But such a system is indefensible, whether or not the lord hands out trinkets. It's difficult, of course, because to the recipients of these bribes they do mean a lot: These anti-homelessness charities might be transformed overnight by a donation that means little to Bezos, and many Walton Family-funded charter schools might actually be incredible places for the small number of poor children who get to go to them. It is important, though, that we be "resolutely ungrateful," because we must raise our expectations. You do not get credit for doing something that wasn't hard and still leaves you as the wealthiest person on earth. You do not even get partial credit. Bezos is the same person today as he was yesterday, and the fact that he has recognized that it is not in the interest of Amazon, Inc. for him to be universally loathed by a public that sees him for what he is does not mean that we should withhold our scorn. Rather, we should direct it toward him at a greater volume than ever before.

Corporate Fuckery

Robbed Blind

“It is a sociopolitical nightmare to have someone with lots of interest and no power. They can create a huge amount of problems. So it’s very important to engage those people—to help them understand.”

You might think it’s always “bad for business” to cause disaster. You’d be very wrong.

Consider residents of deeply conservative parts of Louisiana—why are they so opposed to environmental regulations even as they suffer from environmental catastrophes that stricter regulations could have prevented? I don’t wish here to dive into the many reasons why that is. Instead, I’d like to look at one popular belief that is very easy to believe but also very wrong. When a reporter talks to people about the 2010 BP Deepwater Horizon oil spill, she discovers that they are all strongly opposed to Barack Obama’s temporary moratorium on deep sea drilling, even though they were also appalled by the spill. One of the interviewees says the following:

“It’s not in the company’s own interest to have a spill or an accident. They try hard so if there’s a spill, it’s probably the best the company could do.”

I think it’s easy to see why people believe this. There’s actually a persuasive-sounding logic to it. Many libertarian economists believe it entirely. The argument, expanded a bit, goes: The fact that corporations pursue their own financial self-interest means that regulation is not needed. A company that causes disasters is certainly not helping its own profits. BP didn’t want to spill all that oil in the Gulf, obviously. BP has every incentive to avoid oil spills, because they want to keep the oil! Accidents happen, no company is perfect, but ultimately profits and safety coincide. A corporate executive who bungles like this is not actually pursuing the self-interest of

the company, and so when corporations produce environmental catastrophes it is not because they are pathologically self-interested, but rather because they were not pursuing their self-interest well enough. Greed is still good.

Or: Why would Boeing want its planes to drop out of the sky? Why would they want to lose customers, send their stock price plummeting, embroil themselves in tort lawsuits from the families of the dead, and create a giant public scandal? Boeing wants its planes to stay in the air. So while they'll never be perfect, you shouldn't blame the lax federal oversight or their devotion to profits over people.

It's true that accidents themselves are not in a company's self-interest, in that no company gains anything from a horrible accident that destroys their equipment (and possibly their employees' lives, though from a company's perspective employees are fungible). But "the behavior that produces accidents" can absolutely be in a company's self-interest, and accidents don't always sufficiently damage a company's self-interest to make it worthwhile to avoid them. Eating the cost of a few accidents here and there might end up being more profitable than extreme precaution.

Let's assume that corporations operate according to Milton Friedman's idea that their only responsibility is to increase their profit. Boeing does that by selling functional planes, BP does it by successfully getting oil out of the ground without spilling it. If an accident happens, their bottom line hurts. But let's imagine the following scenario: A company can choose to produce a product through Method A or Method B. Method A costs half as much as Method B but carries a one in ten risk of releasing a giant toxic cloud that will kill a thousand people. Method B is more expensive but does not carry any risk of producing a giant toxic cloud.

Our company doesn't want to produce a giant toxic cloud. And maybe a one in ten chance means that it's better to go with method B. But that depends: Why would the company want to avoid killing people with toxic emissions? On Milton Friedman's theory of how a corporation should normatively operate—and let me remind you, this guy won a Not-a-Nobel Prize and Obama's chief economic advisor declared that "we're all Friedmanites"—a corporation should actually be indifferent to whether those people live or die. Its sole responsibility is to its shareholders, and we presume that it's bad for those shareholders if the company kills people.

But why is it bad for them? The toxic cloud isn't going to kill Westport, Connecticut. It's going to kill a bunch of poor Louisianans who live next to the new petrochemical plant. The only thing that can make it bad for the company is the consequences of doing it. Meaning: If we have strong tort laws, and courts make sure that companies pay their victims a TON of money, so much that they would never adopt Method A, then it's no

longer in a company's interest to choose Method A. If our criminal laws are enforced against corporate wrongdoers, and the executives who chose Method A are charged with murder, then that creates a particularly powerful incentive. If there are strong crusading media institutions that investigate corporate wrongdoing, so that the public will turn against any company that is so irresponsible as to choose Method A, then Method A won't be worthwhile. But if, say, corporations had legal teams so vast that they could ensure victims would never see a court judgment, or if "tort reform" limited damages, or if prosecutors declined to prosecute rich people, or if media institutions were themselves for-profit and incentivized to produce clickbait over important investigations, then there would be no reason not to go ahead and release that cloud!

A Friedmanite—a.k.a. sociopathic—company only has incentives not to hurt people to the extent that there are strong external institutions, in the form of government, media, consumer groups, and labor groups, that can create those incentives. If hurting people doesn't cost money, then it isn't in the interest of companies to avoid cheap, risky practices. The "expected return" on a dangerously risky move might be high enough that it is "economically rational" (not to be confused with being actually rational).

It's also important to remember that just because a gamble doesn't pay off, doesn't mean it was the wrong move. Even if there are strong coercive external institutions that punish toxic cloud emission, which means that if you emit the toxic cloud your company will be severely hurt, a company might still take the gamble on Method A, because the potential rewards are so high. If there's a 99/100 chance that by pressing a given button you get a billion dollars, and a 1/100 chance that you'll be instantly killed, "self interest" doesn't necessarily dictate that you'll stay away from the button. It depends on whether you're feeling lucky. The 2008 financial crisis was like this. People made piles and piles of money off risky investments, until they didn't. They weren't necessarily "failing to pursue their own interest" just because they took risks. For many of them, it was probably a smart move that turned out well. Every company takes risks. What if playing dice with people's lives actually turns out to be good for BP, on the whole? It might go wrong once or twice, but what if overall they make out pretty well from putting quantity of oil over safety, because the oil makes up for the accident costs? Then what?

To a leftist, all of this is eye-rollingly obvious, especially because we have very clear evidence of how this works in practice. Boeing's frantic need to beat Airbus, and the absence of independent oversight, led to calamity. Or look at climate change: Fossil fuel companies suffer no consequences for the damage they do, so it's not in their self-interest to stop. If we applied tort

law to the fossil fuel industry, their self-interest would adjust accordingly. Tobacco companies lied to people about cigarettes up until the moment that external accountability made lying a bad idea. But if they expected the law would never catch up with them, and thought their propaganda campaign could be successful, lying was probably the correct business move.

I am actually quite sympathetic to people who swallow these kinds of talking points. They can truly sound persuasive: Why would Boeing not want safe planes? How could bad planes be in their interest? But risking lives can absolutely be in a company's financial interest, if, as in the case of tobacco companies and fossil fuel companies, you don't actually have to pay a penalty for the lives you take. And even if you do risk a big penalty, if there's a big chance that a risk will create a bonanza, and a small chance it will bankrupt you, you might serve your shareholders by taking the risk. Limited liability offers them pretty comfortable protection. It's important to be clear about this, because it's easy to think that what companies that cause accidents do is recklessly and foolishly pursue their self-interest, and the more sober-minded pursuit of self-interest would be okay. In other words, you're just doing Friedman's idea wrong, rather than Friedman's idea being wrong. But it's pathological self-interest itself that's the problem, because without the threat of consequences there's no reason not to pursue harmful causes of action.

BP certainly wants to convince the ordinary Louisianans that the company is a partner and friend. Why would we want to hurt you? We're all in this together! We're bringing you jobs. We're cleaning up the spill, and we certainly don't want another. Don't believe them. Milton Friedman was quite clear: All they want is money, and if they can convince people that "big government" is bad and regulation is unnecessary, then environmental destruction is costless. The companies tearing down the Amazon rainforests, and displacing native populations, are behaving precisely as Friedman would have wanted. Doing harm is only bad for business if we make it bad for business.

"The enterprises of the country are aggregating vast corporate combinations of unexampled capital, boldly marching, not for economic conquests only, but for political power. The question will arise, and arise in your day, though perhaps not fully in mine, 'Which shall rule—wealth or man; which shall lead—money or intellect; who shall fill public stations—educated and patriotic free men, or the feudal serfs of corporate capital?'"

—Edward G. Ryan, Chief Justice, Supreme Court (WI), 1873

“If we will not endure a king as a political power, we should not endure a king over the production, transportation, and sale of any of the necessaries of life.”

—Senator John Sherman (R-OH), 1890

“I do not expect to see monopoly restrain itself. If there are men in this country big enough to own the government of the United States, they are going to own it.”

—Teddy Roosevelt

Until the 1910s, telegraphy was so expensive that only businesses could afford the service. But Western Union wired offices in the Capitol Building and gave elected officials unlimited free use of the system. According to memos in the Western Union archive, the company privately considered this the “cheapest means” of calming its critics in Washington. Freebies were merely a first line of defense—and relatively innocuous compared with Western Union’s other ploys. Its protective shell was the press. More specifically, Western Union formed an impregnable alliance with the Associated Press (AP)—an organization that had achieved an impressive monopoly of its own.

The AP supplied American newspapers with an endless stream of copy that helped them to economically fill their pages. Most American newspapers couldn’t afford to send correspondents to Washington or Europe, and the AP’s network of reporters allowed them to fill that gap. More than 80 percent of the copy in western papers, according to one survey, came from the wire service. Newspapers relied on the AP, and the AP exploited that reliance. It insisted that its clients use no other wire service. Even worse, it insisted that its clients never say a bad public word about the organization. It was an enviable business model.

Certainly, Western Union salivated over the prospect of acquiring a piece of that action. But the optics of the monopolist acquiring even greater power were terrible. So Western Union stumbled upon an even more elegant solution. The two monopolists of the wires would conspire so that they mutually protected each other. Western Union would grant the AP exclusive use of its wires, at a nicely discounted rate. In return, the AP signed a contract that declared that its members would “not in any way encourage or support any opposition or competing telegraph companies.” The quid pro quo couldn’t have been any clearer. Newspapers that spoke ill of Western Union were tossed from the AP—as was the case with the Omaha Republican, punished for having the temerity to describe the telegraph company as an “onerous” and “grievous” monopoly.

Los Angeles once had one of the finest public transit systems in the world, but Standard Oil and General Motors jointly bought it and closed it down. They then pressured the California legislature to build freeways. And soon, life in Los Angeles became almost impossible without a car. Homes, stores, businesses, and even schools and recreation centers were now so far from each other that they could only be reached by automobile.

The distribution of wealth is not determined by nature. It is determined by public policy. America's corporate and political elites now form a regime of their own and they're privatizing democracy. All the benefits—the tax cuts, policies, and rewards—flow in one direction: up.

In a rigged economy, you may be tricked into thinking you are paying less in taxes, when in reality you just pay privately, typically at higher prices, for what your taxes used to cover (as many have seen with garbage collection and health care). Add your taxes and higher personal spending, and your actual burdens are heavier than those of people in other modern countries who make less and pay higher taxes, but use the wholesale buying power of government to hold down costs.

Before the twentieth century, contracts to lobby government officials were not enforceable on the grounds that lobbying was contrary to public policy. In the 1874 case *Trist v. Child*, for example, Trist, a former diplomat, had hired Child to lobby Congress to authorize payment of money Trist claimed the government owed him and then refused to pay Child when Congress finally came through. Child sued. The Supreme Court declined to enforce the contract between Trist and Child, reasoning that such contracts could lead to corruption.

“If any of the great corporations of the country were to hire adventurers who make market of themselves in this way, to procure the passage of a general law with a view to the promotion of their private interests, the moral sense of every right-minded man would instinctively denounce the employer and the employed as steeped in corruption, and the employment as infamous.”

That logic obviously failed to impress the Supreme Court eighty-six years later when it decided that corporations are people under the First Amendment, entitled to hire as many lobbyist adventurers as they can possibly afford.

Economists have a simple technique for measuring whether an industry is competitive or tending toward monopoly. It is called the Herfindahl-Hirschman Index, or HHI. The formula squares the market share of each

company, then adds up the squares. It's easier than it sounds. In an industry with one firm that has 100 percent market share, the HHI score will be $100 \times 100 = 10,000$. Or, if fifty firms each have two percent of the market, then the score would be 200 ($2 \times 2 = 4$; $4 \times 50 = 200$). On the Justice Department scale, scores up to 1,000 indicate competitive markets, while scores higher than 1,800 are seen as solid evidence that competition is weak to nonexistent.

In 1978, when America had thirty-six Class I railroads, the HHI score was 589, indicating robust competition. By 2004, however, just seven remaining Class I railroads meant the HHI score had soared to 2,263, reinforcing what was already obvious: little competition survived in the marketplace. Although the text of the 1980 Staggers Rail Act cites competition four times as the goal of the law, the effect has been the opposite. To say that there are seven Class I railroads is also misleading. Twin duopolies, one west of the Mississippi River, the other east, dominate rail freight hauling. In the West there are the Union Pacific and Warren Buffett's Burlington Northern Santa Fe. In the East there are CSX and Norfolk-Southern. As long as each of the big players elects not to cut prices to take major customers away from its rival, these duopolies function as price-inflating, profit-making machines to the detriment of the overall economy.

The concept of economic moats is a cornerstone of our stock-investment philosophy. Successful long-term investing involves more than just identifying solid businesses, or finding businesses that are growing rapidly, or buying cheap stocks. Successful investing also involves evaluating whether a business will stand the test of time. The concept of an economic moat can be traced back to legendary parasite Warren Buffett, whose annual Berkshire shareholder letters over the years contain many references to him looking to invest in businesses with "economic castles protected by unbreachable 'moats.'" Moats are important to investors because any time a company develops a useful product or service, it isn't long before other firms try to capitalize on that opportunity by producing a similar—if not better—product. Basic economic theory says that in a perfectly competitive market, rivals will eventually eat up any excess profits earned by a successful business. In other words, competition makes it difficult for most firms to generate strong growth and margins over an extended period of time.

Protecting railroads from competition has an obvious implication: every time you turn on a light in your home or buy a product made with the help of electricity, you're paying more than you would in a competitive market. When a business has a monopoly, as railroads do in many parts of the country, regulation is supposed to act as a substitute for competition, a proxy for market forces. But that assumption breaks down when regulators

identify with the industry more than with customers; then the captains of industry get both undeserved riches and the wherewithal to further the tilt of the system in their favour. Easy profits enable them to make more political donations and offer more jobs to former regulators and their spouses, some of whom know how to get politicians on the oversight committees to make sure that no matter what is said, nothing happens to harm the protected industries.

So ruthless were the nineteenth-century railroads that, as the reformer Henry George wrote in his 1879 book *Progress and Poverty*, railroad monopolists approached the burghers of small towns “as a robber approaches his victim.” The railroads demanded whatever would make them richer, threatening to move their line a few miles this way or that to compel submission. You can still visit the ruins of once-thriving little towns in the Great Plains that became ghost towns because the town fathers dared to resist the demands of railroad barons. Jumping to our time, railroad ownership is more concentrated than in 1887 and the abuse of power as great or greater.

Although two railroads trace the eastern shore of the Red River to Lafayette, the utility’s power plant is twenty miles back upstream on the west side of the river. As it happens, the west bank is Union Pacific’s exclusive province. Well, you might say, why can’t Lafayette negotiate competitive rates from Wyoming to the Lafayette rail yards, then pay Union Pacific a monopoly rate to haul its coal the last twenty miles to the parish’s Rodemacher power plant? Sadly, it doesn’t work that way, and Lafayette pays a monopoly rate for the entire 1,520-mile trip.

“We are a classic captive customer. On ninety-nine percent of the route we have competitive rail service, so we would like to negotiate for competitive rates on that portion, but we cannot.”

The reason is the “bottleneck” decision of the Surface Transportation Board. In 1996, the STB ruled, in essence, that if any portion of a trip is on a monopoly rail line, the monopoly rail can charge monopoly prices not just to the nearest junction with another railroad, but all the way. One implication is that bottlenecks become a good thing for railroads. In the case of coal, two-thirds of which moves under this monopoly-pricing rule, bottlenecks have become a very good, very profitable policy for the carrier, but not the customer.

Union Pacific’s picking of Lafayette’s pockets works out to more than a dollar per week for every man, woman, and child in Lafayette, more than \$200 annually for a family of four. That’s more than enough to finance a 10 percent cut in Lafayette property taxes. Or it could cover free electricity

to Lafayette schools and colleges, relieving taxpayers of that burden, with enough left over for a small property-tax reduction. Looked at another way, that \$6.5 million per year could be spent on local goods and services for the benefit of Lafayette's businesses and workers. Instead, it is extracted from the wallets of local residents and businesses and sent to Omaha, home to both Union Pacific and BNSF owner Warren Buffett.

Buffett often says that his style is to let his managers run their shops, as long as they make their numbers, meaning their expected level of profit. His management style is widely praised in news reports and in profiles of the "Oracle of Omaha." By giving managers the freedom to run their business units as they see fit, Buffett takes on a duty to demand the highest ethical standards. That would not, in my opinion, include gouging customers on coal shipping rates as his BNSF railroad does. Nor would an ethical chief executive allow anyone in his employ ever to suggest that anyone should die to bolster a company's profits. But that is what happens under the Buffett style, in which by his own account he focuses on whether managers—some of whom resort to immoral conduct to give their billionaire boss what he demands—"make their numbers."

In New York the cheap hydropower benefits only a few. Just ten corporations get two-thirds of the cheap power not dedicated to the handful of publicly owned electric utilities in New York. Among those with long-term contracts to buy power at well below the rates anyone else pays are Intel, Occidental Petroleum and Olin, a chemical company. The biggest share—a fourth of Niagara Falls' power—goes to Alcoa for its aluminum smelters at the eastern end of Lake Ontario. This power is so cheap compared to what other industrial customers pay that, over thirty years, Alcoa will save the mind-boggling sum of \$5.6 billion. That is ten times the entire profit Alcoa earned worldwide in 2010. So what does all this cheap power subsidize? About a thousand jobs, filled by workers who earned an average of less than \$60,000 each per year. Divide up the subsidy, and it amounts to about \$150,000 per job annually. Paying the workers in full to stay home would thus save \$90,000 per job each year. That makes the Alcoa subsidy the equivalent of throwing your money over Niagara Falls. The subsidy also means that while Alcoa reports profits to investors, those profits come not from the competitive markets, but this subtle gift of a public resource.

On very hot days, or less often on very cold days, the utilities literally pay lumber mills and smelters, prisons, and public schools to stop drawing power from the grid. Most of these big consumers don't have microgrids. They are 100 percent grid dependent, and using less power means making life pretty unpleasant for their workers and other inhabitants. In New York City, in 2010, sixty-five different facilities had enrolled in one such program.

Reductions at Rikers Island alone that summer accounted for 5.2 megawatts pulled off the grid on the hottest days of the year, providing the Department of Corrections with an incentive payment of \$100,000 for the savings it incurred. It's worth adding that it is easier to take something away from prisoners and other institutionalized persons (like high school students) than from suburbanites. Turning the air-conditioning off in a prison or in a high school—New York's other high performer in 2010 was LaGuardia High School—is, as they say, “picking the low-hanging fruit” off the peak-load tree.

Increasing the cost of all the piped water Americans use by just a penny a gallon taps an extra \$96 billion from consumer pockets per year. That penny would increase the total price that households would pay for piped water from about a billion dollars a week to nearly three billion.

The Montana Supreme Court ruled against Subway because it did not disclose the arbitration requirement prominently on the front page of the contract, as state law required. When Subway appealed to the United States Supreme Court, which takes only a tiny minority of the cases presented to it each year, the court took the case. Its ruling? Eight to one in Subway's favor. Liberal hero Justice Ruth Bader Ginsburg held that the Montana law requiring the front-page disclosure was invalid. Why? Because the disclosure requirement applied only to arbitration and not to all types of disputes, making it discriminatory and thus invalid. The decision invalidated similar notice laws in Georgia, Iowa, Missouri, Rhode Island, South Carolina, Tennessee, Texas, and Vermont. Business lawyers hailed the decision—it obviously enhanced corporate power in such disputes—but consumer advocates did not.

This decision illustrates how the Supreme Court focuses on legal formalism without context and often without recognizing how the law operates in the real world. It is part of a long line of decisions that skew economic power toward corporations that use contracts of adhesion. It also erodes the ancient legal concept that courts must look out for the interests of less sophisticated, less informed and weaker parties if the law is to be merciful and thus widely respected. Ginsburg, supposedly a liberal long known for taking a sharp look at discrimination, in this case hurt many buyers not as sophisticated as she is about discrimination. But it did nothing to hurt her image as a tiny liberal feminist badass—RBG!

The Casarotto case revealed another problem—that the law allows corporations to make promises they have no intention of ever fulfilling and, further, to use those promises to induce people to do all sorts of things, from buying a sandwich shop franchise to accepting a buyout package from a job. A company can put promises in writing and then not fulfill them, without

consequence—promissory fraud. Unless one can prove a positive intention to deceive, not just a lack of an intention to perform, corporations and their agents can make promises to induce people to do business with them and then simply not perform as promised. It is possible to make a promise without having an intention to perform or not to perform and yet under the law not commit fraud. That is because fraud requires “an intention to deceive” when the promise is made. Unless you can prove that the company or its agent intended to defraud you, the company and its agents will not be liable for promissory fraud in courts today. How are you going to prove, though, what the company’s agent intended? How can you establish what the courts call a scheme to defraud? It can be done, but it is extremely difficult unless you can afford, and get a court to approve, subpoenas for company records and you have the time and resources to go through what could be a huge pile of unsorted raw data. Even then, you would likely need to turn up something damning, such as an e-mail boasting about a plan to deceive. Absent such a smoking gun, a company and its agents can explain that they never intended to deceive you, they just did not do what they promised.

Such clauses can even prevent small businesses from alleging that large businesses with whom they’ve contracted have monopolized an industry, thereby giving the small businesses little or no choice but to accept the contract. When the owner of a small restaurant, Italian Colors, located in Oakland, California, accused American Express of abusing its monopoly power by imposing unreasonable rates on the restaurant, American Express responded that such a claim was prohibited by the mandatory arbitration clause in the contract Italian Colors had signed with it. The case went to the Supreme Court, and in 2013 a majority of the court agreed with American Express. But as Justice Elena Kagan argued in dissent, the court’s decision puts small businesses in an impossible bind and gives large monopolists an easy out.

“The monopolist gets to use its monopoly power to insist on a contract effectively depriving its victims of all legal recourse.”

Over the last two decades, every major US airline has been through bankruptcy at least once, usually in order to renege on previously agreed-upon labor union contracts. Under the bankruptcy code—largely crafted by credit card companies and bankers—labor contracts stipulating workers’ pay have a relatively low priority when it comes to who gets paid off first. That means even the threat of bankruptcy can be a potent weapon for getting union members to sacrifice wages already agreed to. In 2003, American

Airlines CEO Don Carty used such a threat to wring almost \$2 billion of concessions from American's major unions. Carty preached the necessity of "shared sacrifice" but failed to disclose that he had secretly established a supplemental executive retirement plan whose assets, locked away in a trust, couldn't be touched in the event of bankruptcy. When Carty resigned he walked off with close to \$12 million, courtesy of the secret plan.

Hill was still dissatisfied with the number of women smokers in 1929. His insistence that Bernays come up with a way to get women to smoke outdoors as well as indoors led to the PR man's most notorious staged event. Bernays obtained a list of New York City debutantes and invited each one to join other women demonstrating their support for the equality of the sexes by walking together in the city's Easter Parade on Fifth Avenue in 1929. Additional women were recruited through ads signed by prominent local advocates of women's rights. All the information stressed that as the women walked, they would light symbols of equality, their "torches of freedom"—cigarettes.

The carefully scripted event went without a hitch, despite fewer than a dozen women showing up. Photos of them—defiant, stylishly dressed female smokers making their way through the parade—were published across the country, and several "torches of freedom" marches followed in support. Women, in other words, took the bait and proclaimed their determination to squelch the old taboo against smoking as the start of a movement to establish their equality with men.

In one particularly telling incident, McDonald's executives were challenged on the company's claim that it serves "nutritious food." David Green, senior vice president of marketing, expressed his opinion that Coca-Cola is nutritious because it is "providing water, and I think that is part of a balanced diet." In another embarrassing exchange, McDonald's executive Ed Oakley explained that the McDonald's garbage stuffed into landfills is "a benefit, otherwise you will end up with lots of vast empty gravel pits all over the country."

The delta's Native Americans include the Pointe-au-Chien tribe. A century ago, Natives like them, isolated, illiterate, non-English-speaking, unable to get to New Orleans, missed the opportunity to claim land and territory after the Louisiana Purchase, in 1803—even though it had for millennia all been theirs. Much of southern Louisiana was claimed by the federal government, which auctioned a lot of it to land companies in the 1800s. Later, oil companies bought much of southern Louisiana. They swindled the Natives out of any crumbs they'd gotten. Native Americans have in the past accused land grabbers and oil companies of seizing waterlands that rightfully belonged to them. They sued to regain vast tracts now owned by

big landholding and energy companies. Needless to say, they lost.

The extractive industries—oil, gas, and mining—tend to be run by some of the most outspoken opponents of government regulation in the country, yet all rely considerably on government permits, regulations, and tax laws to aid their profits and frequently to give them access to public lands.

“Since we can’t control Mother Nature, let’s figure out how to get along with her changes.”

A similar line was subtly argued in the David H. Koch Hall of Human Origins at the Smithsonian’s National Museum of Natural History in Washington, which opened in March 2010. The message of the exhibition, funded by his fortune, was that the human race had evolved for the better in response to previous environmental challenges and would adapt in the face of climate change, too. An interactive game suggested that if the climate on earth became intolerable, people might build underground cities and develop short, compact bodies or curved spines so that moving around in tight spaces will be no problem.

In 1997 the EPA moved to reduce surface ozone, a form of air pollution caused, in part, by emissions from oil refineries. Susan Dudley, an economist who became a top official at the Mercatus Center, came up with a novel criticism of the proposed rule. The EPA, she argued, had not taken into account that by blocking the sun, smog cut down on cases of skin cancer. She claimed that if pollution were controlled, it would cause up to eleven-thousand additional cases of skin cancer each year.

Arguing that mine safety and clean water regulations only hurt workers:

“Are workers really better off being safer but making less income?”

In 2005, Visa launched its pink-and-white Hello Kitty credit card aimed at ten- to fourteen-year-olds. Although corporate officials proclaimed that the card would help kids develop money-management skills, the website marketing the card urged young shoppers to “shop ‘til you drop!”

What does it cost banks to deal with a bounced check? Back in the late 1970s, when checks were still processed by a person and a machine rather than digitally, Crocker Bank (now part of Wells Fargo) was forced to reveal in a California court case that its cost was thirty cents. At that time, the bank was charging customers \$6 for bounced checks, a markup of 2,000 percent. The California Supreme Court held that charging twenty times cost was not necessarily unconscionable. Adjusted for inflation, that \$6 fee would now be \$21, less than half what BofA charges. What are today’s

bank costs for processing a bounced check? BofA won't tell customers, but research papers on costs in the digital era suggest it could be less than a penny, making the markup by BofA in the neighborhood of 470,000 percent. But corporate values now so infuse our society that price gouging is easily brushed off as a function of competition, regardless of whether that's the truth or an ideological fantasy.

The biggest pile of gold comes from fees for overdrawing an account. Charge a \$5 item when your account has \$4.99 and the overdraft fee can easily be \$40. Some banks no longer let customers use their savings account to cover overdrafts, but instead require the use of a credit line. M&T Bank, a Warren Buffett bank—we see you Warren—charges customers \$10 even if they go online and move money in advance of a shortfall from their overdraft account to their checking account. The cost to the bank for such a transfer? The best indication that the cost is infinitesimal is this: moving money from checking to the overdraft account is free of charge. So is moving money from, say, a home equity line of credit to checking, which is free at M&T. Overdraft fees nationwide totaled about \$20 billion in 2011, according to the Consumer Financial Protection Bureau, the federal agency created by Congress to deal with gouging by banks. A much larger estimate, more than \$38 billion, was made by Moebs Services, a private research firm used by the banking industry, for 2009. It found that such fees doubled between 2000 and 2009 as banks raised overdraft charges and more customers incurred them. But as the economy ebbed, so did overdraft fees, down to \$31.6 billion in 2011 by Moebs' estimate.

Here, however, the banks have proved politically astute. The banks designed fee systems, like the two Bank of America charges that it slaps on some customers who innocently deposit a bad check, to hit younger people (under age thirty-five) and those with modest incomes. These people tend also to be less sophisticated and have less access to politicians. Four out of five bank customers surveyed by the American Bankers Association said they paid no overdraft fees in 2009. More customers than that overdrew their accounts, but their bank waived the fees in many cases. Moebs Research estimated that just 10 percent of bank customers pay 90 percent of overdraft fees. Some customers, research by Moebs Research and others shows, pay more than \$125 a month in overdraft fees month after month. The banks would shun them as customers except for the fees they generate. Designing a system so that the people who pay the fees are the very people with the least capacity to get government to listen to their concerns makes sense from the bankers' point of view.

It also shows the nation's growing disregard for the least among us, a trend exacerbated by the decline of private-sector unions and reductions in

money for government consumer advocacy agencies. Political influence is concentrated at the top. The bottom third of Americans have zero direct political influence on roll call votes, and the next third have almost next to none. Thus it is not surprising that the burden of bank fees falls on the most vulnerable.

The Federal Reserve is the “lender of last resort.” Any member bank can borrow whatever cash it needs overnight to avoid overdrawing its own accounts. Banks do it all the time. Bankers don’t have to check their account balances to see if they can cover the funds to be disbursed to you for, say, a new car purchase. No, the bank just makes the loan and, if it needs to cover the cost, it borrows it from others, including the Federal Reserve. To make sure banks do not just loot the Federal Reserve, the Federal Reserve has rules. One of them, Rule 23A, requires that banks hold, and pledge as collateral, valuable paper, such as mortgages, on which the balance owed is much less than the value of the property. Bonds will do, too, those issued by cash-rich and profitable companies; as will stocks in blue-chip companies. By demanding quality collateral, the Federal Reserve should be able to collect on its overnight loans even if the cash-short bank fails. The Federal Reserve has the power to waive its rules on the quality of the collateral it accepts for loans from cash-short banks. It can, under Rule 23A, accept pretty much any piece of paper as collateral, not just valuable paper like mortgages on which the balance is much less than the value of the property or bonds from cash-rich and profitable companies. In recent years, the Federal Reserve has taken less valuable assets as collateral, as you can see by going to www.federalreserve.gov/boarddocs/legalint/FederalReserveAct/xxxx. Just replace the four Xs at the end of the Web address with the year you want to check.

Control fraud occurs when the head of a corporation runs it not for profit, but plunder. That’s essentially what the Mafia does when it takes over a business from someone in too deep with loan sharks. The mob orders all the supplies it can to be delivered as quickly as possible, carts them out the back door, and then torches the place. The vendors never get paid. Crooked bankers just use accounting rules to mask their crimes and then either put the business into bankruptcy or get the government to rescue it. The Chicago School economists and other promoters of regulation that favors corporations all insist that control frauds are rare and thus not significant. That position remains plausible as long as officials insist that no one saw, or could have seen, the 2008 collapse coming; as long as law enforcement is kept busy not looking for criminal conduct. But achieving this requires blinders, what we might call wishful denial of obvious facts.

In recent years US multinationals’ profit shifting to tax havens has become

increasingly aggressive, allowing corporations to enjoy the benefits of making profits in America without sharing much in the burden of maintaining the society that makes those profits possible.

The next time you hear an executive or tax adviser on television complaining about the arduous complexity of the tax code, remember this: business loves complexity when it turns taxes into profits and shifts the burdens of government on to you.

This brings us back to that quote that candidate Ronald Reagan loved so much, the made-up one that warned that the rabble would vote themselves the largesse of the treasury and ruin the country. The lessons here are three:

1. Reagan got it partly right. There are votes to capture the largesse of the treasury. The votes, however, come not from the citizenry, but from lawmakers whose real constituency is the political-donor class that is energetically mining the government treasury for its benefit. One way to do this is to abuse the English language by, say, drafting legislation whose title describes the opposite of what the bill says, as with the job destruction features of the 2004 American Jobs Creation Act.
2. Had Reagan been right, he would never have won election since he promised the voters less, not more, than his opponent, President Jimmy Carter.
3. Unless the voters take the time to understand giveaways (such as the Jobs Creation Act) that effectively take from the many to give to the already-rich few, which will require that the news media provide sustained, serious, and skeptical coverage, then the loose fiscal policy Reagan warned about will continue to be right on the money.

Chains like Target, Walmart, and Hilton charge their Wisconsin operations a royalty to use their logos on signs marking their buildings. These royalty payments funnel money out of Wisconsin to states such as Delaware, Nevada, Texas, and Wyoming, where corporations pay little or no tax on their profits.

A Michigan senate staff report made a crucial point about why those tax giveaways to motion picture projects are a sheer waste of money. Filming on location is inherently fickle, temporary, and movable. Films shot partly in Michigan do not represent fixed investments. A movie shot on location is not like a factory, in which the owners have invested in unique manufacturing equipment and customized buildings, which they have an incentive to keep productive until they wear out decades in the future or demand for their

products ebbs. Location shoots are not even like filming in a studio on soundstages that are costly to build and maintain. The Hollywood studios just use Michigan as a location, shooting its gritty industrial cities and aging factories, its lush forests and Great Lakes shorelines. They fly in the actors, rent hotel rooms, run the cameras for a few hours and leave. All it takes to switch filming—and the jobs that go with it—from Michigan to Louisiana is a slightly larger tax credit from the Pelican State. With a quick polish of the script by a screenwriter, an Upper Peninsula hunting scene can be shot in the bayou. The loons become pelicans. To boost their welfare checks, studios tell the companies they rent cameras from to briefly occupy a vacant space in the state where location shooting will take place. That way they can count the cost of the camera rental as an in-state expense. It's what happened when the makers of *Public Enemies* rented cameras from the temporary Wisconsin storefront of a Chicago-based movie camera rental business.

Companies and the politicians they help keep in office have another technique to help corporations escape taxation: laying off state tax auditors. In many states, notably South Carolina and Wisconsin, governors slashed the number of corporate tax auditors, claiming the state could no longer afford them. It is a preposterous argument. These auditors routinely bring in many times their salaries, which would seem to argue for keeping them working. Firing auditors makes as much sense as a hospital firing doctors; in a real sense, doctors are the source of a hospital's patients and, like auditors, both amount to a sales force. But when politicians fire auditors, plenty of people cheer because their hatred of taxes or government overwhelms logic and reason. How many politicians have you heard saying we need more tax auditors? Would that change if we called them what they are—financial detectives?

At the federal level, the highest paid IRS corporate auditors, with years of experience and advanced degrees, make less than \$75 an hour in pay and benefits. According to IRS data analyzed by the Transactional Records Access Clearinghouse at Syracuse University, each hour spent auditing the biggest companies produced an average of more than \$9,300 of taxes owed. So firing one of these auditors saves less than \$150,000 annually while costing more than \$19 million annually in forgone tax revenue.

The typical problem is abuse of power while pursuing profit. The world isn't black and white, but our policies should aim for the lightest possible shades of gray. We have far too many executives who destroy shareholder wealth and shortchange hardworking subordinates while enriching themselves beyond reason. We have too few effective remedies for victims of abusive pricing. We have too many big business structures that strip resources from

utilities, making them more costly, less reliable, and sometimes downright dangerous. And we should never have a hands-off “make your numbers” management ethos like Warren Buffett’s that prompts people far down below to ask people to die to help the bottom line.

The concepts we need to reintroduce into our culture to avoid sinking into an unprincipled pit—in which all that matters is money—can be summed up simply. We need companies (and executives) who are candid. Fair. Forthright. Honest. Loyal. Prudent. Reasonable. Transparent. Reliable. Responsible. We need to acknowledge that rules define society. When the absence of rules allows businesses to lower their standards toward the lowest common denominator, then, in time, that is what we will get. Accounting rules that lack integrity may produce short-term gains, but the whole market will gravitate toward these bad practices—as it has done.

“Labor is prior to and independent of capital. Capital is only the fruit of labor, and could never have existed if labor had not first existed. Labor is the superior of capital, and deserves much the higher consideration.”

Those words come not from Karl Marx, but from that most famous of Republican presidents, Abraham Lincoln. Lincoln spoke those words in his first State of the Union address in December 1861. He was talking in code about slavery, but his deeper point is that capital and labor exist in symbiosis, like the algae and fungi that make lichen, like the arterial and venous blood that sustain human life. If the veins that carry away carbon dioxide and other waste are smaller than those that bring oxygen and food, the body does not remain healthy. Indeed, pools of blood form and begin to rot, which if left untreated will kill the body.

We are being robbed blind by rules that the politically favored few have buried in the fine print. Just a penny a day per person is \$1.1 billion a year; an unwarranted buck a day redistributes \$113 billion upward to the politically connected few who write the contracts and get government to write the rules in their favor, all the while ensuring billions will needlessly struggle and suffer.

Unless we fight back, the economic elite will continue to stuff their pockets, while damaging the stability of our society. No one else will do this job. That is the whole idea of a democracy—people decide for themselves what kind of government—what kind of fine print—they want. They decide by their actions: whether to speak up, whether to organize, whether or not to vote. If you want a stronger, wealthier, and fairer America, then act. And don’t expect overnight success. Change is not easy.

As Frederick Douglass, the runaway slave who became publisher of the antislavery *North Star* newspaper, observed in 1857:

“If there is no struggle, there is no progress. Those who profess to favor freedom and yet depreciate agitation want rain without thunder and lightning. Power concedes nothing without a demand. It never did and it never will.”

Progress is not a straight line uphill. We are living in an era of setbacks, an era that the future will look back upon and see for all its follies, especially the naïve idea that markets will just run themselves efficiently and honestly and that cutting wages and taxes is the path to prosperity.

People with the skills to sustain themselves and improve their lot build our society. Denying the basic skills needed to succeed, starting with a decent education so that one can comprehend more than simple instructions, is itself a form of crime. Under what theory of morality do we grant those already in a superior economic or legal position ever more power, especially when that power derives from rules in fine print that defy normal human understanding?

Taking Hostages

This belief in the superiority of the free market at the expense of government didn't start with Trump or Bush (or Reagan or Goldwater). In 1958, McKinsey consulted on the organizing of America's response to Sputnik, NASA. From NASA's establishment, the organizational structure that Glennan and the consultants from McKinsey & Company devised for the space agency promoted the use of outside contractors over building internal expertise. Beyond the bare minimum of internal technical expertise, the McKinsey consultants argued that America's "free enterprise society dictates that industry should be given as extensive a role as possible."

This approach, may have dismayed the agency's engineers, but the response cheered NASA administrators. By 1964, 90 percent of NASA's \$5 billion budget went to private companies and 350,000 contractors supported 32,500 NASA employees. Bill Clinton's declaration of the end of big government in 1996 and George W. Bush's pledge to substitute contractors for half of the remaining federal workforce in 2002 were influenced and made possible by the work that McKinsey did in establishing the contractor state. In an ironic twist, two months before the disastrous roll-out of healthcare.gov, McKinsey warned senior White House staff that, "the project lacked comprehensive testing, noted many functions were dependent on contractors and warned against taking risks to meet deadlines."

The hollowing of NASA was not an isolated event. In the 1980s, McKinsey helped Carlos Salinas privatize 85 percent of Mexico's state-owned businesses, Margaret Thatcher do the same in Britain, and West Germany do the same in East Germany. The firm has played a role in privatizing government assets in Latin and Central America, Eastern Europe, and Asia. Inexperienced leaders looking to make a mark turn to McKinsey for ideas, and they are all too eager to recommend privatization. The firm can point to all of its experience managing privatization elsewhere, as well as the influx of cash and positive Western press about how this shows you're a "serious reformer." Beyond the fees, McKinsey is motivated to do this work by its pro-market ideology. That privatization increases inequality, primarily benefits the wealthy, is not immune to corruption, and fundamentally shifts management incentives towards pleasing shareholders and away from the public interest is of little concern to McKinsey.

Beyond the literal privatization of public assets, the steady creep of corporate approaches to governing amounts to privatization in all but name. Government cannot and should not be run like a business, as even the Harvard Business Review admits. One particularly egregious example was

McKinsey's recommendation that the BBC use an internal market to buy and sell services, which led to endless internal negotiations to do tasks as simple as reserving studio time. McKinsey's perceived success at improving corporate governance has led to calls from publications like the *Economist* that it may be "McKinsey's turn to try to sort out Uncle Sam."

In anticipation of the beginning of Obama's presidency, the magazine unironically hoped that "Obama may favour McKinseyites in much the same way as his predecessor seemed addicted to hiring alumni of Goldman Sachs." As we all know, the Goldman Sachs-stuffed Treasury Department led to stable markets and steady growth throughout the Bush administration. They go on to hope that Obama hires "the best technocrats" like Ford Motor CEO turned Defense Secretary Robert McNamara. That these two parties contributed to and presided over the financial crisis and Vietnam War respectively apparently does nothing to shake the *Economist's* confidence in the wisdom of technocratic businessmen.

Perhaps Mayor Pete and his amazing, impressive credentials intended to give them their shot to finally sort out the crazy old uncle? Sorry guys, you'll just have to settle for helping Cuomo peddle his image of a calm, dignified crisis leader who listens to "experts"—maybe when he uses the "piles of corpses" to launch himself into Cuomo2024 you'll finally get your chance.

The initial rise of McKinsey and other management consultancies was due less to the force of their ideas or the ability of their people than to government anti-monopoly legislation, specifically the Glass Steagall Act of 1933. In addition to separating commercial and investment banking, the legislators also outlawed the consultative and reorganizational activities previously performed by banks. This created an opening for management consulting firms. Corporate executives, aware that the New Deal laws prohibited them from employing trade associations, industry cartels, or bankers to create industry benchmarks and to learn about administrative innovations, turned instead to management consultants as their primary source of interorganizational knowledge. At McKinsey, there are benchmarks for everything, whether it's the percentage of expected R&D savings following a pharma merger or the cost of temporary IT labor in the American Southwest. Over the years, McKinsey's work with pretty much every player in every industry has made it the panopticon of global business, willing to share what competitors are up to—as anonymized "best practices" of course—for a price.

In addition to the favorable regulatory environment, McKinsey's pro-market, hyper-rational ideas spread through what some have called "mimetic isomorphism"—the tendency of institutions facing uncertainty to become

more and more alike. In a quest for legitimacy in the eyes of employees, customers, and competitors, large organizations choose from a relatively small set of major consulting firms, which, like Johnny Appleseeds, spread a few organizational models throughout the land. As a result, schools assume the structure of the workplace, hospital and university administrations come to resemble the management of for-profit firms, and the modernization of the world economy proceeds unabated.

McKinsey's reorganization of most of the large companies in post-war Europe demonstrates mimetic isomorphism in action. Facing extreme uncertainty and pressure from American firms, European companies modeled themselves after organizations perceived to be successful (American ones) and relied heavily on a single source of vital resources (McKinsey). Whether American corporate success was due to the decentralized organization model or the fact that their competition was in literal ruins is of little consequence. Decentralization took off because the cool companies decentralized, with McKinsey whispering in their ears. The net effect of these forces was to exacerbate some of the most damaging trends in contemporary life: the growth of wealth inequality and the increased insecurity of private employment.

In the 1950s, McKinsey consultant Arch Patton pioneered the field of executive compensation after discovering that worker wages had risen faster than management wages. (Gasp!) This led to a lucrative business: helping executives justify more and more extreme paychecks. The typical CEO made 20 times the median employee's compensation in 1965. In 2015, that ratio had climbed to 286. When Patton was asked in the 1980s how he felt about his legacy, he had one word:

“Guilty.”

The age at which students start committing to “careers of excellence” is getting younger and younger. Students begin recruiting for jobs in management consulting in the fall of their junior year amid an environment that leaves them wondering whether there's something wrong with them if they're not interested in consulting and investment banking. This is in large part due to the hyper-competitiveness capitalism engenders. Young people are making decisions about their academic and professional careers before they've had a chance to interrogate their values and thoughtfully decide how they want to spend their lives. One of the biggest appeals of management consulting is that it serves as the undecided major of careers, opening more doors than it closes. College seniors with a McKinsey offer can accurately make a two-year commitment, learn useful skills, gain an impressive network, and gold stamp their resume before joining the Peace Corps and returning

to their previously-planned career of do-goodery. Beyond the skill-building, McKinsey markets itself as a place to do good while you're there: two of the four practice cases on its interviewing page are in the social/public sector despite less than 10 percent of the firm's work coming from those sectors. It's almost like they're a group of masterful manipulators. . .

But those two years change you. Idealism turns to cynicism in the face of the cold realities of the world. Shitty college apartments and dining hall meals turn into luxury Starwood properties and expensed Michelin star dinners. The job opportunities at the end of the brief stint can pay \$300,000 per year (private equity shops being a prime post-McKinsey destination). And throughout this time, you're surrounded by other people who made the same decision. For some of them, those two years turned into four turned into ten. Most others will leave as planned, but not to a career of do-goodery. All of these people have come up with justifications for their decision and are eager to share them. Some examples:

- “You're building career capital that you can apply to whatever non-profit or political cause you support down the line.”
- “The speed and innovation of the private sector makes it the best place to have impact.”
- “Someone is going to do the job, so might as well be me (and I'll do more good than the likely replacement).”

Precious few have shown signs that their post-McKinsey careers will be more prosocial than their McKinsey career, but even for those who do, their understanding of how to improve the world has been thoroughly McKinseyfied. An ascendant power elite that is defined by the concurrent drives to do well and do good, to change the world while also profiting from the status quo. These elites believe and promote the idea that social change should be pursued principally through the free market and voluntary action, that it should be supervised by the winners of capitalism and their allies, and not be antagonistic to their needs; and that the biggest beneficiaries of the status quo should play a leading role in the status quo's reform. The MarketWorld problem-solver does not tend to hunt for perpetrators and is not interested in blame.

Any solution that requires redistribution of any wealth or power from the ruling class—the only class who can afford to hire McKinsey—is not even worth considering. It is the same situation described by Tolstoy:

“I sit on a man's back choking him and making him carry me, and yet assure myself and others that I am sorry for him

and wish to lighten his load by all means possible. . . except by getting off his back.”

We are now living with the consequences of the world McKinsey created. Market fundamentalism is the default mode for businesses and governments the world over. Abstraction and myth insulate actors from the atrocities they help perpetuate. Businesses that resisted the pressure to rationalize every decision based on its impact on shareholder value were beaten out or eaten up by those who shed the last remnants of their humanity. With another heavyweight on the side of management, McKinsey tipped the scale even further away from labor, contributing directly to the increase in wealth inequality plaguing the world. Governments are now more similar to the private sector and more reliant on their services. The “best and the brightest” devote themselves to client service instead of public service.

Not all of these results are wholly attributable to McKinsey—there are many conspirators to these crimes. But no firm has touched more and been seen less.

His interviews for the McKinsey job had taught him an early and vital lesson about this approach to problem-solving: It was not about drawing on knowledge, and often even sneered at doing so; it was, rather, about being able to analyze a situation despite ignorance, to transcend unfamiliarity. The interview questions that struck him were of this sort: How many Ping-Pong balls would fit into a Boeing 747? What would you estimate the size of the Bolivian steel industry to be? How many razor blades are sold in Australia every year? His instinct, hearing such questions, was to call a friend in this or that job who might be familiar with the relevant facts.

“But the point in the interviews was not to get the number right. It was to demonstrate how you reason, based on the assumptions you make. The idea was if you break the problem down into small enough pieces that are logically related and make educated guesses combined with facts where they’re available, or at least you join the dots from the facts that you’re able to put together, you can construct a logical and compelling answer to pretty much any problem.”

In other words, his initiation into McKinsey and the protocols more generally was being urged to spit out a preternaturally confident answer to something he knew nothing about. You can perhaps begin to see why one of them might make a formidable politician in today’s world—an extremely dangerous one too.

Before the protocols had come to dominate the world of business, a company might have raised its money from not far away, sourced its inputs from not far away, sold to customers not far away, paid taxes to authorities not far away, and, when growth came, parked the profit in a bank not far away or reinvested it in a new venture with a plant not far away. But in recent decades that began to change, as technology made it easier to do business with faraway entities, as new markets opened, and—importantly—as the financial wizards and management consultants increased their influence over boardrooms. These protocol-equipped figures pressed companies to embrace a new philosophy: Do each of your activities where it can be best done, wherever that might be. You raised money from Korean investors, sourced from Mexico, sold in France, paid taxes in the Caribbean, and, when growth hit, chose a Swiss bank or ethereal Bitcoins to store the proceeds—or reinvested them in whatever venture on earth promised you the most attractive returns. It was an expansion of commercial freedom. This was a win-lose: The companies had flourished because of their freedom to escape and the community's lack of leverage.

In 1888 the town of Ulysses, in far western Kansas, was engaged in a bitter contest with a nearby hamlet to become the seat of government for Grant County. In order to help secure this prize, believed in those days to guarantee eternal prosperity, Ulysses issued \$36,000 in bonds. The official story was that the money would go for municipal improvements, but in fact it was used to prosecute the county-seat war, spent on “professional voters” and gunfighters (the town was founded by a cousin of Wyatt Earp) who would lend a hand in the great showdown. Naturally Ulysses prevailed, and after winning, it proceeded to erect a county courthouse—along with an opera house, four hotels, twelve restaurants, a host of saloons, and the rest of the Gunsmoke set—before collapsing swiftly into destitution. Drought, deflation, and the allure of new territory shrank its population from fifteen-hundred down to forty.

In 1908 the bonds matured, to the tune of eighty-four grand. Not a lot of money these days, perhaps, but back then it was equivalent to one-third of the assessed value of the entire county. To pay off the bondholders in New York, the handful of citizens left in Ulysses would have had to shoulder an impossible burden. What they did instead was toss the collections man in jail while they thought up a plan for moving the town. Impoverished but resourceful, the citizens of Ulysses cut the town's buildings into pieces and dragged them across the prairie to a new location, “leaving the bond-holders,” as the 1939 WPA guide to the state puts it, “40 acres of bare ground on which to foreclose.” The only social actor capable of that kind of defiance today is the corporation. Corporations are mobile; cities are not. They

extract billions from us in bonds, tax abatements, water rights, and outright grants by threatening to pick themselves up and haul their machines and their buildings and their jobs to some sunnier clime.

Every free-trade agreement we have signed in recent years has been designed to make cities vulnerable in precisely this way. If you're a medium-sized city like Wichita, hosting some giant multinational's plant is less of an achievement today than it is a gun pointed at your head, a constant reminder that some executive has the power to turn your town into an instant Flint, to destroy your citizens' lives, your property values, your merchants, and all the rest of it should the whim overtake him while he sits in the audience at some motivational seminar.

Now the essential underlying question here is: How probable is it in the first place that these companies would close up shop and move across state lines? Under Illinois Public Act 97-2, the justification for such tax deals is a "credible" threat that a company will leave the state. But would these companies really go, abandoning their existing investment and disrupting their operations? And furthermore, does it make sense to institutionalize threats to leave a state as the legal basis for getting tax dollars? Motorola has three-thousand highly paid workers around Schaumburg, a quick drive from the cultural amenities of Chicago. Their skills are not easily replaced. It is unlikely many of them are eager to give up their suburban enclave with easy access to museums, theater, and big-time sports teams to live out their lives in, say, rural Iowa or Alabama. Moving them, especially if the company offered to pay their entire household moving costs, would impose huge costs on the company, as well as disruptions to its business. By staying put not only are these costs and disruptions avoided, but, when the current deal ends in 2021, the company can renew the flow of tax dollars by threatening—in a "credible" way, of course—to move its operations to another state.

While schoolchildren are taught about heroic figures who raised the capital to build new factories and fill offices, these days large companies rely on government handouts for that money. Almost every brand-name company is in on these deals; state and local governments spend at least \$70 billion a year of taxpayers' money to subsidize factories, office buildings and the like. That burden comes to \$900 per year for a family of four. But I believe this understates the cost by an unknown but considerable sum. The worst of these are laws in nineteen states that let companies pocket the state income taxes withheld from their workers' paychecks for up to twenty-five years. Hard as it is to believe such laws exist, they do, and they are spreading fast. General Electric, Goldman Sachs, Procter & Gamble and more than 2,700 other big companies have these deals. It is not just

American companies, either. Siemens, the big German computer maker, the Swedish appliance maker Electrolux, and a host of Japanese, Canadian, and European banks have similar arrangements with states from New Jersey to Oregon. In many of these subsidy programs, no jobs are created. Instead the state income taxes are given to companies that agree to move jobs from one state across the border to another, as AMC Theaters agreed to do in moving its headquarters from Kansas City, Missouri, to Leawood, Kansas, just ten miles away. AMC gets to pocket \$47 million withheld from its workers, a boon to its major owners: JPMorgan, Apollo Management, the Carlyle Group and the firm Mitt Romney co-founded in 1984, Bain Capital Management.

From the corporations' point of view, the best part is that the workers are left in the dark. None of these states requires that workers be told that their state income taxes go to their employers—that they are in effect being taxed by their bosses.

In New York, a lawsuit was filed on behalf of more than fifty citizens, ranging from serious libertarians to liberal Democrats, challenging a gift of at least \$1.4 billion of state taxpayer funds to a company controlled by Abu Dhabi's hereditary ruler, Sheikh Khalifa bin Zayed Al Nahyan, one of the wealthiest people in the world. The sheikh's company, GlobalFoundries, is building a microchip factory in the Hudson River Valley near Albany. Back in 1846, the New York State constitution banned gifts to corporations or other business entities, a provision that the voters reaffirmed in 1874, 1938, and again in 1967. In each case the vote was by a margin of two to one, which would seem to make the desires of voters clear. In deciding the suit, two justices said such gifts were plainly illegal. But the court majority found a way around this. They reasoned that while the state government could not make such gifts, the legislature could create an economic development agency, give it the money and, in turn, the agency could give it away to the sheikh and any other business owner. If parallel reasoning were applied to drug deals, the kingpins who finance the drug trade could never be convicted of a crime as long as they do not touch the drugs.

The logic here is utilitarian. You add up the plusses and the minuses of an action, and things that are net positives on the whole are good. The costs were high, the benefits higher, and if you don't support these actions you're guided by weepy, irrational empathy rather than cold but morally superior reason. Whether or not sweatshops actually improve lives, or the atomic bombings actually ended the war, are contestable empirical questions, but for the sake of examining the logic let us assume that as a purely empirical matter some of these are true. It can be difficult to know how to respond to arguments like these: They seem to put you in a position where you have to

accept the “right answer” being something you find horrifying, or at least in some way deeply wrong. (See also: the trolley problem.)

We can begin to see why there is something wrong with these “offers you can’t refuse” if we think about a few other situations in which a parallel kind of logic could be used:

The Amazon Deal: Say it wasn’t tax breaks. Say that Jeff Bezos told the mayor of Gary, Indiana that he would put HQ2 in Gary if:

1. Every school in Gary was renamed after Jeff Bezos
2. A series of local laws, as determined by Bezos, did not apply to Amazon employees
3. Amazon received a permanent seat on the city council
4. The mayor agreed to perform a humiliating nude dance routine for Bezos in private

Giving Up A Thumb: Your spouse is sick and your insurance doesn’t cover treatment. A fabulously wealthy individual offers to pay, on the condition that you cut off your thumb and give it to him. He plans to add it to his collection of poor people’s thumbs, which he keeps on his night stand to remind him of how powerful he is.

The Abusive Boss: You are being bullied, insulted, and demeaned by your boss. You summon your courage and tell the boss to stop. The boss replies:

“You are free to leave if you don’t like it. I’m not breaking the law. You only have this job because of me. You’re better off thanks to me, so I’d appreciate a little more gratitude.”

There are a couple of things I think we should find disturbing about these hypotheticals. The person making the choice is having to make a choice they shouldn’t need to be faced with, by which I mean that there’s no reason why this horrible choice needed to arise in the first place. It’s true that the individual faced with the choice is “better off” in some sense if they take the horrible deal, but it’s because some other individual has chosen to structure the choices this way. If we just analyze things from the perspective of the person faced with the dilemma, the responsibility of the party who produced the dilemma in the first place will go undiscussed. It is “taken as a given.”

This problem occurs in a lot of discussions about economics. It is taken as a given that corporations are sociopathic profit-maximizers who will

extort as much gain from everyone else as they can. It's just the way things are, and all we as the members of a democratic society can do is make the choices that we have available. So it's "Exempt my company from the law or I will take my business elsewhere." On the small scale, this would look like extortion. "I'll give you this medicine if you give me your thumb" is an exploitative bargain, one in which one party's desperation is being preyed upon. And yet companies like Amazon are often treated as if they are being generous and community-spirited by "bringing jobs" to a city, even if their thinking is driven solely by a desire to extract as much wealth as possible from the municipality.

This is what critics of the Amazon deal meant, then, when they said that Amazon was "holding the city hostage." It's the same thing that happens in discussions of the minimum wage or taxes: Companies say "if you raise the minimum wage, we will fire a bunch of people" or rich people say "if you raise my taxes, I will simply leave." The empirical question of whether or not this will happen (it's usually just a bluff) should not distract us from the fact that whoever does this is violating the basic reciprocal obligation of community: treating each other well and not trying to exploit others.

Why would it be bad for Jeff Bezos to ask a mayor to name the schools after Bezos in exchange for HQ2? He gets what he wants, the city gets what it wants. If your sole criterion is "value maximization," then it's hard to object. But if you don't think that people should be able to use large disparities of power in order to bully others into doing things they don't want to do, and you don't think being rich should entitle you to order other people around, then it's obvious why it's wrong. Value maximization can't be your only principle, in part because it necessarily misses critical values, the ones that are difficult to quantify and calculate but are nevertheless extremely important.

We all accept offers we don't like. We take jobs we hate, we pay fees that are unreasonable. But in public policy, just as important as evaluating an offer is evaluating the conditions that determine what will be offered. If you have concentrated corporate power, then corporations will be in a position to extort cities, and Amazon will be its own private government. If you don't have a universal global set of labor standards, then people in certain countries will be forced to choose between working a terrible job inside a sweatshop and a worse job outside of one. A critical question is 'Does it really need to be this way?' Why are we being given these kinds of unacceptable bargains, and how can we shift the balance of power so that the offers aren't controlled by those who are pathologically committed to their own financial self-interest?

In New York City, Amazon decided to leave because politicians were

criticizing it. They hadn't canceled the deal, they had just refused to publicly express the proper level of obsequiousness and slobbering gratitude. It may be true that by refusing to compromise its dignity New York ended up losing a very large amount of money. But unless there is a willingness to resist indefensible choices, to shun cost-benefit analysis when the cost is one's self-respect, then we will continue to inhabit a world in which bullies and exploiters are treated as benefactors for offering "win-win" deals that they shouldn't be in a position to offer in the first place.

Let's say you're driving to work when a radio station reports that astronomers have discovered a comet with an unusual tail that the earth will pass through in a few days. When night comes, you enjoy the cosmic light show in the sky, then you go to bed and the event is soon forgotten. As the years pass, however, you and others begin to notice that a few of us—say one in every thousand—has stopped aging. These people never get sick. In an accident they can be crushed and bleed to death, but otherwise they are immortal. That is not the only change. Whatever their interests before the comet, they now have a single desire. All they care about is money. They will do anything to get it as long as their actions are not illegal. They are neither moral nor immoral, but calmly amoral. As their wealth grows, they hire very smart people to help them make even more money. If such immortal, amoral, and greed-driven people walked the earth, we would have to rewrite our laws governing property. Property law assumes a finite human lifespan, and thus whatever property and power one builds up will be passed on when that person's time runs out. But our new class of immortals could just keep accumulating wealth and power forever. In time they would probably own every single asset on earth worth having.

The immortal being I've just described exists: it is the modern corporation. Unless it bleeds so much cash that it goes bankrupt, the corporation can exist forever. Even if it does go bankrupt, modern American laws allow a fresh infusion of cash from banks and investors to revive it. Because a corporation is not a natural person but an artificial entity, it has no conscience and is therefore amoral. The corporation can do anything legal in order to make money. The values of its officers and directors will shape the company, but by and large, legality alone rules. To be sure, some corporations are scrupulous because the managers of the moment have high ethical standards. But some other corporations will act illegally because their managers believe they will not get caught, that the law is unfair, or because illegal conduct by competitors forces them to do likewise or go out of business. In any case, they're in business to serve the interests of their shareholders, not John Q. Public.

“What is capital, but that all-grasping power which has been wrung, by fraud, avarice, and malice from the labor of this and all ages past.”

In civil law, to be a person is to count as an entity in one’s own right. A corporation can be a legal person, and so, too, can a river, a holy book, and a mosque.

What is a person? We can trace the term back to Roman times, and show that it was never limited to human beings. Early Christian theologians debated the doctrine of the Trinity—that God is “three persons in one.” If “person” meant “human being,” that doctrine would be plainly contrary to Christian belief, for Christians hold that only one of those “persons” was ever a human being. In more contemporary usage, in science fiction movies, we have no difficulty in grasping that aliens like the extraterrestrial in *E.T.*, or the Na’vi in *Avatar*, are persons, even though they are not members of the species *Homo sapiens*. In reading the work of scientists like Jane Goodall or Dian Fossey, we have no difficulty in recognizing that the great apes they describe are persons. They have close and complex personal relationships with others in their group. They grieve for lost loved ones. They are self-aware beings, capable of thought. Their foresight and anticipation enable them to plan ahead. We can even recognize ethics in the way they respond to other apes who fail to return a favor. Contrary to the caricatures of some opponents of these types of lawsuits, declaring a chimpanzee a person doesn’t mean giving him or her the right to vote, attend school, or sue for defamation. It simply means giving him or her the most basic, fundamental right of having legal standing, rather than being considered a mere object.

“A corporation is a legal person created by state statute that can be used as a fall guy, a servant, a good friend, or a decoy. A person you control yet cannot be held accountable for its actions. Imagine the possibilities!”

—Wyoming Corporate Services, Inc.

The Founding Fathers, who were sensitive to the potentially unbridled power of the East India Company, would be shocked by the rise of corporate power in our time. Early in the years following American independence, corporations were regarded with deep suspicion. Back then a corporation was allowed to exist for only a single purpose and for a limited period of time, usually twenty years. To retain the privilege of a corporate charter, the owners had to show that the corporation served a public purpose. Hiring

people was not enough; that was understood to be necessary to do business. The idea that the government would give a corporation money to create jobs was, in the late eighteenth century, beyond imagining. In short, corporations were narrowly defined entities.

When in 1837 a group of businessmen from Amherst, Massachusetts, proposed to create a limited-liability carriage company, the proposal was opposed by a petition by journeymen on the grounds that as journeymen, they looked forward to being their own masters when they would not have to relinquish to others the value they created, stating:

“Incorporations put means into the hands of inexperienced capitalists, to take from us the profits of our art, which has cost us years of labor to obtain, and which we consider to be our exclusive privilege to enjoy.”

Ordinarily such requests were only approved if the company was dedicated to creating and maintaining public works of an obviously useful nature such as a railroad or canal.

Not until well into the nineteenth century did the evolution of corporations into “people” begin. That story begins with a property tax dispute, one that hinged on the issue of whether the Fourteenth Amendment, adopted to make sure freed blacks were treated equally under the law following the Civil War, could be applied to companies. The Southern Pacific Railroad was fighting a property tax imposed by California counties in what is now called Silicon Valley. The decision rendered in the case, *Santa Clara County v. Southern Pacific Railroad*, came not from the justices, but amazingly from the pen of the official court clerk, J. C. Bancroft Davis, who just happened to be a former president of Newburgh and New York Rail—what a fun coincidence. Davis’s one-paragraph statement asserted that the court did not need to hear the case to conclude that corporations were persons under the Fourteenth Amendment and thus were entitled to dispute the tax with the county authorities. Even though the Supreme Court never heard the case, corporations as of that moment were granted personhood in matters of property.

The entire text of Section 1 of the Fourteenth Amendment, ratified in 1868 reads:

“All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State

deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.”

Notice the word ‘person’ in the text. For over a thousand years of British common law and a century of American constitutional law, attorneys and legislators understood that there are two kinds of persons. The first, “natural persons,” are human beings. It was for them, for example, that the Magna Carta was written in 1215. The second type of persons acknowledged by law are, broadly, states and nations, churches and nonprofits, and for-profit and other types of corporations. The reason such institutions need some sort of personhood status is so they can engage in interactions with the rest of us—own and pay taxes on land, for example, or sue and be sued.

From the seventh-century origins of British common law to the 1870s, nobody seriously challenged these two types of personhood, the need for each, and their clear and explicit differences. But in the Reconstruction era following the Civil War, the most powerful corporations in America—the railroads—saw an opportunity to use the arguably sloppy construction of the language of the Fourteenth Amendment to radically grab more power for themselves. They and their attorneys began to argue that when the Fourteenth Amendment was written, its authors in Congress explicitly said “person” rather than “natural person” in the last part of Section 1 because they fully intended it to include both “natural persons” and “artificial persons,” such as railroad corporations. In plain language, they argued that the authors of the Fourteenth Amendment intended to free both the slaves and the corporations, giving to both full constitutional protections.

“This definition suggests at once that it would seem unnecessary to dwell upon the idea that though a corporation is a ‘person,’ it is not the same kind of person as a human being, and need not, of necessity—nay, in the very nature of things, cannot—enjoy all the rights of such or be governed by the same laws. When the law says, ‘Any person being of sound mind and of the age of discretion may make a will,’ or ‘Any person having arrived at the age of majority may marry,’ I presume the most ardent advocate of equality of protection would hardly contend that corporations must enjoy the right of testamentary disposition or of contracting matrimony.

The whole history of the Fourteenth Amendment, demonstrates beyond dispute that its whole scope and object was to establish equality between men—an attainable result—and not

to establish equality between natural and artificial beings—an impossible result. Its mission was to raise the humble, the down-trodden, and the oppressed to the level of the most exalted upon the broad plane of humanity—to make man the equal of man; but not to make the creature of the State—the bodiless, soulless, and mystic creature called a corporation—the equal of the creature of God.

Therefore, I venture to repeat that the Fourteenth Amendment does not command equality between human beings and corporations; that the state need not subject corporations to the same laws which govern natural persons; that it may, without infringing the rule of equality, confer upon corporations rights, privileges, and immunities which are not enjoyed by natural persons; that it may, for the same reasons, impose burdens upon a corporation, in the shape of taxation or otherwise, which are not imposed upon natural persons.”

“Restrictions upon the political activity of business corporations are both politically desirable and constitutionally permissible. The judgment of such a broad consensus of governmental bodies expressed over a period of many decades is entitled to considerable deference from this Court. A State grants to a business corporation the blessings of potentially perpetual life and limited liability to enhance its efficiency as an economic entity. It might reasonably be concluded that those properties, so beneficial in the economic sphere, pose special dangers in the political sphere.

Furthermore, it might be argued that liberties of political expression are not at all necessary to effectuate the purposes for which States permit commercial corporations to exist. Any particular form of organization upon which the State confers special privileges or immunities different from those of natural persons would be subject to like regulation, whether the organization is a labor union, a partnership, a trade association, or a corporation.”

A bit more than a quarter century later, however, Rehnquist’s warning was summarily rejected when, in 2010, under his successor Chief Justice John Roberts, the Supreme Court proclaimed corporations the equal of people in politics.

The grant of personhood to corporations has had currency since 1886, although Congress never passed a law granting these rights, nor did Supreme Court justices ever vote on a decision. Before Davis's bit of mischief, the word 'person' was understood to mean that foreign visitors and immigrants not yet naturalized enjoyed the same legal protections as citizens. This is arguably the most egregious example of how big business has abused plain English in the fine print.

A proposed Constitutional amendment states the following:

“A corporation is not a person and can be regulated. The rights protected by the Constitution of the United States are the right of natural persons only. Artificial entities, such as corporations, limited liability companies, and other entities, established by the laws of any State, the United States, or any foreign state shall have no rights under this Constitution and are subject to regulation by the People, through Federal, State, or local law. The privileges of artificial entities shall be determined by the People, through Federal, State, or local law, and shall not be construed to be inherent or inalienable.

Money is not speech and can be regulated. Federal, State, and local government shall regulate, limit, or prohibit contributions and expenditures, including a candidate's own contributions and expenditures, for the purpose of influencing in any way the election of any candidate for public office or any ballot measure. Federal, State, and local government shall require that any permissible contributions and expenditures be publicly disclosed. The judiciary shall not construe the spending of money to influence elections to be speech under the First Amendment.

Nothing contained in this amendment shall be construed to abridge the freedom of the press.

Congress shall have power to implement this article by appropriate legislation.”

The elegance of explicitly denying constitutional rights to anything except living beings is that it will not only roll back Citizens United but it will also allow future legislatures to challenge corporate claims to “rights” of privacy (Fourth Amendment), protection from self-incrimination (Fifth Amendment), and the power to force themselves on communities that don't want them because to do otherwise is “discrimination” (Fourteenth Amendment). We must be very careful that any amendment put forth isn't just limited to giving Congress the power to regulate campaign spending; to do so would

leave a wide swath of other Bill of Rights powers in the hands of corporations. Instead, an amendment must explicitly overturn the headnote to the Santa Clara County 1886 decision that asserted corporations are the same as natural persons in terms of constitutional protections.

While limiting liability has eased the path to profitability, it has also obscured a corporation's responsibility to function for the benefit of society. The greater good is an idea that's thousands of years old, but in the recent past corporations have been permitted to lose sight of that important notion. I can date the moment it began to fade. In a 1970 article in the *New York Times Magazine*, Milton Friedman argued that the sole duty of a company is to its shareholders, not to the interests of workers and surrounding communities. Friedman closed his piece with these words:

“There is one and only one social responsibility of business—to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud.”

This is a bottom line with lots of implications. Workers may toil their entire lives, communities may tax themselves to create infrastructure a corporation needs, and vendors may invest their entire fortune to supply the corporation—but none of these parties, Friedman said, has significant legal rights or moral claims. The idea was radical. It was not supported by the development of the law, the regulation of business, and the advancement of civilization over thousands of years. But in a surprisingly short time, Friedman's ahistorical thinking has come to dominate our society. The corporate elite, the majority of billionaire investors and the officeholders in the legislative, executive, and judicial branches of government now subscribe to the deceptively simple philosophy that owners matter most, that all other interests are subordinate to the interests of the corporation.

Decisions Are Made

Holy Markets

Neoliberalism: a program for destroying collective structures that may impede the pure market logic.

We are generally conditioned to think that a market-based society provides us with ample (if not equal) opportunities for increasing the value of our “human capital” and self-worth. And in order to fully actualize personal freedom and potential, we need to maximize our own welfare, freedom, and happiness by deftly managing internal resources.

Since competition is so central, neoliberal ideology holds that all decisions about how society is run should be left to the workings of the marketplace, the most efficient mechanism for allowing competitors to maximize their own good. Other social actors—including the state, voluntary associations, and the like—are just obstacles to the smooth operation of market logic.

Neoliberalism divides the world into winners and losers. It accomplishes this task through its ideological linchpin: the individualization of all social phenomena. Since the autonomous (and free) individual is the primary focal point for society, social change is achieved not through political protest, organizing, and collective action, but via the free market and atomized actions of individuals. Any effort to change this through collective structures is generally troublesome to the neoliberal order. It is therefore discouraged.

An illustrative example is the practice of recycling. The real problem is the mass production of plastics by corporations, and their overuse in retail. However, consumers are led to believe that being personally wasteful is the underlying issue, which can be fixed if they change their habits. Recycling plastic is to saving the Earth what hammering a nail is to halting a falling skyscraper. Yet the neoliberal doctrine of individual responsibility has performed its sleight-of-hand, distracting us from the real culprit. This is far from new. In the 1950s, the “Keep America Beautiful” campaign urged individuals to pick up their trash. The project was bankrolled by corporations such as Coca-Cola, Anheuser-Busch and Phillip Morris, in

partnership with the public service announcement Ad Council, which coined the term ‘litterbug’ to shame miscreants. Two decades later, a famous TV ad featured a Native American man weeping at the sight of a motorist dumping garbage. “People Start Pollution. People Can Stop It,” was the slogan.

At face value, these efforts seem benevolent, but they obscure the real problem, which is the role that corporate polluters play in the plastic problem. This clever misdirection has led some to describe Keep America Beautiful as the first corporate greenwashing front, as it has helped shift the public focus to consumer recycling behaviour and thwarted legislation that would increase extended producer responsibility for waste management.

We are repeatedly sold the same message: that individual action is the only real way to solve social problems, so we should take responsibility. We are trapped in a neoliberal trance by a “disimagination machine” which stifles critical and radical thinking. We are admonished to look inward, and to manage ourselves. Disimagination impels us to abandon creative ideas about new possibilities. Instead of seeking to dismantle capitalism, or rein in its excesses, we should accept its demands and use self-discipline to be more effective in the market. To change the world, we are told to work on ourselves—to change our minds by being more mindful, nonjudgmental, and accepting of circumstances.

Markets aren’t real. Economists will often admit this, if you ask them in the right way. They are mathematical models, created by imagining a self-contained world where everyone has exactly the same motivation and the same knowledge and is engaging in the same self-interested calculating exchange. Economists are aware that reality is always more complicated; but they are also aware that to come up with a mathematical model, one always has to make the world into a bit of a cartoon. There’s nothing wrong with this. The problem comes when it enables some (often these same economists) to declare that anyone who ignores the dictates of the market shall surely be punished—or that since we live in a market system, everything (except government interference) is based on principles of justice: that our economic system is one vast network of reciprocal relations in which, in the end, the accounts balance and all debts are paid. These principles get tangled up in each other and it’s thus often difficult to tell which predominates in a given situation—one reason that it’s ridiculous to pretend we could ever reduce human behavior, economic or otherwise, to a mathematical formula of any sort.

The market economy and the nation-state should be viewed as a single man-made system. The coming of the modern nation-state and the modern capitalist economies it fostered altered human consciousness, from one based

on reciprocity and redistribution to one based on utility and self-interest. The idea that the world must be run by the stock market is as mad as any other fundamentalist delusion, Islamic, Christian, or Marxist.

“Businesses that contribute to chronic disease often flourish.
Businesses that contribute to acute disease get shut down.”

Every time there was a major economic meltdown, conventional *laissez-faire* economics took another hit. By the time of the Great Depression of the 1930s, the very notion that the market could regulate itself, so long as the government ensured that money was safely pegged to precious metals, was completely discredited. From roughly 1933 to 1979, every major capitalist government reversed course and adopted some version of Keynesianism. Keynesian orthodoxy started from the assumption that capitalist markets would not really work unless capitalist governments were willing, effectively, to play nanny: most famously, by engaging in massive deficit “pump-priming” during downturns. While in the ‘80s, Margaret Thatcher in Britain and Ronald Reagan in the United States made a great show of rejecting all of this, it’s unclear how much they really did. And in any case, they were operating in the wake of an even greater blow to previous monetary orthodoxy: Richard Nixon’s decision in 1971 to unpeg the dollar from precious metals entirely, eliminate the international gold standard, and introduce the system of floating currency regimes that has dominated the world economy ever since. This meant in effect that all national currencies were henceforth, as neoclassical economists like to put it, “fiat money” backed only by the public trust.

The critical things to watch out for aren’t the rare big events, such as the 2008 bailout of the Street itself, but the ongoing multitude of small rule changes that continuously alter the economic game. Even a big event’s most important effects are on how the game is played differently thereafter. The bailout of Wall Street created an implicit guarantee that the government would subsidize the biggest banks if they ever got into trouble. This gave the biggest banks a financial advantage over smaller banks and fueled their subsequent growth and dominance over the entire financial sector, which enhanced their subsequent political power to get rules they wanted and avoid those they did not.

The “free market” is a myth that prevents us from examining these rule changes and asking whom they serve. The myth is therefore highly useful to those who do not wish such an examination to be undertaken. It is no accident that those with disproportionate influence over these rules, who are the largest beneficiaries of how the rules have been designed and adapted, are

also among the most vehement supporters of the “free market” and the most ardent advocates of the relative superiority of the market over government. But the debate itself also serves their goal of distracting the public from the underlying realities of how the rules are generated and changed, their own power over this process, and the extent to which they gain from the results. In other words, not only do these “free market” advocates want the public to agree with them about the superiority of the market but also about the central importance of this interminable debate.

Few ideas have more profoundly poisoned the minds of more people than the notion of a “free market” existing somewhere in the universe, into which government “intrudes.” In this view, whatever inequality or insecurity the market generates is assumed to be the natural and inevitable consequence of impersonal “market forces.” What you’re paid is simply a measure of what you’re worth in the market. If you aren’t paid enough to live on, so be it. If others rake in billions, they must be worth it. If millions of people are unemployed or their paychecks are shrinking or they have to work two or three jobs and have no idea what they’ll be earning next month or even next week, that’s unfortunate but it’s the outcome of “market forces.”

According to this view, whatever we might do to reduce inequality or economic insecurity—to make the economy work for most of us—runs the risk of distorting the market and causing it to be less efficient, or of producing unintended consequences that may end up harming us. Although market imperfections such as pollution or unsafe workplaces, or the need for public goods such as basic research or even aid to the poor, may require the government to intervene on occasion, these instances are exceptions to the general rule that the market knows best.

There can be no free market without government. The free market does not exist in the wilds beyond the reach of civilization. Competition in the wild is a contest for survival in which the largest and strongest often win. Civilization, by contrast, is defined by rules; rules create markets, and governments generate the rules.

In order to have a “free market,” decisions must be made about:

Property: What can be owned

Monopoly: What degree of market power is permissible

Contract: What can be bought and sold, and on what terms

Bankruptcy: What happens when purchasers can’t pay up

Enforcement: How to make sure no one cheats on any of these rules

Other decisions govern unpaid debts: Big corporations can use bankruptcy to rid themselves of burdensome pension obligations to their employees, for example, while homeowners cannot use bankruptcy to reduce burdensome mortgages, and former students cannot use it to reduce burdensome debts for higher education. You can thank Joe Biden for that last one.

Even the modern corporation, and its ownership, is part of the property mechanism—a consequence of particular decisions by legislatures, agencies, and courts that people who invest in the corporation are entitled to a share of its profits and that their personal property beyond those investments is protected if the corporation can't pay its debts. The “free market” doesn't dictate this. Property and contract rules do. Yet the idea that shareholders are a corporation's only owners, and therefore that the sole purpose of the corporation is to maximize the value of their investments, appears nowhere in the law.

Why should shareholders take prominence over employees? Corporations are nothing more than collections of contracts and property rights. They are not “owned” by shareholders the way ordinary goods are owned. It is common for the individual shareholders of large companies to be blissfully unaware of which specific companies they own, or for how long, because their ownership is through pension funds or mutual funds that tend to move quickly into and out of shares of stock, seeking quick speculative gains. If nothing else, high-frequency trading illustrates the irrelevance of stock ownership to effective corporate governance. Shareholder “ownership” is therefore a legal fiction. So is the idea that CEOs and other corporate executives have a fiduciary duty to maximize the value of corporations' shares of stock. Corporate charters, issued by states, require no such thing. While shareholders select a corporation's directors, the directors are under no legal obligation to put their interests above all others.

The idea that the sole purpose of a corporation is to maximize shareholder value is relatively new, dating back only to the 1980s. The dominant view in the first decades after World War II was that corporations had responsibilities to all of their stakeholders. Besides, shareholders are not the only parties who invest in the corporation and bear a risk that their investments will drop in value. Workers who have been with the firm for many years may have developed skills and knowledge unique to it. Others may have moved their families to take a job with the firm, buying homes in the community. The community itself may have invested in roads and other infrastructure to accommodate the corporation. By contrast, most shareholders of a large corporation do not put their money into enlarging its productive capacity because most of the value of the stock market has little to do with new

infusions of cash. Stocks are more like a vast collection of baseball cards, repeatedly traded.

Apple raised \$97 million in its initial public offering in 1980. Since then, those shares have circulated among investors who have bid up their price, but the added value has not gone to Apple; it has gone to investors lucky enough to buy them low and sell them high. Activist investors like Carl Icahn have bought enough shares to demand that the firm raise its stock price even higher by, for example, buying back some of its shares. Steve Jobs's successor, Tim Cook, was happy to oblige. In 2011 and 2012, during his first two years as CEO, he pocketed \$382 million, of which \$376 million was in the form of stock awards. But none of these machinations have anything to do with Apple's capacity to innovate and add real value, or to be successful over the long-term.

There is a common relationship between wealth and political power. When winners emerge in the race for profit, free markets become less free. The winners gain leverage in government, and the line between public and private blurs. In *The Wealth of Nations*, Adam Smith himself warned of this danger—of businessmen as a class “whose interest is never exactly the same with that of the public, who have generally an interest to deceive and even to oppress the public.” The same drive for expansion that can help progress along can also make it falter.

What guides these decisions? What do the people who make the rules seek to achieve? The rules can be designed to maximize efficiency (given the current distribution of income and wealth in society), or growth (depending on who benefits from that growth and what a society is willing to sacrifice to achieve it, such as fouling the environment), or fairness (depending on prevailing norms about what constitutes a fair and decent society); or they can be designed to maximize the profits of large corporations and big banks, and the wealth of those already very wealthy.

For example, if a democracy is failing—or never functioned to begin with—the rules might enhance the wealth of a comparative few at the top while keeping almost everyone else relatively poor and economically insecure. Those with sufficient power and resources would have enough influence over politicians, regulatory heads, and judges to ensure that the “free market” worked mostly on their behalf. This is not corruption as commonly understood. In the United States, those with power and resources rarely directly bribe public officials in order to receive specific and visible favors, such as advantageous government contracts. Instead, they make campaign contributions and occasionally hold out the promise of lucrative jobs at the end of government careers. And the most valuable things they get in exchange are market rules that seem to apply to everyone and appear to

be neutral, but that systematically and disproportionately benefit them. To state the matter another way, it is not the unique and perceptible government “intrusions” into the market that have the greatest effect on who wins and who loses; it is the way government organizes the market.

Power and influence are hidden inside the processes through which market rules are made, and the resulting economic gains and losses are disguised as the “natural” outcomes of “impersonal market forces.” Yet as long as we remain obsessed by the debate over the relative merits of the free market and government, we have little hope of seeing through the camouflage.

What I have described is not the same as corruption. Few if any public officials in the United States solicit or receive direct bribes. The seduction is more subtle. It is simply easier for officials to choose a path that’s been carefully laid out for them by lobbyists, paid experts, and smart and experienced lawyers than to strike out on their own through territory often regarded by the establishment as menacing. The lures of campaign contributions and well-paying jobs after government service only make the preferred path more enticing.

However organized, the rules of a market create incentives for people. Ideally, they motivate people to work and collaborate, to be productive and inventive; they help people to achieve the lives they seek. The rules will also reflect their moral values and judgments about what is good and worthy and what is fair. The rules are not static; they change over time, we hope in ways that most participants consider to be better and fairer. But this is not always the case. They can also change because certain people have gained the power to change them for their own benefit. Such has been the case in America and many other nations in recent decades.

Societies everywhere, if they are to be societies, must mobilize their members as self-regulating participants in social encounters. One way of mobilizing the individual for this purpose is through ritual. The focus group is a fitting ritual for our market democracy, in which political and commercial success accrues to those who can win our votes and our consumer dollars. It also teaches us to reveal just what the corporate and political elites need us to reveal for these specific persuasive projects, and helps us to play our assigned roles in a society where only a few people hold real power.

But a focus group is, in some ways, what democratic participation now feels like. It is one of the ways we crack the egg and feel we are doing something. It has been part of the evolution of our expressive democracy—that is, a society in which the expression of opinion has been dramatically democratized, while the distribution of everything else that matters—political power, money, et cetera—has only grown more starkly unequal.

The focus group offers us the experience of having a voice and the

possibility of influence in a world that offers most people little control over their lives, and little opportunity to influence anything.

When our system is viewed as a whole—as a political-economic arrangement for allocating rewards for the work people do—there is reason for concern. The meritocratic ideal with which our form of capitalism has been justified does not match the reality in which most of us live and work. The playing field is tilted toward those who have had the resources and power to tilt it in their direction. And as they gain steadily more resources and power, it tilts further.

I do not mean to suggest that those at the top who are shaping the rules are intentionally malevolent—though some certainly are. They are acting out of the same self-interest that has been thought to guide the theoretical free market toward efficient, and therefore publicly beneficial, outcomes. But rather than a theoretical free market they are acting in the real political economy where economic power generates political influence over the rules of the game, which, in turn, serves to enlarge economic power. They are behaving entirely rationally within this system, although the aggregate consequence of their individually rational calculations is neither efficient nor otherwise rational for the system as a whole. To the contrary, it is gradually undermining the system. The problem is not their power or influence, *per se*. It is the comparative lack of power or influence on the other side. There is no longer any significant countervailing power, no force to constrain or balance the growing political strength of large corporations, Wall Street, and the very wealthy. The people—and the economic interests they encompass—have little or no agency.

There's a lot of questions one could ask here, starting with, what does it say about our society that it seems to generate an extremely limited demand for talented poet-musicians, but an apparently infinite demand for specialists in corporate law? Answer: if 1% of the population controls most of the disposable wealth, what we call 'the market' reflects what they think is useful or important, not anybody else.

Milton Friedman argued that economic freedom is as important as civic freedom, because if you lose one, it is only a matter of time before you lose the other. And so one must defend free markets with the same vigor and vigilance as free speech, free religion, and free assembly.

A market society is an indecent society not only because it distorts notions of freedom, equality, and justice, but also because it subordinates human beings to the demands of the market, which is fundamentally humiliating. Instead of citizens creating and being served by the state, they are required to serve and sacrifice themselves or others to the market. More specifically, a neoliberal capitalist culture is fundamentally indecent when it privatizes

healthcare, prisons, schools, et cetera thus exploiting and humiliating the vulnerable. Of course, those who have economic and political privileges do not experience the pain of humiliation, because they have access to resources and the market deems them successful. Yet, the top 10%, who do not experience humiliation, obtain, willfully or inadvertently, the privileges that depend on the humiliation of the 90%, which reflects the reality of an indecent society organized by a neoliberal culture.

The oppressive effect of the prevailing market moralities leads to a form of sleepwalking from womb to tomb, with the majority of citizens content to focus on private careers and be distracted with stimulating amusements. They have given up any real hope of shaping the collective destiny of the nation. Sour cynicism, political apathy, and cultural escapism become the pervasive options.

The Iron Law of Liberalism: Any market reform, any government initiative intended to reduce red tape and promote market forces will have the ultimate effect of increasing the total number of regulations, the total amount of paperwork, and the total number of bureaucrats the government employs.

The old-style NHS was like many public services. Established as part of the 1945 post-war settlement, they were creations of a strong state, but they were not distracted from their true functions by intrusive monitoring and shifting targets set by governments. In contrast, since the injection of market mechanisms into public institutions, life in Britain has become more invasively regulated than it has ever been. The cult of the market has produced a society throttled by bureaucracy.

This is what happens when governments insist on market solutions to every social problem. A nightmare fusion of the worst elements of bureaucracy and the worst elements of capitalism.

This trend is not sustainable, neither economically nor politically. As ever-larger numbers of Americans conclude that the game is rigged against them, the social fabric will start to unravel. Confidence in economic institutions is already falling precipitously. In 2001 a Gallup poll found 77 percent of Americans satisfied with opportunities to get ahead by working hard, and only 22 percent were dissatisfied. But since then satisfaction has steadily declined and dissatisfaction increased. By 2014, only 54 percent were satisfied and 45 percent dissatisfied. According to the Pew Research Center, the percentage of Americans who feel that most people who want to get ahead can do so through hard work has dropped by 13 points since 2000.

This pervasive sense of arbitrariness and unfairness undermines economic institutions in several ways. First, it leads to widespread rule breaking. If the game is perceived to be rigged in favor of those at the top, then others are more likely to view cheating as acceptable—stealing and pilfering from employers, rigging time clocks, dissembling about lengths of time away from desk or office, overbilling, skimming off some of the profits, accepting small bribes and kickbacks for awarding a contract or making a deal. But an economy is based on trust. The cumulative effect of even small violations of trust can generate huge costs. Employers feel compelled to tighten rules, giving all employees less discretion; time-consuming screening and security checks are imposed at the end of the workday; additional reviews must be made of all accounts and additional oversight of all transactions; more legal steps and picayune procedures are required so no party will be surprised by opportunist moves of any other. Commercial dealings are hedged about by ever more elaborate contractual provision; creditors demand more burdensome guarantees for additional loans. Across the economy, red tape multiplies with the profusion of finagles it seeks to contain. The only beneficiaries from this economic sclerosis are the lawyers, accountants, auditors, and contractors for security staff and screeners whose services are increasingly in demand.

For each additional dollar going to each person in the vast majority, how many went to each of those in the top one percent? For 1950 to 1975, the ratio is four dollars more at the top for each dollar going to the vast majority. For 1960 through 1985, the ratio is \$17. And for 1981 through 2005, it is almost \$5,000. Dramatic as those numbers are, they understate the concentration of income. Let's now compare income growth for the vast majority with the top 1/100 of 1%, those 30,000 Americans at the very top of the income ladder. For 1950 to 1975, the ratio was \$36 to one. For 1960 through 1985, it was \$459. And for 1981 through 2005, it was \$141,000 to the dollar. Examining different periods produces the same basic result: since the market-based solutions came to dominate government policy, the winners have been the rich, the very rich and, most of all, the super-rich.

We exist only to be harvested by the 1%—if inadvertently the “market” benefits us, it's a terrible, terrible, horrible mistake.

The expanding freedom of corporations to do what they want may theoretically enlarge the economic pie for everyone. But in recent years the major consequence of such freedom has been to give bigger slices to the top executives of large corporations and Wall Street banks, and their shareholders, and smaller slices to almost everyone else.

Another consequence has been to reduce the freedoms of ordinary working people in the workplace. The supposed freedom of contract is a cruel joke to

workers who have no alternatives but to agree to terms mandating arbitration of all grievances before an arbiter chosen by the company, thereby forcing employees to give up their constitutional right to a trial. A corporation that monitors its employees' every motion from the minute they check in to the minute they check out, even limiting bathroom breaks to six minutes a day, may be a model of free enterprise—and give Bezos more money to spend on his private Space Force—but it does not contribute to the liberty of the people working for it.

The freedom of enterprises to monopolize a market likewise reduces the freedom of consumers to choose. Allowing Internet service providers to reduce or eliminate competition, for example, has made Internet service in the United States more expensive than in any other rich country. Permitting drug companies to prolong their patents by paying generic producers to delay lower-cost versions has kept drug prices higher in the United States than in Canada or Europe. Most of us remain “free” in the limited sense of not being coerced into purchasing Internet services or drugs. We can choose to do without them. But this is a narrow view of freedom.

The argument that it is ‘in the contract,’ agreed on by both parties and therefore to be enforced is an example of false morality. Contracts are only moral when both parties have roughly equal power in the agreement. In the good ole USA, workers do not have enough power to refuse signing. The contract is not moral! Logically, workers work because the employer has a figurative gun to their head. It used to be that contracts signed under ‘your signature or your brains on the paper’ situations, were legally—and morally—invalid.

Plus, while it may now be legal in the US for this type of infringement and censorship, this argument rests on the questionable concept that business and economics overrule all other considerations—political, social, religion, et cetera. Only in the neoliberal worldview is this concept given credence. And then, in typical Ayn Rand hypocrisy, only held by those who have the power to *not* live by it.

“Wealth is an absolute good, the font of society’s advances.
You’re welcome for the industrial revolution.”

“It is efficiency that allows the world to evolve, new things to be created, and more people to be employed. It is this efficiency that allows these companies to survive in the long-term, feeds their growth, and drives constant job creation.”

It’s a standard Econ 101 answer—one that equates profit with progress. And yet it’s not quite that simple. For example, Anheuser-Busch InBev

now employs more than a hundred and fifty-thousand people, but that's not because AB InBev created these jobs; it's because AB InBev keeps swallowing up its rivals in takeovers. Despite these apparent synergies, beer prices are no lower. So by firing people, the company may not be eliminating costs at all but shifting them onto the rest of society. When asked to name a new thing they've created, they didn't respond. But fear not, a recent Heinz investor presentation touted innovations that included yellow mustard and hot sauces. It's like creative destruction without the creative part.

In recent years, corporations have spent less on research and development than on buying their own shares on the exchange, thus inflating the price. This is good for shareholders and for executives with stock options, but not so useful for society as a whole.

Even in tech, most didn't come up with the main innovations behind their companies. Before Microsoft or the Macintosh came Xerox's Palo Alto Research Center. Before Facebook, Friendster, and MySpace. Before the iPhone, US government agencies developed GPS, touch-screens, and voice recognition. Bill Gates himself recently noted that private companies could never have created the Internet. The main genius of Gates and Steve Jobs and Mark Zuckerberg was to build teams, marshal resources, and streamline and mass-market the innovations of others. All three played key roles in the advancement of technology, but in none of these cases did the inventors reap the greatest rewards.

Once an entrepreneur has made it, something funny happens, a narrative forms. A tale with heavy doses of luck and guesswork and help from others morphs retroactively into one of pure individual courage and wisdom. The failures become rites of passage, and the successes seem preordained. We don't hear about all the people who risk everything, lose everything, and never get rich at all.

Any entrepreneur will tell you the first million is the hardest. After that it gets easier, because wealth acts like a magnet on the world.

Entrepreneurs don't have a special gene for risk—they mostly come from families with money. What often gets lost in these conversations is that the most common shared trait among entrepreneurs is access to financial capital—family money, an inheritance, or a pedigree and connections that allow for access to financial stability. While it seems that entrepreneurs tend to have an admirable penchant for risk, it's usually that access to money which allows them to take risks.

More important than the specific policies designed for small businesses is the recognition that the free market is not generally friendly to small businesses—the vast majority of small business owners are heavily dependent on the special treatment they get from the nanny state. Most small businesses

are constantly struggling and usually only survive a short time. But without special treatment on taxes, loans, and regulations, even fewer would survive. While small business owners across the country like to envision themselves as tough individualists, the reality is that they are actually among the prime beneficiaries of the conservative nanny state.

The defense of small businesses relies on a misplaced liberal morality which contrasts “good” local businesses and “evil” corporate ones. This dichotomy has become dogma for many people, who amount their consumer choices to brave political acts. Feel bad about sweatshops? Purchase your next gift at a local boutique! Recession got you down? Shovel dollars into your local economy and dad just might get his job back. But are local businesses actually better for the majority of us?

The dominant image of small businesses as Mom and Pop stores run by elderly couples who work long hours as a labor of love is not reflected in the local economy. The reality is closer to a young, wealthy owner who does not work in their own store but instead employs a small group of wage laborers.

And since small businesses don’t have the profit margins of large corporations, they often rely on sweatshop discipline and poverty wages to make ends meet. Most anyone who has worked in the industry can attest to a repressive atmosphere: workers are not allowed on breaks, are scolded for talking to co-workers and punished for showing up five minutes late. Furthermore, even service workers who make tips frequently earn below a living wage and are subjected to unpredictable work schedules that necessitate finding a second or third job. When these practices happen at large corporate chains, they become the themes of documentaries, muckraking articles in the liberal press, and bumper sticker slogans. But when they’re used by local businesses, they’re written off as necessary evils.

In higher-end establishments, employers frequently justify poor treatment by trying to instill pride and artistic ambitions in their employees; workers are all but required to do extra learning, research, and labor outside of the workday to satisfy the employers’ need to serve the coolest new cocktail or coffee bean. At a recent mandatory meeting for an East Bay-based organic catering company, workers were told by the CEO:

“This is not a job; it’s a craft. You are all artists, and you should treat your job as such. If you don’t, you won’t succeed in this company.”

What he was saying was that if you do not invest hours off the clock in becoming a more efficient and valuable worker, we won’t employ you.

By romanticizing small businesses like the hip restaurants, cafes, and bars currently springing up—often in freshly gentrified areas—we gloss over

the experiences of the low wage workers who make them possible. When compared to the horrendous treatment that service workers must endure, the shattering or spray-painting of a few windows does not even the score.

The market's role in American society has increased exponentially, reaching into nooks and crannies of daily life to an extent that was unimaginable a generation ago.

This encroachment has been ignored in part because of the legacy of the Cold War. Our hostility to communism foreclosed more honest discussions about cooperation and collective ownership as organizing principles. But we have also been imprisoned by the tenacious myth that a commons invariably results in "tragedy"—a view popularized by Garrett Hardin in his famous essay, "The Tragedy of the Commons." Drawing on the example of herders using a common meadow, Hardin describes how a scarce resource open to all comers is depleted and left to ruin. The commons falls apart because every herder enjoys direct benefits from over-exploiting the commons, while suffering only indirect costs. Eventually, over-use destroys the resource.

Although Hardin's own focus was overpopulation, the metaphor soon took on a life of its own in public policy circles. In the hands of conservatives and economists, it began to serve as an all-purpose metaphor to denigrate collectively managed property and champion the efficiencies of private-property regimes. The "tragedy of the commons" narrative invokes an image of helpless individuals caught in an inexorable process of destroying their own resources.

This pessimism persists, in part, because the commons is frequently confused with an open-access regime—a free-for-all in which a resource is essentially open to everyone without restriction. An open-access regime lacks an identifiable authority and recognized property rights; the common resources are taken for sale on markets. In contrast, a real commons has a "social infrastructure" of cultural institutions, rules, and traditions, and the resources are restricted to personal (non-market) uses by members of the community. Without that infrastructure, the only operative social value is private profit for the most aggressive appropriators. Hardin's essay might more appropriately have been titled 'The Tragedy of Open Access.'

Absent from this "tragedy of the commons" argument—and related concerns about free riders—is an acknowledgment that trust, reciprocity, a history of shared commitment, and a robust community can overcome many of the alleged failures of the commons—and sometimes they do. While tragic failures of the commons and free-riding on public commodities certainly do occur, they do not represent the final word, or even an accurate generalization, about the capacity of individuals to pursue common goals.

The fact that people volunteer their time to work on community gardens,

or that scientists openly share their research results with trusted colleagues, or that people post useful information on the Internet for free, seems aberrational or at least marginal in terms of conventional economic thinking. But while cooperation may not conform to the general rule of rationally self-interested behavior, the efficacy of social negotiation and cooperation can be seen in dozens of smaller-scale commons.

Not only do fossil fuel companies receive \$775 billion to \$1 trillion in annual global subsidies, but they pay nothing for the privilege of treating our shared atmosphere as a free waste dump. One might call it the greatest market failure the world has ever seen. That freebie is the real distortion, that theft of the sky the real subsidy.

Each of the environmental threats we face is a market failure, a domain in which the free market has created serious “neighborhood” effects. But despite the friendly sound of this term, these effects are potentially deadly—and global in reach. To address them, governments will have to step in with regulations and nationalizations, in some cases very significant ones, to remedy the market failure. And this is precisely what these men most fear and loathe, for they view regulation as the slippery slope to Socialism, a form of creeping Communism.

The commons has lived in the shadows because of the limited assumptions of conventional economics, which prefers to focus on the individual and not the collective. A market-based perspective also shows relatively little interest in externalities—pollution, social disruptions, costs borne by future generations—and it discounts the power of exogenous variables such as moral and social norms. Intangible and historical context is generally ignored. Our market discourse, therefore, tends to ignore such vital species of common wealth as:

- Government-owned property, including public lands, government research and development, and information resources.
- Natural systems such as the atmosphere, water, local ecosystems, and genetic structures of life.
- User-managed regimes for conserving land, managing community gardens, developing software, and controlling access to fisheries and other natural resources.
- Gift economies, or social networks based on gift exchange, which create economic and social values within academia, Internet communities, and geographic localities.

- Shared, inherited knowledge such as scientific research, historical knowledge, and folk wisdom, all of which contribute to the public domain.
- Cultural traditions and norms, which serve as a set of common moral presumptions and expectations for managing daily life.

In many cases, these resources have no officially recognized value, let alone the legal definition and protection enjoyed by private property. But commoners realize all too well that community structures and social relationships are vitally important in creating wealth, not to mention a humane society.

Property ownership causes problems when control of property is held outside of the user group. When a community owns an individual's home, an individual owns a community's public space, or a state lays claim to an ocean, problems are inevitable.

Free-market enthusiasts and critics of socialism often make the deeply flawed argument that collective ownership of production could never work because it would lack the apparently mystical power of the market to determine the right price for different goods or services. Today's concept of private property, however, is pretty new—for thousands of years before industrial technology made capitalism possible, many resources were collectively owned. Outside of economic hubs controlled by feudal states, unused land was considered common property—free for anyone to work. This meant the poorest folks often still had some access to resources and could subsist on communal farms.

These public lands were privatized by the Enclosure Acts in eighteenth-century Great Britain and other industrial nations adopted that model soon after. Peasants were forced off communal farmlands that, in many cases, were considered public for thousands of years. Many parcels of land were given to wealthy business people by the British Parliament, many of whom developed it to produce wool for the new and incredibly profitable textile industry—you can guess who owned the factories. Considering that private property is only a few centuries old and that much of today's privatized land and natural capital was originally stolen by enclosure or colonization, why should it be hard to envision alternative concepts of property today?

It's worth appreciating just how extraordinary libraries are, why they matter, and what they can tell us about the kinds of institutions we should build. They're spaces of absolute equality, where anyone can come, regardless of financial resources, to study, learn, and hang out. You don't have to purchase anything in order to get to sit in them, you don't have to

be means-tested or background-checked. They give the same things to everybody, and there's something beautiful—and increasingly rare—about that. Privatization generally involves the elimination of that kind of place. When everything costs money, life becomes far more stressful, though that stress is distributed unequally.

What would it really feel like to live in a society where almost every single thing is privately owned and priced? Walking around urban Japan, I feel like I am seeing a society that is several steps closer to that ideal than the United States. You may have heard that Japan is a government-directed society, and in many ways it is. But in terms of the constituents of daily life being privately owned and marginally priced, it is a libertarian's dream world. For example, there are relatively few free city parks. Many green spaces are private and gated off—admission is usually around \$5. On the streets, there are very few trashcans; people respond to this in the way libertarians would want, by exercising personal responsibility and carrying their trash home with them in little baggies. There are also very few public benches. In cafes, each customer must order something promptly or be kicked out; outside your house or office, there is basically nowhere to sit down that will not cost you a little bit of money. Public buildings generally have no drinking fountains; you must buy or bring your own water. Free wireless? Good luck finding that! Does all this private property make me feel free? Absolutely not! Quite the opposite—the lack of a commons makes me feel constrained. It forces me to expend a constant stream of mental effort, calculating whether it's worth it to spend \$4 to sit and rest for ten minutes; whether it's worth \$2 to get a drink.

I get the same feeling walking around New York City, actually. Sitting down or using the restroom can cost money, because you have to do them in a cafe, where you likely need to buy something. I find this experience extremely taxing; I just wish there were lots of big public restrooms, and big public sitting-places, free for everyone to use. This is, first and foremost, because the poor deserve to be able to sit down or pee, and obviously those things should be basic human rights. But it's also because even non-poor people should get to be free to move around the world without constantly having to weigh their choices this way: Can I afford this extra ten minutes? Do I want to sit down so badly that it's worth \$2? The book comparison here is useful. When I'm doing research, I want to just be able to access 'all the books,' to look through them without thinking 'Is this source so valuable that I am willing to pay X amount for it?' The privatization of knowledge, with lots of important information stored in academic journals or newspaper archives or legal documents that cost significant amounts of money to access, makes it difficult to do open-ended research—legally at

least.

The only inflation numbers that matter are related to survival needs, no one should give a fuck if the iPhone price is inflated, but they should care deeply if the cost of healthy, whole food is.

As is often the case in times of starvation, the problem was not quite so simple as a shortage of food. At the height of the famine, Ireland's docks were heaped with sacks of corn destined for export to England. But the corn was a commodity, determined to follow the money; since the potato eaters had no money to pay for corn, it sailed for a country that did.

The conservative nanny state plays a big role in allowing high CEO pay, because the corporation is itself a creation of the government. While nanny state conservatives don't like to call attention to this fact, in a free market corporations do not exist. In a free market, individuals can form partnerships and engage in whatever trade and commercial relations they please, but they cannot establish a new legal entity that exists independently of the individuals who own it. Only a government can create a corporation as a legal entity with its own rights and privileges, the most important of which is limited liability.

The legal privileges of incorporation in America—limited liability, life in perpetuity, corporate personhood for the purpose of making contracts and the enjoyment of constitutional rights—should be available only to entities that share the gains from growth with their workers while also taking the interests of their communities and the environment into account.

The key flaw in the stance that most progressives have taken on economic issues is that they have accepted a framing whereby conservatives are assumed to support market outcomes, while progressives want to rely on the government. This framing leads progressives to futilely lash out against markets, rather than examining the factors that lead to undesirable market outcomes. The market is just a tool, and in fact can be a very useful one. It makes no more sense to lash out against markets than to lash out against the wheel. Many horrible acts have been done with wheels—young children have been run over by cars, sometimes even deliberately—but no one in their right mind would see this as a serious basis for not using wheels. The reality is that conservatives have been quite actively using the power of the government to shape market outcomes in ways that redistribute income upward. However, conservatives have been clever enough to not own up to their role in this process, pretending all along that everything is just the natural working of the market. And, progressives have been foolish enough to go along with this view.

Neither vision takes into account the notion that the government structures the market in fundamental ways that determine market outcomes.

Both visions largely accept the view of the market held by Friedman-esque conservatives—that it is a fact of nature. Undesirable outcomes such as poverty or extreme inequality are givens, and the issue is the extent to which we want the government to supplant the market or ameliorate its effects. Markets are not fixed by nature; rather, they are infinitely malleable. They are and can be structured in different ways depending on the desired outcomes. The enormous upward redistribution in the United States of the last four decades was not an inevitable outcome of technology or globalization. It was the result of deliberate policies, the purpose of which was to redistribute income upward.

In some instances poverty has been a result of a genuine lack of resources—actual scarcity. More frequently, poverty is the result of the way we have organized markets and structured property rules. If we had rules designed to lead to more equal outcomes, there would not be so much poverty co-existing alongside great wealth for the few.

Markets need rules for determining the degree to which economic power can be concentrated without damaging the system.

Markets are never just given. Neither God nor nature hands us a worked-out set of rules determining the way property relations are defined, contracts are enforced, or macroeconomic policy is implemented. These matters are determined by policy choices. The elites have written these rules to redistribute income upward. Needless to say, they are not eager to have the rules rewritten—which means they also have no interest in even having them discussed. But for progressive change to succeed, these rules must be addressed. While modest tweaks to tax and transfer policies can ameliorate the harm done by a regressive market structure, their effect will be limited. The complaint of conservatives—that tampering with market outcomes leads to inefficiencies and unintended outcomes—is largely correct, even if they may exaggerate the size of the distortions from policy interventions. Rather than tinker with badly designed rules, it is far more important to rewrite the rules so that markets lead to progressive and productive outcomes in which the benefits of economic growth and improving technology are broadly shared.

There is no scenario in which the market works alone. Government policies will affect the level of output in the economy. The only question is whether we want to design these policies explicitly to meet certain goals or if we want to pretend we don't notice the impact of the policies we have put in place. Regardless of what we might decide about how fiscal and monetary policy can boost or slow the economy, government policy is playing an enormous role in determining the economy's level of demand and how it functions at a fundamental level.

We live in an interventionist economy, an economy where the government has intervened in a variety of ways that have had the effect of shifting income upward. If this intervention in turn lowers consumption, and therefore output and employment, a policy of ‘not intervening’ is in fact a choice to let the earlier interventions go unchallenged. The beneficiaries of the upward redistribution may like the outcome, but it is not because they prefer leaving matters to the market. Rather, they prefer government interventions that have the effect of giving them more money.

If we move beyond the illusion of non-intervention—the idea that there is some natural fiscal and/or monetary policy that doesn’t involve policy choices—then we realize that we decide, as a matter of policy, whether to have an economy with high or low levels of poverty and inequality. The decision in the United States and most other wealthy countries over the last four decades has been to maintain relatively high levels of inequality. This policy has been seen most directly in the explicit decision by the Federal Reserve Board and other central banks to focus mainly, or even exclusively, on keeping inflation low. This is a sharp shift from prior decades, when central banks saw one of their main functions as promoting high levels of employment.

Powerful interests directly benefit from an over-valued dollar. Many major US manufacturers have set up operations in China and other developing countries for the purpose of exporting back to the United States. They aren’t eager to see the cost of the items produced in these countries rise by 20 to 30 percent if the dollar falls by that amount. Similarly, major retailers like Walmart have established low-cost supply chains in the developing world, and they would prefer not to see the prices of the goods they import rise along with the value of developing country currencies. Thus, there are substantial political obstacles working against major efforts from the US government to force down the value of the dollar and bring the trade deficit closer to balance. For this reason, we can see the large trade deficit as a policy choice, not simply an unavoidable a natural outcome of the workings of the market.

Ways in which policy affects employment:

1. Distributional policies that affect consumption

- Union policy
- Minimum wage
- Regulatory policy
- Structure of unemployment benefit system

2. Incentives for longer or shorter work-years
3. Fiscal policy (more or less expansionary)
4. Monetary policy (more or less expansionary)
5. Currency policy (affects trade deficit or surplus)

It is hypocritical to bless the policies that have the effect of reducing demand as non-intervention and condemn the policies designed to counteract these effects as intervention. We can choose government policies that will be more or less stimulative of growth and employment and inequality, but we can't escape the fact that government policies are affecting these things. The presence of large numbers of people who are unable to find work as a result of inadequate demand is the result of policies we have chosen that keep these people from working. This is not *laissez-faire* or the free market; this is operating the government to benefit a select group.

Anxieties about the latent immorality of commercial society were shared even by such paladins of the free market as Adam Smith. He recognized that poverty and inequality were inevitable outcomes of the growth of the market, arguing that the market could not by itself relieve those "who by the products of their labor feed, clothe, and lodge the whole body of the people should have such a share of the product of their own labor as to be themselves tolerably well fed, clothed, and lodged." Nor, he believed, could one depend on the powers that be because "civil government so far as it is instituted for the security of property, is in reality instituted for the defense of the rich against the poor, or all those who have some property against those who have none at all."

The Machine Appeared

The Dutch Disease: the negative impact of an economy based on one natural resource, causes a sharp inflow of foreign currency, which raises the value of the country's currency, making the country's other products less price competitive. It is cheaper to import products rather than create them. This makes it more difficult for segments of the economy like agriculture and manufacturing to develop.

The machine appeared
 In the distance, singing to itself
 Of money.
 Its song was the web
 They were caught in, men and women
 Together.
 The villages were as flies
 To be sucked empty.
 God secreted
 A tear.
 Enough, enough,
 He commanded, but the machine
 Looked at him and went on singing.

As mother and son play, Aminatta looks down, ashamed, as she recalls how she had once taken Thomas to the countryside and left him to die under a giant cotton tree.

Someone gets to eat the fruits of globalization, someone else ends up with the pits.

The global economy has been transformed from a material-based economy into a knowledge-based economy. Previously the main sources of wealth were material assets such as gold mines, wheat fields, and oil wells. Today the main source of wealth is knowledge. And whereas you can conquer oil fields through war, you cannot acquire knowledge that way. Hence as knowledge became the most important economic resource, the profitability of war declined and wars became increasingly restricted to those parts of the world—such as the Middle East and Central Africa—where the economies are still old-fashioned material-based economies.

Of course water will likely, if not already, be added to this, expanding the scope of war once again. Combined with the fact that while the concept of an iPhone is knowledge, the actual device is not and does require access to key minerals along with labor and transport, this may in fact have more

to do with whether or not they fall sufficiently under Uncle Sam's protective umbrella. But how long can such a thing hold?

In 1998 it made sense for Rwanda to seize and loot the rich coltan mines of neighbouring Congo, because this ore was in high demand for the manufacture of mobile phones and laptops, and Congo held 80 percent of the world's coltan reserves. Rwanda earned \$240 million annually from the looted coltan. For poor Rwanda that was a lot of money. In contrast, it would have made no sense for China to invade California and seize Silicon Valley, for even if the Chinese could somehow prevail on the battlefield, there were no silicon mines to loot in Silicon Valley. Instead, the Chinese have earned billions of dollars from cooperating with high-tech giants such as Apple and Microsoft, buying their software and manufacturing their products. What Rwanda earned from an entire year of looting Congolese coltan, the Chinese earn in a single day of peaceful commerce.

Those who view the global economy as presenting a choice between 'free trade' and 'protectionism' overlook the centrality of power in determining what is to be traded and how. Since all nations' markets depend on political decisions about how their markets are organized, as a practical matter free trade agreements entail complex negotiations about how different market systems will be integrated.

'Free trade' with China, for example, doesn't simply mean more trade, because China's market is organized quite differently from that of the United States. The real issues involve such things as the degree of protection China will give the intellectual property of American-based corporations, how China will treat the assets of US-based investment banks, and the access of China's state-run enterprises to the American market.

In such negotiations the interests of big American-based corporations and Wall Street banks have consistently trumped the interests of average working Americans, whose wages are considered less worthy of protection than, say, an American company's intellectual capital or a Wall Street bank's financial assets. The United States has never sought to require, for example, that trading partners establish minimum wages equal to half their median wages.

