the next 250. The scale of economic growth needed to alleviate poverty under capitalism would mean catastrophic climate change beyond the levels at which even the fiercest climate hawks are willing to make predictions. The classic "capitalism may be flawed, but it is the best we got" argument is simply irreconcilable with the environmental realities of the twenty-first century. If we continue on our current trajectory, then the lengthy timeline to alleviate poverty and the resulting inequality will be the least of our problems. The status quo is a catastrophic risk to all of humanity. What we can't afford to do is ignore alternatives.

Myth 4: At least Western countries are trying to alleviate poverty. If it weren't for the billions Western countries give to the rest of the world, who knows how bad things would be in the Global South?

It is true that Global North countries give billions in financial support to Global South every year. But this narrative changes dramatically when we look at the flow of money in the opposite direction. In 2016, researchers tallied up the total net outflows between rich and poor countries, finding that while \$1.3 trillion is transferred every year from Global North countries to the Global South—in the form of foreign aid, foreign direct investment, remittances—approximately \$3.3 trillion is transferred in the

other direction—mostly due to illicit financial flows such as multinational corporations cheating poor countries out of much-needed tax revenue. In fact, they calculated that that poor countries have sent a total of \$16.3 trillion in net outflows to the Global North since 1980. In other words, for every \$1 of aid that the South receives, they lose \$24. The reality is that aid is effectively flowing in reverse.

And that's not even considering the monies extracted in the name of protecting intellectual property. The real question is not a matter of how bad things would be without us—it is a matter of just how much better things would be if powerful countries didn't rig the rules of the global economy in their favor.

Myth 5: Eradicating poverty is too difficult—we should just give up.

In the face of seemingly intractable problems, it is easy to lose hope. However, poverty is not an intractable problem—in fact, we have a greater capacity to truly eliminate poverty now than ever before in history. It would cost only 3.9 percent of the total incomes of those who live at more than double the poverty line to eradicate poverty for good (even less per person if the super-rich were to pay a higher portion). That is worth repeating: We could end extreme poverty tomorrow and it would cost less than 5 cents on the dollar. What this means is that the poverty we face today is not the result of resource scarcity; we have more than enough to eradicate global poverty 20 times over. For most of human history, poverty has existed because humans lacked certain basic resources. Today poverty exists because we fail to distribute those resources in a remotely just way. We lack the political will, not the economic means, to end poverty once and for all.

And this brings us full circle: Why is it that we lack the will to end global poverty? The answer is obvious: Every day we are inundated with stories about how great everything is already. We are told that we are living in an age of unprecedented global progress. That, thanks to our current economic system, human welfare has increased more in the last 40 years than the previous 400. That all we need to do is sit back and wait for the rising tides of Global Capitalism to lift us all to Utopia.

Denial is a powerful sedative, and there is no more effective form of denial than clinging to the notion that everything is just fine. Without it we all might start questioning a system that benefits the few while leaving so many behind. Without it we may start fighting back. Without it the status quo may just begin to crumble before our eyes.

The first step to recovery is recognizing the problem. We have celebrated the end of poverty while billions remain unable to meet their most basic

needs. We have patted ourselves on the back for charity while taking far more than we would ever give. We have misidentified the root causes of genuine progress. And we have worshiped an economic system that not only produced morally abhorrent outcomes but poses an existential threat to the future of our planet. Only once we stare this harsh reality in the face can we ever hope to find ourselves capable of imagining a more just and equitable world.

Chapter Four

Societal Blueprints

Jesus & the Volcano Virgins

In the would you rescue a child from a pond thought experiment, a strict utilitarian would not rescue the child from the shallow pond at all: he would leave the child to drown, sell his unmuddied clothes, and donate the proceeds to a charity that could save more than one child with the money.

Effective Altruism: A growing social movement, increasingly influential among Silicon Valley entrepreneurs and within the rationalist community, which characterized itself as “an intellectual movement that uses reason and evidence to improve the world as much as possible.” An effectively altruistic act, as opposed to an emotionally altruistic one, might involve a college student deciding that, rather than becoming a doctor and spending her career curing blindness in the developing world, her time would be better spent becoming a Wall Street hedge fund manager and donating enough of her income to charity to pay for several doctors to cure a great many more people of blindness.

People have the potential to be good, but when you live in a society that doesn't groom any goodness, this is what you get.

A life lived without moral/spiritual values is not just incomplete but depraved.

“If we are to suppose, a miracle to be something so entirely out of the course of what is called nature, that she must go out of that course to accomplish it, and we see an account given of such miracle by the person who said he saw it, it raises a question in the mind very easily decided, which is, is it more probable that nature should go out of her course, or that a man should tell a lie?”

Human Suffering: clinging to that which changes

One day, two policemen were driving up the road when, just beyond the railing, they saw a young man about to jump. One of the policemen bolted from the car and grabbed the fellow just as he was stepping off the ledge. His momentum threatened to carry both of them over the cliff, but the policeman refused to let go. Somehow he held on long enough for his partner to arrive and pull the two of them to safety. When a newspaper reporter asked, “Why didn’t you let go? You would have been killed,” he answered:

“I couldn’t... I couldn’t let go. If I had, I couldn’t have lived another day of my life.”

Do you realize what had suddenly happened to that policeman? He had given himself over to death to save a stranger. Everything else in his life dropped off. His duty to his family, his duty to his job, his duty to his own career, all of his wishes and hopes for life, just disappeared. What mattered was saving that young man, even at the cost of his own life.

How can this be? A psychological crisis represents the breakthrough of a metaphysical reality, which is that you and the other are two aspects of one life, and your apparent separateness is but an effect of the way we experience forms under the conditions of space and time. Our true reality is our identity and unity with all life.

“Of course one doesn’t need to justify it on grounds other than religion. Plenty of people believe in religions. So-called rationality is also merely another belief system, as is deciding not to believe in God.”

Believing in things that may not exist—or disbelieving in things that may exist—is a peculiarity of your culture, not a universal human activity. Because it’s universal among you, you assume it’s universal among humans in general.

The cultural fallacy. The belief that the ideas that come to us as the received wisdom of our culture are innate to the human mind—that they actually arise from the structure of the human mind itself. According to this particular cultural fallacy, someone who can’t tell the difference between right and wrong is either retarded or insane.

What exactly does ‘faith’ mean? As in ‘religious faith,’ ‘faith in God,’ et cetera. Isn’t it basically crazy to believe in something that there’s no proof of? Is there really any difference between what we call faith and some primitive tribe’s sacrificing virgins to volcanoes because they believe it’ll produce good weather? How can somebody have faith before he’s presented

with sufficient reason to have faith? Or is somehow needing to have faith a sufficient reason for having faith? But then what kind of need are we talking about?

Plenty of people can believe small aliens have a control room in their head that dictates everything the body does and it doesn't change the accuracy of the statement. Of course all belief systems humans have created are imperfect, so they will all have an element of irrationality. But when a system embraces irrationality, the false virtue of faith is invoked.

Faith was born out of our ignorance, as a result of our curiosity and desire to have a story to explain things, science is slowly taking its place, but of course being imperfect constructs, science can be affected by much of the same biases, preferences, and desires for power that we see have shaped what we call religions. So irrationality and faith can reside here too—just look at the Wuhan Flu panic.

Why did you choose to believe there are no dragons on the moon? Just because Aldrin didn't get set on fire isn't sufficient evidence, I'm sorry, the dragon must have been sleeping. 'Why can't we just find it with a telescope from earth?' Well... umm... it actually only lives on the dark side of the moon. 'Oh, then how come the probe didn't photograph it?' Oh, well it must live underground, yep that's it. 'Hey, so we tunneled in and couldn't find it, what did we do wrong?' Oh you silly fool, the great dragon exists on its own plane, it would only allow you to see it if he wants you to; live a good life and he may appear, and when you die you go to the great treasure hoard in the sky.

You can believe whatever you want personally, but the line must stop at your body when harms are concerned. You wanna beat a living creature as punishment for sins? Beat yourself but you don't get to touch another. This is what is referred to when demanding that you provide justification that is at least more rational than faith. Because if you are familiar with history, you are aware of the numerous horrors committed in the name of irrational justifications, often faith in particular.

What are the proper limits of religious freedom? Marianne Thieme, leader of the Party for the Animals in the Netherlands, offers this answer:

“Religious freedom stops where human or animal suffering begins.”

The Party for the Animals, the only animal-rights party to be represented in a national parliament, has proposed a law requiring that all animals be stunned before slaughter. The proposal has united Islamic and Jewish leaders in defense of what they see as a threat to their religious freedom,

because their religious doctrines prohibit eating meat from animals that are not conscious when killed.

But prohibiting the ritual slaughter of animals does not stop Jews or Muslims from practicing their religion. During the debate on the Party for the Animals' proposal, Rabbi Binyomin Jacobs, Chief Rabbi of the Netherlands, told members of Parliament:

“If we no longer have people who can do ritual slaughter in the Netherlands, we will stop eating meat.”

That, of course, is what one should do, if one adheres to a religion that requires animals to be slaughtered in a manner less humane than can be achieved by modern techniques. Neither Islam nor Judaism upholds a requirement to eat meat.

And like many religious practices, this holy requirement is likely related to spreading a beneficial tip on healthy living. If you just come across an unconscious animal, it's probably sick—meaning you shouldn't eat it. And the easiest way to both spread that knowledge and ensure its adherence is to bake that shit into your religion.

Restricting the legitimate defense of religious freedom to rejecting proposals that stop people from practicing their religion makes it possible to resolve many other disputes in which it is claimed that freedom of religion is at stake. For example, allowing men and women to sit in any part of a bus does not violate orthodox Jews' religious freedom, because Jewish law does not command that one use public transport. It's just a convenience that one can do without—and orthodox Jews can hardly believe that the laws to which they adhere were intended to make life maximally convenient. Likewise, the Obama administration's requirement to provide health insurance that covers contraception does not prevent Catholics from practicing their religion. Catholicism does not oblige its adherents to run hospitals and universities. The government already exempts parishes and dioceses, thereby drawing a distinction between institutions that are central to the freedom to practice one's religion and those that are peripheral to it. Of course, the Catholic Church would be understandably reluctant to give up its extensive networks of hospitals and universities. My guess is that, before doing so, they would come to see the provision of health-insurance coverage for contraception as compatible with their religious teachings. But, if the Church made the opposite decision, and handed over its hospitals and universities to bodies that were willing to provide the coverage, Catholics would still be free to worship and follow their religion's teachings.

Although the lower house of the Dutch Parliament overwhelmingly passed a ban on ritual slaughter, the upper house rejected it. The issue was

resolved by the government brokering a characteristic Dutch compromise: ritual slaughter continues, but a veterinarian must be present, and must stun the animal if it is still conscious 40 seconds after its throat is cut.

So God's got only 40 seconds to get off.

“Much of what convinces me of the existence of God is going to fall into the area of what you do not consider evidence.

- The existence of the universe and life itself.
- The existence of language.
- The existence of a conscience.
- The mystery of consciousness.
- The complexity of the brain.
- The experiences I have with spiritual attack, deception, and temptation, and how the techniques in scripture for dealing with these by not relying on my will and mental powers, but by trusting in the power of God to free me from the temptations, see through the lies, and fend off attacks of unwanted thoughts, compulsive guilt and doubts, et cetera.
- The problems that beset any person have solutions in scripture. If I feel guilt for doing something I know is wrong, I can repent of it, be free of guilt because I am now not the same person inside who chose to do those things. I am free from my past to change. I can forget my failures, press onward toward being the kind of man I believe I should be.
- I am oriented toward love for others as my main goal in life. I consider myself a servant to others, and I can forget the drive to satisfy my own desires because I trust God to provide for my needs, and he does.
- I know I am not capable of being a good person by my own efforts. I've tried. But when I let go of trying and trust God to give me strength to obey his will, I find myself able.
- There is power in the truth I find in scripture. It has changed who I am. I deny myself, put my own old self to death each day, and endeavor to let God's will as exemplified by Jesus' example lead me, rather than doing what my desires prompt me to do.

None of this is likely to be at all convincing to you. God improves me through my surrender to him. I have found the

Bible to be reliable. So in an area of my real experiences with life that is outside of your conception of the universe, I find convincing evidence. I do not find physics to be a satisfactory explanation for the existence of the universe, and I do not find natural selection to be a satisfactory explanation of either the origin of life or of the manifest complexity and beauty of it. My skepticism is as great as yours, I think.”

If you stare long enough at anything, you will start to find similarities. The word ‘coincidence’ exists in order to stop people from seeing meaning where none exists.

Imagine a puddle waking up one morning and thinking, ‘This is an interesting world I find myself in—an interesting hole I find myself in—fits me rather neatly, doesn’t it? In fact it fits me staggeringly well, must have been made to have me in it!’

The Universe is a big place and despite our understandable fascination with the anthropic principle, the stark truth is that nearly all of it is incompatible with life—at least our carbon-based, water-dependent version of it. Given the abundance of other possible locations, if humans existed simply as a result of chance alone, we’d find ourselves—very briefly—somewhere in the very cold empty void of outer space, and would be dead almost instantly. Might this, in turn, contribute to the conclusion that our very existence is evidence of a beneficent designer?

But we’re not the outcome of a strictly random process: we find ourselves occupying the third planet from the Sun, which has sufficient oxygen, liquid water, moderate temperatures, and so forth. It isn’t a coincidence that we occupy a planet that is suitable for life as we know it, if only because we couldn’t survive where it isn’t. It’s no more amazing that the Earth isn’t a hot gas giant than the fact that no matter how tall or short a person might be, her legs are always precisely long enough to reach the ground.

To marvel at the fact of our existing is like a golf ball being amazed that it ended up wherever it did.

The deeper the mysteries of the universe, the less likely it is that whatever is responsible for them gives a damn about female dress codes or human sexual behaviour.

We may think our species genetically unique, and indeed it is, as every species is. But the mix of our DNAs is really an amalgam of all life’s DNA, and in many and varied ways that mix reaches back to a common origin at the dawn of life. One example of most recent common origin comes from our hunter ancestors, whose skill and knowledge were pivotal, as we’ve seen, in the recycling of animal carcasses. Since those carcasses were derived

from formidable live animals, which the hunters had to get to know well in order to hunt them effectively, we became empathetic. We learned that the precious, mysterious gift that we call 'life' may disappear suddenly when the animal is punctured with a spear or arrow. In no area did we know less and need to believe more than in that period after death, when a body is little changed and yet suddenly bereft of life. Where has 'it' gone, and where did it come from and why? We invented stories about human creation to try to make sense of our life and our fate, stories that specified our relationships to each other and to the earth, which then nurtured our morality.

Abstain from murder not because some ancient book forbids it, but because killing inflicts immense suffering on sentient beings. There is something deeply troubling and dangerous about people who avoid killing just because 'God says so.' Such people are motivated by obedience rather than compassion, and what will they do if they come to believe that their god commands them to kill heretics, witches, adulterers, or foreigners?

Among the moral concepts shared across the globe are proscriptions against murder and rape, as well as redress of wrongs. Within all human cultures, individuals tend to react with quick, automatic feelings of anger, contempt, and indignation when they see people causing suffering. The universality of these responses strongly suggests that intuitions about fairness, harm, and respect for authority has been built into the human mind by evolution. All children who are raised in a reasonable environment will come to develop these ideas, even if they are not taught by adults. No society, whether modern or preliterate, can function and cohere unless its citizens exist within a system of personal accountability that stigmatizes some actions and praises others.

What big societies need to really enforce cooperation is a powerful police force that knows not only people's every action but also their every thought. One possibility is an Orwellian thought police and a secret network of spies, but an even better solution is God. Even if someone can deceive other people and disguise his selfishness to others, God can see directly into his mind—and is able to punish him with eternal suffering. The evolutionary importance of cooperation is why God seems to care more about your morality than about your hobbies. Working together and suppressing selfishness is essential to the success of societies and the individuals living within them. Without close neighbors to observe actions, big, anonymous societies need an all-seeing, all-powerful divine judge.

Examining the characteristics ascribed to God across many different human societies—from the small tribes of aboriginal populations to the bustling cities of America—one finds that in the small tribes God is perceived as having a very different mind than He does in big societies like ours. The

gods of small tribes are seen as relatively less powerful and knowledgeable than the God of the Western world. These small gods are not omniscient or omnipotent like our Western gods, and often their power is limited to the village borders. You can even trick these gods and hide your sins from them.

However, as the size of societies increases, their gods also increase in power, knowledge, and moral orientation. In the largest and most anonymous societies, such as the United States, God is “big”—He is omniscient and omnipotent and has very strict ideas about what you ought to do. The concept of sin and punishment features very prominently in Christianity and other Abrahamic religions, and the gravest sins are those that put one’s own interests above social harmony, such as murder, adultery, theft, and jealousy. In Dante’s “Inferno,” the lowest levels of hell are occupied by those who betrayed their families, their friends, and their lords.

Not only does believing in God come with the specter of Hell, but unlike other people, God cannot be tricked. Like Santa Claus, God is always watching your behavior and keeping a list of all your naughty deeds. Feeling watched by God has the same effect on our behavior as being watched by other people—we suddenly feel self-aware and are more likely to act in socially desirable ways. Even more than God, another supernatural mind—the Devil—offers a powerful corrective against wrongdoing, because he most vividly represents the punishment for selfishness: an eternity in hell. In early thought Satan lacked the supernatural powers—and evilness—he is now seen as possessing. The original translation of the Hebrew word *satan* means something like a stumbling block that stands in the way of achieving a goal. Although this obstruction can be negative, it can also be positive, such as when God places barriers in people’s path to imprudent actions. As God became more powerful and moralizing, so too did Satan become more immoral, and the idea of stumbling transformed into “the fall” from grace.

Religion at its most fundamental level is a road map for how to live and explain the world. It can of course be corrupted into a powerful tool of coercion, manipulation, and oppression.

A lot of people tend to go where they find theology that matches their own opinions. It’s much easier for people, rather than being challenged by the Bible, to find some version of the faith that matches what their preexisting belief structure is.

One general rule for helping supernatural ideas stick is “minimal counter-intuitiveness”—when religious concepts are surprising but not too surprising. Consider two different hypothetical supernatural agents. The first is a seemingly normal man named Kitus, who can make himself invisible, hear any conversation on Earth, and be killed only by making him eat a plant grown deep in the Amazon rain forest. The second is a life-form named

R443TTS that frequently looks like a thick paste but can also transform into a feathered hat. It speaks only in clicks and whistles, eats only nickels from 1979, and visits other universes every other Tuesday in months that end with -er. Which one would you guess has more cognitive staying power?

If you said the first, you are right (and might consider calling yourself prophet). People tend to believe in agents that are mostly normal—Kitus is just a person with a couple of special characteristics, whereas R443TTS is abnormal in every respect. Minimally counter-intuitive agents are those that fit squarely into our category of ‘agent’ (or person) but are just a bit different, which makes them emotionally evocative. Minimal counter-intuitiveness can help explain why more people are Christians than are Scientologists: Jesus was a reasonably normal guy who died for your sins, whereas Xenu was an alien dictator who came to Earth (a.k.a. “Teegeeeack”) 75 million years ago on space cruisers that look like DC-8s and used hydrogen bombs to obliterate millions of people near active volcanoes.

Or maybe they threw them into the volcanoes and then dropped the bombs into there—I don’t know. I’m sure some Scientologist will be happy to tell me how wrong I am while his partner is tossing poisoned meat over my fence to murder the dog.

In the past a ‘religion’ was the collection of societal rules and knowledge of the environment the tribes lived in. Just look at the body of religious texts. They lay out the ground rules of their respective societies *and* explain how the world works. A religion was a valid body of knowledge until science caught up and left this body of knowledge biting the dust.

That’s why today’s religious establishments are irrelevant. Their societal rules can’t keep pace with the changes in the society and the knowledge they contain are refuted, and therefore no single religion has the ability to rule the human world.

You may think they help people by giving them the feeling of being part of a community, but I doubt even the consolation of this feeling is permanent. The human being is inquisitive. Religions have to evolve or die. Else they become suppressive like reactionary Christianity or Saudi-style Islam just to keep people inside the religion

“All national institutions of churches, whether Jewish, Christian, or Turkish, appear to me no other than human inventions, set up to terrify and enslave mankind, and monopolize power and profit.”

Fear-based morality was and still is an incredibly effective form of social control.

Any story that explains the meaning of the world, the intentions of the gods, and the destiny of man is bound to be mythology.

If the understanding of how to detoxify cycads is empirical, it wouldn't be surprising that it was passed down in the language of the supernatural, rather than the scientific metaphors we are used to. The hard line between bodily and spiritual health, after all, is an invention of the Western imagination, and a recent one at that. When the Hebrews divined the dangers of porcine trichinosis and the benefits of hand washing, they enshrined the resulting rules alongside the Ten Commandments, never thinking to separate the laws that guard against physical and moral dangers.

The rabies virus appears to improve its transmission by essentially bludgeoning the brain, causing numerous circuits to go haywire all at once. Some of the symptoms it induces—for example, hydrophobia—appear to be irrelevant to its spread, but heightening sexual arousal may be useful (at least in animals). Certainly inciting an animal to bite by stirring up rage and hyperesthesia—jangling its nerves in response to the least sensation—are methods it uses most effectively for host-hopping. Nonetheless, the fact that rabies can be transmitted before symptoms emerge by a friendly lick or nip on the neck during normal sexual coupling suggests the furious stage in reality serves as an insurance policy—in essence, the parasite's backup plan for finding a new host should it fail to get around by more mundane means. That's the modern take on rabies.

In earlier times, before anyone knew about viruses or how they spread, people no doubt saw the disease as a contagious madness. A savage beast bites you, and through the wound, its spirit enters your body. Thus possessed, you too become a wild animal. You foam at the mouth, rage at the world, and may even, in your delirium, bite. You bark like a dog and display uncontrolled carnality. Violence, sex, blood, and gore. An evil that spreads and has a life of its own. If that profile sounds familiar, it's because rabies almost certainly provides the foundation for vampire myths. In many of these legends, especially versions originating in Eastern Europe in the first half of the eighteenth century, vampires are people—including, sometimes, the deceased—who rise at night and, often taking the form of a dog or wolf, violate their neighbors—gorging on their flesh, sucking their blood, or raping them, among other heinous acts. Actually, these were not just stories to people living at that time; they were believed to be true and anyone accused of having such savage powers could be hanged or burned at the stake.

Count Dracula, penned into existence by Bram Stoker in 1897, built on these ancient accounts, except that his villain famously morphs into a bat. It is surely no accident that these supernatural forms possessed the viciousness and hypersexuality of rabid animals and wore the mantle of

rabies's most common hosts—or that vampirism, like the viral disease, can be transmitted by a bite. Nor does the resemblance stop there. According to folklore, the lifespan of a vampire was forty days, which coincides with the average time a victim lives after being bitten by a rabid animal. And just like rabid people, vampires were repelled by light (hence their nocturnal habits), strong smells (the odor of garlic, according to folktales, could ward them off), and water (pouring it around graves was recommended to keep them in their underground vaults).

Or maybe it was *Ruminococcus* instead. *Ruminococcus* produces a substance called haem, which the body needs for many things, including producing blood. One character who probably had problems producing haem was Count Dracula. A genetic defect has been identified in his home country, Romania, that results in symptoms that include a lack of tolerance to garlic, sensitivity to sunlight, and the production of red urine. This urine discoloration is caused by a defect in blood production that means sufferers excrete the unfinished precursors of blood production. Nowadays, those affected by the condition—called porphyria—are given medical treatment rather than the starring role in a horror story.

Traditional religions have lost so much turf because, frankly, they just weren't very good in farming or healthcare. The true expertise of priests and gurus has never really been rainmaking, healing, prophecy, or magic. Rather, it has always been interpretation. A priest is not somebody who knows how to perform the rain dance and end the drought. A priest is somebody who knows how to justify why the rain dance failed, and why we must keep believing in our god even though he seems deaf to all our prayers. Yet it is precisely their genius for interpretation that puts religious leaders at a disadvantage when they compete against scientists. Scientists too know how to cut corners and twist the evidence, but in the end, the mark of science is the willingness to admit failure and try a different tack. That's why scientists gradually learn how to grow better crops and make better medicines, whereas priests and gurus learn only how to make better excuses. Over the centuries, even the true believers have noticed the difference, which is why religious authority has been dwindling in more and more technical fields.

The willingness to admit ignorance has made modern science more dynamic, supple, and inquisitive than any previous tradition of knowledge.

Scientists use wrong models with incomplete data all the time. What sets science apart is its ability to test itself, correct its errors and improve. A model should never be set in stone. It must be constantly probed and analyzed, using new information, and appropriately adjusted, if necessary. This not only allows the model to adapt to changing contexts, but makes it

more resilient against errors. An iterative process of this kind is fundamental: it enables us to detect and correct mistakes and therefore achieve progress.

One undeniable trait of stories is their ability to be passed on from generation to generation. While some ancient tales are still relevant, there is no guarantee that a centuries-old story will be applicable in today's environment or at any time in the future. Religions generally fall short of providing a satisfactory mental model, for this reason. Religious doctrines are, by definition, rarely questioned—questioning them can even be considered taboo. Taking the doctrines for granted is often even regarded in a positive light, as an act of faith. A model that is thousands of years old is likely to exhibit dangerous flaws, especially if one is not aware of the conditions in which it was created.

People afraid of losing their truth tend to be more violent than people who are used to looking at the world from several different viewpoints. Questions you cannot answer are usually far better for you than answers you cannot question.

“It’s OK, thanks for asking. I’m new to this but it seems like its going to be good. The gorilla god, praise be upon him and his silverest of silver backs, is almost like a parental figure for me as an adult. He keeps me safe, he forgives me and still loves me when I’ve done wrong (provided I confess to him of course!), and he’s starting to teach me what right and wrong are and where I belong in the world.

Its such a refreshing feeling: safety, contentment, certainty. I’ve also begun to feel a certain superiority over those that do not follow him, but he says that’s natural, because of course as a follower of the one true religion, I *am* superior.”

The biggest danger of faith is when people believe what they want to believe, defending against any and all evidence; especially when that evidence revolutionizes their foundation from the ground up. And the biggest culprit to that danger is the ego trap: rejecting/criticizing others, for being unlike you.

For centuries, the defense of blind faith has driven nations to war, violence, discrimination, slavery, and to become the society of automatons that we are today; and for just as long, it has been justified with lies. If you know better, act like it.

If you believe in the real God, you may scoff at those who offer prayers to Google, but the breadth of knowledge housed within the mind of Google

is all but incomprehensible, just like the mind of God. Despite being incomprehensible, God's mind is, conveniently, very human-like. God supposedly created us in His image, but how are we to know that we aren't just creating Him in our image?

In one classic study that tested mind perception and God, participants read a story about God doing various tasks, such as helping people. This story was constructed to be consistent with what is called a "theologically correct view of God," such that God could have been in two places at once (omnipresence) or could have heard a conversation over very loud noises (omniscience). Although participants shared this theologically correct view, explicitly ascribing to Him all the appropriate 'omnis,' a different pattern emerged when they informally recalled the stories. Participants spoke of God as having to stop one thing before starting another (violating omnipresence) and of not being able to see something when it was behind a barrier (violating omniscience). In other words, they saw God as an especially powerful person and not an incomprehensible deity.

This contradiction between the human (anthro) and divine (omni) elements of God—particularly in Jesus—has long been a point of contention in Christianity. How can something be both a mortal man and an immortal God? The whole point of being godly is to transcend humanity, whereas the whole point of being human is to have flaws and limitations. Some early Christians found this omni-anthro paradox too hard to take, but this duality may in fact have helped Christianity to spread around the world, as it may be just counter-intuitive enough to stick in people's minds. Something fully godlike or fully human may be easily forgotten, but something that is both may capture attention in a powerful way. An anthropomorphic God not only sticks in our thoughts but is simply easier to think of as someone like us. Western religious images portray Jesus as a white European, despite the fact that a Middle Eastern Jew would look quite different. In Africa Jesus can appear as a black man; in South America, as a Hispanic man. Even more than the physical image of God, we project our individual beliefs onto Him. Ever wonder why people who condemn homosexuality also believe that God hates fags, whereas those who think homosexuality is merely a matter of attraction also believe that God loves us all? God seems to share our exact moral belief, even when it contradicts someone else's God-endorsed moral belief.

Because God talks to people through their thoughts, such conversations blur the line between their own minds and God's, and it takes practice to recognize which of their thoughts have divine provenance. This discernment between mundane and divine thoughts also appears to require social consensus, as congregants frequently relay a number of potentially godly

thoughts to other members, who then identify which ones seem reasonably divine. For example, thoughts that are self-centered (e.g. God says to buy a new stereo) are often seen as coming from the self, whereas thoughts of compassion (e.g., God says to volunteer at the soup kitchen) are collectively acknowledged as godly.

Once people are able to discern their divinely inspired thoughts, they are encouraged to have even more regular conversations with Him. Some women often speak of setting aside a night to have a “date with Jesus,” sometimes setting their dinner table for two: themselves and Him. During these dates people are encouraged to speak to God as if he were actually sitting there, directing his full attention and limitless love to them. As one congregant said about the Bible:

“It’s a love story, and it’s written for me.”

This kind of relationship would seem incredible to medieval believers, who saw God as a cold, inscrutable, and distant judge.

What about those who experience God directly, not in a symbolic way but via an intense, personal vision of God, in the style of Moses, Joseph Smith, or Muhammad? One scientist believes that he can elicit this religious experience in anyone, even the staunchest of disbelievers. Using the “God helmet,” a device that uses a weak electric current to stimulate a small area of the temporal lobe. Participants who wear this special helmet are placed in a completely darkened room with zero stimulation. They are seated comfortably in a large armchair and covered with a blanket. The current is turned on, and they spend the next hour alone in complete darkness—but are they really alone? Participants soon report strange sensations, such as spirits in the room, rising out of their bodies, and an overwhelming feeling of a presence. Sometimes they experience God.

If you know that you’re in a lab, this may be simply a fun adventure in tricking the brain, but imagine the consequences if someone were to have the same experience in a mosque, in a synagogue, in a church, or even home alone at night. Such an experience could be a life-changing revelation for a believer or even cause a skeptic to rethink his views. The God helmet suggests that some of the deepest and most transformative religious experiences could stem from the simple overstimulation of neurons. However, many scientifically sophisticated believers suggest that it cannot be any other way. God—through evolution—gave us the kind of brain that can know Him, not through something magical but through the same neural processes by which we know other truths in the world, such as the love of our children and the freshness of the air after a thunderstorm.

This is why I believe that god is a creation of man. It serves both as a way to control the masses—before the almighty dollar and the economic control of modern times—but it’s also a huge placebo/consolation prize for people. ‘Everything’s okay because bad people go to hell and god is watching over me. Worst case scenario my entire life sucks but when I die I’m going to be placed in paradise of infinite eternal happiness. Right?’ I can’t get over how much that sounds like an idea of man, not something that man stumbled upon because we’re so special.

It is said that God created human beings in His own image; but what we can state with certainty is that human societies create God in their own image. As Xenophanes famously proclaimed:

“If lions and horses had agile hands, they would paint gods as lions and horses.”

All gods are homemade, and it is we who pull their strings, and so, give them the power to pull ours.

“Meanwhile, elsewhere there are an infinite number of other universes each with its own God dreaming the cosmic dream. It is said that men may not be the dreams of the Gods, but rather that the Gods are the dreams of men.”

Gods are great. But the heart is greater, for it is from our hearts they come, and to our hearts they shall return.

I think I understand that religious faith which makes the holy brave and strong; my strength is just somewhere else—it’s in myself. I do not fear what may await me, though I’m equally confident that nothing awaits.

Does this guy Jesus Christ’s life have something to teach me even if I don’t, or can’t, believe he was divine? What am I supposed to make of the claim that someone who was God’s relative, and so could have turned the cross into a planter or something with just a word, still voluntarily let them nail him up there, and died? Even if we suppose he was divine—did he know? Did he know he could have broken the cross with just a word? Did he know in advance that death would just be temporary—because I bet I could climb up there, too, if I knew that an eternity of right-hand bliss lay on the other side of six hours of pain. But does any of that even really matter? Can I still believe in JC or Mohamed or Whoever even if I don’t believe they were actual relatives of God? Except what would that mean, to “believe in?”

Religion is the sigh of the oppressed creature, the heart of a heartless world, and the soul of soulless conditions. It is the opium of the people.

The Epic of Gilgamesh is the world's oldest work of literature, going back in Mesopotamian oral tradition more than 5,000 years. Though unknown to many in the West, its narrative has influenced countless themes of humankind: there is a great flood, and there was an ancient time that existed before the deluge; there is a serpent that upends immortality; there are parables and rules that suggest moral codes for living one's life; and there are warnings of the dangers of absolute power on earth. Gilgamesh's story is so universal that references to it reached thousands of miles away into Egyptian and Hittite courts, into Greek and Roman literature, and even into the two great Judeo-Christian and Islamic books. Gilgamesh links East and West, antiquity and modernity, poetry and history.

While I cannot disprove the existence of every possible kind of deity, we can be sure that we do not live in a world that was created by a god who is all-powerful, all-knowing, and all good. Christians, of course, think we do live in such a world. Yet a powerful reason for doubting this confronts us every day: the world contains a vast amount of pain and suffering. If god is all-knowing, he knows how much suffering there is. If he is all-powerful, he could have created a world without so much suffering. If he is all-good, he surely would have created a world without so much suffering.

Christians usually respond that god bestowed on us the gift of free will, and so is not responsible for the evil we do. This response fails to deal with the suffering of those who drown in floods, are burned alive in forest fires caused by lightning, or die of hunger or thirst during a drought. Sometimes Christians attempt to explain this suffering by saying that all humans are sinners, and so deserve their fate, even if it is a horrible one. But infants and small children are just as likely to suffer and die in natural disasters as adults, and it seems impossible that they could deserve to suffer and die.

Even if one were to accept all this, however, the problem remains unresolved. For humans are not the only victims of floods, fires, and droughts. Animals, too, suffer from these events, and since they are not descended from Adam and Eve, they cannot have inherited original sin. In earlier times, when original sin was taken more seriously than it generally is today, the suffering of animals posed a particularly difficult problem for thoughtful Christians. The seventeenth-century French philosopher René Descartes solved it by the drastic expedient of denying that animals can suffer. They are, he maintained, merely very ingenious mechanisms, and we should not take their cries and struggles as a sign of pain any more than we take the ticking of a clock as a sign that it has consciousness. That claim is unlikely to convince anyone who lives with a dog or a cat.

Many Christians when pressed on this fall back on the claim that we should not expect to understand god's reasons for creating the world as it

is. It is as if an ant should try to understand our decisions, so puny is our intelligence in comparison to the infinite wisdom of god. This is the answer given, in more poetic form, in *The Book of Job*. But once we abdicate our own powers of reason in this way, we may as well believe anything at all.

The evidence of our own eyes makes it more plausible to believe that the world is not created by a god at all. If, however, we insist on divine creation, the god who made the world cannot be all-powerful and all-good. He must either be evil or a bungler.

“You are wrong about gods, and you have wasted a significant portion of your life devoted to groveling before figments of your imagination. There will be no afterlife, no reuniting with loved ones, and no salvation for the ‘sins’ you think you have committed. Every moment you have spent in prayer has been squandered because there isn’t anything out there altering the universe for you. You have based much of your life on a lie, and you are a moron for doing so. I reject your values, your morality, and everything you hold dear.”

The difference between my darkness and your darkness is that I can look at my own badness in the face and accept its existence while you are busy covering your mirror with a white linen sheet. The difference between my sins and your sins is that when I sin I know I’m sinning while you have actually fallen prey to your own fabricated illusions.

Religion is a fraud, what god would intentionally create humans.

God’s ostensible support of war comes from the importance of group coordination in evolution. In the evolutionary landscape, people and their genes were threatened not only by wild animals and lazy individuals but also by rival groups. When resources become scarce or tensions are high, it takes little to prompt one group to attempt the destruction or enslavement of a competing group. The winning group is then free to enjoy the spoils of victory, spreading both their genes and their religion. The most functional religions, therefore, are ones that encourage not only intragroup cooperation but also intergroup dominance.

Although atheists often bemoan religion-induced aggression, consider the point of view of the religion itself. Imagine that you are a god with your own religion and you are competing for believers with lots of other gods, each with their own religions. In other words, you are a religious entrepreneur. How should you design your religion and brand yourself to earn maximum market capitalization?

First, you want to encourage your members to have a lot of children, because they are easily indoctrinated and typically adopt the views of their parents. Second, you want to encourage missionaries to spread your Word across the land and reach new markets. A religion with no children and no missionaries would die as soon as its current believers die. Third, you would want to have reasonably unique views—a distinct brand—to ensure that your religion stands out from others. Research in marketing finds that brand distinctiveness is a key to luring customers and out-competing competitors, and religion is no different. Fourth, you would want to discourage dissent or free thinking, since free thinking could lead people to believe in gods other than you. Fifth and finally, you would want to destroy any other competing religions, whether through marketing campaigns, lawsuits, or outright violence. Regardless of their ultimate truth, religions that have many or all of these features tend to out-compete rival religions.

Consider the world's most popular religion: Christianity. Both Catholicism and Evangelical Protestantism encourage kids and missionaries, the reliance on authority—whether through the pope or the unchanging Bible—and the occasional use of violence against threats. These principles can also explain why Mormonism is one of the fastest-growing religions in the United States, with an increase of 45.5 percent from 2000 to 2010. Mormonism encourages many children, formalizes missionary work by sending young men abroad to spread the Word, and also takes a large annual tithe (10 percent of income) to help build the church's influence and support group projects. Although Christian, Mormons also have unique views, believing that Jesus came to the New World after his crucifixion and that the angel Moroni revealed a set of golden tablets to Joseph Smith in upstate New York. Mormons have also used violence to protect their views, such as in the Mountain Meadows massacre, which left dead a hundred men, women, and children.

Traditionally, religions have propagated themselves by giving children no choice in the matter until habit and social peer pressure can take over. That's a less effective strategy these days.

If the only way you can make your belief persist is to lie to children, if that's the only way this thing can persist, its not worth it, it should disappear.

Religions may have qualities that help them spread from mind to mind, but they must also help their believers in return. One important benefit of believing in a powerful supernatural agent is that belief furnishes people with a sense of control in an otherwise random world. Uncertainty makes people see mind because minds are relatively easy to understand. Consider the question of why earthquakes happen. One reason, provided

by geophysicists, stems from the instability of subduction zones, in which one tectonic plate dives under another and releases a tremendous amount of energy. While technically true, a better explanation for earthquakes—psychologically speaking—is that they are expressions of God’s anger. This explanation also affords a sense of control, as earthquakes can be avoided as long as God stays happy.

The need for control and the belief in God may help explain why the wealthy are the least religious. Of Americans making under \$10,000 a year, 83.8 percent report some belief in God, with 64.7 percent being strong believers. In contrast, only 68.7 percent of Americans making over \$150,000 report some belief in God, with only 40.2 percent being strong believers. The wealthy feel control and agency in their day-to-day lives and so have little need for divine order. In contrast, those struggling with poverty face a number of challenges in their day-to-day lives, and the comfort of a caring creator may serve to create order in an otherwise chaotic world.

The appeal to common sense turns out to have quite strict limits. Almost everything that modern science tells us is intuitively untrue, and much more interesting than common sense can imagine. If the defense of scientific knowledge is that it can be supported by evidence, this too turns out to be more complicated and much less secure than seemed obvious 150 years ago. The things that we take for granted—democracy, equality, human rights, and so on—turn out to be very easy to deny, in theory, as well as in practice, and impossible to justify except by their fruits. They are just as vulnerable to the charge of absurdity as most religions are.

Some are using science the same way some priests do—always promising a better tomorrow in another place, while allowing worsening living conditions here today. ‘Science for a better tomorrow’ is their ‘Religion for a better afterlife.’

For many ideologies, a truly key feature is that, at least for their adhering leaders, their doctrines impart a sense of righteous superiority, of knowing something that the infidels and even the mere laity do not. You cannot burn the heretics without such a conviction that you are in possession of superior truth and insight. And, you can not believe in your own superior knowledge without acknowledging that lesser folk are stuck in the mud of mythos and foolishness.

Perhaps you too have noticed the disturbing trend that many people follow nowadays to just blindly believe every statement shoved their way so long as you put ‘science’ in front of it. Any attempt to question the method used, the results found, or the person/group conducting the study is frequently refuted with ‘shut up you stupid fool, it’s Science!’ Fool is the new heretic. In one of the ultimate ironies, the pursuit of Science has become

one of the fastest growing religions today, despite its supposed resistance to it.

It requires a naïve belief in scientific objectivity. Even in the physical sciences, everything from quantum mechanics to Information Theory has shown that an act of observation is itself part of the phenomenon observed and is analytically inseparable from it. It's now pretty much universally accepted that (a) meaning is inseparable from some act of interpretation and (b) an act of interpretation is always somewhat biased, i.e., informed by the interpreter's particular ideology.

It's important to remember that scientists are just people, each subtly influenced by a set of assumptions and beliefs, each guided by a unique assortment of ambitions, passions, and incentives. Most science is plastic enough that it can be influenced, consciously or otherwise, by the desires of the experimenter. Several surveys of peer-reviewed articles have showed that those studies done with the support of an interested party were more likely to produce a result favorable to that party. The facts researchers produce are constructed in part from observation of reality and in part from the forces that constrain that observation.

The reality of science is that it can't call everything into question at the same time. It has to stand on certain assumptions which for the time being are not challenged, in order to test other things.

Often it isn't scientific phenomena they're observing and tabulating, but rather a set of human behaviors, and a lot of human behaviors are—to be blunt—moronic. Try, for instance, to imagine an authoritative ethics textbook whose principles were based on what most people actually do.

That is the tip of the iceberg. Reproducibility in science is not very sexy. Because our scientific culture generally rewards innovation over cautiousness, replicating a study conducted by others will not get a researcher a publication in a high-end journal, a splashy headline in a newspaper, or a large funding grant from the government. Only an estimated 0.15% of all published results are direct replications of previous studies.

Much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness. Poor methods get results.

It is simply no longer possible to believe much of the clinical research that is published, or to rely on the judgment of trusted physicians or authoritative medical guidelines. I can't tell you exactly what percentage of the trials are flawed, but I think the problem is far bigger than you imagine, and getting

worse. It is so easy to manipulate data, conceal it or fabricate it. There is almost a code of silence not to speak about it.

In one study, more than 70% of researchers tried and failed to reproduce another scientist's experiments, and more than half failed to reproduce their own experiments. 40% of scientists admit that fraud always or often contributes to irreproducible findings.

Doing Good

Religion is an insult to human dignity. With or without it you would have good people doing good things and evil people doing evil things. But for good people to do evil things, that takes religion.

I think it's got something to do with how people should behave. I think you should do things because they're right. Not because gods say so. They might say something different another time.

“A common and natural result of an undue respect for law is, that you may see a file of soldiers, colonel, captain, corporal, privates, powder-monkeys, and all, marching in admirable order over hill and dale to the wars, against their wills, ay, against their common sense and consciences, which makes it very steep marching indeed, and produces a palpitation of the heart. They have no doubt that it is a damnable business in which they are concerned; they are all peaceably inclined. Now, what are they? Men at all? or small movable forts and magazines, at the service of some unscrupulous man in power? Visit the Navy-Yard, and behold a marine, such a man as an American government can make, or such as it can make a man with its black arts—a mere shadow and reminiscence of humanity, a man laid out alive and standing, and already, as one may say, buried under arms with funeral accompaniments. . . .”

—Henry David Thoreau

We often wonder how people of the past, including the most revered and refined, could have universally engaged in conduct now considered unconscionable. While retrospective judgment tends to make us feel superior to our ancestors, it should really evoke humility. Surely some contemporary practices will be deemed equally abominable by succeeding generations. The only question is: *Which ones?*

A “never again” mentality means understanding how atrocities can be normalized, how moral blind spots can cause us to overlook terrible suffering, and how real objectivity does not just require a sense of superficial balance, but a deep understanding of what matters. The past is frozen in amber. We can't go back and scream at those who were willfully blind to obvious crimes. But what we can do is try to look at our own era as we look at theirs, to think about what we'll look like in retrospect, and to try to do what we wish those others would have done. And we can ask if future historians are looking at us across time, pleading with us and asking a question for which

we have no good answer: Why didn't you stop it before it started? Why did you wait until it was too late?

It is crucial that we never confine ourselves to solely what is currently lawful, for the great evil of slavery happened within the confines of the law. The law is generally a poor metric of ethics. Most of history's worst mass crimes have been legal at the time.

“I, for one, support outlawing bad and will gladly sign a petition saying that bad should, in fact, be banned. Only the bad would support bad. And so I must support good, as must anyone who is good. I will, for that matter, go so far as to say that bad is bad and that good is good and would take issue with anyone who would say otherwise”

Obviously hilarious, but I think there is something to take away from this. The standardization of culture that came about with the rise of ubiquitous communication—post, radio, television—also brought marketing strategies to define good. For example, someone may hold the opinion that drugs are bad, not based on medical science or experience, but because they were forced to watch a bunch of fear-mongering public service announcements in the 50s. I was exposed to the art/culture of cyberpunk before I was interested in technology. One of the primary themes was the trans-valuation of values. That as control over discourse increased, what is called good would be more aligned in the interests of keeping established power structures in place rather than actual morality. In this way, what is disruptive can be called bad so as to oppose it not on practical grounds but moral/spiritual. Eventually this becomes a veil of ignorance that keeps the populace productive and tacitly supporting all kinds of atrocities.

Never trust people whose identity is caught up in appearing good.

Any moral code should be impossible to live up to fully. Otherwise one will either attempt to cheat, lie, deceive in order to gain the recognition, status, honor of a rare individual who might be able to achieve it fully. Any moral code capable of being lived to 100% by any large number of people will by necessity have been watered down, diminished, compromised, in order to allow more individuals into the elite, righteous, moral few.

It was to resist personal gain-seeking at the expense of the body politic and group solidarity that the world's major philosophies and religions for the past two-thousand years urged self-control, generosity, care for the weak and poor, and rules to limit the luxurious self-indulgence and anti-social egotism it bred in ruling elites. Excluding this intellectual legacy from the

curriculum has paved the way for inverting today's moral attitude upholding creditor claims against the rest of society.

The only time we should look in our neighbor's bowl is to ensure they have enough food.

Never look down on anyone unless you're helping them up.

What you have become is the price you paid for the things you thought you wanted. Choose carefully those things you want. Understand the cost.

We expect good things to get done our behalf, but we don't want to have to actually do the good things. You can't legislate morality, it has to be learned.

“If a mother in my presence thrashes her child, what shall I do? Consider that the question is what I must do, that is, what is good and rational, and not what my first impulse will be. The first impulse in the case of a personal insult is revenge, but the question is whether this is rational.

Precisely such is the question as to whether it is rational to use violence against the mother who is whipping her child. If a mother is whipping her child, what is it that pains me and that I consider evil? Is it that the child is suffering pain, or that the mother, instead of the joy of love, is experiencing the agony of malice? I think that in either there is evil.

One man can do no evil, for evil is the disunion between men. And so, if I want to act, I can do so only for the purpose of destroying the disunion and establishing the union between the mother and the child. What, then, shall I do? Shall I use violence on the mother? I shall not destroy her disunion (sin) with the child, but shall only introduce a new sin: the disunion between her and me. What, then, shall I do? I will take the child's place, and this will not be irrational.

To what Dostoevsky writes (which has always disgusted me) and what the monks and the metropolitans have told me—that it is lawful to wage war for the purpose of defense (‘to lay down one's life for one's brothers’)—I have always replied, ‘To defend with one's breast and to substitute oneself, yes; but to shoot people with guns, that is not defending, but killing.’”

Instead of ordering young men to be drilled and ready to kill, forgive and be ready to die for love and reason.

The surest way to work up a crusade in favor of some good cause is to promise people they will have a chance of maltreating someone. To be able

to destroy with good conscience, to be able to behave badly and call your bad behavior “righteous indignation”—this is the height of psychological luxury, the most delicious of moral treats.

You take away the sources of power and the man who was formerly a tyrant becomes just an old man.

Just as we typecast actors into enduring character roles, so too do we often typecast people in enduring moral roles, seeing them as either those who do moral deeds or those who receive them. More succinctly, we see others as either moral agents or moral patients. It is hard to imagine Joseph Stalin, George Bush, Barack Obama as a victimized moral patient because of all the evil they committed. Likewise, it is hard to imagine a poor orphan as a responsible moral agent because of all the suffering she feels. Moral typecasting is this phenomenon applied to morality and mind perception: when you see someone as a moral agent, you are blind to their patiency, and when you see someone as a moral patient, you are blind to their agency.

That heroes and villains seem insensitive to pain can make us treat them poorly. For very evil criminals we demand proportionately harsh punishment—not only to atone for their sins but also to overcome their perceived toughness and ensure they suffer enough. That we are especially cruel to the especially cruel is not surprising, but we sometimes seem to mistreat those we admire, easily forgetting the sacrifices of our heroes. We neglect the feelings of our parents, the trials of our mentors, and the suffering of our leaders.

Our schema for heroes is grounded in moral typecasting—those who do good seem tougher than us and better able to endure life’s tribulations. This ‘moral agent only’ schema means that the suffering of heroes is less salient and less demanding of empathy than that of others. When a normal person is punched, our heart leaps, but when Superman or Batman gets punched, we shrug it off because we expect them to do the same. If heroes seem tougher than most, then we may be more likely to give them pain. Admittedly, people seldom enjoy betraying the saintly, but often when push comes to shove—when someone has to be harmed—people harm their heroes.

Imagine a meeting at work where someone is being selected to develop client relationships in Siberia. Chances are the person packing her parka will be the person who has a history of doing previously thankless tasks. If you’ve done past good deeds, others see you as capable of handling terrible burdens that no one else wants to bear—whether that perception is true or false. So next time your selflessness is praised in front of others, beware: making sacrifices for others makes it easier for them to sacrifice you.

To those who see sexual orientation as a matter of biology and not morality, claims of its harmfulness seem hyperbolic, but the moral dyad

suggests that perceptions of harm are legitimate, even if disconnected from objective harm. Just as—despite many cues to mind—the objective criteria for mind-having are unclear, objective criteria for harm are also often elusive. Of course, there are some obvious cues to direct physical and emotional harm, such as bloodshed, crying, and death, but not all harm is so transparent.

Gay marriage seems not to cause death and dismemberment, but how are we to objectively disprove the idea that gay marriage causes “societal decay” or “spiritual damnation”? These kinds of harm are a matter of perception and are perceived when people see immorality. Such harm may seem nebulous, but people often see a direct link between this abstract harm and more direct suffering—a weakened America is more vulnerable to terrorists or race riots. Evil deeds inevitably create perceived suffering victims.

Those who see drug use as wrong think it harms teenagers; those who see flag burning as wrong think it harms disabled veterans; and those who see masturbation as wrong think it harms children. Suffering children are actually a common theme in moral uproar, because their status as vulnerable feelers makes them obvious moral patients. Perceptions of victimhood arise not from effortful justification but automatically from our dyadic moral minds.

In one study participants read about harmless misdeeds, such as defiling a corpse or using strange masturbation techniques, and then rated their harmfulness. Participants not only saw these wrongs as generally harmful but saw even more harm when given a strict time limit that precluded conscious reasoning. Another study in the same set revealed that people perceived more suffering in the faces of children—within milliseconds—after reading about masturbation and necrophilia.

If harm automatically accompanies judgments of immorality, then dyadic completion casts doubt on the very existence of ‘victimless wrongs.’ Harmless wrongs may be a logical possibility but—psychologically speaking—are exceedingly rare; only those who fail to see immorality fail to see harm. Because perceptions of harm are ever present in moral judgments, harm provides a powerful way of understanding morality across cultures.

We have to start talking about morals again. I feel like the left has become really consumed with this idea of desire: ‘What do you want?’ ‘What makes you happy?’ Rather than: ‘What is the moral content of my existence?’

“Love in action is a harsh and dreadful thing compared with love in dreams.”

Ambivalence toward do-gooders arises out of a deep uncertainty about how a person ought to live. Is it good to try to live as moral a life as possible—a saintly life? Or does a life like that lack some crucial human quality? Is it right to care for strangers at the expense of your own people? Is it good to bind yourself to a severe morality that constricts spontaneity and freedom? Is it possible for a person to hold himself to unforgiving standards without becoming unforgiving? Is it presumptuous, even blasphemous, for a person to imagine that he can transfigure the world—or to believe that it really matters what he does in his life when he’s only a tiny flickering speck in a vast universe? Should morality be the highest human court—the one whose ruling overrides all others?

To most people, most of the time, the choice between family and strangers is no choice at all: caring for strangers’ children as much as your own, say, would seem not so much difficult as unnatural, even monstrous. But the do-gooder doesn’t believe his family deserves better than anyone else’s. He loves his more, but he knows that other people love their families just as much. To a do-gooder, taking care of family can seem like a kind of moral alibi—something that may look like selflessness, but is really just an extension of taking care of yourself.

Political movements and religious orders have always known that a certain distance from the claims of family—sometimes to the point of celibacy or abandonment—is necessary for a total commitment to something larger. Abraham was ready to sacrifice his son; Agamemnon was ready to sacrifice his daughter; Buddha left his family behind. Saint Francis was brutal to his parents; Gandhi was brutal to his wife. Jesus says, in Luke:

“If anyone comes to Me, and does not hate his own father and mother and wife and children and brothers and sisters, yes, and even his own life, he cannot be My disciple.”

Sometimes the claims of actual family have been not explicitly rejected so much as incorporated into spiritual family, to the point of disappearance: all humans become brothers; God becomes a husband. A do-gooder might not go so far as hatred or abandonment, but the fact that he even asks himself how much he should do for his family and how much for strangers—weighing the two together in the same balance—may seem already a step too far.

Gandhi believed that the seeker after goodness is obliged to forswear close friendships and exclusive loves, because loyalty may tempt him to wrongdoing, and detracts from an impartial love of all mankind. Reviewing Gandhi’s memoir, George Orwell found this belief repellent. He wrote:

“The essence of being human is that one does not seek perfection, that one is sometimes willing to commit sins for the sake of loyalty, that one does not push asceticism to the point where it makes friendly intercourse impossible, and that one is prepared in the end to be defeated and broken up by life, which is the inevitable price of fastening one’s love upon other human individuals. It is too readily assumed that the ordinary man only rejects saintliness because it is too difficult: in other words, that the average human being is a failed saint. It is doubtful whether this is true. Many people genuinely do not wish to be saints, and it is probable that some who achieve or aspire to sainthood have never felt much temptation to be human beings.”

There is one circumstance in which the extremity of do-gooders looks normal, and that is war. In wartime—or in a crisis so devastating that it resembles war, such as an earthquake or a hurricane or a media-induced panic—duty expands far beyond its peacetime boundaries. In wartime, it’s thought dutiful rather than unnatural to leave your family for the sake of a cause. In wartime, the line between family and strangers grows faint, as the duty to one’s own enlarges to encompass all the people who are on the same side.

It’s usually assumed that the reason do-gooders are so rare is that it’s human nature to care only for your own. There’s some truth to this, of course. But it’s also true that many people care only for their own because they believe it’s human nature to do so. When expectations change, as they do in wartime, behavior changes, too. In war, what in ordinary times would be thought weirdly zealous becomes expected. In ordinary times, to ask a person to sacrifice his life for a stranger seems outrageous, but in war it is commonplace. Acts that seem appallingly bad or appallingly good in normal circumstances become part of daily life. In wartime, extreme malevolence is excused, and extreme virtue is also excused. People respond to this new moral regime in different ways: some suffer under the tension of moral extremity and long for the forgiving looseness of ordinary life; others feel it was the time when they were most vividly alive, in comparison with which the rest of life seems dull and lacking purpose.

This is the difference between do-gooders and ordinary people: for do-gooders, it is always wartime. They always feel themselves responsible for strangers—they always feel that strangers, like compatriots in war, are their own people. They know that there are always those as urgently in need as the victims of battle, and they consider themselves conscripted by duty.

“It then seemed to her that it was not enough to be a nurse, doing work that someone else would do if she didn’t. She would change her life, and she would do work that needed to be done but that other people would not do, because it was too hard or too dangerous.”

Some do-gooders say they’re only doing their duty: they’re only doing what everyone ought to, and if most people think their sense of duty is bizarre and unreasonable, then most people are wrong. They reject the idea that what they do is saintly or heroic, because to them, that’s another way of saying that most people needn’t even try to do such things. Praise is a disguised excuse. But of course it could be those do-gooders who are wrong. Nearly everyone believes that some acts go beyond the call of duty. Nearly every religion believes that there are some superior creatures, such as saints, who are capable of more than the rest of us. Some argue that it’s a fundamental part of human morality to call some deeds saintly or heroic—meaning that they’re very good to do but can’t possibly be demanded of anyone, because the sacrifice or courage they require is too great. To reject the idea of saintliness and heroism—to say that there is no such thing as “beyond the call of duty”—is to say that everyone must be a saint or a hero, in the same way that everyone must pay his debts and avoid stealing; and that would be ridiculous, a morality for angels, not human beings.

Do-gooders believe that most ordinary ideas about how much you owe to strangers, and how much duty can demand of you, are wrong. A do-gooder might believe, like any ordinary person, that you should save your wife rather than two strangers from drowning; but as the number of drowning strangers increases, the do-gooder will worry far sooner than the ordinary person whether it’s immoral not to change his mind. And the number of hours in the do-gooder’s life when he feels free to do entirely as he likes—when he owes nothing to the world, when he has done his duty, and what remains of his day and his money and his energy are his alone—are very few.

Nowadays, a moral theory according to which nearly everyone appears immoral to the point of depravity seems ridiculous. In the past, however, it’s worth remembering, the idea that nearly everybody was a wretched sinner seemed perfectly normal. The do-gooder belief that one is obliged to take care of strangers as well as one’s family can seem like a violation of human instinct; but human instincts do not all tend toward comfort and love. Sacrifice is a human instinct, too. There is an instinct to hoard for one’s family against future disaster; but there is, too, an instinct to send gifts out into the unknown. There is a sublime austerity about giving to unseen, unknown strangers, like the belief in an unseen and mysterious deity.

If it's unnatural to adopt the point of view of the universe, as do-gooders try to do, then it is equally unnatural to imagine the point of view of God.

“Before he watched his father die, he had thought mostly about the pain of animals. He had seen so much footage of terrified animals bellowing in slaughterhouses, of crippled animals infected and bleeding in cages, of animals whose legs hurt so much they couldn't walk—he had spent so many years of his life with these images and sounds in his head that suffering had come in his mind to mean something that humans inflicted on animals, the anguish of the weak and wordless inflicted by the strong. Now he had seen that there were humans trapped in places as brutal as feed cages, and when those humans suffered, their torment was as world-ending as the torment of animals who lived in wretchedness only in order to die. He had known that humans could suffer, of course. But that humans could suffer as helplessly as animals could—that there were humans who could not move, who could not feed themselves, who did not have language to say what was happening to them or to beg for relief—that, he had forgotten.”

Robespierre was a fierce do-gooder who killed his enemies for moral reasons, for justice; and there seemed something more sinister, and more powerful, about a morally passionate killer like him than there was about an ordinary revolutionary like Danton. After Robespierre, extreme moral conviction carried with it the shadow of violence; and after the Communist revolution in Russia reinforced the association, it was no longer possible to see a man who was convinced that he knew how to bring about a better world, and who was prepared to sacrifice himself for it, without thinking of death.

The Story Circle:

- | | |
|--|--|
| 1. A character is in a zone of comfort or familiarity. | 5. They get that which they wanted. |
| 2. They desire something. | 6. They pay a heavy price for it. |
| 3. They enter an unfamiliar situation | 7. They return to their familiar situation. |
| 4. They adapt to that situation. | 8. They have changed as a result of the journey. |

Preachy do-gooder characters are nearly always ridiculed for their self-righteousness, their puritanism, and their efforts to change other people.

“A character who possessed all the seven great virtues would never do as the hero of a novel. He would be perfect, and in consequence unsympathetic, for we are impatient and suspicious of human perfection.”

In fiction, it often seems that the imperfect and sinful are more profoundly human than the good, and so the preachy do-gooder is guilty not only of sanctimony but of a deeper failure to understand human nature. Characters whose emotions are stirred by ideals as much as people are not to be trusted: a character who is any kind of philosopher or theorist is likely to be deplored, either for foolish unworldliness or, if his ideas are effective, for violence. Wise characters are devoted to the complex, the particular, the intimate: to the densely drawn place, the ephemeral moment, and most of all, through love, to the individual person.

When these elements are brought together—the embracing of messiness and imperfection, the dislike of preaching, the prizing of the complex and particular and distrust of the abstract, the injunction to love real people close to you rather than an ideal of people in general—what they amount to is an implicit exhortation to accept the human condition. You should love humans as they are, not as they should or could be. You should embrace human nature, with all its suffering and sin, and accept that it will always be thus. You should accept the role of fate and luck in human life, and the limits of man’s ability to alter his lot. To fail to do these things is to become the sort of do-gooder who doesn’t love the world as it is, or the imperfect humans in it—only ideas inside his head.

The do-gooder’s goodness is not usually obedience—it is often, on the contrary, a revolt against the rules and customs he grew up with. Part of the reason do-gooders seem so strange is that they’re acting on their own. They are following rules that they laid down for themselves, driven by a sense of duty they have felt since they were too small to know what duty was, much less how anybody else thought about it. The people they came from thought they were as weird and extreme as anyone else did. They didn’t come from a community in which their sacrifice was normal, part of the order of things. In some circumstances, do-gooders do not look so odd. For do-gooders, it is always wartime; and in wartime, do-gooders look less zealous, their commitments less severe.

But war itself has changed, which may be one reason do-gooders look even odder now than they used to. War no longer demands sacrifice from

everyone. War for some rich countries is now, as often as not, something that happens to other people, somewhere far away. For most of human history, the sacrificing of self or child or work for something larger was ordinary, because conscription was ordinary. But many countries got rid of the draft decades ago. Not for a long time has it been a common experience in those countries to be expected, as a matter of course, to risk your life, or those of your family members, for the sake of your country. It may be that, in the absence of this older form of duty, the sense of duty to family has expanded to take its place, so that sacrificing family for a cause now seems unnatural and extreme.

Why shouldn't people be spurred to action as much by the existing shame of their country's injustices as they are by the threatened shame of conquest? Why shouldn't the commitment and fellowship and urgency of war be grafted onto the morality of ordinary times?

When people hear about do-gooders, many of them say: "But aren't they mentally ill?" An extreme sense of duty seems to many people to be a kind of disease—a masochistic need for self-punishment, perhaps, or a kind of depression that makes its sufferer feel unworthy of pleasure. Surely those who suffer from a disease like that must live dark, narrow lives, overcast by responsibility, forcing themselves always to think about the misery of others and to endure misery themselves. Surely they must be perpetually crouched in some dank office, bolting a bowl of reheated noodles before racing off to the next emergency.

In fact, some do-gooders are happy, some are not. The happy ones are happy for the same reasons anyone is happy—love, work, purpose. It's do-gooders' unhappiness that is different—a reaction not only to humiliation and lack of love and the other usual stuff, but also to knowing that the world is filled with misery, and that most people don't really notice or care, and that, try as they might, they cannot do much about either of those things. What do-gooders lack is not happiness but innocence. They lack that happy blindness that allows most people, most of the time, to shut their minds to what is unbearable. Do-gooders have forced themselves to know, and keep on knowing, that everything they do affects other people, and that sometimes (though not always) their joy is purchased with other people's joy. And, remembering that, they open themselves to a sense of unlimited, crushing responsibility.

It happens often in politics that people will criticize those who are clearly in the right morally, but will moan about them being "smug" or "arrogant," and dismiss their side, thus helping the people who are clearly the real bad guys. We see it all the time when people criticize environmentalists, civil rights activists, civil liberties activists, and others who are actually trying

to do something about the problems of the world. We may not have to deal with institutionalized slavery these days, but we still have to deal with the very weak human mind that will put up with and rationalize any moral injustice as long as it's the norm; and many are still hostile towards anyone who tries to change it, even when they agree with them.

What is the difference between helping, which doesn't work, and helping, which does? Why is one a disease and the other the road to health? The difference seems to be the difference between helping from above and helping someone like yourself—between telling someone what to do and telling someone what you've done. What is a blessing coming from a sinner is malignant coming from a saint. So sit down and shut the fuck up Bill—and stop funding the pandemic cosplay industry, it makes people stupid, though, we suspect, that might be precisely what you and your billionaire buddies want; it sure is easier to “nudge” a population you've totally knocked off balance with fear. Better enjoy those billions while you can Billy, we're coming for them.

For those that are not wealthy philanthropic douchebags, the logic of codependency suggests that helping is often a disease, because the one who helps is not free. She may believe that she chose to become a therapist, say, because she liked the work, but in fact she needed to do the work, had no choice but to do some work of that sort, because she could not see people in trouble without feeling obliged to help them. But then the question becomes: Is she wrong to feel that way? When she feels responsible for helping other people, is she making a mistake?

Anyone who acknowledges the force of morality at all feels bound to do something. A person who understood herself to be freely choosing a moral life as just one option among others, with no obligation involved—who might with the same sense of freedom have chosen to spend her life throwing pebbles into a bucket—would not be more free but more confused. A person who feels herself wholly unfettered, unbound by duties of any kind, is not free, but a sociopath. And it's not only do-gooders and codependents who crave duty: duty gives meaning and structure to a life. Without it, there can be no home—only the aimless freedom of a tourist. Moral intuitions, like all intuitions, come from somewhere. Suppose a person grows up feeling responsible for helping others because her good parent taught her to do so. What is the difference between a sense of duty that comes from a good parent and a sense of duty that comes from a bad parent? Is one less free or true than the other? Perhaps evil in sub-lethal quantities begets its own cure, as antibodies are produced by an injection of poison.

But any of these stories might have turned out differently. One step over the brink and their commitment might have looked like craziness, or

cruelty. Do-gooders are different from ordinary people because they are willing to weigh their lives and their families in a balance with the needs of strangers. They are willing to risk the one for the sake of the other. They, like anyone else, believe that they have duties to their families, but they draw the line between family and strangers in a different place. It's not that they value strangers more: it's that they remember that strangers have lives and families, too. When this willingness results only in calculated sacrifice, that's one thing; when it results in destruction, it's another. How things turn out depends partly on the choices of the do-gooder, but partly on luck. It might seem that moral judgment shouldn't depend on luck—surely you can't be blamed for something you have no control over. But, in fact, luck affects moral judgments all the time. Someone who attempts murder but fails is judged differently from someone who succeeds. And someone who lives the life of a do-gooder, attempting to relieve the pain of strangers without ruining the lives of those he is close to, is judged, too, on his success.

What would the world be like if everyone thought like a do-gooder? What would it be like if that happy, useful blindness fell away and suddenly everyone became aware, not just intellectually but vividly, of all the world's affliction? What if everyone felt obliged to put aside the work he had chosen and do something about that affliction instead? What if everyone decided that spontaneity or self-expression or certain kinds of beauty or certain kinds of freedom were less vital, or less urgent, than relieving other people's pain? What if everyone stopped believing it was his duty to protect and comfort and give to his family as much as he could, no matter what, and started thinking that his family was no more important or valuable than anyone else's?

If everyone thought like a do-gooder, the world would not be our world any longer, and the new world that would take its place would be so utterly different as to be nearly unimaginable. People talk about changing the world, but that's not usually what they mean. They mean securing enough help so there is less avoidable suffering and people can get on with living decent lives; they don't mean a world in which helping is the only life there is. If there were no do-gooders, on the other hand, the world would be similar to ours, but worse. Without their showing what a person can do for strangers if he sets himself to do it, fewer would try. It may be true that not everyone should be a do-gooder. But it is also true that these strange, hopeful, tough, idealistic, demanding, life-threatening, and relentless people, by their extravagant example, help keep those life-sustaining qualities alive.

This is the story of a wise old man and a smart-aleck boy. The smart-aleck boy wanted to show up the old man as a fool. The boy had captured a small bird in the forest. His plan was to go to the old man with the little

bird cupped inside his hands so that only the small tail of the bird protruded. Then he'd say with a sneer, 'Old man, what do I have in my hand?' And the wise old man would say, 'You have a bird, my son.'

Then the boy would say with confronting disdain, 'Old man, is the bird alive or is it dead?' And if the old man said the bird was dead, the boy would open up his hand and the bird would fly away free into the forest. But if the old man said the bird was alive, then the boy would begin to crush the bird in his cupped hands, and to crush it and crush it until the little bird was dead, and then he'd open his hands and say, 'See, old man, the bird is dead!'

So the smart-aleck boy, as planned, came to the old man with the bird hidden in his cupped hands, and he said, "Old man, what do I have in my hands?" The old man said, "You have a bird, my son." Then the boy said, "Is the bird alive or is it dead?" And the wise old man softly said, "The bird is in your hands, my son."

One challenge raised by the backlash against moral exemplars is how moral entrepreneurs can hope to change majority views. One suggestion comes from the effect of the manipulation on attitudes toward eating meat. The opportunity to derogate do-gooders may have the ironic after-effect of making majority members less resistant to minority values in the face of threat. Given the tentative and unpredicted nature of this result, however, more research is needed to ensure that it is reliable and to better establish its mechanism.

Part of our problem is that we are removed from more and more each year in the name of progress. Now, this is not some hippie argument saying we should 'just stop paving over fuckin everything man.' The shooting of unarmed people are abstracted by our various screens. The imprisonment of hundreds without trial is abstracted by our screens and mostly subservient journalists. The cruel lives of our food sources are abstracted by the farmer, truck driver, butcher, plastic packaging. Our poverty doesn't leave people dead in the streets from malnutrition, but instead dead in hospital beds from heart attacks, diabetes complications, preventable disease.

We forget that our adaption to civilization is in its infancy, a mere blip on our evolutionary timeline. Could we continue our lives if we personally witnessed these killings? Heard the shots, the reactions of others, the smell, the sounds of a dying man. All removed by the frame of the video, the medium lacking full sensory experience. Could we continue to farm as we do, if we saw the results, heard the cries? If we truly understood the cause and effects of our nutrition and healthcare policies, would we continue the way we are?

The "humans are inherently an awful species" bunch, applies the false

notion of animal instinct to humans. It is subtle of course, because it is taboo in most circles to make much of a connection between humans and others, but it is there nonetheless. Assuming the greed, violence displayed today is something inherent and unchangeable. This is of course not true. Certainly our biological hardware has given us the ability to create software which has then allowed us to create immense damage to the planet and ourselves. But our biological hardware is not necessarily required to run this software, we can run stuff which does not promote greed and violence, we simply choose not to or believe not to due to the lies about the permanence of certain aspects of our species. In fact, this was largely true until the real, basic foundations of our current civilization were really laid. In many social groups, helping others helped yourself, we need to get back to a similar model.

Abstraction is the tool which allows a few to gain control over your life. And perhaps you really don't give a shit about animals, unarmed deaths, or healthcare. But there is without a doubt something that you do care about. And just as you are going to desire the time, power, resources to influence how that thing is dealt with, there are those that desire the same for these three issues. Protecting and promoting their power and right to do so, protects and promotes yours as well. You need not endorse it, but you should not suppress it.

“I am the wisest man alive, for I know one thing, and that is
that I know nothing.”

—Plato

For Epicurus, the purpose of philosophy was to attain the happy, tranquil life, characterized by ataraxia—peace and freedom from fear—and aponia—the absence of pain—and by living a self-sufficient life surrounded by friends. He taught that pleasure and pain are measures of what is good and evil; death is the end of both body and soul and should therefore not be feared; the gods neither reward nor punish humans; the universe is infinite and eternal; and events in the world are ultimately based on the motions and interactions of atoms moving in empty space.

The first line of Epictetus' manual of ethical advice, the *Enchiridion*—“Some things are in our control and others not”—made me feel that a weight was being lifted off my chest. For Epictetus, the only thing we can totally control, and therefore the only thing we should ever worry about, is our own judgment about what is good. If we desire money, health, sex, or reputation, we will inevitably be unhappy. If we genuinely wish to avoid poverty, sickness, loneliness, and obscurity, we will live in constant anxiety

and frustration. Of course, fear and desire are unavoidable. Everyone feels those flashes of dread or anticipation. Being a Stoic means interrogating those flashes: asking whether they apply to things outside your control and, if they do, being ready with the reaction ‘Then it’s none of my concern.’

Epictetus also won me over with his tone, which was that of an enraged athletics coach. If you want to become a Stoic, he said, “you will dislocate your wrist, sprain your ankle, swallow quantities of sand,” and you will still suffer losses and humiliations. And yet, for you, every setback is an advantage, an opportunity for learning and glory. When a difficulty comes your way, you should feel proud and excited, like “a wrestler whom God, like a trainer, has paired with a tough young buck.” In other words, think of every unreasonable asshole you have to deal with as part of God’s attempt to “turn you into Olympic-class material.” This is a very powerful trick.

Both Stoicism and Epicureanism are branches of proprietor ethics, but only Stoicism—in various degraded forms—could be turned into sermons for servants. An ‘Epicurean slave morality’ means: no, we will not be content to do our “duty,” and yes, actually we do want what you—up there—have, but we intend to make much wiser use of it.

Every decent man is ashamed of the government he lives under. It doesn’t have to be this way.

Every virtual reality game is a version of Plato’s “Ring of Gyges” problem. As Plato tells the story, Gyges was a guy who came across a ring of invisibility and used that power to seize possession of a queen and a kingdom. The point of the story is to raise the question: What would keep you moral if you had the power of invisibility—that is, freedom from detection, or the power to get away with it? This is what virtual-reality games give us (and lucid dreams, for that matter). We are often encouraged to do all the stuff we could never do and would never do in real life, for the thrill of it. But what happens to us as we do it? How does our moral character change as we flex our talents for immorality in virtual spaces?

What would you do, if you had limitless resources and an entire world to play with—and there was no one around to judge you? What parts of you would rule your actions? Would you build tremendous things? Would you become a destroyer of that world? Would you inflict harm on the beings in it for the dark pleasure of doing so? Would you create industrial “mob farms” that generate monsters and kill them in great numbers, just so that you can harvest the things they drop when they die?

Everything not analogous to being able to flap my arms and fly like a bird is simply arbitrary. Some arbitrary decisions are far more defensible than others. We do not argue about the arbitrariness of a particular rule, construct, et cetera, but instead about the defensibility of the arbitrary

decision. Morals are arbitrary, much “logic” is arbitrary, ideologies are arbitrary.

When it comes to using extreme cases in thought experiments, I find them troubling because I often see them as distracting us from what the larger project of morality ought to be. In the case of having enough food to only feed one child, I don’t think there’s any moral choice to be made. One is being forced to commit an injustice by letting one of the children die, due to larger, societal injustices that allow individuals to live in such poverty. Moral examination shouldn’t lead us to deciding whether we ought to choose the life of a human over the life of a dog—or one child over another—but how to live day-to-day, how to be better.

Nietzsche characterized moral philosophy as the use of bad logic to prop up inherited prejudices. Nietzsche was not saying that morality is a waste of time and we all ought to run out and do whatever happens to come into our heads, from whatever source. He was saying that we don’t yet know the first thing about morality, because we’ve allowed bad logic and inherited prejudices to get in the way of asking the necessary questions—because we haven’t realized that we don’t yet have any clear idea of how to live.

I have become increasingly disturbed by how many people believe that there is no such thing as objective moral truth.

I believe that there are true answers to moral questions, just as there are to mathematical ones. Humans can perceive these truths, through a combination of intuition and critical reasoning, but they remain true whether humans perceive them or not. I believe that there is nothing more urgent for me to do in my brief time on earth than discover what these truths are and persuade others of their reality. I believe that without moral truth the world would be a bleak place in which nothing mattered. This thought horrifies me.

We would have no reasons to try to decide how to live. Such decisions would be arbitrary. We would act only on our instincts and desires, living as other animals live.

I feel myself surrounded by dangerous skeptics. Many of my colleagues not only do not believe in objective moral truth—they don’t even find its absence disturbing. They are pragmatic types who argue that the notion of moral truth is unnecessary, a fifth wheel: with it or without it, people will go on with their lives as they have always done, feeling strongly that some things are bad and others good, not missing the cosmic imprimatur. To me, this is an appalling nihilism.

Subjectivists sometimes say that, even though nothing matters in an objective sense, it is enough that some things matter to people. But that shows how deeply these views differ. Subjectivists are like those who say,

“God doesn’t exist in your sense, but God is love, and some people love each other, so in my sense God exists.”

I am an atheist, but when it comes to moral truth I believe what Ivan Karamazov believed about God: if it does not exist, then everything is permitted.

We have the ability to make the future much better than the past, or much worse, and I know that I will likely not live to discover which turns out to be the case. I know that the way we act toward future generations will be partly determined by our beliefs about what matters in life, and whether we believe that anything matters at all. This is why I continue to try so desperately to prove that there is such a thing as moral truth.

I am now sixty-seven. To bring my voyage to a happy conclusion, I would have to resolve the misunderstandings and disagreements that I have partly described. I would need to find ways of getting many people to understand what it would be for things to matter, and of getting these people to believe that certain things really do matter. I cannot hope to do these things myself. But I hope that, with art and industry, some other people will be able to do these things, thereby completing this voyage.

Purists always force us to examine our own beliefs. It’s true that the moral standard Thoreau set was impossible—he was often vexed by his own failure to meet it. “I cannot fish without falling a little in self-respect,” wrote the sporadic vegetarian.

Today’s progressive may be inclined to dismiss Thoreau’s obsession with purity—an ethical lifestyle being impossible under capitalism—and while this attitude isn’t wrong, it does miss something crucial.

While Thoreau’s refusal to pay the poll tax didn’t slow the operation of the state, it was brilliant propaganda. He forced his peers to examine a machine they might have preferred to ignore, and showed his neighbors—and, later, his readers—that it was possible to say no, even for a day. His attempts at purity expand the imagination, showing us things need not be as they are. His forays into the wild form the other side of this story, offering a glimpse into the lives we could be living. Ultimately, both his guilt over complicity and his sense of connection to the outdoors seem to come from the same radical empathy for all other beings.

The culture of “it’s not my business” and “each to his/her own” negates the idea that the world is in fact our business and we should have a reciprocal relationship with both the planet and with the people who help provide us with a home and a life. Instead, there’s a sense of entitlement, especially in “first world” countries.

Like an old man living above some college students, the moral noise is deafening. One would like to simply be let alone, to live and let live, if not

for that fucking noise. The screams, wails, cries, cheers, taunts, praises.

The first rule of creating and maintaining a good world, or a good society, is living in something approximating the truth. If you are delusional, you cannot make good decisions. The second rule is that your ethical system must, if applied, create a good world.

This is harder than it seems. Ostensibly, we all agree that murder is bad, theft is bad, fraud is bad, and so on. We say that every human life has value and that all humans were created equal. We say that all life has value.

But in our actual actions we prove that we believe none of these things. We excuse mass murder by our own countries. We prioritize the deaths of people not like us over people like us—generally at very high ratios. We place human life over animal life, to the point where we are genociding multiple species every day. We prioritize property over human life more often than not, refusing to spend small amounts of money that would; easily save lives. We have enough food to feed everyone but don't. We have enough industrial capacity to give everyone a decent life, but don't.

We have known for decades that we were killing off animal species and did far too little. We have known about climate change for decades and done essentially nothing.

Our ethics are monstrous. They have led to a great die-off of other animals. They currently cause the death and suffering of hundreds of millions of humans who need do neither.

Until we value everyone's life, and until we value the life of other animals at least to the point where we aren't genociding them, we will not and cannot have a good world overall.

It is often said, by the supporters of the current regime, that things have never been so good, but I don't believe the statistics. Even if they were true, it would not matter, because the reality they describe is not sustainable. If I know I'm doing something which makes me comfortable today but will lead to mass death tomorrow, that isn't ethical, and that's what we are doing.

We can have that good world when a Somali's life matters as much as an American's and when both a billionaire and a poor person receive quality health care. We can have a good world when the possibility of a species extinction is considered, and treated as an emergency. We can have a good life when we look at the human footprint in the world and we don't allow it to destroy multiple other species. We can have a good world when we make sure everyone gets fed, everyone has a decent set of material goods, and everyone is free to do more or less as they choose, so long as their actions are less harmful than the good they do, and don't lead to the foreseeable and preventable suffering and death of others.

It is insane that we are worried about AI and robotics, for example. The idea that machines might be able to do the work that humans do should fill us with joy. It's insane that we cannot imagine a world in which humans do not have to do mostly meaningless drudge work to survive; that we cannot figure out how to distribute resources to people without making them spend the better part of their waking adult lives doing shit they'd rather not do.

If you'd win the lottery and keep your job, congrats, you are the exception. Most people would not.

The right thing to do is generally the right thing to do. It is the great tragedy of the human race that we don't believe that being kind and not hurting other people, or preventing suffering and enabling people to do what they will so they hurt none, and not being mass murderers of other species, is in our self-interest.

It is precisely in our self interest—it is the only way we will ever create a world that is really good to live in for the vast majority of the world's residents.

The great task is trying to figure out a social system that aligns with ethics. This is where the critics will cry about how human nature is incompatible with doing the right thing. Perhaps that is so, though I do not believe it. But if it is so, Earth will remain hell for far too many, and we are in some danger of wiping ourselves out, along with all our victims in the non-human world.

But perhaps it is not so, and just as we could not fly until recently, we simply haven't figured out yet how to be good at scale. And perhaps we should treat this problem as the most important problem in our society, because everything else which seems important from climate change, to war, to fascism, is simply a manifestation of the fact that we suck at being ethical; at being kind.

All lives have value. Everyone's suffering matters. Everyone should have a good life. These are prescriptive statements: statements that to be true, we have to make true. They are truths that will never be absolute, we will never reach 100 percent. But we can get far closer than we are today, and it is on us, as a species, if we do not.

It is a choice. Good and evil are a choice. And the first step towards evil is to say, 'The pain of people like me matters more than the pain of people who are not like me.'

It is not my job to make you do what you know it is right, that is merely your excuse for not doing it.

“What do you think of the argument that if you wish to have any credibility in order to be listened to when you call for

these cultural changes, that you first have to display your own personal daily adherence to modeling these cultural changes in your own life to where all your neighbors can see you doing it?"

I think that sort of "credibility" doesn't necessarily win arguments anyway, as it usually also falls short of absolute perfection, and those who don't want to listen will point to this, find some blemish as it were, and say it ruins the whole thing.

I really think a lot of people are just doing it for their own conscience though, which by definition will not, cannot, save the world. There may often be a resignation that a world as evil as this one—or more accurately, this culture is evil—can't be saved. It's an entirely different way of looking at it to think people are deluded into thinking their small steps matter, and thinking they are resigned to the world going to hell, and just want to die at peace with themselves. Whether they ought to... oh I don't know.

In 1944, *Nation* Washington editor I.F. Stone begged his fellow journalists to publicize the plight of European Jews, then being denied entry to the United States:

"I need not dwell upon the authenticated horrors of the Nazi internment camps and death chambers for Jews. That is not tragic but a kind of insane horror. It is our part in this which is tragic. The essence of tragedy is not the doing of evil by evil men but the doing of evil by good men, out of weakness, indecision, sloth, inability to act in accordance with what they know to be right. The tragic element in the fate of the Jews of Europe lies in the failure of their friends in the West to shake loose from customary ways and bureaucratic habit, to risk inexpediency and defy prejudice, to be wholehearted, to care.

There is much we could have done to save the Jews of Europe before the war. There is much we could have done since the war began. There are still things we could do today which would give new lives to a few and hope to many. The hope that all is not black in the world for his children can be strong sustenance for a man starving in a camp or entering a gas chamber. But to feel that your friends and allies are wishy-washy folk who mean what they say but haven't got the gumption to live up to it must brew a poisonous despair."

After ten-thousand years of human civilization we are coming up hard against questions that have finally become too big to look away from: Can we recognize that we are the snake in the garden? Can we own up to our

abuses and begin to make restitution? Is that even possible? Can we change? This may be our last chance to face these questions and try to answer them. Extreme inequality, climate change, mass extinction, deforestation, soil depletion, acidified oceans, melting ice: all the warning signs have long been flashing red. It is too late now to plan for the future or to issue warnings about it. The future is here. We are living in it.

When we contemplate these changes and these threats, we tend to revert to certain ways of speaking, which themselves stem from certain ways of seeing. We use the language of science and economics; the language of politics; the language of anger and righteousness, guilt and judgment. We talk about the one percent and parts-per-million of carbon, and we talk about our responsibilities to future generations. This kind of talk is easy; it is expected. But I have come to believe that it is largely useless, and not just because nobody is really listening. It is useless because it does not get anywhere near the heart of the matter.

The real questions to be answered are not questions of politics, economics, or social morality. They are questions about what is missing from all of this talk and from the world that we have built. They are questions about what has meaning, what matters, what is greater than us, and how we should behave toward it. And those, whether we like it or not, are religious questions.

The world must have a God; but our concept of God must be extended as the dimensions of our world are extended. The anthropomorphic God can no longer withstand the scrutiny of the bright light of science and reason; but that does not mean we live in a Godless universe. In fact, what some call the “Creator God” actually comes into sharper focus under the light of science and reason, and gives humanity far more dignity and responsibility than our forebears ever imagined. When we talk about God, we may be invoking many different conceptions. It is critical to differentiate between the anthropomorphic God—a personal God that thinks and acts like a human—and the cosmic God—a God that is responsible for the fundamental nature of the universe. The cosmic God is deeply satisfying in that it still retains, in a far more sophisticated form, characteristics of God with which we are familiar: law-giver, life-creator, wisdom-giver. Even the reputed die-hard atheist Richard Dawkins emphasizes in *The God Delusion* that he is only going after the anthropomorphic God. The unfolding of cosmic evolution, especially the evolution of life and mind, can be explained by intelligible persistent patterns, or natural laws, without reference to arbitrary change of natural laws or inelegant “intelligent design.”

If I were called in to construct a religion I would make use of trees. At the heart of the creation myth of the West, in the primeval garden, before

the fall into fire and farming, stands a tree, on which grows a sacred fruit. We pluck and eat the fruit and we are cast from the peace at the heart of all things. The fruit will help us live forever, but first we must saw down the tree and burn it, and use the flames to forge weapons with which to battle the world itself.

What happens if the tree remains? What happens if the warnings from history, the new information provided by the sciences, and the song that sings deep inside us come together to make us, the people of the West, the children of modernity, look at trees as many of the ancients did? Would that begin to heal the wound? If we were to see not just the half of the tree that towers above the ground but the half that lives beneath it. If we were to see that great complex of roots connected to all of the other trees in the woodland by networks of mycelium that act almost as a neural network, connecting up communities of living beings, sending and receiving signals. If we were to see this network, this community, as alive, as in some way aware. If we were to understand that when we tug on one leaf it is connected to everything else in the world.

If we saw trees as living, connected, aware—would we change our ways in relation to them, and would that change us? Perhaps not. We know that mice and rats and cows and pigs are living, aware beings, but that doesn't stop us torturing and slaughtering them if we find it useful. But in the long-term, or maybe sooner, we will be faced with what we have done. That crisis will hit. The Earth will not be ignored nor will it long endure being despised, neglected, or mistreated. We will change, or we will be changed. I suspect it will be the latter. But in the meantime, there is work we can do.

New stories—or old stories in new form—will not be purely individual endeavors. They will not arise from research, from thinking, from analysis, from planning. They will not be utopian, globalist, all-encompassing, neat, and satisfying. If we are to develop different ways of relating ourselves to the earth or to some new spiritual methodology that connects us back again to our natural heritage, this isn't going to come from our rational minds. It may not come from us at all. Some speak of stories as being “an echolocation from the Earth.” The old folktales and foundation myths were not purely the creations of human minds. Rather, those minds acted like aerials, telling a story that a place, or the spirit of a place, wanted to be told. Such new stories, again, are the oldest stories of all: they are a retelling of the eternal story, from before we felled the tree. And they are not the product of thinking. They are the product of listening.

“He who knows does not speak,” Lao Tzu wrote. “He who speaks does not know.” It's a useful warning to essayists everywhere. What if the stories we need, the new ways of seeing, are right here under our feet, waiting for

us to notice them? What if they are dancing through the canopy in the sunlight?

Chapter Five

Sexy Action, Ugly Reflection

Quiet Solitude

“A shy man no doubt dreads the notice of strangers, but can hardly be said to be afraid of them. He may be as bold as a hero in battle, and yet have no self-confidence about trifles in the presence of strangers.”

—Charles Darwin

“The glory of the disposition that stops to consider stimuli rather than rushing to engage with them is its long association with intellectual and artistic achievement. Neither $E = mc^2$ nor *Paradise Lost* was dashed off by a party animal.”

—Winifred Gallagher

“Even when media does depict a less extroverted activity it is done so with action. The representation of essentially all characters in media is that of the extrovert, in most cases where an introvert is depicted they are either the villain or simply creepy, weird, et cetera. More often than not the character is a consumer, whether that’s shopping sprees, visits to a bar, hailing a ride, flying, et cetera. How much of the extrovert/consumer bias can be attributed to the need to make things interesting for the viewer and how much is the greater culture’s influence?”

Today we make room for a remarkably narrow range of personality styles. We’re told that to be great is to be bold, to be happy is to be sociable. We see ourselves as a nation of extroverts—which means that we’ve lost sight of who we really are. Depending on which study you consult, one third to one half of Americans are introverts—in other words, one out of every two or three people you know. Given that the United States is among the most extroverted of nations, the number must be at least as high in other parts of the world.

We live with a value system one might call the Extrovert Ideal—the omnipresent belief that the ideal self is gregarious, alpha, and comfortable in the spotlight. The archetypal extrovert prefers action to contemplation, risk-taking to heed-taking, certainty to doubt. He favors quick decisions, even at the risk of being wrong. She works well in teams and socializes in groups. We like to think that we value individuality, but all too often we admire one type of individual—the kind who’s comfortable “putting himself out there.” Sure, we allow technologically gifted loners who launch companies in garages to have any personality they please, but they are the exceptions, not the rule, and our tolerance extends mainly to those who get fabulously wealthy or hold the promise of doing so.

Introversion—along with its cousins sensitivity, seriousness, shyness—is now a second-class personality trait, somewhere between a disappointment and a pathology. Introverts living under the Extrovert Ideal are like women in a man’s world, discounted because of a trait that goes to the core of who they are. Extroversion is an enormously appealing personality style, but we’ve turned it into an oppressive standard to which most of us feel we must conform.

Many of the most important institutions of contemporary life are designed for those who enjoy group projects and high levels of stimulation. As children, our classroom desks are increasingly arranged in pods, the better to foster group learning, and research suggests that the vast majority of teachers believe that the ideal student is an extrovert. We watch TV shows whose protagonists are not the “children next door,” like the Cindy Bradys and Beaver Cleavers of yesteryear, but rock stars and webcast hostesses with outsized personalities, like Hannah Montana and Carly Shay of *iCarly*. Even Sid the Science Kid, a PBS-sponsored role model for the preschool set, kicks off each school day by performing dance moves with his pals—“Check out my moves! I’m a rock star!”

As adults, many of us work for organizations that insist we work in teams, in offices without walls, for supervisors who value “people skills” above all. To advance our careers, we’re expected to promote ourselves unabashedly. The scientists whose research gets funded often have confident, perhaps overconfident, personalities. The artists whose work adorns the walls of contemporary museums strike impressive poses at gallery openings. The authors whose books get published—once accepted as a reclusive breed—are now vetted by publicists to make sure they’re talk-show ready.

At school you might have been prodded to come “out of your shell”—that noxious expression which fails to appreciate that some animals naturally carry shelter everywhere they go, and that some humans are just the same.

Introverts are not necessarily shy. Shyness is the fear of social disapproval

or humiliation, while introversion is a preference for environments that are not overstimulating. Shyness is inherently painful; introversion is not. One reason that people confuse the two concepts is that they sometimes overlap (though psychologists debate to what degree). Some psychologists map the two tendencies on vertical and horizontal axes, with the introvert-extrovert spectrum on the horizontal axis, and the anxious-stable spectrum on the vertical. With this model, you end up with four quadrants of personality types: calm extroverts, anxious (or impulsive) extroverts, calm introverts, and anxious introverts. In other words, you can be a shy extrovert, like Barbra Streisand, who has a larger-than-life personality and paralyzing stage fright; or a non-shy introvert, like Bill Gates, who by all accounts keeps to himself but is unfazed by the opinions of others (having \$100 billion probably doesn't hurt).

You can also, of course, be both shy and an introvert: T. S. Eliot was a famously private soul who wrote in "The Waste Land" that he could "show you fear in a handful of dust." Many shy people turn inward, partly as a refuge from the socializing that causes them such anxiety. And many introverts are shy, partly as a result of receiving the message that there's something wrong with their preference for reflection, and partly because their physiologies compel them to withdraw from high-stimulation environments.

There is no such thing as a pure extrovert or a pure introvert. Such a man would be in the lunatic asylum.

In 1790, only three percent of Americans lived in cities; in 1840, only eight percent did; by 1920, more than a third of the country were urbanites. Americans found themselves working no longer with neighbors but with strangers. 'Citizens' morphed into 'employees,' facing the question of how to make a good impression on people to whom they had no civic or family ties.

"The reasons why one man gained a promotion or one woman suffered a social snub had become less explicable on grounds of long-standing favoritism or old family feuds. In the increasingly anonymous business and social relationships of the age, one might suspect that anything—including a first impression—had made the crucial difference."

Americans responded to these pressures by trying to become salesmen who could sell not only their company's latest gizmo but also themselves.

Coming of age in the 1920s was such a competitive business compared to what their grandmothers had experienced, warned one beauty guide, that they had to be visibly charismatic:

“People who pass us on the street can’t know that we’re clever and charming unless we look it.”

Such advice, ostensibly meant to improve people’s lives, must have made even reasonably confident people uneasy. Counting the words that appeared most frequently in the personality-driven advice manuals of the early twentieth century and comparing them to the character guides of the nineteenth century one will find that the earlier guides emphasized attributes that anyone could work on improving, described by words like:

- Citizenship
- Duty
- Work
- Golden deeds
- Honor
- Reputation
- Morals
- Manners
- Integrity

But the new guides celebrated qualities that were—no matter how easy Dale Carnegie made it sound—trickier to acquire. Either you embodied these qualities or you didn’t:

- Magnetic
- Fascinating
- Stunning
- Attractive
- Glowing
- Dominant
- Forceful
- Energetic

It was no coincidence that in the 1920s and the 1930s, Americans became obsessed with movie stars. Who better than a matinee idol to model personal magnetism?

Americans also received advice on self-presentation—whether they liked it or not—from the advertising industry. Early print ads were straightforward product announcements:

EATON’S HIGHLAND LINEN:
THE FRESHEST AND CLEANEST WRITING PAPER

However, the new personality-driven ads cast consumers as performers with stage fright from which only the advertiser’s product might rescue them. These ads focused obsessively on the hostile glare of the public spotlight.

A 1922 ad for Woodbury's soap warned:

ALL AROUND YOU PEOPLE ARE JUDGING YOU SILENTLY

The Williams Shaving Cream company advised:

CRITICAL EYES ARE SIZING YOU UP RIGHT NOW

Madison Avenue spoke directly to the anxieties of male salesmen and middle managers. In one ad for Dr. West's toothbrushes, a prosperous-looking fellow sat behind a desk, his arm cocked confidently behind his hip, asking:

EVER TRIED SELLING YOURSELF TO YOU?
A FAVORABLE FIRST IMPRESSION IS THE GREATEST SINGLE
FACTOR IN BUSINESS OR SOCIAL SUCCESS

The Williams Shaving Cream ad featured a slick-haired, mustachioed man urging readers to:

LET YOUR FACE REFLECT CONFIDENCE, NOT WORRY!
IT'S THE 'LOOK' OF YOU BY WHICH YOU ARE JUDGED MOST
OFTEN

Other ads reminded women that their success in the dating game depended not only on looks but also on personality. In 1921 a Woodbury's soap ad showed a crestfallen young woman, home alone after a disappointing evening out. She had "longed to be successful, gay, triumphant," the text sympathized. But without the help of the right soap, the woman was a social failure. Ten years later, Lux laundry detergent ran a print ad featuring a plaintive letter written to Dorothy Dix, the Dear Abby of her day:

"Dear Miss Dix,

How can I make myself more popular? I am fairly pretty and not a dumbbell, but I am so timid and self-conscious with people. I'm always sure they're not going to like me. . .

—Joan G."

Miss Dix's answer came back clear and firm. If only Joan would use Lux detergent on her lingerie, curtains, and sofa cushions, she would soon gain a "deep, sure, inner conviction of being charming." This portrayal of courtship as a high-stakes performance reflected the bold new mores of the Culture of Personality.

“Respect for individual human personality has with us reached its lowest point and it is delightfully ironical that no nation is so constantly talking about personality as we are. We actually have schools for ‘self-expression’ and ‘self-development,’ although we seem usually to mean the expression and development of the personality of a successful real estate agent.”

At the onset of the Culture of Personality, we were urged to develop an extroverted personality for frankly selfish reasons—as a way of outshining the crowd in a newly anonymous and competitive society. But nowadays we tend to think that becoming more extroverted not only makes us more successful, but also makes us better people. We see salesmanship as a way of sharing one’s gifts with the world. This is why Tony Robbins’s zeal to sell to and be adulated by thousands of people at once is seen not as narcissism or hucksterism, but as leadership of the highest order.

Toastmasters, the nonprofit organization established in 1924 whose members meet weekly to practice public speaking and whose founder declared that “all talking is selling and all selling involves talking,” is still thriving, with more than 12,500 chapters in 113 countries. The promotional video on Toastmasters’ website features a skit in which two colleagues, Eduardo and Sheila, sit in the audience at the “Sixth Annual Global Business Conference” as a nervous speaker stumbles through a pitiful presentation.

“I’m so glad I’m not him,” whispers Eduardo.

“You’re joking, right?” replies Sheila with a satisfied smile. “Don’t you remember last month’s sales presentation to those new clients? I thought you were going to faint.”

“I wasn’t that bad, was I?”

“Oh, you were that bad. Really bad. Worse, even.” Eduardo looks suitably ashamed, while the rather insensitive Sheila seems oblivious. “But,” says Sheila, “you can fix it. You can do better. Have you ever heard of Toastmasters?”

Sheila, a young and attractive brunette, hauls Eduardo to a Toastmasters meeting. There she volunteers to perform an exercise called “Truth or Lie,” in which she’s supposed to tell the group of fifteen-odd participants a story about her life, after which they decide whether or not to believe her. “I bet I can fool everyone,” she whispers to Eduardo sotto voce as she marches to the podium. She spins an elaborate tale about her years as an opera singer, concluding with her poignant decision to give it all up to spend more time with her family.

When she finishes, the toastmaster of the evening asks the group whether they believe Sheila’s story. All hands in the room go up. The toastmaster

turns to Sheila and asks whether it was true. “I can’t even carry a tune!” she beams triumphantly.

Sheila comes across as disingenuous, but also oddly sympathetic. Like the anxious readers of the 1920s personality guides, she’s only trying to get ahead at the office. “There’s so much competition in my work environment,” she confides to the camera, “that it makes it more important than ever to keep my skills sharp.” But what do “sharp skills” look like? Should we become so proficient at self-presentation that we can dissemble without anyone suspecting? Must we learn to stage-manage our voices, gestures, and body language until we can tell—sell—any story we want? These seem venal aspirations, a marker of how far we’ve come—and not in a good way—since the days of Dale Carnegie’s childhood.

In the United States conversation is often about how effective you are at turning your experiences into stories, whereas a Chinese person might be concerned with taking up too much of the other person’s time with inconsequential information.

There are traditional Asian attitudes to the spoken word: talk is for communicating need-to-know information; quiet and introspection are signs of deep thought and higher truth. Words are potentially dangerous weapons that reveal things better left unsaid. They hurt other people; they can get their speaker into trouble. Consider these proverbs from the East:

“In a gentle way, you can shake the world.”

—Mahatma Gandhi

“The wind howls, but the mountain remains still.”

—Japanese Proverb

“Those who know do not speak. Those who speak do not know.”

—Lao Zi, *The Way of Lao Zi*

“Even though I make no special attempt to observe the discipline of silence, living alone automatically makes me refrain from the sins of speech.”

—Kamo No Chomei, 12th-century Japanese recluse

And compare them to proverbs from the West:

“Be a craftsman in speech that thou mayest be strong, for the strength of one is the tongue, and speech is mightier than all fighting.”

—Maxims of Ptahhotep, 2400 BC

“Speech is civilization itself. The word, even the most contradictory word, preserves contact—it is silence which isolates.”
—Thomas Mann, *The Magic Mountain*

“The squeaky wheel gets the grease.”

Many Asian cultures are team-oriented, but not in the way that Westerners think of teams. Individuals in Asia see themselves as part of a greater whole—whether family, corporation, or community—and place tremendous value on harmony within their group. They often subordinate their own desires to the group’s interests, accepting their place in its hierarchy. Western culture, by contrast, is organized around the individual. We see ourselves as self-contained units; our destiny is to express ourselves, to follow our bliss, to be free of undue restraint, to achieve the one thing that we, and we alone, were brought into this world to do. We may be gregarious, but we don’t submit to group will, or at least we don’t like to think we do. We love and respect our parents, but bridle at notions like filial piety, with their implications of subordination and restraint. When we get together with others, we do so as self-contained units having fun with, competing with, standing out from, jockeying for position with, and, yes, loving, other self-contained units. Even the Western God is assertive, vocal, and dominant; his son Jesus is kind and tender, but also a charismatic, crowd-pleasing man of influence—Jesus Christ Superstar.

What looks to Westerners like Asian deference, in other words, is actually a deeply felt concern for the sensibilities of others. It is only those from an explicit tradition who would label the Asian mode of discourse “self-effacement.” Within this indirect tradition it might be labeled ‘relationship honouring.’ And relationship honouring leads to social dynamics that can seem remarkable from a Western perspective. It’s because of relationship honoring, for example, that social anxiety disorder in Japan, known as *taijin kyofusho*, takes the form not of excessive worry about embarrassing oneself, as it does in the United States, but of embarrassing others. It’s because of relationship honoring that Tibetan Buddhist monks find inner peace by meditating quietly on compassion. And it’s because of relationship honoring that Hiroshima victims apologized to each other for surviving.

“‘I am sorry,’ said one of them, bowing, with the skin of his arms peeling off in strips. ‘I regret I am still alive while your baby is not.’ ‘I am sorry,’ another said earnestly, with lips swollen to the size of oranges, as he spoke to a child weeping beside her dead mother. ‘I am so sorry that I was not taken instead.’”

How did we go from Character to Personality without realizing that we had sacrificed something meaningful along the way?

The essence of the Harvard Business School education is that leaders have to act confidently and make decisions in the face of incomplete information. The teaching method plays with an age-old question: If you don't have all the facts—and often you won't—should you wait to act until you've collected as much data as possible? Or, by hesitating, do you risk losing others' trust and your own momentum? The answer isn't obvious. If you speak firmly on the basis of bad information, you can lead your people into disaster. But if you exude uncertainty, then morale suffers, funders won't invest, and your organization can collapse. The HBS teaching method implicitly comes down on the side of certainty. The CEO may not know the best way forward, but she has to act anyway.

“The HBS method presumes that leaders should be vocal and in my view that's part of reality. But there is the common phenomenon known as the ‘winner's curse,’ in which two companies bid competitively to acquire a third, until the price climbs so high that it becomes less an economic activity than a war of egos. The winning bidders will be damned if they'll let their opponents get the prize, so they buy the target company at an inflated price.

It tends to be the assertive people who carry the day in these kinds of things. You see this all the time. People ask, ‘How did this happen, how did we pay so much?’ Usually it's said that they were carried away by the situation, but that's not right. Usually they're carried away by people who are assertive and domineering. The risk with our students is that they're very good at getting their way. But that doesn't mean they're going the right way.”

If we assume that quiet and loud people have roughly the same number of good (and bad) ideas, then we should worry if the louder and more forceful people always carry the day. This would mean that an awful lot of bad ideas prevail while good ones get squashed. Studies in group dynamics suggest that this is exactly what happens. We perceive talkers as smarter than quiet types—even though grade-point averages and SAT and intelligence test scores reveal this perception to be inaccurate. In one experiment in which two strangers met over the phone, those who spoke more were considered more intelligent, better looking, and more likable. We also see talkers as leaders. The more a person talks, the more other group members direct

their attention to him, which means that he becomes increasingly powerful as a meeting goes on. It also helps to speak fast; we rate quick talkers as more capable and appealing than slow talkers.

A well-known study found that television pundits—people who earn their livings by speaking confidently on the basis of limited information—make worse predictions about political and economic trends than they would by random chance. And the very worst prognosticators tend to be the most famous and the most confident—the very ones who would be considered natural leaders in an HBS classroom.

The US Army has a name for a similar phenomenon: the Bus to Abilene.

“It’s about a family sitting on a porch in Texas on a hot summer day, and somebody says, ‘I’m bored. Why don’t we go to Abilene?’ When they get to Abilene, somebody says, ‘You know, I didn’t really want to go.’ And the next person says, ‘I didn’t want to go—I thought you wanted to go,’ and so on. Whenever you’re in an army group and somebody says, ‘I think we’re all getting on the bus to Abilene here,’ that is a red flag. You can stop a conversation with it. It is a very powerful artifact of our culture.”

The Bus to Abilene anecdote reveals our tendency to follow those who initiate action—any action. We are similarly inclined to empower dynamic speakers.

We tend to overestimate how outgoing leaders need to be. Most leading in a corporation is done in small meetings and it’s done at a distance, through written and video communications. It’s not done in front of big groups. You have to be able to do some of that; you can’t be a leader of a corporation and walk into a room full of analysts and turn white with fear and leave. But you don’t have to do a whole lot of it. There have been many leaders of corporations who are highly introspective and who really have to make themselves work to do the public stuff. The lesson is clear. We don’t need giant personalities, we need leaders who build not their own egos but the institutions they run.

Introverts are uniquely good at leading initiative-takers. Because of their inclination to listen to others and lack of interest in dominating social situations, introverts are more likely to hear and implement suggestions. Having benefited from the talents of their followers, they are then likely to motivate them to be even more proactive. Introverted leaders create a virtuous circle of proactivity, in other words. Team members report perceiving introverted leaders as more open and receptive to their ideas,

which motivates them to work harder. Extroverts, on the other hand, can be so intent on putting their own stamp on events that they risk losing others' good ideas along the way and allowing workers to lapse into passivity. Often the leaders end up doing a lot of the talking and not listening to any of the ideas that the followers are trying to provide. But with their natural ability to inspire, extroverted leaders are better at getting results from more passive workers.

We have been graced with limelight-avoiding leaders throughout history. Moses, for example, was not, according to some interpretations of his story, the brash, talkative type who would organize road trips and hold forth in a classroom at Harvard Business School. On the contrary, by today's standards he was dreadfully timid. He spoke with a stutter and considered himself inarticulate. The Book of Numbers describes him as "very meek, above all the men which were upon the face of the earth." When God first appeared to him in the form of a burning bush, Moses was employed as a shepherd by his father-in-law; he wasn't even ambitious enough to own his own sheep. And when God revealed to Moses his role as liberator of the Jews, did Moses leap at the opportunity? Send someone else to do it, he said. "Who am I, that I should go to Pharaoh?" he pleaded. "I have never been eloquent. I am slow of speech and tongue."

It was only when God paired him up with his extroverted brother Aaron that Moses agreed to take on the assignment. Moses would be the speechwriter, the behind-the-scenes guy, the *Cyrano de Bergerac*; Aaron would be the public face of the operation. "It will be as if he were your mouth," said God, "and as if you were God to him." Complemented by Aaron, Moses led the Jews from Egypt, provided for them in the desert for the next forty years, and brought the Ten Commandments down from Mount Sinai. And he did all this using strengths that are classically associated with introversion: climbing a mountain in search of wisdom and writing down carefully, on two stone tablets, everything he learned there.

We tend to write Moses' true personality out of the Exodus story. Cecil B. DeMille's classic, *The Ten Commandments*, portrays him as a swashbuckling figure who does all the talking, with no help from Aaron. We don't ask why God chose as his prophet a stutterer with a public speaking phobia. But we should. The book of Exodus is short on explication, but its stories suggest that introversion plays yin to the yang of extroversion; that the medium is not always the message; and that people followed Moses because his words were thoughtful, not because he spoke them well.

"Most inventors and engineers I've met are like me—they're shy and they live in their heads. They're almost like artists. In

fact, the very best of them are artists. And artists work best alone where they can control an invention's design without a lot of other people designing it for marketing or some other committee. I don't believe anything really revolutionary has been invented by committee. If you're that rare engineer who's an inventor and also an artist, I'm going to give you some advice that might be hard to take. That advice is: Work alone. You're going to be best able to design revolutionary products and features if you're working on your own. Not on a committee. Not on a team."

Flow is an optimal state in which you feel totally engaged in an activity—whether long-distance swimming or songwriting, sumo wrestling or sex. In a state of flow, you're neither bored nor anxious, and you don't question your own adequacy. Hours pass without your noticing. The key to flow is to pursue an activity for its own sake, not for the rewards it brings. Although flow does not depend on being an introvert or an extrovert, many flow experiences are solitary pursuits that have nothing to do with reward-seeking: reading, tending an orchard, solo ocean cruising. Flow often occurs in conditions in which people become independent of the social environment to the degree that they no longer respond exclusively in terms of its rewards and punishments. To achieve such autonomy, a person has to learn to provide rewards to herself. There are some activities that are not about approach or avoidance, but about something deeper: the fulfillment that comes from absorption in an activity outside yourself. Psychological theories usually assume that we are motivated either by the need to eliminate an unpleasant condition like hunger or fear, or by the expectation of some future reward such as money, status, or prestige. But in flow, a person could work around the clock for days on end, for no better reason than to keep on working.

Introverts prefer to work independently, and solitude can be a catalyst to innovation. Introversions concentrates the mind on the tasks in hand, and prevents the dissipation of energy on social and sexual matters unrelated to work. In other words, if you're in the backyard sitting under a tree while everyone else is clinking glasses on the patio, you're more likely to have an apple fall on your head.

What's so magical about solitude? In many fields it's only when you're alone that you can engage in Deliberate Practice, which some have identified as the key to exceptional achievement. When you practice deliberately, you identify the tasks or knowledge that are just out of your reach, strive to upgrade your performance, monitor your progress, and revise accordingly. Practice sessions that fall short of this standard are not only less useful—

they're counterproductive. They reinforce existing cognitive mechanisms instead of improving them.

Deliberate Practice is best conducted alone for several reasons. It takes intense concentration, and other people can be distracting. It requires deep motivation, often self-generated. But most important, it involves working on the task that's most challenging to you personally. Only when you're alone can you go directly to the part that's challenging to you. If you want to improve what you're doing, you have to be the one who generates the move. Imagine a group class—you're the one generating the move only a small percentage of the time.

The cooperative approach has politically progressive roots—the theory is that students take ownership of their education when they learn from one another—but it also trains kids to express themselves in the team culture of corporate America. This style of teaching reflects the business community where people's respect for others is based on their verbal abilities, not their originality or insight. You have to be someone who speaks well and calls attention to yourself.

Today the world of business works in groups, so now the kids do it in school. Cooperative learning enables skills in working as teams—skills that are in dire demand in the workplace. Leadership training is a primary benefit of cooperative learning. Indeed many teachers seem to pay close attention to their students' managerial skills. One public school teacher pointed out a quiet student who likes to “do his own thing.” “But we put him in charge of safety patrol one morning, so he got the chance to be a leader, too,” she assures us.

Group brainstorming doesn't actually work. One of the first studies to demonstrate this was conducted in 1963. Researchers gathered forty-eight research scientists and forty-eight advertising executives, all of them male employees of Minnesota Mining and Manufacturing—otherwise known as 3M, inventors of the Post-it and a source of toxic water contamination—and asked them to participate in both solitary and group brainstorming sessions. The researchers were confident that the executives would benefit from the group process. They were less sure that the research scientists, considered more introverted, would profit from group work.

Each set of forty-eight men was divided into twelve groups of four. Each foursome was given a problem to brainstorm, such as the benefits or difficulties that would arise from being born with an extra thumb. Each man was also given a similar problem to brainstorm on his own. Then researchers counted all the ideas, comparing those produced by the groups with those generated by people working individually. In order to compare apples with apples, the ideas of each individual were pooled together with those of three

other individuals, as if they had been working in “nominal” groups of four. The researchers also measured the quality of the ideas, rating them on a “Probability Scale” of 0 through 4. The results were unambiguous. The men in twenty-three of the twenty-four groups produced more ideas when they worked on their own than when they worked as a group. They also produced ideas of equal or higher quality when working individually. And the advertising executives were no better at group work than the presumably introverted research scientists.

Since then, some forty years of research has reached the same startling conclusion. Studies have shown that performance gets worse as group size increases: groups of nine generate fewer and poorer ideas compared to groups of six, which do worse than groups of four. The evidence from science suggests that business people must be insane to use brainstorming groups. If you have talented and motivated people, they should be encouraged to work alone when creativity or efficiency is the highest priority.

The one exception to this is online brainstorming. Groups brainstorming electronically, when properly managed, not only do better than individuals but, it also turns out, the larger the group, the better it performs. The same is true of academic research—professors who work together electronically, from different physical locations, tend to produce research that is more influential than those either working alone or collaborating face-to-face. This shouldn’t surprise us, it was the curious power of electronic collaboration that contributed to the New Groupthink in the first place. What created Linux, or Wikipedia, if not a gigantic electronic brainstorming session? But we’re so impressed by the power of online collaboration that we’ve come to overvalue all group work at the expense of solo thought.

We fail to realize that participating in an online working group is a form of solitude all its own. Instead we assume that the success of online collaborations will be replicated in the face-to-face world. Indeed, after all these years of evidence that conventional brainstorming groups don’t work, they remain as popular as ever. Participants in brainstorming sessions usually believe that their group performed much better than it actually did, which points to a valuable reason for their continued popularity—group brainstorming makes people feel attached. A worthy goal, so long as we understand that social glue, as opposed to creativity, is the principal benefit.

Psychologists usually offer three explanations for the failure of group brainstorming:

Social Loafing: In a group, some individuals tend to sit back and let others do the work

Production Blocking: Only one person can talk or produce an idea at once, while the other group members are forced to sit passively

Evaluation Apprehension: The fear of looking stupid in front of one's peers—the fear of public humiliation is a potent force

Imagine being asked to work together with three other people—call them Jane, Emily, and Megan—to solve challenging math problems. You don't know who in your group is good at math; you have only your imperfect knowledge of your own abilities. On the first problem, Jane is the first to suggest an answer, and Emily chimes in with her own thoughts. Megan is initially quiet, but after a while, she comes up with the correct answer and explains why the other answers were wrong. This happens several times, so it becomes clear to all that Megan is good at solving problems like these. The group comes to defer to her as their *de facto* leader, and it does very well on its task. In an ideal world, group dynamics would always work this way: The cream would rise to the top; all members would contribute their unique knowledge, skills, and competence; and group deliberation would lead to better decisions. But the reality of group performance too often diverges from this ideal.

The very process of putting individuals together to deliberate before they reach a conclusion almost guarantees that the group's decision will not be the product of independent opinions and contributions. Instead, it will be influenced by group dynamics, personality conflicts, and other social factors that have little to do with who knows what, and why they know it. Rather than producing better understanding of abilities and more realistic expressions of confidence, group processes can inspire a feeling akin to 'safety in numbers' among the most hesitant members, decreasing realism and increasing certainty. This reflects another illusion people have about the mind—the misguided intuition that the best way for a group to use the abilities of its members in solving a problem is to deliberate over the correct answer and arrive at a consensus.

People with dominant personalities tend to exhibit greater self-confidence, and due to the illusion of confidence, others tend to trust and follow people who speak with confidence. If you offer your opinion early and often, people will take your confidence as an indicator of ability, even if you are actually no better than your peers. The illusion of confidence keeps the cream blended in. Only when confidence happens to be correlated with actual competence will the most able person rise to the top.

Many of our most important civic institutions, from elections to jury trials to the very idea of majority rule, depend on dissenting voices. But

when the group is literally capable of changing our perceptions, and when to stand alone is to activate primitive, powerful, and unconscious feelings of rejection, then the health of these institutions seems far more vulnerable than we think.

Different Kinds of Power

Psychologists often discuss the difference between “temperament” and “personality.” Temperament refers to inborn, biologically based behavioral and emotional patterns that are observable in infancy and early childhood; personality is the complex brew that emerges after cultural influence and personal experience are thrown into the mix. Some say that temperament is the foundation, and personality is the building.

There is of course a wide range of possible outcomes for each temperament. Low-reactive, extroverted children, if raised by attentive families and in safe environments, can grow up to be energetic achievers with big personalities—the Richard Bransons and Oprahs of this world. But give those same children negligent caregivers or a bad neighborhood and they can turn into bullies, juvenile delinquents, or criminals. Psychopaths and heroes: twigs on the same genetic branch.

Consider the mechanism by which kids acquire their sense of right and wrong. Many psychologists believe that children develop a conscience when they do something inappropriate and are rebuked by their caregivers. Disapproval makes them feel anxious, and since anxiety is unpleasant, they learn to steer clear of antisocial behavior. This is known as internalizing their parents’ standards of conduct, and its core is anxiety. But what if some kids are less prone to anxiety than others, as is true of extremely low-reactive kids? Often the best way to teach these children values is to give them positive role models and to channel their fearlessness into productive activities. A low-reactive child on an ice-hockey team enjoys his peers’ esteem when he charges at his opponents with a lowered shoulder, which is a legal move. But if he goes too far, raises his elbow, and gives another guy a concussion, he lands in the penalty box. Over time he hopefully learns to use his appetite for risk and assertiveness wisely.

Now imagine this same child growing up in a dangerous neighborhood with few organized sports or other constructive channels for his boldness. You can see how he might fall into delinquency. It may be that some disadvantaged kids who get into trouble suffer not solely from poverty or neglect, say those who hold this view, but also from the tragedy of a bold and exuberant temperament deprived of healthy outlets.

Many children are like dandelions, able to thrive in just about any environment. But others, including the high-reactive types, are more like orchids: they wilt easily, but under the right conditions can grow strong and magnificent. The reactivity of these kids’ nervous systems makes them quickly overwhelmed by childhood adversity, but also able to benefit from a

nurturing environment more than other children do. In other words, orchid children are more strongly affected by all experience, both positive and negative. Scientists have known for a while that high-reactive temperaments come with risk factors. These kids are especially vulnerable to challenges like marital tension, a parent's death, or abuse. They're more likely than their peers to react to these events with depression, anxiety, and shyness.

What scientists haven't realized until recently is that these risk factors have an upside. In other words, the sensitivities and the strengths are a package deal. High-reactive kids who enjoy good parenting, childcare, and a stable home environment tend to have fewer emotional problems and more social skills than their lower-reactive peers, studies show. Often they're exceedingly empathic, caring, and cooperative. They work well with others. They are kind, conscientious, and easily disturbed by cruelty, injustice, and irresponsibility. They're successful at the things that matter to them.

Introverts have wide-open information channels, which causes them to be flooded with stimulation and over-aroused, while extroverts have tighter channels, making them prone to under-arousal. Over-arousal doesn't produce anxiety so much as the sense that you can't think straight—that you've had enough and would like to go home now. Under-arousal is something like cabin fever. Not enough is happening: you feel itchy, restless, and sluggish, like you need to get out of the house already.

Introverts and extroverts direct their attention differently: if you leave them to their own devices, the introverts tend to sit around wondering about things, imagining things, recalling events from their past, and making plans for the future. The extroverts are more likely to focus on what's happening around them. It's as if extroverts are seeing 'what is' while their introverted peers are asking 'what if.'

High-reactive kids also tend to think and feel deeply about what they've noticed, and to bring an extra degree of nuance to everyday experiences. This can be expressed in many different ways. If the child is socially oriented, she may spend a lot of time pondering her observations of others—why Jason didn't want to share his toys today, why Mary got so mad at Nicholas when he bumped into her accidentally. If he has a particular interest—in solving puzzles, making art, building sand castles—he'll often concentrate with unusual intensity. If a high-reactive toddler breaks another child's toy by mistake, studies show, she often experiences a more intense mix of guilt and sorrow than a lower-reactive child would. All kids notice their environments and feel emotions, of course, but high-reactive kids seem to see and feel things more. If you ask a high-reactive seven-year-old how a group of kids should share a coveted toy he'll tend to come up with sophisticated strategies like "Alphabetize their last names, and let the person closest to

A go first.” Putting theory into practice is hard for them because their sensitive natures and elaborate schemes are unsuited to the heterogeneous rigors of the schoolyard. Yet these traits—alertness, sensitivity to nuance, complex emotionality—turn out to be highly underrated powers.

Sensitive types may think in an unusually complex fashion. It may also help explain why they’re so bored by small talk. If you’re thinking in more complicated ways, then talking about the weather or where you went for the holidays is not quite as interesting as talking about values or morality. Another thing about sensitive people is that sometimes they’re highly empathic. It’s as if they have thinner boundaries separating them from other people’s emotions and from the tragedies and cruelties of the world. They tend to have unusually strong consciences. They’re acutely aware of the consequences of a lapse in their own behavior. In social settings they often focus on subjects like personal problems, which others consider “too heavy.”

In our culture, guilt is a tainted word, but it’s probably one of the building blocks of conscience. The anxiety these highly sensitive toddlers feel upon apparently breaking the toy gives them the motivation to avoid harming someone’s plaything the next time. By age four these same kids are less likely than their peers to cheat or break rules, even when they think they can’t be caught. And by six or seven, they’re more likely to be described by their parents as having high levels of moral traits such as empathy. They also have fewer behavioral problems in general.

Of course, having these traits doesn’t mean that sensitive children are angels. They have selfish streaks like everyone else. Sometimes they act aloof and unfriendly. And when they’re overwhelmed by negative emotions like shame or anxiety they can be positively oblivious of other people’s needs. But the same receptivity to experience that can make life difficult for the highly sensitive also builds their consciences.

Evolutionary biologists once believed that every animal species evolved to fit an ecological niche, that there was one ideal set of behaviors for that niche, and that species members whose behavior deviated from that ideal would die off. But it turns out that it’s not only humans that divide into those who ‘watch and wait’ and others who ‘just do it.’ More than a hundred species in the animal kingdom are organized in roughly this way. From fruit flies to house cats to mountain goats, from sunfish to bushbaby primates to Eurasian tit birds, scientists have discovered that approximately 20 percent of the members of many species are “slow to warm up,” while the other 80 percent are “fast” types who venture forth boldly without noticing much of what’s going on around them. Slow animals are best described as shy, sensitive types. They don’t assert themselves, but they are observant and

notice things that are invisible to the bold.

Both types of animals exist because they have radically different survival strategies, each of which pays off differently and at different times. This is what's known as the trade-off theory of evolution, in which a particular trait is neither all good nor all bad, but a mix of pros and cons whose survival value varies according to circumstance. Shy animals forage less often and widely for food, conserving energy, sticking to the sidelines, and surviving when predators come calling. Bolder animals sally forth, swallowed regularly by those farther up the food chain but surviving when food is scarce and they need to assume more risk.

When scientists dropped metal traps into a pond full of pumpkinseed fish, an event that perhaps seemed to the fish as unsettling as a flying saucer landing on Earth, the bold fish couldn't help but investigate—and rushed headlong into the traps. The shy fish hovered judiciously at the edge of the pond, making it impossible to catch them. On the other hand, after succeeding in trapping both types of fish with an elaborate netting system and carrying them back to the lab, the bold fish acclimated quickly to their new environment and started eating a full five days earlier than did their shy brethren. There is no single best personality but rather a diversity of personalities maintained by natural selection.

The trade-off theory may even apply to entire species. Among evolutionary biologists, who tend to subscribe to the vision of lone individuals hell-bent on reproducing their own DNA, the idea that species include individuals whose traits promote group survival is hotly debated and, not long ago, could practically get you kicked out of the academy. But this view is slowly gaining acceptance. Some scientists even speculate that the evolutionary basis for traits like sensitivity is heightened compassion for the suffering of other members of one's species, especially one's family.

Suppose a herd of antelope has a few members who are constantly stopping their grazing to use their keen senses to watch for predators. Herds with such sensitive, watchful individuals would survive better, and so continue to breed, and so continue to have some sensitive individuals born in the group. And why should it be any different for humans?

We know from myths and fairy tales that there are many different kinds of powers in this world. One child is given a lightsaber, another a wizard's education. The trick is not to amass all the different kinds of available power, but to use well the kind you've been granted. Introverts are offered keys to private gardens full of riches. To possess such a key is to tumble like Alice down her rabbit hole. She didn't choose to go to Wonderland—but she made of it an adventure that was fresh and fantastic and very much her own.

A quiet temperament is a hidden superpower.

There's a word for "people who are in their heads too much": thinkers.

Most great ideas spring from solitude.

You can stretch like a rubber band. You can do anything an extrovert can do, including stepping into the spotlight. There will always be time for quiet later. But even though you'll need to stretch on occasion, you should return to your true self when you're done.

Two or three close friends mean more than a hundred acquaintances (though acquaintances are great too).

Introverts and extroverts are yin and yang—we love and need each other.

It's okay to cross the hallway to avoid small talk.

You don't need to be a cheerleader to lead. Just ask Mahatma Gandhi. Speaking of Gandhi, he said:

"In a gentle way, you can shake the world."

Chapter Six

Teach the Children Well

Constructing Worlds

“It is certain, in any case, that ignorance, allied with power, is the most ferocious enemy justice can have.”

From public schools shall general knowledge flow,
For ‘tis the people’s sacred right to know.

A lesson which many gifted persons never learn as long as they live is that human beings in general are inherently very different from themselves in thought, in action, in general intention, and in interests. Many a reformer has died at the hands of a mob which he was trying to improve in the belief that other human beings can and should enjoy what he enjoys. This is one of the most painful and difficult lessons that each gifted child must learn, if personal development is to proceed successfully. It is more necessary that this be learned than that any school subject be mastered. Failure to learn how to tolerate in a reasonable fashion the foolishness of others leads to bitterness, disillusionment, misanthropy.

“The value of a college education is not the learning of many facts but the training of the mind to think.”

—Albert Einstein, explaining to a reporter why he didn’t know facts like the speed of sound

“I have sworn, on the altar of God, eternal hostility against every form of tyranny over the mind of man.”

—Thomas Jefferson

“Both teachers and learners go to sleep at their posts as soon as there is no enemy in the field.”

—John Stuart Mill

“I would not be a Moses to lead you into the Promised Land, because if I could lead you into it, someone else could lead you out of it.”

—Eugene Debs

What is the difference between a good leader and a good teacher?