Income gains for Pfizer and Disney translate into lost jobs for workers in the steel and auto industries. The conventional story is that we lose manufacturing jobs to developing countries because they have hundreds of millions of people willing to do factory work at a fraction of the pay of manufacturing workers in the United States. This is true, but developing countries also have tens of millions of smart and ambitious people willing to work as doctors and lawyers in the United States at a fraction of the pay of the ones we have now. Gains from trade work the same with doctors

and lawyers as they do with textiles and steel. Our consumers would save hundreds of billions a year if we could hire professionals from developing countries and pay them salaries that are substantially less than what we pay our professionals now. The reason we import manufactured goods and not doctors is that we have designed the rules of trade that way. We deliberately write trade pacts to make it as easy as possible for US companies to set up manufacturing operations abroad and ship the products back to the United States, but we have done little or nothing to remove the obstacles that professionals from other countries face in trying to work in the United States. The reason is simple: doctors and lawyers have more political power than factory workers.

If our trade negotiators treated doctors and other highly paid professionals the same way they treated manufacturing workers, then trade agreements would have been written to make it as easy as possible for smart, ambitious kids in Mexico, India, and other developing countries to study to meet US standards. They then would be able practice their profession in the United States in the same way as someone born and educated in the United States. The fact that manufacturing workers face competition from low-paid workers in the developing world and doctors and other highly paid professionals don't has nothing to do with the inherent dynamics of globalization: it is about the differences in the power of these groups.

Highly paid professionals are highly paid because they set their own rules. Doctors, dentists, and lawyers don't face the same downward pressure on their wages as textile workers, autoworkers, and retail clerks because the government's policies are not trying to push their pay lower. We aren't designing trade agreements to expose these professions to competition with lower-paid counterparts in the developing world. Nor are politicians constantly looking for new ways to alter regulations in ways that undermine these workers' bargaining power. The workers in these professions sit near the top of the pay ladder not because of the inherent dynamics of globalization and the market economy, but because they have much more say than other workers in setting the rules. There will always be genuine quality concerns in making these decisions, but if the assessment of quality issues is left to the professionals who stand to benefit, we can expect that these professionals will be enriching themselves at the expense of the rest of us.

Of course, many young professionals, especially doctors, have put in years of training and have incurred large debts to practice in a field that they expected to be financially rewarding. It is reasonable to have some sympathy for them and perhaps lessen the blow from market-opening measures by, for example, offering student loan forgiveness. However, why apply a different standard to market openings for highly trained professionals than to market

openings for textile workers and autoworkers? For less highly paid workers we take steps that increase efficiency and promote growth and pledge that we will help those left behind. In most cases the help has not been especially useful. It does not make sense to believe that the most educated workers in society somehow are in need of greater protection from the government than the millions of less-educated workers who have been displaced by trade openings and other measures. Sympathy might be appropriate, special protection is not.

One crucial fact is often left unsaid: our trade with countries where we do not have so-called free trade agreements is growing faster than with countries with which we have such agreements. The implication is clear: free trade agreements are less about increasing trade than about lowering costs (by replacing American workers with cheap overseas labor) so owners and financiers can harvest a larger share of the economic fruits.

Economic globalization, which has happened without globalizing first-world labor protections, has left workers around the world to compete against one another.

So far most of the lost jobs and lowered wages have come at the expense of factory workers, but that is changing. Thanks to the Internet, any job that can be done on a computer can be moved offshore. Engineers, accountants, graphic designers, and millions of other workers could see their jobs sent “offshore.” A case in point? The Reuters news agency fired twenty American and European journalists in 2004 and replaced them with sixty journalists who were paid such low wages in India that the company cut its labor costs by more than \$200,000. Reuters said it was about saving money, but that shouldn’t have been the headline. In fact, the job exchange was about preserving fat pay for top executives. If it were about saving money, then firing the four highest-paid Reuters executives and replacing them with a dozen talented managers in Mumbai, paid on the same salary reduction scale as the journalists, would have saved the company \$968,000 a year, more than four times as much.

Outside the brief interval of enforced peace following the Second World War, Europe has been a boiling cauldron of warfare since its modern cultures began to emerge out of the chaos of the post-Roman dark ages. Most of the world’s most devastating wars have been European in origin. And of course it escapes no one’s attention in the rest of the world that it was from Europe that hordes of invaders and colonizers swept over the entire planet from the sixteenth through the nineteenth centuries—as often as not leaving total devastation in their wake. In histories written a thousand years from now, Europeans will have the same sort of reputation that Huns and Mongols have today and it’s only in the fond fantasies of those who think history has

a direction that those days are definitely over.

There used to be a time when industrialization—often referred to by the magic word ‘development’—was seen as the road to economic independence. As it has emerged, however, industrial development has usually been a process of converting preindustrial dependencies into industrial dependencies. Previously, many left-wing revolutionary movements aimed to throw off the yoke of imperialism by joining with the native capitalists in “national revolutions.” What has often happened, however, is that the local capitalists have supplanted the old landowning oligarchs in trying to cooperate with, rather than break with, foreign capital. Instead of “ugly Americans” or Europeans meddling in their affairs, many Third World regimes are increasingly manned by Americanized Brazilians, Anglicized Indians and Nigerians, and Westernized Saudi Arabians and Egyptians.

As dependent industrialism grows, moreover, its roots spread deeply into the state bureaucracies, in the universities and among the managerial, technical, professional, and intellectual elites. As this happens, military control or the threat of a military takeover becomes somewhat less essential and the military themselves became more civilianized, if not even subordinate to corporate economic interests. Thus a huge infrastructure of dependency is developed which serves as the functional equivalent of a formal colonial apparatus. In fact, external controls are now internalized in domestic institutions, and the new infrastructure may be more powerful than any previous colonial apparatus. Thus, with the old oligarchies pushed aside by industrial development, the sons and grandsons of the preindustrial chieftains and feudal aristocrats leap from landowning to stockholding, from the protection of ancient privileges to the glory of new privileges as the local agents—at times, even junior partners—of the new industrial oligarchs of the “New World” empire. The lands they still own allow them to keep one foot in the past, thus easing the transition, or better yet, allowing them to move into the new world of chemically fertilized, supermechanized, and super-seeded agribusiness.

Socialized enterprises in utilities, transportation, communication, and water are being used to subsidize private firms by providing them with essential services at cost or even below-cost prices. More nationalization of this type is under way—particularly in basic mineral, forest, and land resources.

History as told by Europeans would like us to believe that Europeans were fully responsible for the conquest which established them in the seats of power but indigenous people worldwide were far more involved in choosing the trade empire than they are ever given credit for and the trade empire remained in power even where the Europeans did not. The so-called Spanish,

English, French, and Portuguese conquest of the Americas could never have happened without what their history euphemistically called Indian allies, alliances of nations who vastly outnumbered the Europeans in every case and overthrew the existing empires or rival nations with the help of a few Europeans and their guns.

The indigenous women history deplors as sex slaves who had no autonomy or initiative were sometimes powerful to the point that it would be more accurate to call the Europeans their concubines, or even more accurate to call it a partnership. Hernán Cortés and his little band of 1300 men would not have survived, much less conquered the Aztec alliance, without the connections and actions of La Malinche throughout their campaign and her ability to negotiate alliances with all of the indigenous nations which provided the hundreds of thousands of warriors who overthrew the Aztecs.

The Incas failed to retake Cuzco during the siege of 1536, not because of the 190 Spanish soldiers present but because of the army of tens of thousands sent by the Inca kuraka, Contarhucho, in response to a message from her daughter, the Inca princess, Quispe Sisa, who was living with the Spanish “conquistador” Francisco Pizarro. The combination of European bragging and erasure of all indigenous and female people out of history has given a very unrealistic view of the conquest of every nation on earth by the trade economy. It was not a few European men who conquered the world, it was an idea.

This may reflect *Homo sapiens* position in the food chain. If all that counted were raw physical abilities, *Sapiens* would have found themselves on a middle rung of the ladder. But their mental and social skills placed them at the top. It is therefore only natural that the chain of power within the species will also be determined by mental and social abilities more than by brute force.

The most powerful empires were those who became wealthy from trade. Goods had exchanged hands between tribes for as long as humanity existed and this is frequently referred to as trade, but it probably was usually just sharing. The tradition of state visitors bearing gifts is so long standing and widespread it was probably present in our earliest societies. We know sharing was the only method of exchange between some tribes and it is hard to imagine most other early tribes conducting trades over their limited goods.

Sharing is a social trait common to all people and it would have been easier to communicate and more effective than trade for meeting socially. No human would have grown to adulthood without a mother sharing with them, not as an exchange but as a gift. Since the elderly and weak would also not have survived without sharing, it can be surmised that this was

learned behaviour practiced between all people, not just the parent-child relationship it has been reduced to today. Trade or reciprocal sharing did develop between neighbouring tribes with regular contact however, and this usually increased dramatically with stratified and hierarchical society.

With the progression of our dissociation, wealth no longer follows tribal or imperial leadership, resources, or even trade in resources. The basis for entrance to the elite supranational classes now is existing wealth, celebrity, or power, in any form. The ability to write laws and treaties, control knowledge, or manipulate the public is rapidly replacing the ability to directly control resources as the primary source of power. Tribal knowledge which was once hoarded by guilds is now copyrighted, patented, and kept in the upper strata, defended by lawyers and laws protecting rights which are unrelated to creation.

Unlike power under the elite of the second age, the supranational class at the top of today's global empire does not need to govern or be involved in any way with the divided state-societies below them. Power has become completely dissociated from governance or the well-being of the people of the world. It exists simply to accumulate the currency which purchases dissociated entrance to any society. The supranational class is its own nation. Everyone not in their strata is their outgroup who they spare no empathy towards.

The wealthy are now wealthy for being wealthy. The former merchant classes have followed the old nobility of the second age in convincing the public to continue serving them for no reason except habit and the laws they wrote themselves.

Noblesse oblige—never a popular idea among dictators—was replaced by the idea that the formerly childlike citizens had personal responsibility and responsibility meant accepting corporate slavery. There was no need to justify corporate rule as the trade economy ruled for it. Even the rulers were abstracted away behind corporate names. There was no need to justify their privilege as wealth was its own justification. Rebellions were subverted by convincing the people to compete with each other for trade dominance instead.

Dissociation gave the promise of free will and autonomy to those who had lost it. For those who remembered, it gave the promise of autonomous nations which could hold power without imperial occupation. For those who had long forgotten their tribal autonomy, it gave the promise of freedom from the child-like subservience of imperial citizens. For those persecuted by their own society, it gave freedom from social approval. People and nations no longer needed the approval or agreement of their government or neighbours for anything. They didn't even need to know their neighbours. They just

needed to sell them something and they would have all the dissociated approval they needed to survive, maybe even to build an empire of their own.

This is the role men have been forced into since the beginnings of the trade economy. Men were shunned out of their families and into industry or military far more often than women and were not welcomed back into their families without currency. In many cases they had to give up their entire family life and just send back the currency while they lived far from home. The social approval a woman once received for being a good mother was given to men if they were a good provider.

After the trade economy took control of all social relationships, a good provider was the one who spent the least time with his family or village and was most successful in exploiting his society. Industry pretended that industrialists provided jobs and money, neither of which are needed by any community, and successfully perverted the word 'providers' to be applied to the community destroyers. Social acceptance was granted to those who would formerly have been attacked.

The dissociation of industrialized societies has changed national narcissism into an explosion of individual narcissism. The amount of approval now demanded by individual members of industrialized societies is unlimited and of course, unsustainable. The monetization of this approval still requires a social aspect. As it takes more and more money to buy the envy and obsequiousness of others, the ruthlessness in obtaining wealth and the dissatisfaction it brings will continue.

The solutions to this narcissistic emptiness will not be found in gender parity in a trade economy. The answer is not that women should benefit from trade, it's that men should not. All money in a trade economy comes from the powerful and we need to build a society that benefits the powerless. If service to society becomes the measure of worth, women will have parity overnight and all people will receive direct approval for their contributions. If we reject the economy based on trade to the powerful, neither men nor women will have to, or be able to, buy their acceptance into their own families or the approval of their communities.

The social acceptance we once received for being of service to our communities we now receive for competing with and exploiting them. This acceptance is not the social approval we all crave as humans. It is envy and fear and it leaves us empty.

Approval economies are the natural economies of human society. We separated power from societal approval and exchanged society for trade relationships so long ago most cannot imagine an alternative, but it is still there in the most basic units of society. Economies based on trade

relationships with financial systems as tools of coercion and control cannot coexist with peaceful and just societies. Power will be concentrated in able bodied traders and hoarders as long as we continue using trade economies.

We have always had sectarianism. The difference now is we also have hierarchy. Those who treat the rest of us as an outgroup they have no empathy for are at the very top strata of society and have control over every aspect of our lives. We have always committed atrocities on people in our outgroups. The difference now is we can profit from those atrocities. Whether our actions have social approval or not, they can produce currency which will bring social approval. As long as we can buy social approval with currency we are no longer as susceptible to societal coercion. As long as our societies are non-existent, shunning and inclusion have no effect on us.

The dissociated approval brought by currency was also dissociated authority and dictatorship every bit as cruel but less accountable than the former empires. The dissociation which looked so much like freedom was just sociopathy, the individualism was isolation and impotence. The equality under a trade empire was no equality at all, as any egalitarian system imposed on unequal populations must result in tyranny by those the system was designed for. For many years those who refused to let go of the trade economy dream have insisted the tyrants were there by personal merit, not design, and punished those who failed to excel by insisting they were defective and attempting to reform them. Those who failed to excel also refused to give up on the dream and just demanded it be modified to let them in, giving rise to an endless succession of reformers demanding their rights to succeed in a sociopathic system of oppression.

The trade economy has denied the value of any work benefiting those in need of assistance and denied the value of resources in non-Western countries. Both caregivers and resource rich continents are depicted as being in a state of perpetual begging for handouts from the wealthy despite the obvious fact that no one needs the wealthy and everyone needs caregivers and resources. The same power that once denied ownership by the commons with the homesteading principle now denies the rights of homesteaders in favour of foreign multinational corporations. Laws are stratified to ensure the powerful have superior versions of everything, including immigration rights at a time when much of the world will need refugee status from drought, pollution, conflict, natural disasters. Even natural life expectancy is unapologetically higher for the chosen strata. The world is being funneled through a eugenics program of a previously unimagined scale.

There will be no “tragedy of the commons” greater than this: if we do not recover the commons, regain personal, local, community, and peoples’ involvement in sharing, in being the web of the wild world, that world will

keep slipping away. And, it is clear, the loss of a local commons heralds the end of self-sufficiency and signals the doom of the vernacular culture of the region.

After the collapse of the Soviet Union, the US emerged as the sole remaining superpower, equally committed to the principles of democracy and free markets. The major development since then has been the globalization of financial markets, spearheaded by advocates who argued that globalization increases total wealth. After all, if the winners compensated the losers, they would still have something left over.

The argument was misleading, because it ignored the fact that the winners seldom, if ever, compensate the losers. But the potential winners spent enough money promoting the argument that it prevailed.

Globalization has had far-reaching economic and political consequences. It has brought about some economic convergence between poor and rich countries; but it increased inequality within both poor and rich countries. In the developed world, the benefits accrued mainly to large owners of financial capital, who constitute less than 1% of the population. The lack of redistributive policies is the main source of the dissatisfaction that democracy's opponents have exploited. But there were other contributing factors as well, particularly in Europe.

The effect of all this is to remind you with every prospect that this is a place and a way of life from which the politicians have withdrawn their blessing. Like so many other American scenes, this one is the product of decades of deindustrialization, engineered by Republicans and rationalized by Democrats. This is a place where affluence never returns—not because affluence for Fall River is impossible or unimaginable, but because our country's leaders have blandly accepted a social order that constantly bids down the wages of people like these while bidding up the rewards for innovators, creatives, and professionals.

Even the city's one real hope for new employment opportunities—an Amazon warehouse that is now in the planning stages—will serve to lock in this relationship. If all goes according to plan, and if Amazon sticks to the practices it has pioneered elsewhere, people from Fall River will one day get to do exhausting work with few benefits while being electronically monitored for efficiency, in order to save the affluent customers of nearby Boston a few pennies when they buy books or electronics or a dildo shaped like a dragon dick.

But that is all in the future. These days, the local newspaper publishes an endless stream of stories about drug arrests, shootings, drunk-driving crashes, the stupidity of local politicians, and the lamentable surplus of “affordable housing.” The town is up to its eyeballs in wrathful bitterness

against public workers. As in: Why do they deserve a decent life when the rest of us have no chance at all? It's every man for himself here in a "competition for crumbs," as a Fall River friend puts it.

The US is lucky. We are so rich we could take a lot more corruption before the system started breaking down, and even then, our decay path has been a lot more gradual than for that of a much more fragile emerging economy.

The liberals are not just in disarray—they are in complete collapse because the working class has awakened to the liberals' betrayal and abandonment of the working class in favor of building personal wealth and power. The source of the angry angst rippling through the Democratic Party's progressive camp is not President Trump—it's the complete collapse of the liberals globally.

Broadly speaking, the liberals favored labor (whose rights were protected by the state) and the Right favored capital (also protected by the state). But over the past 25 years of globalized neoliberalism, social democratic movements have abandoned labor to embrace the self-serving wealth and power offered by capital. The essence of globalization is: labor is turned into a commodity as mobile capital is free to roam the globe for the lowest cost labor. In contrast, labor is far less mobile, and unable to shift as fluidly and frictionlessly as capital to exploit scarcities and opportunities.

Neoliberalism—specifically the opening of markets and borders—enables capital to effortlessly crush labor. The liberals, in embracing open borders, have institutionalized an open immigration that shreds the scarcity value of domestic labor in favor of lower cost immigrant labor that serves capital's desire for lower costs.

Globalization and neoliberal financial and immigration policies signify the collapse of the liberals and the victory of capital. Now capital completely dominates the state and its cronyist structures—political parties, lobbying, campaign contributions, charitable foundations operating as pay-for-play cash vacuums, and all the other features of cartel-state capitalism.

To mask the collapse of the liberals' economic defense of labor, the liberals' apologists and PR machine have substituted social justice movements for economic opportunities to acquire economic security and capital. This has succeeded brilliantly, as tens of millions of self-described "progressives" completely bought the liberals' great con that "social justice" campaigns on behalf of marginalized social groups were the defining feature of Progressive Social Democratic movements.

What's most baffling about all of this is that no matter how many times global elites see the rotted fruit of their piggish behavior—instability,

extremism, and collective rejection of their own authority—they continue to pursue it, seemingly inured to the consequences.

In theory free trade should make the world richer because production will reach maximum efficiency as each country returns to the idea of comparative advantage, specializing in what it does best. But while waiting for this economic paradise to arrive by and by, people have to eat. Also, you can't buy a new planet once you've trashed this one getting "rich."

Why did Walmart go to China in the 90s? Was it because customers came into Walmart and marched up to the manager and said 'I'm not buying this expensive American made stuff, and I demand you get these products made in China,' and the managers dutifully sent the message upstairs to the CEO? That would seem to be the mainstream consensus, and that never happened. It was Wall Street's demand for greater profits to boost Walmart's share price which was the greatest motivator for dumping US manufacturing in favor of Made in China.

We're all on board the train of ravenous and ever-growing plunder and pollution. As our locomotive races toward the cliff of ecological collapse, the only thoughts on the minds of our CEOs, capitalist economists, politicians, and most labor leaders is how to stoke the locomotive to get us there faster. Corporations aren't necessarily evil. They just can't help themselves. They're doing what they're supposed to do for the benefit of their owners. But this means that, so long as the global economy is based on capitalism and private property and corporate property and competitive production for market, we're doomed to a collective social suicide—and no amount of tinkering with the market can brake the drive to global ecological collapse. We can't shop our way to sustainability, because the problems we face cannot be solved by individual choices in the marketplace. They require collective democratic control over the economy to prioritize the needs of society and the environment. And they require local, regional, national, and international economic planning to reorganize the economy and redeploy labor and resources to these ends. I conclude, therefore, that if humanity is to save itself, we have no choice but to overthrow capitalism and replace it with a democratically planned eco-socialist economy.

We must face a sobering fact. If every company on the planet were to adopt the best environmental practices of the "leading" companies—say, the Body Shop, Patagonia, or 3M—the world would still be moving toward sure degradation and collapse. Quite simply, our business practices are destroying life on earth. Given current corporate practices, not one wildlife preserve, wilderness, or indigenous culture will survive the global market economy. We know that every natural system on the planet is disintegrating. The land, water, air, and sea have been functionally transformed from life-supporting

systems into repositories for waste. There is no polite way to say that business is destroying the world.

The indigenous are freer and happier than Westerners not by some innate abilities, but because they have chosen to work for their freedom: by co-producing food, tools, clothes, pottery, by hunting, fishing, and foraging together. Westerners have refused to resist thus far, because deep down, many know they are dependent on the system for survival, and don't want to pull that plug, to bite the hand that feeds. It's the only way, though. We are going to have to walk away from all this, and activists, protesters, and concerned citizens are going to have to metaphorically step into our own jungle, and organize around ecology, democracy, and social justice.

If middle-class society is decaying, if we have got into a blind alley from which we cannot emerge without attacking past institutions with torch and hatchet, it is precisely because we have given too much to counting. It is because we have let ourselves be influenced into giving only to receive. It is because we have aimed at turning society into a commercial company based on debit and credit.

Some support the proposition that as industrialized nations shift to higher-tech economies, it is only a matter of global justice that the jobs upon which our middle classes were built should be shared with countries still enslaved by poverty. The problem is that the workers throughout Asia and Latin America, are not inheriting "our" jobs at all. One of the myths of relocation is that those jobs that seemed to be transferred from the so-called North to the South are perceived as similar jobs to what was already being done before. They are not. Just as company-owned manufacturing turned—somewhere over the Pacific Ocean—into "orders" to be placed with third-party contractors, so did full-time employment undergo a mid-flight transformation into "contracts." The biggest challenge to those in Asia is that the new employment created by Western and Asian multinationals investing in Asia is temporary and short-term employment. In fact, zone workers in many parts of Asia, the Caribbean, and Central America have more in common with office-temp workers in North America and Europe than they do with factory workers in those Northern countries.

What is happening is a radical alteration in the very nature of factory work. That was the conclusion of a 1996 study conducted by the International Labor Organization, which stated that the dramatic relocation of production in the garment and shoe industries "has been accompanied by a parallel shift of production from the formal to the informal sector in many countries, with generally negative consequences on wage levels and conditions of work." Employment in these sectors, the study went on, has shifted from "full-time in-plant jobs to part-time and temporary jobs and, especially in clothing

and footwear, increasing resort to homework and small shops.” Indeed, this is not simply a job-flight story.

An example of genuinely fair trade is each country provides what it is best placed to produce, in return for what it most needs, independent of global market prices. So Bolivia provides gas at stable discounted prices; Venezuela offers heavily subsidized oil to poorer countries and shares expertise in developing reserves; and Cuba sends thousands of doctors to deliver free health care all over the continent, while training students from other countries at its medical schools. This is a very different model from the kind of academic exchange that began at the University of Chicago in the mid-fifties, when Latin American students learned a single rigid ideology and were sent home to impose it with uniformity across the continent. The major benefit is that ALBA is essentially a barter system, in which countries decide for themselves what any given commodity or service is worth, rather than letting traders in New York, Chicago, or London set the prices for them. That makes trade far less vulnerable to the kind of sudden price fluctuations that devastated Latin American economies in the recent past. Surrounded by turbulent financial waters, Latin America is creating a zone of relative economic calm and predictability, a feat presumed impossible in the globalization era.

Well, at least it was until Uncle Sam’s meddling.

The standard framing of economic debates divides the world into two schools. On the one hand, conservatives want to leave things to the market and have a minimal role for government. Liberals see a large role for government in alleviating poverty, reducing inequality, and correcting other perceived ill-effects of market outcomes. This framing is fundamentally wrong. The point is that we don’t have “market outcomes” that we can decide whether to interfere with or not. Government policy shapes market outcomes. It determines aggregate levels of output and employment, which in turn affect the bargaining power of different groups of workers. Government policy structures financial markets, and the policy giving the industry special protections allows for some individuals to get enormously rich. Government policy determines the extent to which individuals can claim ownership of technology and how much they can profit from it. Government policy sets up corporate governance structures that let top management enrich itself at the expense of shareholders. And government policy determines whether highly paid professionals enjoy special protection from foreign and domestic competition.

Pretending that the distribution of income and wealth that results from a long set of policy decisions is somehow the natural workings of the market is not a serious position. It might be politically convenient for conservatives

who want to lock inequality in place. It is a more politically compelling position to argue that we should not interfere with market outcomes than to argue for a system that is deliberately structured to make some people very rich while leaving others in poverty. Pretending that distributional outcomes are just the workings of the market is convenient for any beneficiaries of this inequality, even those who consider themselves liberal. They can feel entitled to their prosperity by virtue of being winners in the market, yet sufficiently benevolent to share some of their wealth with the less fortunate. For this reason, they may also find it useful to pretend that we have a set of market outcomes not determined by policy decisions.

We should not structure our understanding of the economy around political convenience. There is no way of escaping the fact that levels of output and employment are determined by policy, that the length and strength of patent and copyright monopolies are determined by policy, and that the rules of corporate governance are determined by policy. The people who would treat these and other policy decisions determining the distribution of income as somehow given are not being honest. We can debate the merits of a policy, but there is no policy-free option out there.

Our objection is obviously not to trade; cultures have always traded goods across borders, and always will. What we object to is the way transnational institutions are using trade deals to globalize pro-corporate policies that are extremely profitable for a small group of players but which are steadily devouring so much of what used to be public and commonly held: seeds, water rights, public health care, and much more.

We cannot ignore the fact that the period 1820 to circa 1950 was one of violent dispossession across much of the Global South. If you have read any colonial history, you will know colonizers had immense difficulty getting people to work on their mines and plantations. As it turns out, people tended to prefer their subsistence lifestyles, and wages were not high enough to induce them to leave. Colonizers had to coerce people into the labor market: imposing taxes, enclosing commons and constraining access to food, or just outright forcing people off their land.

The process of forcibly integrating colonized peoples into the capitalist labor system caused widespread dislocation. Remember, this is the period of the Belgian labor system in the Congo, which so upended local economies that ten-million people died—half the population. This is the period of the Natives Land Act in South Africa, which dispossessed the country's black population of 90 percent of the country. This is the period of the famines in India, where 30 million died needlessly as a result of policies the British imposed on Indian agriculture. This is the period of the Opium Wars in China and the unequal treaties that immiserated the population. And don't

forget: all of this was conducted in the name of the free market.

All of this violence, and much more, gets elided in your narrative and repackaged as a happy story of progress. And you say I'm the one possessed of romantic fairy tales.

Our current financial system is spreading economic humiliation all over the world—and it's having the precise effects that the economist and diplomat John Maynard Keynes warned of a century ago, when he wrote that if the world imposed punishing economic sanctions on Germany:

“Vengeance, I dare predict, will not limp.”

Part VII

The Great Winnowing

Born down in a dead man's town
The first kick I took was when I hit the ground
You end up like a dog that's been beat too much
Till you spend half your life just covering up

Born in the USA
I was born in the USA
I was born in the USA
Born in the USA

Got in a little hometown jam
So they put a rifle in my hand
Sent me off to a foreign land
To go and kill the yellow man

Born in the USA
I was born in the USA
I was born in the USA
I was born in the USA

Come back home to the refinery
Hiring man said son if it was up to me
Went down to see my VA Man
He said son, don't you understand

I had a brother at Khe Sahn, fighting off the Viet Cong
They're still there, he's all gone
He had a woman he loved in Saigon
I got a picture of him in her arms now

Down in the shadow of the penitentiary
Out by the gas fires of the refinery
I'm ten years burning down the road
Nowhere to run ain't got nowhere to go

Born in the USA
I was born in the USA
Born in the USA
I'm a long gone daddy in the USA
Born in the USA
Born in the USA
Born in the USA
I'm a cool rocking daddy in the USA

Chapter Sixty

A Form of Utopia

“Do you think you are the only people who have had to sacrifice? Do you know how much money, how many jobs, my people have turned down from oil and gas and mining companies? Tens of millions of dollars. We do it because there are things that are more important than money.”

Lakota chief Red Cloud lamented:

“They made us many promises, more than I can remember. But they kept but one—they promised to take our land and they took it.”

Genocide is not just a murderous madness; it is, more deeply, a politics that promises a utopia beyond politics—one people, one land, one truth, the end of difference. Genocide is a form of political utopia.

In true cultural extinctions like the Dorset and the Bo, entire ways of speaking about and conceptualizing the world disappear. The era of the Anthropocene is most often defined by human impact on the physical world, but as modernity and globalization sweep and transform communities around the planet, the nonbiological world of thought and language is impacted too. Modernization has become a kind of vortex of cultural assimilation that extinguishes ways of being, both animal and human. Interestingly, the modern mindset, to which many of the people reading this book probably belong, presumes its superiority and centrality to history to such an extent that we don't really comprehend that there are different ways of existing in and thinking about the world.

The history of the idea of wilderness is a fascinating lens on this fact. How did prehistoric peoples think about nature and relate to species? It turns out that this is extraordinarily difficult for us to contemplate. Modernism—the period of history stretching all the way from the Renaissance to today and defined by science, capitalism, and a Judeo-Christian perspective on nature and time—obstructs our ability to inquire into the prehistoric experience of wilderness. Most likely, they didn't think about it at all. Prehistoric

humans lacked a concept of ‘wilderness,’ of natural phenomena or spaces outside of the human domain. They almost certainly had a nondualistic relationship to the world in which there was no separation between mental and physical properties, and as a result, no division between human and natural phenomenon. These things were experienced seamlessly.

Civilized people perpetuate the presupposition that prehistoric humans longed for paradise, some luxurious garden of easy living that would free them from travail and hunger. Because it assumes the categories and values of the modern world—indeed, the psychological profile of the modern mind—as absolutes, this argument invites deconstruction. From a modern perspective, a binary opposition, which can be neither critically nor empirically sustained, appears between archaic and modern culture and underlies the claim that so-called primitive people wanted to gain control over land and animals, and nature more generally. Most if not all evidence contradicts such a reading, and indicates that Paleolithic people lacked a concept of either a wilderness to escape or a civilization to seek. Only by holding our own categories in abeyance can we possibly understand the Paleolithic mind. The assumption that Paleolithic people were mere children in comparison to us, a later, adult phase of humanity, is dubious. So is the belief that the modern mind is the culmination of human intellectuality.

Our fervent belief in the objective superiority of the modern mode of existence perhaps biases us, for example, to assume that the reason Neanderthals didn’t evolve the same technology as us is because they lacked intelligence, rather than they found a sustainable manner of living over 300,000 years. Modernists find it hard to imagine any desirable existence or definition of human except their own. We think of prehistoric and indigenous peoples as living lives of extreme hardship and in a constant state of need, and that the modern mind arose out of an adaptive superiority rather than, say, an appetite for domination.

There is an abundance of evidence that they in fact possessed a rich, complex, and sophisticated body of scientific knowledge about nature. It is clear that various indigenous cultures had developed an extraordinary system of classification and systematics over thousands of years through methodical observation and tested hypotheses. For them plants and animals are not known as a result of their usefulness but are useful or interesting because they are known.

We resist the idea that for all of our scientific and technological achievements, modernity is not necessarily evidence of the forward progress of evolution and culture. Indeed, despite our quality of material existence and abundance of technology, the ecological problems of the twenty-first century have shown us that we don’t understand nature much better—only

very differently—than those that preceded us. Compared to even a hundred years ago, our lives are more distanced and divided from the natural world than ever before. Whereas the earth was once the origin of our history, lives, and source of survival, it has become an abstraction, a background to our everyday experience, perhaps even something we need to escape for other worlds.

Today, 54 percent of people live in urban environments, up from one-third in the 1960s, according to the World Health Organization. How many of us can claim an intimate knowledge of the animal and plant life around us? This might be one of the most telling reasons why stories about the disappearance of species often fail to capture our attention for more than a few moments. Their value is abstract to us. Even for those of us who purport to care very much, chances are the existence of species is not linked to our everyday experience or needs.

Our modern relationship to nature has its origins in a theistic worldview that arose in step with the agricultural revolution. God created the earth for humankind and our task as his servants is to create a New Jerusalem from the land, the Second Creation. In the twenty-first century, a great many of us have discarded this religiosity for a secular worldview that places its faith in scientism. Even science, however, can perpetuate the fractured relationship to nature by making us observers standing apart from the world even as we seek to understand how it works. Many modern environmentalists have sought to heal this breach between humans and nature by proposing new ecological worldviews that restore an ancient, lost connection to the earth. But their appeals, however well-intentioned, remain fundamentally Cartesian, a subset of the modern mind that believes nature is environment and therefore different from humans.

Given that almost every problem of note that we face in the twenty-first century entails engagement with nonhumans—from climate change, drought, and famine; to biotechnology, intellectual property, and privacy; to genocide, terrorism, and war—there seems no time like the present to turn our future attention, resources, and energy toward the nonhuman broadly understood. How do we transition from seeing what we call ‘Nature’ as an object ‘over there’? And how do we avoid ‘new and improved’ versions that end up doing much the same thing just in a cooler, more sophisticated way? When you realize that everything is interconnected, you can’t hold on to a single, solid, present-at-hand thing over there called Nature.

“An idea, a relationship, can go extinct, just like an animal or a plant. The idea in this case is ‘nature,’ the separate and

wild province, the world apart from man to which he adapted, under whose rules he was born and died.”

In this sense, we should happily cheer the end of nature. We need ecology without nature, a future in which we recognize there is no pristine wilderness, only history. In an ecology without nature, we're no longer the bouncer standing outside the club of existence, deciding who gets in or not, what has value or no value, what has rights or no rights at all. Nature is a human construct with no bearing on reality whatsoever. It's a thought-construct going back to the Middle Ages, and not only is it a toxic thought-construct that creates these false binaries between nature and culture, and modern and postmodern people—nature is the problem, and how we got to that by demarcating social space from nonhumans and actually destroying earth.

The greatest wonder of the ancient world is how recent it all is. No city or monument is much more than 5,000 years old. Only about seventy lifetimes, of seventy years, have been lived end to end since civilization began. Its entire run occupies a mere 0.2 percent of the two-and-a-half-million years since our first ancestor sharpened a stone.

It is rating one's conjectures at a very high price to roast a man alive on the strength of them. But prejudice operates on just such a basis, finding easy reasons to punish other people, quickly choosing to put them outside concern if there is any doubt about their affinity.

Although we often attribute certain bodies of wisdom to specific persons, places, and cultures, the commonality of human nature, along with similarities of the global environment and available technologies, determines that no time, group, individuals, or geographical locale has a monopoly on key ideas.

Some writers, seeing history in terms of weapons and winners, have over-emphasized the different rates at which cultures and continents developed. What strikes me as more surprising—and highly significant for finding out what kind of creature we humans are—is how little time it took people to do very similar things independently all around the world, even though they were working within different cultures and ecologies. By 3,000 years ago, “civilization” had arisen in at least seven places: Mesopotamia, Egypt, the Mediterranean, India, China, Mexico, and Peru. Archaeology shows that only about half of these had received their crops and cultural stimuli from others. The rest had built themselves up from scratch without suspecting that anyone else in the world was doing the same. This compelling parallelism of ideas, processes, and forms tells us something important: that given certain broad conditions, human societies everywhere will move towards greater size, complexity, and environmental demand.

China as a nation has the longest and by far the most vast record of inventions in the history of the world. It is now reliably estimated that more than 60% of all the knowledge existing in the world today originated in China, a fact swept under the carpet by the West.

In Ming dynasty China (1368–1644), a woman convicted of adultery might be forced to mount a ceramic dildo attached to a saddle and ride that fake dick until she died. It's worth noting that old China also had its share of less murderous sex toys, including metal dildos constructed to release liquid in order to simulate ejaculation.

Speaking of creamy white liquids, Pasteur, it should be said, discovered pasteurization in the same, limited sense that Columbus discovered America: The Chinese had been pasteurizing alcoholic products since at least the twelfth century.

We were all taught in school that the printing press with movable type was invented in Germany by Johannes Gutenberg in about the year 1550. Not so. China not only invented paper but also the printing press with movable set type, which was in common use in China 1,000 years before Gutenberg was born. Similarly, we were taught that Englishman James Watt invented the steam engine. He did not. Steam engines were in widespread use in China 600 years before Watt was born. There are dated ancient texts and drawings to illustrate and prove the Chinese discovered and documented "Pascal's Triangle" 600 years before Pascal copied it, and the Chinese enunciated Newton's First Law of Motion 2,000 years before Newton.

The same is true for thousands of inventions that the West now claim as theirs but where conclusive documentation exists to prove that they originated in China hundreds and sometimes thousands of years before the West copied them. It is not for nothing that Marco Polo is described in China as "Europe's great thief."

The Chinese invented the decimal number system, decimal fractions, negative numbers, and the zero, so far in the past that the origin is lost in the mists of time. The Chinese tracked sunspots and comets with such detail and accuracy that these ancient records are still used as the basis for their prediction and observation today. The Chinese were drilling for natural gas about 2,500 years ago, wells 4,800 feet deep, with bamboo pipelines to deliver the gas to nearby cities. The Chinese pioneered the mining and use of coal long before it was known in the West. Marco Polo and Arab traders marveled at the "black stone" that the Chinese mined from the ground, that would burn slowly during an entire night.

China had printed paper money almost 1,500 years ago, done in ways to prevent counterfeiting. Wrapping paper, paper napkins, and toilet paper were all in general use in China 2,000 years before the West could produce

them. They were the first to invent and develop a full mechanical clock with a true escapement, many centuries before the Swiss had done so. The Chinese invented an ingenious seismograph still in use that tells not only the severity but the direction and distance of earthquakes. The Chinese invented hot-air balloons, the parachute, manned flight with kites, the wheelbarrow, and matches. They invented hermetically-sealed laboratories for scientific experiments. They invented belt and chain drives, the paddle-wheel steamer, the helicopter rotor and the propeller, the segmental-arch bridge. They invented the use of water power and chain pumps, the crank handle, all the construction methods for suspension bridges, sliding calipers, the fishing reel, image projection, magic lanterns, the gimbal system of suspension. China not only invented spinning wheels, carding machines and looms, but was the world's leader in technical innovations in textile manufacturing, more than 700 years before Britain's eighteenth-century textile revolution.

Chinese expertise with fine porcelain was so advanced millennia ago, that even today it is admitted their ability has never even been equaled in the West, much less surpassed. The Chinese discovered not only magnetism but magnetic remanence and induction, as well as the compass. They invented gunpowder, smoke bombs, the cannon, the crossbow, plated body armor, fireworks, flamethrowers, grenades, land and sea mines, multi-stage rockets, mortars, and repeating guns. China had irrigation canals that were also used for transport, and the Chinese invented the canal locks that could raise and lower boats to different levels 1,500 years before the Americans built the Panama Canal. China has earthquake-proof dams functioning today that were built around 250 BC.

A millennium ago, the Chinese conceived and developed the science of immunology—vaccinating people for diseases like smallpox, knowing how to extract and prepare the vaccine so as to immunize and not infect. They discovered the circadian rhythm in the human body, blood circulation, and the science of endocrinology. The Chinese were using urine from pregnant women to make sex hormones 2,000 years ago, understanding how they acted on the body and how to use them. Many centuries-old Chinese medical books still exist, documenting all this and much more. Around 1550, China compiled a huge 52-volume Chinese Traditional Herbal Medicine encyclopedia that described almost 2,000 herbal sources and 10,000 medical prescriptions. Among them is chaulmoogra oil, which is still the only known treatment for leprosy.

China designed and built the world's largest commercial ships, which were many times longer and ten times larger in volume than anything the West could build at the time. In the late 1500s the largest English ships displaced 400 tons, while China's displaced more than 3,000 tons. Western ships

were small, uncontrollable, fragile, and useless for traveling any distance. Thousands of years ago, Chinese ships had watertight compartments that permitted them to continue journeys even when damaged. Moreover, Chinese ships not only had multiple masts, but China invented the luff sails which permit us to sail almost into the wind, just as sailboats do today, and were therefore not dependent on wind direction for their travel. Their luff sails contained sewn-in bamboo battens that keep the sails full and aerodynamically efficient, as racing sailboats use today. The Chinese invented the ship's rudder—something the Europeans never managed to do, able to steer themselves only with oars, and European sails permitted them to travel only in the direction of the wind, which meant a ship would have to remain in place, sometimes for months, awaiting a favorable wind.

Chinese maps were the best in the world, by orders of magnitude, for more than a millennium, and the precision of their maps became legendary, being far in advance of the West. The Chinese invented Mercator projections, relief maps, quantitative cartography, and grid layouts. China had compasses and such extensive astronomical knowledge that they always knew where they were, could plot courses and follow them by both compass and star charts, and could sail wherever they wanted, regardless of the wind direction. China was so far ahead of the Western world in sailing and navigation that comparisons are just embarrassing. It was only when the West managed to copy and steal China's sailing and navigation technology that it was able to begin traveling the world and colonizing it. It is especially important to emphasize how China, the world technological power between 1100 and 1800, made the West's emergence possible. It was only by borrowing and assimilating Chinese innovations that the West was able to make the transition to modern capitalist and imperialist economies.

China was 1,000 years ahead of the West in anything to do with metals—cast iron, wrought iron, steel, carbon steel, tempered steel, welded steel. The Chinese were so skilled at metallurgy they could cast tuned bells that could produce any tone. Long before 1000 AD, China was the world's major steel producer. In around 1000 AD China was producing about 125,000 tons of steel per year, while 800 years later Britain could produce only 75,000 tons. The Chinese invented the blast furnace, the double-action bellows to achieve the necessary high temperatures for smelting and annealing metals. They invented the manufacture of steel from cast iron. They excelled in creating metallic alloys, and very early were casting and forging coins made from copper, nickel, and zinc. The entire process of mining, smelting, and purifying zinc originated in China. The Chinese developed the processes of mining itself, and the concentration and extraction of metals.

China was highly advanced in agriculture, having invented the winnowing

fan and the seed drill, making an easy process of tilling, planting, and harvesting. Europeans and Americans were still seeding crops by scattering grain from a bag, a greatly wasteful practice that necessitated saving 50% of each year's crop for seed. China developed scientifically efficient plows that have never been equaled and are still used all over the world today. They invented and developed animal harnesses and collars that first permitted horses to actually be used to pull loads. Europe had no efficient plow, and their only way of harnessing animals was to put a rope around their necks, which succeeded only in the animals strangling themselves. The Chinese invented saddles and the riding stirrup. China's food production was orders of magnitude ahead of the world for more than 1,000 years, its advances in agriculture the enabling cause of Europe's agricultural revolution that first permitted it to begin feeding itself adequately. The Chinese were wearing fine silk and cotton clothing and using toilet paper while centuries later Europeans were still wearing animal skins.

Few people in the West are familiar with China's Armillary Spheres. These wonders of the world, cast in bronze several meters in diameter and beautifully decorated with dragons and phoenixes, are some of the oldest and most accurate astronomical observatory instruments in existence, some created more than 3,500 years ago when the Western countries had no knowledge of such things. They determine and measure the positions and equatorial ecliptic and horizontal coordinates of celestial bodies, the positions and daily motions of 1,500 stars and constellations, and much more. When the Western forces invaded China in the late 1800s, they were so captivated that they plundered most of these treasures and the centuries of data from the ancient observatories, disassembling the instruments and removing them to Europe, returning some to China as part of the Treaties after the First World War.

It leaves one speechless to learn the vast extent of Chinese inventions that existed hundreds of years and often millennia, before they appeared in the West. This isn't a simple matter of gunpowder and fireworks, but of discovery that encompasses the entire range of human knowledge, all of which has been consciously hidden from the Western world. Scholars made these discoveries in the 1940s, but neither Western education nor the media have ever referenced or acknowledged them. These are not mere claims; the evidence is conclusive and available for examination but the West has thoroughly erased China from the world's historical memory.

Western historians have distorted and ignored China's dominant role in the world economy until about 1800. There exists an enormous amount of empirical data proving China's economic and technological superiority over Western civilization for the better part of several millennia. Given that China

was the world's supreme technological power up to about 1800, it is especially important to emphasize again that this is what made the West's emergence possible. It was only by copying and assimilating Chinese innovations and China's much more advanced technology that the West was able to make the transition to modern capitalist and imperialist economies. Until then, China was the leading trading nation, reaching most of Southern Asia, Africa, the Middle East, and Europe. China's innovations in the production of paper, book printing, firearms, and tools led to a manufacturing superpower whose goods were transported throughout the world by the most advanced navigational system. Moreover, banking, a stable paper money economy, excellent manufacturing and high agricultural yields resulted in China's per capita income surpassing that of Great Britain until about 1800.

Not only this but the majority of Western economic historians have presented historical China as a stagnant, backward, parochial society, an oriental despotism. China was never thus. During the thirteenth century, Marco Polo described China as vastly wealthier and more advanced than any European country, and leading European philosophers such as Voltaire looked to Chinese society as an intellectual exemplar, the British notably using China as their model for establishing a meritocratic civil service.

A first thought when reviewing this research is that the world must have seemed very primitive to China 500 years ago, truly 'third world' at the time. When Zhang He and others conducted their voyages of exploration, they must have been disappointed in what they found. The rest of the world had no paper or printing, no mathematics, no science, little medicine of note, almost no metallurgy to speak of, a most primitive agriculture, no manufactures of any worthy kind, no porcelain, no spinning wheels or weaving looms to make clothing. From reviewing the history of Chinese invention, one develops an increasingly strong feeling the Chinese looked at the world and found nothing of interest in all those societies that were centuries, and in some cases millennia, behind China in almost every way. One can easily theorize this is the reason China closed itself off from the world at that time, concluding that other nations were so backward that little would be gained from prolonged contact. One can imagine they returned home and closed the door, perhaps planning to return in another 500 years to see if things had progressed. With the addition of detail, this is most likely how events transpired.

What China didn't expect, was the West stealing all these ideas, turning them into weapons of colonization and war, returning to the nation that was the source of that knowledge, and invading it to colonize, to steal resources, and to enslave and massacre the population. China's interest was always only exploration and trade. The Chinese were never expansionist or warlike,

wanting only to protect their own borders from invasion from the North. China was quite unprepared for the violent nature and savage brutality of the White barbarians who sailed the world, invoking his God's blessing on his countless atrocities. Coupled with a weak domestic government and outsiders using opium to reap billions while enslaving a nation under the protection of the British military, we have the severe downward swing for 200 years.

The above summary doesn't even begin to adequately catalog of the extent of Chinese invention, of the sum of China's discoveries and contributions to the modern world. But unfortunately, much of China's total sum of knowledge and history of invention is lost to the world forever. A large part of the recorded knowledge of China's history was destroyed in one of the greatest acts of cultural genocide in the history of the world—the looting and burning of China's Summer Palace, the Yuanmingyuan, which contained more than ten-million of the finest and most valuable historical treasures and scholarly works from 5,000 years of Chinese history. What could not be looted was destroyed, and the entire massive palace burned to the ground. This wanton theft and utter destruction of one of the world's greatest collections of historical knowledge was engineered by the Rothschilds and Sassoons in retaliation for Chinese resistance to their opium.

This is an aside, but the destruction of the Yuanmingyuan was done for the same reason that the Allies bombed Dresden to rubble during the Second World War. Dresden had no military value but it was the spiritual and cultural heart of Germany, its destruction meant “to open a wound in the German soul that would never heal.” For precisely the same reason, the American deep state was savagely determined to drop the first atomic bomb on Kyoto, also the heart and soul of Japanese culture. Kyoto was protected by heavy overcasts of clouds that preventing the bombers from locating it with sufficient accuracy, forcing them to their alternates of Hiroshima and Nagasaki.

But in terms of the destruction of a literary recording of culture and invention, there was perhaps an even greater crime against the history of Chinese knowledge—the destruction of the library and the Yongle Dadian at the Hanlin Academy. That encyclopedia of 22,000 volumes written by more than 2,000 scholars over many years, contained much of the total of 5,000 years of Chinese knowledge, invention, and thought. The British carried all those books outdoors, poured fuel on them, and burnt the entire collection to ashes. Only God knows what was lost in this tragic destruction, ordered by the same drug dealers as punishment for refusing opium, meant to break China's will by striking at the very heart of the nation's culture in the wanton destruction of something of such inestimable value as to leave an

open wound that would never heal. Only about 150 volumes survived the incineration, 40 those residing today in the US Library of Congress, which has no intention of returning them to China. We, on the other hand, would be happy to—no payment required, but if you'd like to engage in a little helpful hacking and election meddling you might improve your odds.

Westerners today justify their unacknowledged appropriation of Chinese knowledge and subsequent claims to ownership on some variant of the proposition that the Chinese invented those things, but never developed or capitalized on them, but the claim is invalid self-serving nonsense since my invention is mine whether or not I choose to develop it. The claim is also untrue.

When the Chinese invented paper and printing, books became widespread throughout China, as with the weaving of cloth and development of textiles. China employed its inventions in unlimited ways for the benefit of Chinese society. What they did not do is file patents, convert everything to privately-owned IP, and transfer their ingenuity from social benefit to private profit. Criticisms of China's use of its inventions are not so much negating a lack of application but the absence of commercialization, these Western justifications implying that any nation not immediately striving for profit maximization of its discoveries is morally negligent, the theft of those discoveries then justified by those who would use them more properly. This is the bank robber taking the high moral ground by claiming he put the money to better use than the bank would have done.

To have foregone private commercialization was neither a character flaw nor a behavioral fault, but a reflection of the pluralistic and socialistic nature of the Chinese people, the same reason that even today China's patent and IP laws and regulations are so much less aggressive than those of the US. Put simply, China has never been as capitalistic or as individualistic as the West. It is part of the greatness of the Chinese nation that this immense population engaged in millennia of stunning research, discovery, and invention and freely distributed those fruits throughout the nation. This emphasis on the greater good and overall benefit to society rather than individual profit, is fundamental to the natural humanity of the Chinese people, and cannot be permitted to be destroyed by the sociopathic Western model so forcefully promoted today on the basis of a fictitious moral superiority.

The West chooses to ignore the fact that the 200-year hiatus in China's innovation was due almost entirely to their own military invasions, when the West was ravaging and destroying the nation. China's development, social progress, and invention, ceased only from the invasions by both the Americans and Europeans, and most especially with the vast program of trafficking in opium in China.

Perhaps of more direct interest is that China's lag in current technology is, more than anything else, an unfortunate accident of fate that occurred during a blip in time. After Mao evicted all the foreigners and China shook off the effects of 200 years of foreign interference and plundering to begin the transition to an industrialized economy, this was precisely when the world of electronics and communication exploded. It was during that brief period of a couple of decades that computers, the Internet, mobile phones and so much more, were conceived and patented by the West. Virtually the entire process passed China by, because during that brief period the nation was entirely enveloped in the fundamentals of its economic and social revolution, and in no position to participate. China's lack of patents and IP in the field of electronics today is due neither to Western superiority nor Chinese lack of innovation, but to Western aggression. The accumulation of American and European patents was in no way due to Western supremacy in innovation but to the absence of the Chinese.

China's inventiveness has not ended. With China recovering it is continuing where it left off 200 years ago. Ignoring the historical setback, Chinese companies are simply by-passing the earlier stages of innovation by foreign firms and proceeding to subsequent stages where the field is open and foreign patents have not precluded innovation and development.

If we examine the fields where China lags today in terms of patents and IP, it is primarily in those areas of science that progressed during that brief period where China was unable to participate. As soon as China found its footing, innovation continued unabated as it had for thousands of years. China missed the computer and smartphone patents, but was perfectly timed for the solar panel revolution and quickly emerged as the world leader—at which point the US imposed tariffs of 300% on Chinese solar panels in an attempt not so much to kill China's export sales but to prevent the accumulation of funds for further R&D. In any area not preempted by IP restriction, China's innovation has soared—usually to world leadership.

Despite US accusations of China copying foreign technology, China's high-technology achievements were entirely home-grown because the US has been so determined to hinder China's rise that by 1950 it engineered an international embargo on all scientific knowledge and on almost all useful products and processes to China, including legislation that Chinese scientists cannot be invited to, or participate in, American scientific forums, while bullying other Western nations into doing the same. In October of 2019, all Chinese scientists and space technology companies were denied visas to attend the week-long International Astronautical Congress in Washington, far from the first time such has occurred.

We hear much in the Western media about China demanding technology

transfers as a condition of corporate residence in China, but this is mostly propaganda. No doubt expectations for technology and know-how transfer do occur, since China doesn't want to spend the rest of its life making toasters and running shoes but, since entry to the Chinese market is a gift of billions in profits, it is perfectly sensible to attach a price to it. However, one must keep in mind that no foreign company is conducting cutting-edge commercial or sensitive military research, or manufacturing quantum computers and hypersonic missiles in China. Any technology actually available for transfer would be almost entirely in consumer goods, and hardly constitute great value or threats to US national security—unless that now means the security of corporations' profits. And, in virtually all of the cutting-edge fields and industries such as quantum computing, telecom, or solar energy, China has already surpassed the US.

In 2015, Chinese engineers announced the world's first quantum communications network, a 2,000 kilometer system linking Beijing and Shanghai with data transmission encoded by quantum key distribution. In August of 2016 China launched the world's first quantum communications satellite, and succeeded in test communication with the country's existing ground stations. In September of 2016, Chinese scientists achieved the world's first quantum teleportation between independent sources, delivering quantum information enciphered in photons between two locations.

In 2014, researchers at Nankai University in Tianjin developed a car with a working brain-control unit, with sensors that capture brain signals permitting humans to control the automobile with their minds. In 2016 China launched a fully-operational space lab to conduct the first ever brain-machine interaction experiments in space. Chinese scientists believe brain-computer interaction will eventually be the highest form of human-machine communication, having developed this process much farther than any Western nation and holding nearly 100 patents.

In 2015, high school students from Tianjin won an International gold medal for the creation of a microbe biological battery. Such attempts in the past have failed due to poor performance and limited usefulness, but these students conceived the idea of combining several types of bacteria into one biological power cell, with each bacterium having specialized responsibilities based on its own unique functions. Their tiny multi-bacteria cell reached over 520 mV, and lasted over 80 hours. Scaled up, their biological battery was able to generate as much power as a lithium battery, with a much longer life and producing no pollution. These are Chinese high school kids.

Chinese researchers are developing the technology and processes to make 3D-printed skin a reality, custom-made skin for burn patients, printed according to their wounds. The country leads the world in cat-scan technology,

in DNA mapping and synthesizing, and many medical fields such as laser eye surgery and cornea transplants.

In May of 2019, a Chinese start-up launched a revolutionary AI chip with the computing power of eight NVIDIA P4 servers but up to five times faster, with half the size and 20% of the energy consumption, and costing 50% less to manufacture. Shanghai's Fudan University developed a transistor based on two-dimensional molybdenic sulfide, meaning computing and data storage happen together in a single cell, perhaps eliminating silicon-based chips which are at their limit. DJI Technology, founded by a Chinese university student, has become in only a few years the global market leader in small consumer drones, and already attracting American sanctions for being too successful in an area the US wants to control. The country produces nearly 40% of the world's robots, with vastly improved core technologies, and is the world leader in 5G technology.

Chinese engineers created a supercomputer seven times faster than America's Oak Ridge installation, the first in the world to achieve speeds beyond 100 PetaFlops, powered by a Chinese-developed multi-core CPU and Chinese software, while displacing the US with the most supercomputers in the top 500. Upon the revelation of China's super-fast supercomputer, authorities reported the NSA had launched hundreds of thousands of hacking attacks, looking to steal the technology for China's new microprocessors.

China's megaproject engineering skills are already legendary, with the longest sea bridges, the longest tunnels, the largest deep-water ports. China has built the world's longest and highest glass bridge in Zhangjiajie, hanging between two steep cliffs 300 meters above the ground, and which set ten world records spanning its design and construction. The Three Gorges Dam is the world's largest, with 5-tier ship locks which can contain the world's largest ships, and also a shiplift for smaller vessels which is the largest and most sophisticated in the world. China has formulated plans to build an electron collider, four times as long (100km) and operating at more than seven times the energy capacity of the European CERN. In 2015, Chinese scientists completed the 500-meter radio telescope, by far the largest in the world with more than ten times the area of the American installation in Puerto Rico.

In 2014, architects in Amsterdam began work on what was to be the world's first completely 3D-printed house, a costly enterprise requiring three years. At exactly the same time in Shanghai, a Chinese company completed ten 3D-printed houses in less than a day, at a cost of less than \$5,000 each, using recycled construction and industrial scrap as the ink. I have seen these homes; large, elegant, multi-story European-styled structures, and so sturdy they can withstand earthquakes up to level 8 on the Richter scale.

We know about China's fabulous high-speed trains, but few outside China are aware of the intense high quality of the HSR network, built with the highest standards in the modern world, including stability. When traveling by train I sometimes place a coin on its edge on the windowsill, and I have video of the coin remaining stable for four or five minutes before it finally falls over—and this is at 300km per hour. Shanghai has a high-speed Maglev train (430km/hr), while many cities have low-speed Maglevs (200km/hr), and Chinese engineers are ready to produce commercially a 600 Km/hr Maglev. The same pace of development is true of the nation's urban subway systems. The city of London needed 147 years to build 408km. of subway lines, New York City 106 years for 370km., Paris 110 years for 215km, while Shanghai needed only 20 years to build 500km.

It has escaped attention that these achievements were not sudden, but developed from a deliberate plan in execution for 30 years, though it is only recently that many of these efforts are bearing fruit. More importantly, China accomplished this from a third-world industrial base while under a total Western embargo on technology transfer. Chinese scientists have developed nuclear energy plants, put men into space, photographed the entire surface of the moon, built a space station, designed and launched a private GPS system. We have Chinese-designed and -built deep-sea submersibles, and the country is rapidly developing its own aircraft industry. Today, with its science and technological base so much more advanced, and with education spending increasing at nearly 10% per year, and very high R&D expenditures, invention and innovation can only increase.

One of the most persistent myths propagated about China, a claim without a shred of supporting evidence, is that Chinese lack creativity and innovation due to flaws in their educational system. We have seen the accusations hundreds of times: China's educational system teaches only rote memory while stifling innovation, the Chinese unable to conceptualize or innovate, knowing only how to achieve high test scores but not how to think.

“I've been doing business in China for decades, and I will tell you that yeah, the Chinese can take a test, but what they can't do is innovate. They're not terribly imaginative. They're not entrepreneurial. They don't innovate. That's why they're stealing our intellectual property—innovation and entrepreneurship are not their strong suits. Their society, as well as their educational system, is too homogenized and controlled to encourage imagination.”

The arrangement sometimes referred to as Bretton Woods II was effectively an agreement since the 1990s to use various unofficial means to keep the dollar's value artificially high, and East Asian currencies—particularly the Chinese—artificially low, in order to expedite cheap Asian exports to the United States. Since real wages in the United States have either stagnated or retreated continually since the 1970s, this, and the accumulation of consumer debt, is the only reason living standards in the United States have not precipitously declined.

From a long-term perspective, China's behavior isn't puzzling at all. In fact it's quite true to form. The unique thing about the Chinese empire is that it has, since the Han dynasty at least, adopted a peculiar sort of tribute system whereby, in exchange for recognition of the Chinese emperor as world-sovereign, they have been willing to shower their client states with gifts far greater than they receive in return. The technique seems to have been developed almost as a kind of trick when dealing with the "northern barbarians" of the steppes, who always threatened Chinese frontiers: a way to overwhelm them with such luxuries that they would become complacent, effeminate, and unwarlike. It was systematized in the "tribute trade" practiced with client states like Japan, Taiwan, Korea, and various states of Southeast Asia, and for a brief period from 1405 to 1433, it even extended to a world scale, under the famous eunuch admiral Zheng He. He led a series of seven expeditions across the Indian Ocean, his great "treasure fleet"—in dramatic contrast to the Spanish treasure fleets of a century later—carrying not only thousands of armed marines, but endless quantities of silks, porcelain, and other Chinese luxuries to present to those local rulers willing to recognize the authority of the emperor. All this was ostensibly rooted in an ideology of extraordinary chauvinism—"What could these barbarians possibly have that we really need, anyway?"—but, applied to China's neighbors, it proved extremely wise policy for a wealthy empire surrounded by much smaller but potentially troublesome kingdoms. In fact, it was such wise policy that the US government, during the Cold War, more or less had to adopt it, creating remarkably favorable terms of trade for those very states—Korea, Japan, Taiwan, and certain favored allies in Southeast Asia—that had been the traditional Chinese tributaries; in this case, in order to contain China.

Bearing all this in mind, the current picture begins to fall easily back into place. When the United States was far and away the predominant world economic power, it could afford to maintain Chinese-style tributaries. Thus these very states, alone amongst US military protectorates, were allowed to catapult themselves out of poverty and into first-world status. After 1971, as US economic strength relative to the rest of the world began to decline, they were gradually transformed back into a more old-fashioned sort

of tributary. Yet China's getting in on the game introduced an entirely new element. There is every reason to believe that, from China's point of view, this is the first stage of a very long process of reducing the United States to something like a traditional Chinese client state. And of course, Chinese rulers are not, any more than the rulers of any other empire, motivated primarily by benevolence.

Mao—like Chiang—had a torture and detention center out of sight. After all, this was a Chinese civil war, and Mao was no saint. The difference was that Mao inspired the Four-Hundred-Million to reclaim their country.

The Jesus Christ of China:

“So long as the task of national salvation is not accomplished,
I shall be responsible for the distress and sufferings of the people.”

In the West, the divine right of kings granted legitimacy to royal families from generation to generation, guaranteeing that the lowborn would not revolt, for revolution was a sin. In contrast, the Mandate of Heaven gave the Chinese people the right of rebellion. A successful revolt against a sitting emperor was interpreted as evidence that Heaven wanted the Mandate to pass to the next ruler. One of the key indicators that Heaven was displeased was an emperor's inability to discipline barbarians.

“There was fundamentally something unhealthy and incongruous in the whole missionary idea. If the endeavor had been confined to primitive savages something could have been said for it. But to go out to a race of high culture and long tradition, with philosophical, ethical, and religious systems antedating Christianity, and to go avowedly to save its people from damnation as dwellers in heathen darkness—in that there was something not only spiritually limited but almost grotesque.”

Teddy Roosevelt disagreed, he was convinced it was the Japanese who were indeed different from other Asians. While he was president, Roosevelt wrote that, unlike the Chinese, the Japanese were “a wonderful and civilized people entitled to stand on an absolute equality with all the other peoples of the civilized world.” In particular, he believed that Japan's military success was a key indicator of the worth of their civilization:

“All the great masterful races have been fighting races; and the minute that a race loses the hard fighting virtues, then it has lost its proud right to stand as the equal of the best.”

Christopher Columbus—a Genoese mapmaker seeking a shorter route to China—touched land in the New World, and the Spanish and Portuguese empires stumbled into the greatest economic windfall in human history: entire continents full of unfathomable wealth, with inhabitants, armed only with Stone Age weapons, some of whom began conveniently dying almost as soon as they arrived. The conquest of Mexico and Peru led to the discovery of enormous new sources of precious metal, and these were exploited ruthlessly and systematically, even to the point of largely exterminating the surrounding populations to extract as much precious metal as quickly as possible. None of this would have been possible were it not for the practically unlimited Asian demand for precious metals.

No doubt scholars will never stop arguing about the reasons for the great “price revolution”—largely because it’s not clear what kind of tools can be applied. Can we really use the methods of modern economics, which were designed to understand how contemporary economic institutions operate, to describe the political battles that led to the creation of those very institutions? This is not just a conceptual problem. There are moral dangers here. To take what might seem an “objective,” macro-economic approach to the origins of the world economy would be to treat the behavior of early European explorers, merchants, and conquerors as if they were simply rational responses to opportunities—as if this were just what anyone would have done in the same situation. This is what the use of equations so often does: make it seem perfectly natural to assume that, if the price of silver in China is twice what it is in Seville, and inhabitants of Seville are capable of getting their hands on large quantities of silver and transporting it to China, then clearly they will, even if doing so requires the destruction of entire civilizations. Or if there is a demand for sugar in England, and enslaving millions is the easiest way to acquire labor to produce it, then it is inevitable that some will enslave them. In fact, history makes it quite clear that this is not the case. Any number of civilizations have probably been in a position to wreak havoc on the scale that the European powers did in the sixteenth and seventeenth centuries—Ming China was an obvious candidate—but almost none actually did so.

The Chinese and Persians did not lack technological inventions such as steam engines. They lacked the values, myths, judicial apparatus and sociopolitical structures that took centuries to form and mature in the West and which could not be copied and internalized rapidly. France and the United States quickly followed in Britain’s footsteps because the French and Americans already shared the most important British myths and social structures. The Chinese and Persians could not catch up as quickly because they thought and organized their societies differently.

In the Confucian value system, merchants—consumed by thoughts of profit—were near the bottom of the social scale. Those concerned with the people’s welfare—the mandarins who studied the classics and served the emperor—were at the top of the heap.

“No doubt your anticipations of future evil have a certain foundation. But it is my business to make a fortune with the least possible loss of time. In two or three years at farthest, I hope to realize a fortune and get away and what can it matter to me, if all Shanghai disappear afterwards, in fire or flood? You must not expect men in my situation to condemn themselves to years of prolonged exile in an unhealthy climate for the benefit of posterity. We are moneymaking, practical men. Our business is to make money, as much and as fast as we can.”

In *The Conquest of America*, Tzvetan Todorov offers a compendium of some of the most chilling reports, mostly from Spanish priests and friars who, even when committed in principle to the belief that the extermination of the Indians was the judgment of God, could not disguise their horror at scenes of Spanish soldiers testing the blades of their weapons by eviscerating random passers-by, and tearing babies off their mother’s backs to be eaten by dogs. Such acts might perhaps be written off as what one would expect when a collection of heavily armed men—many of violent criminal background—are given absolute impunity; but the reports from the mines imply something far more systematic.

When Fray Toribio de Motolinia wrote of the ten plagues that he believed God had visited on the inhabitants of Mexico, he listed smallpox, war, famine, labor exactions, taxes—which caused many to sell their children to moneylenders, others to be tortured to death in cruel prisons—and the thousands who died in the building of the capital city. Above all, he insisted, were the uncountable numbers who died in the mines:

“The eighth plague was the slaves whom the Spaniards made in order to put them to work in the mines. At first those who were already slaves of the Aztecs were taken; then those who had given evidence of insubordination; finally all those who could be caught. During the first years after the conquest, the slave traffic flourished, and slaves often changed master. They produced so many marks on their faces, in addition to the royal brand, that they had their faces covered with letters, for they bore the marks of all who had bought and sold them.

The ninth plague was the service in the mines, to which the heavily laden Indians traveled sixty leagues or more to carry provisions. When their food gave out they died, either at the mines or on the road, for they had no money to buy food and there was no one to give it to them. Some reached home in such a state that they died soon after. The bodies of those Indians and of the slaves who died in the mines produced such a stench that it caused a pestilence, especially at the mines of Oaxaca. For half a league around these mines and along a great part of the road one could scarcely avoid walking over dead bodies or bones, and the flocks of birds and crows that came to fatten themselves upon the corpses were so numerous that they darkened the sun.”

According to the centuries-old Doctrine of Discovery, European nations acquired title to the lands they “discovered,” and Indigenous inhabitants lost their natural right to that land after Europeans had arrived and claimed it. Under this legal cover for theft, Euro-American wars of conquest and settler colonialism devastated Indigenous nations and communities, ripping their territories away from them and transforming the land into private property, real estate. Most of that land ended up in the hands of land speculators and agribusiness operators, many of which, up to the mid-nineteenth century, were plantations worked by another form of private property, enslaved Africans. Arcane as it may seem, the doctrine remains the basis for federal laws still in effect that control Indigenous peoples’ lives and destinies, even their histories by distorting them.

From the mid-fifteenth century to the mid-twentieth century, most of the non-European world was colonized under the Doctrine of Discovery, one of the first principles of international law Christian European monarchies promulgated to legitimize investigating, mapping, and claiming lands belonging to peoples outside Europe. It originated in a papal bull issued in 1455 that permitted the Portuguese monarchy to seize West Africa. Following Columbus’s infamous exploratory voyage in 1492, sponsored by the king and queen of the infant Spanish state, another papal bull extended similar permission to Spain.

Disputes between the Portuguese and Spanish monarchies led to the papal-initiated Treaty of Tordesillas (1494), which, besides dividing the globe equally between the two Iberian empires, clarified that only non-Christian lands fell under the discovery doctrine. This doctrine on which all European states relied thus originated with the arbitrary and unilateral establishment of the Iberian monarchies’ exclusive rights under Christian canon law to colonize foreign peoples, and this right was later seized by

other European monarchical colonizing projects. The French Republic used this legalistic instrument for its nineteenth- and twentieth-century settler colonialist projects, as did the newly independent United States when it continued the colonization of North America begun by the British.

In 1823 the US Supreme Court issued its decision in *Johnson v. McIntosh*. Writing for the majority, Chief Justice John Marshall held that the Doctrine of Discovery had been an established principle of European law and of English law in effect in Britain's North American colonies and was also the law of the United States. The Court defined the exclusive property rights that a European country acquired by dint of discovery:

“Discovery gave title to the government, by whose subjects, or by whose authority, it was made, against all other European governments, which title might be consummated by possession.”

Therefore, European and Euro-American “discoverers” had gained real-property rights in the lands of Indigenous peoples by merely planting a flag. Indigenous rights were, in the Court's words, “in no instance, entirely disregarded; but were necessarily, to a considerable extent, impaired.” The Court further held that Indigenous “rights to complete sovereignty, as independent nations, were necessarily diminished.” Indigenous people could continue to live on the land, but title resided with the discovering power, the United States. The decision concluded that Native nations were “domestic, dependent nations.”

The Doctrine of Discovery is so taken for granted that it is rarely mentioned in historical or legal texts published in the Americas.

In 1982, the government of Spain and the Holy See—the Vatican, which is a nonvoting state member of the United Nations—proposed to the UN General Assembly that the year 1992 be celebrated in the United Nations as an “encounter” between Europe and the peoples of the Americas, with Europeans bearing the gifts of civilization and Christianity to the Indigenous peoples. To the shock of the North Atlantic states that supported Spain's resolution—including the United States and Canada—the entire African delegation walked out of the meeting and returned with an impassioned statement condemning a proposal to celebrate colonialism in the United Nations, which was established for the purpose of ending colonialism. The Doctrine of Discovery had reared its head in the wrong place. The resolution was dead, but it was not the end of efforts by Spain, the Vatican, and others in the West to make the Quincentennial a cause for celebration.

Only five years before the debacle in the UN General Assembly, the Indigenous Peoples of the Americas conference at the UN's Geneva headquarters had proposed that 1992 be made the UN “year of mourning” for the

onset of colonialism, African slavery, and genocide against the Indigenous peoples of the Americas, and that October 12 be designated as the UN International Day of the World's Indigenous Peoples. As the time drew near to the Quincentennial, Spain took the lead in fighting the Indigenous proposals. Spain and the Vatican also spent years and huge sums of money preparing for their own celebration of Columbus, enlisting the help of all of the countries of Latin America except Cuba, which refused (and paid for this in withdrawn Spanish financial investments). In the United States, the George H. W. Bush administration cooperated with the project and produced its own series of events. In the end, compromise won at the United Nations: Indigenous peoples garnered a Decade for the World's Indigenous Peoples, which officially began in 1994 but was inaugurated at UN headquarters in New York in December 1992. August 9, not October 12, was designated as the annual UN International Day for the World's Indigenous Peoples, and the Nobel Peace Prize went to Guatemalan Mayan leader Rigoberta Menchú, announced in Oslo on October 12, 1992, a decision that infuriated the Spanish government and the Vatican. The organized celebrations of Columbus flopped, thanks to multiple, highly visible protests by Indigenous peoples and their allies. Particularly, support grew for the work of Indigenous peoples at the United Nations to develop new international law standards.

On 20 July 1969, Neil Armstrong and Buzz Aldrin landed on the surface of the moon. In the months leading up to their expedition, the Apollo 11 astronauts trained in a remote moon-like desert in the western United States. The area is home to several Native American communities, and there is a story—or legend—describing an encounter between the astronauts and one of the locals.

One day as they were training, the astronauts came across an old Native American. The man asked them what they were doing there. They replied that they were part of a research expedition that would shortly travel to explore the moon. When the old man heard that, he fell silent for a few moments, and then asked the astronauts if they could do him a favour. "What do you want?" they asked. "Well," said the old man, "the people of my tribe believe that holy spirits live on the moon. I was wondering if you could pass an important message to them from my people." "What's the message?" asked the astronauts. The man uttered something in his tribal language, and then asked the astronauts to repeat it again and again until they had memorized it correctly. "What does it mean?" asked the astronauts. "Oh, I cannot tell you. It's a secret that only our tribe and the moon spirits are allowed to know." When they returned to their base, the astronauts searched and searched until they found someone who could

speak the tribal language, and asked him to translate the secret message. When they repeated what they had memorized, the translator started to laugh uproariously. When he calmed down, the astronauts asked him what it meant. The man explained that the sentence they had memorized so carefully said:

“Don’t believe a single word these people are telling you.
They have come to steal your lands.”

In the 1870s, impossibly, the bison herds collapsed to the verge of extinction across the entire prairie. One of the earth’s most abundant food supplies all but vanished in a generation, exterminated in a senseless slaughter by European settlers, with catastrophic ripple effects for the health and peace of Indigenous populations across the Northwest. The ensuing famine would be used by Canada’s newborn Dominion government in distant Ottawa to persuade the First Nations of the west to cede their land rights in a series of numbered treaties and relocate to reserves. There were eleven of these treaties in all.

In 1899 the Dene and Cree of the Athabasca region signed Treaty 8, the largest land transfer by treaty to that point by a wide margin, covering an area bigger than France. The Dene still lived in small, hereditary groups and had no formal political hierarchy, so the “chiefs” who signed the treaty on their behalf were simply respected elders; they trusted the French priests who served as translators for the negotiations and outlined the terms. The First Nations understood the treaty as an agreement between peoples to share the land, with their own rights of livelihood and use of the land extending, as their oral history of the treaty would put it, “as long as the sun shines, the grass grows and the waters flow.” That language did not appear in the final version, and the Canadian government considered the document a direct and unambiguous legal transfer of land ownership. The history of Canada’s Indigenous people ever since is in significant measure a history of the tragic consequences of this discrepancy in the meaning of such treaties.

The chief of a northwestern American tribe, said, approximately—referring to us, of course:

“It didn’t occur to us that you meant to stay.”

Their top-level cultural conditioning told them that people don’t just move into someone else’s territory and settle down as if it were their own, and this overruled what their eyes were telling them.

Throughout the 1870s, American whaling vessels took as many as 125,000 walrus from the Bering Strait region. The slaughter had proved to be a lucrative sideline to the whaling business. The whalers cooked the animal's blubber into oil and hacked off the tusks to sell in ivory markets as far away as England and China. In a single season in 1876, more than 35,000 walrus were killed. Compared to the risky rigors of Arctic whaling, "walrusing" could be ridiculously easy. Rather than wielding lances and harpoons from tippy open boats, the whalers had discovered that they could simply clomp onto the ice with rifles and shoot large numbers of walrus point-blank in the head. Then the butchering, flensing, and boiling could begin. Firing up their try-pots aboard ship, the whalers could render more than twenty gallons of oil from the blubber of a single mature bull. In less than a decade, this industrially efficient slaughter had largely destroyed the Yupiks' primary source of food and the seasonal hunting life upon which it was based. By the 1880s, the walrus was nearly extinct in large swaths of the Bering Sea. It was the Arctic version of a story already well known to Americans, the story of the buffalo and the Indians of the Great Plains. Here, as there, the wholesale slaughter of a people's staple prey had led, in a few short years, to ruinous dislocations, terrible dependencies—and a cultural apocalypse.

The systematic introduction of just a few things—repeating rifles, booze, money, industrial methods of dismantling animal flesh—had caused the native cultures of Alaska to collapse at record speed.

The introduction of the repeating rifle, in particular, had altered the rhythms of native hunting. A few years earlier, the hills around St. Michael had been home to thousands of wild reindeer. Now, armed with buffalo rifles, the Eskimos and other natives would slaughter caribou by the hundreds and leave them "lying where they fell, not even the hides being taken." The hunters would "simply cut out their tongues and leave the rest to be eaten by wolves."

Abuse of alcohol and other drugs is epidemic, like diseases in communities subjected to colonization or other forms of domination, particularly in crowded and miserable refugee situations. This is the case in all parts of the world, not only among Native peoples of North America. Alcohol was an item in the tool kit of colonialists who made it readily and cheaply available. Christian missionaries often took advantage of these dysfunctional conditions to convert, offering not only food and housing but also discipline to avoid alcohol. But this was itself a form of colonial submission.

"The settler's work is to make even dreams of liberty impossible for the native. The native's work is to imagine all possible methods for destroying the settler."

“Armed occupation was the true way of settling a conquered country. The children of Israel entered the promised land, with implements of husbandry in one hand, and the weapons of war in the other.”

The question of self-determination of peoples is a recent historical phenomenon integral both to the formation of modern European nation-states and to the gradual formation of an imperialist world system eventually led by the United States. National integration and state formation occurred first in western Europe as its states established colonies and colonial regimes in Africa, Asia, the Pacific, the Americas, and the Caribbean, and as the United States established itself as an independent state. These conquests afforded European states and the United States access to vast resources and labor that in turn allowed them to industrialize and to create efficient bureaucratic structures and political republicanism.

At the end of this process, with decolonization of European holdings in the twentieth century, self-determination became a major global issue eventually incorporating all human beings as citizens of nation-states. The creation of nation-states and the redrawing of national boundaries that this often entailed inevitably raised the questions of which national, ethnic, religious, and linguistic communities were included and whether their consent or participation would be required.

There are peoples and nations without their own states, locked under a state authority that may or may not be willing to respond to their demands for autonomy within the existing state. If the state is not willing, the peoples or nations may choose to insist on independence. That is the work of self-determination.

Nationalism is a very late development indeed in terms of human history. For many centuries, most Europeans thought of themselves not as British (or English or Scottish or Welsh), French, or German but as members of a particular family, clan, region, religion, or guild. Sometimes they defined themselves in terms of their overlords, whether local barons or emperors. When they did define themselves as German or French, it was as much a cultural category as a political one, and they certainly did not assume, as modern national movements almost always do, that nations had a right to rule themselves on a specific piece of territory.

Those older ways of defining oneself persisted well into the modern age. When commissions from the League of Nations tried to determine borders after World War I in the center of Europe, they repeatedly came upon locals who had no idea whether they were Czechs or Slovaks, Lithuanians or Poles. We are Catholic or Orthodox, came the answers, merchants or farmers, or

simply people of this village or that. An Italian sociologist and activist was astonished to find in the 1950s that there were people living in the interior of Sicily who had never heard of Italy, even though, in theory, they had been Italians for several generations. They were the anomalies, though, left behind as nationalism increasingly became the way in which Europeans defined themselves. Rapid communications, growing literacy, urbanization, and above all the idea that it was right and proper to see oneself as part of a nation, and a nation, moreover, which ought to have its own state on its own territory, all fed into the great wave of nationalism which shook Europe in the nineteenth century and the wider world in the twentieth.

The cumulative result was to create an unreal yet influential version of how nations formed. While it could not be denied that different peoples, from Goths to Slavs, had moved into and across Europe, mingling as they did so with peoples already there, such a view assumed that at some point, generally in the Middle Ages, the music had stopped. The dancing pieces had fallen into their chairs, one for the French, another for the Germans, and yet another for the Poles. And there history had fixed them as “nations.” German historians, for example, could depict an ancient German nation whose ancestors had lived happily in their forests from before the time of the Roman Empire and which at some time, probably in the first century, had become recognizably “German.”

So—and this was the dangerous question—what was properly the German nation’s land? Or the land of any other nation? Was it where the people now lived, where they had lived at the time of their emergence in history, or both? Would the scholars have gone on with their speculations if they could have seen what they were preparing the way for? The bloody wars that created Italy and Germany? The passions and hatred that tore apart the old multinational Austria-Hungary? The claims, on historical grounds, by new and old nations after World War I for the same pieces of territory? The hideous regimes of Hitler and Mussolini with their elevation of the nation and the race to the supreme good and their breathtaking demands for the lands of others?

A paradox is that nationalism is modern but it invents for itself history and traditions. The histories that fed and still feed into nationalism draw on what already exists rather than inventing new facts. They often contain much that is true, but they are slanted to confirm the existence of the nation through time, and to encourage the hope that it will continue.

Nation: a group of people united by a mistaken view about the past and a hatred of their neighbours

The discovery of gold and silver in America, the extirpation, enslavement, and entombment in mines of the aboriginal population, the beginning of the conquest and looting of the East Indies, the turning of Africa into a warren for the commercial hunting of black-skins, signaled the rosy dawn of the era of capitalist production. These idyllic proceedings are the chief moments of prior accumulation.

Once in the hands of settlers, the land itself was no longer sacred, as it had been for the Indigenous. Rather, it was private property, a commodity to be acquired and sold—every man a possible king, or at least wealthy. Later, when Anglo-Americans had occupied the continent and urbanized much of it, this quest for land and the sanctity of private property were reduced to a lot with a house on it, and “the land” came to mean the country, the flag, the military, as in “the land of the free” of the national anthem, or Woody Guthrie’s “This Land Is Your Land.” Those who died fighting in foreign wars were said to have sacrificed their lives to protect “this land” that the old settlers had spilled blood to acquire. The blood spilled was largely Indigenous.

The first population forcibly organized under the profit motive—whose labor was exploited well before overseas exploitation was possible—was the European peasantry. Once forced off their land, they had nothing to eat and nothing to sell but their labor. In addition, entire nations, such as Scotland, Wales, Ireland, Bohemia, the Basque Country, and Catalonia, were colonized and forced under the rule of various monarchies.

The consequences of this amassing of fortunes were first felt in the catastrophe experienced by small farmers in Europe and England. The peasants became impoverished, dependent workers crowded into city slums. For the first time in human history, the majority of Europeans depended for their livelihood on a small wealthy minority, a phenomenon that capitalist-based colonialism would spread worldwide. The symbol of this new development, indeed its currency, was gold.

Gold fever drove colonizing ventures, organized at first in pursuit of the metal in its raw form. Later the pursuit of gold became more sophisticated, with planters and merchants establishing whatever conditions were necessary to hoard as much gold as possible. Thus was born an ideology: the belief in the inherent value of gold despite its relative uselessness in reality. Investors, monarchies, and parliamentarians devised methods to control the processes of wealth accumulation and the power that came with it, but the ideology behind gold fever mobilized settlers to cross the Atlantic to an unknown fate. Subjugating entire societies and civilizations, enslaving whole countries, and slaughtering people village by village did not seem too high a price to pay, nor did it appear inhumane. The systems of colonization were modern and

rational, but its ideological basis was madness.

The English used the term ‘enclosure’ to denote the privatization of the commons in the sixteenth century. During this time, peasants, who constituted a large majority of the population, were evicted from their ancient common lands. For centuries the commons had been their pasture for milk cows and for running sheep and their source for water, wood for fuel and construction, and edible and medicinal wild plants. Without these resources they could not have survived as farmers, and they did not survive as farmers after they lost access to the commons. Not only were the commons privatized during the sixteenth and seventeenth centuries, they were also transformed into grazing lands for commercial sheep production, wool being the main domestic and export commodity, creating wealth for a few and impoverishment for the many.

Denied access to the former commons, rural subsistence farmers and even their children had no choice but to work in the new woolen textile factories under miserable conditions—that is, when they could find such work for unemployment was high. Employed or not, this displaced population was available to serve as settlers in the North American British colonies, many of them as indentured servants, with the promise of land. After serving their terms of indenture, they were free to squat on Indigenous land and become farmers again.

In this way, surplus labor created not only low labor costs and great profits for the woolens manufacturers but also a supply of settlers for the colonies, which was an “escape valve” in the home country, where impoverishment could lead to uprisings of the exploited. The sacred status of property in the forms of land taken from Indigenous farmers and of Africans as chattel was seeded into the drive for Anglo-American independence from Britain and the founding of the United States.

Privatization of land was accompanied by an ideological drive to paint the commoners who resisted as violent, stupid, and lazy. The English Parliament, under the guise of fighting backwardness, criminalized former rights to the commons. Accompanying and facilitating the privatization of the commons was the suppression of women by conjuring witchcraft. Those accused of witchcraft were poor peasant women, often widows, while the accusers tended to be wealthier, either their landlords or employers, individuals who controlled local institutions or had ties to the national government.

Actions and local occurrences said to indicate witchcraft included non-payment of rent, demand for public assistance, giving the “evil-eye,” local die-offs of horses or other stock, and mysterious deaths of children. Also among the telltale actions were practices related to midwifery and any kind

of contraception. The service that women provided among the poor as healers was one of a number of vestiges from pre-Christian, matrilineal institutions that once predominated in Europe. It is no surprise that those who had held on to and perpetuated these communal practices were those most resistant to the enclosure of the commons, the economic base of the peasantry, as well as women's autonomy.

The Crusades in the Iberian Peninsula (Spain and Portugal today) and expulsion of Jews and Muslims were part of a process that created the core ideology for modern colonialism—white supremacy—and its justification for genocide. The Crusades gave birth to the papal law of *limpieza de sangre*—cleanliness of blood—for which the Inquisition was established by the Church to investigate and determine.

Before this time the concept of biological race based on “blood” is not known to have existed as law or taboo in Christian Europe or anywhere else in the world. As scapegoating and suspicion of Conversos—Jews who had converted to Christianity—and Moriscos—Muslims who had converted to Christianity—intensified over several centuries in Christian-controlled Spain, the doctrine of *limpieza de sangre* was popularized. It had the effect of granting psychological and increasingly legal privileges to “Old Christians,” both rich and poor, thus obscuring the class differences between the landed aristocracy and land-poor peasants and shepherds. Whatever their economic station, the “Old Christian” Spanish were enabled to identify with the nobility. The common people looked upwards, wishing and hoping to climb, and let themselves be seduced by chivalric ideals: honour, dignity, glory, and the noble life.

The ideology of white supremacy was paramount in neutralizing the class antagonisms of the landless against the landed and distributing confiscated lands and properties of Moors and Jews in Iberia, of the Irish in Ulster, and of Native American and African peoples.

The Mexican state was crushed and its cities leveled in Cortés's three-year genocidal war. Cortés's recruitment of resistant communities all over Mexico as allies aided in toppling the central regime. Cortés and his two-hundred European mercenaries could never have overthrown the Mexican state without the Indigenous insurgency he co-opted. The resistant peoples who allied with Cortés to overthrow the oppressive Aztec regime could not yet have known the goals of the gold-obsessed Spanish colonizers or the European institutions that backed them.

The logical progression of modern colonialism begins with economic penetration and graduates to a sphere of influence, then to protectorate status or indirect control, military occupation, and finally annexation.

The once proud Communist Eastern Bloc, after liberating dozens of

countries from colonialism, after fighting for an egalitarian world, showing solidarity with all oppressed nations, was then gradually defeated by such shallow bullshit as blue jeans labels, rock and pop songs (a favorite weapon of the West), greed, religions (another Western weapon), and slogans like ‘freedom’ and ‘democracy.’ The Western world which has been denying freedom and democracy to almost all countries on our planet, cynically turned the truth upside down, and fooled East Europeans, by skillfully applying centuries old propaganda methods. In the end, confused and increasingly cynical, what many East Europeans demanded was not freedom, but more money, more labels, and the ability to join the bloc of the countries that have been plundering the world.

Bhutan wasn’t perfect, any more than any human was perfect. It was greatly imperfect. And it had produced legions of young people like Ngawang: modern Bhutanese who loved their country but, unlike their parents before them, yearned for more. Bhutan’s pride and joy, its unadulterated culture, was in danger. The connection to the world beyond was to blame. The minute tourists came in and students went out and television took hold of the people’s brains, there went the Buddhist precepts and the cultural tradition and the status quo.

“Our challenge is that schools [should] not produce selfish economic animals who are only motivated to succeed at the cost of relationships, environment, and family. We have to convince the children that what parents have has nothing to do with who they are. Our little country, once so blissfully isolated in a remote corner of the Himalayas, seemingly protected by high mountain peaks, wisely and peacefully governed by a lineage of great enlightened monarchs, is now buffeted by powerful forces we could not have imagined or conceived just a generation ago. Though some have brought benefit, those powerful forces are not always benign, and some of them threaten not only our profound heritage but even our lives and land.”

Everything in Ngawang’s line of sight conspired to make her feel that if you could only get your feet onto American soil, piles and piles of money could be excavated from the streets or would fall from the heavens. And that money would buy things, items that were the keys to happiness. That message was conveyed in television shows and movies, which Ngawang watched in a near-continual feed at home. And it was enhanced by the tales of the few Bhutanese who made their way to the United States and sent back stacks of cash. Somehow, they managed not to explain how hard they

had to work to earn that money, what kinds of jobs they had to do, the cramped dorm-room-style living conditions they had to endure to be able to save even the few dollars a month they wired back home. How they lived with the constant fear of being found out and deported.

Then there were those lucky, super-smart people who won scholarships. They lived under the nurturing gaze of an academic institution, and while life might not have been cushy, it was rarely the grind of an illegal immigrant. Economics were not the only category warped by the media:

“Are the women in your country really as, umm, sexy as they are in the movies?”

Sorry kid, they are not.

If you ask a modern American for the most basic explanation of how trade works, they might tell you something like this: Henry plants an apple orchard and grows as many apples as he can. Then, he trades them with anyone who wants apples, getting something equally valuable in return and making both parties richer in the end. But the truth is, that’s just one model. In nineteenth century America, this way of looking at trade clashed with a very different one.

Consider relations in nineteenth-century Minnesota between white fur traders working for the American Fur Company and Oceti Sakowin, or seven fireplaces, people. Unlike in the Euro-American economic model the Oceti Sakowin only traded among people with kinship bonds, thereby incurring various mutual obligations. To enter into trading relationships, white fur traders became part of the family, often through marriage to Oceti Sakowin women. Marrying into a family meant that a trader’s relatives were obligated to trade with him, while he was obligated to provide gifts and support as needed.

This sometimes led to clashes. Among the Dakota, for example, individual accumulation was a serious offense. However, fur traders controlled warehouses full of merchandise that they didn’t distribute among their kin. When Oceti Sakowin called for equitable sharing, white American traders labeled this an irrational demand. As one white missionary rather bluntly put it:

“They thought the resources of a white man inexhaustible.”

Different conceptions of reciprocity and debt also confused trade relations. While the American Fur Company expected accounts to be balanced at the end of each year, ongoing debt was a good thing in the Oceti Sakowin system, since it maintained social ties and a sense of mutual obligation. Fur

traders were frequently frustrated at their inability to get Dakota to pay their debts on time each year. Eventually, that resulted in congressional legislation that let trading companies collect unpaid debts from government annuity payments to Native nations—essentially forcing them into the Euro-American concept of debt.

Another area where the two economic models clashed was in production levels. Euro-American economics is all about the allocation of limited resources in the face of unlimited wants. But to the Dakota, wants were limited while resources were bountiful. The task was not to efficiently harness resources but to establish and maintain proper kinship relationships with plants, animals, and deities. That meant that, even if there was a large European demand for furs, other social, political, and religious activities often took precedence over maintaining relationships with fur traders through trapping. Trapping was not a business for profit among the Dakota but primarily a social exchange.

Ultimately, the Euro-American system won out through simple violence, with the military forcing the Oceti Sakowin from much of their land. But, as the continuing fight over the Dakota Access Pipeline's path through Dakota and Lakota land suggests, the clash between profit-oriented Euro-American economics and other ways of thinking about the material world continues today.

American Myths

Navigating Through Time

The Act of Union between England and Scotland requires all succeeding sovereigns of the United Kingdom to take an oath to maintain the Church of Scotland and the Church of England. If future generations feel themselves bound by such provisions, they are enslaved by long-dead tyrants. Objection to such attempts to bind posterity applies not only to the union that created the United Kingdom, but also to the one that formed the United States: Why should the current generation consider itself bound by what was decided hundreds of years earlier? Unlike the framers of the US Constitution, we have had centuries of experience to judge whether it does or does not “promote the general welfare.” If it does, we have all the reason we need to retain it; but if it does not, don’t we have as much power and as much right to change the arrangements under which we are governed as the framers had to prescribe them in the first place? If we do, why should provisions that make the constitution so difficult to amend bind a majority of the electorate?

Sometimes I imagine America as a chapter in a book, centuries after the country has collapsed, encapsulated by the casual language we use when describing the foreboding failure of the Spanish Armada in 1588. And what I imagine is a description like this: The invention of a country is described. This country was based on a document, and the document was unassailable. The document could be altered, but alterations were so difficult that it happened only seventeen times in two-hundred years, and one of those changes merely retracted a previous alteration. The document was less than five-thousand words but applied unilaterally, even as the country dramatically increased its size and population. The document’s prime directives were liberty and representation, even when 5% of the country’s population legally controlled 65% of the wealth. But everyone loved this document, because it was concise and well composed and presented a possible utopia where everyone was the same. It was so beloved that the citizens of this country decided they would stick with it no matter what happened

or what changed, and the premise of discounting (or even questioning) its greatness became so verboten that any political candidate who did so would have no chance to be elected to any office above city alderman. The populace decided to use this same document forever, inflexibly and without apprehension, even if the country lasted for two-thousand years.

Viewed retrospectively, it would not seem stunning that this did not work out.

The ultimate failure of the United States will probably not derive from the problems we see or the conflicts we wage. It will more likely derive from our uncompromising belief in the things we consider unimpeachable and idealized and beautiful. Because every strength is a weakness, if given enough time.

Because he had lived through a true revolution here, and had watched another one sputter and fail in France, Thomas Jefferson knew that periodic revolutions were necessary for America—or any democratic society—to flourish and grow. Jefferson even suggested that “every generation” should have its own smaller form of revolution, reconfiguring the nation and its government to adapt to changing needs and changing times.

The concept of generations has played a role in many governing documents. The Iroquois Confederation’s “Great Law,” which was a major inspiration for the American Constitution, famously called for all governmental decisions to be made in the context of their impact on “the Seventh Generation” down the line into the future. While the definition of the time period represented by a “generation” has been the subject of much speculation over the years, Thomas Jefferson recognized two clear definitions, and repeatedly said that both the Constitution and future legislators should respect each of them. The first was the personal, familial definition of “generation”—which Jefferson put at nineteen years and today is generally considered to be around twenty years. In that context, with the first American Revolution officially beginning in 1776, today’s young people are about the twelfth generation since our nation’s birth. The second was the generational epochs—blocks of time during which generations overlap and a major transfer of power is made from one to another, along with a period of time long enough for a major change in our understanding of government and a recalibration of our worldview. Jefferson and his contemporaries spoke and wrote often about the obligations of each generation to its heirs, and about the political crime of any generation placing shackles—financial or legal—on future generations.

“The question, whether one generation of men has a right to bind another is a question of such consequences as not only to

merit decision, but place also among the fundamental principles of every government.”

No single generation, he wrote, has the right to saddle the next with problems or debts, and it should be obvious “that no such obligation can be transmitted” from generation to generation.

“I set out on this ground, which I suppose to be self evident, that the earth belongs in usufruct [common ownership] to the living; that the dead have neither powers nor rights over it. The portion occupied by any individual ceases to be his when himself ceases to be, and reverts to the society.”

Jefferson’s logic that no person or generation should be able to bind the next one was one of his core beliefs throughout his life, and shared by most of his contemporaries.

“For if he could, he might during his own life, eat up the usufruct [commons] of the lands for several generations to come; then the lands would belong to the dead, and not to the living, which is the reverse of our principle.”

But what was most revolutionary about Jefferson’s thinking on this was the idea of generational revolutions—that the nation itself must fundamentally change roughly once every biological or epochal generation, and that even that wouldn’t prevent larger periodic political transformations of the nation. These were, he believed, not just ideals but a basic force of nature.

“On similar ground it may be proved, that no society can make a perpetual constitution, or even a perpetual law. The earth belongs always to the living generation: they may manage it, then, and what proceeds from it, as they please, during their usufruct [shared ownership]. They are masters, too, of their own persons, and consequently may govern them as they please. But persons and property make the sum of the objects of government. The constitution and the laws of their predecessors are extinguished then, in their natural course, with those whose will gave them being.”

Jefferson believed that even the laws enshrined in our Constitution came with a time limit, and that once the generation that wrote those laws passed on out of power, those laws must be rewritten by the new generation, or at least every second generation.

“Every constitution, then, and every law, naturally expires at the end of thirty-four years. If it be enforced longer, it is an act of force, and not of right. It may be said, that the succeeding generation exercising, in fact, the power of repeal, this leaves them as free as if the constitution or law had been expressly limited to thirty-four years only.”

Jefferson stressed the need for every generation to essentially produce a revolution that would turn the wheel of America forward into the new epoch. He arrived at this conclusion by understanding the weaknesses inherent in the Constitution when it was first drafted, and the need that each new generation must continue to perfect it, or at least adapt it to respond to changing times. Jefferson noted the absurdity of a rigid Constitution—or at least an interpretation of that Constitution—that does not change as the nation grows and times change:

“We might as well require a man to wear still the coat which fitted him when a boy, as civilized society to remain ever under the regimen of their barbarous ancestors. Let us follow no such examples, nor weakly believe that one generation is not as capable as another of taking care of itself.”

We must assume and accept human ignorance, something our mainstream ideologies refuse to do. We will most certainly make mistakes when revising the constitution but as long as the idea that it should be adapted quite often remains, then it is hard for this inevitable ignorance to cause such dramatic harms. And we should also not act like the current interpretation of things has not and is not continuing to cause dramatic harms.

There is simply no way a person from that era could reasonably anticipate how the world would change in the coming two-hundred years (and certainly not how it would continue to change over the next two-hundred following those, since we can't even do that now, from our position in the middle). This logic leads to a strange question: If and when the United States does ultimately collapse, will that breakdown be a consequence of the Constitution itself? If it can be reasonably argued that it's impossible to create a document that can withstand the evolution of any society for five-hundred or a thousand or five-thousand years, doesn't that mean present-day America's pathological adherence to the document we happened to inherit will eventually wreck everything? But attacking the Constitution is attacking America, which means the only people who will do it openly are so radicalized that every subsequent opinion they offer is classified as extremist.

The Constitution worshiper is fascinated by ideas like the separation of powers, inserted by the founders as a barrier against their ultimate fear: tyranny. He will directly exclaim, “I love the separation of powers!” which is a weird thing to exclaim. But he also realizes this trifurcation comes with a cost. One can imagine how the sluggishness and potential for gridlock that such a system creates might actually be our undoing—perhaps because of some single major incident that the government cannot respond to adequately. But more likely because it slowly, quietly, in ways that may be hard to identify, weakens our society and culture and economy, rendering the nation unable to sustain itself and rise to the challenges of the future. States and localities play the most significant role in shaping the education of children, which is great—except in those states that water down science education to placate creationists and siphon money off to unaccountable charter schools. The Supreme Court can strike down laws that it thinks violate the Constitution, which is great—except when it invalidates campaign finance laws that are designed to make our political system fair or they prolong and legitimate inequality and slavery by another name. Both houses of Congress have to agree to pass legislation, which is great—except when one house holds the entire country hostage by refusing to pass a budget or when all the politicians in both are whores to corporations. And if in some future, far-off day we find ourselves no longer a superpower, we may look back and say that this was the result of a constitutional structure that made it overly difficult to implement wise social and economic policy.

“I’d distinguish the parts of the Constitution that we talk about most—the liberty and equality protections and the Fourteenth Amendment—from the parts of the Constitution that create the structure of the government. I think it’s more likely that if we look back with regret at our dedication to the Constitution, it will be with respect to the structural provisions, rather than the liberty and equality ones. The liberty and equality provisions of the Constitution are worded so vaguely that whatever hypothetical blame we might place on them in any faraway future will more likely be aimed at the Supreme Court’s interpretation of the provisions, as opposed to the provisions themselves.

Now, what if because of these provisions, someone gets away with urging or instructing someone else to blow up the White House, thus instigating a chain of events that leads to a nation-destroying insurrection? Or someone who is arrested without being given the proper Miranda warnings goes free and then

blows up the White House? Are we really going to blame the First Amendment or the Fourth Amendment for those catastrophes? If people end up blaming anyone or anything having to do with these provisions—and that itself is a really big if—I think people would blame the Supreme Court and the opinions which gave those amendments the specific content that, when applied, turned out to be disastrous. Earl Warren, rather than James Madison, would turn out to be the real culprit.

There are a handful of sacrosanct principles within the Constitution that would never be directly blamed for anything that happens, based on the logic that the principles themselves are so unassailable that any subsequent problem must be a manifestation of someone applying those principles incorrectly.”

It’s one of those situations where the practical manifestation is the opposite of the technical intention: As Americans, we tend to look down on European countries that impose legal limitations on speech—yet as long as speakers in those countries stay within the specified boundaries, discourse is allowed relatively unfettered (even when it’s unpopular). In the US, there are absolutely no speech boundaries imposed by the government, so the citizenry creates its own limitations, based on the arbitrary values of whichever activist group is most successful at inflicting its worldview upon an economically fragile public sphere. As a consequence, the United States is a safe place for those who want to criticize the government but a dangerous place for those who want to advance unpopular thoughts about any other subject that could be deemed insulting or discomfiting. Some would argue that this trade-off is worth it. Time may prove otherwise.

The men and women who forged this nation were straight-up maniacs about freedom. It was just about the only thing they cared about, so they jammed it into everything. This is understandable, as they were breaking away from a monarchy. But it’s also a little bonkers, since one of the things they desired most desperately was freedom of religion, based on the premise that Europe wasn’t religious enough and that they needed the freedom to live by non-secular laws that were more restrictive than that of any government, including provisions for the burning of suspected witches. The founding fathers saw themselves as old hedgehogs, and the one big thing they knew was that nothing mattered more than liberty. They were of the opinion that a man cannot be happy if he is not wholly free from tyranny, a sentiment that is still believed by almost every American citizen.

During the wars between Athens and Sparta, there were a lot of people questioning if the idea of democracy in Athens made much sense. These were

guys who came in right after the Roman Republic fell who were basically wiping their brow and saying, ‘Thank god that whole experiment with people running things is over, look where that took us.’ These are thoughts conditioned by what we remember. When we talk about one-man rule—some kind of dictatorship or empire or whatever—look at the examples recent history has given us. They’re not exactly shining examples of how it might work out well, whether it’s a Hitler or a Stalin or whoever, so we don’t have any good examples of how this could successfully operate. But in the ancient world, they often had bad examples of democracy. Some of those guys looked at democracies the way we look at failed dictatorships. And yet, had we had, in the 1930s or 1940s, some dictatorship that was run by a real benevolent, benign person who did a really good job and things were great—and let’s throw out the obvious problem of succession, of potentially getting a bad guy after the good guy—we might have a different view of all that.

It almost feels like I’m arguing, ‘Democracy is imperfect, so let’s experiment with a little light fascism.’ But I also realize my discomfort with such thoughts is a translucent sign of deep potential wrongness—so deep that I can’t even think about it without my unconscious trying to convince me otherwise. The Western world (and the US in particular) has invested so much of its identity into the conception of democracy that we’re expected to unconditionally support anything that comes with it.

Voting, for example. Everyone who wants to vote should absolutely do so, but it’s bizarre how angry voters get at non-voters. “It’s your civic responsibility,” they will say. Although the purpose of voting is to uphold a free society, so one might respond that a free society would not demand people to participate in an optional civic activity. “But your vote matters,” they argue. Well, it is counted, usually. That’s true (usually). But believing your one vote makes a meaningful difference reflects unfathomable egotism. Even if you’d illegally voted twenty times in the single tightest Florida county during that aforementioned 2000 presidential election, the outcome would have been unchanged. “But what if everybody thought that way,” they inevitably counter. This is the stupidest of arguments—if the nation’s political behavior were based on the actions of one random person, of course that person would vote, in the same way that random person would never jaywalk if his or her personal actions dictated the behavior of society as a whole. But that is not how the world works. “Okay, fine. But if you don’t vote, you can’t complain.” Actually, the opposite is true—if you participate in democracy, you’re validating the democratic process (and therefore the outcome). You can’t complain if you vote. “People in other countries risk their life for the right to vote.” Well, what can I say? That’s a noble act,

but not necessarily a good decision.

When I see a quote from Plato that condescendingly classifies democracy as “charming” and suggests democracy dispenses “a sort of equality to equals and unequaled alike,” my knee-jerk reaction is to see this as troubling and unenlightened. But Plato is merely arguing that democracy is a nice idea that tries to impose the fantasy of fairness upon an organically unfair social order. I’m not sure how anyone could disagree with that, myself included. But if you’re really into the idea of democracy, this is something you reject out of hand.

There is no evidence that Washington was ever given the chance to become king, and—considering how much he and his peers despised the mere possibility of tyranny—it’s hard to imagine this offer was ever on the table. It is, I suppose, the kind of act that seems like something Washington would have done, in the same way he seems like the kind of fellow who wouldn’t deny that he iced a cherry tree for no reason. Washington’s kingship denial falls into the category of a “utility myth”—a story that supports whatever political position the storyteller happens to hold, since no one disagrees with the myth’s core message (i.e., that there are no problems with the design of our government, even if that design allows certain people to miss the point).

You see the application of other utility myths during any moment of national controversy. Someone will say or do something that offends a group of people, so the offended group will argue that the act was unpatriotic and harmful to democracy. In response, the offending individual will say, ‘Actually, I’m doing this because I’m patriotic and because I’m upholding democracy. You’re unpatriotic for trying to stop me.’ Round and round this goes, with both sides claiming to occupy the spiritual center of the same philosophy, never considering the possibility that the (potentially real) value of their viewpoint hinges on the prospect that patriotism is not absurd and democracy is not simply the system some wig-wearing eighteenth-century freedom junkies happened to select.

Sit back with your favorite beverage or plant, prop up your feet and open your head to consider Independence Day in a whole new way. A historically critical analysis of the American Revolution would typically discuss how the democratic promises of the Declaration were left hanging at war’s end, followed by a decidedly undemocratic constitution six years later. Examples of that would include abandoning ideals stated in the Declaration like: “all men are created equal” and have unassailable rights to “life, liberty, and the pursuit of happiness.” It could cite that:

- Slaves weren’t included in “We the People,” they were only the property

of their owners. Because this human property, unlike a bale of cotton, could plan to run away, particular attention was paid to securing it.

“A person held to service or labor in one state. . . escaping to another. . . shall be delivered up on Claim of the Party to whom such Service or Labour may be due.”

- To appease Southerners interested in gaining the maximum number of seats in the new House of Representatives, the Fathers of Our Country declared, in writing, that these “other persons” would each count as three-fifths of a human.
- Women did not have the right to vote, nor did Catholics and Jews in some states. White, Protestant, men had to own qualifying amounts of property. Thus, only about 6% of the new nation’s population was eligible to vote in the first presidential election and only 3%, or 38,818 people actually did.
- Even those so privileged didn’t actually vote for a presidential candidate. They voted for “electors” pledged to vote for certain candidates and even then, four of the state legislatures picked those electors, not voting citizens.
- State legislatures, not citizens, chose US Senators until the Constitution was amended in 1913.

Clearly, there are reasons to ask what the Founders of Our Country were up to and what our fireworks every Fourth of July about. But, let’s investigate further: was war the only or even the best way to achieve what we now see was more limited than what we were taught?

America’s three Holy Wars—the Revolution, the Civil War and World War II—are three wars in American history that are untouchable, uncriticizable. If something’s unquestioned, it means we’re not thinking about it. The reason for doing so is not to learn what ‘really happened’ in the past—the past is past—the important thing is what does it tell us about today and about what we might do in the world? There’s a present and a future reason for going into the past. We should do something never done in history textbooks: put each of these wars on its own balance sheet—costs on one side, benefits on the other—and then make a judgment. Without that examination we and our grandchildren will be prone to accept wars as possibly good. Because once you have a history of “good wars” fought for good causes to point to, you have a model that makes it possible to have

good wars. Questioning the good wars undermines the possibility of having a good war.

The acknowledged “bad wars” like Vietnam and Iraq are justified by pointing to the “good war.” Words like ‘We mustn’t appease Saddam Hussein,’ ‘Munich,’ ‘Chamberlain,’ ‘Ho Chi Minh is another Hitler,’ are repeated each new generation, suggesting maybe we need another good war. Typically we only look at one side of the balance sheet: what was gained—in this case independence from Britain—and ignore the cost. Rarely do we hear how many people were killed in the Revolution. We won independence. It’s insignificant.

So how many were killed? Perhaps 25,000 or even 50,000. You probably know by now that casualty figures in war are very crude. There’ll be disagreements up to a million. How many people died in Vietnam? I think two-million. Or maybe three-million. We’re not sure. 25,000 is not many soldiers killed—it’s less than half the number of US troops killed in Vietnam. But what would 25,000 mean relative to today’s population? 2,500,000 dead. Today, would we think it’s worth sacrificing two-and-a-half-million people? Might you not say, ‘Well, we want independence, but is there another way?’ If we do that for each of these “good wars” at least then you have an honest balance sheet and you can make a decision. Especially if none of those 2.5 million people are related to you.

Beyond casualties, are there other factors that should go on the balance sheet? Like who gains from victory in war? Governments would like us to believe we all gain from a war. That’s not necessarily true. Did black slaves gain from the Revolutionary War? Slavery before the war. Slavery after the war. You would think blacks would rush to the colors if they were fighting for their freedom, but Washington didn’t want blacks in the army. Washington, Madison, Jefferson, all slave owners, aren’t going to promise freedom. The British did. Only after the British began to enlist blacks did the Continental Army slowly enlist blacks. Indeed, some historians argue that slave-owning colonial leaders might well have seen the first spark of revolution in 1772 in England, when Lord Mansfield ruled in *Somerset v. Stewart* that a slave, James Somerset, who had escaped after being taken to England by his master, could not be forced back into slavery.

And of course, what about the people already here, the Indians? With independence, the colonists won the ability to go westward, beyond the Appalachian line set by the British in the Proclamation of 1763. Not because they were being nice, but because they didn’t want trouble. So what do the Indians gain? It’s worse than nothing. After the Revolution that line was wiped out and we spent the next century taking over the rest of the continent.

Did working people and poor people benefit from the Revolution? Did they rush to Washington's army? No. Poor people had to be conscripted. They could avoid conscription by paying a fee, a practice begun with the Revolution that was carried over to the Civil War. Poor white people weren't eager to join the army, but they were promised land if they won. And much like today, a young man from a tough background, not knowing what the future will bring, might join the army. You get a uniform, a gun, some status, maybe some medals, a little land. After they joined, many found they weren't treated well. They found the officers got good clothes and shoes and food and paid a salary.

Consequently, troops mutinied. How many of you learned that in school? Thousands mutinied. Washington had to deal with it. He made concessions. But when smaller mutinies happened, he rounded up the leaders and had them shot by their fellow mutineers. All this is to say that the Revolutionary War, like all wars, was a class war. But we're not supposed to bring that up. We're all one class, all one patriotic body. No. Wars affect us all differently.

After the Revolution, the Western Massachusetts land given to former soldiers was taxed beyond their ability to pay. Land confiscations were followed by Shays Rebellion in 1786. Thousands rebelled and an army raised by the rich merchants of Boston put it down, But it raised the question for whom was the war fought? Who was betrayed by it? The founding fathers were worried about Shay's Rebellion and Massachusetts wasn't the only place in revolt. Gen. Henry Knox wrote to warn Washington that thousands were beginning to demand an equal share of the wealth gained by the Revolution.

In the shadow of Shay's and in fear of future rebellions, the Constitutional Convention convened in Philadelphia in 1787. A strong central government was set up not just because it's nice to have a strong central government as history texts explain, but to be able to suppress rebellions by workers and slaves, and to protect settlers moving into Indian territory. It should be noted that conventioners met originally to amend our original constitution, the Articles of Confederation. Once together, however, they ditched the Articles with the more top-down, property-friendly constitution we know today.

Could we have put something good on the positive side of the balance sheet without that human cost? Could we have won independence without a war? If something has happened a certain way in history, we assume that's the only way it could have unfolded. But unless we use our imagination, we're going to be stuck doing the same thing over and over. In this particular case, we have more than just imagination to guide us.

The year before Lexington and Concord, farmers in 90% of Massachusetts,

everywhere except Boston, had nonviolently driven out British officials. Nonviolent action had made that state ungovernable. When a place becomes impossible to govern even imperial powers withdraw because they can't control the situation.

On September 6, 1774, at dawn and through the morning, militia companies from 37 rural townships across Worcester County marched into the shiretown (county seat) of Worcester. By an actual headcount taken by Breck Parkman, one of the participants, there were 4,622 militiamen, about half the adult male population of the sprawling rural county. This was not some ill-defined mob but the military embodiment of the people, and they had a purpose: to close the courts, the outposts of British authority in this far reach of the Empire. As you read on, imagine if citizens had responded like this after 2008, and stopped so many from losing their homes to greedy parasites; or after paid-for politicians and corporate executives began to ship jobs overseas?

Lining both sides of Main Street for a quarter mile, the insurgents forced two dozen court officials to walk the gauntlet, hats in hand, reciting their recantations more than thirty times each so everyone could hear. The wording was strong: the officials would cede to the will of the people and promise never to execute "the unconstitutional act of the British parliament" (the Massachusetts Government Act) that would "reduce the inhabitants to mere arbitrary power." With this humiliating submission, all British authority vanished from Worcester County, never to return.

So too in every shiretown save Boston: some 1,500 patriots in Great Barrington, 3,000 in Springfield, and so on. In Plymouth, 4,000 militiamen were so pumped up after unseating British rule that they gathered around Plymouth Rock and tried to move it to the courthouse to display their power. The rock stood where it was, but British authority was gone from Plymouth and every other town. The disgruntled Southampton Tory Jonathan Judd, Jr., summed it all up:

"Government has now devolved upon the people, and they seem to be for using it."