It’s not the source that makes you informed, it’s how you process information. People who are wise don’t pretend to know everything, and they don’t think the truth is wrapped up in a single thing.

“Children don’t have a wide worldview so they can’t really make any meaningful decisions on why this dam should/shouldn’t be built.”

We equate knowing less with making poor decisions and not having good ideas. This is not necessarily true. Experiences can also influence us to be more close-minded; sometimes children, with their open, unbiased minds can offer the most insightful suggestions. Even if idea is poor, it could perhaps spark an idea just by listening to it.

It is a mistake to believe somebody is stupid just because you don’t know their reason for doing something.

Does the child upset over not having toys as nice as another know something we have been trained to ignore? Is the response, while in the case of toys, filtered and affected by consumerism, simply a natural one? Perhaps an evolutionarily favored genetic disposition designed to ensure the social primate and its group survive?

Children’s questions are important. Pay attention not only to what they’re asking, but why. There are lots of really nifty people hiding in child suits.

You are not showing intelligence by punishing unguarded curiosity, because you’re pulling out threads of the future to score ego points for yourself.

Seeing with a child’s eyes is seeing without preconceptions, and it is also, when associated with knowledge, the precondition for making discoveries.

The more details and layers of experience we need to encode, the longer we feel it lasts. This is why childhood summers feel like they last forever, and then start to fly by as we age. When we’re young, everything is new, and we’ve got many images, smells, sights, and sounds to record. But as we age, we tend to see and experience fewer new or novel events.

Genius is nothing more nor less than childhood recovered at will.

Good Learner Questioning Activity

Study the following questions:

1. What is the name of this school?
2. Are children of permissive parents more creative than children of nonpermissive parents?
3. Who discovered oxygen?
4. Who discovered America?
5. Who is the most beautiful woman in America?
6. Are the people on Mars more advanced than the people on Earth?
7. Will it rain tomorrow?
8. How are you?
9. Will you get into the college of your choice?
10. Is love a noun or a verb?
11. $8+6=?$
12. Why do aeroplanes crash?

Answer the following questions:

1. Which of the questions above can you answer with absolute certainty? How can you be certain of your answer?
2. What information will enable you to answer other questions with absolute certainty? Where will you get the information?
3. Which questions restrict you to giving factual information? Which do not? Which require no facts at all?
4. Which questions require the greatest amount of definition before you try to answer than?
5. Which questions require the testimony of experts? What makes one an expert?
6. Which questions assume the answerer is the expert?
7. Which questions may have false assumptions?
8. Which questions require predictions as answers? What kinds of information may improve the quality of a prediction?

Thinking about thinking, metacognition, is like trying to turn up the gas quickly enough to see how the darkness looks.

In 1953, when anti-communist fervor threatened freedom of expression, libraries responded with the historic Freedom to Read Statement. This document offers a powerful and timeless affirmation of librarians' professional charge:

“The written word is possessed of enormous variety and usefulness, worthy of cherishing and keeping free. We realize that the application of these propositions may mean the dissemination of ideas and manners of expression that are repugnant to many persons. We do not state these propositions in the comfortable belief that what people read is unimportant. We believe rather that what people read is deeply important; that ideas can be dangerous; but that the suppression of ideas is fatal to a democratic society. Freedom itself is a dangerous way of life, but it is ours.”

“If you want your children to be intelligent, read them fairy-tales. If you want them to be more intelligent, read them more fairy-tales”

There is no doubt that these weird dramas of risk, terror, loyalty, and reward agitate the blood and captivate the heart. Time spent in fairyland arouses in a child a longing for he knows not what. It stirs and troubles him (to his lifelong enrichment) with the dim sense of something beyond his actual reach and, far from dulling or emptying the actual world, gives it a new dimension of depth. He does not despise real woods because he has read of enchanted woods: The reading makes all real woods a little enchanted.

The reading does something else, too. It situates children in a cultural sense, equipping them to understand references to fairy tales and other classic stories that they will find all around them. When we read “Hansel and Gretel” or “The Fisherman and His Wife” or “Puss in Boots,” we’re at once transporting children with our voices and grounding them in foundational texts. For this reason, the time we spend reading to them can amount to a second education, one that helps children acquire a sense of horizons. What we give them is an introduction to art and literature by means so calm and seamless that they may not notice it’s happening.

There was a boy, his elementary-school librarian showed him around the stacks and told him:

“All the books on the shelves are yours.”

It was a galvanizing moment that he never forgot. And it is a message that every child needs to hear.

The more stories children hear, and the more varied and substantial those tales, the greater the confidence of their cultural ownership. They will recognize allusions that other children may miss. A girl who has heard the stories of Aesop or Jean de la Fontaine will have a clear idea of what is meant by “sour grapes” and will know why people compare the industriousness of ants and grasshoppers. A boy who’s heard a parent read *The Odyssey* has a more complete idea of what constitutes a “siren song” than his friend who thinks it must have something to do with an alarm going off.

The narratives of the past have helped to frame the consciousness and language of the present, and it’s a gift to children to help them recognize as much as they can. The milk of human kindness, the prick of the spindle, the wolf in sheep’s clothing, the wine-dark sea: all are expressions of a vast cultural treasury.

“We all come from the past, and children ought to know what it was that went into their making, to know that life is a braided cord of humanity stretching up from time long gone, and that it cannot be defined by the span of a single journey from diaper to shroud.”

Children get a wider perspective when they’re tugged out of the here and now for a little while each day. In an enchanted hour, we can read them stories of the real and imagined past. With picture-book biographies we can acquaint them with people we want them to know. With any luck, our children will come to appreciate that the people of generations past were as full of life, intelligence, wisdom, and promise as they are, and impelled by the same half-understood desires and impulses; that those departed souls were as good and bad and indifferent as people who walk the earth today. Those who came before us wrote stories and songs, built roads and bridges, invented and created and argued and fought and sacrificed for all sorts of causes.

Young people are inclined to think, in a vague way, that events began when they did. When I was a child, I was told that President Kennedy was shot in 1963. It seemed to me that the tragedy coincided, more or less, with the end of the Civil War. When you’re young, the decades blur together. Only years later did I come to understand that JFK died six months before I was born, and that I entered a world still shocked by his departure.

So it goes. Youth is inattentive. It thinks itself something fresh, full of energy, spirit, and insight. It feels that no one has ever cared so much,

felt with such intensity, or realized truth with such exquisite clarity. It prepares for a future that is unique in its grandeur and meaning. Youth may have no idea that it is wreathed in ghosts, informed by ghosts, held up on the shoulders of ghosts. When we read aloud from the literature of the past—and all literature is the literature of the past—and when we share artistic traditions, we are not merely giving children stories and pictures to enjoy. We're also inviting a measure of humility, gently correcting youth's eternal temptation to arrogance.

Books let you dream about places other than Detroit, Newark, or simply your soulless suburb. You can go anywhere—the past, the future. It exposes you to new points of view. It makes you really imagine what the world would look like, could look like—and reimagine, because the first way you imagined didn't really make any sense.

Reading is an amazing way to learn. The obvious ways, like reading a textbook to remember facts, and subconscious ways like when you read a novel and pick up on social norms, culture, and distinct perspectives. Before written language, we had to depend on oral traditions and experiences for knowledge. The downside to that is that human memory is actually pretty awful. When you think back on something that happened long ago, you aren't usually recalling that moment. Instead, you remember what you were thinking the last time you recalled that moment. Each time there is potential for changes for what happened.

There was a study done where researchers asked participants about an event from their past. Something like do you remember when you were seven years old and you went on that hot air balloon ride? People overwhelmingly reported remembering the event even though it never happened. 'Truth' long after something happens is practically invented by our own desires, biases, and emotions.

By reading, discussing what we read, and re-reading what we've read, we're able to utilize a consistent source of information. Written language provides an objective, universal way to pass on and share knowledge and experiences. Other than fire and agriculture, I can't think of a more important tool in the development of modern society.

The ability to read heightens your potential. You become able to think critically, develop and share complex ideas, and base your understanding of the world past what you see directly or hear from the few people in this world (out of billions) who you actually talk to. Unlike TV, reading lets you 'think the thoughts' in a way, of another human being. Every single person who lives or has ever lived, gained some knowledge that you do not possess. Reading and writing is by far the best way I can think of to keep that knowledge from vanishing into thin air the second a person dies.

There is no greater divide in life than the one between kids for whom the experience of learning to read is a painful or tedious one, whose rewards are remote if real, and those for whom the experiences of reading and writing are addictive, entrancing, overwhelming, and so intense as to offer a new life of their own—those for whom the moment of learning to read begins a second life of letters as rich as the primary life of experience.

Those who do not read pay with their lives and if the offender is a nation, that nation pays with its history. Somehow, the developed world manages to live while being completely oblivious to other worlds living on the same planet.

Leftists like to explain the disaffection of working-class people with public education as a natural reaction to the patriotism, conformity, and civility pushed by what they call the “ideological state apparatus.” The object of education, according to this view, is to police class boundaries by transforming most kids into unquestioning drones while selecting a small number of others for management positions. Kids from blue-collar homes are supposed to know intuitively that this is the case, and they respond accordingly, cutting class and getting high and listening to *The Wall* over and over again. A more nuanced version of this critique points out that high school American history textbooks give a Disney version of history: heroic, egalitarian, jam-packed with progress, and almost entirely free of class conflict. Teaching such an ‘Officer Friendly’ account of reality is merely to make school irrelevant to the major issues of the day. The kids know bullshit when they see it.

The disaffection of the conservatives with public education is almost precisely the opposite. They do not have a problem with the idea that schools should be designed to churn out low-wage workers; indeed, many would tell you that was a worthy goal. The conservatives are pissed off because they think the schools don’t provide enough Disney, enough Officer Friendly.

History is often used as a series of moral tales, to enhance group solidarity or, more defensibly in my view, to explain how important institutions such as parliaments and concepts such as democracy developed; and so the teaching of the past has been central to the debates over how to instill and transmit values. The danger is that what may be an admirable goal can distort history either by making it into a simple narrative in which there are black-and-white characters or by depicting it as all tending in one direction, whether that of human progress or the triumph of a particular group. Such history flattens out the complexity of human experience and leaves no room for different interpretations of the past.

One of history’s most useful tasks is to bring home to us how keenly,

honestly, and painfully past generations pursued aims that now seem to us wrong or disgraceful. Visiting the past is something like visiting a foreign country: they do some things the same and some things differently, but above all else they make us more aware of what we call home.

People sometimes ask how it is that we've come to be so anti-intellectual as a culture. Societies built on violence often repress the reality of their origins behind a veneer of noble intentions. Our national narrative tells us we were founded on the proposition that all men are created equal. On paper, perhaps, but what of the actuality? After all, the country was built on unbelievable violence, first the slaughter of the natives, second the enslavement of Africans. Honest reflection was a psychologically costly luxury that most founders couldn't afford as they forged a nation from the bones of fellow humans.

A citizenry that cannot begin to put the present into context, that has so little knowledge of the past, can too easily be fed stories by those who claim to speak with the knowledge of history and its lessons. History is called in, as we have seen, to strengthen group solidarity, often at the expense of the individual, to justify treating others badly, and to bolster arguments for particular policies and courses of action. Knowledge of the past helps us to challenge dogmatic statements and sweeping generalizations. It helps us all think more clearly.

A popular way of thinking about history goes something like this: Society is a train that travels along an inevitable, one-way track. As it hurtles ceaselessly forward, progress is made.

We once believed that the sun revolved around the earth, before rightly conceding the error of our ways and embracing heliocentrism. We once allowed black people to be kept as chattel, subjected regularly to torture and rape. But then we learned that slavery was wrong. We once hired children to toil in dangerous mines and factories, where they lost eyes and limbs and succumbed early to occupational diseases like black lung. But we abolished child labor because we know better now.

Yes, things just keep getting better and better. And nowhere does this view of history as an inevitable, one-way progress train seem more evident than in the collective imagining of Victorian poverty, which has become a sort of shorthand for gratuitous cruelty and squalor. We tut-tut at the society our unenlightened forebears built, at the workhouse of *Oliver Twist* and the overcrowded tenement of *Jacob Riis*. We sure have come a long way, we tell ourselves.

If you studied studiously in high school, your view of the facts of history is probably very, very misinformed.

One marvels at the yawning gulf between the Very Serious Stuff I was

taught in grade and high school civics and history about the Fundamental Nature Of Our Great Nation and its founding fathers and the Beautiful Documents they wrote, on the one hand, and what we mopes learn, through a drip-drip-drip process punctuated occasionally by Major Revelations, about the real nature of the Empire and our fellow creatures.

When I first read *A People's History*, this a year ago, in my freshman year at college, I was struck most notably with a vivid sense of indignation. For all my life, I had been blatantly lied to. Christopher Columbus was not a hero. He did not welcome the Americas into the “European enlightenment.” He was the architect of a genocide, just like Hitler, Stalin, and every other historically “evil” figure. Throughout all of high school, not once was it mentioned that the worst genocide in known History was committed by the same guy we have a holiday named after.

In high school history, they do spend some time covering The Trail of Tears, Slavery, and the Evils of the Jim Crow era, but its always done so in this theatrical rendition of America triumphing over intolerance.

Lincoln was a hero—even though he sent six-million Americans to their deaths in a war which was primarily fought for economic purposes. J.P. Morgan, and Rockefeller, were savvy, revolutionary business men—even though they reduced half of the population to slave-like conditions in order to achieve their ‘maximum profits.’

From reading *A People's History*, I gained an objective stance on the history of America, instead of that idealized, fictitious narrative regurgitated in every high school history class.

I believe that knowing the idealized version alone is reducing our society to sheep. The majority of us only understand this idealized America because it's all we're aware of. So, when we're faced with the actual America in practice, and we don't know what the hell is going on, we think everybody else is just sullyng our country's good name for foolish reasons. But America has done some fucked up shit in the past, and in various forms, it still is today. It's important to be aware of this.

Instead of receiving an enriching and well-rounded education, we were fed myths. All societies perpetuate lavish myths that enable the few to rule over the many, repress critical thinking, camouflage the grim realities.

Education is the way that a society articulates its values, the way that it transmits its values. Every educational system wants to produce a certain kind of human being.

If I dropped you all of in the middle of nowhere alone, some of you might be able to get home by yourselves, others might need to be rescued. If I gave you a math problem, some of you would be able to solve it, some of you wouldn't. If we had a race, some of you will be faster than others. If

we had a drawing contest, some of the pictures might be better than others. Everyone's got strengths and weaknesses (differences), accept others' and hope they accept yours.

I'm 60 and I've learned basically everything too late:

- No one knows what they're doing 100% of the time. It's not just you who feels out of your depth
- At some point you realize you've completely forgotten someone you thought was your most best friend who'd go through life with you. They were kind of an asshole, anyway. You won't miss them.
- I was a dumbass for not using what I had, as a young, attractive woman, to get what I wanted. Don't be an asshole about it, don't always rely on it, but as long as the rule is in place, use it if you need to. It's practical.
- It's absolutely true that it's quicker and simpler to apologize than to ask for permission. . . in most everything except interpersonal relationships.
- Life is long and fascinating and no one ever knows what's around the next corner. Don't fear it—run to meet it! Jump into the next, let go of the used to be. It's gone. Get over it.
- Remember to look at the small, beautiful things you encounter every day. An icy cold beverage on a hot day, kids jumping in puddles, the toddler that catches your eye in line at the grocery store and smiles, a book that takes your breath away, low clouds over a city, rain on leaves. . . there's so much awfulness swirling around you that you need to balance it with something great, even if it seems so small that it's meaningless. It's not. Each tiny thing we see or hear or touch is a thread that's woven into the day. Add a sparkly one once in a while.
- Plans are bullshit. It's better to be a person who can roll with whatever comes than a person who has unchangeable plans that just can't work. Be the water, not the rock. Unless you are The Rock, in which case, I agree: Vin Diesel is a punk ass bitch.

Why do we adults feel the need to construct the world for our children?
Why can they not explore and construct the world for themselves?

“Students are free to switch lanes on their own. Sometimes they will be in the ‘slow’ lane, sometimes they’ll be in the ‘fast’ lane. My job is to make sure they don’t get stuck in a ditch.”

Multitasking is not only not thinking, it impairs your ability to think. Thinking means concentrating on one thing long enough to develop an idea about it. Not learning other people's ideas, or memorizing a body of information, however much those may sometimes be useful. Developing your own ideas. In short, thinking for yourself. You simply cannot do that in bursts of 20 seconds at a time, constantly interrupted by Facebook messages or Twitter tweets, or fiddling with your iPod, or watching something on YouTube.

I find for myself that my first thought is never my best thought. My first thought is always someone else's; it's always what I've already heard about the subject, always the conventional wisdom. It's only by concentrating, sticking to the question, being patient, letting all the parts of my mind come into play, that I arrive at an original idea. By giving my brain a chance to make associations, draw connections, take me by surprise. And often even that idea doesn't turn out to be very good. I need time to think about it, too, to make mistakes and recognize them, to make false starts and correct them, to outlast my impulses, to defeat my desire to declare the job done and move on to the next thing.

Excellent Sheep

What, in short, is college for? We talk, in the overheated conversation we've been having about higher education lately, about soaring tuition, rising student debt, and the daunting labor market for new graduates. We talk about the future of the university: budget squeezes, distance learning, free tuition, massive open online courses, and whether college in its present form is even necessary. We talk about national competitiveness, the twenty-first-century labor force, technology and engineering, and the outlook for our future prosperity. But we never talk about the premises that underlie this conversation, as if what makes for a happy life and a good society were simply self-evident, and as if in either case the exclusive answer were more money.

Education is more than the acquisition of marketable skills, and you are more than your ability to contribute to your employer's bottom line or the nation's GDP, no matter what the rhetoric of politicians or executives would have you think. To ask what college is for is to ask what life is for, what society is for—what people are for.

In 1971, 73 percent of incoming freshmen said that it is essential or very important to “develop a meaningful philosophy of life,” 37 percent to be “very well-off financially” (not well-off, note, but very well-off). By 2011, the numbers were almost reversed, 47 percent and 80 percent, respectively. For well over thirty years, we've been loudly announcing that happiness is money, with a side order of fame. No wonder students have come to believe that college is all about getting a job.

The things that are most worth doing are worth doing for their own sake. Anyone who tells you that the sole purpose of education is the acquisition of negotiable skills is attempting to reduce you to a productive employee at work, a gullible consumer in the market, and a docile subject of the state. What's at stake, when we ask what college is for, is nothing less than our ability to remain fully human.

You don't arrive in college a blank slate; you arrive having already been inscribed with all the ways of thinking and feeling that the world has been instilling in you from the moment you were born: the myths, the narratives, the pieties, the assumptions, the values, the sacred words. Your soul is a mirror of what is around you. Freshman students can always be counted on to produce an opinion about any given subject the moment it is brought up. It is not that they had necessarily considered the matter before. It is that their minds are like a chemical bath of conventional attitudes that will instantly precipitate out of solution and coat whatever object you introduce.

Being an intellectual begins with thinking your way outside of your assumptions and the system that enforces them. But students who get into elite schools are precisely the ones who have best learned to work within the system, so it's almost impossible for them to see outside it, to see that it's even there. Long before they got to college, they turned themselves into world-class hoop-jumpers and teacher-pleasers, getting A's in every class no matter how boring they found the teacher or how pointless the subject, racking up eight or ten extracurricular activities no matter what else they wanted to do with their time.

Paradoxically, the situation may be better at second-tier schools and, in particular, again, at liberal arts colleges than at the most prestigious universities. Some students end up at second-tier schools because they're exactly like students at Harvard or Yale, only less gifted or driven. But others end up there because they have a more independent spirit. They didn't get straight A's because they couldn't be bothered to give everything in every class. They concentrated on the ones that meant the most to them or on a single strong extracurricular passion or on projects that had nothing to do with school or even with looking good on a college application. Maybe they just sat in their room, reading a lot and writing in their journal. These are the kinds of kids who are likely, once they get to college, to be more interested in the human spirit than in school spirit, and to think about leaving college bearing questions, not résumés.

As you may have guessed, I didn't apply to the Journal or to any judges. But that was because I had a family, and I didn't want to spend any more evenings away from them to do cite checking. I also had a career and enough accomplishments behind me that I was emotionally secure enough not to pursue credentials for their own sake. But if I had been single and in my twenties, I'm sure I would have played the game. That's what our educational system teaches smart young people: that there are universal, objective markers of achievement and ability, and that's what you're supposed to get.

The system does not actually prefer high intelligence; it prefers moderate giftedness—I hate that term, but it's the one currently used—combined with compliance, a desire to please authority figures, and craving status. These are often traits which the profoundly gifted have lower, rather than higher, levels of. Being extremely intelligent does not protect you from cognitive bias, or make you a better person.

The broader problem of credentialism is real. For one thing, the pursuit of brass rings because they are shiny creates unnecessary stress and unhappiness. More generally, when you give out prizes based on idiosyncratic criteria, ambitious people adjust their behavior to excel at those criteria—which may

not be particularly valuable in the real world.

Then there's the cost to society. A world in which success means Rhodes, or Teach for America, or Goldman, or McKinsey followed by Yale Law School or Harvard Business School followed by Blackstone, or Bridgewater, or Google is one in which too many are doomed to failure, too many indoctrinated into a certain way of being and seeing.

To me, the entire value system behind the Race to the Top (RTT) was mistaken. I actually think we should be careful about conceding that education is about "student achievement." Personally, I think education is about introducing young people to the world, helping them achieve wisdom and understanding, and cultivating their curiosity, thoughtfulness, sociability, and creativity. The Obama administration's view seemed to be that education is about improving math and reading outcomes in order to prepare students for college. And college, of course, exists to prepare students for jobs—see Obama's infamous disparaging comment about the economic value of an art history major. The narrowly instrumental view of education has been embraced by libertarians and "progressive" Education Reformers alike, who both seem to accept the premise that schools should be pumping as much Skill into students as possible as efficiently as possible.

I de-emphasize assessment entirely when I think about what a good school should be. This is not because I think it doesn't matter whether students learn. Rather, it's because I believe that when you create the right school environment, in which teachers have what they need, the learning follows, and you don't actually need to worry too much about measuring performance. It's important to remember, as many critics of testing-focused teaching have pointed out, that the more "performance assessment" there is, the less teachers can teach. Time spent assessing is time not spent doing, and among those who demand more quantitatively-based teacher accountability, there is very little discussion of what this actually means in the lives of teachers (e.g. more stress, more paperwork).

I am a lot more interested in the experiences of students and teachers than their Outcomes. Are kids excited to come to school, or do they dread it? Do teachers enjoy their work, or do they feel as if they are being handcuffed by administrative regulations that prevent them from reaching their full potential? I am an old school believer in a "liberal education," the success of which is not measured quantitatively in terms of your test results but qualitatively in terms of your character.

Race to the Top may have been misguided, but it was the logical education policy that followed from the brand of liberalism Obama believed in. This brand of liberalism is meritocratic, technocratic, and capitalistic, meaning that it:

1. Sees competition as good, and winning competitions as proof of desert
2. Defers to policy experts over the actual people affected by policies
3. Views productivity and success within the marketplace as a measure of the good

This view sees “innovation,” “technology,” and “competition” as inherently good things, regardless of the facts on the ground. Those of us with a vision of a humane education need to reject this type of policy entirely.

RTT was wrong in a thousand ways. It prioritized data collection for its own sake, and in spite of its focus on achievement and evidence-based policy, didn’t actually boost achievement and wasn’t based on evidence. It was just free market ideology. Instead of talking about adding yet more assessments of teacher performance, we should be talking about the fact that teachers across the country have to buy their own school supplies, and the profession offers too much work for too little pay to attract good candidates who will stay for the long-term. No more races to the top. What we need is a race to make sure every school has a music teacher, every building is safe and beautiful and well-maintained, every child is well-fed, every classroom is full of books and supplies, and every teacher has what they need in order to help children discover the world of knowledge.

“Children should be custom made not mass produced. One room schoolhouses here are still very popular. The older children help the younger children while the teacher works with individual students.”

The reasons for credentialism go beyond any easy cure. One is the innate conservatism of people who play by the rules and excel at school. One is the high degree of inequality in contemporary society, which inflates the costs of not landing at the top end of the income distribution. One is the homogenization of culture, which means that most smart young people in the United States grow up in the same informational environment, evaluating the same set of options. Finally, for the most part, credentialism is individually rational: it’s ‘work for Goldman now, save the world later.’ But after too many years in that environment, people come to believe that working for Goldman is saving the world—I believe the phrase is “doing God’s work.” And that’s where credentialism can lead you.

Essentially, you sell your life to afford to keep living so you can sell more. And the best you can hope for is to train your whole first quarter of life so that your lifetime is worth more than the time of others.

Within education systems rooted in the Mechanics of the Market, where conformity and competition are widespread, creative self-expression becomes very difficult, individuality is curtailed and the pressure to “achieve” is immense. Such an approach does not liberate intelligence and encourage creative living; on the contrary, it inhibits and frustrates a person. Instead of awakening the integrated intelligence of the individual, education is encouraging you to conform to a pattern and so is hindering your comprehension of yourself. This methodology of competition and conformity is frustrating teachers, sucking creativity out of school and university, and fueling increasing levels of mental illness amongst young people, leading in some cases to self-harm and suicide.

We mandate “activities,” so we reward joiners. We insist on “leadership,” so we reward climbers. We value those who give us what we want, so we reward manipulators. We punish those who will not play the game. We are robbing children of their childhood and teenagers of their adolescence. We have engineered a vast regimentation of youth. So many are desperately struggling to do their best within a system that has lost its mind. But we need to do more than throw up our hands. We cannot continue to go with the flow, however powerful the current is.

When you approach life as a sequence of milestones to be achieved, you exist in a state of near-continuous failure. Almost all the time, by definition, you’re not at the place you’ve defined as embodying accomplishment or success. And should you get there, you’ll find you’ve lost the very thing that gave you a sense of purpose—so you’ll formulate a new goal and start again.

We once had a chance to achieve a balance between autonomy, diversity, and society. Many societies of interwoven dependencies worldwide had the potential to evolve and allow both autonomy and society for all. Instead we created a global, sectarian, stratified class system where everyone must strive for the same goals and all but the few setting the goals would fail.

“Countries with more engineering majors tend to grow faster and those with more law students tend to grow slower.”

Of course, a society in which everyone is a good little worker cog in Carnegie’s money-making machine is also a nightmare. A society in which no one has the skills to critique and analyze the society itself is already dead. We need less lawyers, MBAs, and STEM graduates, and a hell of a lot more English majors—even as infested as that field is with post-modernist bullshit. Also, constant “growth” and technological/industrial “progress” will ultimately bring not just individual societies but our species as a whole to the very brink of planetary destruction.

When schools were asked about the morality of allowing financial firms—which have caused so much harm and contributed so much to inequality—and defense contractors—which have aided in the murder of hundreds of millions in the last century alone—to attend on-campus career fairs they cited their duty of impartiality, which, they believe, prevents them from seeking to influence students' choices, and explained that there were plenty of other careers on offer. But they appear to have confused impartiality with passivity. Passivity in the face of unequal forces is anything but impartial. Impartiality demands an active attempt to create balance, to resist power, to tell the dark side of the celestial tale being pummeled into the minds of undergraduates by the richest money and death cults.

In fairness, many university presidents are paid largely for their ability to attract donations, and it is possible that these presidents were especially successful in attracting contributions. However, this is a skill that matters much more in an unequal society that depends on donations from the rich to support higher education. Being able to develop relationships with the wealthy is a much less valuable skill in a society where the wealthy have less money and education is supported through other channels.

Basically universities have become a cog in the machine of neoliberalism. Rather than anything resembling an institution for the public good, it has taken on the worst aspects of corporate America (and Canada). You can see this in the way they push now for endowment money, the highly paid senior management contrasted with poorly paid adjuncts, and how research is controlled these days. Blue skies research is cut, while most research is geared towards short-term corporate profit, from which they will no doubt milk society with.

I tremble when I think about what all of this means:

1. Students won't be getting a good education when they are taught by adjuncts being paid poverty wages.
2. Corporations will profit in the short-run.
3. The wealthy and corporations—due to endowment money—have a huge sway.
4. Blue skies research will fall and over time, US leadership in hard sciences.
5. The productivity of future workers will be suppressed and with it, their earning potential.

6. Related to that, inequality will increase dramatically as universities worsen the situation.
7. There will be many “left behind” students and graduates with high debt, along with bleak job prospects.
8. State governments, starving for tax money will make further cuts, worsening these trends.
9. Anything hostile to the corporate state will be suppressed.
10. With it, academic freedom and ultimately democracy will be much reduced.

What it means is decline in US technological power and productivity gains, and with them, living standards. All of these trends already are happening. They will worsen.

Our new multiracial, gender-neutral, globalized meritocracy has figured out a way to make itself hereditary, and the education system is that way. That is largely what “diversity” amounts to now. Visit any elite campus across our great nation, and you can thrill to the heartwarming spectacle of the children of white business-people and professionals studying and playing alongside the children of black, Asian, and Latino business-people and professionals. Kids at schools like Stanford think that their environment is diverse if one comes from Missouri, another one from Pakistan, or one plays the cello and the other one lacrosse—never mind that all of them have parents who are bankers or doctors. They aren’t meeting “all kinds of people,” as they like to say. They’re meeting the same kind of people; they just happen to come from all kinds of places. They are aware of themselves as an academic elite, but not as a social or economic one.

We’re not entitled, we work hard—that’s the rationale one often hears. And you may indeed have worked much harder than the kids around you, but what about the ones you couldn’t see? Do you really think that none of them worked hard? What about the kid at the public school a couple of towns over, who put in just as many hours every week, only twenty-five of them were at a Denny’s? The way things go at this point, being treated fairly is itself a form of privilege. Most Americans work hard without receiving the rewards they’ve earned. That, in fact, is pretty much what social inequality involves today.

The kind of individuals who go to elite colleges are enlightened enough to be politically correct, but not enough to find the very idea of an elite college objectionable. They preen themselves on their progressive views on

race, gender, and sexuality, but they blind themselves to the social division that matters the most, that they guard most jealously, that forms the basis of their comfort, their self-respect, and even of their virtue itself: class.

I know it's hard to hear these things if you're a privileged young person. It was very hard for me to hear them, when the knowledge started to be thrust upon me. It's not your fault you grew up affluent and sheltered. But now you need to take responsibility for it. You can start by recognizing that you aren't, in fact, more valuable than other people, no matter what you've always heard. Your pain does not hurt more. Your soul does not weigh more. If I were religious, I would say that God does not love you more. And the social implications should be clear.

Grabbing everything you can isn't any more virtuous when you do it with the power of your brains than it is when you do it with the power of your fists. Yet that is exactly what's happening now, to an extent we haven't seen in nearly a hundred years: our "leaders," the elite, who are supposed to work for the greater good, enrich themselves at everyone else's expense and justify their actions with the notion that they're "better." Not being an entitled little shit is an admirable goal, but the real problem is the situation that makes it so hard to be anything else. The real problem, once again, is the system itself.

The colleges seem to think that piling up rejections makes them special. In fact, it just means that they have collectively opted to deploy their massive, tax-subsidized endowments to replicate privilege rather than fulfill their duty to produce an educated public.

Consider the US News college rankings, student financing was left out of the model. This brings us to the crucial question we'll confront time and again: What is the objective of the modeler? In this case, put yourself in the place of the editors at US News in 1988. When they were building their first statistical model, how would they know when it worked? Well, it would start out with a lot more credibility if it reflected the established hierarchy. If Harvard, Stanford, Princeton, and Yale came out on top, it would seem to validate their model, replicating the informal models that they and their customers carried in their own heads. To build such a model, they simply had to look at those top universities and count what made them so special. What did they have in common, as opposed to the safety school in the next town? Well, their students had stratospheric SATs and graduated like clockwork. The alumni were rich and poured money back into the universities. By analyzing the virtues of the name-brand universities, the ratings team created an elite yardstick to measure excellence.

Now, if they incorporated the cost of education into the formula, strange things might happen to the results. Cheap universities could barge into the

excellence hierarchy. This could create surprises and sow doubts. The public might receive the US News rankings as something less than the word of God. It was much safer to start with the venerable champions on top. Of course they cost a lot. But maybe that was the price of excellence. By leaving cost out of the formula, it was as if US News had handed college presidents a gilded checkbook. They had a commandment to maximize performance in fifteen areas, and keeping costs low wasn't one of them. In fact, if they raised prices, they'd have more resources for addressing the areas where they were being measured. Tuition has skyrocketed ever since.

Between 1985 and 2013, the cost of higher education rose by more than 500 percent, nearly four times the rate of inflation. To attract top students, colleges have gone on building booms, featuring glass-walled student centers, luxury dorms, and gyms with climbing walls and whirlpool baths. This would all be wonderful for students and might enhance their college experience—if they weren't the ones paying for it, in the form of student loans that would burden them for decades.

We cannot place the blame for this trend entirely on the US News rankings. Our entire society has embraced not only the idea that a college education is essential, but the idea that a degree from a highly ranked school can catapult a student into a life of power and privilege. The US News rankings simply fed on these beliefs, fears, and neuroses. It created powerful incentives that have encouraged spending while turning a blind eye to skyrocketing tuition and fees.

Every ranking system can be gamed. And when that happens, it creates new and different feedback loops and a host of unintended consequences. But even those who claw their way into a top college lose out. If you think about it, the college admissions game, while lucrative for some, has virtually no educational value. The complex and fraught production simply re-sorts and reranks the very same pool of eighteen-year-old kids in newfangled ways. They don't master important skills by jumping through many more hoops or writing meticulously targeted college essays under the watchful eye of professional tutors. Others scrounge online for cut-rate versions of those tutors. All of them, from the rich to the working class, are simply being trained to fit into an enormous machine—to satisfy an algorithm. And at the end of the ordeal, many of them will be saddled with debt that will take decades to pay off. They're pawns in an arms race, and it's a particularly nasty one.

Perhaps it was just as well that the Obama administration failed to come up with a rejiggered ranking system. The pushback by college presidents was fierce. After all, they had spent decades optimizing themselves to satisfy the US News model. A new formula based on graduation rates, class size,

alumni employment and income, and other metrics could wreak havoc with their ranking and reputation. No doubt they also made good points about the vulnerabilities of any new model and the new feedback loops it would generate. So the government capitulated. And the result might be better. Instead of a ranking, the Education Department released loads of data on a website. The result is that students can ask their own questions about the things that matter to them—including class size, graduation rates, and the average debt held by graduating students. They don't need to know anything about statistics or the weighting of variables. The software itself, much like an online travel site, creates individual models for each person. Think of it: transparent, controlled by the user, and personal.

Anywhere you find the combination of great need and ignorance, you'll likely see predatory ads. If people are anxious about their sex lives, predatory advertisers will promise them Viagra or Cialis, or even penis extensions. If they are short of money, offers will pour in for high-interest payday loans. If their computer is acting sludgy, it might be a virus inserted by a predatory advertiser, who will then offer to fix it. Even the boom in for-profit colleges is fueled by predatory ads.

A 2012 Senate committee report on for-profit colleges described Vatterott's recruiting manual, which sounds diabolical. It directs recruiters to target:

- Welfare Mom w/Kids
- Pregnant Ladies
- Recent Divorce
- Low Self-Esteem
- Low Income Jobs
- Experienced a Recent Death
- Physically/Mentally Abused
- Recent Incarceration
- Drug Rehabilitation
- Dead-End Jobs—No Future

Why, specifically, were they targeting these folks? Vulnerability is worth gold. It always has been. Picture an itinerant quack in an old western movie. He pulls into town with his wagon full of jangling jars and bottles. When he sits down with an elderly prospective customer, he seeks out her weaknesses. She covers her mouth when she smiles, indicating that she's sensitive about her bad teeth. She anxiously twirls her old wedding ring, which from the looks of her swollen knuckle will be stuck there till the end of her days. Arthritis. So when he pitches his products to her, he focuses on the ugliness of her teeth and her aching hands. He can promise to restore the beauty of her smile and wash away the pain from her joints. With this

knowledge, he knows he's halfway to a sale before even clearing his throat to speak.

It starts with the sales pitch colleges make to kids. The thrust of it is usually that people who go to college make lots more money than the unfortunate dunces who don't. "A bachelor's degree is worth \$2.8 million on average over a lifetime" is how Georgetown University put it. The Census Bureau tells us similarly that a master's degree is worth on average about \$1.3 million more than a high school diploma.

But these stats say more about the increasing uselessness of a high school degree than they do about the value of a college diploma. Moreover, since virtually everyone at the very highest strata of society has a college degree, the stats are skewed by a handful of financial titans. A college degree has become a minimal status marker as much as anything else. I'm sure people who take polo lessons or sailing lessons earn a lot more on average too. But does that mean you should send your kids to sailing school? Maybe you're never too young to start networking?

Your basic citizen's education wasn't expanded from four grades to eight in order to include astronomy, microbiology, and zoology. It wasn't expanded from eight grades to twelve in order to include astrophysics, biochemistry, and paleontology. It wasn't expanded from twelve grades to sixteen in order to include exobiology, plasma physics, and heart surgery. Today's graduates don't leave school with all the advances of the past hundred years in their heads. Just like their great-great-grandparents a century ago, they leave with enough in their heads to start at the bottom of the job market, flipping burgers, pumping gas, and bagging groceries. It just takes today's graduates a whole lot longer to get there.

What happens when busyness and sociability leave no room for solitude? The ability to engage in introspection, I put it to my students one day, is the essential precondition for living an intellectual life, and the essential precondition for introspection is solitude. They took this in for a second, and then one of them said, with a dawning sense of self-awareness:

"So are you saying that we're all just, like, really excellent sheep?"

Well, I don't know. But I do know that the life of the mind is lived one mind at a time: one solitary, skeptical, resistant mind at a time. The best place to cultivate it is not within an educational system whose real purpose is to reproduce the class system.

The Weight of the Past

“When he thinks of the starry-eyed puerility and narcissism of these fantasies now, a rough decade later, he experiences a kind of full-frame internal wince, that type of embarrassment-before-self that makes our most mortifying memories objects of fascination and repulsion at once, though in his case a certain amount of introspection and psychotherapy (the latter the origin of the self-caricature doodling during downtime in his beige cubicle) had enabled him to understand that his professional fantasies were not in the main all that unique, that a large percentage of bright young men and women locate the impetus behind their career choice in the belief that they are fundamentally different from the common run of man, unique and in certain crucial ways superior, more as it were central, meaningful—what else could explain the fact that they themselves have been at the exact center of all they’ve experienced for the whole twenty years of their conscious lives?—and that they can and will make a difference in their chosen field simply by the fact of their unique and central presence in it?”

In America the young are always ready to give, to those who are older than themselves, the full benefits of their inexperience.

The problem with shunning climate change deniers is that it doesn’t take into account that for the average person ignorance about major issues is rational. Most people cannot do anything about climate change, or neoliberalism, or any of the other things that plague us. Deep down most people know that they have little power to change governmental and corporate policy. So the average person either doesn’t follow current events much (the majority) or they only read and watch sources that confirm their beliefs.

Most people are so worn out from work and the difficulties of daily life that they refuse to educate themselves. I used to think that these people were sheep but now I have more sympathy for this kind of attitude. The refusal to think deeply about important and potentially troubling issues is rational because it reduces stress and helps people focus on their immediate survival. To your average person, worrying about something that seems distant, like climate change, seems ludicrous. It is like worrying about an asteroid hitting the Earth. Even if you convinced them that climate change was a serious problem they would say that there is nothing they can do about it.

I don't necessarily blame past generations because they were trapped in the logic of rational ignorance. It just doesn't pay for most people to think deeply about big issues like the environment. Most individuals have a very, very tiny chance of influencing events so it makes sense for them to not be troubled by matters they have no control over. That is why so many people seem to be "sheep." It is a rational way for people to deal with the world around them by putting most of their time and energy into their private lives and not worrying about big picture issues.

The low-wage worker who wants to use his mind isn't going to waste his time on international affairs, because that's useless; he can't do anything about it anyhow, and he might learn unpleasant things and even get into trouble. So he might as well do it where it's fun, and not threatening—professional football or basketball or something like that.

Your first mistake is assuming that the goal of public education is to produce critical thinkers. It isn't. Never was. Never will be. Our entire economic and political paradigm has been concocted to allow those with power to stay in power and those without power to have the illusion of personal autonomy and participation in this society as something more than necessary labor.

Once, long ago, those in power did not need this illusion to maintain their grasp on society. We had widespread actual slavery, actual serfdom, and actual social castes. Now we have virtual freedoms and virtual rights. The moment you begin to upend the apple cart, you get labeled a dissident, bullied by police, military, judiciary, or even other corporatocratic enterprises into ceasing and desisting from destabilizing our fragile marketplace.

Our economy is built on smoke and mirrors and whispers of prosperity. Our workforce exists to peddle material bullshit we don't need and only believe that we want. Our careers exist to provide us not with the means to live, but the means to survive so that we can save enough earnings to not have to work when we become too old and frail to enjoy life as we did when we were young.

Our higher education systems shackle us with debt that we will spend decades working our way out of, such that we will be unable to explore our desires and passions and instead elect to only debase ourselves in the name of profit.

Our prisons don't house those who would undo our society through malice and mental infirmity, they are overflowing with those that dared to involve themselves in illicit commerce. Our patrolmen don't safeguard the public, they generate revenue for municipalities and states.

Our soldiers don't protect the nation against enemy aggressors, they enforce corporate goals against enemy nations by invading and dismantling

countries too weak to repel them. Our politicians don't serve their constituents, they feed an economic paradigm that will continue to stamp and tax reality, manufacturing cheap, plastic meaning instead of calling our state and species to a higher, better purpose.

Our hospitals don't aid the sick or poor, they prolong suffering and death in exchange for money.

Public education is the propaganda wing of a short-sighted, incompetent entity that would rather employ its population in the chasing of white elephants as opposed to expanding their horizons and helping them see reality. We are taught not to see reality, we are told to ignore cynics and preached a whitewashed history of heroes and philanthropists rather than butchers and sociopaths.

“Philosophy is a wonderful thing. Critical thinking is wonderful, but our society would not survive a thinking majority.”

“Knowledge is power; but who hath duly Considered the power of Ignorance? Knowledge slowly builds up what Ignorance in an hour pulls down. Knowledge, through patient and frugal centuries, enlarges discovery and makes record of it; Ignorance, wanting its day's dinner, lights a fire with the record, and gives a flavor to its one roast with the burned souls of many generations.”

—George Eliot, *Daniel Deronda*

Without religious decrees, rules, whatever label you put on them, you are forced to examine everything yourself. Well, this is not entirely true, in modern times our secular culture has replaced religion in many spheres. However, in many instances the secular and religious are the same for our purposes.

Without examining everything, we leave ourselves open to manipulation. Our priests guiding us the way the powerful wish. Our education system should be giving every child the skills needed to do this. However this skill is not only not easily testable by filling in bubbles, it also poses a threat to institutions which allow a few to be enriched, empowered, at the expense of the many. Why concentrate such great power when information can be transmitted to the other side of the planet in the blink of an eye? Why limit decisions to some elite few when information is no longer scattered in physical buildings across the globe but instead accessible by anyone with an inexpensive tool?

Ignorance is a double-edged sword for the powerful, while it is nothing but negative for the powerless. Even those who are not ignorant are shackled

by the masses of still-ignorant, receiving no benefit except the knowledge of their true position.

We embrace (right) or coddle (left) ignorance. Whether it is something to be praised because it shows a truer knowledge, a common-sense that those eggheads just don't have, or a sympathetic gaze and soft touch, because it was the unequal system which helped keep them ignorant.

A group of ignorant people is fucking dangerous. Whether they're surrounding you and picking up some rocks, or just vocally supporting barbaric policies—it doesn't matter—they're a fucking threat. That doesn't mean you need to kill them, just as you don't need to kill all predators just because they might do something bad. But you be fucking aware, wary, and understand the power wielded.

A war or ignorance would be the only 'War on X' that would actually be worth fighting. And it must be fought like a war. Whether that is a cold or hot one, it does not matter, but the stakes are not simply your preferred option not being chosen, a workable compromise chosen, but life and death, if not for you, surely for millions of sentient feeling emotive creatures around the world.

The most dangerous man to any government is the man who is able to think things out for himself, without regard to the prevailing superstitions and taboos. Almost inevitably he comes to the conclusion that the government he lives under is dishonest, insane, and intolerable, and so, if he is romantic, he tries to change it. And even if he is not romantic personally, he is very apt to spread discontent among those who are.

If we were to provide students with the fundamental learning and teaching skills necessary, each individual would be capable of educating their own children at the same level if not better than current institutions. Any other outcome would signal a failure of the institutions, not the people.

The invocation of theory has something modest about it, but it is also "massive," as the kids say now; theology was countered by theories, which are tentative, open-ended, and unsure but also explain things that were otherwise mystifying, and are always empirical—open to probing and testing and changing. Theories are in many ways the ground and basis of our humanity: it is in the child's ability to make theories, test them from experience, and then make new and better ones, that intelligence emerges; and it is, by the same argument, in the perversion of theory into dogma that intelligence becomes enslaved. A child who can't make new theories is a disabled child.

The problem is you're viewing things through too much of your own cultural biases. We view the world and people in it largely in two chunks: Pre-Civilization and Civilization. But at the rough dividing line of these

two, there begins—or likely simply continues—to be a whittling down of ideas, of “acceptable” practices. Some of this whittling was good, but I think you will find, in our ignorance, we cut off quite a bit of useful material as well.

Human nature as it is commonly used is misleading; it is nothing more than the inherited cultural practices of a single dominant ideology.

Conservative arguments throughout history show that they consistently make appeals to the same notions: perversity, futility, and jeopardy: Proposed Reform X is against God or nature, it won’t work, and it will threaten existing progress. The arguments are made consistently regardless of whether there is any evidence that they are true. This is how a war on the imagination is waged, and people become convinced that it isn’t worth dreaming of anything radically different than the status quo. So when teachers are being paid so little that they leave the profession, we are told that the only options are to let unqualified people teach or import teachers from overseas. And when our public schools are underfunded and dysfunctional, we have a debate over how best to turn the schools into effective job-training programs.

One of the distinguishing marks of history as an academic discipline is the better you know a particular historical period, the harder it becomes to explain why things happened one way and not another. Those who have only a superficial knowledge of a certain period tend to focus only on the possibility that was eventually realized. They offer a just-so story to explain with hindsight why that outcome was inevitable. Those more deeply informed about the period are much more cognizant of the roads not taken.

My students used to tell me how lucky I was to be teaching history. Once you have got a period or the events of a war straight, so they assumed, you don’t have to think about them again. It must be so nice, they would say, not to redo your lecture notes. The past, after all, is the past. It cannot be changed. History, they seemed to say, is no more demanding than digging a stone out of the ground. It can be fun to do but not really necessary. What does it matter what happened then? This is now.

Part of the problem lies in the way in which we teach history. We teach as if it is a concrete story, whose facts are certain and agreed upon. It was long ago and we know the truth of what happened. It creates a certain inevitability to the current ways of thinking; adds a certain natural progression to the ideas and cultural practices of the present. Rather than developing critical thinking, history, as currently taught, simply indoctrinates a child into the current culture, giving it an air of superiority and finality.

This will effect all aspects of their life going forward. What they will accept, what they will support, what they will strive for, altered simply by effecting the story of the world.

I distrust summaries, any kind of gliding through time, any too great a claim that one is in control of what one recounts; I think someone who claims to understand but is obviously calm, someone who claims to write with emotion recollected in tranquility, is a fool and a liar. To understand is to tremble. To recollect is to re-enter and be riven. I admire the authority of being on one's knees in front of the event.

The most important impact of script on human history is precisely this: it has gradually changed the way humans think and view the world. Free association and holistic thought have given way to compartmentalization and bureaucracy.

A lobotomy is performed on each generation. Facts are removed. History is excised and replaced by an eternal present. It is the manipulation of power worldwide, while masquerading as a force for universal good, a brilliant, even witty, highly successful act of hypnosis which means that it never happened. Nothing ever happened. Even while it was happening it wasn't happening. It didn't matter. It was of no interest.

Perhaps because historians—much like economists—long to sound like their peers in the sciences, they have increasingly gone in for specialized language and long and complex sentences. Much of the writing is difficult, often needlessly so. A historian offers a curious defense of obscurantism. We should not, he said severely, expect historians to be entertaining or to tell interesting stories:

“Do we need professional history that entertains us—especially when public money pays for so much of what we historians do? Do we need physics that entertains us?”

Historians, however, are not scientists, and if they do not make what they are doing intelligible to the public, then others will rush in to fill the void. Political and other leaders too often get away with misusing or abusing history for their own ends because the rest of us do not know enough to challenge them. What they like to do is select from history—as they see it—the “glorious” moments. Any politician who tries to use history, almost always doesn't get it quite right. Already much of the history that the public reads and enjoys is written by amateur historians. Some of it is very good, but much is not. Bad history tells only part of complex stories. It claims knowledge that it could not possibly have, as when, for example, it purports to give the unspoken thoughts of its characters.

Victorian historians too often depicted the past as an inevitable progress leading to the glorious present when Britain ruled the world. And French and German and Russian and American historians did much the same thing

for their nations' stories. Like epic poems, their books were filled with heroes and villains and stirring events. Such histories sustain us in difficult times, but they are nursery history.

Anyone who has ever had an argument and said, 'You always do that' or 'I trusted you' or 'You owe me one,' is using history to gain an advantage in the present. And almost all of us, from heads of countries to private citizens, do it. We spin the events of the past to show that we always tend to behave well and our opponents badly or that we are normally right and others wrong. Therefore, it goes almost without saying, we are in the right again this time.

In a secular world, which is what most of us in Europe and North America live in, history takes on the role of showing us good and evil, virtues and vices. Religion no longer plays as important a part as it once did in setting moral standards and transmitting values. Congregations at the old mainstream churches have declined sharply. It is true that there are huge evangelical churches out there but they are as much about entertainment and socializing as religion. The millions who describe themselves as born-again Christians often have, according to surveys, the sketchiest of ideas about what it is they are adhering to.

History with a capital 'H' is being called in to fill the void. It restores a sense not necessarily of a divine being but of something above and beyond human beings. It is our authority: it can vindicate us and judge us, and damn those who oppose us.

One part of our problem is that we are too familiar with novels, TV shows, and films. In art, nothing happens that is not later found to be important. Details are clues that affect story plot and help determine the conclusion. But life isn't that way. Life's tales are many, contradictory, overlapping. In life, one needs to stay loose, recognize happenstance, be ok with uncertainty, not indulge magical thinking.

Another aspect regarding the stories we've been told is how evil is handled. It's often given more three-dimensionality than the good to make clear its fearsomeness and to produce some adrenaline flow. To serve this, evil people and groups are often played as geniuses while the good people and groups are common folk who win by the skin of their teeth or by lucking out just because they are good. This is disempowering—our stories need to do better on this.

Art is not life.

The prison is your culture, which you sustain generation after generation. You yourself are learning from your parents how to be a prisoner. Your parents learned from their parents how to be a prisoner. Their parents

learned from their parents how to be a prisoner. And so on, back to the beginning in the Fertile Crescent ten-thousand years ago.

In times of profound change, learners will inherit the earth, while the learned find themselves beautifully equipped to deal with a world that no longer exists.

We spend altogether too much of our energy laboring in the shadows of the past—under the stultifying weight of convention, precedent, received wisdom, and neurosis. Our personal and collective inheritance stands in the way of our enjoyment of life and accomplishment of anything original.

The tradition of all dead generations weighs like a nightmare on the brains of the living. The mind like the moon, cratered with all the big impressions things had made.

Why do people believe in what they do? Why do they do what they do? And how can that be changed?

The primary problem isn't that we don't know what our problems are, or even how to fix them (in technical terms). It is that we aren't fixing them even though we know they exist and have a pretty good idea how to fix them.

I mean, we've known about climate change, undeniably, since the late 70s, at the latest. And we did, well, basically nothing. We know that inequality is terrible for everyone, and people were warning back in the late 80s about it and we, well, slammed our foot down on the accelerator.

And so on.

Now, this isn't a new pursuit for me. I wondered about it when I was younger, but I examined it, mostly, the wrong way—through anthropology, sociology, linguistics, history, neuroscience, and so on. Oh, it's not that these disciplines don't have important insights, but they are all fragmentary and none of them tell you the most important thing, not really: How to change. I mean, it's nice to have some insights into why you're fucked up, but if those insights don't lead to the ability to become less fucked up, the exercise is somewhat sterile.

There are a group of people who have, over millennia, spent virtually all their time examining how the human mind works, and why it believes what it believes. Spiritual people. Not religious people, understand; religion is what people who want pat answers to the insights of spiritual people create. They suck the insights dry, and turn them into set rules.

You've got someone like Mohamed, say, whose first followers are mostly slaves, women, and poor people. And Mohamed, well, he made their lives better; he made new rules which were not as bad as the old rules. Sure, women still weren't equal to men, but they had more rights than before. And people think that the new rules are now set in stone for eternity, rather

than considering that he was making things as much better as he could under the circumstances and given his own, unbroken conditioning.

Then there's poor Jesus. Good God, what his followers have done to his teachings! They've turned them into, with some exceptions like the social gospel, an utter force for evil. This is the fate of the great spiritual figures: to be misunderstood. Sometimes that misunderstanding doesn't do too much harm; sometimes it does a lot, as with Mohamed and Christ.

There's a type of spirituality which basically involves learning to examine one's mind, until the way it really works becomes something one can't deny any more. The simplest rule of the mind is that everything in it is stuff given to you by other people. Your religion, your nationality, your love of sports, whatever—it's all conditioning and while it isn't precisely all garbage, it's close to it. You didn't choose it, but you think it is 'you.' You think your personality is you, or that you are American or Chinese or Hindu or Christian or Jewish.

You're full up to the brim with stinking garbage; realities created by "wise" men of the past, which served their purposes and which has been, usually, completely unsuited to living a healthy, happy life with other humans in such a way that you don't, well, destroy the ecosphere, for one.

And the humor of it is in the identification with it—that you, that we, think that all this garbage is actually us. It's closer to a sickness, a virus, passed from sufferer to sufferer. And it's why we're ten yards from a wall, going 100 miles an hour.

If you want to stop being sick, and a vector for sickness, start by just resting and examining the contents of your consciousness as they come and go. And be ready to be really unhappy, as you realize you're a slave. But it is the slave who believes they are free who is most chained: You can't break invisible chains.

The bullshit this generation puts up with as a temporary nuisance from deranged politicians will seem perfectly ordinary to the next generation.

We use history to understand ourselves, and we ought to use it to understand others. If we find out that an acquaintance has suffered a catastrophe, that knowledge helps us to avoid causing him pain. We can never assume that we are all the same, and that is as true in business and politics as it is in personal relations. If we know nothing of what the loss of the Civil War and Reconstruction meant to Southern whites, how can we understand their resentment toward Yankees that has lingered into the present day? Without knowing the history of slavery and the discrimination and frequent violence that blacks suffered even after emancipation, we cannot begin to grasp the complexities of the relationship between the "races" in the United States. In international affairs, how can we understand the deep

hostility between Palestinians and Israelis without knowing something of their tragic conflicts?

It is sometimes hard for us, perhaps especially in North America, to recognize that history is not a dead subject. It does not lie there safely in the past for us to look at when the mood takes us. History can be helpful; it can also be very dangerous. It is wiser to think of history not as a pile of dead leaves or a collection of dusty artifacts but as a pool, sometimes benign, often sulfurous, that lies under the present, silently shaping our institutions, our ways of thought, our likes and dislikes. We call on it, even in North America, for validation and for lessons and advice. Validation, whether of group identities, for demands, or for justification, almost always comes from using the past. You feel your life has a meaning if you are part of a much larger group, which predated your existence and which will survive you—carrying, however, some of your essence into the future.

In 1935, W.E.B. Du Bois published *Black Reconstruction in America: 1860–1880*. In it, Du Bois challenges the then prevailing view, exemplified by the “Columbia School” of historians, John Burgess and William Dunning, that the end of Reconstruction was brought about by the incapacity of freed Black citizens to govern themselves. Du Bois’s alternative account of the failure of Reconstruction is that white economic elites exploited the racism of poor whites to prevent poor whites and newly freed Blacks from joining together in a labor movement with unified class interests.

Though it took several decades, the accuracy of Du Bois’s account of why Reconstruction came to an end has long since been widely acknowledged. At the time, Du Bois’s correct reading was disregarded, in favor of a manifestly racist interpretation. In the final chapter of the book, Du Bois argues that Burgess and Dunning’s view undermines history, by twisting its ideals of truth and narrative accuracy to the service of dominance and power. The chapter is called in “The Propaganda of History,” and in it he writes:

“If history is going to be scientific, if the record of human action is going to be set down with that accuracy and faithfulness of detail which will allow its use as a measuring rod and guidepost for the future of nations, there must be set some standards of ethics in research and interpretation. If, on the other hand, we are going to use history for our pleasure and amusement, for inflating our national ego, and giving us a false but pleasurable sense of accomplishment, then we must give up the idea of history either as a science or as an art using the results of science, and admit frankly that we are using a version of historical fact in

order to influence and educate the new generation along the way we wish.”

So why study history? Unlike physics or economics, history is not a means for making accurate predictions. We study history not to know the future but to widen our horizons, to understand that our present situation is neither natural nor inevitable, and that we consequently have many more possibilities before us than we imagine.

“But I’ll tell you what. I’ll never look at home the same way again. I’ll never look at education the same way again. That’s what’s been missing here, the whole way, from Kampala to Juba. It’s education. How are you supposed to want something if you’ve never seen it? And we totally take that for granted.”

You cannot understand the world, you cannot even understand yourself, unless you understand the past, for that is largely where your thoughts and feelings come from—not to mention almost all the laws and attitudes and structures that we collectively live by. To study the past is to continually have the experience of realizing: ‘Oh, so that’s why I think that.’ That is what is speaking through me when I say that. A liberal arts education ought to lead to a recognition scene, as at the climax of a play. But in the study of the liberal arts the thing we come to recognize is ourselves.

The most successful tyranny is the one that removes the awareness of other possibilities. The past gave rise to the present, but it is also different from the present. It shows us that things do not have to be the way that they are now. It provides us with a vantage point from which to see that our conventional wisdom is just conventional, not wisdom—that what we think is natural is merely cultural; temporal, not eternal; particular, not universal. It offers us an exit from the present. It tells us that things change: not only don’t they have to be the way they are, they will not be the way they are. The past, in other words, allows us to create the future. If you want to be a leader, if you want to find a new direction, then that is where you need to start.

History is important. If you don’t know history it’s as if you were born yesterday. And if you were born yesterday, anybody up there in a position of power can tell you anything, and you have no way of checking up on it.

As individuals, we are all, at least in part, products of our own histories, which include our geographical place, our times, our social classes, and our family backgrounds. For example, a Canadian who has grown up in Canada, and so has enjoyed an extraordinary period, unusual in much of the world’s

history, of peace, stability, and prosperity. That has surely shaped the ways in which they look at the world, perhaps with more optimism about things getting better than they might have if they had grown up in Afghanistan or Somalia.

People are born into what exists. They have no experience of what previously existed. Therefore, they do not know what has been lost.

One value of history is in fact to recognize how much better or worse or simply different things have been in other times and places. But the purpose of that is not to restore some better time. All past times thus far, each taken as a whole, have been horrendously awful. The purpose is to facilitate the rejection of the silly idea that we're stuck with whatever we happen to have in the way of a lifestyle at the moment.

In northern India, for example, around 500 BC, Siddhartha Gautama, who would later become a Buddha, or "awakened one," began to question the nature of reality and the religious practices of the day, because nobody was giving him answers that satisfied him. The alternative that he developed involved a deep and unsparing examination of the nature of the human mind and the supposed separation of the individual self from the greater whole. The key to Gautama's method was questioning: questioning the reality of the self, questioning the solidity of existence, questioning the nature of the mind, questioning what you were told by everybody else, including him.

Instead of granting authority to history, we can and should destabilize the universalizing narratives to which we've grown accustomed. Embracing such a narrow, unifying vision of identity—such as that which is based upon national myth, history, or family relations—grants legitimacy to fascism. Rather, when we recognize the singular multiplicities that characterize our existence, thus removing the pernicious confines of nation and history, we can re-think how much credence we lend to a mythologized history and to the agenda of national prosperity.

True resistance starts with delegitimizing power, and ends with mobilizing ourselves with new myths and a new vision for stability.

There needs, moreover, to be sufficient accountability for the present. To be alive at a particular time requires that we throw our entire fleshed existence into the chaos of our historical moment. Re-write the American myth to reveal the destruction we've created in the wake of our path. Point to the world around us and concede that this crisis is our crisis.

We must candidly explain the limits of our knowledge to students, then set them loose on the mystery. We need a new generation to solve this. I have a set of pre-assumptions that I'm not even aware of, and it's dictating what I'm thinking. We need these young minds when they're not stuck.

Any story can be told in dozens of different ways. For that very reason, I believe, every time you go back and reexamine an important chapter in your life, you learn something new about it. The same can be said for history.

“There’s two ways to make it more complex for the defense. One is to have a whole bunch of different plays, but that’s no good because then the offense experiences as much complexity as the defense. Another is a small number of plays run out of lots of different formations. That way, you don’t have to teach a guy a new thing to do. You just have to teach him new places to stand.”

It’s easy to overlook the significance of this kind of quote, mostly because it seems obvious and casual and reductionist. But it’s none of those things. It’s an almost perfect description of how thinking slightly differently can have an exponential consequence, particularly when applied to an activity that’s assumed to be inflexible.

“But I was wrong. And I suspect the reason I was wrong was not because I didn’t understand what was happening on this specific play; I suspect it was because I felt like I already understood football. I had played football and written about football and watched it exhaustively for twenty years, so I thought I knew certain inalienable truths about the game. And I was wrong. What I knew were the assumed truths, which are not the same thing. I had brainwashed myself. I was unwilling to admit that my traditional, conservative football values were imaginary and symbolic. They belonged to a game I wasn’t actually watching but was still trying to see. Over time, I realized this had happened with almost every aspect of my life.”

We have a tendency to maintain the status quo. To keep traditions going. This is not to say it is inherent to human nature—that is not necessarily clear—but it does seem to be a common feature of our current dominant cultures.

We must educate and encourage our children—every new generation—to critically examine all of our core social beliefs and values. They should view them with as open a mind as possible. Potentially difficult discussions allowed to flourish, safe in the knowledge that many individuals before them have grappled with many of the same issues. That their peers were grappling with these same issues today. A fresh mind helps reveal stealthy prejudices and unacknowledged assumptions that cloud the way we view the world.

“I can put fifty kids in here. I have a PowerPoint presentation about marine life. I’ll tell them all about the ocean, about ecosystems and endangered species, all these different ways of looking at the environment and stewardship and balance and understanding, not just the science and the laws, but how it’s a part of you and you’re a part of it. And they’re watching and smelling and seeing and hearing the songs and stories of a people who were living the heartbeat of life itself, not just this fabricated system that’s telling you that your freedom is this document, not your birthright to have healthy land, water, and air. That’s your true freedom. Fight for that. Be the voice of that which can’t speak for itself. Because that’s yours too. So I’m building little advocates.”

Any important lesson or decision can be easily done at a 4th–6th grade level.

John Dewey argued that a democratic society is one whose members should always be seeking to realize its ideals. A necessary part of this process is reflection on the failure of those ideals.

If we look back too much and tinker with history through apologies, the danger is that we do not pay enough attention to the difficult problems of the present. There is the danger that focusing on past grievances can be a trap, as governments and groups avoid dealing with issues facing them now. American blacks can demand apologies for slavery and American governments can offer them, but how does that help the black children who are going to poor schools or the black men who are abused today by the criminal justice system?

The message minority groups often get from such a focus on the past is:

“Don’t be fooled, there is only repression.”

Dwelling on past horrors such as the Holocaust or slavery can leave people without the resources to deal with problems in the here and now.

In order to rationalize our industrial-military complex, we have to destroy our capacity to see clearly what is in front of—and to imagine what is beyond—our noses. Long before a thermonuclear war can come about, we have had to lay waste our sanity. We begin with the children. It is imperative to catch them in time.

Without the most thorough and rapid brainwashing their minds would see through our dirty tricks. Children are not yet fools, but we shall turn them into imbeciles like ourselves, with high IQs if possible. From the moment of birth, when the Stone Age baby confronts the twentieth century

mother, the baby is subjected to these forces of violence, called love, as its mother and father, as their parents and their parents before them, have been. These forces are mainly concerned with destroying most of its potentialities, and on the whole this enterprise is successful. By the time the new human is fifteen or so, we are left with a being like ourselves, a half-crazed creature more or less adjusted to a mad world. This is normality in our present age.

Love and violence, properly speaking, are polar opposites. Love lets the other be, but with affection and concern. Violence attempts to constrain the other's freedom, to force him to act in the way we desire, but with ultimate lack of concern, with indifference to the other's own existence or destiny. We are effectively destroying ourselves by violence masquerading as love. We live equally out of our bodies and out of our minds.

Please do not consider as normal a horrible thing, just because it happens to occur everyday.

There once was a time when sorties were being launched by a range of teachers and masters—from Israeli prophets to Chinese sages—against spiritual notions that had served people for millennia but which were proving inadequate for a new time. Animal sacrifices and ancestor worship made no sense in this new world. The world of the spirit had to evolve with the world of economics and technology.

Then as now, old stories were failing and new ones were being conceived. What are our modern-day equivalents of animal sacrifice and ancestor worship? What are our faltering tales? We tell a story that the world is a machine that can be programmed to serve our purposes. We tell a story that humans are the measure of all things, that we can justify enclosing other creatures in factory farms or animal-testing labs, clearcutting the great forests and poisoning the seas, killing off other forms of life to feed our hunger and desire. We tell a story that we can mold the world to the needs of the self, rather than molding the self to the needs of the world.

We would do well to remember that the lens through which we view the world is only one type of lens, there are many different ones that exist, some completely unlike the lens we are familiar with. If I give you a lens that doesn't allow you to see yellow, if most everyone has those lenses, you will never know yellow exists. You may even find someone to be crazy if they told you about it, for you had never seen it or know anyone serious who claims to believe in yellow.

What biases are you not even aware of? What concepts have you not been given or thought of yourself? What concepts *have* you been given or thought of that then influence others? Is there some information, some experience, you lack?

We are limited by the constructs we possess at the time. This applies to

everyone so you must question the fundamentals of your ideology periodically. As a social animal, we are also limited by the way the majority of the culture thinks, especially if the majority culture is overtly hostile towards the ideas; animals being in any way equal to humans being a prominent example.

Brutalizing Youth

The real problems stem from the systemic nature of our education system. The Pledge of Allegiance is just something easy to pick out, but it is really only a small thread in the canvas. The scary part comes when you realize that schools, in order to maintain accountability and safety, must act in a similar fashion as prisons. The students line up, they are counted, roll call commences; a bell rings, it is time to eat; another bell, back to the cell. . . err, classroom. If they break the routine they are labeled: trouble-maker, tardy, problem child. It takes a really open-minded and charismatic teacher to create an environment comfortable and fun enough to combat the routine and make the students interested in anything other than the social aspect of school. Sadly, these people are few and far between. I like to think I am one of these, but it is difficult to really know. I like to think we are realizing the problem as a country, but then shit like SpringBoard comes out and takes what little autonomy teachers have away from them. It makes them teach prepackaged lessons, void of creativity. That is why I get excited to see kids breaking the mold by sitting during the pledge. One small win in my day.

So no matter how much ink is spilled analyzing the legal technicalities of suspending a 17-year-old student for off-campus speech, that's not what the case is really about. The case is really about attitudes. Change society's attitudes to think of 17-year-olds the way we currently think of 25-year-olds, and no judge is going to deny them their right to criticize their school or country on their own time, any more than a judge in today's society would deny that right to a 25-year-old.

And where does this attitude towards minors come from? I suspect that most people who believe that we have to draw the line somewhere around age 18, believe it for no better reason than because they were raised in a society where most other people believe it too. If you think that setting the cutoff age at 18 is just "common sense," then I would bet my house that if you had been raised in a society where the cutoff age was set at 13, that would seem like "just common sense" to you as well, and similarly if you had been raised in a society where the cutoff had been set at 22. This may seem like an unremarkable observation, but my belief in minors' rights has always been motivated by a more fundamental belief that you should not believe things merely because most people in your society believe them.

If that sounds like a trite platitude, consider how few people in the US seem to question the rule that you can show a man's chest on television but not a woman's chest. In more liberal Denmark, supermarkets can stock tabloids at toddler-eye-level with photos of topless women on the cover,

while in Saudi Arabia, adult women can't leave the house without covering their faces, and in all three societies, the majority thinks these regulations are just plain "common sense." Is the age of majority just another arbitrary illusion caused by the power of consensus?

Some might make the thoughtful observation that most countries all over the world set the age of majority for most purposes at 18. But it doesn't quite prove what it seems to prove, because those globally diverse societies did not reach that conclusion independently—they move in similar directions because of cross-cultural influences. The voting age was set at 21 in many democracies before many of them lowered it to 18 in the 1970s within a few years of each other. To get a better sense of whether there is any merit to the idea, we'd have to do something like the 'putting the ten judges in ten separate rooms' test—put ten different societies in mutual isolation from each other, let them develop and debate things on their own, and see if all or most of them reach the conclusion that 18 is a good cutoff age for adulthood.

The idea that actual children—under the age of, say, 11—are qualitatively different from adults, has in fact been re-discovered by civilizations that developed independently at different points in history, all over the world. So there's probably something to it. The idea that teenagers are qualitatively different from adults, is something particular to recent history, and a wise person transported forward in time from the 1500s to the present day might scratch their heads and wonder why we think that 18-year-olds should be allowed to criticize their teachers but 17-year-olds cannot.

Poor children have become targets of the new criminalization. Public school children, particularly in poor communities of color, are arrested and sent to juvenile and even adult courts for school behavior that not long ago was handled with a reprimand. The dangerous rhetoric of "superpredators"—thanks Hillary—and the murders at Columbine High School in Colorado led to "zero tolerance" policies and brought an enlarged police presence, called "school resource officers," into public schools, with the ironic result that the murder of white suburban children led to punitive policies that hit poor inner-city children the hardest.

"In Chinese thinking, the child is the extension of the self."

Parental narcissism does not get more explicit than that. Happiness is not the point; the point is control. But Tiger Mom Chua does not seem like a parent at all. Still an extension of her own parents—forever feeling their eyes upon her, incapable of questioning the values with which she was

raised—she remains an eternal child, insatiable in her demands for love and attention.

The idea of duties to others is de-emphasized when a kid starts their education. There it's 'do better than others,' 'you take the test alone, or else, you're cheating by sharing answers,' 'Johnnie is too dumb and we'll be leaving him behind in the same grade next year.' A young mind is a malleable one and those lessons stay forever.

Caregivers must now attempt to raise contributing members of society while competing with far stronger coercion from media, video games, addiction, mental health issues, and a surrounding sociopathic community. Middle-aged single mothers or elderly grandmothers are not strong enough to stand up to fully grown adolescents, but they are held solely responsible for the behaviour of their teenage sons and daughters. Not only do they receive no societal support, they are degraded in the eyes of the child. Because lifegiving and caregiving work has no value attached, the old inherent debt of honour to lifegivers, caregivers, and community elders has been erased.

State education takes responsibility for indoctrination of selected history and worldview along with preparation for the work force—frequently a compulsory education that parents will go to jail for resisting. Propaganda dictates that the same parents who were capable of teaching nutrition, health, hygiene, speech, safety, and so much more to their children are incapable of teaching reading. Capitalism insists every child has a right to daily indoctrination paid for by the state but not a right to food and shelter. To appoint only mothers and caregivers as fully responsible for producing and caring for the entire society and not recognize or support that work is institutionalized slavery. State propaganda is not a social right. Food, safety, shelter, and all the benefits of the society are. If the child is to love their society, they must be welcomed by it. If a society is to benefit from caregivers, their labour must be recognized and included in the economic structure.

The root of society, the first dependence, is created when a woman gives birth to a child. The nature of society depends on how it is built out from that core, whether all share in responsibility for the first and all other dependencies or whether the strongest are pulled away to isolate caregivers and commodify dependency.

How can a society function efficiently if it cannot depend on parental good faith toward offspring as a bedrock assumption? This does not mean, of course, that there aren't truly awful parents who reject and abuse. But they are the exception rather than the rule. To establish guidelines and policies based on these exceptions grants too much authority to the state and institutions for children's well-being and undermines the role of the

parent. This leads to policies that range from the dangerous to the absurd.

Children will learn anything they want to learn. They'll fail at learning how to figure percentages in the classroom but will effortlessly learn how to figure batting averages, which are of course just percentages. They'll fail at learning science in the classroom but, working at their personal computers, will effortlessly defeat the most sophisticated computer security systems.

Children are universally fascinated by the work their parents do outside the home. In our new tribal system, parents will understand that including their children in their working lives is their alternative to spending tens of billions of dollars annually on schools that are basically just detention centers. We're not talking about turning children into apprentices—that's something else entirely. We're just giving them access to what they want to know, and all children want to know what their parents are up to when they leave the house.

Once they're loose in an office, children do the same things they did at home—they dig up all the secrets, investigate every closet, and of course learn how to work every machine, from the date-stamp machine to the copier, from the shredder to the computer. And if they don't know how to read yet, they'll certainly learn to read now, because there's very little they can do in an office without reading. This isn't to say that children would be prohibited from helping. There's nothing children like better at this age than feeling like they're helping Mommy and Daddy—and again, this isn't something learned, this is genetic.

Imagine what a twelve-year-old with a musical bent could learn at a recording studio. Imagine what a twelve-year-old with an interest in animals could learn in a veterinarian's office. Imagine what a twelve-year-old with an interest in painting could learn in an artist's studio. Imagine what a twelve-year-old with an interest in a trade could learn on a job site.

But, of course, having children underfoot in the workplace would seriously reduce efficiency and productivity. Even though sending them to educational detention centers is terrible for children, it's unquestionably wonderful for business. The system I've outlined here will never be implemented among the people of our culture as long as we value business over people.

A man told me how his native ancestors would go on "vision quests," which was a ritual that young men in villages would undergo when they reached a certain age. They'd venture out into the woods and starve themselves for days on end until they were granted a vision. What they saw during their quest would play a huge role in the formation of their identity. Sometimes they'd even change their name according to whatever animal spirit greeted them. It sounded a bit fantastical, yet I totally got it. The vision quest was like a journey. When we are raised by institutions, we are

fashioned, in ways big and small, to be like everyone else. But when we go on a journey—especially a journey that follows no one else's footsteps—it has the capacity to help a person become something unique, an individual.

We tend to forget that there's nothing sacrosanct about learning in large group classrooms, and that we organize students this way not because it's the best way to learn but because it's cost-efficient, and what else would we do with our children while the grown-ups are at work?

In most cultures, children are net contributors to their households by age seven. They tend livestock, clean the kitchen, and fetch firewood; they cook, do laundry, and sell stuff in markets. But mostly, they are babysitters for their younger siblings and sometimes, their cousins. In fact, in a survey of 186 societies worldwide, anthropologists found that, in most places, mothers are not the principal caretakers or companions of younger children. Older children are. Kids, those who study them tell us, are wired to help out, to spend their day in multi-age groups of other kids, caring for each other, absorbing and passing along the skills they have learned from observing and working alongside adults.

This order of things seems to work well for everybody, especially in contexts of low-skill work where children's contributions are meaningful. In traditional Mayan villages in Mexico, for example, kids essentially run households and market stalls. These children have high levels of self confidence: they know exactly what they're supposed to do, master it, and feel important. And their parents do not report stress, depression, or fatigue as so many parents in the industrialized West do. In West African countries where children begin helping out as early as age three, people often say, "A man with children can never be poor." Children are assets, loved and valued as such. Kids, in these contexts, bring real joy because they really contribute. They make their parents rich.

Sociologists and historians, meanwhile, tell us that childhood is an idea, distinct from biological immaturity, the meaning of which changes over time. In his seminal 1962 study of the subject, the French historian Philippe Ariès argued that childhood as we know it is a modern invention, largely a by-product of schooling. In the Middle Ages, when almost no one went to school, children were treated as miniature adults. At work and at play, there was little age-based segregation. Everything was permitted in their presence, even coarse language, scabrous actions and situations; they had heard everything and seen everything. Power, not age, determined whether a person was treated as a child. Until the eighteenth century, the European idea of childhood was bound up with the idea of dependence: the words 'sons,' 'varlets,' and 'boys,' were also words in the vocabulary of feudal subordination. One could leave childhood only by leaving the state

of dependence, or at least the lower degrees of dependence. Our notion of childhood as a sheltered period of innocence begins to emerge with the modern education system. As the period of economic dependence lengthened among the educated classes, so too did childhood. These days education and the immaturity it entails often lasts well into one's twenties, or longer.

Which particular words are selected as forbidden is an arbitrary accident of history. Words that once would have earned the utterer a mouthful of soap—expressions like “Zounds!” or “That sucks!”—hardly lead the modern schoolmarm to bat an ear. And conversely, words that today rank among the most obscene were at one time commonly used to refer to the most mundane things, like roosters and female dogs. No, the only risk children run by hearing the four-letter words prohibited over the public airwaves is the small chance of broadening their vocabularies. And even this possibility is remote, as anyone can attest who has recently overheard the goings-on in an elementary school playground.

So when the Motion Picture Association of America forbids children from watching a movie; when parents instruct children to put their hands over their ears in “earmuff” position; and, indeed, when the FCC levies fines on broadcasters, they aren't protecting children. But they are having an effect. Paradoxically, it's these actions we take to shield children from words, with censorship foremost among them, that give specific words their power. And this makes perhaps the best argument that we shouldn't be afraid of exposing children to taboo words. Doing so is the best way to take away any perceived threat they pose.

In Chicago, as well as in virtually every other jurisdiction in the country, child welfare officials deem it inappropriate for a brother and sister to sleep in the same bedroom once they reach a certain age. At some point, if the authorities were to find out that Kaitlin and Cole were sharing a room, Jennifer would be at risk of losing custody due to “neglect.” By today's standards of child well-being, Jennifer can't move into a studio apartment to help balance her family's budget.

For the record, suspicion can kill, and prejudice can destroy. And a thoughtless, frightened search for a scapegoat has a fallout all its own, for the children and the children yet unborn.

Who can define ‘abuse’? The difficulty with really interesting cases of abuse is that the ambiguity of the abuse becomes part of the abuse. Beatings, diddlings, rapes, deprivations, domineerment, humiliation, captivity, torture, excessive criticism, or even just utter disinterest. But at least the victims of this sort of abuse can, when they have dredged it back up after childhood, confidently call it abuse. There are, however, more ambiguous cases. Harder to profile, one might say. What would you call a parent who is so neurasthenic

and depressive that any opposition to his parental will plunges him into the sort of psychotic depression where he does not leave his bed for days and just sits there in bed cleaning his revolver, so that the child would be terrified of opposing his will and plunging him into a depression and maybe causing him to suicide? Would that child qualify as abused?

Or a father who is so engrossed by mathematics that he gets engrossed helping his child with his algebra homework and ends up forgetting the child and doing it all himself so that the child gets an A in Fractions but never in fact learns fractions? Or even say a father who is extremely handy around the house and can fix anything, and has the son help him, but gets so engrossed in his projects (the father) that he never thinks to explain to the son how the projects actually get done, so that the son's help never advances past simply handing the father a specified wrench or getting him lemonade or Phillips-head screws until the day the father is crushed in a freak accident and all opportunities for transgenerational instruction are forever lost, and the son never learns how to be a handy homeowner himself, and when things malfunction around his own home he has to hire contemptuous filthy-nailed men to come fix them, and feels terribly inadequate (the son), not only because he is not handy but because this handiness seemed to him to have represented to his father everything that was independent and manly and non-disabled in an American male. Would you cry 'Abuse!' if you were the unhandy son, looking back? Worse, could you call it abuse without feeling that you were a pathetic self-indulgent piss-puddle, what with all the genuine cases of hair-raising physical and emotional abuse diligently reported and analyzed daily by conscientious journalists.

I saw parents, usually upscale and educated and talented and functional and white, patient and loving and supportive and concerned and involved in their children's lives, profligate with compliments and diplomatic with constructive criticism, loquacious in their pronouncements of unconditional love for and approval of their children, conforming to every last jot/tittle in any conceivable definition of a good parent. I saw parent after unimpeachable parent who raised kids who were:

- | | |
|----------------------------|---|
| 1. Emotionally retarded | 5. Consumed with narcissistic self-loathing |
| 2. Lethally self-indulgent | 6. Neurotically driven/addicted |
| 3. Chronically depressed | 7. Psychosomatically disabled |
| 4. Borderline psychotic | 8. Some conjunctive permutation of 1-7 |

Why is this. Why do many parents who seem relentlessly bent on producing children who feel they are good persons deserving of love produce children who grow to feel they are hideous persons not deserving of love who just happen to have lucked into having parents so marvelous that the parents love them even though they are hideous?

Important Questions for Students:

- What do you worry about most?
- What are the causes of your worries?
- Can any of your worries be eliminated? How?
- Which of them might you deal with first? How do you decide?
- Are there other people with the same problems? How do you know? How can you find out?
- If you had an important idea that you wanted to let everyone (in the world) know about, how might you go about letting them know?
- What bothers you most about adults? Why?
- How do you want to be similar to or different from adults you know when you become an adult?
- What, if anything, seems to you to be worth dying for? How did you come to believe this?
- What seems worth living for? How did you come to believe this?
- At the present moment, what would you most like to be or be able to do? Why? What would you have to know in order to be able to do it? What would you have to do in order to get to know it?
- How can you tell 'good guys' from 'bad guys'?
- How can 'good' be distinguished from 'evil'?
- What kind of a person would you most like to be? How might you get to be this kind of person?
- At the present moment, what would you most like to be doing? Five years from now? Ten years from now? Why? What might you have to do to realize these hopes? What might you have to give up in order to do some or all of these things?

- When you hear or read or observe something, how do you know what it means?
- Where does meaning ‘come from’?
- What does ‘meaning’ mean?
- How can you tell what something ‘is’ or whether it is?
- Where do words come from?
- Where do symbols come from?
- Why do symbols change?
- Where does knowledge come from?
- What do you think are some of humans’ most important ideas?
- Where did they come from? Why? How? Now what?
- What’s a ‘good idea’?
- How do you know when a good or live idea becomes a bad or dead idea?
- Which of humans’ ideas would we be better off forgetting? How do you decide?
- What is ‘progress’?
- What is ‘change’?
- What are the most obvious causes of change? What are the least apparent?
- What conditions are necessary in order for change to occur?
- What kinds of changes are going on right now? Which are important? How are they similar to or different from other changes that have occurred?
- What are the relationships between new ideas and change?
- Where do new ideas come from? How come? So what?

- If you wanted to stop one of the changes going on now (pick one), how would you go about it? What consequences would you have to consider?
- Of the important changes going on in our society, which should be encouraged and which resisted? Why? How?
- What are the most important changes that have occurred in the past ten years? Twenty years? Fifty years? In the last year? In the last six months? Last month?
- What will be the most important changes next month? Next year? Next decade? How can you tell? So what?
- What would you change if you could? How might you go about it?
- Of those changes, which are going, to occur, which would you stop if you could? Why? How? So what?
- Who do you think has the most important things to say today? To whom? How? Why?
- What are the dumbest and more dangerous ideas that are ‘popular’ today? Why do you think so? Where did these ideas come from?
- What are the conditions necessary for life to survive?
- Which of these conditions are necessary for all life?
- Which ones for plants? Which ones for animals? Which ones for humans?
- What are the greatest threats to all forms of life? To plants? To animals? To humans?
- What are some of the ‘strategies’ living things use to survive? Which are unique to plants? Which are unique to animals? Which are unique to humans?
- What kinds of human survival strategies are:
 1. Similar to those of animals and plants
 2. Different from animals and plants?
- What does our language permit us to develop as survival strategies that animals cannot develop?

- How might human survival activities be different from what they are if we did not have language?
- What other ‘languages’ does man have besides those consisting of words?
- What functions do these ‘languages’ serve? Why and how do they originate? Can you invent a new one? How might you start?
- Do non-humans have languages?
- What would happen, what difference would it make, what would man not be able to do, if he had no number (mathematical) languages?
- How many symbol systems does man have? How come? So what?
- What are some good symbols? Some bad?
- What good symbols could we use that we do not have?
- What bad symbols do we have that we’d be better off without?
- What’s worth knowing? How do you decide? What are some ways to go about getting to know what’s worth knowing?

Chapter Seven

What Do You Know?

Ideological Blinders

“Most people are other people. Their thoughts are someone else’s opinions, their lives a mimicry, their passions a quotation.”

—Oscar Wilde

“This is the crime of which I accuse my country and my countrymen, and for which neither I nor time nor history will ever forgive them, that they have destroyed and are destroying hundreds of thousands of lives and do not know it and do not want to know it.”

—James Baldwin

Birds born in a cage think freedom is a crime.

Motivated Reasoning: the tendency of people to unconsciously process information to promote goals or interests extrinsic to the decision-making task at hand.

An ideology is simply a social “script” that governs one’s expectations, normative and practical.

If one’s identity is based on a life involving a social script that allows one to expect as a matter of course a rationally unjustifiable amount of society’s goods, given one’s choices, then one’s social script will typically involve unreasonable expectations. So one should construct one’s identity in a way that avoids hierarchies that would justify unreasonable expectations. That is the best way to avoid the formation of false beliefs that lead to moral error.

If we live in a society with an unequal hierarchical structure, that will create stereotypes that influence perception. It is not the mechanisms that are functioning incorrectly; these same mechanisms would provide stereotypes not susceptible to those errors in societies with a different

structure. It is part of ordinary epistemic functioning in societies with flawed social structures to have beliefs based on perceptual mechanisms that mislead us in characteristic ways. If knowledge required a perceptual faculty that did not mislead us in these ways, we would not know anything.

Inequalities, even material inequalities, give rise to flawed ideological beliefs. In a society that is meritocratic, those who fail to possess resources will tend to possess the flawed ideological belief that their failure to acquire resources is a social injustice. In a society that is not meritocratic, those who possess an unjustly high position in the hierarchy, perhaps one not justified by “merit,” will have the flawed ideology that their position in the hierarchy is justified, for example, by individual merit in a society that is meritocratic. Both of these flawed ideologies are democratically problematic: the flawed ideology of the resource-poor in societies in which resources are divided by merit, and the flawed ideology of the resource-wealthy in societies in which resources are unjustly divided.

However, I suspect that there is no coherent metaphysics of merit that could support the claim that some citizens deserve a significantly better overall proportion of society’s resources. And even if there were such a metaphysics, if it were normative in any way, the description of a meritocratic society would be so distinct from any existing human society that it would be revealed to be fantasy. For example, I believe that there is no defensible normative notion of merit that grants more merit to the baby of a wealthy family than to the baby of a poor family.

Members of privileged groups, by something like sociological necessity, develop flawed ideological beliefs. The fates of human beings are not equal. Men differ in their states of health and wealth or social status or what not. Simple observation shows that in every such situation he who is more favored feels the never ceasing need to look upon his position as in some way legitimate, upon his advantage being deserved, and the other’s disadvantage as being brought about by the latter’s fault. That the purely accidental causes of the difference may be ever so obvious makes no difference. The continued exercise of every domination always has the strongest need of self-justification through appealing to the principles of its legitimation. This as a “need” that also makes itself felt in the relation between positively and negatively privileged groups of human beings. It is natural to expect that those who are born into a privileged group will have flawed ideological beliefs concerning the privileges they have. In particular, they will believe they deserve the privileges they obtain as a result of accidental forces, such as birth position. These beliefs will be flawed ideological beliefs.

One main source of the unrevisability of certain beliefs is that they are connected to social practices. The beliefs are ones I need to have in order

to remain in those practices. One central source of ideological beliefs is our social identities. We value our social identities. Social identities are constituted by the practices and habits in which we engage; those we engage with are our community. We must at least act as if certain propositions are true in order to engage in those practices. To abandon these beliefs is to abandon certain practices and habits that constitute our social identity. To abandon these beliefs is therefore to abandon one's community, to leave everyone with whom you identify behind.

This is very difficult for an individual person to envisage; usually they can only perform the experiment of setting beliefs aside that are so connected to their social identities when they explicitly are asked to rationally reflect upon them. But as soon as they slip back into ordinary life, they reengage in the practices that make them who they are. What this means is that revision of flawed ideological belief whose source is flawed social structure is very hard, perhaps almost as hard as revising flawed ideological belief the source of which is flawed psychology.

If this is right, then it's not correct to try to solve the puzzle of why even obviously flawed ideological belief is hard to revise by looking just at intrinsic features of the beliefs themselves, or even the overall mental structure of individuals. Many flawed ideological beliefs 'look mentally' just like ideological beliefs. The reason individuals are loathe to abandon them is that they don't like to leave their friends behind.

The distinctive feature of ideological belief often arises from being embedded in a practice together with people like you, your friends, and family. What is needed to eliminate problematic ideological belief is to change the practice of a large group of people simultaneously over time, to alter a social identity many people share.

Consider a prosperous family in the Antebellum American South who lives on a plantation that has provided a high level of income for the family for several generations. The family owns slaves who maintain and cultivate their plantation, and slaves who work in the house doing domestic chores. The members of the family have grown up with the expectation that slaves will cook their meals for them, slaves will clean the house and raise the children, and slaves will work on the plantation at no cost to provide for their well-being, as well as the well-being of future generations of that family. I will take the ideology of this family to be the beliefs they have that guide them through their social lives, as well as the concepts they use to structure reality around them. The beliefs that are part of this ideology are beliefs like:

- The belief that slaves will cook them dinner

- The belief that slaves will clean the house
- The belief that slaves will work in the field and collect the cotton that is sold on the market for the family's gain

These are beliefs that constitute the ideology of this family. They are representations of social life that serve in some way to support social practices. It is because of the expectation of a dinner without labor that they arrive at the table without first cooking in the kitchen. It is because of the expectation of slaves cleaning the house that they retire to bed without doing any household chores. It is because of the belief that slaves should do the field-work that they spend the day in the house rather than laboring in the hot sun. These beliefs are the ones that explain their everyday behavior. This is what I will, provisionally at least, take to be their ideology.

Now that we have a sense of the ideology of this particular family, I will explain how their ideology can be expected to include, and give rise to, beliefs that will prevent them from gaining knowledge about their social world. The family has, for several generations, relied on the work of slaves to create and maintain their fortune, as well as their daily existence. If the institution of slavery is unjust, then their wealth was not properly obtained. Furthermore, their ancestors, including their own parents, were the ones who built and maintained that wealth by exploiting the institution of slavery.

So if slavery is deeply unjust, then their own immediate ancestors were perpetrators of great wrongs. If slavery is deeply unjust, then the comfortable aristocratic manner of living to which they are accustomed, relying as it does on the institution of slavery, is unjustifiable. It is very difficult to view one's own parents as evil. It is also difficult to contemplate giving up luxuries that one has spent one's life enjoying. It is therefore natural to expect the members of the plantation family, by virtue of the ideology they have, to form beliefs that protect them against considering the hypothesis that slavery is an unjust institution.

One might expect the ideology to lead the members of the plantation family to believe that Blacks are inherently lazy and require the institution of slavery to instill in them a work ethic that they naturally lack. One might expect their ideology to lead them to believe that Blacks, by virtue of culture or genetics, are not capable of self-governance. One might expect them to believe that Blacks are inherently violent and dangerous and require harsh punishment and control to keep them from posing a threat to civil society. One might expect them to believe, as a result of all of these beliefs about Blacks, that the institution of slavery is just and required by the inherent nature of Blacks.

The ideology of the family can be considered to be the social practices they engage in, together with the beliefs that guide their behavior in these practices. These include their ordinary daily expectations about their social life: expectations of a clean house and food without labor, of free labor for their financial gain, and so on. These expectations lead them to adopt a justification for their expectations. It is justified to expect Black slaves to prepare one's dinner, clean the house, raise the children, and labor in the hot sun for free, because Blacks are lazy, incapable of self-government, and a danger to civil society. The institution of slavery is good for society, and good for the Black slaves as well.

These expectations are legitimizing myths, they have importance as the means by which ascendant groups assign to themselves positive social value while portraying others as justifiably possessing lower standing. Without legitimizing myths, hierarchy is merely stratification. With legitimizing myths, hierarchy becomes grounded in superiority and inferiority and formal distinctions become laden with norms.

There are causes of flawed ideological belief other than failures of equality in various senses. Societies in which uniformity of ideology is encouraged will give rise to expectations that one will encounter only others who share that ideology. If one is used to discussions and friendships only with those with the same ideology, encountering someone whose ideology differs may violate one's expectations. Of course, certain kinds of violations of expectations are welcome, rather than disturbing. But if one is raised to think of certain expectations as moral norms, violations of the conventions to which one has grown accustomed will again characteristically seem like a disruption of normal expectations of the sort that is easily mistaken for an encounter with someone who should be morally condemned. That is why those who are brought up in communities with a uniform ideology tend to experience those who fail to share that ideology as morally deviant. Therefore, societies that encourage uniformity of ideology will often result in flawed ideologies, ideologies that contain or produce moral error, that is, false moral beliefs. Those who are raised in communities with a uniform ideology will identify themselves with that ideology.

Stereotypes are an ordered, more or less consistent picture of the world, to which our habits, our tastes, our capacities, our comforts and our hopes have adjusted themselves. They may not be a complete picture of the world, but they are a picture of a possible world to which we are adapted. In that world people and things have their well-known places, and do certain expected things. We feel at home there. We fit in. We are members. We know the way around. There we find the charm of the familiar, the normal, the dependable; its grooves and shapes are where we are accustomed to find

them. And though we have abandoned much that might have tempted us before we creased ourselves into that mould, once we are firmly in, it fits as snugly as an old shoe. No wonder, then, that any disturbance of the stereotypes seems like an attack upon the foundations of the universe. It is an attack upon the foundations of our universe, and, where big things are at stake, we do not readily admit that there is any distinction between our universe and *the* universe. A world which turns out to be one in which those we honor are unworthy, and those we despise are noble, is nerve-racking.

When archaeological excavations called into question many of the key components of the Old Testament and its whole chronology, many fundamentalist Christians and Israelis refused to believe the findings or simply remained indifferent. Many ancient historians and archaeologists have come to believe that the Israelites may never have been in Egypt. If there was an exodus, it may have been only a small affair with a few families. The Israelites may not have conquered the land of the Canaanites, and Jericho probably did not have walls to fall down at the blast of a trumpet. The great kingdom of Solomon and David, which was said to stretch from the Mediterranean to the Euphrates, was more likely to have been a small chiefdom. Remains from the time indicate that Jerusalem was a small city, not the magnificent one of the Bible. So why, has what is a major change in views about the biblical past not provoked a reaction, even from secular Israelis? Perhaps they find it too painful to contemplate.

“The blow to the mythical foundations of the Israeli identity is apparently too threatening, and it is more convenient to turn a blind eye.”

A cherished belief is a belief that we want to retain; it is a pleasant belief to hold. We have to be on our guard against supposing that a belief that is cherished could not be false because it would be so dreadful if it were. The disturbance of a stereotype seems like “an attack upon the foundations of the universe.” A cherished belief is one that we will be reluctant to give up. It is one that is resistant in a distinctive way to rational revision. Beliefs that are connected to our identity will be emotionally dear to us in ways that beliefs unconnected to our identity are not. As a consequence, they will not be easy to abandon.

Why are subjects whose interests are not furthered by the agenda of the elite nevertheless guided by the opinions the elite wish them to have? Almost every highly privileged group develops the myth of its natural, especially its blood, superiority. Under stable conditions that myth is accepted by the negatively privileged group. It is natural to think that the elite maintain

power by promoting the flawed ideology that their interests are the interests of the society at large. They do so by promoting the ideology of elite superiority and the belief that the society is a meritocracy.

Suppose that we take negative privilege to be measured in terms of relative ownership of goods. In this case, many people may be negatively privileged toward those they never encounter, but not negatively privileged relative to those they encounter. This will hinder political action to correct unjust distributions with respect to the former group. Moreover, negative privilege comes in degrees. If so, perhaps the expected utility of acting alone is not sufficiently great.

If one can get negatively privileged groups to accept that the system is basically fair and meritocratic, then one can lead them to oppose attempts to reform corruption. It just makes sound economic sense for the positively privileged groups to get members of negatively privileged groups to accept that the system is fair and meritocratic.

All highly privileged groups throughout history share one thing in common: the ideology that they have achieved their success through merit. Members of the highly privileged group, through control of the media and the education system, will make it part of the dominant narrative of the society that the goods of society are justly distributed, according to merit rather than accident of birth position. This will occur even in conditions in which there are obvious differences in equality from birth, due, for example, to inheritance. This is exactly what one should expect in any society with a highly privileged group that has an unjust accumulation of its goods. In fact, one would expect that the more unjust and more arbitrary the distribution of goods is in a society, the more intensely and more fervently the view that the distribution of goods is due to pure merit will be held.

Suppose we accept that members of negatively privileged groups tend to adopt the dominant narrative. If so, they will be incapable of acting against the very system that oppresses them. Members of the negatively privileged group will fling themselves against the high barriers erected against them, only to blame themselves for their failure to scale them. The few who do manage the feat will be convinced that they did so out of their own individual merit. They then will be used as pawns in a propaganda game of legitimatization of the dominant ideology. The situation will seem deceitful to no one.

On the assumption that belief in the meritocratic nature of society is a flawed ideological belief, it will be held more firmly than rational beliefs. Because members of the highly privileged group accept this myth, they will be highly motivated to celebrate members of negatively privileged groups who succeed in surmounting the high barriers to success facing their

group. They will accept them because they serve as a legitimation of the dominant narrative. And members of the highly privileged group will develop an ideology that explains the failures of most members of the negatively privileged groups to acquire the goods of society in terms of “cultural” flaws of that group.

Adoption of the flawed ideology of the highly privileged group clearly would handicap the negatively privileged group. To act against the structure that oppresses them, they need to know something about the way in which it holds them back from achievement. There are presumably no particular propositions the negatively privileged group needs to know in order to act against their oppression. They might not even have to know that they are oppressed. But if they blame their lack of advancement on themselves rather than on the special barriers they face, they will be prevented from acting against the forces that oppress them. The negatively privileged groups will be prevented from attaining the knowledge needed to act precisely by the flawed ideological beliefs they adopt from the dominant narrative. A primary nexus of democratic contestation is over the distribution of resources. Members of negatively privileged groups will be hindered in such contestation by acceptance of the dominant ideology: that society’s resources are fairly divided by merit.

It is indeed implausible in the extreme that someone would willingly adopt a belief that entails the inferiority of her own group. However, this kind of skepticism about the view relies on a false picture of how beliefs are formed. It relies on the false premise that one can decide to believe. Since it is evident that one would not rationally decide to adopt a belief that presents one’s own group in a negative light, someone gripped by this model of belief formation will be skeptical of the claim. However, we cannot simply decide to believe something. It is not up to me to decide whether or not I am on Mars now. It is similarly not up to me to decide about the direct evidence of my senses. But testimony from authoritative sources is a primary source of evidence. This is why the school system of a state is the paradigm example of an ideological state apparatus.

There is a simple argument from the premise that belief is not under our direct voluntary control to the conclusion that negatively privileged groups will acquire the flawed ideological beliefs of the positively privileged group. The positively privileged group will control the dominant narrative. If the positively privileged group controls the dominant narrative, then the testimonial evidence of authorities will be the ideology of the positively privileged group. That is the mechanism by which the flawed ideology of the positively privileged group comes to be held by the negatively privileged groups. The negatively privileged groups are not exposed to an alternative

ideology.

If the argument is plausible, it raises even more serious concerns in a liberal democratic state. A liberal democratic state requires provision of schooling for all, as well as a news media. The concern is that the education system as well as the news media will become an organ for the propagation of the ideology of the positively privileged group. This is why what is taught in public schools is invariably, in states that self-identify as liberal democracies, a matter of great political contestation. Control of what is taught in the public schools amounts to control of the basic political dialectic. It seems implausible to deny that members of the highly privileged group will win such battles of control.

We accept as truth many things that for the Greeks were partisan positions of war. The ancient Greeks were great experimenters. We are still amazed by their novelty and ingenuity. They fashioned democracy, philosophy, grammar, history, and science out of a loose assortment of shared knowledge and practices from the Mediterranean and Near East.

On the other hand, we accept much of what they considered experiment as fact, thanks to certain politicians, philosophers, grammar teachers, historians, and scientists. We see the same arguments, the same problems, and the same strategies for dealing with them persist into today, even in our remote Midwestern towns. If one wants to reopen the door to experimentation, one must weaken the foundations at the point at which experiment became truth, one must be willing to dispense with comforting facts.

Perhaps even the ingenuity of the Greeks is false, perhaps they simply stole it all from the East and history simply popularizes them and not the originators.

Granting that belief is not under direct voluntary control, maybe belief is nevertheless under indirect voluntary control? I can voluntarily join communities that doubt the sources of evidence I have and, after long exposure, learn to reject such sources of evidence. Perhaps I have been raised in a religious cult. I can choose to go to a university and take courses in other cultures that force me to confront the contingencies of my upbringing. But spontaneous belief formation is in general an involuntary process. We acquire beliefs spontaneously from the testimony of authority figures, from the lack of reliable sources that contradict them, and so on. Even to begin the process of indirect voluntary control over belief is clearly an arduous, often life-changing task, one that often involves separation from family and community.

“I dreamed of going north and writing books, novels. But where had I got this notion of doing something in the future, of

going away from home and accomplishing something that would be recognized by others? I knew that I lived in a country in which the aspirations of black people were limited, marked-off. Yet I felt that I had to go somewhere and do something to redeem my being alive. I was building up in me a dream which the entire educational system of the South had been rigged to stifle. I was feeling the very thing that the state of Mississippi had spent millions of dollars to make sure that I would never feel; I was becoming aware of the thing that the Jim Crow laws had been drafted and passed to keep out of my consciousness; I was acting on impulses that southern senators in the nation's capital had striven to keep out of Negro life; I was beginning to dream the dreams that the state had said were wrong, that the schools said were taboo. My classmates felt that I was doing something that was vaguely wrong, but they did not know how to express it.

As the outside world grew more meaningful, I became more concerned, tense; and my classmates and my teachers would say: 'Why do you ask so many questions?' Or 'Keep quiet.' In me was shaping a yearning for a kind of consciousness, a mode of being that the way of life about me had said could not be, must not be, and upon which the penalty of death had been placed. Somewhere in the dead of the southern night my life had switched onto the wrong track and, without my knowing it, the locomotive of my heart was rushing down a dangerously steep slope heading for a collision, heedless of the warning red lights that blinked all about me, the sirens and the bells and the screams that filled the air."

It is not just that a set of concepts, a conceptual scheme, can be flawed because the concepts misrepresent social reality, for example, by imputing to it a fictional hierarchy of worth between people. A pattern of concepts can be flawed because it lacks some concepts entirely. A striking example of the phenomenon by which a conceptual scheme lacks a crucial concept is from a memoir of the women's liberation movement. The story involved a woman working for Cornell University who was systematically sexually harassed over a period of years. Yet the concept of sexual harassment had yet to be articulated. So she could not conceptualize or understand her "ongoing mistreatment." This is a clear example in which the failure of her ideology to have a concept robbed her of the tools to understand her own oppression. This clearly brings out the sense in which failure to possess a concept can be disabling.

On May 13, 2013, the Chinese government issued a secret document, entitled “A Report about the Current Situation of Ideology,” to university administrations. The report was leaked by Gao Yu and published in the German magazine *Der Spiegel* in August 2013. The document demands that university professors refrain from discussing seven topics. The seven topics are universal values, free press, civil society, civil rights, historical mistakes of the Chinese Communist Party, crony capitalism, and independence of the judiciary. This is a clear attempt to ensure that students lack crucial political concepts, precisely the ones possession of which would enable them to critique Chinese government policy. It is an attempt to instill a flawed ideology in Chinese students by ensuring that they lack crucial political concepts.

Negatively privileged groups are hindered from acting in their own self-interest by their failure to have the right conceptual scheme, a scheme that would isolate and explain the oppressive social contexts in which they find themselves.

The perceived epistemic challenge facing groups that lack society’s resources will prevent them from acting. In schools, they will hear that the society in which they live is a meritocracy. They will encounter confident elites who seem—because they are more confident—more deserving of the goods of society. If the dominant ideology involves a belief that the rich have the goods they do because of hard work alone, members of negatively privileged groups will be especially hindered in democratic contestation. The self-serving ideology of the elites will make sense out of the injustice that members of the negatively privileged groups will encounter. And since knowledge is required to act, if any of the accounts that explain the phenomenon in terms of failure to know are correct (whatever the source), negatively privileged groups will be prevented from acting to alleviate their negatively privileged status. They will not be able to act on the basis of knowledge of injustice, because their negatively privileged status may, in the presence of the alternative explanation provided by the ideology of elite superiority, as well as the prospect of retribution by those controlling the prisons and the police, prevent them from acquiring knowledge.

We have seen that flawed ideologies aid the material interests of the highly privileged group, the elites. But false ideologies harm the elites in ways that cut deeper than material interest. The reason that members of unjustly privileged groups are led to adopt legitimizing myths is that they cannot confront the possibility that their actions are unjust. False ideologies blind even those they seem to help, by making them ‘untrue to themselves.’ The flawed ideology of the elites leads members of the elite to support policies that they would not accept if they knew what the real source of

their support is. Flawed ideologies threaten the autonomy of members of highly privileged groups.

Acceptance of the false ideology of the elite group does lead negatively privileged groups to act against their own material interests. But the false ideology of the elite group leads to members of the elite group acting against their own ethical interests. Inequality is problematic for everyone.

This seems to be an excellent example of the knots individuals must twist themselves into if they allow the dominant ideology to determine what reality is.

The *only* purpose of an economy is to ensure that all are clothed, housed, fed, have clean air and water, healthcare, education, et cetera. And less concretely, things like equality and fairness. If the economy as structured is not doing so, it is a failure and a poor, harmful ideology. There is no need to engage with any of the status quo's arbitrary limits and restrictions which only help legitimize them.

Anything else is a distraction from the real issues—stalling by those few whom the system works for or theorizing by those lacking the creativity and vision to truly think outside the box. If such thinkers are experts in anything they are experts at allowing their reality to be artificially and arbitrarily dictated and limited.

Our artificial constructs can either be used to enhance the well-being of all or they can be used to keep most subjugated and exploited.

Authoritarian socialism and capitalism share strong tendencies toward centralizing—one in the hands of the state, the other in the hands of corporations. They both also keep their respective systems going through ruthless expansion—whether through production for production's sake, in the case of Soviet-era socialism, or consumption for consumption's sake, in the case of consumer capitalism.

What many often fail to see is that it was *authoritarian* communism which proved to be as bad or worse than capitalism. That is not to say that communism is the perfect solution. But it is quite easy to argue—given the biological background of the human species, along with modern scientific knowledge regarding environments and ecosystems—that cooperation, sharing, community, are far more rational and natural ideas to structure society around.

Our structures are often corrupted. Because whether through ignorance or greed we allow them to. We've allowed massively ignorant and greedy individuals to control the course for millennia. But this is not some natural law, some foregone conclusion. It is within our abilities to change this, not guaranteed to, but within the realm of possibility.

The first step is simply recognizing that we're like a horse in a parade wearing binders. We've all been trained from birth with stories which slowly boxed in our rational world, our reality. To many imagining a world with true justice and equality is akin to riding a fire-breathing dragon. But they are nothing alike.

It's the journey part that makes it all worthwhile. A mental inquiry can, simultaneously, be irrational, rational, emotional, intellectual, empirical, theoretical, et cetera. An ongoing mental inquiry is often terminated when imprisoned within an -ism. We are better off to take one statement at a time.

A great many people think they are thinking when they are merely rearranging their prejudices.

“Catholics believe that working through suffering and anxieties while offering them up to the Lord (instead of dwelling on and complaining about their shit deals in life) will help the sinners on earth and those in purgatory. And the extremely poor obviously suffer the most, but they can still feel the entirety of God's peace and love, many times more often than those who are wealthy.”

Oh I agree. When I see all of the gilding and opulence of the Vatican built up on the auspices of “a higher calling” or the guise of social programs for the poor—I feel so many things. Is that what it feels like to get the entirety of God's peace and love? Because if I were poor, I would imagine this feeling would be many times more powerful than if I were wealthy (as you say).

It is worship of mammon. I fail to understand how a significant part of the US' population believe themselves to be devout Christians. A short reading of the beatitudes, with a modern day comparison is instructive:

Blessed are the poor in spirit	→	Blessed are the Rich
Blessed are they that mourn	→	Blessed are they that don't have to
Blessed are the meek	→	Blessed are the arrogant
Blessed are they which do hunger and thirst after righ- teousness	→	Blessed are they who lie
Blessed are the merciful	→	Blessed is warmongering, the death penalty, and pun- ishing victimless crime

Blessed are the pure in heart	→	Blessed are they who cheat and steal
Blessed are the peacemakers	→	Blessed are the warmongers
Blessed are they which are persecuted for righteousness' sake	→	Blessed are they who persecute
Blessed are ye, when men shall revile you, and persecute you, and shall say all manner of evil against you falsely, for my sake	→	Blessed are they who lie and cheat for power's sake

Everyone expects a Christian way of life from a Christian. They want to see in him an example of non-hypocritical faith, honesty, a spiritual attitude and love. On the other hand, there is nothing sadder than seeing a Christian who lives only for worldly, mortal interests.

In an even larger sense, we have substituted ideology for religion. Consider capitalism, privatization, democracy, the profit motive, materialism, utility maximization, and, yes, even the scientific method. We worship these just as ardently as we did the Grecian or Egyptian pantheon of gods in the years BC, and the Christian, Jewish, and Islamic characterizations of god up to the present era.

The unquestioning acceptance of these belief systems filters our perceptions of reality and blinds us to the infinite number of possibilities that exist outside of those frames of reference. In fact, those systems have indeed become our religion and stepping outside of them frequently incurs the same stigma and scorn formerly accorded to religious heretics who were often burned at the stake. One doesn't need to spend more than a day reading a layperson's guide to quantum mechanics to get an idea of what happens when you set your mind free of those confining boxes. I now view all belief systems skeptically and try to place them in a larger context.

The description of economics as an unassailable belief system rings true to me. Not unlike religion—the Crusades, the Inquisition, the Conquistadors, right on up to ISIS—economics has wreaked and is wreaking havoc across the globe. Who knows what wonders await us when we start thinking out of that box.

I'm a great believer in self-deception. If you asked me what makes the world go round, I would say self-deception. Self-deception allows us to create a consistent narrative for ourselves that we actually believe. I'm not saying that the truth doesn't matter. It does. But self-deception is how we survive.

Any meaning that people ascribe to their lives is just a delusion. The other-worldly meanings medieval people found in their lives were no more deluded than the modern humanist, nationalist, and capitalist meanings modern people find. The scientist who says her life is meaningful because she increases the store of human knowledge, the soldier who declares that his life is meaningful because he fights to defend his homeland, and the entrepreneur who finds meaning in building a new company are no less delusional than their medieval counterparts who found meaning in reading scriptures, going on a crusade, or building a new cathedral.

Perhaps happiness is synchronizing one's personal delusions of meaning with the prevailing collective delusions. As long as my personal narrative is in line with the narratives of the people around me, I can convince myself that my life is meaningful, and find happiness in that conviction. This is quite a depressing conclusion.

If you will not live in something fairly close to reality, reality will clock you upside the head for it eventually. As individuals, we may dodge this—we often do—which is why individuals often live in denial. As societies, no. The bill is always paid, and it is always paid in full. It's just usually not paid by the people who wrote the checks based on other people's bodies. Which is why, if you aren't powerful—and you probably aren't—you can't afford to live in fantasy-land.

Consequences are paid. Your opinion that they aren't paid is irrelevant, and if you don't have power, the check is being written on your body and those of the people you claim to care about.

Simple things—like heroin would be legalized and cars would be banned if we legislated things on the basis of how many people they kill and the harm they cause to society—don't seem to occur to the most intelligent of people. Cars are essential to life and drugs are bad is the unchallengeable mantra.

Right and wrong, moral and immoral, all shaped by the environment one develops in. It absolutely does take what one might call 'exceptional morality'—or perhaps a less loaded, ego-stroking term like curiosity—in order to break out of the cage placed on one's worldview by their surrounding environment.

It's ok to feel insane once you know its real name, independent enlightenment. Perhaps as a hermit on a mountain, or some jester to the throne. Our mind cannot see what it does not understand. I like to compare it to remembering the first time you looked inside a car's engine compartment. You stood slack-jawed, and maybe watched and learned to imitate how your parents checked their oil and filled their windshield washer fluid. Maybe you put some time into it, and learned to recognize the car's starter, timing belt,

radiator, and power steering unit. Next thing you know, you can find the starter in any car. Even replace it yourself by replacing three or four bolts.

I've always been crazy but it kept me from going insane.

The 10,000 foot view would show that the United States has been making little progress in providing a fair and equal society for minorities, the poor, and ecosystems partly because American politics has become so polarizing.

This political polarization is tearing us apart and preventing us from working together. The biggest reason for this polarization is the fact that people in each sphere of the political spectrum give others the status of Demigod. These Demigods have also been self-appointed and we have all allowed this. The definition of a Demigod is a being with partial or lesser divine status, such as a minor deity, the offspring of a god and a mortal, or a mortal raised to divine rank.

What happens is a political thinker or someone in the political media puts out a book, podcast, or article that deeply affected us. We do a little independent research into their work which solidifies our belief into the person and then BAM, they are elevated to Demigod status. We start taking every thought jettisoned from their brain as truth. We stop our own independent research. We lazily expect them to solve all our problems and show us how to live. We find ourselves fitting into their paradigm on life instead of using their work to create our own paradigm.

This is where the polarization occurs. Once I find out you follow a certain political thinker or figure I instantly lash out at you and say well if you follow this person's work that also means you subscribe to X, Y, and Z. And you fall for it and go on the defensive. You do this because you have elevated the person to Demigod status and when I question your Demigod's worldview, to you I am questioning your world. This happens because you fail to follow up on the latest thoughts from your Demigod. You fail to vigilantly conduct your own independent research.

If you continued with your own research with a goal of creating your own paradigm you would respond to my challenge by saying actually I only subscribe to X, not Y and Z or maybe you would subscribe to all three, but at least you independently came to that conclusion. You wouldn't respond to my challenge in such a polarizing way that would turn into a heated confrontation. Maybe if this happened more often things wouldn't be so polarizing and we could work together and accomplish more.

What I am asking you to do is create your own paradigm and continue to question everything. It's ok to disagree with a political figure or thinker on an item. That doesn't mean you have to cut them off from your paradigm. I want you to look at creating your paradigm like creating a meal. What they should both consist of is recipes.

Although scientists discovered over a century ago that humans lived in this hunter-gatherer way for hundreds of thousands of years before the Agricultural Revolution spawned our civilization and culture a mere 10,000 years ago, our history along with our collectively held and lived mythology reduce the human experience to civilization-building. Our collective frame of reference not only omits the vast human experience prior to our history, it excludes the experience of humans flourishing in egalitarian tribes concurrent with our history. There are still today scattered pockets of tribal people who have never known the kind of poverty we take for granted. This vast experience suggests that poverty is a function of culture, not of nature, which is relatively immutable.

So one way we perpetuate the myth of never-ending poverty is by continuing to believe, against the facts, that our history, the history of our culture, our civilization, is the history of humanity itself and that anyone outside or predating this history is a poor, half-human savage. Many of us individually will nod to the facts when confronted by them. This matters little, because mythology is something a culture of people buy into together and give expression to in the way they live as a group.

We tend to see civilization as a single block of wood, something we've modified, cutting pieces here, shaving there, adding over here, subtracting over there. This block of wood is the only block we see, some consider it the only block we have, perhaps there were other blocks in the past, but our ancestors deemed this block best, long ago, and it's all we have.

But just like with an actual block that one begins to carve, there can reach a point where the modifications are too extreme to reasonably get the structure that one would like to see. With immense time and effort, perhaps one could still rehabilitate the block, get it back on track. But perhaps instead, one's limited time on this rock might be spent simply reaching for a new block, utilizing what was learned from the previous mistakes, and starting over anew.

Why keep a pet tiger, if you know you can never train it not to think of you as a tasty snack? Capitalism is designed to exploit the majority, to funnel the economic rewards of their labor into the hands of a minority. You can put it in a cage, and put a muzzle over its mouth. But it's still a tiger. We keep failing to put a strong enough cage around it. Maybe it simply isn't possible. Whatever argument for its greater societal value there may once have been—and frankly, I'd be game to dispute even that, given how many people have been exploited and immiserated by it—that need is long gone. Now, the argument tends to be, well, we can't get rid of it peacefully, because the weapons and their wielders are controlled by capital.

But we can at least see it for what it is, and say the truth. Capitalism is

evil. It is innately corrupting and exploitative. The rationale for its being good relies on Lockean notions that the elite will act in the best interest of those beneath them. But that's been disproved again and again and again. Capitalism has eaten through its restraints again and again and again. The elite today is no more wise and beneficial today than it was in 1815—you could argue that it's worse.

There is no evidence that capitalism works for the many. It needs to be replaced. And in the meantime, let's stop pretending it's either inevitable or positive. It is neither.

No, we don't even know if it can be replaced short of total catastrophe, but we can at least tell the truth about it. Because life/death decisions about things that actually can be done or not done depend on the underlying idea of how everything works and whether or not 'everything' is worth preserving. Especially when the people making the decision think it has nothing to do with these big questions, that it's all about some immediate, isolated problem, so that getting up and acting with blundering force is better than getting caught up in doubt. Ideology loves nothing better than passing itself off as common sense, whereas sense or understanding that can actually be held in common tends to be painfully aware of its own partisanship.

How sick is it that Trump's politically incorrect speech whips liberals and the establishment media into a frothing frenzy, while actions he's undertaken that have brought death and destruction—and will likely bring much more of that—to people and nations that have never threatened the United States are met with approval and relief? It's as if liberals think uncouth rhetoric and posturing are worse than violently murdering people! Oh wait... they do! They fetishize the ceremonial aspects of the democratic process over the actual intended purpose of the process.

I'm sure you believe everything you're saying. But what I'm saying is, if you believed something different you wouldn't be sitting where you're sitting.

It may be hard to accept: it couldn't possibly be true that decent American liberals, or the Jewish owners of a major newspaper, could look at the plain facts of the Holocaust and think a mayoral row over stirrup pumps was more newsworthy. But it's important to acknowledge that this was the case, and to try to make sense of it and understand why. If we think that the media's failure during the Holocaust was a failure to "follow the threads and assemble the big picture," there's not much to explain: as an unprecedented crime unfolds, we can only cast limited blame on journalists who weren't quick enough or savvy enough to sift through the lies and find the truth. If, on the other hand, the news was blaring from the pages of the newspaper, we have evidence of something far more disquieting: the

possibility for ordinary Americans to passively stand by and watch the slaughter of millions of innocent people.

There is no way out of the imagined order. When we break down our prison walls and run towards freedom, we are in fact running into the more spacious exercise yard of a bigger prison.

Cognitive dissonance is often considered a failure of the human psyche. In fact, it is a vital asset. Had people been unable to hold contradictory beliefs and values, it would probably have been impossible to establish and maintain any human culture. If, say, a Christian really wants to understand the Muslims who attend that mosque down the street, he shouldn't look for a pristine set of values that every Muslim holds dear. Rather, he should inquire into the catch-22s of Muslim culture, those places where rules are at war and standards scuffle. It's at the very spot where the Muslims teeter between two imperatives that you'll understand them best.

It seems incredible that something so familiar and important could be misunderstood for so long—and perhaps it is the same with our minds. Perhaps your understanding of your thoughts and feelings is like the Egyptians' understanding of the sun.

It is especially difficult—or even impossible—to perceive how your mind works. As an example, please solve this math equation: $5 \times 8 = x$ If you answered '40,' congratulations—but the real question is how you figured it out. It is unlikely that you got five apples and then counted them eight times over. Instead you likely accessed some mathematical machinery that churned unconsciously and then spit out an answer into your conscious mind. At no point did you ever observe how this was working.

Rather than giving true explanations for their behavior or choices, it seems that people simply provide after-the-fact justifications, just as you might when watching someone else's behavior. We've always discussed how other minds are ultimately inaccessible and a matter of perception, but our own minds may be almost as inaccessible and perceived. What is most striking about our lack of self-insight is not necessarily that we make up explanations but our total confidence in their correctness. We seldom pause to consider that we might be mistaken about our reasons for acting—or anything else. Instead we consistently try to confirm what (we think) we already know, a tendency called the confirmation bias. More technically, the confirmation bias is the systematic distortion in the search, interpretation, and recall of information in order to support preexisting theories

We can do a remarkably effective example of the confirmation bias right here, between us. Take this sequence of three numbers: 2, 4, 8. Your job is to come up with the rule that governs the number progression. Your first guess is likely that we multiply the previous number by two ($x_n = 2 \times x_{n-1}$),

making the next number 16. Nope. Perhaps the trick is to add an extra 2 in each step, giving us the next number of 14 ($2 + 2 = 4$; $4 + 4 = 8$; $8 + 6 = 14$). Nope. Or maybe there is some mysterious link to the Fibonacci sequence? Nope. The rule is simple: each number has to be bigger than the last one. You might now complain that all your other suggestions also fit this pattern, but these other suggestions were too specific and missed the broader point. Theories like $x_n = 2 \times x_{n-1} - 1$ are the equivalent of saying that only Asian people are bad drivers when in fact everyone is a bad driver. The reason that people almost always miss this rule is that they ask questions trying to confirm their hypotheses rather than disconfirm them. People always ask, ‘Is the next number 16?’ and never ask, ‘Is the next number -100 ?’

Confirmation bias both consistently leads us astray and imbues us with confidence, undermining the process of discovery. This is why scientists typically try to disconfirm their hypotheses, or at least the hypotheses of their rivals. This can lead them to be quite skeptical of the established wisdom of anything, whether it involves the unimportance of sanitation with respect to disease (cholera is actually caused by poop) or the firmness of matter (actually mostly empty space). Social psychology really began as a skeptical reaction to intuitive accounts of human behavior, with the most classic example being a study first reported in 1963 by Stanley Milgram.

In the aftermath of the World War II, people all over the world grappled with how average Germans could have been complicit—or worse—in the wholesale slaughter of innocent Jews. The prevailing theory at the time was that Germans were an especially tractable people, but Milgram had other ideas. He believed that even God-fearing Americans could be persuaded to kill others through only polite insistence, and he designed a paradigm to test this hypothesis. In this famous study participants were asked to teach another person a list of words and—in order to help them learn—to shock the “learner” for every mistake. On each trial the shock level increased; Milgram wanted to know how many everyday Americans would continue with the experiment all the way to the end, administering the maximum—and ostensibly lethal—voltage of 450 volts. Most experts believed that only one percent to four percent of people would go all the way (a few sadists), but as you may already know, 65 percent of people obeyed to the deadly end. Of course, participants weren’t happy about it.

“At one point, [the participant] pushed his fist into his forehead and muttered: ‘Oh God, let’s stop it.’ And yet he continued to respond to every word of the experiment and obeyed to the end.”

Neither participants nor observers had imagined the scale of this obedience to authority. This study powerfully demonstrates that we too can do terrible things: the path of least resistance sinks us imperceptibly into moral turpitude.

Photography implies that we know about the world if we accept it as the camera records it. But this is the opposite of understanding, an approach which starts from not accepting the world as it looks.

So here is the hinge point where skepticism starts to reverse itself. Are we the first society to conclude that this time we're finally right about how the universe works? No—and every previous society who thought they were correct ended up hopelessly mistaken. That, however, doesn't mean that the goal is innately hopeless. Yes, we are not the first society to conclude that our version of reality is objectively true. But we could be the first society to express that belief and is never contradicted, because we might be the first society to really get there. We might be the last society, because—now—we translate absolutely everything into math. And math is an obdurate bitch.

The history of ideas is a pattern of error, with each new generation reframing and correcting the mistakes of the one that came before. In the ancient world, science was fundamentally connected to philosophy. Since the age of Newton, it's become fundamentally connected to math. And in any situation where the math zeroes out, the possibility of overturning the idea becomes borderline impossible. We don't know—and we can't know—if the laws of physics are the same everywhere in the universe, because we can't access most of the universe. But there are compelling reasons to believe this is indeed the case, and those reasons can't be marginalized as egocentric constructions that will wax and wane with the attitudes of man.

Consider an example from 1846, during a period when the laws of Newton had seemed to reach their breaking point. For reasons no one could comprehend, Newtonian principles were failing to describe the orbit of Uranus. The natural conclusion was that the laws of physics must work only within the inner solar system and since Uranus represented the known edge of that system, it must be operating under a different set of rules. But then someone said: Maybe Newton's laws still work. Maybe there's an unseen force of gravity operating on this planet that we have not accounted for in our equations. So let's assume Newton's law is correct and ask, 'If there is a hidden force of gravity, where would that force be coming from? Maybe it's coming from a planet we have yet to discover.'

This is a very difficult math problem, because it's one thing to say, 'Here's a planetary mass and here's the value of its gravity.' Now we're saying we have the value of gravity, so let's infer the existence of a mass. In math, this is called an inversion problem, which is way harder than starting with

the object and calculating its gravitational field. But great mathematicians engaged in this, and they said, ‘We predict, based on Newton’s laws that work on the inner solar system, that if Newton’s laws are just as accurate on Uranus as they are anywhere else, there ought to be a planet right here—go look for it.’ And the very night they put a telescope in that part of the sky, they discovered the planet Neptune.

The reason this anecdote is so significant is the sequence. It’s easy to discover a new planet and then work up the math proving that it’s there; it’s quite another to mathematically insist a massive undiscovered planet should be precisely where it ends up being. This is a different level of correctness. It’s not interpretative, because numbers have no agenda, no sense of history, and no sense of humor. The Pythagorean theorem doesn’t need the existence of Mr. Pythagoras in order to work exactly as it does.

“In physics, when we say we know something, it’s very simple: Can we predict the outcome? If we can predict the outcome, we’re good to go, and we’re on to the next problem. There are philosophers who care about the understanding of why that was the outcome. Isaac Newton essentially said, ‘I have an equation that says why the moon is in orbit. I have no fucking idea how the Earth talks to the moon. It’s empty space—there’s no hand reaching out.’ He was uncomfortable about this idea of action at a distance. And he was criticized for having such ideas, because it was preposterous that one physical object could talk to another physical object. Now, you can certainly have that conversation about why it happens. But an equation properly predicts what it does. That other conversation is for people having a beer. It’s a beer conversation.

So go ahead—have that conversation. ‘What is the nature of the interaction between the moon and the Earth?’ Well, my equations get it right every time. So you can say that gremlins do it—it doesn’t matter to my equation. Philosophers like arguing about semantics. In physics, we’re way more practical than philosophers. Way more practical. If something works, we’re on to the next problem. We’re not arguing why. Philosophers argue why. It doesn’t mean we don’t like to argue. We’re just not derailed by why, provided the equation gives you an accurate account of reality.”

In terms of speculating on the likelihood of our collective wrongness, this distinction is huge. If you remove the deepest question—the question of

why—the risk of major error falls through the floor. And this is because the problem of why is a problem that’s impossible to detach from the foibles of human nature. Take, for example, the childhood question of why the sky is blue. This was another problem tackled by Aristotle. In his systematic essay “On Colors,” Aristotle came up with an explanation for why the sky is blue: He argued that all air is very slightly blue, but that this blueness isn’t perceptible to the human eye unless there are many, many layers of air placed on top of each other. Similar, according to his logic, to the way a teaspoon of water looks clear but a deep well of water looks black. Based on nothing beyond his own powers of deduction, it was a genius conclusion. It explains why the sky is blue. But the assumption was totally wrong. The sky is blue because of the way sunlight is refracted. And unlike Aristotle, the person who realized this truth didn’t care why it was true, which allowed him to be right forever. There will never be a new explanation for why the sky is blue. Unless, of course, we end up with a new explanation for everything.

Still, we must remember that Galileo merely said that the language of nature is written in mathematics. He did not say everything is. And even the truth about nature need not be expressed in mathematics. For most of human history, the language of nature has been the language of myth and ritual. These forms, one might add, had the virtues of leaving nature un-threatened and of encouraging the belief that human beings are part of it. It hardly befits a people who stand ready to blow up the planet to praise themselves too vigorously for having found the true way to talk about nature.

Deceiving Ourselves

“Now I’m sure some of the ‘word police,’ the ‘wordinistas’ over at Webster’s, are gonna say, ‘Hey, that’s not a word!’ Well, anybody who knows me knows that I’m no fan of dictionaries or reference books. They’re elitist. Constantly telling us what is or isn’t true. Or what did or didn’t happen. Who’s Britannica to tell me the Panama Canal was finished in 1914? If I wanna say it happened in 1941, that’s my right. I don’t trust books—they’re all fact, no heart. Face it, folks, we are a divided nation—divided between those who think with their head and those who know with their heart. Because that’s where the truth comes from, ladies and gentlemen—the gut.”

“Man prefers to believe what he prefers to be true.”

There are two ways to be fooled. One is to believe what isn’t true; the other is to refuse to believe what is true.

“The end of everything we call life is at hand and cannot be evaded”

The Wuhan Flu doesn’t just make individual people ill—it threatens the whole of society too. Measures used to control the virus destroy people’s livelihoods, trample basic freedoms and, if prolonged, could eventually bring about wholesale societal collapse. However, thus far, talk about the virus has been focused on the medical and epidemiological facts—about which there seems to be an astonishing lack of agreement. We still have no real idea of how dangerous the virus is, nor how easily it spreads, nor how many people at the moment have it. Yet, the absence of real information hasn’t caused governments to move extra cautiously. On the contrary, it has encouraged them to take ever more radical steps.

To understand why, requires an appreciation of how all knowledge—most definitely including scientific facts—is socially constructed, and how human beings, for all the philosophers’ assurances to the contrary, are at heart, irrational animals. We are fearful and gullible creatures whose response to crises is governed by deeply entrenched cognitive biases.

On January 11, 2020, China announced its first death from the virus, a 61-year-old man who had purchased goods in a seafood market. For the following two months the world followed the story essentially as spectators. But then, on March 7, an American public looking forward to the weekend

instead woke to the grim news from Dr. James Lawler, a University of Nebraska Medical Center professor, that about 96 million Americans could become infected with the Wuhan Flu. Of these, Lawler calculated 4.8 million would be hospitalized and nearly half a million—480,000—would die!

For the Western world, watching the virus was no longer a spectator sport. Worse news followed only days later when British experts in London published their research. This seemed to show that without drastic action, not half a million but two and half million Americans faced an imminent and nasty end at the hands of the mystery virus. The detailed and apparently authoritative assessment by Professor Neil Ferguson and his team at Imperial College in London predicted at least half a million deaths in the UK alone.

Soon after, in London, the usually jocular Boris Johnson, the politician who had hung from a zip wire waving a union jack to the delight of the media, took unsmilingly to the airwaves to address the nation. “I must level with the British public,” the Prime Minister said. “Many more families are going to lose loved ones before their time.” The broadcast was followed hours later by emergency regulations shutting down many aspects of normal life and announcing plans to quarantine all elderly people for a period—just to get started—of four months.

At the same time, even as President Donald Trump “hesitated,” over in the US, state legislatures began to rush out their own emergency plans. A bill in Alabama called on individuals to “fist bump” rather than shake hands; New York suspended some mortgage payments for small businesses, and Rhode Island formally requested that Trump “declare a National Emergency for the Wuhan Flu Pandemic.”

The media lapped it up. Years of exaggeration plus a new internet-fueled appetite for clickbait headlines and tantalizing images had left the press no longer minded to separate fact from fiction. Instead, all over the world, media, politicians—and health “experts” too—combined forces to convince the world that it was facing imminent doom.

Information Cascade: a radical shift in ideas and beliefs driven not by carefully assessed and evaluated data but rather by uncritically embraced observation and reinforcement of the views of others.

In an information cascade, the actions and decisions of everyone else become more important than evidence you are directly acquainted with, let alone your own judgment. In this way, a particular view “cascades” down the side of an “informational pyramid”—like a waterfall. How many waterfalls really cascade down pyramids? Not many. But that is not the point. Rather, the insight is that it is often easier for people, if they do not

have either the ability or the interest to find out for themselves, to adopt the views of others. This is without doubt a useful social instinct.

But, in the grim spring of 2020, the news and media coverage, academic research and computer models and, above all, actual policy announcements all became a swirl of self-reinforcing misinformation. In a highly mediatized age, there is a bias towards seeing normal amounts of illness and death as exceptional. Perspective is lost. The seasonal toll of flu (or “flu like illness”), the virus everyone agrees is much less serious than the new one, is between 290,000 and 650,000 people. Worldwide, every year, between four and fifty million symptomatic cases in Europe alone, with a death toll there estimated at between 15,000 and 70,000 each winter. Soon, in America, television anchors broke down in tears reading the news while *The Guardian* ran a characteristically self-serving feature about the “strain” journalists were under.

Now, of course, illnesses are terrible things, and bring in their wake many personal tragedies, this virus no less than any other. But this story rapidly spun out of control with the result that a crucial element of perspective along with accuracy was abandoned early on.

One kind of cognitive bias is “Rear-view mirror syndrome.” This occurs when we evaluate a crisis by trying to find parallels with the past. But the parallels chosen in this case were not, for example, the Swine Flu fiasco, where terrible prophecies came to naught—but rather the great flu epidemic of 1918 and even the Black Death of the Middle Ages. Neither journalists nor politicians seemed to make even the quick trip to Wikipedia where they could have read that:

“The coronaviruses are a group of related viruses that cause diseases in mammals and birds. In humans, coronaviruses cause respiratory tract infections that can be mild, such as some cases of the common cold (among other possible causes, predominantly rhinoviruses), and others that can be lethal, such as SARS, MERS, and the Wuhan Flu.”

Fewer still tried to read even short pieces by specialists like Stanford’s Professor of Public Health, John Ioannidis, to discover that “mild” coronaviruses may be implicated in several thousands of deaths every year worldwide, although the vast majority of them are not documented. Instead, they are lost as noise among 60 million deaths from various causes every year.

On the face of it, it’s quite an information failure when policymakers don’t appreciate the difference between terrifying science fiction scourges

that can wipe out entire species and coronaviruses that actually infect many people every year, and are common especially in the elderly and in hospitalized patients with respiratory illness in the winter. In a normal year, coronaviruses infect millions of people and kill thousands. However, this year every even a solitary case and every early death became headline news. Amazing, high magnification images of the virus exploding out of a human cell added a final ghastly, science fiction aspect to the tale.

Long, long ago, Aristotle, the man who said the Earth is fixed at the centre of the universe, proclaimed that Man was a rational animal; but in 2020, the ‘crisis’ revealed human beings as hopelessly irrational creatures whose thinking is driven not by calm consideration of ‘the evidence’ but rather by various kinds of deeply entrenched thinking errors and cognitive biases. Here are some that throw light on the otherwise inexplicable worldwide response to the Wuhan Flu.

First of all, there’s the bias caused by overconfidence. Overconfidence results from a false sense of your skills and capabilities. And governments are particularly prone to it. One common manifestation is an illusion of control in matters over which you actually have no control—things like the spread of an essentially airborne virus for example, or the “contact tracing” of tens of thousands of people. Illusions of control prompt people to talk with over-optimism about events and timings, such as that the ‘curve of the epidemic will be flattened in two weeks,’ or that ‘a vaccine will be ready by September,’ or that ‘virus spores will only travel a fixed distance of two meters.’ It is all linked to infantile delusions of control rooted deep in our reptile brain that something will happen because we want it to. The flipside of overconfidence is ‘loss aversion’ and fear, things that with the Wuhan Flu lead people to prioritize the threat of illness over concerns about writing off trillions of dollars of business and undermining the structures of society.

And, of course, fear is also at the heart of the phenomenon called “Herd Mentality.” The classic instance of this is finance, but herds rush about in many areas, from management innovations to everyday consumer fashions for clothes or foods. When people opt to follow others on the sole basis that if so many people are doing something, well, ‘there must be a good reason for it,’ you have the potential for collective suicide. Indeed, the public health measures that have shut down large swaths of the economy could cause their own health catastrophe, as lost jobs lead to poverty and hopelessness. What we need is to control the panic; in the grand scheme, we’re going to be fine—provided we don’t let these dipshits fuck it up.

Unfortunately, since deaths drive clicks, much of the media instead plays the role of “availability entrepreneurs,” placing excessive weight on images that are particularly vivid—such as halls full of grim-looking beds inside

emergency hospitals or workers clad in full biohazard gear lowering coffins into graves.

And just as herd thinking means everyone must join the rush. Groupthink requires everyone to defer to authority and individualism to give way to imitation. Shared ‘social facts’ reduce anxiety by offering a sense of order and control. Indeed, in a crisis, contrarians are swiftly attacked by ‘mind guards.’ A quick trip to Twitter will illustrate this. Here, people I’ve conversed with for years have told me in no uncertain terms, to “just stop” disputing the consensus, while even well-entrenched commentators like Peter Hitchens and Simon Jenkins, used to thousands of grovelling, approving comments on their articles, are attacked for daring to suggest that governments might be reacting inappropriately to the Wuhan Flu.

Tolerating ambivalence and ‘not knowing’ plays a key role in maintaining openness to new information. In contrast, anxiety during a perceived crisis leads to over-commitment to preferred narratives, and a failure to recognize their provisional nature. It blocks out certain facts, such as that, for example, a surely noteworthy 99% of Italian Wuhan Flu fatalities had several “comorbidities,” to use the now prevalent jargon term. Research into 355 deaths found that just three of the victims, 0.8 percent, had been clear of illnesses before they were infected. Yet reports didn’t make a clear distinction between deaths “precipitated” by the virus and those “caused” by it.

Above all, groupthink suppresses and distorts the collective memory. Very recent history records multiple times when viruses sparked pandemic scares in the West, and how each time the evidence for them was twisted to fit various agenda including the interests of Big Pharma—but lessons from past cannot be benefited from. This kind of collective amnesia is very convenient for certain people. It would otherwise be notable that Neil Ferguson of London’s Imperial College, one of the leading voices calling for radical social distancing and lockdown measures to combat the “threat” of the Wuhan Flu, was likewise pressing very similar strategies, based on very similar arguments during earlier epidemics, such as Swine Flu—which turned out to be much less dangerous than his models predicted—as well as the “Foot and Mouth” one in which he insisted that all the cows, not only from infected farms but neighbouring farms too, had to be slaughtered—which they were, producing apocalyptic scenes of vast funeral pyres. There never was a good argument for the policy and in due course it was seen as a dreadful fiasco.

Well folks, I guess be thankful he didn’t offer that solution for this one—or maybe Bill Gates is keeping that plan under wraps for now, saving it for if the poors get too uppity? Remember Billy, we’re coming for those

billions; you're going to need to ride a fucking bus, bud. And no more global pandemic D&D in ritzy hotels for you.

After such false alarms, the world was supposed to have become more skeptical, and the WHO, in particular, to have changed its approach to pandemics. Instead, only a decade after the Swine Flu fiasco, it is striking how much the public and political coverage has again coalesced around certain myths and misunderstandings of the virus and how dissenting voices have been marginalized—meaning confined to specialist and “fringe” publications—while a false “consensus” of “all the experts” is created.

“With all respiratory diseases, the only thing that stops the disease is herd immunity. About 80% of the people need to have had contact with the virus, and the majority of them won't even have recognized that they were infected, or they had very, very mild symptoms, especially if they are children. So, it's very important to keep the schools open and kids mingling to spread the virus to get herd immunity as fast as possible. We are experiencing all sorts of counterproductive consequences of not well-thought-through policy

I have been an epidemiologist for 35 years, and I have been modeling epidemics for 35 years. It's a pleasure to have the ability to help people to understand, but it's a struggle to get heard.”

In a world in which scientists with computers have replaced priests with crucifix as the sources of unchallengeable truth and wisdom, the history of science shows that scientific progress is not and has never been solely and calmly about facts—far less, Platonic truths—at all, but is instead, a brutal fight in which the dominant view (or paradigm) invariably seeks to suppress its rivals. Kuhn's theory of so-called paradigm shifts should remind us how easily faulty reasoning can flourish and become entrenched. But it doesn't.

For better or for worse, the philosophy of science should remind us that individuals can influence the way we see the world. For better, Louis Pasteur did it by challenging Aristotle's thousand-year dogma that life is continually springing out of everyday chemicals in the air, mud, and water, discovering germs and microorganisms. For worse, activist researcher Ancel Keys managed to persuade governments and populations alike in the 1960s and 70s, that “fatty foods” like cheese and butter really were killing everyone. And now it seems that a handful of activist mathematical modelers of epidemics have managed to change the way we view viruses—the invisible other half of the human biome, essential to life.

The problem is, there are really two kinds of human thinking: fast and slow. ‘Slow’ is when you work things out. ‘Fast’ is what we use in a crisis. We have evolved in desperate times to jump to conclusions, ignoring gaps in information and data. This leap before you look mindset may have had evolutionary advantages. However, in the face of societal crises such as the Wuhan Flu, it is careful, slow thinking that is needed. Alas, it is fast thinking that we get.

Take the work of the computer modelers, for example:

“Every variable is dependent on a number of choices and knowledge gaps. And if every individual piece of a model is wobbly, then the model is going to have as much trouble standing on its own as a data journalist who has spent too long on a conference call while socially isolated after work.”

“There is no master plan in the background being followed here. There is a lot of research being done in real time, which is feeding into policy, to try and work out: is there in some sense an optimal strategy which keeps the NHS functioning, allows more economic and social activity to continue than is going on at the moment and gets us through the next, frankly, 18 months? I don’t know quite what that will look like or even if it’s completely feasible. We don’t have a clear exit strategy at the moment.”

However, it seems that even with life and death issues of public health, the strategy for computer modelers and governments alike is—in the words of the French philosopher Jean-Jacques Rousseau centuries ago on social life in general—to start by saying:

“Let us begin then by laying facts aside, as they do not affect the question.”

All of which highlights the thinking error dubbed, “GIGO,” for ‘Garbage In, Garbage Out’—according the pronouncements of computers (and computer models) far more weight than anything produced by a human being; even though, in reality, what the computer says is determined by the information fed into it by humans. As early as 1964, a researcher warned that even “extremely short exposure to a relatively simple computer program could produce powerful delusional thinking in normal people.” And unfortunately, we are not talking about normal people in this case, but politicians. For these, the fact, so cheerfully acknowledged by Ferguson in interviews, that the data he fed his computer models was largely provisional and debatable,

did not detract from the enormous authority given to the computer's eventual pronouncements. And, what the computer models suggested, in their unchallengeable way, was that so-called self-isolation and social distancing was the universal solution. The 'Italian model' for dealing with the virus was to be backed up by medical staff in cumbersome protective clothing; soldiers patrolling the streets; and legally enforced, profound changes to the lives of the whole population.

Another cognitive bias is the so-called "Narrative Fallacy." With things like the Wuhan Flu, we have been offered many stories, but one of the most compelling is that about people going out, passing the virus on, and killing other people. Notice too, that we are subliminally wired to expect this kind of three-part story—the beginning, the middle and then the end. Advertisers know the power of triples, but so do media propagandists and political advisors. In the UK, the Prime Minister gave public addresses with not one but three messages strapped to his podium:

"Stay home. Protect the NHS. Save lives."

Newspapers described the virus as a tiny, streamlined machine, which engulfs the cells deep in the tiny air sacs of the lung, hijacks their command and control mechanisms, before finally killing them and spewing out more of the infectious virus. In a mediatized age, storytelling is doubly important. The bias recognizes that humans are story-telling animals who naturally try to arrange facts and events in a sequence. Alas, sometimes the story takes on greater authority than it really deserves, propelling us towards a supposed conclusion.

Speaking of storytelling, a harrowing series of tweets by an Obama-era health official outlined how the largest US cities and hospitals would be overrun with Wuhan Flu cases by the end of March and a million Americans would die. The tweets by Andy Slavitt, the former acting administrator of Medicare and Medicaid under President Barack Obama, helped shift public opinion in the US.

"What are mayors, governors and their staffs reporting? That people are jamming the bars. I get it. Home from work. Cooped up. Crisis mentality. We need to let steam off. Shared experience. But stop that. All the bars and restaurants are closed now across Europe."

Describing the situation in Italian hospitals in particular, and what it might mean for the US, he tweeted:

“Every report describes this as a tsunami. And if it happens like a tsunami, in major cities we will have tens of thousands more cases than we have beds and we will have one ventilator for every eight people who need one.”

And there again you have the tell-tale fingerprint of an information cascade. The policy was right because “every report” says it is right. Another clue as to the quality of his diagnosis came in his final tweet about the origins of the crisis. It was a Republican President’s mismanagement that had caused it:

“The original sin is Trump’s months-long denial and his dismantling of public health and response infrastructure.”

Thus politicians cannot help but play their usual games even as the world teeters on the brink of disaster. Which without doubt, it was doing. Only not because of the health crisis that Slavitt and so many others foresaw, a crisis caused by a biological virus—but because of a social and economic rupture caused by rash actions and misinformation.

But let’s not deceive ourselves that it is only politicians who misread information and rush about like fools. Consider two small stories making up the big virus tale. One was the rumor that it was being transmitted by people with no symptoms. A report documenting transmission by an asymptomatic individual had been published in the *New England Journal of Medicine* on January 30. Of course, transmission by people without symptoms would be a huge problem. A few weeks later, however, it turned out that the specific patient did have symptoms, it was just that the researchers had er. . . not asked. Similarly, the respected medical journal *The Lancet* published on February 24 a shocking account by two Chinese nurses about their front-line experience fighting the Wuhan Flu. Only it turned out that the account was not quite what it seemed: it was not a first-hand account. The authors soon retracted their contribution which was as a letter. Such examples show how sensationalism affects even the most prestigious scientific journals.

A further reasoning error occurs when people trust information they have read in several places, without appreciating that the views may feed off each other. Journalists, for example, read each other’s reports and feel reassured to be part of a consensus. Politicians read the reports and shift policies to fit the journalists expectations. In the Wuhan Flu crisis, many journalists felt it was their duty to direct readers thinking in one direction only. Dissenting voices were drowned out. Instead, terrifying predictions and lack of actual data were the context for near universal calls for a

strict policy of social isolation, and for medical systems to move quickly to reorganize and prioritize resources ready for the expected mass epidemic.

The immediate result was radical lockdowns of whole populations—actions that were unprecedented in peacetime. The longer term result was that the global economy and society sustained serious damage from an epidemic that otherwise accounted for “less than 0.01% of all 60 million annual global deaths from all causes and that kills almost exclusively people with relatively low life expectancy.”

And all the time, even as media and politicians rushed frantically from rash idea to rasher policy, the facts were there in plain sight—only no one was prepared to look at them. No one even attempted to explain how social distancing measures and lockdowns could be maintained for months, even years potentially, without major consequences to the economy, society, and mental health. Let alone how unpredictable effects including financial crisis, unrest, civil strife, war, and a ripping of the social fabric could be avoided. Instead, what people were fed were soundbites. Like this one from London’s otherwise ‘liberal’ radio station, LBC:

“If you’re still planning to go out this weekend despite bars being closed, first listen to this remarkable call from an intensive care doctor who warned: ‘If you go out, it’s going to kill people.’”

Lockdown was the most disastrous part of a policy taken by many countries and American states that was supposed to “slow down” the spread of the virus, yet we must accept it had popular support. Even though, the idea was to discourage people from leaving their homes, for walks or cinemas or cafés, and to require them to stay in claustrophobic proximity with each other in their homes for weeks on end. In France, President Macron made long, emotional appeals to his “compatriots” to join in a national struggle against “an invisible enemy,” before listing respectfully those who had fallen already. All public spaces were closed and citizens (like myself) were forbidden to leave their homes for weeks on end, except to buy essential foodstuffs in approved shops. And to do this, they had to clutch an official document downloaded from the government website, setting out their reasons for leaving their house. The interior minister, Christophe Castaner, ordered 100,000 military police to spread around the country to enforce the lockdown. Of course, such people are immune from the virus—and can’t spread it either. Such a thought was no more irrational than the rest of the government’s plans. In the US, President’s Trump’s decision to close America’s borders made no scientific sense—and nor does health screening at borders as it cannot pick out people who may carry viruses but not yet

have symptoms—even if in partisan political terms is seemed to reinforce his campaign themes of a strong fortress America—the one with a wall along the Mexico border.

Tying together all the plans however was the central conviction that we had to “Flatten the Curve.” That is, to spread out the load of virus cases and relieve pressure on health services. This had rapidly become the One Thing Everyone Agrees. Yet even that simple relationship—lots of cases, overloading health services, so better to spread them out—is not entirely straightforward. Because spreading infections out over a longer period of time can just as easily mean that instead of being overwhelmed during a short, acute phase, health services remain overwhelmed for a more protracted period. When health services are overwhelmed, people die. And destroying livelihoods, disrupting social life, and locking people in their homes for months kills people too.

In the absence of data, prepare-for-the-worst reasoning leads to extreme measures of social distancing and lockdowns. Unfortunately, we do not know if these measures work. School closures, for example, may reduce transmission rates. But they may also backfire if children socialize anyhow, if school closure leads children to spend more time with susceptible elderly family members, if children at home disrupt their parents ability to work, and more. School closures may also diminish the chances of developing herd immunity in an age group that is spared serious disease. So perhaps it is worth taking a moment to look at the background of one of the experts whose call for a swift clampdown on all social contact led to dramatic shifts in policy in both the UK and the US.

Neil Ferguson hails from Imperial College London—a university with profitable links to the pharmaceutical industry. Just days after the paper was published, Ferguson’s department of biomathematics announced it was sharing in £20 million of emergency the Wuhan Flu research investment courtesy of the UK government. Not bad for one paper! But the most revealing thing about Neil Ferguson and his department is that they had exactly the same concerns and exactly the same policy advice during the so-called Swine Flu crisis back in 2009.

Flashback to June 11 that year, and the World Health Organization was declaring a “six-level alert”—its grimmest ever—for a new pandemic sweeping the world. This was the so-called Swine Flu or H1N1 virus, and despite having in previous years been found to have been wrong about the dangers of several other viruses, the WHO once again, sounded the deathly warning that “this early pandemic and flu is somewhat similar to the 1918–1919 pandemic swine flu that killed millions.” Exactly what this strain would do in the Fall and Winter of 2009 and into 2010 was unclear,

the WHO said, but “everyone needs to be prepared.”

Naturally, governments everywhere respected the advice of the World Health Organization, a UN agency which after all does so much good work combating disease and guiding research related to public health. And so, after the Swine Flu warning, they promised schools and offices would be closed where necessary. Facemasks were bought in the millions, and vaccines were stockpiled. And also as part of their response, a fount of ‘advice’ was offered to the public. For example, people were told, when back at home in the evening, to disinfect dishes, cups, and utensils by thoroughly soaking in detergent and washing and rinsing thoroughly everything by hand or in the dishwasher. Everyone was to wash their hands frequently. And if, despite staying away from work, ordering the shopping by phone, and disinfecting the dishes, they still fell victim, there was advice on “the symptoms”—fever, chills, coughing, fatigue, congestion, muscle and bone ache, and vomiting and intestinal upset; and then death.

No wonder governments spent so much to combat the threat. No wonder, more specifically, that governments swiftly came up with large amounts of money to buy huge amounts of vaccine from pharmaceutical companies. Yet, at the end of the day, Swine Flu proved to be a paper tiger in the West, just as the skeptical doctors had indicated. The 2009 swine flu epidemic killed hundreds of thousands, mostly in Africa and Southeast Asia. Annoyingly, for Western governments and their advisors, almost no people could be found to be said to have died from H5N1, even though ordinary flu regularly kills several tens of thousands of people each winter. However, for a while, this virus was *the* public health concern, we could say the fashion.

Quite possibly more people, suffering from other complaints, died from the “emergency precautions” surrounding the virus, such as being refused entry to doctors surgeries. But these could hardly be added to the statistics. And all over the (rich) world, millions of germ masks and vaccines began to deteriorate in storage, unused and unusable. Back then, an erroneous piece of expert advice cost an unknown number of lives and enormous sums of money and resources.

Not long after, two independent reports put a belated spotlight on the fact that three of the crucial experts arguing for expensive programs of vaccine preparation—by companies like Roche (the makers of Tamiflu) and GlaxoSmithKiline (the makers of Relenza)—were also paid consultants for the companies. Now, maybe individual researchers aren’t knowingly skewing research reports in order to make money, either for themselves or their institutions. But the structural pressures are there and they can create the same effect. Research is a business and so its conclusions are skewed towards the needs of the paymasters.

And you may well ask, how big a business is an epidemic? The answer is that they can be a very big deal indeed. In the US alone, Congress had appropriated \$7.65 billion in June to fight the 2009 pandemic. In the UK, in order to deal with the Swine Flu threat, the impressively titled and ennobled Chief Medical Officer, Sir Liam Donaldson, said that a £1 billion emergency program of vaccination was needed. If it sounds a lot for a small country, remember, without it up to 65,000 people would die! The most “optimistic assessment” was for 19,000 deaths. His fears were confirmed by virologists such as one who added that without immediate action he had calculated that soon half the population could be infected. Imagine, tens of millions of people dying—and only the government able to save them.

But the funds made available for the Wuhan Flu are on a totally different scale. Even with the number of cases globally still relatively tiny, in March 17, 2020, the World Bank had set aside \$14 billion to help its members to respond to the threat. What sort of things was the money to be spent on? One component was to pay for everyone in the population to be tested for the virus. Vaccines make for profits, but testing is a great earner too. Often in this case tests were to be followed by the isolation of anyone who tested positive. Even though carrying out mass tests on the asymptomatic population could be useless—the contagions are constantly evolving, a person who tests negative today could contract the disease tomorrow.

Governments wouldn't wish to implement pointless and even dangerous polices though, would they? Alas, the herd memory is short, nor are herds known for their willingness to pause and reflect. Otherwise they might have learned lessons from 1976, when President Gerald Ford's administration reacted at speed to the swine flu outbreak, ignoring the World Health Organization's words of caution and vowing to vaccinate “every man, woman and child in the United States.” After 45 million people were vaccinated, the flu turned out to be mild. Worse, researchers discovered that some of the vaccinated—roughly 450 in all—had developed Guillain-Barré syndrome, a rare disorder in which the body's immune system attacks the nerves, leading to paralysis. At least 30 people died. Or from 2017, when a rushed campaign—endorsed by the WHO—to vaccinate nearly one million children for mosquito-borne dengue in the Philippines was halted for safety reasons. The Philippine government indicted 14 state officials in connection with the deaths of ten vaccinated children, saying the program was launched “in haste.”

But back to the earlier Swine Flu outbreak in the UK, the one where the Chief Medical Officer swept aside skeptical voices, and instead advised the British government to order without further delay 32 million face masks to go with that £1 billion-plus worth of vaccines. In France and other European

countries, a similar story had played out—another billion-dollar supply of vaccines stockpiled here, another mountain of unused face masks there.

With hindsight it seems just silly—and expensive. Yet it’s worth recalling that for a few months the Swine Flu pandemic was also genuinely terrifying ‘everyone.’ Like the Wuhan Flu, it had appeared around March and rapidly spread throughout many places on the planet, all doubtless helped by sniffing travelers on airplanes. The Center for Disease Control in the US started a website page to keep track of the death toll for US states and territories: by June 2009 the counter registered 6,506 cases and 436 deaths. The next month, a special counter on the World Health Organization website registered total cases already at 177,457 with a toll of 1,462 deaths.

Admittedly, the figures were not yet exceptional, but the question everyone was asking was how many more might die soon? Basing their view on US statistics, and the lack of a jab for swine flu, experts thought there would be “about 300 million” at risk initially: “typically, anyone who has not had the vaccine.” For a few weeks back then too, it had seemed to a terrified public that the only real way to avoid dying was to ‘Get vaccinated as soon as possible.’ Advice, in other words coming from the drugs industry funded labs that certainly suited the industry. Unfortunately—for Big Pharmas profits—the vaccines would be available only in early October.

And just as in the spring of 2020, there were endlessly repeated helpful hygiene tips, such as to:

- Avoid putting fingers and hands to the mouth or eyes since these are portals of entry for microbes.
- Stay away from large crowds, and all infected people.
- Remember to wear a face mask—certainly if going out of the house.
- Wash hands regularly, before eating or drinking and after visiting the restroom.

With Swine Flu, much of the advice related to safety at school. But with the Wuhan Flu, even though school-age children were recognized as very low risk, schools were immediately shut down.

We should be suspicious of experts recycling old advice. After all, they may be guilty of two more cognitive biases: the phenomenon known as “one model thinking” whereupon only evidence that fits the model is visible. There is either a duck or a rabbit, but not both, to use the example that Wittgenstein made famous, but originated in 1892 issue of *Fliegende Blätter*, a German humour magazine. And there is “Confirmation Bias,” which

is the idea that people seek out information and data that confirms their pre-existing ideas while ignoring contrary information however potentially significant for the decision. The almost non-existent political and media examination of the range of views and strategies for the Wuhan Flu shows that this is one of the most dangerous biases of them all.

All work requires effort. All goals require conviction. All conviction is entwined with doubt. Belief gets us where we are going, but what saves a man when he gets lost?

“The easiest thing of all is to deceive oneself; for we believe whatever we want to believe.”

There have been many psychology experiments that show that people can be exemplary thinkers when they are highly motivated and feel that they have the ability to understand things. In these situations, people typically will buckle down, consider all the information that they encounter until they understand it fully, and then make a carefully reasoned judgment. But when people aren't motivated, such as when they are considering a new proposed law that won't affect them directly, or when they feel that they don't have the ability to fully understand a complex problem, then they show a curious response: they start to attend to things that are really quite irrelevant to the quality of the information. They'll be persuaded just because an argument comes from an attractive person, or from someone who has an impressive sounding title, or by whatever information is presented first, or by a snappy sound-bite that sticks in their mind. That is, when a problem is too challenging, we try to conserve our cognitive resources to make a judgment that feels 'good enough.' We become what psychologists call a "cognitive miser." Thinking takes effort, especially for complex problems, so we use mental shortcuts—what psychologists term "heuristics"—that appear to give us a satisfying answer.

When estimating the frequency of an event, for example, we often base our estimates on how many relevant examples we can bring to mind. This is known as the "availability heuristic." If we want to estimate the likelihood of being killed by a shark versus being killed by a cow, we think of the number of incidents of each of these that we know. Because fatal shark attacks are so noteworthy, they receive much more press attention than fatal encounters with cows, and thus most people can more readily bring to mind examples of shark-caused deaths than cow ones.

Our estimates of the ratio of shark and cow attacks are also influenced by how well an event fits with our existing beliefs—this is known as the

“representativeness heuristic.” Some ideas just are easier to imagine because we have some preexisting expectations and stereotypes that guide our thinking. When it comes to sharks, we think of them as all teeth—efficient cold-blooded killing machines—and we can easily imagine how they could tear up a lone swimmer or surfer. In contrast, people usually think of cows as lumbering docile grazers—gentle beasts that seem content chewing their cud. Attacking humans just doesn’t seem to be representative cow behavior. The availability and the representativeness heuristics make us feel that shark-caused deaths are more common than cow-caused deaths, when in actuality, deaths from cows are far more common. Our mental heuristics provide us with quick, satisfying, and often completely incorrect answers.

Before the discovery of Australia, people in the Old World were convinced that all swans were white, an unassailable belief as it seemed completely confirmed by empirical evidence. The sighting of the first black swan might have been an interesting surprise for a few ornithologists—and others extremely concerned with the coloring of birds—but that is not where the significance of the story lies. It illustrates a severe limitation to our learning from observations or experience and the fragility of our knowledge. One single observation can invalidate a general statement derived from millennia of confirmatory sightings of millions of white swans. All you need is one single black bird.

The Black Swan is the result of collective and individual epistemic limitations (or distortions), mostly confidence in knowledge; it is not an objective phenomenon. The most severe mistake made in the interpretation of the Black Swan is to try to define an objective Black Swan that would be invariant in the eyes of all observers. The events of September 11, 2001, were a Black Swan for the victims, but certainly not to the perpetrators.

Why do we formulate theories leading to projections and forecasts without focusing on the robustness of these theories and the consequences of the errors? It is much easier to deal with the Black Swan problem if we focus on robustness to errors rather than improving predictions.

I don’t particularly care about the usual. If you want to get an idea of a friend’s temperament, ethics, and personal elegance, you need to look at him under the tests of severe circumstances, not under the regular rosy glow of daily life. Can we understand health without considering wild diseases and epidemics? Indeed the normal is often irrelevant.

Models and constructions, these intellectual maps of reality, are not always wrong; they are wrong only in some specific applications. The difficulty is that a) you do not know beforehand (only after the fact) where the map will be wrong, and b) the mistakes can lead to severe consequences. These models are like potentially helpful medicines that carry random but

very severe side effects.

I stick my neck out and make a claim, against many of our habits of thought, that our world is dominated by the extreme, the unknown, and the very improbable—improbable according our current knowledge—and all the while we spend our time engaged in small talk, focusing on the known, and the repeated. This implies the need to use the extreme event as a starting point and not treat it as an exception to be pushed under the rug. I also make the bolder—and more annoying—claim that in spite of our progress and the growth in knowledge, or perhaps because of such progress and growth, the future will be increasingly less predictable, while both human nature and social sciences seem to conspire to hide the idea from us.

The human mind suffers from three ailments as it comes into contact with history. They are:

Illusion of Understanding: How everyone thinks he knows what is going on in a world that is more complicated (or random) than they realize.

Retrospective Distortion: How we can assess matters only after the fact, as if they were in a rearview mirror (history seems clearer and more organized in history books than in empirical reality).

Overvaluation of Factual Information: The handicap of authoritative and learned people, particularly when they create categories—when they ‘Platonify.’

The studious examination of the past in the greatest of detail does not teach you much about the mind of History; it only gives you the illusion of understanding it. History and societies do not crawl. They make jumps. They go from fracture to fracture, with a few vibrations in between. Yet we (and historians) like to believe in the predictable, small incremental progression.

From the standpoint of the turkey, the non-feeding of the one-thousand-and-first day is a Black Swan. For the butcher, it is not, since its occurrence is not unexpected. So you can see here that the Black Swan is a sucker’s problem. In other words, it occurs relative to your expectation. You realize that you can eliminate a Black Swan by science—if you’re able—or by keeping an open mind. Of course you can create Black Swans with science, by giving people confidence that the Black Swan cannot happen—this is when science turns normal citizens into suckers.

Consider the following story:

A nonbeliever in the gods, was shown painted tablets bearing the portraits of some worshipers who prayed, then survived a

subsequent shipwreck. The implication was that praying protects you from drowning. The nonbeliever asked, “Where were the pictures of those who prayed, then drowned?”

The drowned worshipers, being dead, would have a lot of trouble advertising their experiences from the bottom of the sea. This can fool the casual observer into believing in miracles. We call this the problem of silent evidence. The idea is simple, yet potent and universal. The problem, of course, is that unless they are drilled into us systematically, or integrated into our way of thinking, these great observations are rapidly forgotten.

But that we got here by accident does not mean that we should continue to take the same risks. We are mature enough a race to realize this point, enjoy our blessings, and try to preserve, by becoming more conservative, what we got by luck. We have been playing Russian roulette; now let’s stop.

Evolutionary fitness is something that is continuously touted and aggrandized by the crowd who takes it as gospel. The more unfamiliar someone is with the wild Black Swan-generating randomness, the more he or she believes in the optimal working of evolution. Silent evidence is not present in their theories. Evolution is a series of flukes, some good, many bad. You only see the good. But, in the short-term, it is not obvious which traits are really good for you, particularly if you are in the Black Swan-generating environment. This is like looking at rich gamblers coming out of the casino and claiming that a taste for gambling is good for the species because gambling makes you rich! Risk taking made many species head for extinction! This idea that we are here, that this is the best of all possible worlds, and that evolution did a great job seems rather bogus in the light of the silent-evidence effect. The fools, the Casanovas, and the blind risk takers are often the ones who win in the short term. Worse, in a Black Swan environment, where one single but rare event can come shake up a species after a very long-run of “fitness,” the foolish risk takers can also win in the long-term!

There are professions where experts play a role, and others where there is no evidence of skills. Which are which?

Professions that deal with the future and base their studies on the non-repeatable past have an expert problem (with the exception of the weather and businesses involving short-term physical processes, not socioeconomic ones). I am not saying that no one who deals with the future provides any valuable information—newspapers can predict theater opening hours rather well—but rather that those who provide no tangible added value are generally dealing with the future.

Another way to see it is that things that move are often Black Swan-prone. Experts are narrowly focused persons who need to tunnel. In situations where tunneling is safe, because Black Swans are not consequential, the expert will do well.

There is actually a law in statistics called the law of iterated expectations: If I expect to expect something at some date in the future, then I already expect that something at present. Consider the wheel. If you are a Stone Age historical thinker called on to predict the future in a comprehensive report for your chief tribal planner, you must project the invention of the wheel or you will miss pretty much all of the action. Now, if you can prophesy the invention of the wheel, you already know what a wheel looks like, and thus you already know how to build a wheel, so you are already on your way. The Black Swan needs to be predicted!

But there is another form of this law of iterated knowledge. It can be phrased as follows: To understand the future to the point of being able to predict it, you need to incorporate elements from this future itself. If you know about the discovery you are about to make in the future, then you have almost made it.

Assume that you are a special scholar in Medieval University's Forecasting Department specializing in the projection of future history—for our purposes, the remote twentieth century. You would need to hit upon the inventions of the steam machine, electricity, the atomic bomb, and the Internet, as well as the institution of the airplane onboard massage and that strange activity called the business meeting, in which well-fed but sedentary men voluntarily restrict their blood circulation with an expensive device called a necktie. This incapacity is not trivial. The mere knowledge that something has been invented often leads to a series of inventions of a similar nature, even though not a single detail of this invention has been disseminated—there is no need to find the spies and hang them publicly. In mathematics, once a proof of an arcane theorem has been announced, we frequently witness the proliferation of similar proofs coming out of nowhere, with occasional accusations of leakage and plagiarism. There may be no plagiarism: the information that the solution exists is itself a big piece of the solution.

This multiplicative difficulty leading to the need for greater and greater precision in assumptions can be illustrated with the following simple exercise concerning the prediction of the movements of billiard balls on a table. If you know a set of basic parameters concerning the ball at rest, can compute the resistance of the table (quite elementary), and can gauge the strength of the impact, then it is rather easy to predict what would happen at the first hit. The second impact becomes more complicated, but possible; you need to be more careful about your knowledge of the initial states, and more precision

is called for. The problem is that to correctly compute the ninth impact, you need to take into account the gravitational pull of someone standing next to the table. And to compute the fifty-sixth impact, every single elementary particle of the universe needs to be present in your assumptions! An electron at the edge of the universe, separated from us by 10 billion light-years, must figure in the calculations, since it exerts a meaningful effect on the outcome.

Now, consider the additional burden of having to incorporate predictions about where these variables will be in the future. Forecasting the motion of a billiard ball on a pool table requires knowledge of the dynamics of the entire universe, down to every single atom! We can easily predict the movements of large objects like planets (though not too far into the future), but the smaller entities can be difficult to figure out—and there are so many more of them. Note that this billiard-ball story assumes a plain and simple world; it does not even take into account these crazy social matters possibly endowed with free will. Billiard balls do not have a mind of their own.

Operation 1: The Melting Ice Cube Imagine an ice cube and consider how it may melt over the next two hours while you play a few rounds of poker with your friends. Try to envision the shape of the resulting puddle.

Operation 2: Where Did the Water Come From? Consider a puddle of water on the floor. Now try to reconstruct in your mind's eye the shape of the ice cube it may once have been. Note that the puddle may not have necessarily originated from an ice cube.

The difference between these two processes resides in the following. If you have the right models—and some time on your hands, and nothing better to do—you can predict with great precision how the ice cube will melt. This is a specific engineering problem devoid of complexity, easier than the one involving billiard balls. However, from the pool of water you can build infinite possible ice cubes, if there was in fact an ice cube there at all. The first direction, from the ice cube to the puddle, is called the forward process. The second direction, the backward process, is much, much more complicated. The forward process is generally used in physics and engineering; the backward process in non-repeatable, non-experimental historical approaches. In a way, the limitations that prevent us from unfrying an egg also prevent us from reverse engineering history.

Now, let me increase the complexity of the forward-backward problem just a bit by assuming nonlinearity. Take what is generally called the “butterfly in India” paradigm. A small input in a complex system can lead

to nonrandom large results, depending on very special conditions. A single butterfly flapping its wings in New Delhi may be the certain cause of a hurricane in North Carolina, though the hurricane may take place a couple of years later. However, given the observation of a hurricane in North Carolina, it is dubious that you could figure out the causes with any precision: there are billions of billions of such small things as wing-flapping butterflies in Timbuktu or sneezing wild dogs in Australia that could have caused it. The process from the butterfly to the hurricane is greatly simpler than the reverse process from the hurricane to the potential butterfly.

This brings me to a greater problem with the historian's craft. I will state the fundamental problem of practice as follows: while in theory randomness is an intrinsic property, in practice, randomness is incomplete information. Nonpractitioners of randomness do not understand the subtlety. Often when they hear talk about uncertainty and randomness, philosophers, and sometimes mathematicians, wonder whether the randomness addressed is "true randomness" or "deterministic chaos" that masquerades as randomness. A true random system is in fact random and does not have predictable properties. A chaotic system has entirely predictable properties, but they are hard to know.

But there is no functional difference in practice between the two since we will never get to make the distinction—the difference is mathematical, not practical. If I see a pregnant woman, the sex of her child is a purely random matter to me (a 50 percent chance for either sex)—but not to her doctor, who might have done an ultrasound. In practice, randomness is fundamentally incomplete information. And, the mere fact that a person is talking about the difference implies that he has never made a meaningful decision under uncertainty—which is why he does not realize that they are indistinguishable in practice. Randomness, in the end, is just unknowledge. The world is opaque and appearances fool us.

“The real purpose of scientific method is to make sure Nature hasn't misled you into thinking you know something that you actually don't.”

Corporations realized that you could create the impression of controversy simply by asking questions, even if you actually knew the answers and they didn't help your case.

What oil, tobacco, and pharmaceutical companies have done in the past is hire scientists to do research they want kept secret. When the best scientists have evidence that would work against you, but they're not able to present it to the public, well then, you've essentially bought some silence.

“Once again, scientific claims were being published in scientific journals, where only scientists would read them, but unscientific claims were being published in the mass media.”

I am deeply suspicious of statistics. The same data can be used to support very different views in both the life sciences and social sciences, including economics. Moreover, the methods used to produce figures are often debatable, to say the least, and the reliability of the result can only be judged by someone with a degree in advanced statistics. The main illusion produced by all these figures is that they represent reality. In the majority of cases, however, they are doing something else. They are creating a certain image of reality. That image reflects expectations, the product of an ideology we are not always aware of. People then make decisions without reflecting—after all: the figures speak for themselves.

Misinterpretation of ‘no effect’ studies has led to a popular joke in math circles. Two statisticians, on a hunting trip in the woods, spot a deer and each take aim. One misses three feet to the right. The other misses three feet to the left. They rejoice: “We got him!”

The media gives tremendous weight and coverage to the first study published on a research question, and essentially ignores all of those that come later. This bias is unsurprising—fame goes to the discoverer, not to the person who got there a few months later, or who just followed up on the original work. But even in science, the judgment of greatness is a retrospective one that only history can render, and journalism is well known to be only the first draft of history. When a new finding is announced, journalists and other observers might be hard-pressed to say, ‘I won’t report this story until I see it replicated by at least two other laboratories.’ The first report of a new scientific finding is analogous to the front-page coverage granted to a high-profile criminal indictment; the news that the results didn’t hold up winds up in the back pages—if it is covered at all—next to the story about the suspect’s eventual exoneration.

Correlation does not imply causation. This principle needs to be taught because it runs counter to the illusion of cause. It is particularly hard to internalize, and in the abstract, knowing the principle does little to immunize us against the error. Fortunately, we have a simple trick to help you spot the illusion in action: When you hear or read about an association between two factors, think about whether people could have been assigned randomly to conditions for one of them. If it would have been impossible, too expensive, or ethically dubious to randomly assign people to those groups, then the study could not have been an experiment and the causal inference is not supported.

The Simpsons provides one of the best illustrations of the dangers of turning a temporal association into a causal explanation. After a bear is spotted in Springfield, the town initiates an official Bear Patrol, complete with helicopters and trucks with sirens, to make sure no bears are in town.

HOMER: Ahhh. . . not a bear in sight. The bear patrol must be working like a charm.

LISA: That's specious reasoning, Dad.

HOMER: Thank you, honey.

LISA: *picking up a rock from the ground* By your logic, I could claim that this rock keeps tigers away.

HOMER: Ooooh. . . how does it work?

LISA: It doesn't work—it's just a stupid rock. But I don't see any tigers around here, do you?

HOMER: Lisa, I want to buy your rock.

Around 40 percent of people still believe in the Mozart effect, despite the scientific evidence against it. Lest you think that this is just a silly belief that has no real importance, consider some of the implications. Parents holding this belief might think that they are doing just as much, if not more, for their children by sitting them in front of a baby DVD or playing classical music than by interacting with them. Daycare centers, schools, and other institutions might follow suit. The fad of playing Mozart to babies could substitute for much better practices, ones that might actually help the social and intellectual development of children. In other words, a belief in the Mozart effect might make children worse off than they would have been otherwise, as suggested by a study of baby DVDs. If such a sizable number of people continue to believe in the Mozart effect despite its debunking, what about other beliefs in hidden mental powers that have not received as severe a public lashing as the Mozart effect?

A single vivid example that illustrates a causal argument may be taken as proof unless we think carefully about the information we haven't been given—and thinking about what is missing from a story does not come naturally.

Anecdotes are inherently more persuasive than statistics. Precisely because anecdotes capitalize on the power of narrative, they hold considerable sway over all of us. You might know from reading Consumer Reports that Hondas and Toyotas have excellent reliability. Consumers Union, the publisher of Consumer Reports, surveys thousands of car owners and compiles their responses to generate their reliability ratings. But your one friend who complains that his Toyota is perpetually in the shop and

insists that he would never buy another one can have more power than the aggregated reports of thousands of strangers. We can relate to the experiences—especially the suffering—of a single car owner. We can't relate to the statistical facts about thousands. For a story to be powerful, persuasive, and memorable, we need to be able to empathize. Quentin Tarantino, maker of ultra-violent films, explains the importance of empathy this way:

“A beheading in a movie doesn't make me wince. But when somebody gets a paper cut in a movie, you go, ‘Ooh!’”

It makes sense that anecdotes are compelling to us. Our brains evolved under conditions in which the only evidence available to us was what we experienced ourselves and what we heard from trusted others. Our ancestors lacked access to huge data sets, statistics, and experimental methods. By necessity, we learned from specific examples, not by compiling data from many people across a wide range of situations.

Imagine that I cart a pig into your living room and tell you that it can talk. You might say ‘Oh, really? Show me.’ I then wave my wand and the pig starts talking. You might respond, ‘My God! That's amazing!’ You are not likely to say, ‘Ah, but that's just one pig. Show me a few more and then I might believe you.’ If you're convinced that you've seen a talking pig, no amount of scientific evidence that pigs are incapable of talking would convince you. Instead, scientists would need to prove to you that the pig you saw didn't actually talk—that smoke and mirrors were used to create an illusion of a talking pig. And the more people circulate similar anecdotes, all equally fooled into believing the magic is real, the more science will struggle.

We use stories and anecdotes to convey our arguments because narratives are compelling, memorable, and easily understood. But people tend to believe convincing, retrospective stories about why something happened even when there is no conclusive evidence of the event's true causes.

Mothers Against Drunk Driving (MADD) emphasizes its educational mission, and especially its spread of the story of drunk driving. MADD mobilized the image of the drunk driver who kills the innocent victim. More than 82 percent of drunk-driving fatalities are either the driver himself (66 percent) or a fellow occupant (16 percent). The MADD protagonists are almost always innocent bystanders; sometimes a passenger occupant, but never the driver himself.

In most cases, neither drunk driving nor driving while talking on a cell phone lead to accidents. In part, that is because most driving is predictable and lawful, and even if you aren't driving perfectly, the other

drivers are trying not to hit you. The situations in which such impairments are catastrophic, though, are those that require an emergency reaction to an unexpected event. A slight delay in braking might make the difference between stopping short of the boy in the street and running him over.

Researchers have looked at how such distractions affect perception and awareness. About 30 percent of the participants missed the unexpected object when they were just doing a tracking task. However, participants who performed the task while talking on a phone missed the unexpected object 90 percent of the time! Simply having a conversation on a phone tripled the chances that they would fail to see something unexpected. This sobering finding shows that cell phone conversations dramatically impair visual perception and awareness. These impairments are due to the limits of attention and not due to the nature of the phone; even though both tasks seem effortless, both demand our attention. Intriguingly, the cell phone conversation didn't impair the subjects' ability to do the tracking task—it just decreased their chances of noticing something unexpected. This finding may explain why people falsely think that cell phones have no effect on their driving: People are lulled into thinking that they drive just fine because they can still perform the primary task (staying on the road) properly. The problem is that they're much less likely to notice rare, unexpected, potentially catastrophic events, and our daily experience gives us little feedback about such events.

Expertise helps you notice unexpected events, but only when the event happens in the context of your expertise. Put experts in a situation where they have no special skill, and they are ordinary novices, taxing their attention just to keep up with the primary task. And no matter what the situation, experts are not immune to the illusory belief that people notice far more than they do.

To reduce the effects of inattention blindness, one can deliberately reexamine things with an eye toward the unexpected. The unexpected should become the target of focused attention. Devoting attention to the unexpected is not a cure-all, however. We have limited attention resources, and devoting some attention to unexpected events means that we have less attention available for our primary task. It would be imprudent to ask radiologists to take time and resources away from detecting the expected problem in an x-ray ('Doctor, can you confirm that this patient has a pulmonary embolism so that we can begin treatment?') to focus instead on things that are unlikely to be there ('Doctor, can you tell us whether we left anything behind in this patient's body?'). A more effective strategy would be for a second radiologist, unfamiliar with the case and the tentative diagnosis, to examine the images and to look for secondary problems that

might not have been noticed the first time through.

It is hard to look for multiple things at once, to distinguish similar-looking objects, and to remain vigilant over long periods of time performing the same task. Our underappreciation of these constraints can have dire consequences for our safety and security. We expect airport baggage scanners to spot weapons in luggage, but they regularly fail to notice contraband items planted by authorities during tests of security procedures. The task of security scanners is much like the task of radiologists—though the training is, shall we say, much less extensive—and it is difficult if not impossible to see everything in a briefly viewed image. That’s especially true given that the things being searched for are rare.

In a 2009 national survey of fifteen-hundred people, researchers included several questions designed to probe how people think memory works. Nearly half (47%) of the respondents believed that “once you have experienced an event and formed a memory of it, that memory doesn’t change.” An even greater percentage (63%) believed that “human memory works like a video camera, accurately recording the events we see and hear so that we can review and inspect them later.” People who agreed with both statements apparently think that memories of all our experiences are stored permanently in our brains in an immutable form, even if we can’t access them. It is impossible to disprove this belief—the memories could in principle be stored somewhere—but most experts on human memory find it implausible that the brain would devote energy and space to storing every detail of our lives—especially if that information could never be accessed.

It was also found that 83 percent of people believe that amnesia, or sudden memory loss, results in the inability to recall one’s name and identity. This belief may reflect the way amnesia is usually portrayed in movies, television, and literature. For example, when we meet Matt Damon’s character in the movie *The Bourne Identity*, we learn that he has no memory of who he is, why he has the skills he does, or where he is from. He spends much of the movie trying to answer these questions. But the inability to remember your name and identity is exceedingly rare in reality. Amnesia most often results from a brain injury that leaves the victim unable to form new memories, but with most memories of the past intact. Some movies, such as *Memento*, do accurately portray this more common syndrome, known as “anterograde” amnesia.

When we perceive something, we extract the meaning from what we see (or hear, or smell) rather than encode everything in perfect detail. It would be an uncharacteristic waste of energy and other resources for evolution to have designed a brain that took in every possible stimulus with equal fidelity when there is little for an organism to gain from such a strategy. Likewise,

memory doesn't store everything we perceive, but instead takes what we have seen or heard and associates it with what we already know. These associations help us to discern what is important and to recall details about what we've seen. They provide "retrieval cues" that make our memories more fluent. In most cases, such cues are helpful. But these associations can also lead us astray, precisely because they lead to an inflated sense of the precision of memory. We cannot easily distinguish between what we recall verbatim and what we construct based on associations and knowledge.

What is stored in memory is not an exact replica of reality, but a re-creation of it. We cannot play back our memories like a DVD—each time we recall a memory, we integrate whatever details we do remember with our expectations for what we should remember.

It is well known that effortful imagining can blur the boundary between fantasy and reality, as evidenced by findings that imagining events that never happened increases the likelihood of having false memories of them.

In a clever study, psychologists asked subjects to view a doctored photograph showing the subject enjoying a hot air balloon ride as a child. The subjects were each interviewed several times, and were asked each time to recall the event, or if they could not recall it, to imagine that it had happened to themselves. Although none of the subjects had ever taken a hot air balloon ride, the photograph and attempts to recall it led some of them to incorporate information about the image into their personal narrative memories. Half the subjects created a false memory about the balloon ride, some embellishing their memories substantially beyond what was shown in the photograph.

The ability to change memories using doctored photographs has Orwellian ramifications. If we can induce false memories simply by editing images, it might be possible to literally revise history, changing the past by doctoring it. Using a similar approach, researchers showed subjects an edited version of the famous photograph of a single person standing in front of a column of tanks during the 1989 protests at Tienanmen Square in Beijing. In the original version of the photograph, only the lone protester was visible on the wide road. The doctored version shows crowds of people lining a narrower road on both sides of the tanks. When they were quizzed about the historical facts of Tienanmen Square only moments later, those who viewed the doctored photograph believed that far more people had been at the protest.

Beware of memories accompanied by strong emotions and vivid details—they are just as likely to be wrong as mundane memories, but you're far less likely to realize it. We treat confidence as an honest signal of a person's professional skill, accurate memory, or expert knowledge. But the confidence

that people project, whether they are diagnosing a patient, making decisions about foreign policy, handling a pandemic, or testifying in court, is all too often an illusion.

You mistake your knowledge of what happens for an understanding of why it happens, and you mistake your feeling of familiarity for genuine knowledge. Students will sometimes ask how they could have worked so hard but still failed a test. They will often say that they read and reread the textbook and their class notes, and that they thought they understood everything well by the time of the exam. And they probably did internalize some bits and pieces of the material, but the illusion of knowledge led them to confuse the familiarity they had gained from repeated exposure to the concepts in the course with an actual understanding of them. As a rule, reading text over and over again yields diminishing returns in actual knowledge, but it increases familiarity and fosters a false sense of understanding. Only by testing ourselves can we actually determine whether or not we really understand. That is one reason why teachers give tests, and why the best tests probe knowledge at a deep level. Asking whether a lock has cylinders tests whether people can memorize the parts of a lock. Asking how to pick a lock tests whether people understand why locks have cylinders and what functional role they play in the operation of the lock.

Perhaps the most striking aspect of the illusion is how rarely we bother to do anything to probe the limits of our knowledge—especially considering how easy it is to do this. Before telling someone that you know why the sky is blue, all you have to do is simulate the ‘why’ game with yourself to see whether you actually know. We fall prey to the illusion because we simply do not recognize the need to question our own knowledge.

A belief, the reasoning behind which cannot be clearly articulated, is a belief that has not been examined thoroughly enough

Chapter Eight

Fake News

“Where my uncle was an enormous fool, as many talented people are, was that he mistook his gift for intelligence. He was a great big famous film person. He looked better and talked better and had enormous charm. So he thought he was also far more intelligent than Mr. Goebbels. Goebbels was ten-thousand times smarter than my uncle. Film people, actors, are puppets. We are silly. We are silly folk.”

Media myths aren’t harmless. They can scare people, reinforce their biases and become tools of manipulation.

Here is a double dose of media-driven myth, in an article that touched on the influence network television once exerted. To back up that claim, the Sun cited two moments hallowed in broadcast journalism. One was Edward R. Murrow’s legendary See It Now program in March 1954, in which he took on the dreaded and powerful US senator Joseph R. McCarthy. The other was Walter Cronkite’s special report on CBS in February 1968, in which the respected network anchorman declared that US forces in Vietnam were mired in a stalemate. Murrow’s program supposedly led to the downfall of McCarthy and put an end to the senator’s communists-in-government witch hunt. Cronkite’s assessment supposedly forced President Lyndon Johnson to recognize that the American war effort in Vietnam was doomed. “If I’ve lost Cronkite,” the president purportedly said, “I’ve lost Middle America.”

Both anecdotes are well known and even cherished in American journalism. They almost always are invoked in the way the Sun presented them, as telling examples of media power, of journalists at their courageous best. Memorable though they may be, both anecdotes are misleading: neither the Murrow program nor the Cronkite special produced the outcomes so frequently associated with them. Both anecdotes are media-driven myths—dubious, fanciful, and apocryphal stories about or by the news media that are often retold and widely believed. Media-driven myths are tales of doubtful authenticity, false or improbable claims masquerading as factual. In a

way, they are the junk food of journalism—alluring and delicious, perhaps, but not especially wholesome or nourishing.

Media-driven myths are neither trivial nor innocuous. They can and do have adverse consequences. Notably, they tend to distort understanding of the role and function of journalism in American society, conferring on the news media far more power and influence than they necessarily wield. Media myths often emerge from an eagerness to find influence and lasting significance in what journalists do, and they tend to give credit where credit is not entirely due. The heroic-journalist myth of Watergate is a telling example.

The myth holds that the reporting of Bob Woodward and Carl Bernstein in the *Washington Post* brought down Richard Nixon. In reality, the *Post* and other news organizations were marginal factors in unraveling the Watergate scandal. Nixon's fall was the consequence of his criminal conduct, which was exposed in the convergence of many forces, newspaper reporting being among the least decisive. So media myths can be self-flattering, offering heroes like Woodward and Bernstein to a profession more accustomed to criticism than applause.

Media myths also tend to minimize or negate complexity in historical events and present simplistic and misleading interpretations instead. Edward Murrow no more took down Joseph McCarthy than Walter Cronkite swayed a president's views about the war in Vietnam. Yet those and other media myths endure, in part, because they are reductive: they offer unambiguous, easily remembered explanations of complex historic events. Similarly, media myths invite indulgence in the "golden age fallacy," the flawed but enticing belief that there really was a time when journalism and its practitioners were respected and inspiring—the time, say, of Murrow or Cronkite or Woodward and Bernstein. Confronting media myths discourages the tendency to regard prominent journalists in extreme terms—as heroes or villains. Piercing the myths surrounding Murrow and Cronkite render them less Olympian and less remote.

Another hazard of media myths lies in their capacity to feed stereotypes. The misleading if euphonic epithet, bra burning, emerged from a demonstration on the Atlantic City boardwalk in 1968 to become a shorthand way of denigrating the emergent feminist movement and dismissing it as trivial and even a bit odd. The widely misreported pandemic of "crack babies" in the late 1980s and early 1990s seemed to confirm the worst pathologies associated with inner-city poor people. The highly exaggerated news reports of nightmarish violence and wanton criminality in New Orleans following Hurricane Katrina's landfall in 2005 defamed a battered city and impugned its residents at a time of their deep despair.

Revisiting the myth of the crack baby allows insights into a tendency among journalists to neglect or disregard the tentativeness that characterizes serious scientific and biomedical research, and to reach for certainty and definitiveness that are not often found in preliminary findings. The tendency of journalists to push hard on tentative data has been apparent in coverage of more recent drug scares, notably that of methamphetamine in 2004 and 2005. Parallels in exaggerated coverage of “crack babies” and “meth babies” were striking. “Meth addicts are pouring into prisons and recovery centers at an ever-increasing rate, and a new generation of ‘meth babies’ is choking the foster-care system in many states,” *Newsweek* magazine reported in 2005. The methamphetamine scourge seemed to know no bounds. “Anytown, USA, can be turned into a meth den almost overnight,” *Newsweek* declared.

“Proving that the press corps has no memory, they’re at it again, proclaiming without any scientific evidence that a generation of damaged ‘meth babies’ is on the way.”

Beyond methodological complications was an apparent bias, at least in some quarters, against studies that reported few or no adverse effects from prenatal cocaine exposure. A team of researchers reported in 1989 that research indicating adverse effects was significantly more likely to be accepted for presentation at the Society of Pediatric Research than were studies showing few or no effects.

“This bias may lead to distorted estimation of the potential of cocaine to cause birth defects, and thus cause women to terminate their pregnancy unjustifiably.”

The rejected research showing few or no adverse effects tended to be better grounded methodologically. This strengthens the suggestion that most negative studies were not rejected because of scientific flaws, but rather because of bias against their non-adverse message. The subconscious message may be that if a study did not detect an adverse effect of cocaine when the common knowledge is this is a “bad drug,” then the study must be flawed.

Such is the enduring power of the propaganda that today most folks would have great difficulty in accepting the following. This is a short summary of historical realities leading up to World War I that are at complete odds with the official narrative, the political discourse, and the school textbooks:

- It was Great Britain (supported by France and Russia) and not Germany who was the principal aggressor in the events and actions that led to the outbreak of war.

- The British had for twenty years prior to 1914 viewed Germany as its most dangerous economic and imperial rival, and fully anticipated that a war was inevitable.
- In the UK and the US, various factions worked feverishly to ensure the war went on for as long as possible, and scuttled peacemaking efforts from the off.
- Key truths about this most consequential of geopolitical conflicts have been concealed for well over one-hundred years, with no sign the official record will change.
- Very powerful forces—including a future US president—amongst US political, media, and economic elites conspired to eventually convince an otherwise unwilling populace in America that US entry into the war was necessary.
- Those same forces and many similar groups in the UK and Europe engaged in everything from war profiteering, destruction/forging of war records, false-flag ops, treason, conspiracy to wage aggressive war, and direct efforts to prolong the war by any means necessary, many of which will rock folks to their very core.

“I have yet to see a piece of writing, political or non-political, that does not have a slant. All writing slants the way a writer leans, and no man is born perpendicular.”

—E.B. White

Observers of the twenty-first century news business often bemoan the slippage between reporting and opinion. Many cable shows and online outlets now operate from an explicitly ideological perspective rather than promising objectivity the way newspapers often do. Erasure of the lines between fact and opinion, however, actually brings journalism back to where it was more than a century ago.

For much of the nineteenth century, many publications were written in first-person. Writers expressed opinions, used flowery language, and attempted to instill good morals in their audiences. But by the 1880s, Americans were becoming increasingly interested in scientific theories, realism, and documented facts.

This taste for science and factual information made its way into the newspapers of the day. In a trade journal for literary and journalistic professionals, one contributor argued that news writing demanded “the

complete elimination of the writer's individuality" and called for reporters "to be the unmoved observer of events, to see things exactly as they are without regard to possible motives which may have produced them." With this new commitment to empiricism came a new aesthetic.

"The most successful journalists are those able to give the facts, the whole facts, and nothing but the facts, in brief, pithy sentences, the majority of which contain not more than a dozen words."

This was also the heyday of yellow journalism, when many newspapers employed stunts and even fakery to push an agenda or just to sell papers. But even papers that embraced sensationalism generally prided themselves on factual reporting. At the New York World, cards hanging on the walls of the city newsroom read:

"Accuracy! Accuracy! Accuracy! Who? What? Where?
When? How? The Facts—The Color—The Facts!"

The increasing focus on facts led to a widespread belief that editorial pages were on their way out. One writer declared that increasingly educated readers were "just as competent to form an opinion upon the news" as "some man or woman sitting in an editorial chair." If the authoritative, opinionated editor was falling out of favor, the new focus on fact-based reports brought increased respect for the reporter, generally represented as a masculine adventurer ready to brave a fire or a riot to bring back the story.

Not everyone appreciated the focus on facts. In 1891 an old-guard journalist and historian complained about journalism's shift from discussing "the questions and answers of contemporary life" to merely "collecting, condensing, and assimilating the trivialities of the entire human existence." He had a point: random collections of facts are of no particular value. Inevitably, reporters and editors must choose which facts to present, and how to present them. And analysis from a particular point of view may help news consumers understand what to make of the facts they're handed. Ultimately all journalism involves some kind of mix of fact and opinion.

The state has always been very selective with the information that people receive, in order to persuade them to accept lives of suffering servitude to rich and powerful elites. Throughout most of recorded history this was mostly achieved with the mutually beneficial cooperation of the church, whose network of priests provided a direct conduit of controllable information to the ignorant masses. Once the printing press was invented, and more and more people learnt how to read for themselves, additional systems had to

be found for ensuring they received the “right information”—information rulers wanted them to receive. These systems evolved into what are today widely referred to as the “mainstream media.”

The twentieth century saw the mismanagement of public information undergo seismic changes. From the unbelievably crass propaganda that deceived people into supporting the abomination known as the First World War at the start of the century, to the highly sophisticated telling of half-truths and outright lies at the close of the century that deceived people into supporting the illegal and cynical wars of the United States as well as ignoring the catastrophic environmental destruction of the planet that started the sixth mass extinction of species—state manipulation of public information, controlled by the mainstream media, plumbed new depths of depravity.

“We are governed, our minds molded, our tastes formed, our ideas suggested, largely by men we have never heard of. This is a logical result of the way in which our democratic society is organized. Vast numbers of human beings must cooperate in this manner if they are to live together as a smoothly functioning society.

The receptivity of the great masses is very limited, their intelligence is small, but their power of forgetting is enormous. In consequence of these facts, all effective propaganda must be limited to a very few points and must harp on these in slogans until the last member of the public understands what you want him to understand by your slogan. As soon as you sacrifice this slogan and try to be many-sided, the effect will piddle away, for the crowd can neither digest nor retain the material offered.”

If you blame Facebook, Trump, or Putin for ushering in a new and frightening era of post-truth, remind yourself that centuries ago millions of Christians locked themselves inside a self-reinforcing mythological bubble, never daring to question the factual veracity of the Bible, while millions of Muslims put their unquestioning faith in the Quran. For millennia, much of what passed for news and facts in human social networks were stories about miracles, angels, demons, and witches, with bold reporters giving live coverage straight from the deepest pits of the underworld. We have zero scientific evidence that Eve was tempted by the Serpent, that the souls of all infidels burn in hell after they die, or that the creator of the universe doesn’t like it when a Brahmin marries an Untouchable—yet billions of people have

believed in these stories for thousands of years. Some fake news lasts for ever.

I am aware that many people might be upset by my equating religion with fake news, but that's exactly the point. When a thousand people believe some made-up story for one month—that's fake news. When a billion people believe it for a thousand years—that's a religion, and we are admonished not to call it 'fake news' in order not to hurt the feelings of the faithful (or incur their wrath). Note, however, that I am not denying the effectiveness or potential benevolence of religion. Just the opposite. For better or worse, fiction is among the most effective tools in humanity's toolkit. By bringing people together, religious creeds make large-scale human cooperation possible. They inspire people to build hospitals, schools, and bridges in addition to armies and prisons. Adam and Eve never existed, but Chartres Cathedral is still beautiful. Much of the Bible may be fictional, but it can still bring joy to billions and can still encourage humans to be compassionate, courageous, and creative—just like other great works of fiction, such as *Don Quixote*, *War and Peace*, and *Harry Potter*.

You cannot organize masses of people effectively without relying on some mythology. If you stick to unalloyed reality, few people will follow you.

In the vast majority of cases people begin to sanctify the Bible or the Vedas or the Book of Mormon only after long and repeated exposure to other people who view it as sacred. We learn to respect holy books in exactly the same way we learn to respect currency bills. Hence in practice there is no strict division between 'knowing that something is just a human convention' and 'believing that something is inherently valuable.' In many cases, people are ambiguous or forgetful about this division. To give another example, if you sit down and have a deep philosophical discussion about it, almost everybody would agree that corporations are fictional stories created by human beings. Microsoft isn't the buildings it owns, the people it employs or the shareholders it serves—rather, it is an intricate legal fiction woven by lawmakers and lawyers. Yet for 99 percent of the time, we aren't engaged in deep philosophical discussions, and we treat corporations as if they were real entities in the world, just like tigers or humans.

Humans have this remarkable ability to know and not to know at the same time. Or more correctly, they can know something when they really think about it, but most of the time they don't think about it, so they don't know it. If you really focus, you realize that money is fiction. But usually you don't focus. If you are asked about it, you know that football is a human invention. But in the heat of the match, nobody asks you about it. If you devote the time and energy, you can discover that nations are elaborate yarns. But in the midst of a war you don't have the time and energy. If you

demand the ultimate truth, you realize that the story of Adam and Eve is a myth. But how often do you demand the ultimate truth?

Truth and power can travel together only so far. Sooner or later they go their separate ways. If you want power, at some point you will have to spread fictions. If you want to know the truth about the world, at some point you will have to renounce power. You will have to admit things—for example about the sources of your own power—that will anger allies, dishearten followers or undermine social harmony. Scholars throughout history faced this dilemma: do they serve power or truth? Should they aim to unite people by making sure everyone believes in the same story, or should they let people know the truth even at the price of disunity? The most powerful scholarly establishments—whether of Christian priests, Confucian mandarins or communist ideologues—placed unity above truth. That’s why they were so powerful.

The twentieth century has been characterized by three developments of great political importance:

1. The growth of democracy
2. The growth of corporate power
3. The growth of corporate propaganda as a means of protecting corporate power against democracy

All of the tactics used by the oil, beverage, and banking industries to influence lawmakers at every level of government were pulled straight from the cigarette makers’ playbook: Distract people from the real problem; generate fear; split communities with rhetoric, pitting one group against another; encourage people to doubt scientific conclusions; question whether there really is a problem; and say one thing in public while working secretly to do the opposite. This, regrettably, has become common practice in the corporate world. If there is one message—and one that is actually true—it is this: Always look behind any public argument to see how your emotions are being manipulated. And count on it. They are.

Here are actions that you, as an embattled CEO (or your trade association), must take:

1. Hire a big and well-connected PR firm, preferably one that has established a reputation not so much for public relations as for public deception. The firm should pay little or no attention to the Public Relations Society of America’s Code of Ethics, which, among other things, insists that PR practitioners disclose who they are working for

and refrain from engaging in deceit. Fortunately, many of the biggest firms pay little heed to such ethical guidelines. They are more than happy to take your money to...

2. Set up and operate a coalition or front group, which, if at all possible, should have words like 'American' or 'freedom' or 'choice' in its name. You can launder your money through your PR firm so that no one has to know you have any association with the front group. The PR firm will also...
3. Recruit third parties to list as members of your front group. Depending on the scope of your problems and the issues you are battling, the members can range from mom-and-pop bodega owners and motel operators to the US Chamber of Commerce and the National Federation of Independent Business, both of which, by the way, have long track records of lending their names to stealth campaigns. Your PR firm will also maximize the effectiveness of your third parties by helping them...
4. Write letters to the editor and op-eds and place them in local and national publications. In fact, the PR firm will do all the writing and placing. The third parties won't have to do a thing except lend their names. The letters and op-eds will convey all the key messages that you yourself would convey but cannot because doing so would be perceived, correctly, as self-serving. To be sure those letters and op-eds get published in the right places, your PR firm must...
5. Cultivate close relationships with editors and publishers. Chances are, your firm will have PR pros on staff who once worked at the publications and other news outlets important to you and your industry. Because of their relationships with key reporters, those PR people will also be able to...
6. Influence the tone and content of articles that those reporters write about your company and your industry. This is especially important if you are in the midst of a well-publicized crisis. To bolster your point of view and give reporters an all-important angle, your PR firm might need to...
7. Conduct a bogus survey or slice and dice data with the intent of misleading, or "lying with statistics." And your firm's PR pros will also know how to...

8. Feed talking points to TV pundits and frequent contributors to op-ed pages. They will know how to get talk show hosts with big audiences like Rush Limbaugh or Tucker Carlson or Rachel Maddow to say things on the air to support your point of view and discredit your opponents. Lastly, using varying tactics that will depend on the nature of your problem, your PR firm will. . .
9. Develop and carry out a duplicitous communications campaign. Whenever you need to comment publicly, your firm will help you make sure that what you say is perceived to be positive, that you are seen as being responsible and cooperative, and that the public and lawmakers feel that they can count on you to do the right thing and be honest and straightforward. This is the charm offensive. To distract from the fact that your product is widely considered to be a problem, your PR firm will develop a creative campaign to position your company or industry as part of the solution. It will also broaden the issue to take attention off your maligned product, and it will stress how many people your company employs and how much it contributes to the local or national economy. Behind the scenes, your firm will be using the front groups and their devious tactics to do the necessary dirty work for you.

The best public relations is invisible. While it's easy to spot advertising—the stuff that blatantly urges you to go buy something—PR subtly convinces you to change the way you think. Advertising urges you to do something now; PR is patient. Advertisers pay for the time and space devoted to their messages. Good PR usually gets free media space because it is presented as unbiased information.

We may be headed for a world in which there is as yawning a disparity in accurate knowledge as there is in wealth. The elite will be deeply informed, and there will be a huge difference between what they know and what most other Americans know. We could be heading for a well-informed class at the top and a broad populace awash in opinion, spin, and propaganda.

How does mass media end up producing news from the perspective of the flawed ideology of powerful interest groups? Government restrictions on the media and private industry and oligarchic control of the media interact together to present selectively controlled information. Each node in the transfer of information from world to audience via the media must be cleared through a kind of checkpoint: federal government acceptance, local government acceptance, corporate ownership acceptance, corporate sponsor acceptance—the last is to assure corporate profits. Given the

interdependence of the nodes, these pressures tend to lend themselves to coalescing around a rough pattern of uniform interests (just think of the role of advertising in every show one watches on television). The interdependence also allows the whole media system to be rapidly deployed in the service of propaganda in times of supposed emergency.

The facts make it beyond reasonable doubt that even in liberal democracies political leaders and private industry conspire in some, perhaps occasionally unconscious, way with the media to deceive the public into acting on false beliefs. The mechanisms are furthermore not mysterious. The case of the Iraq war in 2003 in the United States is an example in which political and economic elites exploited a free press to convince a large majority of American citizens of beliefs that lacked so much real world evidential support that those very elites later repudiated being associated with them. It is plausible to suppose that the multi-trillion dollar cost of the Iraq War, not to mention the lives lost on both sides, was not in the interest of the nearly 70 percent of Americans convinced by the flawed ideology of patriotism and demonization used to motivate it.

We thus have provided evidence that the highly privileged group will in fact be able to exploit the mechanisms of the media and public schools to produce beliefs that are contrary to the interests of the majority of people who are served by them.

The media conglomerates are not the only industry whose owners have become monopolistic in the American economy. But media products are unique in one vital respect. They do not manufacture nuts and bolts: they manufacture a social and political world.

We need a media that covers grassroots movements, that seeks to understand and explain the complex forces that shape our society, a media that empowers people with information to make sound decisions on the most vital issues of the day: war and peace, life and death. Instead, the media system in the United States, increasingly concentrated in the hands of fewer and fewer multinational corporations, spews a relentless stream of base “reality” shows (which depict anything but reality), hollow excuses for local news that highlight car accidents and convenience store robberies while loaded with ads, and the obsessive coverage of traffic, sports, and extreme weather (never linked to another two words: climate change). Perhaps most harmful of all, we get the same small circle of pundits who know so little about so much, explaining the world to us and getting it so wrong.

Never has there been so much information about so much of our lives in such an accessible form. In the course of a day, the average person in a Western city is exposed to as much data as someone in the fifteenth century would encounter in their entire life.

One way in which the news media complicate economic debates is by using large numbers without providing context. This issue comes up in most policy areas but likely has the greatest relevance in budget debates. The United States is a huge country with more than 320 million people, and as a result its government has a huge budget, at least in terms of the amount of money that ordinary people see in their daily lives. This means that when we hear that the federal government is spending, say, \$17 billion a year on Temporary Assistance for Needy Families (TANF), the core government welfare program, we are likely to think it's a great deal of money. After all, none of us will see \$17 billion in our lifetime or anything remotely close to this sum.

The media's pattern of reporting is likely a major factor behind this misunderstanding, and it could be easily countered if reporters made it a standard practice to put huge numbers in a context that is understandable to their audience. The most obvious way would be to report the number as a share of the budget. In the case of TANF, if people continually heard it reported as 0.4 percent of the federal budget it is unlikely they would believe the program was a major factor.

Will the fake news crisis be the cause of democracy's collapse? Or is it just a consequence of a deeper, structural malaise that has been under way for much longer? While it's hard to deny that there's a crisis, whether it's a crisis of fake news or of something else entirely is a question that every mature democracy should be asking.

Our elites are having none of it. Their fake news narrative is itself fake: it's a shallow explanation of a complex, systemic problem, the very existence of which they still refuse to acknowledge. The ease with which mainstream institutions, from ruling parties to think tanks to the media, have converged upon "fake news" as their preferred lens on the unfolding crisis says a lot about the impermeability of their world view.

The big threat facing Western societies today is not so much the emergence of illiberal democracy abroad as the persistence of immature democracy at home. This immaturity, exhibited almost daily by the elites, manifests itself in two types of denial: the denial of the economic origins of most of today's problems; and the denial of the profound corruption of professional expertise.

The first type manifests itself whenever phenomena like Brexit or Donald Trump's electoral success are ascribed primarily to cultural factors such as racism or voter ignorance. The second type denies that the immense frustration many people feel towards existing institutions stems not from their not knowing the whole truth about how they operate but, rather, from knowing it all too well.

Blinded by these two denials, policymakers prescribe more of what alienates voters in the first place: more expertise, more centralization, more regulation. But, since they can't think in terms of political economy, they inevitably end up regulating the wrong things.

The moral panic around fake news illustrates how these two denials condemn democracy to perpetual immaturity. The refusal to acknowledge that the crisis of fake news has economic origins makes the Kremlin—rather than the unsustainable business model of digital capitalism—everyone's favourite scapegoat.

The second type of denial turns a blind eye to the corruption of today's expert-based knowledge. When think tanks gladly accept funds from foreign governments; when energy firms fund dubious research on climate change; when even the Queen—what a populist, she—questions the entire economics profession; when the media regularly take marching orders from PR agencies and political spin doctors; when financial regulators and European commissioners leave their jobs to work on Wall Street—could anyone really blame the citizens for being skeptical of experts?

The death of political engagement has been caused by parties who do not respond to the real needs and policy positions of the populace, and who subvert the system to silence voices other than their own. It is not that people do not desire to be engaged—their efforts at engagement are being deliberately thwarted. The obvious option left for them was to withdraw their support from those who have done nothing to deserve it.

To hear professional journalists complain about this problem without acknowledging their own culpability further undermines one's faith in expertise. Democracy may or may not be drowning in fake news, but it's definitely drowning in elite hypocrisy.

Caught between the two denials, the elites will never stop searching for innovative solutions to the problem of fake news—much as they never stopped searching for innovative solutions to climate change. The two issues do have a certain similarity: just as climate change is the natural byproduct of fossil capitalism, so is fake news the byproduct of digital capitalism.

Media elites, by virtue of their position, adore the status quo. It rewards them, vests them with prestige and position; welcomes them into exclusive circles; allows them to be close to—if not themselves wielding—great power while traveling their country and the world; provides them with a platform; fills them with esteem and purpose. The same is true of academic elites, and financial elites, and political elites. Elites love the status quo that has given them, and then protected, their elite position.

I am not suggesting that there is some Wall Street censorship committee secretly sequestered somewhere that tells the MSM what to cover and what

not to mention, but rather that the people who rise to positions of authority in the media—just as in politics—already know the accepted parameters of discourse or they would not have gotten to where they are.

Journalism tends toward the autobiographical unless reporters and editors make a determined effort to separate themselves from the frame of their own experiences.

The media compose the pictures of a preferred reality, and their genius is that of the nervous careerist who serves, simultaneously, two masters—the demos, whom they astound with marvels and fairy tales, and the corporate nobility, whose interests they assiduously promote and defend. Anybody who rises to prominence in their ranks—as editor, political columnist, publisher, anchorperson, theater critic—learns to think along the accommodating lines of an English butler bringing buttered scones to the Prince of Wales.

The vast distance between perceived reality and the official version of reality is characteristic of totalitarian systems. The state abolishes liberty and rights while claiming to uphold and defend them.

Today too many journalists, driven by careerism, identify with the powerful people they cover, rather than with the interests of their readers. The bigger the stake the journalist has or aspires to have in the corporate system the more she or he will defend it. Self-interest, not public interest, becomes the motivating factor. A careerist does not rock the boat. A journalist who doesn't rock the boat has no business being a journalist.

Click—now we are at CNN, where the bloviators are delving into the question of whether we should attack Iran over its downing of one of the United States' flying death robots. The matter at hand—the only matter for the folks at CNN—is one of expedience, the utilitarian value of a military response, the “cost” to the United States in treasure and manpower, the “value” of the diplomatic and political “gain” of such an attack. We are talking about war here; we are talking about murder, though nothing of that is said. We are talking about killing children, and I pause on that thought a moment—torn to bits, their heads torn off, their limbs scattered, their intestines unspooled.

And with that image, the noise of the liars on CNN fades away, and I think to myself: ‘These people aren't journalists. They are the hideous abomination of journalism.’ But many of you readers know this, of course, and know too the real function of journalists in a robust democracy: they are the hemorrhoids on people and institutions that hold power. They afflict them. They climb up in their assholes, inflamed, growing ever more painful by the day, until, ideally, they explode and cause a deranged blood-poisoning that destroys the person or institution they have settled on hemorrhoiding.

There you have it, the whole purpose of journalism. They are not here

to provide solutions, policies, compromises, collaborations; they are not here to assuage or comfort or find workable ways forward, or to explain away the evils that men do—murder and more murder, of little children, in the name of, you know, “national security.”

No, at their best, the journalist is a saboteur; they place demolitions under corrupt structures and blow them up and walk away, with middle finger raised and laughter in their mouths.

The role of journalism is afflicting the comfortable and comforting the afflicted.

“It’s odd. As a journalist, I’d regularly talk to people after tragedies in their lives; after the worst moments, after deaths and killings, I would try to ask as politely as possible, ‘How do you feel?’ I wondered sometimes how and why they would talk to me. I understand now. Getting people to pay attention makes you feel less helpless.”

In the 1930s, the term ‘muckraker’ wasn’t necessarily pejorative. It was used first in 1906 by President Theodore Roosevelt to describe the new breed of reporter that had risen with the expansion of newspapers at the end of the nineteenth century, the breed that performed valuable work in exposing and attacking abuses of power by unregulated corporations and corrupt politicians. Roosevelt did, however, have certain reservations about the role:

“The men with the muck-rakes are often indispensable to the well-being of society; but only if they know when to stop raking the muck, and to look upward to the celestial crown above them, to the crown of worthy endeavor. There are beautiful things above and round about them; and if they gradually grow to feel that the whole world is nothing but muck, their power of usefulness is gone.”

Sometimes reporting is finding out what you don’t know, sometimes it’s hearing something said that everyone knows, but that no one has had the guts to say, because they aren’t supposed to say it.

Journalism, by definition, is publishing something that somebody doesn’t want to be published. Everything else is just PR. It is not enough for journalists to see themselves as mere messengers without understanding the hidden agendas of the message and myths that surround it.

Rule number one of Astroturfing: Redirect criticism from ideas to individuals.

There are three arguments most likely to sustain popular apathy toward any issue or problem:

1. Denying that the issue exists.
2. Insisting that it's a good thing rather than a bad thing.
3. Conceding that it's a problem but claiming that it can't possibly be solved.

A democracy requires an informed electorate. The media fought tooth and nail to keep the US electorate uninformed.

“Conventional wisdom is what you say over and over again to people who don't pay attention.”

Poorly educated white voters are essentially fooled into voting against their own economic interests in favor of partisan ideologies that reward the wealthy, usually by means of straw man arguments about ethnic and religious minorities.

This is vexing for observers, and one might expect it to vex the movement's true believers even more. Their grandstanding leaders never deliver, their fury mounts and mounts, and nevertheless they turn out every two years to return their right-wing heroes to office for a second, a third, a twentieth try. The trick never ages; the illusion never wears off. Vote to stop abortion; receive a rollback in capital gains taxes. Vote to make our country strong again; receive deindustrialization. Vote to screw those politically correct college professors; receive electricity deregulation. Vote to get government off our backs; receive conglomeration and monopoly everywhere from media to meatpacking. Vote to stand tall against terrorists; receive Social Security privatization. Vote to strike a blow against elitism; receive a social order in which wealth is more concentrated than ever before in our lifetimes, in which workers have been stripped of power and CEOs are rewarded in a manner beyond imagining.

Others have for decades been conned into thinking they were loathsome minorities whose best path to influence is to make peace with the mightier “center,” which inevitably turns out to support military interventionism, fewer taxes for the rich, corporate deregulation, and a ban on unrealistic “giveaway” proposals like free higher education. Those are the realistic, moderate, popular ideas, we're told.

But it's a Wizard of Oz trick, just like American politics in general. There is no numerically massive center behind the curtain. What there

is instead is a tiny island of wealthy donors, surrounded by a protective ring of for-sale major-party politicians—read: employees—whose job it is to castigate too-demanding voters and preach realism.

Those politicians do so with the aid of dependably alarmist sycophants in the commercial media, most of whom, whether they know it or not, technically inhabit the low end of the one percent and tend to be amazed that people out there are pissed off about stuff.

In the States, the centrist Oz has maintained its influence in large part thanks to another numerical deception. We've been taught that our political spectrum is an unbroken line moving from right to left, Republican to Democrat, and that the country is split in half between the two groups.

The nominal battle between Democrats and Republicans is simply the public, overt, electoral expression of struggles among the ruling elite for maintenance of society. It isn't that there is a monolithic power structure, rather what we have here is one that seeks to hide its existence or diminish its observable impact. The godfather of modern ~~propaganda~~ public relations, Edward Bernays, referred to this as the "invisible government" which rules by promoting only ranges of apparent options for soap, cars, or politicians. Today, the more popular nomenclature is "Deep State" or the permanent apparatuses of power comprised primarily by the intelligence agencies, military, and economic elite. This is, again, not to say there are no differences among these elite or their electoral political avatars—Democrats and Republicans. It is, however, that those differences are magnified so as to appear as the obvious limits of what is possible. Absence of difference is easily recognized and challenged. Appearance of difference or limitations set on differences are more easily distilled via highly weaponized forms of media, messaging and symbol and are, therefore, harder to identify and combat.

The concept of a deep state in America is not some kind of wacko conspiracy theory. It doesn't refer to some cloaked cabal of Jewish elites who meet in the forest to sacrifice children and greet each other with esoteric handshakes as in the straw man that so many corporate media outlets are fond of attacking, but refers rather to the self-evident fact that unelected power structures exist in America, and power structures tend to form alliances. The donor class, Wall Street, Silicon Valley, big oil, the military-industrial complex, various aspects of the intelligence community, the corporate media, national security officials; all of these overlapping and interconnected groups undeniably exist, undeniably wield immense power, and are undeniably not elected by the American people. There is no factual basis on which to deny any of these things; the only thing that can rationally be debated is how they behave. The term 'deep state' exists for use in that dialogue.

I believe that the corporate-owned news media in the US, and the cable news punditocracy in particular, does us all a grave disservice in how they cover presidential candidates from the moment they announce their candidacies through to the general election. Moreover, I believe that they exert an undue influence on our elections, essentially stacking the deck in favor of some candidates and to the detriment of others. In essence, I believe that they are undermining our democratic process and that reforms are needed to end this corrosive influence if we want to actually have free elections.

In schools and campuses across the country, tens of thousands of students are in the midst of media and news literacy courses. Employing online tools with names like Checkology, Allsides, and The Trust Project, following online courses like “Making Sense of the News,” or like scores of classrooms across the nation and around the world, using materials from Stonybrook University’s Center for News Literacy, students are busy learning how to verify sources, detect falsified photos, trace Twitter hoaxes and determine the difference between ‘news’ and ‘fake news.’

Some argue that while often inappropriately named, “fake news” is real. And while hoaxes with severe consequences—often perpetuated by the very outlets now complaining the term is applied to them—such as yellow journalism and propaganda have been around for centuries, starting a few years ago, fake news has suddenly become pernicious and dangerous.

The academy—and the funders—have stepped up with analyses, books, centers, tools, and many millions of dollars. Fighting fake news is not only urgent, it’s also a big business. But are students being taught to think critically? And what kind of news consumers are produced by these courses and tools?

Let’s look at just two of the many news-focused media literacy tools.

Checkology, from the News Literacy Project (NLP), offers middle and high school teachers online exercises and lessons. The project also has a quiz page, “Get Smart About News,” and a weekly newsletter, “The Sift,” with “teachable moments,” analyses and potential classroom exercises.

Funded by grants from corporate publishers, foundations, an audio technology company, and the John S. and James L. Knight Foundation, the NLP raised almost \$1.5 million in 2017 and \$2.8 million the year before.

The Checkology course offers four of its “lessons” for free; for a fee, there are another six, with exercises and other resources.

Corporate media journalists from NBC, the Washington Post and Noticias Univision introduce the first three lessons. They emphasize the importance of “verification,” “multiple sources,” “context,” and “fairness.” In the third lesson, the student is a reporter “on the scene” of an accident, and

has to gather facts, verify details and report. In another lesson, students learn about investigative journalism and the importance of “questioning authority.” All of that is great.

But the lessons also reveal a very status-quo, middle-of-the-road approach to journalism and its roles in society. For example, while NBC’s Tracie Potts tells students to beware of information that might be designed to deceive, she also draws divisions between information meant to “inform” and two other purposes: meant to “document” and to “persuade.” She implies that one ought to be wary of stories that aim to convince a person “to adopt a particular perspective,” even when the arguments are based on facts. Given the historic importance of politically committed journalism, from Thomas Paine through Ida B. Wells to I.F. Stone, this compartmentalization does no favors to students or journalists.

A reporter covering almost any subject has to research and report and then decide where the truth lies, even if that truth is not the currently accepted truth. Even the Society of Professional Journalists calls on reporters to “seek the truth and report it.” That might include laying out new facts and arguments in a way that is meant to persuade a viewer or reader, to convince him or her of the correct version of an issue (like climate change) or an event (like the Wuhan Flu panic).

In another lesson, Univision’s Enrique Acevedo reinforces the middle-of-the-road approach, stressing the need to avoid “bias” and the importance of “presenting the facts and context in a neutral manner,” and by emphasizing “balance,” which he describes as:

“Representing multiple sides of an issue, event, or controversy without giving unfair weight to one side or point of view.”

That kind of advice might be useful and important when covering the scene of an accident, but what if—for example—a journalist is reporting on a more complex issue, like conflict in Iraq, protests over food prices in Latin America, or the opioid crisis in the US? In all three of those examples, the context chosen by the reporter will depend on ideological and political orientations, of both the reporter and the news outlet.

Will the context stick to raw data, like protest deaths or price hikes or overdoses? Or will it go further—probing, for example, the role of US imperialism and the War on Terrorism, draconian tariff policies imposed by the International Monetary Fund, or how the commodification of just about everything, neoliberal capitalism, and extreme individualism in the US might be at least partially responsible for addiction and “deaths of despair”?

“Whatever their objective truth, the facts do not speak for themselves. Someone must give them meaning and impact. We will never be ‘objective’ again, instead journalists must make clear what we stand for, and how.”

Stonybrook’s Center for News Literacy is arguably the most influential news literacy educator out there. Over 10,000 people have enrolled in—but not necessarily finished—the six-module “Making Sense of the News: News Literacy Lessons for Digital Citizens” on Coursera, according to that website. It was designed in part by the Center.

More importantly, the Center offers a full 15-module, college-level course which it says has been taken by “over 10,000 students” at Stonybrook, and has also been used or adapted by over 30 US universities. The Center also says it collaborates with universities or programs in eight other countries.

Like the Checkology course, the Stonybrook course offers a myriad of tools, guiding the student (and the teacher) through—for example—the definition and importance of facts, context, verification, “journalistic truth,” sourcing, indirect and direct evidence, and transparency. The course also takes on more complex issues like cognitive dissonance and filter bubbles. Each module comes with slides and documentation, using examples from recent, everyday social media and newsfeeds to which students can relate.

But there are also some troubling aspects to the course. For example, Lesson 6 repeatedly stresses that reporting can only be considered reliable journalism if it’s verifiable, and if the journalist and media outlet are accountable, both of which are good guidelines. But it also emphasizes that they must be “independent,” defined as “free from the control, influence, or support of interested parties.” Native advertising, for example, is not independent because it is “trying to sell or promote something,” one slide notes.

But aren’t shareholders and hedge funds and for-profit media outlets also trying to sell something? Corporate outlets can and do produce good journalism, but mega-companies like GateHouse Media—which owns over 600 papers in 39 states—and Digital First Media are both owned by hedge funds, and have both proven that profit is the bottom line. For example, GateHouse regularly earns double-digit returns for shareholders while also slashing budgets for reporters, editors, and even closing down newsrooms. A 2018 report from University of North Carolina on the “new media barons” that looked at hedge-fund- and private-equity-owned newspapers noted that the “standard operating formula” has included “aggressive cost-cutting, the adoption of advertiser-friendly policies” and “the sale or shuttering of under-performing newspapers.”

The course also emphasizes the need for sources to be, among other things, “independent” and “authoritative/informed.” What are the definitions of those terms? That depends on who uses them. Would a reporter from a mainstream outlet be likely to quote an authoritative economist who is not a cheerleader for capitalism in a story about a hike in the minimum wage? Maybe even an avowed socialist? Probably not.

Also troubling (but unsurprising) are the slides illustrating “journalism,” like one where a student sees that journalism equals outlets like NBC, the Washington Post and National Public Radio. Where are the alternative, progressive, and radical outlets doing excellent, law-changing and life-saving work? A brief list from this country might include Democracy Now!, WSWS, In These Times. These nonprofit outlets and/or their journalists have regularly won awards for journalistic excellence, uncovered truths, rigorously verify, and supply context.

Both Checkology and the Stonybrook courses also reinforce tired tropes of what is and what is not “newsworthy.” While the Checkology’s “What is News?” lesson lies behind a paywall, a News Literacy Project article explains that Chicago Sun-Times’ Paul Salzman hosts it, and that he stresses four factors:

1. Timeliness
2. Importance to “the public”
3. Whether a subject is “interesting”
4. Whether it’s “unusual enough to warrant attention”

The Stonybrook course and its online Coursera spin-off emphasize ten “universal news drivers,” including “importance,” “prominence” and “conflict,” and also “unusualness” and “relevance.”

But in both cases, the approach is quite limited. For example, who is or are “the public,” and what is “important” to it/them? Is the public the older folks (above 65) who are mostly likely to get news from TV or cable news shows, according to the Pew Research Center? Or younger people, who look at Vox and Vice on their telephones? Or immigrants of varying backgrounds who might listen to Spanish-language radio (local or international) and read a local weekly? Do a non-union waitress working three jobs and a hedge fund manager have the same news and information “interests”?

What about “conflict”? Do corporate media outlets cover protests and conflict in some poor country that doesn’t much interest the US, such as Haiti these days, the same way as they cover them in a place where

Washington is happy to spar with a semi-nemesis (China), like Hong Kong? Do the approved-of journalists and outlets dig deep to expose the roots of those conflicts, even if that might involve exposing some uncomfortable truths?

These two news literacy educational assets, and many others, offer tools that can be useful to teachers and students, but they are also dangerous. At the very moment when the digital universe offers students access to news and information from hundreds of sources in the US and worldwide, the courses present extremely middle-of-the-road approaches. They are a far cry from the media literacy concepts promoted and taught in what is arguably the birthplace of modern media literacy: Ontario, Canada, where media literacy has been required since 1987. One of the eight key concepts reads:

“Media messages have commercial implications. Media literacy aims to encourage awareness of how the media are influenced by commercial considerations, and how they impinge on content, technique, and distribution. Most media production is a business, and so must make a profit.”

But neither Checkology nor the Stonybrook courses bring up the issues of ownership, commercial implications, and profit. Not surprisingly, these days—in the US, at least—there are a whole slew of media literacy education groups that steer clear of the “commercial implications” concept. A recent study talks about the split between those who see media literacy as “a critique of capitalism” and those who do not. They also note:

“Capitalist interests have long aimed to use media to train students as well as consumers.”

Political-economy-shy orientations do students a great disservice. Even the most basic communication theory textbooks at least mention how mass media can (and often do) reinforce the political, social, and economic status quo. In the oft-used *Media & Culture: Mass Communication in a Digital Age* textbook, the authors note the exponential gap in the wages of a CEO to the average worker. One reason, they explain, has to do with the mass media and its reinforcement of status quo, “common sense” thinking and discourse:

“In convincing consumers and voters that the interests of the powerful were common sense and therefore normal and natural, companies and politicians created an atmosphere and context in which there was less challenge and criticism.”

Unfortunately however, the two main news literacy tools do not explore what basic, middle-of-the-road textbooks do. Instead, they limit their critical thinking lessons and tools to much narrower margins. And that's not surprising. As media critics have pointed out repeatedly, one of the ways to control people's thinking is by:

“Creating the illusion that there's a debate going on, but making sure that that debate stays within very narrow margins.”

Charts like one from Allsides confirm this thesis and reinforce the idea that trustworthy journalism takes place between those margins, implying that the middle of the road is the safest place to be. For example, Allsides tells visitors that a “Center” rating means “the source or writer rated does not predictably show opinions favoring either end of the political spectrum.” Is that really true for the Wall Street Journal, The Hill, and Bloomberg, all of which are rated “Center”? The chart also diametrically opposes outlets like New Yorker and The Nation (“Left”) to the “Right,” which features, for example, Fox News Opinion and Breitbart. But are the latter two outlets as consistently fact-based as New Yorker and The Nation, both of which publish award-winning journalism?

The media outlets that Allsides could call “Center,” “Lean Left” and “Lean Right” are more accurately called ‘mainstream,’ and with good reason. The publishers, editors, and journalists do not question the status quo or so-called “common sense.” Indeed, as the New York Times editorial page editor acknowledged, they are unblinkingly “in favor of capitalism,” even though it has had so many negative outcomes. Allsides nevertheless lumps together the Times' opinion section with outlets like The Nation and Jacobin as “Left,” which suggests that the political spectrum used by this media literacy project does little or nothing to help news consumers understand the ideologies of news media.

Until the many well-funded news literacy and anti-fake news websites, tools, and courses take a truly critical and open-minded approach, and teach students to really question authority all the way up the chain, including economic systems, foreign policy, accepted history, and more, they will have to be used with caution. Learning how to detect faked photos is great, but without teaching our students how to think critically about where they get their news, and about the orientations of those outlets, we are simply channeling them towards status quo journalism. While mainstream outlets can and do provide critical contributions, their investigations and outrage are mostly only poking at the edges of structural causes.

The propaganda in the mainstream news is actually quite important, because in order to try and figure out anything, you have to try and decide what's real and what isn't. And so much of it isn't real.

We've whitewashed over MLK, like we do all of our history. What does it say about a country when it's so scared about the truth

The history of the civil rights movement has been rewritten into a very tame, straightforward march of good. It didn't really happen that way, you know. A couple of things always get left out. One is the slow movement of the federal government towards dismantling segregation. As third world nations were getting independence following WWII and being attracted towards communism, US treatment of its non-white population was becoming a major international propaganda loss. Eisenhower was explicit on this problem.

A second is that there were less mellow groups in the civil rights struggle. Beside Malcolm X and Stokely Carmichael, who were big scary blacks advocating Black Power, Martin Luther King was reassuring. You can interpret this as 'See, civility wins' or as I interpret it: it takes incivility to move power to even a less scary option.

A third is that civil rights were perceived and addressed as a Southern sin. It's always fun to feel righteous beside your brother's error. With the federal government and Northern popularity, King led a movement that successfully addressed racial laws in Georgia and Mississippi. He was notably less successful in Chicago and Boston. In fact, his efforts in the North have been dropped from the memory of the civil rights movement. It was after he moved from confronting Southern legal segregationists to confronting Northern economic segregationists that he lost popularity. He regained it after his assassination when his message could be sentimentalized into "I have a dream." Civility in the South did not win over Southern power; it was national power that did so. Civility to politicians will not win over national power if there are no outside forces making it the better deal for elites.

If you read conservative speeches and writings of the time, from Jesse Helms to James Kilpatrick, you find lots of criticism of the civil rights movement, both for content and for means. Martin Luther King was—if not a communist, which J. Edgar Hoover insisted he was—doing wrong by breaking the law. In the way of all power, they insisted that there are other, better ways of trying to change the laws.

What are the current equivalents of international pressure, aggressive accountability groups, and domestic power centers that are bringing pressure on elites? I don't see any. All I see is the need to put pressure on the elites ourselves.

During the lifetime of great revolutionaries, the oppressing classes constantly hounded them, received their theories with the most savage malice. After their death, attempts are made to convert them into harmless icons, to canonize them while at the same time robbing the revolutionary theory of its substance.

Every society honors its live conformists and its dead troublemakers.

Lies are a vital and necessary part of authoritarian rule. If the truth were identified fully and in plain language that could be easily understood by everyone, the revolution would begin in ten minutes. The ruling class knows this very well, so lies are the gruel we ingest every day.

The primary aim of official propaganda is to generate an ‘official narrative’ that can be mindlessly repeated by the ruling classes and those who support and identify with them. This official narrative does not have to make sense, or to stand up to any sort of serious scrutiny. Its accuracy is not the point. The point is to draw a Maginot line, a defensive ideological boundary, between the truth as defined by the ruling classes and any other truth that contradicts their narrative.

Imagine this Maginot line as a circular wall surrounded by inhospitable territory. Inside the wall is normal society, gainful employment, career advancement, and all the other considerable benefits of cooperating with the ruling classes. Outside the wall is poverty, anxiety, social and professional stigmatization, and various other forms of suffering. Which side of the wall do you want to be on? Every day, in countless ways, each of us are asked and have to answer this question. Conform, and there’s a place for you inside. Refuse, and well... good luck out there.

In openly despotic societies, the stakes involved in making this choice—to conform or dissent—are often life and death. In our relatively liberal Western societies the consequences of not conforming to the official narrative—for those of us who are not militant guerrillas—are usually subtler. Despite that, the pressure is still intense. Conforming to the consensus reality generated by these official narratives is price of admission to the inner sanctum, where the jobs, money, professional prestige, and the other rewards of Capitalism are. Conforming does not require belief. It requires allegiance and rote obedience. What one actually believes is completely irrelevant, as long as one parrots the official narrative.

In short, official propaganda is not designed to deceive the public—no more than the speeches in an actor’s script are intended to deceive the actor who speaks them—it is designed to be absorbed and repeated, no matter how implausible or preposterous it might be. Actually, it is often most effective when those who are forced to robotically repeat it know that it is utter nonsense, as the humiliation of having to do so cements their

allegiance to the ruling classes. This phenomenon being a standard feature of the classic Stockholm Syndrome model, and authoritarian conditioning generally.

Television, radio stations, newspapers, magazines, social media, are used to flood the minds of the populace with a certain view of life, particular ideas, values, and carefully edited facts. Political and economic slogans are repeated like mantras over the airwaves, until they infect the populace and are repeated parrot-like by apathetic, ill-informed voters. Education systems are designed to support the message, enabling the most malleable minds to be conditioned into, for example, competition and conformity. Organized religion reinforces the pervasive values and imposes its own, often cripplingly repressive doctrine on the faithful. Creative independent thinking—the principle quality of inquiry, analysis, and response—is for the most part lost within the fogs of dogma and stereotype that are wrapped around the minds of the unsuspecting virtually from birth. The world is presented as hostile, competitive, full of pain and difficulties. Material satisfaction and pleasure is sold as happiness, desire constantly fed—creating agitated noisy minds, discontent, and anxiety, all of which deny or greatly inhibit the possibility of that most democratic quality, free thinking.

The smart way to keep people passive and obedient is to strictly limit the spectrum of acceptable opinion, but allow very lively debate within that spectrum. Imperialism and its consequences—economic, psychological, and physical violence—are largely off limits. We can discuss racism against blacks in the police force, but not racism as a feature of the imperial state. We can discuss corruption on Wall Street, but not finance as a critical tool of imperial exploitation. We can discuss whether policing borders is racist, but not the role of immigration in creating reserve armies of labor for use by the ruling corporatocracy. We can discuss gay rights and gender pay scales, but not how imperialism destroys the lives of countless women and gays in nations we target. We can discuss the Syrian war, but not Syria as a new chapter in imperialism's history of slaughter. So long as we debate and march for issues that do not challenge the ruling class power and wealth, nothing structural will change. Racism, bigotry, gender discrimination, financial exploitation of Main Street by Wall Street, debt peonage, wage serfdom, foreign wars of dubious provenance, the canonization of war criminals past and present, and much more will continue unabated.

We underestimate at our peril the kind of onslaught of received opinion from the media, from the sort of cultural establishment, basically kind of ruling out of court any notion of fundamental change. Ridiculing it as ridiculous, to the extent that, you know, when you start to talk about wanting a better world you see the eyes rolling. What kind of despicable

pass have we come to, that such an aspiration raises scorn? And yet that's where we are, for huge numbers of the political establishment.

Much of our shared understanding of reality is constructed through the mass media. In the 1970s, a media theorist formalized this idea, arguing that the mass media's portrayal of reality affected us all, particularly if we consumed a large diet of such media. The research claims two important things about this mediated reality:

1. Mediated reality is often a stable, repetitive, pervasive, and virtually inescapable pattern of images and ideologies that creates a deep sense of common, shared reality.
2. Mediated reality is often wrong.

Advanced capitalist societies manufacture the social subjects as consumers of mass culture—as they are consumers of McDonald's hamburgers or Starbucks coffee—which is to say their desires are the creations of a culture industry, receptacles of a massive body of disinformation that do not just entertain and preoccupy them but, in fact, engineer them as passive receptacles of an ideological domination beyond their recognition or critique. They are given a false sense of autonomy to choose.

What today we call 'Western Media' is the paramount example of the production of news as commodity fetishism. Such news outlets as BBC, CNN, New York Times are brands under which this commodity that calls itself Western Media manufactures both a truth to be reckoned with and in effect the normative consciousness of the person who consumes that news and thinks herself informed. They may think themselves objective news outlets that occasionally feature or air a commercial for an airline or a washing detergent. But they are themselves a brand just like the other brands they advertise.

This Western Media has historically posited itself initially as the opposite of the news as used to be broadcast in the Soviet Bloc, or China, or the Third World in general, which was branded as "state-controlled," "propaganda," and therefore false, and thereby posited itself as "independent," "objective," "fair," and "truthful."

Everything can be perverted and distorted, millions of people can be deceived, if you use the monopoly of the media.

Destroying the ability to compare and to see things from the universal perspective has been one of the most successful endeavors of the Western indoctrination drive—dispersed through education, media disinformation, and culture. It has effectively influenced and pacified both the people in the

West itself, and those living in its present and former colonies—particularly the local elites and their offspring.

It makes my blood boil, and then run cold, considering that the effect is to reject real reality and substitute ‘The Narrative.’ These words are utterly failing to convey the horror I feel. We’re a nation of people who don’t know our own recent history. We don’t know where we are, how we got here, or what our true trajectory is.

I think the theft of reality itself is one of the worst crimes possible. Those who can make you believe absurdities, can make you commit atrocities. And that’s the whole point. Wars don’t just happen. The depredations of the powers that be, which power their dominance, depend on the participation of us mopes. Toward that end, NYT, WaPo, the rest of the Establishment media, steal from us our real reality and substitute their own absurdities.

I just can’t cram into these words how horrified I am, to be living amongst millions of people who don’t know the truth of our time and are thus ever so easily led to believe absurdities and then rush to commit the atrocity du jour. And to know that those entrusted with the power of the “papers of record” are daily making us crazier and crazier.

Our humanity rests, is embedded in, our perceptions and beliefs about reality. They’re stealing from us our humanity by stealing reality itself. I just can’t put it strongly enough!

If it wasn’t for this redoubt of reality—pretty sure I’d lose what’s left of my damn mind. Thank you all so much for keeping it real.

I look at mankind and I see a species in an awkward transitional phase, like how the ancestors of birds probably were before they really got that whole flying thing down. We’ve evolved these gigantic brains which give us a capacity for abstract thought that has enabled us to out-survive and out-thrive other competing organisms, but we haven’t yet moved into a mature relationship with that newfound capability. A human brain can make someone so crazy and miserable that he’ll blow it out of his own skull with a gun, a weapon which we invented using that same capacity for abstract thought.

Humans, to put it simply, have an unhealthy relationship with narrative. If you have ever experienced a moment of mental stillness, you know how peaceful and pleasant that experience is. It is natural and harmonious. It’s only once you add in the believed mental chatter that we suffer, we hate, we fight each other, and we can be manipulated by narratives inserted into our mental processes by plutocrat-owned media.

There is nothing inherent in the human organism which makes suffering natural or necessary; it’s only the babbling believed narratives in our minds

that generate suffering. The same is true of our susceptibility to mass media manipulation.

Truth doesn't require intellect to believe. Intellect isn't proof against deception. Intelligent isn't the same as less ignorant and unintelligent isn't the same as more ignorant. But yes, many people believe what they are told. Many people are more ignorant than you and I—and perhaps a few are less.

Large groups of people can be made to believe the same, whether true or false. This is quite common. Intellect does give an advantage in evaluating the merits of an idea. But skeptical inquiry isn't always going to lead to fact. It can as easily lead to a wrong idea that fits the facts one has accepted. Confirmation bias can mislead.

At any rate, there are smart more ignorant people and dumb less ignorant ones.

Outrage discourse and programming may be effective at increasing advertising revenues and political support, but the mainstreaming of outrage in American political culture undermines some practices vital to healthy democratic life. Outrage tactics such as ideological selectivity, vilification of opponents, and fear mongering make talking politics beyond our most intimate circles extraordinarily difficult, complicating our ability to have meaningful discussions about politics in our communities. We also see outrageous voices wielding disproportionate influence in elections, independently vetting candidates, anointing or tarring the contestants, particularly during primaries.

In spite of the negative tenor of much of the content, fans feel refreshed by the programs. In many ways, outrage venues serve as political churches. The faithful attend, hear their values re-articulated in compelling ways, and leave feeling validated and virtuous for having participated.

The aggregate audience for outrage media is immense. The estimate for talk radio is roughly 35 million listeners daily. It is the second most popular radio format in the nation, falling only slightly behind the number one format: country music. Nielsen data suggest the nightly outrage programs on cable attract close to 10 million viewers. The audience is composed largely of those who are most likely to vote, most likely to donate to political causes, and most likely to be politically active in many other ways. For example, 78 percent of listeners to talk radio voted in the 2010 election as compared to 41 percent of the eligible electorate. In short, the outrage audience is quite large, politically active, and valuable to both advertisers and politicians.

Those who have least to say are granted the greatest number of platforms on which to say it.

Trolling doesn't take brains. But it works, and it will keep working, until we learn to see through the provocations in real time.

Why is a fragmented media environment hospitable to outrage? Think of the case of television: During the era of big-three network dominance, when programming choices were based on garnering the largest possible number of viewers from the mass audience, the goal was to offend the fewest, to program the least objectionable content. Today, the broadcast networks must work to attract a large audience amid an expansive sea of cable channels. In contrast, cable networks can produce content aimed at smaller, more homogeneous audiences. With this niche-orientation, individual cable channels can afford to offend segments of the market that are not their target audience. In fact, many cable television programs, radio shows, and blogs deliver niche audiences to advertisers specifically through the use of objectionable programming, which is dramatic, entertaining, and shocking enough to "break through the clutter" in a crowded field of cable choices.

While the proliferation of outrage discourse in the media and its concomitant role in direct dialogue about politics is anathema to the values of some, there are others far more open to diverse forms of political expression. Many have persuasively challenged the privileging of rational-critical discourse as exclusionary and anti-democratic because it elevates a set of voices already at the political center and devalues the contributions of voices that have historically been pressed to the margins, such as those of women, the poor, foreign-born. These critics argue that emotional, opinion-based accounts of lived experience are deemed less legitimate than those drawing dispassionately on facts presented as objective precisely because power has been at play in establishing what we take for granted as common sense. Therefore under the pretense of inclusion, deliberation may mask domination. Critics focusing on inequalities tend to home in on one or more of the following: calling attention to these subtleties of power in public discourse, broadening the range of political expressions seen as legitimate, and validating the multiple, coexisting publics where those whose needs are not met gather to deliberate independently.

Meaningful deliberation requires new ways of framing social reality. Performative communications including jokes, shared personal stories, and use of irony, often help people understand things in new ways, proving pivotal for meaningful political discussion. Even if such devices fail to enhance understanding, it seems likely that they enhance the pleasures of and proclivity toward participation in political life. Public participation depends on feelings of pleasure, which may be derived from rational argumentation, but also through more playful forms of argument, such as the clever use of dramatic techniques to place moral conflict into bold (and usually overstated)

relief. This satisfaction is motivating increasing civic participation: If an individual hates Elon Musk or Paul Krugman or Warren Buffett, it is more likely that that person will participate in the public sphere.

“The process of fact-checking has one unavoidable problem—there’s almost no way to verify a story that the writer has fabricated entirely, because you can’t disprove a negative. It’s unreasonable for a magazine fact-checker to start from the premise that the reporter concocted a story out of thin air, since only a psychopath would do so. It would be like a doctor initiating every medical examination by asking the patient if she’s lying about feeling sick.”

The pioneering adherents of propaganda back in the day might never have dreamt how sophisticated and all-encompassing the practice would become, nor would the citizenry at large have anticipated the extent to which the industry has facilitated an entrenched, rapacious plutocracy at the expense of our economic opportunity, our financial and material security, our physical, social and cultural environment, our values and attitudes, and increasingly, our basic democratic rights and freedoms.

We now live in the Age of the Big Shill—cocooned in a submissive void—an era where nothing can be taken on face value yet where time and attention constraints (to name just two) force us to do so; where few people in public life can be taken at their word; where unchallenged perceptions become accepted reality; where “open-book” history is now incontrovertible not-negotiable, upon pain of imprisonment fact; where education is about uniformity, function, form, and conformity, all in the service of imposed neoliberal ideologies embracing then prioritizing individual—albeit dubious—freedoms.

More broadly, it’s the “Roger Ailes” of this world—acting on behalf of the power elites who after all are their paymasters—who create the intellectual systems which control expression through the communications structures, whilst ensuring these systems require only the discreet use of censorship and uniformed men. They are the shapers and molders of the discourse that passes for the accepted lingua franca of the increasingly globalized, interconnected, corporatized political economy of the planet. Throughout this process they will always try to change the established language.

Whether this decision-making is taking place inside or outside the legislative process, these processes are well and truly in the grip of the banks and financial institutions and transnational organizations. In whose interests are they going to be more concerned with? We saw this all just after the Global

Financial Crisis (GFC) when the very people who brought the system to the brink, made billions off the dodge for their banks and millions for themselves, bankrupted hundreds of thousands of American families, were called upon by the US government to fix up the mess, and to all intents given a blank cheque to so do.

That the US is at even greater risk now of economic implosion is something few serious pundits would dispute, and a testament to the effectiveness of the snow-job perpetrated upon Americans regarding the causes, the impact, and the implications of the 2008 meltdown going forward.

And here we are, a mere twelve years later. Getting force-fed, non-stop yet another narrative designed to funnel immense wealth into the hands of a few, and in many cases, make these parasites look good in the process. Things politicians could not have dreamed of months ago, ushered in, cheered on, defended—or criticized for not being extreme enough—by every “credible outlet.”

“Things will never be the same.”

In most cases, one accepts almost by definition such disconnects—read: hidden agendas—are the rule rather than the exception, hence the multi-billion foundation—and global reach and impact—of the propaganda business. This in itself is a key indicator as to why organizations place so much importance on this aspect of managing their affairs. At the very least, once corporations saw how the psychology of persuasion could be leveraged to manipulate consumers and politicians saw the same with the citizenry and even its own workers, the growth of the industry was assured.

As Leni Riefenstahl noted when asked if those embracing the “submissive void” included the liberal, educated bourgeoisie?

“Everyone. Propaganda always wins. . . if you allow it.”

Chapter Nine

Mediated Reality

“Unceasingly we are bombarded with pseudo-realities. Reality is that which, when you stop believing in it, doesn’t go away.”

We were keeping our eye on 1984. When the year came and the prophecy didn’t, thoughtful Americans sang softly in praise of themselves. The roots of liberal democracy had held. Wherever else the terror had happened, we, at least, had not been visited by Orwellian nightmares. But we had forgotten that alongside Orwell’s dark vision, there was another—slightly older, slightly less well known, equally chilling: Aldous Huxley’s *Brave New World*. Contrary to common belief even among the educated, Huxley and Orwell did not prophesy the same thing. Orwell warns that we will be overcome by an externally imposed oppression. But in Huxley’s vision, no Big Brother is required to deprive people of their autonomy, maturity, and history. As he saw it, people will come to love their oppression, to adore the technologies that undo their capacities to think.

What Orwell feared were those who would ban books. What Huxley feared was that there would be no reason to ban a book, for there would be no one who wanted to read one. Orwell feared those who would deprive us of information. Huxley feared those who would give us so much that we would be reduced to passivity and egoism. Orwell feared that the truth would be concealed from us. Huxley feared the truth would be drowned in a sea of irrelevance. Orwell feared we would become a captive culture. Huxley feared we would become a trivial culture, preoccupied with some equivalent of the feelies, the orgy porgy, and the centrifugal bumblepuppy. As Huxley remarked in *Brave New World Revisited*, the civil libertarians and rationalists who are ever on the alert to oppose tyranny “failed to take into account man’s almost infinite appetite for distractions.” In 1984 people are controlled by inflicting pain. In *Brave New World*, they are controlled by inflicting pleasure. In short, Orwell feared that what we hate will ruin us. Huxley feared that what we love will ruin us.

As uncanny as these Nostradamuses might seem, however, they were not so much attempting to foretell the future as they were documenting their concerns about their own place and time. For example, when Orwell and Huxley penned their masterpieces, they did so as commentaries on the rise of a controlling, manipulative scientific establishment, as well as the dangers of totalitarianism in the 1930s and 40s. That their dire extrapolations about the future have proven to be so accurate is less a reflection of their skills as fortunetellers as it is our unmitigated failure to heed their warnings. Likewise, if we fail to take notice of the alarm bells being sounded by contemporary writers, filmmakers, and activists, we will have only ourselves to blame when freedom falls.

Anyone who is even slightly familiar with the history of communications knows that every new technology for thinking involves a trade-off. It giveth and taketh away, although not quite in equal measure. Media change does not necessarily result in equilibrium. It sometimes creates more than it destroys. Sometimes, it is the other way around. We must be careful in praising or condemning because the future may hold surprises for us. The invention of the printing press itself is a paradigmatic example. Typography fostered the modern idea of individuality, but it destroyed the medieval sense of community and integration. Typography created prose but made poetry into an exotic and elitist form of expression. Typography made modern science possible but transformed religious sensibility into mere superstition. Typography assisted in the growth of the nation-state but thereby made patriotism into a sordid if not lethal emotion.

It is an argument that fixes its attention on the forms of human conversation, and postulates that how we are obliged to conduct such conversations will have the strongest possible influence on what ideas we can conveniently express. And what ideas are convenient to express inevitably become the important content of a culture. I use the word 'conversation' metaphorically to refer not only to speech but to all techniques and technologies that permit people of a particular culture to exchange messages. In this sense, all culture is a conversation or, more precisely, a corporation of conversations, conducted in a variety of symbolic modes. Our attention here is on how forms of public discourse regulate and even dictate what kind of content can issue from such forms.

To take a simple example of what this means, consider the primitive technology of smoke signals. While I do not know exactly what content was once carried in the smoke signals of American Indians, I can safely guess that it did not include philosophical argument. Puffs of smoke are insufficiently complex to express ideas on the nature of existence, and even if they were not, a Cherokee philosopher would run short of either wood or

blankets long before he reached his second axiom. You cannot use smoke to do philosophy. Its form excludes the content.

The clearest way to see through a culture is to attend to its tools for conversation. I might add that my interest in this point of view was first stirred by a prophet. In studying the Bible as a young man, I found intimations of the idea that forms of media favor particular kinds of content and therefore are capable of taking command of a culture. I refer specifically to the Decalogue, the Second Commandment of which prohibits the Israelites from making concrete images of anything:

“Thou shalt not make unto thee any graven image, any likeness of any thing that is in heaven above, or that is in the earth beneath, or that is in the water beneath the earth.”

I wondered then, as so many others have, as to why the God of these people would have included instructions on how they were to symbolize, or not symbolize, their experience. It is a strange injunction to include as part of an ethical system unless its author assumed a connection between forms of human communication and the quality of a culture. We may hazard a guess that a people who are being asked to embrace an abstract, universal deity would be rendered unfit to do so by the habit of drawing pictures or making statues or depicting their ideas in any concrete, iconographic forms. The God of the Jews was to exist in the Word and through the Word, an unprecedented conception requiring the highest order of abstract thinking. Iconography thus became blasphemy so that a new kind of God could enter a culture. People like ourselves who are in the process of converting their culture from word-centered to image-centered might profit by reflecting on this Mosaic injunction. But even if I am wrong in these conjectures, it is, I believe, a wise and particularly relevant supposition that the media of communication available to a culture are a dominant influence on the formation of the culture's intellectual and social preoccupations.

Each medium, like language itself, makes possible a unique mode of discourse by providing a new orientation for thought, for expression, for sensibility. Which, of course, is the meaning of ‘the medium is the message.’ This aphorism, however, is in need of amendment because, as it stands, it may lead one to confuse a message with a metaphor. A message denotes a specific, concrete statement about the world. But the forms of our media, including the symbols through which they permit conversation, do not make such statements. They are rather like metaphors, working by unobtrusive but powerful implication to enforce their special definitions of reality. Whether we are experiencing the world through the lens of speech or the printed word

or the camera, our media-metaphors classify the world for us, sequence it, frame it, enlarge it, reduce it, color it, argue a case for what the world is like.

A clock recreates time as an independent, mathematically precise sequence; writing recreates the mind as a tablet on which experience is written; the telegraph recreates news as a commodity.

“The invention of firearms equalized the vassal and the noble on the field of battle; the art of printing opened the same resources to the minds of all classes; the post brought knowledge alike to the door of the cottage and to the gate of the palace.”

Our conversations about nature and about ourselves are conducted in whatever languages we find it possible and convenient to employ. We do not see nature or intelligence or human motivation or ideology as ‘it’ is but only as our languages are. And our languages are our media. Our media are our metaphors. Our metaphors create the content of our culture.

There is a tribe in western Africa that has no writing system but whose rich oral tradition has given form to its ideas of civil law. When a dispute arises, the complainants come before the chief of the tribe and state their grievances. With no written law to guide him, the task of the chief is to search through his vast repertoire of proverbs and sayings to find one that suits the situation and is equally satisfying to both complainants. That accomplished, all parties are agreed that justice has been done, that the truth has been served. You will recognize, of course, that this was largely the method of Jesus and other Biblical figures who, living in an essentially oral culture, drew upon all of the resources of speech, including mnemonic devices, formulaic expressions and parables, as a means of discovering and revealing truth.

In oral cultures proverbs and sayings are not occasional devices—they are incessant. They form the substance of thought itself. Thought in any extended form is impossible without them, for it consists in them. To people like ourselves any reliance on proverbs and sayings is reserved largely for resolving disputes among or with children.

- “First come, first served.”
- “Possession is nine-tenths of the law.”
- “Haste makes waste.”

These are forms of speech we pull out in small crises with our young but would think ridiculous to produce in a courtroom where “serious” matters

are to be decided. Can you imagine a bailiff asking a jury if it has reached a decision and receiving the reply:

“To err is human but to forgive is divine”

Or even better:

“Let us render unto Caesar that which is Caesar’s and to
God that which is God’s”

For the briefest moment, the judge might be charmed but if a serious language form is not immediately forthcoming, the jury may end up with a longer sentence than most guilty defendants. Judges, lawyers, and defendants do not regard proverbs or sayings as a relevant response to legal disputes. In this, they are separated from the tribal chief by a media-metaphor. For in a print-based courtroom, where law books, briefs, citations, and other written materials define and organize the method of finding the truth, the oral tradition has lost much of its resonance—but not all of it. Testimony is expected to be given orally, on the assumption that the spoken—not the written—word is a truer reflection of the state of mind of a witness.

A similar paradox exists in universities, and with roughly the same distribution of resonances; that is to say, there are a few residual traditions based on the notion that speech is the primary carrier of truth. But for the most part, university conceptions of truth are tightly bound to the structure and logic of the printed word. To exemplify this point, consider the still widely practiced medieval ritual known as a “doctoral oral.” I use the word ‘medieval’ literally, for in the Middle Ages students were always examined orally, and the tradition is carried forward in the assumption that a candidate must be able to talk competently about his written work. But, of course, the written work matters most.

In one case, the issue of what is a legitimate form of truth-telling was raised to a level of consciousness rarely achieved. The candidate had included in his thesis a footnote, intended as documentation of a quotation, which read: “Told to the investigator at the Roosevelt Hotel on January 18, 1981, in the presence of Arthur Lingeman and Jerrold Gross.” This citation drew the attention of no fewer than four of the five oral examiners, all of whom observed that it was hardly suitable as a form of documentation and that it ought to be replaced by a citation from a book or article. “You are not a journalist,” one professor remarked. “You are supposed to be a scholar.”