In the Treaty of Tripoli in 1797, the US government stated:

"The Government of the United States of America is not, in any sense, founded on the Christian religion; as it has in itself no character of enmity against the laws, religion, or tranquility, of Mussulmen [Muslims]."

The founders had good reason to be friendly to the faith. It was Sultan Mohammed ben Abdallah of Morocco who was the first world figure to

recognize the United States as an independent country after the Revolutionary War. If that was all part of a secret plan to undermine the Christian West, then holy shit do these people know how to work the long con.

Myth is an arrangement of the past, whether real or imagined, in patterns that reinforce a culture's deepest values and aspirations. Myths are so fraught with meaning that we live and die by them. They are the maps by which cultures navigate through time.

History that challenges comfortable assumptions about a group is painful, but it is a mark of maturity. History should not be written to make the present generation feel good but to remind us that human affairs are complicated. Examining the past honestly, whether that is painful for some people or not, is the only way for societies to become mature and to build bridges to others.

"Imagined communities" are the groups, like nations or religions, that are so big that we can never know all the other members yet which still draw our loyalties. Groups mark out their identities by symbols, whether flags, colored shirts, or special songs. In that process of definition, history usually plays a key role. Army regiments have long understood the importance of history in creating a sense of cohesiveness. That is why they have regimental histories and battle honors from past campaigns. Not surprisingly, the stories from the past that are celebrated are often one-sided or simplistic.

For example, historians have been examining the myth of the American West. Hundreds of Western movies and thousands of novels by writers such as Zane Grey (who only went west on his honeymoon) and Karl May (who never went there at all) have helped to create a picture of a wild world where bold cowboys and determined settlers braved savage Indian hordes. The myth casts a powerful spell. From President Teddy Roosevelt to President George W. Bush, American political elites have liked to portray themselves as bold cowboys. Even Henry Kissinger, improbable as the image may seem, once fell under the spell.

"Americans like the cowboy who leads the wagon train by riding ahead alone on his horse. He acts, that's all, by being in the right place at the right time."

Donald Trump would seem to be the modern version of this, no longer a cattle driving cowboy or outlaw, but a reality TV star.

Yet the "real" old West, the time of the wagon trains moving through the ever-open and lawless frontier, lasted for a surprisingly short time, roughly from the 1840s, when settlers in increasing numbers moved west of the Missouri River, to the opening of the first transcontinental railway in 1869.

Moreover, many of the familiar stereotypes dissolve into something more complex and even disturbing. The cowboys were often teenage gunslingers who today might well be in urban gangs or in jail. Billy the Kid was a charming and cold-blooded killer. Miss Kitty Russell, the warm and attractive saloon owner in the television series *Gunsmoke*, would have looked quite different in the real old West. Women of her sort on the frontier were miserable low-paid prostitutes, frequently drunk and riddled with diseases. Many of them killed themselves.

Going back further, most Americans know the story of Paul Revere's ride: the brave patriot galloping alone through that night in 1775 to warn his fellow revolutionaries that the British redcoats were about to attack. Eight decades later Henry Wadsworth Longfellow helped to fix the ride in American memories with his epic poem. To the regret of historians, he got some of the key details wrong. Revere did not, for example, put the lanterns to signal the movements of the British ("one if by land, and two if by sea") in the steeple of the Old North Church. Rather, they were a signal to him. Most important, perhaps, he acted not on his own but as part of a well-planned, well-coordinated strategy. Several riders went out that night, in different directions.

Many people today think that the Tea Act—which led to the Boston Tea Party—was simply an increase in the taxes on tea paid by American colonists. That's where the whole "taxation without representation" meme came from. But contrary to what many Americans believe, including members of today's Tea Party, the original Boston Tea Party and the smaller ones that followed in other colonial cities were never protests against high taxes. They could not have been, as an examination of official documents at the British Library in London reveals. In that era, taxpayers in the mother country paid twenty-five to fifty times as much in taxes per person as the American colonists. Instead, the purpose of the Tea Act was to give the East India Company full and unlimited access to the American tea trade and to exempt the company from having to pay taxes to Britain on tea exported to the American colonies. It even gave the company a tax refund on millions of pounds of tea that it was unable to sell and holding in inventory. In other words, the Tea Act was the largest corporate tax break in the history of the world.

What the colonists who filled Old South Church in Boston on December 16, 1773, were protesting was a tax exemption intended to bail out investors in the British East India Company. With tons of tea that it couldn't sell, the threat of bankruptcy loomed. That would have meant ruin for friends of King George III in an era when debtors went to prison. And since, at the time, most of the British government and royalty were stockholders in the East India Tea Company, it was also a classic example of crony capitalism.

Most Bostonians were drinking Dutch tea that fall, not because it was better but because it was cheaper. But the British Parliament had granted the East India Company a tax exemption, meaning the British tea would sell for less than Dutch tea. That might have seemed attractive to customers, but only in the short-run, as a royal monopoly was to be strictly enforced. In time, tea prices would rise.

In response, the colonists dressed like Indians, in the middle of the night, boarded ships, and commenced the dumping of hundreds of chests of tea overboard—an act that would eventually light the fuse to war. The American Revolution began with an act of corporate vandalism.

Throughout most of the Revolutionary War, the smart money was on the British winning, and battle by battle, the smart money looked pretty smart. The Brits generally were able to march up and down the colonies almost with impunity. They just didn't have the troops and supply lines to hold and pacify what they'd conquered, nor did they have the will to exterminate the colonials the way they did so many other peoples, largely because the colonials were racially and culturally the same people. The Brits couldn't break the Americans, so eventually they threw in the towel.

Jump ahead to the Civil War: More than a third of the nine-million Southerners were enslaved people of African heritage. Within the CSA, 76 percent of settlers owned no slaves. Roughly 60–70 percent of those without slaves owned fewer than a hundred acres of land. Less than one percent owned more than a hundred slaves. Seventeen percent of settlers in the South owned one to nine slaves, and only 6.5% owned more than ten. Ten percent of the settlers who owned no slaves were also landless, while that many more managed to barely survive on small dirt farms. The Confederate Army reflected the same kind of percentages.

Those who, even today, claim that “states' rights” caused Southern secession and the Civil War use these statistics to argue that slavery was not the cause of the Civil War, but that is false. Every settler in the Southern states aspired to own land and slaves or to own more land and more slaves, as both social status and wealth depended on the extent of property owned. Even small and landless farmers relied on slavery-based rule: the local slave plantation was the market for what small farmers produced, and planters hired landless settlers as overseers and sharecroppers. Most non-slave-owning settlers supported and fought for the Confederacy.

The Union Army victory over the Confederate Army transformed the South into a quasi-captive nation, a region that remains the poorest of the United States well over a century later. The situation was similar to that in South Africa two decades later when the British defeated the Boers (descendants of the original seventeenth-century Dutch settlers). As the

British would later do with the Boers, the US government eventually allowed the defeated southern elite to return to their locally powerful positions, and both US southerners and Boers soon gained national political power. The powerful white supremacist southern ruling class helped further militarize the United States, the army practically becoming a southern institution. Following the barely effective Reconstruction experiment to empower former slaves, the US occupying army was withdrawn, and African Americans were returned to quasi-bondage and disenfranchisement through Jim Crow laws, forming a colonized population in the South.

The United Daughters of the Confederacy, set up in 1894, were vigilant in monitoring school curricula to ensure that their approved version of the past was taught in Southern schools. Textbook publishers complied, publishing different versions of the American history texts: one for the South, which downplayed slavery and ignored its brutality, and the other for Northern schools. And so, even black children in their segregated schools were presented with a picture of the South in which slavery and racism were largely absent. They were told, though, that Africans were fortunate because they had been brought to America and so into contact with European civilization. It was a pity, the texts concluded sadly, that the Africans had not had the innate capacity to take advantage of the opportunity. Black teachers did their best to counteract such views by introducing African and African American history into their schools, but it was not always easy because the curricula had to be approved by white school boards.

We can learn from history, but we also deceive ourselves when we selectively take evidence from the past to justify what we have already made up our minds to do.

Coming to Terms With the Past

The history of the United States is a history of settler colonialism—the founding of a state based on the ideology of white supremacy, the widespread practice of African slavery, and a policy of genocide and land theft. Those who seek history with an upbeat ending, a history of redemption and reconciliation, may look around and observe that such a conclusion is not visible, not even in utopian dreams of a better society. Seeing US history from an Indigenous peoples' perspective requires rethinking the consensual national narrative. That narrative is wrong or deficient, not in its facts, dates, or details but rather in its essence. Inherent in the myth we've been taught is an embrace of settler colonialism and genocide. The myth persists, not for a lack of free speech or poverty of information but rather for an absence of motivation to ask questions that challenge the core of the scripted narrative of the origin story. How might acknowledging the reality of US history work to transform society?

In the United States the legacy of settler colonialism can be seen in the endless wars of aggression and occupations; the trillions spent on war machinery, military bases, and personnel instead of social services and quality public education; the gross profits of corporations, each of which has greater resources and funds than more than half the countries in the world yet pay minimal taxes and provide few jobs for US citizens; the repression of generation after generation of activists who seek to change the system; the incarceration of the poor, particularly descendants of enslaved Africans; the individualism, carefully inculcated, that on the one hand produces self-blame for personal failure and on the other exalts ruthless dog-eat-dog competition for possible success, even though it rarely results; and high rates of suicide, drug abuse, alcoholism, sexual violence against women and children, homelessness, dropping out of school, and gun violence.

These are symptoms, and there are many more, of a deeply troubled society, and they are not new. The large and influential civil rights, student, labor, and women's movements of the 1950s through the 1970s exposed the structural inequalities in the economy and the historical effects of more than two centuries of slavery and brutal genocidal wars waged against Indigenous peoples.

How then can US society come to terms with its past? How can it acknowledge responsibility? While living persons are not responsible for what their ancestors did, they are responsible for the society they live in, which is a product of that past. Assuming this responsibility provides a means of survival and liberation. Everyone and everything in the world is

affected, for the most part negatively, by US dominance and intervention, often violently through direct military means or through proxies. It is an urgent concern.

A “race to innocence” is what occurs when individuals assume that they are innocent of complicity in structures of domination and oppression. This concept captures the understandable assumption made by new immigrants or children of recent immigrants to any country. They cannot be responsible, they assume, for what occurred in their adopted country’s past. Neither are those who are already citizens guilty, even if they are descendants of slave owners, Indian killers, or Andrew Jackson himself. Yet, in a settler society that has not come to terms with its past, whatever historical trauma was entailed in settling the land affects the assumptions and behavior of living generations at any given time, including immigrants and the children of recent immigrants.

Awareness of the settler-colonialist context of US history writing is essential if one is to avoid the laziness of the default position and the trap of a mythological unconscious belief in manifest destiny. The form of colonialism that the Indigenous peoples of North America have experienced was modern from the beginning: the expansion of European corporations, backed by government armies, into foreign areas, with subsequent expropriation of lands and resources. Settler colonialism is a genocidal policy.

Native nations and communities, while struggling to maintain fundamental values and collectivity, have from the beginning resisted modern colonialism using both defensive and offensive techniques, including the modern forms of armed resistance of national liberation movements and what now is called terrorism. In every instance they have fought for survival as peoples. The objective of US colonialist authorities was to terminate their existence as peoples—not as random individuals. This is the very definition of modern genocide as contrasted with premodern instances of extreme violence that did not have the goal of extinction. The United States as a socioeconomic and political entity is a result of this centuries-long and ongoing colonial process. Modern Indigenous nations and communities are societies formed by their resistance to colonialism, through which they have carried their practices and histories.

The goal of settler colonialism is elimination of Indigenous populations in order to make land available to settlers. That project is not limited to government policy, but rather involves all kinds of agencies, voluntary militias, and the settlers themselves acting on their own.

Settler colonialism, as an institution or system, requires violence or the threat of violence to attain its goals. People do not hand over their land, resources, children, and futures without a fight, and that fight is

met with violence. In employing the force necessary to accomplish its expansionist goals, a colonizing regime institutionalizes violence. The notion that settler-indigenous conflict is an inevitable product of cultural differences and misunderstandings, or that violence was committed equally by the colonized and the colonizer, blurs the nature of the historical processes. Euro-American colonialism, an aspect of the capitalist economic globalization, had from its beginnings a genocidal tendency.

Documented policies of genocide on the part of US administrations can be identified in at least four distinct periods: the Jacksonian era of forced removal; the California gold rush in Northern California; the post-Civil War era of the so-called Indian wars in the Great Plains; and the 1950s termination period,

The United States, throughout its history, has alternated between a 'peace' policy and a 'war' policy in its relations with Indigenous nations and communities. These pendulum swings coincided with the strength and weakness of Native resistance. Between the alternatives of extermination and termination (war policy) and preservation (peace policy) were interim periods characterized by benign neglect and assimilation.

With organized Indigenous resistance to war programs and policies, concessions are granted. When pressure lightens, new schemes are developed to separate Indians from their land, resources, and cultures. Scholars, politicians, policymakers, and the media rarely term US policy toward Indigenous peoples as colonialism.

The current mission of the United States to become the center of political enlightenment to be taught to the rest of the world began with the Indian wars and has become the dangerous provocation of this nation's historical intent. The historical connection between the Little Big Horn event and the "uprising" in Baghdad must become part of the political dialogue of America if the fiction of decolonization is to happen and the hoped-for deconstruction of the colonial story is to come about.

Meditating on the five major US wars since World War II—in Korea, Vietnam, Iraq (1991), Afghanistan, and Iraq (2003)—with flashes of historical memory of Jamestown, the Ohio Valley, and Wounded Knee, brings us to the essence of US history. A red thread of blood connects the first white settlement in North America with today and the future.

US people are taught that their military culture does not approve of or encourage targeting and killing civilians and know little or nothing about the nearly three centuries of warfare—before and after the founding of the US—that reduced the Indigenous peoples of the continent to a few reservations by burning their towns and fields and killing civilians, driving the refugees out—step by step—across the continent. Violence directed systematically

against noncombatants through irregular means, from the start, has been a central part of Americans' way of war.

The dispossession of the Indians did not happen once and for all in the beginning. America was continually beginning again on the frontier, and as it expanded across the continent, it killed, removed, and drove into extinction one tribe after another.

Our nation was born in genocide. We are perhaps the only nation which tried as a matter of national policy to wipe out its indigenous population. Moreover, we elevated that tragic experience into a noble crusade. Indeed, even today we have not permitted ourselves to reject or feel remorse for this shameful episode.

Somehow, even 'genocide' seems an inadequate description for what happened, yet rather than viewing it with horror, most Americans have conceived of it as their country's manifest destiny.

Native peoples were colonized and deposed of their territories as distinct peoples—hundreds of nations—not as a racial or ethnic group. 'Colonization,' 'dispossession,' 'settler colonialism,' 'genocide'—these are the terms that drill to the core of US history, to the very source of the country's existence. The charge of genocide, once unacceptable by establishment academic and political classes when applied to the United States, has gained currency as evidence of it has mounted, but it is too often accompanied by an assumption of disappearance.

Indigenous survival as peoples is due to centuries of resistance and storytelling passed through the generations, and this survival is dynamic, not passive. Surviving genocide, by whatever means, is resistance: non-Indians must know this in order to more accurately understand the history of the United States.

Whereas white supremacy had been the working rationalization for British theft of Indigenous lands and for European enslavement of Africans, the bid for independence by what became the United States of America was more problematic. Democracy, equality, and equal rights do not fit well with dominance of one race by another, much less with genocide, settler colonialism, and empire.

It was during the 1820s—the beginning of the era of Jacksonian settler democracy—that the unique US origin myth evolved reconciling rhetoric with reality. Novelist James Fenimore Cooper was among its initial scribes. Cooper's reinvention of the birth of the United States in his novel *The Last of the Mohicans* has become the official US origin story.

Cooper devised a fictional counterpoint of celebration to the dark underbelly of the new American nation—the birth of something new and wondrous, literally, the US American race, a new people born of the merger of the

best of both worlds, the Native and the European, not a biological merger but something more ephemeral, involving the dissolving of the Indian. In the novel, Cooper has the last of the “noble” and “pure” Natives die off as nature would have it, with the “last Mohican” handing the continent over to Hawkeye, the nativized settler, his adopted son. This convenient fantasy could be seen as quaint at best if it were not for its deadly staying power.

Cooper had much to do with creating the US origin myth to which generations of historians have dedicated themselves, fortifying exclusion of many from the process of formation of American society and culture. In the first place US historians exclude Amerindians from participation, except as foils for Europeans, and thus assume that American civilization was formed by Europeans in a struggle against the savagery or barbarism of the nonwhite races. This first conception implies the second—that the civilization so formed is unique. In the second conception uniqueness is thought to have been created through the forms and processes of civilization’s struggle on a specifically American frontier. Alternatively, civilization was able to triumph because the people who bore it were unique from the beginning—a Chosen People or a super race. Either way American culture is seen as not only unique but better than all other cultures, precisely because of its differences from them.

Nonfiction sources of the time reflected the same view: The United States Magazine and Democratic Review summed it up by arguing that whereas European powers “conquer only to enslave,” America, being “a free nation,” “conquers only to bestow freedom.” Far from being antagonistic, ‘empire’ and ‘liberty’ are instrumentally conjoined. If the former stands to safeguard the latter, the latter, in turn, serves to justify the former. Indeed, the conjunction of the two, of freedom and dominion, gives America its sovereign place in history—its Manifest Destiny, as its advocates so aptly called it.

Yet these positive twists on genocidal colonialism were based on the reality of invasion, squatting, attacking, and colonizing of the Indigenous nations. Neither Cooper or the United States Magazine and Democratic Review created that reality. Rather, they created the narratives that captured the experience and imagination of the Anglo-American settler, stories that were surely instrumental in nullifying guilt related to genocide and set the pattern of narrative for future US writers, poets, and historians.

Reconciling empire and liberty—based on the violent taking of Indigenous lands—into a usable myth allowed for the emergence of an enduring populist imperialism. Wars of conquest and ethnic cleansing could be sold to “the people”—could be fought for by the young men of those very people—by promising to expand economic opportunity, democracy, freedom for all.

According to the origin narrative, the United States was born of rebellion against oppression—against empire—and thus is the product of the first anti-colonial revolution for national liberation. The narrative flows from that fallacy: the broadening and deepening of democracy; the Civil War and the ensuing “second revolution,” which ended slavery; the twentieth-century mission to save Europe from itself—twice; and the ultimately triumphant fight against the scourge of communism, with the United States inheriting the difficult and burdensome task of keeping order in the world. It’s a narrative of progress.

The 1960s social revolutions, ignited by the African American liberation movement, complicated the origin narrative, but its structure and periodization have been left intact. After the 1960s, historians incorporated women, African Americans, and immigrants as contributors to the commonweal. Indeed, the revised narrative produced the “nation of immigrants” framework, which obscures the US practice of colonization, merging settler colonialism with immigration to metropolitan centers during and after the industrial revolution. Native peoples, to the extent that they were included at all, were renamed “First Americans” and thus themselves cast as distant immigrants.

That the continued colonization of American Indian nations, peoples, and lands provides the United States the economic and material resources needed to cast its imperialist gaze globally is a fact that is simultaneously obvious within—and yet continually obscured by—what is essentially a settler colony’s national construction of itself as an ever more perfect multicultural, multiracial democracy. The status of American Indians as sovereign nations colonized by the United States continues to haunt and inflect its *raison d’être*.

Multiculturalism became the cutting edge of post-civil-rights-movement US history revisionism. For this scheme to work—and affirm US historical progress—Indigenous nations and communities had to be left out of the picture. As territory and treaty-based peoples in North America, they did not fit the grid of multiculturalism but were included by transforming them into an inchoate oppressed racial group, while colonized Mexican Americans and Puerto Ricans were dissolved into another such group, variously called “Hispanic” or “Latino” or as the kids say today: Latinx—pronounced Lah-teen-ex if you’re not “woke” enough to know that already.

The multicultural approach emphasized the “contributions” of individuals from oppressed groups to the country’s assumed greatness. Indigenous peoples were thus credited with corn, beans, buckskin, log cabins, parkas, maple syrup, canoes, hundreds of place names, Thanksgiving, and even the concepts of democracy and federalism. But this idea of the gift-giving Indian helping to establish and enrich the development of the United States is an

insidious smokescreen meant to obscure the fact that the very existence of the country is a result of the looting of an entire continent and its resources. The fundamental unresolved issues of Indigenous lands, treaties, and sovereignty could not but scuttle the premises of multiculturalism.

It should not have happened that the great civilizations of the Western Hemisphere, the very evidence of the Western Hemisphere, were wantonly destroyed, the gradual progress of humanity interrupted and set upon a path of greed and destruction. Choices were made that forged that path toward destruction of life itself—the moment in which we now live and die as our planet shrivels, over-heated. To learn and know this history is both a necessity and a responsibility to the ancestors and descendants of all parties.

Nation, race, and class converged in land. The question of genocide is never far from discussions of settler colonialism. Land is life—or, at least, land is necessary for life. Everything in US history is about the land—who oversaw and cultivated it, fished its waters, maintained its wildlife; who invaded and stole it; how it became a commodity broken into pieces to be bought and sold on the market.

Under the Homestead Act, 1.5 million homesteads were granted to settlers west of the Mississippi, comprising nearly three-hundred-million acres (a half-million square miles) taken from the Indigenous collective estates and privatized for the market. This dispersal of landless settler populations from east of the Mississippi served as an “escape valve,” lessening the likelihood of class conflict as the industrial revolution accelerated the use of cheap immigrant labor. Little of the land appropriated under the Homestead Acts was distributed to actual single-family homesteaders. It was passed instead to large operators or land speculators. The land laws appeared to have been created for that result.

An individual could acquire 1,120 or even more acres of land, even though homestead and preemption (legalized squatting) claims were limited to 160 acres. A claimant could obtain a homestead and secure title after five years or pay cash within six months. Then he could acquire another 160 acres under preemption by living on another piece of land for six months and paying \$1.25 per acre. While acquiring these titles, he could also be fulfilling requirements for a timber culture claim of 160 acres and a desert land claim of 640 acres, neither of which required occupancy for title. Other men within a family or other partners in an enterprise could take out additional desert land claims to increase their holdings even more. As industrialization quickened, land as a commodity—“real estate”—remained the basis of the US economy and capital accumulation.

Federal land grants to the railroad barons, carved out of Indigenous territories, were not limited to the width of the railroad tracks, but rather

formed a checkerboard of square-mile sections stretching for dozens of miles on both sides of the right of way. This was land the railroads were free to sell in parcels for their own profit. The 1863–64 federal banking acts mandated a national currency, chartered banks, and permitted the government to guarantee bonds. As war profiteers, financiers, and industrialists such as John D. Rockefeller, Andrew Carnegie, and J. P. Morgan used these laws to amass wealth in the East, Leland Stanford, Collis P. Huntington, Mark Hopkins, and Charles Crocker in the West grew rich from building railroads with eastern capital on land granted by the US government.

Origin narratives form the vital core of a people's unifying identity and of the values that guide them. In the United States, the founding and development of the Anglo-American settler-state involves a narrative about Puritan settlers who had a covenant with God to take the land. That part of the origin story is supported and reinforced by the Columbus myth and the Doctrine of Discovery. According to a series of late-fifteenth-century papal bulls, European nations acquired title to the lands they "discovered" and the Indigenous inhabitants lost their natural right to that land after Europeans arrived and claimed it.

In accord with the doctrine of predestination, Calvin taught that human free will did not exist. Certain individuals are "called" by God and are among the "elect." Salvation therefore has nothing to do with one's actions; one is born as part of the elect or not, according to God's will. Although individuals could not know for certain if they were among the elect, outward good fortune, especially material wealth, was taken to be a manifestation of election; conversely, bad fortune and poverty, not to speak of dark skin, were taken as evidence of damnation. The attractiveness of such a doctrine to a group of invading colonists is obvious, for one could easily define the natives as immutably profane and damned, and oneself as predestined to virtue.

Responding to the requirements of a paradoxical age of Renaissance and Inquisition, the West's first modern discourses of conquest articulated a vision of all humankind united under a rule of law discoverable solely by human reason. Unfortunately for the American Indian, the West's first tentative steps towards this noble vision of a Law of Nations contained a mandate for Europe's subjugation of all peoples whose radical divergence from European-derived norms of right conduct signified their need for conquest and remediation.

"There is one feature in the expansion of the peoples of white, or European, blood during the past four centuries which should never be lost sight of, especially by those who denounce such

expansion on moral grounds. On the whole, the movement has been fraught with lasting benefit to most of the peoples already dwelling in the lands over which the expansion took place.”

Columbus Day is still a federal holiday despite Columbus never having set foot on any territory ever claimed by the United States. The provincialism and national chauvinism of US history production make it difficult for effective revisions to gain authority. Scholars, both Indigenous and a few non-Indigenous, who attempt to rectify the distortions, are labeled advocates, and their findings are rejected for publication on that basis.

In the founding myth of the United States, the colonists acquired a vast expanse of land from a scattering of benighted peoples who were hardly using it—an unforgivable offense to the Puritan work ethic. The historical record is clear, however, that European colonists shoved aside a large network of small and large nations whose governments, commerce, arts and sciences, agriculture, technologies, theologies, philosophies, and institutions were intricately developed; nations that maintained sophisticated relations with one another and with the environments that supported them.

By the early seventeenth century, when British colonists from Europe began to settle in North America, a large Indigenous population had long before created a humanized landscape almost everywhere. Native peoples had created town sites, farms, monumental earthworks, and networks of roads, and they had devised a wide variety of governments, some as complex as any in the world. They had developed sophisticated philosophies of government, traditions of diplomacy, and policies of international relations. They conducted trade along roads that crisscrossed the landmasses and waterways of the American continents. Before the arrival of Europeans, North America was indeed a “continent of villages,” but also a continent of nations and federations of nations.

In the case of the British North American colonies and the United States, not only extermination and removal were practiced but also the disappearing of the prior existence of Indigenous peoples—and this continues to be perpetuated in local histories. This practice of writing Indians out of existence is ‘firsting and lasting.’ All over the continent, local histories, monuments, and signage narrate the story of first settlement: the founder(s), the first school, first dwelling, first everything, as if there had never been occupants who thrived in those places before Euro-Americans. On the other hand, the national narrative tells of “last” Indians or last tribes, such as “the last of the Mohicans,” “Ishi, the last Indian,” and “End of the Trail,” as a famous sculpture by James Earle Fraser is titled.

The US establishment of a system of Indian reservations stemmed from a long British colonial practice in the Americas. In the era of US treaty-making from independence to 1871, the concept of the reservation was one of the Indigenous nation reserving a narrowed land base from a much larger one in exchange for US government protection from settlers and the provision of social services.

In the late nineteenth century, as Indigenous resistance was weakened, the concept of the reservation changed to one of land being carved out of the public domain of the United States as a benevolent gesture, a “gift” to the Indigenous peoples. Rhetoric changed so that reservations were said to have been “given” or “created” for Indians. With this shift, Indian reservations came to be seen as enclaves within state’ boundaries. Despite the political and economic reality, the impression to many was that Indigenous people were taking a free ride on public domain.

In 1881, Indian landholdings in the United States had plummeted to 156 million acres. By 1934, only about 50 million acres remained (an area the size of Idaho and Washington) as a result of the General Allotment Act of 1887. During World War II, the government took 500,000 more acres for military use. Over one-hundred tribes, bands, and Rancherias relinquished their lands under various acts of Congress during the termination era of the 1950s. By 1955, the indigenous land base had shrunk to just 2.3 percent of its original size.

Thanks to the nutritious triad of corn, beans, and squash—which provide a complete protein—the Americas were densely populated when the European monarchies began sponsoring colonization projects there. The total population of the hemisphere was about one-hundred-million at the end of the fifteenth century, with about two-fifths in North America, including Mexico. Central Mexico alone supported some thirty-million people. At the same time, the population of Europe as far east as the Ural Mountains was around fifty million. Experts have observed that such population densities in precolonial America were supportable because the peoples had created a relatively disease-free paradise.

There certainly were diseases and health problems, but the practice of herbal medicine and even surgery and dentistry, and most importantly both hygienic and ritual bathing, kept diseases at bay. Settler observers in all parts of the Americas marveled at the frequent bathing even in winter in cold climates. One commented that the Native people “go to the river and plunge in and wash themselves before they dress daily.” Another wrote:

“Men, women, and children, from early infancy, are in the habit of bathing.”

Ritual sweat baths were common to all Native North Americans, having originated in Mexico. Above all, the majority of the Indigenous peoples of the Americas had healthy, mostly vegetarian diets based on the staple of corn and supplemented by wild fish, fowl, and four-legged animals. People lived long and well with abundant ceremonial and recreational periods.

Rather than domesticating animals for hides and meat, Indigenous communities created havens to attract elk, deer, bear, and other game. They burned the undergrowth in forests so that the young grasses and other ground cover that sprouted the following spring would entice greater numbers of herbivores and the predators that fed on them, which would sustain the people who ate them both. Rather than the thick, unbroken, monumental snarl of trees imagined by Thoreau, the great eastern forest was an ecological kaleidoscope of garden plots, blackberry rambles, pine barrens, and spacious groves of chestnut, hickory, and oak.

Inland a few miles from the shore of present-day Rhode Island, an early European explorer marveled at the trees that were spaced so that the forest “could be penetrated even by a large army.” English mercenary John Smith wrote that he had ridden a galloping horse through the Virginia forest. In Ohio, the first English squatters on Indigenous lands in the mid-eighteenth century encountered forested areas that resembled English parks, as they could drive carriages through the trees.

Bison herds roamed the East from New York to Georgia—it’s no accident that a settler city in western New York was named Buffalo. The American bison was indigenous to the northern and southern plains of North America, not the East, yet Native peoples imported them east along a path of fire, as they transformed forest into fallows for the bison to survive upon far from their original habitat. For example, when the Haudenosaunee hunted buffalo, they were harvesting a foodstuff which they had consciously been instrumental in creating.

As for the “Great American Desert,” as Anglo-Americans called the Great Plains, the occupants transformed that too into game farms. Using fire, they extended the giant grasslands and maintained them. When Lewis and Clark began their trek up the Missouri River in 1804, ethnologist Dale Lott has observed, they beheld “not a wilderness but a vast pasture managed by and for Native Americans.” Native Americans created the world’s largest gardens and grazing lands—and thrived.

North America in 1492 was not a virgin wilderness but a network of Indigenous nations, peoples of the corn.

One thing to note about early Native American trails and roads is that they were not just paths in the woods following along animal tracks used mainly for hunting. Neither can they be characterized simply as the routes

that nomadic peoples followed during seasonal migrations. Rather they constituted an extensive system of roadways that spanned the Americas, making possible short, medium, and long distance travel. That is to say, the Pre-Columbian Americas were laced together with a complex system of roads and paths which became the roadways adopted by the early settlers and indeed were ultimately transformed into major highways.

A major road ran along the Pacific coast from northern Alaska (where travelers could continue by boat to Siberia) south to an urban area in western Mexico. A branch of that road ran through the Sonora Desert and up onto the Colorado Plateau, serving ancient towns and later communities such as those of the Hopis and Pueblos on the northern Rio Grande.

The system of decision-making for many groups was based on consensus, not majority rule. This form of decision-making later baffled colonial agents who could not find Indigenous officials to bribe or manipulate.

“The first principle is peace. The second principle, equity, justice for the people. And third, the power of the good minds, of the collective powers to be of one mind: unity. And health. All of these were involved in the basic principles. And the process of discussion, putting aside warfare as a method of reaching decisions, and now using intellect.”

According to the value system that drove consensus building and decision-making in these societies, the community’s interest overrode individual interests. After every member of a council had had his or her say, any member who still considered a decision incorrect might nevertheless agree to abide by it for the sake of the community’s cohesion. In the rare cases in which consensus could not be reached, the segment of the community represented by dissenters might withdraw from the community and move away to found a new community. This was similar to the practice of the nearly one-hundred autonomous towns of northern New Mexico.

This brief overview of precolonial North America suggests the magnitude of what was lost to all humanity and counteracts the settler-colonial myth of the wandering Neolithic hunter. These were civilizations based on advanced agriculture and featuring polities. It is essential to understand the migrations and Indigenous peoples’ relationships prior to invasion, North and South, and how colonialism cut them off.

“I did not know then how much was ended. When I look back now from this high hill of my old age, I can still see the butchered women and children lying heaped and scattered all along the crooked gulch as plain as when I saw them with eyes

still young. And I can see that something else died there in the bloody mud, and was buried in the blizzard. A people's dream died there. It was a beautiful dream—the nation's hoop is broken and scattered. There is no center any longer, and the sacred tree is dead.”

—Black Elk, 1930, on the massacre at Wounded Knee

European explorers and invaders discovered an inhabited land. Many have noted that had North America been a wilderness, undeveloped, without roads, and uncultivated, it might still be so, for the European colonists could not have survived. Neither the technology nor the social organization of Europe in the sixteenth and seventeenth centuries had the capacity to maintain, of its own resources, outpost colonies thousands of miles from home. They appropriated what had already been created by Indigenous civilizations. They stole already cultivated farmland and the corn, vegetables, tobacco, and other crops domesticated over centuries, took control of the deer parks that had been cleared and maintained by Indigenous communities, used existing roads and water routes in order to move armies to conquer, and relied on captured Indigenous people to identify the locations of water, oyster beds, and medicinal herbs.

Incapable of conquering true wilderness, the Europeans were highly competent in the skill of conquering other people, and that is what they did. They did not settle a virgin land. They invaded and displaced a resident population. This is so simple a fact that it seems self-evident.

The first Jamestown settlers lacked a supply line and proved unable or unwilling to grow crops or hunt for their own sustenance. They decided that they would force the farmers of the Powhatan Confederacy—some thirty polities—to provide them with food. Jamestown military leader John Smith threatened to kill all the women and children if the Powhatan leaders would not feed and clothe the settlers as well as provide them with land and labor.

The leader of the confederacy, Wahunsonacock, entreated the invaders:

“Why should you take by force that from us which you can have by love? Why should you destroy us, who have provided you with food? What can you get by war? What is the cause of your jealousy? You see us unarmed, and willing to supply your wants, if you will come in a friendly manner, and not with swords and guns, as to invade an enemy.”

Smith's threat was carried out: war against the Powhatans started in August 1609 and the destruction of the Powhatans became the order of the day.

The Virginia Tech killings were described in 2007 as the worst “mass killing,” the “worst massacre,” in US history. Descendants of massacred Indigenous ancestors took exception to that designation. It was curious with the media circus surrounding the Jamestown celebration, and with Queen Elizabeth and President Bush presiding, that journalists failed to compare the colonial massacres of Powhatans four centuries earlier and the single, disturbed individual’s shootings of his classmates. The shooter himself was a child of colonial war, the US war in Korea.

What transpired up the coast in the founding and growth of the New England colony was different, at least at first. Just before the 1620 landing of the *Mayflower*, smallpox had spread from English trading ships off the coast to the Pequot fishing and farming communities on land, greatly reducing the population of the area the Plymouth Colony would occupy. King James attributed the epidemic to God’s “great goodness and bounty toward us.” Consequently, those who survived in the Indigenous communities had little means to immediately resist the settlers’ expropriation of their lands and resources. Sixteen years later, however, the Indigenous villages had recovered and were considered a barrier to the settlers moving into Pequot territory in Connecticut. A single violent incident triggered a devastating Puritan war against the Pequots in what the colony’s annals and subsequent history texts call the Pequot War.

Puritan settlers, as if by instinct, jumped immediately into a hideous war of annihilation, entering Indigenous villages and killing women and children or taking them hostage. The Pequots responded by attacking English settlements, including Fort Saybrook in Connecticut. Connecticut authorities commissioned mercenary John Mason to lead a force of soldiers from that colony and Massachusetts to one of the two Pequot strongholds on the Mystic River. Pequot fighters occupied one of the forts, while the other one contained only women, children, and old men. The latter was the one John Mason targeted. Slaughter ensued. After killing most of the Pequot defenders, the soldiers set fire to the structures and burned the remaining inhabitants alive.

The settlers gave a name to the mutilated and bloody corpses they left in the wake of scalp-hunts: *redskins*.

By the early 1770s, terror against Indigenous people on the part of Anglo settlers increased in all the colonies, and speculation in western lands was rampant. In the southern colonies especially, farmers who had lost their land in competition with larger, more efficient, slave-worked plantations rushed for western land. These settler-farmers thus set a prefigurative pattern of US annexation and colonization of Indigenous nations across the continent for the following century: a vanguard of farmer-settlers led by seasoned

“Indian fighters,” calling on authorities of the British colonies, first, and the US government later, to defend their settlements, forming the core dynamic of US democracy.

The settlers’ escalation of extreme violence in the Ohio Country led to perhaps the most outrageous war crime, which showed that Indigenous conversion to Christianity and pacifism was no protection from genocide. Moravian missionizing among the ravaged Delaware communities in Pennsylvania had produced three Moravian Indian villages in the decades before the war for independence had begun. Residents of one of the settlements, named Gnadenhütten, in eastern Ohio, were displaced by British troops during fighting in the area, but were able to return to harvest their corn.

Soon afterward, in March 1782, a settler militia from Pennsylvania under the command of David Williamson appeared and rounded up the Delawares, telling them they had to evacuate for their own safety. There were forty-two men, twenty women, and thirty-four children in the group of Delawares. The militiamen searched their belongings to confiscate anything that could be used as a weapon, then announced that they were all to be killed, accusing them of having given refuge to Delawares who had killed white people. They were also accused of stealing the household items and tools they possessed, because such items should only belong to white people.

Condemned to death, the Delawares spent the night praying and singing hymns. In the morning, Williamson’s men marched over ninety people in pairs into two houses and methodically slaughtered them. One killer bragged that he personally had bludgeoned fourteen victims with a cooper’s mallet, which he had then handed to an accomplice. “My arm fails me,” he was said to have announced. “Go on with the work.” This action set a new bar for violence, and atrocities that followed routinely surpassed even that atrocity.

A year earlier, the Delaware leader Buckongehelas had addressed a group of Christianized Delawares, saying that he had known some good white men, but that the good ones were a small number:

“They do what they please. They enslave those who are not of their color, although created by the same Great Spirit who created us. They would make slaves of us if they could, but as they cannot do it, they kill us. There is no faith to be placed in their words. They are not like the Indians, who are only enemies while at war, and are friends in peace. They will say to an Indian: ‘My friend, my brother.’ They will take him by the hand, and at the same moment destroy him. And so you will also be treated by them before long. Remember that this day I

have warned you to beware of such friends as these. I know the long knives; they are not to be trusted.”

In the unconquered Indigenous region of the Old Southwest, resistance took place during the two decades following US independence, with tragic results, thanks to genocidal settler warfare. Tennessee—formerly claimed, but not settled, by the British colony of North Carolina—was carved out of the larger Cherokee Nation and became a state in 1796. Its eastern part, particularly the area around today’s Knoxville, was a war zone. The mostly Scots-Irish squatters, attempting to secure and expand their settlements, were at war with the resistant Cherokees called “Chickamaugas.” The settlers hated both the Indigenous people whom they were attempting to displace as well as the newly formed federal government. In 1784, a group of North Carolina settlers, led by settler-ranger John Sevier, had seceded from western Carolina and established the independent country of Franklin with Sevier as president. Neither North Carolina nor the federal government had exerted any control over the settlements in the eastern Tennessee Valley region. In the summer of 1788, Sevier ordered an unprovoked, preemptive attack on the Chickamauga towns, killing thirty villagers and forcing the survivors to flee south. Sevier’s actions formed a template for settler-federal relations, with the settlers implementing the federal government’s final solution, while the federal government feigned an appearance of limiting settler invasions of Indigenous lands.

Facing the fierce resistance of Indigenous nations in the Ohio Country and the fighting between the Muskogee Nation and the state of Georgia, Washington’s administration sought to contain Indigenous resistance in the South. Yet now the settlers were provoking the Cherokees in what would soon be the state of Tennessee. Secretary of War Knox claimed to believe that the thickness of settlers’ development, converting Indigenous hunting grounds into farms, would slowly overwhelm the Indigenous nations and drive them out. He advised the squatters’ leaders to continue building, which would attract more illegal settlers. This disingenuous view ignored the fact that the Indigenous farmers were well aware of the intentions of the settlers to destroy them and seize their territories.

In the 1785 Treaty of Hopewell between the federal government and the Cherokee Nation, the United States had agreed to restrict settlement to the east of the Blue Ridge Mountains. The several thousand squatter families who claimed nearly a million acres of land in precisely that zone were not about to abide by the treaty. Knox saw the situation as a showdown with the settlers and a test of federal authority west of the mountain chains, from Canada to Spanish Florida. The settlers did not believe that the federal

government meant to protect their interests, which encouraged them to go it alone. In the face of constant attacks, the Cherokees were desperate to halt the destruction of their towns and fields. Many were starving, more without shelter, on the move as refugees, with only the Chickamauga fighters as a protective force fighting off the seasoned ranger-settler Indian killers. In July 1791, the Cherokees reluctantly signed the Treaty of Holston, agreeing to abandon any claims to land on which the Franklin settlements sat in return for an annual annuity of \$100,000 from the federal government.

The United States did nothing to halt the flow of squatters into Cherokee territory as the boundary was drawn in the treaty. A year after the treaty was signed, war broke out, and the Chickamaugas, under the leadership of Dragging Canoe, attacked squatters, even laying siege to Nashville. The war continued for two years, with five-hundred Chickamauga fighters joined by Muskogees and a contingent of Shawnees from Ohio, led by Cheesekau, one of Tecumseh's brothers, who was later killed in the fighting. The settlers organized an offensive against the Chickamaugas. The federal Indian agent attempted to persuade the Chickamaugas to stop fighting, warning that the frontier settlers were "always dreadful, not only to the warriors, but to the innocent and helpless women and children, and old men." The agent also warned the settlers against attacking Indigenous towns, but he had to order the militia to disperse a mob of three-hundred settlers, who, as he wrote, out of "a mistaken zeal to serve their country" had gathered to destroy "as many as they could of the Cherokee towns." Sevier and his rangers invaded the Chickamaugas' towns in September 1793, with a stated mission of total destruction. Although forbidden by the federal agent to attack the villages, Sevier gave orders for a scorched-earth offensive.

By choosing to attack at harvest-time, Sevier intended to starve out the residents. The strategy worked. Soon after, the federal agent reported to the secretary of war that the region was pacified, with no Indigenous actions since "the visit General Sevier paid the [Cherokee] nation." A year later, Sevier demanded absolute submission from the Chickamauga villages lest they be wiped out completely. Receiving no response, a month later 1,750 Franklin rangers attacked two villages, burning all the buildings and fields—again near the harvest—and shooting those who tried to flee. Sevier then repeated his demand for submission, requiring the Chickamaugas to abandon their towns for the woods, taking only what they could transport. He wrote:

"War will cost the United States much money, and some lives, but it will destroy the existence of your people, as a nation, forever."

The remaining Chickamauga villages agreed to allow the settlers to remain in Cherokee country.

In squatter settlements, ruthless leaders like Sevier were not the exception but the rule. Once they had full control and got what they wanted, they made their peace with the federal government, which in turn depended on their actions to expand the republic's territory. Sevier went on to serve as a US representative from North Carolina and as governor of Tennessee. To this day, such men are idolized as great heroes, embodying the essence of the "American spirit." A bronze statue of John Sevier in his ranger uniform stands today in the National Statuary Hall of the US Capitol. But of course it's only those ignorant southern rednecks that celebrate "monsters" with statues.

US Indian agent Benjamin Hawkins was in charge of the US government's "civilization" project. Hawkins's mission was to instill Euro-American values and practices in Indigenous peoples—including the profit motive, privatization of property, debt, accumulation of wealth by a few, and slavery—allowing settlers to gain the land and assimilate the Muskogees.

An Indigenous client class—called "compradors" by Africans, "caciques" in Spanish-colonized America—essential to colonialist projects, was firmly in place. This privileged class was dependent on their colonial masters for their personal wealth. This class division wracked the traditional relatively egalitarian and democratic Indigenous societies internally. This small elite in the Southeast embraced the enslavement of Africans, and a few even became affluent planters in the style of southern planters, mainly through intermarriage with Anglos.

The trading posts established by US merchants further divided Muskogee society, pulling many deeply into the US economy through dependency and debt, and away from the Spanish and British trading firms, which had previously left their lands undisturbed. This method of colonization by co-optation and debt proved effective wherever employed by colonial powers in the world, but only when it was accompanied by extreme violence at any sign of indigenous insurgency. The United States moved across North America in this manner. While most Muskogees continued to follow their traditional democratic ways in their villages, the elite Muskogees were making decisions and compromises on their behalf that would bear tragic consequences for them all.

The surrender document the Muskogee Nation was forced to sign in 1814, the Treaty of Fort Jackson, asserted that they had lost under "principles of national justice and honorable war." Andrew Jackson, the only US negotiator of the treaty, insisted on nothing less than the total destruction of the Muskogee Nation, which the Muskogees had no power to refuse

or negotiate. These terms of total surrender shocked the small group of Muskogee plantation and slave owners, who thought that they had been thoroughly accepted by the US Americans. They had fought alongside the Anglo militias against the majority Red Sticks in the war just concluded, yet all Muskogeese were now to be punished equally.

To no avail did the “friendlies” prostrate themselves before Jackson at the treaty meeting, begging that they and their holdings be spared. Jackson told them that the extreme punishment exacted upon them should teach all those who would try to oppose US domination.

“We bleed our enemies in such cases to give them their senses.”

Jackson’s bleeding of the Muskogeese marks a culminating point in American military history as the end of the Transappalachian East’s Indian wars. The conquest of the West was not guaranteed by defeating the British Army in battle in 1815, but by defeating and driving the Indians from their homelands.

In the Southeast, the Choctaws and Chickasaws turned exclusively to US traders once the new US republic effectively cut off access to the Spanish in Florida. Soon they were trapped in the US trading world, in which they would run up debts and then have no way to pay other than by ceding land to creditors who were often acting as agents of the federal government. This was no accidental outcome but was foreseen and encouraged by Jefferson. In 1805, the Choctaws ceded most of their lands to the United States for \$50,000, and the Chickasaws relinquished all their lands north of the Tennessee River for \$20,000. Many Choctaws and Chickasaws thus became landless participants in the expanding plantation economy, burdened by debts and poverty.

During “Lord Dunmore’s War,” Shawnees and other Indigenous peoples in what the Anglo separatists would soon call the Northwest Territory realized that they were in a life-or-death struggle with these murdering bands of settlers who were led by a wealthy land speculator, intent on destroying their nation and wiping them from the face of the earth. This realization led to another recurrent factor in the onslaught of European colonial ventures: the appearance of an accommodationist faction within the Shawnee Nation that accepted a humiliating peace agreement.

Precolonial Indigenous societies were dynamic social systems with adaptation built into them. Fighting for survival did not require cultural abandonment. On the contrary, the cultures used already existing strengths, such as diplomacy and mobility, to develop new mechanisms required to

live in nearly constant crisis. There is always a hard core of resistance in that process, but the culture of resistance also includes accommodations to the colonizing social order, including absorbing Christianity into already existing religious practices, using the colonizer's language, and intermarrying with settlers and, more importantly, with other oppressed groups, such as escaped African slaves. Without the culture of resistance, surviving Indigenous peoples under US colonization would have been eliminated through individual assimilation.

According to the current consensus among historians, the wholesale transfer of land from Indigenous to Euro-American hands that occurred in the Americas after 1492 is due less to European invasion, warfare, and material acquisitiveness than to the bacteria that the invaders unwittingly brought with them. Epidemic diseases would have caused massive depopulation in the Americas whether brought by European invaders or brought home by Native American traders. Such an absolutist assertion renders any other fate for the Indigenous peoples improbable.

The thinking behind the assumption is both ahistorical and illogical in that Europe itself lost a third to one-half of its population to infectious disease during medieval pandemics. The principal reason the consensus view is wrong and ahistorical is that it erases the effects of settler colonialism with its antecedents in the Spanish "Reconquest" and the English conquest of Scotland, Ireland, and Wales. By the time Spain, Portugal, and Britain arrived to colonize the Americas, their methods of eradicating peoples or forcing them into dependency and servitude were ingrained, streamlined, and effective. If disease could have done the job, it is not clear why the European colonizers in America found it necessary to carry out unrelenting wars against Indigenous communities in order to gain every inch of land they took from them—nearly three-hundred years of colonial warfare, followed by continued wars waged by the independent republics of the hemisphere.

A rapid demographic decline occurred in the sixteenth and seventeenth centuries, its timing from region to region depending on when conquest and colonization began. Nearly all the population areas of the Americas were reduced by 90 percent following the onset of colonizing projects, decreasing the targeted Indigenous populations of the Americas from one-hundred-million to ten-million. Commonly referred to as the most extreme demographic disaster—framed as natural—in human history, it was rarely called genocide until the rise of Indigenous movements in the mid-twentieth century forged questions.

Proponents of the default position emphasize attrition by disease despite other causes equally deadly, if not more so. In doing so they refuse to accept that the colonization of America was genocidal by plan, not simply the

tragic fate of populations lacking immunity to disease. In the case of the Jewish Holocaust, no one denies that more Jews died of starvation, overwork, and disease under Nazi incarceration than died in gas chambers, yet the acts of creating and maintaining the conditions that led to those deaths clearly constitute genocide. But, the “Never Forget” PR team really likes to talk up the gas at the expense of the rest—it’s more emotionally manipulating that way, and helps avoid drawing valid connections between other historic atrocities. ‘Uncle Sam never put anyone in gas chambers, he’s not as bad as that Hitler guy!’

US leaders brought counterinsurgency out of the pre-independence period into the new republic, imprinting on the fledgling federal army a way of war with formidable consequences for the continent and the world. Counterinsurgent warfare and ethnic cleansing targeting Indigenous civilians continued to define US war making throughout the nineteenth century, with markers such as the three US counterinsurgent wars against the Seminoles through the Sand Creek Massacre of 1864 to Wounded Knee in 1890.

Early on, regular armies had incorporated these strategies and tactics as a way of war to which it often turned, although frequently the regular army simply stood by while local militias and settlers acting on their own used terror against Indigenous noncombatants. Irregular warfare would be waged west of the Mississippi as it had been earlier against the Abenakis, Cherokees, Shawnees, Muskogees, and even Christian Indians.

In the Civil War, these methods played a prominent role on both sides. Confederate regular forces, Confederate guerrillas such as William Quantrill, and General Sherman for the Union all engaged in waging total war against civilians. The pattern would continue in US military interventions overseas, from the Philippines and Cuba to Central America, Korea, Vietnam, Iraq, and Afghanistan. The cumulative effect goes beyond simply the habitual use of military means and becomes the very basis for US American identity. The Indian-fighting frontiersmen and the valiant settlers in their circled covered wagons are the iconic images of that identity.

For the first 200 years of our military heritage, then, Americans depended on arts of war that contemporary professional soldiers supposedly abhorred: razing and destroying enemy villages and fields; killing enemy women and children; raiding settlements for captives; intimidating and brutalizing enemy noncombatants; and assassinating enemy leaders. In the frontier wars between 1607 and 1814, Americans forged two elements—unlimited war and irregular war—into their first way of war.

The United States waged three wars against the Seminole Nation between 1817 and 1858. The prolonged and fierce Second Seminole War (1835–42) was the longest foreign war waged by the United States up to the Vietnam War.

The US military further developed its army, naval, and marine capabilities in again adopting a counterinsurgency strategy, in this case against the Seminole towns in the Everglades. Once again US forces targeted civilians, destroyed food supplies, and sought to destroy every last insurgent.

On February 19, 1991, Brigadier General Richard Neal, briefing reporters in Riyadh, Saudi Arabia, stated that the US military wanted to be certain of speedy victory once it committed land forces to “Indian Country.” The following day, in a little-publicized statement of protest, the National Congress of American Indians pointed out that fifteen-thousand Native Americans were serving as combat troops in the Persian Gulf. Neither Neal nor any other military authority apologized for the statement.

The term ‘Indian Country’ in cases such as this is not merely an insensitive racial slur, tastelessly but offhandedly employed to refer to the enemy. It is, rather, a technical military term, like ‘collateral damage’ or ‘ordnance,’ that appears in military training manuals and is regularly used to mean “behind enemy lines.” It is often shortened to ‘In Country.’ This usage recalls the origins and development of the US military, as well as the nature of US political and social history as a colonialist project.

When the redundant ground war, more appropriately tagged a “turkey shoot,” was launched, at the front of the miles of killing machines were armored scouting vehicles of the Second Armored Cavalry Regiment (ACR), a self-contained elite unit that won fame during World War II when it headed General Patton’s Third Army crossing Europe. In the Gulf War, the Second ACR played the role of chief scouts for the US Seventh Corps.

A retired ACR commander proudly told a television interviewer that the Second ACR had been formed in the 1830s to fight the Seminoles, and that it had its first great victory when it finally defeated those Indians in the Florida Everglades in 1836. The Second ACR in the vanguard of the ground assault on Iraq thus symbolized the continuity of US war victories and the source of the nation’s militarism: the Iraq War was just another Indian war in the US military tradition.

After weeks of high-tech bombing in Iraq followed by a caravan of armored tanks shooting everything that moved, the US Special Forces entered Iraqi officers’ quarters in Kuwait City. There they found carrier pigeons in cages and notes in Arabic strewn over a desk, which they interpreted to mean that the Iraqi commanders were communicating with their troops, and even with Baghdad, using the carrier pigeons. High-tech soldiers had been fighting an army that communicated by carrier pigeon—as Shawnees and Muskogees had done two centuries earlier.

The chief characteristic of irregular warfare is that of the extreme violence against civilians, in this case the tendency to seek the utter annihilation of

the Indigenous population. In cases where a rough balance of power existed and the Indians even appeared dominant—as was the situation in virtually every frontier war until the first decade of the nineteenth century—Americans were quick to turn to extravagant violence.

In response to decisions by five of the Iroquois Nations, General George Washington wrote instructions to Major General John Sullivan to take peremptory action against the Haudenosaunee:

“... to lay waste all the settlements around, that the country may not be merely overrun but destroyed. You will not by any means, listen to any overture of peace before the total ruin of their settlements is effected. Our future security will be in their inability to injure us and in the terror with which the severity of the chastisement they receive will inspire them.”

Sullivan replied:

“The Indians shall see that there is malice enough in our hearts to destroy everything that contributes to their support.”

Despite the primary use of settler militias, President Washington insisted that the new government had to develop a professional army that would enhance US prestige in the eyes of European countries. He also thought that the cost of using mercenaries, at four times that of regular troops, was too high. But whenever regular troops were sent into the Ohio Country, the Indigenous resisters drove them out. Reluctantly, Washington resigned himself to the necessity of using what were essentially vicious killers to terrorize the region, thereby annexing land that could be sold to settlers. The sale of confiscated land was the primary revenue source for the new government.

The mercenaries captured three-hundred Red Stick wives and children and held them as hostages to induce Muskogee surrender. Of a thousand Red Stick and allied insurgents, eight-hundred were killed. Jackson lost forty-nine men. In the aftermath of “the Battle of Horseshoe Bend,” as it is known in US military annals, Jackson’s troops fashioned reins for their horses’ bridles from skin stripped from the Muskogee bodies, and they saw to it that souvenirs from the corpses were given “to the ladies of Tennessee.” Following the slaughter, Jackson justified his troops’ actions:

“The fiends of the Tallapoosa will no longer murder our women and children, or disturb the quiet of our borders. They have disappeared from the face of the Earth. How lamentable it

is that the path to peace should lead through blood, and over the carcasses of the slain! But it is in the dispensation of that providence, which inflicts partial evil to produce general good.”

Thomas Jefferson was the thinker and Jackson the doer in forging populist democracy for full participation in the fruits of colonialism based on the opportunity available to Anglo settlers. Jackson carried out the original plan envisioned by the founders—particularly Jefferson—initially as a Georgia militia leader, then as an army general who led four wars of aggression against the Muskogees in Georgia and Florida, and finally as a president who engineered the expulsion of all Native peoples east of the Mississippi to the designated “Indian Territory.”

The fledgling United States government’s method of dealing with native people—a process which then included systematic genocide, property theft, and total subjugation—reached its nadir in 1830 under the federal policy of President Andrew Jackson. More than any other president, he used forcible removal to expel the eastern tribes from their land. From the very birth of the nation, the United States government truly had carried out a vigorous operation of extermination and removal. Decades before Jackson took office, during the administration of Thomas Jefferson, it was already cruelly apparent to many Native American leaders that any hope for tribal autonomy was cursed. So were any thoughts of peaceful coexistence with white citizens.

Jackson was a national military hero, but he was rooted in the Scots-Irish frontier communities, most of whose people, unlike him, remained impoverished. Their small farms were hard-pressed to compete with large plantations with thousands of acres of cotton planted and each tended by hundreds of enslaved Africans. Land-poor white rural people saw Jackson as the man who would save them, making land available to them by ridding it of Indians, thereby setting the pattern of the dance between poor and rich in the US ever since under the guise of equality of opportunity.

Once elected president, Jackson lost no time in initiating the removal of all the Indigenous farmers and the destruction of all their towns in the South. In his first annual message to Congress, he wrote:

“The emigration should be voluntary, for it would be as cruel as unjust to compel the aborigines to abandon the graves of their fathers and seek a home in a distant land. But they should be distinctly informed that if they remain within the limits of the States they must be subject to their laws. In return for their obedience as individuals they will without doubt be protected

in the enjoyment of those possessions which they have improved by their industry.”

This political code language barely veils the intention to forcibly remove the Cherokee, Chickasaw, Choctaw, Muskogee, and Seminole Nations, followed by all other Indigenous communities from east of the Mississippi River.

The state of Georgia saw Jackson's election as a green light and claimed most of the Cherokee Nation's territory as public land. The Georgia legislature resolved that the Cherokee constitution and laws were null and void and that Cherokees were subject to Georgia law. The Cherokee Nation took a case against Georgia to the US Supreme Court. With Chief Justice John Marshall writing for the majority, the Court ruled in favor of the Cherokees. Jackson ignored the Supreme Court, however, in effect saying that John Marshall had made his decision and Marshall would have to enforce it if he could, although he, Jackson, had an army while Marshall did not. A tactic that any leftist president today would be wise to consider.

In the early nineteenth century, North Georgia was occupied mainly by Cherokees having acquired some lifestyle aspects of the ever-encroaching white settlers. In the Dawson Forest, they lived in houses, planted corn and cotton, and enjoyed the quiet, agricultural life. All was peaceful until August 1, 1829, when a newspaper in Milledgeville, the *Georgia Journal*, ran a short notice under the headline: **GOLD**. A gentleman in Habersham County had run across two previously discrete mining parties pulling gold out of the ground along the southeast slope of the Appalachian Mountain range. It had been noticed that gold was present on the downslope of the mountains in North and South Carolina, but this was proof that the deposit extended along a northeast-to-southwest line clean into Georgia, and the pickings were unusually good. The Cherokees, who happened to live on top of the gold, had known about it for a long time without overwhelming interest. They had demonstrated how to mine it to the Hernando de Soto expedition from Spain back in 1540, but nothing came of it.

Now, the news of gold mining hit a particular nerve at just the right time, and all hell broke loose. The first fully developed gold rush in the history of the New World commenced. In a short time, thousands of gold miners were sifting the sand in every creek on the south slope, and the boomtowns Auraria and Dahlonega, a day's walk north of the Dawson Forest, exploded into cities. By 1830, 300 ounces of gold were being mined per day on Cherokee land. The Cherokees, caught up in the excitement, laid down their plows and proceeded to dig up the Dawson Forest. The "Dahlonega Belt" happened to lay right across it, and it was blessed with the Amicalola

River, the Etowah River, and Shoal Creek providing the water necessary to process gold-bearing dirt. The State of Georgia saw an opportunity to both organize the mining operations and increase the state's treasury. The Dawson Forest was divided into 40-acre plots and sold to speculators by lottery. It was a fine idea, except that Indians happened to be living (and mining) on the land, and of that problem came the infamous Trail of Tears. Native Cherokees were persuaded by bayonet point and bribes of pure Georgia gold to relocate to a reservation laid out in Oklahoma, and it was a hard, tragic walk to get there.

Under General Winfield Scott's orders the troops were disposed at various points throughout the Cherokee country, where stockade forts were erected for gathering in and holding the Indians preparatory to removal. From these, squads of troops were sent to search out with rifle and bayonet every small cabin hidden away in the coves or by sides of mountain streams, to seize and bring in as prisoners all the occupants, however or wherever they might be found.

Families at dinner were startled by the sudden gleam of bayonets in the doorway and rose up to be driven with blows and oaths along the weary miles of trail that led to the stockade. Men were seized in their fields or going along the road, women were taken from their wheels and children from their play. In many cases, on turning for one last look as they crossed the ridge, they saw their homes in flames, fired by the lawless rabble that followed on the heels of the soldiers to loot and pillage.

So keen were these outlaws on the scene that in some instances they were driving off the cattle and other stock of the Indians almost before the soldiers had fairly started their owners in the other direction. Systematic hunts were made by the same men for Indian graves, to rob them of the silver pendants and other valuables deposited with the dead. A Georgia volunteer, afterward a colonel in the Confederate service, said:

“I fought through the civil war and have seen men shot to pieces and slaughtered by thousands, but the Cherokee removal was the cruelest work I ever knew.”

Half of the sixteen-thousand Cherokee men, women, and children who were rounded up and force-marched in the dead of winter out of their country perished on the journey. The Muskogees and Seminoles suffered similar death rates in their forced transfer, while the Chickasaws and Choctaws lost around 15 percent of their people en route.

An eyewitness account by Alexis de Tocqueville, the French observer of the day, captures one of thousands of similar scenes in the forced deportation of the Indigenous peoples from the Southeast:

“I saw with my own eyes several of the cases of misery which I have been describing; and I was the witness of sufferings which I have not the power to portray. At the end of the year 1831, whilst I was on the left bank of the Mississippi at a place named by Europeans Memphis, there arrived a numerous band of Choctaws (or Chactas, as they are called by the French in Louisiana). These savages had left their country, and were endeavoring to gain the right bank of the Mississippi, where they hoped to find an asylum which had been promised them by the American government.

It was then the middle of winter, and the cold was unusually severe; the snow had frozen hard upon the ground, and the river was drifting huge masses of ice. The Indians had their families with them; and they brought in their train the wounded and sick, with children newly born, and old men upon the verge of death. They possessed neither tents nor wagons, but only their arms and some provisions.

I saw them embark to pass the mighty river, and never will that solemn spectacle fade from my remembrance. No cry, no sob was heard amongst the assembled crowd; all were silent. Their calamities were of ancient date, and they knew them to be irremediable. The Indians had all stepped into the bark which was to carry them across, but their dogs remained upon the bank. As soon as these animals perceived that their masters were finally leaving the shore, they set up a dismal howl, and, plunging all together into the icy waters of the Mississippi, they swam after the boat.”

Sauk leader Black Hawk led his people back from a winter stay in Iowa to their homeland in Illinois in 1832 to plant corn, the squatter settlers there claimed they were being invaded, bringing in both Illinois militia and federal troops. The “Black Hawk War” that is narrated in history texts was no more than a slaughter of Sauk farmers. The Sauks tried to defend themselves but were starving when Black Hawk surrendered under a white flag. Still the soldiers fired, resulting in a bloodbath.

In his surrender speech, Black Hawk spoke bitterly of the enemy:

“You know the cause of our making war. It is known to all white men. They ought to be ashamed of it. Indians are not deceitful. The white men speak bad of the Indian and look at him spitefully. But the Indian does not tell lies. Indians do not steal. An Indian who is as bad as the white men could not live in

our nation; he would be put to death and eaten up by the wolves. We told them to leave us alone, and keep away from us; they followed on, and beset our paths, and they coiled themselves among us, like the snake. They poisoned us by their touch. We were not safe. We lived in danger.”

It's not that Jackson had a “dark side,” as his apologists rationalize and which all human beings have, but rather that Jackson was the Dark Knight in the formation of the United States as a colonialist, imperialist democracy, a dynamic formation that continues to constitute the core of US patriotism. The most revered presidents—Washington, Jefferson, Jackson, Lincoln, Wilson, both Roosevelts, Truman, Kennedy, Reagan, Clinton, Obama—have each advanced populist imperialism while gradually increasing inclusion of other groups beyond the core of descendants of old settlers into the ruling mythology. All the presidents after Jackson march in his footsteps. Consciously or not, they refer back to him on what is acceptable, how to reconcile democracy and genocide and characterize it as freedom for the people.

During the period of Jackson's military and executive power, a mythology emerged that defined the contours and substance of the US origin narrative, which has weathered nearly two centuries and remains intact in the early twenty-first century as patriotic cant, a civic religion invoked in Barack Obama's presidential inaugural address in January 2009:

“In reaffirming the greatness of our nation, we understand that greatness is never a given. It must be earned. Our journey has never been one of shortcuts or settling for less. It has not been the path for the faint-hearted, for those who prefer leisure over work, or seek only the pleasures of riches and fame. Rather, it has been the risk-takers, the doers, the makers of things—some celebrated, but more often men and women obscure in their labor—who have carried us up the long, rugged path towards prosperity and freedom.

For us, they packed up their few worldly possessions and traveled across oceans in search of a new life. For us, they toiled in sweatshops and settled the West, endured the lash of the whip and plowed the hard earth. For us, they fought and died in places like Concord and Gettysburg; Normandy and Khe Sanh. Time and again these men and women struggled and sacrificed and worked till their hands were raw so that we might live a better life. They saw America as bigger than the sum of our

individual ambitions; greater than all the differences of birth or wealth or faction. This is the journey we continue today.”

Spoken like a true descendant of old settlers. President Obama raised another key element of the national myth in an interview a few days later with Al Arabiya television in Dubai. Affirming that the United States could be an honest broker in the Israeli-Palestinian conflict, he said:

“We sometimes make mistakes. We have not been perfect. But if you look at the track record, as you say, America was not born as a colonial power.”

The affirmation of democracy requires the denial of colonialism, but denying it does not make it go away.

Traversing the continent “from sea to shining sea” was hardly a natural westward procession of covered wagons as portrayed in Western movies. The US invasion of Mexico was carried out by US marines, by sea, through Veracruz, and the early colonization of California initially progressed from the Pacific coast, reached from the Atlantic coast by way of Tierra del Fuego. Between the Mississippi River and the Rockies lay a vast region controlled by Indigenous nations that were neither conquered nor colonized by any European power, and although the United States managed to annex northern Mexico, large numbers of settlers could not reach the Northern California goldfields or the fertile Willamette Valley region of the Pacific Northwest without army regiments accompanying them.

Why then does the popular US historical narrative of a “natural” westward movement persist? The answer is that those who still hold to the narrative remain captives of the ideology of Manifest Destiny, according to which the United States expanded across the continent to assume its pre-ordained size and shape. This ideology normalizes the successive invasions and occupations of Indigenous nations and Mexico as not being colonialist or imperialist, rather simply ordained progress. In this view, Mexico was just another Indian nation to be crushed.

These California Franciscan missions and their founder, Junípero Serra, are extravagantly romanticized by modern California residents and remain popular tourist sites. Very few visitors notice, however, that in the middle of the plaza of each mission is a whipping post. The history symbolized by that artifact is not dead and buried with the generations of Indigenous bodies buried under the California crust. The scars and trauma have been passed on from generation to generation.

Putting salt in the wound, as it were, Pope John Paul II in 1988 beatified Junípero Serra, the first step toward sainthood. California Indigenous

peoples were insulted by this act and organized to prevent the sanctification of a person they consider to have been an exponent of rape, torture, death, starvation, and humiliation of their ancestors and the attempted destruction of their cultures. Serra would take soldiers with him, randomly kidnapping Indigenous individuals and families, recording these captures in his diaries, as in this instance:

“[When] one fled from between their [the soldiers’] hands, they caught the other. They tied him, and it was all necessary, for, even bound, he defended himself that they should not bring him, and flung himself on the ground with such violence that he scraped and bruised his thighs and knees. But at last they brought him. . . He was most frightened and very disturbed.”

In 1878, an old Kamia man named Janitin told an interviewer of his experience as a child:

“When we arrived at the mission, they locked me in a room for a week. Every day they lashed me unjustly because I did not finish what I did not know how to do, and thus I existed for many days until I found a way to escape; but I was tracked and they caught me like a fox.”

He was fastened to the stage and beaten to unconsciousness.

In a true reign of terror, US occupation and settlement exterminated more than one-hundred-thousand California Native people in twenty-five years, reducing the population to thirty-thousand by 1870—quite possibly the most extreme demographic disaster of all time.

The two-year invasion and occupation of Mexico was a joyful experience for most US citizens, as evidenced by Walt Whitman’s populist poetry. Its popularity was possible because of buoyant nationalism, and the war itself accelerated the spirit of nationalism and confirmed the manifest destiny of the United States. Besides new weapons of war and productive capacity brought about by the emerging industrial revolution, there was also an advance in printing and publishing techniques, which increased the book publishing market from \$2.5 million in 1830 to \$12.5 million in 1850.

Most of the books published during the five-year period leading up to, during, and after the invasion were war-mongering tracts. Euro-American settlers were nearly all literate, and this was the period of the foundational “American literature,” with writers James Fenimore Cooper, Walt Whitman, Edgar Allan Poe, John Greenleaf Whittier, Henry Wadsworth Longfellow, James Russell Lowell, Ralph Waldo Emerson, Henry David

Thoreau, Nathaniel Hawthorne, and Herman Melville all active—each of whom remains read, revered, and studied in the twenty-first century, as national and nationalist writers, not as colonialists.

Although some of the writers, like Melville and Longfellow, paid little attention to the war, most of the others either fiercely supported it or opposed it. Whitman, a supporter, was also enamored of the violent Indian- and Mexican-killing Texas Rangers. Whitman saw the war as bolstering US self-respect and believed that a “true American” would be unable to resist “this pride in our victorious armies.” Emerson opposed the war as he did all wars. His opposition to the Mexican War was based, however, not just on his pacifism but also on his belief that the Mexican “race” would poison Anglo-Americans through contact, the “heart of darkness” fear. Emerson supported territorial expansion at any cost but would have preferred it take place without war. Most of the writers of the era were obsessed with heroism.

Opposition to the Mexican War came from writers who were active abolitionists such as Thoreau, Whittier, and Lowell. They believed the war was a plot of southern slave owners to extend slavery, punishing Mexico for having outlawed slavery when it became independent from Spain. However, even the abolitionists believed in the “manifest destiny of the English race,” as Lowell put it in 1859, “to occupy this whole continent and to display there that practical understanding in matters of government and colonization which no other race has given such proof of possessing since the Romans.”

The domination of former Spanish territories in the Americas began not in 1898 with the Spanish-American War, as most history texts claim, but rather nearly a century before, during Jefferson’s presidency, with the Zebulon M. Pike expedition of 1806–7. Those historians who track “continental expansion” separately from clear actions of US imperialism rarely note the juxtaposition in time and presidential administration of the interventions in North Africa and Mexico on the eve of its liberation from Spain.

Like the Lewis and Clark expedition, completed the same year that Pike set off, the Pike expedition was a military project ordered by President Jefferson. Lewis and Clark had headed into the far reaches of the newly acquired Louisiana Territory to gather intelligence on the Mandan, Hidatsa, Paiute, Shoshone, Ute, and many other nations in the huge swath of territory between the Rockies and the Pacific, bordered by Spanish-occupied territory on the west and south and British Canada on the north. Pike and his small force of soldiers and Osage hostages had orders to illegally enter Spanish territory to gather information that would later be used for military invasion.

Under the guise of having gone astray, Pike and his contingent found

themselves inside Spanish-occupied northern New Mexico (today's southern Colorado), where they "discovered" Pikes Peak and built a fort. Ultimately, as they had undoubtedly planned, they were taken into custody by Spanish authorities who transported them to Chihuahua, Mexico, allowing Pike and his men to observe and make notes about northern Mexico on the way. More important, they collected information on Spanish military resources and behavior and the location of and relations among civilian populations. Pike was released, and in 1810 published his findings. Later titled *The Expeditions of Zebulon Montgomery Pike*, the book was a bestseller.

The US Army on the eve of the Civil War was divided into seven departments—a structure designed by John C. Calhoun during the Monroe administration. By 1860, six of the seven departments, comprising 183 companies, were stationed west of the Mississippi, a colonial army fighting the Indigenous occupants of the land. In much of the western lands, the army was the primary US government institution; the military roots to institutional development run deep.

President Abraham Lincoln was inaugurated in March 1861, two months after the South had seceded from the union. In April, the Confederate States of America (CSA) seized the army base at Fort Sumter near Charleston, South Carolina. Of more than a thousand US Army officers, 286 left to serve the CSA, half of them being West Point graduates, most of them Indian fighters, including Robert E. Lee. Three of the seven army department commanders took leadership of the Confederate Army. Based on demographics alone, the South had little chance of winning, so it is all the more remarkable that it persisted against the Union for more than four years. The 1860 population of the United States was nearly thirty-two million, with twenty-three-million in the twenty-two northern states, and about nine-million in the eleven southern states. More than a third of the nine-million Southerners were enslaved people of African heritage.

Abraham Lincoln's campaign for the presidency appealed to the vote of land-poor settlers who demanded that the government "open" Indigenous lands west of the Mississippi. They were called "freesoilers," in reference to cheap land free of slavery. New gold rushes and other incentives brought new waves of settlers to squat on Indigenous land. For this reason, some Indigenous people preferred a Confederate victory, which might divide and weaken the United States, which had grown ever more powerful. Indigenous nations in Indian Territory were more directly affected by the Civil War than anywhere else. The southeastern nations—the Cherokees, Muskokees, Seminoles, Choctaws, and Chickasaws ("Five Civilized Tribes")—were forcibly removed from their homelands during the Jackson administration, but in the Indian Territory they rebuilt their townships, farms, ranches,

and institutions, including newspapers, schools, and orphanages. Although a tiny elite of each nation was wealthy and owned enslaved Africans and private estates, the majority of the people continued their collective agrarian practices. All five nations signed treaties with the Confederacy, each for similar reasons. Within each nation, however, there was a clear division based on class, often misleadingly expressed as a conflict between “mixed-bloods” and “full-bloods.” That is, the wealthy, assimilated, slave-owning minority that dominated politics favored the Confederacy, and the non-slave-owning poor and traditional majority wanted to stay out of the Anglo-American civil war. Muskogee nationalism and well-founded distrust of federal power played a major role in bringing about that nation’s strategic alliance with the Confederacy.

“Was the Creek council’s alliance with the South a racist defense of slavery and its class privileges, or was it a nationalist defense of Creek lands and sovereignty? The answer has to be ‘both.’”

John Ross, principal chief of the Cherokee Nation, at first called for neutrality, but changed his mind for reasons similar to the Muskogees and asked the Cherokee council for authority to negotiate a treaty with the CSA. Nearly seven-thousand men of the five nations went into battle for the Confederacy. Stand Watie, a Cherokee, held the post of brigadier general in the Confederate Army. His First Indian Brigade of the Army of the Trans-Mississippi was among the last units in the field to surrender to the Union Army on June 23, 1865, more than two months after Lee’s surrender of the Army of Northern Virginia at Appomattox Courthouse in April 1865. During the war, however, many Indigenous soldiers became disillusioned and went over to the Union forces, along with enslaved African Americans who fled to freedom.

Another story is equally important, though less often told. A few months after the war broke out, some ten-thousand men in Indian Territory, made up of Indigenous volunteers, along with African Americans who had freed themselves and even some Anglo-Americans, engaged in guerrilla warfare against the Confederate Army. They fought from Oklahoma into Kansas, where many of them joined unofficial Union units that had been organized by abolitionists who had trained with John Brown years earlier. This was not likely the kind of war the Lincoln administration had desired—a multiethnic volunteer Union contingent fighting pro-slavery forces in Missouri, where enslaved Africans escaped to join the Union side. The self-liberation by African Americans, occurring all over the South, led to

Lincoln's 1863 Emancipation Proclamation, which allowed freed Africans to serve in combat.

In Minnesota, which had become a non-slavery state in 1859, the Dakota Sioux were on the verge of starvation by 1862. When they mounted an uprising to drive out the mostly German and Scandinavian settlers, Union Army troops crushed the revolt, slaughtering Dakota civilians and rounding up several hundred men. Three-hundred prisoners were sentenced to death, but upon Lincoln's orders to reduce the numbers, thirty-eight were selected at random to die in the largest mass hanging in US history. The revered leader Little Crow was not among those hanged, but was assassinated the following summer while out picking raspberries with his son; the assassin, a settler-farmer, collected a \$500 bounty.

One of the young Dakota survivors asked his uncle about the mysterious white people who would commit such crimes. The uncle replied:

“Certainly they are a heartless nation. They have made some of their people servants—yes, slaves. The greatest object of their lives seems to be to acquire possessions—to be rich. They desire to possess the whole world. For thirty years they were trying to entice us to sell them our land. Finally the outbreak gave them all, and we have been driven away from our beautiful country.”

By 1861, displaced and captive Cheyennes and Arapahos, under the leadership of the great peace seeker Black Kettle, were incarcerated in a US military reservation called Sand Creek, near Fort Lyon in southeastern Colorado. They camped under a white flag of truce and had federal permission to hunt buffalo to feed themselves. In early 1864, the Colorado territorial governor informed them that they could no longer leave the reservation to hunt. Despite their compliance with the order, on November 29, 1864, Chivington took seven-hundred Colorado Volunteers to the reservation. Without provocation or warning, they attacked, leaving dead 105 women and children and 28 men.

Even the federal commissioner of Indian affairs denounced the action, saying that the people had been “butchered in cold blood by troops in the service of the United States.” In its 1865 investigation, the Congress Joint Committee on the Conduct of the War recorded testimonies and published a report that documented the aftermath of the killings, when Chivington and his volunteers burned tepees and stole horses. Worse, after the smoke had cleared, they had returned and finished off the few survivors while scalping and mutilating the corpses—women and men, young and old, children, babies. Then they decorated their weapons and caps with body

parts—fetuses, penises, breasts, and vulvas—and, in the words of Acoma poet Simon Ortiz:

Stuck them
on their hats to dry
Their fingers greasy
and slick

Once back in Denver, they displayed the trophies to the adoring public in Denver's Apollo Theater and in saloons.

US Army colonel James Carleton formed the Volunteer Army of the Pacific in 1861, based in California. In Nevada and Utah, a California businessman, Colonel Patrick Connor, commanded a militia of a thousand California volunteers that spent the war years massacring hundreds of unarmed Shoshone, Bannock, and Ute people in their encampments. Carleton led another contingent of militias to Arizona to suppress the Apaches, who were resisting colonization under the great leader Cochise. At the time, Cochise observed:

“When I was young I walked all over this country, east and west, and saw no other people than the Apaches. After many summers I walked again and found another race of people had come to take it. How is it? Why is it that the Apaches wait to die—that they carry their lives on their finger nails? The Apaches were once a great nation; they are now but few. Many have been killed in battle.”

Following a scorched-earth campaign against the Apaches, Carleton was promoted to the rank of brigadier general and placed in command of the Department of New Mexico. He brought in the now-seasoned killing machine of Colorado Volunteers to attack the Navajos, on whom he declared total war. He enlisted as his principal commander in the field the ubiquitous Indian killer Kit Carson. With unlimited authority and answering to no one, Carleton spent the entire Civil War in the Southwest engaged in a series of search-and-destroy missions against the Navajos. The campaign culminated in March 1864 in a three-hundred-mile forced march of eight-thousand Navajo civilians to a military concentration camp at Bosque Redondo in the southeastern New Mexico desert, at the army base at Fort Sumner, an ordeal recalled in Navajo oral history as the “Long Walk.”

One Navajo named Herrero said:

“Some of the soldiers do not treat us well. When at work, if we stop a little they kick us or do something else. We do not

mind if an officer punishes us, but do not like to be treated badly by the soldiers. Our women sometimes come to the tents outside the fort and make contracts with the soldiers to stay with them for a night, and give them five dollars or something else. But in the morning they take away what they gave them and kick them off. This happens most every day.”

At least a fourth of the incarcerated died of starvation. Not until 1868 were the Navajos released and allowed to return to their homeland in what is today the Four Corners area. This permission to return was not based on the deadly conditions of the camp, rather that Congress determined that the incarceration was too expensive to maintain.

After the Civil War many Black soldiers, like their poor white counterparts, remained in the army and were assigned to segregated regiments sent west to crush Indigenous resistance. This reality strikes many as tragic, as if oppressed former slaves and Indigenous peoples being subjected to genocidal warfare should magically be unified against their common enemy, ‘the white man.’

In fact, this is precisely how colonialism in general and colonial warfare in particular work. It is not unique to the United States, but rather a part of the tradition of European colonialism since the Roman legions. The British organized whole armies of ethnic troops in South and Southwestern Asia, the most famous being the Gurkhas from Nepal, who fought as recently as Margaret Thatcher’s war against Argentina in 1983.

Buffalo soldiers were just another specially organized colonial military unit. Slaves and the black soldiers, who couldn’t read or write, had no idea of the historical deprivations and the frequent genocidal intent of the US government toward Native Americans. Free blacks, whether they could read and write, generally had no access to first-hand or second-hand unbiased information on the relationship. Most whites who had access often didn’t really care about the situation. It was business as usual in the name of Manifest Destiny. Most Americans viewed the Indians as incorrigible and non-reformable savages. Those closest to the warring factions or who were threatened by it, naturally wanted government protection at any cost.

In an effort to create Indigenous economic dependency and compliance in land transfers, the US policy directed the army to destroy the basic economic base of the Plains Nations—the buffalo. The buffalo were killed to near extinction, tens of millions dead within a few decades and only a few hundred left by the 1880s. Commercial hunters wanted only the skins, so left the rest of the animal to rot. Bones would be gathered and shipped

to the East for various uses. Mainly it was the army that helped realize slaughter of the herds.

Old Lady Horse of the Kiowa Nation could have been speaking for all the buffalo nations in her lament of the loss:

“Everything the Kiowas had came from the buffalo. Most of all, the buffalo was part of the Kiowa religion. A white buffalo calf must be sacrificed in the Sun Dance. The priests used parts of the buffalo to make their prayers when they healed people or when they sang to the powers above.

So, when the white men wanted to build railroads, or when they wanted to farm or raise cattle, the buffalo still protected the Kiowas. They tore up the railroad tracks and the gardens. They chased the cattle off the ranges. The buffalo loved their people as much as the Kiowas loved them. There was war between the buffalo and the white men. The white men built forts in the Kiowa country, and the woolly-headed buffalo soldiers shot the buffalo as fast as they could, but the buffalo kept coming on, coming on, even into the post cemetery at Fort Sill. Soldiers were not enough to hold them back.

Then the white men hired hunters to do nothing but kill the buffalo. Up and down the plains those men ranged, shooting sometimes as many as a hundred buffalo a day. Behind them came the skinners with their wagons. They piled the hides and bones into the wagons until they were full, and then took their loads to the new railroad stations that were being built, to be shipped east to the market. Sometimes there would be a pile of bones as high as a man, stretching a mile along the railroad track. The buffalo saw that their day was over. They could protect their people no longer.”

The longest military counterinsurgency in US history was the war on the Apache Nation, 1850–86. Goyathlay, known as Geronimo, famously led the final decade of Apache resistance. The Apaches and their Diné relatives, the Navajos, did not miss a beat in continuing resistance to colonial domination when the United States annexed their territory as a part of the half of Mexico taken in 1848. The Treaty of Guadalupe Hidalgo between the United States and Mexico, which sealed the transfer of territory, even stipulated that both parties were required to fight the “savage” Apaches. By 1877 the army had forced most Apaches into inhospitable desert reservations. Led by Geronimo, Chiricahua Apaches resisted incarceration in the San Carlos reservation

designated for them in Arizona. When Geronimo finally surrendered—he was never captured—the group numbered only thirty-eight, most of those women and children, with five-thousand soldiers in pursuit, which meant that the insurgents had wide support both north and south of the recently drawn US-Mexico border. Guerrilla warfare persists only if it has deep roots in the people being represented, the reason it is sometimes called “people’s war.” Obviously, the Apache resistance was not a military threat to the United States but rather a symbol of resistance and freedom. Herein lies the essence of counterinsurgent colonialist warfare: no resistance can be tolerated. The US imperative was annihilation unto total surrender.

Geronimo and three-hundred other Chiricahuas who were not even part of the fighting force were rounded up and transported by train under military guard to Fort Marion, in St. Augustine, Florida, to join hundreds of other Plains Indian fighters already incarcerated there. Remarkably, Geronimo negotiated an agreement with the United States so that he and his band would surrender as prisoners of war, rather than as common criminals as the Texas Rangers desired, which would have meant executions by civil authorities. The POW status validated Apache sovereignty and made the captives eligible for treatment according to the international laws of war. Geronimo and his people were transferred again, to the army base at Fort Sill in Indian Territory, and lived out their lives there. The US government had not yet created the term ‘unlawful combatant,’ which it would do in the early twenty-first century, depriving legitimate prisoners of war fair treatment under international law.

In 1875, Captain Richard Henry Pratt was in charge of transporting seventy-two captive Cheyenne and other Plains Indian warriors from the West to Fort Marion, an old Spanish fortress, dark and dank. After the captives were left shackled for a period in a dungeon, Pratt took their clothes away, had their hair cut, dressed them in army uniforms, and drilled them like soldiers. “Kill the Indian and save the man” was Pratt’s motto.

This “successful” experiment led Pratt to establish the Carlisle Indian Industrial School in Pennsylvania in 1879, the prototype for the many militaristic federal boarding schools set up across the continent soon after, augmented by dozens of Christian missionary boarding schools. The decision to establish Carlisle and other off-reservation boarding schools was made by the US Office of Indian Affairs, later renamed the Bureau of Indian Affairs (BIA).

The stated goal of the project was assimilation. Indigenous children were prohibited from speaking their mother tongues or practicing their religions, while being indoctrinated in Christianity. As in the Spanish missions in California, in the US boarding schools the children were beaten for speaking

their own languages, among other infractions that expressed their humanity. Although stripped of the languages and skills of their communities, what they learned in boarding school was useless for the purposes of effective assimilation, creating multiple lost generations of traumatized individuals.

Sun Elk was the first child from the very traditional Taos Pueblo to attend the Carlisle Indian Industrial School, spending seven years there beginning in 1883. After a harsh reentry into Taos society, he told his story:

“They told us that Indian ways were bad. They said we must get civilized. I remember that word too. It means ‘be like the white man.’ I am willing to be like the white man, but I did not believe Indians’ ways were wrong. But they kept teaching us for seven years. And the books told how bad the Indians had been to the white men—burning their towns and killing their women and children. But I had seen white men do that to Indians. We all wore white man’s clothes and ate white man’s food and went to white man’s churches and spoke white man’s talk. And so after a while we also began to say Indians were bad. We laughed at our own people and their blankets and cooking pots and sacred societies and dances.”

Corporal punishment was unknown in Indigenous families but was routine in the boarding schools. Often punishment was inflicted for being “too Indian”—the darker the child, the more often and severe the beatings. The children were made to feel that it was criminal to be Indian.

The idea of corporal punishment, so foreign to traditional Indian cultures, became a way of life for those students returning from their educational experience. You find by the thirties and forties in most Native communities, where large numbers of young people had, in the previous years, attended boarding schools, an increasing number of parents who utilized corporal punishment in the raising of their children, so that although you can’t prove a direct connection, I think you can certainly see that boarding school experiences, where corporal punishment was the name of the game, had their impact on the next generations of native people.

A woman whose mother experienced boarding school related the results:

“Probably my mother and her brothers and sisters were the first in our family to go to boarding school. And the stories she told were horrendous. There were beatings. There was a very young classmate—I don’t know how old they were, probably preschool or grade school—who lost a hand in having to clean this machine that baked bread or cut dough or something, and

having to kneel for hours on cold basement floors as punishment. My mother lived with a rage all her life, and I think the fact that they were taken away so young was part of this rage and how it—the fallout—was on us as a family.”

Sexual abuse of both girls and boys was also rampant. One woman remembers:

“We had many different teachers during those years; some got the girls pregnant and had to leave. One teacher would put his arms around and fondle this girl, sometimes taking her on his lap. When I got there, Mr. M put his arm around me and rubbed my arm all the way down. He rubbed his face against mine.”

At one mission school, a priest was known for his sexual advances:

“Anyway, I ended up beside him [the priest] and all of a sudden he started to feel my legs. I was getting really uncomfortable and he started trying to put his hands in my pants.”

Nuns also participated in sexual abuse:

“A nun was sponge bathing me and proceeded to go a little too far with her sponge bathing. So I pushed her hand away. She held my legs apart while she strapped the insides of my thighs. I never stopped her again.”

Disarmed, held in concentration camps, their children taken away, half starved, the Indigenous peoples of the West found a form of resistance that spread like wildfire in all directions from its source, thanks to a Paiute holy man, Wovoka, in Nevada. Pilgrims journeyed to hear his message and to receive directions on how to perform the Ghost Dance, which promised to restore the Indigenous world as it was before colonialism, making the invaders disappear and the buffalo return. It was a simple dance performed by everyone, requiring only a specific kind of shirt that was to protect the dancers from gunfire. In the twentieth century a Sioux anthropologist interviewed a sixty-year-old Sioux man who remembered the Ghost Dance he had witnessed fifty years before as a boy:

“Some fifty of us, little boys about eight to ten, started out across country over hills and valleys, running all night. I know now that we ran almost thirty miles. There on the Porcupine Creek thousands of Dakota people were in camp, all hurrying

about very purposefully. In a long sweat lodge with openings at both ends, people were being purified in great companies for the holy dance, men by themselves and women by themselves, of course.

The people, wearing the sacred shirts and feathers, now formed a ring. We were in it. All joined hands. Everyone was respectful and quiet, expecting something wonderful to happen. It was not a glad time, though. All wailed cautiously and in awe, feeling their dead were close at hand. The leaders beat time and sang as the people danced, going round to the left in a sidewise step. They danced without rest, on and on, and they got out of breath but still they kept going as long as possible.

Occasionally someone thoroughly exhausted and dizzy fell unconscious into the center and lay there 'dead.' Quickly those on each side of him closed the gap and went right on. After a while, many lay about in that condition. They were now 'dead' and seeing their dear ones. As each one came to, she, or he, slowly sat up and looked about, bewildered, and then began wailing inconsolably.

Waking to the drab and wretched present after such a glowing vision, it was little wonder that they wailed as if their poor hearts would break in two with disillusionment. But at least they had seen! The people went on and on and could not stop, day or night, hoping perhaps to get a vision of their own dead, or at least to hear the visions of others. They preferred that to rest or food or sleep. And so I suppose the authorities did think they were crazy—but they weren't. They were only terribly unhappy."

When the dancing began among the Sioux in 1890, reservation officials reported it as disturbing and unstoppable. They believed that it had been instigated by Hunkpapa Teton Sioux leader Tatanka Yotanka (Sitting Bull), who had returned with his people in 1881 from exile in Canada. He was put under arrest and imprisoned in his home, closely guarded by Indian police. Sitting Bull was killed by one of his captors on December 15, 1890.

All Indigenous individuals and groups living outside designated federal reservations were considered "fomenters of disturbance," as the War Department put it. Following Sitting Bull's death, military warrants of arrest were issued for leaders such as Big Foot, who was responsible for several hundred civilian refugees who had not yet turned themselves in to the designated Pine Ridge Reservation. When Big Foot heard of Sitting Bull's death and

that the army was looking for him and his people—350 Lakotas, 230 of them women and children—he decided to lead them through the subzero weather to Pine Ridge to surrender. En route on foot, they encountered US troops. The commander ordered that they be taken to the army camp at Wounded Knee Creek, where armed soldiers surrounded them. Two Hotchkiss machine guns were mounted on the hillside, enough firepower to wipe out the whole group. During the night, Colonel James Forsyth and the Seventh Cavalry, Custer's old regiment, arrived and took charge. These soldiers had not forgotten that Lakota relatives of these starving, unarmed refugees had killed Custer and decimated his troops at the Little Bighorn fourteen years earlier. With orders to transport the refugees to a military stockade in Omaha, Forsyth added two more Hotchkiss guns trained on the camp, then issued whiskey to his officers.

The following morning, December 29, 1890, the soldiers brought the captive men out from their campsites and called for all weapons to be turned in. Searching tents, soldiers confiscated tools, such as axes and knives. Still not satisfied, the officers ordered skin searches. A Winchester rifle turned up. Its young owner did not want to part with his beloved rifle, and, when the soldiers grabbed him, the rifle fired a shot into the air. The killing began immediately. The Hotchkiss guns began firing a shell a second, mowing down everyone except a few who were able to run fast enough. Three-hundred Sioux lay dead. Twenty-five soldiers were killed in friendly fire. Bleeding survivors were dragged into a nearby church. Being Christmastime, the sanctuary was candlelit and decked with greenery. In the front, a banner read: PEACE ON EARTH AND GOOD WILL TO MEN.

The Seventh Cavalry attack on a group of unarmed and starving Lakota refugees attempting to reach Pine Ridge to accept reservation incarceration in the frozen days of December 1890 symbolizes the end of Indigenous armed resistance in the United States. The slaughter is called a battle in US military annals. Congressional Medals of Honor were bestowed on twenty of the soldiers involved. A monument was built at Fort Riley, Kansas, to honor the soldiers killed by friendly fire. A battle streamer was created to honor the event and added to other streamers that are displayed at the Pentagon, West Point, and army bases throughout the world. L. Frank Baum, a Dakota Territory settler later famous for writing *The Wonderful Wizard of Oz*, edited the Aberdeen Saturday Pioneer at the time. Five days after the sickening event at Wounded Knee, on January 3, 1891, he wrote:

“The Pioneer has before declared that our only safety depends upon the total extermination of the Indians. Having wronged them for centuries we had better, in order to protect

our civilization, follow it up by one more wrong and wipe these untamed and untamable creatures from the face of the earth.”

Three weeks before the massacre, General Sherman made clear that he regretted nothing of his three decades of carrying out genocide. In a press conference he held in New York City, he said:

“Injins must either work or starve. They never have worked; they won’t work now, and they will never work.”

A reporter asked:

“But should not the government supply them with enough to keep them from starvation?”

Sherman replied:

“Why should the government support 260,000 able-bodied campers? No government that the world has ever seen has done such a thing.”

Another aspect of US economic development that affected the Indigenous nations of the West was merchant domination. All over the world, in European colonies distant from their ruling centers, mercantile capitalists flourished alongside industrial capitalists and militaries, and together they determined the mode of colonization. Mercantile houses, usually family-owned, were organized to carry goods over long stretches of water or sparsely populated lands to their destinations.

The merchants’ sources of commodities in remote regions were the nearby small farmers, loggers, trappers, and specialists such as woodworkers and metalsmiths. The commodities were then sent to industrial centers for credit against which money could be drawn. Thus, in the absence of a system of indirect credit, merchants could acquire scarce currency for the purchase of foreign goods. The merchant, thereby, became the dominant source of credit for the small operator as well as for the local capitalist.

Mercantile capitalism thrived in colonial areas, with many of the first merchant houses originating in the Levant among Syrians (Lebanese) and Jews. Even as mercantile capitalism waned in the twentieth century, it left its mark on Native reservations where the people relied on trading posts for credit, a market for their products, and commodities of all kinds—an opportunity for super-exploitation. Merchants and traders, often by intermarrying Indigenous women, also came to dominate Native governance on some reservations.

The corporation is an organization legally authorized by charter to act as a single individual, characterized by the issuance of stock and the limitation of liability of its stockholders to the amount of their respective investment. It was an artificial person that could not be held accountable in a manner familiar to the American Indian way of thinking. Individual responsibility could be masked in corporate personality—a legal abstraction.

“Industrial civilization” diminishes the relevance of persons or communities in its way and one should note that industrial civilization is not exactly the same as “industrialization,” that it is something quite different and more pervasive. Industrial civilization justified exploitation and destruction of whole societies and expansion without regard for the sovereignty of peoples; it promoted individualism, competition, and selfishness as righteous character traits.

“The defect of the reservation system was apparent. It is a socialist system and under that there is no enterprise to make your home any better than that of your neighbors. There is no selfishness, which is at the bottom of civilization. Till this people will consent to give up their lands, and divide among their citizens so that each can own the land he cultivates they will not make much more progress.”

The Hopi Nation resisted allotment with partial success. In 1894, they petitioned the federal government with a letter signed by every leader and chief of the Hopi villages:

“To the Washington Chiefs:

During the last two years strangers have looked over our land with spy-glasses and made marks upon it, and we know but little of what it means. As we believe that you have no wish to disturb our Possessions we want to tell you something about this Hopi land. None of us were asked that it should be measured into separate lots, and given to individuals for they would cause confusion.

The family, the dwelling house and the field are inseparable, because the woman is the heart of these, and they rest with her. Among us the family traces its kin from the mother, hence all its possessions are hers. The man builds the house but the woman is the owner, because she repairs and preserves it; the man cultivates the field, but he renders its harvest into the woman’s keeping, because upon her it rests to prepare the food,

and the surplus of stores for barter depends upon her thrift. A man plants the fields of his wife, and the fields assigned to the children she bears, and informally he calls them his, although in fact they are not. Even of the field which he inherits from his mother, its harvests he may dispose of at will, but the field itself he may not.”

The petition continues, explaining the matriarchal communal society and why dividing it up for private ownership would be unthinkable. Washington authorities never replied and the government continued to carve up the lands, finally giving up because of Hopi resistance. In the heart of New Mexico, the nineteen Indigenous city-states of the Pueblo Indians organized resistance under US occupation using the legal system as a means of survival, as they had under Spanish colonialism and in their relationship with the republic of Mexico. In the decades after they had lost their autonomous political status under Mexico and were counted as former Mexican citizens under US law, both Hispanos and Anglo squatters encroached upon the Pueblos’ ancestral lands. The only avenue for the Pueblos was to use the US court of private land claims. The following report reflects their status in the eyes of the Anglo-American judiciary:

“Occasionally the court room at Santa Fe would be enlivened by a squad of Indians who had journeyed thither from their distant Pueblos as witnesses for their grant. These delegations were usually headed by the governor of their tribe, who exhibited great pride in striding up to the witness stand and being sworn on the holy cross; wearing a badge on his breast, a broad red sash round his waist, and clad in a white shirt, the full tail of which hung about his Antarctic zone like the skirt of a ballet dancer, and underneath which depended his baggy white muslin trousers, a la Chinese washee-washee. The grave and imperturbable bow which the governor gave to the judges on the bench, in recognition of their equality with himself as official dignitaries, arrayed in that grotesque fashion, was enough to evoke a hilarious bray from a dead burro.”

Without redress for their collective land rights under the claims court, the Pueblos had no choice but to seek federal Indian trust status. After they lost in their first attempt, finally in 1913 the US Supreme Court reversed the earlier decision and declared the Pueblos wards of the federal government with protected trust status, stating:

“They are essentially a simple, uninformed, inferior people.”

Of the hundreds of lawsuits for federal trust mismanagement that Indigenous groups have filed, most since the 1960s, the largest and best known is the *Cobell v. Salazar* class-action suit, initially filed in 1996 and settled in 2011. The individual Indigenous litigants, from many Native nations, claimed that the US Department of the Interior, as trustee of Indigenous assets, had lost, squandered, stolen, and otherwise wasted hundreds of millions of dollars dating back to the forced land allotment beginning in the late 1880s.

By the end of 2009, it was clear that the case was headed for a decision favoring the Indigenous groups when the lead plaintiffs, representing nearly a half-million Indigenous individuals, accepted a \$3.4-billion settlement proposed by the Obama administration. The amount of the settlement was greater than the half-billion dollars that the court would likely have awarded. However, what was sacrificed in the settlement was a detailed accounting of the federal government’s misfeasance.

“The result will see some involved with the case, especially lawyers, become quite rich, while many Indians—the majority, in all likelihood—will receive about a third of what it takes to feed a family of four for just one year.”

On July 23, 1980, in *United States v. Sioux Nation of Indians*, the US Supreme Court ruled that the Black Hills had been taken illegally and that remuneration equal to the initial offering price plus interest—nearly \$106 million—be paid. The Sioux refused the award and continued to demand return of the Black Hills. The money remained in an interest-bearing account, which by 2010, amounted to more than \$757 million. The Sioux believe that accepting the money would validate the US theft of their most sacred land.

The Sioux Nation’s determination to repatriate the Black Hills attracted renewed media attention in 2011. A segment of the PBS NewsHour titled “For Great Sioux Nation, Black Hills Can’t Be Bought for \$1.3 Billion” aired on August 24. The reporter described a Sioux reservation as one of the most difficult places in which to live in the United States:

“Few people in the Western Hemisphere have shorter life expectancies. Males, on average, live to just 48 years old, females to 52. Almost half of all people above the age of 40 have diabetes. And the economic realities are even worse. Unemployment rates are consistently above 80 percent. In Shannon County, inside the

Pine Ridge Reservation, half the children live in poverty, and the average income is \$8,000 a year. But there are funds available, a federal pot now worth more than a billion dollars. That sits here in the US Treasury Department waiting to be collected by nine Sioux tribes. The money stems from a 1980 Supreme Court ruling that set aside \$105 million to compensate the Sioux for the taking of the Black Hills in 1877, an isolated mountain range rich in minerals that stretched from South Dakota to Wyoming.”

The only problem: The Sioux never wanted the money because the land was never for sale. Folks, this is what modern propaganda most often looks like.

From 2004 to 2006 the Osage Nation, located in northeastern Oklahoma, engaged in a contentious process of reform that produced a new constitution. The preamble reflects the extraordinary context and content of the new law:

“We the Wah-zha-zhe, known as the Osage People, having formed as Clans in the far distant past, have been a People and as a People have walked this earth and enjoyed the blessing of Wah-kon-tah for more centuries than we truly know. Having resolved to live in harmony, we now come together so that we may once more unite as a Nation and as a People, calling upon the fundamental values that we hold sacred: Justice, Fairness, Compassion, Respect for and Protection of Child, Elder, All Fellow Beings, and Self.

Paying homage to generations of Osage leaders of the past and present, we give thanks for their wisdom and courage. Acknowledging our ancient tribal order as the foundation of our present government, first reformed in the 1881 Constitution of the Osage Nation, we continue our legacy by again reorganizing our government. This Constitution, created by the Osage People, hereby grants to every Osage citizen a vote that is equal to all others and form a government that is accountable to the citizens of the Osage Nation. We, the Osage People, based on centuries of being a People, now strengthen our government in order to preserve and perpetuate a full and abundant Osage way of life that benefits all Osages, living and as yet unborn.”

Similarly, in 2009, the White Earth Nation of the Anishinaabeg (Ojibwe people) adopted a new constitution. White Earth is located in central Minnesota and is one of a number of Anishinaabe reservations in Minnesota,

with others in Wisconsin, South Dakota, and Canada. The preamble to the White Earth constitution is revealing:

“The Anishinaabeg of the White Earth Nation are the ancestors of a great tradition of continental liberty, a native constitution of families, totemic associations. The Anishinaabeg create stories of natural reason, of courage, loyalty, humor, spiritual inspiration, survivance, reciprocal altruism, and native cultural sovereignty. We the Anishinaabeg of the White Earth Nation in order to secure an inherent and essential sovereignty, to promote traditions of liberty, justice, and peace, and reserve common resources, and to ensure the inalienable rights of native governance for our posterity, do constitute, ordain, and establish this Constitution of the White Earth Nation.”

Gerald Vizenor, a citizen of the White Earth Nation participated in the writing of this constitution. Explaining the concept of “survivance,” a term he coined, he stresses that it originates in Indigenous narratives:

“The conventions of survivance create a sense of Native presence over nihility and victory. Survivance is an active presence: it is not absence, deracination, or ethnographic oblivion, and survivance is the continuance of narratives, not a mere reaction, however pertinent. Survivance stories are renunciations of dominance, the unbearable sentiments of tragedy, and the legacy of victimry.”

The Doctrine of Discovery is dissolving in light of these profound acts of sovereignty. But neither arcane colonial laws nor the historical trauma of genocide simply disappear with time, certainly not when conditions of life and consciousness perpetuate them. The Indigenous self-determination and sovereignty movement is not only transforming the continent’s Indigenous communities and nations but also, inevitably, the United States.

Facing the Fantasies

It's important to recognize that the same methods and strategies that were employed with the Indigenous peoples on the continent were mirrored abroad. While the Indigenous Americans were being brutally colonized, eliminated, relocated, and killed, the United States from its beginning was also pursuing overseas dominance.

Between 1798 and 1827, the United States intervened militarily twenty-three times from Cuba to Tripoli (Libya) to Greece. There were seventy-one overseas interventions between 1831 and 1896, on all continents, and the United States dominated most of Latin America economically, some countries militarily. The forty interventions and occupations between 1898 and 1919 were conducted with even more military heft but using the same methods and sometimes the same personnel.

US domination in the region has been virtually unchallenged for almost two-hundred years, ever since President James Monroe's 1823 doctrine proclaimed "the American continents are henceforth not to be considered as subjects for future colonization by any European powers." At the beginning of the twentieth century, President William Taft was more direct about US intentions:

"The day is not far distant when the whole hemisphere will be ours in fact as, by virtue of our superiority as a race, it already is ours morally."

In 1904 Roosevelt pronounced what has come to be known as the Roosevelt Corollary to the Monroe Doctrine. It mandated that any nation engaged in "chronic wrong-doing"—that is, did anything to threaten perceived US economic or political interests—would be disciplined militarily by the United States, which was to serve as an "international police power."

One of the first invasions of the twentieth century was actually carried out not by the US military but by a private one. The army's financial backing came from "Banana Man" Sam Zemurray. When Zemurray arrived in Honduras in 1905 from Mobile, Alabama, the country was already weak and debt-ridden from a British railway construction fraud that had produced no railway. Seizing the moment, the businessman launched a coup and replaced the Honduran government with one more "sensitive to Zemurray's every wish"—namely, land and tax concessions for his banana plantations. Within five years of arriving in Honduras, he controlled more than five-thousand acres of plantations. A few years later, it was fifteen-thousand. By 1913, Zemurray and his closest rivals, the Vacarro brothers from New

Orleans (whose Standard Fruit Company later became Dole), accounted for two thirds of Honduran exports. The banana companies bought up lands, built railroads, established their own banking systems, and bribed government officials at a dizzying pace. If Honduras was dependent on the fruit companies before 1912, it was virtually indistinguishable from them after 1912. In 1914 the leading banana firms held nearly a million acres of the most fertile land. Their holdings grew during the 1920s until the Honduran peasants had no hope of access to their nation's good soil. The wealth of the country was hauled off to the United States. Honduras was left with low-wage jobs in the banana groves and with proceeds from export duties, which were often evaded and, when they did get paid, were in any case mostly pocketed by a small group of Honduran elites.

In popular usage—the clothing company aside—the term nowadays mostly calls to mind buffoon-like Third World despots in the mold of Woody Allen's comedy, *Bananas*. We tend to forget its original meaning. After living in Honduras, the writer O. Henry coined the phrase to refer to weak, marginally independent countries facing overwhelming foreign economic and political domination. In other words, a banana republic is a colony in all but name.

Smedley Butler was a two-time winner of the Medal of Honor. As Hitler came to power, and the possibility of a new war in Europe became more tangible, Butler campaigned for neutrality. In 1935, he published a famous pamphlet—reprinted again and again in different versions up to 1941—“*War Is a Racket*,” in which he asserted that his own actions as a soldier had been, to his shame, dictated by the needs of war profiteers and big capital. In an earlier speech, Butler had confessed:

“I spent 33 years and four months in active military service and during that period I spent most of my time as a high class muscle man for Big Business, for Wall Street and the bankers. In short, I was a racketeer, a gangster for capitalism.

I helped make Mexico and especially Tampico safe for American oil interests in 1914. I helped make Haiti and Cuba a decent place for the National City Bank boys to collect revenues in. I helped in the raping of half a dozen Central American republics for the benefit of Wall Street. I helped purify Nicaragua for the International Banking House of Brown Brothers in 1902–1912. I brought light to the Dominican Republic for the American sugar interests in 1916. I helped make Honduras right for the American fruit companies in 1903. In China in 1927 I helped see to it that Standard Oil went on its way unmolested.

Looking back on it, I might have given Al Capone a few hints. The best he could do was to operate his racket in three districts. I operated on three continents.”

What has motivated the US politicians who have ordered and orchestrated foreign coups d’etat over the past century? Studying US involvement in regime change operations from Hawaii in 1893 to Iraq in 2003, there is often a clear three-stage process that takes place.

First, a US-based multinational corporation faces some kind of threat to its bottom line by the actions of a foreign government demanding that the company pay taxes or that it observe labor laws or environmental laws. Sometimes that company is nationalized or is somehow required to sell some of its land or its assets.

Second, US politicians hear of this corporate setback and reinterpret it as an attack on the United States. They transform the motivation from an economic one into a political or geostrategic one. They make the assumption that any regime that would bother an American company or harass an American company must be anti-American, repressive, dictatorial, and probably the tool of some foreign power or interest that wants to undermine the United States.

The third stage happens when the politicians have to sell the need for intervention to the public, at which point it becomes a broadly drawn struggle of good versus evil, a chance to free a poor oppressed nation from the brutality of a regime that we assume is a dictatorship, because what other kind of a regime would be bothering an American company?

Much of US foreign policy, in other words, is an exercise in mass projection, in which a tiny self-interested elite conflates its needs and desires with those of the entire world.

To keep control in American hands, US diplomacy has opposed any international court to mediate between debtor countries and bondholders, and has refused to submit to arbitration by the International Court of Justice in The Hague. This leaves no rules or global arbiter to assess how much creditors should lose when loans go bad.

Despite the ease with which US corporations can walk away from their creditors, no such leeway or adjustment exists when it comes to nations and their governments. The intent is to subordinate government power to Wall Street and London bankers.

Both sanctions and bombing give the illusion of precision, calibration, and the capacity to ratchet up coercion in a gradual escalation. And both have the capacity to cause tremendous suffering among innocent third parties

while having far less strategic effect than their advocates claim. Sanctions are economic warfare, plain and simple.

Take the case of Venezuela today. To be clear, this unforgivable atrocity rests predominantly on the shoulders of the Trump administration. Imagine if Trump deployed a barrage of Tomahawk missiles onto the most impoverished parts of a densely populated city in Venezuela, then hearing anyone say:

“Well Maduro actually exploded those people, because he wouldn’t do what we told him to do.”

Sanctions are a slower and more grueling weapon of war than bombs and missiles, but they’re vastly superior when it comes to the matter of keeping the public asleep through depraved acts of mass slaughter.

Public media in the West has denigrated BRICS meetings by asking what Russia, China, India, Brazil, and South Africa have in common. The answer is that they all are confronted with the threat of US, Eurozone, and IMF sanctions against countries that do not submit to creditor demands for privatization selloffs and tax shifts onto labor instead of finance and rent seeking. Debtor countries are expected to conduct their foreign trade, investment, and borrowing in dollars mediated by the US banking system, US courts, the US Treasury and State Department.

SWIFT (Society for Worldwide Interbank Financial Telecommunication), based in Brussels, is the global messaging service for thousands of banks all over the world: if a bank in the United States wants to send money to Italy or vice versa, SWIFT facilitates it. SWIFT’s governing board consists of the world’s biggest banks. The Treasury did not previously have access to the huge stream of financial data the system generates, but after the September 11th attacks, SWIFT acceded to US demands and began providing information. The loosening of regulations on interstate banking in the United States and the repeal of the act prohibiting institutions from being both commercial and investment banks has had the fortuitous consequence of giving a few American megabanks, Citigroup and JPMorgan Chase among them, membership on the SWIFT board. In their current role, these banks are a critical point of entry for any international flow of money in violation of sanctions. The American banks do not touch those transactions, and will avoid doing business with foreign banks that do. This has the effect of cutting off those foreign banks from doing business in the United States, or even being able to clear dollar-denominated transactions in the New York market. At the same time, the Treasury has an easier management task in having to deal only with a handful of megabanks with worldwide reach. Getting the big American banks to enforce sanctions is the

key to the system. Due to the heavy legal penalties for violating sanctions, the banks do it out of fear.

That fear may be softened, however, by a degree of recognition on both parts that the banks are now an essential cog in Washington's economic warfare machinery. While some foreign institutions with banking operations in America like HSBC and BNP Paribas have been hit with billion-dollar fines for money laundering and sanctions evasion, the American-based megabanks have avoided this fate. Moreover, they have evaded criminal prosecution for recent questionable domestic activities like mortgage fraud, robo-signings, and selling securities designed to fail, a far different outcome from the aftermath of the savings and loan crisis of the late 1980s, when numerous executives were convicted of crimes.

The 2002 edition of the National Security Strategy of the United States of America states:

“The great struggles of the twentieth century between liberty and totalitarianism ended with a decisive victory for the forces of freedom—a single sustainable model for national success: freedom, democracy, and free enterprise.”

Apart from the uncomfortable fact that feudal monarchies like Saudi Arabia and dictatorships like Egypt were linchpins of the US national security strategy, it appeared that evangelizing on behalf of a particular economic model had become a key component of America's national strategy. The military had become the coercive instrument of a US-led global economic order whose aim is to maintain unfettered access to raw materials and buttress a favorable climate for US investment. The free enterprise system—or, more accurately, its doctrinaire neoliberal interpretation—is not just a throwaway talking point in a national security strategy document that no one bothers to read. The United States uses its military muscle to sustain its economic model and dissuade other countries from deviating from its orthodoxies. For decades, a popular criticism of US foreign policy has been that it is all about oil. But oil is just one component (albeit a major one) of a larger objective: the maintenance of the current distributions of wealth and power.