Perhaps because the candidate knew of no published statement of what he was told at the Roosevelt Hotel, he defended himself vigorously on the grounds that there were witnesses to what he was told, that they were

available to attest to the accuracy of the quotation, and that the form in which an idea is conveyed is irrelevant to its truth. Carried away on the wings of his eloquence, the candidate argued further that there were more than three-hundred references to published works in his thesis and that it was extremely unlikely that any of them would be checked for accuracy by the examiners, by which he meant to raise the question: Why do you assume the accuracy of a print-referenced citation but not a speech-referenced one?

The answer he received took the following line: You are mistaken in believing that the form in which an idea is conveyed is irrelevant to its truth. In the academic world, the published word is invested with greater prestige and authenticity than the spoken word. What people say is assumed to be more casually uttered than what they write. The written word is assumed to have been reflected upon and revised by its author, reviewed by authorities and editors. It is easier to verify or refute, and it is invested with an impersonal and objective character, which is why, no doubt, you have referred to yourself in your thesis as 'the investigator' and not by your name; that is to say, the written word is, by its nature, addressed to the world, not an individual. The written word endures, the spoken word disappears; and that is why writing is closer to the truth than speaking. Moreover, we are sure you would prefer that this commission produce a written statement that you have passed your examination (should you do so) than for us merely to tell you that you have, and leave it at that. Our written statement would represent the truth. Our oral agreement would be only a rumor.

The candidate wisely said no more on the matter except to indicate that he would make whatever changes the commission suggested and that he profoundly wished that should he pass the oral, a written document would attest to that fact. He did pass, and in time the proper words were written.

The concept of truth is intimately linked to the biases of forms of expression. Truth does not, and never has, come unadorned. It must appear in its proper clothing or it is not acknowledged, which is a way of saying that the truth is a kind of cultural prejudice. Each culture conceives of it as being most authentically expressed in certain symbolic forms that another culture may regard as trivial or irrelevant.

As a culture moves from orality to writing to printing to video, its ideas of truth move with it. Every philosophy is the philosophy of a stage of life, every epistemology is the epistemology of a stage of media development. Truth, like time itself, is a product of a conversation man has with himself about and through the techniques of communication he has invented.

Since intelligence is primarily defined as one's capacity to grasp the truth of things, it follows that what a culture means by intelligence is derived from the character of its important forms of communication. In a purely

oral culture, intelligence is often associated with aphoristic ingenuity, that is, the power to invent compact sayings of wide applicability. The wise Solomon, we are told in First Kings, knew three-thousand proverbs. In a print culture, people with such a talent are thought to be quaint at best, more likely pompous bores. In a purely oral culture, a high value is always placed on the power to memorize, for where there are no written words, the human mind must function as a mobile library. To forget how something is to be said or done is a danger to the community and a gross form of stupidity. In a print culture, the memorization of a poem, a menu, a law, or most anything else is merely charming. It is almost always functionally irrelevant and certainly not considered a sign of high intelligence.

Although the general character of print-intelligence would be known to anyone who would be reading this book, you may arrive at a reasonably detailed definition of it by simply considering what is demanded of you as you read this book. You are required, first of all, to remain more or less immobile for a fairly long time. If you cannot do this—with this or any other book, though perhaps especially this book—our culture may label you as anything from suffering ADHD to simply undisciplined; in any case, as suffering from some sort of intellectual deficiency. The printing press makes rather stringent demands on our bodies as well as our minds. Controlling your body is, however, only a minimal requirement. You must also have learned to pay no attention to the shapes of the letters on the page. You must see through them, so to speak, so that you can go directly to the meanings of the words they form. If you are preoccupied with the shapes of the letters, you will be an intolerably inefficient reader, likely to be thought stupid.

If you have learned how to get to meanings without aesthetic distraction, you are required to assume an attitude of detachment and objectivity. This includes your bringing to the task what some have called an “immunity to eloquence,” meaning that you are able to distinguish between the sensuous pleasure, or charm, or ingratiating tone (if such there be) of the words, and the logic of their argument. But at the same time, you must be able to tell from the tone of the language what is the author’s attitude toward the subject and toward the reader. You must, in other words, know the difference between a joke and an argument. And in judging the quality of an argument, you must be able to do several things at once, including delaying a verdict until the entire argument is finished, holding in mind questions until you have determined where, when or if the text answers them, and bringing to bear on the text all of your relevant experience as a counterargument to what is being proposed. You must also be able to withhold those parts of your knowledge and experience which, in fact, do

not have a bearing on the argument.

And in preparing yourself to do all of this, you must have divested yourself of the belief that words are magical and, above all, have learned to negotiate the world of abstractions, for there are very few phrases and sentences in many books that require you to call forth concrete images. In a print-culture, we are apt to say of people who are not intelligent that we must “draw them pictures” so that they may understand. Intelligence implies that one can dwell comfortably without pictures, in a field of concepts and generalizations. To be able to do all of these things, and more, constitutes a primary definition of intelligence in a culture whose notions of truth are organized around the printed word.

In *The Autobiography of Benjamin Franklin*, there appears a remarkable quotation attributed to Michael Welfare, one of the founders of a religious sect known as the Dunkers and a long-time acquaintance of Franklin. The statement had its origins in Welfare’s complaint to Franklin that zealots of other religious persuasions were spreading lies about the Dunkers, accusing them of abominable principles to which, in fact, they were utter strangers. Franklin suggested that such abuse might be diminished if the Dunkers published the articles of their belief and the rules of their discipline. Welfare replied that this course of action had been discussed among his coreligionists but had been rejected. He then explained their reasoning in the following words:

“When we were first drawn together as a society, it had pleased God to enlighten our minds so far as to see that some doctrines, which we once esteemed truths, were errors, and that others, which we had esteemed errors, were real truths. From time to time He has been pleased to afford us farther light, and our principles have been improving, and our errors diminishing. Now we are not sure that we are arrived at the end of this progression, and at the perfection of spiritual or theological knowledge; and we fear that, if we should feel ourselves as if bound and confined by it, and perhaps be unwilling to receive further improvement, and our successors still more so, as conceiving what we their elders and founders had done, to be something sacred, never to be departed from.”

Franklin describes this sentiment as a singular instance in the history of mankind of modesty in a sect. Modesty is certainly the word for it, but the statement is extraordinary for other reasons, too. We have here a criticism of the epistemology of the written word worthy of Plato. Moses himself

might be interested although he could hardly approve. The Dunkers came close here to formulating a commandment about religious discourse: ‘Thou shalt not write down thy principles, still less print them, lest thou shall be entrapped by them for all time.’

Whenever language is the principal medium of communication—especially language controlled by the rigors of print—an idea, a fact, a claim is the inevitable result. The idea may be banal, the fact irrelevant, the claim false, but there is no escape from meaning when language is the instrument guiding one’s thought. Though one may accomplish it from time to time, it is very hard to say nothing when employing a written English sentence. What else is exposition good for? Words have very little to recommend them except as carriers of meaning. The shapes of written words are not especially interesting to look at. Even the sounds of sentences of spoken words are rarely engaging except when composed by those with extraordinary poetic gifts. If a sentence refuses to issue forth a fact, a request, a question, an assertion, an explanation, it is nonsense, a mere grammatical shell.

A written sentence calls upon its author to say something, upon its reader to know the import of what is said. And when an author and reader are struggling with semantic meaning, they are engaged in the most serious challenge to the intellect. This is especially the case with the act of reading, for authors are not always trustworthy. They lie, they become confused, they over-generalize, they abuse logic and, sometimes, common sense. The reader must come armed, in a serious state of intellectual readiness. This is not easy because he comes to the text alone. In reading, one’s responses are isolated, one’s intellect thrown back on its own resources. To be confronted by the cold abstractions of printed sentences is to look upon language bare, without the assistance of either beauty or community. Thus, reading is by its nature a serious business.

The farm boy following the plow with book in hand, the mother reading aloud to her family on a Sunday afternoon, the merchant reading announcements of the latest clipper arrivals—these were different kinds of readers from those of today. There would have been little casual reading, for there was not a great deal of time for that. Reading would have had a sacred element in it, or if not that, would have at least occurred as a daily or weekly ritual invested with special meaning. For we must also remember that this was a culture without electricity. It would not have been easy to read by either candlelight or, later, gaslight. Doubtless, much reading was done between dawn and the start of the day’s business.

What reading would have been done was done seriously, intensely, and with steadfast purpose. The modern idea of “testing a reader’s comprehen-

sion,” as distinct from something else a reader may be doing, would have seemed an absurdity in 1790 or 1830 or 1860. What else was reading but comprehending? As far as we know, there did not exist such a thing as a “reading problem,” except, of course, for those who could not attend school. To attend school meant to learn to read, for without that capacity, one could not participate in the culture’s conversations. But most people could read and did participate. To these people, reading was both their connection to and their model of the world. The printed page revealed the world, line by line, page by page, to be a serious, coherent place, capable of management by reason, and of improvement by logical and relevant criticism.

It may be true that the primary motivation of the writers of the United States Constitution was the protection of their economic interests. But it is also true that they assumed that participation in public life required the capacity to negotiate the printed word. To them, mature citizenship was not conceivable without sophisticated literacy, which is why the voting age in most states was set at twenty-one, and why Jefferson saw in universal education America’s best hope. And that is also why the voting restrictions against those who owned no property were frequently overlooked, but not one’s inability to read.

Telegraphy made relevance irrelevant. The abundant flow of information had very little or nothing to do with those to whom it was addressed; that is, with any social or intellectual context in which their lives were embedded. The phrase ‘water everywhere without a drop to drink’ may serve as a metaphor of a decontextualized information environment: In a sea of information, there was very little of it to use. A man in Maine and a man in Texas could converse, but not about anything either of them knew or cared very much about. The telegraph may have made the country into “one neighborhood,” but it was a peculiar one, populated by strangers who knew nothing but the most superficial facts about each other.

Since we live today in just such a neighborhood—now sometimes called a “global village”—you may get a sense of what is meant by context-free information by asking yourself the following question: How often does it occur that information provided you—on morning radio or television, or in the morning newspaper, or by the morning scroll through your social media feed—causes you to alter your plans for the day, or to take some action you would not otherwise have taken, or provides insight into some problem you are required to solve? For most of us, news of the weather will sometimes have such consequences; for investors, news of the stock market; perhaps an occasional story about a crime will do it, if by chance the crime occurred near where you live or involved someone you know. But most of our daily news is inert, consisting of information that gives us something to

talk—or be outraged—about but cannot lead to any meaningful action. This fact is the principal legacy of the telegraph: By generating an abundance of irrelevant information, it dramatically altered what may be called the ‘information-action ratio.’

What steps do you plan to take to reduce the conflict in the Middle East? Or the rates of inflation, crime, and unemployment? What are your plans for preserving the environment or reducing the risk of nuclear war? What do you plan to do about NATO, Big Oil, the CIA, the NSA, affirmative action, and Big Tech? I shall take the liberty of answering for you: You plan to do nothing about them. You may, of course, cast a ballot for someone who claims to have some plans, as well as the power to act. But this you can do only once every two or four years by giving one hour of your time, hardly a satisfying means of expressing the broad range of opinions you hold. Voting, we might even say, is the next to last refuge of the politically impotent. Or perhaps you’ll give your opinion to a pollster, who will get a version of it through a desiccated question, and then will submerge it in a Niagara of similar opinions, and convert them into—what else?—another piece of news. But maybe you’ll just talk about it on social media where it will be analyzed, filtered, turned into data about you and quite possibly—yes, you guessed it—turned into a piece of news.

Thus, we have here a great loop of impotence: The news elicits from you a variety of opinions about which you can do nothing except to offer them as more news, about which you can do nothing.

We may say then that the contribution of the telegraph to public discourse was to dignify irrelevance and amplify impotence. But this was not all: Telegraphy also made public discourse essentially incoherent. It brought into being a world of broken time and broken attention. The principal strength of the telegraph was its capacity to move information, not collect it, explain it, or analyze it. In this respect, telegraphy was the exact opposite of typography. Books, for example, are an excellent container for the accumulation, quiet scrutiny, and organized analysis of information and ideas. It takes time to write a book, and to read one; time to discuss its contents and to make judgments about their merit, including the form of their presentation. A book is an attempt to make thought permanent and to contribute to the great conversation conducted by authors of the past.

Therefore, civilized people everywhere consider the burning of a book a vile form of anti-intellectualism. But the telegraph demands that we burn its contents. The value of telegraphy is undermined by applying the tests of permanence, continuity, or coherence. The telegraph and now social media and the clickbait internet is suited only to the flashing of messages, each to be quickly replaced by a more up-to-date message. Facts push other facts

into and then out of consciousness at speeds that neither permit nor require evaluation. To the telegraph, intelligence meant knowing of lots of things, not knowing about them.

Ever since the process was named it has been the custom to speak of photography as a 'language.' The metaphor is risky because it tends to obscure the fundamental differences between the two modes of conversation. To begin with, photography is a language that speaks only in particularities. Its vocabulary of images is limited to concrete representation. Unlike words and sentences, the photograph does not present to us an idea or concept about the world, except as we use language itself to convert the image to idea. By itself, a photograph cannot deal with the unseen, the remote, the internal, the abstract. It does not speak of 'man,' only of a man; not of 'tree,' only of a tree. You cannot produce a photograph of 'nature,' any more than a photograph of 'the sea.' You can only photograph a particular fragment of the here-and-now—a cliff of a certain terrain, in a certain condition of light; a wave at a moment in time, from a particular point of view.

And just as 'nature' and 'the sea' cannot be photographed, such larger abstractions as truth, honor, love, falsehood cannot be talked about in the lexicon of pictures. For 'showing of' and 'talking about' are two very different kinds of processes. Pictures need to be recognized, words need to be understood. This means that the photograph presents the world as object; language, the world as idea. For even the simplest act of naming a thing is an act of thinking—of comparing one thing with others, selecting certain features in common, ignoring what is different, and making an imaginary category. There is no such thing in nature as 'man' or 'tree.' The universe offers no such categories or simplifications; only flux and infinite variety. The photograph documents and celebrates the particularities of this infinite variety. Language makes them comprehensible.

In a peculiar way, the photograph was the perfect complement to the flood of telegraphic news-from-nowhere that threatened to submerge readers in a sea of facts from unknown places about strangers with unknown faces. For the photograph gave a concrete reality to the strange-sounding datelines, and attached faces to the unknown names. Thus it provided the illusion, at least, that the news had a connection to something within one's sensory experience. It created an apparent context for the "news of the day." And the news of the day created a context for the photograph. But the sense of context created by the partnership of photograph and headline was, of course, entirely illusory.

You may get a better sense of what I mean here if you imagine a stranger's informing you that the illyx is a subspecies of vermiformplant with articulated leaves that flowers biannually on the island of Aldononjes.

And if you wonder aloud, ‘Yes, but what has that to do with anything?’ imagine that your informant replies, ‘But here is a photograph I want you to see,’ and hands you a picture labeled Illyx on Aldononjes. ‘Ah, yes,’ you might murmur, ‘now I see.’ It is true enough that the photograph provides a context for the sentence you have been given, and that the sentence provides a context of sorts for the photograph, and you may even believe for a day or so that you have learned something.

But if the event is entirely self-contained, devoid of any relationship to your past knowledge or future plans, if that is the beginning and end of your encounter with the stranger, then the appearance of context provided by the conjunction of sentence and image is illusory, and so is the impression of meaning attached to it. You will, in fact, have learned nothing—except perhaps to avoid strangers with photographs—and the illyx will fade from your mental landscape as though it had never been. At best you are left with an amusing bit of trivia, good for trading in cocktail party chatter or solving a crossword puzzle, but nothing more.

As Irna Phillips, inventor of the first radio soap operas, explained:

“Sincerity, honesty, genuineness—true values. If the woman listener is made conscious of these standards in the story itself, how little effort it would take to make her conscious of these same standards with the product advertising.”

In *Fortune* magazine, Phillips revealed her own recipe for engaging female listeners.

“You appeal to: the instinct for self-preservation, sex, the family instinct, or all three together if you can manage.”

Over the 1920s and 1930s, CBS produced a series of pamphlets emphasizing the power of broadcasting to reach into the minds of its listeners. One entitled “You Do What You’re Told” argued that since people tended to obey human voices, radio advertising would be more compelling than existing print forms. Radio, according to the pamphlet, “presents the living voice of authority,” giving it the “supple power to move people and mold them, to enlist them and command them.” It is worth remembering that we, who now swim in a sea of voices transmitted, recorded, and even synthesized, are conditioned to exhibit less of this reflex. This is the attention merchant’s eternal dilemma: too little advertising and the business can’t grow; too much and the listener grows resentful and tunes out. Though of course we have our own weaknesses to exploit.

Progressive critics argued that radio, once imagined as a public service, had been hijacked by commercial interests. Broadcast radio was, in its early days, thought of as a miracle of science, a sacred and blessed realm that ought be free from commercial intrusion. It was to be for the education, entertainment, and enlightenment of the public, and should always deliver “the best of everything” as John Reith of the BBC put it. But over the late 1920s and early 1930s the commercial radio network, embodied by NBC and CBS, had pulled radio very far from that original conception, and resistance was growing.

Bernays convinced CBS that nothing would burnish the CBS brand so much as building its reputation for news coverage. The old propagandist’s instinct was shrewd indeed. For news would give CBS executives license to brag to Congress how diligently CBS was covering public affairs, while at the same time having news coverage made it clear that the network had the power to favor or ignore individual politicians, making CBS a political force to be reckoned with. Ultimately CBS created what was the nation’s first broadcast news service to compete credibly with print.

Radio’s reach and power caused Minister Joseph Goebbels to declare German radio the “towering herald of National Socialism,” a force equal to creating a nation with “one public opinion.” His broadcast chief bragged that “with the radio we have destroyed the spirit of rebellion.” By means of this attention infrastructure, one man could at will reach the minds of the entire nation, whether they cared to hear him or not. The Third Reich was the first dictatorship which made the complete use of all technical means for domination of its own country. Through technical devices like the radio and loudspeaker, 80 million people were deprived of independent thought. It was thereby possible to subject them to the will of one man.

“It is also almost like a giant eye on life itself and can easily become the vehicle for masterpieces of a magnitude and power never achieved before in the arts, given the artists to create them and the audience to support them. For this very reason, it would also become the worst cultural opiate in history, buy and corrupt all talent, and completely degrade the sensibility of the country. Everything depends on the use to which television is put.”

Given TV’s novelty and limited offerings, early audiences were not fickle channel surfers. Contemporary accounts suggest something much more like the deeply immersive experience of motion pictures. Indeed, the lights were usually turned off for viewing, and there was little or no conversation. One

only got up to change the channel. “We ate our suppers in silence, spilling food, gaping in awe,” said one woman in 1950.

“We thought nothing of sitting in the darkness for hours at a stretch without exchanging a word except ‘who’s going to answer that confounded telephone?’”

With a great many Americans, sometimes even a majority, watching the same programs, exposed to the same information, every day—or if not exactly the same, the same theme with slight variations—a kind of convergence was inevitable. Sitting in silence, everyone would receive the same impulses and impressions, find themselves focused on the same centers of interest, experience the same feelings, have generally the same order of reactions or ideas, participate in the same myths—and all this at the same time.

That there were three channels to choose from hardly mattered:

“It was as if the whole nation had gathered at a gigantic three-ring circus. Those who watched the bicycle act believed their experience was different from that of those who watched the gorillas or the flame eater, but everyone was at the circus. What was missing was the exaltation of the rally, the thrill of losing oneself in the common experience for as we all watched from our separate living rooms, it was as if we sat in isolation booths, unable to exchange any responses about what we were all going through together. Everybody was engaged in the same act at the same time, but we were doing it alone. What a bizarre situation!”

The 1950s would be remembered as a decade of conformity, and while the reasons may be many and complex, one cannot exclude the most salient: the historically anomalous scale of attention capture effected by television, together with the homogeneity of the stuff created to do the capturing.

“It involves not this individual or that, but the industry as a whole. There is something radically wrong with the fundamental national policy under which television operates. There is no competition in television except among competitors trying to sell the attention of their audiences for profit. As a result, while television is supposed to be ‘free,’ it has in fact become the creature, the servant, and indeed the prostitute, of merchandising.”

It is interesting to consider what vision the counterculture of the 1960s and 1970s might have achieved if it could have reversed the commercialization of human attention. Its leaders aspired to an age when commercial television and its advertising would face mass indifference and wilt into irrelevance. Once people had tuned out the establishment sources of information, advertising would be recognized as a form of propaganda and carefully avoided. Starved of requisite attention, it would collapse as it nearly did in the 1930s. In its place, the public mind would attend to realities that weren't commercial contrivances—nature, spiritual paths, friends, family, and lovers. Media, if any were needed, would be things like live concerts or perhaps programming in the public interest.

A cynic might say the 1960s vision of the alternative future was just sex, drugs, and rock 'n' roll, with, perhaps, some public radio thrown in. There's little question that the revolt of the 1960s did lead part of a generation away from the attention merchants of the 1950s. But industry calibrated an effective response and perhaps ultimately read the public mood more accurately than any guru. For they had detected the essence of the spirit of liberation: for most people it was not an end of desire (as in some Buddhist sense), or a wish for solitary withdrawal (in a monastic sense), or even, as Leary had hoped, a spiritual longing equal to motivating an inward turn. Rather, after decades of relative conformity and one of ultimate conformity, what had been uncorked was powerful individual desires and the will to express them. Above all, most simply wanted to feel more like an individual. And that was a desire industry could cater to, just like any other.

The most confident among the advertisers knew that the 1960s would not extinguish consumerism, for a simple reason: desire's most natural endpoint is consumption, and advertisers, after honing their art for half a century, knew how to convert all manner of desire into demand for products. And young people's desires were no exception.

“They [the hippies] are in the peak acquisitive years, and their relative affluence enables them to consume goods and services at a rate unheard of for their age level.”

Of course as we now know, the promise of liberation would be used for further repression. Liberty can be made into a powerful instrument of domination, for the free election of masters does not abolish the masters or the slaves, and free choice among a wide variety of goods and services does not signify freedom if these goods and services sustain social controls over a life of toil and fear. This is where an intellectual loses his guruship: leading his followers toward a conceptual bridge too far. If the people wanted

liberation, and if Pepsi was selling it, most people seemed to think, why not just buy it from them?

The main reason why the hoped-for attentional revolution of the 1960s and 1970s ultimately failed had nothing to do with the message, which was, in fact, powerfully delivered and readily embraced. Rather, the failure was owing to one often unremarked fact: over the 1960s and 1970s, most people simply did not stop watching television.

“The public was as they had been for years, sitting home in their living rooms, staring at blue light, their minds filled with TV images. One movement became the same as the next one; one media action merged with the fictional program that followed; one revolutionary line was erased by the next commercial, leading to a new level of withdrawal, unconcern, and stasis. In the end, the sixties were revealed as the flash of light before the bulb goes out.”

Even a show as beloved and hilariously subversive as MASH can be understood to exemplify the kind of opposition that actually perpetuates the status quo. Alan Alda starred as Hawkeye Pierce, an irreverent but deeply humane surgeon sick of the military and uptight people in general. Here was a man of the 1950s that any partisan of the counterculture could love. It was an example of a show that let the writers feel they were still reaching the people with an occasional revolutionary message, fitted ingeniously into the dialogue. At the same time, MASH kept tens of millions of Americans, would-be counterculturals among them, faithfully tuned to commercial television during prime time. If the contest really was, as Leary and others proposed, for the minds of the people, it was lost when America renewed its contract with the attention merchants. The broadcasters had adjusted the terms: now it was free, relevant entertainment in exchange for attention. But in the end, everyone would remain easily accessible to advertisers.

As for the advertisers themselves, Pepsi had shown that they could make the adjustment to the new sensibility even more nimbly than the broadcasters. A gang of hip new “revolutionary” agencies with young staff surged to success with innovative ways of doing things that mimicked the new younger thinking. These agencies—“the creatives”—mounted a serious challenge to the approaches, and the billings, of advertising firms established over the 1910s through 1920s and still dominant through the 1950s.

What was the secret to how the attention industries cheated death yet again, even when the whole zeitgeist of the late 1960s and ‘70s was seemingly

against them? The success may finally be put down to the saving logic of capitalism. For what makes capitalism so powerful is its resilience and adaptability. The game is never lost, only awaiting the next spin of the wheel. As a mode of production, capitalism is a perfect chameleon; it has no disabling convictions but profit and so can cater to any desire, even those inimical to it. In the sixties hip became central to the way American capitalism understood itself and explained itself to the public. And so even disgust with the falseness, shoddiness, and everyday oppressions of consumer society could be enlisted to drive the ever-accelerating wheels of consumption.

Show business is not entirely without an idea of excellence, but its main business is to please the crowd, and its principal instrument is artifice. If politics is like show business, then the idea is not to pursue excellence, clarity, or honesty but to appear as if you are, which is another matter altogether. And what the other matter is can be expressed in one word: advertising.

The television commercial is not at all about the character of products to be consumed. It is about the character of the consumers of products. Images of movie stars and famous athletes, of serene lakes and macho fishing trips, of elegant dinners and romantic interludes, of happy families packing their station wagons for a picnic in the country—these tell nothing about the products being sold. But they tell everything about the fears, fancies, and dreams of those who might buy them. What the advertiser needs to know is not what is right about the product but what is wrong about the buyer. And so, the balance of business expenditures shifts from product research to market research. The television commercial has oriented business away from making products of value and toward making consumers feel valuable, which means that the business of business has now become pseudo-therapy. The consumer is a patient assured by psycho-dramas.

As Xenophanes remarked twenty-five centuries ago, men always make their gods in their own image. But to this, television politics has added a new wrinkle: Those who would be gods refashion themselves into images the viewers would have them be.

‘Rear-view mirror thinking’ describes the assumption that a new medium is merely an extension or amplification of an older one; that an automobile, for example, is only a fast horse, or an electric light a powerful candle. To make such a mistake in the matter at hand is to misconstrue entirely how television redefines the meaning of public discourse. Television does not extend or amplify literate culture. It attacks it. If television is a continuation of anything, it is of a tradition begun by the telegraph and photograph in the mid-nineteenth century, not by the printing press in the fifteenth. What is television? What kinds of conversations does it permit? What are the

intellectual tendencies it encourages? What sort of culture does it produce?

But it is not time constraints alone that produce such fragmented and discontinuous language. When a television show is in process, it is very nearly impermissible to say, 'Let me think about that' or 'I don't know' or 'What do you mean when you say...?' or 'From what sources does your information come?' This type of discourse not only slows down the tempo of the show but creates the impression of uncertainty or lack of finish. It tends to reveal people in the act of thinking, which is as disconcerting and boring on television as it is on a Las Vegas stage. Thinking does not play well on television, a fact that television directors discovered long ago. There is not much to see in it. It is, in a phrase, not a performing art. But television demands a performing art, and so what the networks gave us was a picture of men of sophisticated verbal skills and political understanding being brought to heel by a medium that requires them to fashion performances rather than ideas.

As more and more of the population fills more and more hours of the day with entertainment, this leaves fewer hours for activities that promote intelligence, compassion, or interest in anything that falls outside their own Internet-dominated microcosms. When one's "accomplishments" in life and self-image become focused on things like scoring the most kills in a video war game or being able to see one's favorite rock star in person or having one's favorite sports team win a game—all possible before the Internet but now carried to much greater extremes—what passion is left for the real world, for the problems of fellow human beings? Would it be taking the point too far to suggest a parallel with the Romans, who kept the masses distracted from real-world problems by enticing them into the Colosseum to watch such spectacles as gladiators battling to the death?

The difference with football is the ethical compliance, particularly for casual spectators with little emotional investment. The audience for the Brickyard 400 is a marginalized audience; they all know what happens when cars crash into walls at 140 mph. The audience for Cheyenne Frontier Days is a marginalized audience; they all know what happens when a 2,200-pound bull lands on a cowboy's neck. These are fully invested fans who aren't alarmed or confused by the inherent dangers of their niche obsession. They know what they're getting into. No UFC fan is shocked by the sight of a man knocked unconscious. Football, however, appeals to a swath of humanity many magnitudes larger. It attracts people who haven't necessarily considered the ramifications of what they're witnessing—people who think they're relaxing at home on a Sunday afternoon, nonchalantly watching the same low-stakes distraction as everyone else. So when this type of person is suddenly confronted with the realization that what he is watching might

be killing the people who participate—or if he was to actually see a player killed on the field, which seems increasingly inevitable—he is overcome with guilt and discomfort (and bewilderment over how he's supposed to feel about economically supporting a game that mildly terrifies him).

The sheer scale of football's popularity likewise creates an opportunity for media grandstanding—self-righteous pundits denounce football the same way histrionic gatekeepers denounced booze in 1919 and *Dungeons & Dragons* in 1985. Over time, this fusion of public discomfort and media theatrics generates a political meaning. It now means something to support football. Those who self-identify as enlightened believe it means something tragic. And in ten years, that sentiment might reflect most of the US population. But it won't represent all of the population. It will never represent all of the population, even if it becomes the dominant way to think and feel. And that will make it unkillable. When any idea becomes symbolically dominant, those who dislike the idea will artificially inflate the necessity of whatever it opposes. This is why I can imagine a world where football continues to thrive—not in spite of its violence, but because of it. And not in some latent, unspoken context—openly, and without apology.

In the present moment, football operates as two parallel silos, both of which are shooting skyward and gaining momentum. One silo reflects the overall popularity of the sport, which increases every year. The other silo houses the belief that the game is morally reprehensible, a sentiment that swells every day. Somehow, these two silos never collide. But let's assume such a collision eventually happens, and the silo of popularity collapses on impact. It stops rocketing upward and is obliterated into a pile of bricks. That brick pile will be titanic, and it won't disappear. Neither will the people who built that silo, or those who lived inside it, or those who grew up worshiping its architecture. So they will use those bricks as weapons. They will throw them at the other silo. And since the game will no longer appeal to the casual fan, certain innate problems will turn into strengths.

There is a reason why smart people tend to be wrong as often as their not-so-smart peers—they work from the flawed premise that their worldview is standard. The contemporary stance on football's risk feels unilateral, because nobody goes around saying, 'Modern life is not violent enough.' Yet this sentiment quietly exists. And what those who believe it say instead is, "I love football. It's the last bastion of hope for toughness in America." It's not difficult to imagine a future where the semantic distance between those statements is nonexistent. And if that happens, football will change from a popular leisure pastime to an unpopular political necessity.

Football could lose 75 percent of its audience and matter just as much as it does now, assuming the people who stick with the game view it as a

sanctuary from a modern world they distrust. Over time, it could really, really mean something to love football, in a context that isn't related to sports at all. It could be a signifier for an idea that can't be otherwise expressed—the belief that removing physicality from the public sphere does not remove it from reality, and that attempts to do so weaken the republic. Football could become a dead game to the casual sports fan without losing a fraction of its cultural influence. It could become the only way for a certain kind of person to safely access the kind of controlled violence he sees as a critical part of life.

Should physical differences matter more than intellectual differences? Should the ability to intimidate another person be rewarded? Is it acceptable to scream at a person in order to shape his behavior? Should masculinity, in any context, be prioritized? The growing consensus regarding all of these questions is no. Yet these are ingrained aspects of competitive sports, all the way back to Sparta. A key reason college football came into existence in the late nineteenth century was that veterans who'd fought in the Civil War feared the next generation of men would be soft and ill prepared for the building of a republic 'We gotta give these boys something to do,' these veterans believed. 'Hell, they'll probably go through life without killing anyone!' We inject sports with meaning because they are supposed to mean something. So what happens when the things they signify are no longer desirable traits? It would mean the only value sports offer is their value as an aerobic entertainment commodity. And that would make it the equivalent of a fad, with the inherently finite life span all fads possess.

The spectator-viewer gap for the Famous Idaho Potato Bowl was massive—the human attendance was under 18,000 while the TV audience approached 1.5 million. This prompted USA Today to examine the bizarre possibility of future bowl games being played inside gigantic television studios, devoid of crowds. Crazy as that may sound, there would be some real practicality to this. With no concern for a live audience, the entire event could be constructed to maximize the TV experience. The whole facility could serve as a camera, and the visuals would be unprecedented. But this kind of fantastical speculation speaks to a broader change in how sports are now perceived. It reframes football as a simulation, not that far removed from a movie. The sole purpose of the event would be to fill a three-hour window of programming on ESPN2, and—if a better, cheaper alternative could be aired in its place—the game would have no purpose at all. Yes, the players would still be real. Yes, the hitting would still hurt. But if all this is merely a distraction to stare at on a pixelated screen, why would the human element remain essential? Robot players would work just as well. CGI players would work even better. It could literally be a video game,

controlled and manipulated by a computer. Then we wouldn't have any problems at all. It would just be a TV show that provides an opportunity for gambling.

There is nothing wrong with entertainment. As some psychiatrist once put it, we all build castles in the air. The problems come when we try to live in them. The communications media of the late nineteenth and early twentieth centuries, with telegraphy and photography at their center, called the peek-a-boo world into existence, but we did not come to live there until television. Television gave the epistemological biases of the telegraph and the photograph their most potent expression, raising the interplay of image and instancy to an exquisite and dangerous perfection. And it brought them into the home.

As recently as a decade ago one might have said we were by now well into a fourth or fifth generation of children for whom television has been their first and most accessible teacher and, for many, their most reliable companion and friend. To put it plainly, television was the command center of the new epistemology. There was no audience so young that it is barred from television. There was no poverty so abject that it must forgo television. There was no education so exalted that it is not modified by television. And most important of all, there was no subject of public interest—politics, news, education, religion, science, sports—that did not find its way to television. Which means that all public understanding of these subjects was shaped by the biases of television. Television was the command center in subtler ways as well. Our use of other media, for example, was largely orchestrated by television. Through it we learned what telephone system to use, what movies to see, what books, records, and magazines to buy, what radio programs to listen to. Television arranged our communications environment for us in ways that no other medium had the power to do.

Until the internet. The internet provides all of these things along with the increased democratization of information dissemination. This has allowed the information overload and ability to be manipulated to increase dramatically for the average person.

All that has happened is that the public has adjusted to incoherence and been amused into indifference. Which is why Aldous Huxley would not in the least be surprised by the story. Indeed, he prophesied its coming. He believed that it is far more likely that the Western democracies will dance and dream themselves into oblivion than march into it, single file and manacled. Huxley grasped, as Orwell did not, that it is not necessary to conceal anything from a public insensible to contradiction and narcotized by technological diversions. Although Huxley did not specify that television would be our main line to the drug followed by the even more effective

internet, he would have no difficulty accepting the observation that these are the soma of his *Brave New World*.

We're absolutely dying to give ourselves away to something. To run, to escape, somehow. And there's some kinds of escape that end up, in a twist, making you confront yourself even more. And then there are other kinds that say, 'Give me money, and in return I will make you forget who you are, that you have a pimple on your cheek, and that your gas bill is due.' And that that's fine, in low doses. But we don't stop at low doses.

The technology gets better and better at doing what it does, which is seduce us into being incredibly dependent on it, so that advertisers can be more confident that we will watch their advertisements. And as a technology system, it's amoral. It doesn't have a responsibility to care about us one whit more than it does: It's got a job to do. The moral job is ours.

Why are we watching five to ten hours a day of this? I mean, why do some people get 75 percent of their calories from candy? That's something that a little tiny child would do, and that would be all right, it's a natural exploration of limits. But we're post-pubescent. Somewhere along the line, we're supposed to have grown up. But if some of the most intelligent, promising, and educated people go into designing the candy, creating the demand for candy, then it's impossible to turn down.

NCIS, CSI, Bones—these really commercial, really reductive shows that we so love to sneer at. Are also tremendously compelling. Because the predictability in popular art, the really formulaic stuff, the stuff that makes no attempt to surprise or do anything artistic, is so profoundly soothing. Even the densest or most tired viewer can see what's coming. And it gives you a sense of order, that everything's going to be all right, that this is a narrative that will take care of you, and won't in any way challenge you. It's like being wrapped in a chamois blanket and nestled against a big, generous tit, you know? And that, OK, art-wise maybe not the greatest art. But the function it provides is deep in a certain way. That all this stuff is like deadly serious and really deep all the time. I mean, it doesn't mean that you should go around being some kind of scholar of pop culture and dismantling all the stuff. But that it's—that we find, that art finds a way to take care of you, and take part. Kind of despite itself.

“I think one of the reasons that I feel empty after watching a lot of TV, and one of the things that makes TV seductive, is that it gives the illusion of relationships with people. It's a way to have people in the room talking and being entertaining, but it doesn't require anything of me. I mean, I can see them, they can't see me. And, and, they're there for me, and I can, I can

receive from the TV, I can receive entertainment and stimulation. Without having to give anything back but the most tangential kind of attention. And that is very seductive.

The problem is it's also very empty. Because one of the differences about having a real person there is that number one, I've gotta do some work. Like, he pays attention to me, I gotta pay attention to him. You know: I watch him, he watches me. The stress level goes up. But there's also, there's something nourishing about it, because I think like as creatures, we've all got to figure out how to be together in the same room. And so TV is like candy in that it's more pleasurable and easier than the real food. But it also doesn't have any of the nourishment of real food.

What has happened to us, that we're now willing—and I do this too—that I'm willing to derive enormous amounts of my sense of community and awareness of other people, from television? But I'm not willing to undergo the stress and awkwardness and potential shit of dealing with real people. And that as the Internet grows, and as our ability to be linked up, like—I mean, you and I coulda done this through e-mail, and I never woulda had to meet you, and that woulda been easier for me. Right?

Like, at a certain point, we're gonna have to build some machinery, inside our guts, to help us deal with this. Because the technology is just gonna get better and better and better and better. And it's gonna get easier and easier, and more and more convenient, and more and more pleasurable, to be alone with images on a screen, given to us by people who do not love us but want our money. Which is all right. In low doses, right? But if that's the basic main staple of your diet, you're gonna die. In a meaningful way, you're going to die."

What is the realest fake thing we've ever made on purpose? For as long as I can remember, whenever I watch any scripted TV show, part of my consciousness interrogates its relationship to reality. Could this happen? Does this look the way it would actually look? Does this work the way it would actually work? It does not matter if the details are factually impossible—if I'm watching *Game of Thrones*, I can readily accept that dragons exist. Yet I still wonder if the dragons on my TV are behaving in the way I believe real dragons would behave in reality. I still question the veracity of those dragons, and I instinctively analyze the real-world

plausibility of a scenario that's patently impossible. This is just the way I am, and I never had to try. So I am ready for this question.

We're not supposed to think about TV in this way. Television critics who obsess over the authenticity of picayune narrative details are like poetry professors consumed with penmanship. To attack *True Detective* or *Lost* or *Twin Peaks* as 'unrealistic' is a willful misinterpretation of the intent. We don't need television to accurately depict literal life, because life can literally be found by stepping outside. Television's only real-time responsibility is to entertain. But that changes as years start to elapse. We don't reinvestigate low culture with the expectation that it will entertain us a second time—the hope is that it will be instructive and revelatory, which sometimes works against the intentions of the creator.

Take, for example, a series like *Mad Men*: Here was a show set in the New York advertising world of the 1960s, with a dogged emphasis on precise cultural references and era-specific details. The unspoken goal of *Mad Men* was to depict how the sixties really were. And to the present-day *Mad Men* viewer, that's precisely how the show came across. The goal was achieved. But *Mad Men* defines the difference between ancillary verisimilitude and premeditated reconstruction. *Mad Men* cannot show us what life was like in the sixties. *Mad Men* can only show how life in the sixties came to be interpreted in the twenty-first century. Sociologically, *Mad Men* says more about the mind-set of 2007 than it does about the mind-set of 1967, in the same way *Gunsmoke* says more about the world of 1970 than the world of 1870. Compared to *The Andy Griffith Show* or *Gilligan's Island*, a mediated construct like *Mad Men* looks infinitely more authentic—but it can't be philosophically authentic, no matter how hard it tries. Its well-considered portrait of the sixties can't be more real than the accidental sixties rooted in any 1964 episode of *My Three Sons*. Because those 1964 accidents are what 1964 actually was.

My interest is utility. It's a formalist assessment, focusing on all the things a (normal) person is not supposed to (normally) be cognizant of while watching any given TV show. Particularly:

- The way the characters talk
- The machinations of the world the characters inhabit.
- The manner in which the show is filmed and presented
- The degree to which 'realness' is central to the show's ethos

That first quality is the most palpable and the least quantifiable. If anyone on a TV show employed the stilted, posh, mid-Atlantic accent of

stage actors, it would instantly seem preposterous; outside a few notable exceptions, the goal of televised conversation is fashionable naturalism. But vocal delivery is only a fraction of this equation. There's also the issue of word choice: It took decades for screenwriters to realize that no adults have ever walked into a tavern and said, "I'll have a beer," without noting what specific brand of beer they wanted (an interaction between Kyle MacLachlan and Laura Dern in the 1986 theatrical film *Blue Velvet* is the first time I recall seeing the overt recognition of this). What's even harder to compute is the relationship between a period's depiction of conversation and the way people of that period were talking in real life. Did the average American father in 1957 truly talk to his kids the way Ward Cleaver talked to Wally and the Beaver? It doesn't seem possible—but it was, in all likelihood, the way 1957 suburban fathers imagined they were speaking.

I classify "the machinations of the world" as the unspoken, internal rules that govern how characters exist. When these rules are illogical, the fictional world seems false; when the rules are rational, even a sci-fi fantasy realm can seem plausible. Throughout the 1970s, the most common narrative trope on a sitcom like *Three's Company* or *Laverne and Shirley* was "the misunderstanding"—a character infers incorrect information about a different character, and that confusion drives the plot. What always felt unreal about those scenarios was the way no one ever addressed these misunderstandings aloud, even when that was the obvious solution. The flawed machinations of the seventies sitcom universe required all misunderstandings to last exactly twenty-two minutes.

But when a show's internal rules are good, the viewer is convinced that they're seeing something close to life. When the rom-com series *Catastrophe* debuted on Amazon, a close friend tried to explain why the program seemed unusually true to him. "This is the first show I can ever remember," he said, "where the characters laugh at each other's jokes in a non-obnoxious way." This seemingly simple idea was, in fact, pretty novel—prior to *Catastrophe*, individuals on sitcoms constantly made hilarious remarks that no one seemed to notice were hilarious. For decades, this was an unspoken, internal rule: No one laughs at anything. So seeing characters laugh naturally at things that were plainly funny was a new level of realness.

The way a TV show is photographed and staged—this is point number three—are industrial attributes that take advantage of viewers' preexisting familiarity with the medium: When a fictional drama is filmed like a news documentary, audiences unconsciously absorb the action as extra-authentic; a scene shot from a single mobile perspective, like most of *Friday Night Lights*, always feels closer to reality than scenes captured with three stationary cameras, like most of *How I Met Your Mother*. It's a technical choice that

aligns with the fourth criterion, the extent to which the public recognition of authenticity informs the show's success (a realization that didn't happen in earnest until the 1980s, with shows like *Hill Street Blues*). Now, it's possible that—in two-hundred-fifty years—those last two points may be less meaningful to whoever is excavating these artifacts. Viewers with no relationship to TV won't be fooled by the perspective of the camera, and people living in a different time period won't intuitively sense the relationship between the world they're seeing and the world that was. But these points will still matter a little, because all four qualities are interrelated. They amplify each other. And whatever television program exemplifies these four qualities most successfully will ultimately have the most usefulness to whatever future people end up watching them. For these (yet-to-be-conceived) cultural historians, TV will be a portal into the past. It will be a way to psychically contact the late twentieth century with an intimacy and depth that can only come from visual fiction, without any need for imagination or speculation. It won't be a personal, interpretive experience, like reading a book; it will be like the book is alive. Nothing will need to be mentally conjured. The semi-ancient world will just be there, moving and speaking in front of them, unchanged by the sands of time.

All of which leads to one central question: What TV show will this be?

Removed from context, it's a question that can also be asked like this: What is the realest fake thing we've ever made on purpose?

But I know this matters. I know there is something critical here we're underestimating, and it has to do with television's ability to make the present tense exist forever, in a way no other medium ever has. It's not disposable, even if we want it to be. And someday, future potatoes will prove this.

Writing a blog and writing a book have almost no psychological relationship. They both involve a lot of typing, but that's about as far as it goes. A sentence in a book may be written a year before it's published, with the express intent that it will still make sense twenty years later. A sentence on the Internet is designed to last one day, usually the same day it's written. The next morning, it's overwritten again (by multiple writers). The Internet experience is not even that similar to daily newspaper writing, because there's no physical artifact to demarcate the significance of the original moment.

This limitation is not a failure. It proved to be an advantage. It naturally aligns with the early-adoption sensibility that informs everything else. Even when the Internet appears to be nostalgically churning through the cultural past, it's still hunting for 'old newness.' A familiar video clip from 1986 does not possess virality; what the medium desires is an obscure clip from 1985

that recontextualizes the familiar one. The result is a perpetual sense of now. It's a continual merging of the past with the present, all jammed into the same fixed perspective. This makes it seem like our current, temporary views have always existed, and that what we believe today is what people have always believed. There is no longer any distance between what we used to think and what we currently think, because our evolving vision of reality does not extend beyond yesterday. And this, somewhat nonsensically, is how we might be right: All we need to do is convince ourselves we always were. And now there's a machine that makes that easy.

"I am often wrong," wrote satirist and critic H. L. Mencken, a statement that would seem more disarming were it not for the fact that Mencken so often opened his quotations by suggesting his forthcoming thoughts were worthless.

"My prejudices are innumerable, and often idiotic. My aim is not to determine facts, but to function freely and pleasantly."

I get this. I understand what he's getting at, and sometimes I relate to it: Since our interior thoughts are (ultimately) arbitrary and meaningless, we might as well think whatever we prefer thinking. This was especially important to a guy like Mencken, who was against US participation in World War II and hated Franklin Roosevelt. He was quite willing to concede that his most intensely held opinions weren't based on factual data, so trying to determine what the factual data actually was would only make him depressed. It's a worldview that—even if expressed as sarcasm—would be extremely unpopular today. But it's quietly become the most natural way to think about everything, due to one sweeping technological evolution: We now have immediate access to all possible facts. Which is almost the same as having none at all.

Consider the nature of revisionism. He noted how—as a fifth-grader—he was told that the cause of the Civil War was slavery. Upon entering high school, he was told that the cause was not slavery, but economic factors. At college, he learned that it was not economic factors but acculturated regionalism. But if he had gone to graduate school, the answer to what caused the Civil War would (once again) be slavery. Now, the Civil War is the most critical event in American history, and race is the defining conflict of this country. It still feels very much alive, so it's not surprising that teachers and historians want to think about it on disparate micro and macro levels, even if the realest answer is the simplest answer. But the Internet allows us to do this with everything, regardless of a subject's significance. It can happen so rapidly that there's no sense the argument has even evolved, which generates an illusion of consistency.

There's a common philosophical debate about the nature of time. One side of the debate argues that time is happening in a linear fashion. This is easy to understand. The other side argues that all time is happening at once. This is difficult to comprehend. But replace the word 'time' with 'history,' and that phenomenon can be visualized on the Internet. If we think about the trajectory of anything—art, science, sports, politics—not as a river but as an endless, shallow ocean, there is no place for collective wrongness. All feasible ideas and every possible narrative exist together, and each new societal generation can scoop out a bucket of whatever antecedent is necessary to support their contemporary conclusions. When explained in one sentence, that prospect seems a little terrible. But maybe that's just because my view of reality is limited to river-based thinking.

During a period when many retired eighties-era pro wrestlers died—the Ultimate Warrior, Dusty Rhodes, Rowdy Roddy Piper, et cetera—the outpouring of media recognition regarding these deaths was significant. The obituaries framed these men as legends, and perhaps that's how they deserve to be framed. But what's been weird about this coverage is the unspoken viewpoint. Logically, it seems like a remembrance of Dusty Rhodes should include some version of the following: 'We didn't think this guy was important, but he was. Culturally, we were wrong about pro wrestling.' Because during the 1980s, almost no one thought pro wrestling mattered at all. Even the teenage males who loved it rarely took it seriously. But this is not how these remembrances were delivered. Instead, the unspoken viewpoint was of course these people were important, and of course we all accept and understand this, and of course there is nothing remotely strange about remembering Dusty Rhodes as a formative critic of Reagan-era capitalism. Somebody once believed this, which means it was possible for anyone to have believed this, which means everyone can retroactively adopt this view as what they've always understood to be true. No one was ever wrong about wrestling. We were always right about it.

Chapter Ten

Fame Fetish

“As a reporter, you live for those anecdotal mistakes. Mistakes are where you find hidden truths. But as a person, anecdotal mistakes define the experience of being misunderstood; anecdotal mistakes are used to make metaphors that explain the motives of a person who is sort of like you, but not really.”

Our need to feel social connection explains why people often embellish their relationships with other people. Every time you think of celebrities as close friends or imagine that you and your hunky mail carrier have a deep personal connection, you are creating what are called “parasocial relationships.” Unlike normal two-sided relationships, parasocial relationships are felt by only one person—but to that one person they are undoubtedly real, even when they involve characters on TV. Loneliness makes people imagine a loving bond with other minds, and this love can make even imaginary minds real.

Somehow, somewhere along the line, our natural inclination to learn from the most successful among us got twisted into doomed attempts to emulate people who might as well be mythic figures. The most famous actors have personal trainers, teams of graphic designers, and PR representatives whose sole goal is to hide every sign of aging and unmarketable personal habit from public view. No amount of crunches and face-lifts will turn you into a myth, or a god, and yet that’s what our most famous people have become.

When the old gods withdraw, the empty thrones cry out for a successor, and with good management, or even without management, almost any perishable bag of bones may be hoisted into the vacant seat.

“Other gods are either far away, or do not have ears, or do not exist, or pay no attention to us, whereas you we see present, not wooden or stone but real.”

We must draw a distinction between what might be called honest illusions and dishonest ones. When you make dinosaurs attack spaceships, no one

actually thinks that's real. Much as with a stage magician, half the fun is that everyone knows a trick is being played—they just don't know exactly how it's done. When you subtly enhance the appearance of celebrities, in contrast, you are trying to change viewers' unconscious assumptions about what everyday reality—in this case, of men's and women's bodies—ought to be like, so as to create an uncomfortable feeling that their lived reality is itself an inadequate substitute for the real thing. Where honest illusions add joy into the world, dishonest ones are intentionally aimed toward convincing people their worlds are a tawdry and miserable sort of place.

The fetish of celebrity permeates our own social lives, now that we are able to gaze at the carefully curated images and utterances of people we are actually acquainted with.

Whatever happens in the wiring of a brain that allows a young child to so easily pick up a second language, the digital natives have acquired a new way of absorbing and interacting with our wholly digital world.

“Social media has completely shaped the brains of the younger people I work with. One thing I am often mindful of in a session is this: I could be five or ten minutes into a conversation with a young person about the argument they have had with their friend or girlfriend, when I remember to ask whether this happened by text, phone, on social media, or face-to-face. More often the answer is, ‘text or social media.’ Yet in their telling of the story, this isn't apparent to me. It sounds like what I would consider a ‘real,’ face-to-face conversation. I always stop in my tracks and reflect. This person doesn't differentiate various modes of communication the way I do. The result is a landscape filled with disconnection and addiction.”

Our understanding of addiction is too narrow. We tend to think of addiction as something inherent in certain people—those we label as addicts. Heroin addicts in vacant row houses. Chain-smoking nicotine addicts. Pill-popping prescription-drug addicts. The label implies that they're different from the rest of humanity. They may rise above their addictions one day, but for now they belong to their own category. In truth, addiction is produced largely by environment and circumstance. Steve Jobs knew this. He kept the iPad from his kids because, for all the advantages that made them unlikely substance addicts, he knew they were susceptible to the iPad's charms. These entrepreneurs recognize that the tools they promote—engineered to be irresistible—will ensnare users indiscriminately. There isn't a bright line

between addicts and the rest of us. We're all one product or experience away from developing our own addictions.

To put it bluntly, if I kidnap you, tie you down, and shoot you up with heroin for two months, I can create physical dependence and withdrawal symptoms—but only if you go out and use after I free you will you actually become an addict. Addiction isn't about breaking your brain, or hijacking your brain, or damaging your brain. People can be addicted to behaviors, and even to the experience of love. Addiction is really about the relationship between the person and the experience. It isn't enough to ply someone with a drug or a behavior—that person also has to learn that the experience is a viable treatment for whatever ails them psychologically.

Wanting is much harder to defeat than liking. When people make decisions, they privilege wanting over liking. Wanting is much more robust and big and broad and powerful. Liking is anatomically tiny and fragile—it's easily disrupted and it occupies only a very small part of the brain. In contrast, it's not easy to disrupt the activation of an intense want.

There is an extremely simple, highly amusing, and instructive parlor game which can be played at any party by arranging for the auction of a dollar. The auctioneer auctions off a dollar bill to the highest bidder, with the understanding that both the highest bidder and the second highest bidder will pay. If one person is willing to pay eighty cents for the dollar bill, and another person, the second-highest bidder, is willing to pay seventy cents, the auctioneer takes in one dollar and fifty cents—a tidy profit of fifty cents. Both bidders pay, but only the highest bidder gets the dollar bill. This is a great deal, obviously, because she's paying eighty cents for a bill that's literally worth a dollar. For the second-highest bidder, though, it's a terrible deal. He pays seventy cents for precisely nothing.

I played this game in my lecture, but I auctioned off a twenty-dollar bill. Bids started at one dollar, and rose in increments of one dollar. A dozen voices immediately shouted “one dollar!” because paying a dollar for a twenty-dollar bill is a great investment. I heard “two dollars!” and then “three dollars!” Some of the students stopped bidding early on, but others continued past ten dollars, on toward the magic twenty-dollar mark.

When you watch people taking part, you can see on their faces the exact moment when they realize that the game is a trap. When the number of active bidders inevitably drops to just two, one of those people has to pay for absolutely nothing. For example:

Person A: Sixteen dollars!

Person B: Seventeen dollars!

... *pause*...

Person A: Eighteen dollars!

Person B: Nineteen dollars!

Were this a normal auction, the game would end here. There's no reason for Person A to shout out 'Twenty dollars!' unless he really doesn't like Person B and would rather make zero profit—paying twenty dollars for a twenty-dollar bill—than watch Person B earn a dollar.

But this is a trap, and so the bidding escalates:

Person A: Twenty dollars!

... *pause*...

Person B: Twenty-one dollars!

... *longer pause*...

Person A: Twenty-two dollars!

... *even longer pause*...

Person B (*more quietly*): Twenty-three dollars.

Sometimes the game goes on to triple or even quadruple the bill's worth.

No one wants to pay a huge sum of money for nothing, which makes the Twenty Dollar Auction Game a terrific way to raise money for charity. The Dollar Auction game shows that an early hook fuels many addictive behaviors. The experience seems innocuous at first, but eventually you realize that things might end badly. For the students, the hook was the slim chance of winning twenty dollars at a heavy discount.

Humans learn empathy and understanding by watching how their actions affect other people. Empathy can't flourish without immediate feedback, and it's a very slow-developing skill.

When a society churns out millions of lonely, overworked children, why wouldn't they turn to a boundless source of companionship and escape? That seems like a rational response to their disaffection. What brings about their undoing isn't that they're suffering from a disease, but rather that this digital world is so clearly superior to the real world they're supposed to be inhabiting instead. The teens themselves recognize this. They're sophisticated in ways that escape the adults who grew up in a relatively primitive world.

Some argue that social media creates a "Filter Bubble." The platform's algorithms supply us with the material that we like to read and will feel

moved to share. It might seem easy to see the intellectual and political perils of this impulse. The algorithms unwittingly supply readers with texts and videos that merely confirm deeply felt beliefs and biases; the algorithms suppress contrary opinions that might agitate a user. Liberals are deluged with liberal opinions; vegetarians are presented with endless vegetarian agitprop; the alt-right is fed alt-right garbage; and so on. The algorithms shield us from the sort of challenging disagreement that might change our minds or help us to better understand the views of our fellow citizens.

But, is the change not simply that there are now more diverse bubbles? How was the domination of media by a select few corporations not at least as bad? The establishment has always forced bubbles onto the masses, however now the masses have a chance to break free of that. Of course the danger does exist of creating one's own bubble, but this is clearly still better than having one involuntarily imposed on you. What many seem to in fact be objecting to is the democratization of gatekeeping.

There are two distinct kinds of social media, one is real names and the other is avatar based. The real name one is the one that causes the problems because it focuses on attacks on real people and peer pressure marketing and other addictive elements—really quite bad, in the way it is applied—that are actively socially evil. Pseudonym-based social media is entirely different, right off the bat, no real names, all effectively make believe and anonymous, just people making up stuff and playing with social media.

Real name social media pretends to be The News rather than a fabrication of the news—marketing made to look like news—and the fake identities of influencers who the person portrays themselves as, rather than how they really are. They are in reality the for-profit publishers of propaganda, marketing lies as the truth. As publishers should be held fully legally liable for the content they publish. With avatar based social media, from the start, the identity is specifically and purposefully fake, a thing to play with on social media, it is not your identity, it is its own fantasy play identity.

So the comparison, one for fun and play, essentially the core truth or fiction as the players choose to play; the other, a hostile den of hate and lies, where people attack each other, where corporate PR fakes troll forums with their lies, where politicians pretend to be someone they are not, where lies are wall to wall, pretending to be the truth, a sick exercise in psychopathic marketing. Go to real name social media to torture yourself, to addict yourself to little natural opioid hits of empty fake approval. You are the dog repeatedly kicked who desperately keeps going back for the entirely fake pat because it's all you seem to have.

People often say that online behavior would improve if every comment system forced people to use their real names. It sounds like it should be

true—surely nobody would say mean things if they faced consequences for their actions? Yet the balance of experimental evidence over the past thirty years suggests that this is not the case. Not only would removing anonymity fail to consistently improve online community behavior—forcing real names in online communities could also increase discrimination and worsen harassment. We need to change our entire approach to the question. Our concerns about anonymity are overly-simplistic; system design can't solve social problems without actual social change.

The idea that anonymity is the real problem with the internet is based in part on misreadings of theories formed more than thirty years ago. In the early 1980s, many executives were unsure if they should allow employees to use computers and email. Managers worried that allowing employees to communicate across the company would enable labor organizing, conflict, and inefficiency by replacing formal corporate communication with informal digital conversations. As companies debated email, a group of social psychologists published experiments and speculations on the effects of “computer-mediated communication” in teams. Their articles inspired decades of valuable research and offered an early popular argument that anonymity might be a source of social problems online.

In one experiment, the researchers asked computer science students who were complete strangers to make group decisions about career advice. They hosted deliberations around a table, through anonymous text chat, or through chat messages that displayed names. They also compared real-time chat to email. They found that while online decisions were more equitable, the decisions also took longer. Students also used more swear words and insults in chat conversations on average. But the researchers did not find a difference between the anonymous and non-anonymous groups. Writing about unanswered questions for future research, they speculated in 1984 that since computers included less information on social context, online communications might increase social conflict and disputes with employers. As these speculations became cited thousands of times, the call for more research was often taken as scientific fact. Their later, correlational findings were also misinterpreted as true effects. Along the way, their nuanced appeal for changes in social norms was lost and two misconceptions became common:

1. Social problems could be attributed to the design of computer systems.
2. Anonymity is to blame.

These ideas aren't reflected in the research. In 2016, a systematic review of 16 lab studies found that on average, people are actually more sensitive

to group norms when they are less identifiable to others. While some non-causal studies have found associations between anonymity and disinhibited behavior, this correlation probably results from the technology choices of people who are already intending conflict or harm.

Under lab conditions, people do behave somewhat differently in conversations under different kinds of social identifiability, something psychologists call a “deindividuation effect.” Despite the experimental evidence, the misconception of online anonymity as a primary cause of social problems has stuck. Since the 1980s, anonymity has become an easy villain to blame for whatever fear people hold about social technology, even though lab experiments now point in a different direction.

Beyond the lab, what else does research tell us about information disclosure and online behavior? Roughly half of US adult victims of online harassment already know who their attacker is, according a nationally-representative study in 2014. The study covered a range of behaviors from name calling to threats and domestic abuse. Even if harassment related to protected identities could be “solved” in one effort to move to ‘real names,’ more than half of US harassment victims, over 16 million adults, would be unaffected.

Conflict, harassment, and discrimination are social and cultural problems, not just online community problems. In societies including the US where violence and mistreatment of women, people of color, and marginalized people is common, we can expect similar problems in people’s digital interactions. Lab and field experiments continue to show the role that social norms play in shaping individual behavior; if the norms favor harassment and conflict, people will be more likely to follow. While most research and design focuses on changing the behavior of individuals, we may achieve better results by focusing on changing climates of conflict and prejudice.

Revealing personal information exposes people to greater levels of harassment and discrimination. While there is no conclusive evidence that displaying names and identities will reliably reduce social problems, many studies have documented the problems it creates. When people’s names and photos are shown on a platform, people who provide a service to them—drivers, hosts, buyers—reject transactions from people of color and charge them more. Revealing marital status on DonorsChoose caused donors give less to students with women teachers, in fields where women were a minority. Gender- and race-based harassment are only possible if people know a person’s gender and/or race, and real names often give strong indications around both of these categories. Requiring people to disclose that information forces those risks upon them.

Companies that store personal information for business purposes also

expose people to potentially serious risks, especially when that information is leaked. In the early 2010s, poorly-researched narratives about the effects of anonymity led to conflicts over real-name policies known as “Nymwars.” This provided the justification for more advanced advertising-based business models to develop, which collect more of people’s personal information in the name of reducing online harm. Several high-profile hackings of websites have revealed the risks involved in trusting companies with your personal information.

We also have to better understand if there is a trade-off between privacy and resources for public safety. Since platforms that collect more personal information have high advertising revenues, they can hire hundreds of staff to work on online safety. Paradoxically, platforms that protect people’s identities have fewer resources for protecting users. Since it’s not yet possible to compare rates of harassment between platforms, we cannot know which approach works best on balance.

It’s not just for trolls: identity protections are often the first line of defense for people who face serious risks online. According to a US nationally-representative report by the Data & Society Institute, 43% of online harassment victims have changed their contact information and 26% disconnected from online networks or devices to protect themselves. When people do withdraw, they are often disconnected from the networks of support they need to survive harassment. Pseudonymity is a common protective measure. One study on the reddit platform found that women, who are more likely to receive harassment, also use multiple pseudonymous identities at greater rates than men.

Requirements of so-called “real names” misunderstand how people manage identity across multiple social contexts, exposing vulnerable people to risks. Teenagers commonly manage multiple nickname-based Facebook accounts for different social contexts. Requiring a single online identity can collapse those contexts in embarrassing or damaging ways. In one instance a college admissions officer considered rejecting a black applicant after seeing gang symbols on the student’s social media page. The admissions officer hadn’t considered that the symbols might not have revealed the student’s intrinsic character; posting them might have been a way to survive in a risky situation. People who are exploring LGB and transgender identities often manage multiple accounts to prevent disastrous collapses of context, safety practices that some platforms disallow.

Clear social norms can reduce problems even when people’s names and other identifying information aren’t visible. Social norms are our beliefs about what other people think is acceptable, and norms aren’t de-activated by anonymity. We learn them by observing other people’s behavior and

being told what's expected.

People sometimes reveal their identities during conflicts in order to increase their influence and gain approval from others on their side. News comments, algorithmic trends, and other popular conversations often become networked battlegrounds, connected to existing conflict and discussions in other places online. Rather than fresh discussions whose norms you can establish, these conversations attract people who already strongly identify with a position and behavior elsewhere, which means that these large-scale struggles are very different from the small, decision-making meetings tested in anonymity lab experiments. Networks of “counterpublics” are common in democracies, where contention is a basic part of the political process. This means that when people with specific goals try to reframe the politics of a conversation, they may gain more influence by revealing their preexisting social status. For example, in high-stakes discussions like government petitions, one case study from Germany found that aggressive commenters were more likely to reveal their identity than stay anonymous, perhaps in hopes that the comments would be more influential.

Abusive communities and hate groups do sometimes attempt to protect their identities, especially in cultures that legally protect groups while socially sanctioning them. But many hate groups operate openly in the attempt to seek legitimacy. Even in pseudonymous settings, illegal activity can often be traced back to the actors involved, and companies can be compelled by courts to share user information, in the few jurisdictions with responsive law enforcement. Yet law is reactive and cannot respond to escalating risks until something happens. In pseudonymous communities that organize to harm others, social norms are no help because they encourage prejudice and conflict. Until people in those groups break the law, the only people capable of intervening are courageous dissenters and platform operators.

Advocates of real-name policies understand the profound value of working on preventing problems, even if the balance of research does not support their beliefs. Designers can become seduced by the technology challenges of detecting and responding to problems; we need to stop playing defense. Designers need to see beyond cultural assumptions. Many of the lab experiments on ‘flaming,’ ‘aggression,’ and ‘anonymity’ were conducted among privileged, well-educated people in institutions with formal policies and norms. Such people often believe that problem behaviors are non-normative. But prejudice and conflict are common challenges that many people face every day, problems that are socially reinforced by community and societal norms. Any designer who fails to recognize these challenges could unleash more problems than they solve.

Designers need to acknowledge that design cannot solve harassment

and other social problems on its own. Preventing problems and protecting victims is much harder without the help of platforms, designers, and their data science teams. Yes, some design features do expose people to greater risks, and some kinds of nudges can work when social norms line up. But social change at any scale takes people, and we need to apply the similar depth of thought and resources to social norms as we do to design.

Finally, designers need to commit to testing the outcomes of efforts at preventing and responding to social problems. These are big problems, and addressing them is extremely important. The history of social technology is littered with good ideas that failed for years before anyone noticed. The idea of removing anonymity was on the surface a good idea, but published research from the field and the lab have shown its ineffectiveness. By systematically evaluating your design and social interventions, you too can add to public knowledge on what works, and increase the likelihood that we can learn from our mistakes and build better systems.

Prairie dogs have more in common with redwood trees and bison than the casual observer might guess. All three thrived in great numbers before the European invasion of North America; all three suffered severe decreases in their population at the hands of the newcomers, declining by 96–99%; and all three are still, incredibly, under assault.

The redwoods covered about 2,000,000 acres in 1850, from Monterey County in California to the Chetco River in Oregon. Now, only a few isolated islands remain. Despite this, the Redwoods still need to be defended.

The bison's range once stretched from Idaho to Virginia, and Minnesota to Texas, and the animals numbered 25–30 million. By 1890, settlers had hunted them down to a few hundred. The famous Yellowstone herd, which is based out of the national park, is descended from just 23 individuals and currently numbers less than 5000. Despite this, some are still captured and sent out of the park for slaughter each year.

Prairie dogs are a keystone species originally found throughout the Great Plains and Rocky Mountain states of the US. Though once quite common, over the past century their population has plunged by over 98% due to the activities of the US Occupation, with cascading effects to other fauna and flora. Despite this, they too still need to be defended.

Prairie dogs differ from the Redwood and the Bison in one important aspect: unlike the previous two, they enjoy very little legal protection. Only two of the five species of prairie dog are officially listed as under threat, but these laws are rarely enforced. The US Fish and Wildlife Service has so far turned down all petitions to list the other three species. At the local level, few pro-prairie dog laws exist and in fact some counties actually require the eradication of prairie dogs on private land.

So killing prairie dogs is still a common occurrence. For instance, in Longmont, Colorado, a prairie dog colony was exterminated for no urgent reason and against the wishes of local residents. It was this story that brought the plight of the prairie dogs to my attention and inspired me to investigate further.

Prairie dogs are classified into five different species in the genus *Cynomys*, of which four are found in the United States: Gunnison's prairie dog (*C. gunnisoni*), the white-tailed prairie dog (*C. leucurus*), the black-tailed prairie dog (*C. ludovicianus*) and the Utah prairie dog (*C. parvidens*). The fifth species, the Mexican prairie dog (*C. mexicanus*) is only found south of the border. Of these, only two have conservation status: the Utah is "threatened" under the US Endangered Species Act and the Mexican is designated "endangered" by CITES.

Prairie dogs are mostly herbivorous, living off of leaves and seeds, though they sometimes also eat insects. Prairie dogs are a keystone species, meaning that they have a disproportionately large effect in their ecosystem relative to their abundance. In fact, over 200 vertebrate species and a number of invertebrate species are directly or indirectly dependent on prairie dogs for their own survival. For example, over 90% of the diet of black-footed ferrets (*Mustela nigripes*) is prairie dog, and their numbers fell to a low of 18 individuals in 1986 due to the decline in their food source.

Additional predators who consume prairie dogs are foxes, coyotes, badgers, eagles, and red-tailed hawks. Still other animals nest or shelter in prairie dog burrows, permanently or temporarily, including burrowing owls, mountain plovers, rattlesnakes, salamanders, turtles, and rabbits.

Prairie dogs also have a significant effect on the plants in their range. Their selective foraging promotes a high diversity of plant species, which is appreciated by other browsing herbivores such as bison and pronghorn antelope.

The burrowing activity of the prairie dog positively affects soil structure and health through aeration and by helping rainwater to percolate into it and be retained. This boosts the growth of flowering plants, which in turn benefits insects, birds, and other creatures.

Prairie dogs are social animals who live in colonies that people call "towns." Each town is made up of several to many groups. Each group is comprised of one to several adult females and zero to several adult males plus their offspring. Each group has its own territory which is staunchly defended by males and females alike.

Females are fertile for only about five hours on one day a year in the spring. They bear litters of 4–5 babies and, like cats, there is multiple paternity within each litter. That is, the female can be impregnated by

multiple fathers. Though the young reach maturity in three months, about half of them typically die before reaching breeding age themselves.

Within groups, individuals express a variety of social behaviors including chittering, kissing, and in the case of black-tailed prairie dogs, monkey-like communal grooming. Perhaps most impressive, though, is prairie dog language. Researchers studying the alarm calls made by Gunnison's prairie dog have led to fascinating findings.

First, they noticed that prairie dogs seemed to be making different alarm calls depending on what predator was approaching. So they recorded audio of a variety of calls along with video of the escape responses that followed them. Then the researchers played back the recordings in the field and were able to confirm through observation that calls consistently correlated with responses.

Next, using computer-generated sonograms, they measured the frequency and time values of the pattern of chirps within each call. This was painstaking work, as each individual chirp is only about 1/10th of a second in length. But the labor paid off.

What researchers found was that alarm calls describe individual predators based not only on species—such as coyote, human, hawk, or domestic dog—but had additional signifiers for attributes such as size, shape, and color. For example, differently sized and colored dogs got different calls. So did a human wearing a blue shirt versus the same human wearing a yellow shirt. The structures of the calls, then, are analogous to the nouns and adjectives of human language.

Even abstract shapes were greeted by different sounds, as found when they presented the prairie dogs with illustrations of a circles, triangles, or a colored oval. In these cases, the prairie dogs were describing to each other things that they had never seen before.

In a further parallel to human language, researchers discovered that the same sounds were vocalized with different “dialects” or “accents” by Gunnison's prairie dogs throughout their range around the Four Corners area. After examining sonograms of the calls of other species of prairie dog, the scientists tentatively concluded that they contrast enough from each other to constitute separate languages that would be comprehensible only to their native speakers. Researchers compared this to the differences among human languages such as English, Spanish, French, et cetera.

“Prairie dog language is, at the present time, the most sophisticated animal language that has been decoded.”

The vast majority of the Europeans who participated in the invasion of North America did not have the same interest or respect for prairie dogs.

Violence has been the far more usual hallmark of interaction. The main threats to prairie dogs have been agriculture, development, and introduced disease. It's also been common to shoot them for sport as a form of target practice.

Farmers have long killed prairie dogs because they forage on a wide variety of vegetation in their environs, which includes crops if they are planted in prairie dog territory.

Ranchers have targeted them under the false beliefs that domesticated animals break their legs in the holes (which has never been documented) and that in competing for vegetation with prairie dogs, domesticated animals suffer. This second point is highly debatable. No real evidence exists proving it. Furthermore, bison, who have a diet similar to cows, suffered no apparent adversity from sharing habitat with the prairie dog for millennia. In fact, bison have shown a preference for grazing on the edges of prairie dog towns.

As for development, it's an unfortunate fact for the prairie dogs that they've simply been in the way of urban sprawl. They make their towns on flat, open spaces that are also ideal for houses, malls, and parking lots. Prairie dog towns have also fallen victim to resource extraction activities such as fracking and oil-drilling. Solar and wind farms would also disrupt or destroy their habitat of course.

A large number of prairie dogs have died of the plague, which entered the US in 1900. Carried by fleas, it rapidly spread through many wildlife populations. Unfortunately for prairie dogs, they are particularly susceptible and 90–100% in a town die within two weeks of its introduction.

Human extermination of prairie dogs over the last century has been accomplished through land-clearing, firearms, poison, and explosive gas. These methods are variously quick or agonizing, which is to say more or less “humane.”

One of the most brutal methods is to gas them with aluminium phosphide, an inorganic compound that is lethal to most animals including humans. It is sold under various brand names such as Fumitoxin, Weevilcide, and Phostoxin. Aluminium phosphide is what was used to attack the colony at Longmont, Colorado, on the morning of Friday, November 10th, 2017.

“Four men working for Rocky Mountain Wildlife Services (not to be confused with the Dept of Ag's Wildlife Services but still as vile and heinous) set out to methodically place paper doused in fumitoxin in the homes of over 300 prairie dogs, just so a development company could be spared from humanely relocating them to another place. This colony resided on the edge of open space and habitat to an array of other beautiful and majestic

species, some threatened like the burrowing owl and a family of bald eagles. There are also other bird species like falcons and hawks and of course, along with raccoons, fox, coyote, and the list goes on.”

Fumitoxin is a poison that, once ingested, causes that living being to bleed out, destroying the internal organs. It is an inhumane, slow, and painful death. As bad as this is, it’s worse once you know the backstory. This wasn’t a case of prairie dogs being killed for an imminent construction project or agricultural endeavor, as poor as these excuses would be, given our over-built, over-farmed environment. No, apparently the motivation was, at least in part, real life hatred for prairie dogs and the humans who defend them.

The City of Longmont actually has a law on the books that requires developers to “make a good faith effort” to relocate prairie dogs. Doing so is a part of the permitting process for approving new construction. The developer in this instance was Sun Construction, owned by Steve Strong and Andy Welch, who, as we shall see, are the villains in this tale.

Relocating prairie dogs is not easy. Challenge #1 is finding an appropriate chunk of real estate where the prairie dogs will be welcome. Challenge #2 is winning the approval of the County Commissioners of the receiving county. Challenge #3 is the official blessing of Colorado Parks & Wildlife (CPW), which requires that the developer submit a Wild To Wild Relocation application. Then there are the logistics of the relocation process itself, such as prepping the new spot and trapping the prairie dogs at the old one, et cetera.

Prairie Protection Colorado (PPC) took care of Challenge #1: They found enthusiastic hosts at the Rocky Flats Wildlife Refuge, which is actively seeking prairie dogs as part of restoring a healthy prairie ecosystem that could support the reintroduction of black-footed ferrets. Refuge staff “felt confident” that the commissioners of Jefferson County would sign off on the relocation since the refuge is on federal land, which would cover Challenge #2.

Unfortunately, this left Challenge #3—submitting the paperwork—in the hands of Sun Construction. First they asked the city for a waiver from the relocation requirement. When the city refused, Sun pulled their application to develop the property, even though this meant giving up on a seven-figure project. This left them legally free to exterminate the prairie dogs. Which they did, on November 10th, as told above.

So why did Steve Strong and Andy Welch and Sun Construction kill all the prairie dogs? The way PPC set up the relocation deal financially, it

would not have cost more than extermination. But money was clearly not their primary concern since they were willing to let go of a big project rather than take the simple step to save the animals. This is aberrant behavior for Capitalists. When you can't count on corporations to follow the profit motive, how else do you explain their behavior?

“It is very clear that the killing of 300 animals, in broad daylight, in the middle of Longmont by a barbaric poison was meant as a message to advocates. After all, they are not even developing this parcel; there was no reason to kill these animals.”

What we see in the slaughter of these innocents in Colorado is the same thing that drives the annual massacre of Yellowstone bison and the continued logging of redwood trees. Yes, there is greed, but there is more than that, too. There is also naked hatred.

After the extermination, Prairie Protection Colorado published three different posts about the event on their Facebook page. These posts included Sun Construction's publicly advertised contact information, including their phone number (303-444-4780), email address (info@sunconstruction.com), and their web address (sunconstruction.com). Also named were Steve Strong and Andy Welch, whose role as owners is also a matter of public record.

Soon afterwards, Facebook deleted one of the posts and sent a warning to PPC that they would unpublish their entire page if they didn't voluntarily delete any other posts similar to it. So PPC removed the other two posts and reposted new stories without the contact information, along with the following notice:

“Facebook has required us to remove several posts due to concerns that they don't conform to FB's community standards. We have done so and apologize for any inconvenience this may have caused our followers.”

Two days later, they added:

“Sun Construction's owners are watching this page, and they obviously reported our content to Facebook which resulted in our having to remove posts naming them as the individuals that called for this inhumane and horrific mass annihilation.”

Here we see one of the serious issues with using Facebook for political activism. Although social media is de facto the public realm the way it is treated by its users, it is not so de jure, that is, according to the law. In the

real world, Strong and Welch might not like having their names trumpeted in the town square, but unless a threat is being made against them or they are being slandered—neither of which was the case with PPC’s posts on Facebook—they have no legal recourse for complaint. They’ve simply got to grin and bear it. Of course, they can also make their case for their actions in the same square. These are basic principles of free speech in an open society (which, yes, is under assault).

Facebook, on the other hand, is a privately owned virtual space that can and does police the speech of its users who have no legal recourse except to its Terms of Service. Whereas US Constitutional free speech has been subject to nearly constant refinement and redefinition through the courts over the decades—and so it is fairly clear at this point what it encompasses, for better or worse—Facebook’s terms are a matter of a corporate caprice. The terms are interpreted subjectively, by both people and by algorithms.

All of this is to say that two human beings, Steve Strong and Andy Welch, who orchestrated the painful deaths of close to 300 animals—of a species that has been driven to the edge of extinction—successfully requested that they not be named as the responsible parties in a *de facto* public forum by appealing to that forum’s “community standards.”

One might wonder which terms the Facebook moderators felt that PPC violated. Did they “bully, intimidate, or harass”? Was it “hate speech”? Or “misleading, malicious, or discriminatory”? We will probably never know, nor does PPC have a “right” to be informed.

In the real world, PPC certainly did none of those things, and Strong and Welch wouldn’t have a legal leg to stand on. But Facebook is not the real world and in the realm of social media, there are no rights. Their “community standards” might sound reasonable, but in reality they are no more than mealy-mouthed nonsense, precluding honest discourse and enforcing authoritarian conformity. Note how much of the terminology is borrowed from the language of identity politics, but is here turned on its head and used to protect the actions of the oppressor from the critique of the oppressed. Disgusting.

In the case of PPC and Sun Construction, an unequal power dynamic exists; you have mainstream corporate owners on one hand and marginal, underfunded activists on the other. It is essentially impossible for PPC to “bully” Sun. The same dynamic exists between Facebook itself and its individual users, but to a much greater degree. Sun’s Strong and Welch are, in the end, just individuals and if enough of their community—including friends and family—told them to shape up their act, they just might do it. Facebook, though, is operatively unassailable.

Liberalism has a particularly confused notion of ‘free will.’ Humans

obviously have a will, they have desires, and they are sometimes free to fulfil their desires. If by 'free will' you mean the freedom to do what you desire—then yes, humans have free will. But if by 'free will' you mean the freedom to choose what to desire—then no, humans have no free will. If I am sexually attracted to men, I may be free to realize my fantasies, but I am not free to feel an attraction to women instead. In some cases I might decide to restrain my sexual urges or even try a sexual conversion therapy, but the very desire to change my sexual orientation is something forced upon me by my neurons, egged on perhaps by cultural and religious biases. Why does one person feel ashamed of his sexuality and strives to alter it, while another person celebrates the same sexual desires without a trace of guilt? You can say that the former might have stronger religious feelings than the latter. But do people freely choose whether to have strong or weak religious feelings? Again, a person may decide to go to church every Sunday in a conscious effort to strengthen his weak religious feelings—but why does one person aspire to be more religious, while another is perfectly happy to remain an atheist? This may result from any number of cultural and genetic dispositions, but it is never the result of free will.

And in order to understand ourselves, a crucial step is to acknowledge that the 'self' is a fictional story that the intricate mechanisms of our mind constantly manufacture, update, and rewrite. There is a storyteller in my mind that explains who I am, where I am coming from, where I am heading to, and what is happening right now. Like the government spin doctors who explain the latest political upheavals, the inner narrator repeatedly gets things wrong but rarely, if ever, admits it. And just as the government builds up a national myth with flags, icons, and parades, so my inner propaganda machine builds up a personal myth with prized memories and cherished traumas that often bear little resemblance to the truth.

In the age of Facebook and Instagram you can observe this myth-making process more clearly than ever before, because some of it has been outsourced from the mind to the computer. It is fascinating and terrifying to behold people who spend countless hours constructing and embellishing a perfect self online, becoming attached to their own creation, and mistaking it for the truth about themselves. That's how a family holiday fraught with traffic jams, petty squabbles, and tense silences becomes a collection of beautiful panoramas, perfect dinners, and smiling faces; 99 percent of what we experience never becomes part of the story of the self.

It is particularly noteworthy that our fantasy self tends to be very visual, whereas our actual experiences are corporeal. In the fantasy, you observe a scene in your mind's eye or on the computer screen. You see yourself standing on a tropical beach, the blue sea behind you, a big smile on your

face, one hand holding a cocktail, the other arm around your lover's waist. Paradise. What the picture does not show is the annoying fly that bites your leg, the cramped feeling in your stomach from eating that rotten fish soup, the tension in your jaw as you fake a big smile, and the ugly fight the happy couple had five minutes ago. If we could only feel what the people in the photos felt while taking them!

Social media supposedly replaced cyberspace with something more “real,” but what it created in fact was just another realm of unreality, one that, on account of looking real, was more misleading. Here was a place where friends always congratulated and celebrated; where couples did little but eat at nice restaurants, go on vacation, or announce engagements or newborns; and where children never cried or needed diaper changes or hit each other. On social media, all happy families were alike; the others may have each been unhappy in their own way, but they were not on social media, or at least not popular. Of course, all human communication is slightly inauthentic, but in person or even on the telephone there are limits to our exaggerations. The sugared-cookie-cutter self-styling enabled by social media made America seem a Lake Wobegon online.

All desire is a desire to be, to enjoy an image of fulfillment such as we have observed in others. This is the essential problem with the preening self unbound by social media, and the democratization of fame. By presenting us with example upon example, it legitimates self-aggrandizement as an objective for ever more of us. By encouraging anyone to capture the attention of others with the spectacle of one's self—in some cases, even to the point of earning a living by it—it warps our understanding of our own existence and its relation to others. That this should become the manner of being for us all is surely the definitive dystopic vision of late modernity. But perhaps it was foretold by the metastatic proliferation of the attention merchants' model throughout our culture.

Calling it a business model as opposed to mere narcissism at least provides an excuse, insofar as many careers excuse what would otherwise be considered unhealthy or insane behavior.

Religious puritanism has a protective effect against celebrity worship. People who believe strongly in the rules prescribed by their deity have a clear guide for how they should live their lives. They don't feel as strong a need to look to the examples of other people.

One major traditional function of religion has been to help assuage and moderate the believer's fear of death. Belief in a God generally comes with a belief in some sort of afterlife. And as fewer and fewer of us believe in literal life after death, we start looking for a less literal sort of immortality: fame.

The truth is, whether you believe in a god or not, we're all looking for some sort of cheat sheet to the big existential questions. Why are we here? How should I act? What is it OK for me to have sex with? Even monkeys know those answers don't all come from within. And while some people get their answers from philosophy, from history, or from the admirable people in their own lives, a lot of us will always look to the person who seems to be having the most fun.

Researchers have devised two sentences to provoke what they call "mortality salience" in respondents. That's a fancy way of saying 'make them actively fear the reaper.' Once you've primed them with these lines:

1. "Please describe the emotions the thought of your own death arouses in you."
2. "Jot down, as specifically as you can, what you think will happen to you physically as you die and once you are physically dead."

Your subjects will feel their mortality is salient as shit, and presumably give you honest answers about how death's grim inevitability makes them feel.

On the playing field, every single mistake a player makes is pointed out and criticized until corrected. By design, on the field of real life, the athlete rarely faces similar accountability. Sadly, and too often with tragic repercussions, athletes don't distinguish right from wrong because they actually have no idea of what is right and what is wrong. Rules don't apply. Acceptable standards of behavior don't apply. Little infractions become bigger ones, and adults turn a blind eye. If someone gets into trouble, the first move is for an authority figure, usually in the form of a coach, to get them out of it. When that doesn't work, whether they're high school quarterbacks or pro-ball pitchers, one of two things happens. Sometimes, especially at the high school level, the community rallies around the accused, wanting to believe that "boys will be boys." We don't want to admit that in all these stories, it's not about the individual, or the individual sport, but about the culture we have allowed to grow around them. It is in vogue now to blame and condemn athletes. They should be held accountable for their behavior. But we are just as culpable, allowing them to exist in a realm all their own and not caring a bit about what we have turned them into—as long as they bring us victory.

Representative democracies are part of a personality driven celebrity culture where people are encouraged to support their chosen personalities or groups in any action they take. This has changed from recent history, where celebrity culture existed but was moderated. People were encouraged

to choose principles they supported and ensure those principles were met by any action, regardless of the actor. The advantage of a personality driven system to those in power is it allows them to disregard the principles agreed to in a social contract. It also makes favour swapping and influence peddling the preferred methods of negotiation rather than simply negotiating each action on its own merits, a situation apparent in representative governance assemblies such as the United Nations. When any criticism of an action taken by Person A is met by cries that you must then support Person B, we are dealing with a personality driven system. When similar actions that make Zimbabwe's President Mugabe an alleged war criminal make the former United States President Obama a Nobel Peace Prize winner, we are dealing with a personality driven system.

Chapter Eleven

American Fascism

“Power is always gradually stealing away from the many to the few, because the few are more vigilant and consistent.”

While nationalism teaches me that my nation is unique and that I have special obligations towards it, fascism says that my nation is supreme, and that I owe my nation exclusive obligations. My nation is the only important thing in the world, and I should never prefer the interests of any group or individual over the interests of my nation, no matter what the circumstances are. Even if my nation stands to make but a paltry profit from inflicting much misery on millions of strangers in a far-off land, I should have no qualms supporting my nation. Otherwise, I am a despicable traitor. If my nation demands that I kill millions of people, I should kill millions. If my nation demands that I sacrifice my family, I should sacrifice my family. If my nation demands that I betray truth and beauty, I should betray truth and beauty.

Unfortunately, when people talk of the ills of fascism they often do a poor job, because they tend to depict fascism as a hideous monster while failing to explain what is so seductive about it. This is why today people sometimes adopt fascist ideas without realizing it. People think, ‘I was taught that fascism is ugly, and when I look in the mirror I see something very beautiful, so I cannot be a fascist.’ It is a bit like the mistake Hollywood movies make when they depict the bad guys—Voldemort, Lord Sauron, Darth Vader—as ugly and mean. They are usually cruel and nasty even towards their most loyal supporters. What I never understand when watching such movies is why anyone would be tempted to follow a disgusting creep like Voldemort. The problem with evil is that in real life, it is not necessarily ugly. It can look very beautiful.

Christianity knew this better than Hollywood, which is why traditional Christian art tended to depict Satan as a gorgeous hunk. That is why it is so difficult to resist Satan’s temptations. That is also why it is difficult to deal with fascism. When you look in the fascist mirror, what you see there isn’t ugly at all. When Germans looked in the fascist mirror in the 1930s,

they saw Germany as the most beautiful thing in the world. If today Israelis look in the fascist mirror, they will see Israel as the most beautiful thing in the world. They will then want to lose themselves inside that beautiful collective.

Who needs repression when one can convince the chicken to walk freely into the slaughterhouse.

Fascism always has two faces. One is paternal, benevolent, entertaining, and kind. The other is embodied in the executioner's sadistic grin. Janus-like, fascism seeks to present itself to a captive public as a force for good and promises protection against enemies, real or imagined. But defy its ideology, challenge its power, demand freedom from fascism's iron grip, and you are confronted by the death's head. Fascism, expressed through corporate tyranny, was able to effectively mask its true intentions behind its friendly face—we were successfully stripped of power, shorn of our most cherished rights, and impoverished.

We have undergone a corporate coup d'état in slow motion. Our democracy is a fiction. It is a useful fiction in the hands of the corporate state, which seeks to mask its absolute power, but it no longer exists. The consent of the governed is a cruel joke. Citizens have been demobilized as a political force. Our politics is a form of legalized bribery. We, like the natural world, have become mere commodities in the hands of corporations to exploit until exhaustion or collapse.

And yet, the civic, patriotic, and political language we use to describe ourselves remains unchanged. We continue to hold up the Founding Fathers—although they supported slavery, the genocide of Native Americans, and the political disenfranchisement of the masses—and the sanctity of the constitution. But the America we celebrate is an illusion. It does not exist. Our government and judiciary, wholly owned subsidiaries of the corporate state, have no real sovereignty. Capitalism, as Karl Marx understood, when it finally dominates government, is a revolutionary force. And this revolutionary force, this friendly fascism, is plunging us into a state of neo-feudalism, perpetual war, ecological disaster, and a dystopian nightmare.

You cannot use the word 'liberty' when your government, as ours does, watches you twenty-four hours a day and stores all of your personal information in government computers in perpetuity. You cannot use the word 'liberty' when you are the most photographed, monitored, and eavesdropped population in human history. You cannot use the word 'liberty' when it is impossible to vote against the interests of Goldman Sachs or General Dynamics. You cannot use the word 'liberty' when the state empowers militarized police to use indiscriminate lethal force against unarmed citizens in the streets of American cities and torture tens of thousands of citizens,

most poor people of color, in the largest system of solitary confinement in the largest prison system on earth. This is the relationship between a master and a slave.

We the people seem to have the freest book trade in the world. Certainly we have the biggest. Cruise the mighty Amazon, and you will see so many books for sale in the United States today as would require more than four-hundred miles of shelving to display them—a bookshelf that would stretch from Boston’s Old North Church to Fort McHenry in South Baltimore. Surely that huge catalog is proof of our extraordinary freedom of expression: The US government does not ban books, because the First Amendment won’t allow it. While books are widely banned in states like China and Iran, no book may be forbidden by the US government at any level (although the intelligence agencies censor books by former officers and officials).

Where books are banned in the United States, the censors tend to be private organizations—church groups, school boards, and other local (busy)bodies—roused to purify the public schools or libraries nearby. Despite such local prohibitions, we can surely find any book we want. After all, it’s easy to locate those hot works that once were banned by the government as too “obscene” to sell, or mail, until the courts ruled otherwise on First Amendment grounds—*Fanny Hill*, *Howl*, *Naked Lunch*. We also have no trouble finding books banned here and there as “antifamily,” “Satanic,” “racist,” and/or “filthy,” from *Huckleberry Finn* to *Heather Has Two Mommies* to *Harry Potter*, just to name a few.

And yet, the fact that those bold books are all in print, and widely read, does not mean that we have the freest book trade in the world. On the contrary: For over half a century, America’s vast literary culture has been disparately policed, and imperceptibly contained, by state and corporate entities well placed and perfectly equipped to wipe out wayward writings. Their ad hoc suppressions through the years have been far more effectual than those quixotic bans imposed on classics like *The Catcher in the Rye* and *Fahrenheit 451*. For every one of those bestsellers scandalously purged from some provincial school curriculum, there are many others—we can’t know how many—that have been so thoroughly erased that few of us, if any, can remember them, or have ever heard of them.

How have all those books dropped into the memory hole in these United States? As America does not ban books, other means—less evident, and so less controversial—have been deployed to vaporize them. Some almost never made it into print, as publishers were privately warned off them from on high, either on the grounds of “national security” or with blunt threats of endless corporate litigation. Other books were signed enthusiastically—then dumped, as their own publishers mysteriously failed to market them, or even

properly distribute them. But it has mainly been the press that stamps out inconvenient books, either by ignoring them, or—most often—laughing them off as “conspiracy theory,” despite their soundness (or because of it).

Once out of print, those books are gone. Even if some few of us have not forgotten them, and one might find used copies here and there, these books have disappeared. Missing from the shelves and never mentioned in the press (and seldom mentioned even in our schools), each book thus neutralized might just as well have been destroyed en masse—or never written in the first place, for all their contribution to the public good.

Unchecked corporate power will inevitably lead to corporate fascism. It is characterized by anonymity. It purports to pay fealty to electoral politics, the constitution, and the iconography and symbols of American patriotism, but internally has seized all of the levers of power to render the citizen impotent. The process by which we have been chained and shackled is incremental and often unnoticed until it has concluded. A friendly fascist power structure in the United States, Canada, Western Europe, or today’s Japan would be far more sophisticated than the “caesarism” of fascist Germany, Italy, and Japan. It would need no charismatic dictator nor even a titular head, it would require no one-party rule, no mass fascist party, no glorification of the State, no dissolution of legislatures, no denial of reason. Rather, it would come slowly as an outgrowth of present trends in the Establishment. We would be mesmerized by the entertaining shadows on the wall of the Platonic cave as we were enslaved. It would be too late when we woke up.

When I think of the new dangers from reactionary forces, I remember the famous words used toward the end of the Franco-led rebellion against the Spanish republic:

“I have four columns marching on Madrid and a fifth column inside the city itself.”

Today, I see five columns marching against the people of the United States and our democratic institutions.

The first is a motley array of fanatical freebooters. The so-called Moral Majority and its descendants whips up militarism in an effort to stem anti-militarist tides among other evangelicals. The Ku Klux Klan and the American Nazis stir up racism and anti-semitism. Well-financed frenetics lead frenzied campaigns on the so-called “social issues,” stirring up both sexism and heterosexism. The so-called “right to life” opponents of abortion often condone the destruction of life through military adventurism and the restoration of the death penalty. Political hucksters capitalize on the fear of “crime in the streets” by promoting the quick fixes of more execution

and imprisonment, despite clear evidence that these are no more capable of deterring crime than the phlebotomy (bloodletting) used in the Middle Ages was capable of curing disease.

Together, these groups focus attention on the many scapegoats—Blacks, Hispanics, Jews, feminists, lesbians, gays, transgenders, socialists, anti-war people and low-income criminals—needed by the larger forces leading a new class war against the unemployed, the unemployable, and the working poor. In addition to fostering a violence-vigilante culture, they distract attention from the many shared interests of the poor majority and promote divisive tensions among the heterogeneous elements of the low- and middle-income population.

The second is a far-flung suicide squadron. With passionate intensity and compulsive conviction, its leaders flash their instruments of suicidal destruction. Overstating the dangers of a Russian attack on Western Europe or the latest nemesis in the Persian Gulf, they flaunt their machismo by reserving the right to make a first strike against the anyone they like. Understating the destructive power of US and NATO forces, they seek the charisma—and for the corporations involved, the cost-free capital—derived from resolute dedication to that power’s increase.

For the men and women in military training camps, this glorification of violence is enshrined in the training song:

Kill, Kill
Hate, Hate
Murder, Murder
Mutilate

Behind this bravado is the tacit knowledge that the enlargement of overkill capacity breeds insecurity in the first instance and, in the case of nuclear weapons, if ever used, would destroy its users. The unspoken theme song, even more ominous than the “Kill, Kill” chant, is:

Spread our missiles
far and wide
Defend ourselves
by suicide

The third is a big money battalion. Under the cover of the maxim “there is no free lunch” administration after administration has been giving the truly rich the largest corporate welfare program in US history—through not only military contracts but also an immense variety of tax giveaways, loans, loan guarantees, regulatory or deregulatory favors, bailouts. The

huge handouts promote capital flight, robotization, commodity speculation, merger-mania, condo-mania, speculation in urban and rural real estate and the construction (triply subsidized by federal, state, and local government) of luxury hotels and skyscraping office buildings.

As a reward for initiative in extracting these benefits from the federal, state, and local treasury, top executives get more than free lunch. They get free breakfasts, dinners, cocktail hours, theater tickets, country clubs, vacation resorts, and executive planes, boats, and limousines. They enjoy free, round-the-clock services by devoted retinues of in-house and out-house academics, lawyers, accountants, public relations people, call-girls, call-boys and other experts. The bill for all this corporate and sensory gratification is paid, of course—but not by them. The money comes, rather, from the pockets of the great majority of Americans. The so-called “trickle down” “job-creator” theory is merely a justification for the actual policy of moving money upward. This is done by cutting income maintenance programs for lower and middle income people, encouraging or tolerating higher unemployment and imposing higher taxes on payrolls and consumption.

The members of the fourth column are sappers of the Constitution. With the active help of every occupant of the White House, they are burrowing deeply under almost every provision of the Bill of Rights. The Department of Justice itself has become a staging ground for those undermining the civil rights of minorities and the First, Fourth, Fifth, Sixth, and Eighth Amendment rights of all people. Sixth and Seventh Amendment rights to jury trials are being sidetracked by plea bargaining in criminal cases and “rent-a-judge” schemes in civil cases. Invasions into the area of personal sexual behavior threaten to undermine the Ninth and Tenth Amendments on rights retained by or reserved to the people. And who can forget the all-seeing eye of the three-letter agencies.

The fifth column is inside our minds. It is composed of the ruling myths that camouflage, encourage, and legitimate the other four columns. These myths go far beyond ‘nice guy’ imagery. They establish America’s symbolic environment. The Reagan administration triggered a great leap forward in the mobilization and deployment of corporatist myths. Many billions of tax-exempt funds from conservative foundations have gone into the funding of such think tanks as the Heritage Foundation and the American Enterprise Institute.

Distributing general propaganda, however, is perhaps the scariest operation of the fifth column. Expanded government intervention into the lives of ordinary people is glorified under the slogan “getting the government off our backs.” Decriminalization of corporate bribery, fraud, and the dumping of health-killing wastes is justified under the banner of “promoting free enter-

prise” and countering “environmental extremists.” Private greed, gluttony, and speculation are disguised in “free market” imagery. Business corruption is hidden behind smokescreens of exaggerated attacks on the public sector. Like Trojan horses, these ideas penetrate the defenses of those opposed to any new corporatism. They establish strongholds of false consciousness and treacherous terminology in the minds not only of old-fashioned conservatives but also of the most dedicated liberals and left-wingers. Hence on many issues the left seems bereft, the middle muddled, and the right not always wrong.

“This is not a new world: It is simply an extension of what began in the old one. It has patterned itself after every dictator who has ever planted the ripping imprint of a boot on the pages of history since the beginning of time. It has refinements, technological advancements, and a more sophisticated approach to the destruction of human freedom. But like every one of the superstates that preceded it, it has one iron rule: Logic is an enemy, and truth is a menace.”

I am uneasy with those who still adhere strictly to President Eisenhower’s warning in his farewell address against the potential for the disastrous rise of power in the hands of the military-industrial complex. All these decades later, it should be clear to the opponents of militarism that the military-industrial complex does not walk alone. It has many partners: the nuclear-power complex, the technology-science complex, the energy-auto-highway complex, the banking-investment-housing complex, the city-planning-development-land-speculation complex, the agribusiness complex, the communications complex, and the enormous tangle of public bureaucracies and universities whose overt and secret services provide the foregoing with financial sustenance and a nurturing environment. Equally important, the Big Business-Big Government partnership has a global reach. It is rooted in colossal transnational corporations and complexes that help knit together a “Free World” on which the sun never sets. These are elements of the new despotism.

There is an old adage that the cure for the weaknesses of democracy is more democracy. The reason it sounds hollow is that ‘democracy,’ like ‘fascism,’ is used in many entirely different—even contradictory—ways. When one uses the term to refer only to the formal machinery of representative government, the maxim is a meaningless cliché. Much tinkering with, and perhaps improvements in, democratic machinery might even be expected on the road to serfdom. But if democracy is seen in terms of the decentral-

ization and counterbalancing of power, then the subject for analysis is the reconstructing of society itself.

Both welfare spending and warfare spending have a two-fold nature: the welfare system not only politically contains the surplus population but also expands demand and domestic markets. And the warfare system not only keeps foreign rivals at bay and inhibits the development of world revolution—thus keeping labor power, raw materials and markets in the capitalist orbit—but also helps to stave off economic stagnation at home.

The term ‘welfare state’ also contains a germ of truth. Under pressure from communist regimes and movements, the governments of all major capitalist countries have out-Bismarcked Bismarck in taking over socialist demands and enacting a host of programs to provide state-ordained floors under living and working standards. In a broader sense, however, the welfare state idea is fundamentally misleading. The welfare provided is not the general well-being of the people. It is welfare, rather, in the narrow and restrictive sense of public assistance to the poor and other programs (usually financed by the lower and middle classes themselves) to take the rough edge off capitalist exploitation, promote docility among the exploited, and thereby help form a more perfect capitalism. If this be the general welfare it is subwelfare, the level of which has been grudgingly attuned to the amount of domestic pacification required in a particular country or at a particular time.

Thus, in Britain and Western Europe, with stronger left-wing movements to be contained, the levels of subwelfare have been higher than in the United States, where the productive capacity itself could have supported the highest levels of welfare in the capitalist world. Under President Truman’s Fair Deal (1946–52) dramatic proposals for raising the low US levels, although never approved by Congress, helped placate the many liberal leaders who had been less than enthusiastic about the Cold War and the Korean War. John F. Kennedy’s pleas to “get the country moving again” linked a more interventionist attitude at home with one abroad. Although President Johnson’s Great Society programs were stunted as money and energy went to the war in Asia, the various initiatives in social security, public assistance, health care, education, housing, job-training, and local uplift were cited by administration spokesmen as they begged for liberal and minority tolerance of intervention overseas. Many of these welfare programs, in fact, subsidized banks and other corporations under the banner of providing them with incentives for “doing good” for the poor. Indeed, in most countries of modern capitalism, big business makes at least as much money from welfare as from warfare. Hence there is some logic in using the term ‘warfare-welfare state.’

Since World War II, the government of every major capitalist country has engaged in some form of economic planning, albeit sometimes under the label of ‘policy coordination’ or ‘program integration.’ The central function of these planning efforts is to strengthen capitalist performance by:

- Helping maintain market demand.
- Extending welfare-state programs as a means of doing this while also pacifying protest.
- Designing fiscal, monetary, and regulatory policies to support more profitable corporate operations in specific sectors.
- Mediating conflicts among various interests in the corporate world.

At the local level, this kind of planning has been backed up by zoning regulations, land-use plans, and public improvement programs that have helped subsidize both suburban growth and astronomical increases in urban and suburban land values.

Government ownership and “mixed enterprises” in certain sectors of capitalist society have tended to:

- Help corporate capital pull out of less profitable activities and move to greener fields.
- Promote technological rationalization of backward industries.
- Provide government capital for use by private corporate interests.
- Tax the lower classes by selling government-monopolized products at higher prices.
- Subsidize private business by giving them government goods and services at low prices.

In addition, both government planning and government ownership perform the invaluable service of mobilizing liberals, and socialists—and sometimes communist revolutionaries also—behind the policies needed for a more perfect capitalism.

“With the coming of science and technology, it is fair to say that we can get ten dollars out of nature for every dollar that we can squeeze out of man.”

The two oldest business commandments—“buy cheap, sell dear” and “let the buyer [or borrower] beware”—had to be expanded to a full decalogue which included the following:

- Risk other people’s money.
- Make money out of shortages.
- Use only those new technologies that are more profitable.
- Shift social costs to others.
- Conceal assets and income.
- Squeeze workers as much as possible.
- Buy political influence.
- Help build a powerful establishment.

Each of these maxims, of course, operated under the umbrella of ‘anything goes if you can get away with it.’

Mystery has always hovered around the masters of power and wealth. The oligarchs of agricultural kingdoms wrapped themselves in witchcraft and divinity to conceal their weaknesses and magnify their strengths. They were helped by priests, scribes, courtiers, royal chamberlains, and old-style bureaucrats. As industrial capitalism accumulated power and wealth, the old mysteries were replaced and dwarfed by the new mysteries of high finance, market manipulations, convoluted and lucrative legalisms, pressure-group politics, and a labyrinth of new bureaucracies.

The number of people actively involved—even at the very top—is too large for any meeting or convention hall.

“America is run largely by and for about 5,000 people who are actively supported by 50,000 beavers eager to take their places. I arrive at this figure this way: maybe 2,500 megacorporation executives, 500 politicians, lobbyists, and Congressional committee chairmen, 500 investment bankers, 500 partners in major accounting firms, 500 labor brokers. If you don’t like my figures, make up you own.”

I am convinced these figures are far too small. If there are 4,000–6,000 at the top, they are probably able to deploy at least five times as many in executive management; who in turn operate through at least ten times as

many junior and contingent members. My total ranges between a quarter and a third of a million. Even without adding their dependents, this is a far cry from a small handful of people. Yet in relative numbers this large number of people is still a “few.” A third of a million people numbers less than two tenths of one percent of the US population of about 315 million; and with their immediate family members this would still be less than one percent. It is less than one hundredth of one percent of the “Free World” under the shared leadership of the United States. Seldom, if ever, has such a small number of people done so much to guide the destinies of so many over such vast expanses of the planet.

“Wherever there is great property there is great inequality.
For one very rich man, there must be at least five-hundred poor,
and the affluence of the few supposes the indigence of the many.”

It becomes apparent that a few thousand corporate overseers make strategic decisions on the volume and location of investment, the changing pattern of employment in many countries, the kinds of products that are produced, the level of prices and interest rates, and the content of mass advertising. Instead of government planning there is boardroom planning that is accountable to no outside agency: and these plans set the order of priorities on national growth, technological innovation, and, ultimately, the values and behaviors of human beings.

You don't have to control everything to be in total control. In the modern world this seeming paradox is a systemic reality. In the past, classic totalitarian governments sought to literally control every aspect of biopower. As it turned out, this was a very inefficient and self-defeating way to maintain and increase scientific knowledge and technology, capital accumulation, and total effective power over the long-term. Modern totalitarian arrangements are far more culturally efficacious, superficially unobtrusive, stylistically democratic, and, most importantly, surgically precise.

In addition, modern totalitarian elites not only demand *de facto* control over society as such, but they also desire, as part of their inner ideological ethos, the exercise of that power to reproduce itself under maximum conditions of ease, pleasure, and comfort. Thus, the creation and maintenance of a consumerist society both materially and ideologically aids in the reproduction of neo-totalitarian power.

A consumerist society is to a large extent a self-regulating mechanism for the constant pursuit of public spectacle and private stimulation. The senses and general life instincts are caught in a web of the pursuance of small pleasures. In this way, pleasure itself becomes an insidiously saccharine

form of domination. Yet, from time to time, consumerist relations must be guided, reinforced, and given new goals and reflationary impetus from above.

The political structure in modern, surgical totalitarianism is set up in such a way as to give the appearance of active participation, psychological inclusion, and periodic mass mobilization. However, all consequential decision-making takes place behind this fraudulent structure and represents the true commanding heights of power. The political superstructure serves, at best, as perennial decoy and public delusion.

The modern commanding heights of power require massive amounts of data. It is through the acquisition, manipulation, and active forward interpretation of information that surgical totalitarianism is able to pick and choose its battles. At its most extreme, new “realities” are creatively and cynically constructed from its daily catch of strategic knowledge. The goal is always the same: distract, delude, deflate any possible challenge to the system through active suppression, co-option (the preferred method), and, or, complete elimination.

In this way, any possible threats can be foreseen relatively far in advance and organizational strategies can be conceived for either their containment or elimination. The surgical nature of these methods allows for the relative negative freedom of civil society to generally evolve and reproduce itself in partial self-awareness in so far as it continues to demonstrate no substantive subversive tendencies to liquidate either the material reality and/or ideological superstructure of its own dependency on neo-totalitarian forms of power.

In the end, the system presents itself as perversely elegant, efficient, self-perpetuating, and, even, on a physical level, pleasant. All bodily pleasures are on offer. Entertainment becomes incarceration. All is seemingly permitted while nothing is truly allowed. Critical dissent is tolerated because the mechanisms of mass blindness are secure.

It would be and has been a crucial mistake for leftists of all kinds to think that capitalism is the root cause of the modern day pursuit of total power. On the contrary, surgical totalitarianism utilizes capitalism as just another source of power but not its ultimate ground. Power precedes capitalism. Hierarchy encodes the means and forces of production no matter what they are just as hierarchy projects a self-sustaining superstructure to deceive and deflect its potential challengers. Capitalism is but a modern day tool of hierarchical power. The real enemy is not capital but surreptitious hierarchy.

Chapter Twelve

Consumer Addicts

“When I first began my experience as a consumer I thought that the best way to do my family marketing was to ask the dealer his price and then Jew him down.”

To enjoy a good life, we need food, security, and protection from the elements, and we must use energy and resources to provide these goods. Attempts by psychologists to measure subjective well-being support the obvious conclusion that raising consumption levels above the poverty line is fundamental to our sense of well-being and contentment. A basic minimum of material consumption is the indispensable foundation for a good life. Yet the story of “growth” is also at least 50 percent wrong.

It is wrong in two important ways: It offers an impoverished understanding of the good life and it is steering us toward ecological chaos. We all know that beyond a certain level—and that level may not be very high—well-being depends less and less on material consumption. If you’ve just had a great meal, you won’t increase your well-being by immediately eating five more; restraint is a source of well-being as well as consumption. Indeed, many components of the good life do not require more consumption, because they are renewable resources. They include friendship, empathy, kindness and generosity, good conversation, a sense of beauty, a sense of physical well-being and security, a sense of contentment, a sense of intimacy, a sense of humor, and a delight in good ideas. Measures of increasing consumption cannot capture these psychic goods.

In March 1968, not long before he was assassinated, Robert Kennedy said in a speech at the University of Kansas:

“Our gross national product counts air pollution and cigarette advertising, and ambulances to clear our highways of carnage. It counts the destruction of our redwoods and the loss of our natural wonder in chaotic sprawl. Yet the gross national product does not allow for the health of our children, the quality of their education, or the joy of their play. It does not include the beauty

of our poetry or the intelligence of our public debate or the integrity of our public officials. It measures everything, in short, except that which makes life worthwhile.”

The very world around them, as gorgeously as they see and describe it, tends to exist for them only insofar as it evokes impressions and associations and emotions and desires inside the great self.

Instead of citizens, it produces consumers. Instead of communities, it produces shopping malls. The net result is an atomized society of disengaged individuals who feel demoralized and socially powerless. In sum, neoliberalism is the immediate and foremost enemy of genuine participatory democracy, not just in the United States but across the planet, and will be for the foreseeable future.

“Is freedom just another word for many things to buy?”

Most advertising can be viewed as grafting stories of its own onto the mental narratives in our minds.

There is a gap between the true complexity of the world and the narratives the public uses to understand it. When it comes to war, foreign policy, domestic policy, the consent of the governed has been manufactured. It is no longer possible to believe in the original dogma of democracy; that the knowledge needed for the management of human affairs comes up spontaneously from the human heart. Where we act on that theory we expose ourselves to self-deception, and to forms of persuasion that we cannot verify. Any communication is potentially propagandistic, in the sense of propagating a view. For it presents one set of facts, or one perspective, fostering or weakening some stereotype held by the mind. It is fair to say, then, that any and all information that one consumes (pays attention to) will have some influence, even if just forcing a reaction. That idea, in turn, has a very radical implication, for it suggests that sometimes we overestimate our own capacity for truly independent thought. In most areas of life, we necessarily rely on others for the presentation of facts and ultimately choose between manufactured alternatives, whether it is our evaluation of a product or a political proposition. And if that is true, in the battle for our attention, there is a particular importance in who gets there first or most often. The only communications truly without influence are those that one learns to ignore or never hears at all.

Bernays believed in the necessity of enlightened manipulation. Otherwise, he wrote, the public “could very easily vote for the wrong man or want the wrong thing, so that they had to be guided from above.” As he saw it, “the

conscious and intelligent manipulation of the organized habits and opinions of the masses is an important element in democratic society.”

It is about the large-scale efforts being made, often with impressive success, to channel our unthinking habits, our purchasing decisions, and our thought processes by the use of insights gleaned from psychiatry and the social sciences. Typically these efforts take place beneath our level of awareness; so that the appeals which move us are often, in a sense, hidden. The result is that many of us are being influenced and manipulated, far more than we realize, in the patterns of our everyday lives.

“From our desks we sway millions. We change the currents of trade. We populate new empires, build up new industries and create customs and fashions. We dictate the food that the baby shall eat, the clothes the mother shall wear, the way in which the home shall be furnished. Our very names are unknown. But there is scarcely a home, in city or hamlet, where some human being is not doing what we demand.”

Every time you find your attention captured by a poster, your awareness, and perhaps something more, has, if only for a moment, been appropriated without your consent.

Ultimately, it is not our nation or culture but the very nature of our lives that is at stake. For how we spend the brutally limited resource of our attention will determine those lives to a degree most of us may prefer not to think about. We must reflect that, when we reach the end of our days, our life experience will equal what we have paid attention to, whether by choice or default. We are at risk, without quite fully realizing it, of living lives that are less our own than we imagine.

To understand why you believe some of the things you believe and do some of the things you do, it’s important for you to understand what PR people do and how they do it.

While spectators watched, Clark would reach into a sack, pluck out a fresh snake, asphyxiate it with ether, and plunge it into a pot of boiling water. As he did so, fatty remnants of the snake rose to the top, which Clark skimmed and, on the spot, mixed into an elixir. The resulting potion he called “Clark Stanley’s Snake Oil Liniment” and sold to onlookers. The Snake Oil, Clark boasted, had the power to cure many ailments: it was “good for man and beast.” Of Stanley’s life we have only his own account—*The Life and Adventures of the American Cowboy*, by Clark Stanley Better Known as the Rattlesnake King—a slim volume that functioned both as an autobiography and advertising brochure. By his account he was born

in central Texas in the 1850s and hit the cattle trail at age fourteen. After more than a decade as a cowboy, he was invited one day to visit the Hopi Indians to witness their secret snake dance. Befriending the medicine man, who was impressed with Stanley's Colt revolver and "fancy shooting," he was invited to live with the Indians and learn their secrets, including, most precious of all, "the secret of snake oil" that was entrusted to him alone.

It is easy to ascribe the success of such hokum to the gullibility of another age, until we stop to reflect that the techniques successfully used to sell patent medicine are still routinely used today. The lotions and potions of our times inevitably promise youthfulness, health, or weight loss, thanks to exotic ingredients like antioxidants, amino acids, miracle fruits like the pomegranate and açai berry, extracted ketones, or biofactors. There is scarcely a shampoo or lotion for sale that does not promise an extraordinary result owing to essence of coconut, or rosemary extracts, or another botanical. As devotees of technology we are, if anything, more susceptible to the supposed degree of difference afforded by some ingenious proprietary innovation, like the "air" in Nike's sports shoes, triple reverse osmosis in some brands of water, or the gold-plating of audio component cables. For all our secular rationalism and technological advances, potential for surrender to the charms of magical thinking remains embedded in the human psyche, awaiting only the advertiser to awaken it.

As consumerism grew, it also became possible to sell products solving problems that were hardly recognized as such, let alone matters of life and death. Demand was engineered by showing not so much that the product would solve the problem but that the problem existed at all. Bringing subconscious anxieties to the fore was the inspired brilliance behind the great campaigns for mouthwash and toothpaste, two products largely unknown before the 1920s. Creating demand for new products was the first great goal of the early advertising industry. Otherwise the achievements of American mass production would collapse under their own weight.

"The old-fashioned propagandist," wrote Bernays, "using almost exclusively the appeal of the printed word, tried to persuade the individual reader to buy a definite article, immediately." In contrast, Bernays believed it possible to create demand at an even more fundamental level, by changing customs and norms. He asked: What are the true reasons why the purchaser is planning to spend his money on a new car instead of on a new piano? Because he has decided that he wants the commodity called locomotion more than he wants the commodity called music? Not altogether. He buys a car, because it is at the moment the group custom to buy cars. The modern propagandist therefore sets to work to create circumstances which will modify that custom. The skilled propagandist could be not merely an

engineer of demand, then, but a maker of manners, bringing a multiplier effect to the commercial use of attention capture.

It was now that advertising began to see itself in the image of the original propaganda body, the Church; its work as a mission; and its masters as capitalism's new priestly class. The agencies were educating the masses, doing a sort of missionary work on behalf of the great new companies fulfilling the broadest needs and deepest desires of the nation. President Coolidge captured the new image in a 1926 speech:

“Advertising ministers to the spiritual side of trade. It is a great power that has been entrusted to your keeping which charges you with the high responsibility of inspiring and ennobling the commercial world. It is all part of the greater work of regeneration and redemption of mankind.”

In *The Man Nobody Knows*, a 1925 bestseller by adman Bruce Barton, himself the son of a Methodist preacher, Jesus Christ is depicted, not ironically but with earnest reverence, as an early advertising man and small-business owner, managing his team of disciples who “mastered public attention” and came up with winning slogans such as “the meek shall inherit the earth.” Barton reached even deeper when he wrote that advertising was a force “as old as the world. . . ‘Let there be light’ constitutes its charter. All Nature vibrates with its impulse. The brilliant plumage of the bird is color advertising addressed to the emotions.”

There are some things, like a mother's milk, and basic comforts that one might be born wanting; but for such items advertising is hardly necessary. Most other products in the contemporary economy are what one might call acquired tastes. No one is born wanting 4K television, a purse branded by Hermès or Louis Vuitton, or the odor eliminator product Febreze. For the advertisers, by far the most valuable function of advertising, then, is the shaping or creation of demands that would not otherwise exist.

The creation of strong brand loyalties, having little to do with intrinsic value, was a calculated effort to foster irrational attachments by which a brand might survive competition from other brands that were as good or better. The most effective brand advertising, after all, does not try to convince you to make a choice, but rather to convince you that there is no choice—that Coca-Cola is the cola, that Camel is your cigarette, or that Harley-Davidson is the only motorcycle one would consider. It can succeed if it manages to make the brand part of your identity: One might feel the same loyalty to Miller the beer as a resident of Wisconsin feels to the state. True brand advertising is therefore an effort not so much to persuade as to

convert. At its most successful, it creates a product cult, whose loyalists cannot be influenced by mere information: companies like Apple, Hermès, and Porsche are among those that have achieved this kind of immunity to competition, at least among their true believers. What is offered to adherents is not merely a good product (though often it is), but something deeper and more deeply fulfilling—a sense of meaning that comes with the surrender of choice.

Having too many choices is stressful. Facing more than three or four options increases negative effects like regret, heightened expectations, and disappointment. As the choice set grows larger, those negative effects escalate, leading to anxiety. Only one factor mitigates this effect: if participants are not held accountable for their choices.

We would be wise to consider the relationship between control over one's attention and human freedom. Take the most elementary type of freedom, the freedom to choose between A and B, say, chocolate or vanilla. The most direct and obvious way authoritarians abridge freedom is to limit or discourage or ban outright certain options—'NO CHOCOLATE,' for instance. The State might ban alcohol, for example, as the United States once did and a number of Muslim nations still do; likewise it might outlaw certain political parties or bar certain individuals from seeking office. But such methods are blunt and intrusive, as well as imperfect, which is true of any restriction requiring enforcement.

It is therefore more effective for the State to intervene before options are seen to exist. This creates less friction with the State but requires a larger effort: total attention control. Freedom might be said to describe not only the size of our "option set" but also our awareness of what options there are. That awareness has two degrees. One is conceptual: if you don't know about a thing, like chocolate ice cream, you can hardly ask for it, much less feel oppressed by the want of it. The second degree of awareness comes after we know about things conceptually and can begin to contemplate them as real choices. I may be aware that man has gone into space but the idea that I might choose to go there myself, while conceivable, is only a notion until I find out that Virgin Galactic has started scheduling flights.

The advertiser, unless a monopolist, usually remains within the realm of persuasion among a background of choice. True propaganda, by contrast, aims to obliterate that marketplace and the choices as such, by making them seem unthinkable or nonexistent. Only in rare cases is commercial advertising that powerful. Stated differently, Hitler was not just selling a choice, but a comprehensive vision of reality. To make such a sale, the message had to be complete, monolithic, without a single crack or weakness. The State, as Hitler put it, must "serve its own truth uninterrupted," for

“as soon as by one’s own propaganda even a glimpse of right on the other side is admitted, the cause for doubting one’s own right is laid.” Alternative views, like alternative choices, had no place in this scheme, in which the purposes and ideas of the individual are subsumed into that of the whole, in keeping with the Volksgemeinschaft. That this itself can serve as a kind of carrot is often lost amid liberal idealism, which can overestimate how deep our devotion to choice really runs. Choice may be the cornerstone of individual freedom but, as the history of humanity shows, the urge to surrender to something larger and to transcend the self can be just as urgent, if not more so. The greatest propagandists and advertisers have always understood this.

With total attention control, the Nazi Propaganda Ministry was able to sell a new faith, one vested not in the power of choice but in the glory of something greater and of giving oneself over to it. “There are two ways to make a revolution,” Goebbels wrote in 1933. “One can fire at the opponent with machine guns until he recognizes the superiority of those who have the machine guns. That is the simplest way. One can also transform a nation through a revolution of the spirit, not destroying the opponent, but winning him over.” This he meant not in the sense of winning an argument, but actually displacing individual thought and all its conflicting impulses. As Goebbels put it:

“We want to replace liberal thinking with a sense of community that includes the whole people.”

Brands that said or sought to say to a consumer bludgeoned by herd-pressures to achieve, forbear, trim the fat, cut down, discipline, prioritize, be sensible, self-parent, that hey, you deserve it, reward yourself, brands that in essence said what’s the use of living longer and healthier if there aren’t those few precious moments in every day when you stopped, sat down, and took a few moments of hard-earned pleasure just for you? And various myriad other pitches that aimed to remind the consumer that he was at root an individual, one with individual tastes and preferences and freedom of individual choice, that he was not a mere herd animal.

“I do get weary and worn down from it all. I’m always forced to face the fact that I make my money from poor people. A lot of them are on welfare. Sometimes a mother will come in here with a kid, and the kid is dirty and poorly dressed. But the kid wants a hundred-twenty-buck pair of shoes and that stupid mother buys them for him. I can feel that kid’s inner need—this

desire to own these things and have the feelings that go with them—but it hurts me that this is the way things are.”

Like most North Americans of his generation, he tends to know way less about why he feels certain ways about the objects and pursuits he’s devoted to than he does about the objects and pursuits themselves.

“Subprime is the golden egg. If, as a direct marketer, you can identify subprime characteristics, you can do very well.”

The vast majority of all junk mail—be it loans or otherwise—is directed at the subprime market. The best thing you can tell a client is that you can accurately identify subprime individuals. Which is why, when people are asked to fill in lifestyle surveys, they’ll often see questions like ‘Have you ever experienced difficulty getting credit?’ or ‘Have you ever missed a mortgage payment?’ Those are the sorts of triggers that will identify you as potentially subprime. It’s valuable information. It is slightly chilling to realize there are rational, functional people up there employed to spot, nurture, and exploit those down here among us who are irrational and can barely cope. If you want to know how stupid you’re perceived to be by the people up there, count the unsolicited junk mail you receive. If you get a lot, you’re perceived to be alluringly stupid.

At a certain level, our modern consumer society is built on a truth and a lie. The truth is that if you’re living below the threshold of safety and security, a little bit of stuff can create a huge change in your mental and emotional states and the quality of your life. The lie is the siren song of our culture. If that much stuff will generate that much instant happiness, the lie goes, then ten times as much stuff will make you ten times happier.

Materialism and social isolation have been shown to be mutually reinforcing: lonely people seek material goods more compulsively, while materialist individuals are more at risk of loneliness.

Socially educating people not to seek happiness through excessive consumption of stuff is a huge and probably doomed undertaking, however many times it is shown that happiness does not that way lie. There is now a deeply rooted cultural belief that shopping is necessary and a patriotic undertaking for national economic prosperity, and that buying more things makes a person more desirable and improves their status. Entire industries exist to perpetuate this philosophy, even though most people know, deep down, that the majority of the stuff they buy is unnecessary and wasteful of money and resources. Purveyors of green lifestyles and sustainable fashion products have had some success at convincing small sectors of society to buy

products that are less environmentally damaging. Some consumer-targeted campaigns that have focused on ethical issues have been very successful at persuading people not to buy fur or to buy fish caught in a way that doesn't harm dolphins.

Studies have shown, however, that people who take small steps to act sustainably by using a carpooling scheme, for example, then balance their behaviour by being less likely to recycle. In general, driving consumer change through economic incentives or legal restrictions works better than fighting entrenched cultural practices. Feed-in tariffs—which allow residents (not corporations) to sell their home-made energy to the grid at a higher rate than the market norm, providing grants and cheap payback schemes for rooftop solar panels, or simply subsidising grid energy produced from renewables to make it cheaper than that produced from fossil fuels—have been shown to be highly effective ways of stimulating renewable energy uptake. In countries where plastic bags are paid for or banned, there is an immediate drop in their use. Legal restrictions on the energy efficiency and emissions of new houses, cars, and white goods have also spurred change both in consumer perception of what is culturally normal, and in technological investment and progress towards more sustainable product design.

If materials and built products were scaled on their ease of recyclability, for example, and taxes levied on low-performing items, the market would respond: more sustainable products would be made, and there would be concurrent evolution in efficient recycling technology. But so far, governments have shied away from the more radical steps needed to overhaul consumer choice and spur a low-carbon future in which resources are used according to their availability in the Earth's crust, the energy needed to extract them, and the environmental costs arising from their use.

It takes around 3,000 pounds of raw material to make a five-pound laptop,

A tonne of ore usually contains less than three grams of silver; whereas a tonne of discarded mobile phones (6,000 handsets) can contain 3.5 kg of silver, so it makes more sense to mine old handsets—electronic waste now contains precious-metal deposits that are on average forty to fifty times richer than ores mined in the ground.

Around 50 million tonnes of electronic waste, including mobile phones, is now generated annually, containing engineered parts assembled from hundreds of different materials. The international trade in e-waste is highly lucrative but much of it is currently recycled by people, including children, working in conditions where they are exposed to neurotoxic heavy metals, dioxins, and plastics that are burned to get at the precious metals within. At its best, used electronic equipment is cleansed of data, refurbished and

repaired. At its worst, it is shredded and disposed of, wasting the mined materials and other resources that went into manufacturing it, and causing replacements to be made. Manufacturing electronic equipment now uses 320 tonnes of gold and 7,500 tonnes of silver annually, and yet less than 15% of this hoard is recovered.