Washington has always regarded democratic socialism as a greater threat than totalitarian Communism, which was easy to vilify and made for a handy enemy. In the sixties and seventies, the favored tactic for dealing with the inconvenient popularity of developmentalism and democratic socialism was to try to equate them with Stalinism, deliberately blurring the clear differences between the worldviews. Conflating all opposition with terrorism plays a similar role today.

A stark example of this strategy comes from the early days of the Chicago crusade, deep inside the declassified Chile documents. Despite the CIA-funded propaganda campaign painting Allende as a Soviet-style dictator, Washington's real concerns about the Allende election victory were relayed by Henry Kissinger in a 1970 memo to Nixon:

“The example of a successful elected Marxist government in Chile would surely have an impact on—and even precedent value for—other parts of the world, especially in Italy; the imitative spread of similar phenomena elsewhere would in turn significantly affect the world balance and our own position in it.”

In other words, Allende needed to be taken out before his democratic third way spread.

Salvador Allende died in a US-backed coup. Here's his final address, broadcast over the radio while he was barricaded in the presidential palace:

“My friends,

Surely this will be the last opportunity for me to address you. The Air Force has bombed the towers of Radio Portales and Radio Corporación.

My words do not have bitterness but disappointment. May they be a moral punishment for those who have betrayed their oath: soldiers of Chile, titular commanders in chief, Admiral Merino, who has designated himself commander of the Navy, and Mr. Mendoza, the despicable general who only yesterday pledged his fidelity and loyalty to the government, and who also has appointed himself chief of the Carabineros [national police].

Given these facts, the only thing left for me is to say to workers: I am not going to resign!

Placed in a historic transition, I will pay for loyalty to the people with my life. And I say to them that I am certain that the seed which we have planted in the good conscience of thousands and thousands of Chileans will not be shriveled forever. They have strength and will be able to dominate us, but social processes can be arrested neither by crime nor force. History is ours, and people make history.

Workers of my country: I want to thank you for the loyalty that you always had, the confidence that you deposited in a man who was only an interpreter of great yearnings for justice, who gave his word that he would respect the constitution and the law and did just that. At this definitive moment, the last

moment when I can address you, I wish you to take advantage of the lesson: foreign capital, imperialism, together with the reaction, created the climate in which the armed forces broke their tradition, the tradition taught by General Schneider and reaffirmed by Commander Araya, victims of the same social sector which will today be in their homes hoping, with foreign assistance, to retake power to continue defending their profits and their privileges.

I address, above all, the modest woman of our land, the campesina who believed in us, the worker who labored more, the mother who knew our concern for children. I address professionals of Chile, patriotic professionals, those who days ago continued working against the sedition sponsored by professional associations, class-based associations that also defended the advantages which a capitalist society grants to a few.

I address the youth, those who sang and gave us their joy and their spirit of struggle. I address the man of Chile, the worker, the farmer, the intellectual, those who will be persecuted, because in our country fascism has been already present for many hours—in terrorist attacks, blowing up the bridges, cutting the railroad tracks, destroying the oil and gas pipelines, in the face of the silence of those who had the obligation to protect them. They were committed. History will judge them.

Surely Radio Magallanes will be silenced, and the calm metal instrument of my voice will no longer reach you. It does not matter. You will continue hearing it. I will always be next to you. At least my memory will be that of a man of dignity who was loyal to the workers.

The people must defend themselves, but they must not sacrifice themselves. The people must not let themselves be destroyed or riddled with bullets, but they cannot be humiliated either.

Workers of my country, I have faith in Chile and its destiny. Other men will overcome this dark and bitter moment when treason seeks to prevail. Go forward knowing that, sooner rather than later, the great avenues will open again where free men will walk to build a better society.

Long live Chile! Long live the people! Long live the workers!

These are my last words, and I am certain that my sacrifice will not be in vain, I am certain that, at the very least, it will be a moral lesson that will punish felony, cowardice, and treason.”

I just don't see someone like Bernie Sanders as having the courage or integrity to do something like this.

“I had just one goal—to stay alive until the next day. But it wasn't just to survive, but to survive as me.”

—Mario Villani, *survivor of Argentina's torture camps*

In testimony from truth commission reports across the region, prisoners tell of a system designed to force them to betray the principle most integral to their sense of self. For most Latin American leftists, that most cherished principle was what Argentina's radical historian Osvaldo Bayer called “the only transcendental theology: solidarity.” The torturers understood the importance of solidarity well, and they set out to shock that impulse of social interconnectedness out of their prisoners. Of course all interrogation is purportedly about gaining valuable information and therefore forcing betrayal, but many prisoners report that their torturers were far less interested in the information, which they usually already possessed, than in achieving the act of betrayal itself. The point of the exercise was getting prisoners to do irreparable damage to that part of themselves that believed in helping others above all else, that part of themselves that made them activists, replacing it with shame and humiliation.

“People were in prison so that prices could be free.”

After the collapse of the USSR, a promise was made to the Poles and Russians—that if they followed shock therapy they would suddenly wake up in a “normal European country.” But those normal European countries—with their strong social safety nets, workers' protections, powerful trade unions and socialized health care—emerged as a compromise between Communism and capitalism. Now that there was no need for compromise, all those moderating social policies were under siege in Western Europe, just as they were under siege in Canada, Australia, and the US. Such policies were not about to be introduced in Russia, certainly not subsidized with Western funds.

This liberation from all constraints is Chicago School economics—otherwise known as neoliberalism or, to some, neoconservatism—not some new invention but capitalism stripped of its Keynesian appendages, capitalism in its monopoly phase, a system that has let itself go—that no longer has to work to keep us as customers, that can be as antisocial, antidemocratic, and boorish as it wants. As long as Communism was a threat, the gentleman's agreement that was Keynesianism would live on; once that

system lost ground, all traces of compromise could finally be eradicated, thereby fulfilling the purist goal Friedman had set out for his movement a half century earlier.

That was the real point of Fukuyama's dramatic "end of history" announcement at the University of Chicago lecture in 1989: he wasn't actually claiming that there were no other ideas in the world, but merely that, with Communism collapsing, there were no other ideas sufficiently powerful to constitute a head-to-head competitor.

The Chicago School crisis addicts were certainly on a speedy intellectual trajectory. Only a few years earlier, they had speculated that a hyperinflation crisis could create the shocking conditions required for shock policies. Now a chief economist at the World Bank, an institution funded, by this time, with money from 178 countries and whose mandate was to rebuild and strengthen struggling economies, was advocating the creation of failed states because of the opportunities they provided to start over in the rubble.

But this beast was not always able to be controlled. Time and again we see the backlash in the West—terrorism, migration. This is what Keynes had meant when he warned of the dangers of economic chaos—you never know what combination of rage, racism, and revolution will be unleashed.

Viewed in retrospect, indications that the Long Peace began almost immediately to give way to conditions antithetical to peace seem blindingly obvious. Prior to 9/11, however, the implications of developments like the 1993 bombing of the World Trade Center or the failure of the US military mission to Somalia that same year were difficult to discern. After all, these small events left unaltered what many took to be the defining reality of the contemporary era: the preeminence of the United States, which seemed beyond challenge. During the 1990s, at the urging of politicians and pundits, Americans became accustomed to thinking of their country as "the indispensable nation." Indispensability carried with it both responsibilities and privileges.

The chief responsibility was to preside over a grand project of political-economic convergence and integration commonly referred to as globalization. In point of fact, however, globalization served as a euphemism for soft, or informal, empire. The collapse of the Soviet Union appeared to offer an opportunity to expand and perpetuate that empire, creating something akin to a global Pax Americana.

The indispensable nation's chief privilege, self-assigned, was to establish and enforce the norms governing the post-Cold War international order. Even in the best of circumstances, imperial policing is a demanding task, requiring not only considerable acumen but also an abundance of determination. The preferred American approach was to rely, whenever possible, on "persuasion."

Yet if pressed, Washington did not hesitate to use force, as its numerous military adventures during the 1990s demonstrated.

The status of the United States as “sole superpower” appeared unassailable. Its dominance was unquestioned and unambiguous. This was not just hyper-nationalistic chest-thumping; it was the conventional wisdom. Recalling how Washington saw the post-Cold War world and America’s place in (or atop) it helps us understand why policy-makers failed to anticipate, deter, or deflect the terrorist attacks of September 11, 2001. A political elite preoccupied with the governance of empire paid little attention to protecting the United States itself. In practical terms, prior to 9/11 the mission of homeland defense was unassigned.

Odd as they may seem, these priorities reflected a core principle of national security policy: When it came to defending vital American interests, asserting control over the imperial periphery took precedence over guarding the nation’s own perimeter. After 9/11, the Bush administration affirmed this core principle. Although it cobbled together a new agency to attend to “homeland security,” the administration also redoubled its efforts to shore up the Pax Americana and charged the Department of Defense with focusing on this task. This meant using any means necessary to bring the Islamic world into conformity with prescribed American norms. Rather than soft and consensual, the approach to imperial governance became harder and more coercive.

In the Middle East, generations of diplomats had operated on the assumption that it was necessary to accept the limitations of Persian Gulf political economies in order to fuel America’s economy with reliable, relatively cheap oil supplies. In Africa, by contrast, generations of diplomats had operated on the assumption that all that mattered were the continent’s large, often intractable problems, such as disease and low-grade civil wars.

The distinguishing characteristic of “small wars” is not their scope or their duration but their purpose. Great powers wage small wars not to defend themselves but to assert control over foreign populations. Denominating an operation “Iraqi Freedom” or “Enduring Freedom” does not alter that reality. Historically, that is, small wars are imperial wars. The wars in which the United States currently finds itself engaged are no exception.

Seeing themselves as a peaceful people, Americans remain wedded to the conviction that the conflicts in which they find themselves embroiled are not of their own making. The global war on terror is exactly that. Certain of our own benign intentions, we reflexively assign responsibility for war to others, typically malignant Hitler-like figures inexplicably bent on denying us the peace that is our fondest wish.

Although critics of US foreign policy, and especially of the Iraq War, have

already advanced a variety of alternative explanations—variously fingering President Bush, members of his inner circle, jingoistic neoconservatives, greedy oil executives, or even the Israel lobby—many also find those explanations inadequate. Certainly, the president and his advisers, neocons always looking for opportunities to flex American military muscle, and the Israeli government always looking for a way to use the US against its enemies in the Middle East, bear considerable culpability for our current predicament. Yet to charge them with primary responsibility is to credit them with undeserved historical significance. It's the equivalent of blaming Herbert Hoover for the Great Depression or of attributing McCarthyism entirely to the antics of Senator Joseph McCarthy.

The impulses that have landed us in a war of no exits and no deadlines come from within. Foreign policy has, for decades, provided an outward manifestation of American domestic ambitions, urges, and fears. In our own time, it has increasingly become an expression of domestic dysfunction—an attempt to manage or defer coming to terms with contradictions besetting the American way of life. Those contradictions have found their ultimate expression in the perpetual state of war afflicting the United States today. Gauging their implications requires that we acknowledge their source: They reflect the accumulated detritus of freedom, the by-products of our frantic pursuit of life, liberty, and happiness. Freedom is the altar at which Americans worship, whatever their nominal religious persuasion.

To imagine that installing a particular individual in the Oval Office will produce decisive action on any of these fronts is to succumb to the grandest delusion of all. The quadrennial ritual of electing (or reelecting) a president is not an exercise in promoting change, regardless of what candidates may claim and ordinary voters believe. The real aim is to ensure continuity, to keep intact the institutions and arrangements that define present-day Washington. The veterans of past administrations who sign on as campaign advisers are not interested in curbing the bloated powers of the presidency. They want to share in exercising those powers. The retired generals and admirals who line up behind their preferred candidate don't want to dismantle the national security state. They want to preserve and, if possible, expand it. The candidates who decry the influence of money in national politics are among those most skilled at courting the well-heeled to amass millions in campaign contributions.

No doubt the race for the presidency matters. It just doesn't matter nearly as much as the media's obsessive coverage suggests. Whoever moves into the White House, the fundamental problem facing the country—a yawning disparity between what Americans expect and what they are willing or able to pay—will remain stubbornly in place. Any presidential initiatives

aimed at alleviating the crisis of profligacy, reforming our political system, or devising a more realistic military policy are likely, at best, to have a marginal effect.

Paradoxically, the belief that all (or even much) will be well, if only the right person assumes the reins as president serves to underwrite the status quo. Counting on the next president to fix whatever is broken promotes expectations of easy, no-cost cures, permitting ordinary citizens to absolve themselves of responsibility for the nation's predicament. The same Americans who profess to despise all that Washington represents look to—depending on partisan affiliation—a new John F. Kennedy or a new Ronald Reagan to set things right again. Rather than seeing the imperial presidency as part of the problem, they persist in the fantasy that a chief executive, given a clear mandate, will “change” the way Washington works and restore the nation to good health. Yet to judge by the performance of presidents over the past half century, including both Kennedy and Reagan—whose legacies are far more mixed than their supporters will acknowledge—a citizenry that looks to the White House for deliverance is assured of disappointment.

Even before Obama's inauguration, observers alert to the slightest hint of backsliding complained that the incoming national security team seemed less likely to challenge the status quo than to preserve it. Obama was quick to deflect this charge: He himself would function as the engine of transformation.

“Understand where the vision for change comes from, first and foremost. It comes from me. That's my job.”

This is a large responsibility for any single individual to take on. Given Obama's lack of understanding of history, the challenge he had set for himself was nothing short of daunting.

In Grant Park on November 4, Obama declared that the time had come for Americans “to put their hands on the arc of history and bend it once more toward the hope of a better day.” That our history has a discernible arc and that Americans possess the capacity to bend it to their will are propositions to which any number of earlier presidents—Obama's immediate predecessor not least among them—have fervently subscribed.

Politics requires artful dissembling. The Big Lies are not the pledges of tax cuts, universal health care, family values restored, or a world rendered peaceful through forceful demonstrations of American leadership. The Big Lies are the truths that remain unspoken: that freedom has an underside; that nations, like households, must ultimately live within their means; that history's purpose, the subject of so many confident pronouncements, remains

inscrutable. Above all, there is this: Power is finite. Politicians pass over matters such as these in silence. As a consequence, the absence of self-awareness that forms such an enduring element of the American character persists.

At four-year intervals, ceremonies conducted to install a president reaffirm this inclination. Once again, at the anointed hour, on the steps of the Capitol, it becomes “morning in America.” The slate is wiped clean. The newly inaugurated president takes office, buoyed by expectations that history will soon be restored to its proper trajectory and the nation put back on track. There is something touching about these expectations, but also something pathetic, like the battered wife who expects that this time her husband will actually keep his oft-violated vow never again to raise his hand against her. For the abused wife, a condition of dependence condemns her to continuing torment. Salvation begins when she rejects that condition and asserts control over her life. Something of the same can be said of the American people.

The centers of authority within Washington—above all, the White House and the upper echelons of the national security state—actually benefit from this dependency: It provides the source of status, power, and privileges. Imagine the impact just on the Pentagon were this country actually to achieve anything approaching energy independence. US Central Command would go out of business. Bases in and around the Middle East would close. The navy’s Fifth Fleet would stand down. Weapons contracts worth tens of billions would risk being canceled.

As long as Americans remain in denial—insisting that the power of the United States is without limits—they will remain unlikely to do any of these things. Instead, abetted by their political leaders, they will continue to fancy that some version of global war offers an antidote to Islamic radicalism. The United States will modernize and enhance its nuclear strike capabilities while professing outrage that others should seek similar capabilities. Americans will treat climate change as a problem to be nickel-and-dimed. They will guzzle imported oil, binge on imported goods, and indulge in imperial dreams. All the while, Washington will issue high-minded proclamations testifying to the approaching triumph of democracy everywhere and forever.

They will cling to a culture which makes ‘living standards’ the final norm of the good life and which regards the perfection of technology as the guarantor of every cultural as well as every social-moral value. Above all, they will venerate freedom while carefully refraining from assessing its content or measuring its costs. Adamantly insisting that it is unique among history’s great powers, the United States seems likely to follow the well-worn path taken by others, blind to the perils that it courts through its own feckless behavior.

For all nations, the desire to gain an immediate selfish advantage always imperils their ultimate interests. If they recognize this fact, they usually recognize it too late. Thus does the tragedy of our age move inexorably toward its conclusion. To the end of history social orders will probably destroy themselves in the effort to prove that they are indestructible. Clinging doggedly to the conviction that the rules to which other nations must submit don't apply, Americans appear determined to affirm this axiom of willful self-destruction.

To preserve that which we value most in the American way of life, therefore, requires modifying that way of life, discriminating between things that are essential and those that are not.

We will need courage to face the hidden fantasies, myths, and anxieties that make up the current hysterical crucible; we must look into our own psyches rather than to invisible enemies, devils, and alien invaders for the answers.

“What goes around, it comes back around. This your nation refuses to learn. It will keep creeping back in. You cannot give away your filth and prevent all creepage, no? Filth by its very nature it is a thing that is creeping always back.”

Exceptional America

American liberals and progressives talk a bit about white privilege, male privilege, straight privilege et cetera, but one thing I never hear them talk about is American privilege: the ability their nationality gives them to have a relationship with this world that the rest of us do not have.

American privilege is reassuring yourself that there are problems enough at home without worrying about the trillions your government's war machine is spending terrorizing the world and encircling the planet with military bases.

American privilege is reluctantly allowing the presidential candidates to have an eight-minute conversation about foreign policy in your presidential primary debates, when your country's military policy functionally dictates the affairs of rest of the world.

American privilege is arguing against the legality of assault weapons on the basis that they are "weapons of war," implying that they're fine as long as they're used to kill some foreigner's kids.

American privilege is being able to masturbate your outrage addiction over a racist joke while ignoring the way your military murders black and brown people by the tens of thousands every year.

American privilege is being able to lose your mind over someone using the wrong pronouns while paying no attention to the fact that your government pours your tax money and resources into governments and groups who hang gay people in the town square.

American privilege is believing your propaganda is the truth, and everyone else's understanding of the world is fake news.

American privilege is assuming your prudish Puritanical brand of sexuality is healthy and normal so it's no big deal that you insist that all English-speaking social media adheres to your creepy nipple-hating norms.

American privilege is telling foreigners to butt out of your politics when your politics are literally killing them.

American privilege is having a shit fit over election meddling in one social media post, while cheerleading regime change in the next.

American privilege is starting a war on a lie without being charged with a war crime.

American privilege is committing war crimes with impunity while jailing the whistleblowers and journalists who reveal them and still getting to call yourselves the good guys.

American privilege is being able to spend all day arguing online about domestic policy while the rest of the world, completely incapable of influencing your government's behavior, prays you don't get us all killed.

American privilege is only having a robust antiwar movement when your own citizens are at risk of being drafted, then completely forgetting about peace for decades while an increasingly robotic military force gives you even more peace of mind.

American privilege is being able to relax about war because your soldiers are being replaced with drones and proxy militias in US-driven conflicts, even though those kill people just as dead as manually operated killing machines.

American privilege is being hush-hush about the egregious imperialist stances of progressive candidates like Bernie Sanders because they have some decent domestic policies.

American privilege is black bloc protests against public appearances by figures like Milo Yiannopoulos and the Proud Boys while murderous war pigs like Bill Kristol, Henry Kissinger, John Bolton, David Frum, and arms industry executives go from appearance to appearance relatively unbothered. And now Bolton might even be a liberal hero.

American privilege is benefiting from cheap goods and oil and a strong dollar and never wondering how many innocent foreigners lost their lives and homes in the wars your government starts to make that so.

American privilege is living in a nation whose government can murder an entire family one day with explosives dropped from the sky, and yet you never hear about it because that isn't considered a newsworthy occurrence.

American privilege is being one of the worst-traveled populations in the world while having military bases in countries that most Americans wouldn't recognize the name of, let alone have been to.

American privilege is having your insane culture normalized around the world via Hollywood and other media so that nobody stops and wonders why we're letting this bat shit crazy nation rule our planet, and so no one makes you feel bad about your American privilege.

American privilege is living in a nation that uses its military and economic might to terrorize, murder, imprison, starve, and impoverish anyone who doesn't go along with its interests, and feeling no urgent need to bring a stop to this.

American privilege is being fine with being the world leader, but not being too bothered about what exactly that means.

“Truth was the majority vote of the nation that could lick all others.”

The United States has difficulty conceiving that ordinary people, on their own, could legitimately be hostile to American intentions and policies: somebody must be misleading them, and there is no such thing as a movement that can emerge spontaneously without hierarchical leadership.

When you go around to the dark back side of the nation, you see the shocking truth. There you see a nation whose core fundamentals have been hollowed out, replaced by balsa-wood stilts and wrapped in a frayed canvas of nationalism and bravado—a cloak similar to that worn by nearly every great superpower that has ever existed on the planet just before its own eventual collapse.

“I understand your point of view. However, in my opinion, it is misguided to a degree, for being utopian and non-pragmatic. You value freedom of choice and individual thought as a matter of principle. But is there really freedom of choice in these matters? And does keeping the state away from the process of of identity building make for a better society?”

Identity is perhaps the most fundamental aspect in the fabric of society. In a conflict you will identify with one side and against the other. Of course though there are multiple facets to one’s identity. Every person is multiple things at the same time. But the stronger the bond that unites you, compared to that which separates you, the more likely you are to avoid conflict.

In the end patriotism serves the purpose of stability. It creates a common bond that helps prevent an internal conflict. Without that bond you will just have multiple ‘tribes’ with a much higher potential for disputes among them. You can see this all too often in many other countries where the sense of patriotism is weak and sense of identity is mostly based on other traits.

And this is why, for instance, developing an European identity, not necessarily instead of but on top of national identities is so important and was defined as a major project after WWII—even though some people often forget what the major goal is and why. And this is also why it is so dangerous to create a society where

much of your citizens do not identify nor establish any kind of bond to their host nation (nor supra nation), as we appear to be doing in Europe to an extent.

Of course exacerbated patriotism can be used for bad. It can blind us to one's wrong doings, and make us stick together when we shouldn't. But the lesson shouldn't be that we must avoid it altogether, or keep the state away from it. The lesson should be that it is too fundamental a part of society to be neglected. We must prevent it to from being hijacked, by those inside or outside, and we must prevent it from being broken apart. Instead it must be kept functional and healthy at all times, and it is our responsibility to do so."

What is 'an American'? Do we have something important in common, as Americans, or is it just that we all happen to live inside the same boundaries and so have to obey the same laws? How exactly is America different from other countries? Is there really something unique about it? What does that uniqueness entail? We talk a lot about our special rights and freedoms, but are there also special responsibilities that come with being an American? If so, responsibilities to whom?

"We have two choices. Either we change the way we live, or we must change the way they live. We choose the latter."

—Donald Rumsfeld

"That's not the way the world really works anymore. We're an empire now, and when we act, we create our own reality. And while you're studying that reality—judiciously, as you will—we'll act again, creating other new realities, which you can study too, and that's how things will sort out."

The whole drama of history is enacted in a frame of meaning too large for human comprehension or management. Our dreams of managing history—born of a peculiar combination of arrogance and narcissism—pose a potentially mortal threat to the United States.

"Always with you this freedom! For your walled-up country, always to shout 'Freedom! Freedom!' as if it were obvious to all people what it wants to mean, this word. But look: it is not so simple as that. Your freedom is the freedom-from: no one tells your precious individual USA selves what they must do. It

is this meaning only, this freedom from constraint and forced duress.

But what of the freedom-to? Not just freedom-from. Not all compulsion comes from without. You pretend you do not see this. What of freedom-to. How for the person to freely choose? How to choose any but a child's greedy choices if there is no guide to inform, teach the person how to choose? How is there freedom to choose if one does not learn how to choose?

The rich father who can afford the cost of candy as well as food for his children: but if he cries out 'Freedom!' and allows his child to choose only what is sweet, eating only candy, not pea soup and bread and eggs, so his child becomes weak and sick: is the rich man who cries 'Freedom!' the good father?

This is what happens: you imagine the things I will say and then say them for me and then become angry with them. Without my mouth; it never opens. You speak to yourself, inventing sides. This itself is the habit of children: lazy, lonely, self. I am not even here, possibly, for listening to."

Freedom is not static, nor is it necessarily benign. In practice, freedom constantly evolves and in doing so generates new requirements and abolishes old constraints. The common understanding of freedom that prevailed in December 1941 when the United States entered the war against Imperial Japan and Nazi Germany has long since become obsolete. In some respects, this must be cause for celebration. In others, it might be cause for regret. The changes have been both qualitative and quantitative.

In many respects, Americans are freer today than ever before, with more citizens than ever before enjoying unencumbered access to the promise of American life. Yet, especially since the 1960s, the reinterpretation of freedom has had a transformative impact on our society and culture. That transformation has produced a paradoxical legacy. As individuals, our appetites and expectations have grown exponentially.

Whether the issue at hand is oil, credit, or the availability of cheap consumer goods, we expect the world to accommodate the American way of life. The resulting sense of entitlement has great implications for foreign policy. Simply put, as the American appetite for freedom has grown, so too has our penchant for empire. The connection between these two tendencies is a causal one. In an earlier age, Americans saw empire as the antithesis of freedom. Today, as illustrated above all by the Bush, Obama, and Trump administration's efforts to dominate the energy-rich Persian Gulf, empire has seemingly become a prerequisite of freedom.

There is a further paradox: The actual exercise of American freedom is no longer conducive to generating the power required to establish and maintain an imperial order. If anything, the reverse is true: Centered on consumption and individual autonomy, the exercise of freedom is contributing to the gradual erosion of our national power. At precisely the moment when the ability to wield power—especially military power—has become the *sine qua non* for preserving American freedom, our reserves of power are being depleted.

As individuals, Americans never cease to expect more. As members of a community, especially as members of a national community, they choose to contribute less. Expectations that the world beyond our borders should accommodate the American way of life are hardly new. Since 9/11, however, our demands have become more insistent. In that regard, the neoconservative writer Robert Kagan is surely correct in observing:

“America did not change on September 11. It only became more itself.”

Yet, as events have made plain, the United States is ill-prepared to wage a global war of no exits and no deadlines. The sole superpower lacks the resources—economic, political, and military—to support a large-scale, protracted conflict without, at the very least, inflicting severe economic and political damage on itself. American power has limits and is inadequate to the ambitions to which hubris and sanctimony have given rise.

Here is the central paradox of our time: While the defense of American freedom seems to demand that US troops fight in places like Iraq and Afghanistan and Syria and all over Africa, the exercise of that freedom at home undermines the nation’s capacity to fight. A grand bazaar provides an inadequate basis upon which to erect a vast empire. Meanwhile, a stubborn insistence on staying the course militarily ends up jeopardizing freedom at home. With Americans, even in wartime, refusing to curb their appetites, the Long War aggravates the economic contradictions that continue to produce debt and dependency. Moreover, a state of perpetual national security emergency aggravates the disorders afflicting our political system, allowing the executive branch to accrue ever more authority at the expense of the Congress and disfiguring the Constitution. In this sense, the Long War is both self-defeating and irrational.

History will not judge kindly a people who find nothing amiss in the prospect of endless armed conflict so long as they themselves are spared the effects. Nor will it view with favor an electorate that delivers political power into the hands of leaders unable to envision any alternative to perpetual

war. Rather than insisting that the world accommodate the United States, Americans need to reassert control over their own destiny, ending their condition of dependency and abandoning their imperial delusions. Of perhaps even greater difficulty, the combination of economic, political, and military crisis summons Americans to reexamine exactly what freedom entails. Soldiers cannot accomplish these tasks, nor should we expect politicians to do so. The onus of responsibility falls squarely on citizens.

One of the most pathetic aspects of human history is that every civilization expresses itself most pretentiously, compounds its partial and universal values most convincingly, and claims immortality for its finite existence at the very moment when the decay which leads to death has already begun.

If Americans still cherish the sentiments contained in Jefferson's Declaration of Independence, they have, over time, radically revised their understanding of those "inalienable rights." Today, individual Americans use their freedom to do many worthy things. Some read, write, paint, sculpt, compose, and play music. Others build, restore, and preserve. Still others attend plays, concerts, and sporting events, visit their local multiplexes, message each other incessantly, and join communities of the like-minded in an ever-growing array of virtual worlds. They also pursue innumerable hobbies, worship, tithe, and, in commendably large numbers, attend to the needs of the less fortunate.

Yet none of these in themselves define what it means to be an American in the twenty-first century. If one were to choose a single word to characterize that identity, it would have to be 'more.' For the majority of contemporary Americans, the essence of life, liberty, and the pursuit of happiness centers on a relentless personal quest to acquire, to consume, to indulge, and to shed whatever constraints might interfere with those endeavors. A bumper sticker, a sardonic motto, and a charge dating from the Age of Woodstock have recast the Jeffersonian trinity in modern vernacular: "Whoever dies with the most toys wins"; "Shop till you drop"; "If it feels good, do it."

It would be misleading to suggest that every American has surrendered to this ethic of self-gratification. Resistance to its demands persists and takes many forms. Yet dissenters, intent on curbing the American penchant for consumption and self-indulgence, are fighting a rear-guard action, valiant perhaps but unlikely to reverse the tide. The ethic of self-gratification has firmly entrenched itself as the defining feature of the American way of life. The point is neither to deplore nor to celebrate this fact, but simply to acknowledge it.

Few, however, have considered how an American preoccupation with 'more' has affected US relations with rest of the world. Yet the foreign policy implications of our present-day penchant for consumption and self-indulgence

are almost entirely negative. Over the past six decades, efforts to satisfy spiraling consumer demand have given birth to a condition of profound dependency. The United States may still remain the mightiest power the world has ever seen, but the fact is that Americans are no longer masters of their own fate. The ethic of self-gratification threatens the well-being of the United States. It does so not because Americans have lost touch with some mythical Puritan habits of hard work and self-abnegation, but because it saddles us with costly commitments abroad that we are increasingly ill-equipped to sustain while confronting us with dangers to which we have no ready response.

As the prerequisites of the American way of life have grown, they have outstripped the means available to satisfy them. Americans of an earlier generation worried about bomber and missile gaps, both of which turned out to be fictitious. The present-day gap between requirements and the means available to satisfy those requirements is neither contrived nor imaginary. It is real and growing. This gap defines the crisis of American profligacy.

Touring the United States in the 1830s, Alexis de Tocqueville, astute observer of the young Republic, noted the “feverish ardor” of its citizens to accumulate. Yet, even as the typical American “clutches at everything,” the Frenchman wrote, “he holds nothing fast, but soon loosens his grasp to pursue fresh gratifications.” However munificent his possessions, the American hungered for more, an obsession that filled him with “anxiety, fear, and regret, and keeps his mind in ceaseless trepidation.”

A crude way to put the whole thing is that our present culture is, both developmentally and historically, adolescent. And since adolescence is acknowledged to be the single most stressful and frightening period of human development—the stage when the adulthood we claim to crave begins to present itself as a real and narrowing system of responsibilities and limitations and when we yearn inside for a return to the same childish oblivion we pretend to scorn—it’s not difficult to see why we as a culture are so susceptible to art and entertainment whose primary function is escape—fantasy, adrenaline, spectacle, romance, et cetera. Americans come to art now essentially to escape ourselves—to pretend for a while that we’re not mice and walls are parallel and the cat can be outrun.

Preferring to remember their collective story somewhat differently, Americans look to politicians to sanitize their past. When, in his 2005 inaugural address, George W. Bush identified the promulgation of freedom as “the mission that created our nation,” neoconservative hearts certainly beat a little faster, as they undoubtedly did when he went on to declare that America’s “great liberating tradition” now required the United States to devote itself to “ending tyranny in our world.” Yet Bush was simply putting his own gloss

on a time-honored conviction ascribing to the United States a uniqueness of character and purpose. From its founding, America has expressed through its behavior and its evolution a providential purpose. Paying homage to, and therefore renewing, this tradition of American exceptionalism has long been one of the presidency's primary extra-constitutional obligations.

The movie business is just that—a business. Its purpose is to make money. If once in a while a studio produces a film of aesthetic value, that may be cause for celebration, but profit, not revealing truth and beauty, defines the purpose of the enterprise. Something of the same can be said of the enterprise launched on July 4, 1776. The hardheaded lawyers, merchants, farmers, and slave-holding plantation owners gathered in Philadelphia that summer did not set out to create a church. They founded a republic. Their purpose was not to save mankind. It was to ensure that people like themselves enjoyed unencumbered access to the Jeffersonian trinity.

In the years that followed, the United States achieved remarkable success in making good on those aims. Yet never during the course of America's transformation from a small power to a great one did the United States exert itself to liberate others—absent an overriding perception that the nation had large security or economic interests at stake. From time to time, although not nearly as frequently as we like to imagine, some of the world's unfortunates managed as a consequence to escape from bondage. The Civil War did, for instance, produce emancipation. Yet to explain the conflagration of 1861–65 as a response to the plight of enslaved African Americans is to engage at best in an immense oversimplification. Near the end of World War II, GIs did liberate the surviving inmates of some Nazi death camps. Yet for those who directed the American war effort of 1941–45, the fate of European Jews never figured as more than an afterthought. Plus, the Russians did most of the work.

Crediting the United States with a “great liberating tradition” distorts the past and obscures the actual motive force behind American politics and US foreign policy. It transforms history into a morality tale, thereby providing a rationale for dodging serious moral analysis. To insist that the liberation of others has never been more than an ancillary motive of US policy is not cynicism; it is a prerequisite to self-understanding.

I have believed for a long time that there is no bridge too far to cross, no enormity so great that it would end our ideas of American exceptionalism, an innocence that the “resisters” are feeding into, strengthening it all the time, even as the noose tightens around our necks.

“When it came to action rather than talk, even the policy-makers viewed as most idealistic remained fixated on one overrid-

ing aim: enhancing American influence, wealth, and power. The record of US foreign relations from the earliest colonial encounters with Native Americans to the end of the Cold War is neither uniquely high-minded nor uniquely hypocritical and exploitive. In this sense, the interpretations of America's past offered by both George W. Bush and Osama bin Laden fall equally wide of the mark. As a rising power, the United States adhered to the iron laws of international politics, which allow little space for altruism. If the tale of American expansion contains a moral theme at all, that theme is necessarily one of ambiguity."

I was especially amused by Krugman's argument that American hypocrisy is actually symbolic of its virtue. We "were aware at some level that our treatment of blacks was at odds with our principles," which shows that we have principles that we were "honoring in the breach," as if being aware that you're doing something wrong and doing it anyway makes you a better person. I think we can see here a good example of the extreme moral contortions that are necessary to avoid concluding that the United States has historically been a self-interested country largely indifferent to the welfare of anyone other than its ruling majority. Any neutral evaluator would have to say that self-interest has been a far larger force in determining US policy than "idealism," and the favored American economic theories even imply this, but it would spoil the liberal image of the United States as a well-meaning democracy that makes occasional missteps in its ongoing effort to spread goodness and light.

Here we see the double edge of our uniquely American brand of nationalism. We are raised to be exceptionalists, to think we are the better nation with the manifest destiny to rule. The danger is that some people will actually believe this claim, and some of those will expect the manifestation of our national identity, that is, our government, to comport itself accordingly.

All modern nation-states claim a kind of rationalized origin story upon which they fashion patriotism or loyalty to the state. When citizens of modern states and their anthropologists and historians look at what they consider "primitive" societies, they identify their "origin myths," quaint and endearing stories, but fantastic ones, not grounded in "reality." Yet many US scholars seem unable (or unwilling) to subject their own nation-state's founding story to the same objective examination.

The United States is not unique among nations in forging an origin myth, but most of its citizens believe it to be exceptional among nation-states, and this exceptionalist ideology has been used to justify appropriation of the continent and then domination of the rest of the world. It is one of the

few states founded on the covenant of the Hebrew Torah, or the Christian borrowing of it in the Old Testament of the Bible. Other covenant states are Israel and the now-defunct apartheid state of South Africa, both of which were founded in 1948. Although the origin stories of these three covenant states were based on Judeo-Christian scripture, they were not founded as theocracies. According to the myths, the faithful citizens come together of their own free will and pledge to each other and to their god to form and support a godly society, and their god in turn vouchsafes them prosperity in a promised land.

Certain societies, in certain eras of their development have looked to the scriptures for guidance, the scriptures operating culturally in much the same way as the human genetic code operates physiologically. That is, this great code has, to some degree, directly determined what people would believe and when they would think and what they would do.

In other modern constitutional states, constitutions come and go, and they are never considered sacred in the manner patriotic US citizens venerate theirs. Great Britain has no written constitution. The Magna Carta arguably comes close, but it does not reflect a covenant. US citizens did not inherit their cult-like adherence to their constitution from the English. From the Pilgrims to the founders of the United States and continuing to the present, the cultural persistence of the covenant idea, and thus the bedrock of US patriotism, represents a deviation from the main course in the development of national identities.

Arguably, both the 1948 birth of the state of Israel and advent of Nationalist Party rule of South Africa were emulations of the US founding; certainly many US Americans closely identify with the state of Israel, as they did with Afrikaner-ruled South Africa. Patriotic US politicians and citizens take pride in “exceptionalism.” Historians and legal theorists characterize US statecraft and empire as those of a “nation of laws,” rather than one dominated by a particular class or group of interests, suggesting a kind of holiness.

Granting the traditionally marginalized access to freedom constitutes a central theme of American politics since World War II. It does not diminish the credit due to those who engineered this achievement to note that their success stemmed, in part, from the fact that the United States was simultaneously asserting its claim to unquestioned global preeminence. From World War II into the 1960s, more power abroad meant greater abundance at home, which, in turn, paved the way for greater freedom. The reformers who pushed and prodded for racial equality and women’s rights did so in tacit alliance with the officials presiding over the post-war rehabilitation of Germany and Japan, with oil executives pressing to bring the Persian Gulf

into America's sphere of influence, and with defense contractors urging the procurement of expensive new weaponry.

The creation, by the 1950s, of an informal American empire of global proportions was not the result of a conspiracy designed to benefit the few. Post-war foreign policy derived its legitimacy from a widely shared perception that power was being exercised abroad to facilitate the creation of a more perfect union at home. In this sense, General Curtis LeMay's nuclear strike force, the Strategic Air Command (SAC)—as a manifestation of American might as well as a central component of the post-war military-industrial complex—helped foster the conditions from which Betty Friedan's National Organization for Women emerged. A proper understanding of contemporary history means acknowledging an ironic kinship between hard-bitten Cold Warriors like General LeMay and left-leaning feminists like Ms. Friedan. SAC helped make possible the feminine mystique and much else besides.

In the 1960s, however, the empire of production began to come undone. Within another twenty years—thanks to permanently negative trade balances, a crushing defeat in Vietnam, oil shocks, “stagflation,” and the shredding of a moral consensus that could not withstand the successive assaults of Elvis Presley, “the pill,” and the counterculture, along with news reports that God had died—it had become defunct. In its place there emerged a new Empire of Consumption. Just as the lunch-bucket-toting factory worker had symbolized the empire of production during its heyday, the teenager, daddy's credit card in her blue jeans and headed to the mall, now emerged as the empire of consumption's emblematic figure. The evil genius of the empire of production was Henry Ford. In the empire of consumption, Ford's counterpart was Walt Disney.

Prior to the 1970s, because the United States had long been the world's number one producer of petroleum, American oil companies determined the global price of oil. In 1972, domestic oil production peaked and then began to decline. The year before, the prerogative of setting the price of crude oil had passed into the hands of a new producers' group, the Organization of the Petroleum Exporting Countries (OPEC).

By the late 1970s, a period of slow growth and high inflation, the still-forming crisis of profligacy was already causing real distress in American households. The first protracted economic downturn since World War II confronted Americans with a fundamental choice. They could curb their appetites and learn to live within their means or deploy dwindling reserves of US power in hopes of obliging others to accommodate their penchant for conspicuous consumption. Between July 1979 and March 1983, a fateful interval bookended by two memorable presidential speeches, they opted decisively for the latter.

Here lies the true pivot of contemporary American history, far more relevant to our present predicament than supposedly decisive events like the fall of the Berlin Wall or the collapse of the Soviet Union. Between the summer of 1979 and the spring of 1983, “global leadership,” the signature claim of US foreign policy, underwent a subtle transformation. Although the United States kept up the pretense that the rest of the world could not manage without its guidance and protection, leadership became less a choice than an imperative. The exercise of global primacy offered a way of compensating for the erosion of a previously dominant economic position. Yet whatever deference Washington was able to command could not conceal the extent to which the United States itself was becoming increasingly beholden to others. Leadership now carried connotations of dependence.

Carter began by explaining that he had decided to look beyond energy because “the true problems of our Nation are much deeper.” The energy crisis of 1979, he suggested, was merely a symptom of a far greater crisis.

“So, I want to speak to you first tonight about a subject even more serious than energy or inflation. I want to talk to you right now about a fundamental threat to American democracy.”

In short order, he then proceeded to kill any chance he had of securing reelection. In American political discourse, fundamental threats are by definition external. Nazi Germany, Imperial Japan, or international communism could threaten the United States. That very year, Iran’s Islamic revolutionaries had emerged to pose another such threat. That the actions of everyday Americans might pose a comparable threat amounted to rank heresy.

Yet Carter now dared to suggest that the real danger to American democracy lay within. The nation as a whole was experiencing “a crisis of confidence,” he announced.

“It is a crisis that strikes at the very heart and soul and spirit of our national will. We can see this crisis in the growing doubt about the meaning of our own lives and in the loss of a unity of purpose for our nation.”

This erosion of confidence threatened “to destroy the social and the political fabric of America.” Americans had strayed from the path of righteousness.

“In a nation that was proud of hard work, strong families, close-knit communities, and our faith in God, too many of us

now tend to worship self-indulgence and consumption. Human identity is no longer defined by what one does, but by what one owns. But we've discovered that owning things and consuming things does not satisfy our longing for meaning. We've learned that piling up material goods cannot fill the emptiness of lives which have no confidence or purpose."

In other words, the spreading American crisis of confidence was an outward manifestation of an underlying crisis of values. With his references to what "we've discovered" and what "we've learned," Carter implied that he was merely voicing concerns that his listeners already shared: that average Americans viewed their lives as empty, unsatisfying rituals of buying, and longed for something more meaningful.

To expect Washington to address these concerns was, he made clear, fanciful. According to the president, the federal government had become "an island," isolated from the people. Its major institutions were paralyzed and corrupt. It was "a system of government that seems incapable of action." Carter spoke of "a Congress twisted and pulled in every direction by hundreds of well financed and powerful special interests." Partisanship routinely trumped any concern for the common good:

"You see every extreme position defended to the last vote, almost to the last breath by one unyielding group or another. We are at a turning point in our history. There are two paths to choose. One is a path I've warned about tonight, the path that leads to fragmentation and self-interest. Down that road lies a mistaken idea of freedom, the right to grasp for ourselves some advantage over others. That path would be one of constant conflict between narrow interests ending in chaos and immobility."

The continued pursuit of this mistaken idea of freedom was "a certain route to failure." The alternative—a course consistent with "all the traditions of our past [and] all the lessons of our heritage"—pointed down "another path, the path of common purpose and the restoration of American values." Down that path, the president claimed, lay "true freedom for our Nation and ourselves."

Far more accurately than Jimmy Carter, Reagan understood what made Americans tick: They wanted self-gratification, not self-denial. Although always careful to embroider his speeches with inspirational homilies and testimonials to old-fashioned virtues, Reagan mainly indulged American self-indulgence.

Embedded in Reagan's remarks were two decidedly radical propositions: first, that the minimum requirements of US security now required the United States to achieve a status akin to invulnerability; and second, that modern technology was bringing this seemingly utopian goal within reach. Star Wars, in short, introduced into mainstream politics the proposition that Americans could be truly safe only if the United States enjoyed something akin to permanent global military supremacy.

Pledges of benign intent concealed the full implications of Star Wars. To skeptics—nuclear strategists worried that the pursuit of strategic defenses might prove “destabilizing”—Reagan offered categorical assurances:

“The defense policy of the United States is based on a simple premise: The United States does not start fights. We will never be an aggressor. We maintain our strength in order to deter and defend against aggression—to preserve freedom and peace.”

According to Reagan, the employment of US forces for anything but defensive purposes was simply inconceivable.

“Every item in our defense program—our ships, our tanks, our planes, our funds for training and spare parts—is intended for one all-important purpose: to keep the peace.”

In international politics, the chief danger of hypocrisy is that it inhibits self-understanding. The hypocrite ends up fooling mainly himself.

American profligacy during the 1980s had a powerful effect on foreign policy. The impact manifested itself in two ways. On the one hand, Reagan's willingness to spend without limit helped bring the Cold War to a peaceful conclusion. On the other hand, American habits of conspicuous consumption, encouraged by Reagan, drew the United States ever more deeply into the vortex of the Islamic world, saddling an increasingly energy-dependent nation with commitments that it could neither shed nor sustain. By expending huge sums on an arsenal of high-tech weapons, Reagan nudged the Kremlin toward the realization that the Soviet Union could no longer compete with the West. By doing nothing to check the country's reliance on foreign oil, he laid a trap into which his successors would stumble. If Reagan deserves plaudits for the former, he also deserves to be held accountable for the latter.

Preferring to compartmentalize history into pre-9/11 and post-9/11 segments, Americans remain oblivious to the consequences that grew out of Ronald Reagan's collaboration with the mujahedeen. Seldom has a seemingly successful partnership so quickly yielded poisonous fruit. The

paths of “progress” proved to be more devious and unpredictable than the putative managers of history could understand.

Prior to 1981, the Persian Gulf had lagged behind Western Europe and Northeast Asia in the Pentagon’s hierarchy of strategic priorities. By 1989, it had pulled even. Soon thereafter, it became priority number one.

US involvement in the so-called Tanker War, now all but forgotten, provided a harbinger of things to come. As an ancillary part of their war of attrition, Iran and Iraq had begun targeting each other’s shipping in the Gulf. Attacks soon extended to neutral vessels, with each country determined to shut down its adversary’s ability to export oil. Intent on ensuring that the oil would keep flowing, Reagan reinforced the US naval presence in the region. The waters of the Gulf became increasingly crowded.

Then in May 1987, an Iraqi missile slammed into the frigate USS Stark, killing thirty-seven sailors. Saddam Hussein described the attack as an accident and apologized. Reagan generously accepted Saddam’s explanation and blamed Iran for the escalating violence. That same year, Washington responded favorably to a Kuwaiti request for the US Navy to protect its tanker fleet. When, in the course of escort operations in April 1988, the USS Samuel B. Roberts struck an Iranian mine, suffering serious damage, Reagan upped the ante. US forces began conducting attacks on Iranian warships, naval facilities, and oil platforms used for staging military operations. Iranian naval operations in the Gulf soon ceased, although not before an American warship had mistakenly shot down an Iranian commercial airliner, with the loss of nearly three-hundred civilians.

The Reagan administration congratulated itself on having achieved a handsome victory. For a relatively modest investment—the thirty-seven American sailors killed on the Stark were forgotten almost as quickly as the doomed passengers on Iran Air Flight 655—the United States had seemingly demonstrated its ability to keep open the world’s oil lifeline. But appearance belied a more complex reality. From the outset, Saddam Hussein had been the chief perpetrator of the Tanker War. Reagan’s principal accomplishment had been to lend Saddam a helping hand—at substantial moral cost to the United States.

The slightest suggestion that the United States ought to worry less about matters abroad and more about setting its own house in order elicits from the political elite, Republicans and Democrats alike, shrieks of “isolationism,” the great imaginary sin to which Americans are allegedly prone. Appeasement! Hitler! Yet to begin to put our house in order would be to open up a whole new array of options, once again permitting the United States to “choose peace or war, as our interest, guided by justice, shall counsel.”

Long accustomed to thinking of the United States as a superpower,

Americans have yet to realize that they have forfeited command of their own destiny. The reciprocal relationship between expansionism, abundance, and freedom—each reinforcing the other—no longer exists. If anything, the reverse is true: Expansionism squanders American wealth and power, while putting freedom at risk. Rather than confronting this reality head-on, American grand strategy since the era of Ronald Reagan, and especially throughout the era of George W. Bush, has been characterized by attempts to wish reality away. The fiasco of the Iraq War and the quasi-permanent US occupation of Afghanistan illustrate the results and prefigure what is yet to come if the crisis of American profligacy continues unabated.

The Bush Doctrine provided the ultimate rationale for invading Iraq. Wolfowitz and others in the administration were confident of achieving a quick, decisive victory. Indeed, the principal appeal of Iraq as a target was not that it was strong and fearsome; the first Gulf War and a decade of sanctions had left Saddam Hussein with a decrepit army and essentially no air force. Iraq was inviting because it appeared so weak. An invasion promised to be a “cakewalk.” Wolfowitz and others in the administration were counting on victory, in turn, to validate the Bush Doctrine, demonstrating its efficacy and thereby paving the way for its further application.

Simply put, with victory in Iraq, any last constraints on the employment of US military power—and on the privileges of the imperial presidency—would fall away. It is important to appreciate the scope of the plans that 9/11 set in motion. Our fixation on all that has since gone wrong in Iraq itself should not lead us to overlook the fact that eliminating Saddam was never the endgame. The invasion of Iraq formed only one element of a breathtakingly extravagant design. The Wise Men to whom President Bush turned for advice after 9/11 expected an easy win against a weak opponent to set the stage for far greater victories.

“Actions that are difficult or impossible now will become more feasible after we have taken the first steps.”

Here lay the underlying intent of the Bush Doctrine: It provided a self-validating authorization for the administration to pursue whatever next steps it chose to take.

“We’re an empire now, and when we act, we create our own reality. We’re history’s actors and you, all of you, will be left to just study what we do.”

President Bush explained why. The events of 9/11, he said, had thoroughly discredited the Cold War concepts of containment and deterrence.

Henceforth, the United States needed to snuff out threats before they could materialize.

“In the world we have entered, the only path to safety is the path of action.”

Bush vowed to act. Simply put, the United States had assumed for itself—and for itself alone—an unlimited first-strike prerogative.

The early days of the Cold War had produced its own version of the “one percent doctrine.” When the Soviet Union broke the US nuclear monopoly in 1949, it appeared in some quarters to be only a matter of time before Americans would face the choice of being either “Red or dead.” The country could avoid that choice by putting its hard-earned strategic superiority to work immediately, before it withered away. Here lay the rationale for a first strike against Russia: By attacking the Soviets before they could build up a large nuclear arsenal, the United States in one fell swoop could eliminate its rival and achieve permanent peace and security.

The idea of a preventive war tempts those eager to pick the most propitious moment for the start of what they regard as inevitable hostilities. The rest of us must resist such ideas with every moral resource. Not only is it morally wrong; it is also mad. Nothing in history is inevitable, including the probable. So long as war has not broken out, we still have the possibility of avoiding it. Those who think that there is little difference between a cold and a hot war are either ignorant or malicious.

Bruce Springsteen said this about his own stunningly successful career:

“I understand that it’s the music that keeps me alive. That’s my lifeblood. And to give that up for, like, the TV, the cars, the houses—that’s not the American dream. That’s the booby prize, in the end. Those are the booby prizes. And if you fall for them—if, when you achieve them, you believe that this is the end in and of itself—then you’ve been suckered in. Because those are the consolation prizes, if you’re not careful, for selling yourself out, or letting the best of yourself slip away. So you gotta be vigilant. You gotta carry the idea you began with further. And you gotta hope that you’re headed for higher ground.”

To some, mainstream American life is dysfunctional, the American Dream a hoax. Happiness isn’t bundled in thirty-year mortgages or well-paid careers or a thick steak. Not if everything they buy with their hard-earned cash is disposable and animals are tortured for their sustenance. But while most deal with teenage ennui by numbing the truth and marinating their minds

with herb and booze, these kids want to stay angry. Their melancholy could be a force of good, though it doesn't always feel that way at home. They laugh at the absurdity of life, at the crooked birth lottery, at their wide-open futures, their empty bank accounts, and their refusal to give in to norms of any kind. They are part of a sacred generation torn between feeling everything way too much and not giving any sort of fuck at all.

The whole idea of what life should be like, at least in middle class America: As a young person, you pretty much have to go to college after high school if you want a decent paying, secure job. Of course if you go into a trade it's a different story but stay with me here.

So you have to go to college if you want a good job. But, oh shit, you weren't a stellar student in high school, so no scholarship for you. Your parents are good, hard-working people and they make just the right amount so that you don't get much in the way of help from them, but you also can't qualify for grants or hardship scholarships. So, you are forced to take out tens of thousands of dollars in loans to pay for the school that you have to attend.

You graduated, hooray! You're not exactly happy with the career you'll have to enter, but hey, you'll make good money and have job security. And congrats, you married the girlfriend you met in college. Now it's time to buy a house. The market in your area isn't great, but you find a pretty nice house that you can afford on a thirty year mortgage. Between the house and the new cars you bought to reliably get you and the wife to work, there isn't much cash left over to go on vacation. Oh well. Priorities, right?

Things are good for a few years and you finally have a little security in the bank. But now it's time for kids. You have two, because you only want to replace your wife and yourself—you're responsible people. Only now there are two tiny people that are reliant on you for literally everything. But that's okay, you'll take the financial strain and the stress because you love them.

Fast forward a few years. Your life has become a cycle. You go to the job that you now resent, so you can pay off the loans that you had to take out for college. Your income also goes to paying for the house that's now just a little too small. Your car payments are still due each month because you have to upgrade for the kids' safety. Every hour at work is spent in an effort to pay bills that keep you firmly rooted in the decisions you made ten years ago. Oh sure, you go on vacation. To Disney World, or to visit grandma halfway across the country. You'll definitely go to Europe when the kids are out of the house. You've only had sex once in three years, but you're living the American Dream.

Rinse and repeat. Go to work, pay your bills, and support your family.

Keep telling yourself it'll get better. Eventually you learn to just appreciate the little things because life isn't nearly as exciting as you'd once hoped. But you keep doing what you're "supposed to do" until you're old enough to go to a nursing home. Your kids visit every once in a while, but they're very busy digging themselves out of the same ever deepening hole that you have been in since you were 18. Eventually, death becomes your only relief, and you welcome it.

Fuck. That.

Our societies have become so complex, and so cumbersome, that they create far more punishment than reward. It's badly out of balance. America offers people only a very narrow and almost impossible-to-achieve version of success, but a nearly infinite array of ways to be a total, detestable failure. A 'successful life' is purely aspiration for most Americans, a sense of satisfaction and enjoyment of life is only for the people on TV. All other potential avenues for fulfillment have been foreclosed.

Down at peon level, the pursuit of happiness sounds like a bad joke. "It's called the American dream," George Carlin cracked, "because you have to be asleep to believe it."

"Necessitous men are not free men," said FDR in that 1944 State of the Union speech. "People who are hungry and out of a job are the stuff of which dictatorships are made." A dire statement, demonstrably true, and especially unsettling in now, a point in time when the American Dream seems more viable as nostalgia than a lived phenomenon. Income inequality, wealth distribution, mortality rates—by every measure, the average individual that Eleanor Roosevelt celebrated is sinking. Overall mobility is stagnant at best. If you're born poor in Ferguson or Appalachia, chances are you're going to stay that way. Ditto if your early memories include the swimming pool at the Houston Country Club or ski lessons at Deer Valley, you're likely going to keep your perch near the top of the heap.

There was never a period in American history where one could simply work hard and get rich, better off, et cetera. In every case these "improvements" came on the backs of others that never got to improve, gain wealth. It has always involved the exploitation of the many in order for the few to increase their status, wealth, power.

I'm reminded of the Peace Dividend we were supposed to get in the wake of the collapsing Soviet Union. Alas, we never got it. We squandered a perfectly good empire on McMansions and Ford Explorers. At least Rome got coliseums and orgies.

As health care costs head toward a fifth of the American economy and beyond, they are squeezing out other spending. One of the big losers is education. That, too, played a role in Toyota's decision. Canadian factory hands are so much better educated that Toyota estimated the costs of training workers there would be significantly less. Toyota could rely on verbal instructions and written manuals with Canadian workers, rather than color-coded cards it would need to train some of the reading-challenged workforce in the southern states that had offered subsidies.

“Everything you know about the US you learned off the internet.”

Keep thinking that everyone who thinks America is a shithole is just some stupid foreigner. That's precisely the kind of attitude that makes you the laughingstock of the industrialized world.

“Don't forget the 30k troops we have to keep in your country to keep your country sovereign from most respected leader and Best Korea.”

I don't know if you've noticed, but the fact that US soldiers in Korea are some of the worst representatives of America you've ever seen—public fighting, public drunkenness, public flirting, raping local women, monolingual, refuse to assimilate—has made them very, very unpopular here. Plus the fact that South Korea is more than capable and more than willing to fight North Korea alone, you really shouldn't use the existence of a bunch of uneducated, shitty people the US keeps here as leverage. We don't like them. They're only here because South Korean politicians try to appear hard on North Korea because it gets them votes. Not to mention it's the US's fault North Korea even exists, since the US and the Soviet Union used Korea as a pawn in their fucking stupid proxy war instead of just blowing up each other like they should have done.

Chapter Sixty-three

The Deep State

A small store of bourbon and wine was secreted inside some bunkers—staff swore that the stockpile was to be used only to aid a hypothetical alcoholic congressman who might need to be weaned off.

And even when Congress was primarily male, there was also a stock of birth control pills kept ready at the facilities—perhaps recognition that some of the aides and female secretaries might find recreational activities during a prolonged stay?

In 2009, President Obama signed Executive Order 13527, decreeing a new post-9/11 role for the Postal Service, which had during the Cold War been responsible for registering the dead in the event of a nuclear holocaust. Now, in the era of terrorism, it would serve as the agency responsible for delivering “medical countermeasures” to biological weapons to the nation since it had “the capacity for rapid residential delivery.” Should a wide-scale bioweapon attack like anthrax disrupt a city, state, or region of the country, only the Postal Service would possess the ability to visit every residence in a single day to deliver antibiotics or another antidote from the government’s Strategic National Stockpile, DHS explained. In the event that the “Postal Plan” is activated, the Post Office would suspend all mail delivery to the affected region and, escorted by local or state law enforcement, the mail carriers—each of whom would don disposable clothing, protective gloves, and a “NIOSH-approved N-95 disposable particulate respirator”—deliver “a uniform, predetermined quantity of prepackaged medications to each residential mail address along with information sheets.”

So, if you’re planning a biological attack, make sure neutralizing the postal fleet is on your to-do list—or maybe you can just wait until it gets privatized.

On its surface, presidential succession seems such a simple idea, but it’s a peculiar kind of scientific mysticism, whereby as mortal as any single officeholder may be, the office itself never dies. The president may be replaceable, but the presidency is not—it represents the very idea of the democratic traditions of the United States. “For me personally, no one ever elected to the office of the presidency was worth dying for, yet the office of

the presidency was,” recalled one Secret Service agent.

The odd thing, constitutional scholars now agree, is that Tyler was almost certainly wrong about becoming president. Little was then known about the debates that went on during the Constitutional Convention—Madison’s notes from the debates, for instance, were only published for the first time in 1840 and the first major scholarly review of the convention wasn’t published until 1911. Subsequent study has shown that the Founders clearly intended for the vice president to merely “act” as president during a vacancy or inability. At least three other sections of the Constitution actually refer specifically to the vice president only acting as president. The only way the Founders ever intended for someone to become president was to be elected by the nation; anyone else would merely be “acting.” Yet Tyler’s precedent would guide the nation for the next 120 years.

The Twenty-fifth Amendment of the Constitution, passed by Congress in early 1965, made clear the vice president would officially become president—answering John Tyler’s 120-year-old question—and allowed the president to nominate a new vice president in the event of a vacancy, who would then be subject to confirmation by both houses of Congress. The amendment also delineated a clear process to declare a president unable to serve, as well as a clear process for the president to resume power once recovered: The president could either sign over the office to a vice president, if, for instance, he knew he was undergoing an operation with anesthesia, or if the president couldn’t or wouldn’t sign over the office, the vice president could gather the signatures of a majority of the cabinet, which, when delivered to Congress, would establish the vice president officially as “acting president.”

In March 1995, a Doomsday cult used sarin gas to attack the Tokyo subway, and just a month later the Alfred P. Murrah Federal Building in Oklahoma City was bombed by antigovernment militants, the worst homegrown terror attack in US history. The attack came without warning in an unexpected place, and inside the White House raised new concerns about decapitation of government departments.

“That was a serious contingency that we didn’t have covered. It’s fine to have a bunker in the mountains, but there’s no one there on a daily basis, so in a surprise attack, it’s useless.”

Then came 9/11. If nineteen terrorists, armed with nothing more than box cutters, had managed to wreak this level of havoc on the US government, how, many wondered, would COG hold up during a concerted attack on the leadership itself?

Four core convictions inform this ideology of national security. In his second inaugural address, President Bush testified eloquently to each of

them. According to the first of these convictions, history has an identifiable and indisputable purpose. History, the president declared, “has a visible direction, set by liberty and the Author of Liberty.” History’s abiding theme is freedom, to which all humanity aspires. Reduced to its essentials, history is an epic struggle, binary in nature, between “oppression, which is always wrong, and freedom, which is eternally right.”

According to the second conviction, the United States has always embodied, and continues to embody, freedom. America has always been, and remains, freedom’s chief exemplar and advocate.

“From the day of our Founding, we have proclaimed that every man and woman on this earth has rights, and dignity, and matchless value, because they bear the image of the Maker of Heaven and earth.”

As the self-proclaimed Land of Liberty, the United States serves as the vanguard of history. Revising, refining, and perfecting their understanding of freedom, Americans constantly model its meaning for others around the world. In 1839, the journalist John L. O’Sullivan described the young United States as “the Great Nation of Futurity.” So it remains today. Within the confines of the United States, history’s intentions are most fully revealed.

According to the third conviction, Providence summons America to ensure freedom’s ultimate triumph. This, observed President Bush, “is the mission that created our Nation.” The Author of Liberty has anointed the United States as the Agent of Liberty. Unique among great powers, this nation pursues interests larger than itself. When it acts, it does so on freedom’s behalf and at the behest of higher authority. By invading Iraq, the United States reaffirmed and reinvigorated the nation’s “great liberating tradition,” as the president put it. In so doing, “we have lit a fire as well—a fire in the minds of men. It warms those who feel its power, it burns those who fight its progress, and one day this untamed fire of freedom will reach the darkest corners of our world.” Only cynics or those disposed toward evil could possibly dissent from this self-evident truth.

According to the final conviction, for the American way of life to endure, freedom must prevail everywhere. Only when the light of freedom’s untamed fire illuminates the world’s darkest corners will America’s own safety and prosperity be assured. Or as the president expressed it:

“The survival of liberty in our land increasingly depends on the success of liberty in other lands.”

In effect, what the United States offers to the world and what it requires of the world align precisely. Put simply:

“America’s vital interests and our deepest beliefs are now one.”

This proposition serves, of course, as an infinitely expansible grant of authority, empowering the United States to assert its influence anywhere it chooses since, by definition, it acts on freedom’s behalf.

Through constant repetition, the elements of this ideology have become hardwired into the American psyche. They function as articles of faith, beyond question and beyond scrutiny. Do politicians like Bush, who habitually cite the tenets of this faith, genuinely believe what they are saying? In all likelihood they do, just as Fox News anchors may genuinely believe that they provide “fair and balanced” coverage of world affairs, just as McDonald’s franchisees may genuinely believe that theirs is a business of “serving up smiles,” and just like MSNBC douchebags believe their neoliberal bullshit. Conviction follows self-interest. Aspirants to high office likewise testify to the core tenets of this ideology, hoping thereby to demonstrate their essential trustworthiness.

In the immediate aftermath of the 9/11 attacks, there were some informal discussions in Congress to the effect that Washington and its critical governmental nodes were too vulnerable to terrorist attacks. This was the time when there was a brief fad for “continuity of government” exercises, and Vice President Cheney, then a physical as well as political troglodyte, flitted between “secure, undisclosed locations” that were often underground. The proper institutional solution would have been to permanently disperse much of Washington’s governmental operations to areas around the country: with secure, encrypted teleconferencing and other electronic aids, this plan was eminently feasible. Most other cities have cheaper real estate and living costs. The problem was the same one defense contractors had solved by moving their headquarters to Washington: career-anxious generals and bureaucrats like to be physically, and not just electronically, close to the action.

This mania for physical proximity to the “decision-makers” (and the purse strings they hold) is an abiding obsession of those who indulge in the Deep State’s power games, much as the French aristocracy jockeyed to be in close attendance to the Sun King at the court of Versailles.

For all the bellyaching that goes on throughout the country about out-of-touch bureaucrats, corrupt and unresponsive government, and how much everyone hates Washington, these visible signs of our increasingly intrusive and overbearing government did not fall out of the sky upon an unsuspecting public. The Deep State, along with its headquarters in Washington, is not a negation of the American people’s character. It is an intensification of tendencies inherent in any aggregation of human beings. If

the American people did not voluntarily give informed consent to the web of unaccountable influence that radiates from Washington and permeates the country, then their passive acquiescence, aided by false appeals to patriotism and occasional doses of fear, surely played a role. A majority of Americans have been anesthetized by the slow, incremental rise of the Deep State, a process that has taken decades.

“Unhappy events abroad have retaught us two simple truths about the liberty of a democratic people. The first truth is that the liberty of a democracy is not safe if the people tolerate the growth of private power to a point where it becomes stronger than their democratic State itself. That, in its essence, is fascism—ownership of government by an individual, by a group or by any other controlling private power. The second truth is that the liberty of a democracy is not safe if it does not provide employment and produce and distribute goods in such a way as to sustain an acceptable standard of living. Both lessons hit home. Among us today a concentration of private power without equal in history is growing.”

National economic inequality is still increasing, GDP growth is outrunning wage growth, and an unreformed Wall Street is still creating highly leveraged markets that are as vulnerable to breakdown as the mortgage market of the 2000s. Even the stock market recovery has been deceptive: individual stock ownership has fallen to its lowest level since the 1990s, much of the gain in equities is from cash-rich corporations engaging in the economically useless practice of buying back their own stock, and most of the trading volume comes from high-frequency traders front-running the market and skimming profits from all the hapless remaining investors. Median pay for the top one-hundred highest-paid CEOs at publicly traded companies in the United States reached \$13.9 million in 2013, a nine percent increase over the previous year. Meanwhile, median household income has been stagnant or declining. From that perspective, the Obama administration did not so much save the economy as stabilize the status quo by reforming a few of the worst aspects of the system it inherited while adopting a strategic change in tone. Obama kept the key features of the Deep State intact.

“Increasingly I found myself spending time with people of means—law firm partners and investment bankers, hedge fund managers and venture capitalists. I found myself avoiding certain topics during conversations with them, papering over possible

differences, anticipating their expectations. I know that as a consequence of my fund-raising I became more like the wealthy donors I met, in the very particular sense that I spent more and more of my time above the fray, outside the world of immediate hunger, disappointment, fear, irrationality, and frequent hardship of the other 99 percent of the population—that is, the people that I’d entered public life to serve.”

—Barack Obama, *The Audacity of Hope* (2006)

They and other Washington operators insisted that as personally distasteful as overseeing the bailout supposedly was to them, it was imperative to save the financial sector in order to rescue the broader economy: in short, saving Wall Street saved Main Street. Besides, the bailed-out banks repaid the money with interest, so what was the problem? First, the interest on TARP loans to the banks was far below prevailing market interest rates, giving the banks a subsidy. Second, in the initial round of TARP payouts, the Treasury paid \$254 billion for bank assets worth only \$176 billion, giving the banks a \$78 billion windfall.

Third, bailing out Wall Street did not bail out Main Street: the banks not only took money from the Treasury, they also borrowed billions at a near-zero interest rate from the Federal Reserve System. But these funds did not translate into consumer or business loans as intended. Instead, the banks used the money to buy higher-yield foreign financial instruments and pocketed the arbitrage. In addition, an obscure provision in the bailout bill authorized the Fed, contrary to all sound banking practices, to pay banks a higher interest rate on deposits from banks than the banks had to pay to get loans from the Fed: banks could then borrow money from the Fed and turn right around and park their excess reserves back at the Fed. Instead of stimulating the economy, the money became a risk-free arbitrage mechanism for our biggest banks.

Finally, credit ratings agencies from then on have priced in the likelihood that the bailed-out institutions would always get rescued in the future; that assumption means those banks have a built-in competitive advantage over smaller banks and are able to borrow funds at lower cost. What TARP and the other bailout programs accomplished, then, was to recapitalize the banks, further concentrate them (the five largest American banks had assets equal to 43 percent of US gross domestic product before the crash; by 2012 they made up 56 percent), and send them mostly unreformed on their merry way to the next asset bubble.

Why this entire process was preferable to operating the failing big banks that had commercial depositors under the conservatorship of the

Federal Deposit Insurance Corporation so as to protect those depositors, and concentrating Treasury and Federal Reserve resources directly on helping average people, illuminates how Wall Street has captured and assimilated the decision-making process at the upper levels of government. There is no question that the economy was in a grave state in September 2008, but Paulson's comments were still hyperbolic and, by panicking investors, likely helped create a self-fulfilling prophecy. It is not clear whether the 778-point drop in the Dow Jones Industrial Average after the House's initial rejection of the TARP package was a rational market response or whether the groundwork for a panic sell-off had not already been laid by Paulson's pronouncement that the sky would fall if the bill were not passed. The treasury secretary's handling of the crisis appeared intended to foreclose options other than those he wanted. Seeing bank CEOs among the ranks of the unemployed was apparently such an intolerable outcome that it was necessary to use fear of an economic Armageddon to stampede Congress into approving a virtual no-strings-attached package. A fear which would be exploited for similar aims just twelve years later.

Although the financial jargon, such as TARP, TALF, and repo was new, the modus operandi of those in charge bore an eerie resemblance to national security crises of times past. There is a striking similarity between Wall Street and War Street—the national security state—when they really need to get things done in a hurry. Bernanke's prediction of Armageddon if Congress did not give him and Paulson immediate *carte blanche* bears comparison with statements by national security officials in the aftermath of the September 11, 2001, terrorist attacks. In order for policy-makers to accomplish their goals, the initial targets in both cases were American public opinion and the legislators who represented them. In the wake of 9/11, the national security state did its best to instill in the public the fear that a stateless group of terrorist criminals represented an existential threat to the United States, and that they were in league with a foreign government whose leader conveniently happened to be the hereditary enemy of the Bush clan. When fear is great enough, it justifies preemptive measures against anyone claimed to be a threat, even when the evidence of their wrongdoing is thin. The shock doctrine at work—and we never seem to learn.

Ever since the first ziggurats rose in ancient Babylonia, the so-called forces of order, stability, and tradition have feared a revolt from below. Beginning with Edmund Burke and Joseph de Maistre after the French Revolution, a whole library of political literature, some classical liberal, some conservative, some reactionary, has emphasized this theme. The title of Ortega y Gasset's most famous work, *The Revolt of the Masses*, tells us something about its mental atmosphere, a Freudian fear of defilement by

the great unwashed. But in our globalized postmodern America, what if this whole vision of order, stability, and who threatens those values is inverted? What if Christopher Lasch came closer to the truth in his book *The Revolt of the Elites*:

“In our time, the chief threat seems to come from those at the top of the social hierarchy, not the masses.”

Lasch held that the elites, by which he meant not just the superwealthy but also their managerial coat holders and professional apologists, were undermining the country’s promise as a constitutional republic with their prehensile greed, their asocial cultural values, and their absence of civic responsibility. Lasch wrote this in 1995. Now, over two decades later, the super-rich have at last achieved escape velocity from the gravitational pull of the society they control. They have been able to do this in part because laws were bent or reinterpreted in their favor.

“There is something wrong in this country; the judicial nets are so adjusted as to catch the minnows and let the whales slip through.”

The motto inscribed on the frieze of the United States Supreme Court Building says, “Equal Justice Under Law.” A stickler for semantics would say that the modifiers ‘equal’ and ‘under law’ are redundant, since justice by definition is equal treatment under a system of written and publicly accessible rules. It is a noble sentiment in any case. But perhaps a more accurate one would be:

“The strong do what they will, the weak suffer what they must.”

There is one law for the rich and another for the common clay. Practical, as opposed to explicit, inequality before the law is common in societies all over the world; it usually boils down to how legal procedures are applied as opposed to the letter of the law. Officials who pledged to uphold the law will always protest that they are neutral and unimpeachable executors of justice, and that it is insulting to suggest otherwise. But sometimes the truth slips out.

The ideology of national security persists not because it expresses empirically demonstrable truths but because it serves the interests of those who created the national security state and those who still benefit from its continued existence—the very people who are most responsible for the

increasingly maladroit character of US policy. These are the men, along with a few women, who comprise the self-selecting, self-perpetuating clique that, since World War II, has shaped and perverted national security policy. In a famous book published over a half century ago, the sociologist C. Wright Mills took a stab at describing this “power elite.” His depiction of an interlocking corporate, political, and military directorate remains valid today, although one might amend it to acknowledge the role played by insider journalists and policy intellectuals who serve as propagandists, gatekeepers, and packagers of the latest conventional wisdom.

Although analysts employed by the RAND Corporation or the Hudson Institute may not themselves qualify as full-fledged members of the national security elite, they facilitate its functioning. Much the same can be said about columnists who write for the *New York Times*, the *Washington Post*, or the *Weekly Standard*, the research fellows busily organizing study groups at the Council on Foreign Relations or the American Enterprise Institute, and the policy-oriented academics who inhabit institutions like Harvard’s Kennedy School of Government or Princeton’s Wilson School.

To say that a power elite directs the affairs of state is not to suggest the existence of some dark conspiracy. It is simply to acknowledge the way Washington actually works. Especially on matters related to national security, policy-making has become oligarchic rather than democratic. The policy-making process is not open but closed, with the voices of privileged insiders carrying unimaginably greater weight than those of the unwashed masses.

According to Mills, the power elite and those trafficking in ideas useful to its core membership share a “cast of mind that defines international reality as basically military.” This was true when Mills wrote those words in the 1950s, and it is even truer today. For members of the policy elite, imperfect security is by definition inadequate security. Where gaps exist, they need to be filled. Defenses must be shored up. Yet ultimately absolute security cannot be negotiated; it can only be won. And winning implies the possession of military might along with a willingness to use it.

From the late 1940s to the present day, members of the power elite have shown an almost pathological tendency to misinterpret reality and inflate threats. The advisers to whom imperial presidents have turned for counsel have specialized not in cool judgment but in frenzied overreaction. Although the hawks have not always prevailed—in 1954, Dwight D. Eisenhower deflected urgings to intervene in French Indochina, and in 1962, John F. Kennedy rejected the advice of those pressing to bomb Soviet military installations in Cuba—more often than not the proponents of action, whether advocating direct intervention, relying on covert means, or working

through proxies, have carried the day. The hawks may not always advocate immediate war per se, but they lean forward in the saddle, keeping sabers drawn and at the ready. The mantra of the hawks is the barely veiled threat:

“All options remain on the table.”

American strategists assumed that the Kremlin was prepared to risk all-out war in pursuit of its goals. In fact, given the Soviet Union’s huge losses in both World Wars and the enormous job of reconstruction that lay before it after 1945, it was equally likely that the Soviet leadership would do a great deal to avoid war. We now know that was, in fact, often the case. When Nikita Khrushchev put nuclear-tipped missiles into Cuba in 1962, part of his motive was to let the United States feel what it was like to fear direct attack and the devastation of its land, something the Soviets knew so well. And when he pulled them out, it was because he did not want to live through another, even more deadly war than the two he had already survived.

According to NSC 68, the Soviet program aimed at “the complete subversion and forcible destruction of the machinery of government and structure of society in the countries of the non-Soviet world and their replacement by an apparatus and structure subservient to and controlled by the Kremlin.” “Persistent crisis, conflict, and expansion” defined the essence of Soviet policy. All of this stood in sharp contrast to America’s benign posture, which expressed “the essential tolerance of our world outlook, our generous and constructive impulses, and the absence of covetousness in our international relations.”

The Red Army offered proof of the Kremlin’s nefarious intentions. NSC 68 professed alarm that “the Soviet Union actually possesses armed forces far in excess of those necessary to defend its national territory.” Yes, this does sound like a terribly bad thing for a country to do, good thing that sort of stuff isn’t happening anymore. According to Nitze’s analysis, the Soviet Union—actually a country leveled by World War II and barely in the recovery phase—already enjoyed a clear preponderance of power. Even so, day by day, it was “widening the gap between its preparedness for war and the unpreparedness of the free world for war.”

To respond to this unprecedented threat, Nitze could divine only three options: isolationism; preventive war (which implied a nuclear first strike against a country incapable of responding in kind); or simply “a more rapid build-up” of American power, especially military power. NSC 68 rejected the first option as tantamount to capitulation. It dismissed the second as “repugnant” and “morally corrosive.” That left only option number three.

Nitze's proposed buildup called for massively increased defense spending, with particular emphasis on accelerating the development of a hydrogen bomb; increased security assistance to train and equip the armies of friendly nations; efforts to enhance internal security and intelligence capabilities; and an intensification of covert operations aimed at "fomenting and supporting unrest and revolt" inside the Soviet bloc.

National security had to rank first among the nation's priorities, so NSC 68 called for curbing domestic expenditures. It also argued for higher taxes to make available the resources needed to fund rearmament. In effect, this 'Nitze Doctrine' offered a recipe for the permanent militarization of US policy.

Increased military spending need not imply belt-tightening by the average American, however. NSC 68 held out the prospect that "the economic effects of the program might be to increase the gross national product by more than the amount being absorbed for additional military and foreign assistance purposes." The United States, in other words, could afford both guns and butter—indeed, producing more guns might actually yield more butter.

For Nitze, this was a key selling point. Rather than being at odds with the nation's long-term economic well-being, high levels of military spending could actually provide the basis for continuing prosperity—an argument clearly designed to win over members of the administration, especially President Truman himself, worried about the domestic implications of pouring huge sums of money into defense. Here lay one source of the Nitze Doctrine's enduring appeal: Rearmament promised not only greater security but also ever-greater material abundance.

Yet Truman remained unconvinced, until fate intervened in the form of the Korean War. For an increasingly beleaguered president, the outbreak of war on the Korean peninsula came as yet another unwelcome surprise. For Nitze, it was a timely bit of good luck. Communist North Korea's invasion of the south seemingly affirmed the analysis contained in NSC 68: International communism, responding to directives issued by the Kremlin, was apparently on the march.

Not for the last time in recent American history—the Soviet invasion of Afghanistan in 1979 offers another example—Wise Men impulsively attributed earth-shattering significance to a development of middling importance. The result was to sweep aside remaining doubts about Nitze's prescription. NSC 68 became dogma. The defense budget more than tripled in size, most of the increased spending used not to fight in Korea but to fund the program of general rearmament that Nitze had proposed. The militarization of US policy began in earnest.

NSC 68 was much more than that. Although most Americans today

are unfamiliar with its contents, Nitze's masterwork stands in relation to contemporary US policy as Washington's Farewell Address or the Monroe Doctrine stood in relation to US policy in the nineteenth century. It provides the interpretive key that explains much that was to follow over subsequent decades.

In the mid-1950s, with Nitze himself leading the charge, there came reports of a dismaying "bomber gap," the Soviets said to be outstripping the United States in the production of strategic bombers. Soon thereafter, rumors of a "missile gap" made headlines, with the Soviets reportedly far ahead of the United States in long-range rocketry. The ubiquitous Nitze served as principal author of the Gaither Report that trumpeted this concern. By the end of the decade, insiders worried anxiously that Soviet strategic advantages were becoming so great as to undermine the "delicate balance of terror." The US ability to deter its adversary was eroding and might soon disappear.

In the mid-1970s, then CIA director George H. W. Bush convened a group of Wise Men, Nitze prominent among them, to investigate this concern. This so-called Team B exercise concluded that things were even worse than suspected: The United States was now lagging so far behind that a Soviet first strike loomed as a real possibility.

Hardly had the Soviet menace disappeared than the "Commission to Assess the Ballistic Missile Threat to the United States," chaired by Donald Rumsfeld in 1998, was warning that the United States was underestimating the dangers posed by the missile programs of such nations as Iran, Iraq, and North Korea. None of these, beginning with NSC 68's phantasmagoric description of Soviet capabilities and intentions in 1950, turned out to be accurate. In each and every case, proponents of the Nitze Doctrine garbled the facts and magnified the danger.

The bomber and missile gaps of the Eisenhower era were figments of overactive imaginations. Even as its nuclear arsenal grew in the 1960s and 1970s, the Soviet Union never achieved anything remotely like a preemptive capability. As for the Rumsfeld Commission, its conclusions have proven entirely bogus. Yet in each of these cases, as with NSC 68, the hue and cry concocted by Wise Men produced the intended result.

In each case, as with NSC 68 itself, purportedly rigorous analysis actually served to disguise an exercise in group-think, yielding preconceived conclusions that reflected the prejudices, policy agendas, and career interests of the principals involved. George W. Bush's lieutenants did not invent the idea of "fixing" the facts to fit a particular policy. They merely elevated to new heights of audacity a technique that has played a central role in the politics of national security over the past seventy years.

When JFK became president, plans to overthrow Cuba's Fidel Castro using a small force of CIA-trained and -equipped Cuban exiles were well advanced. Kennedy just needed to give the signal to launch the invasion. The new president hesitated, however, directing General Lyman Lemnitzer, chairman of the Joint Chiefs of Staff, to evaluate the plan's feasibility. When the Chiefs endorsed the operation, Kennedy issued the order. An epic disaster ensued. It soon became apparent that the Chiefs had supported the mission less because they expected it to succeed than because they were counting on a CIA failure to pave the way for a conventional invasion, their preferred option for eliminating Castro. The Chiefs knew that Kennedy had no intention of ordering direct US intervention—he had said as much—but they were counting on a presidentially-ordered CIA disaster to force his hand. Rather than offering the president forthright professional advice, they had deceived him.

In the history of the national security state, the Bay of Pigs proved a turning point. A furious Kennedy, convinced—not without reason—that he had been set up and betrayed, drew two large conclusions from this experience. First, the Bay of Pigs convinced him that the CIA's reputation for tackling tough jobs quietly and economically was wildly overinflated. The hapless invasion scheme hatched by the agency never had even a remote chance of inciting a successful counterrevolution. The intelligence on which it was based had been at best defective, at worst simply invented. The slapdash exile force assembled to invade Cuba lacked numbers, training, discipline, competent leadership, and essential equipment, as well as adequate air and logistics support. From planning to execution, the entire operation was amateurish and harebrained. All this was evident even within the agency—although, needless to say, the CIA classified its own scathing internal investigation of the affair, thereby concealing it from the public.

Second, the Bay of Pigs convinced Kennedy that the Joint Chiefs of Staff, however many ribbons and medals they might have earned, were either stupid or untrustworthy.

“Those sons-of-bitches with all the fruit salad just sat there nodding, saying it would work.”

Whether the Chiefs were too dull or too clever by half, JFK concluded that allowing them any further say in the formulation of policy was a mistake. Although it might be necessary to go through the motions of consulting senior military leaders, never again would he defer to their collective judgment.

After the CIA hoodwinked his brother into launching the Bay of Pigs invasion, President Kennedy put the Attorney General on the White House

panel to find out what went wrong with Operation Zapata. The experienced lawyer found that, as his brother suspected, the CIA had deceived the president. They had lied to him about its possibility of success, and then banked on JFK ordering in the navy to avoid a humiliating defeat. When RFK confirmed this, with the advice of his father's friend Robert Lovett, the Attorney General recommended firing CIA Director Allen Dulles. But after listening to Lovett, the brothers went further and terminated the entire upper level of the Agency: Dulles, Deputy Director Charles Cabell, and Director of Plans Richard Bissell.

When is the last time something like that happened? Who was terminated over the catastrophe of 9/11? How accurate was Robert Kennedy about the Bay of Pigs? It's always nice for a prosecuting attorney to get a written confession. As later discovered in the Dulles archives at Princeton, Allen Dulles posthumously provided just that. In notes prepared for a magazine article, he admitted that such was his strategy: knowing the operation had little chance of success, he wanted President Kennedy to commit American military forces into Cuba. In 1984, when an article was published on the subject, Bissell also confessed to this hidden agenda.

And that's why the CIA—both current and former officials—helped kill JFK and RFK.

For those who occupy the inner circle of power, the national security state is an obstacle to be evaded rather than an asset to be harnessed. Viewed from the perspective of a defense secretary or national security adviser, professional military officers, career diplomats, or intelligence analysts are not partners but competitors. Rather than facilitating the exercise of executive power, the career professionals complicate or even obstruct it, pursuing the favored agendas of their own agencies instead. Yet because the institutions comprising the national security apparatus provide the foundation of executive power, the president-emperor is the person least inclined to acknowledge publicly the defects inherent in that apparatus.

As a consequence, the American people remain in the dark, persisting in the illusion that, whatever their faults, institutions like the Joint Chiefs and the CIA remain indispensable to the nation's safety and well-being. And so the national security state endures. It does so not because its activities enhance the security of the American people, but because, by its very existence, it provides a continuing rationale for political arrangements that are a source of status, influence, and considerable wealth.

Lapses in performance by this apparatus might logically raise questions about whether or not the United States would be better off without it. Instead, failures inspire new efforts to reorganize and reform, which almost invariably translate into further institutional expansion. The more the

national security state screws up, the more sprawling it becomes. In the meantime, presidents occupy themselves cultivating ways to work around, ignore, or subvert those institutions.

Although nominally serving the public, the institutions making up this apparatus go to great lengths to evade public scrutiny, performing their duties shielded behind multiple layers of secrecy. Ostensibly, this cult of secrecy exists to deny information to America's enemies. Its actual purpose is to control the information provided to the American people, releasing only what a particular agency or administration is eager to make known, while withholding (or providing in sanitized form) information that might embarrass the government or call into question its policies. One-way communication, the priestly monopoly of secret knowledge, the multiplication of secret agencies, the suppression of open discussion, and even the insulation of error against public criticism and exposure nullifies public reaction and makes rational dissent the equivalent of patriotic disaffection, if not treason.

The case of *United States v. Reynolds* provides an early, telling illustration of how the system works. In October 1948, a B-29 Superfortress bomber engaged in testing an electronic device crashed near Waycross, Georgia, killing several of those on board. Widows of the deceased crewmen, wanting to know what had caused the crash, petitioned the Air Force to release the accident investigation report. Air Force officials refused, claiming that they could not comply "without seriously hampering national security." When the widows sued, the Supreme Court found in favor of the Air Force.

Writing for the majority, Chief Justice Fred Vinson asserted that in "a time of vigorous preparation for national defense" the courts should steer clear of telling senior national security officials what information to release and what to withhold. Given the overriding importance of keeping secrets absolutely secret, wrote Vinson, courts needed to take officials at their word: "Insisting upon an examination of the evidence, even by the judge alone, in chambers," posed too great a risk. A half century later, when the Pentagon finally declassified the accident report, it held no sensitive information at all; rather, it showed that the aircraft had crashed due to poor maintenance and pilot error. The Air Force had used claims of national security to conceal garden-variety organizational ineptitude.

In May 2007, in a stinging critique of post-9/11 military leadership, Army Lieutenant Colonel Paul Yingling wrote in *Armed Forces Journal* that "a private who loses a rifle suffers far greater consequences than a general who loses a war." Yingling is correct—and one could easily broaden his indictment to include high-ranking civilians. A Pentagon file clerk who misplaces a classified document faces stiffer penalties than a defense secretary whose arrogant recklessness consumes thousands of lives.

Washington's explosive expansion and consolidation around the Beltway would seem to make a mockery of the frequent pronouncements that national governance is breaking down. The institutions of the visible state may be dysfunctional, but the machinery of the Deep State has been steadily expanding. That this secret and unaccountable shadow government floats freely above the gridlock between both ends of Pennsylvania Avenue is the paradox of American governance in the twenty-first century: drone strikes, data mining, secret prisons, and Panopticon-like control of citizens' private data thanks to the technology of Silicon Valley on the one hand; while the ordinary, visible institutions of self-government decline to the status of a banana republic.

The ruling structures of large and complex societies are never uniform. A coalition of dominant factions operates according to an unwritten (or even unspoken) agreement that wary cooperation is better than open strife, and that any clash of conflicting interests ought to be shelved—or at least hidden from public view—in favor of longer-term advantage. Critical analyses of the various components of the Deep State tend to view them as stand-alone entities rather than cooperating factions in a larger social environment.

The elites of this country have far more in common with their rich friends in London, Paris, and Tokyo than with their fellow American citizens.

Former Speaker Tip O'Neill described congressional meetings with Reagan as encounters with an actor on a set reading his lines and hitting his mark.

“He came into the room, read from note cards, and tuned out.”

No doubt Reagan's publicists would have described this behavior as focusing on the Big Picture, or choosing to remain above the fray. Some have retrospectively come to see Reagan's presidency as transformational in a more ominous sense:

“Reagan was the Trojan horse in which a regiment of eager strategists hid, peering through its eye-holes as they wheeled it surreptitiously into the White House. The people at the helm had their sights set on a total overhaul of the relationship between state, government, and capital. They were activists, people with a vision, steeped in emergent neoliberal economic theory and intent on revising the agenda.”

Secret agencies, clandestine programs, and hidden agendas have been a fact of life since the Manhattan Project. What was new in the Reagan

administration was the rise of the expertly choreographed presidency that eased the chief executive out of the messy business of formulating policy and into the realm of the ceremonial. During Watergate, there was no question where culpability and accountability lay. No one was in doubt that Nixon was in charge—that is why his denials rang so hollow. Iran-Contra was far more ambiguous. Who was really running the show? Was it Reagan or a rogue colonel in the West Wing? The Keystone Cops aspect of the affair—we remember National Security Adviser Bud McFarlane flying to Tehran with a cake and a Bible—may have obscured the larger truth that Iran-Contra was a conspiracy to subvert the Constitution.

Reagan may not have been much on policy, but when it came to the ceremonial presidency, he set the gold standard. His time in office coincided with the final triumph of presidential campaign packaging, where an artfully staged and likable persona is deemed more electable than a candidate who has mastered policy issues but does not possess a relatable backstory. It was in the 1980s that the focus group—an opinion survey that began during World War II as a way to gauge the effectiveness of propaganda films—came into its own in political campaigns. A new emphasis was put on subliminal and emotional reactions to candidates at the expense of any rational evaluation of their policy positions.

In the age of permanent national security crisis, serious issues are invariably taken up off-stage and behind closed doors. Here is where the real business of contemporary politics occurs. Here, the real action involves only a handful of players, for the most part unelected, their deliberations largely occurring behind a veil of secrecy. From the outset, two fundamental convictions have informed this practice.

The first is the belief that by consulting a cadre of handpicked Wise Men, presidents are likely to make better decisions. Although “the decider” may make the final call, the actual process of arriving at decisions proceeds collectively, with the president drawing on the counsel of smart, sophisticated, and worldly-wise advisers, who themselves tap the expertise of functionaries possessing more specialized knowledge.

The second conviction relates to the necessity of these advisers working exclusively for the chief executive and no one else. Only if assured that their counsel will remain shielded from the public will Wise Men speak with candor and honesty—here lies the basis for claims of “executive privilege.” Indeed, as a general proposition, Wise Men view popular—or even congressional—intrusion into policy formulation as distinctly unhelpful, if not downright dangerous. The intricacies of national security are said to lie beyond the ken of the average citizen, who is all too likely to be swayed by short-term, emotional considerations rather than taking a sober, long-term view. The

masses, being notoriously fickle, are incapable of grasping such matters. They can't see the big picture. They don't appreciate nuance. They lack resolve.

Public opinion is suspect; when it comes to national security, the public's anointed role is to defer. A president seeking a genuinely strategic approach will rely on seasoned insiders—rational, dispassionate, well-informed, well-connected, and guided by a common vocabulary and a common understanding of the way the world actually works.

This means taking their cues from the likes of Dean Acheson, who himself explained how senior officials manufacture deference: by relying on propaganda. As he wrote in his memoirs, when offering public explanations of policy, “qualification must give way to simplicity, nicety and nuance to bluntness, almost brutality, to carry the point home.” The idea is not to describe truth in all of its messy complexity, but to convey a point of view that is “clearer than truth.”

To judge by the reckless misjudgments that have characterized US policy since 9/11, presidents would be better served if they relied on the common sense of randomly chosen citizens rather than consulting sophisticated insiders. It is, after all, the children and grandchildren of ordinary citizens who end up fighting the wars that Wise Men concoct.

There has been a collapse of the assumption that major national security agencies actually adhere to a common definition of the national interest. The operative question becomes this: If neither the CIA nor the Joint Chiefs of Staff had existed when Osama bin Laden launched his attack, if Congress had not created the Department of Defense or the National Security Council back in 1947, would the United States find itself in any worse shape than it is? That is, if Bush had to rely upon the institutions that existed through World War II—a modest State Department for diplomacy and two small cabinet agencies to manage military affairs—would he have fucked up Iraq any more than he did?

To frame the question more broadly: When considering the national security state as it has evolved and grown over the past six decades, what exactly has been the value added? And if the answer is none—if, indeed, the return on investment has been essentially negative—then perhaps the time has come to consider dismantling an apparatus that demonstrably serves no useful purpose.

All complex societies have an establishment, a social network committed to its own enrichment and perpetuation. In terms of its scope, financial resources, and sheer global reach, the American hybrid state is in a class by itself: sheer quantity can achieve a quality all its own. That said, it is neither omniscient nor invincible. The institution is not so much sinister

(although it possesses menacing aspects) as it is relentlessly well entrenched. Far from being invincible, its failures—Iraq, Afghanistan, Libya, et cetera; its manifest incapacity to anticipate, avert, or appropriately respond to the greatest financial crash since the Great Depression; even its curious blindness to the obvious potential for a hurricane to drown New Orleans—are routine enough that it is only its protectiveness toward its higher-ranking officials that allows them to escape the consequences of their frequent ineptitude.

Far from being brilliant conspirators, the prevalence of mediocre thinking is what frequently makes the system's operatives stand out. We had better debunk an erroneous popular notion which holds that structures that arise from evolutionary processes are qualitatively "better" than the ones preceding them. The Deep State is a wasteful and incompetent method of governance. But it persists because its perverse incentive structure frequently rewards failure and dresses it up as success. Its pervasive, largely commonplace corruption and creation of synthetic bogeymen and foreign scapegoats anesthetize the public into a state of mind variously composed of apathy, cynicism, and fear—the very antithesis of responsible citizenship.

Chapter Sixty-four

The 51st State

“If the Israeli government were the only Jews you knew, you would think Hitler was a hero.”

The problem with the Jewish race idea is there are no DNA sequences common to all Jews and absent from all non-Jews. There is nothing in the human genome that makes or diagnoses a person as a Jew. And even if there were some such sequences, there would be nothing that followed from them, nothing that counted as what we mean by an identity.

Mainstream Judaism solemnly maintains that the entire cosmos exists just so that Jewish rabbis can study their holy scriptures, and that if Jews cease this practice, the universe will come to an end. China, India, Australia, and even the distant galaxies will all be annihilated if the rabbis in Jerusalem and Brooklyn stop debating the Talmud. This is a central article of faith of Orthodox Jews, and anyone who dares doubt it is considered an ignorant fool. Secular Jews may be a bit more skeptical about this grandiose claim, but they too believe that the Jewish people are the central heroes of history and the ultimate wellspring of human morality, spirituality, and learning.

Israeli children usually finish twelve years of school without receiving any clear picture of global historical processes. They are taught almost nothing about China, India, or Africa, and though they learn about the Roman Empire, the French Revolution, and the Second World War, these isolated jigsaw pieces do not add up to any overarching narrative. Instead, the only coherent history offered by the Israeli educational system begins with the Hebrew Old Testament, continues to the Second Temple era, skips between various Jewish communities in the Diaspora, and culminates with the rise of Zionism, the Holocaust, and the establishment of the state of Israel.

Most students leave school convinced that this must be the main plotline of the entire human story. For even when pupils hear about the Roman Empire or the French Revolution, the discussion in class focuses on the way the Roman Empire treated the Jews or on the legal and political status of Jews in the French Republic. People fed on such a historical diet have a very hard time digesting the idea that Judaism had relatively little impact on the

world as a whole. Yet the truth is that Judaism played only a modest role in the annals of our species. Unlike such universal religions as Christianity, Islam, and Buddhism, Judaism has always been a tribal creed. It focuses on the fate of one small nation and one tiny land, and has little interest in the fate of all other people and all other countries. For example, it cares little about events in Japan or about the people of the Indian subcontinent. It is no wonder, therefore, that its historical role was limited.

Israelis often use the term ‘the three great religions,’ thinking that these religions are Christianity (2.3 billion adherents), Islam (1.8 billion) and Judaism (15 million). Hinduism, with its billion believers, and Buddhism, with its 500 million followers—not to mention the Shinto religion (50 million) and the Sikh religion (25 million)—don’t make the cut. This warped concept of ‘the three great religions’ often implies in the minds of Israelis that all major religious and ethical traditions emerged out of the womb of Judaism, which was the first religion to preach universal ethical rules. As if humans prior to the days of Abraham and Moses lived in a Hobbesian state of nature without any moral commitments, and as if all of contemporary morality derives from the Ten Commandments. This is a baseless and insolent idea, which ignores many of the world’s most important ethical traditions.

“Personally I like the idea of descending not from brutal world-conquerors, but from insignificant people who seldom poked their noses into other people’s business.”

When looking at the entire range of stories that seek to define my true identity and give meaning to my actions, it is striking to realize that scale matters very little. Some stories, such as Simba’s Circle of Life, seem to stretch for eternity. It is only against the backdrop of the entire universe that I can know who I am. Other stories, such as most nationalist and tribal myths, are puny by comparison. Zionism holds sacred the adventures of about 0.2 percent of humankind and 0.005 percent of the earth’s surface during a tiny fraction of the span of time. The Zionist story fails to ascribe any meaning to the Chinese empires, to the tribes of New Guinea, and to the Andromeda galaxy, as well as to the countless eons that passed before the existence of Moses, Abraham, and the evolution of apes. Such myopia can have serious repercussions.

One of the major obstacles for any peace treaty between Israelis and Palestinians is that Israelis are unwilling to divide the city of Jerusalem. They argue that this city is “the eternal capital of the Jewish people”—and surely you cannot compromise on something eternal. What are a few dead people compared to eternity? This is of course utter nonsense. Eternity is

at the very least 13.8 billion years—the current age of the universe. Planet Earth was formed about 4.5 billion years ago, and humans have existed for at least 2 million years. In contrast, the city of Jerusalem was established just 5,000 years ago and the Jewish people are at most 3,000 years old. This hardly qualifies as eternity. As for the future, the current understanding of physics tells us that planet Earth will be absorbed by an expanding sun about 7.5 billion years from now, and that our universe will continue to exist for at least 13 billion years more. Does anyone seriously believe that the Jewish people, the state of Israel, or the city of Jerusalem will still exist 13,000 years from now, let alone 13 billion years? Looking to the future, Zionism has a horizon of no more than a few centuries, yet it is enough to exhaust the imagination of most Israelis and somehow qualify as ‘eternity.’ And people are willing to make sacrifices for the sake of “the eternal city,” which they would probably refuse to make for an ephemeral collection of houses.

Luntz’s advice for Israel reflects the understanding that reasonableness in negotiations, undergirded by empathy for one’s negotiating partners, is the expected norm of public discourse. His documents attempt to explain how to feign reasonableness while communicating a message that undermines the reasonableness of one’s interlocutors in the eyes of third parties.

In November 2012, President Obama remarked:

“There’s no country on Earth that would tolerate missiles raining down on its citizens from outside its borders.”

He made the statement in defense of Israel’s attack on Gaza, which was launched in the name of protecting itself from Hamas missile attacks.

“We are fully supportive of Israel’s right to defend itself from missiles landing on people’s homes and workplaces and potentially killing civilians. And we will continue to support Israel’s right to defend itself.”

How would people living in areas of Yemen, Somalia, or Pakistan that have been regularly targeted by US drones or missile strikes view that statement?

In a very real sense, the Palestinians are paying the world’s price for the 2,000 years of oppression, even though they had little to do with it. This is reminiscent of ancient times when the Canaanites basically paid for what the Egyptians did. Israelis seem to have forgotten the commandment not to persecute the stranger because they have been strangers in someone else’s land. The slogan “Never again” has come to mean ‘Get them before they get you.’ Instead, it could mean:

“We know what it is to wander the earth at the mercy of other nations. Let us take no path which would increase the misery of displaced peoples and make sure no one else goes through a holocaust even vaguely approximating ours.”

One of the most stable political situations in the West is the use of charges of antisemitism to attack those who criticize Israel. Alexandria Ocasio-Cortez, who championed Palestine in her primary run, was quickly broken by the pro-Israeli lobby, before she was even elected. The UK Labour party under Jeremy Corbyn has been under constant attack for “antisemitism” because Corbyn is sympathetic to Palestinians. And recently, Representative Ilhan Omar suggested that donation from AIPAC are why Congress supports Israel. I don’t think that’s mostly correct. They fear AIPAC for far more than monetary reasons. Anyway, like a typical liberal, Ilhan was forced into apologizing. Try that shit with us though and see what that gets you.

Let’s state this simply: Israel is a religious-ethnic apartheid settler state, where the land and homes of much of the people who lived there were seized by force. The problem is that criticism of Israel, a particularly evil state, is deliberately conflated with criticism of Jews, because Israel is an explicitly Jewish state.

Jews: average people—some kind, some assholes; don’t belong in camps (unless its a voluntary summer camp, say in Upstate New York or the Georgia mountains or the Sierra Nevadas)

Israelis: citizens of an apartheid colonial state running the world’s largest open-air prison; also don’t belong in camps.

Any Israeli who opposes the government’s Palestine policies is good in that regard. Any Israeli who supports the government is evil. It’s not hard. Extend this to whichever groups and situations you like.

People have responsibility exactly equal to their power. Nonetheless if you support evil, you are culpable. Most ethical situations are, in fact, black and white. We just like to pretend they aren’t. Let’s take another situation: Raising the price of Insulin 1,000% in a few years—evil. People who do it? Mass murderers. Correct punishment? Same as for any other murderers.

None of this is to say redemption is impossible. One of my friends supported the Iraq War. He quickly realized his mistake, reversed his position and has consistently opposed shitty American wars since then. George Bush wouldn’t get off so easy: since he had a lot of power his

responsibility is much greater and since he's no longer in power he can no longer "make it up."

The rule for redemption is as follows: First stop doing evil. Apologize. Make it up. Those insulin execs: drop the prices back down. Disgorge all the profits you made, with a priority to the families of those you killed. That's all it takes. But if you keep doing it or supporting it you are responsible or complicit. This isn't hard. Don't do evil. Don't support evil. If you do or support evil, then you are stained by that evil.

As for Israelis: it is not their fault they are Israelis. However if they support their government's policies against Palestinians, well, they're evil. But remember: still don't belong in camps. The same is true of Jews, as it is of individuals belonging to any identity-group you wish to name. With respect to Israel, well, all it has to do is offer all Palestinians full citizenship and give them reparations equal to what was stolen. This will probably mean the end of Israel as an religious-ethnic state, but are religious-ethnic states a good thing?

We all know what is required when we do wrong. Stop doing harm, apologize and recompense the victims as best one is able. While often what we should do as individuals isn't true of states, for redemption and forgiveness, it is. Stop doing evil. Say sorry. Make it up as best one can. But first, stop doing evil.

There is a peculiar phrase: 'people who disagree with you.' It's used to reduce the depth of political conflicts—they are mere "disagreements," things we shouldn't get too upset over. And it's true that it would be silly to get moralistic over things we simply disagree about. But when we actually remember the human stakes of politics, something seems strange about using the term 'disagreement' to describe these differences. I have a disagreement with Bari Weiss, it's true. I believe that the mass murder of unarmed protesters is something that must be loudly condemned. She disagrees with me. I disagree with George W. Bush over whether half a million Iraqis should be dead who would otherwise have been alive.

If politics are just a hobby, then it does indeed seem strange to hate Bari Weiss. After all, she's apparently a very nice person. But if politics are about the lives of people affected by power, then it doesn't matter at all that she's nice. It's not cute that she chatters about the pen marks on her boob. It is, in fact, rather disturbing, because it shows that she, like so many of her Times colleagues, is able to be completely detached from the reality of the subjects she is writing about. You have the luxury of obsessing over trivia when things that truly matter are invisible to you.

I do not become consumed by hatred casually. I am a reluctant hater. Nevertheless, when I see photos of Palestinian teenagers with blood gushing

from what is left of their faces, I cannot feel anything but rage at those who can use their prominent media platforms to dismiss pain of victims and confidently hold forth with their opinions on a world they know nothing about.

There is an effective debating trick called the Gish gallop, in which you bury your opponent in an avalanche of arguments. The point is to overwhelm them with sheer quantity of claims—disregarding the veracity or strength of the arguments advanced—so that they are unable to respond to everything, and the audience is left thinking that something in that onslaught must be accurate. In the *New York Times Sunday Review*, Bret Stephens runs through a litany of Israeli talking points and propaganda. None of them are particularly original, convincing, or true.

Given just how frequently the arguments Stephens advances are trotted out, it's worthwhile to try and dispel the most prominent ones. To avoid producing a narcolepsy-inducing exegesis, let me focus on the broad strokes of Stephens' arguments and not things like who violated the November 2008 ceasefire (It was Israel). First, Stephens summarizes what he claims to be the progressive narrative: More than a half-century of occupation of Palestinian territories is a massive injustice that fair-minded people can no longer ignore, especially given America's financial support for Israel. Continued settlement expansion in the West Bank proves Israel has no interest in making peace on equitable terms. And endless occupation makes Israel's vaunted democracy less about Jewish self-determination than it is about ethnic subjugation.

“This indictment would be damning if it were true, or even half-true. It's not.”

He then proceeds to lay out a welter of “facts” that supposedly undermine this progressive narrative. In reality, very little of what follows even approaches relevance to the progressive narrative, let alone disproves it. This is because the “narrative” is actually true, and almost impossible to escape if one looks at the facts honestly. Israel maintains an occupation and the settlements are illegal—it's quite clear and simple. One need only look at maps of Israeli settlements in Palestinian territory to conclude that “peace on equitable terms” is not going to be offered willingly by a power engaged in a decades-long land theft.

Stephens does not actually refute, or even address, the “progressive narrative's” claim about settlement expansion. An honest presentation of the facts would make it clear that the progressives are right. He does, however, run through a laundry list of other ostensibly exculpatory talking points.

“Israel’s enemies were committed to its destruction long before it occupied a single inch of Gaza or the West Bank.”

Let’s remember what actually happened, and why there is a state of Israel in the first place. Like ICE, Israel is less eternal than it seems and was created within the lifetimes of still-living people. In 1948, approximately 750,000 Palestinians were uprooted, ethnically cleansed, and displaced from their homes. In the process, Israeli military forces perpetrated mass atrocities. Palestinians and neighboring Arabs fought back against the project to seize and encroach upon their lands. To frame Palestinian resistance as motivated by an irrational seething antisemitism—as Stephens does—and not by opposition to land theft is wildly disingenuous. Even Israeli Zionist historian Benny Morris writes in his sprawling work *Righteous Victims*:

“The fear of territorial displacement and dispossession was to be the chief motor of Arab antagonism to Zionism.”

It’s perfectly obvious why Palestinians would be resistant to the creation of a Jewish state on land they already inhabited.

Despite the initial injustice of Israel’s founding, much of mainstream Palestinian leadership has, for decades, backed a two-state solution, with the pre-June 1967 war borders as the basis for the states, meaning that the Palestinian state would consist of the West Bank and Gaza (East Jerusalem as the capital), only 22 percent of historic Palestine. Since then, Israelis have never accepted this immense compromise—with Palestinians giving up 78 percent of their land—because they have consistently hungered for even more land. And Israel has disregarded the international consensus which has coalesced around a solution, grounded in international law. Which brings us to Stephens’ next context-free fact:

“Israeli prime ministers offered a Palestinian state in 2000 and 2008; they were refused both times.”

And now with Trump’s latest proposal Stephens would argue it’s three times. Palestinian rejectionism is a theme in Israeli hasbara, and Stephens’ rendition is no exception. The recitation tends to go something like: Israelis have time and again bent over backwards to offer Palestinians a state of their own, but they are consistently unwilling to accept peace. Notably absent from Stephens’ assertion is any kind of objective assessment of the so-called “Palestinian states” offered in 2000 and 2008, and that’s for very good reason. Of the 2000 negotiations (Camp David), former foreign minister Shlomo Ben Ami states:

“If I were a Palestinian, I would have rejected Camp David, as well.”

What followed were the Taba negotiations—probably the closest a peace agreement has ever gotten to what international law and consensus dictate—which ended when Prime Minister Barak withdrew his negotiators. Stephens continues to thrash wildly about in the hopes of landing one good punch:

“In proportion to its size, Israel has voluntarily relinquished more territory taken in war than any state in the world.”

This point sounds convincing, until one realizes it’s utterly irrelevant and bizarre. UN Resolution 242 stresses “the inadmissibility of the acquisition of territory by war.” This means that the territory Israel has taken in war must be returned. To frame Israel’s withdrawals as a magnanimous or benevolent gesture is to fundamentally distort what international law entails, and the nature of the conflict. You’re not supposed to seize territory, so relinquishing seized territory just means “ceasing to commit an ongoing crime.” If Mr. Stephens’ claim is true, consider what it also means: In order for Israel to claim that it “has voluntarily relinquished more territory taken in war than any state in the world,” it would also be necessary for Israel to steal more land than many (any?) other countries, relative to its size. Stephens and his ilk would no doubt reply that this is because the ever-victimized Israel faces an unceasing onslaught—besieged on all sides—from its hostile, Jew-hating neighbors. Without running through the full record here, none of the wars Israel has fought were wars of necessity. They were all wars of choice or wars of folly.

Consider, also, this brief review of recent Israeli wartime history: Israel cheered on the Iraq war in 2003; in 2006 Israel invaded Lebanon; in 2008–09 it attacked Gaza, then again in 2012, then again in 2014, and, then, during the overwhelmingly nonviolent Great March of Return, from March 2018–present, Israel has massacred well over 100 protesters and injured more than 10,000 others; Israel routinely threatens Iran with an attack (to cite one recent example); and Israel has fired airstrikes in Syria (not to mention given medical treatment to members of an al-Qaeda affiliate group). It is striking to compare Iran—the wellspring of evil, if you were to believe the Israeli government—and Israel’s record of military aggression. Iran fares relatively well, though not perfectly.

Many defenders of Israel will tell you that the country can’t possibly give up control over the West Bank, Gaza, and East Jerusalem. They’ve tried that already, and it didn’t turn out well. Building on the theme of Israeli magnanimity, Stephens notes that:

“The government of Ariel Sharon removed every Israeli settlement and soldier from the Gaza Strip in 2005. The result of Israel’s withdrawal allowed Hamas to seize power two years later and spark three wars, causing ordinary Israelis to think twice about the wisdom of duplicating the experience in the West Bank.”

It’s tough to know where to start here, because there’s so much to unpack. Let’s begin with Prime Minister Ariel Sharon’s own justification for the withdrawal. He said that the disengagement from Gaza was done, in part, in an effort to strengthen Israel’s grip on the far more valuable primary settlement blocs in the West Bank. In other words, Sharon was admitting that he decided to end the illegal land grab in Gaza to focus on the illegal land grab in the West Bank. Some Israeli settler families, handsomely compensated, moved from illegal settlements in Gaza to illegal settlements in the West Bank. Indeed, in 2003, Sharon explained:

“The occupation is bad for Israel and bad for Palestinians, and bad for the Israeli economy. Controlling 3.5 million Palestinians cannot go on forever.”

But this is not to say, as blind supporters of Israel often do, that Israel had ended its occupation of Gaza. Prime Minister Ehud Olmert later clarified the nature of Israel’s relationship to Gaza:

“We will operate, enter, and pull out as needed.”

Despite protestations to the contrary, Gaza remains occupied territory because Israel continues to control the land borders, airspace, and sea in the Strip, according to the UN and ICRC. The extent of Israeli control over the small strip of land is tough to overstate, even though they have “left.” This is also why Trump’s proposal does nothing to end the occupation—if you don’t control your own borders, you’re in a prison camp, not a sovereign nation.

As for the election of Hamas, in 2006 the militant Islamist party won a majority of seats in parliament, a victory deemed fair and free by the Carter Center for Election Observation. In the wake of the election, senior leaders of Hamas were making moderating overtures towards peace. But Gazans had made the wrong decision, so the United States and Israel responded by backing an attempted coup. In response to Hamas’ subsequent consolidation of power, Israel imposed an illegal and inhumane blockade.

“Nearly 1,300 Israeli civilians have been killed in Palestinian terrorist attacks in this century: That’s the proportional equivalent of about 16 Sept. 11s in the United States.”

This is remarkable: To Stephens, the Palestinian dead are negligible. Not even worth noting. Stephens portrays it as a one-sided conflict in which the only deaths are peace-loving Israelis killed by bloodthirsty Palestinians, when in reality the number of Palestinian deaths outnumbers the number of Israeli deaths by 7:1. In Operation Protective Edge alone, which took place during the summer of 2014, the Israeli Defense Forces killed over 1,400 civilians in Gaza, of those about 550 were children, according to the United Nations. Six civilians in Israel were killed. Why the discrepancy? Israel has the most powerful military in the Middle East, in part thanks to generous aid packages from Uncle Sam. Your kids might be drinking leaded water but check out those well-equipped and -trained IDF women—Girl Power! The chief Palestinian resistance weapon is a rock, though in Gaza sometimes they fire rockets—which are more like glorified fireworks than sophisticated pieces of military hardware—or set fire to kites. The death ratio is precisely what you get when you have a resource-poor, desperate, occupied group up against one of the world’s most powerful militaries.