Capitalism is marvelously adaptive, able to turn the problems it creates into new business opportunities: diet pills, heart bypass operations, insulin pumps, bariatric surgery, face masks, ventilators. But only if it can be done for a profit.

“Advertising is the rattling of a stick inside a swill bucket.”

By taking the side of profit over conscience, business has set our struggle back so far that they have become our oppressors too. Why, some demanded, if Walmart had the power to lower prices, alter CD covers, and influence magazine content, did it not also have the power to demand and enforce ethical labor standards from its suppliers?

Helen Woodward, an influential copywriter in the 1920s, famously warned her co-workers:

“If you are advertising any product, never see the factory in which it was made. Don’t watch the people at work because, you see, when you know the truth about anything, the real inner truth—it is very hard to write the surface fluff which sells it.”

The aim of most manufacturing companies is to optimise the path and frequency from mined materials to product to customer. The earliest example of manufacturers manipulating people into frequently replacing a product may be the so-called “light-bulb conspiracy,” in which a group of companies set up a secret cartel to prevent companies from selling light bulbs with a life span longer than 1,000 hours, even though 100,000-hour bulbs could be produced. Manufacturers of nylon stockings and tights also famously instructed their engineers—who boasted that their nylons were strong enough to pull a car—to make less strong fibres that would fail or ladder. In that way, women would need to replace them more frequently.

This way of selling more products by designing in a set lifespan is known as planned obsolescence, and many politicians and economists believe it to be an economic necessity. The idea was born in the US during the 1930s depression as a way to get the economy moving again and provide employment. By the 1950s, a sophisticated advertising industry and easy credit were persuading people to shop till they dropped. Consumerism was born. The fashion industry is predicated on planned obsolescence, and other

industries are following this high-turnover model and bringing out products that have cosmetic gimmicks or seasonal appeal but which will soon appear dated. Meanwhile, many products are designed to fail or be difficult to repair or upgrade. Television sets have heat-sensitive condensers deliberately fitted on to the circuit board next to a hot transistor. Printers contain chips that are programmed to stop working after a preset number of pages.

In contrast to Western notions of beauty that have everything to do with symmetry, balance, and perfection, in Japan flaws and irregularities are highlighted. And where they might otherwise be overlooked—a cracked pot perfectly repaired—they are brought deliberately to the fore and made to catch the eye. In the case of the broken pot, for example, gold or bright red lacquer might be rubbed into the seams when it is mended. So rude is this interruption to the form of the thing that one hardly sees the original pot anymore. The trace—a sparkling vein; a rivulet in blood-red—these outshine the fact that the object has regained integrity. The fact of having been broken is what matters. The history of a thing—its difficult life—is made to be a part of its attraction.

In the United States, that same pot, clumsily dropped and shattered into shards, might be carefully repaired, the owner, epoxy in hand, taking great care to find all the bits and to reunite them into a seamless, usable whole. More likely, though, the broken ceramic would be blithely swept up and deposited without ceremony in the trash can, and another bowl would be bought on the morrow, or perhaps even ordered online for next-day delivery. Americans don't like dealing with remnants or with imperfect things. We don't want to see that what now serves us perfectly well was once broken or damaged. We want youth and vigor, not old age and a storied life. Repair is not a cultural value. Replacement is.

The idea that even something that works fine should be replaced is now so ingrained in our culture that few question it. But it is a fairly recent concept, brought about by a revolution in the advertising and manufacturing industries, which thrived on twentieth-century changes, including urbanisation, mass production, public broadcast media and globalization, which has turned the entire world into a factory and also a marketplace for the stuff humanity produces. The clothes, steel, gadgets, toys, computers, mobile phones, and cameras that are now so cheap that they can be tossed away and replaced at the smallest fault, are made in low-cost factories where the health and safety of workers is often neglected, where toxic by-products and waste materials are flushed into rivers or left to pollute the soil. Some 20% of China's arable soil is now polluted with heavy metals.

The scale of our globalized buying, selling, and moving of stuff has never been more clearly brought home to me than on the banks of the Panama

Canal, as I watched an awesome ship glide magnificently into one of the locks. Onboard were thousands of containers, the humble steel box, invented six decades ago, that revolutionized global trade and made stuff cheap. The efficiency of container ships for transportation of goods, loading and unloading, vastly lowered the cost of international trade—transport cost is now less than 1% of the price of most goods—meaning that it became cheaper to manufacture goods where labour costs were low.

Thirty years ago, just a handful of camera models would have been around each year, service and repair manuals and spare parts would have been available for each one, as well as a thriving repair industry. But things have changed. Like the majority of consumer electronics, my camera has not been designed to be easily repairable, and the manufacturer no longer releases repair manuals. My camera doesn't come with parts designed to be replaced—the rechargeable battery can be changed when it wears out, but at a similar expense to buying a new camera. In some gadgets the batteries are soldered to the internal circuitry, forcing owners to replace the entire product when the battery dies. As gadgets become progressively cheaper, consumers become ever more willing to “upgrade.”

The turning point was when VCRs came out in the 1980s. Until then, the majority of electronics were made in Europe or America, near to the customers and service technicians who repaired faulty goods with product manuals and parts supplied by the manufacturers. When VCRs came out, most were manufactured in Japan and elsewhere in Asia. As the product manufacture went to Asia, the companies stopped producing service manuals and thousands of repair-shop technicians went out of business. When their product broke, customers threw it out and bought the latest model. And people who bought reconditioned second-hand computers or TVs would also have to buy new.

As a result, most of the big-name companies from Apple to Toshiba now fiercely guard their service manuals, and use copyright law to prevent people from making them public online. The reason they don't issue the manuals is to stifle the resale market, kill the repair business and to strengthen the planned obsolescence of their products. And it also enables companies to significantly mark up different models. For example, the difference between a 16 GB iPad and a 64 GB one is a chip that costs an extra \$7, whereas the price difference for consumers is \$200. If consumers could replace the chip, or change the batteries then the companies would lose a lucrative high-end market.

A lesson in the beyond-short-term viability-curve of advances in consumer technology: First there's some sort of terrific, sci-fi-like advance in consumer tech which always, however, has certain unforeseen disadvantages for the

consumer; and then the market-niches created by those disadvantages are ingeniously filled via sheer entrepreneurial verve; and yet the very advantages of these ingenious disadvantage-compensations seem all too often to undercut the original high-tech advance, resulting in consumer-recidivism and curve-closure.

Americans buy an average of sixty-four items of clothing a year, a little more than one piece of clothing per week. Buying so much clothing, and treating it as if it is disposable, is putting a huge added weight on the environment and is simply unsustainable. Fast fashion's profitability resides in the same place as its appeal—in selling a relentless and unsustainable ocean of new clothes week after week after week.

Price and the pace of fashion are tied together. The more an article becomes subject to rapid changes of fashion, the greater the demand for cheap products of its kind. Today, it's very difficult to convince the average consumer to buy clothing at a reasonable price, and fast fashion gets around this conundrum by selling a treadmill of fresh trends for cheap. But in their race to sell new products, they speed up the pace of fashion, which in turn makes the average consumer even cheaper. Why pay good money for clothes that aren't going to be in style next season? It's a vicious feedback loop.

Most Americans are thoroughly convinced there is another person in their direct vicinity who truly needs and wants all of our unwanted clothes. This couldn't be further from the truth.

Consumers are often just after the name, "a Missoni." CBS writer Ysolt Usigan posted to the Tech Talk blog the day the line went on sale that she was able to land \$200 of "Missoni stuff" from Target.com, including a blouse, a sweater dress, a sweater skirt, and a jumpsuit.

"I don't know what they look and feel like in person. I don't know if they'll fit. I'll worry about that next week when my shipment finally arrives."

Where girls once would have paid at least some attention to the craftsmanship of the product, or even might have sat behind a sewing machine and created their own Missoni-inspired or Karl Lagerfeld look-alike, they can now line up passively to buy disposable versions of it.

There are products people desire more the higher their prices go because they hope this will show other people that they have wealth and status. Clothing is very sensitive to this effect since it deals directly with personal expression and ego. We see it as an extension of ourselves, and it is the most visible way we can strut our stuff. Fashion is the most unique product in this sense because it deals with presenting yourself to the outside world.

The middle class looked to department stores as places where they could buy better-quality goods that allowed them to show off their newfound economic status. And department stores marketed to consumers' increasingly highbrow tastes.

Luxury handbags are one of the biggest scams in the retail world. They are marked up as much as ten to twelve times over the cost of production.

The failure to see the necessity of quick and immediate intervention in financial crisis is based on an economics that fails to take account of such factors as looting, reputation mining, and irrational exuberance. It's based on a faulty logic that would also tell us to do away with fire departments, because there would then be no fires since people would be more careful. Standard economics (the "purely economic model") presumes no civil society, but in fact we live in a community of people who care about one another.

Economists (including those in finance) systematically ignore or downplay the role of trickery and deception in the working of markets. We have already put our finger on a simple reason why they were so ignored: economists' understanding of markets systematically excludes them. The pathology is viewed as mainly due to "externalities." But that fails to see that competitive markets by their very nature spawn deception and trickery, as a result of the profit motive.

There are now more than 750 Cinnabon bakeries in more than thirty countries. Most of us probably take it for granted that there just happens to be such an outlet right where we are waiting for our delayed flight. We fail to appreciate how much effort and expertise went into understanding our weak moments and developing a strategy to take advantage of them. Nor do most of us think of the presence of Cinnabon, which undermines our plans to eat healthily, as the natural result of a free-market equilibrium. But it is: if Rich and Greg Komen hadn't done it, sooner or later someone else would have had a similar—although almost surely not identical—idea. The free-market system exploits our weaknesses automatically.

The problems with a pure free-market can be imagined better if we consider a metaphor for such exploitation. Researchers have succeeded in teaching capuchin monkeys how to use money to trade. In a remarkable beginning for a free-market economy, the monkeys developed an appreciation for prices and expected payoffs; and they even exchanged sex for money. But let's, in our mind's eye, go way beyond the experiments already done. Suppose we opened the monkeys up to trading with humans quite generally. We would give a large population of capuchins substantial incomes and let them be customers of for-profit businesses run by humans, without regulatory safeguards. You can easily imagine that the free-market system, with its taste for profits, would supply whatever the monkeys choose to

buy. We could expect an economic equilibrium, with concoctions appealing to strange capuchin tastes. This cornucopia would give the monkeys their choices; but those choices would be very different from what makes them happy. They love Marshmallow Fluff-filled Fruit Roll-Ups. Capuchins have limited ability to resist temptations. We have every expectation that they would become anxious, malnourished, exhausted, addicted, quarrelsome, and sickened.

Their behavior can be analyzed as if they have two types of what economists call “tastes.” The first type of ‘tastes’ are what the capuchins would exercise if they made the decisions that are good for them. The second type of ‘tastes’—their Fruit Roll-Up tastes—are those they actually exercise. We can view our behavior in the same terms. We can imagine us humans, like the capuchins, as also having two different types of tastes. The first concept of ‘tastes’ describes what is really good for us. But, as in the case of the capuchins, that is not always the basis for all of our decisions. The second concept of ‘tastes’ are the tastes that determine how we really, actually make our choices. And those choices may not, in fact, be “good for us.” The distinction between the two types of tastes and the example of the capuchins gives us an instructive image: we can think about our economy as if we all have monkeys on our shoulders when we go shopping or when we make economic decisions. Those monkeys on our shoulders are in the form of the weaknesses that have been exploited by marketers for ages. Because of those weaknesses, many of our choices differ from what we “really want,” or, alternatively stated, they differ from what is good for us. We are not generally aware of that monkey on our shoulder. So, in the absence of some curbs on markets, we reach an economic equilibrium where the monkeys on the shoulder are substantially calling the shots.

According to the modern version, commonly taught even in introductory economics, a competitive free-market equilibrium is “Pareto optimal.” That means that once such an economy is in equilibrium, it is impossible to improve the economic welfare of everyone. Any interference will make someone worse off. For graduate students, this conclusion is presented as a mathematical theorem of some elegance—elevating the notion of free-market optimality into a high scientific achievement. The theory, of course, recognizes some factors that might blemish such an equilibrium of free markets. These factors include economic activities of one person that directly affect another (called “externalities”); they also include bad distributions of income. Thus it is common for economists to believe that, those two blemishes aside, only a fool would interfere with the workings of free markets. And, of course, economists have also long recognized that firms that are large in size may keep markets from being wholly competitive. But when there are completely

free markets, there is not only freedom to choose; there is also freedom to phish. It will still be true, following Adam Smith, that the equilibrium will be optimal. But it will be an equilibrium that is optimal, not in terms of what we really want; but an equilibrium that is optimal, instead, in terms of our monkey-on-our-shoulder tastes. And that, for ourselves, as for the monkeys, will lead to manifold problems.

This intentionally pallid story is in no way as innocent as it seems. It is not science. But it is powerful rhetoric. The college freshmen, who are the target audience for the textbook, are being given a pronouncement; it will later be implied that not just the purchase of apples and oranges, but all economic decisions are made in this way: the decision-maker has a budget (as in the fruits example for apples and oranges); she makes different choices dependent on the prices; and she makes the choice that yields her most preferred outcome. It is powerful rhetoric, because in the context of the fruit section of the supermarket, it is hard to imagine that anyone would behave differently. The story is convincing for another reason. The freshman reading the textbook is unlikely to put up resistance because she cannot imagine how this parable about apples and oranges will be used with little further question in many different contexts in the remaining pages of the textbook, in her later courses of economics, or—yet further—in her graduate program if she becomes a professional economist. But the textbook rhetoric has gotten her to swallow something whole: this is how people think, quite generally, when they are making decisions. But do they? Almost surely they do in some contexts, such as in the fruit section of Safeway. But the example would have been much less powerful if, instead, it had pictured, for instance, a bride on the pages of *Wedding Magazine*, where budget and price would seem like secondary concerns, in preparation for the Most Important Day of Her Life.

It is useful to look at such a textbook. N. Gregory Mankiw's *Principles of Economics* is an especially good introduction to current economics, and it therefore gives an excellent example, but we could have sampled many others instead. Mankiw's chapter 21, on "The Theory of Consumer Choice," illustrates. As in most modern textbooks, he does not choose the proverbial apples and oranges, but instead Pepsi and pizza. The "budget constraint" is said to be the consumer's income of \$1,000. The consumer's "optimal choice" with a price for Pepsi of \$2 and a price of pizza of \$1 is pictured in a graph. The end of the chapter concludes with a disclaimer:

"Do people really think this way? At some point, however, you might be tempted to treat the theory of consumer choice with some kind of skepticism. And you know that you do not decide by

writing down budget constraints and indifference curves. Doesn't this knowledge about your own decision-making provide evidence against the theory? The answer is no. The theory of consumer choice does not try to present a literal account of how people make decisions. It is a model. The test of the theory is in its applications [predictions]."

This is good rhetoric, but you are not told that "the model" fails to predict Suze Orman's worried clients, and the billions like them. The model may be a good predictor for some things, but it does not tell you when it will not work. Models are like maps: we do not use a map of our neighborhood to travel to Antarctica, just as we would not use a map of Antarctica to travel to the local grocery store.

Standard economics has ignored this difference because most economists have thought that, for the most part, people do know what they want. That means that there is nothing much to be gained from examining the differences between what we really want and what those monkeys on our shoulders are, instead, telling us.

"I think—the thing about the addictive mindset and the addictive continuum, I think some of that stuff is really me, 'cause I see it. I see that, for instance, my nicotine use has taken off on this tour. I mean, I'm somebody who normally chews tobacco five or six times a day, and uses it for work. I'm now smokin' and then chewin'. Chewin' and then smokin'. Wantin' you to buy a Diet Pepsi so I'll know I've got something to spit in, I mean, I can see it. It's the way I as an organism react to stress. But I don't think I'm all that different. I'll bet you've got three or four things, you know, that you're like that with. And one of the things I noticed in the halfway house is the difference between me and like a twenty-year-old prostitute who is dying of AIDS, who'd been doing heroin since she was eleven, is, is a matter of accidents. Choices of substances. Activities to get addicted to. And having other resources, you know? I mean, I really love books and I really love writing, and a lot of these folks never got to find anything else they loved.

I think, I think what you're betraying here is you and I have a somewhat different understanding of 'addict.' I think for you, the addict is the gibbering, life-that-completely-grinds-to-a-halt thing. And for me it's really about a continuum, involving a fundamental orientation. Lookin' for easy pleasurable stuff

outside me to make things all right. And I'm not saying there's anything wrong with it. But I'm saying it's a continuum, and that we slide."

In America, we are never denied the opportunity to amuse ourselves. Tyrants of all varieties have always known about the value of providing the masses with amusements as a means of pacifying discontent. But most of them could not have even hoped for a situation in which the masses would ignore that which does not amuse. That is why tyrants have always relied, and still do, on censorship. Censorship, after all, is the tribute tyrants pay to the assumption that a public knows the difference between serious discourse and entertainment—and cares. How delighted would be all the kings, czars, and führers of the past to know that censorship is not a necessity when all political discourse takes the form of a jest.

Aldous Huxley believed we are in a race between education and disaster, and he wrote continuously about the necessity of our understanding the politics and epistemology of media. For in the end, he was trying to tell us that what afflicted the people in *Brave New World* was not that they were laughing instead of thinking, but that they did not know what they were laughing about and why they had stopped thinking.

The postmodern individual suffers from a strange type of dissociation, a new form of split personality. We condemn the system, are hostile to it, and feel powerless to change it. Yet at the same time we act in a way that reinforces and even extends it. Every decision we make—what to eat and drink, what to wear, how to get about, where to go on holiday—demonstrates this. We are the system that we complain about. Protesting by voting for the ultra-left or ultra-right won't alter this state of affairs. It is not simply a question of making the 'other' change; the painful truth is that we, too, will have to change. Instead of being merely consumers, we must once again become citizens—not just in the voting booth, but above all in the way in which we lead our lives.

One of the things we most need to do is to ditch the cynicism that has taken hold of nearly all of us. We have become wearily pessimistic, taking the neoliberal construction for an exclusive truth. The TINA (There Is No Alternative) syndrome shows that the current crisis is also, and perhaps predominantly, a crisis of the imagination, resulting in fatalistic pronouncements such as 'That's just how people are,' 'We can ride it out,' and 'Let's milk the system.' There can be no doubt that egotism, competitiveness, and aggression are innately human characteristics—the banality of evil is a reality. But altruism, cooperation, and solidarity—the

banality of good—are just as innate, and it is the environment that decides which characteristics dominate.

Instead of consumers, we need once more to become citizens. If we want politics to be governed by the public interest—and that is more necessary than ever—we ourselves must promote that public interest, rather than private concerns. This will require material sacrifices that should ideally go hand in hand with the creation of a new system of ethics. Given the dual processes that shape our identity, any such system will always need to find a balance between autonomy and solidarity, between the individual and the group. The binding element is authority, and the way in which it is exercised. Citizenship isn't just about subjecting ourselves to whomever we have democratically vested with authority, but also about having the courage to assume authority ourselves when a situation demands it. We must have the courage to speak out.

Chapter Thirteen

Bottling Happiness

The Perfect Measure

“Civilization has absolutely no need of nobility or heroism. These things are symptoms of political inefficiency. In a properly organized society like ours, nobody has any opportunities for being noble or heroic. Conditions have got to be thoroughly unstable before the occasion can arise. Where there are wars, where there are divided allegiances, where there are temptations to be resisted, objects of love to be fought for or defended—there, obviously, nobility and heroism have some sense. But there aren’t any wars nowadays. The greatest care is taken to prevent you from loving any one too much. There’s no such thing as a divided allegiance; you’re so conditioned that you can’t help doing what you ought to do. And what you ought to do is on the whole so pleasant, so many of the natural impulses are allowed free play, that there really aren’t any temptations to resist.

And if ever, by some unlucky chance, anything unpleasant should somehow happen, why, there’s always soma to give you a holiday from the facts. And there’s always soma to calm your anger, to reconcile you to your enemies, to make you patient and long-suffering. In the past you could only accomplish these things by making a great effort and after years of hard moral training. Now, you swallow two or three half-gramme tablets, and there you are. Anybody can be virtuous now. You can carry at least half your mortality about in a bottle. Christianity without tears—that’s what soma is.”

“But the tears are necessary. Don’t you remember what Othello said? ‘If after every tempest came such calms, may the winds blow till they have wakened death.’”

People increasingly believe that the immense systems established more than a century ago to strengthen the nation should actually serve the happiness and well-being of individual citizens. We are not here to serve the state—it is here to serve us. The right to the pursuit of happiness, originally envisaged as a restraint on state power, has imperceptibly morphed into the right to happiness—as if human beings have a natural right to be happy, and anything which makes us dissatisfied is a violation of our basic human rights, so the state should do something about it.

In the twentieth century, per capita GDP was perhaps the supreme yardstick for evaluating national success. From this perspective, Singapore, each of whose citizens produces on average \$56,000 worth of goods and services a year, is a more successful country than Costa Rica, whose citizens produce only \$14,000 a year. But nowadays thinkers, politicians, and even economists are calling to supplement or even replace GDP with GDH—gross domestic happiness. After all, what do people want? They don't want to produce. They want to be happy. Production is important because it provides the material basis for happiness. But it is only the means, not the end. In one survey after another, Costa Ricans report far higher levels of life satisfaction than Singaporeans. Would you rather be a highly productive but dissatisfied Singaporean, or a less productive but satisfied Costa Rican?

Even if we are somewhat happier than our ancestors, the increase in our well-being is far less than we might have expected. In the Stone Age, the average human had at his or her disposal about 4,000 calories of energy per day. This included not only food, but also the energy invested in preparing tools, clothing, art, and campfires. Today, Americans use on average 228,000 calories of energy per person per day, to feed not only their stomachs but also their cars, computers, refrigerators, and televisions. The average American thus uses sixty times more energy than the average Stone Age hunter-gatherer. Is the average American sixty times happier? We may well be skeptical about such rosy views.

It appears that our happiness bangs against some mysterious glass ceiling that does not allow it to grow despite all our unprecedented accomplishments. Even if we provide free food for everybody, cure all diseases and ensure world peace, it won't necessarily shatter that glass ceiling. Achieving real happiness is not going to be much easier than overcoming old age and death. The glass ceiling of happiness is held in place by two stout pillars, one psychological, the other biological. On the psychological level, happiness depends on expectations rather than objective conditions. We don't become satisfied by leading a peaceful and prosperous existence. Rather, we become satisfied when reality matches our expectations. The bad news is that as conditions improve, expectations balloon.

Dramatic improvements in conditions, as humankind has experienced in recent decades, translate into greater expectations rather than greater contentment. If we don't do something about this, our future achievements too might leave us as dissatisfied as ever. On the biological level, both our expectations and our happiness are determined by our biochemistry, rather than by our economic, social, or political situation. According to Epicurus, we are happy when we feel pleasant sensations and are free from unpleasant ones. Jeremy Bentham similarly maintained that nature gave dominion over man to two masters—pleasure and pain—and they alone determine everything we do, say, and think. Bentham's successor, John Stuart Mill, explained that happiness is nothing but pleasure and freedom from pain, and that beyond pleasure and pain there is no good and no evil. Anyone who tries to deduce good and evil from something else—such as the word of God, or the national interest—is fooling you, and perhaps fooling himself too.

Liberal concerns about privacy have traditionally seen it as something which needs to be balanced against security. But today, we have to confront the fact that a considerable amount of surveillance occurs to increase our health, happiness, satisfaction, or sensory pleasures. Regardless of the motives behind this, if we believe that there are limits to how much of our lives should be expertly administered, then there must also be limits to how much psychological and physical positivity we should aim for. Any critique of ubiquitous surveillance must now include a critique of the maximization of well-being, even at the risk of being less healthy, happy, and wealthy.

Our hopes are being strategically channeled into this quest for happiness, in an objective, measurable, administered sense. Questions of mood, which were once deemed subjective, are now answered using objective data. At the same time, this science of well-being has become tangled up with economic and medical expertise. As happiness studies become more interdisciplinary, claims about minds, brains, bodies, and economic activity morph into one another, without much attention to the philosophical problems involved. A single index of general human optimization looms into view. What is clear is that those with the technologies to produce the facts of happiness are in positions of considerable influence, and that the powerful are being seduced further by the promises of those technologies.

One of the foundational neoliberal arguments in favour of the market was that it served as a vast sensory device, capturing millions of individual desires, opinions, and values, and converting these into prices. It is possible that we are on the cusp of a new post-neoliberal era in which the market is no longer the primary tool for this capture of mass sentiment. Once happiness-monitoring tools flood our everyday lives, other ways of quantifying feelings

in real time are emerging that can extend even further into our lives than markets.

This is what now preoccupies our global elites. Happiness, in its various guises, is no longer some pleasant add-on to the more important business of making money, or some new age concern for those with enough time to sit around baking their own bread. As a measurable, visible, improvable entity, it has now penetrated the citadel of global economic management. If the World Economic Forum is any guide, the future of successful capitalism depends on our ability to combat stress, misery, illness, and put relaxation, happiness, and wellness in their place. Techniques, measures, and technologies are now available to achieve this, and they are permeating the workplace, the high street, the home, and the human body.

The positive psychology movement disseminates techniques and slogans through which people might improve their happiness in everyday life, often by learning to block out unhelpful thoughts and memories. The idea that some of these methods might be added to the curriculum of schools, so as to train children in happiness, has already been trialed.

A growing number of corporations employ “chief happiness officers,” while Google has (or maybe had?—who can keep up?) an in-house “jolly good fellow” to spread mindfulness and empathy. Specialist happiness consultants advise employers on how to cheer up their employees, the unemployed on how to restore their enthusiasm to work, and—in one case in London—those being forcibly displaced from their homes on how to move on emotionally.

Is it possible to be against happiness? Philosophers can argue as to whether or not this is a plausible position to take. Aristotle understood happiness as the ultimate purpose of human beings, though in a rich and ethical sense of the term. Not everyone would agree with this. “Man does not strive for happiness,” wrote Friedrich Nietzsche, “only the Englishman does that.” As positive psychology and happiness measurement have permeated our political and economic culture since the 1990s, there has been a growing unease with the way in which notions of happiness and well-being have been adopted by policy-makers and managers. The risk is that this science ends up blaming—and medicating—individuals for their own misery, and ignores the context that has contributed to it.

There is also a sense that when the doyens of the World Economic Forum seize an agenda with so much gusto, there is at least some cause for suspicion. The mood-tracking technologies, sentiment analysis algorithms and stress-busting meditation techniques are put to work in the service of certain political and economic interests. They are not simply gifted to us for our own Aristotelian flourishing. Positive psychology, which repeats the mantra that happiness is a personal choice, is as a result largely unable to

provide the exit from consumerism and egocentricity that its gurus sense many people are seeking.

One of the ways in which happiness science operates ideologically is to present itself as radically new, ushering in a fresh start, through which the pains, politics, and contradictions of the past can be overcome. In the early twenty-first century, the vehicle for this promise is the brain. ‘In the past, we had no clue about what made people happy—but now we know,’ is how the offer is made. A hard science of subjective affect is available to us, which we would be crazy not to put to work via management, medicine, self-help, marketing, and behaviour change policies. But what if this psychological exuberance had, in fact, been with us for the past two-hundred years? What if the current science of happiness is simply the latest iteration of an ongoing project which assumes the relationship between mind and world is amenable to mathematical scrutiny?

Repeatedly, from the time of the French Revolution to the present (and accelerating in the late nineteenth century), a particular scientific utopia has been sold: core questions of morality and politics will be solvable with an adequate science of human feelings. How those feelings are scientifically classified will obviously vary. At times they are “emotional,” at other times “neural,” “attitudinal,” or “physiological.” But a pattern emerges, nevertheless, in which a science of subjective feeling is offered as the ultimate way of working out how to act, both morally and politically.

The spirit of this agenda originates with the Enlightenment. But those who have exploited it best are those with an interest in social control, very often for private profit. That unfortunate contradiction accounts for the precise ways in which the happiness industry advances. In criticizing the science of happiness, I do not wish to denigrate the ethical value of happiness as such, less still to trivialize the pain of those who suffer from chronic unhappiness, or depression, and may understandably seek help in new techniques of behavioural or cognitive management. The target is the entangling of hope and joy within infrastructures of measurement, surveillance, and government.

To understand these trends as historical and sociological does not in itself indicate how they might be resisted or averted. But it does have one great liberating benefit: of diverting our critical attention outward upon the world, and not inward upon our feelings, brains, or behaviour. It is often said that depression is “anger turned inwards.” In many ways, happiness science is ‘critique turned inwards,’ despite all of the appeals by positive psychologists to “notice” the world around us. The relentless fascination with quantities of subjective feeling can only possibly divert critical attention away from broader political and economic problems. Rather than seek to alter our

feelings, now would be a good time to take what we've turned inwards, and attempt to direct it back out again.

Maybe this scientific view of the mind, as a mechanical or organic object, with its own behaviours and sicknesses to be monitored and measured, is not so much the solution to our ills, but among the deeper cultural causes. Arguably, we are already the product of various overlapping, sometimes contradictory efforts to observe our feelings and behaviours. Advertisers, human resource managers, governments, pharmaceutical companies have been watching, incentivizing, prodding, optimizing, and preempting us psychologically since the late nineteenth century. Maybe what we need right now is not more or better science of happiness or behaviour, but less, or at least different. How likely is it that, in two-hundred years' time, historians will look back at the early twenty-first century and say, 'Ah, yes, that was when the truth about human happiness was finally revealed'? And if it is unlikely, then why do we perpetuate this kind of talk, other than because it is useful to the powerful?

Workplaces put a growing emphasis on community and psychological commitment, but against longer-term economic trends towards atomization and insecurity. We have an economic model which mitigates against precisely the psychological attributes it depends upon. In this more general and historical sense, then, governments and businesses created the problems that they are now trying to solve. Happiness science has achieved the influence it has because it promises to provide the longed-for solution.

First of all, happiness economists are able to put a monetary price on the problem of misery and alienation. The opinion-polling company Gallup, for example, has estimated that unhappiness of employees costs the US economy \$500 billion a year in lost productivity, lost tax receipts, and health-care costs. This allows our emotions and well-being to be brought within broader calculations of economic efficiency. Positive psychology and associated techniques then play a key role in helping to restore people's energy and drive. The hope is that a fundamental flaw in our current political economy may be surmounted, without confronting any serious political-economic questions. Psychology is very often how societies avoid looking in the mirror.

Evidence from social epidemiology paints a worrying picture of how unhappiness and depression are concentrated in highly unequal societies, with strongly materialist, competitive values.

“The good and happiness of the members, that is, the majority of the members, of any state, is the great standard by which everything relating to that state must finally be determined.”

Bentham was eighteen years old and the year was 1766 when he came across this. Over the next sixty years, he took this insight and converted it into an extensive and hugely influential doctrine of government: utilitarianism. This is the theory stating that the right action is whichever one produces the maximum happiness for the population overall. There is something telling about the fact that Bentham's eureka moment was not a matter of great intellectual originality. Nor did he ever claim to be much of a philosophical pioneer. In addition to Priestley's influence, Bentham was content to admit that much of his account of human nature and motivation was lifted from the Scottish philosopher David Hume. He had little interest in producing new theories or weighty philosophical tomes, and never took much enjoyment in writing. As far as Bentham was concerned, there was a limit to what any idea or text could hope to achieve when it came to the political or social improvement of mankind. Merely believing that "the greatest happiness of the greatest number" should be the goal of politics and ethics was of little consequence, unless a set of instruments, techniques, and methods could be designed to turn this belief into the founding principle of government.

The great advances of the natural sciences, as he saw it, derived from the ability to avoid the meaningless use of language. Politics and the law had to learn this lesson. In Bentham's view, every noun either refers to something "real" or something "fictitious"—but we often fail to notice the difference. Words such as 'goodness,' 'duty,' 'existence,' 'mind,' 'right,' 'wrong,' 'authority,' or 'cause' might mean something to us, and they have come to dominate philosophical discourse. But, as far Bentham was concerned, there is nothing which these words actually refer to. "The more abstract the proposition is," he argued, "the more liable is it to involve a fallacy." The problem is that we often mistake such propositions for reality.

It's possible to spot elements of Bentham's own life experiences in this psychological theory of politics. Its premise was a tragic one, which spoke of its author's own unhappiness: the one thing which all human beings hold in common is their capacity to suffer. Optimism could only lie in a wholesale reorientation of the state, towards the relief of suffering and the promotion of pleasure. Bentham was known to be unusually empathetic, often to a fault. His sensitive nature made him highly attuned to the unhappiness of others. One of the great virtues of utilitarianism, as a moral philosophy, is this empathetic dimension, its belief that we should take all others' welfare as seriously as our own. Given that humans are not the only species that suffers, many utilitarians also extend this to animals.

Unlike their predecessors, who would allow religious and political authorities to dictate truth from falsehood, right from wrong, the mature and

Enlightened citizen would draw on nothing but his own judgment. The motto of Enlightenment, Kant suggested, was *sapere aude*—dare to know. The critical individual mind was the only authoritative barometer of truth. But for this reason, it was equally important that everybody was using the same yardsticks of comparison, or the whole project would collapse into a relativist babble of subjective perspectives.

These were and remain the options: money or the body. Economics or physiology. Payment or diagnosis. If politics were to become scientific and emancipated from abstract nonsense, it is through economics, physiology, or some combination of the two that the project would be realized. When the iPhone 6 was released in September 2014, its two major innovations were quite telling: one app which monitors bodily activity, and another which can be used for in-store payments. Whenever experts seek to witness our shopping habits, our brains, or our stress levels, they are contributing to the project that Bentham had mapped out. The status of money in this science is intriguing. While political and moral concepts are attacked as empty, nonsensical abstractions, somehow the language of pounds and pence is viewed as having some firm and natural relationship to our inner feelings. The exceptional status attributed to economics from the late nineteenth century onwards, as closer to a natural science than a social one, is one legacy of this worldview.

How can some particular part of our bodies or selves possess its own voice, and how can experts claim to know what it is saying? First and foremost is the distrust of language as a medium of representation. Bentham's fear of the "tyranny of sounds" casts doubt on the capacity of individuals to adequately express themselves. To be sure, Bentham recognized that each person was the best judge of her own private pleasures and happiness in her own life. But for the purposes of a public politics, some other means of knowing what was good for people needed inventing. Variants of mind-reading technology are invented only to get around the apparent problem that language is inadequate to communicate feelings, desires, and values. Whether that technology involves money and prices, or measurements targeted at the human body (such as pulse, sweat, or fatigue monitors), the science of our inner sensations seeks forms of truth that might eventually bypass speech altogether. The final destination of such developments is a form of silent democracy, peopled only by mute physical bodies.

In the monistic worldview of Bentham and Fechner, experiences differ in terms of their quantity, sitting on a scale between extreme pleasure and extreme pain. One thing that this necessarily discounts is the possibility that human beings may have their own considered reasons to be happy or unhappy, which may be just as important as the feelings themselves. In

order to credit individuals with ‘critiques’ or ‘judgments’ or ‘demands’ (or, for that matter, with ‘gratitude’ or ‘acclaim’), we have to recognize that they possess authority to speak for their own thoughts and bodies. This means understanding the difference between, say, ‘despair’ and ‘sadness,’ and the ability of the person using those terms to do so deliberately and meaningfully.

Were, for instance, someone to describe themselves as ‘angry,’ a response focused on making them feel better might entirely miss the point of what they were saying. It might even be deemed insulting. Were someone to be unhappy about the fact that income inequality in Britain and the United States has reached levels not seen since the 1920s, the advice—as given by some happiness economists—that one is best off not knowing what other people earn would seem like a form of hopelessness. In a monistic world, there is merely sentiment, experiences of pleasure and pain that fluctuate silently inside the head, with symptoms that are discernable to the expert eye.

Psychiatrists, therapists, and analysts turn their critical eye upon the subject having the feelings, rather than the object that seems to be causing them. If lifting weights becomes too painful, you’re faced with a choice: reduce the size of the weight, or pay less attention to the pain. In the early twenty-first century, there is a growing body of experts in resilience training, mindfulness, and cognitive behavioural therapy whose advice is to opt for the latter strategy.

The job of intervening, to alter the psychological calculations and feelings of individuals, can be distributed across various types of institution and expert. We classify some as ‘medical’ or ‘managerial,’ others as ‘educational’ or ‘penal.’ But really, these terms are just further abstractions and fictions. All that matters is how effectively they administer their task, of offering the carrots and sticks which alter human activity and experience for the better.

Let’s consider again the foundation of Bentham’s political science:

“Nature has placed mankind under the governance of two sovereign masters, pain and pleasure.”

By making this claim, Bentham hoped to strip out abstract, unscientific bases for political programmes. But in what sense is his claim about “nature” really any less metaphysical? Since when did nature involve erecting “sovereign masters” over certain species? That sounds suspiciously like metaphysics after all. No matter how scientific his portrait of motivation may claim to be, in its epic generality it is guilty of the same abstraction that Bentham deplored in philosophy. And if it weren’t, then the notion of happiness as the ultimate purpose of government would not be able to hold.

Here's the paradox. If happiness is granted its grand, philosophical and moral status as a "sovereign master," we might agree that this is ultimately what life is all about. But then how could such an entity ever be measured scientifically? Whereas if happiness is anchored firmly in the physical, sensory experience of pleasure and pain, who is to say that such a mundane matter carries any fundamental or political importance? It becomes just a grey mushy process inside our brains. Too often, the utilitarian route out of this dilemma is simply to duck it altogether. If we are asked why happiness matters we can give no further external reason. It just obviously does matter. Is happiness measurement really a way of resolving moral and philosophical debate? Or is it actually a way of silencing it? Once the technocrats are in charge, it is too late to raise any questions of intrinsic meaning or collective purpose.

Economics, as passed down by Adam Smith, was not strictly speaking a science: it lacked the mechanical and mathematical rigor. But by starting from a different premise perhaps this was a domain that was amenable to truly scientific reasoning after all. If the economy could be understood as a mathematical problem, to be solved through the attainment of quasi-mechanical balance, then economics would be placed on genuinely scientific foundations.

The Chicago School complaint against governments was not that they had too much power, but that they used it in an unscientific fashion. In short, policy-makers needed to listen to economists more closely, a view that reveals the most distinctive Chicagoan trait of all: the fundamental belief that economics is an objective science of human behaviour which can be cleanly separated from all moral or political considerations.

At the root of this science lay a simple model of psychology that can be traced back via Jevons to Bentham. According to this model, human beings are constantly making cost-benefit trade-offs in pursuit of their own interests. Jevons explained the movement of market prices in terms of such psychological rationality on the part of consumers, who are constantly seeking more bang for their buck (or less buck for their bang). What distinguished the Chicago School was that they extended this model of psychology beyond the limits of market consumption, to apply to all forms of human behaviour. Caring for children, socializing with friends, getting married, designing a welfare programme, giving to charity, taking drugs—all of these apparently social, ethical, ritualized, or irrational activities were reconceived in Chicago as calculated strategies for the maximization of private psychological gain. They referred to this psychological model as "price theory" and saw no limit to its application.

What if the psychological model or "price theory" itself was faulty?

What if people don't act like rational calculators of private gain, least of all in their domestic, social, and political lives? What if economics isn't fully adequate to understanding why people behave as they do? In the seminar rooms of Chicago economics, these were the questions that could never be raised. All regimes of radical, skeptical, anti-philosophical empiricism require certain propositions which are exempted from scrutiny. In Chicago, that proposition is price theory, which, from the lectures of Viner during the 1930s through to the current pop-economics fad of Freakonomics, has been the central article of faith for an institution that proclaims to have no need for faith.

The central fact about money is that it must perform two contradictory functions at once: to serve as a store of value and as a medium of exchange. When acting as a store of value, it becomes something we cherish and want to hang onto, often by placing it in a bank account. When acting as a medium of exchange, it is something that opens up infinite possibilities to attain other, much more useful and desirable things. This contradiction is manifest in the physical design of money itself, which has to combine a high level of symbolic appeal (in its insignia and shininess) and minimal level of actual physical usefulness.

Thus one way of understanding the history of liberal economics, from Smith onwards, is as an ongoing attempt to deal with the bipolar character of money. As we all instinctively recognize, markets are places where goods or services are exchanged for money of some sort. But what we tend to overlook is how odd such an exchange actually is. How is that a £10 note can be deemed equivalent to, say, a pizza? In order for this exchange to take place, money's dual roles as both medium of exchange (I am willing to get rid of it) and as store of value (the pizza seller is willing to accept it) have to function simultaneously. How can a piece of pure, numerical symbolism serve as equivalent to a doughy, cheesy meal, without either side feeling hard done by? The constant risk is that people either value money too highly or not highly enough. The solution offered by economists is to invent a mysterious entity that lurks magically inside the pizza, which they term "value."

Often, we use the word 'value' to mean price, as when someone says, 'This painting is valued at £1,000.' But it's quite clear from other uses of the term 'value' that it doesn't mean price at all. If I describe the pizza as 'bad value for money,' that suggests it really shouldn't have been exchanged for as much as £10. The value and price of the pizza were not, in fact, equivalent to each other, and the customer was being ripped off. The idea of value allows us to view markets as balancing devices, whose outcome should in principle be fair. By suggesting that value is a quantity like money,

economists are able to show how both sides of an exchange are, ultimately, equivalent. When the market for pizzas is working correctly, they argue, ten of these pounds will buy you an equivalent quantity of value. Rather than exchange a quantity (money) for a quality (pizza), both sides of the equation can be represented in numerical terms. The market becomes imagined as a set of scales, which weigh money and value against each other, until the two are in perfect balance. What the idea of value really says is this: money itself is not the most important thing in life, but it is the perfect measure for anything that we do consider important.

The bizarre philosophical status of whiplash as a form of entirely invisible pain makes it unusually amenable to fraudulent insurance claims. Intuitively, this explains how rates of whiplash diagnosis vary so sharply from one country to the next: in countries such as Britain and the United States, where it is a well-known phenomenon, drivers who have suffered a rear-end collision will be that much more likely to spot the opportunity for some monetary reward.

What if whiplash is necessarily entangled with the pursuit of monetary compensation? And what if fraud of this sort is not some unfortunate, exceptional, and eradicable element of our compensation culture, but an entirely inevitable feature of how our sense of justice and injustice has been colonized by monetary calculation? Deep within the whiplash syndrome, there is the idea of equivalence between the sensations produced via the nervous system and money. The principle states that a certain quantity of subjective feeling can be counterbalanced by an appropriate quantity of money. Admittedly, this principle may be widely abused, in some societies far more than others. But the very fact that it is impossible to know whether it is being abused, or by how much, tells us something about the absurdity of this presupposition. Maybe, instead of searching harder for the truth of physical pain, we should explore if money could ever serve as some neutral, honest, and mathematical representation of our feelings.

By the 1880s, retail culture, based upon widespread circulation of paper money and even some recognizable brands, was established. In the absence of such a culture, an economic theory founded on the premise of individual pleasure-seeking would have looked like crazed utopianism. In short, capitalism could now be viewed as an arena of psychological experiences, in which physical things were merely props for the production of sensations, to be acquired through cash. A commodity was simply anything that can give pleasure, or take away pain.

Man cannot create material things. In the mental and moral world indeed he may produce new ideas; but when he is said to produce material things, he really only produces utilities; or in other words, his efforts and

sacrifices result in changing the form or arrangement of matter to adapt it better for the satisfaction of wants. During the 1980s, it became fashionable to declare that capitalism had suddenly become based upon knowledge, intangible assets, and intellectual capital, following the demise of many heavy industries in the West. In truth, the economy was reconceived as a phenomenon of the mind a whole century earlier. Capitalism became oriented around consumer desire, directed by that most alluring spokesman for our silent inner feelings: money.

As economists saw it, they have no need to know how much pleasure a pizza gives me, but only whether I would prefer to have a pizza or a salad. The way I spend my money is determined by my preferences, and not by my actual subjective sensations. Gradually economists discovered that they could say less and less about what goes on in the minds of consumers, to the point where it's enough to simply observe their use of money and assume the rest.

Take the Exxon Valdez incident. Beyond Exxon's liability for the cost of the clean-up, there was a broader moral question: how to punish the company for the damage they had done to a thousand miles of beautiful coastline? How to counterbalance what they'd done? One of the answers to this question was produced by the state of Alaska. Using a technique known as a willingness to pay survey, a representative sample of citizens in all of the other forty-nine US states were interviewed on how much they would be willing to pay for the Exxon Valdez disaster not to have taken place. They were each provided with information about the extent and impact of the disaster to inform this mental calculation. The answer, so it turned out, was an average of \$31 per household. Multiplied by 91 million households, this produced the calculation that Exxon owed the American public \$2.8 billion. This figure was used to help calculate the final legal settlement of what Exxon had to pay as a fine.

What we witness in this sort of example is economics becoming used as a basis for broad public agreement, well beyond the limits of the marketplace. Techniques invented for the study of equilibrium in small private market exchanges are extended to deliver judgments over major public moral controversies. And think what a strange activity is at work at the heart of this: citizens scattered across America were required to close their eyes and imagine what they personally would pay in order for some distant event not to have happened. They must reach down inside themselves, in search of some number which they believe to be equivalent to the "value" of a clean coastline. How odd it is that a technique based on wild introspection, whose veracity is entirely impossible to prove one way or the other, should attain higher authority than, say, the testimony of judges or elected officials or

wildlife experts.

And yet the political authority of such techniques is growing all the time. Wherever the capacity to reach publicly acceptable agreements recedes, so the recourse to economics to settle disputes has increased. To find out whether it is worth spending money to protect beautiful landmarks, making cultural resources freely available to the public, or increasing transport safety, policymakers increasingly use techniques such as willingness to pay surveys to work out what the hypothetical price of those goods might be. Other techniques include studying the effect of a beautiful park on local house prices, to understand the park's value in money terms. In health care, where limited resources must be spent in the best way possible, the question of "value for money" is a constant problem. Once again, psychological introspection plays a role, with the public being surveyed to discover their numerical evaluation of cancer or blindness, despite typically having no experience of these hypothetical syndromes.

Of course spending on health care requires some basis on which to navigate dilemmas. The problem is money has become the moral *lingua franca* through which this is now done: different health outcomes are given different monetary values by specialist health economists. But as economics is drawn into more and more public issues and moral disputes, so the psychological question of valuation becomes more problematic.

These techniques represent a fudge between a democratic worldview, which demands that the voice of the public be heard, and a Benthamite science, which states that only numbers can be trusted. The unwieldy outcome is that the public may speak, but on the condition that they adopt metrics and prices as their language. In order to have their say, they must mimic a calculator.

Some economists now wonder: could value in fact be a real, chemical substance, varying in quantity, inside our brains? When I decide to spend £10 on a pizza, might this actually be because I will receive an exactly equivalent quantity of dopamine, by way of reward? Some perfect balance is imagined, with cash on one side of the scales, and a commensurate dose of neurochemical on the other. Perhaps it might be possible to identify the exchange rate through which these dollars-for-dopamine trades are undertaken.

Common sense suggests that these are absurd propositions. The sheer unlikelihood that the brain would "naturally" operate according to principles first developed by economists in the 1860s seems overwhelming. Why would anyone believe that, in our fundamental biological nature, we operate like accounting machines? The answer to that question is simple: to rescue the discipline of economics and, with it, the moral authority of money.

The neuroeconomic prejudice is that the mechanical, mathematical view of the mind ought ultimately to be correct. Of course there are anomalies, when neurochemicals are produced in the wrong quantity, or at the wrong time. But by tracing when these occur and building them into our calculations, the mind can be relied upon to perform its balancing act once more. The truth is that whenever policy-makers, economists, or business leaders start to dabble in the neuropsychology of reward or incentives or dopamine, their agenda is really a different one altogether: to ensure that money retains its privileged position as the measure of all value. A financial crisis represents an acute threat to the public status of money, raising the urgency of placing ‘value’ on firm foundations. The brain is simply the latest locus for these foundations, in a history that snakes back to the 1860s. Much of our interest in pleasure and happiness today derives from a tradition of economics that only requires sufficient theory of the mind, as is required by a free market economy. To suggest that such theories can be divorced from that political and cultural context is like trying to understand a set of kitchen scales without any understanding of what cooking involves. Unless the idea of fairness can be disentangled from the notion of “value for money,” with all of the psychological questions that the notion poses, philosophical quandaries such as whiplash will proliferate.

In 2014, British Airways trialed a “happiness blanket,” which represents passenger contentment through neural monitoring. As the passenger becomes more relaxed, the blanket turns from red to blue, indicating to the airline staff that they are being well looked after.

While the scanning technology that promises to unlock the secrets of our feelings is dazzlingly new, the philosophical and ethical questions that result from it are quite old. This points us to a recurring pattern within psychological research that dates back to those first optical tachistoscopes of the 1850s, and it concerns the mesmerizing lure of mind-reading technologies. With every wave of new methods and instruments for scanning the thought processes or sensations of others, so there occurs a resultant belief that hard science has ousted philosophy and ethics once and for all. At the same time, there is always the hope that it is possible to understand another human being without talking to them. But on each occasion, there is still some residual vision of what freedom and consciousness really mean that escapes scientific validation. When psychologists, neuroscientists, or market researchers claim to have liberated their discipline from moral or philosophical considerations once and for all, the question has to be posed: So where do you get your understanding of humanity from, including its various emotional states, drives, and moods? From your own intuition? And what feeds that?

In the years since the first tachistoscopes were introduced, the answer has become increasingly plain. The residual notion of freedom that structures how this science progresses is the freedom to shop. If that is the case then contemporary neuromarketing and facial coding might rightly be accused of being a circular venture. What they discover in the synapses of our brains and the flickering of our eyes is not raw data, to be injected afresh into advertising designs, but is unavoidably interpreted through a consumerist philosophy.

It is thanks to technical methods and instruments, from the tachistoscope onwards, that psychology can claim to be its own objective science in the first place. The seductive power of such instruments has allowed certain individuals to declare that philosophy and ethics are no longer needed. It is here that much of the Benthamite promise of a scientific politics has been channelled, a politics in which hard expertise over the feelings of others replaces the messiness and ambiguity of dialogue. But behind this version is not national government in pursuit of a public interest, rather a corporation in pursuit of a private one.

Many these days assume that human beings are slaves to external incentives, and not actually possessing free will at all. And they have studies replete with colorful images of brains, pop-sci books, and interviews and presentations by charismatic, highly credentialed “experts” to back them up.

Factual truth is not a popularity contest. So what if most people think that they and others have ‘free will’? Thus we come to the heart of the matter: The question whether humans can live in a material world and yet be morally responsible is not empirically testable. It is not a scientific problem. It is a conceptual and ethical impasse that has bedeviled thinkers since antiquity and is still without a resolution. Rest assured, our goal here is not to attempt to solve it; indeed, it may well be unsolvable. What we do want to establish here—and this is a crucial point—is that neuroscience has not resolved it either. Those who believe that the absence of ultimate free will means that moral responsibility is an incoherent notion and that society should therefore abolish blame have already staked out a philosophical claim. Simply amassing more data on the workings of the brain may strengthen their conviction that determinism is correct, but it won’t make their argument against the coexistence of determinism and moral agency any stronger.

Between the middle of the nineteenth century and the first World War, fifty-thousand Americans traveled to Germany and Austria to undertake university degrees and research training to bring back to the United States. This represents one of the biggest exports of intellectual capital in history, especially in areas such as chemistry, physiology, and the new field of

psychology.

Many Germans wondered why were these American students so obsessed with understanding fluctuations in pleasure? Crudely put, they wanted to provide a set of tools for managers. American psychology had no philosophical heritage. It was born into a world of big business and rapid social change, which risked spiralling out of control. If it couldn't offer to alleviate the problems that were afflicting American industry and society, then it had no reason to exist at all. That, at any rate, was the view expressed by leaders of the new league of universities, who were eager to please their corporate benefactors. In the early twentieth century, psychology made an explicit pitch to act as the "master science" through which the American dream might yet be rescued. If individual decision-making itself could be reduced to a hard science, with quasi-natural laws and statistics, then it might still be possible for a multinational, multi-ethnic, industrial, mass society to function, while still upholding the core Enlightenment principle of liberty on which the republic had been founded.

Contained within each of these policy projects is a single ideal: that individual activity might be diverted towards goals selected by elite powers, but without either naked coercion or democratic deliberation. Behaviourism stretches Bentham's dream of a scientific politics to its limit, imagining that beneath the illusion of individual freedom lie the cold mechanics of cause and effect, observable only to the expert eye. When we put our faith in behavioural solutions, we withdraw it from democratic ones to an equal and opposite extent.

Don't appeal to the consumer's existing emotions and desires but trigger new ones. In the 1920s, the risk of Resor and Watson's scientific exuberance was that they overlooked what members of the public actually thought and felt, so confident were they that they could dictate emotional responses from scratch. Corporate America could not depend on this leap of faith alone. Behaviourism's radically scientific view of the mind suggested there was nothing to fear here. There was nothing lurking, hidden, in the dark recesses of the mind that actually existed beyond what could be observed by psychologists. In fact, the very idea of the mind was just a philosophical distraction. The worry this generates is that a brand (or, for that matter, a politician or ideology or policy) might have become unappealing in ways that are apparent to the public but not yet to scientists and elites. The science of desire also required discovering what people wanted, finding out what they hoped for, in addition to trying to shape it.

Button-pressing machines for the capturing of attitudes—like the "worm" that reveals how the audience feels during a presidential debate, or the Facebook "like" button—cut out the use of speech from attitudinal research,

but not the judgment of the attitude-holder. This was the crypto-democratic underbelly of how market research developed as the Great Depression took hold, and elites grew increasingly concerned as to what the masses had in mind.

Once the judgment and voice of the ordinary person is admitted into market research, things can start to shift in a democratic direction. This is an unpredictable and—from the perspective of a corporation, government, or advertising account executive—worrying situation. It contains the possibility that people may report a negative attitude towards consumerism, or even towards capitalism itself. On the other hand, it is precisely the capacity to detect such threats that made these techniques indispensable for corporations and governments. Roosevelt may have conducted endless polls on how the public perceived his policies, but he never once altered a policy in response. Every commission for a new attitudinal study also included the requirement for advice on “how the attitude might be corrected”—in other words: propaganda.

Under the influence of market research, political ideals are quietly converted into economic desire. The cold mechanics of marketing and the critique of capitalism are locked into a constant feedback loop, such that there is no remaining idea of what freedom might look like, beyond that of consumption.

At the heart of the cultural and political battles of the 1960s was an acute relativism which attacked the roots of moral, intellectual, cultural, and even scientific authority. The right to declare some behaviours as “normal,” certain claims as “true,” particular outcomes as “just,” or one culture as “superior” was thrown into question. When the traditional sources of authority over these things attempted to defend their claims, they were accused of offering just one partial perspective, and of using their own parochial language to do so. In place of some values being “better” or “truer” than others, there was simply conformity on the one hand and difference on the other. The core political and philosophical questions posed by the 1960s were these:

- How to take any publicly legitimate decisions, once there are no commonly recognized hierarchies or shared values any longer?
- What will provide the common language of politics, once language itself has become politicized?
- How will the world and society be represented, once even representation is considered to be a biased and political act?

The problem, from a governmental point of view, was that the reach of democracy was extending too far.

In a world where we cannot agree on what counts as ‘good’ and what counts as ‘bad,’ because it’s all a matter of personal or cultural perspective, measurement offers a solution. Instead of indicating quality, it indicates quantity. Instead of representing how good things are, it represents how much they are. Instead of a hierarchy of values, from the worst up to the best, it simply offers a scale, from the least up to the most. Numbers are able to settle disputes when nothing else looks likely to. At its most primitive, the legacy of the 1960s is that more is necessarily preferable to less. To grow is to progress. Regardless of what one wants, desires, or believes, it is best that one gets as much of it as possible.

This belief in growth as a good-in-itself was made explicit by some subcultures and psychological movements. Humanistic psychology, as advanced by Abraham Maslow and Carl Rogers, attempted to reorient psychology—and society at large—away from principles of normalization and towards the quest for ever greater fulfillment. Individuals were perceived to be hemmed in by the dull conformity of 1950s culture, which blocked their capacity to grow. To assume that there was a natural or moral limit to personal growth was to fall back into repressive traditions. It wasn’t long before corporations were making the identical argument about the malign impact of market regulation on profit growth.

Given that labour was central to the classical economic view of capitalism, it must surely be relevant that workers suffer different levels of pain as they go through their day, which then influences how much they are able to produce. It is often said in circumstances of boring or monotonous work that the last hour drags the longest. The longer one spends labouring on a task, the harder it gets. Such insights spoke to an emerging concern among industrialists at the time, that workers were suffering from fatigue, and that the bourgeoisie’s principal source of wealth, namely labor, was gradually becoming depleted. As the nineteenth century wore on, this worry led to an explosion of strange experiments on fatigue and possible ergonomic solutions. And so it was via the subjective experience of work, as an exercise that gradually increases in painfulness, that capitalists became interested in how we think and feel for the very first time.

Physiologists—and industrialists—were growing increasingly concerned by the problem of physical human fatigue, especially in the factory. The Victorians had tended to view inactivity and unemployment as moral failings, associated with drink and “bad character.” But by the 1880s, there was a creeping concern that industrial work was simply grinding people down. Human beings were running out of steam.

It would be perverse to defend Taylorism, but there was at least a transparency about its logic. Workplaces and managers existed to extract value, in the most efficient way possible. Workers were never expected to like this, which was a freedom of sorts. As Ian Curtis, the lead singer of Joy Division who hanged himself aged twenty-three, once said:

“I used to work in a factory and I was really happy because I could daydream all day.”

Labourers in a Taylorist factory brought their physical capabilities into work, to be exploited for sure, but were never expected to give anything more personal or intangible. And this is exactly why managers soon turned their backs on Taylor’s version of scientific management.

Others had some much more far-reaching theories regarding the ways in which the insights of psychology might fundamentally reform and rescue capitalism. By focusing on the entire person in the workplace, including all of their personal concerns and mental well-being, work might provide the labourer with their deepest source of meaning, and offset the risk of industrial upheaval once and for all.

Management, which originated as a technique for controlling slaves on plantations, and developed as a means of running heavy industrial corporations, had become a soft, social and psychological skill.

By the 1980s, an employee’s customer care, service ethic and enthusiasm were not simply mental resources, which existed to help churn out more products: they were the product. The importance of employee happiness and psychological engagement becomes all the greater once corporations are in the business of selling ideas, experiences, and services. Businesses speak of “intangible assets” and “human capital” in the hope of capturing this amorphous workplace ethos, but in practice it is nothing which resembles either an asset or capital. Some other way of conceiving of work is required.

Robbins and Hayek were seeking to muster a fight-back against the Keynesian and socialist thinking that thrived through the Depression, by highlighting the unique intelligence contained in the price system of competitive markets. Coase breathed this in. More importantly, he was exposed to Hayek’s intense skepticism regarding what any social science, including economics, could be capable of knowing.

Coase’s brilliance was to spot within the Chicago School position a final remnant of metaphysical speculation that they themselves were not aware of. Up until this point, the Chicago School still assumed that markets needed to be open, competitive, run according to certain principles of fairness, or else they would become submerged under the weight of monopolies. Markets

needed ground rules if they were to match up to the ideal of being a space of individual freedom. This meant that they still required authorities capable of intervening, once competitors ceased to play fair or grew too powerful, and the market started to fail. Ever the sceptic, Coase did not accept this style of reasoning. Nothing in real economic life was ever that simple. Markets were never perfectly competitive in actuality, so the categorical distinction between a market that ‘works’ and one that ‘fails’ was an illusion generated by economic theory. The question economists should be asking, Coase argued, is whether there is good evidence that a specific regulatory intervention will make everyone better off overall. And by ‘everyone,’ this shouldn’t just mean consumers or small businesses, but the party being regulated as well.

This argument was straight out of Bentham: he was advocating that policy be led purely by statistical data on aggregate human welfare, and abandon all sense of ‘right’ and ‘wrong’ altogether. If there isn’t sufficient data to justify government intervention—and such evidence is hard to assemble—then regulators would be better off leaving the economy alone altogether. One of the most far-reaching implications of Coase’s argument was that monopolies are not nearly as bad as economists tend to assume. Compared to a perfectly competitive, perfectly efficient market, then yes, monopolies are undesirable. But this was what Coase disparagingly called “blackboard economics.” If economists opened their eyes and looked at capitalism as it actually existed, they might discover that regulatory efforts to produce efficient markets were often counter-productive. Meanwhile, leaving firms alone to work things out for themselves—using private contracts and compensation where necessary—could actually produce the best available outcome overall; not a perfect outcome, just the best one available. The function of economics was to carefully calculate what should be done, on a case-by-case basis, not to offer utopian visions of perfect scenarios.

To maintain authority amidst various conflicting perspectives on the rights and wrongs of a competitive situation, regulators needed to be staffed by economists who would simply represent the facts. Stigler and his colleagues had little interest in such even-handedness. What they now possessed was a devastating critique of the moral authority of regulators and legislators, who purported to act in the “public interest” but were typically just acting either in their own interests (to create more jobs for regulators) or out of political resentment towards large successful businesses. What regulators and left-wing liberals had singularly failed to recognize was that large, exploitative, monopolistic businesses also generate welfare. In fact, given a free rein, who knew how much welfare they might produce?

From the increasingly bullish Chicagoan perspective, the scale of giant

corporations allowed them to work more efficiently, doing more good for consumers and society at large. The benefit they produced did not happen in spite of their aggressive competitive behaviour, but because of that behaviour. Let them grow as far as they can, as profitably as they can, and see what happens. Why worry about businesses getting too big? Who is to say that they shouldn't be even bigger? By the end of the decade, Friedman was stating the pro-corporate argument even more nakedly. As he put it in a famous article published in the *New York Times Magazine* in 1970, the single moral duty of a corporation is to make as much money as it possibly can.

Regulators had long been striving to protect competitors from larger bullies, but what about the welfare of the bully? Didn't he deserve to be taken into account as well? And—as the Chicago School would later seek to explain—might consumers actually be better off being served by the same very large, efficient monopolists than constantly having to choose between various smaller, inefficient competitors? If the welfare of everyone were taken into account, including the welfare of aggressive corporate behemoths, then it was really not clear what benefit regulation was actually achieving.

There is one deeply counter-intuitive lesson which emerges from this: American neoliberalism is not actually all that enamoured with competitive markets at all. That is to say, if we understand a market as a space in which there is a choice of people to transact with, and a degree of freedom as to whether to do so—think of eBay for example—the Chicago School was entirely comfortable with the notion of businesses restricting this choice, restricting this freedom, on grounds that it produces more utility overall. What Stigler, Friedman, Director, and their colleagues really admired was not the market as such, but the competitive psychology that was manifest in the entrepreneurs and corporations which sought to vanquish their rivals. They didn't want the market to be a place of fairness, where everyone had an equal chance; they wanted it to be a space for victors to achieve ever-greater glory and exploit the spoils. In their appeals to the limitless potential of capital, these Chicago conservatives were making a similar appeal to the logic of growth as the counterculture and the humanistic psychologists were. With the metaphor of “human capital,” the distinction between corporate strategy and individual behaviour dissolved altogether: each person and each firm was playing a long-term game for supremacy, whether or not there was a market present.

In what sense is this winner-take-all economics still competition? Perhaps the clue to the Chicagoan vision lay in their own combative intellectual culture. These professed outcasts, with a chip on their shoulder, believed that no game was ever really lost. Friedman made his career on the basis

of arguing single-handedly against a global Keynesian orthodoxy for nearly four decades, until finally, by the late 1970s, he was perceived to have “won.” Coase no doubt impressed his hosts partly by his willingness to stand up for his minority view, and willing them over. The elites of Harvard, MIT, and the federal government were entitled to enjoy their period of dominance, but they should have taken these upstarts in Chicago a little more seriously from the start. Because when the neoliberals got to taste intellectual and political victory, they would fight just as hard to cling onto it. Chicago-style competition wasn’t about co-existing with rivals; it was about destroying them. Inequality was not some moral injustice, but an accurate representation of differences in desire and power.

The Chicago School message to anyone complaining that today’s market is dominated by corporate giants is a brutal one: go and start a future corporate giant yourself. What is stopping you? Do you not desire it enough? Do you not have the fight in you? If not, perhaps there is something wrong with you, not with society. This poses the question of what happens to the large number of people in a neoliberal society who are not possessed with the egoism, aggression, and optimism of a Milton Friedman or a Steve Jobs. To deal with such people, a different science is needed altogether.

Your Broken Brain

Even after the epic failure of the neoliberal model of 2008, Britain's political class returned to this rhetoric, announcing that the "global race" requires that welfare is slashed and labour markets further deregulated. The need to entrench "competitiveness" as the defining culture of businesses, cities, schools, and entire nations, so as to out-do international rivals, is the mantra of the post-Thatcher era. A science of winning, be it in business, sport, or just in life, now brings together former sportsmen, business gurus and statisticians to extend lessons from sport into politics, from warfare into business strategy, and from life coaching into schools.

It transpires that competition and competitive culture, including that of sport, is intimately related to a disorder that was scarcely discussed in 1977 but which had become a major policy concern by the end of the century. As the 1970s drew to a close, Western capitalist countries stood on the cusp of a whole new era of psychological management. The disorder at the heart of this was depression.

One way of observing the relationship between depression and competitiveness is in statistical correlations between rates of diagnosis and levels of economic inequality across society. After all, the function of any competition is to produce an unequal outcome. More equal societies, such as Scandinavian nations, record lower levels of depression and higher levels of well-being overall, while depression is most common in highly unequal societies such as the United States and United Kingdom. The statistics also confirm that relative poverty—being poor in comparison to others—can cause as much misery as absolute poverty, suggesting that it is the sense of inferiority and status anxiety that triggers depression, in addition to the stress of worrying about money. For this reason, the effect of inequality on depression is felt much of the way up the income scale.

Yet there is more to this than just a statistical correlation. Behind the numbers, there is troubling evidence that depression can be triggered by the competitive ethos itself, afflicting not only the "losers" but also the "winners." What was identified as the socialist fear, that competition makes many people seem inferior, has been proved far more valid than even left-wing 1970s schoolteachers could have imagined; it also tells them that they are inferior.

A series of experiments and surveys has revealed that aspirational values, oriented around money, status, and power, are linked to higher risk of depression and a lower sense of "self-actualization." Wherever we measure our self-worth relative to others, as all competitions force us to, we risk

losing our sense of self-worth altogether. One of the sad ironies here is that the effect of this is to dissuade people, including schoolchildren, from engaging in physical exercise altogether.

The depressive-competitive disorder of neoliberalism arises because the injunction to achieve a higher utility score—be that measured in money or physical symptoms—becomes privatized. Very rich, very successful, very healthy firms or people could, and should, become even more so. In the hands of the Chicago School of economics or the St. Louis School of psychiatry, the logic that says we have a particular political or moral responsibility towards the weak, which may require us to impose restrictions on the strong, is broken. Authority consists simply in measuring, rating, comparing, and contrasting the strong and the weak without judgment, showing the weak how much stronger they might be, and confirming to the strong that they are winning, at least for the time being. Buried within the technocratic toolkits of neoliberal regulators and evaluators is a brutal political philosophy. This condemns most people to the status of failures, with only the faint hope of future victories to cling onto. That school in London “where the pupils are allowed to win just one race each, for fear that to win more would make the other pupils seem inferior” was, in fact, a model of how to guard against a depressive-competitive disorder that few in 1977 could have seen coming. But that would also have required a different form of economy, which few policymakers today are prepared to warrant.

Psychologists have shown that individuals tend to be happiest if they credit themselves for their successes, but not for their failures. This might sound like a symptom of delusion, but it is arguably no more delusional than a competitive, depressive culture which attributes every success and every failure to individual ability and effort.

Few private sector managers are required to negotiate with unions any longer, but nearly all of them confront a much trickier challenge, of dealing with employees who are regularly absent, unmotivated, or suffering from persistent, low-level mental health problems. Resistance to work no longer manifests itself in organized voice or outright refusal, but in diffuse forms of apathy and chronic health problems. The border separating general ennui from clinical mental health problems is especially challenging to managers in twenty-first-century workplaces, seeing as it requires them to ask personal questions on matters that they are largely unqualified to deal with.

The World Health Organization caused a stir in 2001 by predicting that mental health disorders would have become the world’s largest cause of disability and death by 2020. Some estimates suggest that over a third of European and American adults are suffering from some form of mental health problem, even if many are going undiagnosed.

If capitalism is being ground down by the chronic, unspecifiable alienation of those it depends on, then surely solving that problem may also open up possibilities for political reform? The hard economic costs that ennui now places upon employers and governments means that human misery has shown up as a chronic problem that elites cannot simply shove aside.

One report on the topic, sponsored by a number of UK corporations including Barclays Bank, stated with a peculiar absence of compassion:

“Today’s brain-based economy puts a premium on cerebral skills, in which cognition is the ignition of productivity and innovation. Depression attacks that vital asset.”

A UK government report published in 2008 complained that “the fallacy persists that illness is incompatible with being at work,” which doctors were guilty of peddling. A government campaign was launched to dissuade doctors of this, and their official “sick notes” (which were once signed by doctors to declare that an individual shouldn’t work) were replaced by “fit notes,” requiring doctors to describe the remaining ways in which an individual could still be employed, despite any illnesses or disabilities. Doctors were encouraged to sign a draft statement scripted by the state, agreeing that work is good for people.

The philosophical deficit in the science of happiness is dealt with by importing ideas from Buddhism and new age religions.

The psychology of motivation blends into the physiology of health, drawing occasionally on insights from sports coaches and nutritionists, to which is added a cocktail of neuroscientific rumours and Buddhist meditation practices. Various notions of ‘fitness,’ ‘happiness,’ ‘positivity,’ and ‘success’ bleed into one another, with little explanation of how or why. The idea which accompanies all of this is that there is one ideal form of human existence: hardworking, happy, healthy, and above all, rich. A science of elite perfectibility is built on the back of this heroic capitalist vision.

In the eyes of these consultants, unemployment is really a symptom of some broader personal malaise, which manifests itself in inactivity. The solution consists of a range of coaching programmes, combined with “behavioural activation” courses, aimed at restoring the unemployed individual’s self-belief and optimism with ruthless efficiency. As one participant in a course reported, they were shouted at by a self-help guru to “talk, breathe, eat, shit belief in yourself” and that “you are the product—you either believe it or you don’t.”

One of America’s leading workplace happiness gurus, Tony Hsieh, argues that the most successful businesses are those which deliberately and strategically nurture happiness throughout their organizations. Businesses should

employ chief happiness officers to ensure that nobody escapes workplace happiness. But if this sounds like the recipe for inclusive community, it isn't. Hsieh advises businesses to identify the 10% of employees who are least enthusiastic towards the happiness agenda, and then lay them off. Once this is done, the remaining 90% will apparently become "super-engaged," a finding which is open to more than one psychological interpretation.

In the face of workplace ennui and psychological stagnation, the motivational gurus simply demand more willpower. By this account, the activities that might result in happiness, such as socializing or relaxing, are only valuable to the extent that they might restore brain and body to a level of fitness, from which they can then be propelled forwards to the next business challenge. This particular version of utilitarianism means expanding corporate rationality further into everyday life, such that there is now even an "optimal" way of taking a break from work, and simply going for a walk can be viewed as a calculated act of productivity management.

"He believed in the social arrangements of capitalism regardless of what capitalism did to him. Naturally, he was a positive thinker, and in his ability to overlook the world's cruelty and focus exclusively on reforming himself he embodied the 'social anesthetic' side of positive thinking."

Positive thinking is an all-American coping mechanism, practically a national pastime. Author James Rorty noted this during the Great Depression, when he traveled America talking with people forced to seek work on the road. In his 1936 book, *Where Life Is Better*, he was dismayed that so many of his interview subjects seemed so unshakably cheerful:

"I encountered nothing in 15,000 miles of travel that disgusted and appalled me so much as this American addiction to make-believe."

Positive thinking is very preachy and small minded stuff to be honest. It oversimplifies the human experience as if we're all living in some Rocky movie narrative. Sometimes people get injured in ways that they don't come back from. Sometimes those injuries are not visible from the outside. This is all well and good for a Hollywood pep talk scene but not all endings are happy and that's life. This is why we have to take responsibility for how we treat others because you never know the next guy's deal and it's real easy to assume and pass judgment but no one is in any place to do that when so few of us can see past our own nose. It's amazing how many people think that mental illness is fake just because they haven't experienced it

personally or how many people think that their journey is what everyone else is dealing with and whatever worked for them is some universal truth that everyone should heed. That's simple human arrogance.

It's really admirable to encourage people to grow and bounce back but every person has limits, whether they've realized them or not and when we've crossed the threshold of pain and weight and we have no more to give, that's when people check out after being strong for a lifetime of putting their all in. It's one thing to offer help but don't be condescending of another man's struggle just because you think you know what will work and is best for them. The notion that we all have to be happy all the time is just nonsense anyway created by the self-help and pharmaceutical industry. There's nothing wrong with having lows to your highs and occasionally accepting that life is joy and pain, because that's what it means to be human.

Gym teacher pep talks are fine for a charlie horse but someone who's lived more pain than any single person is meant to experience doesn't need your arrogant oversimplification of their life.

Far too often, self-help leaders delivering these pompous philosophies of life and living have no rightful standing to be doing any such thing. There's a tendency on the reader's part to think these people are unimpeachable authorities speaking gospel truth. That's hardly the case. In truth, the only difference between a self-help reader and a self-help writer may be that the writer can write well enough to get a book deal. The end result is that consumers make sweeping changes in their lives based on something their aunt or auto mechanic could have told them.

Within the movement, a teapot tempest raged over whether the real culprit was nature or nurture, or what degree of each. But both camps arrived at the same philosophical end point: You were helpless against the forces that made you what you were. Consequently, Victimization told people to stop beating themselves up: No one wants to make hurtful mistakes, but we're human, and humans err. You gotta let go of all that guilt! You didn't make yourself this way, so it's not your fault. After all, wasn't the very first step out of twelve an admission of powerlessness? Victimization framed guilt as a bad thing, which, by implication if not definition, also framed conscience as a bad thing. By extension, the message became: Your needs are paramount here. It's all about you. Recovering a healthy sense of self entailed forsaking your excessive or unhealthy concern for others—for in the twelve-step universe, such excessive concern came to constitute the pitiable emotional quagmire of codependency. By the concept's heyday in the late 1980s, the term would be applied to just about every interpersonal relationship that fell short of sheer bliss.

In their eagerness to provide additional mechanisms for overcoming guilt and self-loathing, the Victimization movement's spiritual leaders made an important discovery: They could help a constituent better cope with the burden of his failings by redefining them. This insight led to clever semantic distinctions that either made the untoward behaviors sound tamer or, following Bill W.'s example, framed those shortcomings as actual medical or psychological conditions. Such artful use of language became a hallmark of the self-help movement and had dramatic repercussions far beyond the world of self-help. Under this guiding principle, which became known as the "disease model" of bad or unproductive behavior, the roster of newfound conditions naturally mushroomed. Drug abuse, sex addiction, compulsive eating, compulsive lying, compulsive shopping, compulsive gambling—eventually these problems and many others were deemed diseases.

Imagine walking into a coffee shop, ordering a cappuccino, and then, to your surprise, being informed that it has already been paid for. This sounds like a pleasant experience, one which might even make the coffee more pleasurable to drink. Where did this unexpected gift come from? It transpires that it was left by the previous customer. The only snag, if indeed it is a snag, is that you now have to do the same for the next customer to walk in. This is known as a "pay-it-forward" pricing scheme. It is something that has been practiced by a number of small businesses in California, such as Berkeley's Karma Kitchen, and sometimes has been introduced spontaneously by customers themselves. On the face of it, it would seem to defy the logic of free market economics. After all, the basic premise of the price system, as it appeared to William Stanley Jevons and the neoclassical economists, is that I will exchange my money for a pleasure that I experience privately. Money for the shopkeeper is counter-balanced against satisfaction for me. Markets, surely, are places where we are allowed, even expected, to behave selfishly. With its hippy idealism, pay-it-forward would appear to defy the core tenets of economic calculation.

But there is more to it than this. Researchers have looked closely at pay-it-forward pricing and discovered something with profound implications for how markets and business work. It transpires that people will generally pay more for a good, under the pay-it-forward model, than under a conventional pricing system. This is true even when the participants are complete strangers. People don't want to look cheap. They want to be fair, but they also want to fit in with the social norms. Contrary to what economists have long assumed, altruism can often exert a far stronger influence over our decision-making than calculation. If individuals can become seduced into relationships of reciprocity, rather than of selfish calculation, the capacity to influence them is that much greater. So is the opportunity to charge them

more money.

Similar research findings have been made in the workplace. The notion of “performance-related pay” is a familiar one, suggesting, reasonably enough, that additional effort by an employee is rewarded by a commensurate increase in pay. But studies conducted by researchers at Harvard Business School have discovered that there is a more effective way of extracting greater effort from staff: represent pay increases as a gift. When money is offered in exchange for extra effort, the employee may be minded to view the extra money as their entitlement and carry on as before. But when the employer makes some apparently gratuitous act of altruism, the employee enters a more binding reciprocal relationship and works harder.

When it comes to the free market, all corporations dwell in a paradoxical position. They seek all of the freedoms that the market offers for their vested interests, but as few as possible for anybody else. The trick is to maintain maximum autonomy for shareholders and executives while gaining maximum commitment from employees and customers. The last thing a business wants from its customers (or their more valued staff) is for them to remember that they are in a market, with freedom of choice. Freebies are a useful way of disguising what’s really taking place.

Making an explicit moral commitment—even under duress—seems to bind people in certain ways that utilitarian penalties and incentives often do not. It seems that this undermines the cynical, calculative, individualist theory of human psychology, which lies at the heart of Benthamism and orthodox economics. It transpires that we are as much motivated by moral principles as we are by our own selfish interests. Maybe the cold rationality of the market does not have quite the grip on our psychology as we have long feared. Could it be that we are decent, social creatures after all? Perhaps this could be the basis for a new political hope, of a society in which sharing and gift-giving offer a serious challenge to the power of monetary accumulation and privatization.

But there is also a more disturbing possibility: that the critique of individualism and monetary calculation is now being incorporated into the armoury of utilitarian policy and management. The history of capitalism is littered with critiques of the dehumanizing, amoral world of money, markets, consumption, and labour, offered by romantics, Marxists, anthropologists, sociologists, and cultural critics among many. These critics have long argued that social bonds are more fundamental than market prices. The achievement of behavioural economics is to take this insight, but to then instrumentalize it in the interests of power. The very idea of the social is being captured. John B. Watson had promised in 1917 that, in an age of behaviourist science, “the educator, the physician, the jurist and the businessman could utilize

our data in a practical way, as soon as we are able, experimentally, to obtain them.” Behavioural economics has been true to this mission statement. One of its key insights is that, if one wants to control other human beings, it is often far more effective to appeal to their sense of morality and social identity than to their self-interest. By framing notions such as ‘fairness’ and ‘gift’ in purely psychological and neurological terms, behavioural science converts them into instruments of social control.

Viewed from a more cynical perspective—as behavioural economists themselves do—activities such as pay-it-forward and random acts of managerial generosity have a pernicious element, which works through never being made explicit. In abandoning the psychology of pure self-interest, these projects shift to a far more invasive and constrictive alternative, namely the psychology of credit and debt. A psychological sense of social obligation is first manufactured and then harnessed for particular purposes which remain concealed. If utilitarianism is, at its heart, a political logic in which every institution is to be judged in terms of its measured outcome, then the extension of this to encompass our basic moral sensibilities must represent that logic’s final triumph.

The ideology of this new “social” economy depends on painting the old economy as horribly individualistic and materialistic. The assumption is that, prior to the World Wide Web and the Californian gurus that celebrate it, we lived atomized, private lives, with every relationship mediated by cash. Before it became “social,” business was a nasty, individualist affair, driven only by greed. This picture is, of course, completely false. Corporations have been trying to produce, manage, and influence social relationships—as an alternative to purely monetary transactions—since the birth of management in the mid-nineteenth century. Businesses have long worried about their public reputation and the commitment of their employees. And it goes without saying that informal social networks themselves are as old as humanity.

What has changed is not the role of the “social” in capitalism, but the capacity to subject it to a quantitative, economic analysis, thanks primarily to the digitization of social relationships. The ability to visualize and quantify social relations, then subject them to an economic audit, is growing all the time. While the expert practitioners of “social analytics” are best placed to do this, there is also a growing tendency and opportunity for individuals themselves to view their social lives in this mathematical, utilitarian sense. As this happens, the moral dimension of friendship and reciprocity starts to recede, and the more explicitly utilitarian dimension moves to the foreground. Something like pay-it-forward ceases to influence us because we want to fit in with social norms, and more because of the

psychological kick we get out of it ourselves. People start to think of altruism in terms of incentives. Viewing social relations and giving in this tacitly economic way introduces an unpleasant question: what's in it for me? One of the most persuasive answers emerging is that friendship and altruism are healthy, for both mind and body.

Once again, the logic of monetary market exchange is vigorously attacked in positive psychology. The words which recur over and over in positive psychology texts and speech are gratitude, giving, and empathy. In a world that seems cold, calculating, and careless, positive psychology invites its follower to adopt a more ethical stance, based around empathy and generosity. The fact that this stress upon social reciprocity is entirely in keeping with the current spirit of capitalism (clearly manifest in marketing) goes unremarked-upon. But what really leaps out from this new ethical orientation is the way in which it is ultimately justified: giving makes the giver feel happier. Equally, the mental habit of feeling grateful delivers positive mental benefits. The advice is to stop thinking so much of oneself—but the justification is ultimately a self-centred one.

It's like when Oprah Winfrey creates a game show where the whole goal is to give money away to sycophantic strangers: It's an impossible act to criticize, because (of course) charity is wonderful. Yet there's something perverse about high-profile public altruism; it always feels like the individual is trying to purchase 'good person' status with money they could never spend on themselves, anyway. Oprah is doing something good, but not necessarily for the motive of goodness. And the motive matters.

Of course seeing someone else do something, or even imagining doing something ourselves, is not exactly the same as experiencing it directly. For example, we mostly only experience the affective part of the physical pain of others; we really don't have the same intense physical sensations in our body. This means that you'll suffer along with the character on screen trying to cut off his foot, but won't be screaming in agony as though your foot really was being sawed from your leg (but it might ache a little).

“Every week, each of us puts in around \$3.30 to pay for our aid program—about the cost of a cup of coffee.”

Is that how much we want to help the less fortunate? One cup of coffee a week? I just pulled my local paper out of the letterbox, and it has an article on a company that wants to take you up in a plane and let you jump out, at a cost of \$425 per jump. That kind of sum can save a child's life, or restore sight to people who have gone blind and cannot afford a simple operation that Australians take for granted. How can we compare saving

a life, or restoring sight to a blind person, with a brief thrill? I shouldn't pick on skydivers just because the cost per minute is so high. Four days in a grandstand seat for a grand prix costs about the same, and a couple of concert tickets could too, or dinner and wine at a good restaurant, or some new clothes. I'm not saying that no one should be having any fun. I'm just reminding you how much we have, in comparison with the little we give.

Are these emotions the best guide to what we ought to do? According to Make-A-Wish, the average cost of realizing the wish of a child with a life-threatening illness is \$7,500. That sum, if donated to the Against Malaria Foundation and used to provide bed nets to families in malaria-prone regions, could save the lives of at least two or three children (and that's a conservative estimate). If donated to the Fistula Foundation, it could pay for surgeries for approximately 17 young mothers who, without that assistance, will be unable to prevent their bodily wastes from leaking through their vaginas and hence are likely to be outcasts for the rest of their lives. If donated to the Seva Foundation to treat trachoma and other common causes of blindness in developing countries, it could protect 100 children from losing their sight as they grow older. It's obvious, isn't it, that saving a child's life is better than fulfilling a child's wish.

Why then do so many people give to Make-A-Wish, when there are more practical ways of using their charitable dollars? The answer lies, at least in part, in those above-mentioned emotions, which, as psychological research shows, make the plight of a single identifiable individual much more salient to us than that of a large number of people we cannot identify. That is a flaw in our emotional make-up, one that developed over millions of years when we could help only people we could see in front of us. It is not justification for ignoring the needs of distant strangers.

Social science and physiology are converging into a new discipline, in which human bodies are studied for the ways they respond to one another physically. It would seem a little perverse to suggest that policy-makers ignore this evidence of the impact of social networks and altruism on health. And if positive psychology can generate just a little more mutual concern, through self-help and cognitive tips, then why not? Yet there is still a danger lurking in this worldview, which is the same problem that afflicts all forms of social network analysis. In reducing the social world to a set of mechanisms and resources available to individuals, the question repeatedly arises as to whether social networks might be redesigned in ways to suit the already privileged. Networks have a tendency towards what are called power laws, whereby those with influence are able to harness that power to win even greater influence.

A negative frame of mind, including depression itself, is known to be

socially contagious. Happy, healthy individuals can then tailor their social relationships in ways that protect them against the risk of unhappiness. If you find yourself living with or around people with negative outlooks consider balancing out your friend roster say some. The impact of this friend-roster-rebalancing on those unfortunates with the “negative outlooks” is all too easy to imagine. There is something a little sad that the fabric of social life is now a problem which is addressed within the rubric of health policy. Loneliness now appears as an objective problem, but only because it shows up in the physical brain and body, with calculable costs for governments and health insurers. Generosity and gratitude are urged upon people, but mainly to alleviate their own mental health problems and private misery. And friendship ties within poor inner-city neighbourhoods have become a topic of government concern, but only to the extent that they mediate epidemics of bad nutrition and costly inactivity. This is all an attempt to grasp the social world without departing from mathematical, individualist psychology. While this may offer genuine medical aid to needy individuals, trying to understand society in purely psychological terms is also a recipe for narcissism. And the man who initiated it was nothing if not a narcissist.

The vision of social life that fuelled sociometry was undoubtedly a far more individualistic one than that which had inspired sociology up until then. Collective entities emerged only thanks to the spontaneous power of individual egos. They could just as easily be dispensed with again. As far as Moreno was concerned, American culture was founded on specifically this freedom to enter and exit groups. But creating a social science which recognized this individual freedom was far from straight-forward.

Two problems in particular presented themselves. Firstly, the rich, binding, comforting, and sometimes suffocating nature of social life gets eliminated from view. The sorts of data that can be included in a sociometric study are necessarily very simplified. Just as social media sites offer users limits to how they can define themselves romantically (‘single,’ ‘in a relationship’ or ‘it’s complicated’) or in relation to each other (‘friend’ or ‘unfriend,’ ‘follow’ or ‘unfollow’), Moreno’s sociometry would only succeed if nuance were stripped out. The price to be paid for exiting the restricted limits of the Freudian office was that the depths of the human psyche started to disappear from view. To carve a path between a science of society and a science of the isolated individual, sociometry necessarily had to simplify both substantially. Of course such simplification can also be attractive. To act scientifically upon the social world, elites need to have nuance and culture removed. Secondly, what to do with the reams of data that resulted from viewing society as a web of interpersonal relations? How to cope with it all or make sense of it? Moreno had no answer to this. The fact that

social network analysis would not really take off until the 1960s wasn't for want of an adequate underlying theory, but for want of sufficient power to crunch the numbers.

Methods of social analysis are never as politically innocent as they appear. While social network analysis purports to be a simple, stripped-down mathematical study of the ties that bind us, it's worth reflecting on the philosophy that inspired its founder. As far as Moreno was concerned, other people are there to prop up and please individual egos. A friendship is valuable to the extent that it makes me feel better. Once the study of social life is converted into a branch of mathematical psychology, then this produces some worrying effects on how people start to relate to each other. The narcissism of the small boy playing God surrounded by his angels has become another model for how pleasure is now manufactured and measured.

If I identify happiness with fleeting pleasant sensations, and crave to experience more and more of them, I have no choice but to pursue them constantly. When I finally get them, they quickly disappear, and because the mere memory of past pleasures will not satisfy me, I have to start all over again. Even if I continue this pursuit for decades, it will never bring me any lasting achievement; on the contrary, the more I crave these pleasant sensations, the more stressed and dissatisfied I will become. To attain real happiness, humans need to slow down the pursuit of pleasant sensations, not accelerate it.

This Buddhist view of happiness has a lot in common with the biochemical view. Both agree that pleasant sensations disappear as fast as they arise, and that as long as people crave pleasant sensations without actually experiencing them, they remain dissatisfied. However, this problem has two very different solutions. The biochemical solution is to develop products and treatments that will provide humans with an unending stream of pleasant sensations, so we will never be without them. The Buddha's suggestion was to reduce our craving for pleasant sensations, and not allow them to control our lives. According to Buddha, we can train our minds to observe carefully how all sensations constantly arise and pass. When the mind learns to see our sensations for what they are—ephemeral and meaningless vibrations—we lose interest in pursuing them. For what is the point of running after something that disappears as fast as it arises?

People drink alcohol to forget, they smoke pot to feel peaceful, they take cocaine and methamphetamines to be sharp and confident, whereas Ecstasy provides ecstatic sensations, and LSD sends you to meet Lucy in the Sky with Diamonds. What some people hope to get by studying, working, or raising a family, others try to obtain far more easily through the right dosage of molecules. This is an existential threat to the social and economic

order, which is why countries wage a stubborn, bloody, and hopeless war on biochemical crime. The state hopes to regulate the biochemical pursuit of happiness, separating “bad” manipulations from “good” ones. The principle is clear: biochemical manipulations that strengthen political stability, social order and economic growth are allowed and even encouraged (those that calm hyperactive kids in school, or drive anxious soldiers forward into battle). Manipulations that threaten stability and growth are banned. But each year new drugs are born in the research labs of universities, pharmaceutical companies and other criminal organizations, and the needs of the state and the market also keep changing. As the biochemical pursuit of happiness accelerates, so it will reshape politics, society, and economics, and it will become ever harder to bring it under control.

If pupils suffer from attention disorders, stress, and low grades, perhaps we ought to blame outdated teaching methods, overcrowded classrooms and an unnaturally fast tempo of life. Maybe we should modify the schools rather than the kids? It is interesting to see how the arguments have evolved. People have been quarrelling about education methods for thousands of years. Whether in ancient China or Victorian Britain, everybody had his or her pet method, and vehemently opposed all alternatives. Yet hitherto everybody still agreed on one thing: in order to improve education, we need to change the schools. Today, for the first time in history, at least some people think it would be more efficient to change the pupils’ biochemistry.

If science is right and our happiness is determined by our biochemical system, then the only way to ensure lasting contentment is by rigging this system. Forget economic growth, social reforms and political revolutions: in order to raise global happiness levels, we need to manipulate human biochemistry. And this is exactly what we have begun doing over the last few decades. Fifty years ago psychiatric drugs carried a severe stigma. Today, that stigma has been broken. For better or worse, a growing percentage of the population is taking psychiatric medicines on a regular basis, not only to cure debilitating mental illnesses, but also to face more mundane depressions and the occasional blues.

Over half a century after the discovery of antidepressants, it remains the case that nobody has ever discovered precisely how or why they work, to the extent that they do. As has been widely researched and commented on, antidepressants are only marginally more effective than placebos, and the effectiveness of placebos has been growing year on year. Nor could anybody ever make this discovery, because what it means for an SSRI to “work” will differ from one patient to the next. A great deal of attention is paid to how SSRIs alter our understanding of unhappiness, relocating it in our brain neurons; but they also fundamentally alter the meaning of a medical

diagnosis and the nature of medical and psychiatric authority. A society organized around the boosting of personal satisfaction and fulfillment—“self-anchored striving”—would need to reconceive the nature of authority, when it came to tending and treating the pleasures and pains of the mind. Either that authority would need to become more fluid, countercultural and relativist itself, accepting the lack of any clear truth in this arena, or it would need to acquire a new type of scientific expertise, more numerical and dispassionate, whose function is to construct classifications, diagnoses, hierarchies, and distinctions, to suit the needs of governments, managers, and risk profilers, whose job would otherwise be impossible.

Mental illness has become something detectable by observation and classification, which doesn't require any explanation of why it has arisen. Psychiatric insight into the recesses and conflicts of the human self was replaced by a dispassionate, scientific guide for naming symptoms. And in scrapping the possibility that a mental syndrome might be an understandable and proportionate response to a set of external circumstances, psychiatry lost the capacity to identify problems in the fabric of society or economy. Proponents described the new position as “theory neutral.” Critics saw it as an abandoning of the deeper vocation of psychiatry to heal, listen, and understand. Even one of the task force members started to get cold feet:

“I believe that what we now call disorders are really but symptoms.”

Today, 80 percent of the prescriptions that are written for antidepressants in the United States are by medical doctors and primary care practitioners, and not by psychiatrists at all. In a post-1960s era of “self-anchored striving,” what can people possibly hold in common other than a desire for more happiness? And what higher purpose could a psychological expert pursue than the reduction of unhappiness? These simple, seemingly indisputable principles were what emerged from the cultural and political conflicts which came to a head in 1968. The growing problem of depression, experienced as a non-specific lack of energy and desire, combined with the emergence of a drug that seemed selectively to alleviate this, and the need of drug companies, regulators, and health insurers to find clarity amidst such murkiness, meant that psychoanalytic expertise was heading for a fall.

It is often said that depression is the inability to construct a viable future for oneself. What goes wrong, when people suffer our contemporary form of depression, is not simply that they cease to experience pleasure or happiness, but that they lose the will or ability to seek pleasure or happiness. It is not that they become unhappy per se, but that they lose

the mental—and often the physical—resources to pursue things that might make them happy. In becoming masters of their own lifestyles and values, they discover that they lack the energy to act upon them. It is only in a society that makes generalized, personalized growth the ultimate virtue that a disorder of generalized, personalized collapse will become inevitable. And so a culture which values only optimism will produce pathologies of pessimism; an economy built around competitiveness will turn defeatism into a disease. Once the Benthamite project of psychic optimization loses any sense of agreed limits, promising only more and more, the troubling discovery is made that utilitarian measurement can go desperately negative as well as positive.

“Just do it.” “Enjoy more.” Slogans such as these, belonging to Nike and McDonald’s respectively, offer the ethical injunctions of the post-1960s neoliberal era. They are the last transcendent moral principles for a society which rejects moral authority. Enjoyment has become an even greater duty than to obey the rules. Thanks to the influence of the Chicago School over government regulators, the same is true for corporate profitability.

The entanglement of psychic maximization and profit maximization has grown more explicit over the course of the neoliberal era. This is partly due to the infiltration of corporate interests into the APA. In the run up to the DSM-V, published in 2013, it was reported that the pharmaceutical industry was responsible for half of the APA’s \$50 million budget, and that eight of the eleven-strong committee which advised on diagnostic criteria had links to pharmaceutical firms. The ways in which we describe ourselves and our mental afflictions are now shaped partly by the financial interests of big pharma.

A curious shift is taking place in the way that the illness model is applied in psychiatry: symptoms—for example, attention deficit and hyperactivity—are being classified as diseases. The use of snappy acronyms camouflages this to an extent, but the trend is now so well established that it takes some effort to see that it only produces pseudo-explanations. Using this model, a man with high fever (HF) and excessive sweating (ES) would be diagnosed as suffering from HFES. The conclusion would then be that this poor man is feverish and sweaty because he suffers from HFES. Which is just like saying that a woman has attention deficit (AD) and is hyperactive (HA) because she suffers from ADHD. To put it another way: in the current version of the illness model, we constantly run up against circular arguments that only provide the illusion of a scientific explanation. Pronouncements such as ‘ADHD is causing attention deficit in classrooms,’ or ‘A bipolar disorder causes severe mood swings’ are examples of this. The description is presented as the cause of what is being described, and the use of abbreviations means

we don't see through the trick. A final example to round off: someone who experiences sporadic outbursts of uncontrollable rage is said to suffer from IED. IED stands for Intermittent Explosive Disorder. In other words, someone has attacks of rage from time to time because he or she suffers from periodic rage attacks.

Such criticism is easily parried with the claim that only lay people talk like this, and that medical language is both more correct and founded on sound research—there's even checklists and scales! To establish whether this is really true, we need to ask two questions. One has to do with observation and diagnosis, and concerns the reliability of grouping certain symptoms or behaviours under the heading of a single disorder. Does everyone agree with this grouping, and can every clinician use it to reach the same diagnosis in the case of the same patient? The other has to do with causes. What evidence is there for the presumed underlying neurobiological processes and genetic causality of a specific grouping of symptoms?

We can't escape the conclusion that in present-day psychodiagnostics, diagnostic validity—the extent to which a diagnosis indicates a real and unequivocally identifiable disease—is distressingly low. This easily explains the low reliability—the extent to which different doctors concur in their diagnosis of the same patient. The strange thing is that hardly anyone seems to lose any sleep about this, and we all just carry on as if nothing were wrong. How is it possible that, in these days of evidence-based medicine, this state of affairs—which is borne out by plenty of solid evidence—receives little or no attention? There are at least two reasons for this. The first is fairly straightforward: a dominant paradigm leads to blind faith. The second is less obvious: the illness model lets everyone off the hook. No one need feel responsible any more, let alone guilty.

Mental health is produced socially: the presence or absence of mental health is above all a social indicator and therefore requires social, as well as individual solutions. A preoccupation with individual symptoms may lead to a disembodied psychology which separates what goes on inside people's heads from social structure and context. The key therapeutic intervention then becomes to “change the way you think” rather than to refer people to sources of help for key catalysts for psychological problems: debt, poor housing, bullshit jobs, violence, crime.

A diagnostic system of this type clearly influences the goal of treatment: the “too much” must be surgically removed, or the “too little” fleshed out, so that the patient once again complies with social norms. This built-in link between diagnostics and treatment confirms: you only know the full extent of a problem when you see the solutions that are proposed. If a child labelled with ADHD is sitting quietly in the classroom attending

to the lesson, the problem has been solved. In other words, the disorder doesn't really bother the child so much as its parents or teachers. But if the child makes a nuisance of himself or herself, he or she is prescribed Ritalin and an obsolete form of behavioural therapy. This explains a very strange medical finding, namely that medication and behavioural therapy aren't really needed outside school-term times. I would go so far as to say that the aim of most DSM diagnoses is to restore compliance with social norms.

HELPS THE PROBLEM CHILD BECOME LOVABLE AGAIN

—Ritalin Ad

“Whereas the adult comes for treatment largely because of his own distress and at his own initiative, the child comes to our attention because of his family's or his community's initiative. Who, then, are we to classify diagnostically: the child, the family, the community, or all three?”

“I can't make your home less chaotic, I can't run your school differently, I can't get your parents back together or help you with your homework. But I can give you a diagnosis, I can give you medication.”

A doctor in rural Georgia prescribes Adderall and Concerta not because children have real ADHD, but merely to help them in what were financially strapped, subpar schools:

“I don't have a whole lot of choice. We've decided as a society that it's too expensive to modify the kid's environment. So we have to modify the kid.”

Perhaps even more amazing, several experts concede that this approach is not necessarily rare. They agree that, because class sizes have consistently increased while physical education and other services waned, doctors are indeed being forced to rely on medication to keep some kids from getting sucked down failure's whirlpool—Meducation.

Millions of kids today are labeled with a brain disorder they probably do not have, changing their self-image and personal narrative forever. Yet this doesn't seem to bother a lot of powerful people. Whether it's just one child or today's six-million, if we're going to tell a kid that he has a permanent, potentially devastating brain disorder, we'd better damn well be right.

“After a while I felt like I was living someone else’s life. Adderall helped me live someone else’s life. And alcohol helped me escape that. No one ever asked me what I wanted—what I wanted to do.”

We need to figure out why kids are reaching outside of themselves in order to alter reality—it’s as simple as that. Then we need to heal those reasons, those causes. Many don’t even ask questions about why they’re taking medicines, it’s as simple as: ‘You’re depressed so we should probably put you on antidepressants.’

Beware the simple and sovereign explanation.

More than anything else, Kristin had one of those square-peg personalities that didn’t quite fit her world’s round—and shrinking—holes. The human brain has evolved over many thousands of years, yet only in the last hundred, a blip on that time line, have we demanded that each and every young one sit still and pay attention for seven hours a day. Kristin couldn’t.

You’re putting a monkey in a cage. It upsets the monkey, so they say there’s something wrong with the monkey. But some monkeys should be swinging from a tree.

To this day, the United States is one of only two developed nations that allows advertising of ADHD medications—or any other prescription medication—to the general public. The other is New Zealand, but the practice is rendered unprofitable there by the state-run health care system.

“It’s been a while, Professor Brown. Now that we have your blood pressure under control I don’t see you as often. What brings you in today?” The lab-coated, stethoscoped doctor clasped her hands and peered into the patient’s sunken eyes.

The forty-something man explained that his work had slipped. His boss was getting annoyed. “I just need to focus on getting things done,” he groaned.

“Do you find it difficult staying on a task without wandering off onto something else?” she asked.

He did. “I’m just not organized and I don’t understand how people get so much done,” the man explained. “I really have no patience to sit for long periods of time. These are usually important meetings—I just get bored and lose track.”

“I’d like to explore this with you further,” she said. She handed him an adult ADHD rating scale, almost certainly the six- or eighteen-question sheet devised by Harvard and NYU doctors, and asked him to fill it out. Afterward, she reviewed his answers

and grew serious. “You indicate that you interrupt conversations and have trouble waiting in line,” the doctor said. “I’m concerned about your difficulty with procrastinating, missing deadlines and making careless errors. You’ve never been diagnosed with ADHD. Has anyone in your immediate family been diagnosed?”

The man perked up. “Well, actually, yes,” he said. “I was surprised when my son was diagnosed before he went to college. He’s on medication now, and he’s doing well, especially with schoolwork.”

“Well, that is interesting,” she said, her eyes widening. “Because if you have ADHD—which I believe you do—family members often respond well to similar medications.” Her lips cracked into the slightest of knowing grins. “Would you consider giving that a try?”

It took an entire six minutes for the doctor to diagnose her adult patient with ADHD, and to recommend some of the most addictive substances known to medicine. No discussion of their risks. No talk of what other factors might be causing his work distress, if in fact he really was distressed in the first place. Just a few boilerplate questions, a check-off-some-boxes survey, and—voilà!—another patient off the ADHD assembly line.

A spoof by antipsychiatry zealots? A snarky *How to Score Free Blow* Internet script for college students? No. Precisely the opposite. These scenes came straight from an ostensibly serious video series that aimed to teach today’s physicians how to diagnose adult ADHD. It was part of doctors’ Continuing Medical Education—the small courses that states require providers to take so that they stay abreast of new medical developments (and keep their licenses). The videos and Web pages, often absorbed in an hour and ending with a remarkably obliging multiple-choice quiz, have become a primary means by which psychiatry is taught after medical school. But while other professionals, such as lawyers and hairdressers, generally pay to fulfill their fields’ requirements, drug companies often foot the bill for doctors. Symposia held by major organizations, such as the American Psychiatric Association, or more niche groups, such as APSARD, are heavily subsidized by drug makers, who can fund classes and other events that amount to free promotion, to great audience appreciation. A psychiatrist once gazed at the lavish digs at an APA convention and said that without industry money:

“We’d be sitting in the basement of the YMCA.”

Many doctors discourage in-depth analysis, thinking it's a waste of your time or theirs, in part because most insurance companies will not pay them for anything more than a brief assessment. One doctor tried to rationalize his mishandling of a case by saying:

“I hate to say this, but when you put in five hours and get paid for only one, it's hard to make a living.”

You wouldn't tolerate a mechanic telling you, 'Well, I skipped some steps on your brakes because Ford doesn't reimburse me.' If it's not good enough for your car, it's not good enough for your child.

“You take one pill, and next thing you know, the paper's done. I've known people who have over two-hundred pills at one time. One had a jar of like three-hundred or four-hundred. I got diagnosed in maybe ten minutes. My doctor is clueless. Ten bucks a pill, maybe \$25 during finals. It's kind of hard to be like, 'Oh, I shouldn't take this.' It's like, 'Okay I have some shit to get done, and here's a get-shit-done pill.’”

Here's how those pills got from the development stage to your mouth. It works like this: The companies are often running their own trials on their own products. That means they set up the clinical trial, and they get to decide who gets to see any results. So they are judging their own products. They're involving all these poor researchers who have no other source of funding and who have little control over how the results will be written up and presented. Once the scientific evidence is gathered, it's not even the scientists who write it up much of the time. Typically, it's the company people who write up the published scientific reports. This evidence then goes to the regulators, whose job is to decide whether to allow the drug onto the market. But in the United States, 40 percent of the regulators' wages are paid by the drug companies—in Britain, it's 100 percent. When a society is trying to figure out which drug is safe to put on the market, there are meant to be two teams: the drug company making the case for it, and a referee working for us, the public, figuring out if it properly works. But in this match, the referee is paid by the drug company team, and that team almost always wins.

The rules they have written are designed to make it extraordinarily easy to get a drug approved. All you have to do is produce two trials—any time, anywhere in the world—that suggest some positive effect of the drug. If there are two, and there is some effect, that's enough. So you could have a situation in which there are one-thousand scientific trials, and 998 find

the drug doesn't work at all, and two find there is a tiny effect—and that means the drug will be making its way to your local pharmacy.

Of all the studies drug companies carry out, 40 percent are never released to the public, and lots more are only released selectively, with any negative findings left on the cutting room floor.

By exporting an American view of mental disorders as solid scientific entities treatable by trusted pharmaceuticals, we may be inadvertently increasing the spread of such diseases. We assume that people around the world react the same way to stress as we do. We assume that mental illness around the world manifests the same way as it does in the US. We assume that our methods and pills are better ways to manage mental illnesses than local and traditional methods. But are these assumptions correct? Suffering and sadness in many Asian cultures has traditionally been seen as part of a process of spiritual growth and resilience. People in other cultures react to stress differently from us. Even severe illnesses such as schizophrenia may manifest differently outside the US, due to cultural adaptations or degrees of social support. For example, a landmark World Health Organization study of 1,379 patients from ten countries showed that two-year outcomes of first-episode schizophrenics were much better for the patients in the poor countries than in the US, despite a higher proportion of American patients on medications.

One of the last remaining checks on the neurochemical understanding of depression was the exemption attached to people who were grieving: this, at the very least, was still considered a not unhealthy reason to be unhappy. But in the face of a new drug, Wellbutrin, promising to alleviate “major depressive symptoms occurring shortly after the loss of a loved one,” the APA caved in and removed this exemption from the DSM-V. To be unhappy for more than two weeks after the death of another human being can now be considered a medical illness. Psychiatrists now study bereavement in terms of its possible mental health “risks,” without any psychoanalytic or common sense of why loss might be a painful experience.

The main charge that has been levelled against the DSM, since the introduction of the DSM-III in 1980, is that it converts everyday forms of sadness and personality quirks into illnesses. This has been particularly pronounced in the identification of ever more forms of addiction. Until the early 1970s, addiction would only have been understood as referring to syndromes which affect the metabolism, such as alcoholism, and even then its social and cultural dimensions would have been recognized. In the era of the DSM-III and since, new addictions have been identified and diagnosed in relation to all manner of hedonistic practices and experiences, from gambling to shopping to sex. Inevitably, the new diagnostic categories

lend support to biological explanations that the behaviours are hard-wired into certain brains or genes.

What we witness, in the case of a World of Warcraft addict, a social media addict or, for that matter, a sex addict, is only the more pathological element of a society that cannot conceive of relationships except in terms of the psychological pleasures that they produce. The person whose fingers twitch to check their Facebook page, when they're supposed to be listening to their friend over a meal, is the heir to Jacob Moreno's ethical philosophy, in which other people are only there to please, satisfy, and affirm an individual ego from one moment to the next. This inevitably leads to vicious cycles: once a social bond is stripped down to this impoverished psychological level, it becomes harder and harder to find the satisfaction that one desperately wants. Viewing other people as instruments for one's own pleasure represents a denial of core ethical and emotional truths of friendship, love, and generosity.

One grave shortcoming of this egocentric idea of the 'social' is that none (or at least, vanishingly few) of us can ever constantly be the center of attention, receiving praise. Nobody can be God the whole time; mostly they must be the angels who surround the deity. And so it also proves with Facebook. As an endless stream of grandiose spectacles, Facebook has been shown, on balance, to make individuals feel worse about themselves and their own lives. The mathematics of networks means that most people will have fewer friends than average, while a small number of people will have far more than average. The tonic to this sense of inferiority is to make grandiose spectacles of one's own, to seek the gaze of the other, thereby reinforcing a collective vicious cycle. As the positive psychologists are keen to stress, this inability to listen or empathize is a significant contributor to depression.

Our society is excessively individualistic. Markets reduce everything to a question of individual calculation and selfishness. We have become obsessed with money and acquisition at the expense of our social relationships and our own human fulfilment. Capitalism spreads a plague of materialism, which undermines our connectedness, leaving many of us isolated and lonely. Unless we can rediscover the art of sharing, our society will fragment altogether, making trust impossible. Unless we can recover the values associated with friendship and altruism, we will descend into a state of nihilistic ennui. These types of claim have animated various critiques of capitalism and markets for centuries. They have often provided the basis of arguments for political and economic reform, whether moderate attempts to restrain the reach of markets, or more wholesale demands to overhaul the capitalist system. Today, the same types of lament can be heard, but from some very different sources. Now, the gurus of marketing, self-help, behavioural economics, social media, and management are first in line to

attack the individualistic and materialist assumptions of the marketplace. But all they're offering instead is a marginally different theory of individual psychology and behaviour.

The depressed and the lonely, who have entered the purview of policy-making now that their problems have become visible to doctors and neuroscientists, exhibit much that has gone wrong under the neoliberal model of capitalism. Individuals want to escape relentless self-reliance and self-reflection. On this, the positive psychologists have a very clear understanding of the malaise of extreme individualism, which locks individuals into introverted, anxious questioning of their own worth relative to others. Their recommended therapy is for people to get out of themselves and immerse themselves in relationships with others. But in reducing the idea of society to the logic of psychology, the happiness gurus follow the same logic as Jacob Moreno, behavioural economics, and Facebook. This means that the 'social' is an instrument for one's own medical, emotional, or monetary gain. The vicious cycle of self-reflection and self-improvement continues.

If people have become locked in themselves, gazing enviously at others, this poses questions that need institutional, political, collective answers. It cannot be alleviated simply with psychological appeals to the social, which can exacerbate the very problems they aim to alleviate, once combined with digital media and the egocentric model of connectivity which those media facilitate. There is a crucial question of how businesses, markets, policies, laws, political participation might be designed differently to sustain meaningful social relationships, but it is virtually never confronted by the doyens of social capitalism.

We might call this neoliberal socialism. Sharing is preferable to selling, so long as it doesn't interfere with the financial interests of dominant corporations. Appealing to people's moral and altruistic sense becomes the best way of nudging them into line with agendas that they had no say over. Brands and behaviours can be unleashed as social contagions, without money ever changing hands. Empathy and relationships are celebrated, but only as particular habits that happy individuals have learnt to practice. Everything that was once external to economic logic, such as friendship, is quietly brought within it; what was once the enemy of utilitarian logic, namely moral principle, is instrumentalized for utilitarian ends. The logic of neoliberalism, stating that "winners" deserve whatever prizes they can grab, risks usurping the faint glimpse of social reform contained within this agenda. Social neuroscience may prove most decisive here, because it offers a firm physiological basis on which to analyze social behaviour as a component of health, happiness, and wealth. Focused resolutely on the individual brain and body, this science clearly offers as much—and probably

more—to the powerful and rich as it does to the lonely and marginalized. Once social relationships can be viewed as medical and biological properties of the human body, they can become dragged into the limitless pursuit of self-optimization that counts for happiness in the age of neoliberalism.

The reduction of social life to psychology, as performed by Moreno and behavioural economists, or to physiology as achieved by social neuroscience, is not necessarily irreversible. Karl Marx believed that by bringing workers together in the factory and forcing them to work together, capitalism was creating the very class formation that would eventually overwhelm it. This was despite the bourgeois ideology which stressed the primacy of individuals transacting in a marketplace. Similarly, individuals today may be brought together for their own mental and physical health, or for their own private hedonistic kicks; but social congregations can develop their own logic, which is not reducible to that of individual well-being or pleasure. This is the hope that currently lies dormant in this new, neoliberal socialism.

Business ideas and practices do not simply spread of their own accord, not even when they appear to yield clear profits. They need pushing. Sometimes they need cultural and political barriers to be forcefully broken down before they are later adopted, until eventually they come to appear entirely natural. The idea of “scientific advertising,” pioneered in the 1920s by the firm James Walter Thompson (JWT), with support from John B. Watson, is a case in point.

The term ‘data’ derives from the Latin, *datum*, which literally means “that which is given.” It is often an outrageous lie. The data gathered by surveys and psychological experiments is scarcely ever just given. It is either seized through force of surveillance, thanks to some power inequality, or it is given in exchange for something else, such as a monetary reward or a chance to win a free iPad. Often, it is collected in a clandestine way, like the one-way mirrors through which focus groups are observed. In social sciences such as anthropology, the terms on which data is gained (in that case, through prolonged observation and participation) are a matter of constant reflection. But in the behavioural sciences, the innocent term ‘data’ usefully conceals a huge apparatus of power through which people can be studied, watched, measured, and traced, with or without their consent.

Evidently, this political dimension was still visible in the 1920s, when JWT were expanding overseas. In the years since, however, it has receded from view. Questions of what people think or feel, how they intend to vote, how they perceive certain brands, have become simple matters of fact. This is no less true of happiness. Gallup now surveys one-thousand American adults on their happiness and well-being every single day, allowing them to trace public mood in great detail, from one day to the next. We are

now so familiar with the idea that powerful institutions want to know what we're feeling and thinking that it no longer appears as a political issue. But possibilities for psychological and behavioural data are heavily shaped by the power structures which facilitate them. The current explosion in happiness and well-being data is really an effect of new technologies and practices of surveillance. In turn, these depend on preexisting power inequalities.

In other circumstances, this data is being "opened up" on the basis that it is a public good. After all, we the public created it by swiping our smart cards, visiting websites, tweeting our thoughts, and so on. Big data should therefore be something available to all of us to analyze. What this more liberal approach tends to ignore is the fact that, even where data is being opened up, the tools to analyze it are not. Consider New York City's open data regulations: they judiciously leave out the algorithms which are used by government contractors to analyze the data. While the liberal left continues to worry about the privatization of knowledge as enacted by intellectual property rights, a new problem of the privatization of theory has arisen, whereby algorithms which spot patterns and trends are shrouded in commercial secrecy. Entire businesses are now built on the capacity to interpret and make connections within big data.

The spread of narcissism has been harnessed as a research opportunity. When JWT first sought to profile European consumers in the 1920s, this was experienced as an invasion of privacy, as indeed it was. More recently, tolerance for surveys has fallen all over again, though more out of impatience on the part of potential participants than anything else. People simply cannot be bothered to share details of what they like, think, or want with researchers holding clipboards any more. But when Facebook asks its one-billion users that faux-innocent question "What's on your mind?" we pour our thoughts, tastes, likes, desires, and opinions into the company's massive databank without a further thought. When obliged to report on their inner mental states for research purposes, people do so only grudgingly. But when doing so of their own volition, suddenly reporting on behaviour and moods becomes a fulfilling, satisfying activity in its own right. The "quantified self" movement, in which individuals measure and report on various aspects of their private lives—from their diets, to their moods, to their sex lives—began as an experimental group of software developers and artists. But it unearthed a surprising enthusiasm for self-surveillance that market researchers and behavioural scientists have carefully noted. We now have a number of ways in which health and fitness products can be sold alongside quantified self apps, which allow individuals to make constant reports of their behaviour (such as jogging), generating new data sets for the company in the process.

Based on the analysis algorithms give people, they may forget how they actually experience their day-to-day lives and end up with a sunnier or gloomier overall take than is actually representative of their mood. We might consider this to be a form of delusion, although people are of course at liberty to narrate their lives however they see fit.

Moods and decisions, once attributable to the self, begin to migrate to other parts of our body. The cultural imperative to relocate depression in the body has reached the point where scientists now believe that it can be diagnosed through a blood test. What if the patient disagreed? Would they be wrong? More bizarrely, the term ‘brain’ is morphing into an abstract concept, that can refer to various body parts. Some claim to have discovered a “second brain” in the gut, which handles digestion, but which may experience its own moods and mental illnesses.

Where this is explicitly for our own health and well-being—which a great deal of it is developed for—it becomes difficult to mount resistance. On the contrary, many of the new digital apps and analytics tools aimed at uncovering the secrets of happiness and well-being require us to actively cooperate in the measurement of ourselves, and to share data on our mood enthusiastically. There must be obvious benefits available for doing so, or else these forms of measurement would largely cease to work. The problem is that this is never the end of the matter. What begins as a scientific enquiry into the conditions and nature of human welfare can swiftly mutate into new strategies for behavioural control.

Philosophically speaking, there is a gulf separating utilitarianism from behaviourism: the former privileges the inner experience of the mind as the barometer of all value, whereas the latter is only concerned with the various ways in which the observed human animal can be visibly influenced and manipulated. But in terms of methods, technologies, and techniques, the tendency to slip from the former into the latter is all too easy. Inner subjective feelings are granted such a priority under utilitarianism that the appeal of machines capable of reading and predicting them in an objective, behaviourist fashion becomes all the greater. Likewise, what often begins as a basis on which to understand human flourishing and progress—fundamental ideas of enlightenment and humanism—suddenly reappears as a route to sell people stuff they don’t need, work harder for managers who don’t respect them and conform to policy objectives over which they have no say. Quantifying relations among mind, body, and world invariably becomes a basis for asserting control over people and rendering their decisions predictable.

One interesting element of this is that our quasi-private conversations with each other (for instance via Facebook) are viewed as good hard data to be analyzed, whereas the reports we make to interviews or surveys are

considered less reliable. Our conscious statements of opinion or critique are untrustworthy, whereas our unwitting “verbal behaviour” is viewed as a source of inner psychological truth. This may make sense from the perspective of behavioural and emotional science, but it is disastrous from the point of view of democracy, which depends on the notion that people are capable of voicing their interests deliberately and consciously. These developments have generated a new wave of optimism regarding what can be known about the individual mind, decision-making, and happiness. Finally, the real facts of how to influence decision-making may come to light. At last, the truth of why people buy what they buy might come to light. Now, over two centuries after Bentham, we might be about to discover what actually causes a quantifiable increase in human happiness. And in the face of a depression epidemic, mass surveillance of mood and behaviour might unlock the secrets of this disease, so as to screen for it and offer tips and tools to avoid it.

The unspoken precondition of this utopian vision is that society becomes designed and governed as a vast laboratory, which we inhabit almost constantly in our day-to-day lives. This is a new type of power dynamic altogether, which is difficult to characterize purely in terms of surveillance and privacy. The accumulation of psychological data occurs unobtrusively in such a society, often thanks to the enthusiastic cooperation of individual consumers and social media users. Its rationale is typically to make life easier, healthier, and happier for all. It offers environments, such as smart cities, which are constantly adapting around behaviour and real-time social trends, in ways that most people are scarcely aware of. And in keeping with Bentham’s fear of the “tyranny of sounds,” it replaces dialogue with expert management. After all, not everybody can inhabit a laboratory, no matter how big. A powerful minority must play the role of the scientists.

This logic of experimentation allows for policies to be introduced which would otherwise seem entirely unreasonable, or even illegal. Behavioural experiments on criminal activity show that individuals are less psychologically prone to take drugs or engage in low-level crime if the resulting penalty is swift and certain. The association between the act and the result needs to be as firm as possible if punishment is to succeed as a deterrent. In that sense, due process becomes viewed as an inefficient blockage, standing in the way of behaviour change. The much-celebrated HOPE (Hawaii’s Opportunity Probation with Enforcement) programme, which builds directly on this body of evidence, ensures that repeat offenders know they will be jailed immediately if found up to no good.

Projects such as the Hudson Yards quantified community, the Nudge Unit’s fake survey, and HOPE share a number of characteristics. Most

obviously, they are fueled by a high degree of scientific optimism that it may be possible to acquire hard objective knowledge regarding individual decision-making, and then to design public policy (or business practices) accordingly. This optimism is scarcely new; indeed it tends to recur ever few decades or so. The first wave occurred during the 1920s, inspired by Watson and Taylorist principles of “scientific management.” A second occurred in the 1960s, with the rise of new statistical approaches to management, whose most high-profile proponent was US Defense Secretary Robert McNamara during the Vietnam War. The 2010s represent a third wave.

What really drives this behaviourist exuberance? The answer in every case is the same: an anti-philosophical agnosticism, combined with an enthusiastic embrace of mass surveillance. These two things necessarily go together. What the behaviourist is really saying is this: I start with no theory about why people act as they do. I make no presumption as to whether the cause of their decisions is found in their brain, their relationships, their bodies, or their past experiences. I make no appeal to moral or political philosophy, for I am a scientist. I make no claims about human beings beyond what I can see or measure. But this radical agnosticism is only plausible on the basis that the agnostic in question is privy to huge surveillance capabilities. This is why new epochs of behaviourist optimism always coincide with new technologies of data collection and analysis. Only the scientist who can look down on us from above, scraping our data, watching our bodies, assessing our movements, measuring our inputs and outputs, has the privilege of making no presumptions regarding why human beings act as they do.

For the rest of us, talking to our neighbours or engaging in debate, we are constantly drawing on assumptions of what people intend, what they’re thinking, why they have chosen the path they did, and what they actually meant when they said something. On a basic level, to understand what another person says is to draw on various cultural presuppositions about the words they’ve used and how they’ve used them. These presuppositions may not be theories in any strict sense, but more like rules of thumb, which help us to interpret the social world around us. The claim that it is possible to know how decisions are taken, purely on the basis of data, is one that only the observer in his watchtower can plausibly make. For him, theory is simply that which hasn’t yet become visible, and in the age of big data, fMRI, and affective computing, he hopes to be able to abandon it altogether.

We have an unbroken lineal connection to our very first ancestor, the bacterium/protozoa/Protista or organo-chemical molecular combination that jerked into reproductive life when the observable universe was a mere ten-billion years old. That strand of life evolved into billions of life forms (mostly now extinct) including, among the current survivors, us, leaving

a trail of fossil history to prove it. It was a bumpy ride for evolving life: the planet groaned and belched fire; the crust cooled and cracked; tectonic plates drifted aimlessly about, fracturing Pangaea into continental Laurasia and Gondwana; while a cocktail of two bits of hydrogen mixed with one bit of oxygen and violently stirred by bolts of lightning formed the oceans. Survival became paramount. Anything that could not adapt to the violent upheavals was consigned to extinction.

A massive experiment was underway, in which Nature selected the fittest life forms for reproduction—i.e. fishes, amphibians, reptiles, mammals, birds, and insects, as well as vegetation, viruses, and bacteria—under constantly varying climatic conditions, providing all with the necessary instinctive behaviors needed for survival, including, most importantly, a central nervous system controlled by a brain.

We humans eventually got less furry, descended to the plains, adopted bipedalism, and began to wonder what life was all about. We hunted and gathered, made babies and stone tools and spread across the planet. With not a little hubris, we eventually called ourselves wise (after we had learnt to use speech to communicate in proto-language) and were able to dominate our food supplies and competitors. Eventually we discovered that, as a sapient species, we could work things out. This became an obsession and soon there was no subject on or in the earth, oceans, sky, or space that we did not want to know more about. We just had to know!

This led to obsessive curiosity: Who? What? When? Where? Why? How? This desire to know emanated from the brain, which was coupled to a spinal neural stalk, comprising electro-chemical relay stations. The human brain grew and grew in volume and electro-chemical neural complexity, the cranium expanding during evolutionary embryonic development to accommodate it. Our brain—together with the brains of other animals, particularly our primate relatives—gradually became self-aware.

This needs an explanation.

The brain's internal interactions of trillions of neurons, tightly networked three dimensionally and nourished by hormones and oxygen-rich blood, developed into a throbbing autonomous powerhouse. This dynamic state of neural activity may be defined as consciousness—a condition of self-awareness (which is absent in the pathological condition of unconsciousness). The state of consciousness is a platform which energizes the faculty we call mind or the operating system. In this state, the brain's mind started to think, using its neural arsenal and newly acquired language and conceptual skills. True sapience emerged.

Consciousness/unconsciousness and mind are conditional states of being (attributes) and do not exist as physical entities.

The journey of evolution equipped manifest life with sensors, or senses, to allow it to survive and reproduce, a mandate handed down to all life forms from the original ancestor, via Nature. These sensors conveyed the state of the external world to the brain via neural pathways, and, via intricately interwoven somatic nerves, the state of the internal world too. The thinking brain/mind collectively became an interpreter, able to coordinate incoming sensations as well as internal somatic nerve impulses, with regard to its own survival.

The interpreter manipulated and assessed, as a coherent whole, the electro-chemical nervous systems, sensory input/output data, cognitive and memory functions, turning them into thought processes. This is the real causal experiencer—the quasi-self. In its broadest sense, this sequence applies to all life thus endowed.

So, with survival at stake and guided by evolutionary law, the brain formed an identity and sense of agency or selfhood. The brain thus developed into a thinking organ, wearing its accompanying body as a vehicle: with senses for spatial orientation, organs for breathing, legs for locomotion, arms for feeding, all under the interpreter's control, via extremely complex networks of nerves. Since survival was of utmost importance to the evolving organism, automatic responses to dangerous quotidian interactions were hardwired in by nature, allowing for fight, flight, feigning, yielding, and other instinctive survival behaviors. Access to memory allowed the brain's responses, which led us to compete or cooperate, to become options, choices exercised by the faculties of discrimination and volition.

Control of autonomic life operations (heart rate, respiration, blood, hormones, cell metabolism, organ functions, salinity, temperature and moisture control, regulation of pH levels, digestion, immune systems) were denied direct access to the conscious brain by a selected genetic block, or guardian—for self-preservation. These are functions of vital importance to the organism's survival, the responsibility for which, apparently, Nature could not trust to the brain's conscious agency.

So, in the beginning, the physical body was formed by the natural laws of genetic inheritance, the vital awareness of which entered into the brain's consciousness at birth. Further development of the infant's brain took place by way of stimulation, through external and somatic impressions and speech mimicry. The brain became aware of its appendages (body/limbs) and its apparent centrality in the new environment: the brave new world. Nurture, language, and mental activity followed, with the result that the brain assumed an identity and self-awareness and acted, collectively, as an interpreter.

Lawyers and judges have grown up thinking that social science is soft.

Neuroscience gives the courts a hook.

How likely is it that citizens are about to be confronted by the chilling words ‘We have a warrant to search your brain’ anytime soon?

With its implied promise of decoding the brain, it is easy to see why brain imaging would beguile almost anyone interested in pulling back the curtain on the mental lives of others: politicians hoping to manipulate voter attitudes, marketers tapping the brain to learn what consumers really want to buy, agents of the law seeking an infallible lie detector, addiction researchers trying to gauge the pull of temptations, psychologists and psychiatrists seeking the causes of mental illness, and defense attorneys fighting to prove that their clients lack malign intent or even free will. The problem is that brain imaging cannot do any of these things—at least not yet.