“Also: If the Jewish state is really so villainous, why doesn’t it behave more like Syria’s Bashar al-Assad or Russia’s Vladimir Putin—both of whom, curiously, continue to have prominent sympathizers and apologists on the anti-Israel left?”

It does! All of them are butchers who murder babies; all of them are led by authoritarian strongmen with a commitment to remain in power above nearly all else. The difference is, given the mainstream narrative’s hatred of Vlad and Bashar, they are given far less latitude to do things without criticism than shitheads like Netanyahu who hide behind a pile of holocaust victims.

“Next is the belief that anti-Zionism is a legitimate political position, and not another form of prejudice.”

Discussions about Zionism tend to take us away from Israel’s egregious record, but I have tried to remain focused on how Zionism in practice in Israel leads to a Jewish supremacist state. I shouldn’t be surprised, but the flagrancy of Stephens’ disingenuousness is truly shocking. Mr. Stephens can scream, gnash his teeth, throw a tantrum, and loudly assert this point until he is blue in the face, but it doesn’t make it true. Stephens

is ignoring the long history of anti-Zionist Jews, secular and religious, who opposed the creation of the state of Israel and now oppose a Jewish supremacist state that affords special privileges to Jews and discriminates against non-Jews. To dismiss them as anti-Semites or self-hating Jews is not just intellectually lazy, but it actually puts him at odds with a significant swath of the Jewish community. Without offering any evidence, Stephens' promulgation can be easily dismissed. In fact, Jewish Voice for Peace, an American anti-occupation organization comprised of thousands of Jews, recently formally declared itself anti-Zionist. Even President Jeremy Ben-Ami of the liberal-centrist J-Street, a pro-Israel lobbying organization, parted ways with Stephens, explaining:

“We do not accept the contention that all anti-Zionism should be automatically defined as antisemitism.”

Later, Stephens makes clear that he is fundamentally ignorant of what anti-Zionism actually is. He writes:

“Anti-Zionism proposes nothing less than the elimination of that identity and the political dispossession of those who cherish it, with no real thought of what would likely happen to the dispossessed. Do progressives expect the rights of Jews to be protected should Hamas someday assume the leadership of a reconstituted ‘Palestine’?”

To believe that a state shouldn't be explicitly Jewish is only “political dispossession” in the sense that having a democratic government deprives one ethnic group of the right to enshrine its identity in the state itself. Dispossessed of what? The notion that the result of Israel becoming a binational state with equal rights for all would be Jews thrown into the sea is pandering nonsense. What Stephens really seems to fear is that Jews might be treated like Palestinians already are. When he asks if progressives expect “the rights of Jews to be protected,” it's unclear what kinds of rights he's referring to. If he means ethnic supremacist rights like the right to demolish Palestinian homes, steal land with impunity, claim citizenship and all the exclusive privileges that go along with it, solely on the basis of your Jewish identity (the Law of Return), then, no, those rights should not be protected. As for basic civil rights, afforded to all citizens, I see no reason to believe that Palestinians would be unable to live alongside Jews in amity. Unlike Bret Stephens, I don't happen to believe Arabs are uniquely barbaric. As in South Africa and Northern Ireland, peace is possible.

Stephens shuffles on:

“Of course it’s theoretically possible to distinguish anti-Zionism from antisemitism, just as it’s theoretically possible to distinguish segregationism from racism. But the striking feature of anti-Zionist rhetoric is how broadly it overlaps with traditionally anti-Semitic tropes.”

This confused (and confusing) analogy scrambles the brain. Stephens has managed to turn reality on its head. It is Zionism in practice that has led to Jewish-only towns, segregated roads and schools. Anti-Zionists are opposed to this kind of segregation and racism prevalent in Israeli society. They are the ones calling for integration and equal rights for all, not fighting against it like Stephens is.

“To say, as progressives sometimes do, that Jews are ‘colonizers’ in Israel is anti-Semitic because it advances the lie that there is no ancestral or historic Jewish tie to the land.”

It is no contradiction to acknowledge Jewish historical, religious, and cultural ties to certain land areas and simultaneously acknowledge that Israel has engaged in ethnic cleansing and has seized and colonized Palestinian land. When the Zionist movement started its ethnic cleansing operations in Palestine, in early December 1947, the country had a “mixed” population of Palestinians and Jews. The indigenous Palestinians made up the two-third majority, down from ninety percent at the start of the Mandate. One third were Jewish newcomers: Zionist settlers and refugees from war torn Europe, most of whom had arrived in Palestine since the 1920s.

Imagine a white South African saying that it was anti-white to criticize white colonization of Africa, on the grounds that white people had ancestral ties to the land. Africa was, after all, the birthplace of humanity! This would be childish: The question is ‘What actually happened?’ Colonization here is the description of a process by which people came to a place and displaced those living there already. This happened—it was explicitly the point of the Zionist project. It doesn’t mean that Jews in Israel have no legitimate claims, it is simply an attempt to accurately describe the historical process that created the present-day demographic reality of Israel.

Stephens continues with another reckless accusation of antisemitism:

“To claim that Israel is committing genocide in Gaza, when manifestly it is not, is anti-Semitic because it’s an attempt to Nazify the Jewish state.”

It remains unclear here whether Stephens believes that it is anti-Semitic to accuse Israel of committing genocide if it is committing genocide, or

whether it's only anti-Semitic because it's false. The arguments in favor of applicability of the G-word are straightforward enough. Gaza has been described as: "a prison camp," "the largest concentration camp ever to exist," and the "Gaza ghetto." One Israeli government official said that they intended to "put the Palestinians on a diet." Infrastructure is crumbling. Borders are strictly controlled by Israel and Egypt, and a harsh blockade has been imposed so things like fruits, vegetables, and construction materials have historically been prevented from entering. Every two years or so, Israel "mows the lawn," killing hundreds, injuring thousands, destroying sewage and power plants, mosques, schools, houses, and chicken farms. With only 2–4 hours a day of electricity, Gaza is unlivable. 97 percent of the water is undrinkable. What do you call an open-air prison in which the population is being poisoned?

One needs to be able to use accurate language. If use of phrases like 'concentration camp' would "Nazify" Israel and therefore definitionally be anti-Semitic, then Israel cannot, no matter what the actual facts are, ever be accused of creating a concentration camp. This gives an extraordinary license for abusive behavior: If Israel cannot be accused of anything that was also done by Nazi Germany, because to do so would be to compare it to Nazi Germany, then it will be impossible to speak honestly when the Israeli government commits particular crimes with historical precedents. Walling off particular allegations as impermissible—regardless of the facts—offers a dangerous kind of immunity from scrutiny.

"To insist that the only state in the world that has forfeited the moral right to exist just happens to be the Jewish state is anti-Semitic, too: Are Israel's purported crimes really worse than those of, say, Zimbabwe or China, whose rights to exist are never called into question?"

The phrase 'right to exist' should be critically examined, because it's used constantly in these discussions, but it's not quite clear what it means. It is designed to sound unobjectionable: Who could possibly deny the Right To Exist?—as if denial of this right would mean the endorsement of genocide. But when we think clearly about it, it's a peculiar expression: What does it mean for a state to have a "right to exist?" When supporters of Israel use the phrase, they want to imply that they are simply asking for something basic—the right not to be killed, the right to simple existence. But they are actually proposing something far more controversial: the right for Israel to exist as an ethnostate. If you deny that there is a right for states to have ethnic supremacy enshrined in their laws, then in a sense you are denying

Israel's right to exist. But you are not thereby denying that Jews should get to live peacefully and democratically in the territory currently governed by the state of Israel.

There is also an element of retroactive approval in the phrase. The 'right to exist' implies a 'right to come into existence'—i.e., if there were no Israel it would be permissible to create it, with the accompanying mass displacement. It is obvious why Palestinians cannot endorse a right to exist in this sense, because it requests legitimization of the original crime upon which the state was founded.

Ultimately, no state has a right to exist. It either does or it doesn't. The United States does not have the right to exist, though its people have the right to live under a democratic government. What Stephens is calling for is a special privilege afforded only to Israel.

“But the most toxic assumption is that Jews, whether in Israel or the US, can never really be thought of as victims or even as a minority because they are white, wealthy, powerful, and ‘privileged.’”

If someone did think Jews could “never really be thought of as victims,” they would have a simplistic conception of power. But of course Jews can be victims, a belief shared by every reasonable progressive.

“Martin Luther King Jr. preached nonviolent resistance; Yasir Arafat practiced terrorism. The civil rights movement was about getting America to live up its founding ideals; anti-Zionism is about destroying Israel's founding ideals.”

Yes, that's what the Palestinians and their supporters should practice: good old fashioned nonviolent resistance, like Martin Luther King. Tactics like boycotts, right? If Stephens cared even a whit about nonviolent resistance, he would be praising the Boycott, Divestment, and Sanctions (BDS) movement as a welcome alternative to violent resistance. But, no, to supporters of nonviolent resistance, actual nonviolent resistance is off the table too. When asked what the BDS movement was all about, he answered simply:

“It's antisemitism.”

Bret Stephens doesn't want Palestinians to switch their tactics. He wants them to curl up and die.

Whatever your feelings about the goals of the BDS movement, their tactics are unimpeachable. There were plenty of white Southerners who decried Martin Luther King Jr., SNCC, and others in the civil rights movement as seeking to destroy America's founding ideals. King was a law-breaker, and many worried that his actions encouraged others to engage in delinquent behaviors. If one of America's founding ideals is white supremacy, then it should be rooted out. So too with Israel: If one of its founding ideals is Jewish supremacy, then it needs to change.

“As for the oft-cited apartheid analogy, black South Africans did not have a place in the old regime's Parliament, as Israeli Arabs have in the Knesset; nor were they admitted to white universities, as Israeli Arabs are to Israeli universities. Israel can do more to advance the rights of its Arab citizens (just as the United States, France, Britain, and other countries can for their own minorities). And Israel can also do more to ease the lives of Palestinians who are not citizens. But the comparison of Israel to apartheid South Africa is unfair to the former and an insult to the victims of the latter.”

Stephens should hold off on ventriloquizing the victims of South African apartheid. Many of the most prominent figures of the anti-Apartheid movement have compared the Palestinian struggle to their own and even used the A-word themselves. For those that will quickly dismiss such pronouncements as motivated by seething Jew Hatred, consider that former Prime Ministers David Ben Gurion, Yitzhak Rabin, Ehud Olmert, and Ehud Barak have warned that if Israel didn't end its control over the Palestinians it would become an apartheid state. Other Israeli politicians have been more forthright, insisting that Israel is already an apartheid state. There are unquestionably differences between apartheid as practiced in South Africa and in the occupied territories. But the notion that the analogy is beyond the pale demonstrates a serious lack of familiarity with Israeli politics. The center-left Israeli newspaper Haaretz, for instance, routinely runs articles that use the term.

So what's the basis for its usage? Palestinians who live, in essence, under Israeli rule are unable to vote in Israeli elections. Stephens pointing to “Israeli Arabs” who are able to vote doesn't negate the fact that very many are unable, because it doesn't disprove discrimination. Consider grandfather clauses and voting tests under Jim Crow. All men are allowed to vote, provided they can pass a literacy test or constitutional quiz or pay this poll tax, and if they cannot meet those requirements, that is ok—

they're still allowed to vote, as long as their ancestors could vote! And the defenders of such a policy could note: We're not discriminating against African Americans, because, look, some African Americans are able to vote! Palestinians living in the West Bank, under Israeli rule, are still not allowed to vote in Israeli elections even though Jewish Israeli settlers living in the same territory are. That's not fair.

There are also all sorts of discriminatory land ownership and leasing policies, which favor Jewish Israelis. I've already mentioned the segregated housing and settlements above. And any Jew is able to immigrate, from anywhere in the world, to Israel and be granted citizenship, on the basis of the Law of Return. The same is not true for Palestinians.

Like the United States, Israel has a shockingly discriminatory criminal justice system. A teenage Palestinian girl was sentenced to eight months in prison for slapping an Israeli soldier who was trespassing on her property (shortly after her cousin had been shot). An Israeli soldier that shot a disarmed Palestinian in the head got a slap on the wrist and was celebrated as a hero. A Palestinian woman faced up to eight years in prison for her poetry, which she posted to Facebook, and ultimately served five months, while the Israeli military perpetrates war crimes with impunity. Palestinians are tried in Israeli military courts which have a 99.7 conviction rate. If this two-tiered legal system isn't enough to convince you, there's an actual (illegal) separation wall dividing the two peoples, one of which has a state and one of which does not.

Social discrimination is rampant. Take incidents like this: Hundreds of Israelis turned out to demonstrate against the sale of a home to a Palestinian family. The former mayor, who joined the protests in support, explained:

“The residents of Afula don't want a mixed city, but rather a Jewish city, and it's their right. That's not racism.”

Recently the country passed a law which declares that “the realization of the right to national self-determination in Israel is unique to the Jewish people” and contained other parts that favored Jewish Israelis. (Then there are all these other discriminatory laws.) It is helpful, in clarifying our thinking, to imagine how we would feel about every defense of Israel if it substituted the terms ‘white’ and ‘black’ for ‘Jewish’ or ‘Israeli’ and ‘Arab’ or ‘Palestinian.’ The reason the apartheid analogy is useful is because it allows us to see why things that have been normalized are actually so repugnant and absurd—the argument that destroying Israel as a Jewish state would destroy it altogether is like arguing that destroying South Africa as a white state would destroy it—only true if the nation's identity is bound up entirely with ethnic supremacy.

Hasbara is easy to refute but also easy to produce, and people like Bret Stephens deploy it in such endless barrages that it can feel futile to even begin to engage. The same thing happens with every ongoing human rights abuse—defenders of the powerful will expend every effort to prove that the victims brought it upon themselves, that the perpetrators are the real victims, that what looks like an obvious crime is actually either justice or an unavoidable tragedy with nobody to blame. It's important that we be prepared with the facts, and understand the various ways in which they are evaded, massaged, and manipulated in order to add the illusion of complexity to morally straightforward issues.

Life in the Arena

War! What Is It Good For?

“Liberty is a bitch who must be bedded on a mattress of corpses.”

There’s never been a true war that wasn’t fought between two sets of people who were certain they were in the right. The really dangerous people believe that they are doing whatever they are doing solely and only because it is without question the right thing to do. And that is what makes them dangerous.

For every war a motive—of safety or revenge, of honor or zeal, of right or convenience—may be readily found in the jurisprudence of conquerors.

There is something dangerous about the equation of military success and moral right; the argument favoring violence for the sake of an ideal can make us idealize violence, and gets people to forget what the actual costs of war are.

~~“A single death is a tragedy, a million deaths is a statistic. The war? I can’t find it too terrible! The death of one man: that is a catastrophe. One-hundred-thousand deaths: That is a statistic!”~~

~~—Joseph Stalin~~ Kurt Tucholsky, *Französischer Witz*

“Of all the enemies of true liberty, war is, perhaps, the most to be dreaded, because it comprises and develops the germ of every other. No nation could preserve its freedom in the midst of continual warfare. War is the parent of armies; from these proceed debts and taxes; and armies, and debts, and taxes are the known instruments for bringing the many under the domination of the few. In war, too, the discretionary power of the Executive is extended; its influence in dealing out offices, honors, and emoluments is multiplied; and all the means of

seducing the minds, are added to those of subduing the force, of the people. The same malignant aspect in republicanism may be traced in the inequality of fortunes, and the opportunities of fraud, growing out of a state of war, and in the degeneracy of manners and of morals engendered by both.”

“War is a racket. It always has been.

It is possibly the oldest, easily the most profitable, surely the most vicious. It is the only one international in scope. It is the only one in which the profits are reckoned in dollars and the losses in lives.

A racket is best described, I believe, as something that is not what it seems to the majority of the people. Only a small ‘inside’ group knows what it is about. It is conducted for the benefit of the very few, at the expense of the very many. Out of war a few people make huge fortunes.

In the World War a mere handful garnered the profits of the conflict. At least 21,000 new millionaires and billionaires were made in the United States during the World War. That many admitted their huge blood gains in their income tax returns. How many other war millionaires falsified their tax returns no one knows.

How many of these war millionaires shouldered a rifle? How many of them dug a trench? How many of them knew what it meant to go hungry in a rat-infested dug-out? How many of them spent sleepless, frightened nights, ducking shells and shrapnel and machine gun bullets? How many of them parried a bayonet thrust of an enemy? How many of them were wounded or killed in battle?

Out of war nations acquire additional territory, if they are victorious. They just take it. This newly acquired territory promptly is exploited by the few—the selfsame few who wrung dollars out of blood in the war. The general public shoulders the bill.

And what is this bill? This bill renders a horrible accounting. Newly placed gravestones. Mangled bodies. Shattered minds. Broken hearts and homes. Economic instability. Depression and all its attendant miseries. Back-breaking taxation for generations and generations.

For a great many years, as a soldier, I had a suspicion that war was a racket; not until I retired to civil life did I fully realize

it. Now that I see the international war clouds gathering, as they are today, I must face it and speak out.”

“The jet plane that roars over your head costs three quarter of a million dollars. That is more money than a man earning ten-thousand dollars every year is going to make in his lifetime. What world can afford this sort of thing for long? We are in an armaments race. Where will it lead us? At worst to atomic warfare. At best, to robbing every people and nation on earth of the fruits of their own toil.

Every gun that is made, every warship launched, every rocket fired signifies, in the final sense, a theft from those who hunger and are not fed, those who are cold and are not clothed. This world in arms is not spending money alone. It is spending the sweat of its laborers, the genius of its scientists, the hopes of its children. The cost of one modern heavy bomber is this: a modern brick school in more than 30 cities. It is two electric power plants, each serving a town of 60,000. It is two fine, fully equipped hospitals. It is some fifty miles of concrete pavement. We pay for a single fighter plane with a half-million bushels of wheat. We pay for a single destroyer with new homes that could have housed more than 8,000 people. This is, I repeat, the best way of life to be found on the road the world has been taking. This is not a way of life at all, in any true sense. Under the cloud of threatening war, it is humanity hanging from a cross of iron. Is there no other way the world may live?”

—President Eisenhower, 1953

Göring: Why, of course, the people don't want war. Why would some poor slob on a farm want to risk his life in a war when the best that he can get out of it is to come back to his farm in one piece? Naturally, the common people don't want war; neither in Russia nor in England nor in America, nor for that matter in Germany. That is understood. But, after all, it is the leaders of the country who determine the policy and it is always a simple matter to drag the people along, whether it is a democracy or a fascist dictatorship or a parliament or a communist dictatorship.

Gilbert: There is one difference. In a democracy, the people have some say in the matter through their elected representatives, and in the United States only Congress can declare wars.

Göring: Oh, that is all well and good, but, voice or no voice, the people can always be brought to the bidding of the leaders. That is easy. All you have to do is tell them they are being attacked and denounce the pacifists for lack of patriotism and exposing the country to danger. It works the same way in any country.

As Aeschylus, the illustrious Greek tragedian, noted in the fifth century BC:

“In war, truth is the first casualty.”

Ten-million soldiers to the war have gone,
 Who may never return again
 For the ones who died in vain
 I didn't raise my boy to be a soldier
 Who dares to put a musket on his shoulder,
 To shoot some other mother's darling boy?
 It's time to lay the sword and gun away.

“Arise, all women who have hearts, whether your baptism be that of water or of tears! Say firmly: We will not have great questions decided by irrelevant agencies. Our husbands shall not come to us, reeking with carnage, for caresses and applause. Our sons shall not be taken from us to unlearn all that we have been able to teach them of charity, mercy, and patience.”

The poor, ignorant serfs had been taught to revere their masters; to believe that when their masters declared war upon one another, it was their patriotic duty to fall upon one another and to cut one another's throats for the profit and glory of the lords and barons who held them in contempt. The working class who fight all the battles, the working class who make the supreme sacrifices, the working class who freely shed their blood and furnish the corpses, have never yet had a voice in either declaring war or making peace. It is the ruling class that invariably does both. They alone declare war and they alone make peace. You need at this time especially to know that you are fit for something better than slavery and cannon fodder.

It's a hell of a thing, killing a man. You take away all he's got and all he's ever gonna have. It is only those who have neither fired a shot nor heard the shrieks and groans of the wounded who cry aloud for blood, more vengeance, more desolation.

People may think of war as if it's a ballet, like it's choreographed ahead of time, and when the orchestra strikes up and starts playing, everyone goes out there and goes through a set piece. Well, it is choreographed, and what happens is the orchestra starts playing and some son of a bitch climbs out of the orchestra pit with a bayonet and starts chasing you around the stage. And the choreography goes right out the window.

War remains today what it has always been—elusive, untamed, costly, difficult to control, fraught with surprise, and sure to give rise to unexpected consequences. Only the truly demented will imagine otherwise.

“Fighting a war to fix something works about as good as going to a whorehouse to get rid of a clap.”

War is two old men throwing other people's children at each other until one of them gets tired. There's no glory or honor in war, there's nothing noble about it. People do heroic and extraordinary things under terrible circumstances but war itself is a bottomless pit that we shovel money, material, and young men into. There's only one truth in war: people die. A lot of them will be kids or civilians.

War is always about betrayal, betrayal of the young by the old, of idealists by cynics, and of troops by politicians.

It is the same in all wars; the soldiers do the fighting, the journalists do the shouting, and no true patriot ever gets near a front-line trench, except on the briefest of propaganda tours.

Teddy Roosevelt marketed wars as desirable means of building character and slaughtering lesser races. Barack Obama marketed wars as philanthropic assistance to the places being bombed. But both kill just the same.

The arena: It is a favorite concept, capturing a dangerous and seductive worldview when applied to war. The idea came from Theodore Roosevelt's famous speech, trashing critics and valuing the experience of risk over all else.

“It is not the critic who counts. The credit belongs to the man who is actually in the arena, whose face is marred by dust and sweat and blood, who strives valiantly, who errs, and who comes up short again and again.”

What mattered wasn't what the war was about, or what might or might not be accomplished; what mattered was that there was an inherent value in being a man, in going into action, in bleeding. There was little difference in victory or failure. The sacrifice of blood had an almost spiritual value beyond politics, beyond success, beyond good and evil; blood and sweat

and pain made up its own ideology, existing within its own moral universe of a very narrowly defined concept of honor and bravery. It was as brave and honorable to take a bullet for the brotherhood as it was to cover up a bullet's mistake. It didn't matter that in Afghanistan, the US military had come up short again and again. What mattered is that they tried.

The simple and terrifying reality, forbidden from discussion in America, was that despite spending \$600 billion a year on the military, despite having the best fighting force the world had ever known, they were getting their asses kicked by illiterate peasants who made bombs out of manure and wood. The arena acts as a barrier, protecting their sacrifices from the uncomfortable realities of the current war—that it might be a total waste of time and resources that historians would look back on, cringing, in the same way we looked back on the Soviets and the British misadventures there.

Permanent war is a proven way to degrade a democracy. A national security state resists transparency and democratic control.

When our manufacturing base is military, we produce things that don't produce any lasting benefit for our society. When we build a school or a bridge or a high-speed rail system, years, decades, sometimes even centuries of use and value come from it. They produce for us, over time, far more than they cost us. Even consumer goods—from homes to washing machines to computers—increase our personal ability to be productive, thus producing a return on investment (albeit not so visible in GDP as are infrastructure investments). But when we spend \$100 million on a bunker-buster bomb, and that bomb is dropped somewhere, that \$100 million just went up in smoke, never to be seen again. As the Romans and so many other empires before ours have found out, military spending is the least productive and sustainable way to build an economy. In fact, a quick inspection of previous world superpowers reveals that they all met their demise by economic collapse following binges of military adventurism—often after a desperate campaign was launched to protect the last vestiges of their empire.

Our military leaders and intelligence agencies are far too powerful and their playing politics has to be slowed if not stopped lest we continue to have to endure their rather open blackmailing of our political system.

Militarization is happening at the individual level, when a woman is persuaded that the best way she can be a good mother is to allow the military recruiter to recruit her son so her son will get off the couch. When she is persuaded to let him go, even if reluctantly, she's being militarized. She's not as militarized as somebody who is a Special Forces soldier, but she's being militarized all the same. Somebody who gets excited because a jet bomber flies over the football stadium to open the football season and is glad that he or she is in the stadium to see it, is being militarized.

So militarization is not just about the question ‘do you think the military is the most important part of the state?’—although obviously that matters. It’s not just ‘do you think that the use of collective violence is the most effective way to solve social problems?’—which is also a part of militarization. But it’s also about ordinary, daily culture, certainly in the United States.

Everyday life and the culture in general are damaged by ramped-up militarization, and this includes academia, particularly the social sciences, with psychologists and anthropologists being recruited as advisors to the military. Anthropology was born of European and US colonial wars. Today’s weaponization of anthropology and other social sciences has been a long time coming, and post-9/11 America’s climate of fear coupled with reductions in traditional academic funding provided the conditions of a sort of perfect storm for the militarization of the discipline and the academy as a whole.

American Heroes

“War is the great auditor of institutions.”

Since 9/11, the United States has undergone such an audit and been found wanting. That adverse judgment applies in full to America’s armed forces. Valor does not offer the measure of an army’s greatness, nor does fortitude, nor durability, nor technological sophistication. A great army is one that accomplishes its assigned mission. Since George W. Bush inaugurated his global war on terror, the armed forces of the United States have failed to meet that standard.

In the aftermath of September 11, 2001, Bush conceived of a bold, offensive strategy, vowing to “take the battle to the enemy, disrupt his plans, and confront the worst threats before they emerge.” The military offered the principal means for undertaking this offensive, and US forces soon found themselves engaged on several fronts.

Two of those fronts—Afghanistan and Iraq—commanded priority attention. In each case, the assigned task was to deliver a knockout blow, leading to a quick, decisive, economical, politically meaningful victory. In each case, despite impressive displays of valor, fortitude, durability, and technological sophistication, America’s military came up short. The problem lay not with the level of exertion but with the results achieved.

In Afghanistan, US forces failed to eliminate the leadership of al-Qaeda. Although they toppled the Taliban regime that had ruled most of that country, they failed to eliminate the Taliban movement, which soon began to claw its way back. Intended as a brief campaign, the Afghan War became a protracted one. Nearly seven years after it began, there was no end in sight. If anything, America’s adversaries were gaining strength. The outcome remains much in doubt.

In Iraq, events followed a similar pattern, with the appearance of easy success belied by subsequent developments. The US invasion began on March 19, 2003. Six weeks later, against the backdrop of a White House–produced banner proclaiming “Mission Accomplished,” President Bush declared that “major combat operations in Iraq have ended.” This claim proved illusory.

Writing shortly after the fall of Baghdad, the influential neoconservatives David Frum and Richard Perle declared Operation Iraqi Freedom “a vivid and compelling demonstration of America’s ability to win swift and total victory.” General Tommy Franks, commanding the force that invaded Iraq, modestly characterized the results of his handiwork as “unequaled in its excellence by anything in the annals of war.” In retrospect, such judgments—and they were legion—can only be considered risible. A war thought to

have ended on April 9, 2003, in Baghdad's al-Firdos Square was only just beginning. Fighting dragged on for years, exacting a cruel toll. Iraq became a reprise of Vietnam, although in some respects at least on a blessedly smaller scale.

It wasn't supposed to be this way. Just a few short years ago, observers were proclaiming that the United States possessed military power such as the world had never seen. Here was the nation's strong suit. "The troops" appeared unbeatable. Writing in 2002, for example, Max Boot attributed to the United States a level of martial excellence "that far surpasses the capabilities of such previous would-be hegemonies as Rome, Britain, and Napoleonic France." With US forces enjoying "unparalleled strength in every facet of warfare," allies, he wrote, had become an encumbrance:

"We just don't need anyone else's help very much."

Boot dubbed this the Doctrine of the Big Enchilada. Within a year, after US troops had occupied Baghdad, he went further: America's army even outclassed Germany's Wehrmacht. The mastery displayed in knocking off Saddam, Boot gushed, made "fabled generals such as Erwin Rommel and Heinz Guderian seem positively incompetent by comparison."

All of this turned out to be hot air. If the global war on terror has produced one undeniable conclusion, it is this: Estimates of US military capabilities have turned out to be wildly overstated. The Bush administration's misplaced confidence in the efficacy of American arms represents a strategic misjudgment that has cost the country dearly. Even in an age of stealth, precision weapons, and instant communications, armed force is not a panacea. Even in a supposedly unipolar era, American military power turns out to be quite limited.

How did it happen that Americans so utterly over-appraised the utility of military power? The answer to that question lies at the intersection of three great illusions.

According to the first illusion, the United States during the 1980s and 1990s had succeeded in reinventing armed conflict. The result was to make force more precise, more discriminating, and potentially more humane. The Pentagon had devised a new American Way of War, investing its forces with capabilities unlike any the world had ever seen. As President Bush exuberantly declared shortly after the fall of Baghdad in April 2003:

"We've applied the new powers of technology to strike an enemy force with speed and incredible precision. By a combination of creative strategies and advanced technologies, we are

redefining war on our terms. In this new era of warfare, we can target a regime, not a nation.”

The distinction between regime and nation was a crucial one. By employing these new military techniques, the United States could eliminate an obstreperous foreign leader and his cronies, while sparing the population over which that leader ruled. Putting a missile through the roof of a presidential palace made it unnecessary to incinerate an entire capital city, endowing force with hitherto undreamed-of political utility and easing ancient moral inhibitions on the use of force. Force had been a club; it now became a scalpel. By the time the president spoke, such sentiments had already become commonplace among many (although by no means all) military officers and national security experts.

Here lay a formula for certain victory. Confidence in military prowess both reflected and reinforced a post-Cold War confidence in the universality of American values. Harnessed together, they made a seemingly unstoppable one-two punch.

With that combination came expanded ambitions. In the 1990s, the very purpose of the Department of Defense changed. Sustaining American global preeminence, rather than mere national security, became its explicit function. In the most comprehensive articulation of this new American Way of War, the Joint Chiefs of Staff committed the armed services to achieving what they called “full spectrum dominance”—unambiguous supremacy in all forms of warfare, to be achieved by tapping the potential of two “enablers”—“technological innovation and information superiority.”

Full spectrum dominance stood in relation to military affairs as the political scientist Francis Fukuyama’s well-known proclamation of “the end of history” stood in relation to ideology: Each claimed to have unlocked ultimate truths. According to Fukuyama, democratic capitalism represented the final stage in political economic evolution. According to the proponents of full spectrum dominance, that concept represented the final stage in the evolution of modern warfare. In their first days and weeks, the successive invasions of Afghanistan and Iraq both seemed to affirm such claims.

According to the second illusion, American civilian and military leaders subscribed to a common set of principles for employing their now-dominant forces. Adherence to these principles promised to prevent any recurrence of the sort of disaster that had befallen the nation in Vietnam. If politicians went off half-cocked, as President Lyndon Johnson and Secretary of Defense Robert McNamara had back in the 1960s, generals who had correctly discerned and assimilated the lessons of modern war could be counted on to rein them in.

These principles found authoritative expression in the Weinberger-Powell Doctrine, which specified criteria for deciding when and how to use force. Caspar Weinberger, secretary of defense during most of the Reagan era, first articulated these principles in 1984. General Colin Powell, chairman of the Joint Chiefs of Staff during the early 1990s, expanded on them. Yet the doctrine's real authors were the members of the post-Vietnam officer corps. The Weinberger-Powell principles expressed the military's own lessons taken from that war. Those principles also expressed the determination of senior officers to prevent any recurrence of Vietnam.

Henceforth, according to Weinberger and Powell, the United States would fight only when genuinely vital interests were at stake. It would do so in pursuit of concrete and attainable objectives. It would mobilize the necessary resources—political and moral as well as material—to win promptly and decisively. It would end conflicts expeditiously and then get out, leaving no loose ends. The spirit of the Weinberger-Powell Doctrine was not permissive; its purpose was to curb the reckless or imprudent inclinations of bellicose civilians.

According to the third illusion, the military and American society had successfully patched up the differences that produced something akin to divorce during the divisive Vietnam years. By the 1990s, a reconciliation of sorts was under way. In the wake of Operation Desert Storm, “the American people fell in love again with their armed forces.” So, at least, General Colin Powell, one of that war's great heroes, believed. Out of this love affair a new civil-military compact had evolved, one based on the confidence that, in times of duress, Americans could be counted on to “support the troops.” Never again would the nation abandon its soldiers.

The All-Volunteer Force (AVF)—despite its name, a professional military establishment—represented the chief manifestation of this new compact. By the 1990s, Americans were celebrating the AVF as the one component of the federal government that actually worked as advertised. The AVF embodied the nation's claim to the status of sole superpower; it was “America's Team.” In the wake of the Cold War, the AVF sustained the global Pax Americana without interfering with the average American's pursuit of life, liberty, and happiness. What was not to like?

Tom Brady makes millions playing quarterback in the NFL and rakes in millions more from endorsements. Pat Tillman quit professional football to become an army ranger and was killed in Afghanistan. Yet, of the two, Brady more fully embodies the contemporary understanding of the term ‘Patriot.’

An army composed of regulars is no longer a people's army—the people have little say in its use. In effect, the professional military has become

an extension of the imperial presidency. The troops fight when and where the president determines. A reliance on professional soldiers eviscerates the concept of civic duty, relieving citizens at large of any obligation to contribute to the nation's defense. Ending the draft during the waning days of the Vietnam War did nothing to heal the divisions created by that conflict; instead, it ratified the separation of army from society. Like mowing lawns and busing tables, fighting and perhaps dying to sustain the American way of life became something that Americans pay others to do.

Today, with the possible exception of conservative evangelicals, no significant segment of the electorate will concede to the federal government the authority to order their sons and daughters into uniform. Legislation mandating involuntary service would almost certainly elicit the same reaction that Prohibition induced back in the 1920s, only more quickly and on a larger scale: The law would be unenforceable.

Granted, arguments that a draft might correct the inequities inherent in our existing military system have indisputable merit. To anyone with a conscience, sending soldiers back for multiple combat tours while the rest of the country chills out can hardly seem an acceptable arrangement. It is unfair, unjust, and morally corrosive. Yet seldom in American history have questions of fairness or equability played a decisive role in shaping public policy. The present moment does not qualify as one of those occasions; if it were, we would not tolerate the gaping disparities between rich and poor in our society.

Relying on a small number of volunteers to bear the burden of waging an open-ended global war might make Americans uneasy, but uneasiness will not suffice to produce change. To salve the nation's conscience, the government might augment our hard-pressed troops with pricey contractor-mercenaries, but it won't actually trouble citizens to do anything. Indeed, the privatization of war—evident in the prominence achieved by armies-for-rent such as the notorious Blackwater or Xe or whatever the fuck they're called today—suggests a tacit willingness to transform military service from a civic function into an economic enterprise, with money rather than patriotism the motive. Americans may not like mercenaries, but many of them harbor an even greater dislike for the prospect of sending their loved ones to fight in some godforsaken country on the other side of the world.

Toward the end of the Vietnam War when Richard Nixon first proposed abolishing the draft, the Joint Chiefs of Staff opposed the idea. Since then, with the partial exception of the Marine Corps, each of the services has become enamored with a force composed of highly skilled, long-service "warriors." When Secretary of Defense Donald Rumsfeld dismissed the draftees of prior wars as having added "no value, no advantage, really," he

may have violated some canon of political correctness, but he accurately reflected prevailing Pentagon opinion. The truth is that the four-star generals and admirals view citizen-soldiers as more trouble than they're worth.

Depending on the context, the small word 'why' can be totally innocuous or it can be just about the most subversive and even sacrilegious word one can utter. This is probably why I love this word so much: its ability to unleash tremendous power against all sorts of sacred cows and unchallenged beliefs. So, today I want to ask everybody why so many people feel the need to thank veterans for their "service"?

But first, let's debunk a few myths:

First, let's begin by getting myth number one out of the way: the notion that Americans don't like wars. That is totally false. Americans hate losing wars, but if they win them, they absolutely love them. In other words, the typical US reaction to a war depends on the perceived outcome of that war. If it is a success they love it—even if it is a turkey-shoot like Desert Storm. If it is a deniable defeat—the US/NATO air operations against Serbian forces in Kosovo or the total clusterfuck in Grenada—they will simply forget it. And if it is an undeniable defeat—Iraq or Afghanistan—then, yes, indeed, many Americans will be opposed to it.

Next is myth number two: the truth is that no US serviceman or woman has fought a war in defense of the US since at least WWII—and even this one is very debatable considering that the US forced Japan to wage war and since the attack on Pearl Harbor was set-up as a pretext to then attack Japan. Since 1945 there has not been a single situation in which US soldiers defended their land, their towns, their families, or their friends from an aggressor. Not one! All the wars fought by the US since 1945 were wars of aggression, wars of choice and most of them were completely illegal to boot—including numerous subversive and covert operations. At most, one can make the argument that US veterans defended the so-called "American way of life," but only if one accepts that the American way of life requires and mandates imperialist wars of aggression and the wholesale abandonment of the key concepts of international law.

Finally, there is the ugly dirty little secret that everybody knows but, for some reason, very few dare to mention: the decision to join the all volunteer US military is one primarily based on financial considerations and absolutely not some kind of generous "service" to the motherland for pure, lofty, ideals. Yes, yes, I know—there were those who did join the US military after 9/11 thinking that the US had been attacked and that they needed to help bring the fight to those who attacked the US. One of them was even Adam Driver, who was discharged after suffering injuries bravely fighting a mountain bike. But these are not the norm.

Even if some folks did not see through the lies and even if *they* believed that they joined the US military to defend the US, why would the rest of us who by 2020 all know that the attack on Iraq was purely and solely based on lies, thank veterans for stupidly waging war for interests they cannot even identify? Since when do we thank people for making wrong and, frankly, immoral decisions?!

Now let's look at another basic thing: what is military service? The way I see it, military personnel can roughly be split into two categories: those who actually kill people and those who help those who kill people kill people. Right? If you are a machine gunner or a tank driver, then you personally get to kill people. If you are a communications specialist, or a truck driver, or an electrician, you don't get to kill people yourself, but your work is to make it easier for those who kill people to kill people. So I think that it would be fair to say that joining a military, any military, is to join an organization whose main purpose is to kill people. Of course, that killing can be morally justifiable and, say, in defense of your country and fellow citizens. But that can only be the case if you prepare for a defensive war and, as we all know, the US has not fought such a war for 70+ years now, which means that with a few increasingly rare exceptions—WWII veterans, and only possibly—all the veterans which get thanked for their service did what exactly? If we put it in plain English, what fundamental, crucial decision did all these veterans make?

In simple and plain English, veterans are those who signed up to kill people outside the US for money. Sorry, I know that this sounds offensive to many, but this is a fact. The fact that this decision—to join an organization whose primary purpose is to murder people in their own countries, hundreds and thousands of miles away from the US—could also have been taken for “patriotic” reasons (i.e. by those who believed in what is most likely the most dishonest propaganda machine in history) or to “see the world” and “become a real man” does not change the fact that if the US military offered no pay or benefits, no scholarships, no healthcare, then the vast majority of those who claim that they joined to “serve” would never have joined in the first place. We all know that, let's not pretend otherwise! Just look at the arguments recruiters use to convince people to join: they are all about money and benefits! Need more proof? Just look at the kind of social groups who compose the bulk of the US military: uneducated, poor, with minimal career prospects. The simple truth is that financially successful folks very rarely join the military and, when they do, they usually make a career out of it.

Folks join the military precisely for the same reasons they enter the police force or become correctional officers: because in all those endeavors there

is money to be made and benefits to enjoy. Of course, there must be some percentage who joined these violent careers for purely lofty and noble ideals. But these would be a small, tiny, minority. The overwhelming majority of cops, correctional officers, and soldiers joined primarily for material and/or financial reasons.

Since that is the case, is it not also true that the soldier—just like the cop or the correctional officers—has already received his/her gratitude from the society for their service in the form of a check? Why do folks then still feel the need to “thank them for their service”? We don’t thank air traffic controllers or logging workers—also very tough careers—for their service, do we? And that is in spite of the fact that air traffic controllers and logging workers did not choose to join an organization whose primary goal is to kill people in their own homes—whether private homes or national ones—which is what soldiers get paid for. And, well, I guess maybe the loggers did too, depending on how you want to look at it.

Let me repeat that truism once again, in an even more direct way: veterans are killers hired for money. Period. The rest is all propaganda.

The post-9/11 drive to get the American public to thank the troops endlessly for their service in distant conflicts amounts to stifling criticism of those wars by linking it to ingratitude.

Dulce et decorum est Pro patria mori.
 For generations we’ve sold these goods
 To young boys who burn for glory.
 Dulce et decorum est Pro patria mori.
 Indeed, how sweet,
 Pray tell
 Poppy covered warrior.
 Dulce et decorum est Pro patria mori.
 How sweet was the Somme?
 Such little ground was gained
 With half a generation gone.
 Dulce et decorum est Pro patria mori.
 When weapons far outpace the men
 What an empty word is glory.

“I hated them because they asked me to take other people’s lives in a manner that dishonored us both, me the killer and them the victim. Shame on all of us.”

“Have you ever reflected on the fact that, despite the horrors of war, it is at least a big thing? I mean to say that in it one is

brought face to face with realities. The follies, selfishness, luxury, and general pettiness of the vile commercial sort of existence led by nine-tenths of the people of the world in peacetime are replaced in war by a savagery that is at least more honest and outspoken. Look at it this way: in peacetime one just lives one's own little life, engaged in trivialities, worrying about one's own comfort, about money matters, and all that sort of thing—just living for one's own self. What a sordid life it is!

In war, on the other hand, even if you do get killed you only anticipate the inevitable by a few years in any case, and you have the satisfaction of knowing that you have 'pegged out' in the attempt to help your country. You have, in fact, realized an ideal, which, as far as I can see, you very rarely do in ordinary life. The reason is that ordinary life runs on a commercial and selfish basis; if you want to 'get on,' as the saying is, you can't keep your hands clean. Personally, I often rejoice that the War has come my way. It has made me realize what a petty thing life is. I think that the War has given to everyone a chance to 'get out of himself,' as I might say. Certainly, speaking for myself, I can say that I have never in all my life experienced such a wild exhilaration as on the commencement of a big stunt, like the last April one for example. The excitement for the last half-hour or so before it is like nothing on earth."

Entire American units in the Pacific openly boasted of a "take no prisoners" policy and the routine collection of body parts of Japanese soldiers as battlefield souvenirs. It is chilling reading for anyone who smugly assumes that war atrocities were a monopoly of the Nazi regime or the Axis Powers. Not too surprising though, if you're familiar with the treatment of Native Americans by the Army.

Many of the most notorious wartime atrocities—Oradour and Malmédy, the Japanese rampage through Manila, the American slaughter of prisoners and mutilation of corpses on many Pacific islands, and the massacre at My Lai—involved a kind of "battlefield frenzy." Soldiers who were inured to violence, numbed to the taking of human life, embittered over their own casualties, and frustrated by the tenacity of an insidious and seemingly inhuman enemy sometimes exploded and at other times grimly resolved to have their revenge at the first opportunity. Though atrocities of this kind were too often tolerated, condoned, or tacitly (sometimes even explicitly) encouraged by elements of the command structure, they did not represent official government policy. Despite the hate-filled propaganda of each nation

and the exterminatory rhetoric of many leaders and commanders, such atrocities still represented a breakdown in discipline and the chain of command. They were not “standard operating procedure.” The fire-bombing of German and Japanese cities, the enslavement and murderous maltreatment of foreign laborers in German camps and factories or along the Siam-Burma railroad, the reprisal shooting of a hundred civilians for every German soldier killed by partisan attack in Yugoslavia or elsewhere in eastern Europe—these were not the spontaneous explosions or cruel revenge of brutalized men but the methodically executed policies of government.

Both kinds of atrocities occur in the brutalizing context of war, but the men who carry out “atrocities by policy” are in a different state of mind. They act not out of frenzy, bitterness, and frustration but with calculation.

When the generation that remembers the last Great War has died out, a nation is set on course—some would say doomed—to have another war. While the horrors of war are forgotten, the monuments and heroes of war are everywhere.

“That’s the problem with heroes. Heroes aren’t people. Heroes don’t come home messed up, or needing help, or just wanting to live their fucking lives—whatever is left of it anyway. Heroes are symbols. Heroes are *property*. Their lives are not their own anymore. Heroes don’t need help and don’t have nightmares and don’t say anything that might be contrary to what you believe, whatever that is. Heroes are grateful always.”

Our memories—as a culture—are largely defined by the practical memories of those who participate in media and government, mostly people from their thirties to their sixties. So, at the most, we as a popular culture remember fifty or so years of history at a slice.

In the seventies, conservatives came to believe that the legacy of Vietnam was the “Vietnam syndrome,” a debilitating fear of sending in the troops lest lives (and votes) be lost. A more obvious legacy these days is the ferocious new militarism in which setbacks in the field are routinely blamed on liberals in Congress and in the media, and in which it is thought to be socially acceptable for old soldiers to revel in their brutalization and even to boast about their personal kill-skills. Example: the popular sniper bumper sticker that threatens, “Don’t run, you’ll only die tired.” All that a soldier wants to do is fight, according to this understanding, and the more violently the better. Training him and sending him off to battle isn’t a hideous imposition; it is natural and even noble. To support our men in uniform is to let them see combat. Such a viewpoint denies the age-old conflict between officers

and enlisted men that is documented by every war novel ever written, and instead identifies the lowliest of foot soldiers unproblematically with their commanders, who assuredly do pine to give their soldiers that chance to fight. Applied to the historical Vietnam War itself, this way of thinking implies that the army suffered no disobedience, no griping, not even any of the jolly countercultural troublemaking seen in feel-good war films like *Good Morning Vietnam*. Dissent was the sole province of the hippie traitors at home.

Until 1913 the Army actively discouraged its soldiers from marrying. A popular line has long said if the Army had wanted you to have a wife, it would have issued you one.

Numerous studies have taught the military that in order to get soldiers to shoot to kill, to actively participate in violence, the soldiers must be sufficiently desensitized to the act of killing. In other words, they have to learn to not feel—and to not feel responsible—for their actions. They must be taught to override their own conscience. Yet these studies also demonstrate that even in the face of immediate danger, in situations of extreme violence, most people are averse to killing. In other words, the vast majority of combatants throughout history, at the moment of truth when they could and should kill the enemy, have found themselves to be conscientious objectors.

Modern military training programs grapple with how to turn empathic people into killing machines, often instilling unquestioning obedience to authorities and a powerful sense of loyalty toward your comrades. If the commands of superiors do not move you, then you are moved by the knowledge that failing to shoot might spell death for your friends. Using social-psychological principles the American military also encourages the division between ‘us’ and ‘them’ by using words like ‘haji’ and ‘raghead’ to describe Muslims. Although these terms are dehumanizing, they are often seen as a necessary survival tactic, because a moment’s hesitation about the humanity of your enemy could be the difference between your life and death. Finally, these training programs automate killing, bending thoughts of the enemy away from mind perception and toward reflexive aggression.

Consider the murder of Michael Roberts, a fifty-three-year-old homeless man, by a group of teenagers. Their motive? Boredom. The boys were looking for amusement, and Roberts was simply in the wrong place at the wrong time. The teens punched and kicked him and hit him with sticks. One boy even dropped a log onto Roberts’s ribs, which the boys then jumped on. They left Roberts’s body in a woods and the next day invited friends to come see the corpse of the man they had just killed. Who were they? Terrifyingly, they were just normal teenage boys together in a group. Just

as groups can strip perceived mind from members, they can also strip actual mind from members.

Losing one's individual mind to the group collective is called deindividuation, and though it may most easily affect young men, it can influence anyone, regardless of age, race, or gender. Whenever people assemble for a common purpose, whether a sporting event, a religious service, or a political protest, our minds seem to leave us and get taken up by the group. This heady experience, called "we-feeling," is a kind of altered state of consciousness that is not necessarily bad in itself. In fact, it can be a wonderful thing, as with the Allahabad pilgrims, who transcended their individual lives when spiritually connected to millions of like-minded others. This we-feeling is induced especially through synchrony, when your actions are closely matched to those of other group members. Examples of synchrony include platoons marching in step, concert fans swaying back and forth together, and prayers being jointly said by a congregation—each of which seems to bind people together into a coherent whole.

Synchrony facilitates not only group goodness but also group evil. The link between synchrony and destructive conformity explains why military groups march in step. Nazi goose-stepping may look odd, but it encouraged the soldiers to follow the cruel orders of their leaders.

Synchrony with group members is one way that groups encourage evil against outsiders, and anonymity is another. History has repeatedly shown that groups are especially destructive when members cannot be identified, whether because of masks or uniforms or even the firewalls of the Internet. This anonymity leads group members to identify more with the group and see outsiders as more bound to their rival groups. Cloaked in his uniform, a Nazi soldier sees himself not as an individual but instead as simply a Nazi, while also viewing his victims not as individual human beings but as members of an undesirable group to be exterminated.

That day on the ground, McChrystal's Delta Force commandos were lying in wait. Once the house was bombed, they swarmed the target, picking through the rubble, confirming Zarqawi's death and retrieving the body. There had been days, weeks, and even months of effort on the part of the so-called black special operators, the hero hunter-killers of a growing enterprise and the very human and heroic embodiment of millennia-old warfare. Yet in this new war no names were divulged, not even of the pilots. The general narrative isn't erroneous—it was indeed one team doggedly and bravely risking it all, vanguards of an entire nation even if they were all made into invisible and masked ninja warriors. In a world full of terrorists, the "good guys" have been made faceless, further enhancing the preeminence of the Machine. I know the justification: that the military is merely protecting the

fighters and their families from the repercussions of a globally transparent world that could place them at risk from terrorists even while at home. In this era of global targeting and surgical geolocation, the importance of the “sanctity of the home” has diminished. There is an erosion of the distinction for both sides as to what is military and what is civilian, and one can now be targeted while in the “safety” of one’s own home.

Wars are fought on physical terrain—deserts, mountains, et cetera—as well as on what they call “human terrain.” Human terrain is essentially the social aspect of war, in all its messy and contradictory forms. The ability to navigate human terrain gives you better intelligence, better bomb-targeting data, and access to what is essentially a public relations campaign for the allegiance of the populace. The Taliban burned down a school in the Korengal, for example, and by accident also burned a box full of Korans. The villagers were outraged, and the Taliban lost a minor battle in the human terrain of the valley. You can occupy a hilltop in human terrain much like you can in real terrain—hiring locals to work for you, for example—and that hilltop position may protect you from certain kinds of attack while exposing you to others.

Human terrain and physical terrain interact in such complex ways that commanders have a hard time calculating the effect of their actions more than a few moves out. You can dominate the physical terrain by putting an outpost in a village, but if the presence of foreign men means that local women can’t walk down certain paths to get to their fields in the morning, you have lost a small battle in the human terrain. Sometimes it’s worth it, sometimes it isn’t. Accidentally killing civilians is a sure way of losing the human terrain—this applies to both sides—and if you do that too many times, the locals will drive you out no matter how many hilltops you occupy. It has been suggested that one Taliban strategy is to lure NATO forces into accidentally killing so many civilians that they lose the fight for the human terrain. The physical terrain would inevitably follow.

One might marvel at the insane amount of firepower available to the Americans—they have a huge shoulder-fired rocket called a Javelin, for example, that can be steered into the window of a speeding car half a mile away. Each Javelin round costs \$80,000, and the idea that it’s fired by a guy who doesn’t make that in a year at a guy who doesn’t make that in a lifetime is somehow so outrageous it almost makes the war seem winnable.

“People have died, and often for that matter, because of the 15 minutes of analysis I put into a report. Some commander further down range trusted my judgment and used it as justification to drop steel on these people. That happened routinely. You

constantly question if you did everything you could, if you had the full picture, if you translated everything right. I spoke their language. I know what they were saying. I may not have been down range pulling the trigger, but I assure you it was intimate.”

These streets used to be nice; the houses were owned by upper-class families. Now every third house we enter is abandoned, the Iraqi families who once lived here having left the country or the city. It is an exodus of the educated—doctors, lawyers, professors, businessmen. Those with the resources and skills to play a role in rebuilding the country are gone.

“What didn’t you see? You didn’t see where those bullets landed. You didn’t see what happened when the mortar landed. A puff of smoke is not what a mortar looks like when it explodes, believe me. There are horrors that were completely left out of this war. It was a glorious, wonderful picture that had a lot of people watching and a lot of advertisers excited about cable news. But it wasn’t journalism, because I’m not so sure that we in America are hesitant to do this again, to fight another war, because it looked like a glorious and courageous and so successful, terrific endeavor, and we got rid of horrible leader: We got rid of a dictator, we got rid of a monster, but we didn’t see what it took to do that.

I think there were a lot of dissenting voices before this war about the horrors of war, but I’m very concerned about this three-week TV show and how it may have changed people’s opinions. It was very sanitized. War is ugly and it’s dangerous, and in this world, the way we are discussed on the Arab street, it feeds and fuels their hatred and their desire to kill themselves to take out Americans.”

“We may not necessarily be down to the grindstone like those whose boots are the ground, but we have our own stresses. We see what you see. We see what everyone sees, and its fucking horrific. I’ve seen feeds akin to innocent civilians executed with det-cord, of children ripped to shreds by a chainsaw, of some mass of meat having what I could only assume was their head mashed to a pulp by the buttstock of an AK-47.

Something inside you breaks a little each time. Some are better at dealing with it than others. Some, obviously, are not.

Humans are disgusting and I hate every single one of them. We're fucking monsters. We're fucking monsters, and that's one piece of information that I have no idea how to deal with."

"It is difficult once you become aware that you are killing children. By direct fire, by indirect fire, by directing fire. There was this one girl they brought to Camp Warehouse when I was on guard, legs gone, shrapnel all over her body, somehow still alive. They just dropped her out of a taxi and took off. You get closer to her and you realize she is alive. You see the damage, you want to help, yet you stay back because you remember the last time they lured you into a trap and rigged a corpse with explosives. She breathes and says something you don't understand. Someone yells orders to stand back and get EOD. You can't leave her there. You just move and pick her up while someone yells at you to not touch her. She looks at you with a face of innocence and pain. You turn around and carry her inside the camp to medical. Now everyone helps. You hand her over and stay outside. Your sergeant starts yelling at you but his words don't reach you.

You later learn that she died. At the briefing the next week the incident comes up again. She didn't step on a mine, she was hit by a 40mm round during fighting. The guys who dropped her off were too afraid we'd shoot them too. War just sucks man, there is nothing heroic about it, it is just a giant tragedy. And its coming home with you."

Mothers and fathers die with their dead children.

"We are gathered here, friends, to honor the victims of our monstrous leaders, children dead, all dead, all murdered in war. It is customary on days like this to call such lost children men. I am unable to call them men for this simple reason: that in the same war in which they died, my own son died. My soul insists that I mourn not a man but a child. I do not say that children at war do not die like men, if they have to die. To their everlasting honor and our everlasting shame, they do die like men, thus making possible the manly jubilation of patriotic holidays.

But they are murdered children all same.

And I propose to you that if we are to pay our sincere respects to the lost children, that we might best spend the day despising

what killed them; which is to say, the stupidity and viciousness of all mankind. Perhaps, when we remember wars, we should take off our clothes and paint ourselves blue and go on all fours all day long and grunt like pigs. That would surely be more appropriate than noble oratory and shows of flags and well-oiled guns. If today is really in honor of children murdered in war, is today a day for a thrilling show? The answer is yes, on one condition: that we, the celebrants, are working consciously and tirelessly to reduce the stupidity and viciousness of all mankind.”

Meet the world’s largest polluter and ruling titan in the industry of child murder: the US military.

At a typical forward operating base that was recently examined, 95 percent of the base’s electricity went to air condition, inefficiently, tents sitting in a hot sandy place. All of this electricity was produced by a diesel generator.

“We are getting people blown up in fuel convoys to deliver the fuel to be wasted in that way. Just connect the dots and obviously there is something wrong with this picture.”

The men were mostly in their early twenties, and many of them have known nothing but life at home with their parents and war. The moral basis of the war doesn’t seem to interest soldiers much, and its long-term success or failure has a relevance of almost zero. Soldiers worry about those things about as much as farmhands worry about the global economy, which is to say, they recognize stupidity when it’s right in front of them but they generally leave the big picture to others.

He has little capacity for what civilians refer to as “life skills”; for him, life skills literally keep you alive. Those are far simpler and more compelling than the skills required at home.

“In the Korengal, almost every problem could get settled by getting violent faster than the other guy. Do that at home and it’s not going to go so well.”

It’s a stressful way to live but once it’s blown out your levels almost everything else looks boring. He knows himself: when he gets bored he starts drinking and getting into fights, and then it’s only a matter of time until he’s back in the system. If that’s the case, he might as well stay in the system—a better one—and actually move upward. There are a few civilian jobs that offer a little adrenaline—wilderness trip guide, firefighter—but it’s

just not the same. He is at one of the most exposed outposts in the entire US military, and he's crawling out of his skin because there hasn't been a good firefight in a week. How do you bring a guy like that back into the world?

Civilians balk at recognizing that one of the most traumatic things about combat is having to give it up. War is so obviously evil and wrong that the idea there could be anything good to it almost feels like a profanity. And yet throughout history, men have come home to find themselves desperately missing what should have been the worst experience of their lives. To a combat vet, the civilian world can seem frivolous and dull, with very little at stake and all the wrong people in power. These men come home and quickly find themselves getting berated by a rear-base major who's never seen combat or arguing with their girlfriend about some domestic issue they don't even understand. When men say they miss combat, it's not that they actually miss getting shot at—you'd have to be deranged—it's that they miss being in a world where everything is important and nothing is taken for granted. They miss being in a world where human relations are entirely governed by whether you can trust the other person with your life.

War is a big and sprawling word that brings a lot of human suffering into the conversation, but combat is a different matter. Combat is the smaller game that young men fall in love with, and any solution to the human problem of war will have to take into account the psyches of these young men. For some reason there is a profound and mysterious gratification to the reciprocal agreement to protect another person with your life, and combat is virtually the only situation in which that happens regularly. These hillsides of loose shale and holly trees are where the men feel not most alive—that you can get skydiving—but the most utilized. The most necessary. The most clear and certain and purposeful. If young men could get that feeling at home, no one would ever want to go to war again, but they can't. So here he sits, one month before the end of deployment, seriously contemplating signing back up.

It's a foolish and embarrassing thought but worth owning up to. Perfectly sane, good men have been drawn back to combat over and over again, and anyone interested in the idea of world peace would do well to know what they're looking for. Not killing, necessarily—that couldn't have been clearer—but the other side of the equation: protecting. The defense of the tribe is an insanely compelling idea, and once you've been exposed to it, there's almost nothing else you'd rather do.

The willingness to die for another person is a form of love that even religions often fail to inspire, and the experience of it changes a person profoundly. Self-sacrifice in defense of one's community is virtually universal

among humans, extolled in myths and legends all over the world, and undoubtedly ancient. No community can protect itself unless a certain portion of its youth decide they are willing to risk their lives in its defense. That sentiment can be horribly manipulated by leaders and politicians, of course, but the underlying sentiment remains the same. Cheyenne Dog Soldiers wore long sashes that they staked to the ground in battle so that they couldn't retreat from the spot unless released by someone else. American militiamen at the Alamo were outnumbered ten to one and yet fought to the last man rather than surrender to Mexican forces trying to reclaim the territory of Texas. And soldiers in World War I ran headlong into heavy machine-gun fire not because many of them cared about the larger politics of the war but because that's what the man to the left and right of them was doing. The cause doesn't have to be righteous and battle doesn't have to be winnable; but over and over again throughout history, men have chosen to die in battle with their friends rather than to flee on their own and survive.

Considering the extreme nationalism of the Nazi era, one might expect that territorial ambition and a sense of racial superiority motivated most of the men on the German line. In fact, those concepts only helped men who were already part of a cohesive unit; for everyone else, such grand principles provided no motivation at all. A soldier needs to have his basic physical needs met and needs to feel valued and loved by others. If those things are provided by the group, a soldier requires virtually no rationale other than the defense of that group to continue fighting. Allied propaganda about the moral wrongfulness of the Nazi government had very little effect on these men because they weren't really fighting for that government anyway. As the German lines collapsed and the German army, the Wehrmacht, began to break up, the concerns of fighting began to give way to those of pure physical survival. At that point, Allied propaganda campaigns that guaranteed food, shelter, and safety to German deserters began to take a toll. But even then the men who deserted tended to be disgruntled loners who had never really fit into their unit. They were men who typically had trouble giving or receiving affection and had a history of difficult relations with friends and family back home. A significant number had criminal records. The majority of everyone else either fought and died as a unit or surrendered as a unit. Almost no one acted on their own to avoid a fate that was coming to the whole group.

“It's around this time that killing begins to make a kind of sense to me. It's tempting to view killing as a political act because that's where the repercussions play out, but that misses the point: a man behind a rock touched two wires to a

battery and tried to kill me—to kill us. There are other ways to understand what he did, but none of them overrides the raw fact that this man wanted to negate everything I'd ever done in my life or might ever do. It felt malicious and personal in a way that combat didn't. Combat theoretically gives you the chance to react well and survive; bombs don't allow for anything. The pressure cooker was probably bought in Kandigal, the market town we passed through half an hour earlier. The bomber built a campfire in the draw to keep himself warm that night while waiting for us. We could see his footprints in the sand. The relationship between him and me couldn't be clearer, and if I'd somehow had a chance to kill him before he touched the wires together I'm sure I would have. That's not a pretty thought to have in your head. That's not a thought that just sits there quietly and reassures you about things."

Society can give its young men almost any job and they'll figure how to do it. They'll suffer for it and die for it and watch their friends die for it, but in the end, it will get done. That only means that society should be careful about what it asks for. In a very crude sense the job of young men is to undertake the work that their fathers are too old for.

Soldiers themselves are reluctant to evaluate the costs of war, but someone must. That evaluation, ongoing and unadulterated by politics, may be the one thing a country absolutely owes the soldiers who defend its borders. There are other costs to war as well—vaguer ones that don't lend themselves to conventional math. What about the survivors? Is the territory worth the psychological cost of learning to cheer someone's death? It's an impossible question to answer but one that should keep getting asked.

War is supposed to feel bad because undeniably bad things happen in it, but for a nineteen-year-old at the working end of a .50 cal during a firefight that everyone comes out of okay, war is life multiplied by some number that no one has ever heard of. In some ways twenty minutes of combat is more life than you could scrape together in a lifetime of doing something else. Combat isn't where you might die—though that does happen—it's where you find out whether you get to keep on living. Don't underestimate the power of that revelation. Don't underestimate the things young men will wager in order to play that game one more time. The core psychological experiences of war are so primal and unadulterated, however, that they eclipse subtler feelings, like sorrow or remorse, that can gut you quietly for years.

Maybe the ultimate wound is the one that makes you miss the war you got it in.

In the civilian world almost nothing has lasting consequences, so you can blunder through life in a kind of daze. You never have to take inventory of the things in your possession and you never have to calculate the ways in which mundane circumstances can play out—can, in fact, kill you. As a result, you lose a sense of the importance of things, the gravity of things. Back home mundane details also have the power to destroy you, but the cause and effect are often spread so far apart that you don't even make the connection; in war, that connection is impossible to ignore. It is tedious but it gives the stuff of one's existence—the shoelaces and the water and the lost shirt—a riveting importance. Frankly, after you get used to living that way it is hard to go home.

We train a generation to be as violent as possible, then we expect them to come home and be OK. It's not mental illness. It's that we're doing something to a generation, and we're not responding to the needs they have.

“I did not kill myself, as several boys did during those years, nor did I kill my mind and soul, as some did so their body could survive.”

Military psychotherapists usually try to blend in and dedicate themselves to the service, largely because the professional ethics of psychology say critiquing institutions is outside their domain. They are supposed to serve whatever institution solicits their talents. The American Psychological Association secretly collaborated with the administration of President George W. Bush to bolster a legal and ethical justification for the torture of prisoners swept up in the post-9/11 war on terror. In conformity with professional ethics, if psychotherapists are working with active duty soldiers, their goal is to get them back on the front line; if they are treating veterans, their goal is to get them to overcome any remorse about those they shot or anything else they experienced while in the service. Again, the problem is seen to rest with the individual, not the institution. If you are in the military, psychotherapists are there to help you adjust to what might be the most pathological institution of all, one in which the most sane response may well be insanity. The institution itself may be so insane that there is no sane way to function within it.

There is a tendency to “psychologize the political,” that is, to deny the sociological imagination in order to prevent any recognition that the problem may rest with the institution, not the individual. Using psychological labels can be a way of transforming rational responses to inherently irrational

situations into diseases. We can infer that the way to cure the real diseases is to transform the entire society and possibly to abolish certain institutions: As a case of psychologizing the political, the construction of PTSD is a textbook case of how ‘badness’ can be reframed as ‘sickness.’ In no sense did the neo-Freudian perspective on shell shock imply that the illness of veterans needing to be understood was not real. Rather, it shifted the diagnostic gaze from causes external to the victim, like exploding shells, to causes that were internal to the mind and emotions of the veteran. What the patient was really afraid of was his own shortcomings. New stories about wartime atrocities that are couched as the failure of individual soldiers to meet the national standards, or reported as forms of personal “breakdown” are a kind of spin put on violations of human decency so as to shift the blame away from public policy and social norms.

From an evolutionary perspective, it’s exactly the response you want to have when your life is in danger: you want to be vigilant, you want to avoid situations where you are not in control, you want to react to strange noises, you want to sleep lightly and wake easily, you want to have flashbacks and nightmares that remind you of specific threats to your life, and you want to be, by turns, angry and depressed. Anger keeps you ready to fight, and depression keeps you from being too active and putting yourself in more danger. Flashbacks also serve to remind you of the danger that’s out there—they’re a highly efficient single-event survival-learning mechanism. All humans react to trauma in this way, and most mammals do as well. It may be unpleasant, but it’s preferable to getting killed.

What happens to all this grief? You put it away somewhere in the back of your mind, bury it under layers of calloused scarring from years of accumulated experiences. Soldiers are told to be tough, not to be crushed by experience, however painful those experiences may be. A soldier learns to use his or her grief as a motivator. But there is one thing soldiers rarely do. They never take the time to process the loss. They suck it up and move on, putting one foot in front of the other. Over time, the grief they’ve accumulated and buried becomes so great it can never be processed. Opening the door to those feelings would be like splitting the face of a dam. Once the water started to flow, there would be no way to stop it.

Moral injury takes place at the intersection of psychology and spirituality, and so is, in a sense, all in someone’s head. When experiencing moral injury, a person wields guilt and/or shame as a self-inflicted penalty for a choice made. PTSD is more physical, more fear-based, and often a more direct response to an event or events witnessed in war.

Think of it this way: PTSD is more likely to result from seeing something terrible, moral injury from doing something terrible.

What help can there be for something so human?

There are, of course, the bad answers, all too often including opioids and alcohol. But sufferers soon learn that such substances just send the pain off to ambush you at another moment, and yet, as many told me, you may still look forward to the morning's first throat-burning shot of something strong. Drinking and drugs have a way, however temporarily, of wiping out hours of pain that may stretch all the way back to the 1940s. You drink in the dark places, even after you understand that in the darkness you can see too much.

Tragically, suicide is never far from moral injury. The soul isn't that big a place. The psychic injuries of wartime don't end until the sufferers do. Moral injury turns out to be a debt that often can never be repaid.

“Like me, many Gulf War veterans battled health issues and struggled to stay in the workforce for years. As I have often said, if it weren't for the military, I wouldn't have been able to keep on struggling, but then again, if it weren't for the military, I wouldn't have had to.”

On the morning after the battle of Waterloo (1815), heaps of sawn-off hands and legs could be seen adjacent to the field hospitals. In those days, carpenters and butchers who enlisted to the army were often sent to serve in the medical corps, because surgery required little more than knowing your way with knives and saws.

A shy teenage boy called Saadullah survived a drone strike that killed three of his relatives, but he lost both legs, one eye, and his hope for the future:

“I wanted to be a doctor but I can't walk to school anymore. When I see others going, I wish I could join them.”

And, of course, he is not the only one:

“Sometimes I am so sad that my heart wants to explode. When your body is intact, your mind is different. You are content. But the moment you are wounded, your soul gets damaged. When your leg is torn off and your gait slows, it also burdens your spirit.”

Under the Chernenko regime, the Soviets increased the use of antipersonnel mines. Bombers sprinkled the countryside with tens of thousands of miniature booby traps made to resemble brightly colored toys. Such

mines were specifically created to attract very young Afghans; when the kids picked them up they would explode, maiming and killing the children. Toward this same end, Soviet Badgers also randomly scattered hundreds of thousands—some reports say millions—of so-called butterfly mines over vast areas. Designed to flutter gently to earth and then arm upon impact, these camouflaged plastic devices wouldn't detonate until Afghan herders happened to step on them. The mines' relatively small size was intended to blow off limbs but not necessarily cause fatal injuries, in the belief that forcing Afghan villagers to take care of gravely injured countrymen would cause more hardship than killing them outright.

Laos is on the list of least-developed nations. One reason for this is the cluster bombs littering the country that make it tricky to plough a field or build a road without painstaking and expensive mines clearance. One-third of the two-million tonnes of bombs dropped on Laos during nearly 600,000 US missions during the Secret War in the late 1960s failed to detonate. More than fifty years later, the bombs continue to kill and maim people especially during the sowing season when they are triggered by farmers turning the soil. The number of casualties is increasing, particularly among children who are seeking out the orange-sized bombs, because of the lucrative new market for scrap metal in China.

During the US-Indochina War, the Hmong became the front line of the US invasion of Laos. Recruited by General Vang Pao, whole villages gave up agriculture to subsist on CIA airdrops of food. The men called in US bombers, putting their bodies on the line so that Americans could destroy the country from the skies.

One Hmong elder whom I had asked about his life used the opportunity to tell me about how to throw back grenades and what to do if you are shot. The logistics of wartime survival were the substance of his life.

“I, too, am worried by our descent into pre-war hatred. I had a friend from Dubrovnik in the 80s. She was a typical Yugoslav—half Croatian, quarter Serbian, and a quarter Russian. She was full of hope, smart, pretty, and heartbreakingly naïve. If she survived the war, I'm pretty sure my friend lost what made her a beautiful human being. She haunts me. Civil wars seem implausible until they start and then they follow the devil's logic. People like my friend tend to die in them or turn into something less than they were in order to survive.”

“I am scared and sometimes I feel like my life is in danger. There are days when I am scared to even say a word to anyone.

I am afraid to wake up because I never know what is going to happen to me. . . I get so depressed here I wish my life by fast.”

Hoping for time to pass swiftly makes our lives seem small and unworthy.

“I would sleep beside Dad’s bed, wake up, go to school. I got to see a lot of dead bodies. That was the kind of life we were going through: you try to go to school, you get caught up in crossfire, you cannot pass over dead bodies, so you return to Dad’s side in the ward.

I never experienced any peace. I lost many of my cousins in that war and most of my friends didn’t make it. Part of me died and was dark.”

If killing won wars we’d still be using bows. A good soldier with a muzzle loader could fire three times a minute. I am a mediocre archer and I can fire twelve arrows a minute easily. Up until the early or mid-1800s, the bow was more accurate and had a much greater range than the firearms available. But they didn’t make smoke and fire and thunder. They didn’t scare men and terrify horses and wars are never won by killing people, they are won by breaking will.

Genocide, from the death camps of World War II to the slaughter of Tutsi in Rwanda or Sudanese in Darfur, does more than take innocent lives. Suffering on that scale shatters the familiar and makes it difficult for the living to cope.

“How much more grievous are the consequences of our anger than the acts which arouse it.”

—Marcus Aurelius

“It is forbidden to kill; therefore all murderers are punished unless they kill in large numbers and to the sound of trumpets.”

—Voltaire

On August 20, 1955, there were frenzied attacks on Europeans living around the port of Philippeville. In a nearby mining town, where 130 Europeans lived among 2,000 Muslims, FLN fellaghas (“bandits”) went from home to home during the noonday siesta, slaughtering everyone inside. French paratroopers who arrived shortly thereafter found a scene of horrors.

“When I saw children chopped up into pieces, with their throats slit or crushed to death, the women who had been

disemboweled or decapitated, I think I really forgot what having any pity meant. What was hardest to believe was that these people had been massacred and mutilated by their Algerian Muslim neighbors, who had been peacefully living with them until then.”

The troops found rebels mixed with civilians in the streets and “fired indiscriminately on the whole lot of them.”

“For two hours our submachine guys never stopped firing,” a para recalled. “The barrel of my P.M. [submachine gun] got so hot I couldn’t touch it.” Eventually orders were given to take prisoners. Hundreds of Arab men were rounded up. The next morning they were massacred by the regiment’s automatic rifles and machine guns. The French counted 1,273 dead Muslims—so many that they had to be buried with bulldozers.

“I was totally indifferent. We had to kill them and I did it. That was all.”

The trouble with Eichmann is precisely that so many were like him, and that the many were neither perverted nor sadistic, that they were, and still are, terribly and terrifyingly normal. From the viewpoint of our legal institutions and of our moral standards of judgment, this normality is much more terrifying than all the atrocities put together.

Where once soldiers were regular civilians who left their everyday lives to fight in defense of their societies, and were therefore worthy of the highest honour and gratitude, those civilians are now called ‘terrorists,’ ‘militants,’ and ‘unprivileged combatants’ and we are informed they have no right to fight in wars and are in fact war criminals for doing so. The people who deserve honour we are told, are professional paid killers, willing to do anything they are told, not in defense of their society but in offense to any country they are paid to attack. Our laws have been twisted to grant impunity to those we once reviled as mercenaries and make war criminals of those we once celebrated as heroes.

“‘That is so cool, unmanned aircraft. That’s really bad-ass,’ I thought when seeing recruitment posters for the drone program. I was under the impression that America was saving the world, like that we were Big Brother and we were helping everyone out.”

“When I first got into the military, I mean I was thinking it was a win-win. It was a force for good in the world. I thought I was going to be on the right side of history.”

As a general rule, the United States is considerably more forgiving of its war criminals than its whistleblowers and truth-tellers.

As it happened, the fifth anniversary of the My Lai massacre in Vietnam occurred at the time of the 1973 siege of Wounded Knee. It was difficult to miss the analogy between the 1890 Wounded Knee massacre and My Lai, 1968. Alongside the front-page news and photographs of the Wounded Knee siege that was taking place in real time were features with photos of the scene of mutilation and death at My Lai.

Lieutenant William “Rusty” Calley was then serving his twenty-year sentence under house arrest in luxurious officers’ quarters at Fort Benning, Georgia, near his hometown. Yet he remained a national hero who received hundreds of support letters weekly, who was lauded by some as a POW being held by the US military. One of Calley’s most ardent defenders was Jimmy Carter, then governor of Georgia. Three years later, as president, Carter would pardon Calley.

One of the documented acts, among many, that Calley committed and ordered others to carry out at My Lai took place when he saw a baby crawling from a ditch filled with mutilated, bloody bodies. He picked the baby up by a leg, threw the infant back into the pit, and then shot the baby point-blank. My Lai was one of thousands of such slaughters led by officers just like Calley, who a few weeks before My Lai had been observed throwing a stooped old man down a well and firing his automatic rifle down the shaft.

“One of the challenges of being a whistleblower is living with the knowledge that people continue to sit, just as you did, at those desks, in that unit, throughout the agency, who see what you saw and comply in silence, without resistance or complaint. They learn to live not just with untruths but with unnecessary untruths, dangerous untruths, corrosive untruths. It is a double tragedy: what begins as a survival strategy ends with the compromise of the human being it sought to preserve and the diminishing of the democracy meant to justify the sacrifice.”

The universe of people who will critically examine the goings-on at the institutions they work for is always going to be small. As Upton Sinclair said:

“It is difficult to get a man to understand something when his salary depends upon his not understanding it.”

After years of disclosures by government investigations, media accounts, and reports from human rights organizations, there is no longer any doubt

as to whether the Bush administration committed war crimes. The only question that remains to be answered is whether those who ordered the use of torture will be held to account.

“I tell my folks they must be very careful. I say to them, ‘If you only saw what you think about you would think quite differently about it. It would give you a great shock.’ I did a very cruel thing once because I did not know what cruelty was like. I had not seen it, you know. That is the great thing: you must see it. And then you are redeemed and saved. It was not our Lord that redeemed me, but a young woman whom I saw actually burned to death. It was dreadful: oh, most dreadful. But it saved me. I have been a different man ever since.”

A gaunt twenty-year-old from Marin County, California, carrying a Koran in a cloth sack, squatted in a foxhole in Afghanistan, sipping tea. John Walker Lindh, or “The American Taliban,” as he became known, had traveled halfway around the world, and to another universe culturally and politically, to take up sentry duty on the Taliban’s front line in the Northeast Takhar Province on September 6, 2001. His guard post was atop a 2,000-foot-tall hill not far from the Tajikistan border. To the left was the Oxus River, which Alexander the Great had crossed; to the right were the snow-capped peaks of the Hindu Kush. In the distance lurked the remnants of the Northern Alliance, which before the CIA’s cash infusion reached it was close to losing Afghanistan’s civil war. What was left of the Northern Alliance’s defensive line was a battery of hulking Soviet tanks, mementos of the force’s former sponsor during the years of Soviet occupation.

The territory was so desolate, a private investigator from San Francisco who later traced Lindh’s footsteps said, “If there had been a sign saying, ‘World Ends Here,’ I would not have been surprised.” One could walk for days, in all directions, and see no lights, no cars, and no phones. “It felt to be about 500 BC,” said the detective, who was hired by Lindh’s legal defense team.

Lindh hoisted a rifle and carried two grenades, which he had been taught how to use that summer in an Afghan training camp called Al Farooq, a camp that was funded by Osama Bin Laden. A Muslim convert who had come to the region to study Arabic, Lindh had become convinced that a proper Muslim needed to do more than read and pray. “I believed it was the part of every good Muslim to train” for military jihad, he later said. His intention was to help the Taliban defeat the Northern Alliance, then create a “pure” Muslim state.

At the camp, Lindh had been taught how to shoot rocket-propelled grenades and guns. He had also personally met Bin Laden. The Saudi terrorist was a legend in the region, but Lindh said he'd only been vaguely aware of his reputation. He claimed that he had never heard of al-Qaeda, which terrorism experts found plausible.

“There were two kinds of training at Al Farooq—al-Qaeda training, to fight civilians, and military training, to fight the Northern Alliance. Lindh took only the military training. Seventy-thousand people were trained in general warfare at these camps, but perhaps only a tenth received advanced terrorist training.”

Lindh met Bin Laden, but it proved something of a letdown. Bin Laden gave an evening lecture at the camp. Arriving in a swirling, dusty motorcade of Land Rovers, he had been treated like a rock star. But Lindh had been less than enraptured. Asked what Bin Laden had been like, Lindh later told his defense team:

“To tell you the truth, he was really boring. I was so tired. The training was really grueling. I thought he seemed sick. Most of the speakers stood up when they spoke, but he sat down, and talked in a really soft voice about the history of Afghanistan, and how everyone had invaded it starting with the Greeks. I listened to the beginning, but it wasn't very interesting. So I fell asleep.”

Lindh professed to be oblivious to the terror plotting around him. But he admitted that he had been taken aside toward the end of his training by an Egyptian official at the camp named Abu Mohammed al-Masri, who was later identified as a confirmed member of al-Qaeda, for a private talk. “He asked me whether I'd like to do a martyrdom operation” in the United States or Israel, Lindh later admitted. “I said no, I'm not interested in that. I came to fight the Northern Alliance, not other countries.” The Egyptian accepted Lindh's demurrals but warned him that, whatever else he did, he was not to mention their conversation to anyone.

At his sentry post, Lindh had never had the occasion to use his weapons. But he had won something of a reputation among his fellow soldiers for another skill. He had a knack for cooking macaroni. A shipment of the dried pasta had arrived, but few of the other Taliban had known what to do with it.

News of the September 11 attacks took a while to reach Lindh. Details were sketchy. It wasn't clear who had perpetrated the violence. Lindh did notice, however, that just around September 11, a handful of the better-connected Arab fighters in his unit seemed to vanish from the front, as if perhaps they knew something.

Exactly what Lindh knew about Bin Laden and his attack plans, and how far the United States could go in trying to wring this and other precious intelligence out of him, were at the heart of a roiling debate back in Washington that had only just reached the Bush White House. The misfit son of a liberal upper-middle-class family, from a part of Northern California better known for hot tubs than mosques, would become the first experiment in detainee treatment in the war on terror, literally prisoner number "001."

As a test, Lindh's case was both unique, because of his American citizenship, and typical in the sense that the way that he was stripped, humiliated, and deliberately exposed to cold and hunger and other mistreatment would in time become quite familiar to the world after the photos of Abu Ghraib emerged. But in the furor immediately after 9/11, questions about his rough handling were seldom asked. At the time, photos that appeared of him naked, bound in duct tape to a stretcher, with a homemade sign reading "Shit Head" affixed to his blindfold, seemed funny to most Americans in a fittingly sadistic way.

Before the details of his case were known Hillary Clinton denounced him as a "traitor" in an interview on Meet the Press, a crime meriting the death penalty. Lindh's parents, who had supported the Clinton presidency, frantically tried to reach Senator Clinton without success, instead leaving a message with an aide asking her to withhold judgment.

Interestingly, among the few sympathetic words for him, after he was first captured, were those from President Bush. "I don't know what we're going to do with the poor fellow," the President said in an interview with Barbara Walters. His father, George Herbert Walker Bush, was less understanding, perhaps reflecting the difference between their roles in the family as patriarchal paragon and wayward son. "He's just despicable," said the elder President Bush on Good Morning America. "I thought of a unique penalty: Make him leave his hair the way it is and his face as dirty as it is, and let him go wandering around this country and see what kind of sympathy he would get."

Death threats and mock executions are considered war crimes under the Geneva Conventions, and felony offenses under US anti-torture laws.

Preempting what would become one of the fiercest debates dividing the administration during the rest of Bush's presidency, the memo nonchalantly dismissed international law, suggesting that the President could abide by

it or not, selectively. In a preview of Cheney's speech two days later, the memo also stated that terror suspects were not automatically entitled to "receive the protections of the Geneva Conventions or the rights that laws of war accord to lawful combatants." In saying so, the memo signaled a fundamental and egregious misunderstanding of the Geneva Conventions.

These laws of war, dating back centuries but codified first in 1864 and updated most recently in 1949, laid out civilized rules of treatment for all categories of people caught in international armed conflicts, not just regular soldiers—or, as they were called, "lawful combatants." There were rules for the treatment of citizens and other rules for the treatment of spies and saboteurs—or "unlawful" combatants. Drafted after World War II with the French Resistance in mind, these non-uniformed, "unlawful" combatants could be interrogated. If found guilty in brief hearings, they could be executed. But they still could not be subjected to "physical or moral coercion." Nor could they be tortured either physically or psychologically.

In 1949 at an international gathering in Geneva, humanitarian law was rewritten by several nations, including the United States. These new "Geneva Conventions" strove to close any loopholes, ensuring that all categories of people caught in international armed conflicts were protected from the shockingly inhumane abuse of captives practiced by the Nazis and the Japanese. America was at the forefront of this effort. US negotiators advocated that the rules be absolutely clear, even specifying food rations, barracks conditions, and athletic requirements—provisions later mocked by the Bush legal team. Having lived so recently through the horrors of war, the US Senate eagerly ratified the new conventions, making them binding US law.

In the Revolutionary War, George Washington and the Continental Army were regarded by the British as treasonous, "illegal combatants" undeserving of the protections of legitimate soldiers, the same category into which the Bush Administration was casting terror suspects. As a result, the British freely brutalized and killed American prisoners of war, in conditions considered scandalous even in that day. In contrast, Washington ordered American troops to take a higher road, in keeping with the ideals of the new republic. He insisted that enemy captives must be given food and medical attention and be housed in conditions that were no worse than those of the American soldiers. In directives still eloquent today, he ordered his troops to treat British war prisoners "with humanity, and let them have no reason to complain of us copying the brutal manner of the British Army. While we are contending for our own liberty we should be very cautious of violating the rights of conscience in others, ever considering that God alone is the judge of the hearts of men, and to Him only in this case, are they answerable."

Washington's orders, which became the backbone of American military doctrine until 2001, were not simply gestures of kindness or even morality. They sprang also from a shrewd calculation that brutality undermines military discipline and strengthens the enemy's resolve, while displays of humanity could be used to tactical advantage.

History provides a powerful counterargument to those who think that the laws of war coddle the enemy at the expense of domestic security. Any dilution of the Geneva Convention will end up having the very reverse effect of what is intended. Far from protecting Americans from terror, it will end up exposing them to it.

A military commission can try only violations of the laws of war. Under federal criminal statutes, for example, conspiring to commit terrorist acts is a crime. But, as the Nuremberg trials established, under the laws of war it is not, since all soldiers could be charged with conspiring to fight for their side. Yet a charge of conspiracy is the only thing there is in many cases at Guantánamo—guilt by association.

“Waterboarding in Guantanamo Bay sounds rad if you don't know what either of those things mean.”

Why did the Bush administration remain largely silent about the discoveries of old WMD stockpiles? The answer to that question might have proved even more embarrassing to the Bush dynasty. Because the shocking fact is that it was the United States and its allies that provided Iraq with the bulk of its weapons of mass destruction—the WMDs that American troops were now tracking down and which, indeed, were sickening some soldiers.

As the *New York Times* subsequently reported, during the Iraq-Iran War, when Saddam unleashed the horrors of chemical warfare:

“In five of six incidents in which troops were wounded by chemical agents, the munitions appeared to have been designed in the United States, manufactured in Europe, and filled in chemical agent production lines built in Iraq by Western companies.”

Thus, Saddam began building his WMD stockpiles back in the 1980s courtesy of the US government—which was then led by President Ronald Reagan, and, of course, by Vice President George Bush, father of the man who took the country to war over those very same WMDs.

Despite denials and explanations, to outsiders the attack on Al Jazeera looked absolutely intentional. The Arab network had become famous for reporting on civilian casualties from inside Afghanistan, a role similar to the one that Radio Television of Serbia (RTS) played in the 1999 Kosovo

war. Given that NATO intentionally bombed the Belgrade headquarters of the RTS during Operation Allied Force, it was easy to speculate that Al Jazeera was targeted simply for reporting a side of the war that the United States wanted suppressed.

On March 11, 1945, American B-52s with bellies full of napalm flew over Iwo Jima, headed north. LeMay launched the biggest air attack in history against Tokyo, killing around one-hundred-thousand civilians in about three hours. More Tokyo civilians died in a shorter time than in any previous military operation in any war.

“We scorched and boiled and baked to death more people in Tokyo on that night of March 9–10 than went up in vapor at Hiroshima and Nagasaki combined.”

LeMay exaggerated a bit, but his point was that the two atomic bombs dropped on Hiroshima and Nagasaki later overshadowed the powerful role of his groundbreaking napalm bombings, which reduced the majority of Japan’s cities to ash and made an astonishing fifteen-million urban Japanese homeless.

Only months after this weaponized toxin was introduced, both Vietnamese and American soldiers showed signs of dioxin’s insults to the body: fluid-filled cysts on the skin, and particularly on the face. But time would bring far worse problems: soldiers and airmen who had sprayed Agent Orange from aircraft or been exposed to it on the ground began to exhibit symptoms of everything from persistent numbness, dizziness, and memory loss to depression, violent rages, and suicidal tendencies. Many of these soldiers ultimately died of cancer. After the war, thousands of veterans would testify that they suffered neurological problems, impotence, miscarriages, and deformed babies.

There were no Purple Hearts awarded to those gravely injured by dioxin, but their wounds were real—and they never healed. The suffering inflicted on the people of Vietnam, North and South, combatant and noncombatant alike, was, for many years, an unacknowledged legacy of shame inherited by our country.

Over a period of sixty hours, from February 23 to 26, almost six-hundred parcels of retribution—more than half of all the projectiles fired during Desert Storm and nearly as many shells as American battleships fired during the last fifteen months of World War II—rained down on the coastal “defenders.” The official military justification was to deceive Iraqi troops into thinking an amphibious invasion was coming and thus pinning them in place. But the real purpose was a form of brutal housekeeping: away from TV cameras and

probing eyes, the battleships were pulled out of the old industrial closet and deployed. The United States was able to landfill the old ammunition abroad, rather than having to dispose of it back home. Faylakah was the perfect venue for our leftovers. In fact, fighters bombing Iraqi targets farther inland also dropped bombs on Faylakah Island upon returning to their aircraft carriers from unsatisfying missions—the planes couldn't land on the ships with external bombs still slung under their wings, so they had to go. They could have been jettisoned into the water, but why waste a bomb?

Many of the birth defects being seen in Iraqi hospitals are so rare that there is no medical term for them. Concerned about the birth defects plaguing her country, Dr. Alani met with physicians in Japan who are knowledgeable about the lingering health effects from the atomic bombs dropped by the United States on Hiroshima and Nagasaki during World War II. To her surprise, Dr. Alani learned that the birth defect rates in those two Japanese cities following the devastating nuclear attacks were between one and two percent, while her own case logs showed a far higher rate—almost 15 percent—for babies born in Fallujah.

Some medical experts, for instance, believe that ammunition containing depleted uranium—widely used by US forces in Iraq—bears major responsibility for the Iraqi health crisis. But others argue that the burn pits are the primary source of Iraq's health woes. Researchers found the same high levels of titanium and magnesium in the lung tissues of US soldiers stationed in Iraq as they did in the children of Hawijah, a city taken over by American forces in 2003.

And despite the 2010 withdrawal of US forces from Iraq and the end of conventional combat in Afghanistan, no one believes that the United States has really reduced its footprint overseas. The smaller number of troops is more indicative of a twenty-first-century reality, which is the end of the industrial era and the ability to generate even greater combat power than in yesteryear with fewer and fewer soldiers. But while fewer boots, fewer trainees, and fewer deaths and injuries are supposed to mean less human hassle (and less expenditure on people), the strategy is really a Washington bookkeeping trick. Machines do more of the work, but an invisible multitude of civilian contractors has quietly replaced soldiers.

Having Halliburton or Sodexo as its caterer may have improved the taste of the food, but that arrangement wouldn't work if the military were ever again to get into a really desperate slugging match like the Battle of the Bulge. The Pentagon and the State Department have even contracted out combat to soldiers for hire. The lack of training, discipline, and accountability of mercenary organizations is notorious, as became evident with Blackwater's shooting of seventeen innocent civilians in Nisour Square, Baghdad, in 2007.

The real story did not come out for another seven years. Even before the massacre, State Department investigators were probing the company's operation in Iraq, calling the firm's culture "an environment full of liability and negligence." But the probe ended when a top Blackwater manager threatened to kill a State Department investigator, saying that "no one could or would do anything about it as we were in Iraq." The American embassy in Baghdad, which had been all but taken over by intelligence operatives and contract personnel of various kinds, sided with Blackwater against the State Department, its own nominal superior.

If a crude and gangsterish upstart like Blackwater is able to back down the senior cabinet agency in the government with criminal threats of violence, it does not require much imagination to theorize why the Justice Department felt unable to bring criminal indictments against the executives of a half-dozen megabanks whose assets make up more than 50 percent of the country's GDP. To sum up, there is literally nothing that the Deep State does not contract out to the corporations that provide campaign donations to the political figureheads nominally in charge of the whole enterprise: the Arlington, Virginia-based contracting firm CACI is facing a federal lawsuit for its alleged involvement in torture at Abu Ghraib prison. Privatization has been great for contractors, not so good for the public.

Even after adjusting for inflation, the Pentagon spent more in the crash year of 2008 than during the peak of involvement in Korea and Vietnam. Both of those earlier conflicts were much larger wars than the current war on terrorism, and both wars occurred while the United States was simultaneously containing a peer competitor, the Soviet Union. Not only are we seeing unprecedented military spending, we are getting less for our money.

In 1991, William Anders, CEO of General Dynamics, told a group of industry executives:

"Most weapons manufacturers don't bring a competitive advantage to non-defense business. Frankly, sword makers don't make good and affordable plowshares."

A visitor to Washington, DC might be surprised to find ads in the city's Metro system selling a fighter plane, or spot a huge sign on a telecom building near the Southeast-Southwest Freeway extolling the virtues of an aerial tanker aircraft. A reader of *National Journal* or *Congressional Quarterly* or *Politico* will discover full-page ads for the littoral combat ship. A listener to WTOP news radio, the city's highest-rated radio station, will hear commercial spots hawking some homeland security gizmo that promises

to make our daily lives even more inconvenient, while other spots solicit persons possessing top-secret/SCI clearances—which give them access to the most sensitive “code word” information—to join this or that Beltway contractor for a unique and fulfilling career.

All of this weapon-mongering has become so ubiquitous that no one stops to think and ask one elementary question: why on earth? It is not as if the commuter from Reston or the soccer mom in Fairfax City is going to plunk down \$135 million to buy a shiny new F-35. The US government is a monopsony for the contractors: the sole customer for their wares. Even overseas contracts must be duly authorized, as Congress has the right to prohibit the sale. Government purchases must be made according to applicable statute and according to the Federal Acquisition Regulations, subject to the availability of funds appropriated expressly for the purpose. So why is public advertising necessary? Despite the formal ban on using contract revenues for advertising, the fungibility of money makes it difficult to interpret ads by a company that is dependent on the government for most of its revenue as anything other than the use of federal funds in a propaganda campaign for the purpose of pushing their wares in front of Washington’s so-called opinion leaders. Whether they intended it or not, the contractors have succeeded in normalizing the abnormal by transforming the sale of a killer drone into the ethical equivalent of a Mad Men pitch for a new mouthwash brand.

Digital Death Squads

On September 1, 2007, two IED bombers in northern Iraq were killed while lying in wait to detonate their roadside bomb the next time American soldiers passed by. The insurgents themselves were being watched by an Army Hunter drone flying high overhead. Without any noise or warning, a weapon came out of the sky and killed the men. It was the first Army weapon fired from one of its own drones in combat, organically able to spy and kill at the same time and all on its own.

But the missile wasn't Hellfire, Predator's aptly named hunter-killer, nor was it one of the half dozen weapons configured for delivery by Reaper, just then newly flying over the skies of the Middle East.

It was Viper Strike. A glide weapon modified from a Cold War invention intended to attack massed armored formations with swarms of what were then called "brilliant" munitions, the reconfigured Viper Strike was reoriented as a single weapon for the purpose of killing individuals. It weighs only a third of Predator's Hellfire, and has just 2.5 pounds of explosives, one-twentieth of even that small weapon's punch. Everything about Viper Strike is top-down. The weapon follows a trajectory that takes it directly over the target, setting itself up to make a steep dive nose-first, its warhead shaped and designed to explode with a focused downward-directed blast. With a laser seeker homing in on its quarry, it has a rated three-foot accuracy, meaning that friendly soldiers on the ground can be extremely close and still be safe in an attack.

Viper Strike was first tested in 2002—another "quick reaction capability," of course—conceived for combat in places like Kabul or Baghdad where "urban canyons" exist. A small munition like Viper Strike reduces risk to nearby friendly soldiers, in addition to minimizing harm to civilian bystanders. Viper Strike is a kind of cop on the beat, turning loitering not just into observation of what goes on in the corners of Everybad but also into its own SWAT team, the full cycle completed in turning everyday soldiers into assassins for the Machine.

GPS guidance and a data link were further added to Viper Strike's laser seeker in 2008, allowing the weapon to fly to the target vicinity, receive updates while in the air, and then use its laser seeker to home in on a designated spot. Like a satellite-guided JDAM, the forty-pound missile could be launched indirectly and off-axis from as high as 31,000 feet, with operators and commanders on the ground and in helicopters watching its flight path through a constant video feed, another one of those truly brilliant inventions where the drone itself is the least important part. Unseen,

unheard, and undetectable, Viper Strike offers a “covert capability.” The weapon “does not have a plume; it is a stealthy glide weapon. You don’t hear it coming,” the program manager said. As an Army briefing expounds, Viper Strike is perfect for picking off one car in a motorcade or as a six-kilometer-range sniper for “Golden Shot” missions, which it describes as taking out a bad guy on a roof while leaving the roof intact or killing two guys hiding without any further skin off the hide.

When the 15th Military Intelligence Battalion fired Viper Strike from one of its twenty-year-old Hunters in September 2007, the earth moved for those once-lowly geeks, collectors, and analysts previously relegated to combat support.

As there is with all new weapons, there are shortcomings: Viper Strike has to be launched from a canister, and it doesn’t operate in all weather conditions. And only about 1,200 Cold War BAT munitions could be converted into Viper Strikes, and even they have a limited shelf life. And, as with other spiral and ad hoc developments, the weapon, though approved by the Army vice chief in 2002, came about without any validated military requirement. But with Secretary Gates on a tear criticizing the endless search for perfect weapons while soldiers were dying, the potential for Viper Strike to join the black box cavalcade unfolded. As early as 2004, the Army was working on the Laser Homing Attack or Anti-Tank Missile (LAHAT), essentially an advanced follow-on to Hellfire at a third of the weight. The Air Force followed the Viper Strike path and took another Cold War antitank weapon—called Skeet—and started a program of test-firing it from a drone. The navy’s weapons laboratory at China Lake developed Spike, the world’s smallest guided missile. Weighing in at about 5.3 pounds and two feet in length, it could be fired from a small drone or from a shoulder launcher and travel two miles. And it could punch right through a window before exploding. Another weapon under development was the Miniature Guided Bomb Unit (MGBU), weighing less than four pounds and designed for urban use from Army Shadow and Marine Corps Blackjack/Integrator drones. Soon after, BAE Systems tested what it called the Advanced Precision Kill Weapon System (APKWS), doubling Viper Strike accuracy to half a meter (or 1.5 feet) by adding a laser seeker to a 2.5-inch rocket. The Lethal Miniature Aerial Munitions System (LMAMS) followed, a weapon that would fit on man-portable drones like Raven—“incapacitating effects using kinetic means,” in other words, making it sound almost like no explosion was involved. Next came Griffin and then Pyros, both weapons with even more advanced targeting techniques that allowed for increased accuracy.

In early 2009, Spike was fired from a drone, joining Viper Strike as another potential personal weapon and extending the possible number of armed

drones into the hundreds. In March 2012, APKWS went to Afghanistan, initially qualified on Marine Corps helicopters, attack and utility, but slated for drones as well. The Air Force acquired a LMAMS prototype that it called Anubis. The Army started shipping the tiny LMAMS, now called Switchblade, to Afghanistan in August 2012. It is described as the perfect hybrid of spying and killing—a “weapon designed for hand, tube, or aerial launch that could provide the warfighter with a rapid delivery to gather ISR information”—an expendable camera that goes beyond line of sight and gives the soldier the option to kill. When LMAMS reaches the target, its camera allows an individual soldier to have not only “eyes on” the target but also the ability to wave the weapon off if the situation demands or if the soldier thinks the person being targeted is the wrong one. And then Switchblade can loiter for up to an hour in the air while the user searches for another person to kill.

The Marine Corps also deployed Harvest Hawk in 2010, not a drone or a new weapon but another platform, this one a manned hybrid that could be called cousin to Global Hawk’s BACN. Harvest Hawk is a black box that fits onto Marine Corps aerial refueling aircraft, giving them intelligence collection and weapons capabilities all in one. It is a black box of the future: one platform doing everything, as Harvest Hawk doesn’t just collect—it also can carry Hellfire, Viper Strike, and Griffin.

It would be stretching things beyond the innovation of each development to say that any of these weapons made much of a difference beyond the immediate ability to just kill the same target in a different way and with seemingly less immediate danger and harm to others. Given the efforts expended to reach this level of seeming perfection and equality, the numbers still don’t support the image of a terrorist and insurgent class being eliminated.

Granted, the war in Iraq had ended and the war in Afghanistan was winding down when Harvest Hawk first deployed, but the advances in spying and killing didn’t and don’t stand still. The production lines for drones stay open not because of the need to ship more to the fight but because they are becoming the standard equipment of every unit. If every Army and Marine Corps division now needs its own complement of Predator-type drones, that is what determines the inventory. If every tactical unit is expected to go out with a Raven or a Puma, that is what establishes how many are required. If every base and every military police unit needs a certain number of drones or other unmanned surveillance gadgets in the form of balloons and towers and ground sensors for security and force protection, the number of bases in Afghanistan or Iraq or Djibouti or wherever determines how many. And none of this seemingly interferes with traditional missions or changes doctrine.

Harvest Hawk is of value precisely because it is, as they say, “platform agnostic”—a black box and a weapon fitted to an airplane up there and flying anyhow. The plane is manned, but its unmanned spying and killing black box is more tied to the larger Machine than to the refuelers on board.

The military has been wholly transformed by these black boxes, and yet the Army itself can’t see what it has become. Any notion of centralized intelligence—of a temple of information leading a nation in an actual strategy—has disappeared. Information belongs to everyone, and the assassin’s tool is increasingly at the beck and call of the decentralized god. The new aesthetic favored above all else is that no one puts their life at risk if a machine can do the job instead. And if soldiers have to work at the edge, they must be connected to the network and have personal ISR and weapons. Processing and bandwidth expand in service of the Data Machine, reachback continues because everyone serves the fighting man. No civilian leader or decision-maker seems to have the ability to see what has been created or question that the United States is stuck not just in this state of perpetual war but in a particular kind of war. No one has wrestled with the accumulated impact of the Data Machine and its erosion of distinction, nor the impact of its rampaging across cyberspace for five years or a decade, and more. Unmanned, “attack the network,” geolocation, reachback, a network for all, smaller and smaller weapons—each represents a huge but little-understood “advance” that stymies an understanding even of what is new and old, what is military and what is not. Harvest Hawk isn’t married to just any airplane: it is married to a KC-130J tanker, a version of the venerable four-engine propeller C-130 transport, which is itself one of the oldest airplanes in the US inventory, surpassing fifty years of continuous production and upgrade, now souped up with black boxes to make it nothing like its ancestors. We can no longer measure combat capability merely in numbers of troops or platforms and ignore the black boxes and networks. But the arithmetic of the enemy also confounds, seemingly demanding hundreds of billions of dollars’ worth of effort to merely keep a few thousand at bay.

Somewhere in the middle of all of this, a new president arrived in Washington. Everyone wants to believe that the Obama team decided to pursue some new tack against al-Qaeda. Critics from the left and right, even insiders, speak of “Obama’s drone war” almost in an attempt to personalize this wholly automated and detached effort driven by the Data Machine. Obama is labeled “assassin in chief,” making personal life-and-death calls from the White House, micromanaging the military and intelligence community in a style reminiscent of Lyndon Baines Johnson. Dick Cheney can both express his affection for drones and criticize the Obama administration for being so weak that it has given up on trying to

capture and interrogate the bad guys and instead just kills them.

It is true that drone activity over Pakistan accelerated in the year that overlapped the Bush-to-Obama transition, but in a historical sweep, it is the continuation of a policy predicated on a capability. On January 30, 2009, the new administration asked the military's Joint Chiefs of Staff to cut the defense budget submission for Fiscal Year 2010 by more than 10 percent. Two months later, General Atomics delivered its 200th Predator to the Air Force. Reaper, its eventual replacement, was moving steadily forward in production, deployed with Gilgamesh and Airhandler black boxes, and armed with its own wide-area sensor, called Gorgon Stare. Wide area widened even further with Constant Hawk, MAAS, Kestrel, and WAPS (the Wide Area Persistent Surveillance system), all coming off production lines in the new administration.

While Obama and his advisors debated Afghanistan surges and withdrawals, General Petraeus asked for more hyperspectral imagery, prompting Secretary Gates's ISR Task Force to search for an instrument "that was not a science project" and could be delivered quickly. The Advanced Responsive Tactically Effective Military Imaging Spectrometer (ARTEMIS) black box was launched into orbit barely four months after Obama was elected, collecting 480 different channels of data for each pixel in its view. But the capability was so secret and so obscure that six months later, when ACES HY was approved, it was called the first. Airborne Cueing and Exploitation System-Hyperspectral would fly on Predator in 2012, the thoroughbred successor to WARHORSE, a 100-pound marvel that could be integrated and enable the drone to also carry its standard electrooptical/infrared ball. Satellite-borne, unmanned, and even manned hyperspectral would join the Obama team: in 2010, U-2s incorporated SPIRITT, the Spectral Infrared Remote Imaging Transition Testbed, optimized for its high-altitude mission. Not one is an Obama initiative, not one is anything more than more.

Each ongoing emergency project, each quick-reaction capability, each experiment carried the most promising technology or black box forward. If there weren't enough drones and black boxes already in the fight, there was also each new discipline, like hyperspectral, that came on board. And then there were also "special communications" black boxes to support unmanned ground sensors and the x-men, some of the devices so secret-agent that they slip as much into the category of black bag as black box. In 2009, one company even touted an inflatable, airline-checkable, 2.4-meter satellite antenna system that would allow a secret agent to set up a remote high-bandwidth communications hub, perfect for infiltrating into a Pakistan or a Yemen or beyond. As one set of top secret briefing slides says, the goal is "holistic integrated solutions," the ability to differentiate between "terrorist"

and “indigenous activities” with the goal of “providing timely, actionable intelligence enabling disruption of terrorist kill chains.” The Data Machine drives an uninterrupted and never-ending search for novel techniques to detect and locate the signatures of terrorist activities, right down to their socks. Everybad is now reachable, and though we may debate “defense” as a set of choices of buying this or that industrial monster or pivoting to Asia, the reach to Everybad is political party and president agnostic.

In Obama’s first year, Predator and Reaper inventories peaked at 228—174 Predators and 54 Reapers. Two years later, at the height of all operations overseas, Predator-type drones had increased their daily schedules from three combat air patrols (orbits) to seventy-five-plus “caps” daily. And it wasn’t just Predator and Reaper—there were Global Hawk and all the other drones and dozens of different types of manned aircraft. After 9/11, the United States accumulated hundreds of different types of wide-area and hyperspectral sensors on thousands of platforms capable of creating countless images daily. And try to fathom this: the next generation of wide-area motion imagery sensors will be capable of collecting 2.2 petabytes of data per day, bringing 450 percent more data into the network than all of Facebook adds on a typical day. And the generation after that, “broad area” imaging, what is called persistent surveillance and is already happening, will demand twice that.

In Pakistan, after the assassination of Benazir Bhutto, President Bush expanded the target list beyond al-Qaeda to the Taliban and other “nexus” targets and increased the tempo of attacks; by the end of 2008 there had been forty-six drone strikes over the border. Initially, Pakistani intelligence was consulted, but when US intelligence showed President Bush evidence that the targets might be receiving warnings, the United States started only to inform Pakistani officials concurrently. Bush also approved the employment of a more “attack the network” approach, bombing infrastructure and then tracking “squirters”—those who got away—to the next hideout. X-men operating as part of Joint Expeditionary SIGINT Tactical Reconnaissance (JESTR) teams would infiltrate and get as close to potential targets with their Swiss Army knife black box collection conducting “Charlie Ops” under the COHESIVE OVATION program. The operations were so successful that twenty additional ones were mounted between July and Obama’s election. When Obama took over the program, drones were flying out of Pakistan and there were extensive plans to expand the area of permitted strikes and increase operations on the ground in Pakistan. Deputy National Security Advisor Thomas Donilon told Bob Woodward that though Obama had campaigned against Bush’s ideas and approaches, he underestimated the extent to which he had inherited George W. Bush’s presidency—“the

apparatus, personnel and mind-set of war making.”

In other words, Obama didn't accelerate anything. He just assumed “command” of greater capabilities to hit targets. That means also that the pretense of fewer troops can be sold as deescalation of conflict or even success. The impression can be left behind that the American president himself sits at the joystick and the rest of the country has nothing to do with it. But that in itself is the triumph of the Machine. The unlaborers and the system are invisible, and so the Machine becomes platform agnostic—political platform agnostic as well.

When President Obama appeared before the cadets at West Point on graduation day 2014, his promise was a withdrawal from Afghanistan by a certain date, just as he had done in Iraq. The administration said that as the United States wound down its war in Afghanistan, it would keep a force of just 9,800 US service members in 2015. But “America's combat mission will be over,” Obama said. And the United States would “have to develop a strategy that matches” the diffuse terrorism threat—“one that expands our reach without sending forces that stretch our military too thin, or stir up local resentments.”

Commentary on the president's speech dissected every nuance about the American future, but black boxes are what makes that withdrawal possible, by allowing for a network that is less dependent on a human ground presence at the point of fighting. And because of the network, nearly ten-thousand troops on the ground equals some hundreds of thousands of yesteryear. The nature of the Data Machine, moreover, including all of its mystifying classifications of military, civilian, and contractor; of overt, covert, clandestine, invisible, and just special, obscures what is the true commitment and activity on the ground and presents the illusion of demobilization and pulling back, when in fact that is not the reality. Find a president or a political decision in the continuity from Desert Storm to the mid-1990s to 9/11 and beyond: Clinton inherited Bush; Bush inherited Clinton; Obama, Bush; Trump, Obama. Our foreign policy itself is unmanned.

The distinction between regime and nation was a crucial one. By employing these new military techniques, the United States could eliminate a non-compliant foreign leader and his cronies, while sparing the population over which that leader ruled. Putting a missile through the roof of a presidential palace made it unnecessary to incinerate an entire capital city, endowing force with hitherto undreamed-of political utility and easing ancient moral inhibitions on the use of force. Force had been a club; it now became a scalpel.

In Afghanistan and Iraq, and then in new battlefields in Yemen and Pakistan, everyone was told that this was going to be a new kind of war.

The United States wasn't going to win the fight against terrorism through defeating an army on the battlefield or attacking some set of traditional targets with bombers. The new mission was going out and hunting. Special operations forces and secret agents—that is, the small-scale and elite fighters like the Navy SEALs of the individual commando variety—would lead the fight, and more activity would take place in the shadows than in the light. Information would be as valuable as any bullet. Humans are engaged in this effort, and there are those individuals who actually go out there and risk their lives. But the irony is that this very humancentric design of hunter-killer special operations, these particular types of boots on the ground, require far more exhaustive preparation and microscopic-level intelligence information than industrial armies ever needed. Thus the technological effort and the human effort demand the same data, a circular requirement that has become the dominant activity.

Warfare hasn't completely transformed into an endeavor where everyone on the battlefield is merely there to sustain being on the battlefield, but the ratio of those actually doing the fighting to those processing the information and operating the Machine is at historical extremes. It is hard to quantify, but during the Afghanistan war, only 1.6% of the supplies shipped to the battlefield comprised ammunition, and less than 1% was repair parts. Fuel, on the other hand, constituted almost 39%; water, food, clothing, and personal items made up another 55.4%.

When you talk to military elders about their cadre of digital natives, they describe them as those who “want to do, not to be told.” With connectivity as their hallmark, they expect to jump right into a new piece of equipment, a new website, or a new game, learning the controls through trial and error. And not only that—digital natives value team learning, and they achieve and improve naturally through social media. When you visit a military unit or a command post these days, it's quite noticeable that the ubiquitous accoutrement of modern-day war-making is social media, from the common operating picture to the multiple open chat sessions connecting highly dispersed information workers. And yet this instant messaging, which has all of the immediacy, abbreviation, and fleetingness of teenage texting, goes on in a secure and hidden world and concerns matters of life and death.

The government effort costing hundreds of billions of dollars, constituting tens of thousands of sensors and hundreds of thousands of human operators and analysts, is barely able to keep up with the task of finding and monitoring a few thousand people. And that's the point: monumental leaps have occurred, both in technology and in the ways of war, but they have all been to achieve a very limited objective. The military has been transformed and become hyperprecise, but it also has become able to do only one thing: drill

down to the individual—a terrorist, a car, an armored vehicle, a window in an office, the most hidden or fragile heart or brain of a machine or a network. Data feeds this incredible targeting machine, which goes about its work with such economy that it is sometimes not even apparent what is being destroyed, let alone why. It is such a new way of warfare that every death—friendly and enemy—is enormously magnified. Ours is a numerically anomalous tragedy; theirs an exaggerated and overmagnified victory.

Some might say that these advances merely repeat the historical cycles of technological innovation that every war produces. But that is dangerous thinking. Every element of what has emerged in this increasingly unmanned world is dependent on civilian technology and, in fact, civilian infrastructure. Nothing happens in this world without the Internet, even if private pipelines and superencryption are the way that the military facilitates its own secure enclave within the network. As a result, private and public communications have become one. Developments in the processing and handling of big data, the use of the cloud, and information analysis move forward in parallel military and civilian worlds and at breakneck speed; the best of what is civilian is readily adapted for the military, whereas the robustness of what is military is desperately needed to protect networks that are no longer just civilian.

Given how much more lethal and exacting every weapon was also becoming, the numbers were turned upside down—that is, one bomber became equal to ten or fifty or a hundred of a half-century earlier; one Hellfire-type missile could do what thousands of bombs couldn't even do in the past: kill the target. The equation of how many people are needed to make war shifted from warriors to data processors and unlaborers. The changing of the doing itself thus also changed the very nature of war. There was a transition period between the Cold War and merely war, to an era of wars of policy rather than wars of necessity. And there were changes in society, coincident or as a consequence, whereby the assumption of universal military service was abandoned for a volunteer and professional military—though I would argue, and I have, that society overall has become much more militarized.

And, of course, there was just the reality of societies' movement to the information era and the age of the digital self. The shift to the unmanned is therefore not merely some post-9/11 phenomenon. The Data Machine wasn't the product of any diabolical mind or plans of the Bush administration. Predator was not some invention intended for al-Qaeda. Targeted killing is not just some macabre Obama pastime. Unmanned is warfare changed with society and then accelerated in more than a decade of warfare that was hardly ever industrial in nature.

Volumes would later be written as to whether terror is a crime or an act

of war, about the namby-pamby pre-9/11 reactions, about the failures of intelligence and government that led to the 2001 attacks, and then about the turnaround and all the supposed correctives that followed. But there is no denying in hindsight that by conferring warrior status upon al-Qaeda, the United States also conferred the age-old mantle of the military on a bunch of criminals, even if they were arch-criminals. Like the goddess Ishtar throwing a tantrum that resulted in Enkidu's death, the black box reared its mighty pencil and took on the role of judge and jury—and more, claimed the essential authority and power of the gods. None of it would have happened without unmanned systems—first the long-range Tomahawk cruise missiles that could be fired from the Indian Ocean deep into Afghanistan, and then Predator, which now proved that it could range anywhere, and also could soon do so with its own weapon.

One can almost hear the adolescent guffaws in the American telling of the first Gulf War, locker-room swagger that glosses over all the difficulties involved in preparing to fight the fourth-largest army in the world. Gone and forgotten are the many drills in anticipation of chemical weapons or worse, the thousands of body bags shipped to Saudi Arabia for the expected corpses, the fear that the new smart weapons would not work, and the many frustrations when the likes of Scud missiles stymied the best of plans. All was miraculously expunged at the end of forty-three days, and making fun of the hapless opponents, with their mismatched uniforms and meager supplies, became the new narrative.

Perhaps one of the saddest pretenses is in the urban legend of Iraqi soldiers being so stupid that they tried to surrender to a drone. It was on one of the last days of the conflict. An unmanned Pioneer, its snowmobile engine screeching away at about 2,000 feet, overflew Kuwait's Faylakah Island, taking video that included footage of Iraqi soldiers waving white flags in the air. The footage was beamed back to a US Navy battleship and went viral in military channels. The story, which was quickly embellished, became lore not just of Iraq's easy dispatch but also of the magic of the unmanned. Remote images of the enemy surrendering!

During the Battle of Tora Bora, Global Hawk dropped its planned imagery collection profile altogether and started tracking Taliban and al-Qaeda positions and cave entrances, either using its infrared camera to detect campfires or receiving tip-offs to take a closer look with its sensors into crevices and cracks off angle from satellites. Aircraft and AC-130 gunships in the area would undertake airstrikes, which Global Hawk could then instantly confirm via star-shaped infrared flashes, recording bomb explosions, the sparkle of success.

Such instant gratification made quite a contrast with doctrine and even

practice before the war: in old-fashioned war, the army corps commander, in charge of three to five divisions, would rely upon his own intelligence units—either field artillery radars or organic collection assets—out from the front. A fire support team would determine the best way to attack beyond the range of the divisions. If airstrikes were desired, a liaison would nominate the target through higher headquarters to the daily targeting board at the air command center, which would then task flying squadrons, which would fly the requested missions anywhere from one to three days later. If the target was mobile, the nominated target would have to be meticulously tracked and its position updated to the air guys as many as three times a day. The obvious question then asked in the fall of 2002 was “When we find a target, why not just kill it right then?” Capabilities and communications had certainly improved; what was needed was closer cooperation at the working level and a change in practice to reflect the new capabilities of the Data Machine.

“You know, if the Predator gets shot down, the pilot goes home and fucks his wife. It’s OK. There’s no POW issue here.”

No loss of American life, or so it seemed, meant there was no issue of any kind.

Every second of every day, over fifty of these Predator-type drones are airborne worldwide, over Afghanistan and Pakistan, quietly flying over Yemen or Syria, working in Africa and Latin America, patrolling the US border, monitoring the oceans, conducting civilian and scientific missions of all kinds.

Every drone consists of four distinct elements: the platform itself (whether aircraft, ground, or waterborne robot), the payload (the black box—that is, the sensor or weapon), the control station (where the flight is directed from, whether it is on the ground or not), and the communications network that is required to control the platform and receive its product. External to the drone world are the processors (analysts or computers) who scrutinize the product and then the users (political decision-makers, commanders, special operatives, soldiers) who take action, the manned element of the unmanned system, who are hardly trivial.

The ground presence was also substantial, not necessarily a flaw but a surprise to some who had a vision of one-man, one-joystick, one-vehicle operations. Cost, the Air Force found out, was ten times what many assumed. In fact, despite the term ‘unmanned,’ maintaining Predator proved more labor-intensive than manned operations, not even counting how many people

were needed to handle the incoming intelligence, which just kept increasing in volume.

The one characteristic that makes aerial drones so different from manned aircraft—a characteristic shared with robots and unmanned undersea vehicles—is that, relieved of the human being on board, they can loiter. They can linger aimlessly, moving about in a slow and idle manner and making purposeless stops in the course of a trip. Before the military started using the buzzphrases “persistent surveillance” and “perch and stare” to atomize intelligence and envelop the drone as just another one of the guys, they used the word ‘loiter’ thereby saying way more than was ever intended.

Now, the reader might think I bring up the term ‘loitering’ to suggest a metaphor for some sort of crime being committed, when in fact it is the aimlessness that I want to focus on. Loitering, drone war advocates say, provides “a clearer picture of the target and its surroundings, including the presence of innocent civilians.” The danger is that this very confidence in “surgical precision”—this “laser-like focus,” to use the words of drone war architect and former CIA director John Brennan—self-validates the use of drones. Proponents argue that because the United States is taking unprecedented measures to be both discriminating and meticulous in its pursuit of terrorists, it is therefore doing the right thing.

The goal is to deploy solar-powered drones that can loiter in the air for weeks without coming down. Once you can do that, and you put any typical signals-collection device on the bottom of it to monitor, unblinkingly, the emanations of, for example, the different network addresses of every laptop, smartphone, and IoT device, you know not just where a particular device is in what city, but you know what apartment each device lives in, where it goes at any particular time, and by what route. Once you know the devices, you know their owners. When you start doing this over several cities, you’re tracking the movements not just of individuals but of whole populations.

By preying on the modern necessity to stay connected, governments can reduce our dignity to something like that of tagged animals, the primary difference being that we paid for the tags and they’re in our pockets. It sounds like fantasist paranoia, but on the technical level it’s so trivial to implement that I cannot imagine a future in which it won’t be attempted. It will be limited to the war zones at first, in accordance with our customs, but surveillance technology has a tendency to follow us home.

From the first night of Afghanistan bombing in October 2001, when everyone boggled over the all-seeing eye for the first time, decision-makers at the CIA, the Pentagon, the White House, and command centers near and far were glued to their own DNN—the Drone News Network—everyone fully in thrall. Video was of course the simplest explanation, spawning epithets

of “Predator porn” and “CAOC crack,” but what really appealed to a television-watching and image-obsessed generation was persistence. General Jumper called it the buzzword of the decade in 2003. Arguably the most important strategy document that the Pentagon prepares, the Quadrennial Defense Review, in 2006 argued that future capabilities needed to favor “systems that have far greater range and persistence; larger and more flexible payloads for surveillance or strike; and the ability to penetrate and sustain operations in denied areas.” BACN is the facilitator of anywhere and always. Now all that was needed was all the time.

The concept of persistence requires yet another family of black box sensors. Predator is up there like no other, but it provided far less than the persistence that was envisioned, at least beyond extremely narrow individual targeting that came from looking through a soda straw. It’s an “immediate-time kind of reporting,” one Air Force officer said, “of viewing exactly what’s going on with whatever your selected target is—whether that’s a house, a building, a vehicle moving down the road, whatever that is—you are able to then sit there and watch that. It’s very small. So I just see one vehicle or two or three vehicles at the most, but my field of view just isn’t that big on the ground.” Not only did the Predator camera show a limited perspective, but the raw imagery from the moving platform proved not so easy to interpret, the thirty-to forty-five-degree angle constantly changing as the drone moved. Scientists went to work on better processing, developing software and hardware that would provide georeferences (what we today call metadata) and even a converted top-down perspective that matched a scene-based correlation, virtually all of the advances being borrowed from graphics processors used in gaming applications. The other two avenues of attack were increasing the breadth of the perspective (wide area) and providing higher resolution, thus allowing greater exploitation of each imaged scene by the naked eye.

Sonoma was the first experiment of widening the perspective, developed starting in 2003 by Lawrence Livermore National Laboratory in California. Using a novel mosaic-like sensor design that could view a wide area at high definition, the first prototype carried a 22-megapixel sensor (six times Predator’s resolution), the second a 66-megapixel sensor, and the third a 176-megapixel sensor, each capable of imaging a larger and larger area in a single frame. Where that normal sensor on Predator can image the area of a city block, Sonoma 2 could cover an area the size of downtown Washington, DC, and Sonoma 3 could see the entire metropolitan area. Such wide-area high-definition imaging exposes every corner. In one of the initial Sonoma experiments, an IED scenario was created—Red Team Intent—that assumed that any car that slowed down to five miles per hour for more than 100

feet was suspicious. Software was written that highlighted the path of all vehicles matching this signature. Then, once the pattern was triggered, an analyst could rewind the video and discover where a suspicious vehicle came from. And Sonoma could track 8,000 simultaneous moving objects.

It was truly persistence, but in order for surveillance to be useful, an analyst must be able to see the data in real time. As the Livermore laboratory explained, “all data processing for one frame must be completed before the next frame is captured.” With data being collected at two frames per second, Sonoma’s data exceeded the bandwidth of available communications by a factor of 100 to 10,000. So scientists applied various techniques, including data compression, to show only movement (or anomalies), while the georeferenced static background was only episodically transmitted to match what the sensor was seeing.

Sonoma turned into the Mohawk Stare experiment for the Army and then into Constant Hawk, and in 2006, a prototype Constant Hawk wide-area persistent surveillance (WAPS) system was quietly deployed in Iraq, owned and operated by contractors. Constant Hawk could record and archive sensor data that allowed for playback of incidents, such as roadside IED bomb blasts, to be reviewed. Once an event occurred, the data was downloaded, and analysts attempted to backtrack from the incident, tracing bomb-makers and insurgents who might have deployed the IED and, if possible, following them backward even to their points of origin. They call this method of going backward to pick up clues forensic analysis. This was warfare completely turned on its head. Constant Hawk was an immediate hit. But the experimental black box was integrated on a manned airplane and not a drone, giving it limited time in the air. And it still produced enormous amounts of data, much more than could be moved very far, and in formats useful only for demonstration.

Then, as these things go, the Los Alamos National Laboratory in New Mexico produced Angel Fire for the Marines—smaller and more user friendly—and other wide-area and persistent programs came knocking.

More black boxes meant more data. And the introduction of wide-area surveillance, and particularly high definition, exponentially increased the amount of information available. Collection outpaced the ability to move the information, store it, or process it. As a result, the Pentagon admitted in 2009 that it was drowning in data. It was now looking at hundreds of terabytes of new data coming in every day. That’s over 400 laptops with the typical 128-gigabyte solid state drive, and more than the total of all the terabytes collected by the Library of Congress Web teams. “We’re going to find ourselves in the not too distant future swimming in sensors and drowning in data,” said Lieutenant General David Deptula, head of Air

Force intelligence in January 2010. And within a couple of years, Reapers would be carrying their own wide-area black boxes that would be able to track up to twelve different targets simultaneously, delivering 84 million pixels twice a second. “The iteration after that will jump to 30 and there are plans to eventually reach 65. That’s an increase from 39 possible video feeds [from Predators and Reapers] to more than 3,000 with a 50 cap force,” Deptula said. Data pipes were filled and storage was approaching saturation levels.

The next month, BAE Systems announced successful flight tests of its ARGUS-IS, a 1.8-billion-pixel camera with a resolution of six inches that can see a minimum of sixty-five “Predator-like” video windows across more than 100 square kilometers. And ARGUS would transmit at five times the frame rate of Constant Hawk, ten times a second. One minute of high-definition video of a city block already demanded one gigabyte; an 800-megapixel image of a small city—required to extract intelligence information at specific locations—demanded half of a terabyte per minute; ARGUS-IS, operating at 1,800 megapixels, could image a large city demanding half a petabyte per minute of bandwidth if all of the data was transmitted.

BACN was pursued because everyone saw saturation coming, because there was a demand for far more bandwidth and data.

Part of the problem is the haystack itself. When 9/11 came, there were about 450 million Internet users and close to one-billion mobile connections in use around the globe, sending about 10 billion electronic messages daily, 10 percent of them text messages. By 2014, the planet was closing in on two-billion Internet users and the number of mobile connections was estimated at 7.5 trillion, with only about five percent of them in the United States. Internet use was no longer dominated by people sitting at computers; in most parts of the world, particularly in places like Afghanistan and Iraq, the vast majority of Internet access, including everything from communications to banking, was achieved using smartphones. By 2014, the number of electronic messages sent daily topped 500 billion. In the decade and a half after 9/11, the numbers multiplied many times over, with each development—digital DVDs replacing analog CDs, digital radio and television, high-definition, social media, and people living online—exerting greater and greater demands for bandwidth and presenting an infinite universe of data to be collected.

Everyone, including the custodians and residents of the Data Machine, is now drowning in information. The number of all kinds of manned and unmanned collection platforms tripled in the two years after 9/11 and continued to grow after the Iraq war started, increasing by over 200 percent from the end of the Bush administration until 2012. Just in terms of combat flight hours, drones increased from a total of around 22,000 in 2001 to over

550,000 in 2011. The demands for intelligence became so great, and the capacity to collect information proliferated so broadly, that by 2013 there were triple the number of platforms in Afghanistan than there had been at the height of operations in Iraq, despite the fact that the fighting force on the ground there was only one-fifth the number of troops that deployed to Iraq.

Those in the know describe just the amount of visual data collected every day as five seasons' worth of every professional football game played—thousands upon thousands of hours. The data moves around the globe multiple times, first for “actionable” purposes, which means in support of an immediate high-value mission. The data then moves to be processed for second-phase and multi-INT exploitation. It then moves to contribute to geospatial products. It then moves to park itself somewhere on the network. And it then moves whenever someone pulses the system, secret search engines that go under names like Stone Ghost, Gemini, and Hercules. On a daily basis, the Data Machine produces hundreds of thousands of reports, many of which require no human intervention whatsoever.

All of this data is now constantly on and fully dynamic and moving from desktops to handheld ROVERs and ginormous video walls in fusion centers, occupying chat, e-mail, and Web services for processors and users all along the way. It is a wholesale change in culture that had quietly taken hold in the military and intelligence communities, one where information—data—came to dominate, where it was seen as key to soldier safety and discriminate warfare. Yet despite the coming end of the big wars in Iraq and Afghanistan, despite the directive to stop buying platforms, and despite the saturation that was affecting movement and storage, no one could seem to find a limit, a point when or where information ended. Years later, when Edward Snowden brought to light the NSA's infinite collection of signals, the broader impact (and appetite) of the Data Machine was lost in discussions of the legality and privacy of eavesdropping and cyberdata interception. The way the Data Machine itself works also wields enormous demands of its own, not just the post-9/11 cult of connect the dots and the kill chain perfected, but also the human factors—user friendliness and interactivity that make the machine workable for a generation of digital natives, seamless production values that now mask the drivel of most of the content.

Though the systems available are an overwhelming word list of acronyms, there are basically two parts to the convention of getting through today and increasing the odds for tomorrow. In Everybad, wherever it is, pattern analysis has become the ubiquitous mission preparation: think all-news AM radio that provides traffic alerts ‘on the 8s’ transformed into an automobile-mounted GPS that magically ingests slowdowns and accidents and then

places it all in a life-and-death, no-mistakes instant navigator that not only provides warnings but also can assess the possibilities and dangers of alternate routes. Whether unit analysts input their SIGACTs into an older flattened Time/Event Plot Wheel or use the density plot software contained in the Distributed Common Ground System, the dual goal is not just to report bad traffic but to create a record of date, time, and location patterns to track enemy networks so as to know who is responsible for the jam and where they are at any given moment. And then the pseudoscience of this new type of warring is to predict where they will be next.

Any unit that ventures out into the unknown can create a mathematical grid: each kilometer of road is given a unique identifier within fixed named areas of interest, many of the latter as small as a two-block area; as many as 300 in a company area of operations may support about 180 infantrymen, masterminded by a handful of data gatherers. Every SIGACT is associated with a specific geographic point and instantly logged to show which grid is quiet, active, more active, and even more active; up to 10,000 SIGACTs at a time can be tracked at the unit level. With engagements plotted by location, and by hour and day of the week, and with percentages established by commanders for thresholds—say 15 percent to designate a high-risk area—windows of engagement with the highest probabilities of success are established: a location where indirect fire such as a mortar is known to have come from, a line of fire that snipers have consistently employed, IEDs that have been found and detonated.

When it all comes together, when the data is collected and entered properly, when the servers serve and all the knowns are collected, the probability of success is increased: one NCO describes his experiences with convoy operations, remarking that the data in his area of operations showed that only about five percent of the roadside bombings occurred between the hours of 2400 and 0400, not only determining the optimum time to conduct movements but also providing immeasurable psychological reassurance to his soldiers.

A shipment of plastic men's sandals stamped 'MADE IN CHINA' and common in South Asia goes on sale in Peshawar. A wafer-thin tagging device no bigger than a business card has been embedded during manufacture, China being only a stamp. Some of the tags are passive and will register when they pass by special readers, with the location of the shoe transmitted to a central tracker. Others are active and will transmit a signal that can be picked up from tuned receivers, even in space. It's a long shot, but the shoes will do the talking: when they cross the border or visit certain locations, the unknown wearer will be identified as a person of interest. A sensitive-site exploitation team moves to search suspect buildings, leaving behind tiny

motion-activated surveillance cameras. A grid of clandestine unattended motion-detecting ground sensors—eyes on the ground—is also left behind, blanketing the neighborhood with visual, acoustic, and seismic informants.

From more than one kilometer away, a close-access target reconnaissance team watches a suspect compound. A high-value individual on the target list has been followed off and on for weeks by Predator, and now a cell phone call locates an associate. Utilizing their long-range sensors, the team gets a decent biometrics profile of two individuals—height, estimated weight, 2-D facial, hyperspectral signature—and transmits the files to the tactical operations center, where it is relayed to the Biometrics Fusion Center in West Virginia for second-phase analysis and confirmation of identity.

Predators flying high overhead establish pattern of life, identifying a truck never before connected with any known bomb-making network. Predator footage, together with archival satellite imagery, feeds into geolocating software that determines the truck's coordinates with one-foot accuracy. A small drone is then launched, a very special drone with a classified name. It silently lands near the truck, dispensing its micro morphing air-land vehicle, which skitters to the truck and then crawls underneath. Its camera, which normally faces forward during flight, flips up and gathers images of a bomb that has been placed on the truck's underbelly.

Where mechanical eyes and ears fail, where the Data Machine stumbles, something akin to the dark arts begins. These are the most secret of all secrets: the how of how the United States and its allies find and confirm individuals, the individual, when satellites and drones overhead or intercepted digits just aren't enough. The starting point of such a mission could be a tip-off from sensors demanding positive ID and greater precision, or it could be just a name leading to a link leading to a link, and on and on and on, as the global hunt proceeds to find the body. This is the cutting edge of what is both manned and unmanned. And not only that, but this is also where the seams are: these black ops—military operations—exist in a gap where things are neither strictly military nor strictly covert, nor in the realm of law enforcement.

The lines separating those communities—soldiers, spies, cops—used to be clearly marked, and for good reason—military was military, civilian was civilian, war was war, and assassination was something that didn't happen within war's rules. Even if military special operations worked clandestinely, they weren't covert, that is, operations where the United States sought to hide its involvement (and those operations were once solely the domain of the CIA). And the CIA wasn't the military, that honor being reserved for those who operate in the open. Military special operators and CIA people might work together, and lawmen might even be brought into a hostage

rescue or an individual takedown, but the basic distinction of each of their roles pretty much held up until 9/11.

A conventional fighting force pursuing an unconventional foe just couldn't do things in the old ways in the hopes of stopping terror (or later, even just stopping IED attacks) before it occurred. Or more precisely, while conventional military forces fought in the light, another war went on in the dark.

Manned close-access target reconnaissance—combining the four main technical surveillance disciplines (electronics, video, audio, and TTL)—puts the x-men in the riskiest positions, whether in penetrating deep into the mountains of Pakistan on lone missions, or in going into the urban areas of today's conflict zones (or even into cities and places not yet on the public target lists). But the development of these technologies and the risk assumed can also obscure the true transformation here and the ultimate hallmark of the x-men: They cross the lines. They go where others can't. They are soldiers, policemen, and covert operators all rolled into one. No border holds them back, and similarly, no conventional law applies. They have ridden the wave of post-9/11 jingoism, of connect the dots, and they march forward on the simplest explanation of why those attacks came. They are armed with technologies that are only tangentially arms. They have access to nanotechnologies and MASINT and the sciences of biometrics and forensics, which previously were available only in the security and law enforcement domains.

And they are the answer machines: what used to be complementary and a mere adjunct to traditional intelligence is now more often than not the second source, the positive ID or the right-down-to-his-socks conclusion that decision-makers and x-men use to pull the trigger, acting as both intelligence collectors and executioners. These nonsoldiers, nonlawmen are all-in-one: a manned unmanned.

For all the talk of drones and black boxes, this hunt of the x-men is about as human as one could imagine. Yet when armed with so much information and so much power, remote and long-range begins to look pretty good in comparison. For to embody all of the attributes of military and civilian, soldier and policeman, surgeon and killer in one is essentially to create highly adaptive and essentially automated decision-making that leads to one answer, one continual answer.

Equipped with the greatest of real-world black boxes, sensors, communications, and weapons, with the Data Machine always at their beck and call, these x-men are the essence of imagined perfection—the x-men working at the edge also increase the level of confidence in the final decision. The willingness to make mortal sacrifices, the assumption of meticulous preparation,

and the magic of the special ensure that commanders and decision-makers start from the assumption that the target is the most dangerous and deadly to friendly forces (and to the World), thereby justifying all of the effort, but also that once the penetration is made, they know enough detail to satisfy the unspoken color-of-the-socks test. As former Air Force chief scientist Dr. Mark Maybury says of the combination of persistence and closeness, they have “a very positive impact on increasing knowledge because you have a chance to loiter and see more things,” bolstering with positive identification and reducing civilian casualties.

The Data Machine has changed everything and the warriors of special reconnaissance are valued more as collectors than killers, humans to be sure, but not valued for their cognitive abilities or language skills or even because they make a choice at the end whether to pull the trigger or not. No, here, ‘close’ is the key word: the human operative is valued because getting close, putting an RFID device on a car, tagging an individual to follow him or her, slipping an intercept chip into a phone, fiddling with someone’s computer or home router, picking up some cell phone call, or taking some picture; even just watching and listening to all of this activity peeping tom-style, is valued because it gains access and data that the central brain does not (yet) know.

Yet the close-access operator is also merely a new platform and data processor for the unmanned. The president and his advisors literally sit around the conference table at the White House Situation Room half a world away watching an operation unfold live because of these men. One might imagine that courageous political decisions are made in executing the mission that day, in taking whatever momentary risk there is in the willingness to take the heat for failure. But in approving the execution—We know the color of the socks! It’s a go!—the option of trial isn’t even seriously considered; and in military terms, capture isn’t even attempted.

All these decisions are made a little easier because Navy SEALs or other special operators are not quite soldiers. These are, after all, the elite of the elite, further obscuring all of the distinctions of military and civilian and just and unjust, a blurring that empowers other outlaw fighters to justify their own actions and their cause. From targeting Osama bin Laden down to designating the umpteenth al-Qaeda number three to be killed, the machine facilitates a corrosive blight. The military mission from Desert Storm through this post-Iraq, post-Afghanistan period of no-name war is ever more obsessed with perfecting the process of finding and killing the target. Only the imprecision of using such a euphemism is left.

Bush’s CIA and NSA chief Hayden said about Obama’s drone assassination of Anwar al Awlaki:

“We needed a court order to eavesdrop on him but we didn’t need a court order to kill him. Isn’t that something?”

Drones are a tool, not a policy. The policy is assassination. While every president since Gerald Ford has upheld an executive order banning assassinations by US personnel, Congress has avoided legislating the issue or even defining the word ‘assassination.’ This has allowed proponents of the drone wars to rebrand assassinations with more palatable characterizations, such as the term du jour, “targeted killings.”

The military is easily capable of adapting to change, but they don’t like to stop anything they feel is making their lives easier or is to their benefit. And this certainly is, in their eyes, a very quick, clean way of doing things. It’s a very slick, efficient way to conduct the war, without having to have the massive ground invasion mistakes of Iraq and Afghanistan. But at this point they have become so addicted to this machine, to this way of doing business, that it seems like it’s going to become harder and harder to pull them away from it the longer they’re allowed to continue operating in this way.

Members of the special operations community view the people being hunted by the United States for possible death by drone strike as if they have no rights, no dignity, no humanity to themselves. They’re just a “selector” to an analyst. You eventually get to a point in the target’s life cycle that you are following them, you don’t even refer to them by their actual name. This practice contributes to dehumanizing the people before you’ve even encountered the moral question ‘Is this a legitimate kill or not?’

Whatever the actual numbers of terrorists, the Muslim world—and much of the rest of the world—remains unpersuaded about the supposedly benign designs of American empire, even if the foot is smaller and the stomp is more of a grind.

Uncle Sam's Outposts

The opening words of a US Army War College study bluntly declare:

“US national security strategy requires access to overseas military bases.”

The policy underlying this deeply held belief is known as the “forward strategy.” These two words have had profound implications. Cold War policy held that the United States should maintain large concentrations of military forces and bases as close as possible to the Soviet Union, in order to hem in and “contain” supposed Soviet expansionism. Suddenly the security of the United States, in the minds of policymakers, lost much of its former inseparability from the concept of the territory of the United States.

By the beginning of the twenty-first century, the United States operated more than 900 military bases around the world, including 287 in Germany, 130 in Japan, 106 in South Korea, 89 in Italy, 57 in the British Isles, 21 in Portugal, and 19 in Turkey. The number also comprised additional bases or installations located in Aruba, Australia, Djibouti, Egypt, Israel, Singapore, Thailand, Kyrgyzstan, Kuwait, Qatar, Bahrain, the United Arab Emirates, Crete, Sicily, Iceland, Romania, Bulgaria, Honduras, Colombia, and Cuba (Guantánamo Bay), among many other locations in some 150 countries, along with those recently added in Iraq, Afghanistan, and Syria.

Even military resorts and recreation areas in places such as Tuscany and Seoul are bases of a kind; worldwide, the military runs more than 170 golf courses.

Americans may not know much about them but of course people living near US bases in countries worldwide pay them more attention. For many, US bases are one of the most prominent symbols of the United States, along with Hollywood movies, pop music, and fast food. Indeed, the prevalence of Burger Kings and Taco Bells on many of our bases abroad is telling: ours is a supersized collection of bases with franchises the world over. While there are no freestanding foreign bases on US soil, today there are around eight-hundred US bases in foreign countries, occupied by hundreds of thousands of US troops.

The presence of US bases can turn a country into a target for foreign powers or militants. On Guam, a dark Cold War joke said that Soviet nuclear missile targeters were just about the only people who could locate the island on a map; with a China-focused US military buildup under way, some are expressing similar concerns about Chinese missiles potentially targeting the island today.

While scholars generally identify Guantánamo Bay as the first US military base abroad, they strangely overlook bases created shortly after independence. Hundreds of frontier forts helped enable the westward expansion of the United States, and they were built on land that was very much abroad at the time. Fort Harmar, built in 1785 in the Northwest Territory, was the first. Others appeared in today's Ohio and Indiana, including Forts Deposit, Defiance, Hamilton, Wayne, Washington, and Knox. Each of these bases helped waves of US settlers move into the lands of Native American nations, pushing Indians progressively westward. By 1802, there was a chain of US forts from the Great Lakes to New Orleans

Fort Leavenworth, Kansas, was initially supposed to mark the “very western edge of civilization” and the “permanent Indian frontier.” However, by protecting the start of the Santa Fe and Oregon trails, it only furthered the westward migration of Euro-American settlers, miners, traders, and farmers. The Army soon became the “advance agent” and “pry bar” of US conquest.

The United States first took possession of Pearl Harbor in 1887, when officials coerced the indigenous monarchy into granting exclusive access to the protected bay. Half a century later, after the Japanese attack on Pearl Harbor, the US Navy seized Kahoolawe, the smallest of Hawaii's eight major islands, and ordered its inhabitants to leave. The Navy turned the island, which is home to some 544 archaeological sites and other sacred places for indigenous Hawaiians, into a weapons testing range. It wasn't until 2003 that the Navy finally returned the island—now environmentally devastated—to the state.

In 1903, US officials pressured Cuban leaders into accepting thinly disguised US rule in exchange for Cuba's official independence and the withdrawal of most (though not all) US troops. The US-penned Platt Amendment allowed the United States to invade Cuba at will to ensure stability and so-called independence, prevented Cuba from making treaties with other governments, and permitted the construction of US “coaling or naval stations.” The two governments also signed a lease giving the US military “complete jurisdiction and control” over forty-five square miles of Guantánamo Bay—an area bigger than Washington, D.C. Tellingly, the “lease” had no termination date, which effectively meant that Cuba had ceded the territory to its northern neighbor. In exchange, the United States agreed to build a fence, prevent commercial or industrial activities within the base, and pay a meager yearly fee of \$2,000.

Cuban leaders would eventually annul the Platt Amendment, but US officials insisted on a new treaty to hold on to Guantánamo Bay. The treaty continued the terms of the original lease and stipulated that Cuba could

never force the United States to leave. Renters everywhere only wish they had such eviction-proof leases.

In 1903, the same year US officials secured access to Guantánamo Bay, they did much the same in Panama. A treaty imposed on the newly independent country gave the United States what amounted to sovereign rights in perpetuity across 553 square miles that became the Panama Canal Zone. The treaty also authorized other extensive powers, including land expropriation outside the Canal Zone and the authority to build bases. Panama would eventually host fourteen. As in Cuba, Panama's constitution allowed the United States to intervene militarily, and between 1856 and 1989, the US military invaded twenty-four times. With prominent US bases occupying their land and enabling easy intervention, Panama and Cuba were effectively colonies.

The base nation as we know it was born on September 2, 1940. It is a vastly underappreciated moment, generally treated as a small detail in World War II history books. But it was then, with the flash of a pen, that President Franklin Delano Roosevelt began the transformation of the United States from one of the world's major powers into a global superpower of unparalleled military might. On that momentous day, more than a year before the United States entered the war, Roosevelt informed Congress that he was authorizing an agreement with Britain: the country would provide its nearly bankrupt ally with fifty World War I-era destroyers in exchange for US control over a collection of air and naval bases in Britain's colonies. Although such a pact should have required congressional approval, Roosevelt simply declared it done. Under what became known as the "destroyers-for-bases" agreement, the United States acquired ninety-nine-year leases and near-sovereign powers over bases in the Bahamas, Jamaica, St. Lucia, St. Thomas, Antigua, Aruba-Curaçao, Trinidad, and British Guiana, plus temporary access to bases in Bermuda and Newfoundland. Roosevelt called the agreement "the most important action in the reinforcement of our national security since the Louisiana Purchase." The leases' ninety-nine-year length reflected similarly grand ambitions: President Roosevelt intended to cement the global power of the United States for at least a century to come.

Once the United States entered World War II, the military worked to expand its base collection as quickly as possible. The government signed new deals to station US forces in location after location: new bases were built or occupied in Mexico, Brazil, Panama, Northern Ireland, Iceland, Danish Greenland, Australia, Haiti, Cuba, Kenya, Senegal, Dutch Suriname, British and French Guiana, the Portuguese Azores, the Galápagos Islands, Britain's Ascension Island in the South Atlantic, and Palmyra Island near Hawaii. By war's end, the military was building base facilities at an average

rate of 112 a month. In five years, it built the largest collection of bases in world history.

Shortly before the war's conclusion, President Harry Truman addressed the issue of post-war bases during the "Big Three" meeting in Potsdam, Germany. "Though the United States wants no profit or selfish advantage out of this war," Truman declared, "we are going to maintain the military bases necessary for the complete protection of our interests and of world peace." And, he added pointedly:

"Bases which our military experts deem to be essential for our protection we will acquire."

The military felt especially justified in retaining captured Pacific islands because of the high human and financial costs of their acquisition. Having defeated or subordinated its former imperial rivals in the Pacific the United States military was in no mood to hand back occupied real estate. Many in Congress agreed. No one, they felt, had the right to give away land which had been bought and paid for with American lives:

"We fought for them, we've got them, we should keep them. They are necessary to our safety. I see no other course."

The maintenance of such an extensive collection of military bases was also rooted in a widely held strategic belief that the security of the nation and the prevention of future wars depended on dominating the Pacific through a combination of naval forces and island strongholds. This imperial solution to American anxieties about strategic security in the post-war Pacific exhibited itself in a bureaucratic consensus about turning the Pacific Basin into an American lake.

The buildup of US troops around the world was the result of a profound change in how US leaders thought about the very idea of 'defense,' as well as a newly expansive concept of 'national security.' Even before the United States entered World War II, Roosevelt and other leaders had started developing a vision of the world as intrinsically threatening, in which any instability and danger, no matter how small or how far removed from the United States, was seen as a vital threat. "No attack is so unlikely or impossible that it may be ignored," argued Roosevelt in 1939. In a world of "permanent danger," the military thus needed to be a "permanently mobilized force" ready to confront threats wherever they might appear. "If the United States is to have any defense," Roosevelt and others believed, "it must have total defense."

Since World War II, the United States has been inexorably acquiring permanent military enclaves whose sole purpose appears to be the domination of one of the most strategically important areas of the world.

But, a base that's reassuring for one power can look like a threat to another.

Calling a base "temporary" often provides benefits, whether abroad or at home. For instance, it provides a rhetorical mechanism to circumvent the Honduras constitution's prohibition against the permanent stationing of foreign troops on Honduran soil. If there was any doubt about who really controls the base, a 2008 incident was revealing. At the time, Honduran president Manuel Zelaya proposed using Soto Cano's runway as part of a new international airport for joint civilian and military use. An embassy staffer in the Honduran capital told me that the US response was: No problem. But US officials added, "Oh, by the way, all the power, all the water, all the sewage, all the lighting, all the air traffic control stuff, the radar, is all controlled by the US, and our laws prohibit US military funds supporting private enterprises. So, if you want to open up an international airport"—by building replacement facilities from scratch, that is—"by all means, go for it." The Honduran project went nowhere.

Bases are frequently established on the political margins of national territory, on lands occupied by ethnic or cultural minorities or otherwise disadvantaged populations. While the military is generally driven by strategic considerations when deciding what regions should have bases, within a given region the selection of specific base locations is heavily influenced by the ease of land acquisition. The ease with which the military can acquire land tends to be strongly linked to the relative powerlessness of that land's inhabitants, which in turn is usually linked to factors such as their nationality, skin color, and population size. Across history displacements and demolitions are the norm.

In a way, the idea for acquiring Diego Garcia dates to the winter of 1922, when eight-year-old Stuart Barber found himself sick and confined to bed at his family's home in New Haven, Connecticut. Stu, as he was known, was always a solitary boy, and he sought solace in a cherished geography book. He was particularly fascinated by the world's remote islands, and he developed a passion for collecting the stamps of far-flung island colonies. While the British-controlled Falkland Islands off the coast of Argentina was his favorite, Barber noticed that the Indian Ocean off the east coast of Africa was also dotted with islands claimed by Britain.

Thirty-six years later, Barber would once again be consulting lists of small, isolated colonial islands from every map, atlas, and nautical chart he could find. The year was 1958. Thin and spectacled, Barber was a civilian

working in the Navy's long-range planning office.

At this time of decolonization and Cold War confrontation between East and West, Barber and other officials in the growing national security bureaucracy were concerned about what would happen as colonized nations gained their independence.

Post-war independence movements were vocally opposed to foreign military facilities, and US, British, and French bases were also increasingly criticized by the Soviet Union and the United Nations. US officials were particularly worried that losing overseas bases would diminish American influence in the so-called Third World, where they predicted future military conflicts would likely take place.

"Within the next 5 to 10 years," Barber wrote to the Navy brass, "virtually all of Africa, and certain Middle Eastern and Far Eastern territories presently under Western control will gain either complete independence or a high degree of autonomy," making them likely to "drift from Western influence." The inevitable result, Barber predicted, would be the withdrawal of US and allied European military forces and "the denial or restriction" of Western bases in these areas. The Cold War's "forward strategy" was premised on maintaining large numbers of bases and troops as close as possible to the Soviet Union, but Barber and others feared that the United States would soon face eviction orders across much of the globe.

Barber's solution to this perceived threat was what he called the "Strategic Island Concept." Island bases near hot spots in the "Third World," he said, would increase the nation's ability to rapidly deploy military force wherever and whenever officials desired. His plan was to avoid traditional base sites located in populous mainland areas, where bases were vulnerable to local opposition. Instead, he wrote, "only relatively small, lightly populated islands, separated from major population masses, could be safely held under full control of the West." With the decolonization process unfolding rapidly, Barber argued that if the United States wanted to protect its "future freedom of military action," government officials would have to act fast to "stockpile" basing rights, grabbing as many islands as possible as quickly as possible to retain territorial sovereignty in perpetuity. Just as a sensible investor would "stockpile any material commodity which foreseeably will become unavailable in the future," Barber said, the United States had to find small, little-noticed colonial islands around the world and either buy them outright or ensure that Western allies maintained sovereignty over them. Otherwise the islands could be lost to decolonization forever. Once officials secured the islands, the military could then prepare them for base construction whenever future needs required.

So if you ever find yourself in possession of a time machine, perhaps skip

the cliché of baby Hitler and go to 1922 and steal this little fucker's atlas. Or, you know, it is 1922, sick kids die all the time. . .

The Chagos Archipelago comprises more than sixty small coral islands isolated in the Indian Ocean halfway between Africa and Indonesia, a thousand miles south of the nearest continent, India. In the late 1950s, Navy officials began developing a plan to build a new US base on the British-controlled island of Diego Garcia, in the Chagos Archipelago. During talks with their British counterparts, Pentagon and State Department negotiators insisted that the Chagos islands come under their “exclusive control (without local inhabitants).” This tiny parenthetical phrase amounted to an expulsion order. Between 1968 and 1973, the United States and Britain, the latter the colonial administrator, forcibly removed the indigenous inhabitants of the islands, the Chagossians.

Once British officials had agreed and base construction appeared imminent, any Chagossians who left Chagos after 1967 for medical treatment or a routine vacation in Mauritius were barred from returning home. Agents for the steamship company that connected the islands told the travelers that their islands had been sold and that they could never return. The Chagossians were marooned in Mauritius, separated from many of their family members and almost all their possessions. British officials soon began restricting the flow of food and medical supplies to Chagos. As conditions deteriorated, more Chagossians began leaving the islands, hoping to return when the situation improved. Meanwhile, British and US officials designed a public relations plan aimed, as a British bureaucrat wrote, at “maintaining the fiction” that Chagossians were migrant laborers rather than a people whose roots on Chagos stretched back across many generations. One British official called them “Tarzans” and, in a similarly racist reference, “Man Fridays.”

With the help of US Navy Seabees, British agents began the deportation process by rounding up the islanders' pet dogs. They gassed and burned them in sealed cargo sheds as Chagossians watched in horror. Never Forget™? Then the authorities ordered the remaining Chagossians onto overcrowded cargo ships. During the deportations, which took place in stages until May 1973, most of the Chagossians slept in the ship's hold atop guano—bird shit. Horses stayed on deck. By the end of the five-day journey, vomit, urine, and excrement were everywhere. At least one woman miscarried. Some compare conditions to those on slave ships. Upon arrival in Mauritius and the Seychelles, most Chagossians were literally left on the docks. They were homeless, jobless, and had little money. Most were able to bring only a single box of belongings and a sleeping mat. In 1975, two years after the last removals, the *Washington Post* exposed the story for the first time in

the Western press. A reporter found the people living in “abject poverty,” victims of what the paper called an “act of mass kidnapping.”

The exiled Chagossians received no resettlement assistance. Decades after their expulsion, they generally remain the poorest of the poor in Mauritius and the Seychelles, struggling to survive in places that outsiders know as exotic tourist and honeymoon destinations. The US military, having claimed the Chagossians’ former home, has nicknamed Diego Garcia “the Footprint of Freedom.”

“We were living like animals. Land? We had none. Work? We had none. Our children weren’t going to school.”

The Chagossians had lost almost everything, for no reason other than the happenstance of living on an island desired by the US Navy.

The Chagossians are not the only indigenous people around the world that the US military has displaced. The military established a pattern during and after the Vietnam War of forcibly removing indigenous peoples from sites deemed strategic for the placement of military bases. The peoples of the Bikini Atoll in the South Pacific and Puerto Rico’s Vieques Island are perhaps the best-known examples, but there were also the Inughuit of Thule, Greenland, and the thousands of Okinawans and Indigenous peoples of Micronesia.

During the harsh deportation of the Micronesians in the 1970s, the press took some notice. In response to one reporter’s question, Secretary of State Henry Kissinger said of the Micronesians:

“There are only ninety-thousand people out there. Who gives a damn?”

This is a statement of permissive genocide. Now usually we don’t condone punching the elderly in the face, but Henry’s probably a good exception. Do it for the . . . well hell, how to choose, Henry’s got quite a bit of blood on his wrinkled old claws don’t he? Or is he dead now? Maybe the Wuhan Flu got him? That’d be nice.

Indigenous territories in New Mexico bristle with nuclear weapons storage, and Shoshone and Paiute territories in Nevada are scarred by decades of aboveground and underground nuclear weapons testing. The Navajo Nation and some New Mexico Pueblos have experienced decades of uranium strip mining, the pollution of water, and subsequent deadly health effects. The impact of the military on the world and on Native America is pervasive.

The displacement of Chagossians, Marshallese islanders, and other groups demonstrates the vulnerability of small, isolated populations whose forcible

relocation US officials have so often treated as a matter of negligible concern. The story of another group of islands underscores the decisive role that ideas about race have played in such decisions.

Before World War II, Japan's Bonin-Volcano (also known as Ogasawara) islands, which include Iwo Jima, had a population of roughly seven-thousand. The islanders were the descendants of nineteenth-century settlers, most of whom had come from Japan but also from the United States and Europe. In 1944, Japanese officials evacuated all the Bonin-Volcano islanders to Japan's main islands to protect them from impending US attack. After the US capture of the Bonin-Volcanos, American officials prohibited the locals from returning in order to give the military unhindered use of the islands.

In 1946, however, officials modified the decision: they would "permit the return of those residents of Caucasian extraction who had been forcibly removed to Japan during the war and who had petitioned the United States to return." US authorities subsequently assisted with the repatriation of approximately 130 Euro-American men and their families to the Bonin-Volcano islands. The Navy helped them establish self-government, allowed children to attend a Navy school, and created a cooperative trading company to market agricultural products on Guam and a Bonin-Volcano Trust Fund to provide financial support. The only differences between this community and the Chagossians were the color of their skin and their ties to the United States.

At the urging of the military after the war, the government maintained its control over possessions once called colonies, including Guam, American Samoa, the Northern Mariana Islands, Puerto Rico, and the US Virgin Islands, as "territories" of the United States. These islands have neither full independence nor the full democratic rights that would come with incorporation into the United States. They highlight how, even in the twenty-first century, our base nation still relies on the perpetuation of colonial relationships, albeit under new guises and with new vocabulary. From the military's perspective, Guam and the other territories offer unmatched autonomy.

"This is not Okinawa. This is American soil in the midst of the Pacific. Guam is a US territory. We can do what we want here, and make huge investments without fear of being thrown out."

Guam has the paradoxical nature of being considered a tiny, insignificant footnote to the United States while sitting at the center of American power.

After World War II, Chamorros on Guam expected their bravery and loyalty during the war at least to be rewarded with citizenship and self-

rule. The Navy thought otherwise. Adding insult to an array of injuries, it reestablished military rule, and Chamorros had to struggle for years to win US citizenship. Only when State Department officials grew concerned that the policy was creating “an island of anti-American radicals,” and there were widespread acts of civil disobedience and threats of a general strike, did the Truman administration authorize the control over Guam to be transferred from the Navy to the Department of the Interior. In 1950, Guam became an “unincorporated territory,” giving the island limited rights to self-governance. The US Congress maintained ultimate control. To this day, Guam remains one of just seventeen non-self-governing territories in the world, as tracked by the UN. Others on the list include American Samoa and the US Virgin Islands, along with territories like French Polynesia and Gibraltar. In the words of the Department of the Interior, Guam became an “area in which the United States Congress has determined that only selected parts of the United States Constitution apply.”

Despite Guam's marginalization, the military enjoys almost unparalleled support on the island. Enlistment rates on Guam generally top those of nearly every US state and territory. This is in no small part because Guam's unemployment and poverty rates tend to top the nation's as well. At \$39,000 a year, median household income is less than three quarters of the US average. Nearly everyone on the island has a family member or close friend connected to the military in some way, whether as a member of the military, a veteran, or an employee on base or in a base-dependent industry.

In 2006, Pentagon officials announced a major multibillion-dollar buildup of new base infrastructure on Guam. The buildup would accommodate up to nine-thousand marines and tens of thousands of family members and civilians moving from Okinawa in the face of continued protests against the US base presence. Around the same time, the Air Force announced plans to increase its presence on the island by naming it one of four major global hubs for its strike forces, which it called “Guam Strike.”

Meanwhile, the Navy made plans to expand Apra Harbor's ability to host nuclear aircraft carriers and submarines; the Army National Guard planned new construction to accommodate its planned force expansion; and the Pentagon selected Guam as a key site for its ballistic missile defense system. The island thus became the centerpiece of the most significant transformation in the structure of US forces in Asia since at least the departure from the Philippines and perhaps since the end of the war in Vietnam.

Planners anticipated nearly eighty-thousand people, including almost twenty-thousand construction workers, moving to Guam in a four-year period. Since Guam's entire population is only around 160,000, that would mean an almost 50 percent population increase.

Given the island's high poverty and unemployment rates, there is little surprise that many on Guam expressed enthusiasm about the economic benefits anticipated from the buildup. Military representatives promised tens of millions of dollars in additional tax revenues, government aid, and infrastructure investments. For a time, at least, a gold rush atmosphere prevailed. Email solicitations with subject lines like "Opportunity of a Lifetime!" proclaimed, "The tiny little island of Guam is about to become a great big deal! There's Work to be Done and Money to be Made!"

The Guam Chamber of Commerce, among others, trumpeted both the economic benefits of the buildup and the security rationale for the move. To provide evidence of the need for the buildup, a 2011 Chamber report outlined a long list of threats ranging from North Korean missiles and China's cyberwar capabilities to violent extremism, transnational criminal organizations, pandemics, and natural disasters. In the face of these dangers, the business organization wrote, Guam offers "permanent sovereign facilities" to demonstrate US "strength, presence, [and] engagement" in Asia, thus helping to "avoid confrontation and conflict" by deterring potential adversaries.

Given such high levels of support for the military on Guam, many were surprised when growing numbers of people started expressing concerns about the buildup.

Along with established activists, some of the most prominent voices of opposition came from young people, mostly in their twenties. They formed a group called We Are Guåhan, after the Chamorro name for the island, to monitor the buildup. As the group and others scrutinized the plan, their work seemed to reveal just how much the military takes for granted the kind of nearly unchecked power it has enjoyed on the island since Guam became a US colony in 1898. We Are Guåhan and others pointed out the dangers of the planned population boom on an island with an already strained infrastructure. Guam's public school system was expected to have its student population grow by up to 26 percent. Demand for the island's sole public hospital was expected to increase by 20 percent.

The military's own assessment predicted that at its height the buildup would strain and exceed the island's wastewater treatment capacities. Given what the military called "the current poor state of the utilities infrastructure on Guam," civilians would also face a shortage of millions of gallons of drinking water per day, requiring the military to share some of its surplus. Opponents noted that while the military hadn't budgeted to expand Guam's civilian facilities, the buildup plan included money to build new military schools, a new military hospital, and other base infrastructure.

The military's offer to share water to meet civilian needs only underlined

the island's inequalities and many locals' feelings of being second-class citizens.

When the Environmental Protection Agency (EPA) looked at the buildup plan, it had many of the same concerns. In a scathing report, the agency found the buildup would likely damage "Guam's existing substandard drinking water and wastewater infrastructure, which may result in significant adverse public health impacts." Dredging to expand Apra Harbor would cause "unacceptable impacts" to seventy-one acres of coral reef. The EPA deemed the buildup plan "environmentally unsatisfactory," saying it "should not proceed as proposed."

Many Chamorro activists were particularly upset that the Marines wanted to acquire 1,800 additional acres of Guam's land to build a gun range on the remains of Pãgat, a sacred indigenous village and burial ground dating to at least 900. We Are Guåhan spokesperson Cara Flores-Mays compared the Marines' plan for Pãgat to putting a firing range on Arlington Cemetery:

"You would never think to do that. We have a lot of responsibility for our ancestors and those who came before us, and so you can understand why some people would get angry."

While the military's brazenly poor planning of the buildup is far from unique to Guam, the carelessness also reflects something larger than decades of Pentagon profligacy. The major elements of the buildup that generated so much opposition—the idea of building a shooting range on sacred indigenous land without even considering an alternative; seizing 1,700 acres of additional private land; planning to increase Guam's population by 50 percent without the civilian infrastructure to handle the growth; embarking on a major buildup without a master plan—all come back to the same root cause: for more than a century, 'we can do what we want here' has been the military's core attitude toward Guam.

The military has frequently adopted a 'we can do what we want here' attitude in Guam, Diego Garcia, Okinawa, Puerto Rico, the Philippines, Panama, Greenland, and well beyond. The attitude shows us how the base nation has relied on continuing colonial relationships in the twentieth and twenty-first centuries, albeit under new guises and with new terminology. After all, in the post-World War II age of decolonization, with rare exceptions, maintaining large colonies became impossible. But as the Strategic Island Concept shows, the government and a few of its European allies found ways to maintain a handful of small, mostly island, colonies largely because of their strategic value as base sites. From the military's perspective, ongoing colonial relationships have allowed officials to "do what we want" without

many of the restrictions faced in the fifty states or in fully independent nations. From the perspective of the Chamorros on Guam and others trapped in similar colonial relationships today, the military's attachment to overseas bases means that they still lack the basic democratic rights and freedoms taken for granted by most of their fellow citizens.

This 'I'm king' attitude implies a hierarchy, of the kind that is fundamental to military training. Researchers have shown that one of the most difficult challenges militaries face is that of teaching human beings to kill other human beings, and that doing so requires dehumanizing others by promoting the belief that another human is somehow a "lesser" creature. One of the central forms of dehumanization promoted by military training and the culture of daily life in the military has been the supposed inferiority of women—that women are less than men. Institutionalized military prostitution provides one important source for this dehumanization of women and the militarized masculinity that helps perpetuate it. In places where there is an ethnic difference between GIs and sex workers, military prostitution can also reinforce societal beliefs about supposed racial and ethnic superiority, and the naturalness of some people serving and others being served.

A large-scale study of US bases created since 1898 confirms that autocratic states have been consistently attractive to US officials as base hosts. Due to the unpredictability of elections on the other hand, democratic states prove less attractive in terms of sustainability and duration. In some cases, US officials have reacted to this unpredictability by intervening in ostensibly democratic processes to produce outcomes to their liking and ensure ongoing base access. In the lead-up to Italy's crucial 1948 national elections, for instance, the CIA, the State Department, and other agencies of the US government used propaganda, smear campaigns, threats to withdraw aid, and the appearance of warships off Italy's coasts, among other tactics, to help the Christian Democracy party defeat Italy's favored communist and socialist parties. The Christian Democrats, who maintained a client relationship with the US government and provided widespread base access, then dominated Italian politics for the next five decades. Their rule ended only when a massive 1994 corruption scandal reshuffled all of Italian politics.

The US government also provided similar covert and overt support in the aftermath of World War II for the right-wing Liberal Democratic Party in Japan and for dictatorial governments in South Korea. This support ensured that of the four countries worldwide hosting the largest number of US bases, three saw virtually unbroken one-party rule for half a century or more. The other, Germany, had twenty years of one-party rule after the war.

The US basing presence may have diminished these host countries' overall

national sovereignty, but it also afforded their rulers significant private political benefits. The result has been a pattern of US support for violence and repression. Not surprisingly, this can also be a self-reinforcing cycle. As the protests at Soto Cano suggest, supporting repressive regimes builds resentment and opposition to the United States—which makes the eviction of US bases all the more likely when countries do transition to democratic rule. Knowing this, the US military has even more incentive to prevent that transition from taking place.

You know nothing good is coming when a Navy lawyer responds to a question about the destructive impacts of bombing practice with:

“It depends what you mean by ‘destroy.’”

It was 2011, and the Navy was holding a public meeting on Saipan, the largest of the Northern Mariana Islands, some 130 miles north of Guam. The meeting was part of an environmental impact statement process for proposed military training and testing around Guam and the Northern Marianas. Many locals were especially concerned about the bombing of Farallon de Medinilla, known as FDM, a two-hundred-acre uninhabited island in the Northern Marianas that is home to numerous species of migratory birds. When the Northern Marianas negotiated with the US government in the 1970s to end its UN trust territory status and become a US commonwealth (like Puerto Rico), part of the deal involved giving the military full use of FDM and two thirds of the island of Tinian. Much like at Puerto Rico's Vieques, the military then used FDM for years as a live-fire range to test two-thousand-pound bombs, precision-guided munitions, and various other large guns, cannons, mines, and missiles. In 2002, several environmental groups successfully sued to stop the bombing, but the Pentagon found exemptions to environmental regulations and was allowed to resume testing.

At the meeting on Saipan, a Navy video was playing in a loop behind the environmental lawyer for the Navy's Pacific Fleet. “For decades the Mariana Islands have provided a safe training and testing environment for the military,” a woman's voice intoned, as images of exotic birds, whales, coral reefs, and the Marianas' beaches alternated with photos of ships, submarines, fighter jets, troops, and weapons.

A sailor in uniform told the camera:

“If we can't train, then we would not be prepared for the real scenario.”

The narrator continued:

“The military is committed to protecting the islands’ natural and cultural resources and heritage and strives to minimize the effects of its training and testing activities on the environment.”

People inside and outside the military often laud the environmental record of the Pentagon and the armed services. Many point to the protection some large military bases and training ranges provide for wilderness areas and wildlife. With control over tens of millions of acres of land, bases indeed do in some cases (primarily in the contiguous United States) shield the nonhuman environment from the expansion of cities, suburbs, highways, and parking lots.

Since the George H. W. Bush administration, the Pentagon has also made progress in “greening” itself at home and abroad to lessen the military’s environmental footprint. In 1989, Secretary of Defense and future Vice President Dick Cheney noted the poor environmental conditions on bases and initiated a “Defense and the Environment” initiative to make the Pentagon “the federal leader in agency environmental compliance and protection.” By 1995, the Pentagon reported reducing energy usage on bases by an average of 14 percent and fuel usage by 20 percent over levels a decade earlier. In 1998, the Environmental Protection Agency gave the Pentagon an award for reducing its pesticide use by 50 percent; two years later, it credited the military with “significant decreases” in greenhouse gas emissions. In 1999, the military reported reducing toxic chemical disposal by 77 percent in five years. During the George W. Bush administration, the Pentagon reported reducing hazardous waste disposal by 68 percent since 1992 and diverting 41 percent of its solid waste to recycling.

While the downsizing of the military by almost one third during the 1990s contributed to these reductions, the Pentagon has shown an unusually high level of environmental awareness compared to most of the US government. Years ago, for example, long before many in the civilian world, the Pentagon identified global warming and climate change as serious threats to national security. The military has made investments in solar power and other alternative energy sources for everything from its bases to the Pentagon itself. According to the Army, the new US base in Vicenza, Italy, was the first base in the world to receive LEED Green Building certification. The armed services hold Earth Day events, the Pentagon mentors other federal agencies in environmental management, and even Guantánamo Bay has three wind turbines to produce clean energy.

Regardless of the progress the US military has made in improving its practices, there is no underestimating the profound environmental damage caused by most military bases and the significant risks they pose to humans

and the rest of the natural environment. By definition, most bases store large quantities of weapons, explosives, and other inherently dangerous tools of war; nearly all of them contain toxic chemicals and other hazardous waste. Pollution, contamination, and other forms of environmental harm are found at nearly every base. Any town, city, or other large concentration of people causes some degree of environmental harm, but bases magnify those effects, both inadvertently—through toxic leaks, accidental ordnance detonation, and other dangerous accidents—and through the intentional discharge of weapons and other environment damage caused during training. Bases storing nuclear weapons are especially dangerous.

Even the greenest military installation has a carbon footprint vastly disproportionate to the number of people living and working on base. Bases are, after all, usually home to large concentrations of extraordinarily fuel-inefficient trucks, tanks, aircraft, and naval vessels. All of these require massive supplies of fuel, oil, lubricants, and other petroleum products for frequent training and exercises, not to mention wartime activities. The military also uses huge amounts of energy to cool, heat, and power its bases' tens of thousands of buildings and structures. The military's thirst for petroleum is so great that on a worldwide basis, the US armed services consume more oil every day than the entire country of Sweden. This means that with the exception of a handful of countries, the US military probably produces more greenhouse gas emissions and other forms of pollution than almost any other organization, corporation, or entity on earth.

Before the introduction of national environmental legislation, the environmental damage caused by military bases was even worse than it is today. At home and abroad, bases regularly dumped toxic substances into rivers and streams, including asbestos, leaded paint, and other hazardous materials. Bases habitually oiled down dirt roads to contain dust. Some dumped hazardous waste at sea, including materials associated with nuclear, biological, and chemical weapons. An Army spokesperson admitted that in waters off eleven states around the country, the Army "secretly dumped 64 million pounds of nerve and mustard gas agent in the sea, along with 400,000 chemical-filled bombs, landmines, and rockets, and more than 500 tons of radioactive waste either tossed overboard or packed into the holds of scuttled vessels." By 2000, the military estimated that its bases in the United States alone contained 28,538 toxic waste sites, with nearly twenty-seven-million acres of contaminated property. The estimated cleanup costs are nearly \$50 billion.

The military offered no count of toxic sites abroad, but there is little reason to believe its record there is any better. In fact, it's likely that the situation overseas is considerably worse. After all, as we have seen, in

the minds of many military leaders, one of the advantages to having bases abroad is the freedom they offer—and part of that freedom is in not being constrained by environmental regulations. Some countries, such as Germany, have strict environmental protection laws and “status of forces” agreements requiring high levels of environmental compliance for US bases. But in most other host nations, environmental protection in local laws and status of forces agreements is often weak or nonexistent. In many cases, the military does not have to meet standards that would be required under US law. This is also sometimes true at domestic bases, as when courts have granted the Pentagon waivers from US environmental laws.

Foreign soil or not, places like Ramstein tend to resemble insulated, self-contained small American towns that allow their inhabitants to hardly ever leave the base. These Little Americas have become both a symbol of American life and an exaggerated version of it. In many ways they resemble gated communities, with sprawling grounds, shopping malls, fast food, golf, and a car-based lifestyle. Service members get their cars shipped overseas free of charge, and gasoline is heavily subsidized. These simulacrum of suburbia subtly and not so subtly shape life around them, presenting the host nation with their particular vision of American culture and transforming local economies to reflect the consumption habits of US troops. Even in Afghanistan and, previously, in Iraq, the biggest bases have been Little Americas, absent family members but complete with tens of thousands of troops, fast-food outlets, sports facilities, swimming pools, and shopping.

“It’s the purest application of socialism there is. It’s a really fair system, and a lot of thought has been put into it, and people respond to it really well.”

On many bases, a lower class of segregated housing exists for people termed “third country nationals.” These are the citizens of countries other than United States and the host nation of the base, who frequently cook, clean, and keep the physical infrastructure of bases running every day. Most often, they are Filipinos. At Gitmo, the Filipinos live in dormitories that usually have four bunk beds to a room; Jamaicans have slightly better housing, formerly occupied by US troops. At bases in Afghanistan and Iraq, many of the contractors have been from Nepal, Bangladesh, and as far away as Fiji. They are the Pentagon’s invisible army, the more than seventy-thousand cooks, cleaners, construction workers, fast-food clerks, electricians, and beauticians from the world’s poorest countries who service US military logistics. Filipinos launder soldiers’ uniforms, Kenyans truck frozen steaks and inflatable tents, Bosnians repair electrical grids, and Indians provide

iced mocha lattes. While the nationalities of the people who make up this invisible army tend to change from country to country—aside from the widespread presence of Filipinos—the amenities and services they provide and the facilities they maintain are remarkably similar at most bases. The comforts provided for the benefit of families help ensure that bases look and function like small American towns, making the adjustment to life overseas and from base to base as easy as possible.

A 2013 study of overseas bases showed that “despite substantial host-nation financial and in-kind support, stationing forces and maintaining bases overseas produces higher direct financial costs than basing forces in the United States.” In Europe, for example, the Air Force’s estimated average annual cost just for running a base (before adding the costs of having any personnel there) is more than \$200 million. That’s more than double the costs of an Air Force base in the United States. When it comes to personnel, the Air Force’s cost per person on an overseas base is almost \$40,000 per year more, on average, than on a domestic base. The Navy’s annual cost per person in Europe is almost \$30,000 more than domestically, while in Japan, the Army pays on average nearly \$25,000 more per person every year than at home. Even in the least expensive case, that of the Marines in Japan, it costs \$10,000 to \$15,000 more per year for every marine stationed there compared to locations in the continental United States. For eleven-thousand marines, that adds up to an extra \$110 million to \$165 million that we are spending every year to keep marine forces in Japan rather than in America. When one considers all the deployments globally, the numbers are staggering.

Another way to get a sense for the magnitude of the costs is this: because of the hundreds of bases overseas, the US military is probably the world’s largest international moving company. Why? Because when stationed abroad for any period other than a temporary assignment, every member of the military generally has the right to ship his or her entire household and a personal vehicle to and from an overseas station. With tours generally lasting between one and three years, about one third of the military moves in any given year. Among other things, this means the military is shipping tens of thousands of privately owned vehicles to and from bases overseas every year. Based on recent contracts, this is costing around \$200 million every year. And that’s in addition to shipping every last piece of furniture, every book, every television, every kitchen pot and pan, every fork and spoon, every bicycle and children’s toy, and every other item in a uniformed service member’s household, up to a weight limit of 5,000 to 18,000 pounds (depending on rank and on whether one has family members). Which is in addition to the long-term storage of household goods for troops overseas, for which the military also pays. Which is in addition to miscellaneous expenses

such as pet quarantine fees—which the military will also cover, up to \$550 per move. Overall, the total annual moving costs alone easily stretch into the hundreds of millions of dollars.

By law, the Pentagon must tell Congress what it spends on all the military's activities at bases, embassies, and other facilities abroad in an annual report called the "Overseas Cost Summary" (OCS). This means calculating all the costs of building, running, and maintaining every last base site, garrison, airfield, port, warehouse, ammunition dump, radar station, and drone base, plus the costs of paying for and maintaining every US service member and family member abroad, including all their salaries, housing, schools, teachers, hospitals, moving costs, lawn mowing, utilities, and much, much more. For the 2012 fiscal year, the Overseas Cost Summary put the total at \$22.7 billion. That's a considerable sum, roughly equal to the entire budget of the Department of Justice or the Department of Agriculture. It's also about half the entire 2012 budget of the Department of State—significant portions of which actually go to arms sales, foreign military training, and other military (rather than diplomatic) purposes overseas. At the same time, however, the Pentagon's official figure contrasts sharply with the only other recent estimate available. In 2009, an economist estimated total spending on bases and troops abroad at \$250 billion—a more than tenfold difference. Part of the discrepancy stems from including war spending in the total, whereas at Congress's direction, the OCS doesn't include the billions spent on the wars in Iraq, Afghanistan, and elsewhere around the globe. But even without war spending, the figure comes to around \$140 billion—still almost \$120 billion more than the Pentagon suggests.

Military spending creates fewer jobs per billion dollars expended than the same billion dollars invested in education, health care, or energy efficiency—less than half as many jobs as investing in schools, for example. In 1953, President Dwight Eisenhower famously said:

“Every gun that is made, every warship launched, every rocket fired signifies, in the final sense, a theft from those who hunger and are not fed, those who are cold and are not clothed. This world in arms is not spending money alone. It is spending the sweat of its laborers, the genius of its scientists, the hopes of its children. The cost of one modern heavy bomber is this: A modern brick school in more than 30 cities. It is two electric power plants, each serving a town of 60,000 population. It is two fine, fully equipped hospitals. It is some 50 miles of concrete highway. We pay for a single fighter with a half-million bushels of wheat. We pay for a single destroyer with new homes that

could have housed more than 8,000 people.”

So, too, every base that is built, maintained, and manned overseas signifies a theft from society. Today, Eisenhower might say the cost of one modern base is this: A college scholarship for a year for 63,000 students. It is 295,000 households with renewable solar energy for one year. It is 260,000 low-income children getting health care for one year. It is 63,000 children getting a year of Head Start. It is 64,000 veterans receiving health care for a year.

Proponents of outsourcing the work of building, running, and supplying bases overseas argue that contractors save the government money, and that they allow the military to focus on its combat duties. But research suggests that this is often not the case. On base and off, contractors tend to provide services at higher costs than the military itself. Around the globe, military bases have become an important source of corporate profit making, diverting hundreds of billions of federal dollars from domestic needs.

Once upon a time, the military, not contractors, built and ran US bases. Soldiers, sailors, marines, airmen, and airwomen built the barracks, cleaned the clothes, and peeled the potatoes. But this started changing during the Vietnam War, when Brown & Root began building major military installations in South Vietnam as part of a contractor consortium. Brown & Root enjoyed deep ties with President Lyndon Johnson dating back to the 1930s, leading to well-founded suspicions that Johnson personally steered contracts to the company.

During the first Gulf War in 1991, one out of every hundred deployed personnel was a contractor. Later in the 1990s, during military operations in Somalia, Rwanda, Haiti, Saudi Arabia, Kuwait, and especially the Balkans, Brown & Root received more than \$2 billion in base support and logistics contracts, covering construction and maintenance, food services, waste removal, water production, transportation services, and much more. In the Balkans alone, Brown & Root built thirty-four bases. The largest, Camp Bondsteel in Kosovo, covered 955 acres and included two gyms, two movie theaters, extensive dining and entertainment facilities, coffee bars, and a PX for shopping. Speaking of off-duty soldiers, a US Army representative told USA Today:

“We need to get these guys pumping iron and licking ice cream cones, whatever they want to do.”

By contrast, military personnel from other NATO countries lived in existing apartments and factories.

Most of KBR's contracts to support bases and troops overseas have come under the multibillion-dollar Logistics Civilian Augmentation Program, known as LOGCAP.

In 2001, KBR won a one-year LOGCAP contract to provide an undefined quantity and an undefined value of "selected services in wartime." Thanks to a series of one-year contract extensions, the company then enjoyed nearly eight years of work without facing a competitor's bid. Overall, between 2001 and 2010, the number of Pentagon contracts issued without competitive bidding nearly tripled. "It's like a gigantic monopoly," a representative from Taxpayers for Common Sense said of LOGCAP.

The work KBR performed under LOGCAP also reflected the Pentagon's frequent use of "cost-plus" contracts. These reimburse a company for its expenses and then add a percentage of the costs on top of that as the company's fee. In other words, as the Congressional Research Service explains, "increased costs mean increased fees to the contractor," and therefore there is "no incentive for the contractor to limit the government's costs." As one Halliburton official bluntly told a congressional committee, the company's unofficial mantra in Iraq became:

"Don't worry about price. It's 'cost-plus.'"

Military facilities small and large alike all too often harm local communities in ways that locals do not easily forget.

A US military court once acquitted a sergeant who shot and killed a fifty-five-year-old Okinawan woman after he claimed he mistook her for a wild boar.

In Ansbach, residents say some of their discomfort comes not so much from the noise itself as from what it represents. The whoomp-whoomp of the whirling blades symbolizes the wars that those helicopters have helped wage, and hosting the helicopters in their city makes the locals feel complicit. For some, there is a painful irony in the garrison's motto, "We are all part of the fight."

The nature of the US presence in Vicenza has changed since the Cold War. In those days the Italian bases were strategically positioned to defend against 'Russian invaders,' but now it is an operative site. People from there—they don't stay there. They go to war and come back. They bring their damages back. They rest. They go to war again.

"Now we're talking about combat units being here. It's a bit different."

Russell Madden was a member of the 173rd Airborne brigade that's split between Vicenza and Germany. Madden died in Afghanistan on June 23, 2010, from blast injuries sustained when a rocket-propelled grenade tore through his vehicle. He grew up in Bellevue, Kentucky, a town of six-thousand, where he was a high school football star. At twenty-nine, he enlisted in the Army because he needed health insurance to cover treatment for his four-year-old son's cystic fibrosis. "He joined because he knew that Parker would be taken care of no matter what," Madden's sister said. His mother, Peggy Madden Davitt said that Russell had signed up for the Army soon after his son was turned away by the Mayo Clinic, where the family had hoped to get treatment. "No one will ever send my son away again," she remembers Russell saying.

After Russell's death, Peggy received a standard condolence letter from President Obama. "I am deeply saddened to learn of the loss of your son," the letter said. "Our Nation will not forget his sacrifice, and we can never repay our debt to your family." Turning over the presidential stationery, Peggy addressed a response to President Obama:

"If my son had found a decent employer and sufficient health insurance in this great land of ours my son would not have had to sacrifice his life for his son."

Peggy sent the letter back to the White House. She did not receive a reply. Russell Madden's story is a reminder of the life-and-death significance of the choices connected to our base nation. Unlike virtually all of the wealthy industrialized countries in which the United States maintains bases—Germany, Japan, South Korea, Britain, Spain, Italy, Portugal, Norway, and Belgium among them—the United States does not guarantee health care for all its citizens. The idea of doing so is often dismissed as too expensive. Meanwhile, the nation spends immense sums every year supporting a global base infrastructure largely born of a world war and a cold war that ended decades ago.

Health care, of course, is not the only area in which we have made a questionable trade-off. Consider the impressive public transportation systems found in some of the countries hosting our bases, such as Germany, Japan, and South Korea. Even in Italy, where many often criticize the train system and the public sector, the speed and efficiency of public transportation options are far superior to those in the United States. While countries such as Germany, Japan, South Korea, and Italy have spent large amounts supporting US bases on their soil, their military spending has been accompanied by impressive investments to improve their citizens' lives.

Meanwhile, US investments in bases have come at the cost of decades of neglecting transportation, health, education, housing, infrastructure, and other human necessities. Think about what just half of the \$70 billion or more going into the base world every year could do to improve lives.

When troops deploy for a humanitarian activity such as providing dental care or vaccinations, its primary purpose is not to treat poor people. It's not to train host nation medical people. It's not to train host nation military people. The primary purpose is for US personnel to practice, to get training in preparing for deployment. Pentagon budget documents explain that humanitarian operations help "maintain a robust overseas presence" and provide "access to regions important to US interests." Of course diplomacy goes on so Hondurans don't think you're coming to take advantage of them. You need to show them your people are going to get benefits. Your doctors are going to get benefits. Your local politicians are going to get benefits in the form of donated equipment or construction. But from the viewpoint of the US military, much of what troops need to do with their time is deploy to conduct training in realistic scenarios. That's why the US has been so good at wars. To be able to do it, you've got to practice it. And a place like Honduras provides a good place to practice. So you take units from the States you deploy, build something—whether a military facility or a school—and when you leave it behind, it's a sign of goodwill on our part. But again, you don't advertise the first part to the host nation. You say the primary purpose is to work together.

This included seventeen one-hundred-bed "Ebola treatment units" and a field hospital in Monrovia, Liberia, and an "intermediate staging base" in Dakar, Senegal. While many portrayed the military's reaction to Ebola as pure altruism, months before the Ebola deployment, the Pentagon already had plans to build three to five new bases on the continent as well as an intermediate staging base in West Africa—that is, like the one constructed in Dakar, Senegal.

The US has deployed around two dozen military advisers directly into Somalia to lead efforts to defeat the country's al-Qaeda-linked group, al-Shabab. The military has pursued a covert war in the country and launched raids to capture and extradite at least two al-Shabab fighters to the United States. The CIA has secretly had a permanent presence for several years. For operations in Somalia and Yemen, the military has also positioned an "afloat forward staging base" in the Indian Ocean off the coast of Djibouti and used nearby navy vessels to shell Somalia. There are likely several hundred special operations troops involved in undisclosed wars and conflicts throughout North Africa's Sahel-Sahara region. It may be reasonably assumed, that much more is happening than has yet been disclosed and

there will be more to come.

Forget full-scale invasions and large-footprint occupations on the Eurasian mainland, America has a new way of war. Instead, think special operations forces working on their own but also training or fighting beside allied militaries (if not outright proxy armies), the militarization of spying and intelligence, the use of drone aircraft, the launching of cyber-attacks, and joint Pentagon operations with increasingly militarized “civilian” government agencies. We can add to this list nominally humanitarian missions that clearly serve military intelligence, patrol, and “hearts and minds” functions; the rotating deployment of US forces around the globe coupled with port visits and other long-standing “showing the flag” demonstrations of US military might; expansion of joint military exercises; the growing use of military contractors; and regular training provided by permanently deployed special operations forces, who give the military *de facto* presence worldwide. Plus lots and lots of lily pads.

In the wake of September 11, 2001, many military strategists have come to believe the neoconservative mantra that “the whole world is a battlefield.” They anticipate a future of endless small-scale interventions in which a large, geographically dispersed collection of bases will always be primed for instant operational access. Pentagon officials dream of nearly limitless flexibility, the ability to react with remarkable rapidity to developments anywhere on earth, and thus something approaching complete military control over the entire planet.

Cyber weapons are now being added to this list of tools of control. Unfortunately, once a cyber weapon is released into the wild, it does not die, degrade, break. It can be repurposed. Unlike conventional bombs, which explode into a million parts when dropped on their targets, weaponized malware can be used over and over again. Though military and intelligence officials may spend millions of dollars secretly developing a particular weapon, computer code is easy to copy. Once released, it becomes available to hacktivists, crime groups, and terrorists to exploit for their own purposes, enabling new forms of cyber-weapons proliferation.

The training of Latin American military leaders at the infamous School of the Americas secured their collusion in US military and geopolitical strategy to a considerable degree. By building relationships with military leaders and exposing them to US doctrine and US power, the school bound them closer to the United States, opened them to greater manipulation and preempted military assistance from other states that might challenge US dominance. Relationships built around lily pads and other military activities do much the same, offering possibilities to sway foreign governmental decisions on matters far beyond things military alone. Much like the patrol bases that

helped “open” China to trade in the nineteenth century, lily pads can thus help advance US business interests. They provide privileged US access to overseas markets, resources, and investment opportunities. They create stability for the regular working of capitalism. And they solidify political alliances. A lily pad has an influence by virtue of its presence—a political impact. Through these intertwined and growing political, economic, and military ties, the US military ultimately helps to deepen the dependence of countries such as Honduras on the United States.

The US military now stands ready to flood the most obscure areas of the earth with troops at a moment’s notice. Visit lily pad bases and other obscure and remote locations around the globe and you’ll likely hear a consistent refrain:

“Welcome to Injun Country.”

These words, and the frequent descriptions of lily pads as “frontier forts” hosting a “global cavalry,” are deeply troubling—for their racial overtones, for their invocation of a Manifest Destiny-like “civilizing” mission, and for the suggestion of ever-expanding military operations. One doesn’t go to “Injun Country” just for the scenery. One goes looking for Injuns.

On Independence Day in 1821, John Quincy Adams, then the secretary of state, warned of the dangers of looking for enemies abroad. America, he said, “goes not abroad in search of monsters to destroy.” If it were to do so, Adams cautioned, the country “would involve herself, beyond the power of extrication, in all the wars of interest and intrigue, of individual avarice, envy, and ambition, which assume the colors and usurp the standard of freedom.” For Adams, this did not mean neglecting other nations and the causes of freedom and independence. Rather, he said, America should support those causes, but through “the countenance of her voice, and the benignant sympathy of her example” rather than military power. If the country did involve itself in foreign wars, Adams said:

“The fundamental maxims of her policy would insensibly change from liberty to force. The frontlet upon her brows would no longer beam with the ineffable splendor of freedom and independence; but in its stead would soon be substituted an imperial diadem, flashing in false and tarnished lustre the murky radiance of dominion and power. She might become the dictatress of the world: she would be no longer the ruler of her own spirit.”

A succession of empires and world powers through the centuries have amassed and subsequently lost most if not all of their foreign bases, either

by force or divestment. Following in the footsteps of Portugal, Holland, Spain, and France, Britain had to shutter most of its foreign bases in the midst of an economic crisis in the 1960s and 1970s. The United States is headed in that same direction. The only questions are when and whether the country will close its bases and downsize its global mission by choice, or whether it will follow Britain's path as a fading power forced to give up its bases from a position of weakness.

Proclaiming that things can never change is a self-fulfilling prophecy. Not making such proposals, not developing alternatives to the existing base nation, is the surest way to guarantee the continuation of a status quo that has hurt us all.

A Quest for Peace

“On the average, only those prisoners could keep alive who, after years of trekking from concentration camp to camp, had lost all scruples in their fight for existence; they were prepared to use every means, honest and otherwise, even brutal force, theft, and betrayal of their friends, in order to save themselves. We who have come back, by the aid of many lucky chances or miracles—whatever one may choose to call them—we know: the best of us did not return.”

—Viktor E. Frankl

The good war was not for supporting the troops. In fact, lacking intense modern conditioning to prepare soldiers to engage in the unnatural act of murder, some 80 percent of US and other troops in World War II did not fire their weapons at the enemies. That those soldiers were treated better after the war than soldiers in other wars had been, or have been since, was the result of the pressure created by the Bonus Army after the previous war. That veterans were given free college was not due to the merits of the war or in some way a result of the war. Without the war, everyone could have been given free college for many years. If we provided free college to everyone today, it would take way more than World War II stories to get people into military recruiting stations.

Several times the number of people killed in German camps were killed outside of them in the war. The majority of those people were civilians. The scale of the killing, wounding, and destroying made this war the single worst thing humanity has ever done to itself in a short space of time. That it was somehow “opposed” to the far lesser killing in the camps—although, again, it actually wasn’t—can’t justify the cure that was worse than the disease.

Escalating the war to include the all-out destruction of civilian cities, culminating in the completely indefensible nuking of Hiroshima and Nagasaki took this war out of the realm of defensible projects for many who had defended its initiation—and rightly so. Demanding unconditional surrender and seeking to maximize death and suffering did immense damage and left a legacy that has continued.

Killing huge numbers of people is supposedly defensible for the “good” side in a war, but not the “bad.” The distinction between the two is never as stark as fantasized. The United States had an apartheid state for African Americans, camps for Japanese Americans, a tradition of genocide against Native Americans that inspired Nazis, programs of eugenics and human experimentation before, during, and after the war including giving syphilis

to people in Guatemala during the Nuremberg trials. The US granted immunity to scientists in Unit 731 in exchange for the experimentation results. The US military hired hundreds of top Nazis at the end of the war—they fit right in. The US aimed for a wider world empire, before the war, during it, and ever since.

The “good” side of the “good war,” the party that did most of the killing and dying for the winning side, was the communist Soviet Union. That doesn’t make the war a triumph for communism, but it does tarnish the tales of triumph for democracy.

World War II still hasn’t ended. The bases have never closed. The troops have never left Germany or Japan. There are over 100,000 US and British bombs still in the ground in Germany, still killing.

Going back 80 years to a nuclear-free, colonial, world of completely different structures, laws, and habits to justify what has been the greatest expense of the United States in each of the years since is a bizarre feat of self-deception that isn’t attempted in the justification of any lesser enterprise. Assume I’ve got this totally wrong—you’ve still got to explain how the world of the early 1940s justifies dumping into 2020 wars funding that could have fed, clothed, cured, and environmentally protected the earth.

“First: Let us examine our attitude toward peace itself. Too many of us think it is impossible. Too many think it unreal. But that is a dangerous, defeatist belief. It leads to the conclusion that war is inevitable—that mankind is doomed—that we are gripped by forces we cannot control. We need not accept that view. Our problems are manmade—therefore, they can be solved by man. And man can be as big as he wants. No problem of human destiny is beyond human beings. Man’s reason and spirit have often solved the seemingly unsolvable—and we believe they can do it again. I am not referring to the absolute, infinite concept of peace and good will of which some fantasies and fanatics dream. I do not deny the value of hopes and dreams but we merely invite discouragement and incredulity by making that our only and immediate goal. Let us focus instead on a more practical, more attainable peace—based not on a sudden revolution in human nature but on a gradual evolution in human institutions—on a series of concrete actions and effective agreements which are in the interest of all concerned. There is no single, simple key to this peace—no grand or magic formula to be adopted by one or two powers. Genuine peace must be the product of many nations, the sum of many acts. It must be dynamic, not static, changing

to meet the challenge of each new generation. For peace is a process—a way of solving problems.

With such a peace, there will still be quarrels and conflicting interests, as there are within families and nations. World peace, like community peace, does not require that each man love his neighbor—it requires only that they live together in mutual tolerance, submitting their disputes to a just and peaceful settlement. And history teaches us that enmities between nations, as between individuals, do not last forever. However fixed our likes and dislikes may seem, the tide of time and events will often bring surprising changes in the relations between nations and neighbors. So let us persevere. Peace need not be impracticable, and war need not be inevitable. By defining our goal more clearly, by making it seem more manageable and less remote, we can help all peoples to see it, to draw hope from it, and to move irresistibly toward it.

Yet it is sad to read these Soviet statements—to realize the extent of the gulf between us. But it is also a warning—a warning to the American people not to fall into the same trap as the Soviets, not to see only a distorted and desperate view of the other side, not to see conflict as inevitable, accommodation as impossible, and communication as nothing more than an exchange of threats. No government or social system is so evil that its people must be considered as lacking in virtue. As Americans, we find communism profoundly repugnant as a negation of personal freedom and dignity. But we can still hail the Russian people for their many achievements—in science and space, in economic and industrial growth, in culture and in acts of courage. Among the many traits the peoples of our two countries have in common, none is stronger than our mutual abhorrence of war. Almost unique among the major world powers, we have never been at war with each other. And no nation in the history of battle ever suffered more than the Soviet Union suffered in the course of the Second World War. At least 20 million lost their lives. Countless millions of homes and farms were burned or sacked. A third of the nation's territory, including nearly two thirds of its industrial base, was turned into a wasteland—a loss equivalent to the devastation of this country east of Chicago.

Today, should total war ever break out again—no matter how—our two countries would become the primary targets. It is an ironic but accurate fact that the two strongest powers are

the two in the most danger of devastation. All we have built, all we have worked for, would be destroyed in the first 24 hours. And even in the cold war, which brings burdens and dangers to so many nations, including this Nation's closest allies—our two countries bear the heaviest burdens. For we are both devoting massive sums of money to weapons that could be better devoted to combating ignorance, poverty, and disease. We are both caught up in a vicious and dangerous cycle in which suspicion on one side breeds suspicion on the other, and new weapons beget counter-weapons. In short, both the United States and its allies, and the Soviet Union and its allies, have a mutually deep interest in a just and genuine peace and in halting the arms race. Agreements to this end are in the interests of the Soviet Union as well as ours—and even the most hostile nations can be relied upon to accept and keep those treaty obligations, and only those treaty obligations, which are in their own interest.

So, let us not be blind to our differences—but let us also direct attention to our common interests and to the means by which those differences can be resolved. And if we cannot end now our differences, at least we can help make the world safe for diversity. For, in the final analysis, our most basic common link is that we all inhabit this small planet. We all breathe the same air. We all cherish our children's future. And we are all mortal.

Let us reexamine our attitude toward the cold war, remembering that we are not engaged in a debate, seeking to pile up debating points. We are not here distributing blame or pointing the finger of judgment. We must deal with the world as it is, and not as it might have been had the history of the last 18 years been different. We must, therefore, persevere in the search for peace in the hope that constructive changes within the Communist bloc might bring within reach solutions which now seem beyond us. We must conduct our affairs in such a way that it becomes in the Communists' interest to agree on a genuine peace. Above all, while defending our own vital interests, nuclear powers must avert those confrontations which bring an adversary to a choice of either a humiliating retreat or a nuclear war. To adopt that kind of course in the nuclear age would be evidence only of the bankruptcy of our policy—or of a collective death-wish for the world.”

—JFK

“Just suppose with me for a moment that an Ivan and an Anya could find themselves, oh, say, in a waiting room or sharing a shelter from the rain or a storm with a Jim and Sally. And there was no language barrier to keep them from getting acquainted. Would they then debate the differences between their respective governments? Or would they find themselves comparing notes about their children and what each other did for a living? Before they parted company, they would probably have touched on ambitions and hobbies and what they wanted for the children and problems of making ends meet.

And as they went their separate ways, maybe Anya would be saying to Ivan: ‘Wasn’t she nice. She also teaches music.’ And Jim would be telling Sally what Ivan did or didn’t like about his boss. They might even have decided they were all going to get together for dinner some evening soon. Above all they would have proven that people don’t make wars. People want to raise their children in a world without fear and without war. They want to have some of the good things over and above bare subsistence that make life worth living. They want to work at some craft, trade, or profession that gives them satisfaction and a sense of worth. Their common interests cross all borders. If the Soviet Government wants peace, then there will be peace. Together we can strengthen peace, reduce the level of arms and know in doing so that we have helped fulfill the hopes and dreams of those we represent and, indeed, of people everywhere. Let us begin now.”

—Ronald Reagan

Let me tell you a story. A story about American bombers in World War II and the gallant men who flew them. American planes, full of holes and wounded men and corpses took off backwards from an airfield in England. Over France, a few German fighter planes flew at them backwards, sucked bullets and shell fragments from some of the planes and crewmen. They did the same for wrecked American bombers on the ground, and those planes flew up backwards to join the formation.

The formation flew backwards over a German city that was in flames. The bombers opened their bomb bay doors, exerted a miraculous magnetism which shrunk the fires, gathered them into cylindrical steel containers, and lifted them into the bellies of the planes. The containers were stored neatly in racks. The Germans below had miraculous devices of their own, which were long steel tubes. They used them to suck more fragments from the

crewmembers and planes. But there were still a few wounded Americans and some of the bombers were in bad repair. Over France though, German fighters came up again, made everything and everybody as good as new.

When the bombers got back to their base, the steel cylinders were taken from the racks and shipped back to the United States of America, where factories were operating night and day, dismantling the cylinders, separating the dangerous contents into minerals. Touchingly, it was mainly women who did this work. The minerals were then shipped to specialists in remote areas. It was their business to put them into the ground, to hide them cleverly, so they would never hurt anybody ever again.

Another: Once upon a time, in a far away world, there was born to the Allfather and the Goddess of Wisdom, a boy they named Balder.

Balder is called the Shining One, but what matters is that he was he was the gentlest of all the Gods, and the most beloved, for he was the God of Peace.

His mother, Frigg, loving him greatly, sought to ensure he could never die, and went to all the worlds and asked every living thing for its promise not to harm Balder. The only one she did not receive a promise from was mistletoe, for it was young.

And so, when Loki, the God of Mischief, decided to kill Balder, he tipped an arrow with Mistletoe and tricked a blind God into shooting Balder, and so died the Shining God, The God of Peace, the most beloved God of all.

His mother, Frigg, bereft, went to the Goddess of the Dead and asked that he be allowed to leave the land of the dead, and live again. Hel was willing to allow it, so long as everyone who lived agreed.

And so Frigg went, again, to all who lived on all the worlds, and asked their permission. All agreed save one, though none agree who that one was: Loki, or the Willow, whom he tricked, and who has wept ever since that it was so.

And so Balder stayed dead, the most beloved of all the Gods, and he will not live again, until after the final battle of Ragnarok.

Peace is the most precious and beloved of all things, and the most fragile. All it takes to kill peace, is one person who does not agree to keep the peace. And peace cannot be restored so long as even one person does not want it restored.

Obviously this is not quite true, but it nonetheless contains a great truth worth thinking on. We live in a world where we have de-mythologized and as such we rarely consider the truth behind many myths: what they were trying to say.

“They will hammer their swords into plowshares and their

spears into pruning hooks. Nation will not lift up sword against nation, and never again will they learn war.”

Cannot swords be turned to plowshares? Can we and all nations not live in peace? In our obsession with antagonisms of the moment, we often forget how much unites all the members of humanity. Perhaps we need some outside, universal threat to make us recognize this common bond. I occasionally think how quickly our differences world-wide would vanish if we were facing an alien threat from outside this world. And yet, I ask you, is not an alien force already among us? What could be more alien than war and the threat of war?

The Mohists, egalitarian rationalists whose social base seems to have been urban artisans, not only were philosophically opposed to war and militarism, but organized battalions of military engineers who would actively discourage conflicts by volunteering to fight in any war against the side of the aggressor.

What would that world be, a world without war? It would be the real world. Peace is the true life, the life of working and learning and bringing up children to work and learn. War, which devoured work, learning, and children, was the denial of reality. But my people know only how to deny. Born in the dark shadow of power misused, we set peace outside our world, a guiding and unattainable light. All we know to do is fight. Any peace one of us can make in our life is only a denial that the war is going on, a shadow of the shadow, a doubled unbelief.

Always, always, the young men are ready to rush out and kill whoever the old men tell them to kill—each other, women, old people, children; always there is a war to be fought in the name of Peace, Freedom, Justice, the Lord.

During the 1930s, a Peace Monument was erected on the Rollins campus in Winter Park, Florida. The monument was a German artillery shell from the First World War set atop a stone plinth. The inscription began:

“PAUSE, PASSER-BY, AND HANG YOUR HEAD IN SHAME...”

As the UNESCO slogan puts it:

“Since wars begin in the minds of men, it is in the minds of men that the defenses of peace must be constructed.”

You fight the war with guns, you fight the peace with stories.

No Second Chances

In the Roman Empire, during the Crisis of the Third Century, everything began falling apart. The army was swapping emperors out left and right, and the political system could no longer generate the legitimacy or stability that had prevailed in the two centuries prior. Chunks of the empire lost faith in the ability of the central authority to restore order, and began looking to their own defenses. It was bleak. During this period, there was a philosopher by the name of Plotinus, the progenitor of “Neoplatonism.” Plotinus didn’t try to solve the problems of the political system.

“He turned aside from the spectacle of ruin and misery in the actual world, to contemplate an eternal world of goodness and beauty. In this he was in harmony with all the most serious men of his age. To all of them, Christians and pagans alike, the world of practical affairs seemed to offer no hope, and only the Other World seemed worthy of allegiance. To the Christian, the Other World was the Kingdom of Heaven, to be enjoyed after death; to the Platonist, it was the eternal world of ideas, the real world as opposed to that of illusory appearance. Christian theologians combined these points of view, and embodied much of the philosophy of Plotinus.”

Today there are a large number of people who have been demoralized by our political system. Like Plotinus, they have sought out other ways of finding meaning in their lives. These forms of self-care psychologically protect the individual while contributing nothing to resolving the political problems of our age. They are forms of retreat. In our time, I see five of them:

1. The self-care, self-help, and mindfulness industries, all of which aim to give the user the power to cope with a distressing world rather than change it. Examples include stuff like Thrive Global or the work of Jordan Peterson.

2. Accelerationism, scientism, transhumanism, and other forms of techno-neoplatonism, in which faith in the science and technology of the future takes over the saviour role played by the one, the soul, or Jesus Christ in ancient religions and philosophies.
3. Consumer movements, oriented around primitivism, sustainability, or veganism, which encourage people to attempt to solve irreducibly global problems through trivial lifestyle changes. These changes are not sufficient to deal with the problems in question but enable the user to virtue signal, contributing to the user's self-esteem.
4. Discursive movements, which mistake interventions in the discourse for meaningful political action. These movements attempt to popularize new forms of language and to police out other forms, without at any point seriously challenging for institutional power. Again, those who use the "right" kinds of language receive a self-esteem buff.
5. Fandoms, in which people form identity attachments to particular canons of fiction, defining themselves in relation to the kinds of art they enjoy.

Individuals often mix and match these things. But they all divert energy away from politics. Some of them do this by pretending to be politics when they do not in fact produce any meaningful change, like the consumption and discourse movements. Others are more overtly and explicitly escapist, like those committed to fandoms or futurism. The self-care option is exceptionally defensive and more in the tradition of religious asceticism, though it lacks the comprehensive theology of something like Buddhism, Stoicism, or Christian existentialism.

If our civilization is destroyed, it will not be by barbarians from below or without. Our barbarians come from above or within.

In 1996, a platoon of light infantry spent days in the Puerto Rican jungle acclimatizing to stifling heat and humidity, cautiously monitoring their water intake before simulating a nighttime raid. The platoon included "some of the most fit and motivated soldiers in the battalion." When the evening of the raid came, the platoon leader began leading his troops through the jungle, machete-ing a path through the brush. Before long, he was felled by fatigue and delegated his leadership to an underling. When the second private failed to advance the platoon quickly enough, the platoon leader demanded to lead again. But soon he found himself hyperthermic and unable to walk. His soldiers had to douse him in cold water and supply him with intravenous infusions. Eventually four soldiers had to carry him. Before long, the extra

demands vitiated the entire platoon, all of whom began to fall prey to heat stress. The exercise had to be called off before it became a massacre.

So I look at that as, if it's nighttime, and acclimatized, fit people can just disintegrate into a pool of useless people on stretchers—that's what I see happening to society, to cultures. If you want to know how mass extinctions happen, that's how. So when people talk about the Pleistocene megafauna extinctions and Clovis people, sometimes they act like it's a mystery how these things happen. But it happens in exactly the same way. You have something tearing apart the strongest members, the weaker ones try to fill in the gaps, they're really not strong enough to take it, and the whole thing collapses. You want to know how societies collapse? That's how.

Each year the US population spends more money on diets than the amount needed to feed all the hungry people in the rest of the world.

The old proverb says if you want to go fast, go alone, if you want to go far, go together. Let's take that as a guide and dismiss the insane pursuit of "efficiency" at all costs. Yes we can get faster "advancement" with unlimited capitalism, but eventually the inequality stresses will break the system and the masses will flip over the monopoly board and refuse to play anymore.

The answer to my most gnawing, constant question dawned on me just the other day. Why don't They see that they're driving our nation over the cliff? Why don't They see that their rapacious greed is wrecking the very economy that made their own wealth possible? Why don't They see that they've killed the goose that laid the golden egg?

Then it dawned on me that you can visualize our economy in a certain sense, as a wave, a wave that the powers that be have been both shaping, and riding. They've worked very hard to build this thing, and they really succeeded in getting a tremendous amount of momentum going here.

Our masters of the universe are a crazed gang of hoodlum surfers, and they've caught a monstrous wave. It's all a matter of hysterical momentum. They are riding a mountainous wave of greed-fueled hubris, and they see some sort of illusory finish line ahead where the rest of us see a very real chasm.

They cannot stop, they would never in a million years think of stopping. As things are, there is virtually nothing standing in their way other than a terribly fragmented and uncoordinated public opinion, and that public has been so thoroughly convinced of it's own helplessness that so far, it's been mostly staring down the road in anticipation of the crash.

It is already too late, the tipping point is here. It is no longer possible to make believe that we can turn the Democratic party around, convince them to listen to our pleading. I've had my doubts, but those doubts have

disappeared; yes, They intend to take everything, and the Democrats as much as the Republicans are helping them carry it all away.

It's no longer necessary to list their crimes, we all know what they are. It's no longer necessary to convince anyone of the uselessness of petitioning our politicians to come to our aid before it's too late, everyone knows that. The tipping point is now.

For most of my adult life I've been hoping that so-called liberals were going to be the agents of the changes we so obviously need, and that has turned out to be a ridiculously foolish expectation, so I cannot bring myself to criticize the folks who have decided to place their hopes in a totally different direction.

We're experiencing cultural collapse. The very same collapse that was experienced by the Plains Indians when their way of life was destroyed and they were herded onto reservations. The very same collapse that was experienced by countless aboriginal peoples overrun by us in Africa, South America, Australia, New Guinea, and elsewhere. It matters not that the circumstances of the collapse were different for them and for us, the results were the same. For both of us, in just a few decades, shocking realities invalidated our vision of the world and made nonsense of a destiny that had always seemed self-evident. For both of us, the song we'd been singing from the beginning of time suddenly died in our throats. The outcome was the same for both of us: Things fell apart. It doesn't matter whether you live in tepees or skyscrapers, things fall apart. Order and purpose are replaced by chaos and bewilderment. People lose the will to live, become listless, become violent, become suicidal, and take to drink, drugs, and crime. The matrix that once held all in place is shattered, and laws, customs, and institutions fall into disuse and disrespect, especially among the young, who see that even their elders can no longer make sense of them.

Visions of imminent social collapse might be taking all this a bit too far. Or maybe not. Civilizations are fragile, impermanent things. Are modern societies vulnerable? It's a common belief that our technological capacity, energy resources, our knowledge of economics and history mean our civilization should be able to survive whatever crises ancient and simpler societies found insurmountable.

But as a corrective, we must recall one of the lessons of the Roman empire: Civilization can die, because it has already died before.

Nobody defines themselves as self-serving, greedy, and lacking in virtue. Everyone feels trapped in the system as it is, a swirling funhouse of smoke and mirrors in which everyone seeks to maximize their private gain at the expense of others or the system itself, all the while signaling their virtue with cheap, substance-free speech acts.

This precisely mirrors what the Romans were proclaiming as their empire crumbled around them. You can't rebuild a moral center with more regulations and legislation, or by trying to silence critics. Proliferating regulations and attempts to silence critics are simply proof that the disintegration is accelerating down the slide to disorder and collapse.

To think about it slightly more critically, Boston is the headquarters for two industries that are steadily bankrupting middle America: big learning and big medicine, both of them imposing costs that everyone else is basically required to pay and yet which increase at a pace far more rapid than wages or inflation. A thousand dollars a pill, forty-grand a semester: the debts that are gradually choking the life out of people where you live are what has made this city so very rich. Perhaps it makes sense, then, that another category in which Massachusetts leads the nation is inequality. Once the visitor leaves the brainy bustle of Boston, he discovers that this state is filled with wreckage—with former manufacturing towns, with workers watching their way of life drain away, with cities that are little more than warehouses for people on Medicare. According to one survey, Massachusetts has the eighth-worst rate of income inequality among the states; by another metric it ranks fourth. However you choose to measure the diverging fortunes of the Ten Percent and the rest, Massachusetts always seems to finish among the nation's most unequal places.

As an oldish millennial, what saddens and mystifies me most about my generation is the near universal, creepily personal obsession with people who appear in any media that their friends and family might see. The desire for some sort of recognition or connection to that world is disturbingly powerful.

I was once set upon by a whole group of somewhat younger millennials as if they'd just discovered a suitcase full of millions and were going to split it with me. The wondrous secret they presented to me was the opportunity to waste the next many hours for a slim opportunity to meet Michael Bay of Transformers fame. I was confused.

“Why do I want to do that? Wouldn't you guys rather relax here. I got some beer and whiskey?”

They all thought I was joking. When they finally realized I wasn't, shocked disbelief set in. “But it's Michael Bay!” “What's wrong with you!!!!” (literally shrieking) “You could actually touch him!” I told them they were being creepy, and that while I occasionally enjoy passing some time with his mediocre movies, they seem to indicate that he is a decidedly not-interesting person. Few other times did the class gap between their and my upbringings feel more salient. Not one of my HS dropout and frequently petty criminal friends I grew up with would ever have deigned to be so sycophantic.

The point of that whole lengthy aside is that a great many highly “educated” people under the age of 35 are so obsessed with some kind of media recognition and turning their lives into some TV show narrative because those identifications are the closest things to meaning and purpose and sense of self they know. The self-centered desperation this leads to makes it literally impossible for them to think deeply and independently. Everything about their tastes, thoughts, opinions, careers, social behavior, is filtered through ‘what will people think about me if I do/say/think/feel this.’

A recent study of pollen and animal remains on Easter Island concluded that it wasn’t humans who deforested the landscape; rather, it was the rats that came along for the ride and then bred unchecked. The native palms couldn’t produce seeds fast enough to keep up with their appetites.

Like all of us, I am a foot soldier of empire. It is the empire of *Sapiens* and it stretches from Tasmania to Baffin Island. Like all empires, it is built on expropriation and exploitation, and like all empires it dresses these things up in the language of morality and duty. When we turn wilderness over to agriculture, we speak of our duty to feed the poor. When we industrialize the wild places, we speak of our duty to stop the climate from changing. When we spear whales, we speak of our duty to science. When we raze forests, we speak of our duty to develop. We alter the atmospheric makeup of the entire world—half of us pretend it’s not happening, the other half immediately start looking for new machines that will reverse it. This is how empires work, particularly when they have started to decay. Denial, displacement, anger, fear.

The environment is the victim of this empire. But the ‘environment’—that distancing word, that empty concept—does not exist. It is the air, the waters, the creatures we make homeless or lifeless in flocks and legions, and it is us too. We are it; we are in it and of it, we make it and live it, we are fruit and soil and tree, and the things done to the roots and the leaves come back to us. We make ourselves slaves to make ourselves free, and when the shackles start to rub we confidently predict the emergence of new, more comfortable designs.

These stories failed us long ago, and it is increasingly common now to hear the claim that we need new stories to replace them. These new stories, it is said, will be stories of belonging again. They will be stories of returning to the earth, of understanding our true place in the great maelstrom of the universe, not as gods now but as family members. Our challenge is to create a new language, even a new sense of what it is to be human. It is to transcend not only national limitations, but even our species isolation, to enter into the larger community of living species. This brings about a

completely new sense of reality and value. This is, it seems to me, essential. But it is not a new story. Rather, it is a very old one, being haltingly rediscovered by a culture that long ago forgot how to listen to it. Every indigenous culture recognizes this as the oldest of old tales. Once we peel back our failing narratives, we see it waiting patiently underneath. What we don't know is what to do with it. From the perspective of our modernity, enmeshed as we are in machines, in cities, in minds trapped by what we have built, we don't know how we might even start to live it again.

One thing is clear to me: any deep change is not going to come from intellectuals writing books or articles about why we need new stories. If that were going to save the world, the world would be fine by now. Deep change is going to come through a radical alteration in people's lived experience. And that is only going to come from a crisis that forces people up against the consequences of what we have done. It is going to come when economies start collapsing, when political systems crumble, when cities flood, when seas rise, when people are hungry or dying. New stories emerge from collapses that kill off the old ones.

Here in the West, we are deep into a centuries-long crisis of meaning. As we chase our goals, they drift farther away. If and when we reach them, they suck out our souls. Our material religion, like the transcendent religions it sprang from, aims for eternity. In the future, we will all be immortal millionaires. The goal of our religion is impossible to reach; and if it weren't, we would find ourselves in hell.

At the core of our animal beings, something is bleeding. If we stop and pay attention, we can feel the wound. In the wound lies the hope.

To employ a mathematical analogy, we can say that although the risk of extinction may be fractional, the stake is, humanly speaking, infinite, and a fraction of infinity is still infinity. In other words, once we learn that a holocaust might lead to extinction we have no right to gamble, because if we lose, the game will be over, and neither we nor anyone else will ever get a another chance.

Part VIII

Oppression Economics

I was eight years old and running with a dime in my hand
To the bus stop to pick up a paper for my old man
I'd sit on his lap in that big old Buick and steer as we drove through town
He'd tousle my hair and say son take a good look around
This is your hometown
This is your hometown
This is your hometown
This is your hometown

In '65 tension was running high at my high school
There was a lot of fights between the black and white
There was nothing you could do
Two cars at a light on a Saturday night, in the back seat there was a gun
Words were passed in a shotgun blast
Troubled times had come
To my hometown
To my hometown
To my hometown
To my hometown

Now Main street's whitewashed windows and vacant stores
Seems like there ain't nobody wants to come down here no more
They're closing down the textile mill across the railroad tracks
Foreman says these jobs are going boys and they ain't coming back
To your hometown
To your hometown
To your hometown
To your hometown

Last night me and Kate we laid in bed talking about getting out
Packing up our bags maybe heading south
I'm thirty-five we got a boy of our own now
Last night I sat him up behind the wheel and said son take a good look around
This is your hometown

EconoNonsense

There would be little to say on this subject, were it not for all the nonsense that has been talked about it.

Language gives access to a people's culture, and culture to its history. Its history tells us how it sees itself and others. Knowledge of languages should thus be an essential component of a historian's technical equipment. It is the key to understanding the past and future of international relations. But this belief in the fundamental importance of knowing particular languages has faded, even among historians. All social sciences, to a greater or lesser degree, start with a yearning for a universal language, into which they can fit such particulars as suit their view of things. Their model of knowledge thus aspires to the precision and generality of the natural sciences. Once we understand human behavior in terms of some universal and—crucially—ahistorical principle, we can aspire to control—and of course improve—it.

No social science has succumbed to this temptation more than economics. Its favored universal language is mathematics. Its models of human behavior are built not on close observation, but on hypotheses that, if not quite plucked from the air, are unconsciously plucked from economists' intellectual and political environments. These then form the premises of logical reasoning of the type, 'All sheep are white, therefore the next sheep I meet will be white.' In economics: 'All humans are rational utility maximizers. Therefore, in any situation, they will act in such a way as to maximize their utility.' This method gives economics a unique predictive power, especially as the utilities can all be expressed and manipulated quantitatively. It makes economics the "queen of the social sciences."

In principle, economists don't deny the need to test their conclusions. At this point, history, one might have thought, would be particularly useful. Is it really the case that all sheep are white, in every place and clime? But most economists disdain the evidence of history, regarding it as little better than anecdote. They approach history by one route: econometrics. At best, the past is a field for statistical inquiry.

"The best and brightest in the profession proceed as if

economics is the physics of society. There is a single universally valid model. It only needs to be applied. You could drop a modern economist from a time machine at any time, in any place, along with his or her personal computer; he or she could set up in business without even bothering to ask what time and which place.”

In short, much of the historical modeling economists do assumes that people in the past had essentially the same values and motives as we do today.

“The construction of a mechanical, artificial world, populated by interacting robots, that is capable of exhibiting behavior the gross features of which resemble those of the actual world.”

The goal of economics is to replace the particular languages that obstruct the discovery of general laws with the universal language of mathematics. Elon Musk takes the idea of interacting robots one step further, with his ambition to link the human brain directly to the world (which includes other human brains). Our thoughts will be directly socialized without the intermediation of any language. When you think ‘door, open!’ it does. Whereas economists dream of putting God in their models, the robotic utopians dream of reversing the fall of man by creating godlike humans.

To be clear, this is the apotheosis of a Western conceit. The West still views itself as the bearer of universal civilization, with the non-West no more than a lagging cultural indicator. In the West itself, the authority of economics has diminished, but this hasn’t dented the West’s propensity to export its civilization. “Good economics” has been partly replaced by a commitment to universal human rights as the means to save the world from itself, but the purpose is the same: to lecture everyone else on their shortcomings. Here, we encounter a paradox. The triumph of universalism has come just when Western power is collapsing. And it was that power which made Western thought seem universal in the first place. Conquest, not missionaries, spread Christianity around the world.

An economist would find it inefficient to maintain two lungs and two kidneys: consider the costs involved in transporting these heavy items across the savannah. Such optimization would, eventually, kill you, after the first accident, the first “outlier.” Also, consider that if we gave Mother Nature to economists, it would dispense with individual kidneys: since we do not need them all the time, it would be more efficient if we sold ours and used a central kidney on a time-share basis. You could also lend your eyes at night since you do not need them to dream.

“The theories of the universe that I developed so painstakingly in the seventies and eighties were but fantasies that arose directly from my peculiar perch in life. Here was I, a Mission Hills lad, growing up in one of the perfect regional arcadias of American capitalism, a place more like the grounds of Versailles than the average post-war suburb, and what I had managed to do was invent a romantic justification for precisely the system of social arrangements that had made Mission Hills possible. I had laboriously reinvented the wheel of laissez-faire thought, deciphered it painstakingly from the world around me, re-created the first principles of capitalist society by close observation of capitalist institutions, and had all the while imagined that what I was actually doing was discovering the timeless laws of nature and all human society.”

Suppose that I inherited from my rich parents a large plot of vacant land, and that you are my poor, landless neighbor. I offer you the following deal. You can work the land, doing all the hard labor of tilling, sowing, irrigating, and harvesting. I'll pay you \$1 a day for a year. After that, I'll sell the crop for \$50,000. You decide this is your best available option, and so take the deal. If I think of our bargain in terms of rational self-interest, then it is rational to offer you \$1 a day, knowing that you have no other prospects. But I am clearly not being reasonable. I am not imagining someone in your situation, and then asking what would seem fair from that perspective.

The title of Adam Smith's chair at the University of Edinburgh was 'Moral Philosophy.' This remained the name for economics courses taught in Britain and America through most of the nineteenth century. Another name was 'Political Economy,' and seventeenth-century writers used the term 'Political Arithmetic.' The common aim was to influence public policy: above all how to finance government, what best to tax, and what rules should govern banking and credit.

Economics as currently taught—like so many ideologies embraced and preached by the powerful throughout history—is simply a tool of manipulation and control. A tool to get one to accept—and in many cases defend—the existence of one's chains, of the massive inequality and injustice.

Rise, like lions after slumber
 In unvanquishable number!
 Shake your chains to earth like dew
 Which in sleep had fallen on you:
 Ye are many—they are few!

Remove your blinders, throw off your chains, fight for a future with true justice and equality.

Both ‘the Economy’ and ‘The Floor is Lava’ are games involving imaginary things we instill with power. They are quite similar, in both you accept a set of premises that are not actual reality but by accepting them influence how one perceives and interacts with actual reality. However, in order to make them truly similar, should a child step off, fall into the lava, the other children would have to douse them in lighter fluid and set them on fire, the equivalent of letting one die from despair, lack of care, et cetera—from not having money.

- The federal deficit is too high.
- Federal deficit spending (a.k.a. “printing money”) causes hyperinflation.
- The federal debt is “unsustainable.”
- Our children will pay for the federal debt.
- Federal taxes fund federal spending.
- The federal government can run short of dollars.
- The federal government should live within its means.
- Federal finances are like personal finances.
- The International Monetary Fund (IMF) benefits poor nations.
- Federal debt crowds out private debt.
- Federal spending crowds out private spending.
- The poor are lazy, dishonest “takers”; the rich are smart, energetic “makers.”
- The US government should be run like a business, by a businessperson.
- Austerity helps an economy grow.
- Some people don’t pay their “fair share” of federal taxes.
- Raising interest rates kills economic growth.
- There is no difference between monetary sovereignty and monetary non-sovereignty

- Money and debt are two different things.
- A growing economy does not need a growing supply of money.
- Federal surpluses help the economy grow.
- The federal debt is too large.
- The federal debt is the total of federal deficits.
- The federal debt ceiling has a beneficial function.
- The current level of deficits is unsustainable.
- Current federal debt growth is unsustainable.
- Federal taxes help pay for federal spending.
- The federal government cannot create money; only the Fed can.
- State, county, and city governments are financially similar to the federal government.
- Federal borrowing helps pay for federal spending.
- The federal government spends taxpayers' money.
- Our children and grandchildren will pay for today's federal deficits.
- A balanced federal budget is more prudent than a federal deficit.
- The federal debt/GDP ratio measures the government's ability to service its debts.
- The federal debt/GDP ratio measures the health of the economy.
- Each of us is liable for a share of the federal debt.
- Federal earmarks, pork barrel spending, and waste hurt the economy.
- The single biggest cause of inflation is excessive federal deficit spending.
- Inflation is too much money chasing too few goods.
- Consumer saving helps the economy grow.
- In fractional reserve banking, banks keep a fraction of deposits and lend the rest.

- The best way to cure inflation is to increase taxes and/or to cut federal spending.
- FICA taxes pay for Medicare and Social Security.
- The government cannot afford to fund Medicare or Social Security.
- The US, like the EU nations, can go bankrupt.
- Without increases in taxes or decreased spending, Medicare and Social Security will go bankrupt.
- Without tax increases, the federal government cannot afford to increase support for education; infrastructure improvements; bailouts for states, counties, and cities; the military; research; and local police.
- Gold is safer and more prudent than “paper” (fiat) money.
- The federal government needs to borrow to pay for deficit spending.
- Federal borrowing reduces the availability of lending funds.
- The two main reasons for the 2008 economic collapse were low interest rates and lack of federal credit supervision.
- Low interest rates stimulate the economy; high rates slow it.
- Taxing the rich does not hurt the poor.
- Cutting payments to doctors and/or taxing “Cadillac” health insurance plans, is one good way to help pay for improved health care.
- America should try to export more and import less, to achieve a positive balance of payments.
- The US states, counties, and cities should be self supporting via local taxes, and not rely on federal assistance.
- Rather than being a net borrower, the federal government should be a net lender.
- Greece, Ireland, and the other troubled euro nations need to exercise spending restraint and austerity.

How many of these myths do you believe? Do you understand why they are myths?

The ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else. Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually the slaves of some defunct economist.

The purpose of studying economics is not to acquire a set of ready-made answers to economic questions, but to learn how to avoid being deceived by economists.

So Hayek called freedom fascism, and he called fascism freedom. The first thing that the Chicago boys did in Chile was to close every economics department. Because they realized that you can't have a Hayek-style free market unless you're willing to kill everybody who disagrees with you. They had to kill labor leaders and tens of thousands of intellectuals. They closed every economics department in the country except for the Catholic University where they taught. There was mass murder. If you're not willing to kill everybody who has a different idea than yourself, you cannot have Hayek's free market. You cannot have Alan Greenspan or the Chicago School, you cannot have the economic freedom that is freedom for the rentiers and the FIRE sector to reduce the rest of the economy to serfdom.

Hayek's saying that the way to create serfdom is to make people think that freedom is serfdom. So we're back with Orwell: Freedom is slavery, war is peace. That is the Orwellian economics now taught by mainstream orthodoxy. You no longer have the history of economic thought being taught, as it was 50 years ago. It's been stripped out of the curriculum. If people really read what Adam Smith said after he traveled to France and met with the Physiocrats—and was convinced that there should be a land tax and that economies shouldn't have free riders—you realize that what he said is the exact opposite of today's ostensible free-market ideology. John Stuart Mill defined rent as what landlords make “in their sleep,” without working. These classical economists were on the road to socialism. Only half-way there, but on the road to it.