The neurobiological domain is one of brains and physical causes. The psychological domain, the domain of the mind, is one of people and their motives. Both are essential to a full understanding of why we act as we do and to the alleviation of human suffering. The brain and the mind are different frameworks for explaining experience. And the distinction between them is hardly an academic matter; it bears crucial implications for how we think about human nature, personal responsibility, and moral action.

Brain imaging often amounts to what I mockingly call neurogeography. The typical outcome is a brain map with an area lighted up in yellow or red: it tells us where things happen in the brain, but rarely do we hear an explanation of what is going on and why.

The problem is that so many neuroimaging studies show so many different patterns. A large part of the reason for this is that brain studies generally rely on a low number of subjects, so as you grow the dataset the actual patterns emerge, whereas with just a few subjects the potential for bias is very large.

It is also important to note that the final brain scan that we see in a magazine or on television rarely portrays the brain activity of a single person. Instead, it almost always represents the averaged results of all participants in the study. Any resemblance between brain scans and photographs is illusory. Photos capture images in real time and space. Functional imaging scans are constructed from information derived from the magnetic properties of blood flowing in the brain. If we removed half of the skull to observe the surface of the living brain in action, we wouldn’t see a multicolored light show as various areas become active during thinking, feeling, and behaving. As striking as they are, scans are far less immediate; at their most accurate, they simply represent local activation based on statistical differences in BOLD signals.

The idea that a specific area in the brain is solely responsible for enabling

a given mental function may be intuitively appealing, but in reality it is rarely the case. Mental activities do not map neatly onto discrete brain regions. For example, Broca's area—once believed to be the brain's one and only language-production center—has been discovered not to have exclusive rights over this capacity. More precisely, it can be thought of as one of the key nodes, or convergence centers, for pathways that process language. Nor is there one designated site in charge of speech comprehension; it too relies on patterns of connectivity across multiple brain regions. Although neuroscientists regard a few cortical regions as being highly specialized for particular operations—such as the perception of faces, places, and body parts, ascribing mental states to others (“theory of mind”), and processing visually presented words—most neural real estate is zoned for mixed-use development. Furthermore, the brain can sometimes reorganize itself after injury so that other areas take over the functions of damaged regions, especially when the injury occurs early in life. For example, the “visual cortex” in blind people can be used to perceive touch, such as the feel of Braille letters.

What's more, a given region may appear deceptively less engaged with a task, on the basis of activation levels, than it really is. In fact, the region could be very important to enabling the task but appear less active because the brain becomes more efficient at tasks it performs repeatedly or automatically. Such a “practice-suppression” effect means that the blood oxygen level required to perform the task is lower than it would be for someone who has never before performed it. It's essential, therefore, to take practice effects into account when one is gauging the relative contribution of various regions.

For the most part, the science which the new laboratory produces is beyond reproach: we are seduced by the idea that, underneath the liberal myth of individual autonomy, every choice has some cause or objective driver, be that biological or economic. What is too often forgotten is that this idea makes no sense whatsoever, absent the apparatuses of observation, tracking, surveillance, and audit. Either we can have theories and interpretations of human activity, and the possibility of some form of self-government; or we can have hard facts of behaviour, and reconstruct society as a laboratory. But we cannot have both.

This is why the capacity to translate bodily and monetary measures into one another is potentially so important right now. It begins to dissolve the boundaries which separate otherwise discrete measures of well-being or pleasure, and to build an apparatus capable of calculating which decision, outcome, or policy is ultimately best in every way. This is a utopian proposition (in the literal sense of utopia as “no place”). There can be

no single measure of happiness and well-being, for the good philosophical reason that there is not actually any single quantity of such things in the first place. Monism is useful rhetorically, and attractive from the perspective of the powerful who yearn for simple ways of working out what to do next. But does anyone actually believe that all pleasures and pains sit on a single index? Sure, we might debate matters as if that were the case, using the metaphor of ‘utility’ or ‘well-being’ with which to do so. But take away its objective neural, facial, psychological, physiological, behavioural, and monetary indicators, and the ghostly notion of happiness as a single quantity also vanishes into thin air.

The main thing is that if unhappiness can be expressed via instruments of measurement, if success can be understood in terms of quantifiable outcomes, then critical and emancipatory projects are ensnared, and their energies are harnessed. Utilitarianism can sanction virtually any type of policy solution in pursuit of mental optimization, including quasi-socialist forms of organization and production on a small scale, where they appear to make people feel better and healthier. It favours human “flourishing” in an open-ended, humanistic sense, which may be achieved through friendship and altruism, as recommended by positive psychologists. But if a definition of optimization were offered which included control over one’s circumstances and one’s time, a voice that exerted power over decision-making, and a sense of autonomy that wasn’t reducible to neural or psychological causality, this simply would not be computable. Such an idea of human fulfillment, in which each individual speaks her mind rather than reveals it unwittingly, where unhappiness is a basis for critique and reform rather than for treatment, and where mind-body problems are simply forgotten rather than targeted through relentless medical research, points towards a different form of politics altogether.

There are a number of critical psychologists over the years who have sought to point this out, by stressing how mental illness is entangled with disempowerment. There are plenty of inspiring ventures and experiments which seek to give people hope partly through restoring their say over their own lives. When the British Office for National Statistics produced its first official data on “national well-being,” it concluded that the happiest residents of the UK were those living in remote and beautiful parts of Scotland, while the happiest workers were those managing forests.

There is a long history of putting mentally troubled people to work on farms. The routines of milking, tilling, and harvesting offer their own form of normality for those who cannot cope with the normality offered in society at large. People who can’t seem to find coherence in their own lives, can’t relate to a conventional job, or have suffered some brutal emotional rupture,

discover that the presence of plants and animals has a calming influence. The harshness of agricultural life may sometimes be part of its value. Crops fail, weather turns bad, but the only plausible response is to laugh and collectively have another go. Neither individual glory nor individual blame are appropriate, in strong contrast to the ethos of twenty-first-century neoliberalism.

Virtually all the scientific analysis of the psychological effects of spending time with plants completely ignores why a person might do so. Gardening and harvesting become merely therapeutic. The relationship between foliage and mood is represented as a simple one of cause and effect. The ethos of Growing Well is entirely different from this. Its organizing principle is that volunteers share the same purpose, of producing and selling good vegetables. The farm is established as an “industrial and provident society,” one of the legal forms available for the creation of co-operatives in the UK. Anyone who has an interest in Growing Well, be it as a customer, a volunteer or a visitor wanting to know more about farming, is encouraged to become a member, who is then able to participate in decision-making. Volunteers are offered the opportunity to engage in management of the business, at whatever level of seniority they would like. This isn’t just about ‘working with your hands’; it is also about expressing a view and taking some control.

The agencies funding Growing Well, and the doctors referring patients to volunteer there, have one theory as to what is going on. Many psychologists and behaviourists have another one entirely. According to the former, the volunteers are medically ill and receiving a form of treatment. According to the latter, they are rediscovering their dignity, exercising judgment, and participating in a business which trades successfully in the local area. In the first theory, the volunteers are passive, without any medically relevant interpretation of their own of their situation. In the second theory, they are active and gaining opportunities to influence the world around them, through interpreting and debating it.

Could it not be that both views are correct? In a superficial sense, it could. People can maintain different ideas of what is going on, based on different types of evidence and scientific methodology. The more fundamental question is what it means for society, for politics, or for personal life stories, to operate according to certain forms of psychological and neurological explanation. A troubling possibility is that it is precisely the behaviourist and medical view of the mind—as some sort of internal bodily organ or instrument which suffers silently—that locks us into the forms of passivity associated with depression and anxiety in the first place. A society designed to measure and manage fluctuations in pleasure and pain, as Bentham envisaged, may be set up for more instances of “mental breakdown” than

one designed to help people speak and participate.

Treating the mind (or brain) as some form of decontextualized, independent entity that breaks down of its own accord, requiring monitoring and fixing by experts, is a symptom of the very culture that produces a great deal of unhappiness today. Disempowerment is an integral part of how depression, stress, and anxiety arise. And despite the best efforts of positive psychologists, disempowerment occurs as an effect of social, political, and economic institutions and strategies, not of neural or behavioural errors. To deny this is to exacerbate the problem for which happiness science claims to be the solution.

At each point in the history of happiness measurement, from the Enlightenment through to the present, hopes for a different social and economic world flicker into view, as unhappiness becomes a basis to challenge the status quo. Understanding the strains and pains that work, hierarchy, financial pressures, and inequality place upon human well-being is a first step to challenging those things. This emancipatory spirit flips swiftly into a conservative one, once the same body of evidence is used as a basis to judge the behaviour and mentality of people, rather than the structure of power. Hope is not so much dashed as ensnared. Critique is turned inwards. This is not necessarily how things have to be. Once the critical eye is turned upon institutions, and away from the emotion or mood of the individual who inhabits them, things start to look very different indeed. Among wealthy nations, the rate of mental illness correlates very closely to the level of economic inequality across society as a whole, with the United States at the top. The nature and availability of work plays a crucial role in influencing mental well-being, as do organizational structures and managerial practices.

If we want to live in a way that is socially and psychologically prosperous, and not simply highly competitive, lonely, and materialistic, there is a great deal of evidence from clinical psychology, social epidemiology, occupational health, sociology, and community psychology regarding what is currently obstructing this possibility. The problem is that, in the long history of scientifically analyzing the relationship between subjective feelings and external circumstances, there is always the tendency to see the former as more easily changeable than the latter. As many positive psychologists now enthusiastically encourage people to do, if you can't change the cause of your distress, try and alter the way you react and feel instead. This is also how critical politics has been neutralized.

This is not to say that altering social and economic structures is easy. It is frustrating, unpredictable, and often deeply disappointing. What is hard to deny, however, is that it becomes virtually impossible to do in any legitimate way once institutions and individuals themselves have become so

preoccupied by measuring and manipulating individual feelings and choices. If there are to be social and political solutions to the problems which cause misery, then the first step must be to stop viewing those problems in purely psychological terms. And yet the utilitarian and behaviourist visions of an individual as predictable, malleable, and controllable (so long as there is sufficient surveillance) have not triumphed merely due to the collapse of collectivist alternatives. It has been repeatedly pushed by specific elites, for specific political and economic purposes, and is experiencing another major political push right now.

What would an escape from this hard psychological science look like? If politics and organization have been excessively psychologized, reducing every social and economic problem to one of incentives, behaviour, happiness, and the brain, what would it take for them to be de-psychologized? One answer is a constant temptation, but we should be wary of it. This is to flip the harsh, rationalist objective science of the mind (and brain) into its opposite, namely a romantic, subjective reveling in the mysteries of consciousness, freedom, and sensation. Confronted by a social world that has been reduced to quasi-mechanical natural forces of cause and effect, the lure of mysticism grows all the greater. In the face of the radical objectivism of neuroscience and behaviourism, which purport to render every inner feeling visible to the outside world, there is a commensurate appeal in radical subjectivism, which claims that what really matters is entirely private to the individual concerned. The problem is that these two philosophies are entirely compatible with one another; there is no friction between them, let alone conflict.

For evidence of this, see how the promotion of mindfulness (and many versions of positive psychology) slips seamlessly between offering scientific facts about what our brains or minds are doing and quasi-Buddhist injunctions to simply sit, be, and notice events as they flow in and out of the consciousness. The limitation of the behavioural and neurosciences is that, while they purport to ignore subjective aspects of human freedom, they speak a language which is primarily meaningful to expert researchers in universities, governments, and businesses. By focusing on whatever can be rendered objective, they leave a gap for a more subjective and passive discourse. New age mysticism plugs this gap.

They analyze official statistics, draw on the lessons of neuroscience, mine data, and trace behaviours to produce their own objective view of what makes people happy. And then they push for new secular religions, meditation practices, and mindfulness, which will provide the narrative through which the non-scientist can master his own well-being. The result is that the powerful and the powerless are speaking different languages, with the latter's consequently incapable of troubling the former's. Nothing like

a public denunciation or critique of the powerful is possible under these conditions.

The language and theories of expert elites are becoming more idiosyncratic and separate from those of the public. How ‘they’ narrate human life and how ‘we’ do so are pulling apart from each other, which undermines the very possibility of inclusive political deliberation. For example, positive psychology stresses that we should all stop comparing ourselves to each other and focus on feeling more grateful and empathetic instead. But isn’t comparison precisely what happiness measurement is there to achieve? Doesn’t giving one person a seven and another person a six work so as to render their differences comparable? The morality that is being offered by way of therapy is often entirely insulated from the logic of the science and technologies which underpin it.

There are those who possess the power of algorithmic analysis and data mining to navigate a world in which there are too many pieces of data to be studied individually. These include market research agencies, social media platforms and the security services. But for the rest of us, impulse and emotion have become how we orientate and simplify our decisions. Hence the importance of fMRI and sentiment analysis in the digital age: tools which visualize, measure, and codify our feelings become the main conduit between an esoteric, expert discourse of mathematics and facts, and a layperson’s discourse of mood, mystical belief, and feeling. ‘We’ simply feel our way around, while ‘they’ observe and algorithmically analyze the results. Two separate languages are at work.

Gradually, our everyday language of moods, choices, and tastes is being translated into terms that correspond to different physical parts of our brains. Neuromarketers can now specify that one advertisement causes activity in a given part of the brain, while a different advertisement does not. This is believed to have significant commercial implications. But to what extent does so much technological progress aid us in a more fundamental problem of social life, that of understanding other people?

To understand what a word means is to understand how it is used, meaning that the problem of understanding other people is first and foremost a social one. Equally, to understand what another person is doing is to understand what their actions mean, both for them and for others who are involved. If I ask the question, ‘What is that person feeling?’ I can answer by interpreting their behaviour, or by asking them. The answer is not inside their head or body, to be discovered, but lies in how the two of us interact. There is nothing stopping me from being broadly right about what they are feeling, so long as that is recognized as an interpretation of what they are doing and communicating, or what their behaviour means. I am not

going to discover what they are feeling as some sort of fact, in the way that I can discover their body temperature. Nor would they be reporting a fact, should they tell me what they're thinking.

And yet we needn't (and mustn't) return to dualism either. To assert the subjective, transcendent, intangible nature of the mind, in opposition to the physical body, is to keep flipping the same dualism on its head, like preaching a mindfulness doctrine that is one half neuroscience and the other half Buddhism. To return to a vision of the mental realm as entirely private and invisible to the outside world is to remain trapped in a state of affairs where we keep asking ourselves neurotic and paranoid questions, such as 'What am I really feeling?' or 'I wonder if he is truly happy.' It is in this sort of confused philosophical territory that the owner of the brain scanner can promise to resolve all moral and political questions, once and for all.

At its most fundamental, the choice between Bentham and Wittgenstein is a question of what it means to be human. Bentham posited the human condition as one of mute physical pain, to be expertly relieved through carefully designed interventions. This is an ethic of empathy, which is extrapolated to a society of scientific surveillance. It also views the division between humans and animals as philosophically insignificant. For Wittgenstein, by contrast, there is nothing prior to language. Humans are animals which speak, and their language is one that other humans understand. Pleasure and pain lose their privileged position, and cannot be treated as matters of scientific fact. You learned the concept 'pain' when you learned language, but it is fruitless to search for some reality of consciousness outside of the words we have to express ourselves. If people are qualified to speak for themselves, the constant need to anticipate—or to try and measure—how they are feeling suddenly disappears. So, potentially, does the need for ubiquitous psychosomatic surveillance

Systematic efforts to understand other people, through their behaviour and speech, are entirely worthwhile. But they are not so different from the forms of understanding that we all make of one another in everyday life. We all face the occasional problem of not being sure what other people mean or intend but have ways of overcoming this. The only possible solution is to use our understanding of ourselves as the basis for the understanding of others, and our understanding of others of our species to further our understanding of ourselves.

Techniques such as surveys may have a valuable role to play in fostering mutual understanding across large and diverse societies. But again, there is too much misunderstanding as to what is going on when a survey takes place. Surveys can never be instruments which represent some set of quasi-natural, objective facts; rather they are useful and interesting ways of engaging with

people, probing them for answers.

Psychology, clearly understood, is a door through which we pass on the way to political dialogue. This is in contrast to the Benthamite and behaviourist traditions which view psychology as a step towards physiology and/or economics, precisely so as to shut the door on politics. Unless something goes wrong, the core questions of psychology are relatively simple: ‘What is that person doing?’ ‘What is that person feeling right now?’ For the most part, the answers to these questions are relatively unproblematic, and the first and most important methodology for answering them is one that we all use every day: just ask them.

That this methodology is not taken more seriously by managerial elites is scarcely surprising. It requires processes of deliberation. It credits people with their own legitimate interpretations and critiques of their own circumstances. It also requires skills to listen, which become submerged in societies that have privileged the power to observe and visualize. Management and government are more secure with the notion of brains “lighting up” or thinking being “no less observable than baseball,” than they are with the prospect of people intentionally expressing their emotions and judgments. For various reasons, making our minds visible seems safer than making them audible. Entire organizational structures would need to change if the behaviourist vision of an automated, silent mind were abandoned in favour of an intelligent, speaking one.

Recognizing that people get angry, critical, resistant, and frustrated is to understand that they have reasons to feel or act in these ways. People express themselves in different ways and with different levels of confidence, but there are good reasons to accept the narratives that people offer about their own lives. If someone is invited to express her feeling—rather than instructed to correctly name or quantify it—she makes it into a social phenomenon. Once people are critical or angry, they can also be critical or angry about something which is external to themselves. Whether or not they are considered an articulate or expert person is scarcely relevant. This is already a less lonely, less depressive, less narcissistic state of affairs than one in which people wonder how their minds or brains are behaving, and what they should do to improve them.

Imagine if just a small proportion of the political will and financial capital that pushes the behaviourist and happiness agendas were diverted elsewhere. What if just a chunk of the tens of billions of dollars that are currently spent monitoring, predicting, treating, visualizing, anticipating the smallest vagaries of our minds, feelings, and brains were spent instead on designing and implementing alternative forms of political-economic organization? The laughter which this would no doubt be met with in the higher echelons of

business, university management and government is a sign of how politically important the techniques of psychological control have now become.

Would an enlightened mental health practitioner or social epidemiologist find it equally funny? I suspect not. Many psychiatrists and clinical psychologists are entirely aware that the problems they are paid to deal with do not start within the mind or body of a solitary individual, or even necessarily within the family. They start with some broader social, political, or economic breakdown. Delimiting psychology and psychiatry within the realms of medicine (or some quasi-economic behavioural science) is a way of neutering the critical potential of these professions. The demand that misery be de-medicalized, in explicit opposition to the interests of the pharmaceutical industry (and its representatives within the American Psychiatric Association) is one that is gathering momentum.

A regime that seeks to stamp out feelings of unhappiness and discontent; the situation sounds dystopian. Not only is unhappiness a normal part of life—and certainly a normal part of being young—it is indispensable for any kind of transformation: of the self, of institutions, of society. Change is driven by the tension between *is* and *ought*—a tension that you have to feel inside your soul.

We tend to think of slavery as a property relation. If someone owns you and you have to do what they say, you're a slave. If no one owns you and you can find a job for yourself, you're free. But Aristotle had a very different view of slavery. For him, a slave is someone who does not choose their own ends. Aristotle divides people into three categories:

1. The virtuous, those who choose their own ends on the basis of what ends they take to be “good.”
2. The vulgar, those who choose their own ends on the basis of what will yield wealth and/or status.
3. The slavish, those who do not choose their own ends and instead act as tools of the virtuous and the vulgar.

So for Aristotle, it doesn't matter whether someone owns you—if you aren't choosing your own ends, you're acting like a slave. Most of us don't get to choose the jobs we believe are best. Most of us have to settle for jobs that will pay us enough to survive. These jobs usually involve working for some individual or organization with its own notion of what is good or worthwhile that we don't entirely share. Aristotle believes that we are what we repeatedly do. If we repeatedly serve as a tool of another rather than act on the basis of our own values, we are repeatedly acting like a slave, and

that makes us slavish. So in a very important sense, most of us are not free. No one owns us, but we are still slaves, because we don't get to choose our own ends.

Aristotle makes an important distinction between 'amusement' and 'leisure.' For Aristotle, 'leisure' is time we spend thinking about what it would be good or worthwhile to do. If we don't have leisure, we can't self-determine our ends. If we cannot self-determine our ends, we are inevitably enslaved. 'Amusement,' by contrast, is about getting ourselves in a psychological condition in which it is possible to return to work. When we engage in amusement, we have free time, but we don't have the mental energy or education to use that free time in a leisurely way. So instead the free time has to be spent rectifying our deteriorated mental state or squandered on frivolous, childlike pursuits.

One of the ways you keep someone enslaved is by denying them leisure. If people have leisure, they start to get their own ideas about what their lives should be for. That makes them less compliant. They might start to organize politically to change their lives and create new and different opportunities for themselves. To deny people leisure, it's necessary to deny them mental energy and to deny them education.

Our system presently accomplishes this in two ways. First, by increasing economic precarity and forcing us to compete ever more heavily for an ever scarcer number of good professional-class jobs, we are pushed to use all of our mental energy trying to satisfy our current or future employers. Nothing is left for leisure, and whenever we have free time we can do nothing but amusement. This is where self-care comes in—self-care is a modern name for amusement. Right now, we feel we have so little free time that it's necessary even to argue for our right to use some of our free time to prepare ourselves to return to work. Looking out for our own mental health has itself been painted as a radical assertion. But it's not radical, because self-care is about surviving, about avoiding burnout, about continuing to be a useful tool. It's amusement, not leisure.

Second, by focusing our universities ever more heavily on job placement, we are ensuring that our young people spend their time at university cultivating résumés for future employers. This means they don't receive an education which is about teaching them how to think about what ends are good or worthwhile. Instead, their training is increasingly vocational in nature, even when the degree is a professional degree like engineering, computer science, law, medicine, or business. These degrees are still about job placement. They don't prepare students to think about what kind of ends are worth having. Students' degrees aren't leisurely, and when they have free time outside of their degrees their energy is depleted and they are

pushed to engage in amusement and self-care to rectify their mental states. Their available time even for amusement is shrinking and rates of mental illness are increasing at universities.

The result is that many people—including many of the people with secure professional-class jobs—never acquire a substantive set of ends for themselves beyond amusement itself. They end up like overgrown high schoolers. In high school, everyone is tired and stressed out all the time, and the result is that high school students are desperate for amusement. It's so important to them that when they are away from school they be permitted to de-stress, and if their home environment is toxic and disallows this the demand for amusement can spill out into all sorts of unhealthy activities. High school students build friend groups around shared amusements. If you watch the same shows, play the same games, read the same books, listen to the same music, buy the same clothes, or do the same drugs, you're cool. If not, you're lame. A mark of maturity is moving on from these aesthetic identifiers and acquiring a life project that is bigger and more meaningful than "have a good time this weekend." But because high school kids spend most of their time and energy doing pointless work assigned to them by other people, they are starved of leisure and desperate for amusement. So their lives are built around instant gratification, hedonism, and self-care.

We are increasingly denying people the temporal and educational resources to grow beyond this, and now adults have childish interests and build their lives around gratifying themselves by purchasing garbage which vaguely relates to whatever lame thing they do on the weekend. There's little ambition beyond this. On some level they know that living their lives for the weekend is more than a bit vacuous. The result is a superabundance of culture which is nihilistic, absurdist, or existentialist in tone, alongside a thriving industry of YouTube pseudointellectuals selling young people books which promise to give their lives meaning. Politically, it also gives rise to new radical and reactionary political movements that sell young people on making their online lives about social causes.

But these people don't have leisure. They are mentally unwell, lack access to non-vocational education, and must spend the bulk of their free time on amusement. Without these things, they cannot think about different sets of ends in a sophisticated way or decide among them. So even in their attempts to find meaning, these people end up slaves—foot soldiers in other people's cults.

Since they need amusement so badly, they not only spend their free time on amusement, they spend their extra money on it too. This prevents even reasonably well-off young people from building up a sum of money they might use to break free, because the extra money they receive will be poured

into expanding or maintaining their collections of objects and experiences related to their child interests. They buy games, art, experiences, all sorts of stuff, just to facilitate amusement. The more objects they buy, the more they must maintain and store. This means there's never enough money to get off the amusement treadmill and pursue leisure, even for people in the nicer professional-class jobs. So the vast majority of people, in both blue collar and white collar jobs, are constantly on the treadmill and never get off.

Desperate for meaning, they look for it in relationships, and marry people who are poor fits out of boredom and existential dread, contributing to high divorce rates, domestic violence, and broken homes, condemning the next generation to a similar existence. They fill their homes with kitschy stuff, imitating their parents' path in lieu of developing one for themselves. The result is entire lives lived without any real meaning at all. The call for self-care is a sad response—it's a demand that people try harder to get amusement when what they really lack is leisure. In this respect it is an intensification of everything that is wrong with modern capitalism, a further retreat into the nostalgic realm of the teenage weekend.

What we need instead is a politics that is committed to restoring our time to us, one which gives us not just sufficient amusement, but access to leisure and the genuine, deep education it requires. As access to universities has expanded, universities have moved away from this kind of education, and there is a real danger that before long virtually no one will have it. We are at risk of creating a society in which no one is meaningfully free, in which no one is capable of self-determining ends. In such a society even the wealthiest people would themselves be slaves to vulgar market values. They would be incapable of envisioning an alternative value set, much less make any kind of real choice between market values and that alternative. When the slaves enslave the slaves, the blind lead the blind, and there is no one left to rescue us from Plato's cave.

One of the central problems in left-wing organizing today is that by putting the lived experience of the oppressed at the center of things, left-wing organizations suffer from a persistent leisure shortfall. When our organizations are run by mentally ill people trying to use left-wing politics to amuse themselves or fill existential voids, they become vehicles for self-care instead of real political organizations with plausible strategic orientations. We need some people in the left to do the thinking, or we won't be able to achieve the institutional and policy changes that are necessary to widen access to leisure. But leisure is in short supply precisely because we haven't yet achieved these changes, and therefore competent, thoughtful leadership is always a scarce commodity in left-wing politics. The more the left fails,

the worse this becomes, because as the position of the worker is eroded by right-wing economic policy, life becomes more precarious, competition becomes fiercer, and amusement deficits pile ever higher. The longer we stay on the amusement treadmill, the harder it is to get off, both individually and collectively. Slavery degrades the slaves, and self-care does not free the self, much less the other.

As the Cult Of Psychology is unequivocally an extension of ruling class power, the pressure to see a therapist in many ways constitutes an attempt at duping the citizen into voluntarily relinquishing any remaining vestiges of privacy. Moreover, the end game of this cult dogma is to manipulate the citizen into surrendering oneself—mind, body, and soul—to the most rapacious power the world has ever known, and to have the masses acknowledge on bended knee, that they and they alone are to blame for their sorrows.

The devious cult-like language with which CoP members are inculcated, teaches them to view the world through a profoundly delusional prism, making rational political discourse all but impossible. And they read the same pernicious rot for years on end, their brains steadily atrophying amidst the onslaught of soulless jargon and lies that they drink like a poison, and which condemn them to a slow and torturous death of mindlessness, soullessness, and the most base and abject dehumanization.

Yet there is no lack of space for these fundamentalists to pray. For their churches are the ruins of our civilization.

“The final end of the State was to make men free to develop their faculties.”

Privacy is required in order to create the conditions for men and women to think independently and critically. We must have intellectual privacy—the protection from surveillance or interference when we are engaged in the processes of generating ideas. Public debate is possible only after the formulation of private opinions—and that requires the freedom to experiment and discard ideas, without worrying about prying eyes. If we believe we’re being watched, we’re far less likely to let our minds roam toward opinions that require courage or might take us beyond the bounds of acceptable opinion. We begin to bend our opinions to please our observer. Without the private space to think freely, the mind deadens—and then so does the Republic.

“The greatest menace to freedom is an inert people.”

Chapter Fourteen

What's Your Type?

The most important rule of speaking type was you had to conceive of personality as an innate characteristic, something fixed since birth and immutable, like blue eyes or left-handedness.

“You have to buy into the idea that type never changes. We will brand this into your brains. The theory behind the indicator supports the fact that you are born with a four-letter preference. If you hear someone say, ‘My type changed,’ they are not correct.”

The insistence on a singular and essential self—a self whose moods and mysteries were crystallized by four simple letters—seems impossibly retrograde amidst the cheerful promises of self-transformation through diet, exercise, travel, therapy, and meditation that we encounter in popular culture every day. Yet it can also be an irresistibly attractive fiction. There was a certain narcissistic beauty to the idea, a certain luminance to the promise that, by learning to speak type, you could learn to compress the gestures of our messy, complicated lives into a coherent life story, one capable of expressing both to ourselves and to others not just who we were but who we had been all along. What type offered us was a vision of individual identity in its most transcendent and transparent form. “Who are you?” the type indicator asked. ‘I am a clear ENTJ.’ ‘I am an ISFP.’ What other language afforded such clarity? Who would not want to believe in it?

The most interesting secrets of the Myers-Briggs Type Indicator are not the secrets that the skeptics of personality testing might expect. For some time, it has been a well-known fact that the type indicator is not scientifically valid; that the theory behind it has no basis in clinical psychology; and that it is the flagship product of a lucrative global corporation, one whose interests sit at the shadowy crossroads of industrial psychology and self-care. For some time too, critics of typological thinking have issued scathing indictments of personality assessment’s liquidation of the individual. Type performs a rather insidious sleight of hand. It convinces people of their status as rounded and exceptional beings. Yet it does so by flattening human

behavior into a static, predetermined set of traits, traits that often register the interests of the powerful institutions that use personality assessment to rationalize their daily affairs. By the late twentieth century, these institutions included corporations like Standard Oil and General Electric that used type to hire, fire, and promote employees; elite colleges like Swarthmore and Bryn Mawr that used type to admit students; churches that used type to ordain ministers; and government bureaucracies that used type to appoint civil servants. Under the rule of type, the labeling of live human beings emerged as one technique for annihilating individuality—for treating people as interchangeable, and sometimes disposable, parts of an unforgiving social whole. Type was, in short, one of the bluntest and best-disguised tools of modernity: a wolf in sheep's clothing.

None of this is new. What remains unexplained is why, in the face of this knowledge, so many people—two-million a year, in nearly all Fortune 500 companies and US colleges and universities, in community centers and churches and couples' retreats, in the army, the navy, and the CIA—continue not only to embrace the type indicator but to defend its inviolability with the kind of ardor usually reserved for matters of the deepest faith. “Myers-Briggs is like my religion” is a familiar refrain one hears at accreditation sessions.

“It helped me find myself.”

“It changed my life.”

“I was never the same again.”

There is an unwavering belief in type's ability to comprehend who we are—why we work the jobs we work, why we love the people we love, why we behave in the apparently various and contradictory ways we do—a belief that persists despite how shamelessly type classifies individuals and conscripts them into the bureaucratic hierarchies of the workplace, the school, the church, the state, and even their own families. At the heart of this mystery is a set of questions fundamental to all human existence: What is a personality? Where does it come from? Why are we so intent on categorizing it? And, of course, the greatest question of all: Who am I?

One had to deal with “the task of the individual,” Katharine wrote, “who from his own microscopic beginnings must repeat in one lifetime the adventure of his whole race or go to Hell.” She thought that salvation was to be found in cultivating one's personality, which she defined in the oldest, most basic sense of the word: the qualities or capacities of thought that

made a person recognizable as a human being and not an animal—a “brute,” as she deemed the less civilized orders of men.

“We teach a lie when we teach that all men are equal. The lower orders of men are far closer to the higher animals than to the higher orders of men, and we ought to recognize that fact.”

Although her tone brooked no argument, for some time she continued to wonder at her inability to love life, her status as a spectator of the present. The family doctor prescribed all sorts of small diversions to help her connect with reality: a game of tennis with Bert when he came back home for a visit, an outdoor concert with her parents on a warm summer night, a birthday party with the neighborhood children. But she dismissed his suggestions as a waste of time and energy. She knew that she had to direct herself even deeper inward, not outward, if she were to save her soul in this modern world, a world that seemed to have no use for the soul at all. So she chose instead to dwell in her fantasies and her daydreams, detached from the ebb and flow of life around her, frequently alone.

Buoyed by love for her daughter, extinguished by grief over the loss of her son, Katharine was confronted with her second crisis of faith. “Is life worth living?” she wondered as she approached her twenty-fifth birthday.

“Does it mean anything? Is there any point to it? Why live at all? Why beget children who will beget children who will beget more children and keep the tragic life stream going on and on in futile struggle?”

Her existential despair may have seemed hypothetical. It was not. Her son’s death had taught her how precious the lives of her children were, how closely their activities had to be regulated if they were to live long enough to cultivate their personalities and ensure their salvation. Under the shadow of death, she recalled the Darwinian education she had once spurned, the techniques of scientific manipulation she had practiced on lesser organisms at Michigan, poking and prodding and recording the behaviors of frogs and earthworms to see what would kill them and what would keep them alive. She wondered if she could learn to apply these same techniques to the problem of human life, both physical and spiritual. Could she conduct daily trials in living that would shape the outer and the inner worlds of the people she loved best? Could she reconcile her quest for personal salvation with the rational methods of the modern world? Could she make her home into a laboratory of personality research, an institution of scientific experimentation

to rival Lyman's workshop at Johns Hopkins or her father's classroom at Michigan?

Although many forms of personality assessment retain some trace of their creators' personal preoccupations, the Myers-Briggs Type Indicator was more intimately attuned to its creators' lives from the start. Katharine was a mother, and as a mother, she believed that children needed two things to mature into "civilized adults": "submission to necessary authority" and the "discipline of ambition." She believed that the mark of civilized adulthood was "specialization." A parent had to direct a child to choose one line of work and pursue it zealously, not for personal fulfillment or financial success, but as a meaningful contribution to society—the kind of good deed that would ensure their salvation.

"The architect fathers civilization when buildings are to be erected; actors and musicians father civilization when people require recreation or entertainment; the physician fathers civilization wherever people are ill."

If, as a wife and mother, Katharine could not specialize in something properly professional—if she could not "father civilization" directly—then she could make mothering into the lifeblood of all specialization. She could help children develop the psychological wherewithal to determine what kind of work was best suited to their personalities. Her efforts would have spectacular repercussions. Half a century later, her daughter, convinced that her mother's ideas about specialization applied just as well to workers as it did to children, would make the same pitch for the Myers-Briggs Type Indicator, the questionnaire she would construct, as a premier "people sorting device."

"Not only psychologists, but otherwise intelligent people, quickly become consummate jackasses when they are asked to develop a child's character."

Katharine bristled at the suggestion that parents could simply let their children be.

"As if every child were not, because of the very nature of the situation, an experiment from the moment of birth! As if everything done for him or left undone, from feeding formula to discipline, were not an experiment, every parent an experimenter, and his home an experimental station!"

Absent the microscopes and plants of her formal education, Katharine's home laboratory was nevertheless designed to see what kinds of growing conditions might permit her to control the little lives that, as she had recently discovered, were not hers to control at all. When Isabel was a toddler, she began with "No! No!" drills. Katharine would place her child in front of a bright, tempting object—a glass bowl, a flickering flame—and chant "No! No!" when the child would try to touch it. If Isabel reached too close and too fast, as most toddlers are wont to do, Katharine would slap her hands or spank her with vigor to reinforce the rule. "No! No!" drills were followed by "Come here!" drills, "Don't touch!" drills, and "Just touch!" drills, which mother and daughter repeated nearly every day, of every year, until Isabel turned five.

She had no tolerance for mothers who inflated their children's sense of self-importance. Nor could she abide mothers who, claiming an excess of maternal feeling, refused to spank or slap their children as she had spanked and slapped Isabel.

"The futile, unauthoritative mother is simply ridiculous."

When one mother recoiled from her suggestion that she spank her son Davy when he ran out of her arms and into the street—"I will never use physical violence on my child," she vowed, her voice trembling with indignation—Katharine responded with cool antipathy:

"Nonsense. You use physical violence on your child every day of his life. You used physical violence just now when you picked him up and brought him kicking and screaming out of the street. You use physical violence every time you wash his face, clean his nose, or give him a dose of medicine. For a baby of his age a spanking is medicine. It's the only way to get across to him certain vitally important truths."

For Katharine, emotional women like Davy's mother had obstructed the progress of society with their unwarranted praise, their excessive fawning over their average or below-average children. The ultimate purpose of baby training, she believed, was first to identify "slow" children whose emotional and intellectual development lagged their peers and help them catch up, and then to transform the "average" children into high-functioning adults, each one capable of specializing in a profession based on his personality. Otherwise these children would grow up into adults with no purpose in the world.

“Multitudes of people are utterly worthless or worse than worthless, having no just claims whatsoever upon the civilization which they burden with the dead weight of their existence. This is a sound, incontrovertible judgment, which has to be shunned, because our feeling for the ‘underprivileged’ is so strong that such truths can hardly be mentioned. Our feeling revolts against it.”

In December 1914, there was on the cover of *Woman’s Home Companion* an article with the headline “The Case for the Homemaker,” which begged readers to acknowledge the women who, like Katharine, did the important, if largely invisible, work of raising children.

“The women who count most of all, who are really doing the things worthwhile for the world’s progress, are a quiet lot. Go to any public school, visit any room, and ask the teacher to introduce a child who is well cared for; who is polite; who is considerate of others. Go home with that child and meet one of the women who counts, who really counts.”

As President Roosevelt called the idle engine of the American economy to action, urging business owners and employers to subordinate their interest in profit to the greater good of the nation, Isabel recalled her mother’s disdain for the president and his extraverted feeling politics.

“When we gave suffrage to women we rather violently increased the number of feeling-types in the electorate. I think if you wanted to go back and check this trend in legislation since then there may be some laws because of that.”

She was drawn to the language Jung used to describe the soul, terms like ‘introvert’ and ‘extravert,’ which had very different meanings in 1923 than they do today. What defined Jung’s introvert was not quietude, solitude, or indecision (as many summaries of the Myers-Briggs types would later claim) but her interest in the self, or what Jung, writing in more technical language, called “the subjective factor.” What made an introvert an introvert was her belief in the superiority of her singular orientation to the world—her subjectivity—over and above the expectations and desires of those around her. To the extravert, the introvert came across as “either a conceited egoist or a crack-brained bigot,” for the extravert’s behavior was governed by pure objective conditions.

To illustrate the contrast between the two, Jung offered a simple example. On a blustery winter day, the fact that it was cold outside would prompt

the extravert to don his overcoat, while the introvert, the person who “wants to get hardened,” Jung wrote, “finds this superfluous.” Whereas the extravert resigned herself to the simple fact of the cold, the introvert sought to overcome it by toughening the very fiber of her being. And while the introvert was committed to cultivating herself in whatever way she deemed fit, no matter the circumstances, the extravert fretted over the arrangements of his various “personae,” a term Jung had appropriated from the theater, where it referred to the many distinct characters (*dramatis personae*) that one actor could play in front of an audience. The extravert was as chameleonic as any seasoned actor, forever adapting himself to suit the stages and scenes of life. The extravert “does what is needed of him, or what is expected of him, and refrains from all innovations that are not entirely self-evident or that in any way exceed the expectations of those around him,” Jung summarized. If the self-focused introvert ran the risk of excessive egoism, the extravert ran the risk of excessive normality. The extravert was the weak-willed one, pathologically disconnected from his inner world, lacking in self-possession.

“I have never been imitative. Quite the contrary. The fact that everyone else is doing something gives that thing an aspect of routine, cut-and-driedness, barrenness, which is acutely distasteful.”

Meeting yourself, she warned, could be a profoundly lonely endeavor. As it liberated you, so too did it sever the bonds you had established with other people, other ways of living and loving life. Meeting yourself meant assuming a great and solitary responsibility for your actions, a responsibility that could leave one feeling appallingly alone.

“Your function is to create a man. Some women create children but it is greater to create a man. If you create Murray you will have done something very fine for the world.”

Jung’s stark division of the world of women into opposing types—women who create children, women who create men—did not surprise or alarm her. Nor did his insistence that “a woman suffers a relationship to be and she also suffers it not to be.” In the face of inevitable suffering, the noblest work a woman could do was to help a man recognize the full extent of his powers. Like the sibyls or Beatrice or any of the gracious Greek muses Jung named in *Psychological Types*, she was to serve as a medium, a lightning rod, an inspiratrice for male geniuses.

For both Katharine and Murray the personality of Adolf Hitler had come to stand in for more properly political concerns about fascism: the centralization of authority, the rising tides of nationalism and ethnocentrism, the programs of mass deportation and genocide. In the cold light of historical retrospect, the easy slippage from the personal to the political might seem surprising. Or it might not. For even today, politics remains chained to discourses of personality in ways that are as crude as, if not cruder than, Murray's assessment of Hitler. Most people want to like their democratically elected leaders or want them to be likable or, at the very least, presentable and polite—the kind of man you could invite over for a beer, the kind of woman who might read sweet stories to your children. Sometimes it seems that we are more shocked by violations of common courtesy than we are by unfair or oppressive policies.

The politicization of personality is not wrong in any moral sense. It is simply the inevitable result of a modern democratic process that invites the people to imagine their elected officials as extensions of themselves—their representatives in a very literal sense. The body that Germans saw on display at dozens of rallies and speeches—the flabby muscles, the hollow chest, the ladylike walk—stood in not only for the nation's public preferences but for its people's private lives: their feelings of impotence, their discriminatory states of mind, the stories they had invented to explain the injustice of their place in the world.

How do you kill an icon? How do you rob it of its aura, its immortality? Literally killing Hitler was impossible, Murray advised the OSS. His death at the hands of the Allies would only consecrate Hitler's status as a martyr for the German people. "An Analysis of the Personality of Adolph Hitler" offered a series of predictions for Hitler's future behavior—nine futures in all, arrayed from least to most likely. It was unlikely that Hitler would be imprisoned or murdered by his own troops. More likely was that Hitler would arrange to have himself killed by someone else.

"This would complete the myth of the hero—death at the hand of some trusted follower. Siegfried stabbed in the back by Hagen, Caesar by Brutus, Christ betrayed by Judas. It might increase the fanaticism of the soldiers and create a legend in conformity with the ancient pattern. If Hitler could arrange to have a Jew kill him, then he could die in the belief that his fellow countrymen would rise in their wrath and massacre every remaining Jew in Germany."

For Murray, the most likely of all scenarios was that Hitler would commit suicide in some dramatic fashion, that he would retreat to his fortress at the

Berghof, where he would blow himself up with dynamite, immolate himself upon a funeral pyre, shoot himself in the head with a silver bullet, or throw himself off the parapet. “This outcome, undesirable for us all, is not at all unlikely,” Murray reported to the OSS.

The most desirable outcome was that Hitler would fall into the hands of the United Nations. After a show trial, during which Hitler would be pronounced mentally unbalanced, he would be removed to the psychiatric ward at Saint Elizabeth’s Hospital in Washington, D.C. There he would live out the rest of his days in solitary confinement. A committee of psychiatrists would administer daily intelligence and personality tests to him, and they would film his behavior during these assessments. Murray predicated that he would rant and rave and denounce everyone, even the Germans who had fought and died for him. The most damning clips from the films would be played around the world, in theaters and on television sets, on loop if possible. They would puncture the myth of Hitler that had captivated the public imagination, and they would serve as a warning to anyone else with a will to power. This was what happened to “crack-brained fanatics who try to dominate the world,” Murray wrote as he outlined the Allies’ improbable revenge fantasy. The final Hitler anyone would see would be Hitler exposed, Hitler unhinged. After some time, the clips would stop. Hitler would be left to die in his cell, alone and forgotten.

“The pictures will become quite tiresome after a while and people will get bored with Hitler. Trust science to take the drama out of anything.”

In contrast to a personologist like Murray, another research team were interested not in the singularity of Hitler but in the audience members who had been seduced by Nazi ideology—those prone to the same prejudice, hostility, and irrationality to which Hitler gave voice.

“The task of fascist propaganda is rendered easier to the degree that antidemocratic potentials already exist in the great mass of people.”

The Nazis were effective insofar as they were able to “activate every ounce” of the German people’s antidemocratic potential while stamping out the “slightest spark of rebellion.” It was not enough to expose one fascistic leader as a babbling madman to prevent the rise of fascism elsewhere, when fascism was an extension of industrial modernity. The hierarchical division of society into classes meant that the marks of social repression were impressed

onto the soul long before a demagogic leader ever opened his mouth to speak.

The only solution, the authors believed, was to eliminate the static, biologized understanding of type and substitute a thoroughly self-reflexive test of personality. What the post-war world needed, then, was not a test of selfhood that divided people into normal and abnormal types but a “critical typology”: one whose major dichotomy lay “in the question of whether a person is standardized himself and thinks in a standardized way, or whether he is truly ‘individualized’ and opposes standardization in the sphere of human experience.” The trick was to design a test of type that would, paradoxically, undo the impulse to think typologically. From both a theoretical and a practical point of view, the problem was how to predict any individual’s potential for fascistic behavior—not his explicit preferences, not his past actions, but the latent desires that could push someone to behave like a fascist at some unspecified point in the future.

“People are continuously molded from above because they must be molded if the overall economic pattern is to be maintained, and the amount of energy that goes into this process bears a direct relation to the amount of potential, residing within the people, for moving in a different direction.”

What the history of type after World War II would reveal was not just the maintenance of the economic pattern that the authors bemoaned but its intensification. Type would continue its creeping spread through all the institutional organs of post-war America: the corporation, the college, the hospital, the psychological laboratory.

Isabel, an avid reader of management theorist Elton Mayo’s articles on human relations, which stressed the primacy of employee morale to job performance, knew that the most effective way to increase worker productivity was not to peg workers as normal, antisocial, or manic-depressive. Rather, it was for management to make every worker feel as if he was needed somewhere, doing something, no matter how unglamorous the task; to increase the attention they paid to the psychic lives of their employees. The idea was not to accept work as a grim reality—the proverbial grind—but to set up the ideological conditions under which one would bind oneself to it freely and gladly, as a point of pride and a source of self-validation. As Katharine had written in one of her child-rearing articles:

“We often say of young people who are slow about getting down to the business of becoming adult, that they have not

found themselves yet. We mean that they have not yet found any worldly adult occupation congenial enough to enable them to lose themselves in it.”

To find oneself only to lose that self in work—this was the impulse that shaped the history of type as it passed from Katharine’s to Isabel’s hands.

The benefits of knowing one’s type did not accrue to all workers equally. If a corporation mainly employed unskilled laborers, she dissuaded them from spending too much money evaluating their workers, stripping them of the assumed benefits of self-knowledge. “The type differences show principally in the more intelligent and highly developed half of the population,” she explained, echoing a similar rationale to the one her mother had articulated many years ago to separate the world into its “primitive” and “enlightened” psychological classes. From her experience, executives revealed an extraordinarily high degree of type development by “every criterion we have.” They outstripped every group of workers she had sampled except some top research scientists from the National Bureau of Standards—the government organization where her father, approaching eighty, and now her son, fresh off his Rhodes Scholarship, worked. By contrast, manufacturers, mechanics, and other blue-collar workers demonstrated the weakest type development.

Of course, there existed no controlled study, no real evidence, to validate Isabel’s belief in the inverse relationship between intelligence and the strength of one’s type preferences. But as was the case for the 1940s’ most famous test, the intelligence quotient (IQ) test, evidence mattered less than the indicator’s ability to justify as “natural” or “normal” the division that already existed in the world, a world in which the wealthier, whiter, and more upwardly mobile were found to be more self-aware than everyone else. It did not occur to anyone, even Isabel, as unusual that the strongest preferences were always expressed by successful, self-assured men with ready access to power, whether in the form of cold hard cash or institutional authority.

“As in all applications of scientism it is society’s values that are enshrined. The tests, essentially, are loyalty tests, or rather, tests of potential loyalty. Neither in the questions nor in the evaluation of them are the tests neutral; they are loaded with values, organization values, and the result is a set of yardsticks that reward the conformist, the pedestrian, the unimaginative—at the expense of the exceptional individual without whom no society, organization, or otherwise can flourish.”

Some encouraged all test takers to memorize the following dictums to provide the most “conventional, run-of-the-mill, pedestrian” answers to any given question.

- I loved my father and my mother, but my father a little bit more.
- I like things pretty well the way they are. I never worry much about anything.
- I don't care for books or music much.
- I love my wife and children. I don't let them get in the way of company work.

The comedy of such a list is, at first, the comedy of the person who seems to have no personality—the futility of trying to extrapolate anything from such flat, noncommittal proclamations as “I like things pretty well the way they are” or “I don't care for books or music much.” At the same time, it is the comedy (or tragedy) of a nonpersonality or impersonality constituted entirely by an exaggerated devotion to one's employer, a devotion that outpaces love for one's wife and children, a devotion that yields a studied indifference to reading books and listening to music—solitary and imaginative pursuits (classic introvert characteristics, according to the Briggs-Myers Type Indicator) that threaten to undercut the incessant sociability on which the organization man's personality relies. At heart, though, the comedy of the list is the comedy inherent to faking a personality—any personality, even one characterized by its excessive blandness. To commit these dictums to memory, to recite them as one sits with pencil poised over answer sheet, is to replace the self with a kind of awkward, unhinged machine—a cheerful robot.

The New York Times profiled several mid-level executives who had been asked to undergo MBTI-based career counseling when their personalities started interfering with their abilities to manage happy and high-functioning teams. “I was angry and humiliated at first,” testified a woman whom colleagues had described as “a pain in the neck.” She continued:

“But I was also open to it. I said if the company wants to pay for me to get some coaching, I'm smart enough to realize this is not any different than if I went for computer training.”

Her coach asked her to take the indicator. “The more we talked, the more the light bulb went on,” the woman reported after learning her type, which she chose not to disclose.

“When my boss asks me to do something, I should say, ‘Sure, no problem.’ If I felt somebody asked me something stupid, I might still feel angry, but now I hide it. That’s what I learned.”

Often, the best version of someone was the most complacent version, eager to please both the people she worked for and the people who worked for her. “My people skills needed to be polished,” reported one woman, whose subordinates complained that she acted like “a dictator rather than a mentor.” Learning how to be a mentor meant softening one’s hard edges, making herself more available and pliable to the company’s needs.

What also became apparent throughout the training was that the impulse to treat personality as complete and innate was, in no small part, a convenient way of slotting people into their designated niches in a high-functioning and productive social order. This was another fiction—a dystopian fiction—that most contemporary personality tests continued to trade in: the fantasy of the rational organization of labor.

THE MBTI WILL PUT YOUR PERSONALITY TO WORK!

promises a career assessment flyer, a promise that was echoed by the many leadership guides and self-help books.

“For companies today, business is all about the participative management of things. The old command-and-control approach doesn’t work. You have to bring feeling into it.”

To believe that one was ideally suited to do one’s job still meant to do it well and to do it willingly—to embrace one’s work under the belief that everyone was exactly where he or she was meant to be. Or as one trainee belted out in the middle of an exercise:

“Teamwork makes the dream work!”

A half-century after blistering critiques of type’s relationship to industrial modernity, the false consciousness perpetuated by the language of type remains almost impenetrable.

“You psychologists, you’re always trying to find out what’s wrong with people. And this is not what type is about. Type is about how people reach their own special kind of excellence. This research is just a way for us to understand if people are having trouble on their pathway, how do we help them?”

Chapter Fifteen

Tyranny of Specialists

High-IQ Morons

“Fuckin’ magnets, how do they work? And I don’t wanna talk to a scientist. Y’all motherfuckers lying and getting me pissed.”

For Insane Clown Posse a true understanding of “fucking rainbows” would reduce them to, as Keats put it, “the dull catalogue of common things.” Violent J shakes his head sorrowfully:

“Who looks at the stars at night and says ‘Oh, those are gaseous forms of plutonium?’ No! You look at the stars and you think, ‘Those are beautiful.’”

“It is not easy for uncredentialed people to stand up to the credentialed, even when the so-called expertise is grounded in ignorance and folly.”

The word ‘experienced’ often refers to someone who has gotten away with doing the wrong thing more frequently than you have.

I am most often irritated by those who attack the bishop but somehow fall for the securities analyst—those who exercise their skepticism against religion but not against economists, social scientists, and phony statisticians. Using the confirmation bias, these people will tell you that religion was horrible for mankind by counting deaths from the Inquisition and various religious wars. But they will not show you how many people were killed by nationalism, social science, and political theory under Stalinism or during the Vietnam War. Even priests don’t go to bishops when they feel ill: their first stop is the doctor’s. But we stop by the offices of many pseudo-scientists and “experts” without alternative. We no longer believe in papal infallibility; we seem to believe in the infallibility of the Nobel.

What if the conservation movement—the scientists and professors and regulators—were not saving the planet? Many have long perceived that

the world is steered by experts armed with good facts and good intentions. What if this is false? In the best-case scenario, the well-meaning experts are being whipped by superior opponents. In the worst case, the experts are twiddling their thumbs, drawing salaries from universities and government while the planet burns.

Most modern careers require submitting to specialization, degradation, trivialization, and tyrannization.

It is important to emphasize that in professional environments, the ability to play the role is generally far more important than the ability to actually do the work. The obsession with prioritizing form over content has played havoc with the professions. Why is it that Catch Me If You Can-style imposters can often successfully pretend to be airline pilots or surgeons without anyone noticing they have no qualifications for the job? The answer is that it's almost impossible to get fired from a professional job—even pilot or surgeon—for mere incompetence, but very easy to get fired for defiance of accepted standards of external behavior, that is, for not properly playing the part. The imposters have zero competence, but play the part perfectly; hence, they are much less likely to be dismissed from their positions than, say, an accomplished pilot or surgeon who openly defies the unspoken codes of external comportment attendant on the role.

Is it any wonder that our country has itself appeared to lose all sense of purpose, when our leaders have none of their own? Once, we dreamed of eradicating poverty, reaching the moon, ensuring racial justice, creating a more equitable society. Now—what? What large national project are we pursuing, or even talking of pursuing? So much freedom. So much wealth and power. Such technological sophistication. But in the end, to what end?

Brilliant, gifted, energetic, yes; but also anxious, greedy, bland, and risk-averse, with no courage and no vision—that is our elite today. The meritocracy is also a technocracy. It can solve the problems that you put in front of it, but it cannot tell you whether they're the right ones to be working on. It is trained to operate within the system, never to imagine that we might create a better one. It is oblivious to beliefs, values, and principles—the things the humanities teach you to think about—because it takes them so much for granted that it ceases to remember they exist. It is bereft of intellectual resources more nutritious than today's op-ed or yesterday's position paper. It is the rule of experts, high-IQ morons—people lacking in a wider thoughtfulness. We do need experts, to be sure, but we also need them not to be in charge. The Wuhan Flu panic is an example of the disastrous consequences that can occur as a result.

Some will argue: It isn't about ideology; it's about competence—the technocrat's creed in a nutshell. Competence makes the trains run on time

but doesn't know where they're going.

IQ tests conveniently omit areas of intelligence that most academics are not good at. For example, these tests do not assess the intelligence it takes to be funny and not bore an entire class; to read body language; to see through bullshit; or to stay alive on the streets in a dangerous neighborhood. Psychologist academics routinely have no great intelligence in these areas, and so, of course, these capacities are omitted from IQ tests.

Professionalism is more than an occupational category; it is an ideology. For many, it provides an entire framework for understanding our modern world. As a political ideology, professionalism carries enormous potential for mischief. For starters, it is obviously and inherently undemocratic, prioritizing the views of experts over those of the public. That is tolerable to a certain degree—no one really objects to rules mandating that only trained pilots fly jetliners, for example. But what happens when an entire category of experts stops thinking of itself as “social trustees”? What happens when they abuse their monopoly power? What happens when they start looking mainly after their own interests, which is to say, start acting as a class?

What are we to make of our modern-day technocracy, a meritocracy of failure in which ineffectual people rise to the top and entire professions—accountants, real-estate appraisers, et cetera—are roiled by corruption scandals? The answer is that the professional ideology brings with it certain predictable, recurring weaknesses.

The first of these pitfalls of professionalism is that the people with the highest status aren't necessarily creative or original thinkers. Although the professions are thought to represent the pinnacle of human brilliance, what they are actually brilliant at is defending and applying a given philosophy. Ideological discipline is the master key to the professions. Despite the favorite sixties slogan, professionals do not question authority; their job is to apply it. This is the very nature of their work and the object of their training. Professionals are obedient thinkers who implement their employers' attitudes and carefully internalize the reigning doctrine of their discipline, whatever it happens to be. In addition, the professions are structured to shield insiders from accountability. This is what defines the category: professionals do not have to listen. They are the only occupational group with the recognized right to declare outside evaluation illegitimate and intolerable.

The peril of orthodoxy is the second great pitfall of professionalism, and it's not limited to economics. Every academic discipline is similar: international relations, political science, cultural studies, even American history. None of them are as outrageous as economics, it is true, but each of them is dominated by some convention or ideology. Those who succeed in a professional discipline are those who best absorb and apply its master

narrative.

One final consequence of the ideology of professionalism is the liberal class's obsessive pining for consensus. Most of the Democratic leadership has shared these views for decades; for them, a great coming-together of the nation's educated is the obvious objective of political work. This obsession, so peculiar and yet so typical of our times, arises from professionals' well-known disgust with partisanship and their faith in what they take to be apolitical solutions. If only they could bring Washington's best people together, they believe, they could enact their common-knowledge program.

Figures in the media, as well as teachers in schools, exploit their position as knowledge authorities to issue assertions that are not supposed to be taken as proposals, but as commands. The newscaster telling the audience something like 'austerity is needed to cut down debt' is an order to each audience member to add it to her stock of beliefs. It cannot be a proposal to add it to the common ground, because the relation between the newscaster and the audience is fundamentally asymmetric. He is telling me things, not proposing things that he may himself give up when I present him with a good counterargument. Telling someone something from a position of authority is a command, not an assertion. The social studies teacher in school is not genuinely proposing her claims for debate. Proposing is something one does with an equal.

One cannot command another person to believe something, unless one simultaneously presents evidence for the belief that is to be adopted. I cannot successfully command you to believe that you are on Mars right now. However, in combining epistemic and practical authority, my assertion can have the effect of a command to change one's beliefs. This is what happens when we are in school listening to teachers or watching the news. One can command someone to believe something, by presenting oneself as an epistemic authority, whose expert testimony is sufficient to back up one's practical command.

It is very often the case that members of dispossessed groups seem to lack the required knowledge, or the required confidence, to act to alleviate their own oppression.

No system that usurps the autonomy of persons can be acceptable, even if it is in the name of greater social efficiency or the common good. The lessons of history show that humans are too prone to confuse the furtherance of their own interests with the common good, and their subjective explanatory framework with objective fact.

Samuel Huntington argued that the problems of the United States in the 1970s resulted from "an excess of democracy," and recommended "claims of expertise, seniority, experience, and special talents" in order to "override

the claims of democracy as a way of constituting authority.” Huntington’s recommendation for the United States was to try to reinstall some measure of obedience to authority by making various central domains in life, ones that should be governed democratically, the domain of experts, who are employed to make the masses feel unqualified to weigh in on central decisions about their lives. Huntington is recommending installing obedience to authority in negatively privileged groups, by making them feel unqualified to make autonomous democratic decisions in the face of self-proclaimed “experts” of various sorts.

Huntington’s suggestion for handling the “excess of democracy” was to employ the vocabulary of scientific expertise in a political way.

‘Technicism’ is the view that scientific expertise and technological advancements are the solution to the problems of the human condition. There are two chief dangers in the technicist worldview. First, it seeks to replace a liberal education with vocational technical skills. The technicist educational system therefore seeks to rob us of the capacity for autonomy. Secondly, a technicist culture encourages a tendency to defer one’s practical decisions to the epistemic authority of experts. Some societies are organized so as to restrict the distribution of important forms of authoritative agency to particular ruling elites. In other societies all normal members of society are considered “responsible free agents.” Even in most of these, however, certain people are designated as more equal than others. Why? Because their mastery of a particular cognitive area of discourse or practice seems to make it socially desirable that they be granted the right, under certain circumstances, to intervene in the freedom of other agents. Such privileged people are normally called “professionals.”

Technicism is an ideology that excludes, for example, narrative claims about personal experience as reasons for action or belief. The ideology of technicism is one that restricts genuine reasons in the public sphere to those whose contents contain only scientific or quantitative concepts. The ideology of technicism does not contain concepts for personal experience; it therefore consigns them to the status of mere “convenient rhetoric” or anecdote. The ideology of technicism undermines democracy by undermining the autonomy of those who are unfamiliar with the technicist concepts. The ideology of technicism makes citizens feel unqualified to participate democratically in the formation of the laws that govern their behavior. It is what underlies discounting personal narratives as explanations of patterns of statistics that paint minority groups in an unflattering light. It is employed by those in power to disenfranchise and subordinate those who are not in power, and hence is connected to a distinct social identity, the identity of ruling elites.

The employment of such a radically impoverished conceptual scheme as

the technician one is not just an accident of history. The idea that public reason should be constrained to technocratic concepts is there for a specific purpose: to serve the interests of the ruling elite. In the face of Samuel Huntington's appeal to employ the language of expertise more widely as a mechanism to deal with the "excesses of democracy," it is difficult to reject this further claim. It is a flawed ideology, because, by denying us access to narrative accounts and personal testimony, it blocks us from an understanding of the human suffering that explains the statistics, even when the statistics are factually correct.

Political propaganda is the employment of a political ideal against itself. Someone who presents subjective values, or self-interested goals, as the embodiment of objective scientific ideals is therefore producing prime examples of propaganda.

Professionals are a high-status group, but what gives them their lofty position is learning, not income. They rule because they are talented, because they are smart. A good sociological definition of professionalism is "a second hierarchy"—second to the main hierarchy of money, that is—"based on credentialed expertise." Which is to say, a social order supported by test scores and advanced degrees and defended by the many professional associations that have been set up over the years to define correct practice, enforce professional ethics, and wage war on the unlicensed.

Another distinguishing mark of the professions is their social authority. Professionals are the people who know what ails us and who dispense valuable diagnoses. Professionals predict the weather. They organize our financial deals and determine the rules of engagement. They design our cities and draw the traffic patterns through which the rest of us travel. Professionals know when someone is guilty of a moral or criminal misdeed and they also know precisely what form of retribution that culpability should take. Curriculum Planners know what we must learn; architects know what our buildings must look like; economists know what the Federal Reserve's discount rate should be; art critics know what is in good taste and what is in bad.

Although we are the subjects of all these diagnoses and prescriptions, the group to which professionals ultimately answer is not the public but their peers—and, of course, their clients. They listen mainly to one another. The professions are autonomous; they are not required to heed voices from below their circle of expertise. In this way the professions build and maintain monopolies over their designated fields. Now, 'monopoly' is admittedly a tough word, but it is not really a controversial one among sociologists who write about the professions. Monopolizing knowledge is a baseline description of what professions do; this is why they restrict entry

to their fields. Professions certify the expertise of insiders while negating and dismissing the knowledge-claims of outsiders.

Many believe Snowden more than they believe the government. He does, however, make one statement in *Citizenfour* that to some seems preposterous and wrong: While discussing the alleged greatness of the early, pre-mass-surveillance Internet, he notes that a child in one part of the world could have an anonymous discussion with a verified expert in another part of the world and “be granted the same respect for their ideas.” To many, that does not sound like a benefit. That sounds like a waste of time and energy, at least for the verified expert. The concept of some eleven-year-old in Poland facelessly debating an expert on an equal platform, just because there’s a machine that makes this possible, seems about as reasonable as letting dogs vote. They still can’t accept the possibility of certain experts being totally wrong.

I mean, if we found records of an eleven-year-old girl from 340 BC who contacted Aristotle and told him his idea about a rock wanting to sit on the ground was irrational bullshit, we’d name a college after her.

They assume it must be terrifying to view the world from the perspective that most people are wrong, and to think that every standard belief is a form of dogma, and to assume that reality is not real. And I get what they’re driving at, and I realize that—from their vantage point—any sense of wide-scale skepticism about the seemingly obvious would be a terrifying way to live. There’s an accepted line of reasoning that keeps the average person from losing his or her mind. It’s an automatic mental reflex. The first part of the reasoning involves a soft acceptance of the impossible: our recognition that the specific future is unknowable and that certain questions about the universe will never be answered, perhaps because those answers do not exist.

The second part involves a hard acceptance of limited truths: a concession that we can reliably agree on most statements that are technically unprovable, regardless of whether these statements are objective (‘The US government did not plan the 9/11 attacks’), subjective (‘Fyodor Dostoyevsky is a better novelist than Dan Brown’), or idealistic (‘Murder is worse than stealing, which is worse than lying, which is worse than sloth’). It’s a little like the way we’re biologically programmed to trust our friends and family more than we trust strangers, even if our own past experience suggests we should do otherwise. We can’t unconditionally trust the motives of people we don’t know, so we project a heightened sense of security upon those we do, even if common sense suggests we should do the opposite. If 90% of life is inscrutable, we need to embrace the 10% that seems forthright, lest we feel like life is a cruel, unmanageable joke. This is the root of naïve

realism. It's not so much an intellectual failing as an emotional sanctuary from existential despair. It is not, however, necessary.

Science is inherently reductive; its ethos is to break big problems down into smaller chunks that can be more easily attacked. But this can hinder seeing broader connections and limit the ability to synthesize information in anything resembling real-time.

Many experts lose the creativity and imagination of the less informed. They are so intimately familiar with known patterns that they may fail to recognize or respect the importance of the new wrinkle. The process of applying expertise is, after all, the editing out of unimportant details in favor of those known to be relevant. The mind of the beginner is empty, free of the habits of the expert, ready to accept, to doubt, and open to all the possibilities.

Intuitively, most people think that experts consider more alternatives and more possible diagnoses rather than fewer. Yet the mark of true expertise is not the ability to consider more options, but the ability to filter out irrelevant ones. Of course, it can be these "irrelevant" ones which lead to innovative fixes, but more often than not they won't.

Experts in various fields who predict the future are typically less accurate than a collection of reasonably informed people. Those who know many little things tend to predict better than those who know one area of expertise, although the latter are considered the experts and everybody wants to hear their opinions in the media.

There's also a detriment with our escalating progression toward the opposite extremity—the increasingly common ideology that assures people they're right about what they believe. And note that I used the word 'detriment.' I did not use the word 'danger,' because I don't think the notion of people living under the misguided premise that they're right is often dangerous. Most day-to-day issues are minor, the passage of time will dictate who was right and who was wrong, and the future will sort out the past. It is, however, socially detrimental. It hijacks conversation and aborts ideas. It engenders a delusion of simplicity that benefits people with inflexible minds. It makes the experience of living in a society slightly worse than it should be.

A dozen people picked at random on the street are at least as likely to offer sensible views on moral and political matters as a cross-section of the intelligentsia. But I would go further. One of the principal lessons of our tragic century, which has seen so many millions of innocent lives sacrificed in schemes to improve the lot of humanity, is—beware intellectuals. Not merely should they be kept well away from the levers of power, they should also be objects of particular suspicion when they seek to offer collective advice.

Beware committees, conferences, and leagues of intellectuals. Distrust public statements issued from their clustered, cloistered ranks. Discount their verdicts on political leaders and important events.

Intellectuals—far from being highly individualistic and nonconformist people—follow certain regular patterns of behavior. Taken as a group, they are often ultra-conformist within the circles formed by those whose approval they seek and value. That is what makes them, *en masse*, so dangerous, for it enables them to create climates of opinion and prevailing orthodoxies, which themselves often generate irrational and destructive courses of action. Above all, we must at all times remember what intellectuals habitually forget: that people matter more than concepts and must come first. The worst of all despotisms is the heartless tyranny of ideas.

David Brooks always comes back to his essential conviction, the article of faith that makes a writer like him fit so comfortably at the Times: the well-graduated are truly great people. And on that day in 2008 when Brooks beheld the incoming Obama crew, with their Harvard-certified talent—Lord!—he just about swooned. “I find myself tremendously impressed by the Obama transition,” he wrote. Why? Because “they are picking the best of the Washington insiders”: “open-minded individuals” who are “not ideological” and who exhibit lots of “practical creativity.” They were “admired professionals,” the very best their respective disciplines had to offer. Brooks did not point out that choosing so many people from the same class background—every single one of them, as he said, was a professional—might by itself guarantee closed minds and ideological uniformity. Nobody else pointed this out, either. We always overlook the class interests of professionals because we have trouble thinking of professionals as a “class” in the first place; like David Brooks, we think of them merely as “the best.” They are where they are because they are so smart, not because they’ve been born to an earldom or something.

The top ranks of the professions are made up of highly affluent people. They are not the billionaire Walmart clan, but they have a claim to leadership nevertheless. These two power structures, one of ownership and the other of knowledge, live side by side, sometimes in conflict with one another but usually in comity.

The problem with such broad-brush generalizations about any social stratum, of course, is that there are lots of exceptions, and a group of educated and often sophisticated individuals naturally contains lots of honorable folks who care sincerely about society’s well-being. Many of them understand the madness of a deregulated market system as it spins out of control. But in a sweeping sociological sense, professionals as a class do not get it. This is because inequality does not contradict, defy, or even

inconvenience the logic of professionalism.

On the contrary, inequality is essential to it. Professionals, after all, are life's officer corps. They give the orders; they write the prescriptions. Status is essential to professionalism; achieving a more exalted level in life's hierarchy is the most central dimension of the professionalization project. Inequality is what it's all about. Sometimes the privileges accorded to the professions are enshrined in law—not just anyone is allowed to step into a courtroom and start pleading before a judge, for example—and even when they aren't, they are maintained by artificial scarcity, by a monopoly of expertise. Meritocracy is what makes these ideas fit together; it is the official professional credo—the conviction that the successful deserve their rewards, that the people on top are there because they are the best. This is the First Commandment of the professional-managerial class.

Bill Clinton expressed his thoughts in a December 1992 speech to his “economic summit.” Here is how he proposed to deal with the various economic problems he had identified on the campaign trail:

“Our new direction must rest on an understanding of the new realities of global competition. *The world we face today is the world where what you earn depends on what you can learn.* There's a direct relationship between high skills and high wages, and therefore we have to educate our people better to compete. We will be as rich and strong and rife with opportunity as we are skilled and talented and trained.”

I put Clinton's line about “what you earn” in italics because it may well be the most important passage of them all for understanding how his party—how our entire system—has failed so utterly to confront income inequality. It's a line Clinton repeated a number of times in the course of his years in government, and here, in a single sentence, is the distilled essence of the theory that has governed the politics of work and compensation from that day to this: You get what you deserve, and what you deserve is defined by how you did in school. Furthermore, this is supposedly true both for individuals and for the nation. Everyone says this. Barack Obama says it, David Brooks says it, George W. Bush says it, even Wisconsin governor Scott Walker said it, by implication, when he demanded that the mission of the University of Wisconsin be changed from the “search for truth” to making people employable.

It doesn't take an advanced degree to figure out that this education talk is less a strategy for mitigating inequality than it is a way of rationalizing it. To attribute economic results to school years finished and SAT scores achieved

is to remove matters from the realm of, well, economics and to relocate them to the provinces of personal striving and individual intelligence. From this perspective, wages aren't what they are because one party (management) has a certain amount of power over the other (workers); wages are like that because the god of the market, being surpassingly fair, rewards those who show talent and gumption. Good people are those who get a gold star from their teacher in elementary school, a fat acceptance letter from a good college, and a good life when they graduate. All because they are the best. Those who don't pay attention in high school get to spend their days picking up discarded cans by the side of the road. Both outcomes are our own doing.

These days meritocracy has come to seem so reasonable that many of us take it for granted as the true and correct measure of human value. Do well in school, and you earn your credential. Earn your credential, and you are admitted into the ranks of the professions. Become a professional, and you receive the respect of the public plus the nice house in the suburbs and the fancy car and all the rest. Meritocracy makes so much sense to us that barely anyone thinks of challenging it, except on its own terms.

For Barack Obama, belief in meritocracy is a conviction of the most basic sort. Obama's faith lay in cream rising to the top. The president believed this for the most personal of reasons: because this was the system that had propelled him to the top. Because he himself was a product of the great American post-war meritocracy he could never fully escape seeing the world from the status ladder he had ascended.

What this doctrine means for the politics of income inequality should be clear: a profound complacency. For successful professionals, meritocracy is a beautifully self-serving doctrine, entitling them to all manner of rewards and status, because they are smarter than other people. For people on the receiving end of inequality—for those who have just lost their home, for example, or who are having trouble surviving on the minimum wage, the implications of meritocracy are equally unambiguous. To them this ideology says: forget it. You have no one to blame for your problems but yourself. There is no solidarity in a meritocracy. The very idea contradicts the ideology of the well-graduated technocrats who rule us. Leading members of the professional class show enormous respect for one another—call it “professional courtesy”—but they feel precious little sympathy for the less fortunate members of their own cohort: for the adjuncts frozen out of the academic market for tenure, for colleagues who get fired, or even for the kids who don't get into “good” colleges. That life doesn't shower its blessings on people who can't make the grade isn't a shock or an injustice; it's the way things ought to be.

To the liberal class this is a fixed idea, as open to evidence-based

refutation as creationism is to fundamentalists: if poor people want to stop being poor, poor people must go to college. But of course this isn't really an answer at all; it's a moral judgment, handed down by the successful from the vantage of their own success. The professional class is defined by its educational attainment, and every time they tell the country that what it needs is more schooling, they are saying: 'Inequality is not a failure of the system; it is a failure of you.'

Nor can the leaders of the professional class see the absurdity of urging everyone else to do exactly as they themselves did to make their way to the top. It is as if some oil baron were to proclaim that the unemployed could solve their problems if they just found good places to drill for oil. Or if some mutual-fund manager were to suggest that the solution to inequality was for everyone to put their savings in the stock market.

Look back to the days when government-by-expert actually worked—to some extent at least—and you will notice an astonishing thing. Unlike the Obama administration's roster of well-graduated mugwumps, the talented people surrounding Franklin Roosevelt stood very definitely outside the era's main academic currents. Harry Hopkins, Roosevelt's closest confidant, was a social worker from Iowa. Robert Jackson, the US Attorney General whom Roosevelt appointed to the Supreme Court, was a lawyer who had no law degree. Jesse Jones, who ran Roosevelt's bailout program, was a businessman from Texas with no qualms about putting the nation's most prominent financial institutions into receivership. Marriner Eccles, the visionary whom Roosevelt appointed to run the Federal Reserve, was a small-town banker from Utah with no advanced degrees. Henry Wallace, who was probably the nation's greatest agriculture secretary, studied at Iowa State and came to government after running a magazine for farmers. Harry Truman, FDR's last vice president, had been a successful US senator but had no college degree at all. Even Roosevelt's Ivy Leaguers were often dissenters from professional convention. John Kenneth Galbraith, who helped to run the Office of Price Administration during World War II, spent his entire career calling classical economics into question. Thurman Arnold, the Wyoming-born leader of FDR's Antitrust Division, wrote a scoffing and derisive book called *The Folklore of Capitalism*. Just try getting a job in Washington after pulling something like that today.

Whenever you see something defining itself with the 'You're doing it wrong' conceit, it's inevitably arguing for a different approach that is just as specific and limited. When you see the phrase "You're doing it wrong," the unwritten sentence that follows is: 'And I'm doing it right.' This has become the pervasive way to argue about just about everything, particularly in a Web culture where discourse is dominated by the reaction to (and the

rejection of) other people's ideas, as opposed to generating one's own.

Some of us place so much value on being rational that we're unable to recognize that when someone tells you to be rational, they may just be telling you that their ideas weigh more than yours. The rhetoric of rationalism can be used as a seemingly benign disguise for social control.

The United States has more lawyers per capita, 3.65 per thousand, than other wealthy countries, such as Canada (2.2) and Germany (1.3). While the relatively large number of lawyers in the United States is a drain on the economy, factors unique to the United States might explain the higher ratio. Specifically, the rate of incarceration in the United States is far higher than in other wealthy countries, and so the demand for prosecutors and criminal defense lawyers is higher. In addition, the fact that the United States does not provide universal health insurance and has extraordinarily high health care costs means that people would have incentives that do not exist in other countries to pursue legal actions over physical injuries. Finally, regulation and litigation are alternative forms of protection. In countries with more extensive regulation for consumer protection and safety, there may be less need for legal action.

Individual income tax filings is another area that provides a considerable amount of often unnecessary work for lawyers. It should be possible for the IRS to calculate the returns of most low- and moderate-income workers and send the completed forms back to the taxpayer for approval. This is the practice in several European countries. Adopting this approach would radically reduce the need for tax consultants and for lawyers to challenge the work of these consultants.

The greatest crimes of human history are made possible by the most colorless human beings. They are the careerists. The bureaucrats. The cynics. They do the little chores that make vast, complicated systems of exploitation and death a reality. They collect and read the personal data gathered on tens of millions of us by the security and surveillance state. They keep the accounts of ExxonMobil, BP, and Goldman Sachs. They build or pilot aerial drones. They work in corporate advertising and public relations. They issue the forms. They process the papers. They deny food stamps to some and unemployment benefits or medical coverage to others. They enforce the laws and the regulations. And they do not ask questions.

Good. Evil. These words do not mean anything to them. They are beyond morality. They are there to make corporate systems function. If insurance companies abandon tens of millions of sick to suffer and die, so be it. If banks and sheriff departments toss families out of their homes, so be it. If financial firms rob citizens of their savings, so be it. If the government shuts down schools and libraries, so be it. If the military murders children

in Pakistan or Afghanistan, so be it. If commodity speculators drive up the cost of rice and corn and wheat so that they are unaffordable for hundreds of millions of poor across the planet, so be it. If Congress and the courts strip citizens of basic civil liberties, so be it. If the fossil fuel industry turns the earth into a broiler of greenhouse gases that doom us, so be it. They serve the system. The god of profit and exploitation. The most dangerous force in the industrialized world does not come from those who wield radical creeds, whether Islamic radicalism or Christian fundamentalism, but from legions of faceless bureaucrats who claw their way up layered corporate and governmental machines. They serve any system that meets their pathetic quota of needs.

These systems managers believe nothing. They have no loyalty. They are rootless. They do not think beyond their tiny, insignificant roles. They are blind and deaf. They are—at least regarding the great ideas and patterns of human civilization and history—utterly illiterate. And we churn them out of universities. Lawyers. Technocrats. Business majors. Financial managers. IT specialists. Consultants. Petroleum engineers. Positive psychologists. Communications majors. Cadets. Sales representatives. Computer programmers. Men and women who know no history, know no ideas. They live and think in an intellectual vacuum, a world of stultifying minutia. They are the hollow men, the stuffed men. Shape without form, shade without colour. Paralyzed force, gesture without motion.

It was the careerists who made possible the genocides, from the extermination of Native Americans to the Turkish slaughter of the Armenians, from the Nazi Holocaust to the creation of the world's largest open-air prison by Israel. They were the ones who kept the trains running. They filled out the forms and presided over the property confiscations. They rationed the food while children starved. They manufactured the guns. They ran the prisons. They enforced travel bans, confiscated passports, seized bank accounts and carried out segregation. They enforced the law. They did their jobs.

Political and military careerists, backed by war profiteers, have led us into useless wars, including World War I, Vietnam, Iraq, and Afghanistan. And millions followed them. Duty. Honor. Country. Carnivals of death. They sacrifice us all. In the futile battles of Verdun and the Somme in World War I, 1.8 million on both sides were killed, wounded, or never found. In July of 1917 British Field Marshal Douglas Haig, despite the seas of dead, doomed even more in the mud of Passchendaele. By November, when it was clear his promised breakthrough at Passchendaele had failed, he jettisoned the initial goal—as we did in Iraq when it turned out there were no weapons of mass destruction and in Afghanistan when al-Qaeda left the country—and opted for a simple war of attrition. Haig won if more Germans than allied

troops died. Death as score card. Passchendaele took 600,000 more lives on both sides of the line before it ended. It is not a new story. Generals are almost always buffoons. Soldiers followed John the Blind, who had lost his eyesight a decade earlier, to resounding defeat at the Battle of Crécy in 1337 during the Hundred Years War. We discover that leaders are mediocrities only when it is too late.

“Before the battle of Passchendaele the Tanks Corps Staff prepared maps to show how a bombardment which obliterated the drainage would inevitably lead to a series of pools, and they located the exact spots where the waters would gather. The only reply was a peremptory order that they were to ‘Send no more of these ridiculous maps.’ Maps must conform to plans and not plans to maps. Facts that interfered with plans were impertinencies.”

Here you have the explanation of why our ruling elites do nothing about climate change, refuse to respond rationally to economic meltdown, and are incapable of coping with the collapse of globalization and empire. These are circumstances that interfere with the very viability and sustainability of the system. And bureaucrats know only how to serve the system. They know only the managerial skills they ingested at West Point or Harvard Business School. They cannot think on their own. They cannot challenge assumptions or structures. They cannot intellectually or emotionally recognize that the system might implode. And so they do what Napoléon warned was the worst mistake a general could make: paint an imaginary picture of a situation and accept it as real. But we blithely ignore reality along with them. The mania for a happy ending blinds us. We do not want to believe what we see. It is too depressing. So we all retreat into collective self-delusion.

“One day in 1943 when I was already in Crematorium 5, a train from Bialystok arrived. A prisoner on the ‘special detail’ saw a woman in the ‘undressing room’ who was the wife of a friend of his. He came right out and told her: ‘You are going to be exterminated. In three hours you’ll be ashes.’ The woman believed him because she knew him. She ran all over and warned to the other women. ‘We’re going to be killed. We’re going to be gassed.’ Mothers carrying their children on their shoulders didn’t want to hear that. They decided the woman was crazy. They chased her away. So she went to the men. To no avail. Not that they didn’t believe her. They’d heard rumors in the Bialystok

ghetto, or in Grodno, and elsewhere. But who wanted to hear that? When she saw that no one would listen, she scratched her whole face. Out of despair. In shock. And she started to scream.”

We run heedlessly into the abyss after putting something in front of us to stop us from seeing it.

Adolf Eichmann was primarily motivated by an extraordinary diligence in looking out for his personal advancement. He joined the Nazi Party because it was a good career move.

“The trouble with Eichmann, was precisely that so many were like him, and that the many were neither perverted nor sadistic, that they were, and still are, terribly and terrifyingly normal.

The longer one listened to him, the more obvious it became that his inability to speak was closely connected with an inability to think, namely, to think from the standpoint of somebody else. No communication was possible with him, not because he lied but because he was surrounded by the most reliable of all safeguards against words and the presence of others, and hence against reality as such.”

“The most nauseating type of S.S. were to me personally the cynics who no longer genuinely believed in their cause, but went on collecting blood guilt for its own sake. Those cynics were not always brutal to the prisoners, their behavior changed with their mood. They took nothing seriously—neither themselves nor their cause, neither us nor our situation. One of the worst among them was Dr. Mengele, the Camp Doctor I have mentioned before. When a batch of newly arrived Jews was being classified into those fit for work and those fit for death, he would whistle a melody and rhythmically jerk his thumb over his right or his left shoulder—which meant ‘gas’ or ‘work.’ He thought conditions in the camp rotten, and even did a few things to improve them, but at the same time he committed murder callously, without any qualms.”

These armies of bureaucrats serve a corporate system that will quite literally kill us. They are as cold and disconnected as Mengele. They carry out minute tasks. They are docile. Compliant. They obey. They find their self-worth in the prestige and power of the corporation, in the status of

their positions, and in their career promotions. They assure themselves of their own goodness through their private acts as husbands, wives, mothers, and fathers. They sit on school boards. They go to Rotary. They attend church. It is moral schizophrenia. They erect walls to create an isolated consciousness. They make the lethal goals of ExxonMobil or Goldman Sachs or Raytheon or insurance companies possible. They destroy the ecosystem, the economy and the body politic and turn working-men and -women into impoverished serfs. They feel nothing. Metaphysical naiveté always ends in murder. It fragments the world. Little acts of kindness and charity mask the monstrous evil they abet. And the system rolls forward. The polar ice caps melt. The droughts rage over cropland. The drones deliver death from the sky. The state moves inexorably forward to place us in chains. The sick die. The poor starve. The prisons fill. And the careerist, plodding forward, does his or her job.

It is interesting and important to note that many of the petty officials who do absurd and terrible things in the name of paperwork are keenly aware of what they are doing and of the human damage that is likely to result—even if they usually feel they must remain stone-faced when dealing with the public. Some rationalize it. A few take sadistic pleasure. But any victim of the system who has ever asked herself, ‘How can such people live with themselves?’ might take some comfort in the fact that, in many cases, they can’t.

With the collapse of the old welfare states, all this has come to seem decidedly quaint. As the language of anti-bureaucratic individualism has been adopted, with increasing ferocity, by the Right, which insists on “market solutions” to every social problem, the mainstream Left has increasingly reduced itself to fighting a kind of pathetic rearguard action, trying to salvage remnants of the old welfare state: it has acquiesced with—often even spearheaded—attempts to make government efforts more “efficient” through the partial privatization of services and the incorporation of ever-more “market principles,” “market incentives,” and market-based “accountability processes” into the structure of the bureaucracy itself. The result is a political catastrophe. There’s really no other way to put it.

What is presented as the “moderate” Left solution to any social problems—and radical left solutions are, almost everywhere now, ruled out tout court—has invariably come to be some nightmare fusion of the worst elements of bureaucracy and the worst elements of capitalism. It’s as if someone had consciously tried to create the least appealing possible political position. It is a testimony to the genuine lingering power of leftist ideals that anyone would even consider voting for a party that promoted this sort of thing—because surely, if they do, it’s not because they actually

think these are good policies, but because these are the only policies anyone who identifies themselves as left-of-center is allowed to set forth. Is there any wonder, then, that every time there is a social crisis, it is the Right, rather than the Left, which becomes the venue for the expression of popular anger? The Right, at least, has a critique of bureaucracy. It's not a very good one. But at least it exists. The Left has none. As a result, when those who identify with the Left do have anything negative to say about bureaucracy, they are usually forced to adopt a watered-down version of the right-wing critique.

One could go further. The “acceptable” Left has, as I say, embraced bureaucracy and the market simultaneously. The libertarian Right at least has a critique of bureaucracy. The fascist Right has a critique of the market—generally, they are supporters of social welfare policies; they just want to restrict them to members of their own favored ethnic group.

In contemporary American populism—and increasingly, in the rest of the world as well—there can be only one alternative to ‘bureaucracy,’ and that is ‘the market.’ Sometimes this is held to mean that government should be run more like a business. Sometimes it is held to mean we should simply get the bureaucrats out of the way and let nature take its course, which means letting people attend to the business of their lives untrammelled by endless rules and regulations imposed on them from above, and so allowing the magic of the marketplace to provide its own solutions. ‘Democracy’ thus came to mean the market; ‘bureaucracy,’ in turn, government interference with the market; and this is pretty much what the word continues to mean to this day.

“A few weeks ago, I spent several hours on the phone with Bank of America, trying to work out how to get access to my account information from overseas. This involved speaking to four different representatives, two referrals to nonexistent numbers, three long explanations of complicated and apparently arbitrary rules, and two failed attempts to change outdated address and phone number information lodged on various computer systems. In other words, it was the very definition of a bureaucratic runaround. (Neither was I able, when it was all over, to actually access my account.) Now, there is not the slightest doubt in my mind that, were I to actually locate a bank manager and demand to know how such things could happen, he or she would immediately insist that the bank was not to blame—that it was all an effect of an arcane maze of government regulations. However, I am equally confident that, were it possible to investigate

how these regulations came about, one would find that they were composed jointly by aides to legislators on some banking committee and lobbyists and attorneys employed by the banks themselves, in a process greased by generous contributions to the coffers of those same legislators' reelection campaigns."

And the same would be true of anything from credit ratings, insurance premiums, mortgage applications, to, for that matter, the process of buying an airline ticket, applying for a scuba license, or trying to requisition an ergonomic chair for one's office in an ostensibly private university. The vast majority of the paperwork we do exists in just this sort of in-between zone—ostensibly private, but in fact entirely shaped by a government that provides the legal framework, underpins the rules with its courts and all of the elaborate mechanisms of enforcement that come with them, but (crucially) works closely with the private concerns to ensure that the results will guarantee a certain rate of private profit. In cases like this the language we employ—derived as it is from the right-wing critique—is completely inadequate. It tells us nothing about what is actually going on.

Consider the word 'deregulation.' In today's political discourse, deregulation is—like 'reform'—almost invariably treated as a good thing. Deregulation means less bureaucratic meddling, and fewer rules and regulations stifling innovation and commerce. This usage puts those on the left-hand side of the political spectrum in an awkward position, since opposing deregulation—even, pointing out that it was an orgy of this very deregulation that led to the banking crisis of 2008—seems to imply a desire for more rules and regulations, and therefore, more gray men in suits standing in the way of freedom and innovation and generally telling people what to do. But this debate is based on false premises.

Let's go back to banks. There's no such thing as an unregulated bank. Nor could there be. Banks are institutions to which the government has granted the power to create money—or, to be slightly more technical about it, the right to issue IOUs that the government will recognize as legal tender, and, therefore, accept in payment of taxes and to discharge other debts within its own national territory. Obviously no government is about to grant anyone—least of all a profit-seeking firm—the power to create as much money as they like under any circumstances. That would be insane. The power to create money is one that, by definition, governments can only grant under carefully circumscribed (read: regulated) conditions. And indeed this is what we always find: government regulates everything from a bank's reserve requirements to its hours of operation; how much it can charge in interest, fees, and penalties; what sort of security precautions it can or

must employ; how its records must be kept and reported; how and when it must inform its clients of their rights and responsibilities; and pretty much everything else.

So what are people actually referring to when they talk about deregulation? In ordinary usage, the word seems to mean ‘changing the regulatory structure in a way that I like.’ In practice this can refer to almost anything. About the only policies that can’t be referred to as deregulation are ones that aim to reverse some other policy that has already been labeled ‘deregulation,’ which means it’s important, in playing the game, to have your policy labeled ‘deregulation’ first.

The People or a Mob?

Journalism is one of many fields of public influence—including politics—in which credentials function as de facto permission to speak, rendering those who lack them less likely to be employed and less able to afford to stay in their field. Ability is discounted without credentials, but the ability to purchase credentials rests, more often than not, on family wealth.

“Why do Americans think this is a good requirement, or at least a necessary one? Because *They* think so. We’ve left the realm of reason and entered that of faith and mass conformity.”

Almost every endeavor that used to be considered an art best learned through doing now requires formal professional training and a certificate of completion, and this seems to be happening, equally, in both the private and public sectors, since, as already noted, in matters bureaucratic, such distinctions are becoming effectively meaningless. While these measures are touted—as are all bureaucratic measures—as a way of creating fair, impersonal mechanisms in fields previously dominated by insider knowledge and social connections, the effect is often the opposite. As anyone who has been to graduate school knows, it’s precisely the children of the professional-managerial classes, those whose family resources make them the least in need of financial support, who best know how to navigate the world of paperwork that enables them to get said support. For everyone else, the main result of one’s years of professional training is to ensure that one is saddled with such an enormous burden of student debt that a substantial chunk of any subsequent income one will get from pursuing that profession will henceforth be siphoned off, each month, by the financial sector.

In some cases, these new training requirements can only be described as outright scams, as when lenders, and those prepared to set up the training programs, jointly lobby the government to insist that, say, all pharmacists be henceforth required to pass some additional qualifying examination, forcing thousands already practicing the profession into night school, which these pharmacists know many will only be able to afford with the help of high-interest student loans. By doing this, lenders are in effect legislating themselves a cut of most pharmacists’ subsequent incomes.

One result of all this debt is to render the government itself the main mechanism for the extraction of corporate profits. Just think, here, of what happens if one tries to default on one’s student loans: the entire legal apparatus leaps into action, threatening to seize assets, garnish wages, and apply thousands of dollars in additional penalties. The only way graduates

can reduce their student debt burden, according to a 1998 law enacted at the behest of the student loan industry, is to prove in a separate lawsuit that repayment would impose an “undue hardship” on them and their dependents. This is a stricter standard than bankruptcy courts apply to gamblers seeking to reduce their gambling debts. Another result is to force the debtors themselves to bureaucratize ever-increasing dimensions of their own lives, which have to be managed as if they were themselves a tiny corporation measuring inputs and outputs and constantly struggling to balance its accounts.

It’s also important to emphasize that while this system of extraction comes dressed up in a language of rules and regulations, in its actual mode of operation, it has almost nothing to do with the rule of law. Rather, the legal system has itself become the means for a system of increasingly arbitrary extractions. As the profits from banks and credit card companies derive more and more from “fees and penalties” levied on their customers—so much so that those living check to check can regularly expect to be charged eighty dollars for a five-dollar overdraft—financial firms have come to play by an entirely different set of rules.

“Well, you have to understand the approach taken by US prosecutors to financial fraud is always to negotiate a settlement. They don’t want to have to go to trial. The upshot is always that the financial institution has to pay a fine, sometimes in the hundreds of millions, but they don’t actually admit to any criminal liability. Their lawyers simply say they are not going to contest the charge, but if they pay, they haven’t technically been found guilty of anything.”

So you’re saying if the government discovers that Goldman Sachs, for instance, or Bank of America, has committed fraud, they effectively just charge them a penalty fee.

“That’s right.”

Has there ever been a case where the amount the firm had to pay was more than the amount of money they made from the fraud itself?

“Oh no, not to my knowledge. Usually it’s substantially less.”

So what are we talking here, 50 percent?

“I’d say more like 20 to 30 percent on average. But it varies considerably case by case.”

Which means. . . correct me if I’m wrong, but doesn’t that effectively mean the government is saying, ‘you can commit all the fraud you like, but if we catch you, you’re going to have to give us our cut’?

“Well, obviously I can’t put it that way myself as long as I have this job. . .”

So: what would a left-wing critique of total, or predatory, bureaucratization look like? I think the story of the Global Justice Movement provides a hint—because it was a movement that, rather to its own surprise, discovered this was what it was about. Back in the 1990s, “globalization,” as touted by journalists like Thomas Friedman—but really, by the entire journalistic establishment in the United States and most of it in other wealthy countries—was portrayed as an almost natural force. Technological advances—particularly the Internet—were knitting the world together as never before, increased communication was leading to increased trade, and national borders were rapidly becoming irrelevant as free trade treaties united the globe into a single world market. In political debates of the time in the mainstream media, all of this was discussed as such a self-evident reality that anyone who objected to the process could be treated as if they were objecting to basic laws of nature—they were flat-earthers, buffoons, the left-wing equivalents of Biblical fundamentalists who thought evolution was a hoax.

Thus when the Global Justice Movement started, the media spin was that it was a rearguard action of hoary, carbuncular leftists who wished to restore protectionism, national sovereignty, barriers to trade and communication, and, generally, to vainly stand against the Inevitable Tide of History. The problem with this was that it was obviously untrue. Most immediately, there was the fact that the protesters’ average age, especially in the wealthier countries, seemed to be about nineteen. More seriously, there was the fact that the movement was a form of globalization in itself: a kaleidoscopic alliance of people from every corner of the world, including organizations ranging from Indian farmers’ associations, to the Canadian postal workers’ union, to indigenous groups in Panama, to anarchist collectives in Detroit. What’s more, its exponents endlessly insisted that despite protestations to the contrary, what the media was calling globalization had almost nothing to do with the effacement of borders and the free movement of people, products, and ideas. It was really about trapping increasingly large parts of the world’s population behind highly militarized national borders within which social

protections could be systematically withdrawn, creating a pool of laborers so desperate that they would be willing to work for almost nothing. Against it, they proposed a genuinely borderless world.

Much of what is being called ‘international trade’ in fact consists merely of the transfer of materials back and forth between different branches of the same corporation.

Whenever someone starts talking about the free market, it’s a good idea to look around for the man with the gun. He’s never far away. Free-market liberalism of the nineteenth century corresponded with the invention of the modern police and private detective agencies, and gradually, with the notion that those police had at least ultimate jurisdiction over virtually every aspect of urban life, from the regulation of street peddlers to noise levels at private parties, or even to the resolution of bitter fights with crazy uncles or college roommates. We are now so used to the idea that we at least could call the police to resolve virtually any difficult circumstance that many of us find it difficult to even imagine what people would have done before this was possible. Because, in fact, for the vast majority of people throughout history—even those who lived in in large cities—there were simply no authorities to call in such circumstances. Or, at least, no impersonal bureaucratic ones who were, like the modern police, empowered to impose arbitrary resolutions backed by the threat of force.

I was reminded of this a few years ago by none other than Julian Assange, when a number of Occupy activists appeared on his TV show *The World Tomorrow*. Aware that many were anarchists, he asked what he considered a challenging question:

“Say you have a camp, and there are some people playing the drums all night and keeping everyone awake, and they won’t stop, what do you propose to do about it?”

The implication is that police, or something like them—some impersonal force willing to threaten violence—were simply necessary in such conditions. He was referring to a real incident—there had been some annoying drummers in Zuccotti Park. But in fact, the occupiers who didn’t like the music simply negotiated a compromise with them where they would only drum during certain hours. No threats of violent force were necessary. This brings home the fact that, for the overwhelming majority of humans who have lived in human history, there has simply been nothing remotely like police to call under such circumstances. Yet they worked something out. One seeks in vain for Mesopotamian or Chinese or ancient Peruvian accounts of urban dwellers driven mad by neighbors’ raucous parties.

History reveals that political policies that favor “the market” have always meant even more people in offices to administer things, but it also reveals that they also mean an increase of the range and density of social relations that are ultimately regulated by the threat of violence. This obviously flies in the face of everything we’ve been taught to believe about the market, but if you observe what actually happens, it’s clearly true. In a sense, even calling this a ‘corollary’ is deceptive, because we’re really just talking about two different ways of talking about the same thing. The bureaucratization of daily life means the imposition of impersonal rules and regulations; impersonal rules and regulations, in turn, can only operate if they are backed up by the threat of force. And indeed, in this most recent phase of total bureaucratization, we’ve seen security cameras, police scooters, issuers of temporary ID cards, and men and women in a variety of uniforms acting in either public or private capacities, trained in tactics of menacing, intimidating, and ultimately deploying physical violence, appear just about everywhere—even in places such as playgrounds, primary schools, college campuses, hospitals, libraries, parks, or beach resorts, where fifty years ago their presence would have been considered scandalous, or simply weird.

Supporters of the old Prussian bureaucratic state in the nineteenth century, like Hegel or Goethe, insisted that its authoritarian measures could be justified by the fact they allowed citizens to be absolutely secure in their property, and therefore, free to do absolutely anything they pleased in their own homes—whether that meant pursuing the arts, religion, romance, or philosophical speculation, or simply a matter of deciding for themselves what sort of beer they chose to drink, music they chose to listen to, or clothes they chose to wear. Bureaucratic capitalism, when it appeared in the United States, similarly justified itself on consumerist grounds: one could justify demanding that workers abandon any control over the conditions under which they worked if one could thus guarantee them a wider and cheaper range of products for them to use at home. Even the Soviet bureaucracy combined a celebration of labor with a long-term commitment to creating a consumer utopia. It should be noted that when the Reagan administration effectively abandoned antitrust enforcement in the eighties, they did it by shifting the criteria for approval of a merger from whether it operates as a restraint of trade to whether it “benefits the consumer.” The result is that the US economy is in most sectors, from agriculture to book sales, dominated by a few giant bureaucratic monopolies or oligopolies.

Bureaucracies public and private appear—for whatever historical reasons—to be organized in such a way as to guarantee that a significant proportion of actors will not be able to perform their tasks as expected. It’s in this sense that I’ve said one can fairly say that bureaucracies are utopian

forms of organization. After all, is this not what we always say of utopians, that they have a naïve faith in the perfectibility of human nature and refuse to deal with humans as they actually are? Which is, are we not also told, what leads them to set impossible standards and then blame the individuals for not living up to them? But in fact all bureaucracies do this, insofar as they set demands they insist are reasonable, and then, on discovering that they are not reasonable—since a significant number of people will always be unable to perform as expected—conclude that the problem is not with the demands themselves but with the individual inadequacy of each particular human being who fails to live up to them.

For example:

“We expect everyone to work as hard as possible for the common good without expectation of reward! And if you are not capable of living up to such standards, clearly you are a counterrevolutionary bourgeois individualist parasite, and we’ll have to send you to a gulag.”

Now, I admit that this emphasis on violence might seem odd. We are not used to thinking of nursing homes or banks or even HMOs as violent institutions—except perhaps in the most abstract and metaphorical sense. But the violence I’m referring to here is not abstract. I am not speaking of conceptual violence. I am speaking of violence in the literal sense: the kind that involves, say, one person hitting another over the head with a wooden stick. All of these are institutions involved in the allocation of resources within a system of property rights regulated and guaranteed by governments in a system that ultimately rests on the threat of force. ‘Force’ in turn is just a euphemistic way to refer to violence: that is, the ability to call up people dressed in uniforms, willing to threaten to hit others over the head with wooden sticks. It is curious how rarely citizens in industrial democracies actually think about this fact, or how instinctively we try to discount its importance.

This is what makes it possible, for example, for graduate students to be able to spend days in the stacks of university libraries poring over Foucault-inspired theoretical tracts about the declining importance of coercion as a factor in modern life without ever reflecting on that fact that, had they insisted on their right to enter the stacks without showing a properly stamped and validated ID, armed men would have been summoned to physically remove them, using whatever force might be required. It’s almost as if the more we allow aspects of our everyday existence to fall under the purview of bureaucratic regulations, the more everyone concerned colludes to downplay

the fact (perfectly obvious to those actually running the system) that all of it ultimately depends on the threat of physical harm.

Imagine, if you will, some warlike tribe (let's call them the Alphas) that sweeps out of the desert and seizes a swath of land inhabited by peaceful farmers (let's call them the Omegas). But instead of exacting tribute, they appropriate all the fertile land, and arrange for their children to have privileged access to most forms of practical education, at the same time initiating a religious ideology that holds that they are intrinsically superior beings, finer and more beautiful and more intelligent, and that the Omegas, now largely reduced to working on their estates, have been cursed by the divine powers for some terrible sin, and have become stupid, ugly, and base. And perhaps the Omegas internalize their disgrace and come to act as if they believe they really are guilty of something. In a sense perhaps they do believe it. But on a deeper level it doesn't make a lot of sense to ask whether they do or not. The whole arrangement is the fruit of violence and can only be maintained by the continual threat of violence: the fact that the Omegas are quite aware that if anyone directly challenged property arrangements, or access to education, swords would be drawn and people's heads would almost certainly end up being lopped off. In a case like this, what we talk about in terms of "belief" are simply the psychological techniques people develop to accommodate themselves to this reality. We have no idea how they would act, or what they would think, if the Alphas' command of the means of violence were to somehow disappear.

Is it accurate to say that acts of violence are, generally speaking, also acts of communication? It certainly is. But this is true of pretty much any form of human action. It strikes me that what is really important about violence is that it is perhaps the only form of human action that holds out even the possibility of having social effects without being communicative. To be more precise: violence may well be the only way it is possible for one human being to do something which will have relatively predictable effects on the actions of a person about whom they understand nothing. In pretty much any other way in which you might try to influence another's actions, you must at least have some idea about who you think they are, who they think you are, what they might want out of the situation, their aversions and proclivities, and so forth. Hit them over the head hard enough, and all of this becomes irrelevant. It is true that the effects one can have by disabling or killing someone are very limited. But they are real enough—and critically, it is possible to know in advance exactly what they are going to be. Any alternative form of action cannot, without some sort of appeal to shared meanings or understandings, have any predictable effects at all.

What's more, while attempts to influence others by the threat of violence

do require some level of shared understandings, these can be pretty minimal. Most human relations—particularly ongoing ones, whether between longstanding friends or longstanding enemies—are extremely complicated, dense with history and meaning. Maintaining them requires a constant and often subtle work of imagination, of endlessly trying to see the world from others' points of view—interpretive labor. Threatening others with physical harm allows the possibility of cutting through all this. It makes possible relations of a far more simple and schematic kind ('Cross this line and I will shoot you'; 'One more word out of any of you and you're going to jail'). This is of course why violence is so often the preferred weapon of the stupid. One might even call it the trump card of the stupid, since—and this is surely one of the tragedies of human existence—it is the one form of stupidity to which it is most difficult to come up with an intelligent response.

I do need to introduce one crucial qualification here. Everything, here, depends on the balance of forces. If two parties are engaged in a relatively equal contest of violence—say, generals commanding opposing armies—they have good reason to try to get inside each other's heads. It is only when one side has an overwhelming advantage in their capacity to cause physical harm that they no longer need to do so. But this has very profound effects, because it means that the most characteristic effect of violence, its ability to obviate the need for "interpretive labor," becomes most salient when the violence itself is least visible—in fact, where acts of spectacular physical violence are least likely to occur. These are of course precisely what I have just defined as situations of structural violence, systematic inequalities ultimately backed up by the threat of force. For this reason, situations of structural violence invariably produce extremely lopsided structures of imaginative identification.

Curiously, it was Adam Smith, in his *Theory of Moral Sentiments*, who first observed the phenomenon we now refer to as 'compassion fatigue.' Human beings, he proposed, are normally inclined not only to imaginatively identify with their fellows, but as a result, to spontaneously feel one another's joys and sorrows. The poor, however, are so consistently miserable that otherwise sympathetic observers are simply overwhelmed, and are forced, without realizing it, to blot out their existence entirely. The result is that while those on the bottom of a social ladder spend a great deal of time imagining the perspectives of, and genuinely caring about, those on the top, it almost never happens the other way around. Whether one is dealing with masters and servants, men and women, employers and employees, rich and poor, structural inequality—what I've been calling structural violence—invariably creates highly lopsided structures of the imagination. Since imagination tends to bring with it sympathy, the result is that victims of

structural violence tend to care about its beneficiaries far more than those beneficiaries care about them. This might well be, after the violence itself, the single most powerful force preserving such relations.

“A mother who loses a child is a wounded woman. We hear her laugh again, and see her go about her business of surviving, but she has been wounded and the scars go deep. I am grateful for mothers out there who have the strength to go on and to live full, useful lives, and who can continue to love. And I thought of men who need to kill the children of mothers. The black and white winter birds were at my feeder. They do not kill each other. And I thought that perhaps the world should be ruled by small black and white winter birds and, yes, by mothers.

My God has let me know by His scriptures and by His Holy Spirit that I am not required according to His Laws, to bow under laws which trample upon my liberties by which my God has made me a free man. My God is more powerful than you and your illegal laws, and only slaves will bow under those conditions; therefore, all I can say is go to Hell, you and your kind, for such unrighteous demands.”

From the time we were bouncing babes we were taught where to bounce and how. We do as we're told by authority. Through our formative years our parents were authority figures, as were our teachers. Endless government officials from the dogcatcher to the parking-meter lady daily exercise authority over us. The police have unmitigated power. They direct traffic. We follow. They blow their sirens. We pull over. Whatever they demand, we are in the habit of obeying. At work, for all of our lives, our employers tell us what to do, where and when. Our government taxes us, and we pay without a street fight. In retirement we strictly follow the rules we must in order to obtain the benefits of our retirement that we've earned. And even at death our bodies are disposed of according to the law. We do not revolt against authority. We do not scream in the streets when the rights of others are wrested from them. We make no undue disturbance in public places. We stand in line waiting our turn, even if it is painful to do so. We allow people we have never seen and will never see again, under color of authority, to search us at airports. Rarely do we exercise independent judgment, and when we do, our judgments are subject to the scrutiny of authority. Cattle walk quietly down the killing chute to be butchered because they are domesticated and respect our authority. Our minds are polluted with propaganda from the

power structure, and we accept their statements even when they lie to us, including their pronouncement that we are free.

Generations of police sociologists have pointed out that only a very small proportion of what police actually do has anything to do with enforcing criminal law—or with criminal matters of any kind. Most of it has to do with regulations, or, to put it slightly more technically, with the scientific application of physical force, or the threat of physical force, to aid in the resolution of administrative problems. In other words they spend most of their time enforcing all those endless rules and regulations about who can buy or smoke or sell or build or eat or drink what where that don't exist in places like small-town or rural Madagascar. So: Police are bureaucrats with weapons.

If you think about it, this is a really ingenious trick. Because when most of us think about police, we do not think of them as enforcing regulations. We think of them as fighting crime, and when we think of 'crime,' the kind of crime we have in our minds is violent crime. Even though, in fact, what police mostly do is exactly the opposite: they bring the threat of force to bear on situations that would otherwise have nothing to do with it. I find this all the time in public discussions. When trying to come up with a hypothetical example of a situation in which police are likely to be involved, people will almost invariably think of some act of interpersonal violence: a mugging or assault. But even a moment's reflection should make it clear that, when most real acts of physical assault—domestic violence, gang fights, drunken brawls—do occur, even in major cities like Marseille or Montevideo or Minneapolis, the police do not get involved. Police are only likely to be called in if someone dies, or is so seriously hurt they end up in the hospital.

But this is because the moment an ambulance is involved, there is also paperwork; if someone is treated in the hospital, there has to be a cause of injury, the circumstances become relevant, police reports have to be filed. And if someone dies there are all sorts of forms, up to and including municipal statistics. So the only fights which police are sure to get involved in are those that generate some kind of paperwork. The vast majority of muggings or burglaries aren't reported either, unless there are insurance forms to be filled out, or lost documents that need to be replaced, and which can only be replaced if one files a proper police report. So most violent crime does not end up involving the police.

On the other hand, try driving down the street of any one of those cities in a car without license plates. We all know what's going to happen. Uniformed officers armed with sticks, guns, and/or tasers will appear on the scene almost immediately, and if you simply refuse to comply with their instructions, violent force will, most definitely, be applied. Why are

we so confused about what police really do? The obvious reason is that in the popular culture of the last fifty years or so, police have become almost obsessive objects of imaginative identification in popular culture. It has come to the point that it's not at all unusual for a citizen in a contemporary industrialized democracy to spend several hours a day reading books, watching movies, or viewing TV shows that invite them to look at the world from a police point of view, and to vicariously participate in their exploits. And these imaginary police do, indeed, spend almost all of their time fighting violent crime, or dealing with its consequences.

Ancient Egypt in contrast created whole genres of literature to warn young students against adventurous occupations. They would typically begin by asking whether the reader had ever dreamed of becoming the captain of a ship, or a royal charioteer, then go on to describe just how miserable such an apparently glamorous occupation would likely really turn out to be. The conclusion was always the same: don't do it! Become a bureaucrat. You'll have a prosperous job and all you'll be able to order around the soldiers and sailors who will treat you like a god.

Have you ever asked yourself: 'How have I come to accept the cop's argument as the whole truth without questioning how I came to believe it?' But who tells the people's truth? The large majority of law-abiding citizens know little about "what goes on out there." What we think we know we've been taught by decades of fictional TV cop shows sponsored by Power—the insurance companies, the mammoth oil corporations, international banks, car manufacturers, national loan sharks, pill pushers, and the various other offspring of Power. We've been provided entertainment, not the whole truth, by the voice of Power—the media. We've come to believe Power's propaganda in much the same way that we believe our religions—that our police and prosecutors will not prosecute and convict the innocent. Such would be un-American. But blind beliefs, cultural brainwashings, can hasten the end of a free people.

Note that cop movies of the 'rogue cop breaking all the rules' variety, that now seems the default mode for a Hollywood action movie, did not exist at all until the 1970s. In fact for the first half-century of American cinema there were hardly any movies at all that took a policeman's point of view. The rogue cop movie appeared at the moment the Western disappeared and is largely a transposition of Western plots into an urban bureaucratic setting. Clint Eastwood famously defined the transition: from Sergio Leone's *Man with No Name* (1964, 1965, 1966), to *Dirty Harry* (1971). As others have observed, the Western plot is typically an effort to contrive a situation where it is justifiable for a basically decent person to do things that in any other situation would be absolutely unjustifiable. Transposing that onto an urban

bureaucratic environment has disturbing implications: indeed, one might well argue that Jack Bauer is the logical culmination of the genre.

The overwhelming majority of those who end up getting beaten or otherwise brutalized by police turn out to be innocent of any crime. Cops don't beat up burglars. The reason is simple: the one thing most guaranteed to provoke a violent reaction from police is a challenge to their right to define the situation. That is, to say, 'No, this isn't a possible crime situation, this is a citizen-who-pays-your-salary-walking-his-dog situation, so shove off,' let alone the invariably disastrous, 'Wait, why are you handcuffing that guy? He didn't do anything!' It's talking back above all that inspires beat-downs, and that means challenging whatever administrative rubric—an orderly or a disorderly crowd?; a properly or improperly registered vehicle?—has been applied by the officer's discretionary judgment. The police truncheon is precisely the point where the state's bureaucratic imperative for imposing simple administrative schema and its monopoly on coercive force come together. It only makes sense then that bureaucratic violence should consist first and foremost of attacks on those who insist on alternative schemas or interpretations. At the same time, if one accepts Jean Piaget's famous definition of mature intelligence as the ability to coordinate between multiple perspectives, or possible perspectives, one can see, here, precisely how bureaucratic power, at the moment it turns to violence, becomes literally a form of infantile stupidity.

We're staring at something that's staring back, something that's inherently dangerous to a free society. I can no longer ignore what I've known all along—and have never wanted to admit: Too many of America's police are potentially state-sanctioned killers who know if they're called upon to answer for their crimes they'll likely be protected by prosecutors and judges.

The law is not always just, the courts are not always right. Under the law, before you can kill in self-defense you must retreat to the wall, the legal jargon meaning you must retreat to the point where retreat can no longer save you from your attacker. Only then can you kill in self-defense. That law applies to the police.

“I don't worry about the cops. I have nothing to hide.”

If one has been spawned in a fishbowl, how does one know the dangers of the river?

If the power of the police can't be properly monitored and controlled, if our ability to change the police culture is stuck in the dead goo of precedent, the result will produce a police state. That is my promise. Indeed, one may ask, have we become like a sleeping passenger on the bus, and when the bus

arrives at its destination and comes to a jerking stop, will we awaken and ask, 'Are we already here?'

It's one thing to read cold statistics that suggest something's awry. But statistics provide us no real understanding of human pain and helplessness, and they do little to move us toward reform. Thankfully, most Americans haven't had an abundance of firsthand experience with overly aggressive police. Most of us have never been the victim of a police baton across the side of the head, or a Glock 17 in the gut, or found our child dead in the street with six bullets through his body, or lay handcuffed watching our dog bleed out. Most of us have never faced the horror of pleading guilty to a crime we didn't commit to save ourselves from being convicted of a frightening list of added crimes we also didn't commit.

Until we become 'the subject' of a serious, life-threatening encounter with the police, we try to just get along, to raise our kids, love our grandkids, watch our favorite TV programs in the evening, take our deserved two weeks of vacation, and hope for a comfortable retirement and a merciful death. Then one day one of our own, even one of us, becomes the subject. We are arrested. We are thrown in jail, and if we cannot be bonded out we will be imprisoned for months, even years, awaiting trial. We will lose our identity as a member of society. We are provided a number underneath our mug shot, and our history will be forever besmirched by a criminal charge blaring out at the world from our police record. Innocent or not, we will most likely become another number in a penitentiary or a convicted murderer on death row. Such a transforming process puts me in mind of the hawk sitting in a treetop waiting for the sparrow to fly by. At the precise moment of the hawk's strike, the sparrow loses its identity as a fellow bird and becomes the prey. To the police, when we become the subject, we are no longer persons, and we'll be de-feathered, ripped apart, and disposed of in one way or another.

In too much of policing today, officer safety has become the highest priority. It trumps the rights and safety of suspects. It trumps the rights and safety of bystanders. It's so important, in fact, that an officer's subjective fear of a minor wound from a dog bite is enough to justify using potentially lethal force, in one case at the expense of a 4-year-old girl. Or when an Iowa cop shot and killed a woman by mistake while trying to kill her dog. Other cops have shot other kids, other bystanders, their partners, their supervisors, and even themselves while firing their guns at a dog. That mindset is then, of course, all the more problematic when it comes to using force against people.

The absurd cruelties of the American police state keep reaching newer heights. Consider that if you kill a police dog, you could face a longer prison

sentence than if you'd murdered someone or abused a child. If a cop kills your dog, however, there will be little to no consequences for that officer. Not even a slap on the wrist. In this, as in so many instances of official misconduct by government officials, the courts have ruled that the cops have qualified immunity, a legal doctrine that incentivizes government officials to engage in lawless behavior without fear of repercussions.

This is the heartless, heartbreaking, hypocritical injustice that passes for law and order in America today. It is estimated that a dog is shot by a police officer every 98 minutes. The Department of Justice estimates that at least 25 dogs are killed by police every day. The Puppicide Database Project estimates the number of dogs being killed by police to be closer to 500 dogs a day (which translates to 182,000 dogs a year). In one out of five cases involving police shooting a family pet, a child was either in the police line of fire or in the immediate area of a shooting. For instance, a 4-year-old girl was accidentally shot in the leg after a police officer opened fire on a dog running towards him, missed and hit the little girl instead.

At a time when police are increasingly inclined to shoot first and ask questions later, it doesn't take much to provoke a cop into opening fire on an unarmed person guilty of doing nothing more than standing a certain way, or moving a certain way, or holding something—anything—that police could misinterpret to be a weapon. All a cop has to do is cite an alleged "fear" for his safety. Even in the absence of an actual threat, the perception of a threat is enough for qualified immunity to kick in and for the cop to be let off the hook for behavior that would get the rest of us jailed for life.

The epidemic of cops shooting dogs takes this shameful behavior to a whole new level, though. It doesn't take much for a cop to shoot a dog. According to the Sixth Circuit Court of Appeals, all it takes for dogs to pose a sufficient threat to police to justify them opening fire is for the dog to move or bark. Dogs shot and killed by police have been "guilty" of nothing more menacing than wagging their tails, barking in greeting, or merely being in their own yard. For instance, Spike, a 70-pound pit bull, was shot by NYPD police when they encountered him in the hallway of an apartment building in the Bronx. Surveillance footage shows the dog, tail wagging, right before an officer shot him in the head at pointblank range.

Arzy, a 14-month-old Newfoundland, Labrador and golden retriever mix, was shot between the eyes by a Louisiana police officer. The dog had been secured on a four-foot leash at the time he was shot. An independent witness testified that the dog never gave the officer any provocation to shoot him.

Seven, a St. Bernard, was shot repeatedly by Connecticut police in the presence of the dog's 12-year-old owner. Police, investigating an erroneous tip, had entered the property—without a warrant—where the dog and her

owner had been playing in the backyard, causing the dog to give chase.

Dutchess, a 2-year-old rescue dog, was shot three times in the head by Florida police as she ran out her front door. The officer had been approaching the house to inform the residents that their car door was open when the dog bounded out to greet him.

Yanna, a 10-year-old boxer, was shot three times by Georgia police after they mistakenly entered the wrong home and opened fire, killing the dog, shooting the homeowner in the leg, and wounding an investigating officer.

Payton, a 7-year-old black Labrador retriever, and 4-year-old Chase, also a black Lab, were shot and killed after a SWAT team mistakenly raided the mayor's home while searching for drugs. Police shot Payton four times. Chase was shot twice, once from behind as he ran away. "My government blew through my doors and killed my dogs. They thought we were drug dealers, and we were treated as such. I don't think they really ever considered that we weren't," recalls Mayor Cheye Calvo, who described being handcuffed and interrogated for hours—wearing only underwear and socks—surrounded by the dogs' carcasses and pools of the dogs' blood.

In another instance, a Missouri SWAT team raided a family home, killing a 4-year-old pit bull Kiya. Believe it or not, this time the SWAT raid wasn't in pursuit of drugs, mistaken or otherwise, but was intended "to check if the home had electricity and natural gas service."

Size does not matter. There have been countless dog shootings in which a police officer said he felt threatened' and had no choice but to use lethal force, including the killing of a Dalmatian (more than once), a yellow Lab, a springer spaniel, a chocolate Lab, a boxer, an Australian cattle dog, a Wheaten terrier, an Akita, a Jack Russell terrier, a 12-pound miniature dachshund and a 5-pound chihuahua.

Chihuahuas, among the smallest breed of dog (known as "purse" dogs), seem to really push cops over the edge. In Arkansas, for example, a sheriff's deputy shot an "aggressive" chihuahua for barking repeatedly. The dog, Reese's, required surgery for a shattered jaw and a feeding tube to eat. Same thing happened in Texas, except Trixie—who was on the other side of a fence from the officer—didn't survive the shooting.

Let's put this in perspective, shall we? We're being asked to believe that a police officer, fully armed, trained in combat, and equipped to deal with the worst case scenario when it comes to violence, is so threatened by a yipping purse dog weighing less than ten pounds that the only recourse is to shoot the dog? If this is the temperament of police officers bred by the police state, we should all be worried.

Clearly, our four-legged friends are suffering at the hands of an inhumane police state in which the police have all the rights, the citizenry have very

few rights, and our pets—viewed by the courts as personal property like a car or a house, but far less valuable—have no rights at all. So what's to be done?

Essentially, it comes down to training and accountability. It's the difference between police officers who rank their personal safety above everyone else's and police officers who understand that their jobs are to serve and protect. It's the difference between police who are trained to shoot to kill and police trained to resolve situations peacefully. Most of all, it's the difference between police who believe the law is on their side and police who know that they will be held to account for their actions under the same law as everyone else.

Unfortunately, more and more police are being trained to view themselves as distinct from the citizenry, to view their authority as superior to the citizenry, and to view their lives as more precious than those of their citizen counterparts. Instead of being taught to see themselves as mediators and peacemakers whose lethal weapons are to be used as a last resort, they are being drilled into acting like gunmen with killer instincts who shoot to kill rather than merely incapacitate.

These dog killings are a side effect of the new SWAT, paramilitary focus in many police departments, which has supplanted the idea of being an officer of the peace. Thus, whether you're talking about police shooting dogs or citizens, the mindset is the same: a rush to violence, abuse of power, fear for officer safety, poor training in how to de-escalate a situation, and general carelessness. It's time to rein in this abuse of power.

A good place to start is by requiring police to undergo classes annually on how to peacefully resolve and de-escalate situations with the citizenry. While they're at it, they should be forced to de-militarize. No one outside the battlefield—and barring a foreign invasion, the US should never be considered a domestic battlefield—should be equipped with the kinds of weapons and gear being worn and used by local police forces today. If the politicians are serious about instituting far-reaching gun control measures, let them start by taking the guns and SWAT teams away from the countless civilian agencies that have nothing to do with military defense that are packing lethal heat.

Ultimately, this comes down to better—and constant—training in nonviolent tactics, serious consequences for those who engage in excessive force, and a seismic shift in how law enforcement agencies and the courts deal with those who transgress.

In terms of our four-legged friends, many states are adopting laws to make canine training mandatory for police officers. Officers' inclination to take command and take control can cause them to antagonize dogs unnecessarily.

Officers need to realize they're there to neutralize, not control. If they have enough money to militarize the police with Humvees, they have enough money to train them not to kill family members. And pets are considered family.

After all, while postal workers regularly encounter both vicious and gregarious dogs on their daily rounds letter carriers don't kill dogs, even though they are bitten by the thousands every year. Instead, the Postal Service offers its employees training on how to avoid bites. Using live dogs, handlers and trainers put postal workers through scenarios to teach them how to read a dog's behavior and calm a dog, or fend it off, if necessary. Meter readers also have benefited from the same training, drastically reducing incidents of dog bites.

Yet, there will be no end to the bloodshed—of unarmed Americans or their family pets—until police stop viewing themselves as superior to those whom they are supposed to serve and start acting like the peace officers they're supposed to be.

Consider a successful policing initiative in Newark, New Jersey. Cops who walked the beat there, according to the program, were supposed to be highly tolerant. Their job was to adjust to the neighborhood's own standards of order and to help uphold them. Standards varied from one part of the city to another. In one neighborhood, it might mean that drunks had to keep their bottles in bags and avoid major streets but that side streets were okay. Addicts could sit on stoops but not lie down. The idea was only to make sure the standards didn't fall. The cops, in this scheme, were helping a neighborhood maintain its own order but not imposing their own.

“From early 2000 to late 2002, I was working with the New York Direct Action Network—the principal group responsible for organizing mass actions as part of the global justice movement in New York City at that time. I call it a ‘group,’ but technically DAN was not a group at all but a decentralized network, operating on principles of direct democracy according to an elaborate, but quite effective, form of consensus process. It played a central role in ongoing efforts to create new organizational forms. DAN existed in a purely political space. It had no concrete resources—not even a significant treasury—to administer. Then one day someone gave DAN a car.

The DAN car caused a minor, but ongoing, crisis. We soon discovered that, legally, it is impossible for a decentralized network to own a car. Cars can be owned by individuals, or they can be owned by corporations (which are fictive individuals),

or by governments. But they cannot be owned by networks. Unless we were willing to incorporate ourselves as a nonprofit corporation (which would have required a complete reorganization and an abandonment of most of our egalitarian principles) the only expedient was to find a volunteer willing to claim to be the legal owner. But then that person was held responsible for all outstanding fines and insurance fees, and had to provide written permission to allow anyone else to drive the car out of state. And, of course, only he could retrieve the car if it were impounded. One courageous activist did agree to undertake the responsibility, but as a result, weekly meetings were overwhelmed by reportbacks about his latest legal problems. Before long the DAN car had become such an endless source of tribulation that we decided to organize a fundraiser, throwing a big party where we provided a sledgehammer to anyone willing to pay five dollars to take a whack at the thing.”

It struck me there was something profound to this story. Why is it that projects like DAN’s—projects aimed at democratizing society—are so often perceived as idle dreams that melt away as soon as they encounter hard material reality? In DAN’s case, at least, it had nothing to do with inefficiency: police chiefs across the country had called them the best organized force they’d ever had to deal with. It seems to me that the reality effect (if one may call it that) comes rather from the fact that radical projects tend to founder—or at least become endlessly difficult—the moment they enter into the world of large, heavy objects: buildings, cars, tractors, boats, industrial machinery. This in turn is not because these objects are somehow intrinsically difficult to administer democratically—history is full of communities that successfully engage in the democratic administration of common resources—it’s because, like the DAN car, they are surrounded by endless government regulation, and are effectively impossible to hide from the government’s armed representatives.

In America, I have seen endless examples of this dilemma. A squat is legalized after a long struggle; suddenly, building inspectors arrive to announce it will take ten-thousand dollars’ worth of repairs to bring it up to code. Organizers are therefore forced to spend the next several years organizing bake sales and soliciting contributions. This means setting up bank accounts, which means, in turn, adhering to legal regulations that specify how any group receiving funds, or dealing with the government, must be organized (again, not as an egalitarian collective). All these regulations are enforced by violence. True, in ordinary life, police rarely come in swinging

billy clubs to enforce building code regulations, but, as anarchists are often uniquely positioned to find out, if one simply pretends the state and its regulations don't exist, this will, eventually, happen. The rarity with which the nightsticks actually appear just helps to make the violence harder to see. This in turn makes the effects of all these regulations—regulations that almost always assume that normal relations between individuals are mediated by the market, and that normal groups are organized internally by relations of hierarchy and command—seem to emanate not from the government's monopoly of the use of force, but from the largeness, solidity, and heaviness of the objects themselves.