I think most people, without understanding economics, would instinctively tell you they think that's what's happening right now, in some way. As long as you can avoid studying economics you know what's happened. Once you take an economics course you step into brainwashing. It's an Orwellian world. It gets you locked into the wrong way of thinking as opposed to just basic common sense.

Finance has taken over the industrial economy, so that instead of finance becoming what it was expected to be in the nineteenth century, instead of

the banks evolving from usurious organizations that lent to governments, mainly to wage war, finance was going to be industrialized. They were going to mobilize savings and recycle it to finance the means of production, starting with heavy industry. This was actually happening in Germany in the late nineteenth century. You had the big banks working with government and industry in a triangular process. But that's not what's happening now. After WWI and especially after WWII, finance reverted to its preindustrial form. Instead of allying themselves with industry, as banks were expected to do, banks allied themselves with real estate and monopolies, realizing that they can make more money off real estate.

The bank spokesman David Ricardo argued against the landed interest in 1817, against land rent. Now the banks are all in favor of supporting land rent, knowing that today, when people buy and sell property, they need credit and pay interest for it. The banks are going to get all the rent. So you have the banks merge with real estate against industry, against the economy as a whole. The result is that they're part of the overhead process, not part of the production process.

Vested interests are the main endowers and backers of the higher learning in America. Hardly by surprise, they promote a bankers'-eye view of the world. Imperialists promote a similar self-serving worldview.

Economic theory, like history, is written by the winners. In today's world that means the financial sector. They depict banks as playing a productive role, as if loans are made to help borrowers earn the money to pay interest and still keep something for themselves. The pretense is that banks finance industrial capital formation, not asset stripping.

What else would you expect banks to promote? The classical distinction between productive and unproductive—that is, extractive—loans is not taught. The result has been to turn mainstream economics as a public-relations advertisement for the status quo, which meanwhile becomes more and more inequitable and polarizes the economy.

Economics is primarily a social science, rather than a physical science. Study of the physical sciences delves into the mechanics of cause and effect. Study of the social sciences requires understanding motivation.

Economics' effects cannot be foretold by charts—though so-called “chartists” devote their lives trying to refute that fact—because charts do not take into consideration motive.

A sociologist would not begin a discussion of socioeconomic inequality with tax policy. But an economist would, and therein lies the problem. Control over arguments regarding political economy in the public sphere has to be wrested from economists, so that we can start to talk about what

actually matters. We must take control of the argument and lay bare the absurdities of those who benefit from the status quo.

I say we boycott economists. Sure some of them are not terrible, but the discipline needs to be torn down and rebuilt from the ground up.

One of the most powerful and effective tools in the hands of capitalist economists is the suggestion that economics in general and capitalism in particular is some sort of science. This illusion—and illusion it is—is strongly assisted by the fact that modern economics is taught with the aid of impressive-looking mathematical equations and “proofs.” Economic textbooks are cluttered with tables, statistics, and graphs which make the books look like physics textbooks—or math books even. Therefore economics must also be a science, right?

Well, no, actually. For the very simple reason that real sciences, such as physics and chemistry, demand a standard of proof and intellectual rigour that not only doesn’t exist in modern economics, it has never existed at all since the earliest days when some sort of economic theory could be perceived. Early economic principles were conceived in religion, and religion strongly influenced economic practices for at least two-thousand years. Capitalism, the dominant economic belief of today, is still more of a religion than a science, because it demands from its adherents a level of blind faith which is little different from any other religious fanatic.

“Let’s form a global economy guided by ideas of economic liberalism where we put the economy first over the interests of people.”

Unfortunately, no one really understood how the economy worked. 2008: “How did that happen?” What more evidence do we need?

What is wrong with economics when science can successfully send spacecraft to the outer edges of the solar system? Science has been allowed to develop successfully as it cannot be modified to suit certain vested interests to make them richer. Economics is not like this. There is something wrong with economics that was first spotted at the end of the nineteenth century and pretending it is a real science today is little more than wishful thinking. Thorstein Veblen wrote an essay in 1898 titled “Why is economics not an evolutionary science?”

Real sciences are evolutionary and old theory is replaced as new theory comes along and proves the old ideas wrong—not always in practice but the ideal is there. Economics jumps about like a cat on a hot tin roof and is not evolutionary, in the late 1970s Keynesian ideas were ditched for the ideas of Milton Friedman. We threw out the old Keynesian economics and brought in something new and untested just as we are about to embark on globalization, it was asking for trouble. Milton Friedman hadn’t realized—or didn’t care—that real science is evolutionary.

Looking back we can see other problems. Malthus came up with an economics that worked for the vested interests of the land owning class. Ricardo came up with an economics that worked for the vested interests of the financial class. Marx came up with an economics that worked for the ideology he was trying to put forward. It’s complex, quite fuzzy, and can be easily biased to suit vested interests. Early on it became very apparent to the wealthy and powerful that economics needed to be biased in the right direction for their interests.

As Classical Economics reached its zenith in the nineteenth century it had come to some unfortunate conclusions that powerful, vested interests didn’t like so they backed a new, neoclassical economics that missed out on—or simply ignored—the undesirable conclusions from Classical Economics like the differentiation of ‘earned’ and ‘unearned’ income. Most of the UK and US now dreams of giving up work and living off the unearned income from a portfolio, extracting the earned income of generation rent. The dream is to be like the idle rich, rentier, living off unearned income and doing nothing productive. This distinction between ‘earned’ and ‘unearned’ income has been buried ever since.

Neoclassical economics led to the Wall Street Crash of 1929 and the Great Depression, where its ideas just made things worse. Keynes came up with some new ideas that were incorporated into the New Deal and the recovery began in the US. Keynes’ ideas had some unpleasant conclusions as well and so economists molded some of Keynes’ ideas into neoclassical economics ready to use after the Second World War. Keynes had said that capitalism was inherently unstable and recognized the dangers from financial

asset investing, not the sort of ideas that were desirable.

The Golden Age of the 1950s and 1960s followed. The new hybrid Keynesian ideas went wrong in the 1970s and its ideas did not lead to recovery. The powerful vested interests sought an opportunity to bring back their really biased pure neoclassical economics and use it as the basis for a global economy. It was improved, but still had all the old problems:

- **1920s/2000s:** high inequality, high banker pay, low regulation, low taxes for the wealthy, robber barons (CEOs), reckless bankers, globalization phase
- **1929/2008:** Wall Street crash
- **1930s/2010s:** Global recession, currency wars, rising nationalism and extremism
- **1940s/2020s:** World War?

Left to their own devices, powerful vested interests will develop an economics that is so biased the economic system will collapse due to the polarization of wealth at the personal and national level (like now).

Lots of other inconvenient stuff is missing too, which has led to many of the recent mistakes, including 2008 and its aftermath. Stuff like:

- The true nature of money and how it is created and destroyed on bank balance sheets.
- Debt inflated asset bubbles; their inflation, bursting, and the debt deflation that follows.
- Balance sheet recessions.

You can bias economics to suit vested interests but you can't make that biased economics work. Economics needs to be rebuilt from the bottom up in an evolutionary, scientific manner not missing the bits that are inconvenient for wealthy and powerful vested interests.

You can't put the economy first without good economics.

Let's get busy.

Every branch of knowledge benefits from a process of occasionally stepping back from itself and scrutinizing itself objectively for anomalies and absurdities. If a glaring anomaly or absurdity becomes apparent and remains unquestioned, that discipline is in danger of being seen as floundering in the midst of its own technicalities.

I once tried, unsuccessfully, to explain to an econ professor of mine that insisting that economics be purely positive—focused on what is—rather than normative—focused on what should be—is itself a normative stance. It makes a claim about what economics *should* be: devoid of ethical considerations.

Economists, by and large, would like to think they can avoid ethical quandaries simply by stating that they are doing so. Unfortunately for them—and for us—that is not how ethics works.

Economics is nothing but politics in disguise.

To refer to economists as a priesthood has become a commonplace. Economists practice a religion couched in the language of mathematics and statistics. Their church, to carry the symbolism further, has a magnificent gold and marble altar where they offer praise to Capital. And, as in the magnificent centuries-old churches of Europe, there are chapels off to the sides of the main altar.

The economics profession always pushes that population must always grow and simply assumes the economy can always accommodate any population increase. One can imagine a Native American economist in the 1600s telling his tribal elders not to worry about the new arrivals, as the large American continent could handle the population increase without any problems.

The concept of a limited carrying capacity of an environment is not in the economics playbook, as human ingenuity will always solve any problem. In a finite world of diminishing resources the freedom of individuals will not lead hopefully to progress but fatalistically to destruction.

Another blind economist wandering through the zoo, stumbling upon an elephant's trunk, and conjuring up ideas to make it grow longer. Sustained exponential growth is mathematically impossible. At any rate of growth, the end result is that humans and their things end up occupying every square inch of territory, using every joule of energy, and consuming every natural resource until collapse intervenes.

Natural capital—the physical characteristics of the biosphere—is the foundation of all life including that of homo sapiens. Any economic theory that fails to build from this fundamental fact is mere econobabble.

Modern humans are a tribal species who have devoted much of their “human capital” to warfare. Any discussion of contemporary capitalism in the USA that fails to examine the pivotal role of the military-industrial state is fatally flawed.

The goal of economic policy should be the maximization of quality of life for a population level that can live in harmony with the billions of other inhabitants of the biosphere—a goal diametrically opposed to Sapiens' goal of growth in ability to dominate it.

But obviously I'm just a Luddite and my responses can simply be dismissed as unserious. Though, let's turn it around for a moment. The assumption behind your 'serious point' is that technological evolution is a kind of natural law, that it occurs independent of people, therefore it is the task of people to adapt to technology.

Obviously, as someone who has benefited greatly from antibiotics and enjoyed the convenience of air travel, I'm not opposed to all technological development; that said, with every advance comes a setback. Antibiotics have saved millions of lives, but they've also strengthened bacteria. The aeroplane gets us to Australia quicker, but it has also increased global warming and spread of disease, with potentially catastrophic consequences, and, by allowing mass-tourism, has effectively helped to destroy the habitats and ways of life of many indigenous cultures and peoples. And all for what? So we can say we've seen the pyramids or the Sydney Opera House?

My serious point is that convenience is not an unalloyed good. If these devices are for the benefit of humanity, then we should really look deeply at the consequences of their development, particularly now when the pace of technological change is so rapid and is having such profound effects on our societies, greater even than the industrial revolution, in my opinion. We need to slow down and assess all this stuff that is being rammed down our throats. I'm not sure that Homo Digitalis is a step forward, for us or for the universe.

The spinning jenny, the aeroplane, and the car, were all mass-produced in the name of profit and convenience, not with an eye to their effects. Well, the jenny led to the mass-exploitation of the poor and the "Dark, Satanic Mills," and the mass-usage of the car and plane are destroying the environment. I think it's time we really attempted to look at what the net effect of these "conveniences" is on human (and animal) well-being.

Technology should be the handmaid of people, not the other way round. To paraphrase Upton Sinclair;

"It's very difficult to get someone to see that something is bad for them when they believe that their happiness depends on not seeing it."

Now, I didn't say that 'new conveniences are the cause' of those things. I was responding to the contention that conveniences are necessarily good. We have more labour-saving devices than we did in 1950 yet people work far longer hours, are more indebted—often as a result of buying those conveniences with money they don't have—and suffer more mental illness because of the lifestyles that we need to adopt in order to afford the conveniences.

We have more cars on the road because people want the convenience of motor travel and are prepared to use debt to buy them.

In reality there is no such “demand” except where artificially juiced by propaganda and retail prices kept deceptively low by hiding most of the costs and simply refusing to pay the environmental costs. But this environmental debt is vastly greater than the national debt. National debts are denominated in money and owed to other money-mongers—or often no one at all—and therefore can be written off without much trouble. But civilization’s mounting debt to Gaia is existential, biological, not financial; and it cannot be written off. On the contrary the Earth, perhaps at first slowly but all the more surely, will insist on payment in full, with interest.

Capitalism does not see its limits as limits at all, only as barriers to be overcome.

The idea that “the profits of production must be reinvested in increasing production” sounds trivial. Yet it was alien to most people throughout history.

There’s something fundamentally flawed about a system that has a prime directive to churn nature and humans into capital, and do it more and more each year, regardless of the costs to human well-being and to the environment we depend on. What becomes clear here is that ours is a system that is programmed to subordinate life to the imperative of profit.

I have come to the conclusion that capitalism is successful primarily because it can impose the majority of the costs associated with its economic activities on outside parties and on the environment. In other words, capitalists make profits because their costs are externalized and borne by others. In the US, society and the environment have to pick up the tab produced by capitalist activity.

Capitalism is a system for concentrating wealth, which makes possible new investments, which further concentrate wealth. This process is accumulation. Classic models take us to the factory: factory owners concentrate wealth by paying workers less than the value of the goods that the workers produce each day. Owners “accumulate” investment assets from this extra value. Even in factories, however, there are other elements of accumulation. In the nineteenth century, when capitalism first became an object of inquiry, raw materials were imagined as an infinite bequest from Nature to Man. Raw materials can no longer be taken for granted. In our food procurement system, for example, capitalists exploit ecologies not only by reshaping them but also by taking advantage of their capacities. Even in industrial farms, farmers depend on life processes outside their control, such as photosynthesis and animal digestion. In capitalist farms, living things made within ecological processes are co-opted for the concentration of wealth. This is what

some call “salvage,” that is, taking advantage of value produced without capitalist control. Many capitalist raw materials (consider coal and oil) came into existence long before capitalism. Capitalists also cannot produce human life, the prerequisite of labor. “Salvage accumulation” is the process through which lead firms amass capital without controlling the conditions under which commodities are produced. Salvage is not an ornament on ordinary capitalist processes; it is a feature of how capitalism works.

Salvage accumulation through global supply chains is not new, and some well-known earlier examples can clarify how it works. Consider the nineteenth-century ivory supply chain connecting central Africa and Europe as told in Joseph Conrad’s novel *Heart of Darkness*. The story turns around the narrator’s discovery that the European trader he much admired has turned to savagery to procure his ivory. The savagery is a surprise because everyone expects the European presence in Africa to be a force for civilization and progress. Instead, civilization and progress turn out to be cover-ups and translation mechanisms for getting access to value procured through violence: classic salvage.

For a brighter view of supply-chain translation, consider Herman Melville’s account of the nineteenth-century procurement of whale oil for Yankee investors. *Moby Dick* tells of a ship of whalers whose rowdy cosmopolitanism contrasts sharply with our stereotypes of factory discipline; yet the oil they obtain from killing whales around the world enters a US-based capitalist supply chain. Strangely, all the harpooners on the *Pequod* are unassimilated indigenous people from Asia, Africa, America, and the Pacific. The ship is unable to kill a single whale without the expertise of people who are completely untrained in US industrial discipline. But the products of this work must eventually be translated into capitalist value forms; the ship sails only because of capitalist financing. The conversion of indigenous knowledge into capitalist returns is salvage accumulation. So too is the conversion of whale life into investments.

Savage and salvage are often twins: Salvage translates violence and pollution into profit.

Global supply chains ended expectations of progress because they allowed lead corporations to let go of their commitment to controlling labor. Standardizing labor required education and regularized jobs, thus connecting profits and progress. In supply chains, in contrast, goods gathered from many arrangements can lead to profits for the lead firm; commitments to jobs, education, and well-being are no longer even rhetorically necessary. Supply chains require a particular kind of salvage accumulation, involving translation across patches.

One can suggest the future for humans could be viewed through the

mind's eye of all life on this planet. For other species are already seeing a shrinking resource world, habitat-wise, be they butterflies, bees, large mammals, fish, or trees. The "science" of economics has a hand in this as human economists seem to promote the idea that remaking the world for human comfort is the only important goal. An animal economist would be very troubled by what has already occurred as the future is not "up and to the right" as they see numerous species struggling, and failing, to survive.

For economics to become a science—in the old sense of a study based on observation rather than theory based on a priori fantasy—it would have to put the biosphere at the center of its investigation. The biosphere is the source of all human life and all human activities. Without it, humans can do nothing, and in fact are nothing and won't exist. This truth is too archaic for the modern mind to accept, and yet is obvious.

Pollinating insects of all kinds—not just honeybees, which are actually fine since they're a mass produced, semi-domesticated industrial tool bred by people largely for use in for-profit enterprise—are facing population declines and threats of extinction. Our modern response to that is to fantasize replacing them with pollinating robots. Robots that in the first place we do not know how to design, nor build, nor program. The idea that we have—in any sense of the word—the ability to replace the essential parts of the biosphere we destroy, is pure delusion and a sign that our modern world has finally entered the realm of straight out insanity and senility. Haven't they seen *Black Mirror*?

Once you start looking at externalities, you find they are everywhere, and neither capitalism nor modern socialism can exist without them. Capitalism is—as it has always been—a scheme for shifting costs onto others, including the biosphere, and without that, capitalism makes no profit. Ever.

Merely noticing externalities is very preliminary groping, when what we need is understanding. It will always be too slow until we recognize that the field of economics is essentially bogus—containing tricks that work under specialized conditions but with no deep understanding of why the specialized conditions are specialized and what their limits are.

Once you see the primacy of the biosphere, then you can look at how it makes possible particular human activities of production of goods and services. This is secondary. It is also worth studying, but the point is it only exists in the context of a functioning biosphere that allows it to happen.

When people talk about technological revolution, they often fail to consider the additional complexity that comes with these technological changes. It is this complexity, and our inability to fully comprehend our place in that complexity, or its feedback on our lives, that will likely provide the ultimate limits to growth or advancement. Complexity will result in diminishing

returns—it will limit growth. The complex solutions to old problems typically generate new and more complex problems that are more difficult to solve. For example, the technological innovation of fracking to obtain tight oil/gas has resulted in groundwater pollution and has exacerbated climate change—problems that are orders of magnitude more difficult to solve.

As the Fed attempts more and more elaborate, innovative schemes to prop up the house of cards, the house of debt, the shakier the entire economic system becomes. Our new innovation-driven growth is not based on simple principles of useful product development, but rather on marketing to create desire for unnecessary consumption and on riskier and riskier financial bets that create bubble economies ripe for collapse. In addition, the glue that holds the system together is based on faith and myths that are more difficult to sell as the financial cracks become fissures; soon to become crevasses. The economy has lost its way—forgotten why it was created—morphed into a profit-driven machine rather than a needs-driven social exchange.

Complexity hinders our ability to see the big picture since complexity forces us to focus on narrow problems and solutions which we can comprehend with our finite consciousness. Complexity blinds us—we can't see the forest for the trees. We don't even understand how our unconscious desires control and overrule our conscious. As we attempt more and more complex solutions to problems driven by desires, not by need, we create a whole new set of problems—blowback from our inability to see the bigger picture. The demand to innovate and show movement, defined as a growth of knowledge, is all that seems to matter in our capitalist culture—even when no one pays attention to that new knowledge—much like all the other garbage we discard. I think we are rapidly approaching the saturation point in our ability to use this new complex information in a beneficial way.

In my own narrow sub-field of physics, I used to be able to at least skim the journals and find those articles of interest and worth reading to contemplate and discuss with others. But the demand for growth—growth of publications (publish or perish)—and growth of people in my field (grad student production) has transformed the journals into masses of information with incremental results that lack placement in the broader understanding. Most of this new knowledge is useless. Fewer and fewer scientists see the bigger picture. Scientists are so driven to generate new results, to produce, that the journals are too thick to parse unless you do nothing else. And the articles that scientists recommend to others are often their own publications in the hope that someone else might read them. The internet tools help—I can now download an article much faster than going to the library—but on the other hand I can't read and digest that article any faster, and the increased number of articles published has reached the point where it is

difficult to even find that useful article. The volume of information is growing too fast, and the older insights in the field are becoming lost to the newer generation of scientists who must attempt to rapidly innovate—or mimic what was already done—just to show progress. There is no time to develop wisdom.

Don't be too proud of this technological terror you've constructed.

The underlying theme that makes Single Payer, a Post Office Bank, and Paper Ballots so unattractive to the ruling liberal elite is that all three reduce complexity by orders of magnitude.

Liberalism today believes that complex problems require ever-escalating complex solutions, and it is almost an embedded trait to reflexively believe that anything else is “oversimplifying.” If a simple solution doesn't ignore supposedly critical aspects of the needs of a program, it certainly ignores some element of the political path required to get there. We all know that a desire to be “reasonable” leads many liberal leaders to begin negotiations by absorbing 50% of the hits from the adversary in advance.

When all else fails, it's also possible to create new needs through identity politics in terms of who gets what and when. In order to provide for poor urban populations without rankling white suburbanites, we create hoops. Means test everything! Even if it means that in 15 years that shiny new progressive program will be viewed as another layer of Welfare to be cut.

Ultimately, though, the underlying value set is that the ultimate merit in our society is the ability—mentally, financially, temporally—to navigate complexity. Those who can't, well they won't pass the means test and they don't deserve it. Having a complex playing field where you can get screwed if you don't do your homework and rewarded if you do is paramount to reinforcing that value set. Giving people single payer healthcare, post office banks, and paper ballots would just reward laziness!

The fact that all three also have fundraising and electoral implications is just gravy. While it is a feature, and not a bug, it's not the main reason behind the objection. The main reason is that the cultural value of innovation has captured our elite in a way not seen since the Victorian concepts of the deserving and undeserving poor, now wrapped up in an iPhone case.

The end of growth exposes the stupidity and ignorance of all but (and even that's a maybe) a precious few “leaders.” There is no other way this could have run, because an era of growth simply selects for different people to float to the top of the pond than a period of contraction does. Can we agree on that?

‘Growth leaders’ only have to seduce voters into believing that they can keep growth going, and create more of it (though in reality they have no

control over it at all). Anyone can do that. So anyone who's sufficiently hooked on power games will apply. 'Contraction leaders' have a much harder time; they must convince voters that they can minimize the suffering of the herd. Which is invariably a herd that no-one wants to belong to. A tough sell.

The claim that no income is unearned defines all economic activities as being productive in proportion to how much income they obtain. No one way of making money is deemed more or less productive than any other. Everyone earns just what he or she deserves. Natural law will proportion income and wealth to their recipients' contribution to production, if not interfered with.

There also is no measure of criminal income, smuggling, or fictitious accounting for tax avoidance. No category of spending is counted as overhead, not even pollution cleanup costs or crime prevention, not to mention financial bailouts. Economists dismiss these as "externalities," meaning external to the statistics deemed relevant. Yet despite the rising proportion of spending that takes the form of rent extraction, environmental pollution cleanup costs, debt pollution and its bailout costs, GDP is treated as an accurate measure of economic welfare. The result confuses healthy growth with that of a tumor on the body politic. Taken together, these omissions deter the kind of systemic analysis that would have alerted policy-makers and voters to the distortions leading up to the 2008 crash.

GDP is a poor measure of universal or even widespread thriving and prosperity, economic security and economic well-being.

Judging the health of our society by looking at stock prices is like judging the health of a dying man by looking at the leeches on his skin. 'Wow, those leeches are *very* happy. This man is in peak condition!'

Government deficits, the money supply, and GDP are abstractions that obscure the issues of power and distribution of wealth that are the consequence of a given political system. These abstractions make no sense as ends in themselves. A public deficit just means that a sovereign has spent money into the economy that it hasn't taxed back. It doesn't say whether that money was spent on bombs or schools or pure graft. A country can have a high GDP because a small subset of the population sells tons of luxury goods and financial instruments to each other while everyone else starves. Ultimately, what matters is the quality and distribution of resources.

If it cost a worker \$100 to make \$10, we would clearly see that as flawed, not worth it. But what is the real cost of our GDP growth? While the GDP is certainly a large number, the cost to get there is never noted, perhaps—likely certainly—this number is much higher.

Gross Domestic Product (GDP) is so flawed that we do not know whether

the increased output costs more to produce than it is worth. GDP is really a measure of what has been looted without reference to the cost of the looting. Environmental deregulation means that capitalists can treat the environment as a garbage dump. The planet can become so toxic that it cannot recover.

A property right is not a factor in production. If you sell off a road—a federal or local road—and you put up a toll booth and make it into a toll road, all of a sudden GDP goes up. If you go to war abroad, and you spend more money on the military, the military-industrial complex, all this is counted as increased production. None of this is really part of the production system of capital and labor building more and more factories, and producing more things that people need to live, and to do business. All of this is overhead. But there's no distinction between wealth and overhead.

And failing to draw that distinction means that the host doesn't realize that there is a parasite there. The host economy, the industrial economy, doesn't realize what the industrialists realize from the nineteenth century: that if you want to be an efficient economy and be low-priced, and sell, under-sell competitors, you have to cut your price by having the public sector provide roads freely; medical care freely; education freely. If you charge for all of these then you get to the point that the US economy is in today. Where if American workers, who work for factories, were to get all of their consumer goods for nothing—all of their food, transportation, clothing, furniture, everything for nothing—they still couldn't compete with Asians or other producers, because they have to pay up to 40% of their income for rent or mortgage interests, 10% or more of their income for student loans, credit card debt, 15% of their paycheck is automatic withholding to pay social security, to cut taxes on the rich, or to pay for medical care.

So Americans, you built into the economy all of this overhead. And there's no distinction between growth and overhead, and it's all made America so high-priced that we're priced out of the market, regardless of what trade policy we have.

In mainstream textbooks there is no exploitation. Even fraudulent banks, landlords, and monopolists are reported as earning whatever they take—as if they are contributing to GDP. In the 1960s there was still an emphasis on the history of economic thought, and also on economic history. That's gone now.

One can easily see why. Adam Smith, John Stuart Mill, and other classical economists sought to free their societies from the legacy of feudalism: landlordism and predatory finance, as well as from the monopolies that bondholders had demanded that governments create as a means of paying their war debts.

Back in the 1960s, just like today, university courses did not give any training in actual statistics. Academic courses didn't even make reference to accounting—so there was no conceptualization of 'money,' for instance, in terms of the liabilities side of the balance sheet.

New York University's money and banking course was a travesty. It was about helicopters dropping money down—to be spent on goods and services, increasing prices. There was no understanding that the Federal Reserve's helicopter only flies over Wall Street, or that banks create money on their own computers. It was not even recognized that banks lend to customers mainly to buy real estate, or speculate in stocks and bonds, or raid companies.

Economics is taught like English literature. Teachers explain the principle of "suspension of disbelief." Readers of novels are supposed to accept the author's characters and setting. In economics, students are told to accept just-pretend parallel universe assumptions, and then treat economic theory as a purely logical exercise, without any reference to the world.

The switch from fiction to reality occurs by taking the policy conclusions of these unrealistic assumptions as if they do apply to the real world: austerity, trickle-down economics shifting taxes off the wealthy, and treating government spending as deadweight even when it is on infrastructure. The most fictitious assumption is that Wall Street and the FIRE sector add to output, rather than extracting revenue from the rest of the economy.

The history of economic thought has been replaced by mathematics, to mathematize a fictitious parallel universe model. The result is what computer operators call 'Garbage In, Garbage Out' (GIGO). You're mathematizing something fictitious. If you look at the introductions to Paul Samuelson's or Bill Vickery's textbooks, they won the Not-a-Nobel prize for writings that came right out and said that economics is not about reality. It's about the internal consistency of assumptions. It's to build a beautiful system that, if it really worked, would be so appealing that students will be willing to suspend disbelief. That is what a good science fiction writer would do. The trick is to make readers willing to accept the assumptions that they're given at the outset. Free-market tunnel vision is simply about logical consistency of unrealistic assumptions.

These people are idiot savants. They're very smart in an abstract, autistic way, but they don't know what to be smart about. They're willing to use their smartness to be deceptive, to become financial lobbyists. Their work is then turned over to focus groups to find out what kind of rhetoric is best going to trick people into thinking that poverty is wealth. The aim is to convince people that they can get rich from going into debt to buy a house and become part of the middle class economic treadmill, and to believe:

‘Only the rich can save us.’ If you can get people to believe that, you’ve won their hearts and minds

Financial systems tend to develop into Ponzi schemes if unchecked. The main issue is the exponential overgrowth and instability inherent in the “miracle of compound interest,” underlying such schemes and financialized economies. For the economy at large, such growth sucks revenue and wealth from the broad base to the narrow top, impoverishing the many to enrich the few.

Compound interest takes from the weak and gives to the strong; makes the rich richer and the poor poorer; builds palaces for the idle and hovels for the diligent. Only the wealthy are able to save up significant amounts and let sums simply accumulate and accrue interest over time. Small savers must live off their savings, drawing them down long before the mathematics of compound interest become truly significant.

What is remarkable is that this principle of compound interest has come to be viewed as a way to make populations richer rather than poorer. It is as if workers can ride the exponential growth of financial debt claims, by saving in mutual funds or investing in pension funds to financialize the economy. This rosy scenario assumes that the increase in debt does not dry up the growth in markets, investment, and employment.

J. P. Morgan and John D. Rockefeller are said to have called the principle of compound interest the Eighth Wonder of the World. For them it meant concentrating financial fortunes in the hands of an emerging oligarchy indebting the economy to itself at an exponential rate. This has been the key factor in polarizing the distribution of wealth and political power in societies that do not take steps to cope with this dynamic.

After 2008, for instance, banks innovated a new financial “product” called reverse mortgages. Retirees and other homeowners signed agreements with banks or insurance companies to receive a given annuity payment each month, based on the owner’s expected lifetime. The annuity was charged against the homeowner’s equity as prepayment for taking possession upon the owner-debtor’s death. The banks or insurance companies ended up with the property, not the children of the debtors. In some cases the husband died and the wife received an eviction notice, on the ground that her name was not on the ownership deed. Capitalism!

The moral is that what is inherited in today’s financialized economy is creditor power, not widespread home ownership. So we are brought back to the fact that compound interest does not merely increase the flow of income to the rentier One Percent, but also transfers property into its hands.

Few global managers today are drawn from industry. Most economic decision-makers have been trained in business schools to view companies

primarily as vehicles to produce financial gains.

In the first three decades after World War II, major American corporations typically retained and reinvested their earnings. But beginning in the 1980s, a steadily increasing portion of corporate earnings went to share buybacks. Between 1934 and 1982, the Securities and Exchange Commission regarded stock buybacks as potential vehicles for stock manipulation and fraud. It required companies to disclose the volume of their buybacks and prohibited companies from repurchasing more than 15 percent of the value of their stock on any given day. But in 1982, John Shad, the new chairman of the SEC, appointed by Ronald Reagan, removed these restrictions. Henceforth, CEOs could use buybacks to manipulate the prices of their companies' shares.

Adding to the allure of stock options was a subsequent decision by the SEC, in 1991, to permit top executives, even though technically company insiders with knowledge of the timing of their company's stock buybacks, to quietly cash in their stock options without public disclosure. Then, in 1993, the Clinton administration decided to allow companies to deduct from their taxable income executive pay in excess of \$1 million if that pay was linked to corporate performance—that is, if it came in the form of stock options and awards linked to share prices. Not surprisingly, stock options thereafter boomed.

The financial sector is the major endower of business schools. They have become training grounds for Chief Financial Officers. At Harvard, one professor reasoned that managers should aim at serving stockholders, not the company as such. The result was an incentive system tying management bonuses to the stock price. So naturally, CFOs used corporate earnings for stock buybacks and dividend payouts that provided a short-term jump in the stock price.

The ideological foundation of today's business schools is that economic control should be shifted out of government hands into those of financial managers—that is, Wall Street. That is their idea of free enterprise. Its inevitable tendency is to end in more centralized planning by Wall Street than in Washington.

The aim of this financial planning is quite different from that of governments. The euro and the ECB were designed in a way that blocks government money creation for any purpose other than to support the banks and bondholders. The financial sector takes over the role of economic planner, putting its technicians in charge of monetary and fiscal policy without democratic voice or referendums over debt and tax policies.

Financial planning always has been short-term. That is why planning should not be consigned to banks and bondholders. Their mentality is

extractive, and that ends up hit-and-run. What passes for mainstream financial analysis is simply to add up how much is owed and demand payment, not help the economy grow. To financial managers, economic prosperity and unemployment is an externality—that is, not part of the equation that they are concerned with.

The vocabulary taught to students today in economics—and used by the mass media and by government spokesmen—is basically a set of euphemisms. If you look at the television reports on the market, they say that any loss in the stock market isn't a loss, it's "profit taking." And when they talk about money. Or the stock market rises—"Oh that's good news." But it's awful news for the short sellers it wipes out. Almost all the words we get are kind of euphemisms to conceal the actual dynamics that are happening. For instance, "secular stagnation" means it's all a cycle. Even the idea of "business cycles": Nobody in the nineteenth century used the words 'business cycle.' They spoke about "crashes". They knew that things go up slowly and then they plunge very quickly. It was a crash. It's not the sine curve that you have in Josef Schumpeter's book on business cycles. It's a ratchet effect: slow up, quick down. A cycle is something that is automatic, and if it's a cycle and you have leading and lagging indicators as the National Bureau of Economic Research has. Then you'd think 'Oh, okay, everything that goes up will come down, and everything that goes down will come up, just wait your turn.' And that means governments should be passive.

Well, that is the opposite of everything that's said in classical economics and the Progressive Era, when they realized that economies don't recover by themselves. You need the government to step in, you need something "exogenous," as economists say. You need something from outside the system to revive it. The covert idea of this business cycle analysis is to leave out the role of government. If you look at neoliberal and Austrian theory, there's no role for government spending, and no role of public investment. The whole argument for privatization, for instance, is the opposite of what was taught in American business schools in the nineteenth century. The first professor of economics at the Wharton School of Business, which was the first business school, was Simon Patten. He said that public infrastructure is a fourth factor of production. But its role isn't to make a profit. It's to lower the cost of public services and basic inputs to lower the cost of living and lower the cost of doing business to make the economy more competitive. But privatization adds interest payments, dividends, managerial payments, stock buybacks, and mergers and acquisitions. Obviously these financialized charges are factored into the price system and raise the cost of living and doing business.

The classical concept of economic rent has been censored by calling

finance, real estate and, monopolies “industries.” The result is that about half of what the media report as “industrial profits” are FIRE-sector rents, that is, finance, insurance, and real estate rents—and most of the remaining “profits” are monopoly rents for patents (headed by pharmaceuticals and information technology) and other legal privileges. Rents are conflated with profit. This is the terminology of financial intruders and rentiers seeking to erase the language and concepts of Adam Smith, Ricardo, and their contemporaries depicting rents as parasitic.

Obliterating the logic that led society to regulate and tax rentiers in the first place, think tanks and business schools favor economists who portray rentier takings as a contribution to the economy rather than a burden on it. By 2012, over 60 percent of the value of homes in the United States is owed to creditors, so that most rental value is paid as interest to banks, not to the community.

Home ownership has been democratized on credit. Yet banks have succeeded in promoting the illusion that the government is the predator, not bankers. The rising proportion of owner-occupied housing has made the real estate tax the most unpopular of all taxes, as if property tax cuts do not simply leave more rental income available to pay mortgage lenders.

Today’s banks don’t finance tangible investment in factories, new means of production, or research and development—the “productive lending” that is supposed to provide borrowers with the means to pay off their debt. Banks largely lend against collateral already in place, mainly real estate (80 percent of bank loans), stocks, and bonds. The effect is to transfer ownership of these assets, not produce more.

So basically you have the financial sector ending up with much more of the gains. And the name of the game if you’re on Wall Street isn’t profits. It’s capital gains. And that’s something that wasn’t even a part of classical economics. They didn’t anticipate that the price of assets would go up for any other reason than earning more money and capitalizing on income. And actually, what you have in the last 50 years, really since WWII, has been asset price inflation, that most families have—middle-class families—have gotten the wealth that they’ve got since 1945 not really by saving what they’ve earned by working, but by the price of their house going up. They’ve benefited by the price of the house. And they think that that’s somehow made them rich.

And the reason the price of the house has gone up is that a house is worth whatever a bank is going to lend against it. And if banks made easier and easier credit, lower down payments, then you’re going to have a financial bubble. And so now, you have, indeed, real estate having gone up as high as it can, I don’t think it’ll take more than 40% of somebody’s income to buy it.

But now, if you, imagine if you're joining the labor force. You're not going to be able to buy a house at today's prices, putting down a little bit of your money, and then somehow end up getting rich just on the house investment. All of this money you pay the bank is now going to be subtracted from the amount of money that you have to spend on goods and services.

So we've turned the post-war economy that made America prosperous and rich, we've turned it inside out, and somehow the most people believe that you could get rich by going into debt to borrow something that's going to rise in price. And you can't get rich, ultimately, by going into debt. In the end, the creditors always win, and that's why every society since Sumer and Babylonia have had to either cancel the debts, or you come to a society like Rome that didn't cancel the debts, and then you have a dark age. Everything collapses.

Yes. The head of Goldman Sachs came out and said: Goldman Sachs workers are the most productive in the world. That's why they're paid what they are. And the concept of productivity in America is the income divided by the labor. So if you're Goldman Sachs and you pay yourself \$20 million a year in salary and bonuses, you're considered to have added \$20 million to GDP, and that's enormously productive. So we're talking with tautology. We're talking with circular reasoning here.

So the issue is whether Goldman Sachs, Wall Street, predatory pharmaceutical firms, actually add a product or whether they're just exploiting other people. People think of the parasite as simply taking money, taking blood out of the host, or taking money out of the economy. But in nature, it's much more complicated. The parasite can't simply come in and take something. First of all, it needs to numb. It has an enzyme that numbs the host so the host doesn't even realize the parasite's there. And then the parasites have another enzyme that makes the host—it takes over the host's brain. And it makes the host imagine that the parasite is part of the body, actually part of itself, to be protected.

Well, that's basically what Wall Street has done. It depicts itself as part of the economy. Not as a wrapping around it. Not as external to it. But actually is the part that's helping the body grow, and that actually is responsible for most of the growth, when in fact it's the parasite that is taking over the growth.

So the result is an inversion of classical economics. It turns Adam Smith upside down. It says what the classical economists said was unproductive, parasitism, actually is the real economy, and the parasites are labor and industry, that get in the way of what the parasite wants, which is to reproduce itself, not help the host.

The "free market" has been redefined to mean freedom for the rentier

class to create a tollbooth economy, not freedom from their predatory incursions to extract unearned income in today's New Enclosure Movement. Its advocates trumpet this not as class war, but as "the end of history," as if it is inevitable and There Is No Alternative. As if austerity is a fact of nature instead of a tactic in class warfare.

The assumption that no government spending can take the form of capital investment, and that all budget deficits are simply a deadweight drain on the economy, inverts the direction in which civilization has been traveling for thousands of years. There is no accounting offset for public investment as an asset, reducing the deficit from "current" spending. It is as if only the private sector has a balance sheet with assets and productive spending on it. The irony is that account keeping and profit-and-loss statements were innovated in the temples and palaces of Mesopotamia some five-thousand years ago!

For thousands of years, from ancient Mesopotamia through classical Greece and Rome, temples and palaces were the major creditors, coining and providing money, creating basic infrastructure and receiving user fees as well as taxes. The Templars and Hospitallers led the revival of banking in medieval Europe, whose Renaissance and Progressive Era economies integrated public investment productively with private financing.

To make this symbiosis successful and immune to special privilege and corruption, nineteenth-century economists sought to free parliaments from control by the propertied classes that dominated their upper houses. Britain's House of Lords and senates throughout the world defend the vested interests against the more democratic regulations and taxes proposed by the lower house. Parliamentary reform extending the vote to all citizens was expected to elect governments that would act in society's long-term interest. Public authorities would take the lead in major capital investments in roads, ports, and other transportation, communications, power production and other basic utilities, including banking, without private rent-extractors intruding into the process. The alternative was for infrastructure to be owned in a pattern much like absentee landlordship, enabling rent-extracting owners to set up tollbooths to charge society whatever the market would bear.

Such privatization is contrary to what classical economists meant by a free market. They envisioned a market free from rent paid to a hereditary landlord class, and free from interest and monopoly rent paid to private owners. The ideal system was a morally fair market in which people would be rewarded for their labor and enterprise, but would not receive income without making a positive contribution to production and related social needs. Adam Smith, David Ricardo, John Stuart Mill, and their contemporaries warned that rent extraction threatened to siphon off income and bid up prices above

the necessary cost of production. Their major aim was to prevent landlords from “reaping where they have not sown,” as Smith put it. Toward this end their labor theory of value aimed at deterring landlords, natural resource owners and monopolists from charging prices above cost-value. Opposing governments controlled by rentiers.

If you read Adam Smith and subsequent classical economists, you see that their main concern was to distinguish between productive and unproductive economic activity. They wanted to isolate unproductive rentier income, and unproductive spending and credit.

To do this, they developed the labor theory of value to distinguish value from price—with “economic rent” being the excess of price over socially necessary costs of production. They wanted to free industrial capitalism from the legacy of feudalism: tax-like ground rent paid to a hereditary landed aristocracy. They also opposed the monopolies that bondholders had insisted that governments create to sell off to pay the public debt. That was why the East India Company and the South Sea Company were created with their special privileges.

Smith and his followers are applauded as the founding fathers of “free market” economics. But they defined free markets in a diametrically opposite way from today’s self-proclaimed neoliberals. Smith and other classical economists urged markets free from economic rent.

These classical reformers realized that progressive taxation to stop favoring rentiers required a government strong enough to take on society’s most powerful and entrenched vested interests. The nineteenth-century drive for Parliamentary reform in Britain aimed at enabling the House of Commons to override the House of Lords and tax the landlords. This rule finally passed in 1910 after a constitutional crisis. Now there has been a fight by creditors to nullify democratic politics, most notoriously in Greece.

Today’s neoliberals define free markets as those that free rent-seekers and predatory bankers from government regulation and taxes. No wonder the history of economic thought has been stripped away from the curriculum. Reading the great classical economists would show how the Enlightenment’s reform program has been inverted. The world is now racing down a road to the Counter-Enlightenment, a neo-rentier economy that is bringing economic growth to a halt.

In 2015, studies estimate that US renters paid \$535 billion to landlords in residential rents. To put this in perspective, \$535 billion is about enough to give \$15,000 to every human being in the US state of California. It would also be enough to replace every page of every book in the US Library of Congress with \$100 bills. And if a person stood outside of Walt Disney World every day from open to close, handing \$30,000 in cash to each individual

visitor, it would take a year to hand out \$535 billion. But what exactly did this massive sum of money actually pay for? Why did people start paying landlords in the first place? And do lands really need lords?

Long before the blossoming of modern technology and the dawn of the industrial era, humanity occupied only a fraction of the lands it does today. Between the hubs of ancient commerce, an immense wilderness existed that, legally speaking, was the property of no one and even land that had already been settled was likely to be managed communally. In parts of West Europe, wild and communal lands were—and are still are—called “commons” and those who could not or did not wish to make a living in the town often had the option to subsist by farming common land or to join a communal farming-village that was already established. Similar forms of non-private, custom-based and communal systems of land-use existed across the globe in the preindustrial ages for tens-of-thousands of years—until a few centuries ago.

Before modern notions of private-property arose alongside the full development of capitalism in the eighteenth century, social and economic life in medieval Europe was organized within a system that today is known as feudalism. Under the preindustrial conditions of feudalism, the central focus of economic activity was agriculture and, since land was the main thing needed for production, landholdings were the most important form of wealth in feudal society. In the same sense that money is power in capitalist societies today, land is power in feudal society.

Feudalism appears in different forms, depending on time and place. In feudal England, all land belonged to a king who strategically granted titles to powerful members of the nobility that allowed them to rule over large estates in exchange for pledges to provide knights or soldiers for the king’s military. In turn, the “lords” of these estates—none of whom could possibly use so much land—leased parts of the land to their aristocratic peers and important allies, many of whom also sublet parts of their land, often for similar pledges of military-aid, for rents, or as payment for services.

Noble landholders were considered to be the lords of their sub-tenants, as well as the peasants and serfs inhabiting the land, and most lords were also considered a tenant (also known as a vassal) of the overlord who granted the land to them. A lord whose land was given directly by the king was known as a tenant-in-chief and held the title of baron, in addition to attending the king’s councils. Altogether, such arrangements added up to form a kind of “military-agrarian complex” that reinforced the monarchic regime’s ability to control land through a complex bureaucracy of landholders that enforced the rigid hierarchy of feudal society.

While the warlords, aristocrats, and Church officials who made up the

landholding class mostly occupied political, military, and religious roles, it was the peasants who did the work in feudal society. Unlike the nobility, few peasants had their own land and many were considered serfs (an Old French word related to servant and slave) who were legally prohibited from leaving the land they cultivated without their lord's permission due to laws dating from the late Roman empire. In most cases, serfs were bound to work the same land as their ancestors, which meant that serfs were essentially leased along with the land by one landed lord to another. While free peasants at least could move or be married without permission slips, their circumstances were rarely better. Since most were landless, landed lords demanded rents from peasants in exchange for the right to work the soil, often paid with daily labor or with a hefty part of the peasant's own harvest.

Because the Church had forbidden usury (issuing loans with interest), landed lords started to buy and sell leases of land and, by the year 1500, the leasehold had become a common and lucrative way to circumvent the Church's ban. The practice of transferring land in the form of leaseholds—which naturally included the feudal right to exploit the labor of serfs and extract rent from its tenants—is what forms the legal foundation for the residential leases that exist across the world today.

Unlike the hereditary rights of kings to rule or the institutions of serfdom, which had already been largely eroded by the time of the industrial age, the feudal relationships of landlord and tenant were never really abolished. As factory-based industry spread, the market-economics that would come to characterize the emerging capitalist societies took hold around the world, much of which—thanks to colonialism—had not just been colonized by Europe but also by European legal systems, along with the feudal property laws they codified. The English system was transplanted everywhere from the Americas and Pacific Islands to Africa, India, and Australia, while similar feudal systems were exported by France, Spain, and other colonial and imperialist nations.

Over the next few hundred years, feudal leaseholds, as well as the land in general, were gradually privatized through acquisitions, settlement, and processes of enclosure pushed by governments that were often led by the same wealthy lords in shiny, new capitalist hats.

Even setting aside the social and legal history that traces the origins of rent collection to feudal entitlements that granted hereditary rights to inbred clans of medieval warlords, there is still the question—why should landlords be entitled to payment at all?

Before continuing the discussion, an important distinction needs to be drawn between the small-time mom-and-pop landlord and the big-time tycoons and corporate landlords. The key point of difference is that small-

time landlords tend to act as groundskeepers who perform labor, such as landscaping and maintenance, whereas the tycoon and corporate landlords act as shareholders, hiring others to perform the labor of maintaining their properties. Of course there will always be exceptions, and perhaps outside forces are even pushing more and more small-time landlords into exploitative roles. However, in the interest of fairness, the following discussion will consider small-time landlords to be groundskeepers and exclusively address the large-scale landlords.

The rental of residential land and living-space is a strange commodity. Broadly speaking, commodities—whether physical products like food and cars, services like repair and healthcare, or information like research and iPhone apps—are the results of some kind of production. Or in other words, commodities are made by people using other things. Cars are made by people using factory machinery and steel, things are repaired by people using tools and parts, and apps are created by software-developers with knowledge gained from education and the value of each is determined by how much labor is needed to produce them. But who produces land and space, with what materials, and how many labor-hours on average is needed to produce them?

If a thing is produced, it is reasonable to argue that the person who labored to make the thing has a right to control its use, whether she wants to use it herself, lend or sell it to others, or give it away because she created it. That, in fact, is exactly the reasoning used by classical-liberal philosophers like John Locke to support the idea of a natural right to property, which was fairly radical at the time because it opposed the feudal entitlements to land held by a ruling minority of aristocrats. Things like land and space, along with springs, oyster-beds, or other forms of “natural capital,” are non-produced. And if neither the landlord’s nor anyone’s labor is a factor of land’s existence, why should society’s laws entitle landlords to payments from anyone too poor to buy property?

The absurdity of entitlements to rent is clearest in cases of unimproved land with no structures, utilities, or other bells and whistles added. Extracting rent for the use of idle soil and empty living-spaces is nothing but a legalized act of extortion. Since the basis of society (and human survival) is availability of living-space and cultivation of land, to keep others, human or non-human, from occupying living space or using land productively is not just violent but anti-social in the most literal sense of the word.

In cases of improved land, rent collection seems more defensible at first. It may be argued, for instance, that a landlord who buys an apartment complex and pays for its upkeep has a right to collect rents to recover his investment and in reward for assuming the risk. But this accounts only for

the landlord's personal interest without considering the deficit to society overall. After the costs to build the complex, the only real costs left are to maintain it. Since these costs must be less than a landlord's revenue to create income, rents must always exceed the real cost to maintain the property and rent collectors must always be less efficient than if tenants had simply paid such costs directly.

The real cost to build and maintain housing is unavoidable because society depends on housing to exist and, while small-time landlords often provide at least some real labor and materials, rent collection in itself contributes nothing to this endeavor. If small-time landlords who maintain properties are considered as workers like the grounds-keepers and other workers who are paid for similar labor, the remaining landlords' only labor is to manage the rent-collecting business. And business is booming. Because everyone needs a place to live.

According to the US Department of Housing and Urban Development (HUD), this rental business raked in an average \$11,232 per unit yearly for about 43.9 million housing units in 2015—but what does the business provide in return? The US Census Bureau's Rental Housing Finance Survey shows landlords spend an average of 10 hours per month managing properties overall, while half of them spend just 3 hours per month or less, and that is according to landlords' own responses. The average expenses were \$4,751 per unit and most of it covered property tax and business activity—insurance, payroll, professional and legal services—while maintenance, grounds, and landscaping accounted for just \$1,906. This means that, aside from the necessary costs to continue providing housing to a renter, the landlord collects. . .

$$\$11,232 - 1,906 = \$9,326$$

After settling property taxes (coincidentally also \$1,906 per unit on average), the landlord is essentially siphoning \$7,420 from the wages of each of their tenants. For \$11,232, a US tenant can expect \$1,906 in maintenance and landscaping services on average, in addition to not having to pay the property tax—and that's it. In return for arranging those services, the average landlord can expect to be free from the kinds of wage-labor that most renters have no choice but to perform if they wish to enjoy the privilege of a roof over their heads.

The alternatives to this medieval system of land tenure are only limited by the imagination. One of the more straightforward options would be to transform private residential properties into housing cooperatives, grouped

by neighborhood, building, or community. Instead of rent, funds for maintenance costs would be pooled together through the cooperatives and paid out as needed and surpluses could be re-distributed as dividends to residents to incentivize efficient repairs or re-invested in improvements—community gardens, pools, shared tool-libraries, cooperative wifi-zones, et cetera.

Depending on how the transition to cooperative housing was handled, it might even be plausible to preserve the jobs of small-time landlords as groundskeepers who are compensated for labor rather than property ownership. The process of changing residence would remain mostly the same except that cooperatives would manage applications rather than landlords and the major consideration would be the average maintenance-costs at different housing cooperatives rather than rental agreements.

Of course, the real problem lies in overcoming political obstacles to land reform. Though rental-property owners make up just 3% of the US population, the rental-housing market is stuffed with nearly as much capital as the US defense budget and so it may be fair to say that a successful US land-reform movement would be about as hard to build as a successful US anti-war movement. Not impossible, of course, but pretty damned challenging.

The good news is that virtually everyone in society stands to benefit from ditching this outdated model and, if the historical record is any indication, the chance of revolutionary action is likely to rise pretty quickly once enough of the peasants are miffed about unfair land-distribution. And if history teaches us anything, it is that nothing—not kings nor even gods—can hold the united wrath of the peasants in abeyance for long.

What is at work is an Orwellian strategy of rhetorical deception to represent finance and other rentier sectors as being part of the economy, not external to it. This is precisely the strategy that parasites in nature use to deceive their hosts that they are not free riders but part of the host's own body, deserving protection and nourishment.

The idea of parasitism as a positive symbiosis is epitomized by the term 'host economy'—one that welcomes foreign investment. Governments invite bankers and investors to buy or finance infrastructure, natural resources, and industry. Local elites and public officials in these economies typically are sent to the imperial or financial core for their education and ideological indoctrination to accept this dependency system as mutually beneficial and natural. The home country's educational cum ideological apparatus is molded to reflect this creditor/debtor relationship as one of mutual gain.

The financial sector's strategy to dominate labor, industry, and government involves disabling the economy's 'brain'—the government—and behind it, democratic reforms to regulate banks and bondholders. Financial

lobbyists mount attacks on public planning, accusing public investment and taxes of being a deadweight burden, not as steering economies to maximize prosperity, competitiveness, rising productivity and living standards. Banks become the economy's central planners, and their plan is for industry and labor to serve finance, not the other way around. Even without so conscious an aim, the mathematics of compound interest turns the financial sector into a wedge to push large sectors of the population into distress. The buildup of savings accruing through interest that is recycled into new lending seeks out ever-new fields for indebtedness, far beyond the ability of productive industrial investment to absorb

In 2008, we watched a dress rehearsal for this road show when Wall Street convinced Congress that the economy could not survive without bailing out bankers and bondholders, whose solvency was deemed a precondition for the real economy to function. The banks were saved, not the economy. The debt tumor was left in place. Homeowners, pension funds, city and state finances were sacrificed as markets shrank, and investment and employment followed suit. "Saving" since 2008 has taken the form of paying down debts to the financial sector, not to invest to help the economy grow. This kind of zombie saving depletes the economy's circular flow between producers and consumers. It bleeds the economy while claiming to save it, much like medieval doctors.

To siphon off a free lunch without triggering resistance, the parasite needs to take control of the host's brain, at first to dull its awareness that an invader has attached itself, and then to make the host believe that the free rider is helping rather than depleting it and is temperate in its demands, only asking for the necessary expenses of providing its services. In that spirit bankers depict their interest charges as a necessary and benevolent part of the economy, providing credit to facilitate production and thus deserving to share in the surplus it helps create. Insurance companies, stockbrokers, and underwriters join bankers in aiming to erase the economy's ability to distinguish financial claims on wealth from real wealth creation. Their interest charges and fees typically eat into the circular flow of payments and income between producers and consumers. To deter protective regulations to limit this incursion, high finance promotes a "value-free" view that no sector exploits any other part. Whatever creditors and their financial managers take is deemed to be fair value for the services they provide

The most lethal policy sedative in today's mainstream orthodoxy is the mantra that "All income is earned." This illusion distracts attention from how the financial sector diverts the economy's nourishment to feed monopolies and rent-extracting sectors surviving from past centuries, now supplemented by yet new sources of monopoly rent, above all in the financial

and money management sectors.

The self-portrait that today's economies draw to describe their circulation of spending and production is the National Income and Product Accounts (NIPA). As presently designed, the NIPA neglect the distinction between productive activities and zero-sum transfer payments where no overall production or real gain takes place, but income is paid to one party at another's expense. The NIPA duly report the revenue of the Finance, Insurance, and Real Estate (FIRE) sector and monopolies as "earnings." These accounts have no category for what classical economists called economic rent—a free lunch in the form of income siphoned off without a corresponding cost of labor or enterprise. Yet a rising proportion of what the NIPA report as earnings actually derive from such rents.

Milton Friedman adopted the rentier motto as a cloak of invisibility: "There Is No Such Thing As A Free Lunch" (TINSTAAFL). That means there are no parasites taking without giving an equivalent value in return—at least, no private sector parasites. Only government regulation is condemned, not rent-extraction. In fact, taxation of rentiers—the recipients of free-lunch income, "coupon clippers" living off government bonds or rental properties or monopolies—is denounced rather than endorsed, as was the case for Adam Smith, John Stuart Mill and their nineteenth-century free market followers.

In short, the NIPA are not really a model of how economies work and how fortunes are made in today's world. Instead, the NIPA provide a cloak of invisibility for rent-extracting activities. The vested interests have won the fight against creating more relevant statistical categories. Their hope evidently is that if exploitative activities are not seen or quantified, they are less likely to be taxed or regulated.

Today's major rentier sector is banking and high finance. Most bank loans are geared not to produce goods and services, but to transfer ownership rights for real estate, stocks (including those of entire companies), and bonds.

What a realistic set of national accounts should show is that instead of using their wealth to invest in producing more to raise living standards, the One Percent lend out their savings at interest to extract revenue from wage earners, real estate, industry, and government, shrinking the economy instead of expanding it. Most financial transactions now take place with other financial institutions, largely in the form of computerized bets ("derivatives") calculating risks on which way interest rates and exchange rates or stock and bond prices will move. One party's gain is another's loss, and the overall system ends up needing to be bailed out by government. But instead of simply creating the money to pay everyone off, central bank managers insist that labor and industry must pay, by raising taxes on the real economy

to pay for the financial sector's losses, on the pretense that the financial sector is what is making the economy richer, not poorer, and that austerity (poverty for the 99 Percent) will be a cure—a cure mainly for the fact that the One Percent do not yet control all the wealth.

Here again we find the basic rentier demand:

“Your money, or your life.”

At the generally accepted creation of the concept ‘free markets,’ it largely meant free from predatory landlords and other powerful rentiers implementing and influencing things in such a way as they could harm “the people.”

Unfortunately their desire to throw off the aristocracy has been forgotten or manipulated into the modern day version most of us are familiar with. Like many banned chemicals, they simply tweaked the formulation of their oppression and exploitation slightly and kept on going, becoming better and better at it as they went.

And here we are. Yay progress.

The illusion of progress is much more marketable than actual progress. As in fake robot cars are so much better, cooler, awesome than viable public transportation where you might have to ride around with the dirty, smelly poors. Even though increasing public transportation is the sane response to climate change and limiting emissions, there is no profit in it, or the expectation of profit—which is the Uber/Amazon game—so our visionary politicians choose the least sane and rational option. Plus, public transit doesn't fund political campaigns.

If humanity survives to twenty-second century, there will surely be some great economist who will eviscerate capitalism's ability to routinely and grandly misallocate resources, in between his or her time spent harvesting and growing the O₂ producing algae keeping him or her barely alive.

Falling on your face is a state of equilibrium. So is death—and each moment of dying. Equilibrium is simply a cross section in time. Water levels 20 or 30 feet higher would be another form of equilibrium. But to the oil industry, ‘equilibrium’ means their earnings continuing to grow at the present rate, year after year. This involves selling more and more oil, even if this raises sea levels and floods continents. That is simply ignored as not relevant to earnings. By the time that flooding occurs, today's executives will have taken their bonuses and capital gains and retired.

That kind of short-termism is the essence of junk economics. It is tunnel-visioned. What also makes economics junky is assuming that any “disturbance” sets in motion countervailing forces that return the economy

to its “original” state—as if this were stable, not moving down the road to debt peonage and similar economic polarization.

The reality is what systems analysts call positive feedback: When an economy gets out of balance, especially as a result of financial predators, the feedback and self-reinforcing tendencies push it further and further out of balance. Once a class or economy falls into debt, the debt overhead tends to grow steadily until it stifles market demand and subjects the economy to debt deflation. Income is sucked upward to the creditors, who then foreclose on the assets of debtors. This shrinks tax revenue, forcing public budgets into deficit. And when governments are indebted, they become more subject to pressure to privatize public enterprises. Assets are turned over to monopolists, who further shrink the economy by predatory rent seeking.

An economy going bankrupt such as Greece and having to sell off its land, gas rights, ports, and public utilities is in equilibrium at any given moment that its working-age population is emigrating, people are losing their pensions and suffering.

When economists treat depressions merely as self-curing “business downturns,” they are really saying that no government action is required from “outside the market” to rectify matters and put the economy back on track to prosperity. So equilibrium thinking is basically anti-government libertarian theory.

But when banks are subjected to equilibrium by writing down debts in keeping with the ability of borrowers to pay, Wall Street’s pet politicians and economic journalists call this a crisis and insist that the banks and bondholders must be saved or there will be an even worse crisis. This is not a solution. It makes the problem worse and worse.

There is an alternative, of course. That is to understand the dynamics at work transforming economic and social structures. That’s what classical economics was about. The post-classical revolution was marginalist. That means that economists only look at small changes, not structural changes. That is another way of saying that reforms are not necessary—because reforms change structures, not merely redistribute a little bit of income as a bandage.

What used to be ‘political economy’ gave way to just plain ‘economics’ by World War I. As it became increasingly abstract and mathematical, students who studied the subject because they wanted to make the world better were driven out, into other disciplines.

Our societal epitaph will read: ‘The most destructive species on the planet; decided to kill all complex life because people needed jobs.’

“You have all the right moral things to say but absolutely no idea how economies work. At the beginning of the Industrial Revolution British workers weren’t being paid an amazing wage. But as the country developed and traded with other countries we attracted more customers. This meant businesses made more money, they built more factories, and the economy grew.

As the skilled workmanship from the time could demand a higher price abroad the staff began to demand more wages. This along with unionization and laws pushed workers rights and pay upwards.

But you can’t just start out with a high pay rates and workers’ rights. The economy underneath it has to be there to support and sustain it. Many developing nations are still in these stages of developing an economy. Attracting business and educating their staff are the first steps. Their only incentive currently to attract business is usually their cheap cost. If you remove that incentive and impose high costs why would anyone invest there. They could go to a developed country where the staff are better trained and their money is safer.

Your ideals are right but if you remove the low cost of workers in developing nations you cut the legs out of an economy trying to get moving. It feels cold to disregard the suffering of individual workers, the long hours for little pay. But I don’t think we can impose our system directly. We have to let these countries grow organically as ours did. If we can help out by investing there then I think we should.”

This seems to reflect the usual assumption that people are supposed to serve “the economy,” a convenient abstraction masking the interests of the wealthy. A social organization that creates losers is plainly wrong: people don’t just need rudimentary sustenance but respect.

The aim of academic trade theory is to tell students, ‘Look at the model, not at how nations actually develop.’ So of all the branches of economic theory, trade theory is the most wrongheaded.

For lead nations, the objective of free trade theory is to persuade other countries not to protect their own markets. That means not developing in the way that Britain did under its mercantilist policies that made it the first home of the Industrial Revolution. It means not protecting domestic industry, as the United States and Germany did in order to catch up with British industry in the nineteenth century and overtake it in the early twentieth century.

Trade theorists start with a conclusion: either free trade or protectionism. Free trade theory as expounded by Paul Samuelson and others starts by telling students to assume a parallel universe—one that doesn't really exist. The conclusion they start with is that free trade makes everyone's income distribution between capital and labor similar. And because the world has a common price for raw materials and dollar credit, as well as for machinery, the similar proportions turn out to mean equality. All the subsequent assumptions are designed to lead to this unrealistic conclusion.

But if you start with the real world instead of academic assumptions, you see that the world economy is polarizing. Academic trade theory can't explain this. In fact, it denies that today's reality can be happening at all!

A major reason why the world is polarizing is because of financial dynamics between creditor and debtor economies. But trade theory starts by assuming a world of barter. Finally, when the transition from trade theory to international finance is made, the assumption is that countries running trade deficits can "stabilize" by imposing austerity, by lowering wages, wiping out pension funds and joining the class war against labor.

All these assumptions were repudiated already in the eighteenth century, when Britain sought to build up its empire by pursuing mercantilist policies. The protectionist American School of Economics in the nineteenth century put forth the Economy of High Wages doctrine to counter free-trade theory. None of this historical background appears in today's mainstream textbooks.

In the 1920s, free-trade theory was used to insist that Germany could pay reparations far beyond its ability to earn foreign exchange. Keynes, Harold Moulton, and other economists controverted that theory. In fact, already in 1844, John Stuart Mill described how paying foreign debts lowered the exchange rate. When that happens, what is lowered is basically wages. So what passes for today's mainstream trade theory is basically an argument for reducing wages and fighting a class war against labor.

You can see this quite clearly in the eurozone, above all in the austerity imposed on Greece. You can see it in the austerity programs that the IMF imposed on Third World debtors from the 1960s onward. It looks like a dress rehearsal to provide a cover story for the same kind of "equilibrium economics" we may see in the United States.

That always amazes me. The elite argument is: 'How dare you complain when there are starving workers in the third world?' Yet those who say this are often those who essentially do no productive work, and are living high on the fiat currency hog, benefiting from the extreme domestic *and* global inequality they pretend is inevitable and in some mysterious way just.

Their argument would hold true if the United States had instituted strong redistributive policies so that all American citizens shared in the

wealth created by globalized capital and production flows. If the standard of living for all Americans sank slightly as the rest of world rose, that argument would at least be factually accurate and morally valid. But that's not at all what happened. Instead, a thin layer of Americans at the top radically increased their share of the wealth, without adding any value at all, merely by being structurally advantaged based on various forms of theft. The current regime has several protected classes—doctors, who are protected in numerous ways from competition and regulation, for one. The upper middle class that had its hand on the neoliberal steering wheel made sure to aim away from the careers their own children would seek.

It is absolutely maddening seeing people like the Vox boys get rich claiming to be wonky when the simplest, middle-school-level evaluation of the data shows they're arguing in extremely bad faith.

First, tax land rent and other economic rent. Make it the tax base. Otherwise, this rental value will end up being pledged to banks as interest on credit borrowed to buy rent-yielding assets.

Second, make banks into public utilities. Credit creation is like land or air: a monopoly created by society. As organs of public policy they would not play the derivatives casino, or make corporate takeover loans to raiders, or falsify mortgage documents.

Third, do not privatize basic utilities. Public ownership enables basic services to be provided at cost, on a subsidized basis, or freely. That will make the economy more competitive. The cost of upgrading public infrastructure can be defrayed by basing the tax system on economic rent, not wages.

It doesn't matter how much your government spends, simply what it spends it on. \$1 spent on blowing up children is too much waste; \$1 trillion on education isn't necessarily.

A federal budget is not 'healthy' when it is in surplus and 'sick' when it is in deficit. A federal budget deficit due to the automatic stabilizers' powerful response to the Great Recession is a sign of health. An even larger (short-run) budget deficit through a stimulus program is an even greater sign of economic health that should be celebrated. People who seek to inflict austerity on the people in such circumstances are not "fiscal conservatives." They may be well meaning, but ignorant of economics. However, they also may want to enrich their wealthy donors and themselves

Austerity is to economics as bleeding a patient is to medicine. That's the best summary of the argument, and should be repeated often, perhaps in similar form: Austerity for an economy in recession is like bleeding an anemic patient.

I love the language of fragility around the economy. If touched, all will fall to pieces. The idea of fragility now seems to extend to every single institution we have: government is fragile and can fall apart with the wrong administration; churches are shrinking and can't react to the changing religious attitudes; healthcare cannot be changed because the costs would be too great; bureaucracies need to function the way they always have or we will face destruction.

The flip side of this is that actually fragile things are ignored: the ecosystems influenced by human behavior can fall apart in an instant; water can be ruined through energy extraction; technology, especially the internet, relies on cables laid across the ocean floor, ever more electricity, and international cooperation; learning is a process that needs care and attention and instead is managed by school reform boards.

It's a weird world we live in.

The most ancient and fundamental economy is the gift economy. All economies derive from this. I help you to the best of my ability as you need, you help me to the best of your ability as I need—around and around the cycle goes until we're dead. This is the type of economy—though few would refer to it as such—that you and your immediate family participated in. A cycle imbalanced towards the child at the beginning and towards the parent at the end. A cycle embedded within ever-widening circles, each with their own independent and interconnected cycles. Strip away all the added complexities, obfuscation, propaganda, and this is precisely what you will find, not exactly replicated, with different imbalances, but still easily recognizable.

How do we re-establish credence and trust in economics as a science? Five changes are absolutely required.

1. Stop pretending that we have exact and rigorous answers on everything. Because we don't. We build models and theories and tell people that we can calculate and foresee the future. But we do this based on mathematical and statistical assumptions that often have little or nothing to do with reality. By pretending that there is no really important difference between model and reality we lull people into thinking that we have things under control. We haven't! This false feeling of security was one of the factors that contributed to the financial crisis of 2008.
2. Stop the childish and exaggerated belief in mathematics giving answers to important economic questions. Mathematics gives exact answers to exact questions. But the relevant and interesting questions we

face in the economic realm are rarely of that kind. Questions like ‘Does $2 + 2 = 4$?’ are never posed in real economies. Instead of a fundamentally misplaced reliance on abstract mathematical-deductive-axiomatic models having anything of substance to contribute to our knowledge of real economies, it would be far better if we pursued ‘thicker’ models and relevant empirical studies and observations.

3. Stop pretending that there are laws in economics. There are no universal laws in economics. Economies are not like planetary systems or physics labs. The most we can aspire to in real economies is establishing possible tendencies with varying degrees of generalizability.
4. Stop treating other social sciences as poor relatives. Economics has long suffered from hubris. A more broad-minded and multifarious science would enrich economics.
5. Stop building models and making forecasts of the future based on totally unreal micro-founded macromodels with intertemporally optimizing robot-like representative actors equipped with rational expectations. This is pure nonsense. We have to build our models on assumptions that are not blatantly in contradiction to reality. Assuming that people are “lightning calculators of pleasures and pains” is not a good—not even as a “successive approximation”—modeling strategy

Everyday Communism

Without goods and services, mostly the product of human labour, money would be worthless. In a way, our current economic crisis is one in which this basic truth has been forgotten and people have imagined that money can be made just from money.

Most basically, we need to remember something that has been forgotten in modern mainstream economics: economics is about provisioning. As anthropologists have reminded us, it's about how societies provide themselves with the wherewithal to live. Provisioning requires work—producing goods, from food and shelter through to clothes and newspapers, and services, such as teaching, providing advice and information, and care work. Almost all provisioning involves social relations between people, as producers, consumers, owners, lenders, borrowers, and so on. It's through these relations that provisioning is organized. Some kinds of provisioning take place through markets; some do not. The market/non-market boundary does not define the edge of the economy: unpaid work in preparing a meal for someone is as much an economic act as preparing pizzas for sale—or selling computers or insurance.

Most economists and political theorists think of economic actors only as independent, able-bodied adults, forgetting that they all started off as helpless babies, unable to provide for themselves and dependent on others, and who sooner or later reach a stage where, whether for reasons of illness, disability, or age, they become unable to contribute to provisioning themselves and others. There is nothing exceptional about these conditions. We all go through them: they are universals. We can never pay back our parents for all the work they did for us, just as future generations will never be able to pay their parents back. Dependence on others, particularly across generations, is part of being human; it derives from the fact that we are social animals, dependent rational animals—we cannot survive on our own. Robinson Crusoe depended on having been brought up in society; the newborn Crusoe wouldn't have lasted more than a few hours on his own. And like Crusoe we depend on the resources of the earth to survive; we cannot flourish if we damage the planet.

Communism is not some magical utopia, and neither does it have anything to do with ownership of the means of production. It is something that exists right now—that exists, to some degree, in any human society, although there has never been one in which everything has been organized in that way, and it would be difficult to imagine how there could be. All of us act like communists a good deal of the time. None of us acts like a communist consistently. ‘Communist society’—in the sense of a society organized exclusively on that single principle—could never exist. But all social systems, even economic systems like capitalism, have always been built on top of a bedrock of actually-existing communism. Starting from the principle of “from each according to their abilities, to each according to their needs” allows us to look past the question of individual or private ownership—which is often little more than formal legality anyway—and at much more immediate and practical questions of who has access to what sorts of things and under what conditions. Whenever it is the operative principle, even if it’s just two people who are interacting, we can say we are in the presence of a sort of communism. Almost everyone follows this principle if they are collaborating on some common project. If someone fixing a broken water pipe says, ‘Hand me the wrench,’ his co-worker will not, generally speaking, say, ‘And what do I get for it?’—even if they are working for Exxon-Mobil, Burger King, or Goldman Sachs. The reason is simple efficiency, ironically enough, considering the conventional wisdom that “communism just doesn’t work”—if you really care about getting something done, the most efficient way to go about it is obviously to allocate tasks by ability and give people whatever they need to do them.

This is presumably also why in the immediate wake of great disasters—a flood, a blackout, or an economic collapse—people tend to behave the same way, reverting to a rough-and-ready communism. However briefly, hierarchies and markets and the like become luxuries that no one can afford. Anyone who has lived through such a moment can speak to their peculiar qualities, the way that strangers become sisters and brothers and human society itself seems to be reborn. This is important, because it shows that we are not simply talking about cooperation. In fact, communism is the foundation of all human sociability. It is what makes society possible. There is always an assumption that anyone who is not actually an enemy can be expected on the principle of “from each according to their abilities,” at least to an extent: for example, if one needs to figure out how to get somewhere, and the other knows the way.

This same logic can be, and is, extended within groups: not only cooperative work groups, but almost any in-group will define itself by creating its own sort of baseline communism. There will be certain things shared or

made freely available within the group, others that anyone will be expected to provide for other members on request, that one would never share with or provide to outsiders: help in repairing one's nets in an association of fisherman, stationery supplies in an office, certain sorts of information among commodity traders, and so forth. Also, certain categories of people we can always call on in certain situations, such as harvesting or moving house. One could go on from here to various forms of sharing, pooling, who gets to call on whom for help with certain tasks: moving, or harvesting, or even, if one is in trouble, providing an interest-free loan. Finally, there are the different sorts of 'commons,' the collective administration of common resources. The sociology of everyday communism is a potentially enormous field, but one which, owing to our peculiar ideological blinkers, we have been unable to write about because we have been largely unable to see it.

We are not really dealing with reciprocity here—or at best, only with reciprocity in the broadest sense. What is equal on both sides is the knowledge that the other person would do the same for you, not that they necessarily will. The Iroquois example brings home clearly what makes this possible: that such relations are based on a presumption of eternity. Society will always exist. Therefore, there will always be a north and a south side of the village. This is why no accounts need be taken. In a similar way, people tend to treat their mothers and best friends as if they will always exist, however well they know it isn't true.

If the needs (for instance, dire poverty), or the abilities (for instance, wealth beyond imagination), are sufficiently dramatic, then unless there is a complete absence of sociality, some degree of communistic morality will almost inevitably enter into the way people take accounts.

A Turkish folktale about the Medieval Sufi mystic Nasruddin Hodja illustrates the complexities thus introduced into the very concept of supply and demand: One day when Nasruddin was left in charge of the local teahouse, the king and some retainers, who had been hunting nearby, stopped in for breakfast. "Do you have quail eggs?" asked the king. "I'm sure I can find some," answered Nasruddin. The king ordered an omelet of a dozen quail eggs, and Nasruddin hurried out to look for them. After the king and his party had eaten, he charged them a hundred gold pieces. The king was puzzled. "Are quail eggs really that rare in this part of the country?" "It's not so much quail eggs that are rare around here," Nasruddin replied. "It's more visits from kings."

The element of competition can work in completely different ways. In cases of barter or commercial exchange, when both parties to the transaction are only interested in the value of goods being transacted, they may well—as economists insist they should—try to seek the maximum material advantage.

On the other hand, as anthropologists have long pointed out, when the exchange is of gifts, that is, the objects passing back and forth are mainly considered interesting in how they reflect on and rearrange relations between the people carrying out the transaction, then insofar as competition enters in, it is likely to work precisely the other way around—to become a matter of contests of generosity, of people showing off who can give more away.

Exchange allows us to cancel out our debts. It gives us a way to call it even: hence, to end the relationship. With vendors, one is usually only pretending to have a relationship at all. With neighbors, one might for this very reason prefer not to pay one's debts.

An anthropologist writes about arriving in a Tiv community in rural Nigeria; neighbors immediately began arriving bearing little gifts: "two ears corn, one vegetable marrow, one chicken, five tomatoes, one handful peanuts." Having no idea what was expected of her, she thanked them and wrote down in a notebook their names and what they had brought. Eventually, two women adopted her and explained that all such gifts did have to be returned. It would be entirely inappropriate to simply accept three eggs from a neighbor and never bring anything back. One did not have to bring back eggs, but one should bring something back of approximately the same value. One could even bring money—there was nothing inappropriate in that—provided one did so at a discreet interval, and above all, that one did not bring the exact cost of the eggs. It had to be either a bit more or a bit less. To bring back nothing at all would be to cast oneself as an exploiter or a parasite. To bring back an exact equivalent would be to suggest that one no longer wishes to have anything to do with the neighbor.

Tiv women, she learned, might spend a good part of the day walking for miles to distant homesteads to return a handful of okra or a tiny bit of change, "in an endless circle of gifts to which no one ever handed over the precise value of the object last received"—and in doing so, they were continually creating their society. There was certainly a trace of communism here—neighbors on good terms could also be trusted to help each other out in emergencies—but unlike communistic relations, which are assumed to be permanent, this sort of neighborliness had to be constantly created and maintained, because any link can be broken off at any time.

Any system of exchange is always necessarily founded on something else, something that, in its social manifestation at least, is ultimately communism. With all those things that we treat as eternal, that we assume will always be there—our mother's love, true friendship, sociality, humanity, belonging, the existence of the cosmos—no calculation is necessary, or even ultimately possible; insofar as there is give and take, they follow completely different principles. What, then, happens to such absolute and unlimited phenomena

when one tries to imagine the world as a set of transactions—as exchange? Generally, one of two things. We either ignore or deify them. Mothers, and caregiving women in general, are a classic case in point. Or we do both. What we treat as eternal in our actual relations with one another vanishes and reappears as an abstraction, an absolute. In the case of Buddhism, this was framed as the inexhaustible merit of bodhisattvas, who exist, in a certain sense, outside of time. They are at once the model for the Inexhaustible Treasuries, and also their practical foundation: one can only repay one's endless karmic debt, or one's infinite milk-debt, by drawing on this equally infinite pool of redemption, which, in turn, becomes the basis for the actual material funds of the monasteries, which are equally eternal—a pragmatic form of communism, in fact, since they were vast pools of wealth collectively owned and collectively managed: the center of vast projects of human cooperation, which were assumed to be similarly eternal. Yet at the same time this communism became the basis, in turn, of something very much like capitalism. The reason was, above all, the need for constant expansion. Everything—even charity—was an opportunity to proselytize; the Dharma had to grow, ultimately, to encompass everyone and everything, in order to effect the salvation of all living beings.

Religious traditions often insist that the only true charity is anonymous—in other words, not meant to place the recipient in one's debt. One extreme form of this, documented in various parts of the world, is the gift by stealth, in a kind of reverse burglary: to literally sneak into the recipient's house at night and plant one's present so no one can know for sure who has left it. The figure of Santa Claus, or Saint Nicholas—who, it must be remembered, was not just the patron saint of children, but also the patron saint of thieves—would appear to be the mythological version of the same principle: a benevolent burglar with whom no social relations are possible and therefore to whom no one could possibly owe anything, in his case, above all, because he does not actually exist.

All human interactions are not forms of exchange. Only some are. Exchange encourages a particular way of conceiving human relations. This is because exchange implies equality, but it also implies separation. It's precisely when the money changes hands, when the debt is canceled, that equality is restored and both parties can walk away and have nothing further to do with each other. Debt is what happens in between: when the two parties cannot yet walk away from each other, because they are not yet equal. But it is carried out in the shadow of eventual equality. Because achieving that equality, however, destroys the very reason for having a relationship, just about everything interesting happens in between. In fact, just about everything human happens in between—even if this means that all such

human relations bear with them at least a tiny element of criminality, guilt, or shame.

Consider the custom, in American society, of constantly saying ‘please’ and ‘thank you.’ To do so is often treated as basic morality: we are constantly chiding children for forgetting to do it, just as the moral guardians of our society—teachers and ministers, for instance—do to everybody else. We often assume that the habit is universal but it is not. Like so many of our everyday courtesies, it is a kind of democratization of what was once a habit of feudal deference: the insistence on treating absolutely everyone the way that one used only to have to treat a lord or similar hierarchical superior.

Of course one could argue that some equivalent of ‘please’ and ‘thank you’ could be identified in any human language, if one were determined to find them, but then the terms you find are often used so differently—for instance, only in ritual contexts, or to hierarchical superiors—that it’s hard to attach much significance to the fact. It is significant that over the last century or so just about every human language that is used in offices or to make transactions in shops has had to create terms that do function as an exact equivalent of the English ‘please,’ ‘thank you,’ and ‘you’re welcome.’

In fact, the English ‘please’ is short for ‘if you please,’ ‘if it pleases you to do this’—it is the same in most European languages (French: *si il vous plait*; Spanish: *por favor*). Its literal meaning is “you are under no obligation to do this.” ‘Hand me the salt. Not that I am saying that you have to!’ This is not true; there is a social obligation, and it would be almost impossible not to comply. But etiquette largely consists of the exchange of polite fictions, or, to use less polite language, lies. When you ask someone to pass the salt, you are also giving them an order; by attaching the word ‘please,’ you are saying that it is not an order. But, in fact, it is.

In English, ‘thank you’ derives from ‘think,’ it originally meant, “I will remember what you did for me”—which is usually not true either—but in other languages (the Portuguese *obrigado* is a good example) the standard term follows the form of the English ‘much obliged’—it actually does mean “I am in your debt.” The French *merci* is even more graphic: it derives from ‘mercy,’ as in begging for mercy; by saying it you are symbolically placing yourself in your benefactor’s power—since a debtor is, after all, a criminal.

Saying ‘you’re welcome,’ or ‘it’s nothing’ (French: *de rien*; Spanish: *de nada*)—the latter has at least the advantage of often being literally true—is a way of reassuring the one to whom one has passed the salt that you are not actually inscribing a debit in your imaginary moral account book. So is saying ‘my pleasure’—you are saying, ‘No, actually, it’s a credit, not a debit—you did me a favor because in asking me to pass the salt, you gave me the opportunity to do something I found rewarding in itself!’

Decoding the tacit calculus of debt, ‘I owe you one,’ ‘No, you don’t owe me anything,’ ‘Actually, if anything, it’s me who owes you,’ as if inscribing and then scratching off so many infinitesimal entries in an endless ledger, makes it easy to understand why this sort of thing is often viewed not as the quintessence of morality, but as the quintessence of middle-class morality. True, by now middle-class sensibilities dominate society. But there are still those who find the practice odd. Those at the very top of society often still feel that deference is owed primarily to hierarchical superiors and find it slightly idiotic to watch postmen and pastry cooks taking turns pretending to treat each other like little feudal lords. At the other extreme, those who grew up in what in Europe are called “popular” environments—small towns, poor neighborhoods, anyplace where there is still an assumption that people who are not enemies will, ordinarily, take care of one another—will often find it insulting to be constantly told, in effect, that there is some chance they might not do their job as a waiter or taxi driver correctly, or provide houseguests with tea.

In other words, middle-class etiquette insists that we are all equals, but it does so in a very particular way. On the one hand, it pretends that nobody is giving anybody orders (think here of the burly security guard at the mall who appears before someone walking into a restricted area and says, “Can I help you?”); on the other, it treats every gesture between people as if it were really a form of exchange. As a result, like Tiv neighborhoods, middle-class society has to be endlessly recreated, as a kind of constant flickering game of shadows, the crisscrossing of an infinity of momentary debt relations, each one almost instantly canceled out. All of this is a relatively recent innovation. The habit of always saying ‘please’ and ‘thank you’ first began to take hold during the commercial revolution of the sixteenth and seventeenth centuries—among those very middle classes who were largely responsible for it. It is the language of bureaus, shops, and offices, and over the course of the last five-hundred years it has spread across the world along with them. It is also merely one token of a much larger philosophy, a set of assumptions of what humans are and what they owe one another, that have by now become so deeply ingrained that we cannot see them.

If human beings owed nothing to one another, life would be a mere unruly brawl. Amongst human beings none will save another; it will do no good, a man shouting ‘Help!’ ‘Fire!’ ‘I’m drowning!’ ‘Murder!’—nobody will come and help him. Why? Because he has lent nothing: and no one owes him anything. No one has anything to lose by his fire, his shipwreck, his fall, or his death. He has lent nothing. And: he would lend nothing either hereafter. In short, Faith, Hope, and Charity would be banished from this world.

Reducing all human life to exchange means not only shunting aside all other forms of economic experience, but also ensuring that the vast majority of the human race who are not adult males, and therefore whose day-to-day existence is relatively difficult to reduce to a matter of swapping things in such a way as to seek mutual advantage, melt away into the background. As a result, we end up with a sanitized view of the way actual business is conducted. The tidy world of shops and malls is the quintessential middle-class environment, but at either the top or the bottom of the system, the world of financiers or of gangsters, deals are often made in ways not so completely different from ways that the Gunwinggu or Nambikwara make them—at least in that sex, drugs, music, extravagant displays of food, and the potential for violence do often play parts. The economists' insistence that economic life begins with barter, the innocent exchange of arrows for tepee frames, with no one in a position to rape, humiliate, or torture anyone else, and that it continues in this way, is touchingly utopian.

Cannibal Capitalism

We don't go into a state of shock when something big and bad happens; it has to be something big and bad that we do not yet understand. A state of shock is what results when a gap opens up between events and our initial ability to explain them. When we find ourselves in that position, without a story, without our moorings, a great many people become vulnerable to authority figures telling us to fear one another and relinquish our rights for the greater good.

Friedman articulated contemporary capitalism's core tactical nostrum, what some have come to understand as the shock doctrine:

“Only a crisis—actual or perceived—produces real change. When that crisis occurs, the actions that are taken depend on the ideas that are lying around. That, I believe, is our basic function: to develop alternatives to existing policies, to keep them alive and available until the politically impossible becomes politically inevitable.”

Friedman was a key adviser to successive Republican administrations and held tremendous influence over many officials in the Bush White House. He had mentored Rumsfeld early in his career, and Cheney and the leading neocons in the administration regularly sought his counsel.

The bottom line is that while Friedman's economic model is capable of being partially imposed under democracy, authoritarian conditions are required for the implementation of its true vision.

And it wanted more than that—it wanted to expropriate what workers and governments had built during those decades of frenetic public works. The assets that Friedman urged government to sell were the end products of the years of investment of public money and know-how that had built them and made them valuable. As far as Friedman was concerned, all this shared wealth should be transferred into private hands, on principle.

The theories of Milton Friedman gave him the Not-a-Nobel Prize; they gave Chile General Pinochet.

The aim of a financialized economy is to make money for a narrow financial layer by establishing a credit stranglehold on industry and labor, and on the government itself. This reverses the direction in which classical political economy seemed to be moving to propel governments out of the feudal era by reforming the way society employs and accumulates wealth. In a modern version of the feudal epoch's "primitive accumulation" by military seizure, financial dynamics serve to concentrate wealth by means of debt leveraging and privatization loading down industry, real estate, and infrastructure with debt.

Speculators may do no harm as bubbles on a steady stream of enterprise. But the position is serious when enterprise becomes the bubble on a whirlpool of speculation. When the capital development of a country becomes a by-product of the activities of a casino, the job is likely to be ill-done.

The economy's ability to produce and earn enough of a surplus to pay exponentially rising interest charges is limited. The more it is stripped to pay creditors, the less able it is to produce and pay as a result of unemployment, underutilization of resources, emigration, and capital flight.

The aim of predatory lending in much of the world is to obtain labor to work off debts (debt peonage), to foreclose on the land of debtors, and in modern times to force debt-strapped governments to privatize natural resources and public infrastructure.

To simple people it is clear that the nearest cause of the enslavement of one class of men by another is money. They know that it is possible to cause more trouble with a dollar than with a club; it is only political economy that does not want to know it.

The financial sector has the same objective as military conquest: to gain control of land and basic infrastructure, and collect tribute. To update von Clausewitz, finance has become war by other means. What formerly took blood and arms is now obtained by debt leverage. Direct ownership is not necessary. If a country's economic surplus can be taken financially, it is not necessary to conquer or even to own its land, natural resources and infrastructure. Debt leverage saves the cost of having to mount an invasion and suffer casualties. Who needs an expensive occupation against unwilling hosts when you can obtain assets willingly by financial means—as long as debt-strapped nations permit bankers and bondholders to dictate their laws and control their planning and politics?

The creditor's objective is to obtain wealth by indebting populations and even governments, and forcing them to pay by relinquishing their property or its income. Such financial conquest is less overtly brutal than warfare waged with guns and missiles, but its demographic effect is just as lethal. For debt-strapped Greece and Latvia, creditor-imposed austerity has caused

falling marriage, family formation, and birth rates; shortened life spans and rising suicide rates; and emigration.

The financial fiction is that economies can extricate themselves from debt by borrowing yet more from banks—presumably to make new debt-leveraged gains from rising asset prices being inflated by this credit. So we are plunged back in the bubble economy's game plan.

Neoliberal privatization capped the Cold War by dismantling the Soviet Union's public sector and reducing it to a neofeudal society. Post-Soviet economies were free of public debt, business debt, real estate and personal debt or other bank loans when they obtained their political independence in 1991. Their residential and commercial real estate, transportation facilities, and highly educated population could have provided the foundation for a competitive low-cost modern economy. Every family could have been given its home at a nominal price. Prime real estate and infrastructure monopolies were turned over to insiders on such terms. But by the time most families started to buy into home ownership, prices were soaring.

Baghdad, New Orleans, and Sandy Springs provide glimpses of a kind of gated future built and run by the disaster capitalism complex. It is in Israel, however, that this process is most advanced: an entire country has turned itself into a fortified gated community, surrounded by locked-out people living in permanently excluded red zones. This is what a society looks like when it has lost its economic incentive for peace and is heavily invested in fighting and profiting from an endless and unwinnable War on Terror. One part looks like Israel; the other part looks like Gaza.

Just as mortgage lenders view rental income as a flow to be turned into payment of interest, international banks view the hard-currency earnings of foreign countries as potential revenue to be capitalized into loans and paid as interest. The implicit aim of bank marketing departments—and of creditors in general—is to attach the entire economic surplus for payment of debt service.

The moral of Latvia's and Ireland's economic plunge is thus the opposite of what neoliberals depict. Banking should be a public utility. Otherwise, its lending preferences will thwart industrial growth, employment, and living standards. Credit will be created mainly to buy or take over existing properties, infrastructure, and companies, bidding up their cost to make basic needs more expensive rather than competitive.

The idea that the euro has "failed" is dangerously naïve. The euro is doing exactly what its progenitor—and the wealthy one-percenters who adopted it—predicted and planned for it to do: Removing a government's control over currency would prevent nasty little elected officials from using Keynesian monetary and fiscal juice to pull a nation out of recession.

“It puts monetary policy out of the reach of politicians. Without fiscal policy, the only way nations can keep jobs is by the competitive reduction of rules on business.”

Hence, currency union is class war by other means.

The pretense is that money is technocratic and requires professional—defined as suitably tunnel-visioned—anti-government ideologues. Ever since the establishment of the modern nation-state in the late eighteenth and nineteenth centuries, the creation of the euro was perhaps the first significant experiment in modern times in which there was an attempt to separate money from the state, that is, to denationalize currency, as some right-wing ideologues and founders of modern neoliberalism, such as Hayek, had defended. The denationalization or “supra-nationalization” of money with the establishment that happened in the Eurozone took away from elected national governments the capacity to meaningfully manage their economies. Unless governments in the Eurozone are able to renegotiate a significant control and access money from their own central banks, the system will be continually plagued with crisis and will probably collapse in the longer term.

To make matters worse, the hands of central banks in Europe and the United States are tied by the impression (sponsored by financial lobbyists) that governments should not run deficits but maintain surpluses that drain the economy’s circular flow and oblige it to rely on commercial banks and bondholders. Instead of public credit financing economic growth, bank debt is monetized in ways that benefit creditors at the expense of their host economies.

Corporate takeovers, management buyouts, and company share buybacks typically are bought with borrowed credit. The theory is simplicity itself: Borrow cheap to buy companies with a higher yield. If the interest rate is lower than the profit or dividend rate, it pays raiders to buy these companies on credit—and companies themselves to borrow cheap and buy up their own higher-paying shares. At least, that is the theory. The logical end of this process is for companies (or speculators) to buy up all the real estate and industry, mines and public utilities in the world that yield more than the going interest rate. And interest rates have plunged steadily to only nominal levels today.

Given the ability of banks to create credit electronically, why should they not create enough credit to buy up every stock in the world—and for that matter, all the housing and commercial real estate—and pocket the excessive typical yield of real estate (about six percent) or of dividend-paying stocks (three to seven percent) over this borrowing rate? The end result would replace equity with debt, which would be backed by the income of

industry and real estate. Along the way, leveraged buyouts would bid up stock market and property prices, generating enormous capital gains up to the point where companies and other properties were so high-priced that interest charges would totally absorb their profits and rents.

This debt-for-equity arbitrage would make the world's corporate raiders rich, along with their bankers. But it would not leave revenue available for new direct investment, research and development, or other expenses that are not quickly reflected in profit streams. Hiring would slow, consumer spending and hence markets would shrink, causing profits to fall—resulting in defaults on the debt service that is owed. This is the bubble economy's financialization dynamic along which the world's economies were moving until 2008. The trend is now being resumed. Economies throughout the world are moving back into debt, corporate buyouts and stock buybacks are accelerating and a veritable bubble is re-inflating in junk bond financing.

Selling assets is different from taxing rentiers and other well to do players. Asset sales do not reduce deficits; they merely finance them. They reflect the failure to tax wealth or create central bank money.

On an economy-wide level, asset-stripping can be sustained mainly by asset-price inflation, that is, increasing prices for real estate, stocks, and bonds simply by lending more bank credit against them, at a falling interest rate and on easier (more reckless) credit terms. This debt leveraging ends up increasing the break-even cost of doing business, until the corporate sector collapses under the debt burden.

During the financial upswing the financial sector receives interest and capital gains. In the fallback period after the crisis, the economy's private- and public-sector assets are expropriated to pay the debts that remain in place.

Such austerity is the creditor's idea of a well-run economy. Prices and wages fall, increasing the difficulty of paying back debts taken on at the higher "old" prices. Unemployment suppresses wages, leading to defaults that transfer property to creditors. When bankers depict this debt and price deflation as "stability," they simply mean increasing their power over labor and industry.

The advice of central bankers is the same everywhere: Don't interfere with lending, and make sure that all creditors get paid in full, even speculators. That is how financial "free markets" preserve "confidence." It ends up meaning bailouts.

What is still missing, in many quarters, is recognition by bureaucrats and bankers that failure is an inevitable part of the market system, and that it sometimes pays to wipe the slate clean rather than endlessly sweep problems under the carpet. Letting borrowers run away from bad loans may

not be healthy; but it is even less healthy to leave a chunk of the population trapped in the virtual prison of debt that can never be repaid.

How much more clearly early economists recognized the problems of governments (or others) relying on creditors for policy advice. As Adam Smith explained, a creditor of the public, considered merely as such, has no interest in the good condition of any particular portion of land, or in the good management of any particular portion of capital stock. He has no inspection of it. He can have no care about it. Its ruin may in some cases be unknown to him, and cannot directly affect him. The bondholders' interest is solely to extricate as much as they can as quickly as possible with little concern for the social devastation they cause. Yet they have managed to sell the idea that sovereign nations as well as individuals have a moral obligation to pay debts, even to act on behalf of creditors instead of their domestic populations.

Although Wall Street bankers usually see the handwriting on the wall, their lobbyists insist that all debts can be paid, so that they can blame countries for not "tightening their belts."

A common tactic to sell anti-labor "reforms" is to blame the US and European budget deficits on populations aging and receiving more expensive health care, and on social programs benefiting low-income families rather than on the financial minority getting richer by shifting the tax burden onto labor to cause austerity leading to falling tax revenues and deeper budget deficits. Blame is placed on the victims, not their financial victimizers.

Indeed, as tax revenues fall in response to rising debt service and the tax burden shifts onto labor (along with higher rake-off of prices for privatized hitherto public services), financial lobbyists use fiscal deficits as an opportunity to call for auctioning off public infrastructure. Creditor leverage over public deficits (especially in foreign currency) is wielded to turn public roads into toll roads. Other public investments are financialized as similar tollbooth opportunities. These privatizations increase the cost of living and doing business, making the economy higher-cost even as it is being impoverished. That is how democracy devolves into neofeudal oligarchy.

The end stages of capitalism, Marx wrote, would be marked by developments that are intimately familiar to Scranton. Unable to expand and generate profits at past levels, the capitalist system would begin to consume the structures that sustained it. It would prey upon, in the name of austerity, the working class and the poor, driving them ever deeper into debt and poverty and diminishing the capacity of the state to serve the basic needs of ordinary citizens. It would, as it has, increasingly automate or relocate jobs, including both manufacturing and professional positions, to countries with cheap pools of laborers. This would trigger an economic assault on

not only the working class but the middle class—the bulwark of a capitalist democracy—that would be disguised by massive personal debt as incomes declined or remained stagnant and borrowing soared. Politics would, in the late stages of capitalism, become subordinate to economics, leading to political parties hollowed out of any real political content and abjectly subservient to the dictates of corporations.

But as Marx warned, there is a limit to an economy built on austerity and the scaffolding of debt expansion. There comes a moment, Marx knew, when there would be no new markets available and no new pools of people who could take on more debt. This is what happened with the subprime mortgage crisis. Once the banks could not conjure up new subprime borrowers, the scheme fell apart and the system crashed. Capitalist oligarchs, meanwhile, hoard huge sums of wealth—\$7.6 trillion stashed in overseas tax havens—exacted as tribute from those they dominate, indebted, and impoverish. Capitalism would, in the end, Marx said, turn on the so-called free market, along with the values and traditions it claims to defend. It would in its final stages pillage the systems and structures that made capitalism possible. It would resort, as it causes widespread suffering, to harsher forms of repression to maintain social control. It would attempt, in a frantic last stand, to extract profit by looting and pillaging state institutions, contradicting its stated nature.

To the financial sector, the most important privatization is that of money creation. The aim is for economies to become dependent on bank credit rather than government spending to provide the money and credit needed to grow. This dream was realized during Bill Clinton's administration, which ended the 1990s by running a budget surplus—that is, by taxing more out of the economy than spending into it. The money supply grew solely by expanding the economy's debt overhead, not by government money creation.

Prosperity was the ultimate political trump card. Played the right way, prosperity could negate any concerns, could override any objections, could even make policies seem like their opposites. Prosperity meant that, for years, Clinton associates like Hillary and Rahm Emanuel could pose as mystic prophets of affluence—they had worked with Bill, after all. They knew what it took to make a country rich. Prosperity made Clinton himself into a respected elder statesman, a champion of the little guy, and a towering economic success whose every move needed to be emulated by future Democrats.

Its eager adoption by liberal politicians tells us something important about the modern Democratic Party and its attitudes toward equality. In its quest for prosperity, the Party of the People declared itself wholeheartedly in favor of a social theory that forthrightly exalted the rich—the all-powerful

creative class. For many cities and states, this was the economic strategy; this was what our leaders came up with to revive the urban wastelands and restore the de-industrialized zones. The Democratic idea was no longer to confront privilege but to flatter privilege, to sing the praises of our tasteful new master class. True, this was all done with an eye toward rebuilding the crumbling cities where the rest of us lived and worked, but the consequences of all this “creative class” bootlicking will take a long time to wear off.

Wall Street was an ideal constituency for a party reorienting itself as a representative of the professional class. The industry in question was supremely wealthy, of course. And financiers tended to be well-graduated people of a certain cultural liberalism; the prospect of gay marriage, for example, never seemed to send them into a moral panic the way it did so many others. Wall Street didn’t pollute either, at least not in a way that cameras can see. The industry’s operations were always coated in a thick patina of expert-talk, which the professional mind finds irresistibly beguiling. Furthermore, any distasteful results of Wall Street’s operations could be easily ignored and were always far removed from the thrilling precincts of lower Manhattan.

The final great accomplishment of Bill Clinton’s presidency was another act of sweeping bank deregulation, the 1999 repeal of the Glass-Steagall Act, which had separated commercial from investment banking since 1933. Treasury Secretary Rubin had long argued that the old law had to go so that Wall Street could achieve “revenue diversification” and stay competitive with foreign banking establishments. Banking lobbyists agreed with him, as did lobbyists for the insurance industry and—well, lobbyists for just about everyone with money. In fact, among members of the professional class, the cancellation of Glass-Steagall was another no-brainer, what with globalization and the New Economy and all. The term of art this time around was ‘Depression-era’—as in “Depression-era barriers” or “Depression-era rules” or “Depression-era walls”—which cast the old law’s repeal in the familiar terms of political rejuvenation, with the Democratic party symbolically casting off the conditions of its New Deal heyday.

As with NAFTA, every expert who mattered was on the same page. A retrospective on the banking law published by the Minneapolis Fed in 2000 casually referred to it as “the now infamous Glass-Steagall Act of 1933.” “Almost everybody agreed that Glass-Steagall was an anachronism in a global economy,” proclaimed a 1995 New York Times news story on the effort to repeal the law. “Enacted in 1933 to prevent a recurrence of financial skulduggery that many believed touched off the Great Depression, the act is widely viewed today as a drag on the economy.” Not only did everybody agree on what was widely viewed, but repealing it was a bridge

to the future itself.

“At the end of the twentieth century, we will at last be replacing an archaic set of restrictions with a legislative foundation for a twenty-first-century financial system.”

Some foundation. Nine years later, after the greatest wave of insider looting ever seen, the deregulated twenty-first-century financial system had to be rescued almost in its entirety. To say this was a system built on sand would be charitable. Its foundations actually lay upon a speculative bubble, pumped up by the prospect of a bigger sucker who everyone believed could be found a little ways down the line.

The virtue of the old Glass-Steagall Act, which regulated the banking industry from 1933 until its final repeal in the Clinton era, was its simplicity: It structurally separated investment banking from commercial banking and forced those parts to compete with one another. The 2010 Dodd-Frank Act, which was supposed to re-regulate the business, uses a different method—it instructs federal agencies to make detailed new rules for the industry. When they had finished about two-thirds of that task their regulatory work consisted of a staggering 22,000 pages of rules, loopholes, and exceptions. Neoliberals love complexity.

In November 1999, Texas Republican Senator Phil Gramm, Iowa Republican Congressman Jim Leach, and Virginia Republican Congressman Tom Bliley sponsored the Financial Services Modernization Act of 1999. It was an Orwellian euphemism to characterize disabling the New Deal as “modernization.” In the wake of the 1929–31 financial crisis, the idea of modernizing finance was to insulate retail consumer banking from Wall Street speculation. It took only a decade for the deregulation of mortgage credit and commercial lending to become tangled in a web of interbank speculation in casino “derivatives.”

In 2004 the FBI announced that it had identified mortgage fraud as an epidemic. It identified two kinds of mortgage fraud. One involved people who borrowed money to buy a house they could not afford, hoping they could flip it for a profit before their inability to pay became apparent. The other involved people borrowing to live in a house they could not afford until they were evicted. The FBI also announced that its partner in identifying such frauds was the Mortgage Bankers Association. What the FBI missed was that it was banks that were creating the frauds, including some members of the MBA. The fox got the watchdog to look at the eggs instead of watching the chickens, which were being eaten by the fox family. Bank agents were helping buyers fabricate loan documents.

After 2008, new lending dried up. Consumers had to start paying down their credit card balances. Homeowners had to pay down their mortgages rather than “cashing out” on the debt-inflated “equity” value of their homes. This net repayment has become the new definition of “saving.” It increases net worth not by building up assets and real wealth, but by paying down the debts that have been taken on. In accounting terms, it is a negation of a negation. But it is not debtors that enjoy the liquidity from this saving; it is the creditors who receive the loan amortizations.

Leading up to 2008, the US saving rate fell to zero. The much-discussed number seemed to suggest that no saving was taking place—as if the entire economy were making a choice to be profligate and live for today, not tomorrow. There actually was as much overall saving as ever. Gross savings remained high—about 18 percent of national income. But the rise in debt was keeping pace. Homebuyers, industrial companies, consumers, and even local and federal government had run so deeply into debt that their borrowing fully absorbed the savings, producing a zero net saving rate. In fact, the domestic US savings rate was actually a negative 2%. The overall rate was rescued from negative territory by foreign central banks (mainly in China, Japan, and Germany) recycling their export surpluses into US Treasury bonds. This “foreign savings inflow” is counted as part of the US savings rate.

When the banks stopped lending in 2008, the savings rate rose to seven percent of GDP by May 2009. The New York Times applauded that “many people were putting that money away instead of spending it.” The Wall Street Journal reported that Social Security recipients of one-time government payments “seem unwilling to spend right away.” But this saving was not taking the form that most people think of as saving. It did not mean that prudent behavior had returned and people were keeping more money in the bank to withdraw on a rainy day. It took the form of paying down debts, not liquid money available for spending by the former debtors, who found that they needed to run down whatever liquid savings they had. They simply were spending their income to pay down the debt they had taken on earlier. The “saving” in question was an accounting entry in the national income accounts—a negation of a negation, and hence a positive. The only way these savings were “money in the bank” was that they were paid by debtors to their banks and credit card companies.

This debt deflation shows how false the image is of using one’s home like the proverbial piggy bank. Running up a debt is not at all like withdrawing cash from a savings account. Bankers euphemize taking out equity loans (borrowing more against the property’s rising market price) as “cashing out” on one’s equity, as if this does not leave a legacy of debts, which constrain

future spending by diverting more income to pay creditors. The more the “savings rate” rose in the post-2008 world, the less money “savers” had to spend. Debtors ate cheaper foods and ran down whatever liquid savings they had. This “upside down” saving led to debt deflation.

Western economies entered a period of debt deflation hitherto suffered only by Third World countries under IMF destabilization plans. Opportunities for upward mobility gave way to a debt-ridden austerity, shrinking markets, and leaving even less income available to pay debts.

The key to understanding how Asset-Price Inflation leads inexorably to Debt Deflation is to recognize that there are, in fact, two economies. Wall Street pretends that its financial gains are infused into the economy (much as Malthus described British landlords two centuries ago), creating jobs and financing new factories and other means of production. The reality is that bank loans do not fund direct investment and employment. They extract debt service while inflating asset prices to provide capital gains. This makes homes more expensive to buy, requiring new owners to take out larger mortgage loans. That is the Asset-Price Inflation phase of the financial cycle. At some point, repayment time arrives. Paying off debts absorbs income that otherwise would be available for spending on the goods and services that labor produces. This is the Debt Deflation phase. Each business upswing leaves a higher level of debt, diverting a rising proportion of income to pay debt service. The post-2008 bailout and imposition of austerity aimed to squeeze out enough income to carry the debt claims. But austerity generates even more defaults and a deeper crash.

The term ‘Debt Deflation’ was coined in 1933 by Irving Fisher to explain how bankruptcies stemming from the inability to pay debts were wiping out bank credit and spending power, and hence the ability of economies to invest and hire new workers. Federal Reserve Chairman Ben Bernanke failed to understand this. In his view, debt service simply transfers purchasing power from debtors to creditors, with no effect on overall spending on current output. This assumes that creditors will spend the debt service they receive on consuming as much as indebted consumers and workers would have done. No economist prior to the 1980s anticipated that government budget deficits would take the form of transfer payments to the banks in the form of bailouts and cheap Federal Reserve credit. But since 2008 the rise in public debt and central bank credit has not been created to increase employment or consumer demand. The aim is to help Wall Street’s liquidity, not that of consumers. Chairman Ben Bernanke’s helicopter dropped money only over Wall Street, for banks to lend yet more to the already debt-ridden economy. The Fed’s idea of “recovery” has been to fund a new financial bubble and bid prices back up for existing real estate, stocks, and bonds, as if this will

revive the industrial economy instead of simply weighing it down with yet more debt.

If creditors (or real estate moguls) spend the same proportion of their income and capital gains on consumer goods and investment goods as do average wage earners, there would be no debt deflation or general spending shortfall, but simply a transfer of purchasing power from debtors to creditors and their fellow rentiers. But the whole point is that “spending propensities” do differ between the One Percent and the 99 Percent, between rentiers on the one hand, and consumers and producers on the other. Wealthier people spend a lower proportion of their income on consumption. And when today’s Wall Street financiers do spend their multi-million dollar salaries and bonuses money on themselves, it is largely on fine art trophies, luxury apartments that already have been built, on yachts and high fashion—largely imported, as was noted already in Malthus’s day. But most important, the super-rich lend out most of their gains, indebting the rest of the economy to themselves.

Until 2008, financial crashes had a silver lining: to wipe away the debt overhead so that economies can recover. Debt relief through bankruptcy traditionally forced housing prices to fall back to more affordable levels. But the Fed’s aim was (and remains) to preserve the economic power of the One Percent and revive bank balance sheets by preventing housing, stock market, or bond prices from falling. Instead of the bad debts built up prior to 2008 being wiped out, they have been kept in place. In conjunction with cutting back public spending programs, this shrinks the domestic market, and wages fall instead of the housing and other asset prices being supported. The banks were bailed out, not the economy.

The Federal Reserve and Treasury provided credit under the guise that recovery requires banks to rebuild their depleted net worth so that they can make yet more interest-bearing loans to the already debt-ridden economy—pushing housing and stock prices back up, as if this is what prosperity means. And by year-end 2010 the financial sector did indeed recoup its heavy losses from 2008 to register “about 30% of all operating profits” despite accounting “for less than 10% of the value added in the economy.” By mid-2013 the banking system’s share of corporate profits had risen “to 42 percent and the Fed expects them to keep rising.”

In October 2008, Paulson invested \$10 billion on behalf of the federal government into Goldman. He made the deal three weeks after Warren Buffett had also invested in Goldman. How did the deals compare? Buffett got a \$500 million annual dividend. The federal government invested twice as much, but got the same dividend. Buffett got the right to buy 11% of Goldman for \$115 per share. The government bought the right, for almost

\$7 more per share, to buy just 2% of Goldman. That was obviously a bad deal—a disguised handout—but just how bad?

Using textbook valuation techniques, in plain English, the federal government made a gift to Goldman Sachs worth \$5 billion. It amounted to more than \$16 for every American, \$64 for a family of four. Later the Obama administration let Goldman buy back the securities. Goldman issued a statement saying the government made a 22 percent annualized return on their money. That figure is correct, but it ignores three key facts. One, Goldman got to pick when to buy out the federal government's investment, which would not be when it reached maximum gain. Two, the 22 percent return was not commensurate with the risks taken, especially compared to the deal Buffett made. Three, it ignored the \$13 billion Goldman got from the government when they paid off Goldman's bad—and possibly worthless—bets with AIG. All in all the government saved Goldman from facing the rigors of the market for its mismanagement, and average people were left with less while Goldman enjoyed more. And Goldman did not even thank you for your generosity.

Instead of buying mortgage-related securities—the program's “troubled assets”—the Treasury helped recapitalize bank balance sheets directly by buying \$25 billion senior “preferred” non-voting stock and warrants from each of the ten largest American banks. The label ‘preferred’ confuses many casual readers. Bailing out the banks by buying preferred shares—instead of directly taking over the most reckless lenders—set the Treasury and Fed at odds with the FDIC's ability to protect depositors. An FDIC takeover would have wiped out the value of the government's preferred stock along with that of common stockholders. Although preferred stockholders are paid dividends before normal stockholders get their turn, they do not have legal priority over bondholders, or even over speculators in collateralized swaps (CDOs) in case of bankruptcy. To preserve the government's investment position in bank preferred stock, Paulson's ploy hooked it into continuing support rather than letting the FDIC do its job. The non-voting character of the TARP shares prevented the Treasury from exerting management policy over the banks that received funding. It also did not use its controlling creditor position to ask for seats on the bank boards, or for any voice in what the banks did with the TARP money, or with their deposits and credit-creating power.

The modified TARP's Capital Purchase Program provided banks with money at a concessionary rate of only 5%. Government loans are not supposed to be made to insolvent institutions, or on easy terms that enable banks to use the funds for speculation in a period of economic distress. But this is precisely what happened. The Congressional Budget Office estimated

that the first \$247 billion of securities purchased represented so large a premium over actual market valuation that it amounted to a 26 percent (\$64 billion) subsidy to the banks receiving funds. They were rewarded rather than punished for their reckless and even fraudulent lending. While some of you reading this were rewarded with homelessness. Seems fair.

The obvious question that government regulators sought to prevent the public from asking was why not nationalize the reckless banks whose entire net worth was less than the government's \$25 billion TARP loan? Citigroup and Bank of America (and very nearly Goldman and other investment banks) were insolvent without the government giveaways. Taking over ownership and operating them as a public financial option would have enabled the government to fire the officers responsible for the bad, often crooked, loans, and recoup what they had paid themselves in salaries and bonuses on the deception that their management was making money, not losing it. After all, bank managers of such institutions did not provide productive management but just the opposite: They acted in a predatory way that poisoned the financial system with toxic waste. The government's failure to take ownership gave managers, stockholders, and bondholders a free lunch.

The government imposed tougher terms on AIG than on bailed-out banks. The government, for example, took a controlling equity stake in AIG, largely wiping out shareholders. In contrast, it left shareholders at bailed-out banks intact, even at arguably insolvent institutions like Bank of America and Citigroup. The injustice in that disparate treatment, however, is not that AIG was treated too harshly, but that the banks got off too easy. If the government had taken control of, say, Bank of America, citizens would have shared directly in its recovery. Instead, the subsequent gains flowed to shareholders who, but for the bailouts, would have been ruined. The government also took control over how the AIG bailout money was spent. The bank bailouts, in contrast, had virtually no strings attached. That harmed the public because there was no way for the government to force the banks to increase lending and help homeowners, even though officials had said that the bailouts would foster lending and foreclosure relief. It's certainly true that the government deserves criticism for how it spent the AIG bailout money: It funneled the money to the banks to make them whole on deals they had done with AIG, instead of requiring them to absorb some of the losses. But again, the real victim of the overly generous treatment of the banks is the American public.

Wall Street's casino—"the financial system"—profits from the illusion that defaults can somehow be covered by private-sector insurance. It is as if everyone can buy options to avoid the systemic risk that results from over-lending. This illusion helped Wall Street shut its eyes to the looming

convulsion that cost far more than any insurance company reserves ever would be able to pay for. Wall Street, the City of London, and other financial centers had simply pretended to insure against the uninsurable.