When one is asked to be “realistic,” then, the reality one is normally being asked to recognize is not one of natural, material facts, nor some supposed ugly truth about human nature. Being realistic usually means taking seriously the effects of the systematic threat of violence. When one says ‘let's be realistic here,’ what reality is it we're referring to? What is the hidden reality, the underlying forces, assumed to be moving below the surface of political events?

I have remained committed to the idea that the ultimate, hidden truth of the world is that it is something that we make, and could just as easily make differently. In this sense, a phrase like “all power to the imagination” expresses the very quintessence of the Left. From a left perspective, then, the hidden reality of human life is the fact that the world doesn't just happen. It isn't a natural fact, even though we tend to treat it as if it is—it exists because we all collectively produce it. We imagine things we'd like and then we bring them into being. But the moment you think about it in these terms, it's obvious that something has gone terribly wrong. Since who, if they could simply imagine any world that they liked and then bring it into being, would create a world like this one?

Even the rich and powerful will ordinarily concede that the world is a miserable place for most of those who live in it, but still, insist that this is inevitable, or that any attempt to change it will make it worse—not that we actually live in an ideal social order.

Capitalism is not something imposed on us by some outside force. It only exists because every day we wake up and continue to produce it. If we woke up one morning and all collectively decided to produce something else, then we wouldn't have capitalism anymore. This is the ultimate revolutionary question: what are the conditions that would have to exist to enable us to do this—to just wake up and imagine and produce something else?

In the sphere of industry, it is generally those on top that relegate to themselves the more imaginative tasks (i.e. they design the products and organize production), whereas when inequalities emerge in the sphere of

social production, it is those on the bottom who end up expected to do the major imaginative work—notably, the bulk of what I’ve called the ‘labor of interpretation’ that keeps life running.

No doubt all this makes it easier to see the two as fundamentally different sorts of activity, making it hard for us to recognize interpretive labor—for example, most of what we usually think of as women’s work—as labor at all. To my mind it would probably be better to recognize it as the primary form of labor. Insofar as a clear distinction can be made here, it’s the care, energy, and labor directed at human beings that should be considered fundamental. The things we care about most—our loves, passions, rivalries, obsessions—are always other people, and in most societies that are not capitalist, it’s taken for granted that the manufacture of material goods is a subordinate moment in a larger process of fashioning people. In fact, I would argue that one of the most alienating aspects of capitalism is the fact that it forces us to pretend that it is the other way around, and that societies exist primarily to increase their output of things.

Thesis: There appears to have been a profound shift, beginning in the 1970s, from investment in technologies associated with the possibility of alternative futures to investment in technologies that furthered labor discipline and social control.

The Cold War saw frenetic efforts by US industrial planners to find ways to apply existing technologies to consumer purposes, to create an optimistic sense of burgeoning prosperity and guaranteed progress that, it was hoped, would undercut the appeal of radical working-class politics. The famous 1959 “kitchen debate” between Richard Nixon and Nikita Khrushchev made the politics quite explicit: “Your communist ‘worker’s state’ may have beat us into outer space,” Nixon effectively argued, “but it’s capitalism that creates technology like washing machines that actually improve the lives of the toiling masses.”

Whether the space race or consumer products, in either case, the initiative really came from the Soviet Union itself. All this is difficult for Americans to remember, because with the end of the Cold War, the popular image of the USSR switched so quickly from terrifying rival to pathetic basket case—the exemplar of a society that “just didn’t work.”

Back in the fifties, many US planners were laboring under the suspicion that the Soviet system quite possibly worked much better than their own. Certainly, they keenly recalled the fact that in the 1930s, while the United States was mired in depression, the Soviet Union was maintaining almost unprecedented economic growth rates of 10 to 12 percent a year,

an achievement quickly followed by the production of the vast tank armies that defeated Hitler—another fact difficult for Americans to remember—and of course, the launching of Sputnik in 1957, followed by the first manned spacecraft, the Vostok, in 1961. When Khrushchev assured Nixon that Soviet living standards would surpass those of the Americans in seven years, many Americans feared he might actually be right.

It's often said that the Apollo moon landing was the greatest historical achievement of Soviet communism. Surely, the United States would never have contemplated such a feat had it not been for the cosmic ambitions of the Soviet Politburo. Even putting things this way is a bit startling. Cosmic ambitions? We are used to thinking of the Politburo as a group of unimaginative grey bureaucrats, but while the Soviet Union was certainly run by bureaucrats, they were, from the beginning, bureaucrats who dared to dream astounding dreams—the dream of world revolution was just the first. Of course, most of their grandiose projects—changing the course of mighty rivers, that sort of thing—either turned out to be ecologically and socially disastrous, or, like Stalin's projected one-hundred-story Palace of the Soviets, which was to be topped by a twenty-story statue of Lenin, never got off the ground. And after the initial successes of the Soviet space program, most projects remained on the drawing board.

But the Soviet leadership never ceased coming up with new ones. Even in the eighties, when the United States was attempting its own last—itsself abortive—grandiose scheme, Star Wars, the Soviets were still planning and scheming ways to transform the world through creative uses of technology. Few outside of Russia now remember most of these projects, but vast resources were devoted to them. It's also worth noting that unlike the Star Wars project, which was a purely military project designed to sink the Soviet Union, most were peaceful: as for instance, the attempt to solve the world hunger problem by harvesting lakes and oceans with an edible bacteria called spirulina, or to solve world energy problems by a truly breathtaking plan to launch hundreds of gigantic solar power platforms into orbit and beaming the resulting electricity back to earth.

By the time of the moon landing of 1968, US planners no longer took their competition seriously. The Soviets had lost the space race, and as a result, the actual direction of American research and development could shift away from anything that might lead to the creation of Mars bases and robot factories, let alone become the technological basis for a communist utopia. The standard line, of course, is that this shift of priorities was simply the natural result of the triumph of the market. The Apollo program was the quintessential Big Government project—Soviet-inspired in the sense that it required a vast national effort, coordinated by an equally vast government

bureaucracy. As soon as the Soviet threat was safely out of the picture, this story goes, capitalism was free to revert to lines of technological development more in accord with its normal, decentralized, free-market imperatives—such as privately funded research into marketable products like touch-pad phones, adventurous little start-ups, and the like. This is, certainly, the line that many began taking in the late-seventies and early-eighties. But it's obviously wrong.

First of all, the amount of really innovative research being done in the private sector has actually declined since the heyday of Bell Labs and similar corporate research divisions in the fifties and sixties. Partly this is because of a change of tax regimes. The phone company was willing to invest so much of its profits in research because those profits were highly taxed—given the choice between sinking the money into higher wages for its workers (which bought loyalty) and research (which made sense to a company that was still locked in the old mind-set that said corporations were ultimately about making things, rather than making money), and having that same money simply appropriated by the government, the choice was obvious. After the financial reforms in the seventies and eighties all this changed. Corporate taxes were slashed. Executives, whose compensation now increasingly took the form of stock options, began not just paying the profits to investors in dividends, but using money that would otherwise be directed towards raises, hiring, or research budgets on stock buybacks, raising the values of the executives' portfolios but doing nothing to further productivity. In other words, tax cuts and financial reforms had almost precisely the opposite effect as their proponents claimed they would.

Antithesis: Yet even those areas of science and technology that did receive massive funding have not seen the breakthroughs originally anticipated.

As one physicist has recently warned students pondering a career in the sciences, even when one does emerge from the usual decade-long period languishing as someone else's flunky, one can expect one's best ideas to be stymied at every point.

“You will spend your time writing proposals rather than doing research. Worse, because your proposals are judged by your competitors you cannot follow your curiosity, but must spend your effort and talents on anticipating and deflecting criticism rather than on solving the important scientific problems.”

It is proverbial that original ideas are the kiss of death for a proposal; because they have not yet been proved to work.

Common sense dictates that if you want to maximize scientific creativity, you find some bright people, give them the resources they need to pursue whatever idea comes into their heads, and then leave them alone for a while. Most will probably turn up nothing, but one or two may well discover something completely unexpected. If you want to minimize the possibility of unexpected breakthroughs, tell those same people they will receive no resources at all unless they spend the bulk of their time competing against each other to convince you they already know what they are going to discover.

It is true that certain capitalist firms of the Silicon Valley sort—the ones that consider themselves cutting-edge—will adopt some version of the old Bell Labs blue sky approach and make sure everyone knows that they are doing so. But these efforts always prove, on investigation, to be largely publicity stunts. In Silicon Valley-style firms, innovation is largely outsourced to start-ups. At present, the most promising research is generally conducted neither in corporate nor in directly government-funded environments but in the nonprofit sector (which includes most universities), but here too, the corporatization of institutional culture ensures more and more time is taken up with grantsmanship.

“Convivial competition is where I (or my team) wish to be the first to prove a particular conjecture, to explain a particular phenomenon, to discover a particular species, star, or particle, in the same way that if I race my bike against my friend I wish to win. But convivial competition does not exclude cooperation, in that rival researchers (or research teams) will share preliminary results, experience of techniques, and so on. Of course, the shared knowledge, accessible through books, articles, computer software and directly, through dialogue with other scientists, forms an intellectual commons.”

Most people who work in corporations or academia have witnessed something like the following: A number of engineers are sitting together in a room, bouncing ideas off each other. Out of the discussion emerges a new concept that seems promising. Then some laptop-wielding person in the corner, having performed a quick Google search, announces that this new idea is, in fact, an old one; it—or at least vaguely similar—has already been tried. Either it failed, or it succeeded. If it failed, then no manager who wants to keep his or her job will approve spending money trying to revive it. If it succeeded, then it’s patented and entry to the market is presumed to be unattainable, since the first people who thought of it will

have “first-mover advantage” and will have created “barriers to entry.” The number of seemingly promising ideas that have been crushed in this way must number in the millions.

A timid, bureaucratic spirit has come to suffuse every aspect of intellectual life. More often than not, it comes cloaked in a language of creativity, initiative, and entrepreneurialism. But the language is meaningless. The sort of thinkers most likely to come up with new conceptual breakthroughs are the least likely to receive funding, and if, somehow, breakthroughs nonetheless occur, they will almost certainly never find anyone willing to follow up on the most daring implications.

Defenders of capitalism generally make three broad historical claims: first, that it has fostered rapid scientific and technological development; second, that however much it may throw enormous wealth to a small minority, it does so in such a way that increases overall prosperity for everyone; third, that in doing so, it creates a more secure and democratic world. It is quite clear that in the twenty-first century, capitalism is not doing any of these things. In fact, even its proponents are increasingly retreating from any claim that it is a particularly good system, falling back instead on the claim that it is the only possible system—or at least, the only possible system for a complex, technologically sophisticated society such as our own.

Bureaucracy enchants when it can be seen as a species of poetic technology, that is, one where mechanical forms of organization, usually military in their ultimate inspiration, can be marshaled to the realization of impossible visions: to create cities out of nothing, scale the heavens, make the desert bloom. For most of human history this kind of power was only available to the rulers of empires or commanders of conquering armies, so we might even speak here of a democratization of despotism. Once, the privilege of waving one’s hand and having a vast invisible army of cogs and wheels organize themselves in such a way as to bring your whims into being was available only to the very most privileged few; in the modern world, it can be subdivided into millions of tiny portions and made available to everyone able to write a letter, flick a switch, or tap an app.

The simplest explanation for the appeal of bureaucratic procedures lies in their impersonality. Cold, impersonal, bureaucratic relations are much like cash transactions, and both offer similar advantages and disadvantages. On the one hand they are soulless. On the other, they are simple, predictable, and—within certain parameters, at least—treat everyone more or less the same. And anyway, who really wants to live in a world where everything is soul? Bureaucracy holds out at least the possibility of dealing with other human beings in ways that do not demand either party has to engage in all those complex and exhausting forms of interpretive labor, where just as you

can simply place your money on the counter and not have to worry about what the cashier thinks of how you're dressed, you can also pull out your validated photo ID card without having to explain to the librarian why you are so keen to read about homoerotic themes in eighteenth century British verse. Surely this is part of the appeal.

In fact, if one really ponders the matter, it's hard to imagine how, even if we do achieve some utopian communal society, some impersonal—dare I say, bureaucratic?—institutions would not still be necessary, and for just this reason. To take one obvious example: languishing on some impersonal lottery system or waiting list for a desperately needed organ transplant might be alienating and distressing, but it's difficult to envision any less impersonal way of allocating a limited pool of hearts or kidneys that would not be immeasurably worse. But we probably shouldn't let rich fucks like Dick Cheney who can hop a plane at a moments notice be on multiple lists around the country.

There is no consensus amongst philosophers about what the word 'rationality' even means. According to one tradition, for instance, rationality is the application of logic, of pure thought untempered by emotions; this pure, objective thought is then seen as the basis of scientific inquiry. This has attained a great deal of popular purchase, but there's a fundamental problem: scientific inquiry itself has proved it cannot possibly be true. Cognitive psychologists have demonstrated again and again that there is no such thing as pure thought divorced from emotions; a human being without emotions would not be able to think at all.

Others prefer a more pragmatic approach, claiming merely that a rational argument can be defined as one that is both grounded in empirical reality, and logically coherent in form. The problem here is that these two criteria don't really have much to do with one another. One is about observation; the other is about reasoning. What do they have in common? Mainly, it seems, that when someone makes an argument that is either delusional or incoherent, we are equally likely to write that person off as not right in the head. On one level, that's fair enough: we do call crazy people 'irrational.' But if so, calling someone, or an argument, 'rational' is saying almost nothing. It's a very weak statement. You're just saying they are not obviously insane.

But the moment you turn it around, you realize that claiming one's own political positions are based on rationality is an extremely strong statement. In fact, it's extraordinarily arrogant, since it means that those who disagree with those positions are not just wrong, but crazy. Similarly, to say one wishes to create a rational social order implies that current social arrangements might as well have been designed by the inhabitants of a

lunatic asylum. Now, surely, all of us have felt this way at one time or another. But if nothing else, it is an extraordinarily intolerant position, since it implies that one's opponents are not just wrong, but in a certain sense, wouldn't even know what it would mean to be right, unless, by some miracle, they could come around and accept the light of reason and decide to accept your own conceptual framework and point of view.

We are used to speaking of 'the state' as a single entity but actually, I think, modern states are better seen as the confluence of three different elements, whose historical origins are quite distinct, have no intrinsic relation with one another, and may already be in the process of finally drifting apart. I will call these sovereignty, administration, and politics.

Sovereignty is usually taken to be the defining feature of the state: a sovereign state is one whose ruler claims a monopoly over the legitimate use of violence within a given territory. Most governments in the ancient world, or for that matter the Middle Ages, never claimed sovereignty in this sense. Nor would it have occurred to them to do so: this was the logic of conquering empires, not of any sort of civilized community.

The second principle is administration, which can and often does exist without any single center of power to enforce its decisions. It could also, of course, simply be referred to as bureaucracy. In fact, the most recent archaeological evidence from Mesopotamia indicates that bureaucratic techniques emerged not just before sovereign states, but even before the existence of the first cities. They were not invented to manage scale, as ways of organizing societies that became too big for face-to-face interaction. Rather, they seem to have been what encouraged people to assemble in such large communities to begin with. At least, this is what the record seems to show. The standardization of products, storage, certification, record-keeping, redistribution, and accounting all seem to have emerged in small towns along the Tigris and Euphrates and its tributaries in the fifth millennium BC, a thousand years before the urban revolution. We don't really know how or why; we don't even know whether there were actual bureaucrats (in the sense of a distinct class of trained officeholders) or whether we are simply talking about the emergence of bureaucratic techniques. But by the time historical records do kick in there certainly are: we find vast temple and palace complexes with a hierarchy of trained scribes carefully registering and allocating resources of every sort.

We can refer to the third principle as politics if one takes that word in what might be termed its maximal sense. Obviously, there is a minimal sense in which anything people do can be said to have a political aspect, insofar it involves jockeying for power. But there are only some social systems in which politics in this sense becomes a spectator sport in its own right, where

powerful figures engage in constant public contests with one another as a way of rallying followers and gathering support. We now think of this as an aspect of democratic systems of government, but for most of human history, it was seen as more of an aristocratic phenomenon. One need only think of the heroes of Homeric, or for that matter Germanic or Celtic or Hindu epics, who are constantly engaged in boasting, dueling, vying to organize the most splendid feasts or most magnificent sacrifices, or to outdo one another with the giving of extravagant gifts.

Such “heroic” social orders, as they’ve been called, represent the quintessence of the political. They recognize no principle of sovereignty, but create no system of administration either; sometimes there is a high king but usually he has very limited power, or is a pure figurehead; real power fluctuates continually as charismatic aristocrats assemble bands of followers, the most successful poaching off their rivals’ retinues, while others crash magnificently, or decline into brooding obscurity. Politics in this sense has always been an essentially aristocratic phenomenon.

Heroic societies are, effectively, social orders designed to generate stories. This takes us back to questions about the very nature of politics. One might well argue that political action—and this is true even on the micro-level—is a matter of acting in a way that will influence other people at least partially by their hearing or finding out about it. Everyday politics—whether in a rural village or corporate office—has everything to do with the manufacture of official narratives, rumors, and accounts. It stands to reason that heroic societies, which turned political self-aggrandizement into an art form, would also have been organized in such a way as to become vast engines for the generation of stories. Everything was turned into a platform for some sort of contest, some narrative of perseverance, treachery, revenge, impossible challenges, epic quests, or magnificent acts of self-sacrifice. This is why poets were so important. The whole point of life was to do things that other people might wish to sing about. Even from the beginning, the inhabitants of bureaucratic societies like Egypt or Babylonia could not avoid developing a certain fascination with the barbarian hinterlands, which quickly became murky lands full of monsters and strange magical powers. And of course, dramatic stories about violent barbarians became even more compelling in ages when actual violent barbarians were no longer much around.

Historically, one of the most effective ways for a system of authority to tout its virtues is not to speak of them directly, but to create a particularly vivid image of their absolute negation—of what it claims life would be like in the total absence of, say, patriarchal authority, or capitalism, or the state. As an ideological ploy, the trick works best when the image is on some level, profoundly appealing. One is first drawn in to the vision of the alternative

world, experiences a kind of vicarious thrill imagining it—only to ultimately recoil in horror at the implications of one’s own desires.

Roman games provide an excellent example. Until the coming of the empire, most Mediterranean cities had had some form of self-governance, with public assemblies debating matters of public concern. In democracies, even legal cases were tried by public juries consisting of hundreds of citizens. Under the Empire, of course, these were stripped of all authority, and eventually disappeared. Instead, the main occasion when large numbers of citizens assembled in public was at the Coliseum or the Circus, for chariot races or gladiatorial games, or to watch criminals be torn to pieces by wild animals. Insofar as those citizens had any experience of voting for anything, it was to put their thumbs up or down over the question of whether some defeated gladiator would be put to death. In other words, the Empire not only justified itself largely by imposing a uniform system of law over its subjects, it also made a point of encouraging those subjects to form organized lynch mobs (the games were often sponsored by the very magistrates who presided over the courts), as if to say, ‘Democracy? Now you know where that will lead.’

This was so effective that for the next two-thousand years, warnings about the perils of democracy—and almost all educated Europeans for most of this period were staunchly opposed to democracy—insisted that “the people” in such a system would inevitably end up behaving like the mob at the Roman circus: riven by violent factionalism, careening irrationally between extremes of mercy and cruelty, between blindly following charismatic idols and destroying them again. And to this day, almost all educated people still feel that, even if they are willing to grudgingly accept a few democratic elements in some aspects of society, they need to be kept entirely separate from the administration of justice and the law.

Some argue that freedom in the classic liberal tradition is not a matter of being able to act without the interference of power, or even threats of violence—since legal systems do threaten those who break the rules with violence—but rather, to act without the interference of arbitrary power. This is not the place to launch into a detailed analysis but the entire formulation thus comes to present a zero-sum view of freedom. ‘Arbitrary’ after all just means “non-determined.” In a system of arbitrary authority, decisions reflect the “will and pleasure” of the despot. But from the perspective of the despot, arbitrariness is freedom. So the people are free if the ruler is not. Powerful people have to follow the rules. But since all citizens have a certain degree of power, so does everyone else. Ultimately, since freedom means protection from the arbitrary (non-rule-bound) power of others, and since power is everywhere, the logic provides a charter for the reduction of

all aspects of human life into sets of transparent rules.

The university is in its own way the quintessential feudal institution, with an endless accretion of customs and traditions, and anthropology, though a relatively new department, had its own traditional ways of going about everything that no one could entirely articulate; indeed, that no one completely understood. But in order to become “transparent” to the administration, they had to start articulating them; in practice, what this meant was that they had to take what had always been a subtle, nuanced form of procedures and turn them into an explicit set of rules. In effect, they had to turn custom into a kind of board game.

Faced with such demands, everyone’s first impulse was just to say, ‘Well, sure, we’ll just write that for the authorities and proceed as we always have.’ But in practice this quickly becomes impossible, because the moment any conflicts crop up, both parties will automatically appeal to the rule-book. Such reforms may aim to eliminate arbitrary personal authority, but of course they never actually do. Personal authority just jumps up a level, and becomes the ability to set the rules aside in specific cases—a sort of miniature version of sovereign power again. However, in practice, the fact that the reforms do not in any sense achieve their stated goals doesn’t have the effect of undermining their legitimacy. Instead, the effect is quite the opposite, since anyone who objects to such personalized power can only do so by demanding even more rules and even more transparency. Suddenly, freedom and justice really do become a matter of reducing everything to a game.

If we think about it, this sort of thing happens all the time—and even in contexts that have nothing to do with arbitrary personal authority. The most obvious example is language. Call it the grammar-book effect. People do not invent languages by writing grammars, they write grammars—at least, the first grammars to be written for any given language—by observing the tacit, largely unconscious, rules that people seem to be applying when they speak. Yet once a book exists, and especially once it is employed in schoolrooms, people feel that the rules are not just descriptions of how people do talk, but prescriptions for how they should talk.

It’s easy to observe this phenomenon in places where grammars were only written recently. In many places in the world, the first grammars and dictionaries were created by Christian missionaries in the nineteenth or even twentieth century, intent on translating the Bible and other sacred texts into what had been unwritten languages. For instance, the first grammar for Malagasy, the language spoken in Madagascar, was written in the 1810s and 1820s. Of course, language is changing all the time, so the Malagasy spoken language—even its grammar—is in many ways quite different than

it was two-hundred years ago. However, since everyone learns the grammar in school, if you point this out, people will automatically say that speakers nowadays are simply making mistakes, not following the rules correctly. It never seems to occur to anyone—until you point it out—that had the missionaries come and written their books two-hundred years later, current usages would be considered the only correct ones, and anyone speaking as they had two-hundred years ago would themselves be assumed to be in error.

Laws emerge from illegal activity. This creates a fundamental incoherence in the very idea of modern government, which assumes that the state has a monopoly of the legitimate use of violence—only the police, or prison guards, or duly authorized private security, have the legal right to beat you up. It's legitimate for the police to use violence because they are enforcing the law; the law is legitimate because it's rooted in the constitution; the constitution is legitimate because it comes from the people; the people created the constitution by acts of illegal violence. The obvious question, then: How does one tell the difference between 'the people' and a mere rampaging mob? There is no obvious answer.

The response by mainstream, respectable opinion is to try to push the problem as far away as possible. The usual line is: the age of revolutions is over (except perhaps in benighted spots like Gabon, Syria, Venezuela, Hong Kong); we can now change the constitution, or legal standards, by legal means. This of course means that the basic structures will never change. We can witness the results in the United States, which continues to maintain an architecture of state, with its electoral college and two-party system, that, while quite progressive in 1789, now makes us appear, in the eyes of the rest of the world, the political equivalent of the Amish, still driving around with horses and buggies. It also means we base the legitimacy of the whole system on the consent of the people despite the fact that the only people who were ever really consulted on the matter lived over two-hundred years ago. In America, at least, "the people" are all long since dead.

We've gone then from a situation where the power to create a legal order derives from God, to one where it derives from armed revolution, to one where it is rooted in sheer tradition—"these are the customs of our ancestors, who are we to doubt their wisdom?" And of course a not insignificant number of American politicians make clear they'd really like to give it back to God again.

This, as I say, is how these matters are considered by the mainstream. For the radical Left, and the authoritarian Right, the problem of constituent power is very much alive, but each takes a diametrically opposite approach to the fundamental question of violence. The Left, chastened by the disasters of the twentieth century, has largely moved away from its older celebration of

revolutionary violence, preferring nonviolent forms of resistance. Those who act in the name of something higher than the law can do so precisely because they don't act like a rampaging mob. For the Right, on the other hand—and this has been true since the rise of fascism in the twenties—the very idea that there is something special about revolutionary violence, anything that makes it different from mere criminal violence, is so much self-righteous twaddle. Violence is violence.

But that doesn't mean a rampaging mob can't be 'the people' because violence is the real source of law and political order anyway. Any successful deployment of violence is, in its own way, a form of constituent power. This is why we cannot help but admire the great criminal, because, as so many movie posters over the years have put it, "he makes his own law." After all, any criminal organization does, inevitably, begin developing its own—often quite elaborate—set of internal rules and regulations. They have to, as a way of controlling what would otherwise be completely random violence. But from the right-wing perspective, that's all that law ever is. It is a means of controlling the very violence that brings it into being, and through which it is ultimately enforced. This makes it easier to understand the often otherwise surprising affinity between criminals, criminal gangs, right-wing political movements, and the armed representatives of the state. Ultimately, they all speak the same language. They create their own rules on the basis of force. As a result, such people typically share the same broad political sensibilities. Mussolini might have wiped out the mafia, but Italian Mafiosi still idolize Mussolini.

In Athens, nowadays, there's active collaboration between the crime bosses in poor immigrant neighborhoods, fascist gangs, and the police. In fact, in this case it was clearly a political strategy: faced with the prospect of popular uprisings against a right-wing government, the police first withdrew protection from neighborhoods near the immigrant gangs, then started giving tacit support to the fascists; the result was the rapid rise of an overtly Nazi party. Roughly half of Greek police were reported to have voted for the Nazis in the last election. But this is just how far-right politics work. For them, it is in that space where different violent forces operating outside of the legal order (or in the case of the police, sometimes just barely inside it) interact where new forms of power, hence order, can emerge.

This is exactly the space that superheroes, and supervillains, also inhabit. An inherently fascist space, inhabited only by gangsters, would-be dictators, police, and thugs, with endlessly blurring lines between them. Sometimes the cops are legalistic, sometimes corrupt. Sometimes the police themselves slip into vigilantism. Sometimes they persecute the superhero, at others they look the other way, or help. Villains and heroes occasionally team up.

The lines of force are always shifting. If anything new were to emerge, it could only be through such shifting forces. There's nothing else, since in the DC and Marvel universes, God, or The People, simply doesn't exist. Insofar as there is a potential for constituent power then, it can only come from purveyors of violence.

And indeed, the supervillains and evil masterminds, when they are not merely dreaming of committing the perfect crime or indulging in random acts of terror, are always scheming of imposing a New World Order of some kind or another. Surely, if Red Skull, Kang the Conqueror, or Doctor Doom ever did succeed in taking over the planet, a host of new laws would be created very quickly. They wouldn't be very nice laws. Their creator would doubtless not himself feel bound by them. But one gets the feeling that otherwise, they would be quite strictly enforced.

Superheroes resist this logic. They do not wish to conquer the world—if only because they are not monomaniacal or insane. As a result, they remain parasitical off the villains in the same way that police remain parasitical off criminals: without them, they would have no reason to exist. They remain defenders of a legal and political order which itself seems to have come out of nowhere, and which, however faulty or degraded, must be defended, because the only alternative is so much worse. They aren't fascists. They are just ordinary, decent, super-powerful people who inhabit a world in which fascism is the only political possibility.

I note in passing that my analysis here is of mainstream comic book fiction, especially in the first several decades. Many may critique this for not taking consideration of the most sophisticated examples of the literature: Frank Knight's Batman, the Watchmen series, V for Vendetta, and other more explicitly political comic plots. And even mainstream comics have become more explicitly political over time—Lex Luthor, for example, became President! Still, if one wants to understand the essence of a popular genre, one does not examine its most sophisticated, high-culture variants. If one wants to understand the essence of a popular genre, one looks at schlock.

The greatest crimes of human history are made possible by the most colorless human beings. They are the careerists. The bureaucrats. The cynics. They do the little chores that make vast, complicated systems of exploitation and death a reality. They collect and read the personal data gathered on tens of millions of us by the security and surveillance state. They keep the accounts of ExxonMobil, BP, and Goldman Sachs. They build or pilot aerial drones. They work in corporate advertising and public relations. They issue the forms. They process the papers. They deny food stamps to some and unemployment benefits or medical coverage to others. They enforce the laws and the regulations. And they do not ask questions.

Good. Evil. These words do not mean anything to them. They are beyond morality. They are there to make corporate systems function. If insurance companies abandon tens of millions of sick to suffer and die, so be it. If banks and sheriff departments toss families out of their homes, so be it. If financial firms rob citizens of their savings, so be it. If the government shuts down schools and libraries, so be it. If the military murders children in Pakistan or Afghanistan, so be it. If commodity speculators drive up the cost of rice and corn and wheat so that they are unaffordable for hundreds of millions of poor across the planet, so be it. If Congress and the courts strip citizens of basic civil liberties, so be it. If the fossil fuel industry turns the earth into a broiler of greenhouse gases that doom us, so be it. They serve the system. The god of profit and exploitation. The most dangerous force in the industrialized world does not come from those who wield radical creeds, whether Islamic radicalism or Christian fundamentalism, but from legions of faceless bureaucrats who claw their way up layered corporate and governmental machines. They serve any system that meets their pathetic quota of needs.

Chapter Sixteen

Big Brother is Watching

Being in public doesn't mean consent to be recorded and tracked and to have all your actions collated and published and commented on. It has never meant that before. It certainly didn't mean that 50 years ago. Technology couldn't do it, and anyone trying to do it manually would have been arrested for stalking you. Just because technology can now do it to everyone at once doesn't make it somehow ok now.

What's your ideal future hold? Chinese social credit scores. That's dystopian. You think that's freedom?

For the first time ever, it will become technologically and financially feasible for authoritarian governments to record nearly everything that is said or done within their borders—every phone conversation, electronic message, social media interaction, the movements of nearly every person and vehicle, and video from every street corner.

Democracy requires accountability and consent of the governed, which is only possible if citizens know what is being done in their name. The presumption is that, with rare exception, they will know everything their political officials are doing, which is why they are called public servants, working in the public sector, in public service, for public agencies. Conversely, the presumption is that the government, with rare exception, will not know anything that law-abiding citizens are doing. That is why we are called private individuals, functioning in our private capacity. Transparency is for those who carry out public duties and exercise public power. Privacy is for everyone else.

It is not that I have something to hide, but nothing I want you to see.

The Fourth Amendment is a bedrock principle for law enforcement officers in the United States. However, technology has enabled the exploitation of loopholes in the interpretation of the Fourth Amendment. Some of the most important loopholes are:

Public Space: The Fourth Amendment protects only “persons, houses, papers and effects.” The Supreme Court has interpreted this language to mean that individuals have no reasonable expectation of privacy

in public. However, technology has reduced the protective confines of private space by enabling surveillance of computer use in one's own home and drones that fly over backyards.

Third-Party Doctrine: The Supreme Court has established the “Third-Party Doctrine,” which states that individuals do not have a reasonable expectation of privacy in information they give to third parties—such as their bank or their phone company. As a result, even sensitive information that is stored with third parties, such as e-mail, can often be obtained without a search warrant.

Metadata: Metadata is data about data—for example, the envelope containing a letter can be considered metadata; the data is the letter itself. The court has traditionally set lower legal standards for searches of metadata than for searches of data. For instance, the post office can take a photograph of the envelope of your letter without a warrant, but it cannot open the letter without a warrant. In the digital era, metadata can reveal a lot, such as all the phone numbers you call, the people you e-mail, and your location. A cell phone emits an electronic pulse every few seconds to the nearest cell phone tower or wifi router, even when not in use. In these pulses are the model of phone, its OS, the location of the phone, and its user.

Border Searches: Courts have largely supported a “border search exception” to the Fourth Amendment, which allows government to conduct searches at the border without obtaining a search warrant. In today's electronic age, that means that agents can—and often do—download the entire contents of an individual's phone or computer at the border. US Customs and Border Patrol says that it conducts about fifteen electronic media searches per day. In March 2013 the US Court of Appeals for the Ninth Circuit in California set a new limit on device searches at the border, ruling in *United States v. Cotterman* that reasonable suspicion of criminal activity was required for a forensic search of a device—such as using software to analyze encrypted or deleted data, as opposed to performing a more cursory look at documents, photos, or other files.

In the digital age, these loopholes have become large enough to allow for the type of suspicion-less searches that outraged the Founding Fathers.

LAPD surveillance missions often occur at heights of ten-thousand feet or more, making those helicopters invisible to the naked eye, even while they meticulously track a single car or pedestrian for hours at a time.

An Orlando, Florida, company called L-3 CyTerra has developed a “stepped frequency continuous wave” handheld radar system called the RANGE-R. This device, about the size of a walkie-talkie, allows users to see through walls—or ceilings. It is primarily marketed as a tool of great value for search-and-rescue operations, where firefighters might use it to locate someone inside a burning building or even trapped beneath rubble after an earthquake. However, the RANGE-R is also enthusiastically pitched as a near-miraculous device no SWAT team should be without, offering police a tool for determining “the presence and location of assailants or hostages inside a building prior to entry,” the company boasts.

The RANGE-R made national news for all the wrong reasons, however, when, back in February 2013, US marshals used one of the units to determine whether a suspect was inside his home in Wichita, Kansas. The man’s subsequent arrest was later disputed in court on the basis that using radar to, in effect, watch him inside his own home was a form of unconstitutional entry. Its use should thus require a warrant. This argument was based on an earlier Supreme Court case, *Kyllo v. United States*, where the court determined that using thermal-imaging cameras to scan a suspect’s home for signs of a marijuana-growing operation was only legal with the appropriate search warrant. The court did not agree, however, that radar should be subjected to the same limitations, and police use of a RANGE-R remains perfectly legal and does not require a warrant.

Passive tags are not unlike those now used to scan almost every postal shipment. The most complex tags can also be manufactured from phosphors, dyes, and nanomaterials, substances that show up when exposed to air or light or are viewed by special sensors or by multi-and hyperspectral imagers. Perhaps the most tantalizing advance of all is in the field of nanotechnology, where a class of nanomaterials is called quantum dots. By using quantum dot (QD) technology taggants, which can be aerosolized or dispensed in an inconspicuous powder, friendly and suspect individuals can be uniquely marked and covertly tracked. The tags are undetectable in the visible-light spectrum, and they dissolve, minimizing detection in the long-term. A lightweight laser interrogator can simultaneously identify QD-tagged objects from as far away as two kilometers.

The unique capacity of hyperspectral imagers to detect, locate, and identify materials associated with a downed pilot or a captured soldier made long-range search and rescue an early articulation of mission need, a capability made all the more practical with the development of specially formulated material—taggants—with exact spectral features, material so small that it could be worn or carried by a pilot and yet also detected in real time by a hyperspectral sensor. As part of the HyCAS program in

2003, taggants that the human eye could not readily detect were tested and successfully identified in airborne surveillance.

The DEA even created a black box that could process the propeller noise of a small plane and identify it by the specific signature it emitted, based upon minute variations in balance and torque.

“He said that after being released from prison, he spent a lot of time taking long walks around the suburban landscape of Southern California. He began noticing that every twenty-five feet, he would hit a driveway; he’d then walk eight feet across the driveway before hitting another stretch of grass; then another twenty-five feet to the next driveway, and so on, seemingly forever, ‘and the uniformity of that totally echoed the uniformity of the prison environment where I had my cell and my seven feet of wall and then a door. And I remember thinking, Oh my God, man.’ He laughed at the utter despair of it all, having gone from one system of containment to another. How would you get away or escape from this?”

Consider a casino—cameras are everywhere. ATM cameras are wired directly to the casino’s central security network; check-cashing cameras catch every detail of your appearance (even down to your signature); cameras are on the way to the bathrooms; cameras are at the tops of escalators. Indeed, escalators reveal one of the casino world’s preferred tactics. Subtly guiding people onto an escalator almost immediately upon entering a casino might seem to be an example of bad architectural design, but it works as an ingenious security protocol. Nearly every visitor to the building dutifully lines up to have his or her picture taken, not just once but multiple times, from nearly every conceivable angle, as people are carried from the entrance to the gaming floor.

The idea of designing out crime is by no means unique to our era. In nineteenth-century Paris, for example, acting under instructions from Emperor Napoléon III, urban administrator Georges-Eugène Haussmann instituted an extraordinarily ambitious series of urban improvements. He ordered the demolition of entire neighborhoods, the erasure of whole streets from the center of Paris, and the widespread replacement of them both with the broad, leafy, and beautiful boulevards Paris is known for today. This was not motivated by aesthetics, however, but was explicitly a police project, a deliberate—and quite successful—effort to redesign the city so that the streets would be too wide to barricade, the back alleys no longer winding or confusing enough for insurgents and revolutionaries to disappear

or get away. The urban landscape of Paris became a police tool, its urban core reorganized so aggressively that popular uprisings would henceforth be spatially impossible.

This is not the only police project for which Paris is widely known. The idea of lighting the streets of Paris back in the 1600s originally came from the police. Streetlights were one of many new patrol tools implemented by Louis XIV's lieutenant general of police, Gabriel Nicolas de la Reynie. De la Reynie's plan ordered that lanterns be hung over the streets every sixty feet—with the unintended side effect that Paris soon gained its popular moniker, the City of Light. The world's most romantic city takes its nickname from a police operation.

Some long for a smart city that will be able to anticipate—and, more important, interrupt or preempt—certain behaviors, whether that means speeding, committing a burglary, or violating curfew. So-called predictive policing has been much discussed over the past few years, whereby authorities use detailed statistics and algorithms—a city's criminal patterns and rhythms—to “predict” when and where a crime is most likely to occur. A kind of predictive urban design, a geospatial policing project where specific activities become impossible to perform: police can turn off your car engine from miles away or redirect driverless vehicles to clog the road precisely when you're trying to escape. It would be the exact opposite of *The Italian Job*: red lights all the way, an impenetrable phalanx of traffic that only the police can control or navigate.

It's hard to know which is more dystopian: the idea that your every move is being studied by occasionally malign figures of anonymous government authority, or that everything you've done in the public sphere has for years now been secretly recorded for no particular reason, by people who would rather be doing almost anything else. I was reminded of a study I'd once read about surveillance-camera operators in the UK; an anthropologist had gone to work in a CCTV control room for a season to see what life was like behind the screens. While most Brits are convinced they're living through the rise of an all-pervasive surveillance state, being filmed from every conceivable angle at every time of day, the reality was far more diffuse and disorganized. In a particularly stark example, one security-room supervisor admitted that he would arrive at work each day and, first thing, train one of the cameras away from the building he was being paid to protect in order to watch his own car out in the parking lot. He would make himself a cup of tea, read the morning's sports pages, and spy on his car against possible break-ins.

You first spot the apartment from afar, thanks to a light still shining in the kitchen window. Walking closer and pulling the brim of your hat down closer to hide your face, you see the top of what appears to be an

open laptop computer sitting on the kitchen table. No one is there, working or surfing the Internet; in the minute or two you've had to study the place, you haven't noticed any movement inside, no other lights turning on or off. In fact, it looks as if only one light is on in the whole apartment.

You step up onto a small brick perimeter wall across the street to get a better look—just a low fence framing the yard of a multistory housing block—and sure enough, the laptop is sitting there alone, without an owner to be seen. Astonishingly, a digital camera has been left out on the table next to it, as if someone had been transferring photos from one device to the other, only to leave, maybe for the whole night, maybe just for a quick errand. Either way, no one's there right now, and that makes this your best opportunity. Best of all, a living-room window partially hidden behind some bushes is slightly ajar—meaning that whoever lives there has taken zero precautions against burglary and thus practically deserves to be robbed (you tell yourself). It's instant karma—payback for his or her absentminded naïveté. So it's now or never.

With one final scan of the surrounding street and a quick squint up at other windows in case someone might be watching, you confirm you're all alone. It's time to go. You cross the street, pop open the window, and slide in. It's almost too easy. Immediately, you head for the bedroom, both to make sure no one is there sleeping and also to grab a pillowcase to stuff everything in. While you're in there, you notice it's oddly furnished; it's almost as if no one really spends a lot of time here, as if it's just a place to crash, because nothing but a bed and a nightstand are in the room. It feels strange—but you're in now, so it's all about getting the job done, then getting out.

Quickly, you open the bathroom medicine cabinet, hoping to find some medications—but there's nothing. Then you go into the kitchen to pop open the cupboards one by one. Almost nothing is in them, which again seems strange, and you've also noticed that everything feels vaguely dirty, as if whoever lives here hasn't cleaned in a while. Anything you've touched—a doorknob or cabinet handle—has made your fingers feel oily, your palms a bit slick with something you can't see. If not for the laptop, which you head toward to grab, this would not have been worth it; now it's time to go.

Which is exactly when you hear the front door of the apartment burst open, and that word you've been hoping to avoid your whole criminal career echoes into the room around you: "Police!" Two officers sweep through the door, and it's far too late to get back to the open window and escape. You're trapped—or captured, as the case may be.

"Capture houses" are fake apartments run by the police to attract and, as their name implies, capture burglars. They are furnished to be all but

indistinguishable from other apartments, with the important difference that nearly everything inside them has been tagged using a chemical residue only visible under UV light. These chemical sprays and forensic coatings—applied to door handles, window latches, and any portable goods found throughout the properties, including TVs, laptops, and digital cameras—are also known as SmartWater. Tiny internet-connected cameras film each room from various angles. Finally, a small team of officers waits patiently nearby, usually in an apartment next door or across the hall.

All this means that if you are the burglar in question, the local police have designed and furnished an apartment with you in mind. When you are next out and about, casing homes for a possible burglary, and you feel attracted to a certain property, you have to step back and consider the almost science-fiction-like possibility that it was put there specifically to attract you.

What remains so interesting about the idea of a capture house is this larger, abstract notion that the houses, apartments, bars, shops, and businesses standing all around us might be fake, that they exist as a police-monitored surrogate of the everyday world, a labyrinth of law-enforcement stage sets both deceptive and alluring. Indeed, beyond just trapping local burglars, the capture-house program's overriding and perhaps most successful effect lies in inspiring a distinct and quite peculiar form of interpretive unease among local criminals: the uncanny feeling that the very place you are now standing in is somehow not real but a kind of well-furnished simulation, a deliberate mirage or architectural replica run by the local police, overseen by invisible cameras recording your every move. Even if you're looking for signs that a given home or apartment is a capture house, you won't find them. You won't know you've actually broken into a simulation until the police themselves come crashing in, looking for you.

Surveillance Capitalism:

1. A new economic order that claims human experience as free raw material for hidden commercial practices of extraction, prediction, and sales.
2. A parasitic economic logic in which the production of goods and services is subordinated to a new global architecture of behavioral modification.
3. A rogue mutation of capitalism marked by concentrations of wealth, knowledge, and power. unprecedented in human history

4. The foundational framework of a surveillance economy.
5. As significant a threat to human nature in the twenty-first century as industrial capitalism was to the natural world in the nineteenth and twentieth.
6. The origin of a new instrumentarian power that asserts dominance over society and presents startling challenges to market democracy.
7. A movement that aims to impose a new collective order based on total certainty.
8. An expropriation of critical human rights that is best understood as a coup from above, an overthrow of the people's sovereignty.

In 2000 a group of computer scientists and engineers at Georgia Tech collaborated on a project called the "Aware Home." It was meant to be a "living laboratory" for the study of "ubiquitous computing." They imagined a "human-home symbiosis" in which many animate and inanimate processes would be captured by an elaborate network of "context aware sensors" embedded in the house and by wearable computers worn by the home's occupants. The design called for an "automated wireless collaboration" between the platform that hosted personal information from the occupants' wearables and a second one that hosted the environmental information from the sensors.

There were three working assumptions: first, the scientists and engineers understood that the new data systems would produce an entirely new knowledge domain. Second, it was assumed that the rights to that new knowledge and the power to use it to improve one's life would belong exclusively to the people who live in the house. Third, the team assumed that for all of its digital wizardry, the Aware Home would take its place as a modern incarnation of the ancient conventions that understand 'home' as the private sanctuary of those who dwell within its walls. All of this was expressed in the engineering plan. It emphasized trust, simplicity, the sovereignty of the individual, and the inviolability of the home as a private domain. The Aware Home information system was imagined as a simple "closed loop" with only two nodes and controlled entirely by the home's occupants.

"Because the house would be constantly monitoring the occupants' whereabouts and activities, even tracing its inhabitants' medical conditions. There is a clear need to give the occupants knowledge and control of the distribution of this information."

All the information was to be stored on the occupants' wearable computers "to insure the privacy of an individual's information."

By 2018, the global "smart-home" market was valued at \$36 billion and expected to reach \$151 billion by 2023. The numbers betray an earthquake beneath their surface. Consider just one smart-home device: the Nest thermostat, which was made by a company that was owned by Alphabet, the Google holding company, and then merged with Google in 2018. The Nest thermostat does many things imagined in the Aware Home. It collects data about its uses and environment. It uses motion sensors and computation to "learn" the behaviors of a home's inhabitants. Nest's apps can gather data from other connected products such as cars, ovens, fitness trackers, and beds. Such systems can, for example, trigger lights if an anomalous motion is detected, begin video and audio recording, and even send notifications to homeowners or others.

As a result of the merger with Google, the thermostat, like other Nest products, will be built with Google's artificial intelligence capabilities, including its personal digital "assistant." Like the Aware Home, the thermostat and its brethren devices create immense new stores of knowledge and therefore new power—but for whom? Wi-Fi-enabled and networked, the thermostat's intricate, personalized data stores are uploaded to Google's servers. Each thermostat comes with a "privacy policy," a "terms-of-service agreement," and an "end-user licensing agreement." These reveal oppressive privacy and security consequences in which sensitive household and personal information are shared with other smart devices, unnamed personnel, and third parties for the purposes of predictive analyses and sales to other unspecified parties. Nest takes little responsibility for the security of the information it collects and none for how the other companies in its ecosystem will put those data to use.

A detailed analysis of Nest's policies concluded that were one to enter into the Nest ecosystem of connected devices and apps, each with their own equally burdensome and audacious terms, the purchase of a single home thermostat would entail the need to review nearly a thousand so-called contracts. Should the customer refuse to agree to Nest's stipulations, the terms of service indicate that the functionality and security of the thermostat will be deeply compromised, no longer supported by the necessary updates meant to ensure its reliability and safety. The consequences can range from frozen pipes to failed smoke alarms to an easily hacked internal home system.

By 2018, the assumptions of the Aware Home were gone with the wind. Where did they go? What was that wind? The Aware Home, like many other visionary projects, imagined a digital future that empowers individuals to lead more-effective lives. What is most critical is that in the year 2000

this vision naturally assumed an unwavering commitment to the privacy of individual experience. Should an individual choose to render her experience digitally, then she would exercise exclusive rights to the knowledge garnered from such data, as well as exclusive rights to decide how such knowledge might be put to use. Today these rights to privacy, knowledge, and application have been usurped by a bold market venture powered by unilateral claims to others' experience and the knowledge that flows from it. What does this sea change mean for us, for our children, for our democracies, and for the very possibility of a human future in a digital world?

Surveillance capitalism unilaterally claims human experience as free raw material for translation into behavioral data. Although some of these data are applied to product or service improvement, the rest are declared as a proprietary behavioral surplus, fed into advanced manufacturing processes known as "machine intelligence," and fabricated into prediction products that anticipate what you will do now, soon, and later. Finally, these prediction products are traded in a new kind of marketplace for behavioral predictions—behavioral futures markets. Surveillance capitalists have grown immensely wealthy from these trading operations, for many companies are eager to lay bets on our future behavior. The competitive dynamics of these new markets drive surveillance capitalists to acquire ever-more-predictive sources of behavioral surplus: our voices, personalities, and emotions.

Eventually, surveillance capitalists discovered that the most-predictive behavioral data come from intervening in the state of play in order to nudge, coax, tune, and herd behavior toward profitable outcomes. Competitive pressures produced this shift, in which automated machine processes not only know our behavior but also shape our behavior at scale. With this reorientation from knowledge to power, it is no longer enough to automate information flows about us; the goal now is to automate us. In this phase of surveillance capitalism's evolution, the means of production are subordinated to an increasingly complex and comprehensive "means of behavioral modification." In this way, surveillance capitalism births a new species of power that we might call 'instrumentarianism.' Instrumentarian power knows and shapes human behavior toward others' ends. Instead of armaments and armies, it works its will through the automated medium of an increasingly ubiquitous computational architecture of "smart" networked devices, things, and spaces.

It has become difficult to escape this bold market project, whose tentacles reach from the gentle herding of innocent Pokémon Go players to eat, drink, and purchase in the restaurants, bars, fast-food joints, and shops that pay to play in its behavioral futures markets to the ruthless expropriation of surplus from Facebook profiles for the purposes of shaping individual

behavior, whether it's buying pimple cream at 17:45 on Friday, clicking 'yes' on an offer of new running shoes as the endorphins race through your brain after your long Sunday morning run, or voting next week. Just as industrial capitalism was driven to the continuous intensification of the means of production, so surveillance capitalists and their market players are now locked into the continuous intensification of the means of behavioral modification and the gathering might of instrumentarian power.

Surveillance capitalism is a rogue force driven by novel economic imperatives that disregard social norms and nullify the elemental rights associated with individual autonomy that are essential to the very possibility of a democratic society. Just as industrial civilization flourished at the expense of nature and now threatens to cost us the Earth, an information civilization shaped by surveillance capitalism and its new instrumentarian power will thrive at the expense of human nature and will threaten to cost us our humanity. The industrial legacy of climate chaos fills us with dismay, remorse, and fear. As surveillance capitalism becomes the dominant form of information capitalism in our time, what fresh legacy of damage and regret will be mourned by future generations? By the time you read these words, the reach of this new form will have grown as more sectors, firms, startups, app developers, and investors mobilize around this one plausible version of information capitalism. This mobilization and the resistance it engenders will define a key battleground upon which the possibility of a human future at the new frontier of power will be contested.

One explanation for surveillance capitalism's many triumphs floats above them all: it is unprecedented. The unprecedented is necessarily unrecognizable. When we encounter something unprecedented, we automatically interpret it through the lenses of familiar categories, thereby rendering invisible precisely that which is unprecedented. A classic example is the notion of the "horseless carriage" to which people reverted when confronted with the unprecedented facts of the automobile. A tragic illustration is the encounter between indigenous people and the first Spanish conquerors. When the Taínos of the pre-Columbian Caribbean islands first laid eyes on the sweating, bearded Spanish soldiers trudging across the sand in their brocade and armor, how could they possibly have recognized the meaning and portent of that moment? Unable to imagine their own destruction, they reckoned that those strange creatures were gods and welcomed them with intricate rituals of hospitality.

This is how the unprecedented reliably confounds understanding; existing lenses illuminate the familiar, thus obscuring the original by turning the unprecedented into an extension of the past. This contributes to the normalization of the abnormal, which makes fighting the unprecedented

even more of an uphill climb.

Our effort to confront the unprecedented begins with the recognition that we hunt the puppet master, not the puppet. A first challenge to comprehension is the confusion between surveillance capitalism and the technologies it employs. Surveillance capitalism is not technology; it is a logic that imbues technology and commands it into action. Surveillance capitalism is a market form that is unimaginable outside the digital milieu, but it is not the same as the “digital.” As we saw in the story of the Aware Home the digital can take many forms depending upon the social and economic logics that bring it to life. It is capitalism that assigns the price tag of subjugation and helplessness, not the technology. That surveillance capitalism is a logic in action and not a technology is a vital point because surveillance capitalists want us to think that their practices are inevitable expressions of the technologies they employ.

For example, in 2009 the public first became aware that Google maintains our search histories indefinitely: data that are available as raw-material supplies are also available to intelligence and law-enforcement agencies. When questioned about these practices, the corporation’s former CEO Eric Schmidt mused:

“The reality is that search engines including Google do retain this information for some time.”

In truth, search engines do not retain, but surveillance capitalism does. Schmidt’s statement is a classic of misdirection that bewilders the public by conflating commercial imperatives and technological necessity. It camouflages the concrete practices of surveillance capitalism and the specific choices that impel Google’s brand of search into action. Most significantly, it makes surveillance capitalism’s practices appear to be inevitable when they are actually meticulously calculated and lavishly funded means to self-dealing commercial ends. Despite all the futuristic sophistication of digital innovation, the message of the surveillance capitalist companies barely differs from the themes once glorified in the motto of the 1933 Chicago World’s Fair:

“Science Finds—Industry Applies—Man Conforms”

In order to challenge such claims of technological inevitability, we must establish our bearings. We cannot evaluate the current trajectory of information civilization without a clear appreciation that technology is not and never can be a thing in itself, isolated from economics and society. This means that technological inevitability does not exist. Technologies are always economic

means, not ends in themselves: in modern times, technology's DNA comes already patterned by the economic orientation. Economic ends are always intrinsic to technology's development and deployment. Economic action determines objectives, whereas technology provides appropriate means. The fact that what is called the technological development of modern times has been so largely oriented economically to profit-making is one of the fundamental facts of the history of technology. In a modern capitalist society, technology was, is, and always will be an expression of the economic objectives that direct it into action. A worthwhile exercise would be to delete the word 'technology' from our vocabularies in order to see how quickly capitalism's objectives are exposed.

An app called Genetic Access Control, was made available on GitHub. The app accessed genomic data on 23andMe (a private company through which you get your genome sequenced) and used that data to restrict users' access to Web sites. The app's developer suggests relatively innocuous uses for the app, including creating "safe spaces," like Web sites that can only be accessed by females. But it's easy to imagine how an app like this could be used for more sinister purposes. Imagine a site that only people with a certain skin color can visit, or a site that only individuals lacking genetic defects could visit. Furthermore, even the more benign uses will create problems, because identity is both genetic and cultural. Some people with a traditionally female body type carry XY chromosomes, and a group that genetically barred non-females would have to decide how to handle that. 23andMe quickly blocked this app's access to their data, but we can probably expect problems like this to pop up again in the future.

And it's not just your personal genetic information. You get half of your genome from your mom and half from your dad—unless you're some weird lab-baby. So if you make your genome public, you're sharing half of each of your parent's genomes. In fact, whenever you share genetic information, you are to some degree compromising the anonymity of all people in your kin group. Imagine you have a twin who is in political office, and you find out that you carry a genetic risk of schizophrenia. Do you have a social obligation to share that information? Do you have a filial obligation to hide it?

Perhaps we need for data analysts some sort of principles which they should adhere, just as doctors do.

Big Data's Hippocratic Oath

- I will remember that I didn't make the world, and it doesn't satisfy my equations.

- Though I will use models boldly to estimate value, I will not be overly impressed by mathematics.
- I will never sacrifice reality for elegance without explaining why I have done so.
- Nor will I give the people who use my model false comfort about its accuracy. Instead, I will make explicit its assumptions and oversights.
- I understand that my work may have enormous effects on society and the economy, many of them beyond my comprehension.

Early commentators on the developing webworld clearly viewed and identified the internet as a communications commons. Even more, movements of tech activists were seen as commonists—asserting the sharing of web resources and the need for alternatives to capitalist ownership and control but in a way that avoided, or refuted, the authoritarian or statist examples of communism. At the same time, some segments of capital readily grasped the enormous commercial potential of this untapped channel of profitability. To do so fully, the cyber commons—like the land commons in England during the late feudal period—would have to be enclosed, brought within the purview of private property owners, as commodities. Many early cyber activists recognized this too and tried to mobilize users and producers to defend the free net and extend the spheres of openness, through tech worker collectives and open source technologies. Over the last decade, of course, the enclosure of the internet as commercial space has expanded massively. The internet has gone from being viewed as a medium of mass communication or interchange to become a mass market (for exchange value). Corporations have used the internet to advance global trade in an immediate fashion, collapsing space and time for commerce. At the same time, corporations have found entirely new commodities and spaces for profit making.

Selling data became a lucrative business for governments at all levels. The state of Florida alone makes about \$62 million a year selling driver's license data. The US Postal Service generates \$9.5 million in revenue a year allowing companies like Acxiom to access its National Change of Address database.

The trackers are deeply intertwined. Government data are the lifeblood for commercial data brokers. And government dragnets rely on obtaining information from the private sector. Consider just one example: voting. To register to vote, citizens must fill out a government form that usually requires their name, address, and, in all but one state, birth date. But few voters realize that those lists are often sold to commercial data brokers.

A 2011 study found that a statewide voter list sold for as little as \$30 in California and as high as \$6,050 in Georgia.

Commercial data brokers combine the voting information with other data to create rich profiles of individuals. For instance, the data broker Aristotle Inc. markets its ability to identify 190 million voters by more than “500 consumer data points” such as their credit rating and size of their mortgage. And guess who buys Aristotle’s enriched data? Politicians, who are sometimes using government money. Aristotle crows that “every US President—Democrat and Republican—from Reagan through Obama, has used Aristotle products and/or services.”

A 2012 study found that fifty-one members of the US House of Representatives bought data from Aristotle using some of their congressional allowances, allowing them to identify their constituents by the age of their children, whether they subscribe to religious magazines, or if they have a hunting license. And thus, the data comes full circle. The government requires citizens to create data and then sells it to commercial entities, which launder the data and sell it back to the government.

The dark data cycle occurs with nearly every type of data. State auto vehicle records are swept into LexisNexis reports, which are enhanced with other data and sold to the Department of Homeland Security. Foreclosure records are compiled in state courts and then collected by data brokers such as CoreLogic, which sells packages of real estate data to clients including the government. An even darker data cycle occurs in the secret Foreign Intelligence Surveillance Court, where the government can demand that private industry hand over data about their customers. In those circumstances, giant companies such as Google, Yahoo!, AT&T, Verizon, and Microsoft have been forced to hand over customer data to the NSA. The reality is that corporate and government dragnets are inextricably linked; neither can exist without the other.

It has allowed a space in which data has become a valuable commodity at the same time as allowing data to be more accessible than ever to potential consumers. Corporations that hope to capitalize on data try to clear out the online commons and subjugate internet users to the ever encroaching profit motive of online companies. Government bills, laws, and treaties have consistently restricted the rights of internet users and tech workers while affirming or asserting special rights of capital (owners and investors who seek a privately commodified web). In many ways, hacktivism is a response to this contestation of rights.

As in the case of earlier processes of capitalist commodification, the efforts to commodify the internet or communications commons are being met with resistance. As the enclosures of common lands gave rise to the Diggers,

Levelers, and Ranters, communities that took direct action to reclaim the commons, so the efforts to privatize and corporatize the web have given rise to hacktivists and cyber disobedients who take action for a free and open webworld. These new Diggers, Levelers, and Ranters take names such as Anonymous, Lulzsec, Riseup, and TAO (The Anarchy Organization). As in previous periods, the resistance is criminalized by states acting on behalf of propertied interests that profit from enclosure. Cyber disobedients are criminalized because they seek, or succeed, to give away that which capital seeks to own, and sell, for a profit. Restricting access to readily available information is a way to maintain and extend the commodification of data. And the key way in which this commodification can be achieved is by making information a scarce resource, by limiting its accessibility.

Not too long ago, monopolies and oligopolies were illegal in America. This was because our ancestors understood that concentrated economic power was incompatible with democracy and equality in all sorts of ways. Since the days of Ronald Reagan, however, every administration has chosen to drop the enforcement of the antitrust laws except in rare cases. This has come to mean that mergers and takeovers are permitted in nearly all instances, and achieving monopoly has once again become the obvious objective of every would-be business leader. From Big Pharma to Silicon Valley, everyone in the C-suites knows that this is the path to success today. ‘Competition is for losers,’ they say. Unless your startup has a plan for cornering and using market power, you can forget about interest from venture capital.

Unlike the old monopolists, who controlled production, the new monopolists control networks. Antitrust laws often busted up the old monopolists. But the new monopolists have enough influence to keep antitrust at bay.

Whether it is Apple’s mobile hardware and related software, Google’s search engine and content, Twitter’s tweets, Facebook’s connections, Amazon’s shopping platform, or Alibaba’s shopping exchange, huge revenues come from owning a standard platform. To be sure, such platforms can sometimes make it easier for people to introduce their apps or books or videos or whatever other content they want to showcase. But the real power and profits lie with the owners of the platform rather than with the people who make use of it. And as that power and those profits increase, the people who depend on it have less and less bargaining leverage to negotiate good prices for their contributions. Since it costs almost nothing to sell more units, these new monopolists can keep out (or buy out) potential competitors and gain almost complete control—along with the profits and the legal and political leverage control brings.

A handful of giant corporations are reaping the rewards of such network

effects. The larger their networks become, the more data they collect, and therefore the more effective and powerful they become. Consumers may be satisfied with the results, but they will never know what ideas have been squelched or stymied, how much more they are paying than they would otherwise, and how the rules of the game are being changed to the advantage of the owners of the standard platforms.

This was the Big Data economy, and it promised spectacular gains. A computer program could speed through thousands of résumés or loan applications in a second or two and sort them into neat lists, with the most promising candidates on top. This not only saved time but also was marketed as fair and objective. After all, it didn't involve prejudiced humans digging through reams of paper, just machines processing cold numbers. By 2010 or so, mathematics was asserting itself as never before in human affairs, and the public largely welcomed it.

Yet there was clearly trouble if you looked. The math-powered applications powering the data economy were based on choices made by fallible human beings. Some of these choices were no doubt made with the best intentions. Nevertheless, many of these models encoded human prejudice, misunderstanding, and bias into the software systems that increasingly manage our lives. Like gods, these mathematical models are opaque, their workings invisible to all but the highest priests in their domain: mathematicians and computer scientists. Their verdicts, even when wrong or harmful, are beyond dispute or appeal. And they tend to punish the poor and the oppressed in our society, while making the rich richer.

Scheduling software can be seen as an extension of the just-in-time economy. But instead of lawn mower blades or cell phone screens showing up right on cue, it's people, usually people who badly need money. And because they need money so desperately, the companies can bend their lives to the dictates of a mathematical model.

It's almost as if the software were designed expressly to punish low-wage workers and to keep them down. The software also condemns a large percentage of our children to grow up without routines. They experience their mother bleary eyed at breakfast, or hurrying out the door without dinner, or arguing with her mother about who can take care of them on Sunday morning. This chaotic life affects children deeply.

“Young children and adolescents of parents working unpredictable schedules or outside standard daytime working hours are more likely to have inferior cognition and behavioral outcomes.”

The parents might blame themselves for having a child who acts out or fails in school, but in many cases the real culprit is the poverty that leads

workers to take jobs with haphazard schedules—and the scheduling models that squeeze struggling families even harder.

Poor people are more likely to have bad credit and live in high-crime neighborhoods, surrounded by other poor people. Once the dark universe of algorithms digests that data, it showers them with predatory ads for subprime loans or for-profit schools. It sends more police to arrest them, and when they're convicted it sentences them to longer terms. This data feeds into other algorithms, which score the same people as high risks or easy targets and proceed to block them from jobs, while jacking up their rates for mortgages, car loans, and every kind of insurance imaginable. This drives their credit rating down further, creating nothing less than a death spiral of modeling. Being poor in a world of algorithms is getting more and more dangerous and expensive.

The same algorithms that abuse the poor also place the comfortable classes of society in their own marketing silos. They jet them off to vacations in Aruba and wait-list them at Wharton. For many of them, it can feel as though the world is getting smarter and easier. Models highlight bargains on prosciutto and chianti, recommend a great movie on Amazon Prime, or lead them, turn by turn, to a café in what used to be a “sketchy” neighborhood. The quiet and personal nature of this targeting keeps society's winners from seeing how the very same models are destroying lives, sometimes just a few blocks away. Our national motto, *E Pluribus Unum*, means ‘Out of Many, One.’ But algorithms reverse the equation. Working in darkness, they carve one into many, while hiding us from the harms they inflict upon our neighbors near and far.

And those harms are legion. They unfold when a single mother can't arrange child care fast enough to adapt to her work schedule, or when a struggling young person is red-lighted for an hourly job by a workplace personality test. We see them when a poor minority teenager gets stopped, roughed up, and put on warning by the local police, or when a gas station attendant who lives in a poor zip code gets hit with a higher insurance bill. It's a silent war that hits the poor hardest but also hammers the middle class. Its victims, for the most part, lack economic power, access to lawyers, or well-funded political organizations to fight their battles. The result is widespread damage that all too often passes for inevitability.

For example, attempting to calculate the impact that one person may have on another over the course of a school year is extremely complex. Attempting to score a teacher's effectiveness by analyzing the test results of only twenty-five or thirty students is statistically unsound, even laughable. The numbers are far too small given all the things that could go wrong. Indeed, if we were to analyze teachers with the statistical rigor of a search

engine, we'd have to test them on thousands or even millions of randomly selected students. Statisticians count on large numbers to balance out exceptions and anomalies.

Equally important, statistical systems require feedback—something to tell them when they're off track. Statisticians use errors to train their models and make them smarter. If Amazon, through a faulty correlation, started recommending lawn care books to teenage girls, the clicks would plummet, and the algorithm would be tweaked until it got it right. Without feedback, however, a statistical engine can continue spinning out faulty and damaging analysis while never learning from its mistakes. Many of our models behave like that. They define their own reality and use it to justify their results. This type of model is self-perpetuating, highly destructive—and very common. When Mathematica's scoring system tags teachers as failures, the district fires them. But how does it ever learn if it was right? It doesn't. The system itself has determined that they were failures, and that is how they are viewed. "Bad" teachers are gone. That fact alone appears to demonstrate how effective the value-added model is. It is cleansing the district of underperforming teachers. Instead of searching for the truth, the score comes to embody it.

Unfortunately, misinterpreted statistics run through the history of teacher evaluation. The problem started with a momentous statistical mistake in the analysis of the original Nation at Risk report. It turned out that the very researchers who were decrying a national catastrophe were basing their judgment on a fundamental error, something an undergrad should have caught. In fact, if they wanted to serve up an example of America's educational shortcomings, their own misreading of statistics could serve as exhibit A. Seven years after *A Nation at Risk* was published with such fanfare, researchers at Sandia National Laboratories took a second look at the data gathered for the report. These people were no amateurs when it came to statistics—or one would hope, since they build and maintain nuclear weapons—and they quickly found the error.

Yes, it was true that SAT scores had gone down on average. However, the number of students taking the test had ballooned over the course of those seventeen years. Universities were opening their doors to more poor students and minorities. Opportunities were expanding. This signaled social success. But naturally, this influx of newcomers dragged down the average scores. However, when statisticians broke down the population into income groups, scores for every single group were rising, from the poor to the rich. In statistics, this phenomenon is known as Simpson's Paradox: when a whole body of data displays one trend, yet when broken into subgroups, the opposite trend comes into view for each of those subgroups. The damning

conclusion in the *Nation at Risk* report, the one that spurred the entire teacher evaluation movement, was drawn from a grievous misinterpretation of the data.

Such models also tend to punish the poor. This is, in part, because they are engineered to evaluate large numbers of people. They specialize in bulk, and they're cheap. That's part of their appeal. The wealthy, by contrast, often benefit from personal input. A white-shoe law firm or an exclusive prep school will lean far more on recommendations and face-to-face interviews than will a fast-food chain or a cash-strapped urban school district. The privileged are processed more by people, the masses by machines.

When automatic systems sift through our data to size us up for an "e-score," they naturally project the past into the future. The poor are expected to remain poor forever and are treated accordingly—denied opportunities, jailed more often, and gouged for services and loans. It's inexorable, often hidden and beyond appeal, and unfair.

Consider the feedback loop that the Kronos personality test engenders. Red-lighting people with certain mental health issues prevents them from having a normal job and leading a normal life, further isolating them. This is exactly what the Americans with Disabilities Act is supposed to prevent.

You cannot appeal to a model. That's part of their fearsome power. They do not listen. Nor do they bend. They're deaf not only to charm, threats, and cajoling but also to logic—even when there is good reason to question the data that feeds their conclusions. Yes, if it becomes clear that automated systems are screwing up on an embarrassing and systematic basis, programmers will go back in and tweak the algorithms. But for the most part, the programs deliver unflinching verdicts, and the human beings employing them can only shrug, as if to say, 'Hey, what can you do?' Algorithms are an optimized version of the cliché useless and unhelpful bureaucrat.

Do you see the paradox? An algorithm processes a slew of statistics and comes up with a probability that a certain person might be a bad hire, a risky borrower, a terrorist, or a miserable teacher. That probability is distilled into a score, which can turn someone's life upside down. And yet when the person fights back, suggestive countervailing evidence simply won't cut it. The case must be ironclad. The human victims of models are held to a far higher standard of evidence than the algorithms themselves.

Models, despite their reputation for impartiality, reflect goals and ideology. When a parent removes the possibility of eating Pop-Tarts at every meal, they are imposing their ideology on the meals model. It's something we do without a second thought. Our own values and desires influence our choices, from the data we choose to collect to the questions we ask. Models

are opinions embedded in mathematics.

Racism, at the individual level, can be seen as a predictive model whirring away in billions of human minds around the world. It is built from faulty, incomplete, or generalized data. Whether it comes from experience or hearsay, the data indicates that certain types of people have behaved badly. That generates a binary prediction that all people that look like them will behave that same way. Needless to say, racists don't spend a lot of time hunting down reliable data to train their twisted models. And once their model morphs into a belief, it becomes hardwired. It generates poisonous assumptions, yet rarely tests them, settling instead for data that seems to confirm and fortify them. Consequently, racism is the most slovenly of predictive models. It is powered by haphazard data gathering and spurious correlations, reinforced by institutional inequities, and polluted by confirmation bias. And now we are seeking to digitize and systematize these biases.

PredPol doesn't focus on the individual. Instead, it targets geography. The key inputs are the type and location of each crime and when it occurred. That seems fair enough. And if cops spend more time in the high-risk zones, foiling burglars and car thieves, there's good reason to believe that the community benefits. But most crimes aren't as serious as burglary and grand theft auto, and that is where serious problems emerge. When police set up their PredPol system, they have a choice. They can focus exclusively on so-called "Part 1" crimes. These are the violent crimes, including homicide, arson, and assault, which are usually reported to them. But they can also broaden the focus by including "Part 2" crimes, including vagrancy, aggressive panhandling, and selling and consuming small quantities of drugs. Many of these nuisance crimes would go unrecorded if a cop weren't there to see them. These nuisance crimes are endemic to many impoverished neighborhoods. In some places police call them antisocial behavior, or ASB.

Unfortunately, including them in the model threatens to skew the analysis. Once the nuisance data flows into a predictive model, more police are drawn into those neighborhoods, where they're more likely to arrest more people. After all, even if their objective is to stop burglaries, murders, and rape, they're bound to have slow periods—it's the nature of patrolling. And if a patrolling cop sees a couple of kids who look no older than sixteen guzzling from a bottle in a brown bag, he stops them. These types of low-level crimes populate their models with more and more dots, and the models send the cops back to the same neighborhood. This creates a pernicious feedback loop. The policing itself spawns new data, which justifies more policing. And our prisons fill up with hundreds of thousands of people found guilty of victimless crimes. Most of them come from impoverished neighborhoods,

and most are black or Hispanic. So even if a model is color blind, the result of it is anything but. In our largely segregated cities, geography is a highly effective proxy for race.

Just imagine if police enforced their zero-tolerance strategy in finance. They would arrest people for even the slightest infraction, whether it was chiseling investors on 401ks, providing misleading guidance, or committing petty frauds. Perhaps SWAT teams would execute no-knock raids in Greenwich, Connecticut. They'd go undercover in the taverns around Chicago's Mercantile Exchange. Not likely, of course. The cops don't have the expertise for that kind of work. Everything about their jobs, from their training to their bullet-proof vests, is adapted to the "mean streets." Clamping down on white-collar crime would require people with different tools and skills.

The small and underfunded teams who handle that work, from the FBI to investigators at the Securities and Exchange Commission, have learned through the decades that bankers are virtually invulnerable. They spend heavily on our politicians, which always helps, and are also viewed as crucial to our economy. That protects them. If their banks go south, our economy could go with them. The poor have no such argument. So except for a couple of criminal outliers, such as Ponzi-scheme master Bernard Madoff, financiers don't get arrested. As a group, they made it through the 2008 market crash practically unscathed. What could ever burn them now?

My point is that police make choices about where they direct their attention. Today they focus almost exclusively on the poor. That's their heritage, and their mission, as they understand it. And now data scientists are stitching this status quo of the social order into models, like PredPol, that hold ever-greater sway over our lives.

In 2009, the Chicago Police Department received a \$2 million grant from the National Institute of Justice to develop a predictive program for crime. The theory behind Chicago's winning application was that with enough research and data they might be able to demonstrate that the spread of crime, like epidemics, follows certain patterns. It can be predicted and, hopefully, prevented.

'For fucks sake, its goddamn inequality and unfairness coupled with unpopular and punitive laws you ignorant fucks. You made the fucking crime with your shit social policies,' doesn't get you \$2 million.

Chicago Police have implemented a policy of warning the top-400 most likely to commit violent crimes, as decided by an algorithm. And to be fair to Chicago police, they're not arresting people, at least not yet. The goal of the police in this exercise is to save lives. If the four-hundred people who appear most likely to commit violent crimes receive a knock on the door and a warning, maybe some of them will think twice before packing

a gun. But let's consider this case in terms of fairness. He happened to grow up in a poor and dangerous neighborhood. In this, he was unlucky. He has been surrounded by crime, and many of his acquaintances have gotten caught up in it. And largely because of these circumstances—and not his own actions—he has been deemed dangerous. Now the police have their eye on him. And if he behaves foolishly, as millions of other Americans do on a regular basis, if he buys drugs or gets into a barroom fight or carries an unregistered handgun, the full force of the law will fall down on him, probably much harder than it would on most of us. After all, he's been warned. I would argue that the model that led police to his door has the wrong objective. Instead of simply trying to eradicate crimes, police should be attempting to build relationships in the neighborhood. This was one of the pillars of the original “broken-windows” study. The cops were on foot, talking to people, trying to help them uphold their own community standards. But that objective, in many cases, has been lost, steamrolled by models that equate arrests with safety.

We're often faced with a choice between fairness and efficiency. Our legal traditions lean strongly toward fairness. The Constitution, for example, presumes innocence and is engineered to value it. From a modeler's perspective, the presumption of innocence is a constraint, and the result is that some guilty people go free, especially those who can afford good lawyers. Even those found guilty have the right to appeal their verdict, which chews up time and resources. So the system sacrifices enormous efficiencies for the promise of fairness. The Constitution's implicit judgment is that freeing someone who may well have committed a crime, for lack of evidence, poses less of a danger to our society than jailing or executing an innocent person. Big Data models, by contrast, tend to favor efficiency. By their very nature, they feed on data that can be measured and counted. But fairness is squishy and hard to quantify. It is a concept. And computers, for all of their advances in language and logic, still struggle mightily with concepts. They understand ‘beauty’ only as a word associated with the Grand Canyon, ocean sunsets, and grooming tips in *Vogue* magazine. They try in vain to measure ‘friendship’ by counting likes and connections on Facebook. And the concept of fairness utterly escapes them. Programmers don't know how to code for it, and few of their bosses ask them to. So fairness isn't calculated into algorithms. And the result is massive, industrial production of unfairness. If you think of such algorithms as a factory, unfairness is the black stuff belching out of the smoke stacks. It's an emission, a toxic one. The question is whether we as a society are willing to sacrifice a bit of efficiency in the interest of fairness. Should we handicap the models, leaving certain data out?

Would society be so willing to sacrifice the concept of probable cause if everyone had to endure the harassment and indignities of stop and frisk? Chicago police have their own stop-and-frisk program. In the name of fairness, what if they sent a bunch of patrollers into the city's exclusive Gold Coast? Maybe they'd arrest joggers for jaywalking from the park across W. North Boulevard or crack down on poodle pooping along Lakeshore Drive. This heightened police presence would probably pick up more drunk drivers and perhaps uncover a few cases of insurance fraud, spousal abuse, or racketeering. Occasionally, just to give everyone a taste of the unvarnished experience, the cops might throw wealthy citizens on the trunks of their cruisers, wrench their arms, and snap on the handcuffs, perhaps while swearing and calling them hateful names. In time, this focus on the Gold Coast would create data. It would describe an increase in crime there, which would draw even more police into the fray. This would no doubt lead to growing anger and confrontations. I picture a double-parker talking back to police, refusing to get out of his Mercedes, and finding himself facing charges for resisting arrest. Yet another Gold Coast crime. This may sound less than serious. But a crucial part of justice is equality. And that means, among many other things, experiencing criminal justice equally. People who favor policies like stop and frisk should experience it themselves. Justice cannot just be something that one part of society inflicts upon the other.

If building trust is the objective, an arrest may well become a last resort, not the first. This more empathetic approach could lead to warmer relations between the police and the policed, and fewer of the tragedies we've seen in recent years.

Surveillance will change the very nature of insurance. Insurance is an industry, traditionally, that draws on the majority of the community to respond to the needs of an unfortunate minority. In the villages we lived in centuries ago, families, religious groups, and neighbors helped look after each other when fire, accident, or illness struck. In the market economy, we outsource this care to insurance companies, which keep a portion of the money for themselves and call it profit. As insurance companies learn more about us, they'll be able to pinpoint those who appear to be the riskiest customers and then either drive their rates to the stratosphere or, where legal, deny them coverage. This is a far cry from insurance's original purpose, which is to help society balance its risk. In a targeted world, we no longer pay the average. Instead, we're saddled with anticipated costs. Instead of smoothing out life's bumps, insurance companies will demand payment for those bumps in advance. This undermines the point of insurance, and the hits will fall especially hard on those who can least afford them.

Suppose a shady billionaire offered you the following deal:

“I will pay you \$30 a month, and in exchange, you will allow me to brainwash you for an hour every day, installing in your mind whichever political and commercial biases I want.”

Would you take the deal? Few sane people would. So the shady billionaire offers a slightly different deal:

“You will allow me to brainwash you for one hour every day, and in exchange, I will not charge you anything for this service.”

Now the deal suddenly sounds tempting to hundreds of millions of people. Don't follow their example.

“You want to fund the operation of websites through some means other than ads or paywalls.”

Well, see, I don't actually give the least fuck about how people fund their websites. Some sites will have subscriptions, and some subset of people will buy them. Some set of users will allow ads, some will block them. If you have a paywall, or ads, I'll block that shit—if I can't get to your site, I'll use the back button. Sites need traffic to claim to be relevant. Lock everyone out unless they pay, you lose people out of the gate—lock out people with ad-blockers, and you lose relevance.

“Shut down any site that doesn't have a shopping cart and isn't run by a nonprofit organization or as an individual's hobby?”

I simply don't give a fuck how organizations or people fund their sites. But I will keep blocking ad companies until I no longer can, and at which point the internet will have fully transitioned to be nothing but useless commercial shit anyway. I'm saying take anybody who works for an internet ad or analytics company, and beat them soundly with bats or doxx them and their families.

But I'm not willing to operate under the fiction that by visiting your website I have agreed to be ass-raped by the terms and conditions of every parasite you've partnered with—my terms of service are: I reserve the right to block anything I want, and you are free to in turn block me.

If I walked into a physical store and someone tried to collect my details and pass them on to their marketing partners and put a tracker on me, they'd be met with physical violence—digitally speaking I'm just doing the same thing. But I see no reason whatsoever why I should implicitly trust every third-party your site links to or let assholes like Facebook track me on unrelated sites.

In 2007, Facebook launched a service called Beacon that aimed to help people “share” their online shopping activity with their friends. As a result, when Sean Lane bought a diamond ring for his wife on Overstock.com as a surprise gift for Christmas, he was shocked to find that his purchase was automatically posted to all 720 of his friends, including his wife. In 2009, Facebook agreed to pay \$9.5 million to settle a class action lawsuit over Beacon and to shut down the service.

Instead of dropping the idea of turning its users into free product advertisements, however, Facebook revived it in 2011 with a product called Sponsored Stories that allowed advertisers to buy the rights to republish a user’s post and display it to that user’s friends as an advertisement. In 2013, Facebook agreed to pay \$20 million to settle a class action lawsuit over Sponsored Stories.

But rather than do away with the product, Facebook simply added new language to its privacy policy to make it clear to users that Facebook has the right to use its customers’ images and posts in advertisements. In other words, Facebook has been waging a multi-year war to be able to turn its users’ conversations into ads that it can sell. Google has since joined the fray, launching a similar program called “shared endorsements” that will turn users’ reviews, ratings, and comments into advertisements.

There is a study showing that an individual will respond more positively to a politician whose picture is subtly blended with his or her own photo. The change in the photo is undetectable, but it makes the viewer more receptive to the politician’s message. It turns out we like people more if they look like us. Now imagine if a social network were to offer a comparable service, permitting advertisers to blend their spokesperson with the user’s own profile picture. It is not a far leap from our current state of bathtub ads following us around. After all, if food engineers can design junk food to specifically target our taste buds in a way that makes us consume more, and gambling companies can build slot machines that encourage us to play more, why won’t marketers design their online presence to manipulate us in new ways?

In the months leading up to the November 2012 presidential election, Google took its guesses into the political realm in a controversial way. Searchers who looked up Barack Obama saw news about the president threaded into their future searches on other topics. Searchers who looked up Mitt Romney did not see news about the Republican presidential candidate included in subsequent searches. Google said that the disparity was simply the result of the mathematical formula it was using to predict users’ queries.

Google’s technologists viewed their effort as helping us figure out the answer to our needs before we know we have those needs. But it is worth

noting that if a newspaper did the same thing—inserted Obama news into articles about toothpaste for certain readers—it would be roundly called out as biased and intrusive. Similarly, a newspaper would be called out if it placed only gay ads in the papers of subscribers it deemed to be gay, or diabetes treatment ads in the papers of subscribers it guessed had the disease. Does technology immunize Google from something that would not otherwise be socially acceptable?

In a dream world, politicians would navigate countless targeted safe zones so that they could tailor their pitch for every subgroup—without letting the others see it. One candidate could be many candidates, with each part of the electorate seeing only the parts they liked. The convergence of Big Data and consumer marketing now provides politicians with powerful tools to attempt to do just that. They can target microgroups of citizens for both votes and money and appeal to each of them with a meticulously honed message, one that no one else is likely to see. It might be a banner on Facebook or a fund-raising email. But each one allows candidates to quietly sell multiple versions of themselves—and it's anyone's guess which version will show up for work after inauguration.

These tactics aren't limited to campaigns. They infect our civic life, with lobbyists and interest groups now using these targeting methods to carry out their dirty work. In 2015, the Center for Medical Progress, an antiabortion group, posted videos featuring what they claimed was an aborted fetus at a Planned Parenthood clinic. The videos asserted that Planned Parenthood doctors were selling baby parts for research, and they spurred a wave of protest, and a Republican push to eliminate the organization's funding. Research later showed that the video had been doctored: the so-called fetus was actually a photo of a stillborn baby born to a woman in rural Pennsylvania. Plus, Planned Parenthood does not sell fetal tissue. The Center for Medical Progress admitted that the video contained misinformation. That weakened its appeal for a mass market. But with microtargeting, antiabortion activists could continue to build an audience for the video, despite the flawed premise, and use it to raise funds to fight Planned Parenthood.

While that campaign launched into public view, hundreds of others continue to hover below the surface, addressing individual voters. These quieter campaigns are equally deceptive and even less accountable. And they deliver ideological bombs that politicians will only hint at on the record. These groups pinpoint vulnerable voters and then target them with fear-mongering campaigns, scaring them about their children's safety or the rise of illegal immigration. At the same time, they can keep those ads from the eyes of voters likely to be turned off (or even disgusted) by such messaging.

As this happens, it will become harder to access the political messages our neighbors are seeing—and as a result, to understand why they believe what they do, often passionately. Even a nosy journalist will struggle to track down the messaging. It is not enough simply to visit the candidate's web page, because they, too, automatically profile and target each visitor, weighing everything from their zip codes to the links they click on the page, even the photos they appear to look at. It's also fruitless to create dozens of fake profiles, because the systems associate each real voter with deep accumulated knowledge, including purchasing records, addresses, phone numbers, voting records, social security numbers, and Facebook profiles. To convince the system it's real, each fake would have to come with its own load of data. Fabricating one would require far too much work for a research project, and in the worst-case scenario it might get the investigator tangled up in fraud. The result of these subterranean campaigns is a dangerous imbalance. The political marketers maintain deep dossiers on us, feed us a trickle of information, and measure how we respond to it. But we're kept in the dark about what our neighbors are being fed. This resembles a common tactic used by business negotiators. They deal with different parties separately so that none of them knows what the other is hearing. This asymmetry of information prevents the various parties from joining forces—which is precisely the point of a democratic government.

The owners of powerful companies will always have their own interests and agendas. If they have the means to promote and protect their self-interest and deep beliefs, refraining from the opportunity will require restraint that isn't universally present in human beings. That temptation grows even stronger when technology permits hidden-hand interventions in the political process. It's foolish to believe that it can't happen here, when it already has.

At the federal level, this problem could be greatly alleviated by abolishing the Electoral College system. It's the winner-take-all mathematics from state to state that delivers so much power to a relative handful of voters. It's as if in politics, as in economics, we have a privileged one percent. And the money from the financial one percent underwrites the microtargeting to secure the votes of the political one percent. Without the Electoral College, by contrast, every vote would be worth exactly the same. That would be a step toward democracy.

As is often the case, the very same models that inflict damage could be used to humanity's benefit. Instead of targeting people in order to manipulate them, it could line them up for help. In a mayoral race, for example, a microtargeting campaign might tag certain voters for angry messages about unaffordable rents. But if the candidate knows these voters

are angry about rent, how about using the same technology to identify the ones who will most benefit from affordable housing and then help them find it? With political messaging, as with most algorithms, the heart of the problem is almost always the objective. Change that objective from leeching off people to helping them and the model can potentially become a force for good.

While more fairness and justice would of course benefit society as a whole, individual companies are not positioned to reap the rewards. For most of them, in fact, algorithms appear to be highly effective. Entire business models, such as for-profit universities and payday loans, are built upon them. And when a software program successfully targets people desperate enough to pay 18 percent a month, those raking in the profits think it's working just fine.

In our society, where money buys influence, these victims of models are nearly voiceless. Most are disenfranchised politically. Indeed, all too often the poor are blamed for their poverty, their bad schools, and the crime that afflicts their neighborhoods. That's why few politicians even bother with antipoverty strategies. In the common view, the ills of poverty are more like a disease, and the effort—or at least the rhetoric—is to quarantine it and keep it from spreading to the middle class. We need to think about how we assign blame in modern life and how models exacerbate this cycle. Human decision-making, while often flawed, has one chief virtue: it can evolve. As human beings learn and adapt, we change, and so do our processes. Automated systems, by contrast, stay stuck in time until engineers dive in to change them.

In a sense, our society is struggling with a new industrial revolution. And we can draw some lessons from the last one. The turn of the twentieth century was a time of great progress. People could light their houses with electricity and heat them with coal. Modern railroads brought in meat, vegetables, and canned goods from a continent away. For many, the good life was getting better. Yet this progress had a gruesome underside. It was powered by horribly exploited workers, many of them children. In the absence of health or safety regulations, coal mines were death traps. In 1907 alone, 3,242 miners died. Meatpackers worked twelve to fifteen hours a day in filthy conditions and often shipped toxic products. Armour and Co. dispatched cans of rotten beef by the ton to US Army troops, using a layer of boric acid to mask the stench. Meanwhile, rapacious monopolists dominated the railroads, energy companies, and utilities and jacked up customers' rates, which amounted to a tax on the national economy.

Clearly, the free market could not control its excesses. So after journalists like Ida Tarbell and Upton Sinclair exposed these and other problems, the

government stepped in. It established safety protocols and health inspections for food, and it outlawed child labor. With the rise of unions, and the passage of laws safeguarding them, our society moved toward eight-hour workdays and weekends off. These new standards protected companies that didn't want to exploit workers or sell tainted foods, because their competitors had to follow the same rules. And while they no doubt raised the costs of doing business, they also benefited society as a whole. Few of us would want to return to a time before they existed.

There's no fixing a backward model like the value-added model. The only solution in such a case is to ditch the unfair system. Forget, at least for the next decade or two, about building tools to measure the effectiveness of a teacher. It's too complex to model, and the only available data are crude proxies. The model is simply not good enough yet to inform important decisions about the people we trust to teach our children. That's a job that requires subtlety and context. Even in the age of Big Data, it remains a problem for humans to solve. Of course, the human analysts, whether the principal or administrators, should consider lots of data, including the students' test scores. They should incorporate positive feedback loops. These are the angelic cousins of the pernicious feedback loops we've come to know so well. A positive loop simply provides information to the data scientist—or to the automatic system—so that the model can be improved. In this case, it's simply a matter of asking teachers and students alike if the evaluations make sense for them, if they understand and accept the premises behind them. If not, how could they be enhanced? Only when we have an ecosystem with positive feedback loops can we expect to improve teaching using data. Until then it's just punitive.

The problem is that when we outsource thinking to machines, we are really outsourcing thinking to the organizations that run the machines. Organizing knowledge is an ancient pursuit. Those who toiled in this field over the centuries—librarians and bookstore owners, scholars and archivists—were trained to go about their work lovingly, almost worshipfully. A professional code implored them to treat their cargo as if the world depended on its safe transit through the generations. The tech companies share none of that concern.

The tech companies are destroying something precious, which is the possibility of contemplation. They have created a world in which we're constantly watched and always distracted. Through their accumulation of data, they have constructed a portrait of our minds, which they use to invisibly guide mass behavior—and increasingly individual behavior—to further their financial interests. Their most precious asset is our most precious asset, our attention, and they have abused it.

The somewhat surprising truth is that behavior consistently rewarded is in fact more prone to “extinction” than behavior inconsistently rewarded. Hope springs eternal. Of course, if we pause to consider this we might see it is not so counter-intuitive after all. Most of us will have experienced taking something for granted—a loved one, a service, a safety device, a feeling—and the potential in bustle of everyday experience to undervalue such things.

If, through the right combination of reminders, nudges, and virtual badges, we can get people to be “perfect citizens”—recycle, show up at elections, care about urban infrastructure—should we take advantage of the possibilities offered by smart technologies? Or should we, perhaps, accept that slacking off and idleness, in small doses, are productive in that they create spaces and openings where citizens can still be appealed to by deliberation and moral argument, not just the promise of a better shopping discount courtesy of their smartphone app? If problem solvers can get you to recycle via a game, would they even bother with the less effective and often more difficult path of engaging you in moral reasoning? The difference is that those people earning points in a game might end up not knowing anything about the problem they were solving, while those who had been through the argument would have at least a tiny chance of grasping the issue’s complexity and doing something that would matter in the years to come, not just today.

For those who are worried about the loss of privacy such practices seem to portend, Eric Schmidt tells us that it’s all inevitable anyway, nothing we can do about it.

“In the future, by the time a man is in his forties, he will have accumulated and stored a comprehensive online narrative, all facts and fictions, every misstep and every triumph, spanning every phase of his life. Even the rumors will live forever.”

The aim of such a statement, obviously, is to make Google’s scary business model seem like no big deal, just the future doing what comes naturally. Even so, the scary side keeps peeking through. Schmidt’s single most famous statement, delivered to a CNBC talker in 2009, is a direct rationalization of surveillance-for-profit:

“If you have something that you don’t want anyone to know, maybe you shouldn’t be doing it in the first place.”

The way to react to a world in which you are under observation at all times, in other words, is simply to never step out of line.

The truth is that many Americans may not see looking into a suspect's or defendant's mind without consent as a fundamental affront to human dignity.

We owe it to future generations to make an active choice on the proper balance between privacy and security. Given the different cultural backgrounds that people bring to the table, our best bet may be to think about things from the perspective of someone who knew she would one day be accused of a crime but did not know whether she would be innocent or guilty. With that outlook, we wouldn't go down the road to routine police questioning using brain scans until the science was very settled indeed. We might, however, be supportive of a defendant's right to bring in even imperfect proof of truthfulness. There's no reason that prosecutors and defendants should have to meet the same hurdles when it comes to lie-detection evidence. And in a period of less than absolute certainty, it seems fitting that mind-reading technology should serve as a shield rather than a sword.

Though Facebook will occasionally talk about the transparency of governments and corporations, what it really wants to advance is the transparency of individuals—or what it has called, at various moments, “radical transparency” or “ultimate transparency.” The theory holds that the sunshine of sharing our intimate details will disinfect the moral mess of our lives. Even if we don't intend for our secrets to become public knowledge, their exposure will improve society. With the looming threat that our embarrassing information will be broadcast, we'll behave better. And perhaps the ubiquity of incriminating photos and damning revelations will prod us to become more tolerant of one another's sins. Besides, there's virtue in living our lives truthfully. According to the wise sage, Mark Zuckerberg:

“The days of you having a different image for your work friends or co-workers and for the other people you know are probably coming to an end pretty quickly. Having two identities for yourself is an example of a lack of integrity.”

The answer is simple: troves of personal data can and will be abused. Consider one of the oldest and supposedly innocuous dragnets of all: the US Census. The confidentiality of personal information collected by the census is protected by law, and yet census data have been repeatedly abused. During World War I, it was used to locate draft violators. During World War II, the Census Bureau provided the names and addresses of Japanese-American residents to the US Secret Service. The information was used to round up Japanese residents and place them in internment camps. It was not until 2000 that the Census Bureau issued a formal apology for its behavior.

And in 2002 and 2003, the Census Bureau provided statistical information about Arab-Americans to the Department of Homeland Security. After bad publicity, it revised its policies to require that top officials approve requests from other agencies for sensitive information such as race, ethnicity, religion, political affiliation, and sexual orientation.

The United States is not alone in abusing population statistics. Australia used population registration data to force the migration of aboriginal people at the turn of the twentieth century. In South Africa, the census was a key instrument of the state's apartheid system of racial segregation. During the Rwandan genocide of 1994, Tutsi victims were targeted with the help of ID cards that indicated their ethnicity. During the Holocaust, France, Poland, the Netherlands, Norway, and Germany used population data to locate Jews for extermination.

A simple truth: information is power. Anyone who holds a vast amount of information about us has power over us. At first, the information age promised to empower individuals with access to previously hidden information. We could comparison shop across the world for the best price, for the best bit of knowledge, for people who shared our views. But now the balance of power is shifting and large institutions—both governments and corporations—are gaining the upper hand in the information wars, by tracking vast quantities of information about mundane aspects of our lives. Now we are learning that people who hold our data can subject us to embarrassment, or drain our pocketbooks, or accuse us of criminal behavior. This knowledge could, in turn, create a culture of fear.

In a study of psychological effects of Stasi surveillance about thirty individuals who had had direct encounters with the secret police were interviewed. It was found that their fear of another Stasi encounter had prompted them either to become model citizens or to withdraw from society. Researchers concluded that people who encountered the Stasi internalized repression into “the body's wrinkles and the brain's mechanisms.”

It's been known since at least 2008 that mass surveillance in the US suppresses any behavior seen as minority behavior, undesirable behavior, or weak behavior, and this is a huge effect.

This is the truly insidious nature of self-censorship: it does the gag work more efficiently than an army of bullying and meddling media moguls could ever hope to accomplish.

Research shows that covert surveillance can cause anxiety and self-repression in adults. In children, surveillance appears to do something particularly depressing: it undermines their enthusiasm to learn. A landmark 1975 study concluded that adult surveillance of children had the effect of “turning play into work,” dampening the children's enthusiasm for playing

with an interesting puzzle. In the study, children were left alone in a room with a camera pointed at them and told that an adult would be watching them through the camera as they played with the puzzle. The next time the surveilled children were presented with the puzzle in a normal classroom setting, they had far less interest in playing with it than the control group. “The knowledge that one’s performance at a task is being observed and evaluated by someone else appears sufficient to decrease later interest in the task,” wrote the study’s authors.

The children’s enthusiasm for the puzzle declined even further when they were given explicit rewards for playing with the puzzle. Children were shown enticing toys and told that they could play with them if they did a good job on the puzzles. The next time that they were presented with the puzzle in a normal classroom setting, their interest in the puzzle fell even further. The researchers concluded that the best way to interest children in an activity is to “employ the minimal amount of pressure sufficient to elicit or maintain the desired behavior.”

Many of us always cared about privacy, even as kids. As a kid, we were concerned about parental surveillance. Now we are concerned about corporate and governmental surveillance. Over time, our threat model has simply changed.

The limitations to speech we allow to be imposed on us now will impact our governance as surely as moats and mountains did in the past.

“Encryption by itself is not enough. If you don’t influence your government as well, eventually encryption (by you) will be illegal with penalties equivalent to murder.”

Well fuck then, if I’m a murderer either way, might as well do me some real, old-fashioned murdering.

Brandenburg v. Ohio, overturned the criminal conviction of a Ku Klux Klan leader who had threatened violence against political officials in a speech. The Court said that the First Amendment guarantees of free speech and free press are so strong that they “do not permit a State to forbid or proscribe advocacy of the use of force.”

I’m thinking and might have even texted some guy about possibly buying drugs. Better lock me up because thinking or discussing things is the same as doing.

I used my gardening skills to help a friend in IRC with his grow op. Better lock me up for intent to cultivate and distribute.

My friends and I planned how to rob a bank and procured all the necessary materials but didn't rob one. Better lock us up for this horrible crime we've committed against society.

Information is not harmful, direct action is. Open your eyes.

If there has been no harmful action, then there is nothing but speech, information, thoughts and ideas, and tools, which may or may not translate into direct action in the future. Attacks and punishments for anything less than direct action is simply oppressive and unjust.

A greater risk of physical harm is much better than allowing the government to deprive individuals of rights and justice before any harm has been caused.

We don't devote huge amounts of resources to surveil and track corporate executives and their plans around how to possibly skirt some regulation or law to make more money, maybe polluting and sickening some people in the process. This ideology has harmed far more individuals directly than radical Islam yet here we are hunting down these people for their thoughts and discussions and collection of tools without any actual harm to show for it.

“If someone posted online threats to kill X, repeatedly, then met with groups that advocated X's murder, discussed specific technical details of how to kill him, searched for methods and materials to kill him, and the FBI knew all of this, what would you have them do? Wait until the bomb went off?”

There's a lot of words there designed to hide what you're really saying:

What would you have them do? Wait until an actual crime was committed before acting?

And of course you conveniently leave out the option of stopping them during the commission of the crime, when it is quite clear that they are not simply sharing information and thoughts but directly acting.

The object of efficient totalitarian states is to create a climate in which people do not think of rebelling, a climate in which incarceration and state-sanctioned murder are used against only a handful of unmanageable renegades. The totalitarian state achieves this control by systematically shutting down all human spontaneity—and by extension, human freedom—through fear. This fear and loss of spontaneity keep a population traumatized and immobilized and turn the courts, along with legislative bodies, into mechanisms that legalize the crimes of state.

A successful movement must contain a willingness to accept death or suffering as a possible consequence. Or an exit strategy that allows oneself

to get away to live and fight another day. An over militarized police takes care of one and Big Brother takes care of the other.

A system that is overwhelmingly powerful relies on everyone in power to act perfectly—so much has to go right to prevent meaningful abuse.

What advancements are we making impossible today—at the societal level—by creating a mass surveillance society where all laws, rules, and expectations are increasingly expected to be followed, and where the celebration of misfits are emptier words than ever before? Where privacy is no longer guaranteed, but rather prevented, by those governments which are supposed to uphold it?

“He had used the Internet as a teenager to explore ideas and speak with people in faraway places and from radically different backgrounds whom he’d never otherwise have encountered.

‘Basically, the Internet allowed me to experience freedom and explore my full capacity as a human being. For many kids, the Internet is a means of self-actualization. It allows them to explore who they are and who they want to be, but that works only if we’re able to be private and anonymous, to make mistakes without them following us. I worry that mine was the last generation to enjoy that freedom.’”

Freedom is not merely the opportunity to do as one pleases; neither is it merely the opportunity to choose between set alternatives. Freedom is, first of all, the chance to formulate the available choices, to argue over them—and then, the opportunity to choose.

When people ask me why I care about privacy, I always return to the simple thought that I want there to be safe, private spaces in the world for myself, for everybody. I want there to be room in the digital world for letters sealed with hot wax. Must we always be writing postcards that can—and will—be read by anyone along the way? Do we want to live in a world where we are always at risk of being hacked? A world where we can always be found, we can’t keep secrets, we can be watched even in our own homes, we can be impersonated, we can be trapped in a hall of mirrors, we can be financially manipulated and put in a police lineup?

Perhaps the most famous formulation of what privacy means and why it is so universally and supremely desired was offered by US Supreme Court Justice Louis Brandeis in the 1928 case *Olmstead v. US*:

“The right to be left alone is the most comprehensive of rights, and the right most valued by a free people.”

The value of privacy, he wrote, “is much broader in scope” than mere civic freedoms. It is, he said, fundamental:

“The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man’s spiritual nature, of his feelings and of his intellect. They knew that only a part of the pain, pleasure, and satisfactions of life are to be found in material things. They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations. They conferred, as against the Government, the right to be let alone.”

In the chaos of the great crime bill orgy of 1970, many senators would vote on bills that took predatory swipes at civil liberties protections dating back centuries—with little knowledge of what was actually in them. Senate majority leader Mike Mansfield—the highest-ranking member of the Senate after the vice president—was typical. Mansfield said at one point that he was so overwhelmed, he’d just given up on trying to figure out if some of the laws he was voting on were constitutional. He said he’d just vote for them all and let the courts sort it out.

“The Alice-in-Wonderland nature of this pronouncement is not lost on me; but after careful and extensive consideration, I find myself stuck in a paradoxical situation in which I cannot solve a problem because of contradictory constraints and rules—a veritable Catch-22. I can find no way around the thicket of laws and precedents that effectively allow the Executive Branch of our Government to proclaim as perfectly lawful certain actions that seem on their face incompatible with our Constitution and laws, while keeping the reasons for their conclusion a secret.”

All individuals have a right to privacy. All organizations and actions which affect the public must be completely transparent to the public. These principles do not work in isolation; the fault is not with the principles, but the isolation.

The lack of importance placed on privacy may also be directly related to the rule by extroverts we have been subjected to since the beginnings of society. Until we had the internet, the leaders of large crowds were almost always charismatic people with a gift for public speaking and a natural resistance to personal attack, belonging to powerful demographic groups. As the internet has gained in power to the point where it is a direct threat to those currently holding power, as liquid feedback replaces public shouting

matches, the powerful in the molecular world have sought to expose and control those in the online world. Any involuntary exposure has been met by violent reaction from the internet as it is the first place for many that has ever felt like a safe place to speak. One reason Anonymous and the internet in general has had a low opinion of those who seek personal fame may be that the internet is well populated by those who have been persecuted and had their voices repressed by others who easily acquire fame and social power.

The voices of the 50% of the population who are naturally more introverted and almost everyone eliminated from mainstream forums for one reason or another, are at least as important as those currently heard. This, however, completely changes the society we are accustomed to, if the voiceless suddenly gain voices, if the creators no longer need the marketers, women do not need to speak through men, and children, the elderly, discriminated minorities, the ostracized of all societies can suddenly speak and have their messages amplified as well as anyone else. This would eliminate huge swathes of industry from communication and representative types of roles, everything from politicians, to media, to marketing companies and NGOs. Not at all coincidentally, all of the lobby groups attempting to control the internet, strip privacy and anonymity, and manage access are from the groups who would no longer be required if everyone had a voice.

Assemblies and all other group and public activities have continued the oligarchies of the extroverts.

Even more than privacy, anonymity is viewed as a hostile act by those in power. A culture in which fame is the ultimate achievement cannot understand the value of ownerless ideas and shape-shifting personas. Anonymity has been equated almost exclusively with criminal activity by politicians and lawmakers.

These are the salient points that have actually changed people's minds, or at least made them seriously reconsider their position on privacy, in my day to day encounters. I tend to pick two from these four, and tailor them to the person that I'm talking to, to talk about the things that they probably value the most.

The Society Argument: Privacy may not be critically important to you, but it is crucial to consider how it impacts all of us collectively. There are rights that are taken for granted that can be dismantled if privacy is lost, that will lead to a worse world to live in. The loss of things like doctor-patient confidentiality; attorney-client privilege; the ability to maintain important business secrets, for reporters to maintain

confidential sources, for whistle-blowers to report wrongdoing at their workplaces, and to go about your everyday lives is crucial.

The Chinese censor the news and monitor internet traffic to identify potential dissidents and send them to “reeducation camps.” They are also implementing a national social credit score, where doing things like speaking out against the government, or talking to someone who does, can inhibit your ability to travel, get a job, and live your life. In Bangladesh, bloggers who speak out against Islam are murdered when their online identities are tied to their real ones. The US has had a number of recent incidents where whistle-blowers are being hunted—and no, this is not limited to the Bad Orange Man.

The Security Argument: To understand the impact of mass surveillance it is crucially important to understand the damage that surveillance programs do to worldwide standards and digital security. Making software do what we want it to is the hallmark problem of this century. As things are now, adding complexity to any system makes it less secure, and surveillance does exactly that. The governments of the world are constantly pushing to make systems less secure so that they can continue mass surveillance effectively. These policies lead us down a road where billions of dollars are lost and data breaches are daily news. Even the strongest systems in the world are not impervious to attack, as we saw with the Office of Personnel Management hack that leaked information about active American spies. We should be building the most secure systems we can and not worrying about spying, especially considering the next two arguments.

The Bad Actor Argument: It is important to consider that collected information is permanent, and just because you may support or accept the current administration in your country, it may not be there in the future. You may trust the people who have access to your data now, but will you trust every person who ever has access to your information for the rest of your life? The Axis powers in WWII used detailed dossiers gathered by countries long before the war to effectively find and exterminate Jewish citizens. Or, if we want to look to a more modern slice of history, our Facebook data is actively used against us by political actors, both domestic and foreign. In Egypt they use social media and Internet monitoring to find and punish gay people. The Iranians use the web to find people who violate religious law, who are then charged with “spreading corruption on earth.”

The Utilitarian Argument: The equipment that it takes to conduct mass surveillance is ludicrously expensive, and there's no real evidence that all of that expenditure is even marginally effective. There's better ways to use all of that money, even if you just want to keep more of it in your own pocket.

Not everyone will be convinced. But many people will be, as I've never heard an effective argument against any of these points. It is important to make them consider the real-world consequences that their position has, and to broach the topic in a way that is non-confrontational and allows them to dwell on the new information that you've given them.

Often, this provides a great base of ideas and leads a person who hasn't given the topic much thought at all to grow into a supporter of internet privacy.

Human Sacrifice

Camouflaged Oppression

If we could see the emotional scars, the still raw, red, infected wounds, what would we do? Would a mass of the working class today look any less disfigured than one composed of those eaten by the machines of the industrial revolution?

Structural violence is the war of the billionaires and millionaires against the rest of us, marks and suckers born every second in their eyes. Disaster Capitalism is violence. Parasitic investing is war. Hostile takeovers are. Hedge funds poisoning retirement funds and billions wasted, stolen with fees to “manage” this dirty money are war. Forced arbitration is war. PayDay loans are war. Wells Fargo stealing homes is war. Lead in New Jersey cities’ pipes is war. Hog excrement, toxins, blood, aborted fetuses, and pond scum sprayed onto land near poor communities is war.

Fence-lining polluting industries against poor and minority populations is war. Placing garbage dumps, oil refineries, and other hazardous manufacturing operations in the midst of black communities is a continuation of the Jim Crow policies that have existed in one form or another, legally or illegally, since slavery. The evidence has been before us for decades that the lower class have been getting sick and enduring horrible deaths from the filth that they breathe, eat, drink, and otherwise ingest from the garbage dumps, landfills, incinerators, toxic waste sites, oil refineries, petrochemical plants and other world-class generators of pollution that have been deliberately and relentlessly installed in the neighborhoods where they live, work, worship, and go to school. Government and industry alike have used poor neighborhoods as dumping grounds for the vilest and most dangerous of pollutants.

War is making it illegal to sit on a curb, holding a sign asking for a handout; so is the fact there are millions of empty buildings collecting black mold and tax deferments. War is offshore accounts, and war is a society plugged into forced, perceived, and planned obsolescence.

Human sacrifice props up the social order. We must recognize this still occurs instead of simply looking down on the “savages” we are presumed to have long since surpassed in morality. At least one contemporary practice is the death penalty.

People die. One of the powers of a leader in our society is to decide who dies when, where, how, and most importantly, why.

Haven't the tens of thousands of deaths since Obama and his courtiers gave us Obamacare instead of single payer been sacrificed on the altar of insurance company profits and elite power in general? What about Terror Tuesdays? We even had a Jesuit in on the “disposition.” Is not war at some level a contest to see who can pile up more lucky stiffes on their altars? ‘We can kill more of you, faster, so bow down.’

Or highway deaths. Or deaths from pollution from power plants. Or workplace deaths. Or deaths from despair?

We daily sacrifice thousands for our vaunted “way of life.” But the Steven Pinkers will tell us: ‘Yes, thousands die every day, but that’s what it takes to provide us with our modern way of life. So if you like modern comforts, don’t complain. Plus, it’s better than ever!’

Human sacrifice is alive and well right here and now. We’ve just learned not to see it so explicitly—hard to enjoy modern comforts with knowledge of those we deliberately sacrifice to obtain them. It certainly helps that John Hopkins has not made a fancy video-game-esque dashboard to track such sacrifices, that there is no constantly updated ticker, scrolling below, above, alongside your favorite pretty propagandist. No daily published death counts; no somber, serious press conferences by shitbags like Andrew Cuomo—now there’s a fantastic example of much of what is wrong with American politics in one family: dynastic political power combined with narrative control through the media. Who’s excited for ‘Cuomo 2024’? We are. And Fredo, we hope your sniffles weren’t too bad, and that your tooth is OK—I’m sure you can use your high-quality private health insurance to get it fixed, you’ll be a pretty propagandist once more—we want you healthy so we can use you like the tool you are. Using fever dreams to peddle your authoritarian bullshit—what an asshat.

From forty acres and a mule to the Great Society to subprime, it was the same swindle, over and over and over again: promises that turned into brutal obligations that turned into life-ruining debt and neighborhood-destroying foreclosures for some and massive windfall profits for others.

It is the quiet decisions, the individual judicial rulings and laws and executive orders—generally fashioned by well-meaning people, often in the plain light of day but overlooked for their homeliness, their implications lost in the weeds of their small details—that make possible the fiascos, the

follies, and the excesses that turn governments into the enemies of their constituents. For every Cheney mongering fear and nurturing paranoia, there are many officials quietly going about their business—drafting legislation, writing legal opinions, arguing in court—thinking they are doing the right thing but failing to grasp that in their wish to protect the country, they are in fact betraying it. And in no part of government has that betrayal by accretion, the death of liberty by a thousand cuts, been more momentous, or more disturbing, than in the institutions of justice—the courts, the laws, and the Justice Department.

“By the way, where are we on the slippery moral slope?”

Good question, let us analyze:

- Are we at the top: No. Guantanamo, et cetera.
- Are we at the bottom? No. This new injustice is not all encompassing.
- Are we ascending or descending? This is a new injustice—therefore descending.

We have a vector, but no absolute position.

- Do we have concentration camps? Not for a mass of citizens based on race. No. We are better than those guys.
- Do we have rule of law? Maybe, those in Chicago might disagree, as might many black citizens.
- Do we have an accountable parliament? No. See: health care. We are worse than those guys.

Hey we are both better and worse than those guys—does that put us in the middle?

Conclusion:

- We are on the slippery slope, in motion (not stationary) and sliding downwards.
- The position is sort of in the middle of the slope (with considerable uncertainty—measured by rights lost and gained)
- The velocity is not measurable, because the unit scale is not defined (How many named rights do we have, and how many rights per week abridged).

Process to measure and correct the system:

1. Name and enumerate the rights
2. Measure how many abridged by whom from what group on a time line
3. Deduce velocity and acceleration
4. Invent brakes? This may have something to do with elections and corruption.
5. Apply brakes! Stop the descent.
6. Climb back up slippery slope—needs a solid push from below (Typically considered as climbing over corpses).

Here's what I learned about Fear, American Style: The worst, most terrible things that the United States has done have almost never happened through an assault on American institutions; they've always happened *through* American institutions and practices. These are the elements of the American polity that have offered especially potent tools and instruments of intimidation and coercion: federalism, the separation of powers, social pluralism, and the rule of law. All the elements of the American experience that liberals and conservatives have so cherished as bulwarks of American freedom have also been sources and instruments of political fear. In all the cases I looked at, coercion, intimidation, repression, and violence were leveraged through these mechanisms, not in spite of them.

This is a country which eradicated whole civilizations from coast to coast. This is a country that managed to enslave—to torture and drive unto death, both physical and social—millions of black men, women, and their children, for over two centuries, and then to re-enslave them by another name for another century, not by shredding the Constitution but by writing and interpreting and executing the Constitution. This is a country that managed to mow down trade unionists and dissenters, to arrest and throw them into jail, to destroy vibrant social movements, to engineer a near-complete rout of American social democracy after World War II, to build and fill concentration camps, to pass legislation during the Cold War authorizing internment camps: all without a strongman; indeed, often with the collusion of some of the most esteemed voices of liberty in the country.

This is a country that in the last half-century has managed to undo some of the precious achievements of liberal civilization—the ban and revulsion against torture, the prohibition on preventive war, the right to organize, the

skepticism of the imperial executive—through lawyers, genteel men of the Senate with their august traditions and practices, and the Supreme Court.

When it comes to the most terrible kinds of repression and violence, Fear, American Style has worked because it has given so many players a piece of the pie. The most prized elements of American constitutionalism—shared and fragmented power, compromise and consent, dispersed authority—are the very things that have animated and underwritten Fear, American Style.

Freedom in America is an illusion and the powerful interlocking interests working to the disadvantage of common humanity must be challenged repeatedly and tirelessly.

Unlike political theory, the Constitution not only offers us a picture of reality but through the state's monopoly on violence, it forces citizens to act, or at least to speak, "as if." Acting as if the rule of law, equality of opportunity, freedom of the individual, and the neutrality of the state, all of which are inscribed in the Constitution, are more than formally true inhibits people's ability to recognize that they are all practically false, that the society set up with the help of the Constitution simply does not operate in these ways.

It is not a matter of reality failing to live up to a set of commendable ideals but of these ideals serving to help mask this reality through misrepresenting what is legal for what is actual, what is permissible in law for what is possible in society.

When does an ideal become a barrier to the realization of what it supposedly promotes? When people are encouraged to treat the ideal as a description, however imperfect, of the real, as in the claim that ours is a society ruled by law, where whatever actually exists that goes counter to this claim is relegated to the role of a passing qualification.

Viewed in this way, the dynamics of who is doing what to whom and why, together with the structural reforms needed to change things, can never be understood.

Freedom has little meaning without reference to power. Those who claim to be on the side of freedom while ignoring the growing imbalance of economic and political power in America and other advanced economies are not in fact on the side of freedom. They are on the side of those with the power.

Gandhi said one of the crucial roles for anyone who wants to change anything is to make the oppression visible—to give it a physical shape.

"If a white man wants to lynch me, that's his problem. If he's got the power to lynch me, that's my problem. Racism is not a question of attitude; it's a question of power. Racism gets

its power from capitalism. Thus, if you're anti-racist, whether you know it or not, you must be anti-capitalist. The power for racism, the power for sexism, comes from capitalism, not an attitude."

—Stokely Carmichael

As nightfall does not come at once, neither does oppression. In both instances, there is a twilight when everything remains seemingly unchanged. And it is in such twilight that we all must be most aware of change in the air—however slight—lest we become unwitting victims of the darkness.

We should not judge the past by the standards of the present. Darwin wrote about "savages;" we wouldn't. But then, we use words that our great-grandchildren will be shocked by, too—though which ones: wife? veal chops? But we should not judge the past by the standards of the past either—if we did that, we'd smile politely as some of our ancestors burned books, and nod understandingly as others burned witches—and some of us would be nodding as both our ancestors and their books got burned. We should judge the past by the standards of the best voices that were heard within it.

Europe's use of slaves dropped after the fall of the Western Roman Empire with the increase in serfs and indentured servants and the decrease in trade. Europe was still frequently raided for slaves for all reasons, particularly the Slavs who were so often raided that the condition of slavery became synonymous with their name. Possibly three-million Russians, Poles, Ukrainians, Moldovans, Circassians, and Lithuanians were enslaved by Central Asian khanates between 1500–1774 or six-and-a-half-million between 1200 to 1760, in a trade several authors have dubbed the "harvesting of the steppe." The great Russian historian Vasily Klyuchevsky observed:

"If you consider how much time and spiritual and material strength was wasted in the monotonous, brutal, toilsome, and painful pursuit of [the Tatar] steppe predators, one need not ask what people in Eastern Europe were doing while those of Western Europe advanced in industry and commerce, in civil life and in the arts and sciences."

In the era of abolition, slavery was depicted in American colonies as a problem of racial equality. This approach disregards the entire history of global slavery which took place before racism was invented and which hasn't been slowed at all by attempts to eliminate racism. The international focus on one part of the historical trade, labour slaves from Africa to European colonies, in particular the United States, has allowed all other slavery to

operate with varying levels of impunity. When slavery becomes so visible it can't escape notice, it is now called human trafficking. While the new term focuses on the sale of people rather than the use of them, they are both incomplete terms and the only reason to swap one for the other is to pretend that there was a point in history where slavery was abolished and now it is a historical topic. While there may no longer be African slaves picking cotton in the United States, there is unprecedented slave labour in the United States from the rest of the Americas and even more slaves from around the world in the United States sex industry. Despite the fact that there are far more books and papers discussing the end of slavery than the continuation of it, slavery has increased in almost every part of the world.

Slavery, like genocide, is a problem that has been with us in every region and every era. To our credit, both are now almost universally recognized as something we need to overcome, but we are nowhere close to doing so. Both are largely ignored by both media and public, perhaps because those whose job it is to see that these crimes do not go on are helpless to stop them. Despite the attempts at creating peacekeeping forces by the United Nations and others, we have not developed a way for larger society to protect one group of people who another are intent on massacring. Neither do we have any way to stop a lucrative trade economy in any product, particularly when many of those profiting occupy powerful positions. It is easier to pretend these things no longer happen.

It makes sense that slavery and environmental destruction would go hand in hand. In some ways they spring from the same root. Our consumer economy is driven at its most basic level by resource extraction, pulling things from the earth, an extraction that we never actually see. We pull food from the earth, of course, but we also pull our cellphones from the earth, our clothing, our computers, our flat-screen televisions, our cars—it all comes from the earth, ultimately. And pulling things from the earth can be a dirty business. To make our consumer economy hum and grow and instantly gratify, costs are driven down as low as they can go, especially at the bottom of the supply chain; this can lead to abusive conditions for workers and harm to the natural world. Taken to the extreme it means slavery and catastrophic environmental destruction. But all this normally happens far from any prying eyes. It's a hidden world that keeps its secrets.

It turns out that the foundations of our ingenious new economy rest on the forceful extraction of minerals in places where laws do not work and criminals control everything.

Exhausted, hollow-eyed children, wasted sinewy men, and women with blank stares float through the mist like ghosts and cower when swaggering soldiers pass. Their fear is real.

“This is where the girls are butchered like goats. And if anyone is suspected of swallowing precious minerals, they just cut open their bellies.”

The supply chain that reaches from the Bisie mine to the phone in your pocket has around eleven steps, the last two being the retailer where we buy our goods and ourselves, the ultimate consumers of the cellphones, laptops, and everything else. Since most businesses don't want slavery in their products, the lies told to hide slavery cluster most thickly at the beginning of the supply chain. The sense of guilt or responsibility for the origin of the base materials fades at every step on the chain—until it is completely extinguished in the minds of many consumers.

While accountants are pressing hard on their suppliers, it is that same pressure that echoes all the way back to the mines in the Congo. Back in the mines, money is driving slavery, high up the supply chain, money is driving a blind eye to slavery. And the money that ultimately drives both is the spending and bargain hunting by consumers.

At the very beginning of the twentieth century there was an unquenchable demand in America and Europe for an amazing new technology—air-filled rubber tires. The Age of the Railroad was ending. Henry Ford was making cars by the million, bicycles were pouring out of factories, freight was moving in gasoline-powered trucks, and they all ran on rubber. The Congo had more natural rubber than anywhere else. To meet this demand King Leopold II of Belgium, in one of the greatest scams in history, tricked local tribes into signing away their lands and lives in bogus treaties that none of them could read. He sold these “concessions” to speculators who used torture and murder to drive whole communities into the jungle to harvest rubber. The profits from the slave-driving concessions were stupendous.

Wild rubber, as well as elephant ivory for piano keys and decoration, was ripped out of the forests at an incredible human cost. Experts believe that ten-million people died. It is the great forgotten genocide of the twentieth century—the Holocaust marketing team had access to better PR-folks. One witness was an African-American journalist named George Washington Williams. He coined the phrase “crimes against humanity” to describe what he saw.

The same cycle that fueled the slavery and genocide of 1901 continues to revolve today, not just in Congo but around the world. It's a four-step process; simple in form yet complex in the way it plays out. In the rich half of the world step one arrives with great advertising fanfare. A new product is developed that will transform our lives and, suddenly, we can't live without it. Consumer demand drives production that, in turn, requires raw materials.

These materials might be foodstuffs or timber, steel or granite, or one of a hundred minerals from glittering gold and diamonds to muddy pebbles of coltan and tin.

Step two is the inevitable casting of a curse—the “resource curse” that falls on the poorest parts of the world when their muddy pebbles, little-used forest, or some other natural resource suddenly becomes extremely valuable. In a context of poverty and corruption the scramble for resource control is immediate and deadly. Kleptocratic governments swell with new riches that are used to buy the weapons that will keep them in power. But for every bloated dictator there are ten lean and hungry outsiders who also know how to use guns, and they lust for the money flowing down the product chain. Soon, civil war is a chronic condition, the infrastructure of small businesses, schools, and hospitals collapses, the unarmed population is terrorized and enslaved, and the criminal vultures settle down to a long and bloody feed.

Step three arrives as the pecking order stabilizes and gangs begin to focus less on fighting each other and more on increasing their profits. A little chaos is good for criminal business, but too much is disruptive, even for warlords. Black markets also need some stability, and with territories carved up and guns pointing at workers instead of other armed gangs, the lean and hungry men begin to grow fat themselves. Step four builds on this new stability that serves only the criminals. Secure in their power, the thugs ramp up production, finding new sources of raw materials and new pools of labor to exploit. Thus the curse has reached its full power. In that lawless, impoverished, unstable, remote region, slavery and environmental destruction flourish.

The shock of sexual assault is often the beginning of slavery, followed by grinding abuse and dangerous and degrading work that destroys the natural world. Rape is used to break the spirit and make the new slave more pliable, and that slave is then used as a tool against nature, crushing it to fund more violence and more slavery. This cycle of rape, slavery, and ecocide is not the work of lone criminals, but a vicious policy from the very top that brings new meaning to the term ‘total war.’

It is a truth that human beings survive what so often seems to be unsurvivable. At the same time, survivors are changed. The past is never dead. It’s not even past. How do we—and the men and women in the electronics companies who share our responsibility—make this right? The first step is just to admit what we’ve done and stop thinking we’re some kind of victim because conflict minerals have been foisted upon us. Yes, criminals tried hard to conceal what they were doing, but we created the market, rushing headlong into the wonders of our new electronics and demanding that they be cheap and plentiful. The corporations responded to our demand, and

we've done well out of it, but we were heedless of where all this great stuff was coming from. It's time to accept our responsibility. Then we can start to clean up the mess we helped to create.

That's the thing about criminals that commit slavery and ecocide, they hide what they do and make things hard to trace. But if you're making your living dealing in metals, whether in the form of jewelry or cellphones, you have a responsibility to not hurt other people while you make profits. The supply chain may be complicated; the morals are not. And, if we are the beneficiaries of the work of slaves and the devastation of the environment, our responsibility goes far beyond ensuring that we have clean laptops. If others paid for our favorite tools and toys with their bodies and minds, we owe them relief, care, and restitution. Without that their damage will roll like a hereditary disease down through the generations.

“When I was sixteen my father sent me to Dublar Char. My family, my parents, were very poor, and the economy was so bad, my parents sent me there. A recruiter came to our house. He told my parents he would give them 2,000 taka [\$29] if they'd let me come and work. He promised to pay them more later when I had earned more. He said the work was easy, you just cut fish and hang them on racks to dry, and there was plenty of food to eat. My parents needed the money and I wanted to help, so it was agreed and I left with the recruiter.

We traveled all night on a boat, it was cold but all right, and they gave me some rice. There were some other boys on the boat as well. In the morning we reached the island and the recruiter handed us over to a boss. Right away the boss began to shout at us, he told us we had to make our own shelter. He gave us tools and we began to cut poles and palm leaves. As we worked, one of the trees fell on one boy breaking his hand. The bones were pushing out, the skin all lumpy, the boss just sent him to a boat and told them to take him back.

Before we could finish the shelter, boats came to the island with the fish they'd caught that day. Now the work really started. As long as the boats came we had to keep working. First we'd wade into the water and carry baskets of fish to shore. Once several basket loads were spilled out on a mat some of us would begin to cut open the fish and clean them. Some fish had to be cut a certain way, others had to be split just right. As the cleaned and split fish piled up, other boys would run them over to the racks and hang them to dry. The racks were just poles

tied together, some were one level, maybe four feet high, but others were built up and up and you had to climb up eight, ten, twelve feet or more to put fish on the different levels.

It was cold. We were always cold and wet. My clothes would be soaked from wading into the water to the boats, and the fish guts were everywhere, splashing onto us as we cut them open. We sat on the wet ground all night. If we slowed down or stopped the boss would hit us, if we weren't moving fast when we hung the fish on the racks he'd hit us with a long stick he carried. All the time he'd yell at us, calling us filthy names. Some boats brought their catch at night, others just at dawn. Often we'd have to work twenty-four hours straight. Maybe we'd be able to snatch a little sleep. The boss made us keep going as long as there were fish to clean and hang on the racks. The longer I worked, I'd get exhausted and clumsy. Sometimes I'd cut myself with the gutting knife or slip and fall from the drying rack. If you were cut or hurt, you had to keep working. Whenever I made a mistake, the boss would hit me.

About twelve of us slept in the same shelter, and we got one meal a day. The recruiter lied about the food. The boss would give us 250 grams of old dried lentils for the whole group, and we'd make a thin soup. There were bits of fish around but we couldn't eat them. There were fish guts everywhere, everything stank of fish, we didn't want to eat fish, we were sick of fish. Sometimes, if we got really hungry, we'd eat a small handful of fish. With the lentils the boss sometimes gave us two or three potatoes to split between all of us, or maybe some old cauliflower to put in the soup. We'd put a lot of chili peppers in the soup to cover up the rank old lentils. We were hungry all the time.

I got sick. Once I had a fever, I was too sick to work. The boss came and beat me till I got up and went back to work. It was always this way, fevers and diarrhea. While I was there, seven or eight people in the fishing camp died of diarrhea. The guard would just take their bodies into the forest and leave them.

There were two small boys in our hut. The guard was sexually abusing them. He would come and get one or the other of them from the shelter at night. They were really hurt. I felt so guilty that I couldn't protect them. The guard would come at night and take a boy, and we'd want to stop him but we couldn't. If we said anything, the guards would beat us. Finally, after two and a half months a boat came from my village to buy dried

fish. I knew someone on the boat. I talked to the people on the boat and told them what was happening. That night, as we were loading fish, we sneaked the two boys onto the boat. They were hidden behind the baskets of dried fish when the boat left. The people on the boat were frightened, they knew they'd be hurt if they were caught.

That night we were very frightened too. I knew the guard would kill us if he found out, but I had an idea. So early the next morning we went to the guard and said, 'Where are those boys? What did you do with them? We can't find them!' We knew the guard would kill us if he knew the truth. The guard was confused, he just said, 'Oh, maybe they ran into the forest and a tiger ate them. . . .' He never suspected what had happened. He probably thought they had run away into the forest.

I was on Dublar Char six months, the whole winter when the fish are coming. When the season came to an end, the boss let me get on a boat with some of the last fish sold. I was sick and weak, but the boat left me near my village and I was able to get home. I was never paid, my parents never got anything beyond the 2,000 taka the recruiter gave them. Now it is winter again and my father wants me to go because he wants the money, but I said 'no'—now there is a training project and I am learning carpentry. I am making chairs and tables. I make them according to order. I'm doing okay."

—Shumir

"The man who recruited me said nothing about the hard work, but it was bad. As soon as we got to the island, the smell was terrible, I'll never forget it. Then the man said, 'You'll clean fish, and dry and pack fish, and if you don't work, well, we'll be very angry.' So I followed the other boys when the fishing boats would come close to the shore and we'd walk out into the water and carry baskets of fish back to the camp. The baskets were heavy, but you had to carry them, if I couldn't carry one or if I dropped it, I'd be beaten. I'd watch the sea, because I knew when the tide came, the fishing boats would come with their fish.

In the middle of the camp was a big space for cleaning fish, this is where I'd take a basket and dump it on palm-leaf mats spread on the ground. First, everyone dumps their fish, then everyone starts sorting the fish. Each type of fish had to be

sorted into its own pile. Then we'd tie the fish together by their mouths, unless they were knife-fish, then we'd attach their tails together. When they were tied together they were ready to hang on the drying frames. Some fish you cut a little bit to make it dry more quickly, others you made cuts so it could be hung on the rack. There are a lot of different types of fish, but the worst kind is shark. Cutting and cleaning the sharks was the hardest part for me because they are so big, you have to cut out their stomachs and wash them inside. They were heavy. Then you had to cut them in half lengthwise in order to put them to dry.

When you're cutting fish, you cut yourself too; it happens all the time. There were fifteen or twenty other boys there with me. Some were little like me, some were aged fifteen or sixteen, and some were smaller, maybe eight or ten years old. When one load of fish was done, you'd start another. If there wasn't another load, then I'd just sit, but we'd also have to use that time to make food, or repair nets, or collect the dried fish from the racks and pack them into big burlap bags.

We got to sleep if there were no fish to clean, but that might be for only an hour between loads. I felt confused all the time because I had no sleep. Sometimes when I was cutting fish my head would start nodding and I would fall asleep, then the boss would hit me.

See, there's a guard there all the time with a stick. He was a big man, a fat man. He would shout or hit me. If I worked really hard he would be happy, but if I didn't he would swear at me—'son-of-a-bitch,' he called me, or 'pig's-son,' or worse things. I felt so bad when that happened.

Whenever I was tired he'd hit me; basically this was every day. Sometimes I got sick, like with a fever, other boys did too. There was someone who sold medicine, but no money, no medicine, so we never got medicine. One boy had terrible diarrhea and died. And headaches, I had horrible headaches, maybe from carrying the baskets on my head. But this wasn't the worst. The worst thing was the tigers.

Tigers live on the island and in the forest by the camp. At night we'd hear the tigers. When they roar you can hear them from a long way away. We'd never know how close they were. One day a boy was sent into the forest next to the camp to gather wood for cooking. A tiger took him; a couple of days later we found him. He had been eaten. This was the most

frightening thing.

After I escaped, I got back here and started catching crabs with my father. I like being back here and working here. Of course, this is my home. I don't want to go to school anymore, I want to work. I want to work with my dad on his boat. My mom died in childbirth a while back, that was when I went to the island, so it is hard. But I just want to stay here.

There are still a lot of children there. . . .”

—Shankar

Fifty years ago there were no shrimp farms or fish camps like these carved out of the protected forest. In the past, local fishermen worked the waters and took their catch to the markets in nearby river towns. At that time, the Sundarban islands, already a UNESCO World Heritage Site, and the great mangrove forest, the largest carbon sink in Southeast Asia, was protected more by its wild remoteness than by the laws setting it aside as a national park.

All that changed when seafood went global. In America and Europe it was a slow, barely noticeable change. In the 1950s a fancy meal might start with shrimp cocktail, four or five shrimp arranged around the rim of a cocktail glass filled with sauce. It was country club food, it cost more than steak, and you turned up your pinkie as you ate it and got to think of yourself as sophisticated in the bargain. Unless you happened to be near the Gulf of Mexico, those fresh little shrimp would have been rushed over a long distance at enormous cost. Adjusted for inflation, those five little shrimp around a cocktail glass in 1950 cost over a dollar each. Today, three dollars will buy you a whole pound of shrimp brought all the way from Bangladesh to your refrigerator.

From a camp like Shumir's or Shankar's, dried fish flow mainly into local markets, for pet food and livestock feed and human food, such as fish stock cubes. You don't think of organized crime being involved in stock cubes, but a wilderness island like Dublar Char makes a perfect slave-based processing site.

If you take somebody far from home, under certain conditions, you can get them to do whatever you want. It could happen to anybody.

“I come from a little village in the north of the country, up near the border with Burkina Faso. It is very poor there, the land is poor, there is little water. Hot winds come down from the Sahara. There are lots of people, but not much work.

When I was six years old, my father died. I don't know how or why. My mother tried to hold us together, but it was hard, we didn't have much to eat. Then, when I was nine, she died too. She just got weaker and weaker and died. My brothers and sisters were given to other families, I don't know what has happened to them. My uncle took me, he wasn't married, so it was just the two of us. By that time I had done two years of school, but when my mother died I had to stop going to school and start working. After a while my uncle decided to leave our village and come south and find work. That was how I came here."

Ibrahim and his uncle were following a trail of words, stories of the golden south where there was plenty of food and good jobs. They joined an exodus so great that the population of northern Ghana fell by a third over the space of ten years. Ibrahim and his uncle tracked the rumors south to the gold mines in Ashanti state—believing that any work involving gold would have to pay well. They'd heard wonderful stories about the jobs in the big company mines: training, equipment, sometimes even housing was provided, and a whopping regular salary. There was even medical care if you needed it. But when Ibrahim and his uncle reached the mining town of Obuasi, there were no jobs for them. To get a job you needed education and recommendations, and they were just two more Northerners in a flood of desperate migrants. The mining companies turned them away. Ibrahim explained what happened next:

"We'd run out of money and we knew no one in the south. We didn't have a place to stay and we were hungry. My uncle was looking everywhere for work, we just wanted to earn a little so we could live. But there were no jobs. Then we met a man who said he could get us a job in a gold mine. He said there would be food and plenty of work, and that the more gold we mined, the more money we could make. So my uncle agreed to join an eight-man crew that would be working together. The man gave us some money to buy food before we went to the mine. He said we would work for three months and then we would be paid according to the amount of gold we had mined.

We had to walk a long way into the forest where the mining camp was hidden. When we got to the mine, we realized this wasn't a legal mine being run by one of the big companies. We were told not to tell anyone about the mine, and there were

guards to warn if anyone came near, but also to keep us from leaving. It was a big camp spread around the entrance to a deep shaft mine, more than four-hundred people were working there.

My uncle became the co-leader of the eight-man work gang. At first we were just carriers, hauling the ore on our backs from deep in the mine to the surface and then carrying it on a path out to the road. This is the lowest job; you only get paid a little according to the amount of ore that you carry. Then, after a while, my uncle began to work with a hammer and chisel at the rock face, this was a better job, but also more dangerous. I was still small, so I did whatever I could to earn and help out. Sometimes I would carry ore, fetch tools, or run errands, I had to do anything anyone ordered me to do.

My uncle was able to protect me, but only a little. He kept me from having to work at the rock face, or deep in the mine, but it was still very hard. I was beaten pretty often. Some men would bully me, one would hit me on the back with the flat side of his machete. Anything I did wrong, any kind of mistake, would bring on a beating. If I overslept I would be beaten. This happened all the time. Sometimes it was the gang leader, sometimes other men in the gang, sometimes it was my uncle who hit me. It was bad, but my uncle and the rest of the gang were working flat out to earn as much as they could in the three months they had to work. They wanted to make a lot so they could send money to their families.

After three months the man who had brought us to the mine—we found out he was also the local gold buyer—came to settle up with my uncle and the work gang. We were expecting to be paid, but he told us that we hadn't earned enough. He said that the gold ore we had mined and carried wasn't worth enough to cover the advance he had given us to buy food plus the cost of tools and food we'd had over the three months at the mine. We didn't make anything! In fact now we owed even more money. It was a big sum and he said we would have to repay that with interest before we could leave the mine. The interest rate was fifty percent. We were shocked, but the boss wasn't angry, he said he would help us and told us not to worry. 'You'll get lucky with some rich ore soon,' he said, 'and make plenty to pay me back. Meanwhile, I'll advance you a little more money so you'll have the food to keep working.'"

You could call it bad luck, or bait and switch, or fraud, but the debt trap is one of the most common ways to trick people into slavery. It has many advantages for the slaveholders: no need for kidnapping or violence, the slaves are motivated and work hard, and the cost of getting slaves is very, very low. It takes little more than slick promises and some food to get desperate people like Ibrahim and his uncle to surrender, unknowingly, into slavery. And once they're enslaved, the debt trap has a powerful force that locks them in bondage—honesty.

Dishonesty feeds on honesty. The very rules of trust and honesty that guided Ibrahim and his uncle in their dealings with other people were a tool used against them. They were poor, but they were honest and religious people. They had a very strong sense that debts must be repaid, and that a person who did not pay their debts was a thief and a sinner. The abuse of this fundamental belief by the gold buyer was very clever, since it was in his interest to string the slaves along with lies as long as possible.

If a slaveholder resorts to violence too soon or too arbitrarily, the workers will realize that they can never work their way out of debt and their pride and honesty can no longer be used to manipulate them. When it becomes clear that the boss is lying, that they are being cheated, then a different set of rules applies. For that reason, the boss will keep appealing to their sense of "fair play." The workers are told they just have to try a little harder, that the boss is trying to help them. The workers are caught in a situation where they believe trust might pay off but running away will pay nothing. To increase his psychological control, the slaveholder boss may choose to actually pay some of the workers occasionally, though late and usually below the agreed rate. The fact that they might get paid (or are paid even a little) gives them hope and keeps them working, especially since the alternative is no work, no money, nothing to support their families, and no way to get home. The crucial truth that workers like Ibrahim and his uncle don't know is that when they realize the truth of their situation and try to get away, violence will fall on them like a hammer.

Just after his tenth birthday the jaws of the debt trap snapped shut and Ibrahim became a slave. There was no ceremony or clear marker as he lost his freedom, but hemmed in by hunger and exhaustion, accepting the "fact" of his crippling debt, and knowing that resistance brought violence, he was just swallowed by slavery. He didn't know it but he was joining the hundreds of thousands of others who, over the centuries, had been enslaved in this very same place as gold fed greed and greed spawned bondage.

The ton of ore Ibrahim mines in a day yields, on average, about ten dollars' worth of gold, but by the time all the "fees" are paid, his share will barely cover the one or two dollars a day needed to pay for that day's

food, and goes nowhere toward clearing his existing debt. Over time it becomes clear to the workers that they are trapped. It's fair to ask why they don't just run away. The answer is simple, as simple as slavery has been throughout history—if you try to leave you'll be hunted down and beaten.

The boss at each mine keeps an eye on the enslaved haulers and chiselers, encouraging them to work harder with blows and abuse. He forces the sick back to work, and if someone tries to slip off, he drags them back and beats them in front of everyone else. If a worker does manage to escape, corrupt local police know they will be paid to track him down. Once caught, after the police have beaten him, he'll be returned to the mine or taken before a judge where another bribe will secure his conviction for defrauding the gold buyer (in his role of moneylender). The cost of the trial and bribe are then added to the worker's debt. The miners learn they can't win, or as one miner said:

“I know this is a crime, but there is nothing I can do about it. If I tried anything my children would go hungry.”

Not even death provides an escape. When a miner dies the debt passes to his next of kin, and the gold buyer's thugs make sure the brother, wife, or child know that they now carry the load.

To look squarely at yourself in slavery is to look down a well of hopelessness. It can be excruciatingly painful to speak honestly about a stolen life, but Ibrahim, sometimes shaking as he spoke, faced his devils and told his story:

“I've worked in several mines, and lived through many raids by police and security guards. When a raid starts, there is usually a warning shot from a lookout, and then everyone runs for their lives. We know that anyone caught will be beaten badly. You just have to sleep in the forest that night, and then sneak back to the mine the next day. It is always the same, everything is destroyed, and anything you didn't carry into the forest is gone. But the gang leader is there with the guards, and you have to go back to work, cleaning up, getting the mine ready to start producing again.

Once, when I was seventeen, the police surrounded the mine and I was grabbed as I ran into the forest. They beat me up and arrested me for illegal mining. After a night in jail I was taken before a judge. I couldn't understand what was happening; it was all going so quickly. Then I heard the sentence—two years in prison, and that was that. I was taken to the town of Kumasi

and locked up. The prison was packed, really crowded, and it was dangerous. Bad things happened there. We got one meal a day. Inside I realized many prisoners were just teenagers like me, and I thought about how the gang leaders and the moneylenders were never arrested, never paid fines.

I feel good that you are listening to me, for the first time someone is letting me talk about my pain. I am happy that I have been listened to and understood. But it also makes me feel very sad that all this is happening to me, and I do not have a clue about how to get out of it. I know from what we have talked about that I am a slave. I want to be remembered. When my story is written and your book is ready, will you send me a copy? I want to show it to others, to show them that I am not completely useless. I just want to show that something good can come out of my life.”

The slavery feeding into a stream of gold baubles that we might give to our loved ones or receive as some reward for our “good deeds” is so immediately heartbreaking that it is hard to see beyond it. It is a crime and an affront to any sense of decency. But there is more to this crime than just slavery. The silicosis, the mercury poisoning, and the environmental destruction mean that families who are not enslaved also suffer, that communities that don’t have anything to do with gold can end up slowly dying of poison and disease. That damage is a widening gyre encompassing all of us, a circle that soon overlaps other circles of slavery and destruction. But that damage also reaches from the physical world and into the special realm of memory.

In the twenty-first century, slavery has brought a dark age of ignorance to the gold region. The enslaved workers know no history and no future. There are virtually no machines, but plenty of constant, mindless toil. As so many times before, memory is a casualty of slavery. It is hard to measure this loss of memory. How do you fathom what is not there; how do you gauge a void? Most of us are replete with memories, and surrounded by aide-mémoires. We don’t just hold a mind full of experiences, we keep photos, letters, videos, cards, gifts, drawings, seashells, feathers, a gold ring perhaps—anything that stores precious or crucial or even frivolous memories for us. It is difficult for those of us who live in freedom, who are so glutted with memory, to imagine a mind that cannot store away the meaningful or the simply enjoyable. Yet, one way that slavery steals life in its essence is by never allowing memories to form.

Slavery steals so much from a person. Free will, movement, having your own money and charting your own way, they are all lost. For an adult who

has come to slavery by making bad choices or just by being tricked, this loss is deeply painful. But what of the little child who is enslaved, and grows up to know nothing but bondage? Their loss is the greatest of all, for they lose the chance to construct from their memories that most precious of mysterious creations: a self.

Seba had been sent from her native Mali to France as a small girl, supposedly to live with a family to learn French and get an education. The reality was brutal slavery as a domestic servant, torture, and sexual assault that lasted from the time she was eight or nine until she was twenty-two. When I met her, Seba had recently been freed and was living with a volunteer foster family. She was receiving counseling and learning to read and write. As we talked, I plied her with questions, based on my assumptions about what slavery must be like, about her life and views and memories, and I soon realized that we weren't really communicating.

Trying a new tack, I pointed to a nearby round lampshade printed to look like a globe of the world, using it to ask some questions about where she was from. Within seconds it was clear—she did not know the world. There was no recognition that this ball represented our earth; that it was anything but a paper lampshade marked with blue and green splotches. I stepped back and started again, asking this bright and verbal young woman about the simplest of things. Yes, she had heard that the world was round. At the same time I found she had no concept of weeks, months, or years, and I came to understand that for Seba her only memory, her only understanding, was an endless round of work and sleep.

Denied the knowledge of time, her memories were strangely amorphous. She knew that there were hot days and cold days, but didn't know that the seasons follow a pattern. If she ever knew her birthday she had forgotten it, and did not know her age. And she was baffled by the idea of 'choice.' She told me she knew she was supposed to like these things called choices, that everyone seemed excited about her having this thing called a choice, but that no one had ever shown her one, so she just played along. It was in these moments that I got my first inkling of the lived reality of slavery. I learned slavery is much more than the loss of freedom, more than not having any choices. The brutality of slavery extends to the theft of our common knowledge, and the denial and destruction of our memories.

We tend to see our memories as who we are, the very stuff of our beings. Without memory we might not cease to exist, but we would cease to be who we are. The denial and destruction of memory is the special crime of slavery. The law might say that slavery occurs when one person has the rights of ownership over another person, but that is simply control, not the denial and destruction of a personality that is the less visible outcome of

slavery. And as this is done to a single slave, it can be perpetrated on whole populations, whole generations of slaves. In the same way slavery denies individual memory, it also massacres the common memory. The millions of slaves taken to the Americas from the Gold Coast and other parts of Africa were pressed hard to forget, worked into a stupor of exhaustion, separated from kin, and stripped of any physical remnant—clothing, charm, or comb—of their past. Often the only survival was a story, a song, or a seed, things that were intangible or seemingly unimportant. Brought together they might form a precious relic, a stew of okra cooked to a chant of words that still carried the rhythm and tone of memories if not their meaning.

When memory is lost, so is a sense of place. The slave has no home that is a refuge or a comfort. When your body is a disposable commodity, it is not hard to see everything reduced to the base valuation of greed. This is how slavery perniciously extends its devastation in new ways. This is how enslavement crushes Ibrahim's family and also consumes the natural world that could sustain them in freedom. The destruction of a single mind in slavery is multiplied out, to other people, and across species, space, and time to the natural world beyond.

Postcolonial independence movements—which so often had the redistribution of unjustly concentrated resources, whether of land or minerals, as their core missions—were consistently undermined through political assassinations, foreign interference, and, more recently, the chains of debt-driven structural adjustment programs—not to mention the corruption of local elites.

A labor inspector tried to dismiss the idea of slavery, but try as he might, he couldn't quite pull it off.

“This is not forced labor, but if they go to the illegal mines to work they borrow money and then get threatened when it is time to repay it. When the workers realize they are not being paid, they're told to just hang on awhile and keep working, then they are still not paid. If they try to leave, the gang leaders drag them back, keep them working, and don't let them off the premises. If they do run away they lose everything, and children are working in this debt labor as well.”

That's a pretty clear description of debt bondage slavery, but officials like the labor inspector are told not to use the word 'slavery.'

It's not just the government trying a cover-up. In African countries that suffered in the transatlantic slave trade, the word is loaded and touchy. Slavery is the great crime that Europeans did to them, not something that

they would allow their citizens to suffer today. In addition, in Ghana in particular, there is a strong taboo against calling anyone a slave, or even suggesting someone is a descendant of a slave. Everyone in Ghana knows that slavery was both an indigenous activity as well as something exploited by the Europeans. They also know who of their neighbors and fellow citizens is actually descended from slaves. It is easy to tell that about a person, their last names testify to it. But to speak of it is completely taboo.

It seems that everyone with power in the gold supply chain—governments, mining companies, local authorities, both large and small illegal operators, and slaveholders—all have an interest in business as usual. It is only the hungry displaced farmer, the young economic migrant, and the enslaved miner who are desperate for change.

Blind eyes are turned at every opportunity; as long as the flow of gold is not interrupted the current state of affairs serves everyone—except the slaves and the natural world, but who speaks for them?

It is hard to know if the great symbolism we invest in our little gold rings is the key to taking slavery out of the mines and protecting the natural world, or the biggest obstacle to those goals. When your gold ring carries the profound emotional investment of symbolizing your love and your marriage, then it should be important to know that no slavery, no dangerous child labor, no mercury poisoning of rivers and streams taints that ring. Yet, for many people, those facts are just too ugly to think about.

Of course, some people want gold as a badge of wealth not love. They use gold as a blatant demonstration of economic superiority, and they don't really care where it comes from. Ropes of bling, chunky gold watches, solid gold MP3 players, and gold-plated car wheels are all just a way of saying:

“This is all about me, and since I have things of obvious value, then I must be important and valued as well.”

It's a sad and pathetically hollow self-worth that depends on shiny jewelry, but it's so common it seems unavoidable, a kind of permanent flaw in human beings. Can people learn to see gold in a new way? All of human history seems to shout 'No!' Human existence is littered with lives damaged and destroyed by the lust for gold. But history also shows us that change might be possible. Remember that for most of human history slaves were an important way of showing off your wealth.

Even in relatively simple societies little penetrated by money, there were ritual needs for substantial expenditures—the payment of bride-price for marriage and the slaughter of a buffalo at the death of a family member. It is widely reported that such ritual needs are the most common reason why the poor become indebted to the rich.

It's not as if it is ordinary for fathers in traditional societies to be able to sell their children. This is a practice with a very specific history: it appears in the great agrarian civilizations, from Sumer to Rome to China, right around the time when we also start to see evidence of money, markets, and interest-bearing loans; later, more gradually, it also appears in those surrounding hinterlands that supplied those civilizations with slaves. What's more, if we examine the historical evidence, there seems good reason to believe that the very obsession with patriarchal honor that so defines tradition in the Middle East and Mediterranean world itself arose alongside the father's power to alienate his children—as a reaction to what were seen as the moral perils of the market. All of this is treated as somehow outside the bounds of economic history.

Focusing on the sex industry would be deceptive, though. Then as now, most women in debt bondage spend the vast majority of their time sewing, preparing soups, and scouring latrines. Even in the Bible, the admonition in the Ten Commandments not to “covet thy neighbor's wife” clearly referred not to lust in one's heart (adultery had already been covered in commandment number seven), but to the prospect of taking her as a debt-peon—in other words, as a servant to sweep one's yard and hang out the laundry.

Once we remove some of our usual blinders, we can see that matters have changed far less over the course of the last five-thousand years or so, than we really like to think.

The peculiar quality of social currencies is that they are never quite equivalent to people. If anything, they are a constant reminder that human beings can never be equivalent to anything—even, ultimately, to one another. This is the profound truth of the blood-feud. No one can ever really forgive the man who killed his brother because every brother is unique. Nothing could substitute—not even some other man given the same name and status as your brother, or a concubine who will bear a son who will be named after your brother, or a ghost-wife who will bear a child pledged to someday avenge his death. In a human economy, each person is unique, and of incomparable value, because each is a unique nexus of relations with others. A woman may be a daughter, sister, lover, rival, companion, mother, age-mate, and mentor to many different people in different ways. Each relation is unique, even in a society in which they are sustained through the constant giving back and forth of generic objects such as raffia cloth or bundles of copper wire. In one sense, those objects make one who one is—a fact illustrated by the way the objects used as social currencies are so often things otherwise used to clothe or decorate the human body, that help make one who one is in the eyes of others. Still, just as our clothes don't really make us who

we are, a relationship kept alive by the giving and taking of raffia is always something more than that. This means that the raffia, in turn, is always something less.

Even the notion that a person can substitute for a person, that one sister can somehow be equated with another, is by no means self-evident. In this sense, the term ‘human economy’ is double-edged. These are, after all, economies: that is, systems of exchange in which qualities are reduced to quantities, allowing calculations of gain and loss—even if those calculations are simply a matter (as in sister exchange) of one equals one, or (as in the feud) of one minus one equals zero. How is this calculability effectuated? How does it become possible to treat people as if they are identical? To make a human being an object of exchange, one woman equivalent to another for example, requires first of all ripping her from her context; that is, tearing her away from that web of relations that makes her the unique conflux of relations that she is, and thus, into a generic value capable of being added and subtracted and used as a means to measure debt. This requires a certain violence. To make her equivalent to a bar of camwood takes even more violence, and it takes an enormous amount of sustained and systematic violence to rip her so completely from her context that she becomes a slave. I should be clear here. I am not using the word ‘violence’ metaphorically. I am not speaking merely of conceptual violence, but of the literal threat of broken bones and bruised flesh; of punches and kicks; in much the same way that when the ancient Hebrews spoke of their daughters in “bondage,” they were not being poetic, but talking about literal ropes and chains.

Most of us don’t like to think much about violence. Those lucky enough to live relatively comfortable, secure lives in modern cities tend either to act as if it does not exist or, when reminded that it does, to write off the larger world “out there” as a terrible, brutal place, with not much that can be done to help it. Either instinct allows us not to have to think about the degree to which even our own daily existence is defined by violence or at least the threat of violence and to overstate the importance—or at least the frequency—of things like war, terrorism, and violent crime. The role of force in providing the framework for human relations is simply more explicit in what we call “traditional societies”—even if in many, actual physical assault by one human on another occurs less often than in our own.

Corralling the Fed, staunching the flow of money into politics, and limiting the predations of Big Government on civil liberties and economic freedoms would be welcome reforms, but they won’t be enough. The moral rot has hollowed out not just these institutions of governance and power, but the entire social order and the mode of production

Slavery, animal abuse, domestic violence, environmental destruction—

these are the issues we cannot focus on because we continue to allow a small minority to control the levers of power, monopolize the discourse, gain unprecedented wealth. We are constantly cleaning up—poorly—the mess caused by these systemic, fundamental aspects of our societal structure that we lose focus, deem unimportant, other tragic acts of harm. These issues are caused by us, our flawed ideas, ideologies, which promote greed, selfishness, destruction.

“The gangs make life dangerous and noisy for ordinary people living here. Constant war with the police, who use helicopters day and night, adds to the general mayhem of bikes roaring up and down and fireworks and crackers exploding in warning of a police presence. Their reputation for violence and crime tarnishes all the residents, who are discriminated against in job applications, health care and other ways. In almost all situations, it is easier to join a gang than battle against mainstream society for a place in its ranks.”

“I am a farmer from Echarte village near Cusco. It’s a very poor area. I had some pigs and grew cocoa and vegetables, but there was drought and our productivity went down. One day in 2003, a man came into the village and asked if we wanted a better life in Lima. He said we would live in a nice house and find good jobs and a good school for our two little boys. I thought about it with my wife for a few months, because we didn’t want to leave our families and our home.

But the drought got worse. We paid the man 1,500 soles and packed up a few belongings and left the countryside. We were told to meet the man at 5:00 with the money and a few sheets of plywood or *esteras* [bamboo sheeting]. When we met him, there were lots of other families just like us waiting there. We were taken to a sand dune and told to fence off an area of the dune and start constructing our houses from the material we brought with us. He helped arrange for a private company to connect us to the electricity and cable TV for a fee.

We have no water or sanitation. Our toilet is a silo, a hole we dig in the floor of the room and cover with plywood. Every couple of years, it gets full so we make another hole. It takes ten years for the whole of the floor space to be full of shit, and I don’t know what we’ll do then.”

How do you best act cruelly? It's to take something that's the dearest thing to that person away from them.

Owning Things Absolutely

Occasionally you hear people on the Right, or just grumpy small business owners, asserting that taxation is a form of legalized robbery. Some even compare it to slavery—Grover Norquist, commenting on Alexandria Ocasio-Cortez’s plan for a 70 percent marginal tax rate on multi-millionaires, asked: If “slavery is when your owner takes 100% of your production, what is the word for 70% expropriation?” Right-wing libertarians sometimes quote Frederick Douglass talking about how his wealth was taken by his master in order to grouse about having their wealth taken by their own “master,” Big Government.

It’s hard to think anyone who says this really believes it. In this country, slavery was a condition under which people could be beaten to death if they refused to work, under which women could be raped, their children sold away from them. A slave could be told to do a task and punished for not doing it, a slave could be prohibited from marrying or forced to marry. Ocasio-Cortez proposed that if you earn over 10 million dollars per year, every additional dollar should be taxed highly. To compare these two situations seems to me to involve such a detachment from reality that I hardly even know where to begin. It trivializes the harms of slavery, by comparing the condition of the slave to the condition of the present-day American super-wealthy—the freest, most privileged people in human history. If you think high marginal tax rates are slavery, then I’m sure you wouldn’t mind changing places with an actual slave. After all, it’s the same. They wouldn’t be losing anything, right? And if they think they would be losing something, well, that something is precisely the difference between having to pay your taxes and being a slave.

I could make you a list of about 400 ways in which being taxed is not like slavery. For one thing, you get to vote on tax policy! If slavery involved getting to choose your government, getting to choose which labor you did and for how long, and having a large pile of money, it might look more like the situation of the contemporary rich. But those things were not features of the system. Nevertheless, serious philosophers on the right have argued that taxation is a form of “forced labor.” Some have made the argument that taxing someone means forcing them to work. They argue that if you do believe in self-ownership you must agree that this means that people own their time, talents, and labor. They argue the standard Lockean argument for private property: that we produce goods by mixing our labor and talents with resources and goods in the natural world. This mixing generates the ownership of the items we have modified and made valuable. Now, if the

government taxes our income it is taking away our time, talents, and goods produced by our labor. Taxation is the taking of our labor and talents by force which means that the taking means effectively that the government owns our talents and labor and so owns us. According to them, taxation means that the government takes away our self-ownership which is called slavery.

There is so much slippery sophistry in this one paragraph. First, the “standard Lockean argument for private property” is bonkers, based far more on assertion than reasoning. The question it tries to answer is: How do “unowned” things come to be “owned” things in the first place? Or, since a property right is “the right to exclude others from use of a thing, by force if necessary,” the question is: How come people have a “right” to exclude others by force from things that were once held in common by all? The world was once unowned, but now people have private property. Why did they get to declare things their property? Now, historically speaking, they declared things their property largely by seizing them from those who were using them. But this makes the foundations of private property rights seem very shaky, hence the argument that people obtain property by “mixing their labor” with unowned things.

The “labor mixing” theory is vague and unhelpful. If I go into a public forest, and I carve a tree into a totem pole, do I now own the tree? After all, the totem pole is a fruit of my labor. What if I carve my name into it? If I open a can of soup into the ocean, spreading the soup far and wide, do I own the ocean? Who decides when I have put in adequate labor for a thing to become mine? This idea that you can claim pieces of the commons and call them ‘yours’ is what leads some to declare that “property is theft.” By fencing off a park and calling it mine, I am stealing it from other people. They used to have access to it, and now they don’t.

The philosophy of property rights is important, because the big holes in it make angry conservative appeals to “entitlement” somewhat nonsensical. If I live on stolen land, taken from a people who held the land as a commons, what on earth am I talking about when I say that it’s my land and that I’m entitled to the fruit of the labor I put into it?

“Seizing the results from someone’s labor is equivalent to seizing hours from him and directing him to carry on various activities. If people force you to do certain work, or unrewarded work, for a certain period of time, they decide what you are to do and what purposes your work is to serve apart from your decisions. This process whereby they take this decision from you

makes them a part-owner of you; it gives them a property right in you.”

I am not sure why “seizing the results from someone’s labor” is “equivalent” to “directing him to carry on various activities.” Stealing someone’s wallet means they’ll have to work some more if they want to have the same amount of things as before (or they’ll have to sit around and wait for some more capital income to accrue), but they won’t be punished or killed for not laboring. Theft and forced labor are different, and while this is an argument that taxation is theft, it’s not a good argument that it’s forced labor, because the labor isn’t forced. We do have legalized forced labor in the United States, actually, thanks to the Thirteenth Amendment—which explicitly permits slavery as punishment for crimes—but it is in prisons rather than boardrooms.

Is taxation theft, then? Well, first, I want us to be careful: Deciding whether taxation is ‘theft’ doesn’t actually tell us whether taxation is justified. The word ‘theft’ is used to imply that taxation is illegitimate, but it could be that taxation is both a kind of theft and is completely acceptable. How? Because Jean Valjean or Aladdin and his little monkey were correct to steal that loaf of bread. It wasn’t ‘not stealing.’ But it was fine. Unless you believe property rights are absolutes, that there is no other moral consideration that can override them, then we have to weigh the “sanctity of ownership” against other factors like people’s lives. Even the staunchest libertarians do not think property rights are absolutes—and if you press them on where to draw the line, they squirm, as you can see in this fascinating exchange between a libertarian and a socialist.

The libertarian says that obviously, if something he owned were necessary to save the universe, his property rights wouldn’t trump everything else. But when the socialist asks him “Why?” he flounders and sputters until the moderators steps in to save him. He struggles because once he announces a principle for why certain outcomes are bad enough that they justify overriding property rights, it won’t take much to make the case that today’s socialists are justified in seeing widespread material deprivation as bad enough to trump property rights.

I don’t think the question of whether taxation is theft is particularly relevant, then, because I think a more important question is what differing conceptions of rights produce in terms of justice. And I don’t think respect for the property rights of the wealthy is morally justified. A friend of mine is a teacher in the Detroit school system. She tells me that her kids are bright and gracious and wonderful, but they are poorer than you might realize. Many go to bed hungry, and are hungry at school. Many are homeless and

do not know where they will be spending the night. They do not have changes of clothes, they pass out in class because they couldn't get any rest. You can't ask them about what toys they like to play with, because they don't have them.

Now, Jeff Bezos has a net worth of \$140,000,000,000—or maybe it's more now. He could change every single one of these children's lives with the money he makes in about nine seconds. I do not really give a damn whether we decide that it's theft for the state to seize a portion of this wealth, because whatever value we might assign to respecting property rights is outweighed a thousandfold by the needs of others. The "utility" differences are staggering: an amount of money that is literally negligible to a billionaire can be of immeasurable assistance to someone who is rationing their insulin. The justice of massive expropriation is clear regardless of where we come down on taxation being a form of "legalized robbery" or not.

But there are still good reasons why it's not sensible to refer to taxation as a kind of theft. For one thing, taxation is foundational to a functional market economy. It's impossible to imagine a world in which everyone received their pre-tax income. The government is critical to the existence of the economy: Property rights are enforced by courts, money is issued by the government, the military "protects" us. There is no world in which pre-tax income could ever meaningfully belong to its recipients, because without taxes, there is no government, and government is necessary to create the roads, sewers, streetlights, courts, et cetera that make obtaining the income possible. The hand of government in creating the economy is present in myriad ways people don't notice. Consider limited liability and bankruptcy protection, two ways the state interferes significantly with property rights in ways favored by business. A corporation is incorporated, it makes money because it exists within a legal structure established by the state, with a set of legal protections afforded by the state.

There is a dimension of the 'taxation is theft' argument that I think is worth mentioning: the interesting conception of 'force' involved. The argument is quite simple: Taxation is a threat—give the Leviathan your money or go to jail, and if a private citizen did that they would be a mugger. But there's another important aspect to this: Not only are you not forced to earn an income or be rich, but you could always go and live somewhere else. Perhaps a floating artificial city, perhaps Bermuda, perhaps the moon. There is an important argument that if you choose to continue living in the United States, you accept its social contract.

You could immediately object by saying that this is not a meaningful choice: A dictator could say 'I haven't restricted free speech by banning newspapers, because they could always go and publish in some other country.'

Not everyone has the ability to go and live on the moon. Funnily enough, this is kind of a leftist argument: ‘Choice’ is not just a matter of whether you consent, but about the pressures that cause you to feel like you have to consent. It’s actually what leads us to argue that capitalists are the ones committing systemic theft, by forcing you to work longer hours than you would have if they hadn’t used a portion of your productivity to make other people rich. People on the right say that you “consent” to your employment conditions, but for poor workers that’s no different from saying that you consent to the restrictions on your speech imposed by a dictator by choosing not to flee the country.

We can imagine the United States as one big company town, or a block of residences governed by a condo association. The free market argument is that you don’t have liberties at work, or rights against private entities, because you contracted with them. If Facebook owns the city, and you live there, then you can’t complain about the rules Facebook imposes. You can’t say that Facebook’s security officers violated the Fourth Amendment in searching you, because the Fourth Amendment doesn’t apply to private entities. Corporations are kind of private dictatorships: By stepping onto their turf, you obey their rules, and you don’t have any kind of democratic decision-making power—as you, at least theoretically, do with the United States government. You can’t vote for your boss.

Let’s accept, then, that the left theory of coercion is correct: Just because people enter an institution voluntarily, doesn’t mean they lack rights vis-à-vis the institution, even if the contract says so. Wouldn’t that mean taxation is theft? Now, part of me wants to strike a bargain: If conservatives will say that employers steal surplus value from employees, I will say that taxation is theft, albeit perfectly justified and democratically voted-for theft that is returned to you in the form of countless important services. There’s another element to choice, though, which is that choice depends on your meaningful capacity to do otherwise. The ability of a rich person to leave the country and go work elsewhere is greater than the ability of a poor person to do so, because money is power. And rich citizens do sometimes give up their citizenship to avoid taxes.

More importantly, though: I do not believe that billionaires have any property right to their wealth in the first place. They have a legal right, but that doesn’t mean very much. Legal rights are created by laws, and so if you change the laws you change the rights. The question is whether there is some kind of natural entitlement to wealthy people having their vast wealth, and there isn’t. Property is, after all, theft to begin with, and just because you managed to obtain something lawfully under a legal system set up by people in your economic class doesn’t mean I have to respect your “natural”

right to it.

This is not to say that I believe nobody deserves to have their possessions protected: As I say, I am somewhat flexible and pragmatic in my approach, meaning that I do think people without much wealth should have their things treated as their things and respected, but I don't think people with a lot of wealth should have that same presumption. I think property, a.k.a. the right to use force to exclude others, should exist to the extent necessary, and the less you have, the more necessary it is to be able to exclude others from using the things you have. Some socialists draw a distinction between "personal possessions" and "private property." They think people should have their possessions, like heirlooms, clothes, a bicycle, respected, because these things are for personal use. A factory, on the other hand, is not for personal use, and should be held in common by its workers. Now, don't ask me to start putting every object on earth in one or the other of these categories. But it's a place to start in trying to distinguish the differences between Jeff Bezos' ownership of the Washington Post (which enables him to tell people what to do—and fire them if he likes—as well as influence the national narrative) and my ownership of my pants (which entitles me only to wear them).

Property is not really a relation between a person and a thing. It's an understanding or arrangement between people concerning things. The only reason that we sometimes fail to notice this is that in many cases—particularly when we are talking about our rights over our shoes, or cars, or power tools—we are talking of rights held, as English law puts it, "against all the world"—that is, understandings between ourselves and everyone else on the planet, that they will all refrain from interfering with our possessions, and therefore allow us to treat them more or less any way we like. A relation between one person and everyone else on the planet is, understandably, difficult to conceive as such. It's easier to think of it as a relationship with a thing. But even here, in practice this freedom to do as one likes turns out to be fairly limited. To say that the fact that I own a chainsaw gives me an "absolute power" to do anything I want with it is obviously absurd. Almost anything I might think of doing with a chainsaw outside my own home or land is likely to be illegal, and there are only a limited number of things I can really do with it inside. The only thing "absolute" about my rights to a chainsaw is my right to prevent anyone else from using it.

If you think about it, this really is an odd place to start in developing a theory of property law. It is probably fair to say that, in any part of the world, in any period of history, whether in ancient Japan or Machu Picchu, someone who had a piece of string was free to twist it, knot it, pull it apart, or toss it in the fire more or less as they had a mind to. Nowhere else

did legal theorists appear to have found this fact in any way interesting or important. Certainly no other tradition makes it the very basis of property law—since, after all, doing so made almost all actual law little more than a series of exceptions. How did this come about? And why? Perhaps the notion of absolute private property is really derived from slavery. One can imagine property not as a relation between people, but as a relation between a person and a thing, if one's starting point is a relation between two people, one of whom is also a thing. This is how slaves were defined in Roman law: they were people who were also a *res*, a thing.

The emphasis on absolute power begins to make sense as well. The word 'dominium,' meaning absolute private property, was not particularly ancient. It only appears in Latin in the late Republic, right around the time when hundreds of thousands of captive laborers were pouring into Italy, and when Rome, as a consequence, was becoming a genuine slave society. By 50 BC, Roman writers had come to simply assume that workers—whether the farmworkers harvesting peas in countryside plantations, the muleteers delivering those peas to shops in the city, or the clerks keeping count of them—were someone else's property. The existence of millions of creatures who were simultaneously persons and things created endless legal problems, and much of the creative genius of Roman law was spent in working out the endless ramifications.

In earliest Roman law slaves were still people, but of diminished worth, since injuries against them counted as 50 percent those of a free person. By the late Republic, around the time of the emergence of the concept of *dominium*, slaves had been redefined as *res*, things, and injuries to them had the same legal status as injuries to farm animals.

One need only flip open a casebook of Roman law to get a sense of these. This is from the second-century jurist Ulpian:

“Again, Mela writes that if some persons were playing ball and one of them, hitting the ball quite hard, knocked it against a barber's hands, and in this way the throat of a slave, whom the barber was shaving, was cut by a razor pressed against it, then who is the person with whom the culpability lay is liable under the *Lex Aquilia* [the law of civil damages]? Proclus says that the culpability lies with the barber; and indeed, if he was shaving at a place where games are normally played or where traffic was heavy, there is reason to fault him. But it would not be badly held that if someone entrusts himself to a barber who has a chair in a dangerous place, he should have himself to blame.”

In other words, the master cannot claim civil damages against the ballplayers or barber for destroying his property if the real problem was that he bought a stupid slave. Many of these debates might strike us as profoundly exotic—could you be accused of theft for merely convincing a slave to run away?; if someone killed a slave who was also your son, could you take your sentimental feelings toward him into account in assessing damages, or would you have to stick to his market value?—but our contemporary tradition of jurisprudence is founded directly on such debates.

In creating a notion of dominium, then, and thus creating the modern principle of absolute private property, what Roman jurists were doing first of all was taking a principle of domestic authority, of absolute power over people, defining some of those people (slaves) as things, and then extending the logic that originally applied to slaves to geese, chariots, barns, jewelry boxes, and so forth—that is, to every other sort of thing that the law had anything to do with. It was quite extraordinary, even in the ancient world, for a father to have the right to execute his slaves—let alone his children. No one is quite sure why the early Romans were so extreme in this regard.

It's telling, though, that the earliest Roman debt law was equally unusual in its harshness, since it allowed creditors to execute insolvent debtors. The early history of Rome, like the histories of early Greek city-states, was one of continual political struggle between creditors and debtors, until the Roman elite eventually figured out the principle that most successful Mediterranean elites learned: that a free peasantry means a more effective army, and that conquering armies can provide war captives who can do anything debt bondsmen used to do, and therefore, a social compromise—allowing limited popular representation, banning debt slavery, channeling some of the fruits of empire into social-welfare payments—was actually in their interest. Presumably, the absolute power of fathers developed as part of this whole constellation in the same way as we've seen elsewhere.

Debt bondage reduced family relations to relations of property; social reforms retained the new power of fathers but protected them from debt. At the same time, the increasing influx of slaves soon meant that any even moderately prosperous household was likely to contain slaves. This meant that the logic of conquest extended into the most intimate aspects of everyday life. Conquered people poured one's bath and combed one's hair. Conquered tutors taught one's children about poetry. Since slaves were sexually available to owners and their families, as well as to their friends and dinner guests, it is likely that most Romans' first sexual experience was with a boy or girl whose legal status was conceived as that of a defeated enemy.

What made Roman slavery so unusual, in historical terms, was a con-

juncture of two factors. One was its very arbitrariness. In dramatic contrast with, say plantation slavery in the Americas, there was no sense that certain people were naturally inferior and therefore destined to be slaves. Instead, slavery was seen as a misfortune that could happen to anyone. As a result, there was no reason that a slave might not be in every way superior to his or her master: smarter, with a finer sense of morality, better taste, and a greater understanding of philosophy. The master might even be willing to acknowledge this. There was no reason not to, since it had no effect on the nature of the relationship, which was simply one of power.

The second was the absolute nature of this power. There are many places where slaves are conceived as war captives, and masters as conquerors with absolute powers of life and death—but usually, this is something of an abstract principle. Almost everywhere, governments quickly move to limit such rights. At the very least, emperors and kings will insist that they are the only ones with the power to order others put to death. But under the Roman Republic there was no emperor; insofar as there was a sovereign body, it was the collective body of the slave-owners themselves. Only under the early Empire do we see any legislation limiting what owners could do to their (human) property: the first being a law of the time of the emperor Tiberius (dated 16 AD) stipulating that a master had to obtain a magistrate's permission before ordering a slave publicly torn apart by wild beasts.

However, the absolute nature of the master's power—the fact that in this context, he effectively was the state—also meant that there were, at first, no restrictions on manumission: a master could liberate his slave, or even adopt him or her, whereby—since liberty meant nothing outside of membership in a community—that slave automatically became a Roman citizen. This led to some very peculiar arrangements. In the first century, for example, it was not uncommon for educated Greeks to have themselves sold into slavery to some wealthy Roman in need of a secretary, entrust the money to a close friend or family member, and then, after a certain interval, buy themselves back, thus obtaining Roman citizenship. This despite the fact that, during such time as they were slaves, if their owner decided to, say, cut one of his secretary's feet off, legally, he would have been perfectly free to do so.

The relation of *dominus* and slave thus brought a relation of conquest, of absolute political power into the household, in fact, made it the essence of the household. It's important to emphasize that this was not a moral relation on either side. With the Romans as with the Athenians, for a male to be the object of sexual penetration was considered unbecoming to a citizen. In defending a freedman accused of continuing to provide sexual favors to

his former master, Haterius coined an aphorism that was later to become something of a popular dirty joke: *impudicitia in ingenuo crimen est, in servo necessitas, in liberto officium*—to be the object of anal penetration is a crime in the freeborn, a necessity for a slave, a duty for a freedman. What is significant here is that sexual subservience is considered the “duty” only of the freedman. It is not considered the “duty” of a slave. This is because, again, slavery was not a moral relation. The master could do what he liked, and there was nothing the slave could do about it.

This allows us to understand precisely how Liberals like Adam Smith were able to imagine the world the way they did. This is a tradition that assumes that liberty is essentially the right to do what one likes with one’s own property. In fact, not only does it make property a right; it treats rights themselves as a form of property. In a way, this is the greatest paradox of all. We are so used to the idea of “having” rights—that rights are something one can possess—that we rarely think about what this might actually mean. In fact (as Medieval jurists were well aware), one man’s right is simply another’s obligation. My right to free speech is others’ obligation not to punish me for speaking; my right to a trial by a jury of my peers is the responsibility of the government to maintain a system of jury duty. The problem is just the same as it was with property rights: when we are talking about obligations owed by everyone in the entire world, it’s difficult to think about it that way. It’s much easier to speak of having rights and freedoms. Still, if freedom is basically our right to own things, or to treat things as if we own them, then what would it mean to ‘own’ a freedom—wouldn’t it have to mean that our right to own property is itself a form of property? That does seem unnecessarily convoluted. What possible reason would one have to want to define it this way?

Historically, there is a simple—if somewhat disturbing—answer to this. Those who have argued that we are the natural owners of our rights and liberties have been mainly interested in asserting that we should be free to give them away, or even to sell them. Modern ideas of rights and liberties are derived from what came to be known as “natural rights theory.” It is one of the great ironies of history that this was always a body of theory embraced not by the progressives of that time, but by conservatives. Liberty was property and could be exchanged in the same way and in the same terms as any other property—sold, swapped, loaned, or otherwise voluntarily surrendered. It followed that there could be nothing intrinsically wrong with, say, debt peonage, or even slavery. And this is exactly what natural-rights theorists came to assert. In fact, over the next centuries, these ideas came to be developed above all in Antwerp and Lisbon, cities at the very center of the emerging slave trade. After all, they argued, we don’t really know what’s

going on in the lands behind places like Calabar, but there is no intrinsic reason to assume that the vast majority of the human cargo conveyed to European ships had not sold themselves, or been disposed of by their legal guardians, or lost their liberty in some other perfectly legitimate fashion. No doubt some had not, but abuses will exist in any system. The important thing was that there was nothing inherently unnatural or illegitimate about the idea that freedom could be sold.

Before long, similar arguments came to be employed to justify the absolute power of the state. Thomas Hobbes was the first to really develop this argument in the seventeenth century, but it soon became commonplace. Government was essentially a contract, a kind of business arrangement, whereby citizens had voluntarily given up some of their natural liberties to the sovereign. Finally, similar ideas have become the basis of that most basic, dominant institution of our present economic life: wage labor, which is, effectively, the renting of our freedom in the same way that slavery can be conceived as its sale.

It's not only our freedoms that we own; the same logic has come to be applied even to our own bodies, which are treated, in such formulations, as really no different than houses, cars, or furniture. We own ourselves, therefore outsiders have no right to trespass on us. Again, this might seem an innocuous, even a positive notion, but it looks rather different when we take into consideration the Roman tradition of property on which it is based. To say that we own ourselves is, oddly enough, to cast ourselves as both master and slave simultaneously. 'We' are both owners (exerting absolute power over our property), and yet somehow, at the same time, the things being owned (being the object of absolute power). The ancient Roman household, far from having been forgotten in the mists of history, is preserved in our most basic conception of ourselves—and, once again, just as in property law, the result is so strangely incoherent that it spins off into endless paradoxes the moment one tries to figure out what it would actually mean in practice.

Just as lawyers have spent a thousand years trying to make sense of Roman property concepts, so have philosophers spent centuries trying to understand how it could be possible for us to have a relation of domination over ourselves. The most popular solution—to say that each of us has something called a 'mind' and that this is completely separate from something else, which we can call 'the body,' and that the first thing holds natural dominion over the second—flies in the face of just about everything we now know about cognitive science. It's obviously untrue, but we continue to hold onto it anyway, for the simple reason that none of our everyday assumptions about property, law, and freedom would make any sense without it.

When “human rights abuses” are evoked in the newspapers, it is only when governments can be seen as trespassing on some victim’s person or possessions—say, by raping, torturing, or killing them. The Universal Declaration of Human Rights, like just about all similar documents, also speaks of universal rights to food and shelter, but one never reads about governments committing human rights abuses when they eliminate price supports on basic foodstuffs, even if it leads to widespread malnutrition, or for razing shantytowns or kicking the homeless out of shelters.

At this point we can finally see what’s really at stake in our peculiar habit of defining ourselves simultaneously as master and slave, reduplicating the most brutal aspects of the ancient household in our very concept of ourselves, as masters of our freedoms, or as owners of our very selves. It is the only way that we can imagine ourselves as completely isolated beings. There is a direct line from the new Roman conception of liberty—not as the ability to form mutual relationships with others, but as the kind of absolute power of “use and abuse” over the conquered chattel who make up the bulk of a wealthy Roman man’s household—to the strange fantasies of liberal philosophers like Hobbes, Locke, and Smith, about the origins of human society in some collection of thirty- or forty-year-old males who seem to have sprung from the earth fully formed, then have to decide whether to kill each other or begin to swap beaver pelts.

European and American intellectuals, it is true, have spent much of the last two-hundred years trying to flee from the more disturbing implications of this tradition of thought. Thomas Jefferson, that owner of many slaves, chose to begin the Declaration of Independence by directly contradicting the moral basis of slavery, writing “we hold these truths to be self-evident, that all men are created equal, and that they are endowed by their Creator with certain inalienable Rights”—thus undercutting simultaneously any argument that Africans were racially inferior, and also that they or their ancestors could ever have been justly and legally deprived of their freedom. In doing so, however, he did not propose some radically new conception of rights and liberties. Neither have subsequent political philosophers. For the most part, we’ve just kept the old ones, but with the word ‘not’ inserted here and there. Most of our most precious rights and freedoms are a series of exceptions to an overall moral and legal framework that suggests we shouldn’t really have them in the first place. Formal slavery has been eliminated, but—as anyone who works for someone else can testify—the idea that you can alienate your liberty, at least temporarily, endures. In fact, it determines what most of us have to do for most of our waking hours, except, usually, on weekends. The violence has been largely pushed out of sight. But this is largely because we’re no longer able to imagine what a world based on social arrangements

that did not require the continual threat of tasers and surveillance cameras would even look like.

One might well ask: If our political and legal ideas really are founded on the logic of slavery, then how did we ever eliminate slavery? Of course, a cynic might argue that we haven't; we've just relabeled it. The cynic would have a point: an ancient Greek would certainly have seen the distinction between a slave and an indebted wage laborer as, at best, a legalistic nicety. Still, even the elimination of formal chattel slavery has to be considered a remarkable achievement, and it is worthwhile to wonder how it was accomplished. Especially since it was not just accomplished once. The truly remarkable thing, if one consults the historical record, is that slavery has been eliminated—or effectively eliminated—many times in human history.

In Europe, for instance, the institution largely vanished in the centuries following the collapse of the Roman empire—a historical achievement rarely recognized by those of us used to referring to these events as the beginning of “the Dark Ages.” On the popular level, slavery remained so universally detested that even a thousand years later, when European merchants started trying to revive the trade, they discovered that their compatriots would not countenance slaveholding in their own countries—one reason why planters were eventually obliged to acquire their slaves in Africa and set up plantations in the New World. It is one of the great ironies of history that modern racism—probably the single greatest evil of our last two centuries—had to be invented largely because Europeans continued to refuse to listen to the arguments of the intellectuals and jurists and did not accept that anyone they believed to be a full and equal human being could ever be justifiably enslaved.

A Hollow State

Democratic Delusions

The decayed condition of American democracy is difficult to grasp, not because the facts are secret, but because the facts are visible everywhere.

An important indication of the erosion of the democratic ideal, which no longer envisions a rough equality of condition but merely the selective promotion of non-elites into the professional-managerial class. Ambitious people understand, then, that a migratory way of life is the price of getting ahead. It is a price they gladly pay, since they associate the idea of home with intrusive relatives and neighbors, small-minded gossip, and hidebound conventions. The new elites are in revolt against “Middle America,” as they imagine it: a nation technologically backward, politically reactionary, repressive in its sexual morality, middlebrow in its tastes, smug and complacent, dull and dowdy. Those who covet membership in the new aristocracy of brains tend to congregate on the coasts, turning their back on the heartland and cultivating ties with the international market in fast-moving money, glamour, fashion, and popular culture.

It is a question whether they think of themselves as Americans at all. Patriotism, certainly, does not rank very high in their hierarchy of virtues. “Multiculturalism,” on the other hand, suits them to perfection, conjuring up the agreeable image of a global bazaar in which exotic cuisines, exotic styles of dress, exotic music, exotic tribal customs can be savored indiscriminately, with no questions asked and no commitments required. The new elites are at home only in transit, en route to a high-level conference, to the grand opening of a new franchise, to an international film festival, or to an undiscovered resort. Theirs is essentially a tourist’s view of the world—not a perspective likely to encourage a passionate devotion to democracy.

The market in which the new elites operate is now international in scope. Their fortunes are tied to enterprises that operate across national boundaries. They are more concerned with the smooth functioning of the system as a whole than with any of its parts. Their loyalties—if the

term is not itself anachronistic in this context—are international rather than regional, national, or local. They have more in common with their counterparts in Brussels or Hong Kong than with the masses of Americans not yet plugged into the network of global communications. These are people who live in a world of abstract concepts and symbols, ranging from stock market quotations to the visual images produced by Hollywood and Madison Avenue, and who specialize in the interpretation and deployment of symbolic information. Contrast them with the two other principal categories of labor: routine production workers, who perform repetitive tasks and exercise little control over the design of production, and in-person servers, whose work also consists of routine, for the most part, but must be provided person-to-person and therefore cannot be sold worldwide.

We have lost our respect for honest manual labor. We think of creative work as a series of abstract mental operations performed in an office, preferably with the aid of computers, not as the production of food, shelter, and other necessities. The thinking classes are fatally removed from the physical side of life—hence their feeble attempt to compensate by embracing a strenuous regimen of gratuitous exercise. Their only relation to productive labor is that of consumers. They have no experience of making anything substantial or enduring. They live in a world of abstractions and images, a simulated world that consists of computerized models of reality—hyperreality—as distinguished from the palpable, immediate, physical reality inhabited by ordinary men and women. Their belief in the social construction of reality—the central dogma of postmodernist thought—reflects the experience of living in an artificial environment from which everything that resists human control (unavoidably, everything familiar and reassuring as well) has been rigorously excluded. Control has become their obsession.

In their drive to insulate themselves against risk and contingency—against the unpredictable hazards that afflict human life—the thinking classes have seceded not just from the common world around them but from reality itself. The culture wars that have convulsed America since the sixties are best understood as a form of class warfare, in which an enlightened elite (as it thinks of itself) seeks not so much to impose its values on the majority (a majority perceived as incorrigibly racist, sexist, provincial, and xenophobic), much less to persuade the majority by means of rational public debate, as to create parallel or “alternative” institutions in which it will no longer be necessary to confront the unenlightened at all.

People feel bound by democratic elections only when they share a basic bond with most other voters. If the experience of other voters is alien to me, and if I believe they don’t understand my feelings and don’t care about my vital interests, then even if I am outvoted by a hundred to one, I have

absolutely no reason to accept the verdict. Democratic elections usually work only within populations that have some prior common bond, such as shared religious beliefs and national myths. They are a method to settle disagreements between people who already agree on the basics.

“I have this feeling that whoever’s elected president no matter what promises you make on the campaign trail—blah, blah, blah—when you win, you go into this smoky room with the twelve industrialist, capitalist scumfucks that got you in there, and this little screen comes down. . . and it’s a shot of the Kennedy assassination from an angle you’ve never seen before, which looks suspiciously off the grassy knoll. . . And then the screen comes up, the lights come on, and they say to the new president: ‘Any questions?’”

When I stand behind the curtain in the polling booth, liberalism instructs me to consult my authentic self, and choose whichever party or candidate reflects my deepest desires. Yet the life sciences point out that when I stand there behind the curtain, I don’t really remember everything I felt and thought in the years since the last election. Moreover, I am bombarded by a barrage of propaganda, spin, and random memories which might well distort my choices. Just as in the cold-water experiment, in politics too the narrating self follows the peak-end rule. It forgets the vast majority of events, remembers only a few extreme incidents and gives a wholly disproportional weight to recent happenings. For four long years I may repeatedly complain about the President or PM’s policies, telling myself and anyone willing to listen that he will be the ruin of us all. However, in the months prior to the elections the government cuts taxes and spends money generously. The ruling party hires the best copywriters to lead a brilliant campaign, with a well-balanced mixture of threats and promises that speak right to the fear center in my brain. On the morning of the elections I wake up with a cold, which impacts my mental processes, and causes me to prefer security and stability over all other considerations. And voila! I send the man who will be the ruin of us all back into office for another four years.

Under dictatorship, people are enslaved but they know it. Here, the politicians constantly lie to people and they become immune to these lies because they have the privilege of voting. But voting is rigged and democracy here is a gigantic profusion of lies and clever brainwashing.

The right to vote also includes the right to not vote. If it didn’t then voting wouldn’t be a right, but an obligation. If you chose to not vote, then

your effect is the same as spoiling your ballot or leaving the ballot blank. Though, is it even possible to do such a thing with a voting machine?

Criticism of government policy or action is part of the day-to-day workings of democracy. Citizen engagement with how government works is a fundamental feature of a properly-functioning democracy. Democracy doesn't happen only every four years in a voting booth. One could turn the trope on its head: If you aren't routinely engaged with politics, why should you be allowed to vote every four years?

“A Democratic Spirit is one that combines rigor and humility, i.e., passionate conviction plus a respect for the convictions of others. As any American knows, this is a difficult spirit to cultivate and maintain, particularly when it comes to issues you feel strongly about. Equally tough is a DS's criterion of 100 percent intellectual integrity—you have to be willing to look honestly at yourself and at your motives for believing what you believe, and to do it more or less continually. This kind of stuff is advanced US citizenship. A true Democratic Spirit is up there with religious faith and emotional maturity and all those other qualities that people spend their whole lives working on.

A Democratic Spirit's constituent rigor and humility and self-honesty are, in fact, so hard to maintain on certain issues that it's almost irresistibly tempting to fall in with some established dogmatic camp and to follow that camp's line on the issue and to let your position harden within the camp and become inflexible and to believe that the other camps are either evil or insane and to spend all your time and energy trying to shout over them. It seems to be a natural law that camps form only in opposition to other camps and that there are always at least two with regard to any difficult issue.”

When we speak of democracy today, we refer, more often than not, to the democratization of “self-esteem.” The current catchwords—diversity, compassion, empowerment, entitlement—express the wistful hope that deep divisions in American society can be bridged by goodwill and sanitized speech. We are called on to recognize that all minorities are entitled to respect not by virtue of their achievements but by virtue of their sufferings in the past. Compassionate attention, we are told, will somehow raise their opinion of themselves; banning racial epithets and other forms of hateful speech will do wonders for their morale. In our preoccupation with words, we have lost sight of the tough realities that cannot be softened simply by

flattering people's self-image. What does it profit the residents of the South Bronx to enforce speech codes at elite universities?

In the first half of the nineteenth century most people who gave any thought to the matter assumed that democracy had to rest on a broad distribution of property. They understood that extremes of wealth and poverty would be fatal to the democratic experiment. Their fear of the mob, sometimes misinterpreted as aristocratic disdain, rested on the observation that a degraded laboring class, at once servile and resentful, lacked the qualities of mind and character essential to democratic citizenship. They thought democratic habits—self-reliance, responsibility, initiative—were best acquired in the exercise of a trade or the management of a small holding of property. A “competence,” as they called it, referred both to property itself and to the intelligence and enterprise required by its management. It stood to reason, therefore, that democracy worked best when property was distributed as widely as possible among the citizens.

The point can be stated more broadly: Democracy works best when men and women do things for themselves, with the help of their friends and neighbors, instead of depending on the state. Not that democracy should be equated with rugged individualism. Self-reliance does not mean self-sufficiency. Self-governing communities, not individuals, are the basic units of democratic society. It is the decline of those communities, more than anything else, that calls the future of democracy into question. Suburban shopping malls are no substitute for neighborhoods. The same pattern of development has been repeated in one city after another, with the same discouraging results. The flight of population to the suburbs, followed by the flight of industry and jobs, has left our cities destitute. As the tax base shrivels, public services and civic amenities disappear. Attempts to revive the city by constructing convention centers and sports facilities designed to attract tourists merely heighten the contrast between wealth and poverty.

The city becomes a bazaar, but the luxuries on display in its exclusive boutiques, hotels, and restaurants are beyond the reach of most of the residents. Some of those residents turn to crime as the only access to the glittering world seductively advertised as the American dream. Those with more modest aspirations, meanwhile, are squeezed out by high rents, gentrification, and misguided policies intended to break up ethnic neighborhoods that allegedly stand in the way of racial integration.

Democracy requires a vigorous exchange of ideas and opinions. Ideas, like property, need to be distributed as widely as possible. Yet many of the “best people,” as they think of themselves, have always been skeptical about the capacity of ordinary citizens to grasp complex issues and to make critical judgments. Democratic debate, from their point of view, degenerates

all too easily into a shouting match in which the voice of reason seldom makes itself heard. Horace Mann failed to see that political and religious controversy is educative in its own right and therefore tried to exclude divisive issues from the common schools. His eagerness to avoid sectarian quarrels is understandable enough, but it left a legacy that may help to explain the bland, innocuous, mind-numbing quality of public education today.

Some argue public opinion is a weak reed. It is shaped more by emotion than by reasoned judgment. The very concept of a public is suspect. The public idealized by the progressives, a public capable of the intelligent direction of public affairs, is a phantom. It exists only in the minds of sentimental democrats.

“The public interest in a problem is limited to this: that there shall be rules. The public is interested in law, not in the laws; in the method of law, not in the substance.”

Substantive questions can safely be left to experts, whose access to scientific knowledge immunizes them against the emotional symbols and stereotypes that dominate public debate. This argument rests on a sharp distinction between opinion and science. Only the latter, they think, can claim to be objective. Opinion, on the other hand, rests on vague impressions, prejudices, and wishful thinking.

This cult of professionalism had a decisive influence on the development of modern journalism. Newspapers might have served as extensions of the town meeting. Instead they embraced a misguided ideal of objectivity and defined their goal as the circulation of reliable information—the kind of information, that is, that tends not to promote debate but to circumvent it. The most curious feature in all this, of course, is that although Americans are now drowning in information, thanks to newspapers and television and the internet and social media, surveys regularly report a steady decline in their knowledge of public affairs. In the “age of information” the American people are notoriously ill informed. The explanation of this seeming paradox is obvious, though seldom offered: Having been effectively excluded from public debate on the grounds of their incompetence, most Americans no longer have any use for the information inflicted on them in such large amounts. They have become almost as incompetent as their critics have always claimed—a reminder that it is debate itself, and debate alone, that gives rise to the desire for usable information. In the absence of democratic exchange, most people have no incentive to master the knowledge that would make them capable citizens.

The most basic problem for democracy raided by propaganda is the possibility that the vocabulary of liberal democracy is used to mask an undemocratic reality. If so, there could be a state that appeared to be a liberal democracy. It would be a state the citizens of which believed was a liberal democracy. But the appearance of liberal democracy would be merely the outer trappings of an illiberal, undemocratic reality. There is no corresponding existential threat for authoritarian regimes. It is utterly standard to mask the nature of an authoritarian regime with the use, for example, of revolutionary or socialist vocabulary. This is not a threat to the authoritarian nature of the regime. In contrast, masking the undemocratic nature of a state with democratic vocabulary is an existential threat to a democratic regime.

A democratic culture is one in which everyone has a say in the policies and laws that apply to them. A corporate or managerial culture is quite distinct from a democratic culture. Yet public culture in the United States, since the industrial revolution, has been dominated by a managerial ethos. By 1900, the acceptance of the business philosophy was so general that it has to be considered one of the basic characteristics of American society in this period. During the industrial revolution, the idea of success as material success and the business ideology of management were a heavy emphasis in popular journalism. It was during this time that politicians also started to speak of themselves as businessmen running corporations, something that survives today not only in the United States, but in the European Union.

In 1941, James Burnham published a book, *The Managerial Revolution*, predicting the end of an era in which communism faced off against capitalism, and Stalinism against democracy. Burnham argued that the future would be “a managerial society” in which heads of multinational corporations would have de facto policy control over individual states. He argued that in a managerial society “managers can maintain their ruling position only through assuring for themselves control of the state,” a task that is “not so simple” in a democracy, which guarantees “freedom for minority political expression.”

“The economic structure of managerial society seems to raise obstacles for democracy. There is no democracy without opposition groups. Opposition groups cannot, however, depend for their existence merely on the good will of those who are in power.”

But since in the managerial society of the future “all major parts of the economy will be planned and controlled by the single integrated set of

institutions which will be the managerial state,” there is “no independent foundation for genuine opposition political groups.” Burnham raises the possibility that in the future, the United States, as well as other alleged liberal democracies, will be managerial states instead of democracies, yet ones that use the vocabulary of liberal democracy to conceal their true nature.

In a managerial society, the greatest good is efficiency. In a democratic society, by contrast, the greatest good is liberty, or autonomy. There are many different senses of ‘liberty’ and ‘autonomy.’ But in none of these senses does it mean the same thing as ‘efficiency.’

One reason Plato gives for rejecting democracy is that it leaves life-decisions, such as the pursuit of a career, in the hands of those whom he regarded as unfit to make the decision—unfit because it would reduce social efficiency. His argument assumes that democratic participation in government has only instrumental value, determined by its efficiency in promoting interests that are quite distinct from it. Against Plato, however, we might value control over what happens to us, and shared responsibility for it, even at some cost in efficiency. Each of us values himself as an agent who to some extent plans his life; and each of us shows respect for others as agents of the same sort, in so far as we decide collectively about our lives. Plato rejected democracy as a system, because by concentrating on liberty, it failed to maximize efficiency. A managerial society is a society ruled by technocrats who make decisions on behalf of the masses. It is, since Plato’s time, regarded as a system that is opposed to democracy, rather than one exemplifying it.

He argues only philosophers are capable of caring first and foremost about the common good. Philosophers will be able to make sure the state is efficient for all. In a managerial state one can expect that what ‘efficiency’ means is efficiency for those who control the resources, or efficiency for the managers, or those who own the companies, rather than the managed. But even if there were a state controlled by Plato’s ideal philosophers, who somehow manage it to be more efficient for all, such a state is not a democracy.

One would expect, in a managerial culture, even Plato’s ideal one, that hard work would be a central value, and respect would be accorded on the basis of one’s ability to work hard. Thus one might expect that accusations of laziness would be particularly stinging. A democratic culture is different. Efficiency may be a value, but it is not a democratic value. In a democratic culture, someone who is a bad worker, or lazy, still deserves equal respect. Are alleged liberal democracies now exploiting confusion between democratic values and managerial values to advance antidemocratic policies?

The use of democratic language to mask an antidemocratic worldview that places market efficiency at its center, rather than liberty, is a pervasive and important misuse of democratic vocabulary. The usurpation of liberal democratic language to disguise an antidemocratic managerial society is at the basis of the American public school system as it was restructured between 1910 and 1920.

But liberal democratic cultures seem on the surface free from propaganda; politicians and television hosts shy away from the claim that they are delivering overt propaganda. In liberal democracy, propaganda standardly occurs masked.

Suppose we are in a state that supposedly follows liberal democratic ideals. But the reality diverges deeply from those ideals. For example, perhaps the citizens do not treat one another with equal respect, of the sort governing conversation or exchange between equals. What will be needed to keep the state stable, to keep the citizens from fomenting dissent, is some way to hide the gap between illiberal reality and professed liberal ideals. For example, perhaps the liberal democratic ideals are used to refer to a political system that tolerates massive political inequality (as some think when 'liberalism' is used to refer to neoliberalism). Propaganda in this context is more complicated. The liberal ideals themselves are propagandistically used. It is the propagandistic use of the liberal democratic vocabulary that is responsible for many cases in which we do not notice gaps between ideals and reality.

Vehicle of Propaganda: An institution that represents itself as defined by a certain political ideal, yet whose practice tends to undermine the realization of that ideal.

A school in a liberal democracy is intended to make its students into informed citizens who have the information necessary for informed participation in political deliberation. Suppose the school intentionally leaves out certain information, for example, about the country's systematic injustice toward certain groups. The students it produces therefore have incomplete information, but believe the information to be complete. The school therefore undermines the ideal of having fully informed citizens. A school that produces partially informed citizens who believe they are fully informed is a vehicle of propaganda, even if it never produces any actual propagandistic claims.

Similarly, if a television news station or newspaper presents itself as reporting all relevant news for political decision-making in a country, yet withholds crucial information for decision-making, it too is a vehicle of

propaganda, even if it never produces any actual propagandistic utterances. It is a vehicle of propaganda in virtue of undermining the political ideal it represents itself as embodying, that of fully informing its audience.

Undermining Propaganda: A contribution to public discourse that is presented as an embodiment of certain ideals, yet is of a kind that tends to erode those very ideals.

There are certain traditional views of liberalism that privilege market exchange. But it is nevertheless undermining propaganda to present even these views as the view that what now passes for market exchange in the United States is this kind of liberalism, the kind of view of liberalism espoused by Adam Smith in *The Wealth of Nations*. Smith has a very particular conception of market exchange, one connected to political equality. But the system of market exchange prevalent in the United States is one that has systematically barred certain minorities from participation in contracts, for example, blacks from fair mortgages. It also typically involves unfair exchanges between rich and poor. If so, it is undermining propaganda to represent the liberalism of Adam Smith as connected to market exchange as historically practiced in the United States. Market exchange as historically practiced in the United States does not have the connection to political equality, fair exchange between equals that is at the heart of traditional conceptions of liberalism that emphasize market exchange.

The kind of propaganda that is most threatening to liberal democracy is a species of undermining propaganda we may call demagoguery. Demagoguery is propaganda in the service of unworthy political ideals. What counts as demagoguery therefore depends on moral and political facts. Demagoguery can come in the form of strengthening unworthy political ideals.

There is a simple and compelling argument, known since Plato, which would lead us to expect that even apparently robust liberal democracies are such in name only. The argument is as follows: A certain form of propaganda, associated with demagogues, poses an existential threat to liberal democracy. The nature of liberal democracy prevents propagandistic statements from being banned, since among the liberties it permits is the freedom of speech. But since humans have characteristic rational weaknesses and are susceptible to flattery and manipulation, allowing propaganda has a high likelihood of leading to tyranny, and hence to the end of liberal democracy.

A great many words have some kind of social meaning, that is, not-at-issue content, even a word as innocuous as ‘mother.’ These social meanings, like the social meaning of slurs, cannot be divorced from the use of these

expressions either. The words with the most political efficacy are presumably going to be the seemingly innocuous ones, those words that do not appear to be slurs but are associated with a social meaning that is disabling in some way.

Not only politics but also everyday discourse involve apparently innocent words that have the feature of slurs, namely, that whenever the words occur in a sentence, they convey the problematic content. The word ‘welfare,’ in the American context, is not on any list of prohibited words. Yet the word ‘welfare’ always conveys a problematic social meaning, whenever it is used.

One kind of linguistic propaganda involves repeated association between words and social meanings. Repeated association is also the mechanism by which conventional meaning is formed; it is because people use ‘dogs’ to refer to dogs, repeatedly, that ‘dogs’ comes to refer to dogs.

When the news media connects images of urban Blacks repeatedly with mentions of the term ‘welfare,’ the term ‘welfare’ comes to have the not-at-issue content that Blacks are lazy. At some point, the repeated associations are part of the meaning, the not-at-issue content. This does not mean that someone hearing the term ‘welfare’ automatically comes to believe that Blacks are lazy. It does mean that they may have to shift to different vocabulary, or consciously resist the effects of the association, in conversation or otherwise, to deter the propagandistic effect.

The effect of propaganda in a liberal democracy is to erode respect for a targeted group. In humans, respect for a group or a person is characteristically based upon empathy for them. One characteristic effect of propaganda in a liberal democracy will be to erode empathy for the perspectives of a group in a population, while presenting itself as not so doing. This means that there will be expressions that have normal contents, which express these contents via a way that erodes empathy for a group.

In conversations between members of the dominant group and members of the subordinate group, the members of the subordinate group feel pressure to accept the negative stereotypes of their own group. For example, when a white US citizen is speaking to a Black US citizen about the “problems in the inner city,” there will be pressure, just to move the conversation forward, for the Black citizen to say that she recognizes that many people in the inner city are in fact lazy and violent. So there will be pressure, just for conversation ease, to accept the stereotype of one’s group, and of course then to personally distance oneself from that stereotype. Subordinate group members may be led to accept, however provisionally, the negative stereotype of their group, simply to enter smoothly into any conversation about their group with members of the dominating group.

There is a commonly held view that politics is simply about power and

interests, and the political vocabulary is only ever used strategically. The rhetoric of political and moral ideals is just one more weapon in a game whose object is to seize power and, along with it, the goods of society.

Buddhism, which proclaimed the equality of all men, has generated the theocracy of Tibet; and the religion of Christ, which seemed especially made for the poor and humble, has generated the Roman theocracy. The decline of the old elite and its increasing arrogance at the time of the Reformation can be clearly seen in the emergence of the robber barons. As usual, the new elite leaned on the poor and humble; as usual, the poor and humble believed in the promises made to them; as usual they were deceived, and the yoke weighed even heavier on their shoulders than before. Similarly, the revolution of 1789 produced the Jacobin oligarchy and ended with the imperial despotism. This is what has always happened because the elite are able to weaponize the masses' ignorance and lack of coordination.

Supporting Propaganda: A contribution to public discourse that is presented as an embodiment of certain ideals, yet is of a kind that tends to increase the realization of those very ideals by either emotional or other non-rational means.

There are certain examples of supporting propaganda that are perfectly acceptable in a democracy. For example, cigarette packs in many democratic countries carry stark warnings, such as "cigarettes kill." These are clearly intended to overwhelm rational and emotional capacities to further the realization of ideals, in this case, the ideal of health. But propagandistic warning labels on cigarettes seem democratically acceptable, in a way that other propaganda is not.

What is the difference? We can think of a Ministry of Health as tasked to look out for the physical health of a democratic nation when its citizens do not have time to do the relevant research. In a sense, therefore, we task the ministry of health with giving us warnings that will convey a message that will have the effect of doing all the work of informing us about the relevant health issue. In the case of warning labels on cigarette packs, presumably the idea is that we have tacitly granted our permission to the ministry of health to take such steps. If we have not tacitly granted our permission in this manner, then such warning labels are democratically problematic.

In totalitarian societies, there is an official Ministry of Propaganda. Because of that, it is easy in such societies not to take propaganda seriously. But because propaganda can be sincere, the danger propaganda poses in totalitarian societies is that it is not taken seriously. The danger propaganda poses in democratic societies is entirely different. Part of the propaganda

of states that consider themselves liberal democracies is that they do not allow propaganda. So the distinctive danger propaganda poses in liberal democracies is that it is not recognized as propaganda. When effective propaganda is demagogic, it undermines the democratic legitimacy of the goal it is used to motivate.

There is no problem in totalitarian societies recognizing something as propaganda. Claims that are propaganda are those that emerge from the Ministry of Propaganda. The problem in totalitarian societies lies in figuring out which pieces of propaganda are to be taken seriously. It is only natural in liberal democratic societies to take at least the news media seriously. The problem in democratic societies lies in figuring out which apparently non-propagandistic claims are in fact propaganda.

One might argue that whatever the problems of democracy in the United States are, propaganda is not one of them. After all, despite intensive and successful efforts by the wealthiest Americans to dismantle campaign finance laws, polling reveals that Americans continue to support campaign finance reform. Furthermore, one might think that there is no significant problem for democracy, because Americans do not rank campaign finance reform high on their list of priorities. But both of these arguments result from a failure to understand the strategy taken by sophisticated propagandists. Americans do think that there is a serious problem about campaign financing, and they do think that there is a serious problem about climate change. The propaganda that has been employed against them has been in the service of convincing them that the kind of laws that they want passed are invariably in the service of agendas most of them oppose.

For example, 80 percent of Americans think that actual campaign finance reform laws are or would be corrupt, having the purpose of “helping current congress members get reelected” rather than of improving the system. Similarly, in a statement on May 7, 2001, from the Bush White House spokesperson Ari Fleisher, in response to a question about whether the president would urge Americans to change their world-leading energy-consumption habits, he replied:

That’s a big no. The president believes that it’s an American way of life, that it should be the goal of policy-makers to protect the American way of life. The American way of life is a blessed one. The president considers Americans’ heavy use of energy a reflection of the strength of our economy, of the way of life that the American people have come to enjoy.

In the case of climate change, the function of corporate propaganda has been to push the idea that climate change legislation is not in the service

of doing anything about the climate, but rather in the service of changing lifestyles to accommodate a socially progressive agenda—climate change policy as gay marriage.

Suppose that Snowbelt voters support federal government social programs by a 70–30 margin, while Sunbelt voters oppose those programs by a 70–30 margin. To keep things simple, also suppose that there are 100 million voters in all, initially divided as 60 million in the Snowbelt and 40 million in the Sunbelt. Sixty percent of congressional seats and hence roughly 60 percent of electoral votes will be in the Snowbelt and 40 percent in the Sunbelt.

It's easy to see that nationwide 54 percent of the voters support the social programs and 46 percent oppose them. Suppose now that a random mix of 20 million northerners move to the Sunbelt. Of those migrants, 70 percent (14 million) support government social programs and 30 percent (6 million) oppose them. Assume as well that there is no change of political values among the 100 million Americans, so that a 54–46 majority nationwide continues to support the social programs. Nonetheless, with the new demography, Congress is now likely to vote down the programs.

Here's why. In the new Sunbelt, there will now be 60 million voters. The old 40 million Sunbelt residents oppose government programs by a vote of 28 million versus 12 million. The new residents—who have arrived from the Snowbelt—support government programs by a margin of 14 million to 6 million. In total, therefore, 34 million voters of the new Sunbelt (57 percent) will oppose government social programs and 26 million (43 percent) will support them. The South will still be a majority anti-government region, though less decisively than before the in-migration from the North. Yet now it will command a majority of seats in Congress and in the Electoral College and will elect an anti-government majority to Congress and the presidency. Even though there is no change in national opinion—which is still a majority in favor of the social programs—the rise of the Sunbelt population by itself is enough to shift Washington from a pro-government majority to an anti-government majority. Demography is not quite destiny, but it plays a major role.

Underlying effective propaganda are certain kinds of group identities. Some group identities lead to the formation of beliefs that are difficult to rationally abandon, since abandoning them would lead them to challenge our self-worth. When our own identity is tied up with that of a particular group, we may become irrational in these ways. When this occurs, when our group affiliates are such as to lead us to these kinds of rigidly held beliefs, we become especially susceptible to propaganda. In the United States, the two-party system works as a way to manufacture an artificial group identity, akin to an ethnic or national one or an allegiance to a sports team. Part of

the identity seems to consist in allegiance to certain conclusions on a range of “hot button” political issues. On those issues, political party affiliation does seem to result in rigidly held belief and loyalty in the voting booth.

Allegiance to the group identity forged by political party affiliation renders Americans blind to the essential similarities between the agendas of the two parties, similarities that can be expected to be exactly the ones that run counter to public interest, in other words, those interests of the deep-pocketed backers of elections to which any politician must be subservient in order to raise the kind of money many believe is necessary to run for national office. Satisfaction at having one’s group win seems to override the clearly present fundamental dissatisfaction with the lack of genuine policy options. If the function of the two parties is to hide the fact that the basic agenda of both is shared, and irrational adherence to one of the two parties is used propagandistically to mask their fundamental overlap, then we can see how Burnham’s prediction may have come to pass, despite the existence of two distinct political parties.

Political party affiliation is a method to deceive citizens to import partiality that is a normal and healthy part of certain practices, such as being a sports fan, into a realm in which it is not appropriate, namely, political decisions. Political party affiliation is illiberal. Beliefs that are connected to one’s identity will be difficult to abandon. So it will be difficult to abandon the beliefs connected to one’s identity as a political party member. But these will be politically important beliefs, which will now be much less resistant to rational revision. An ideology that is partial becomes democratically problematic when it affects political judgment about policies that might address the injustices that the ideology overlooks. As long as a partial perspective is kept within its proper domain—for example, sports talk radio—it is not flawed. But as soon as it is imported into discourse and reasoning about the public good, it functions as illiberal.

Flawed ideological beliefs corrode rational debate. In a healthy democracy, the goal of a public official should be to dissolve them, rather than rely on them. Relying upon them only strengthens them and makes them much more problematic barriers in subsequent debate.

In front of the camera, both parties cooperate in generating periodic deficit “crises” to cudgel their opponents and get them to give way on their more central priorities. A great deal of maneuvering on domestic policy can be understood as the strategic deployment of the “deficit” charge against your opponent while working behind the scenes to keep the money machine going for your own purposes.

“The United States is also a one-party state,” Julius Nyerere, the first president of Tanzania, once observed in defending his own one-party system.

“But with typical American extravagance, they have two of them.”

Democratic citizenship requires taking yourself to be subject to the laws that emerge from a “fair and honest” process of deliberating among one’s fellow politicians and the public, even when those laws are not the ones that you yourself support. The ideals of public reason are central to democratic political philosophy, because it is through debate that is fair and honest that the democratic legitimacy of a policy emerges. Democracy is a system of government that, minimally, preserves the liberty of its citizens by ensuring that they are not subject to arbitrary restrictions. If a polity agrees to laws governing all of its citizens, the rules must be fairly decided upon by the entire public, with the full participation of all the citizens, for the rules to not illegitimately restrict the liberty of some of the citizens.

Suppose you are part of a group jointly deliberating about a policy the group intends to adopt. Perhaps it is a town hall meeting about whether to allow fracking in exchange for the building of a school or some jobs. Suppose you are in the group, and the policy runs counter to your own self-interest. For example, perhaps your house has a well fed by a spring that is likely to be poisoned by the fracking. You are initially therefore opposed. However, the main advocate of the policy produces an argument that the policy is best for all, and convinces the majority to adopt the policy. Suppose that you later find out that the main advocate was lying, or otherwise employing deceit. Furthermore, the reason that the main advocate pushed for that policy is that she was paid to do so. In such a situation, you would feel tricked. You would feel that the decision to adopt that policy was not legitimate. You would feel that the group’s demand that you adhere to the policy was also not a legitimate demand. If they forced you to adhere to the policy, you have legitimate grounds to feel coerced.

In contrast, suppose that you are part of a group deliberating about a policy that the group is contemplating adopting. The main advocate of the policy gives persuasive arguments that it is in the overall best interest of the community to adopt the policy. The policy runs counter to your own self-interest, but you see that the arguments are correct, and that the policy is in fact best for the community as a whole. The advocate is honest, and her arguments are good. You vote against it, but you lose. In this case, you don’t really feel that you have a complaint. The policy was arrived at via fair deliberation. If the group demands that you adhere to the policy, you don’t have legitimate grounds to feel coerced.

The first case we discussed, the decision to allow fracking, was one in which an unfair process led to a policy that was bad for the community at large. The second case we discussed involved a fair process that led to a policy that was good for the community at large. These are what one might

think of as pure cases. The deliberation and policy were both unfair and bad, or fair and good, respectively. What about the impure cases? That is, what about a fair deliberative process that leads, because of false beliefs due to a flawed ideology, for example, to a policy that is bad for the community? Or what about an unfair deliberative process that bypasses some of the community's unreasonable and irrational members to arrive at a policy that is good for the community?

The policies that result from discussion involving deception and trickery are not democratically legitimate. The person who loses out in a discussion subject to devious machinations is analogous to someone who has lost her freedom in an unjust war. Governance by the rules that emerge from such a process results in domination, rather than preservation of autonomy. In order for the principles decided upon by a group of autonomous agents to have binding force on each of them, without loss of autonomy, the procedure by which the joint decision is made must lend legitimacy to the result. As we have seen, if there is no constraint that the people who are party to the deliberation not simply mislead and lie and evade in order to further their own interests, the results of the deliberation will not be democratically legitimate.

A significantly unequal distribution of the goods of society leads to expectations on behalf of those who benefit that they will receive more of the goods of society than they in fact deserve. Failure to receive the goods one is accustomed to receiving will be a disruption of one's expectations that is prone to be mistaken as a violation of justice. There will be a motive from self-interest not to correct the resulting "moral error." That is another way of saying that large and unjust distributions of goods will lead those that are its beneficiaries to adopt a flawed ideology. The existence of flawed ideologies explains the efficacy of demagoguery, the kind of propaganda that undermines democratic deliberation. The notion of equality at the basis of democracy is political, not material. However, because large material inequalities lead to the formation of flawed ideologies that undermine democracy, some kind of general material equality is quite likely a prerequisite for states to be capable of following democratic ideals.

In contemporary American politics, appearances belie reality. Although the text of the Constitution has changed but little since FDR's day, the actual system of governance conceived by the framers—a federal republic deriving its authority from the people in which the central government exercises limited and specified powers—no longer pertains. Citizens disgusted with what many see as a perpetual mess in Washington yearn for a restoration of a mythical Old Republic. The democratic techniques of a free society place checks upon the power of the ruler and administrator and thus prevent it

from becoming vexatious. To the extent that this offers an apt definition of democracy, then, American democracy in our time has suffered notable decay. Checks upon the power exercised by the ruler have eroded badly, with frequently vexing results. Since 1940, a succession of national security emergencies, real and imagined, have permitted the federal government to assume a vast array of new responsibilities at the expense of state and local authorities.

As the chief executive achieved supremacy, the legislative branch not only lost clout but gradually made itself the object of ridicule. David Addington, chief of staff to Vice President Dick Cheney, pungently described the philosophy of the Bush administration this way:

“We’re going to push and push and push until some larger force makes us stop.”

Americans can no longer afford to underwrite a government that does not work. A condition of quasi-permanent crisis stretching across generations has distorted our Constitution with near-disastrous results. To imagine at this juncture that installing some fresh face in the White House, transferring the control of Congress from one party to the other, or embarking upon yet another effort to fix the national security apparatus will make much of a difference is to ignore decades of experience. Yet if presidents have accrued too much power, if the Congress is feckless, if the national security bureaucracy is irretrievably broken, the American people have only themselves to blame. They have allowed their democracy to be hijacked. The hijackers will not voluntarily return what they have stolen.

You don’t need a government that doesn’t serve its citizens—what the hell’s the point?

Paper Institutions

“He is a government official of a type that happily is becoming more common—one of those men who appreciate that they represent the public and that they are expected to look after the interests of the public and not the interests of any class. No wonder he is so cordially hated by those who heretofore fattened at the expense of public health and well-being.”

The state’s role as regulator was exchanged for that of enabler, and instead of the commons being protected, it was divvied up amongst the highest bidders.

Although relatively few legislators are overtly dishonest, in the sense of taking bribes or kickbacks, a subtler form of corruption pervades both the Senate and the House of Representatives. The Congress may not be a den of iniquity, but it is a haven for narcissistic hacks, for whom self-promotion and self-preservation take precedence over serious engagement with serious issues. To judge by the impassioned rhetoric heard on Capitol Hill, one might think otherwise. Yet even as they take turns denouncing one another, the two parties tacitly collaborate to maintain a status quo that both find eminently satisfactory. To be sure, party loyalists and ideologues of various stripes maintain the pretense that issues of decisive importance are at stake. Right-wingers charge tax-and-spend liberals with being socialists or worse. Self-styled progressives accuse conservatives of conspiring to send women into back alleys to end unwanted pregnancies. But this amounts to little more than theater.

The problem with the existing system of government is not that it differs from what the authors of the Federalist Papers intended or from what elementary school students learn about in social studies. The problem is that what we have doesn’t work. The gross incompetence of those who preside over the federal apparatus is appalling and unacceptable. Washington ought to symbolize enlightened governance. Instead, a system conceived “to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defense, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity” poses a clear and present danger to those it is meant to serve. This is the political crisis confronting Americans today.

Granted, everyone makes mistakes. Nobody bats a thousand. To err is human. Yet these familiar rationalizations simply won’t do. Some mistakes, even honest ones, cannot be forgiven.

When an industry doesn't want a law enacted but fears a public backlash if it openly opposes the proposed law, it quietly makes sure that there aren't enough funds to enforce it. This was the case when the food industry went along with the Food Safety Modernization Act, which became law in 2011, after thousands of people were sickened by tainted food. Subsequently, the industry successfully lobbied Congress to appropriate so little to enforce it that it has been barely implemented. Defanging laws by hollowing out the agencies charged with implementing them works because the public doesn't know it's happening. The enactment of a law attracts attention. There might even be a signing ceremony at the White House. News outlets duly record the event. But the defunding of the agencies supposed to put the law into effect draws no attention, even though it's the practical equivalent of repealing it.

The Occupational Safety and Health Administration (OSHA) and its state partners has only about 2,000 inspectors charged with protecting the safety of 130 million workers in more than eight-million workplaces. That is about one inspector for every 59,000 workers. Over the years, congressional appropriations to OSHA have dropped. The agency had been systematically hollowed out. So, too, with the National Highway Traffic Safety Administration, charged with automobile safety. Its \$134 million budget for 2013, supposedly enough to address the nation's yearly toll of some 34,000 traffic fatalities, was less than what was spent protecting the US embassy in Iraq for three months of that year.

Reducing required reporting to government sounds like a good idea if you think data collection makes companies inefficient. But keep in mind all those statements by politicians—especially those who affiliate themselves with business—that government should be run like a business. Corporations collect and analyze mountains of internal data to understand their operations. To set policy, to keep the competitive playing field level and the regulated field fair to investors and customers alike, government also needs lots of reliable data. When companies have this data internally and regulators do not, it creates what economists call an asymmetry, meaning one-sided knowledge. Asymmetry creates regulatory blindness. One-sided information lets the companies game the system for their benefit because it obscures what policy-makers understand. Lack of information makes already cautious regulators even more hesitant, and it emboldens companies, strengthening their confidence that conduct they want to keep private is likely to remain unobserved.

Fudging figures, doctoring reports, and creative accounting may seem minor, though deplorable, offenses. But they are not minor. When it comes to nuclear plant safety, the value of accurate, complete, and reliable

paperwork cannot be underestimated. In the United States, NRC inspectors audit only about five percent of the activities at nuclear plants, according to senior managers at the commission. Most of these audits involve reviewing the records of tests and inspections performed by plant workers. The NRC inspectors themselves witness only a very small fraction of actual tests and inspections. To put this another way: when workers feel free to prepare fictional accounts of tests and inspections, nuclear safety assurances begin morphing from nonfiction to fiction as well.

“If the Federal Aviation Administration operated on the same rules as pipeline safety regulators, I wouldn’t get on a plane.”

Instead of replacing corroded pipelines, the owners just de-rate them. ‘De-rating’ means reducing the maximum pressure allowed from, say, 1,500 pounds per square inch to 1,200 pounds. As corrosion eats through more of a pipeline’s steel wall, the pressure maximum may be reduced again and again based on calculations estimating the rate of corrosion. In theory, if the engineers guess right about the rate of corrosion, the pipeline will keep operating at lower and lower pressures until it is no longer profitable and will then be replaced or abandoned. In the meantime, as if engaged in some sort of life-or-death power game, they bet on the balance of corrosion and pressure.

The federal officials whose responsibility is to keep us safe from pipeline explosions have been granting “special permits” for segments of high-pressure pipelines that are supposed to be inspected under a 2002 law. While the federal Department of Transportation calls them “special permits,” that is just another euphemism for inspection-rule waivers. In reading some of these waivers, one might notice that they seemed not to say what was presumably intended.

Five safety waivers were issued to Empire Pipeline LLC, a subsidiary of National Fuel Gas in suburban Buffalo, New York, for nearly two miles of pipelines because of the difficulty involved in inspecting the pipes, which vary in diameter. As written, the permits set limits: Empire Pipeline may pump gas through when corrosion has eaten through 72 percent of the pipeline wall not covered by the safety waiver and, where the safety waiver is in effect, 80 percent along segments. It would in fact seem the permit was actually intended to say the reverse—requiring repairs at 28 percent corrosion for the main areas and 20 percent for the waived areas. When notified, both Empire’s president, Ronald Kraemer, and the Secretary of Transportation’s office did not follow-up. If the Empire pipeline ever blows

up, it will be in part thanks to the studied inaction of both the company and the government when notified of this potentially lethal paperwork error.

Just where is this one-third-mile-long pipeline? Unless you know the proprietary mile marking system that the pipeline company uses, you cannot tell. Does it run through a wheat farm or along Church Street? Past a wooded lot or a hospital? If you request map coordinates, street intersections or street addresses at the start and end of the section, neither Empire nor the Transportation Secretary's office nor their agency's Pipeline and Hazardous Materials Safety Administration will tell you. The reason for this secrecy, is official concern that terrorists might blow up the pipeline segments. With easily identifiable pipelines in places like Manhattan, terrorists aren't likely to target a section of pipeline in the Finger Lakes region of New York. But this misguided secrecy on the part of federal pipeline safety regulators does mean that people along the Empire Pipeline route are ignorant of the fact that they are living, shopping, playing, and going to schools near pipelines that have been given inspection waivers and are still allowed to operate when pipeline walls may be 80 percent corroded.

Although the means to inspect inside pipelines exist, the principal method of detecting gas leaks is to fly overhead and look for desiccated grass and trees—leaking natural gas kills plant life at the roots. That may be adequate for slow leaks, but not sudden ruptures which can create sparks.

“The compressor stations have been refitted to handle higher pressure and higher volumes of gas. So you would think that means more and more careful supervision, but just the opposite has happened. Now in compressor stations, fewer people are utilized and more reliance is put on computers. Fortunately we have not had a major disaster at a large compressor station for some time, but when we do, I believe it will make the pipeline explosions look like small fireworks.”

There's a final irony. The pipeline monopolies whose prices are regulated by the government get to include in their rates the cost of insurance to pay for losses from pipeline disasters. As pipelines age and as more people live near pipelines, the risk of disaster increases—and so does the cost of insurance. But because pipelines are monopolies, they get to add the higher insurance costs to the rates they charge. So you get to pay more even as you are put in greater danger.

“I have to look at the entire industry, not just what is best for public health.”
—USDA Official

That we do not experience more episodes of illness is nothing less than miraculous, a tribute more to our healthy immune systems, the benefits of cooking and food preservation, and plain good luck than to federal oversight.

The story of consumer protection in the United States is often the story of a country playing defense, an account of government regulators waking up, time and time again, to yet another public health crisis. The 1906 food and drug law, which established federal food regulation, was propelled into being largely by a series of scandals over food processing, including the gruesomely spectacular case of the Chicago meatpackers. The 1938 law, which created the modern US Food and Drug Administration, was passed following the deaths of dozens of children who were poisoned by a cough syrup legally sweetened with the antifreeze ingredient diethylene glycol. A 1956 decision by the FDA to ban some of the old coal-tar dyes arose from the sickening of children by Halloween candy that contained unsafe levels of orange and red coloring agents. A 1976 law authorizing the agency to regulate medical devices was passed after some 200,000 women reported injuries from an intrauterine birth control device called the Dalkon Shield.

More recently, the Food Safety Modernization Act (FSMA), a sweeping update to the FDA's protective authority, was signed into law after one of the most severe food-poisoning outbreaks in American history, one that continued for months—from late 2008 to early 2009—and derived from one of the country's most trusted and ordinary food staples. The cause was a line of peanut butters made by the Virginia-based Peanut Corporation of America. The company used factories that were deliberately unregistered to avoid government attention. Many of the jars and containers of peanut butter, produced in notably unsanitary conditions, contained the pathogenic bacteria salmonella. People in forty-six states were sickened; the US Centers for Disease Control and Prevention linked the products to an estimated nine deaths and up to 22,000 illnesses. To the dismay of consumers and legislators alike, the source of the contamination was identified not by the federal government but by state laboratories in Minnesota, Georgia, and Connecticut, harking back to nineteenth-century failures in enforcing nationwide consumer protection.

The CFPB's entire budget is equal to just two percent of what JPMorgan Chase set aside in reserves for its litigation expenses in 2013. If it doesn't blow shit up or kill people, you don't get much.

Many recommend a unified and central framework for managing federal food safety programs, one that is headed by a single official and which has the responsibility and control of resources for all federal food safety activities. This recommendation envisions an identifiable, high-ranking, presidentially appointed head, who would direct and coordinate federal activities and

speak to the nation, giving federal food safety efforts a single voice. The structure created, and the person heading it, should have control over the resources Congress allocates to the food safety effort; the structure should also have a firm foundation in statute and thus not be temporary and easily changed by political agendas or executive directives. The most viable means of achieving these goals would be to create a single, unified agency headed by a single administrator.

To ensure safe food Congress should provide the mandate, authority, and funding necessary to achieve:

- A single agency accountable for providing consistent and coordinated oversight of food safety, from farm to table
- Revision of the 1906 safety inspection laws to permit oversight of microbial pathogens
- Institution of Pathogen Reduction: HACCP, with performance standards verified by pathogen testing, at every step of food production
- A national food safety plan that sets priorities, adopts strategies, ensures accountability, and monitors progress
- Recall authority, access to records, and penalties for lapses in safety procedures
- Uniform food safety standards for states, consistent with federal policies
- Standards for imported foods equivalent to those for domestic foods
- Food safety to take precedence over commercial considerations in trade disputes
- Universal food safety education for commercial food handlers
- A national system for monitoring cases and outbreaks of foodborne disease and their causes
- Research on methods to control microbial contamination and illness, and on prevention strategies

Foolish Farming

Big Ag's Stranglehold

Prior to the invention of the railroad, much of the nation functioned as an archipelago of many different communities, each supporting a largely self-contained economy. Especially in communities apart from major natural waterways or canal systems, a farmer could spend his entire life farming the same plot of land, selling his crops to the same local customers, with minimal impact upon business in other states. After the growth of the railways, this same farmer's crops could travel to one of several central hubs, where the railroads could take them anywhere in the country or even to a port that would bring them overseas. The nation's economy was interconnected in a way that America's colonial ancestors could never have anticipated, and this unity made a new kind of business arrangement possible.

The very same railroads that enabled a farmer in Iowa to sell his crops in New York also placed him in competition with farmers throughout the nation—and the same was true of virtually every other business in the country. Timber mills, mines, and manufacturers who once supplied their entire community now risked being undercut by a business hundreds of miles away, and they also had a new opportunity to cut into that company's bottom line. It wasn't long before often-distant competitors began joining together in trusts and similar combinations to gain advantage over their smaller rivals.

The consequences for borrowing money and failing to repay it are clear, certain, and often devastating. But it wasn't always this way. An early nineteenth-century Massachusetts lending company helped create the debt system we know today. The Massachusetts Hospital Life Insurance Company (MHLIC) was created in 1823 and quickly became the largest financial institution in New England. Despite its name, its main business during its first two decades was investing Boston elites' wealth in mortgages on farms west of the city.

There was nothing new about farm loans, but prior to the 1820s they

typically operated in a personal way. Borrowers and lenders often knew each other socially, and in most cases people wouldn't sue their neighbors. Local debts were often carried on the books for years and paid off only at a farmer's death. MHLIC created a new, bureaucratic way of doing business. Farmers in need of loans applied to lawyers who served as regional agents. Chief Executive Nathaniel Bowditch and the corporation's loan committee then decided whether to issue credit, using strict procedures for determining whether a farm operation was creditworthy. In evaluating the farmers, agents considered their work routines, spending, drinking habits, and—especially—punctuality.

For farmers the focus on punctual payments took some getting used to. Borrowers often wrote to explain that they couldn't make an annual payment on time because of bad weather or, sometimes, for no particular reason. One wrote:

“I should have sent this before but have been absent on a Journey and it slipped [sic] my mind before I left.”

When payments were even slightly late, however, the company sent notices threatening lawsuits and foreclosures. Some farmers and rural politicians worried that foreclosures could bring farms under corporate ownership, turning yeoman farmers into tenants and corporations into a new aristocracy. In reality, the MHLIC rarely followed through on its threats. Bowditch noted in internal messages that it would hurt the company's reputation to be perceived as seizing an unlucky farmer's land.

What the company really wanted was to teach farmers to accept the demands of the growing financial order, which was impersonal and precision-oriented. Bowditch was personally fixated on regularity, punctuality, and precise record-keeping. This sometimes rubbed fellow elites the wrong way when he applied the same standards to the loans they took out. But it was the reason he'd been recruited to run the MHLIC. When farmers and populists suggested that the company's behavior was cold-blooded, Bowditch insisted that they were simply rational and even-handed.

When one rural borrower asked permission to send in his payment late, the Company responded:

“The interest on your note must be paid immediately—the officers of the Co. have no power to suspend the By-Law.”

As if it were a law of physics. That attitude may sound familiar to anyone who's ever had to deal with a twenty-first century debt-collecting bureaucracy.

The people who were once radical are now reactionary. Though they speak today in the same aggrieved language of victimization, and though they face the same array of economic forces as their hard-bitten ancestors, today's populists make demands that are precisely the opposite. Tear down the federal farm programs, they cry. Privatize the utilities. Repeal the progressive taxes. All they ask today is a little help nailing itself to that cross of gold.

"It was his own fault, of course," wrote the historian Vernon L. Parrington of the Midwestern farmer's predicament of the 1890s. Due to his own political slackness the farmer had allowed himself to become the common drudge of society. While capitalism had been perfecting its machinery of exploitation he had remained indifferent to the fact that he himself was the fattest goose that capitalism was to pluck. He had helped indeed to provide the rope for his own hanging. He had voted away the public domain to railways that were now fleecing him; he took pride in the county-seat towns that lived off his earnings; he sent city lawyers to represent him in legislatures and in Congress; he read middle-class newspapers and listened to bankers and politicians and cast his votes for the policy of Whiggery that could have no other outcome than his own despoiling.

Consider what used to happen in Oelwein, Iowa, before the large-scale consolidation in the 1980s and '90s of almost every niche of the food-production chain. Corn farmers would have bought seed from the local seed company. Once harvested, that corn would go to a grain elevator, also locally owned. It would be shipped to a small feedlot in order to fatten cattle raised in Nebraska, Wyoming, Florida, or Arizona; or perhaps it would go to a dairy in northern Missouri, a chicken farm in Indiana, or a pork outfit in Kansas. The variables were infinite, and the market was dynamic. The barge, truck, or railroad car that carried the grain was likely independently owned, too, as would have been the pigs, cows, and chickens it fed. At each stage, the price would have to be "discovered" as multiple potential customers vied to handle the product, with competition keeping the price "true," or fair, in the context of the marketplace. Eventually, the Oelwein corn used to feed sows in Topeka might return to Oelwein in the form of hocks to be disassembled, packaged, and shipped at the Iowa Ham plant. From there, a whole new market, just as complex and multifaceted, would take over in order to distribute the food and sell it at a retail level, perhaps at the grocery (once locally-owned). The farmers would have been the essential building blocks in a vibrant system in which the variables contributed at all stages to what's called the "social capital" of rural communities. In circulatory terms, there was blood flow even in the capillaries.

Beginning with the precedent set in 1987 with the IBP takeover of Hormel

in Ottumwa—and the subsequent takeover of Iowa Ham by Gillette—a few companies would come to control most of the US food business. Today, according to sociologists, the dynamism essential to the marketplace has been lost because there is no longer a multifaceted context. Price discovery no longer happens; the value chain is controlled by a limited number of entities. Seed is not sold; it's biogenetically engineered by companies like Monsanto, which entered a joint venture with Cargill in 1998. Cargill—not the farmer—owns the corn that is grown, too, because it's more than likely that the farmer, who would once have chosen a buyer for his crop, has been contracted to sell only to Cargill. In the Illinois and Ohio river valleys, Cargill owns 50 percent of the grain elevators and other storage facilities. Along with Tyson, Swift and Co., and the National Beef Packing Company, Cargill owns 83.5 percent of the beef packing industry. Cargill, Hormel, ConAgra, and Carolina Turkey own 51 percent of turkey production and packing. Cargill is number one in flour milling; number two in ethanol production and in animal feed plants, producing nine-million tons a year; and number three in soybean crushing. If you are a corn farmer almost anywhere from Pennsylvania to Iowa, you are likely to work for Cargill in at least one of several ways. Even in places like Fayette County, Iowa, where Cargill's presence is implicit rather than explicit, family farms must grow to an enormous size in order to compete. This squeezes out all but the heartiest souls who care enough about their way of life to essentially take a vow of poverty.

As usual, there are many factors at work in the farm crisis, but the main cause is the five or six huge agribusiness conglomerates that buy raw materials from farmers and process and package them for export or for sale in grocery stores. People who have never lived in a farm state often think of all agriculture interests as essentially identical: farmers and agribusiness all want the same things, they believe. But in reality the interests of the two are more like those of the chicken and Colonel Sanders. And Colonel Sanders has been on an unbroken winning streak now for twenty-some years, with farm legislation, trade policy, and a regulatory climate all crafted to strengthen the conglomerates while weakening farmers. For shareholders and upper management of companies like Archer Daniels Midland (ADM) and Tyson, the result has been miraculous, a heaven on earth. For towns like Emporia, it has been ruinous.

The farm is where Americans learned their first lessons in the pitfalls of laissez-faire economics a hundred years ago. Farming is a field uniquely unsuited to the freewheeling whirl of the open market. There are millions of farmers, and they are naturally disorganized; they can't coordinate their plans. Not only are they easily victimized by powerful middlemen—as they

were by the railroads in the Populists' day—but when they find themselves in a tough situation—when, say, the price they are getting for wheat is low—farmers do not have the option of cutting back production, as every other industry does. Instead, each of those millions of farmers works harder, competes better, becomes more efficient, cranks out more of the commodity in question and thus makes the glut even worse and pushes the prices still lower. This is called an “overproduction trap,” and it can only be overcome by a suspension of competition through government intervention. Such intervention is what the Populists and the farmers' unions fought for decades to secure; it finally came with the New Deal, which brought price supports and acreage set-asides and loan guarantees.

For agribusiness, however, farm overproduction is the ideal situation. From their perspective, lower farm prices means higher profits and even greater power in the marketplace. Overproduction and all-out competition between farmers are thus to be encouraged by all available political means. While farmers are naturally disorganized, agribusiness moves in the opposite direction: like all industries, it seeks always to merge and acquire and choke off competition. And, also like other industries, it was finally permitted to do these things in the deregulatory climate of the Reagan–Clinton era.

In the eighties agriculture experts generally agreed that if four companies controlled over 40 percent of market share in a given field, it was no longer competitive. Today, however the four largest players process 81 percent of the beef, 59 percent of the pork, and 50 percent of the chicken produced in the United States. The same phenomenon is at work in grain: the largest four process 61 percent of American wheat, 80 percent of American soybeans, and either 57 percent or 74 percent of American corn, depending on the method. It is no coincidence that the internal motto of Archer Daniels Midland, the grain-processing giant notorious for its political clout and its price-fixing, is reported to be “the competitor is our friend and the customer is our enemy.”

These percentages are estimates, of course, because accurate figures have become more difficult to obtain. Trade journals have come under pressure to not publish some of this information and government agencies often say that to reveal the proportion of a market controlled by a single firm in such a concentrated market is revealing proprietary information.

Agribusiness had acquired most of this stranglehold by the mid-nineties, but farmers were not yet totally in their grasp, thanks to the various farm programs enacted in the thirties. This escape route was closed off in 1996 under the ironically named Freedom to Farm Act, which effectively terminated certain price supports, threw all acreage open to cultivation, and generally brought a close to the New Deal system of agriculture regulation. It

also launched the nation's remaining farmers into a desperate overproduction spiral, a frantic race to compete in which the devil, as usual, takes the hindmost. Written by Kansas senator Pat Roberts and supported by the other Republican members of the state's delegation, Freedom to Farm was one of the many bold deregulatory initiatives that marked the New Economy era; farmers, it was believed, now had the tools to compete effectively on the free market. Everything was different now. They didn't need the government telling them what to do (that farmers had themselves demanded the New Deal programs was forgotten by then); they could grow whatever they wanted in whatever quantities and trust to the market to give them a fair price. Markets were great. Markets made everything fine.

From a high of over \$6.50 in 1996, the average price of a bushel of wheat (the dominant crop in Kansas) fell to \$2.25 in 1999, the same price that it had fetched in the disaster years of the mid-eighties. At such a rate, failure was inevitable for everyone except the largest and most efficient farms. In fact, the crisis got so bad so fast that the federal government resumed making massive payouts to farmers in order to stop the bleeding—not as price supports this time, but simply on the basis of production, so that the larger farms, the ones that needed the money the least, got the most. In Kansas in 2000 and 2001, such federal handouts were actually greater than what farmers earned from farming itself. For ADM, Cargill, ConAgra, and the rest of the food trust, Freedom to Farm couldn't have been better if they had written the law themselves. The processor or feedlot operator now paid substantially less for his wheat and corn than what it cost to grow the wheat and corn; for his finished goods he continued to charge shoppers at the grocery store the same price as before.

Ask a free-market economist about all these goings-on, and he or she will tell you that what happens to the farmers doesn't matter as long as consumers get cheap beef, bread, and potatoes. The problem, however, is that when an industry becomes so concentrated that its component companies have unchallenged market power—as is clearly the case with the food trust—there is nothing forcing them to pass along the savings to the consumer. So while the farmers work themselves into an ever deeper hole, prices in supermarkets remain roughly the same. According to the findings of one professor of agriculture, food prices for consumers have grown by 2.8 percent since 1984 while the prices that farmers receive for producing the same food have fallen by 35.7 percent. The middlemen keep the difference.

Freedom to Farm is a license to a couple of multinational grain companies to steal the product produced by the farmers. The gigantic subsidies handed out since the law was passed in 1996 are merely an indirect subsidy to large-scale corporations and livestock operations.

One can characterize the changes in rural America in terms of Karl Marx's critique of the theory of political economy posited by Adam Smith. With many buyers and many sellers there is perfect competition and no need for government intervention. Smith's "invisible hand of capitalism" works, in theory, to effect the highest amount of economic blood flow at all levels. In reality, Marx's counter-theory has unfortunately proved more insightful. Strapped with the mandate to "grow or die," businesses are encouraged to cannibalize competition until there are no longer many buyers and many sellers, but rather, many buyers and an increasingly limited number of sellers. The flow of capital is dammed up. Once competition has been annihilated, the surviving companies, like Cargill, begin to effect political decisions through their enormous lobbying capabilities. The government no longer governs unimpeded: it does so in tandem with the major companies, just as Marx predicted. It was a century ago that Teddy Roosevelt made his reputation by "busting up the trusts" that had become too powerful. Those "trusts," not coincidentally, were in large part the industrial meat-packers of the early twentieth century.

By 1996, Cargill—with the help of Monsanto and its stable of seed companies—controlled massive shares of almost every food-related market. It was among the top five beef and pork packers, beef-feedlot owners, turkey-farming operators, and ethanol producers. It was number one in animal-feed plants and grain elevators, and number two in flour milling, dry corn milling, wet corn milling, and soybean crushing. Cargill was also moving aggressively into the transportation business, namely river barges, railroad cars, and trucking companies, as well as acquiring grocery store chains. As a result of this centralization most rural economic development specialists discount agriculture as a contributor to rural development. That's to say that, whether you're talking about Oelwein, Algona, or Ottumwa, Iowa, between 1980 and 1995, the lifeblood of those towns ceased to provide the same life that it had offered for over a hundred years.

It was an astonishing sea change in a very short period. Just a quarter century ago when family businesses were the predominant system in rural communities, researchers talked of multiplier effects of three or four—meaning that each dollar generated by farmers in Oelwein would exchange hands three or four times before leaving the community. Today that number is down to one. Historically, farming communities were models of rural economic health, and mining communities like those in the Appalachians were an indicator of a crippling system of centralization. Today, farming and mining communities are indistinguishable. Oelwein and Algona are statistically related to Elk Garden, West Virginia.

It's worth noting that the reason your dinner moves an average of fifteen-

hundred miles to get from its source to your plate is because the source—or sources, really—is determined by companies like Tyson and Cargill and ConAgra, based on where they can pay the cheapest labor costs.

There has also been a rise of the contract system under which an increasing percentage of farm products are now delivered to the processor. In some areas of farm production, in fact, actual markets—in which cattle or hogs, say, are bid up or down by competing buyers—have almost completely disappeared. Farmers are merely “growers” now, workers who provide labor and land to produce some commodity that is under contract from start to finish to the conglomerate. Animals are raised by contract with the all-powerful meatpackers, a price agreed upon long before the creature changes hands.

Beginning in the sixties the big thinkers of the meat biz figured out ways to routinize and de-skill their operations from beginning to end. Not only would this allow them to undercut the skilled, unionized butchers who were then employed by grocery stores, but it would also let them move their plants to the remotest part of the Great Plains, where they could ditch their unionized big-city workers and save on rent. By the early nineties this strategy had put the century-old stockyards in Chicago and Kansas City out of business altogether. As with every other profit-maximizing entity, the industry’s ultimate preference would probably be to have been done with this expensive country once and for all and relocate operations to the third world, where it could be free from regulators, trial lawyers, and prying journalists. Sadly, for the packers, they are prevented from achieving that dream by various food regulations. So instead they bring the workers here, employing waves of immigrants from Southeast Asia, Mexico, and points south.

There were other advantages for the packers in moving to distant and isolated towns. In the big cities, they had always been conspicuous targets for reformers and reporters; you couldn’t pass through Chicago without catching a whiff of the stockyards and being instantly reminded of *The Jungle*. On the High Plains the packers are just about the only game in town. And they use their power accordingly. They threaten to close down a plant if they don’t get their way on some issue or other. They play towns off against one another the way pro sports franchises do. Who will give the packers the biggest tax abatement? Who will vote the fattest bond issue? Who will let them pollute the most? If they can’t flee to another country, well, they’ll just bring those countries’ conditions here to the US it seems.

This is economic growth, yes, but it is the sort of growth that makes a city less wealthy and less healthy as its population increases. Nor does the situation improve much as the decades pass. It has been twenty years now since the packers first moved to Garden City, and two anthropologists who

have studied the region now warn of a permanent breakdown in middle-class life; of a strategy of development that forever puts a town, despite its best efforts, at the mercy of the meat industry's insatiable appetite for cheap labor and the social turmoil that follows from it.

The Garden City saga bespeaks the acceptance of a marginal class, and passive exploitation of it, as a permanent feature of the social system by a nation's middle and upper classes. Anthropologists caution us in their sober way about a recipe for "growth" that blandly accepts a permanent impoverished class. They may be too polite to say it aloud, but they know that poverty rocks. Poverty is profitable. Poverty makes stocks go up and labor come down.

In 1999, Cargill-Excel placed newspaper advertisements in the poor, industrial border towns of Juárez and Tijuana offering two free months' rent to workers who could make it to Ottumwa from Mexico. For Cargill and the rest of the meat-packing conglomerates, employing illegals would appear to have been the best of all possible situations, for the simple reason that these employees, lacking legal identification, didn't technically exist, and therefore had no rights. Nor were they apt to argue with the harsh conditions of an industry that continues today to have the highest rate of employee injury in the United States.

A failed 2001 federal criminal case brought against a Tyson plant in Shelbyville, Tennessee, made clear that corporations would essentially not be held liable for employing or recruiting illegal immigrants to work in the plants. Despite the fact that two Shelbyville managers were caught on tape by federal investigators asking human traffickers for five-hundred undocumented workers over four months, Tyson's defense team successfully maintained that it's too difficult for Tyson employees to determine who's who among legal and illegal employees. The ruling institutionalized the notion that employers of immigrants are not beholden to offering the same rights to workers that other companies must, for the simple reason that they don't know—and don't need to know—who works for them. Alternatively, how can there be any hope of enforcing laws on people who are not who they say they are? According to two former employees of the Cargill-Excel plant in Ottumwa—both of whom were in the United States illegally—the going rate on stolen social security cards at the plant in 2005 was one-thousand dollars, though the most prolific vendor offered the equivalent of a package deal if you wanted more than one.

A Banana Tale

A discarded banana peel quickly became a gooey mess. People actually did slip, fall, and sometimes injure themselves when they stepped on them. So common an occurrence, Charlie Chaplin was even asked how to make something so tired seem new. How, for example, could one make a fat lady, walking down Fifth Avenue, slip on a banana peel and still get a laugh? It's been done a million times. Do you show first the banana peel, then the fat lady approaching, then she slips? Or do you show the fat lady first, then the banana peel, and then she slips? Chaplin's answer:

“Neither. You show the fat lady approaching. Then you show the banana peel; then you show the fat lady and the banana peel together; then she steps *over* the banana peel and disappears down a manhole.”

What we know as a movie gag was real enough that in 1909 the St. Louis city council passed an ordinance prohibiting persons from “throwing or casting” a “banana rind” on public streets or sidewalks. Another regulation the official body passed that year forbid anyone from allowing a “bear to run at large.”

Such private efforts were of little help. It took a public agency to solve the banana peel problem. In New York, a former Civil War colonel named George Waring used his military experience to fashion the city's department of street sweeping. The wild pigs that once roamed the street, eating any organic matter they could find (this is not a joke), were replaced by uniformed workers, who tidied specific beats and deposited the waste they collected into public composting facilities.

Everywhere bananas have appeared, they've changed the cultures that embraced them. In the most ancient translations of the Bible, the “apple” consumed by Eve in the Garden of Eden is the more suggestive banana. The Koran also situates the banana in the sacred garden. There, Eden's forbidden tree is called the *talh*, an archaic Arabic word that scholars usually translate as “tree of paradise” (or sometimes even more directly as “banana tree”). The Islamic sacred text describes the tree as one whose “fruits piled one above another, in long extended shade, whose season is not limited, and whose supply will not be cut off.” Sure enough, that description matches the concentric rings of banana bunches and the plant's multigenerational life span.

But let's swing back to the Judeo-Christian Bible, for a moment. In the Western story of Eden, Adam and Eve are said to react to their nakedness by

covering themselves with “fig leaves.” Fig greenery might cover the essentials, barely. Perhaps Eve was the inventor of the first thong? However, it is more likely that Adam’s banana hammock was made of actual banana leaves. Banana leaves have been used to make clothing—as well as rope, bedding, and umbrellas—in many parts of the world, a practice that continues even today. In this case, the word for the Edenic fruit isn’t mistranslated, just misunderstood: Bananas have been called figs throughout history. Alexander the Great, after sampling the fruit in India, described it as such, as did Spanish explorers in the New World. The clincher comes from ancient Hebrew. In that language, the language of the Torah (the first five books of the Old Testament, including Genesis) a word for the forbidden fruit translates directly: It is called the “fig of Eve.”

In the African nations surrounding Lake Victoria, the word for food, translated from Swahili, is also the word for banana. In Central America, bananas built and toppled nations: a struggle to control the banana crop led to the overthrow of Guatemala’s first democratically elected government in the 1950s, which in turn gave birth to the Mayan genocide of the 1980s. In the 1960s, banana companies—trying to regain plantations nationalized by Fidel Castro—allowed the CIA to use their freighters as part of the failed Bay of Pigs invasion of Cuba. Over and over again, the banana is linked with triumph and tragedy: Banana workers in Honduras wrote epic novels, poems, and songs about the difficult conditions they worked under. Eli Black, the chairman of Chiquita, threw himself out the window of a Manhattan skyscraper in 1974 after his company’s political machinations were exposed. The term ‘banana republic’ reflects the excess of influence banana producers wielded throughout the twentieth century.

It isn’t fair to blame the banana industry for all of Colombia’s problems. But it is important to point out that in that country and throughout Latin America, the destabilization resulting from banana-related interventions created a tradition of weak institutions, making it difficult for true democracy and fair economic policies to take hold. The Latin American tradition of governments not supported by the general population, and propped up by overseas commercial interests, was created under the authorship of United Fruit.

Items that we consider mealtime standards today didn’t exist until United Fruit invented them. Company research found that mothers were feeding mashed bananas to their babies, for example. So United Fruit hired doctors to endorse the practice and launched advertisements to drive the point home. In 1924 the company scored what would be its biggest culinary hit: The United Fruit test kitchens suggested that the perfect breakfast for a busy, modern family would consist of bananas sliced into corn flakes

with milk. It wasn't just the recipe that broke new ground. It was also the coupons, pioneered by the company, packed inside cereal boxes, redeemable for free bananas that the cereal companies, not the fruit importer, paid for. The company made sure that children knew about bananas, too. It set up an official "education department," devoted to publishing textbooks and curriculum materials that subtly provided information about the fruit.

Europe had unified and in doing so had become an even bigger market for bananas than the United States. (Not by much: Continental consumption averages about 30 million tons of the fruit annually versus 26 million tons in the United States.) Among the lesser-known elements of Europe's consolidation were programs designed to aid former colonies. That included the Caribbean banana plantations Chiquita had mostly abandoned as Panama disease moved from island to island. Now, those small farms, growing Cavendish but no longer owned by Chiquita, were given preferential treatment by European governments—the measures were designed to ensure the economic health of those now-independent countries. The result? Chiquita, which had held 20 percent of the European market, suddenly found itself with less than half that.

The company had to do something with all those excess bananas, so it sold them in the United States, creating a banana glut that caused prices to plummet. Chiquita's lawyers and lobbyists argued that the European regulations were both unfair and illegal under World Trade Organization rules, a case of government policy mandating preferential treatment to specific companies in what was supposed to be an open market. They went directly to US officials—at that time, the Clinton administration—and in 1996 the United States lodged an official protest with the agency. The day after the meeting with administration officials, the banana mogul donated \$500,000 to the Democratic Party—sackfuls of cash or coin dropped on a desk were so much more honest. One of the things that seemed to be forgotten in the fight was why the European tariffs were enacted in the first place: to help the banana-growing islands keep jobs and emerge from poverty. In an interview, one Dominican farmer imagined the consequences of an outcome favorable to Chiquita, which would return the banana industry to the grown-where-they're-cheapest status quo:

"If they squeeze us out, we will be the ones that will suffer. When you take away a man's daily bread, you take away my livelihood. You send me to common crime. You force me to traffic in drugs."

With Panama disease, in every case, the failure of the banana companies to enforce proper quarantine and isolation practices hastened the spread.

The banana moguls knew what Panama disease was. They knew what it did. They knew how it spread. But they refused to use any of this knowledge for positive change. It was as if the power of the banana, which had changed both the nations that consumed it and those that grew it, had addicted United Fruit and its rivals to just one method of growth: blunt marauding through the tropics without considering the consequences of, or alternatives to, standard procedure. Now that nature had answered back, the banana companies seemed deaf and baffled. When Black Sigatoka came along, they tried a different tactic.

Five lawsuits were filed against Dole on behalf of banana workers in Costa Rica, Nicaragua, Guatemala, Honduras, and Panama. The suits alleged that the former Standard Fruit had, since the 1970s, knowingly used a pesticide called DBCP—mostly to fight Black Sigatoka—that made workers sterile (the chemical is banned in the United States). In August 2007, Dole CEO David DeLorenzo testified in a Los Angeles courtroom that his company safeguarded the health of workers by instituting screening programs and offering free medical care. Company documents uncovered during the case confirmed that the fruit importer did test employees—and also ignored reports that came back positive. At one point, Dow Chemical, the manufacturer of DBCP, told Dole that the chemical was dangerous and that it would no longer sell it to the banana producers. Dole threatened Dow with a breach-of-contract lawsuit, and the spraying continued.

Our Synthetic Century

“The rains are getting worse and more unpredictable every year—we don’t even have proper seasons any more—but I will persevere with farming for as long as I can. It is a good kind of work to make food for people.”

“Initially, I wanted to be a doctor or a dental surgeon. But I ended up in the agricultural field and I think that was the best thing that could have happened to me. Our professor used to tell us: this is the best faculty. Look at the doctors, they cannot treat patients if they themselves are hungry. Look at the patients, they cannot recover unless they have food. Look at the lawyers, without food nobody can work and you are the ones that can provide it.”