The reality is that insuring against any economy's overall debt overhead is impossible in principle, because in the end the debts cannot be paid. It is magical to believe that money can be lent out as debts grow exponentially without limit. The Magic of Compound Interest leads in due course to debt deflation. The insurance obligation to 'make losers whole' becomes unlimited, far beyond the ability of default swaps or other financial insurance to cover the losses that stemmed from deregulation and financial fraud. Any scheme to protect against debt defaults is bound to be underinsured in the absence of regulatory agencies to prevent fraud. The only way for these gambles to be paid in full when the insurance companies acting as "bookies" lack sufficient reserves is for the government to make up the gap. This is what happened in 2008. The Treasury and Fed picked up the tab, claiming that this was a necessary price to pay to "restore stability." By "stability" they meant preserving the fiction that much of the economy was not insolvent.

In the ordinary course of business, the well-established rules of bankruptcy would have led AIG's counterparties to write down their claims. Instead, "rescuing" AIG transformed Wall Street's risky derivative wagers into government-guaranteed obligations. It was as if the high-risk trade in default insurance derivatives deserved the same backstop as FDIC-insured savings deposits and checking accounts.

Neoliberal economists claim that debt is not a problem and can be ignored because (as the saying goes) "we owe it to ourselves." According to this chop-logic, it all cancels out into a net zero balance in which one person's debt is treated as another's asset. This simplistic and misleading view neglects the who/whom dimension: Most of the net debt is owed by the 99 Percent to the One Percent (Wall Street's "ourselves"). The credit that banks create adds to rentier charges, not to price and income stability. Thirty years of neoliberal junk economics has prepared the ground for imposing mass unemployment, emigration, and privatization selloffs. The pretense is that public budget deficits cause inflation. But inflation has largely remained in check for the past few decades. What critics of government spending really oppose is public funding of Social Security, Medicare, and other social programs out of the general budget. The hypocrisy becomes apparent when Wall Street praises public "debt" creation as governments create money to bail out banks.

Retail savings and checking accounts were never threatened by the bad gambles that banks made. But this myth had to be promoted in order for Paulson, Geithner, Bernanke, and other bank protectors to persuade

Congress to overrule Bair and make government pay. Their aim was to save the banks from being nationalized, and to protect bankers from being prosecuted for fraud or reining in the exorbitant salaries and bonuses they had given themselves. No attempt was made to change the system that had led to the crash.

If the traditional bank reforms had been preserved, then the FDIC would have closed down Citigroup and the government would have regulated the derivatives market. If the legal system had worked, chief executives of Wall Street's major investment banks and the crooked brokerage companies that promoted and sold liars' loans would have landed in jail. Instead, banks paid civil fees—often covered by insurance policies—without their executives being prosecuted. Instead of “saving the system,” the financial oligarchy made its move to end economic democracy. It saved its own future, not the existing status quo.

The real burden of Wall Street's near meltdown fell on small investors and homeowners. As home prices plummeted, many homeowners found themselves owing more on their mortgages than their homes were worth and unable to refinance. Yet Chapter 13 of the bankruptcy code (whose drafting was largely the work of the financial industry) prevents homeowners from declaring bankruptcy on mortgage loans for their primary residence.

When the financial crisis hit, some members of Congress, led by Illinois senator Dick Durbin, tried to amend the code to allow distressed homeowners to use bankruptcy. That would give them a powerful bargaining chip for preventing the banks and others servicing their loans from foreclosing on their homes. If the creditors didn't agree, their cases would go to a bankruptcy judge, who presumably would reduce the amount to be repaid rather than automatically force people out of their homes. The bill passed the House, but when in late April 2009 Durbin offered his amendment in the Senate, the financial industry flexed its muscles to prevent its passage, arguing that it would greatly increase the cost of home loans. No convincing evidence showed this to be the case. The bill garnered only forty-five Senate votes, even though Democrats were in the majority. Partly as a result, distressed homeowners had no bargaining power. More than five-million of them lost their homes, and by 2014 another two-million were near foreclosure. So much for shared sacrifice.

The ten-million homeowners whose debt soared in excess of the market price of their homes (“negative equity”) received no leniency such as the banks received. They were subjected to a wave of foreclosures by robo-signed documents hitherto illegal under US law, but which were permitted simply because the practice was so pervasive that to have enforced the law would have brought down the system. ‘The system’ was precisely what should have

been brought down! The financial high-jinks on Wall Street was not ‘the economy.’ It was the banksters, pretending that their interest coincided with that of the economy at large. It was as if keeping debts in place preserved real wealth and employment rather than destroying them.

Things didn’t go down this way because helping average citizens during hard times is a utopian dream, but rather because those citizens’ interests conflicted with the interests of the upper strata. A choice between the two had to be made, and Obama made it. The most notorious example was the Democratic proposal that would have allowed judges to modify homeowners’ mortgage debt when they filed for bankruptcy—a process called “cramdown” that would have been extremely helpful to millions of homeowners but would also have had unpleasant consequences for whoever it was who owned the mortgages. In 2008, Obama had announced he was in favor of cramdown, but when it came up in the Senate in April of 2009, the president and his team wouldn’t lift a finger to help. With the banks lobbying energetically against it, the measure naturally failed.

Under the pretense of restoring normalcy, the new financial oligarchy achieved a political coup to insure payment of debts owed mainly to the banks, bondholders, and the One Percent behind them. Most people hardly realized that Congress, the Treasury, and Federal Reserve had joined to endow bankers, bondholders, and speculators with massive fortunes. The closest parallel is Alexander Hamilton’s commitment to pay off the “Continental”—the paper money the American colonies fighting for their independence had used to pay militiamen and suppliers. The currency had lost nearly all its value, but was bought up by speculators, the “vulture funds” of their day. Treasury Secretary Hamilton paid them off in full, ostensibly to show the fiscal dependability of the new US Government. Speculators used their gains to buy up land in a follow-up series of frauds. Many of the nation’s early fortunes thus were created at a stroke of the pen.

The ethic of walking away from underwater real estate deals is practiced more cynically by the wealthy. Wall Street investors call this “strategic default.” But mortgage bankers urge less affluent homeowners to take an uneconomic view of debt in terms of a personal ethic of responsibility, a moral obligation to pay debts. While manipulating the moral bias of homeowners to stay put and keep paying the banks for loans in excess of the home’s still-falling market price, the Mortgage Banking Association was walking away from its own underwater headquarters. It had bought the 10-story glass building in Washington DC in 2007 with a \$75 million mortgage.

“Like millions of American households,” the Wall Street Journal noted, the association “found itself stuck with real estate whose market value has plunged far below the amount it owed its lenders.” The story is one

of hilarious hypocrisy. Having put down only 5% of the purchase price, the trade group decided to strategically default on its mortgage when the property lost \$34 million (45%) in the declining market. The association rented offices five blocks away, announcing “that continued ownership of the building, which was financed with \$75 million of variable-rate debt, would be economically imprudent.” It ended up being sold for just \$41.3 million.

The Association’s CEO John Courson refused to confirm just how much money it saved by walking away from the property, but he urged homeowners to “keep paying their loans even if that no longer seemed to be in their economic interest,” because “defaults hurt neighborhoods by lowering property values.”

“What about the message they will send to their family and their kids and their friends?”

That is the banks’ marketing plan: to siphon off the benefits of rising wages and salaries as debt service, preventing this income from being used to raise living standards. Without “jingle mail,” banks will lend beyond the value of the collateral being pledged, intending to come after the debtor’s overall income (and that of co-signers, as in the case of many student loans), and failing that, to make “taxpayers” pay for their losses. This public liability for bad bank loans is what helped wreck Ireland and other Eurozone countries.

Today, years after the 2008 financial crisis, the most pressing task for economic theory should be to explain why employment and consumption spending have not recovered. The Federal Reserve has given banks \$4 trillion and the European Central Bank has given €1 trillion in Quantitative Easing to help the financial layer atop the economic pyramid, not to write down debts or revive the real economy by public spending. This enormous act of money creation could have enabled debtors to free themselves of debt so that they could resume spending to keep the circular flow of production and consumption in motion. Instead, governments have left the economy debt-strapped, creating money only to give to financial institutions. Orwellian rhetoric is invoked to describe governments running budget deficits and creating central bank credit to help banks and bondholders but not employment and production.

This is called “preserving the system.” However, what is intended to be preserved is not the indebted economy, but the debt overhead owed to the financial sector. Central banks assiduously avoid any attempt to quantify how far wages, profits, and tax revenue can be diverted to pay creditors without causing economic collapse and insolvency. Today’s crisis

is dismissed as an anomaly, ruled out by assumptions made at the outset. This blind spot is a precondition for steering economies down the road to debt deflation.

It should not be surprising that an economy 70 percent dependent on consumer spending stalls when creditors, monopolists, and property owners extract tribute from indebted borrowers, renters, students, and users of public infrastructure services. In effect, these groups are paying reparations for losing the financial and class war that they didn't even realize was being waged.

This rationale that saving the people required saving the banks—the trickle-down idea that saving the 99 Percent required enriching the One Percent even more—became the umbrella for unlimited giveaways and concessions to the Treasury's and Fed's Wall Street constituency, much as bondholders used to hide behind “widows and orphans” whose trust funds presumably would be eroded by inflation resulting from wage increases for the population having to work for a living.

For the Treasury, Federal Reserve, and much of Congress, Wall Street *is* the economy. At least it is the sector from where financial officials are drawn, and from which politicians derive their largest campaign contributions. This makes it easy to believe that giving banks special tax breaks and privileges to “earn their way out of debt” is synonymous with saving the economy. The reality is that bailouts are being done at the expense of business, consumers, and industry.

Just two months after taking office the new president invited the executives of thirteen leading Wall Street institutions to the White House. After listening to their arguments for why banks had to continue paying bonuses—ostensibly to get the best talent to manage their money—Obama told them:

“Be careful how you make those statements, gentlemen. The public isn't buying that.”

He explained that only he could provide them with the political shield needed to forestall public pressure for reform, not to mention prosecution of financial fraud.

“My administration is the only thing between you and the pitchforks.”

One leading banker attending the meeting:

“The sense of everyone after the meeting was relief. The president had us at a moment of real vulnerability. At that

point, he could have ordered us to do just about anything and we would have rolled over. But he didn't—he mostly wanted to help us out, to quell the mob.”

Obama had them scared and ready to do almost anything he said. An hour later, they were upbeat, ready to fly home and commence business as usual. Obama in a nutshell.

This piece of shit, not only does he bail out Wall Street, not only does he fuck over average people for eight years, not only does he cash in with the largest book deal ever done immediately after leaving office, but he then goes on to create a production studio, and on the cover art for his shit, he's fucking “Executive Producer President Barack Obama.” Not only is it ridiculous that certain people who have held certain positions retain that title when being addressed by others, but this fucker uses it himself. Don't believe us? Take a look at the poster for his latest film, *Crip Camp*—shithead, you ain't president no more, I'm sure you miss *Terror Tuesdays* but you're just going to have to find some other way to make that tiny dick hard—maybe a three-way with Georgie, Michelle, and some candies. Oh, and while we're on the topic: Start packing for The Hague motherfucker. But really, we should be thanking you Barack, I mean, short of you coming straight out and saying, ‘I'm a narcissistic douchebag and a whore for capitalism,’ you couldn't make it any more clear: that's exactly what you are.

No business sector can do more damage to an economy and a society than finance. The potential losses are virtually unlimited, as shown by the simple fact that in 2008 the stated value of all derivatives far exceeded the net worth of the entire planet. By wrapping unsound financial products in fancy names like credit default swap and collateralized mortgage-backed securities, the wizards of Wall Street can practice modern alchemy—until one of their formulations blows up. But just as the philosopher's stone never turned lead into gold, the mortgage-backed securities turned out to be as toxic as lead, and the implications for the average person very real. The 2008 meltdown cost every thirty-fourth person in America his or her job. Then the federal government compounded the irresponsible greed of the financiers by committing what, in the worst case, would have been the entire economic output of the nation for an entire year to rescuing the very same derivatives trading houses and failed commercial banks whose alchemy had just been exposed as bankrupt.

Although having run on a populist platform, Obama's role was to deliver his Democratic Party's liberal constituency of urban labor, racial and ethnic minorities, environmentalists, and anti-war advocates to his campaign contributors. Over the past half-century the Democratic Party's strategy

has been to create a menu of promises in two columns. Column A reflects the hopes and changes that voters want. That is the platform on which the Democrats run. Column B represent what the party's major contributors and lobbyists want. Obama won the election by verbalizing the hopes of the 99 Percent, but did in practice what his campaign backers from the One Percent wanted. His language was populist, his policies oligarchic and aimed to prevent change.

To say "the center held," as one of his biographers does, is an optimistic way to describe Barack Obama's accomplishment. Another would be to say he saved a bankrupt system that by all rights should have met its end. America came through an economic debacle, an earthquake that shook people's faith to the ground. Yet out of it, the system emerged largely unchanged. The predators resumed operations. Everything pretty much stayed the same.

What the sprawling stimulus measure did not include was the obvious thing, the most effective thing, the thing Americans of all ages remember that Franklin Roosevelt did—direct federal job-creation in the WPA manner. Obama was careful to avoid such things, because they would have expanded the federal workforce. Instead, his New New Deal—much like the proposed Green New Deal—merely sent money to others; on its own it built no tunnels in national parks, constructed no Art Deco county courthouses, painted no murals on post office walls, published no guidebooks to the states. As a result, it missed out on another achievement of the Roosevelt era: the creation of spectacular and unmistakable monuments to activist government.

Like FDR, Obama saved capitalism, yet unlike FDR, Obama felt no need to do anything to soften the blows upon the people.

Thus did the "Party of the People" turn the government over to Wall Street in the years after Wall Street had done such lasting damage to the People. The classic explanation for this perverse act is the donations the banks made to Obama's campaign in 2008. But there's another, and it takes us deep into the shared predilections of the liberal class: Obama deferred to Wall Street in so many ways because investment banking signifies professional status like almost nothing else. For the kind of achievement-conscious people who filled the administration, investment bankers were more than friends—they were fellow professionals; people of subtle minds, sophisticated jargon, and extraordinary innovativeness. They were the "creative class" that Democrats revere.

They were often people of dazzling credentials as scholars but not necessarily as reformers, regulators, and law enforcers. They had successfully internalized mainstream thinking in their respective disciplines, maybe, but that was not enough for the challenges of the moment. Reform often comes

from the margins of American life, but marginal is not a term anyone would use to describe the satisfied, conventionally-minded people of the Obama administration. This team was limited by its excellence, restrained by its orthodoxy.

Seriousness is the coin of the realm in Washington, a city that finds Wall Street's simulation of professional solemnity to be highly convincing, what with its impenetrable technical dialect and its advanced financial instruments. So complex are the latter, one deputy US attorney general complained in 2014, that when examining them, "we are dealing with financial rocket science." The economic expertise of Wall Street's analysts, strategists, and traders is taken for granted in Washington. This belief seeps into all corners of life in the capital.

Consider the words of White House Press Secretary Jay Carney, who advocated for a payroll tax cut in 2011 by referencing "responsible economists," by which he meant "not adjuncts of one party or the other, or people from partisan think tanks, but economists on Wall Street, economists out in the country and academic economists who are not affiliated with a party or a position." What is interesting here is Carney's assumption, three years after the financial crisis, that Wall Street shares the high ground of respectability with academia. It is not a synonym for 'criminal,' but the opposite: a signifier of legitimacy.

Whichever way economies go from here, they cannot return to the pre-2008 normalcy. So there can be no talk of "recovery" of the past, given the overgrowth of debts that cannot be paid. Going forward, there are two alternatives: (1) banks and bondholders will lose if debts are written down; or (2) the economy will face a generation of austerity as debt deflation and privatization smother growth and upward mobility. In that case the One Percent will inherit wealth, while the 99 Percent inherit debt bondage.

From F. Scott Fitzgerald's *The Great Gatsby* to Tom Wolfe's *Bonfire of the Vanities*, novelists have symbolized the very rich as irresponsible auto drivers killing innocent pedestrians.

"They were careless people, Tom and Daisy, they smashed up things and creatures and then retreated back into their money or their vast carelessness or whatever it was that kept them together, and let other people clean up the mess they had made."

That is what makes the rich different. The collateral damage from their attacks is as irresponsible as it is devastating. They are insensitive to how their actions impact the life of others.

Posing as "job creators," rentiers claim to be proxies acting like shepherds as a virtual government. Their wealth is supposed to trickle down, somehow,

as if by helping themselves financially, they also will help economies grow. So today's creditors call financialization "wealth creators," whom Goldman Sachs describes as "doing God's work."

This is financial warfare—and not all wars end with the victory of the most progressive parties. The end of history is not necessarily utopia. The financial mode of conquest against labor and industry is as devastating today as in the Roman Republic's Social War that marked its transition to Empire in the first century BC. It was the dynamics of debt above all that turned the empire into a wasteland, reducing the population to debt bondage and outright slavery. Livy, Plutarch, and other Roman historians placed the blame for their epoch's collapse on creditors. Tacitus reports the words of the Celtic chieftain Calgacus, circa 83 AD, rousing his troops by describing the empire they were to fight against:

"Robbers of the world, having by their universal plunder exhausted the land. If the enemy is rich, they are rapacious; if he is poor, they lust for dominion; neither the east nor the west has been able to satisfy them. To robbery, slaughter, plunder, they give the lying name of empire. They make a wasteland and call it peace."

The peace brought by Rome turned out to be a world reverting to subsistence production on the land as cities became deserted. Rome became the model of what happens to economies that do not annul their debts but instead polarize between creditors and debtors. Its history—and hence, antiquity—ended in a convulsion of depopulation and a Dark Age for Europe.

We are living today in a transition period much like that of Athens circa 330 BC when Aristotle wrote his *Politics*. Seeing inequality widen as his city-state became an empire, he described how wealthy families tend to emerge within democracies to become a financial oligarchy. Book V of *Politics* traces how these oligarchies indebt a rising proportion of the population to themselves, creating hereditary estates on which to found aristocratic dynasties. In time, rivalries develop within the leading aristocratic families, and some decide to overthrow other elites of the old order by "taking the multitude into their camp."

In the seventh century BC, populist tyrants gained power in Corinth and other wealthy Greek cities by canceling the debts, redistributing the land and driving the old ruling elites into exile. Democracy was introduced more peacefully by reformers in sixth-century Athens. Solon banned debt bondage in 594, and Kleisthenes locked in political democracy in 508. But an oligarchy emerged once again, to be followed by aristocracy, democracy, and

so on in Aristotle's eternal political triangle. Destruction of democracy by the creditors and property owners who make up the One Percent thus is not a new phenomenon. The leading Roman historians blamed the destruction of Republican liberty on the rising power of creditors overpowering democracies. Using violence to block the reforms proposed by the Gracchi brothers in 133 BC, Senate leaders initiated a century of social war that ended in debt deflation and, in due course, serfdom.

From Greece and Rome to today's world, the driving force in the transition from democracy to oligarchy has been the fight by creditors against debtors. From the United States to Europe, creditors are taking over government agencies to control public policy and the tax system to undermine debtor rights, privatize public property in their own hands, and impose the modern equivalent of debt serfdom.

Financial strategists in nations subject to democratic ratification of policies face a challenge over how to get voters to elect governments that impose austerity, regressive tax policies, and anti-debtor bankruptcy laws of the sort that authoritarian Third World oligarchies and military dictatorships imposed from the 1960s onward. Financial tacticians start by limiting the sphere over which democratic choice is allowed. Control over the Executive Branch of government is shifted to central banks and Treasuries staffed by bank apparatchiks. The cover story for this regulatory capture is that central bank "independence" from partisan politics is a "hallmark of democracy"—as if making financial policy independent from oversight by elected legislators is democratic! Bankers trot out neoliberal professors to preach that only professionals drawn from the ranks of leading financial institutions (i.e., to act as their lobbyists) have the expertise needed to set monetary policy. This ideology denies that there is any such thing as careers in public service to check the potentially predatory behavior of high finance. The only entrance path to regulatory agencies is held to be the revolving door between the large financial institutions and government.

Opposition to a true central bank to monetize public budget deficits is based on the fantasy that this would cause hyperinflation, such as the Weimar Republic suffered in the early 1920s. The reality is that nearly all hyperinflations result from paying foreign debt or shortages of real resources. The highly political effect of a "hard money" policy blocking central banks from financing budget deficits is to leave credit and money creation for private bankers.

When global bankers wring their hands about the financial system melting down, what they really mean is that the top One Percent may lose some of the astounding amount of wealth they have accumulated since the Bubble years.

The events of 2011 showed that “confidence” meant whistling in the dark and refraining from measuring the debtor’s realistic ability to pay. This suspension of disbelief was politically necessary because once it is recognized that debts can’t be paid out of tax revenues and austerity, basic moral principles call for debts to be nullified. No debtor nation should be obliged to commit economic suicide, dismantle its public domain and force 5, 10, or 20 percent of its population to emigrate, as did “success story” Latvia, duly followed by Greece. At issue is what interest should take priority: creditor demands, or the economic growth and employment of sovereign nations.

Europe’s elites are behaving today as if they understand neither the nature of the crisis that they are presiding over, nor its implications for the future of European civilization. They are choosing to plunder the diminishing stocks of the weak and the dispossessed in order to plug the gaping holes of the financial sector, refusing to come to terms with the unsustainability of the task.

The formerly left-wing parties have let themselves be co-opted to limit democratic politics to innocuous social lifestyle choices that do not threaten financial interests, while accepting austerity leading to perpetual fiscal emergency and debt serfdom. The great objective behind nineteenth-century liberalism was, as Marx never tired of pointing out, to separate the economic sphere from the political sphere and to confine politics to the latter while leaving the economic sphere to capital.

Referendums are regularly overturned, if they cross the will of rulers. Voters whose views are scorned by elites shun the assembly that nominally represents them, turnout falling with each successive election. Bureaucrats who have never been elected police the budgets of national parliaments dispossessed even of spending powers. Parties lose members; voters lose belief that they count, as political choices narrow and promises of difference dwindle or vanish in office.

The classical idea of a post-industrial leisure economy was to free nations from rent and interest overhead to bring prices in line with necessary direct costs of production, with governments subsidizing basic services out of progressive taxes or new money creation.

By contrast, today’s financialized version of free markets obliges families to spend their life working mainly to pay banks for the credit needed to survive in today’s world. Saddling students and homebuyers with debt has turned their hopes and ambition into a road to insolvency. People can choose which bank to borrow from, which home to buy with a 30-year working-life mortgage, and which college to take out an education loan to attend. But whatever their choice, they are subjected to a financialized version of the Company Store, a deregulated and predatory economy. Something must

give way when earnings are unable to cover the stipulated debt service. If banks do not write down their loans, foreclosure time arrives and assets will be forfeited.

By imposing an access fee on the entry point into the middle class job market, privatizing and financializing the educational system raises the cost of living. This reverses the policy long followed by the United States, Germany, and other successful nations that made their economies more competitive by providing education and other basic services freely or at subsidized rates. Creating a need for loans at the educational choke point turns universities into vehicles for banks to earn government-guaranteed interest. Much as interest charges on home mortgages end up giving banks a larger sum than the sales price received by the sellers, student loan payments often give the bank as much interest income over time as the college or trade school has received as tuition. Consumer credit, home mortgages, and education loans thus treat the labor force much as feudal landlords treated the land and its occupants: as a source of tribute.

Debt leveraging is a major reason why the United States and Britain have lost their industrial advantage. Debt-inflated costs for housing, education, and other basic needs have priced their labor out of markets abroad and at home.

Neoliberal financialization is not how to create a viable economy. Academic theories must be mistrusted if they do not explain why financial and industrial objectives are diverging, not converging. FIRE-sector lobbyists have censored economic theory so as to misrepresent Adam Smith and the anti-rentier spirit of classical economists who believed that a free market required public regulation to keep predatory finance and rent seeking in check, and to keep basic infrastructure in the public domain.

Only by such intellectual clear-cutting to wipe out history could so much of the public come to believe what no generation ever before has believed: that the financial and related rent-extracting sectors are an intrinsic part of the real economy of production and consumption, not external to it and predatory on it, and that they can get money fastest by borrowing to buy assets being inflated by bank credit.

This predatory financial dynamic stifles industrial potential, raising the specter of lapsing back into ancient usury. Much like creditors in ancient Rome, today's financial power seeks to replace democracy with oligarchy. We are seeing a resurgence of "primitive accumulation" by exponentially accruing debt dependency, foreclosure, and privatization, whose effects threaten to be as devastating as the brutal military conquests of past epochs that reduced populations to serfdom.

The aim is to transfer ownership of the vast capital expenditure sunk in

the hitherto public domain—from roads to education, ports, power systems medical care and communications—to buyers on credit, with the revenue going to bankers, bondholders, and stockholders. Labor is cornered onto a virtual reservation, driven into debt by being obliged to buy essential goods and services and obtain housing and an education at the proverbial Company Store.

The financial crisis now plaguing Western economies is age-old. Throughout history the greatest fortunes have been obtained by lending and foreclosing, above all by privatizing the Commons (the public domain) by indebting governments to force sell-offs, or simply via insider dealings and fraud. It would be a travesty of language to say that the resulting privatization rents, financial extraction, and “capital” gains are “earned.”

Today’s passivity by the 99 Percent in the face of a rentier counter-Enlightenment reflects the degree to which voters have come to accept the neoliberal financial and tax system as part of the natural environment, as if there indeed is no alternative.

Restructuring the financial system is hard to do when people are engulfed in a crisis, especially when they imagine that they can recover by borrowing more—and fear that there is no alternative. The reality is that history is rife with possible remedies. These remedies almost always involve debt writedowns.

Hayek’s hyperbole in *The Road to Serfdom* characterizes public planning, taxation, and regulation as metaphoric serfdom. This reflects the One Percent’s fear and even hatred of democracy, progressive taxation, and public enterprise and social spending programs. In their place, Hayek’s acolytes would set economies on the road to literal debt serfdom, a state of dependency in which access to housing and education requires taking on a lifetime of debt.

The way that history was supposed to unfold was that banking would provide credit for capital investment. Public services were to be offered at falling prices—ultimately freely—to a widening population. But instead of evolving toward such socialism, bankers and wealthy elites found rent extraction to be their major source of gain. Calling their opposition to a government strong enough to keep them in check “libertarian,” their aim is simply to replace democratic government with planning by bankers and bondholders. To call their rent extraction and debt-financed asset-price inflation “wealth creation,” is to adopt the vocabulary of rentiers.

Chapter Seventy

Human Hamster Wheels

“To separate labor from other activities of life and subject it to the laws of the market was to annihilate all organic forms of existence and to replace them by a different type of organization, an atomistic and individualistic one.”

The Mysterious Case of the Missing Surplus Value of Labor:

Jack wants to open a factory. Jack possesses capital in the form of money and so he buys some land and has a factory built. Since nobody can run an entire factory, Jack agrees to pay Mary to run the factory machine while he fills out the paperwork and arranges the sale of the products. In this scenario, Jack pays himself and Mary for their labor as a manager and a machinist with what is left after factory upkeep—nothing problematic yet. But now business is going well and Jack realizes the factory makes enough money to pay the bills, Mary, himself, and a third person. Jack begins to pay Omar to do the paperwork and arrange the sales. Even though Jack spends most days playing Pokémon GO and relaxing, he continues to pay himself each month. Eventually, Jack replenishes his capital enough to buy a second factory. Now, Jack is paid enough to live comfortably and invest in more factories without needing to work himself. In this scenario, Jack is “earning” wealth by exploiting the value of labor provided by Mary and Omar—Jack has become a capitalist dog.

Some frame inequality in terms of fairness, luck, and pluck and treats money as some form of prize in an economic game. I suppose this way of looking at things works up to a point as long as we look to those below us and congratulate ourselves on our merit while accepting some greater luck of those above us which help rationalize our merit. But any concepts of fairness or justice rapidly fracture if we look past those in our own neighborhood.

Riding a bubble through the slums here and elsewhere in the world it becomes very difficult to rationalize justice and merit. Looking in the other direction toward the high rises and gated estates and manifestations of wealth I can't even imagine and the fragments of the fairness or justice of things evaporates completely.

In our society money and wealth is equated with merit. It packages demand for automatic respect and deference. This one-size-fits all measure for character, intellect, excellence, creativity, leadership, even physical attractiveness, undermines all these values reducing them to commodities of the marketplace. But the ability of money and wealth to control and command the lives of others and the collective resources of society is far more pernicious. What concept of fairness or justice can justify this aspect of inequality?

There can never be a pure meritocracy because high-status parents will invariably seek to pass on their positions, either through the use of influence or simply by the cultural advantages that their children inevitably possess. See: Felicity Huffman

A neoliberal meritocracy would have us believe that success depends on individual effort and talents, meaning responsibility lies entirely with the individual and authorities should give people as much freedom as possible to achieve this goal. For those who believe in the fairy tale of unrestricted choice, self-government and self-management are the preeminent political messages, especially if they appear to promise freedom. Along with the idea of the perfectible individual, the freedom we perceive ourselves as having in the West is the greatest untruth of this day and age.

Today my friends I wish to speak about a cursed tree and it's evil fruit. No, not an apple and Eve, though the parallels will be obvious to many. There once was a tree, it had twenty-dollar bills for leaves, its flowers were government bonds, its fruit diamonds. It attracted human beings who killed each other around the roots and made very good fertilizer.

The true violence isn't when a police officer brings his baton down on a protester's skull or throws a sting grenade. It is the deep-rooted, institutional forms of violence such as educational failure and the promise of shitty wages for dead-end jobs.

A lot of people forget that having debt you can't pay back really sucks. Debt is not just a credit instrument, it is an instrument of political and economic control.

It's actually baked into our culture. The phrase 'the man,' as in 'fight the man,' referred originally to creditors. 'The man' in the nineteenth century stood for 'furnishing man,' the merchant that sold nineteenth century sharecroppers and Southern farmers their supplies for the year, usually on

credit. Farmers, often illiterate and certainly unable to understand the arrangements into which they were entering, were charged interest rates of 80–100 percent a year, with a lien placed on their crops. When approaching a furnishing agent, who could grant them credit for seeds, equipment, even food itself, a farmer would meekly look down nervously as his debts were marked down in a notebook. At the end of a year, due to deflation and usury, farmers usually owed more than they started the year owing. Their land was often forfeit, and eventually most of them became tenant farmers.

They were in hock to the man, and eventually became slaves to him. This structure, of sharecropping and usury, held together by political violence, continued into the 1960s in some areas of the South. As late as the 1960s, Kennedy would see rural poverty in Arkansas and pronounce it “shocking.” These were the fruits of usury, a society built on unsustainable debt peonage.

Today, we are in the midst of creating a second sharecropper society. Today, the debts do not involve liens against crops. People in modern America carry student loans, credit card debt, and mortgages. All of these are hard to pay back, often bringing with them impenetrable contracts and illegal fees. Credit card debt is difficult to discharge in bankruptcy and a default on a home loan can leave you homeless. A student loan debt is literally a claim against a life—you cannot discharge it in bankruptcy, and if you die, your parents are obligated to pay it. If the banks have their way, mortgages and deficiency judgments will follow you around forever, as they do in Spain.

Young people and what only cynics might call ‘homeowners’ have no choice but to jump on the treadmill of debt, as debtcroppers. The goal is not to have them pay off their debts, but to owe forever—an utter perversion of the tribal gift economy. Whatever a debtcropper owes, a wealthy creditor owns. And as a bonus, the heavier the debt burden of American citizenry, the less able we are to organize and claim our democratic rights as citizens. Debtcroppers don’t start companies and innovate, they don’t take chances, and they don’t claim their political rights. Think about this when you hear the calls from ex-Morgan Stanley bankers and current World Bank Presidents pining for the gold standard. Or when you hear Warren Buffett partner Charlie Munger talk about how the bailouts of the wealthy were patriotic, but we mustn’t bail out homeowners for fear of “moral hazard.” Or when you hear Pete Peterson Foundation President and former Comptroller General David Walker yearn nostalgically for debtor’s prisons.

Professional-class liberals aren’t really alarmed by oversized rewards for society’s winners. On the contrary, this seems natural to them—because they are society’s winners. The liberalism of professionals just does not extend to matters of inequality; this is the area where soft hearts abruptly

turn hard.

Innovation liberalism is a liberalism of the rich. This doctrine has no patience with the idea that everyone should share in society's wealth. What Massachusetts liberals pine for, by and large, is a more perfect meritocracy—a system where the essential thing is to ensure that the truly talented get into the right schools and then get to rise through the ranks of society. Unfortunately, however, as the blue-state model makes painfully clear, there is no solidarity in a meritocracy. The ideology of educational achievement conveniently negates any esteem we might feel for the poorly graduated.

This is a curious phenomenon, is it not? A blue state where the Democrats maintain transparent connections to high finance and big pharma; where they have deliberately chosen distant software barons over working-class members of their own society; and where their chief economic proposals have to do with promoting innovation, a grand and promising idea that remains suspiciously vague. Nor can these innovation Democrats claim that their hands were forced by Republicans. They came up with this program all on their own.

Their intellectual dishonesty stems from their inability to step outside their credentialed class echo chamber and recognize that it is the credentialed class policies of neoconservative foreign policy and neoliberal economic policy that have proven disastrous for the majority of Americans. Intellectuals like them are *the* major problem for progressives because they serve up seemingly cogent arguments that only serve to distract attention from the truth of the failed world view they espouse and provide cover for the arrogant meritocracy, for which they are card carrying members. They are apologists for 16 years of Clinton/Obama neocon/neoliberal governance that abandoned 90% of American citizens.

At a key moment in the history of neoliberal thought, its advocates shifted from defending markets as competitive arenas amongst many, to viewing society-as-a-whole as one big competitive arena. Under the latter model, there is no distinction between arenas of politics, economics, and society. To convert money into political power, or into legal muscle, or into media influence, or into educational advantage, is justifiable, within this more brutal, capitalist model of neoliberalism. The problem that we now know as the '1%' is, as has been argued of America recently, a problem of oligarchy.

Underlying it is the problem that there are no longer any external, separate, or higher principles to appeal to, through which oligarchs might be challenged. Legitimate powers need other powers through which their legitimacy can be tested; this is the basic principle on which the separation of executive, legislature, and judiciary is based. The same thing holds true

with respect to economic power, but this is what has been lost.

Regulators, accountants, tax collectors, lawyers, public institutions have been drawn into the economic contest, and become available to buy. To use the sort of sporting metaphor much-loved by business leaders: it's as if the top football team has bought not only the best coaches, physios, and facilities, but also bought the referee and the journalists as well. The bodies responsible for judging economic competition have lost all authority, which leaves the dream of meritocracy or a 'level playing field'—crucial ideals within the neoliberal imagination—in tatters. Politically speaking, this is as much a failure of legitimacy as it is a problem of spiraling material inequality.

The result is a condition of “contingent neoliberalism,” contingent in the sense that it no longer operates with any spirit of fairness or inclusiveness. The priority is simply to prop it up at all costs. If people are irrational, then nudge them. If banks don't lend money, then inflate their balance sheets through artificial means. If a currency is no longer taken seriously, political leaders must repeatedly guarantee it as a sovereign priority. If people protest, buy a water cannon. This is a system whose own conditions are constantly falling apart, and which governments must do constant repair work on.

The outrage with the one percent (and, more accurately, with the 0.1%), the sense that even the rich are scarcely benefiting, is to be welcomed. It is also overdue. For several years, we have operated with a cultural and moral worldview which finds value only in winners. Our cities must be “world-leading” to matter. Universities must be “excellent,” or else they dwindle. This is a philosophy which condemns the majority of spaces, people and organizations to the status of losers. It also seems entirely unable to live up to its own meritocratic ideal any longer—if it ever did. The discovery that, if you cut a winner enough slack, eventually they'll try to close down the game once and for all, should throw our obsession with competitiveness into question. And then we can consider how else to find value in things, other than their being “better” than something else.

Another paradox of neoliberalism is that universal competition relies upon universal quantification and comparison. The result is that workers, job-seekers, and public services of every kind are subject to a stifling regime of assessment and monitoring, designed to identify the winners and punish the losers. The doctrine that Von Mises proposed would free us from the bureaucratic nightmare of central planning has instead created one.

Constant evaluations at work cause a decline in autonomy and a growing dependence on external—often shifting—norms. This results in the infantilization of the workers. Adults display childish outbursts of temper and

are jealous about trivialities—‘She got a new office chair and I didn’t’—tell white lies, resort to deceit, delight in the downfall of others, cherish petty feelings of revenge. This is the consequence of a system that prevents people from thinking independently and that fails to treat employees as adults.

More important, though, is the serious damage to people’s self-respect. Self-respect largely depends on the recognition that we receive from the other. The main question for employees these days is: ‘Who needs me?’ For a growing group of people, the answer is: no one.

There is a very interesting debate raging at the moment about the nature of sin, morality—And what do they think? Against it, are they?

No, they say, ‘It’s not as simple as that. It’s not a black and white issue. There are so many shades of gray.’

Nope. There’s no grays, only white that’s got grubby. And sin, my friends, is when you treat people as things. Including yourself. That’s what sin is. But wait they say, ‘It’s a lot more complicated than that...’

No. It ain’t. When people say things are a lot more complicated than that, they mean they’re getting worried that they won’t like the truth. People as things, that’s where it starts. You may claim that there are certainly worse crimes, but they all start out with thinking about others as things.

Some societies behave with brutal exploitation. Worst example: Western capitalism. Other societies do not and did not. They were or are cooperative, supportive, and lived sustainably. Many indigenous cultures were absolutely astounded by the Europeans’ greed and lack of ethics.

Reminds me of a favorite story. The Englishman said to the Pacific Islander:

“Get a job! Work as hard as you can, for as long as you can. Send your kids to school in England for a good education so they can know the right people and get good jobs. Then, if you’re lucky, you can retire, buy a vacation property here, and fish.”

The Pacific Islander knows he’s being lectured by a crazy person.

I think as humans we are also hardwired to behave cooperatively. Otherwise we would never survive.

Funnily enough, it seems that bees love stimulants, even cocaine. When I was growing *nicotiana rustica*, both for smoking and to boil up and spray other plants with, it was by far the local bees’ favorite plant in my yard. New hives even formed nearby. It got to the point where I stopped watering the tobacco plants because there were so many god damn bees. Had to have a guy come out and collect them at one point. Now I realize that I

accidentally created several societies of addicts and then had them forcibly removed because I didn't like them there. Humans are dicks. Or, at least, I am.

It's the human way—'kill what you don't like,' whereas it should be 'live with what belongs here.'

An indigenous chief was tied with a noose around his neck, and his feet in a wood pile for a fire to burn him alive—Christians can't even kill their victims humanely. He was one of the last of up to 20 million people who inhabited Hispaniola before the Christians came and massacred them. A preacher came to him, and tried to get him to convert to Christianity "to save him" before he was burned alive—he would still be burned alive regardless, since that's how Christians roll. The preacher told him about heaven and hell. The chief asked, "Do all Christians go to heaven?" The preacher replied, "Yes." The chief stated, "I think I would rather prefer hell.

When states pretend to respect indigenous governance, they respect indigenous rights to govern within the limits of the state and corporate box they are placed in. Even uncontacted tribes are placed in a state controlled box where they are considered consensual citizens of a government they have never heard of. Ecuador claims the Yasuni as its property to sign mining contracts for despite the government warning Ecuadorians of the dangers of traveling too far into uncontacted tribal land. Supposedly autonomous governance for some involves councils governing allocation of funds and property in formerly moneyless, gifting, commons cultures. It is not autonomy if people cannot choose their own economy, membership, and method of governance. Telling formerly borderless nations that they can govern as they wish within borders is ridiculous as the governance they wish is borderless. Living and fluid societies that used continual shunning and adopting, joining and leaving, for their economic and cultural health, have been converted to dead cages and economic markets, an architected global caste system. Declaring autonomy within those borders is akin to declaring freedom within prison walls.

The tough reality of economic development is that it will always be easier to move people to jobs than the jobs to people. Which is akin to telling many, many voters the only possible way they can live an even modest lifestyle is to abandon their roots for the uniformity of urban life. They must sacrifice their identities to survive. You will be assimilated. Resistance is futile. Follow the Brooklyn hipsters to the Promised Land.

This is a bitter pill for many to swallow. To just sit back and accept the collapse of your communities. And I suspect the white working class resents being told to swallow that pill when the Democrats eagerly celebrate the identities of everyone else

Former Australian prime minister Tony Abbott said of the proposed closure of 150 remote Indigenous communities:

“What we can’t do is endlessly subsidize lifestyle choices if those lifestyle choices are not conducive to the kind of full participation in Australian society that everyone should have. If people choose to live miles away from where there’s a school, if people choose not to access the school of the air, if people choose to live where there’s no jobs, obviously it’s very, very difficult to close the gap.”

If you want to live, get out of your traditional lands. The similarities are not coincidental.

In both cases, the argument accepts capital accumulation as the touchstone for human relations, the sole legitimator of social good. If the customs of Indigenous Australia don’t fit the priorities of modern capitalism, then, by definition, they’re dysfunctional and so the custodians of the oldest living culture in the world should embrace a different “lifestyle,” one more compatible with free market principles.

The traditions of Garbutt, NY, aren’t nearly as ancient. Yet, in a way, the relative novelty of what’s being demolished merely highlights the cruelty of the process.

Throughout most of the twentieth century, American capitalism depended upon working people faithfully serving their local mill or mine or factory. Hence the importance attached to so-called “small town” values: civic pride, steadiness, family, and so on. Such ideals that suited employers but that were also embraced by workers, who often built their lives around them.

Now many tell them they were suckers. Twenty-first century capitalism requires, it seems, a nimble, high-tech workforce, capable of relocating anywhere that business might temporarily settle. You believed your town and your church and your local football team counted for something? Tough luck, feller. The market’s moved on. If you don’t follow, the ruination that will befall you—unemployment, crime, drug abuse, et cetera—will be entirely your own fault.

On the coast of Siberia near Plover Bay, Hooper called at a tiny settlement of thirty Chukchi natives. He and his men were invited into one of the hovels half-buried in the ground, its roof little more than a network of bones and driftwood logs covered in walrus skins. Inside, Muir was surprised to find “a number of very snug, clean, luxurious bedrooms, whose sides, ceiling, and floor were made of fur; they were lighted by means of a pan of whale-oil with a bit of moss for a wick.” Muir found these people happy, well fed, and seemingly living in equilibrium with their world.

“After being out all day hunting in the stormy weather, the Chukchi withdraws into this furry sanctum, takes off all his clothing, and spreads his wearied limbs in luxurious ease, sleeping perfectly nude in the severest weather.”

To know how to live in and with such purportedly “savage” environments—to have the skills to vary, extend, enrich, or interact with them without simply reducing them to resources for infinite growth—has frequently been assumed to diminish your humanity.

Among European colonialist thinkers like John Locke, Native Americans were not felt to be capable of adding any human ingredients to land at all. In colonial India, “waste” lands were seen to be occupied by “criminal” people. Today, the Asian Development Bank is on record claiming that it is only by removing people from forested mountain areas that they can be brought to “normal life.”

The Zápara had survived into the twenty-first century, but they had entered it tipsy, and stayed that way. They still hunted, but men now walked for days without finding tapirs or even quail. They had resorted to shooting spider monkeys, whose flesh was formerly taboo. Again, Ana María pushed away the bowl proffered by her granddaughters, which contained chocolate-colored meat with a tiny, thumbless paw jutting over its side. She raised her knotted chin toward the rejected boiled monkey:

“When we’re down to eating our ancestors, what is left?”

What humanity came up with and held on to during its first three-million years was a social organization that worked well for people. It didn’t work well for products, for motorboats and can openers and operettas. It didn’t work well for the greedy, the ruthless, the power hungry. That’s what we have, a social organization that works beautifully for products—which just keep getting better and better every year—but very poorly for people, except for the greedy, the ruthless, the power hungry. Many of our ancestors lived in societies that every anthropologist agrees were non-hierarchical and markedly egalitarian. They weren’t structured so that a few at the top lived lives of luxury, a few more lived in the middle in comfort, and the masses at the bottom lived in poverty or near poverty, just struggling to survive. They weren’t riddled with crime, depression, madness, suicide, addiction. And when we came along with invitations to join our glorious civilization, they fought to the death to hold on to the life they had.

It was the outgrowth of human intelligence and experience. What didn’t work (and one has to suppose that things were tried that didn’t work) was abandoned—and abandoned by people who knew it wasn’t working.

What was left after all the trials was the tribe, which was evolutionarily stable, meaning not that it was perfect but that hundreds of thousands of years of natural selection—on a social level—was unable to produce an organization that worked better. To my mind the evolution of the tribe was an accomplishment of greater importance to the human race than all the advances of the Industrial Revolution put together. If we were still living tribally, we'd be facing a future measured in millions of years. As it is, we've walked on the moon but are now facing a future that can be measured in decades, if we go on living the way we're presently living.

In general, their societies are vastly superior to the ones Western people are running. For several reasons.

First, poverty. Western society is a big producer of poverty. This is especially true in Amazon countries like Brazil and Peru. Indigenous people entering industrial society will be left at the bottom of the bottom, socially and economically. Statistically, they frequently end up homeless and addicted to alcohol.

Second, environmental destruction. It is healthier to live in the forest than to live outside of it and destroy it for hydropower and gold mining and oil drilling and cattle ranching. People who grow up in the forest understand this. It is normal to choose a healthy society, where money is unnecessary and all your basic needs are met, than an unhealthy one where you sleep on concrete, or in boxes if you're rich, and spend your life toiling away in wage slavery. Or regular slavery. It is Brazil after all.

Third, freedom. People in our society spend thousands of dollars on camping equipment and air tickets just to spend a few days living lives that indigenous people have access to. Younger people in the tribe are free to leave and join Washichu culture, yet they generally don't. It's because industrial people don't know how to live. They work and work in jobs they hate, and destroy everything to support lifestyles that ultimately make them unhealthy and unhappy. Leaving the forest to become someone who destroys the forest is simply not appealing.

If you have a chance, go to Google Street View and look at Manaus in Brazil. The place is a shithole. It's a suburb in the middle of the forest, but all the trees have been cut down and there is no shade. People walking in the streets are obviously hot and unhappy.

It's arrogant to assume indigenous people want to become like us. They don't. They have no reason to. Our society doesn't treat human beings with respect. Our society is full of unnecessary stressful and semi-impossible bullshit, like finding a career or spending your life paycheck-to-paycheck in a minimum wage job. Check out Survival International's website and look at their interviews and travels with indigenous people. They are happy.

They like the forest. They have lived in the forest for tens of thousands of years, and it is not their responsibility to destroy the forest and go to the city because some alien culture has decided they don't have the right to live as they choose.

The forest is home to ancient hunter-gatherer communities as well as subsistence rice and vegetable farmers. But in recent years, the Laos government has been systematically seeking out and expelling hunter-gatherers and housing them in villages, where they are given some land to farm. Government officials find the presence of hunter-gatherers a national embarrassment that doesn't fit well with its desired image of a modern developed nation. But once removed from the forest, most of these people become sick and die. Entire tribes have been lost in this way. They believe that their protective spirits stay on in the forest, too far to provide protection.

Too bad they're in the way of capitalism.

A village that sustains itself and doesn't trade much is worth absolutely nothing to a capitalist economy. But if you drive them off their lands, you have land and potential resources, while the villagers need to join the work force and sell their labor power for money. They will need to compete with the other workers and this way lower the wages, and what little they receive as a wage will all flow back into the economy as they live their new wage slave life from paycheck to paycheck.

Welcome to the great capitalist system, where we make technological leaps only to employ them to maintain the system through artificial shortages. Where it is more economical to throw away half the food than to feed the poor. Where we employ tens of thousands of smart workers to monetize health care as salesmen and insurance workers, doing nothing but trying to extract as much money from each other as possible, while we let doctors and nurses work 20-hour shifts.

The great efficiency of capitalism is in its ability to sustain itself on the back of the working class, and that's it.

People with land and strong tribal bonds do not need money which is just an artificial, dissociated form of societal approval. Once people no longer have land, they are at the mercy of the trade economy and they have no choice but to use currency as a dissociated form of approval. This currency can buy them a simulation of everything their tribe once brought them, from acceptance to a comfortable home and food security. Removing people from their land cripples their resistance as the resulting dissociated nation, even when intact, is beset by the social problems which accompany grief, poverty, and racism from the wider society and struggling to meet the demands of the trade economy. States then depict nations as ethnic groupings, which they never were, instead of a network of dependencies

which was their true nature.

A world in which people are valued by the shit they own and not what they've done, know, or think. A world filled with commercialism that says every minute of the day: 'You are only as good as the product you buy.' And then proceeds to constantly try to fill that self sustaining void by shoving more products into it. Imagine if you actually could live off of how good a friend you were, how strong a role model you are, how many people love you and respect you, how much effort you put into making the world a better place than when you arrived. We all know these things and shove them to the very bottom of our mind in an effort to agree, en masse, that this lie of shit consumerism is actually as good as it gets. We don't want to admit we've been doing it wrong for a very long time. So that truth manifests in depression and abhorrent behaviors. Just because we're ignoring it doesn't mean it's going away. An uncleaned wound only festers into pus, it doesn't just fade away.

This is a story of fishermen in Palau, an island country in Micronesia. Seafood was once abundant there. The Palauan fisherman never had trouble finding enough fish to satisfy their own and their village's needs. The fisherman gave away the fish they didn't eat to other villagers. They lived in a state of 'subsistence affluence.'

After Japan colonized Palau in the 1920s the fishermen began to sell their fish to obtain attractive and exotic goods offered by the Japanese. The fishermen bought nets and motorized boats with the money, allowing them to catch more fish to sell in order to obtain more goods. They fished harder to harvest more fish and visited more distant areas of the reef to find them. Over the years, the fish abundance dropped.

The fishermen bought even bigger boats to catch the vanishing fish, but to do that they had to borrow money. They had to sell all their fish to pay off their loans. They stopped giving them away in the villages; instead they sold them to the outsiders and to other villagers. Now the people in the village had to work for the money to buy their food.

Pretty soon, there were not enough fish over the reefs for the fishermen to make payments on their loans, so the village sold their customary access rights to the fishing grounds. The people in the village began to eat imported fish in cans.

In a nutshell, that is the superhighway. Here are a few simple observations:

1. The superhighway is driven by trade.
2. Trade seduces local people to transform a local resource into a commodity which they exchange for commodities from other localities.

3. Transforming local resources into commodities—which can be sold to much larger communities (i.e. markets)—seduces the local people into over-harvesting or over-utilizing the local natural resource.
4. As the local resource-commodity becomes more difficult to obtain, local people are further seduced into adopting new and more aggressive technologies to harvest it—resulting in a further over-harvesting or over-utilization of the resource.
5. As the technologies required to harvest the local resource-commodity become more complex and expensive, the local people are forced to go into debt to acquire and operate those technologies.
6. To service their debt, the local people eventually are forced to consign to their creditors their natural ownership of the local resource itself. The local people are now the tenants and employees of the new owner—which, in one personification or another, is the superhighway.
7. The new tenants and employees now work for wages—which are set by the superhighway—and must use their wages to buy their subsistence in the form of commodities produced by the superhighway from the global network of local resources it now owns and controls.
8. In the end:
 - a) The superhighway literally owns the earth's resources.
 - b) Everyone in the world is a working tenant and employee (except for the 1% of the people in the world who are the creditors who own the superhighway itself).
 - c) Every local resource has been over-harvested or spoiled to the point of collapse or depletion.

It is this last point, of course, which is ultimately Rachael Carson's warning: Whether you're a creditor or debtor, an owner or employee, a landlord or tenant, when the local resources—and all resources are "local"—are spoiled, depleted, and cannot be restored or renewed, the pavement of the superhighway comes to an end. There is nothing left to exploit, nothing left to trade. Long before that point is reached, however, life stops being fun—first for the 99%, then, finally, for the 1%, which is basically everybody still traveling the superhighway

Most people enjoy helping others and few people enjoy abusing others. That is why the trade economy had to be invented and pretend its system

of global slavery was helping others. The old adage ‘Give a man a fish, and you feed him for a day; Teach a man to fish, and you feed him for a lifetime’ was co-opted by the trade economy to pretend it was helping people around the world become self-sufficient by creating jobs when it was doing the exact opposite. No one on earth has ever needed to have jobs created for them, we have all always found plenty to do. While waged labour has been considered lazy by its masters since its beginning—as have slaves—there has never been a free society that died from lack of industry to feed and shelter itself or care for its young. Human history is a history of industry as long as there is autonomy and free will over one’s own work.

Give a man a fish and you feed him for a day. Dismantle the corporations destroying his river and home and he can catch his own fish.

A brutally endless cycle of printing replacement parts—this is how the economy works. If things don’t break and people didn’t screw up, more than half the jobs out there would be gone. The economy is mostly just sustaining itself while a very small percentage of people make technological progress.

“There’s the true agenda. Socialism, and the control of all means of production by the elite. We can’t be trusted to own the means of production, because we might do something harmful, so a very few ‘enlightened’ rulers need to make all of the decisions for us.”

Socialism does not mean transferring the means of production to the elite or to just a small group of “enlightened rulers.” Get that McCarthyist propaganda bullshit out of your head and read what Socialism is actually about. Government control of the means of production is just one potential outcome of a socialist society, the other is a democratic, or social ownership, of the means of production.

I recommend you read Adam Smith’s *The Wealth of Nations* as well, since I doubt you know what a pure capitalist society is either. The mongrel economic system that we have in this country right now that we loosely define as “capitalism” has already led to a society where the means of production are mostly owned by the elites. Have you not noticed that the only area of real economic growth and expansion that first world countries are experiencing right now is within the tech industry? And even then, this growth has resulted in the creation of even more useless jobs in providing services.

“The rest of humanity, the plebs, the slaves, should just shut up and do what they’re told. So, what, that we all have to live

in low energy poverty? It's what's necessary for the elite to have a nice place to live. Isn't that the most important thing?"

The irony is that this is the state of society that we are *already* living in. The only difference is that we have energy abundance and are ludicrously wasteful with it.

So the issue that critics of capitalism have is not that even feudalism and slavery would be better, but that there is still too much of feudalism and slavery within capitalism. Especially three points:

1. **The Class Society:** While individuals may rise and fall between the ranks—which was possible even in feudalism—there still is a strong class society under capitalism. The capitalists have the financial capital, social connections, and knowledge to lead the economy. They privately own the means of production. Therefore the working class is dependent on the capitalists, as they need access to means of production to work and survive.
2. **Exploitation:** Exploitation describes the simple fact that an employee does not receive all the value they create, because a part of it is taken by their employer. This is the easiest understood in a slave society: It is only economical to keep a slave if they create more value than it costs to maintain them. All the additional value is taken away by the slave master as a profit. And the slave has no say in what happens to that surplus value. This same exploitation is a cornerstone of capitalism. A wage worker may have some choice in which capitalist will exploit them, but they must be exploited or they wouldn't find a job.
3. **Alienation:** To understand alienation it's best to look at the original classless tribal society, like a hunter-gatherer tribe, or even a non-human animal. For the original living being, work is a natural part of their life. The horse needs to eat grass, the wolf needs to hunt, the humans need to sustain their tribe. Even though they cannot freely determine their work—because natural circumstances like hunger and the seasons will force them, or because they need to work and share with a tribe—this is still their very own natural labor. The wage worker's work in contrast is alienated in several ways:
 - a) The product of their work belongs to their employer, not themselves.

- b) The process of work is dictated to the worker. You're told to be there at some time, you're given specific tools, and tight guidelines on how to do your job.
- c) Alienation of the workers from their peers by the laws of competition.

Maybe you see from this why socialism is *not* the state ownership over the means of production, which effectively just boils down to some form of either state capitalism or bureaucratic feudalism.

The problems of exploitation can be eliminated by changing the concept of property to place the means of production under the control of a working-class democracy. Means of production are the land, resources, and machinery used to produce a society's wealth. The means are stuffs nobody personally needs to use—steel mills, freight trains, and vast tracts of farmland, for example, are means of production, while the tools in someone's garage, a Honda Civic, and a garden are not means of production.

Rights of private property under capitalism ensure the wealth produced by a society is controlled by a ruling minority that perpetuates its advantage over an exploited class of workers denied access to the means of producing their own wealth. With no access to the means, the working classes are subject to the terms and conditions dictated by the ruling class which owns them. Putting the means under democratic control would end this cycle of exploitation and the systemic inequality and poverty it produces.

And this is socialism—control over the means of production by the people, for the people.

“They were, simply, totally free. They were financially free, and secure, not because of their means but because of their wants. Ironically by being beggars, they had the equivalent of ‘fuck you’ money, which one can get more easily by being at the lowest rung than by being member of the income dependent class.”

Complete freedom is the last thing you would want if you have an organized religion to run. Total freedom is also a very, very bad thing for you if you have a firm to run.

As we can see, economists stopped one or two inches short of the notion of skin in the game. They never thought in risk terms to realize that an employee is a risk management strategy. Had economists had any interest in the ancients, they would have discovered the risk management strategy relied upon by Roman families who customarily had a slave for treasurer, the

person responsible for the finances of the household and the estate. Why? Because you can inflict a much higher punishment on a slave than a free person or a freedman—and you do not need to rely on the mechanism of the law for that. You can be bankrupted by an irresponsible or dishonest steward who can divert your estate's funds to Bithynia. You run a lower financial risk by having the steward function fulfilled by a slave.

In short, every organization wants a certain number of people associated with it to be deprived of a certain share of their freedom. How do you own these people? First, by conditioning and psychological manipulation; second by tweaking them to have some skin in the game, forcing them to have something significant to lose if they were to disobey authority—something hard to do with beggars who flaunted scorn of material possessions. In the orders of the mafia, things are simple: 'made men' can be whacked if the capo suspects lack of allegiance, with a transitory stay in the trunk of a car—and a guaranteed presence of the boss at their funerals. For other professions, skin in the game comes in more subtle form.

Slave ownership by companies has traditionally taken very curious forms. The best slave is someone you overpay and who knows it, terrified of losing his status. Multinational companies created the expat category, a sort of diplomat with a higher standard of living representing the firm far away and running its business there. A bank in New York sends a married employee with his family to a foreign location, say a tropical country with cheap labor, with perks and privileges such as country club membership, a driver, a nice company villa with a gardener, a yearly trip back home with the family in first class.

It keeps him there for a few years, enough to be addicted. He earns much more than the "locals," in a hierarchy reminiscent of colonial days. He builds a social life with other expats. He progressively wants to stay in the location much longer but he is far from headquarters and has no idea of his minute-to-minute standing in the firm except through signals. Eventually, like a diplomat, he begs for another location when time comes for a reshuffle.

Returning to the home office means loss of perks, having to revert to the unchanged base salary, and the person is now a total slave; a return to lower middle class life in the suburbs of New York City taking the commuter train, perhaps, god forbid, a bus, and eating a sandwich for lunch! The person is terrified when the big boss snubs him. Ninety five percent of the employee's mind will be on company politics which is exactly what the company wants. The big boss in the board room will have a supporter in the event of some intrigue.

All large corporations had employees with expat status and, in spite of its costs, it was an extremely effective strategy. Why? Because the further

from headquarters an employee is located, the more autonomous his unit, the more you want him to be a slave so he does nothing strange on his own.

At IBM, a corporation that embodied the ideal of the company man, the sales force gathered each morning to belt out the company anthem, “Ever Onward,” and to harmonize on the “Selling IBM” song, set to the tune of “Singin’ in the Rain.” “Selling IBM,” it began, “we’re selling IBM. What a glorious feeling, the world is our friend.” The ditty built to a stirring close:

“We’re always in trim, we work with a vim. We’re selling,
just selling, IBM.”

Then they went off to make their sales calls, proving that the admissions people at Harvard and Yale were probably right: only a certain type of fellow could possibly have been interested in kicking off his mornings this way.

A company man is someone who feels that he has something huge to lose if he doesn’t behave as a company man—that is, he has skin in the game. If the company man is, sort of, gone, he has been replaced by the companies person, thanks to both an expansion of the gender and a generalization of the function. For the person is no longer owned by a company but by something worse: the idea that he needs to be employable.

A companies person is someone who feels that he has something huge to lose if he loses his employability—that is, he or she has skin in the game. The employable person is embedded in an industry, with fear of upsetting not just their employer, but other potential employers. An employee is—by design—more valuable inside a firm than outside of it, that is more valuable to the employer than the market

Perhaps by definition an employable person is the one that you will never find in a history book because these people are designed to never leave their mark on the course of events. They are, by design, uninteresting to historians.

The trade economy promised that slavery could be abolished as work could be freely accepted or refused and those who worked hardest or best would receive the greatest reward. By making autonomy and social acceptance available only with currency and currency available to the lower classes only through jobs, the merchant class was able to equate slavery with freedom. Instead of managing a lower class of slaves who demanded freedom, they gave the lower class their freedom and convinced them to demand slavery. People who would never argue that slaves were better off under slavery as they had food and housing would spend the next centuries arguing exactly that for wage slavery.

“Every level of the contracting food chain is grotesquely overfed except the bottom rung where the actual work is carried out.”

True, a contractor (the real kind, not the Uber-kind) has downside, a financial penalty that can be built-into the contract, in addition to reputational costs. But consider that an employee will always have more risk. And conditional on someone being an employee such a person will be risk averse. By having been employees they signal a certain type of domestication.

Someone who has been employed for a while is giving you the evidence of submission. Submission is displayed by having gone through years of the ritual of giving up his personal freedom for nine hours every day, punctual arrival at an office, denying himself his own schedule, and not having beaten up anyone. You have an obedient, housebroken dog.

Employees are more risk averse, they fear being fired more than contractors do being sued. Even when the employees ceases to be an employee, they will remain diligent. The longer the person stays with a company, the more emotional investment they will have in staying and, when leaving, are guaranteed in doing an “honorable exit.”

It’s not about deciding to be a cab driver. It’s about accepting the low pay and complete lack of any financial stability. 66% of Americans live paycheck to paycheck—a fragile existence—meaning they’re one check away from homelessness. You would think they’d be marching in the streets demanding change. They’re not. Another phrase comes to mind: quiet desperation.

See, if you’re gonna live like that you need something to keep you going. Something to let you ignore just how terrifyingly precarious your entire life is. Stupidity only goes so far. Logic won’t get you out of that. If you start thinking logically you’ll demand better condition. That’s where the Job Creator narrative (among others) comes in. You can’t sustain your blind faith in capitalism—not shared by the capitalists, who rely heavily on the government to bail them out every 10–15 years when they tank the economy with their gambling—without a powerful narrative that shifts your self image away from the reality of your one-major-expense-away-from-disaster life and to one of an upper middle class working man who’s just a little down on his luck.

They can’t legally kill the people they deem worthless so they starve them and dehumanize them and mistreat them in other ways. This ensures the best goes to their and their friends’ offspring. Have to start breaking down your children’s future servants early on. How else could you get a psychologically, emotionally, and socially healthy child to stand in a box for

30+ hours a week 5–10 years later serving people who get to play and run free and explore outside?

“The problem with that view is the ‘lifestyle’ of the guy making \$30k a year is currently ‘living without healthcare and eating poorly.’ The 15 years you spend avoiding the doctor might cost you a lot of years of that supposedly exciting retirement. I make substantially more than the \$30k/year person. But I keep finding things to spend money on. Like when my catalytic converter breaks in my car and needs a \$2500 repair or I can’t drive to work. Or like when I have to decide between a \$6000 surgery this year or a potential irreparable situation down the road. My allergy medicines cost me \$60/month. The alternative is expensive ER visits for an epipen when it finally triggers an asthma attack. My job causes a lethargic lifestyle that will either cost me medical bills 20 years from now or require significant investment in exercise today to mitigate. That leads to a crippling lack of free time which is part of why I end up paying a therapist monthly. The other part is the knowledge that at any time, I can be terminated with no severance because this is a ‘right to work’ state, so somehow I also always need to be networking to be ready to change jobs at the drop of a hat. Then the rent goes up. Every year, 10%. Renting is for suckers, I should have a house, right? That’s going up 10% every year, too, including the down payment. So I have to move further out. Which makes the gas cost more, and the commute takes more of my free time.

I spend my time at my job to pay for the things I need to make sure I get to the job on time. I’d be bankrupt if I were doing the things that actually make me happy in life. \$30k is twice what I made when I had a job I was happy with. Every article talking about how terrible my generation is at saving? I’ve got twice the money of the ‘average’ member of my generation. Every article talking about where I should be for my age? I’m not even halfway. But they bitch anyway that I’m not buying new cars or having children to feed their industry. My great-grandfather got to retire at 50, buy an RV, and travel the country. I’m going to be lucky if I’ve got a house by then. Because I’m not ‘hustling’ enough? Please. I’ve got more education than the last five generations of my family combined. Somehow that hasn’t translated into wealth like it did for them. I guess I just expect handouts?”

There's a Walmart employee event down in Bentonville, Arkansas every year. It's by invitation only. I think we had one person from our store go in the three years I worked for them. He described the entire experience as somewhere between cult and bat shit fucking insane. Apparently, those who get to go have generally been absolutely brainwashed into thinking this is some kind of major honor. For example: The lady next to him on the bus was super excited and talking about how long she'd worked for the company and how long she's waited to go on this trip. He says he's only worked for the company for about three months.

Not only did she get angry and refuse to interact with him the rest of the drive down, she told everyone else and they all decided he hadn't earned the right to be there either. He became a social pariah because he wasn't fully indoctrinated into the Walmart cult. At the actual event people rabidly cheered for everything. The cult leadership got applause like they were Tom Cruise. But wait, turns out the leadership got more screaming and cheering than Tom Cruise, who actually got paraded out on stage to talk to the workers about how awesome they are for working at Walmart. And these people just ate it all up.

I don't do the story justice though. The way he tells it, it's kind of a frightening, surreal trip through the psyche of a mob of ignorant people, and really makes you worry about the future in general.

Hierarchies aren't natural phenomena within the human race. Outside of parenting, human beings aren't born with the inclination to be ruled, controlled, managed, and supervised by other human beings. Hierarchies are artificial constructs designed to serve a purpose. They are a necessity within any society that boasts high degrees of wealth and power inequities. They are a necessity for maintaining these inequities and ensuring they are not challenged from below.

If you go to the city of Washington, and you examine the pages of the congressional directory you will find that almost all of them claim—these corporation lawyers and cowardly politicians, members of Congress and misrepresentatives of the masses—in glowing terms that they have risen from the ranks to places of eminence and distinction. I am very glad I cannot make that claim for myself. I would be ashamed to admit that I had risen from the ranks. When I rise it will be with the ranks, and not from the ranks.

Our house was outside the city, off one of the blacktop roads. We had us a big dog my daddy would keep on a chain in the front yard. A big part German shepherd. I hated the chain but we didn't have a fence—we were right off the road there. But he had dignity. What he'd do, he'd never go out to the length of the chain. He'd never even get out to where the chain

got tight. Even if the mailman pulled up, or a salesman. Out of dignity, this dog pretended like he chose this one area to stay in that just happened to be inside the length of the chain. Nothing outside of that area right there interested him. He just had zero interest. So he never noticed the chain. He didn't hate it. The chain. He just up and made it not relevant. Maybe he wasn't pretending—maybe he really up and chose that little circle for his own world. He had a power to him. All of his life on that chain. I loved that damn dog.

To enjoy bodily warmth, some small part of you must be cold, for there is no quality in this world that is not what it is merely by contrast. Nothing exists in itself. If you flatter yourself that you are all over comfortable, and have been so a long time, then you cannot be said to be comfortable any more.

We have been bribed with privileges. Bought off, conned. Our comfort has become our chains, the rabbit we chase around the track. Never satisfied, never satiated.

“For those of us on the inside, we don't deserve any sympathy. But I'd like to offer a glimmer of insight into the conflict that those of us with any sort of conscience wrestle with because it is a conflict which is going to shape our societies over the next generation. Increasingly, if you want to get and hang on to a middle class job, that job will involve dishonesty or exploitation of others in some way.”

We must be grateful that good and decent people sometimes start out believing Orwellian tales. Dull, cowardly, and servile people never blow whistles.

“The basic point is that ‘ordinary men’ can find themselves committing heinous acts because their fear of ostracism and humiliation is greater than their fear of dying or killing.”

Please accept the fact that you have painted yourself into a corner, and that you have to leave promptly—with an apology and a payment plan—in order to avoid any further destruction to your professional and personal world. Your itinerary of self-destruction is a stellar one.

“If they are given the labor it is theirs. My grandfather owns a refrigeration company that employs 10 people. They give him the labor so that they get paid. They are not slaves.”

They are not slaves in the sense that your grandfather owns them, but when your choice is between a subsistence wage and starvation, you are essentially left with no choice. How and why is it that your grandfather is the one that owns his business, and not one of his employees for example? I'm sure he works very hard, but working hard isn't in and of itself a prerequisite for success. Firstly, he would need to be of a sound mind and body. You can't run a refrigerator company if you are mentally impaired or missing a limb. Secondly, he would need to be in the right place and the right time to succeed. If he were born 1,000 years in the past I doubt many people would need his services, likewise if he were born in Mongolia, where most people don't have refrigeration or even electricity, I doubt he would be able to succeed. Thirdly, he needs to have capital, or access to the capital necessary to found a company. To get this he needs to have cultural capital (be a person who is trusted enough by banks to be loaned money). Above all, he needs the intelligence and the drive to succeed.

Obviously, not everyone has these. Does this make them less intrinsically valuable people? Is it just that a person born in Somalia, surrounded by famine and civil war, should die of starvation, while your grandfather succeeds, just because your grandfather was lucky enough to be born where he was? Again, I'm sure your grandfather worked very hard to get where he is, and I'm not trying to take that away from him. The problem is that one's success is predicated on chance and circumstance. Can you really say that he has more of a right to the life that he lives than someone else?

But you can never actually prioritize workers when social relations are premised on the idea that in order to eat, most people must sell their work for a price set by capitalists, and then those capitalists get to keep all the value produced by that labor in excess of wages and other overhead—what we call profits—as a reward for owning the business. That setup prioritizes bosses by nature, and leaves workers fighting over scraps.

A Profound Violence

A report comparing employment in the US between 1910 and 2000 gives us a clear picture—one pretty much exactly echoed in the UK. Over the course of the last century, the number of workers employed as domestic servants, in industry, and in the farm sector has collapsed dramatically. At the same time, “professional, managerial, clerical, sales, and service workers” tripled, growing “from one-quarter to three-quarters of total employment.” In other words, productive jobs have, just as predicted, been largely automated away. Even if you count industrial workers globally, including the toiling masses in India and China, such workers are still not nearly so large a percentage of the world population as they used to be.

But rather than allowing a massive reduction of working hours to free the world’s population to pursue their own projects, pleasures, visions, and ideas, we have seen the ballooning not even so much of the service sector as of the administrative sector, up to and including the creation of whole new industries like financial services or telemarketing, or the unprecedented expansion of sectors like corporate law, academic and health administration, human resources, and public relations. And these numbers do not even reflect on all those people whose job is to provide administrative, technical, or security support for these industries, or for that matter the whole host of ancillary industries—dog-washers, all-night pizza deliverymen, et cetera—that only exist because everyone else is spending so much of their time working in all the other ones.

These are bullshit jobs.

It’s as if someone were out there making up pointless jobs just for the sake of keeping us all working. And here, precisely, lies the mystery. In capitalism, this is precisely what is not supposed to happen. Sure, in the old inefficient Socialist states like the Soviet Union, where employment was considered both a right and a sacred duty, the system made up as many jobs as it had to. This is why in Soviet department stores it took three clerks to sell a piece of meat. But, of course, this is the very sort of problem market competition is supposed to fix. According to economic theory, at least, the last thing a profit-seeking firm is going to do is shell out money to

workers they don't really need to employ. Still, somehow, it happens. While corporations may engage in ruthless downsizing, the layoffs and speed-ups invariably fall on that class of people who are actually making, moving, fixing, and maintaining things. Through some strange alchemy no one can quite explain, the number of salaried paper pushers ultimately seems to expand, and more and more employees find themselves—not unlike Soviet workers, actually—working forty- or even fifty-hour weeks on paper but effectively working fifteen hours just as Keynes predicted, since the rest of their time is spent organizing or attending motivational seminars, updating their Facebook profiles, or downloading TV box sets.

The answer clearly isn't economic: it's moral and political. The ruling class has figured out that a happy and productive population with free time on their hands is a mortal danger. Think of what started to happen when this even began to be approximated in the sixties. And, on the other hand, the feeling that work is a moral value in itself, and that anyone not willing to submit themselves to some kind of intense work discipline for most of their waking hours deserves nothing, is extraordinarily convenient for them.

And what does it say about our society that it seems to generate an extremely limited demand for talented poet-musicians but an apparently infinite demand for specialists in corporate law? Answer: If one percent of the population controls most of the disposable wealth, what we call "the market" reflects what they think is useful or important, not anybody else.

There is a profound psychological violence here. How can one even begin to speak of dignity in labor when one secretly feels one's job should not exist? How can it not create a sense of deep rage and resentment? Yet it is the peculiar genius of our society that its rulers have figured out a way to ensure that rage is directed precisely against those who actually do get to do meaningful work. For instance: in our society, there seems to be a general rule that, the more obviously one's work benefits other people, the less one is likely to be paid for it. Again, an objective measure is hard to find, but one easy way to get a sense is to ask: What would happen were this entire class of people to simply disappear? Say what you like about nurses, garbage collectors, or mechanics, it's obvious that were they to vanish in a puff of smoke, the results would be immediate and catastrophic. A world without teachers or dockworkers would soon be in trouble, and even one without science-fiction writers or ska musicians would clearly be a lesser place. It's not entirely clear how humanity would suffer were all private equity CEOs, lobbyists, PR researchers, actuaries, telemarketers, bailiffs, or legal consultants to similarly vanish. Many suspect it might improve markedly. Yet apart from a handful of well-touted exceptions—doctors, engineers, et cetera—the rule holds surprisingly well.

If someone had designed a work regime perfectly suited to maintaining the power of finance capital, it's hard to see how he or she could have done a better job. Real, productive workers are relentlessly squeezed and exploited. The remainder are divided between a terrorized stratum of the universally reviled unemployed and a larger stratum who are basically paid to do nothing, in positions designed to make them identify with the perspectives and sensibilities of the ruling class (managers, administrators, et cetera)—particularly its financial avatars—but, at the same time, foster a simmering resentment against anyone whose work has clear and undeniable social value. Clearly, the system was never consciously designed. It emerged from almost a century of trial and error. But it is the only explanation for why, despite our technological capacities, we are not all working three- to four-hour days.

I would like this book to be an arrow aimed at the heart of our civilization. There is something very wrong with what we have made ourselves. We have become a civilization based on work—not even productive work but work as an end and meaning in itself. We have come to believe that men and women who do not work harder than they wish at jobs they do not particularly enjoy are bad people unworthy of love, care, or assistance from their communities. It is as if we have collectively acquiesced to our own enslavement. The main political reaction to our awareness that half the time we are engaged in utterly meaningless or even counterproductive activities—usually under the orders of a person we dislike—is to rankle with resentment over the fact there might be others out there who are not in the same trap. As a result, hatred, resentment, and suspicion have become the glue that holds society together. This is a disastrous state of affairs. I wish it to end. If this book can in any way contribute to that end, it will have been worth whatever the costs.

When our own definitions produce results that seem intuitively wrong to us—it's because we're not aware of what we really think. The label 'bullshit jobs' clearly strikes a chord with many people. It makes sense to them in some way. This means they have, at least on some sort of tacit intuitive level, criteria in their minds that allow them to say 'That was such a bullshit job' or 'That one was bad, but I wouldn't say it was exactly bullshit.' Many people with pernicious jobs feel the label fits them; others clearly don't.

Feudal overlord is not a bullshit job. Kings, earls, emperors, pashas, emirs, squires, zamindars, landlords, and the like might, arguably, be useless people; many of us would insist (and I would be inclined to agree) that they play pernicious roles in human affairs. But they don't think so. So unless the king is secretly a Marxist, or a Republican, one can say confidently that 'king' is not a bullshit job. This is a useful point to bear in mind

because most people who do a great deal of harm in the world are protected against the knowledge that they do so. Or they allow themselves to believe the endless accretion of paid flunkies and yes-men that inevitably assemble around them to come up with reasons why they are really doing good. Nowadays, these are sometimes referred to as think tanks. This is just as true of financial-speculating investment bank CEOs as it is of military strongmen in countries such as North Korea and Azerbaijan. It would appear to be a general truth that the more harm a category of powerful people do in the world, the more yes-men and propagandists will tend to accumulate around them, coming up with reasons why they are really doing good—and the more likely it is that at least some of those powerful people will believe them.

There are three broad categories of jobs: useful jobs (which may or may not be shit jobs), bullshit jobs, and a small but ugly penumbra of jobs such as gangsters, slumlords, top corporate lawyers, or hedge fund CEOs, made up of people who are basically just selfish bastards and don't really pretend to be anything else. This three-part list is not meant to be comprehensive. For instance, it leaves out the category of what's often referred to as "guard labor," some of which (unnecessary supervisors) is bullshit, but much of which is simply obnoxious or bad.

The Iron Law of Liberalism: any market reform, any government initiative intended to reduce red tape and promote market forces will have the ultimate effect of increasing the total number of regulations, the total amount of paperwork, and the total number of bureaucrats the government employs.

Just as Socialist regimes had created millions of dummy proletarian jobs, capitalist regimes somehow ended up presiding over the creation of millions of dummy white-collar jobs instead.

If 37 percent to 40 percent of jobs are completely pointless, and at least 50 percent of the work done in non-pointless office jobs is equally pointless, we can probably conclude that at least half of all work being done in our society could be eliminated without making any real negative effects at all. Actually, the number is almost certainly higher, because this would not even be taking into consideration second-order bullshit jobs: real jobs done in support of those engaged in bullshit. We could easily become societies of leisure and institute a twenty-hour workweek. Maybe even a ten-hour week. Instead, we find ourselves, as a society, condemned to spending most of our time at work, performing tasks that we feel make no difference in the world

whatsoever. Perhaps a benefit of the Wuhan Flu overreaction is that we might be able to prove this fact more concretely.

Just as a thought experiment: imagine you are a feudal class extracting 50 percent of every peasant household's product. If so, you are in possession of an awful lot of food. Enough, in fact, to support a population exactly as large as that of peasant food producers. You have to do something with it—and there are only so many people any given feudal lord can keep around as chefs, wine stewards, scullery maids, harem eunuchs, musicians, jewelers, and the like. Even after you've taken care to ensure you have enough men trained in the use of weapons to suppress any potential rebellion, there's likely to be a great deal left over. As a result, indigents, runaways, orphans, criminals, women in desperate situations, and other dislocated people will inevitably begin to accumulate around your mansion (because, after all, that's where all the food is). You can drive them away, but then they're likely to form a dangerous vagabond class that might become a political threat. The obvious thing to do is to slap a uniform on them and assign them some minor or unnecessary task. It makes you look good, and at least that way, you can keep an eye on them.

“They had this thing about us not being able to just do nothing, even if the shop was empty. So we couldn't just sit at the till and read a magazine. Instead, the manager made up utterly meaningless work for us to do, like going round the whole shop and checking that things were in date (even though we knew for a fact they were because of the turnover rate) or rearranging products on shelves in even more pristine order than they already were. The very, very worst thing about the job was that it gave you so much time to think, because the work was so lacking in any intellectual demand. So I just thought so much about how bullshit my job was, how it could be done by a machine, how much I couldn't wait for full communism, and just endlessly theorized the alternatives to a system where millions of human beings have to do that kind of work for their whole lives in order to survive. I couldn't stop thinking about how miserable it made me.”

This is what happens, of course, when you first open the entire world of social and political possibility to a young mind and then tell it to stop thinking and tidy up already tidy shelves.

Experiments have shown that if one first allows a child to discover and experience the delight in being able to cause a certain effect, and then

suddenly denies it to them, the results are dramatic: first rage, refusal to engage, and then a kind of catatonic folding in on oneself and withdrawing from the world entirely. This is the trauma of failed influence and some suspect that such traumatic experiences might lie behind many mental health issues later in life.

According to classical economic theory, *homo economicus*, or “economic man”—that is, the model human being that lies behind every prediction made by the discipline—is assumed to be motivated above all by a calculus of costs and benefits. All the mathematical equations by which economists bedazzle their clients, or the public, are founded on one simple assumption: that everyone, left to his own devices, will choose the course of action that provides the most of what he wants for the least expenditure of resources and effort. It is the simplicity of the formula that makes the equations possible: if one were to admit that humans have complicated motivations, there would be too many factors to take into account, it would be impossible to properly weight them, and predictions could not be made. Therefore, while an economist will say that while of course everyone is aware that human beings are not really selfish, calculating machines, assuming that they are makes it possible to explain a very large proportion of what humans do, and this proportion—and only this—is the subject matter of economic science. This is a reasonable statement as far as it goes. The problem is there are many domains of human life where the assumption clearly doesn’t hold—and some of them are precisely in the domain of what we like to call the economy.

The underlying assumption is that if humans are offered the option to be parasites, of course they’ll take it. In fact, almost every bit of available evidence indicates that this is not the case. Human beings certainly tend to rankle over what they consider excessive or degrading work; few may be inclined to work at the pace or intensity that “scientific managers” have, since the 1920s, decided they should; people also have a particular aversion to being humiliated. But leave them to their own devices, and they almost invariably rankle even more at the prospect of having nothing useful to do.

Most people who have ever existed have assumed that normal human work patterns take the form of periodic intense bursts of energy, followed by relaxation, followed by slowly picking up again toward another intense bout. This is what farming is like, for instance: all-hands-on-deck mobilization around planting and harvest, but otherwise, whole seasons taken up largely by minding and mending things, minor projects, and puttering around. But even daily tasks, or projects such as building a house or preparing for a feast, tend to take roughly this form. In other words, the traditional student’s pattern of lackadaisical study leading up to intense cramming before exams

and then slacking off again—a punctuated hysteria—is typical of how human beings have always tended to go about necessary tasks if no one forces them to act otherwise. Some students may engage in cartoonishly exaggerated versions of this pattern. But good students figure out how to get the pace roughly right. Not only is it what humans will do if left to their own devices, but there is no reason to believe that forcing them to act otherwise is likely to cause greater efficiency or productivity. Often it will have precisely the opposite effect.

Obviously, some tasks are more dramatic and therefore lend themselves better to alternating intense, frenetic bursts of activity and relative torpor. This has always been true. Hunting animals is more demanding than gathering vegetables, even if the latter is done in sporadic bursts; building houses better lends itself to heroic efforts than cleaning them. As these examples imply, in most human societies, men tend to try—and usually succeed—to monopolize the most exciting, dramatic kinds of work; they'll set the fires that burn down the forest on which they plant their fields, for example, and, if they can, relegate to women the more monotonous and time-consuming tasks, such as weeding. One might say that men will always take for themselves the kind of jobs one can tell stories about afterward, and try to assign women the kind you tell stories during.

“Idle fingers knit sweaters for the devil,” my great-grandmother used to warn her daughter back in Poland. But this kind of traditional moralizing is actually quite different from the modern “If you have time to lean, you have time to clean,” because its underlying message is not that you should be working but that you shouldn't be doing anything else. Essentially, my great-grandmother was saying that anything a teenage girl in a Polish shtetl might be getting up to when she wasn't knitting was likely to cause trouble. Similarly, one can find occasional warnings by nineteenth-century plantation owners in the American South or the Caribbean that it's better to keep slaves busy even at made-up tasks than to allow them to idle about in the off-season; the reason given always being that if slaves were left with time on their hands, they were likely to start plotting to flee or revolt. The modern morality of “You're on my time; I'm not paying you to lounge around” is very different. It is the indignity of a man who feels he's being robbed. A worker's time is not his own; it belongs to the person who bought it. Insofar as an employee is not working, she is stealing something for which the employer paid good money (or, anyway, has promised to pay good money for at the end of the week). By this moral logic, it's not that idleness is dangerous. Idleness is theft.

Historically speaking, the institution of wage labor is a sophisticated latecomer. The very idea of wage labor involves two difficult conceptual steps.

First, it requires the abstraction of man's labor from both his person and his work. When one purchases an object from an ancient craftsman, one has not bought his labor but the object, which he has produced under his own time and his own conditions of work. But when one purchases an abstraction, labor power, which the purchaser then uses it at a time and under conditions which he, the purchaser, not the "owner" of the labor power, determines (and for which he normally pays after he has consumed it). Second, the wage-labor system requires the establishment of a method of measuring the labor one has purchased, for purposes of payment, commonly by introducing a second abstraction, labor time. We should not underestimate the magnitude, speaking socially rather than intellectually, of these two conceptual steps; even the Roman jurists found them difficult.

To be a slave, to be forced to surrender one's free will and become the mere instrument of another, even temporarily, was considered the most degrading thing that could possibly befall a human being. As a result, the overwhelming majority of examples of wage labor that we do encounter in the ancient world are of people who are already slaves: a slave potter might indeed arrange with his master to work in a ceramics factory, sending half the wages to his master and keeping the rest for himself. Slaves might occasionally do free contract work as well—say, working as porters at the docks. Free men and women would not. And this remained true until fairly recently: wage labor, when it did occur in the Middle Ages, was typical of commercial port cities such as Venice, or Malacca, or Zanzibar, where it was carried out almost entirely by unfree labor.

The only notable exception to this rule is that free citizens in democracies were often willing to hire themselves out to the government for public works: but this is because the government being seen as a collective of which the citizen was a member, it was essentially seen as working for oneself.

“He is not the sort of a man who looks at a clock merely to see what time it is. Not that he lacks interest in the content of clocks, which is of concern to everyone from moment to moment, but he is far more interested in how a clock creates the idea of ‘moment to moment.’ He attends to the philosophy of clocks, to clocks as metaphor, about which our education has had little to say and clock makers nothing at all.”

The clock is a piece of power machinery whose product is seconds and minutes. In manufacturing such a product, the clock has the effect of disassociating time from human events and thus nourishes the belief in an independent world of mathematically measurable sequences. Moment

to moment, it turns out, is not God's conception, or nature's. It is man conversing with himself about and through a piece of machinery he created. Beginning in the fourteenth century, the clock made us into time-keepers, and then time-savers, and now time-servers.

Human beings have long been acquainted with the notion of absolute, or sidereal, time by observing the heavens, where celestial events happen with exact and predictable regularity. But the skies are typically treated as the domain of perfection. Priests or monks might organize their lives around celestial time, but life on earth was typically assumed to be messier. Below the heavens, there is no absolute yardstick to apply. To give an obvious example: if there are twelve hours from dawn to dusk, there's little point saying a place is three hours' walk away when you don't know the season when someone is traveling, since winter hours will be half the length of summer ones. In Madagascar, rural people—who have little use for clocks—still often describe distance the old-fashioned way and say that to walk to another village would take two cookings of a pot of rice. In medieval Europe, people spoke similarly of something as taking “three paternosters,” or two boilings of an egg. This sort of thing is extremely common. In places without clocks, time is measured by actions rather than action being measured by time.

There is a classic statement on the subject by an anthropologist; he's speaking of the Nuer, a pastoral people of East Africa:

“The Nuer have no expression equivalent to ‘time’ in our language, and they cannot, therefore, as we can, speak of time as though it were something actual, which passes, can be wasted, can be saved, and so forth. I do not think that they ever experience the same feeling of fighting against time or having to coordinate activities with an abstract passage of time, because their points of reference are mainly the activities themselves, which are generally of a leisurely character. Events follow a logical order, but they are not controlled by an abstract system, there being no autonomous points of reference to which activities have to conform with precision. Nuer are fortunate.”

By the fourteenth century, most European towns had created clock towers—usually funded and encouraged by the local merchant guild. It was these same merchants who developed the habit of placing human skulls on their desks as *memento mori*, to remind themselves that they should make good use of their time because each chime of the clock brought them one hour closer to death. The dissemination of domestic clocks and then

pocket watches took much longer, coinciding largely with the advent of the industrial revolution beginning in the late 1700s, but once it did happen, it allowed for similar attitudes to diffuse among the middle classes more generally. Sidereal time, the absolute time of the heavens, had to come to earth and began to regulate even the most intimate daily affairs. But time was simultaneously a fixed grid, and a possession. Everyone was encouraged to see time as did the medieval merchant: as a finite property to be carefully budgeted and disposed of, much like money. What's more, the new technologies also allowed any person's fixed time on earth to be chopped up into uniform units that could be bought and sold for money.

What I want to underline here is that this was both a technological and a moral change. It is usually laid at the feet of Puritanism, and Puritanism certainly had something to do with it; but one could argue equally compellingly that the more dramatic forms of Calvinist asceticism were just overblown versions of a new time sense that was, in one way or another, reshaping the sensibilities of the middle classes across the Christian world. As a result, over the course of the eighteenth and nineteenth centuries, starting in England, the old episodic style of working came increasingly to be viewed as a social problem. The middle classes came to see the poor as poor largely because they lacked time discipline; they spent their time recklessly, just as they gambled away their money.

Meanwhile, workers rebelling against oppressive conditions began adopting the same language. Many early factories didn't allow workers to bring their own timepieces, since the owner regularly played fast and loose with the factory clock. Before long, however, workers were arguing with employers about hourly rates, demanding fixed-hour contracts, overtime, time-and-a-half, the twelve-hour day, and then the eight-hour day. But the very act of demanding "free time," however understandable under the circumstances, had the effect of subtly reinforcing the idea that when a worker was "on the clock," his time truly did belong to the person who had bought it—a concept that would have seemed perverse and outrageous to their great-grandparents, as, indeed, to most people who have ever lived.

The official line is that we all have rights and live in a democracy. Other unfortunates who aren't free like we are have to live in police states. These victims obey orders or else, no matter how arbitrary. The authorities keep them under regular surveillance. State bureaucrats control even the smallest details of everyday life. The officials who push them around are answerable only to higher-ups, public or private. Either way, dissent or disobedience are punished. Informers report regularly to the authorities. All this is supposed to be a very bad thing. And so it is, although it is nothing but a description of the modern workplace—or life during the Wuhan Flu panic.

While it is quite rare for supervisors to tell workers directly they are supposed to pretend to work, it does happen occasionally. One car salesman says:

“According to my superiors, if I’m being paid a salary, I have to be doing ‘something’ and ‘pretend’ to be productive even though there’s no real value to the work. So, I spend several hours a day making phone calls to nobody. Does that make any sense?”

Too much honesty in such matters appears to be a profound taboo almost anywhere. I remember once in graduate school, I had a gig doing research for a Marxist professor who among many other things specialized in the politics of workplace resistance. I figured if I could be honest with anyone, it would be him, so after he had explained to me how the timesheet worked I asked, “So how much can I lie? How many hours is it okay to just make up?” He looked at me as if I’d just said I was a starseed from another galaxy so I quickly changed the subject and assumed the answer was ‘a discreet amount.’

If being forced to pretend to work is so infuriating because it makes clear the degree to which you are entirely under another person’s power, then bullshit jobs are, as noted above, entire jobs organized on that same principle. You’re working, or pretending to work—not for any good reason, at least any good reason you can find—but just for the sake of working. Hardly surprising it should rankle. But there’s one obvious difference, too, between bullshit jobs and a dishwasher being made to clean the baseboards in a restaurant. In the latter case, there is a demonstrable bully. You know exactly who is pushing you around. In the case of bullshit jobs, it’s rarely so clear-cut. Who exactly is forcing you to pretend to work? The company? Society? Some strange confluence of social convention and economic forces that insist no one should be given the means of life without working, even if there is not enough real work to go around? At least in the traditional workplace, there was someone against whom you could direct your rage. There is something terrible, ridiculous, outrageous going on, but it’s not clear whether you are even allowed to acknowledge it, and it’s usually even less clear who or what can be blamed.

Psychologists sometimes refer to these kind of dilemmas as “scriptlessness.” Psychological studies, for instance, find that men or women who had experienced unrequited love during adolescence were in most cases eventually able to come to terms with the experience and showed few permanent emotional scars. But for those who had been the objects of unrequited love,

it was quite another matter. Many still struggled with guilt and confusion. One major reason, researchers concluded, was precisely the lack of cultural models. Anyone who falls in love with someone who does not return their affections has thousands of years' worth of romantic literature to tell them exactly how they are supposed to feel; however, while this literature provides detailed insight on the experience of being Cyrano, it generally tells you very little about how you are supposed to feel—let alone what you're supposed to do—if you're Roxanne. Many, probably most, bullshit jobs involve a similar agonizing scriptlessness. Not only are the codes of behavior ambiguous, no one is even sure what they are supposed to say or how they are supposed to feel about their situation.

Or you could be like Nouri. Nouri had the misfortune to stumble through a series of relentlessly absurd and/or abusive corporate environments. He managed to keep himself sane—at least to the degree of fending off complete mental and physical breakdown—by finding a different sense of purpose: he began to carry out a detailed analysis of the social and institutional dynamics that lie behind failed corporate projects. Effectively, he became an anthropologist. Then he discovered politics, and began diverting time and resources toward plotting to destroy the very system that created such ridiculous jobs. At this point, he reports, his health began to markedly improve.

There are a million ways to make a human feel unworthy. The United States, so often a pioneer in such areas, has, among other things, perfected a quintessentially American mode of political discourse that consists in lecturing others about what jerks they are to think they have a right to something. Call it 'rights-scolding.' Rights-scolding has many forms and manifestations. There is a right-wing version, which centers on excoriating others for thinking the world owes them a living, or owes them medical treatment when they are gravely ill, or maternity leave, or workplace safety, or equal protection under the law. But there is also a left-wing version, which consists of telling people to "check their privilege" when they feel they are entitled to pretty much anything that some poorer or more oppressed person does not have. According to these standards, even if one is beaten over the head by a truncheon and dragged off to jail for no reason, one can only complain about the injustice if one first specifies all the categories of people to which this is more likely to occur.

Rights-scolding may have seen its most baroque development in North America, but it has spread all over the world with the rise of neoliberal market ideologies. Under such conditions, it's totally understandable that demanding an entirely new, unfamiliar, right—such as the right to meaningful employment—might seem a hopeless project. It's hard enough nowadays

being taken seriously when asking for things you're already supposed to have. The burden of rights-scolding falls above all on the younger generations. In most wealthy countries, the current crop of people in their twenties and thirties represents the first generation in more than a century that can, on the whole, expect opportunities and living standards substantially worse than those enjoyed by their parents. Yet at the same time, they are lectured relentlessly from both left and right on their sense of entitlement for feeling they might deserve anything else. This makes it especially difficult for younger people to complain about meaningless employment.

One might imagine that leaving millions of well-educated young men and women without any real work responsibilities but with access to the internet—which is, potentially, at least, a repository of almost all human knowledge and cultural achievement—might spark some sort of Renaissance. Nothing remotely along these lines has taken place. Instead, the situation has sparked an efflorescence of social media—Facebook, YouTube, Instagram, Twitter; basically, of forms of electronic media that lend themselves to being produced and consumed while pretending to do something else.

The question of why one player won a game rather than another is different from the question of how hard the game is to play. Or why people are playing the game to begin with. That's a third question. Similarly, in cases like these, where one is looking at a broad pattern of social change, such as the rise of bullshit jobs, I would propose we really need to look not at two but at three different levels of explanation:

1. The particular reasons any given individual ends up homeless
2. The larger social and economic forces that lead to increased levels of homelessness (say, a rise in rents, or changes in the family structure)
3. The reasons why no one intervened

We might refer to this last as the political and cultural level. It's also the easiest to overlook, since it often deals specifically with things people are not doing.

“I well remember the first time I discussed the phenomenon of homelessness in America with friends in Madagascar. They were flabbergasted to discover that in the wealthiest and most powerful country in the world, there were people sleeping on the streets. ‘But aren't Americans ashamed?’ one friend asked me. ‘They're so rich! Doesn't it bother them to know everyone else in the world will see it as a national embarrassment?’ I had

to concede it was a good question. Why didn't Americans see people sleeping on the streets as a national embarrassment?"

In certain periods of US history, they certainly would have. If large numbers of people were living on the streets in major cities in the 1820s, or even the 1940s, there would have been an outcry and some kind of action would have been taken. It might not have been very nice action. At some points, it would probably have meant rounding up vagrants and placing them in workhouses; at other times, it might have involved building public housing; but whatever it might have been, they would not have been left to languish in cardboard boxes on public thoroughfares. Since the 1980s, the same American was more likely to react not with outrage at how social conditions could have come to this pass, but by appeal to explanations of the first level—and conclude that homelessness was nothing more than the inevitable result of human weakness. Humans are fickle beings. They always have been. There's nothing anyone can do to change this fact.

Much of the confusion that surrounds debate about social issues in general can be traced back to the fact that people will regularly take these different explanations as alternatives rather than seeing them as factors that all operate at the same time. For example, people sometimes tell me that any attempt to explain bullshit jobs in political terms is wrongheaded; such jobs, they insist, exist because people need the money—as if this consideration had somehow never occurred to me before. Looking at the subjective motives of those who take such jobs is then treated as an alternative to asking why so many people find themselves in a position where the only way they can get money is by taking such jobs to begin with.

It's even worse on the cultural-political level. There has come to be a tacit understanding in polite circles that you can ascribe motives to people only when speaking about the individual level. Therefore, any suggestion that powerful people ever do anything they don't say they're doing, or even do what they can be publicly observed to be doing for reasons other than what they say, is immediately denounced as a "paranoid conspiracy theory" to be rejected instantly. Thus, to suggest that some "law and order" politicians or social service providers might not feel it's in their best interest to do much about the underlying causes of homelessness, is treated as equivalent to saying homelessness itself exists only because of the machinations of a secret cabal. Or that the banking system is run by lizard-people.

What was the unemployment level in ancient Greece? Or medieval China? The answer, of course, is zero. Having a large proportion of the population who wish to work, but cannot, appears to be peculiar to what Marx liked to call "the capitalist mode of production." But it appears to be,

like public debt, a structural feature of the system which must nonetheless be treated as if it were a problem to be solved.

Some see the increase in the numbers and power of university administrators as a simple power grab—one which has resulted in a profound shift in assumptions about the very nature of universities and the reasons for their existence. Back in the 1950s or 1960s, one could still say that universities were one of the few European institutions that had survived more or less intact from the Middle Ages. Crucially, they were still run on the old medieval principle that only those involved in a certain form of production—whether this be the production of stonework or leather gloves or mathematical equations—had the right to organize their own affairs; indeed that they were also the only people qualified to do so. Universities were basically craft guilds run for and by scholars, and their most important business was considered to be producing scholarship, their second-most, training new generations of scholars. True, since the nineteenth century, universities had maintained a kind of gentleman’s pact with government, that they would also train civil servants (and later, corporate bureaucrats) in exchange for otherwise being largely left alone. But since the eighties university administrators have effectively staged a coup. They wrested control of the university from the faculty and oriented the institution itself toward entirely different purposes. It is now commonplace for major universities to put out “strategic vision documents” that barely mention scholarship or teaching but go on at length about “the student experience,” “research excellence” (getting grants), collaboration with business or government, and so forth.

The upper quintile is growing in size and income because all the value created by actual productive workers in the lower quintiles gets extracted by those at the top. When the top classes rob everybody else, they need a lot more guard labor to keep their stolen loot secure.

It makes little sense to speak of separate spheres of ‘politics’ and ‘the economy’ because the goods are extracted through political means and distributed for political purposes. In fact, it was only with the first stirrings of industrial capitalism that anyone started talking about the economy as an autonomous sphere of human activity in the first place.

Under capitalism, in the classic sense of the term, profits derive from the management of production: capitalists hire people to make or build or fix or maintain things, and they cannot take home a profit unless their total overhead—including the money they pay their workers and contractors—comes out less than the value of the income they receive from their clients or customers. Under classic capitalist conditions of this sort it does indeed make no sense to hire unnecessary workers. Maximizing profits means

paying the least number of workers the least amount of money possible; in a very competitive market, those who hire unnecessary workers are not likely to survive. Of course, this is why doctrinaire libertarians, or, for that matter, orthodox Marxists, will always insist that our economy can't really be riddled with bullshit jobs; that all this must be some sort of illusion. But by a feudal logic, where economic and political considerations overlap, the same behavior makes perfect sense.

The whole point is to grab a pot of loot, either by stealing it from one's enemies or extracting it from commoners by means of fees, tolls, rents, and levies, and then redistributing it. In the process, one creates an entourage of followers that is both the visible measure of one's pomp and magnificence, and at the same time, a means of distributing political favor: for instance, by buying off potential malcontents, rewarding faithful allies (goons), or creating an elaborate hierarchy of honors and titles for lower-ranking nobles to squabble over. If all of this very much resembles the inner workings of a large corporation, I would suggest that this is no coincidence: such corporations are less and less about making, building, fixing, or maintaining things and more and more about political processes of appropriating, distributing, and allocating money and resources.

This means that, once again, it's increasingly difficult to distinguish politics and economics, as we have seen with the advent of "too-big-to-fail" banks, whose lobbyists typically write the very laws by which government supposedly regulates them, but even more, by the fact that financial profits themselves are gathered largely through direct juro-political means. JPMorgan Chase & Co., for example, one of the largest banks in America, reported in 2006 that roughly two-thirds of its profits were derived from "fees and penalties," and "finance" in general really refers to trading in other people's debts—debts which, of course, are enforceable in courts of law.

The rule of finance has seen the insertion of competitive games of this sort at every level of corporate life, or, for that matter, within institutions such as universities or charities that had previously been seen as the very antithesis of corporations. Perhaps in some it hasn't reached that zenith of bullshit which is Hollywood. But everywhere, managerial feudalism ensures that thousands of hours of creative effort will literally come to nothing. Take the domain of scientific research, or higher education once again. If a grant agency funds only 10 percent of all applications, that means that 90 percent of the work that went into preparing applications was just as pointless as the work that went into making the promo video for the doomed reality TV show *Too Fat to Fuck*. Even more so, really, since one can rarely make such an amusing anecdote out of it afterward. This is an extraordinary squandering of human creative energy.

At the height of the Greek debt crisis, public opinion in Germany was almost unanimous that Greek debt should not be forgiven because Greek workers were entitled and lazy. This was countered by statistics showing Greek workers actually put in longer hours than German ones; which, in turn, was countered by the argument that this might be true on paper but Greek workers slacked off on the job. At no point did anyone suggest that German workers were working too hard, creating an overproduction problem that could only be solved by lending foreign countries money to be able to import their goods, let alone that the Greek ability to enjoy life was in any way admirable or a model for others.

To take another example, when, in the 1990s, the French Socialist Party ran on the platform of a thirty-five-hour workweek, I remember being struck by the fact that no American news source I was able to find that deigned to mention this fact suggested that reducing working hours might be seen as, let alone be, good in itself, but only presented it as a tactic for reducing unemployment. In other words, allowing people to work less could only be treated as a social good if it allowed more people to be working.

Opinion writers are the moralists of our day. They are the secular equivalent of preachers, and when they write about work, their arguments reflect a very long theological tradition of valorizing work as a sacred duty, at once curse and blessing, and seeing humans as inherently sinful, lazy beings who can be expected to shirk that duty if they can. The discipline of economics itself emerged out of moral philosophy—Adam Smith was a professor of moral philosophy—and moral philosophy, in turn, was originally a branch of theology. Many economic concepts trace back directly to religious ideas. As a result, arguments about value always have something of a theological tinge.

Some originally theological notions about work are so universally accepted that they simply can't be questioned. One cannot assert that hardworking people are not, generally speaking, admirable—regardless of what they might be working hard at—or that those who avoid work are not in any way contemptible, and expect to be taken seriously in public debate. If someone says a policy creates jobs, it is not considered acceptable to reply that some jobs aren't worth having. I know this because I have occasionally done so to policy wonks, partly just to observe the shocked confusion that ensues. Say any of these things, and anything else you might say will be written off as well, as the effusions of a provocateur, a comedian, a lunatic—anyway, someone whose further arguments can now be automatically dismissed.

A case could be made for equality of income for all members of society, based on the following logic: Why might one pay certain people more than others? Normally, the justification is that some produce more or benefit

society more than others. But then we must ask why they do so:

1. If some people are more talented than others (for example, have a beautiful singing voice, are a comic genius, or a math whiz), we say they are “gifted.” If someone has already received a benefit (a “gift”), then it makes no sense to give them an additional benefit (more money) for that reason.
2. If some people work harder than others, it is usually impossible to establish the degree to which this is because they have a greater capacity for work (a gift again), and the degree to which it is because they choose to work harder. In the former case, it would again make no sense to reward them further for having an innate advantage over others.
3. Even if it could be proved that some work harder than others purely out of choice, one would then have to establish whether they did so out of altruistic motives—that is, they produced more because they wished to benefit society—or out of selfish motives, because they sought a larger proportion for themselves.
4. In the former case, if they produced more because they were striving to increase social wealth, then giving them a disproportionate share of that wealth would contradict their purpose. It would only make moral sense to reward those driven by selfish motives.
5. Since human motives are generally shifting and confused, one cannot simply divide the workforce into egoists and altruists. One is left with the choice of either rewarding everyone who makes greater efforts, or not doing so. Either option means that some people’s intentions will be frustrated. Altruists will be frustrated in their attempts to benefit society, while egoists will be frustrated in their attempts to benefit themselves. If one is forced to choose one or the other, it makes better moral sense to frustrate the egoists.
6. Therefore, people should not be paid more or otherwise rewarded for greater effort or productivity at work.

Many of the underlying assumptions could no doubt be challenged on a variety of grounds, but I’m not so much interested in whether there is, in fact, a moral case for equal distribution of income, as much as observing that in many ways, our society seems to have embraced in points 3 and 4—just without 1, 2, 5, or 6. Critically, it rejects the premise that it is impossible

to sort workers by motives. One need only look at what sorts of careers a worker has chosen. Is there any reason a person might be doing this job other than the money? If so, then that person should be treated as if point 4 applies. As a result, there is a sense that those who choose to benefit society, and especially those who have the gratification of knowing they benefit society, really have no business also expecting middle-class salaries, paid vacations, and generous retirement packages. By the same token, there is also a feeling that those who have to suffer from the knowledge they are doing pointless or even harmful work just for the sake of the money ought to be rewarded with more money for exactly that reason.

“What is work? Work is of two kinds: first, altering the position of matter at or near the earth’s surface relatively to other such matter; second, telling other people to do so. The first kind is unpleasant and ill paid; the second is pleasant and highly paid.”

Work, Aristotle insisted, in no sense makes you a better person; in fact, it makes you a worse one, since it takes up so much time, thus making it difficult to fulfill one’s social and political obligations. As a result, the punishment aspect of work tended to be emphasized in classical literature, while the creative and godlike aspect was largely seen as falling to those male heads of household rich enough that they didn’t actually have to get their hands dirty but could tell others what to do. In Northern Europe in the Middle Ages and the Renaissance, almost everyone was expected to get their hands dirty at some point or another. As a result, work, especially paid work, was seen as transformative. This is important because it means that certain key aspects of what was to become known as the ‘Protestant work ethic’ were already there, long before the emergence of Protestantism.

“In the glorification of ‘work’ and the never-ceasing talk about the ‘blessing of labor’ I see fear of everything individual. For at the sight of work—that is to say, severe toil from morning till night—we have the feeling that it is the best police, viz, that it holds everyone in check and effectively hinders the development of reason, of greed, and of desire for independence. For work uses up an extraordinary proportion of nervous force, withdrawing it from reflection, meditation, dreams, cares, love, and hatred”

The reality is that most working-class labor, whether carried out by men or women, actually more resembles what we archetypically think of as women’s work, looking after people, seeing to their wants and needs,

explaining, reassuring, anticipating what the boss wants or is thinking, not to mention caring for, monitoring, and maintaining plants, animals, machines, and other objects, than it involves hammering, carving, hoisting, or harvesting things.

What tube workers actually do, then, is something much closer to what feminists have termed “caring labor.” It has more in common with a nurse’s work than a bricklayer’s. It’s just that, in the same way as women’s unpaid caring labor is made to disappear from our accounts of “the economy,” so are the caring aspects of other working-class jobs made to disappear as well. One might make a case, perhaps, that British working-class traditions of caring labor do make themselves known in popular culture, which is largely a working-class product, with all the characteristic gestures, manners, and cadences by which working-class people cheer one another up reflected in British music, British comedy, and British children’s literature. But it is not recognized as value-creating labor in itself.

‘Caring labor’ is generally seen as work directed at other people, and it always involves a certain labor of interpretation, empathy, and understanding. To some degree, one might argue that this is not really work at all, it’s just life, or life lived properly—humans are naturally empathetic creatures, and to communicate with one another at all, we must constantly cast ourselves imaginatively into each other’s shoes and try to understand what others are thinking and feeling, which usually means caring about them at least a little—but it very much becomes work when all the empathy and imaginative identification is on one side. The key to caring labor as a commodity is not that some people care but that others don’t; that those paying for services—note how the old feudal term is still retained—feel no need to engage in interpretive labor themselves. This is even true of a bricklayer, if that bricklayer is working for someone else. Underlings have to constantly monitor what the boss is thinking; the boss doesn’t have to care.

That, in turn, is one reason, I believe, why psychological studies regularly find that people of working-class background are more accurate at reading other people’s feelings, and more empathetic and caring, than those of middle-class, let alone wealthy, backgrounds. To some degree, the skill at reading others’ emotions is just an effect of what working-class work actually consists of: rich people don’t have to learn how to do interpretive labor nearly as well because they can hire other people to do it for them. Those hirelings, on the other hand, who have to develop a habit of understanding other’s points of view, will also tend to care about them.

As a result underlings will also tend to care more about their superiors than their superiors will care about them, and this extends to almost any relation of structural inequality: men and women, rich and poor, black and

white, and so on. It has always seemed to me this is one of the main forces that allows such inequalities to continue.

In the immediate wake of the Civil War the first stirrings of large-scale bureaucratic, corporate capitalism appeared. The “Robber Barons,” as the new tycoons came to be called, were at first met (as the name given them implies) with extraordinary hostility. But by the 1890s they embarked on an intellectual counteroffensive, proposing a Gospel of Wealth. The fledgling corporate giants, their bankers, and their political allies objected to producerist moral claims and, starting in the 1890s, reached out with a new ideology that claimed, to the contrary, that capital, not labor, creates wealth and prosperity. Powerful coalitions of corporate interests made concerted efforts to transform the message of schools, universities, churches, and civic groups, claiming that “business had solved the fundamental ethical and political problems of industrial society.” Steel magnate Andrew Carnegie was a leader of this cultural campaign. To the masses, Carnegie argued for what we’d now call consumerism: the productivity of “concentrated” capital, under the wise stewardship of the fit, would so lower the price of commodities that the workers of tomorrow would live as well as the kings of the past. To the elite, he argued that coddling the poor with high wages was not good for “the race.”

The promulgation of consumerism also coincided with the beginnings of the managerial revolution, which was, especially at first, largely an attack on popular knowledge. Where once hoopers and wainwrights and seamstresses saw themselves as heirs to a proud tradition, each with its secret knowledge, the new bureaucratically organized corporations and their “scientific management” sought as far as possible to literally turn workers into extensions of the machinery, their every move predetermined by someone else. The real question to be asked here, it seems to me, is: ‘Why was this campaign so successful?’ Because it cannot be denied that, within a generation, “producerism” had given way to “consumerism,” the source of status no longer the ability to make things but simply the ability to purchase them. And the labor theory of value—which had, meanwhile, been knocked out of economic theory by the “marginal revolution”—had so fallen away from popular common sense that nowadays, only graduate students or small circles of revolutionary Marxist theorists are likely to have heard of it. Nowadays, if one speaks of “wealth producers,” people will automatically assume one is referring not to workers but to capitalists.

Most economists nowadays see the labor theory of value as a curiosity from the formative days of the discipline; and it’s probably true that, if one’s primary interest is to understand patterns of price formation, there are better tools available. But for the worker’s movement—and arguably,

for revolutionaries like Karl Marx—that was never the real point. The real point is philosophical. It is a recognition that the world we inhabit is something we made, collectively, as a society, and therefore, that we could also have made differently. This is true of almost any physical object likely to be within reach of us at any given moment. Every one was grown or manufactured by someone on the basis of what someone imagined we might be like, and what they thought we might want or need. It's even more true of abstractions like 'capitalism,' 'society,' or 'the government.' They only exist because we produce them every day.

Perhaps it's as simple as enough of us deciding to stop making capitalism. After all, even though we all act as if capitalism is some kind of behemoth towering over us, it's really just something we produce. Every morning we wake up and re-create capitalism. If one morning we woke up and all decided to create something else, then there wouldn't be capitalism anymore. There would be something else. One might even say that this is the core question—perhaps ultimately the only question—of all social theory and all revolutionary thought. Together we create the world we inhabit. Yet if any one of us tried to imagine a world we'd like to live in, who would come up with one exactly like the one that currently exists? We can all imagine a better world. Why can't we just create one? Why does it seem so inconceivable to just stop making capitalism? Or government? Or at the very least bad service providers and annoying bureaucratic red tape?

It strikes me that recognizing that a great deal of work is not strictly speaking productive but caring, and that there is always a caring aspect even to the most apparently impersonal work, does suggest one reason why it's so difficult to simply create a different society with a different set of rules. Even if we don't like what the world looks like, the fact remains that the conscious aim of most of our actions, productive or otherwise, is to do well by others; often, very specific others. Our actions are caught up in relations of caring. But most caring relations require we leave the world more or less as we found it. In the same way that teenage idealists regularly abandon their dreams of creating a better world and come to accept the compromises of adult life at precisely the moment they marry and have children, caring for others, especially over the long-term, requires maintaining a world that's relatively predictable as the grounds on which caring can take place. One cannot save to ensure a college education for one's children unless one is sure in twenty years there will still be colleges—or for that matter, money. And that, in turn, means that love for others—people, animals, landscapes—regularly requires the maintenance of institutional structures one might otherwise despise.

How are workers supposed to find meaning and purpose in jobs where

they are effectively being turned into robots? Where they are actually being told they are little better than robots, even as at the same time they are increasingly expected to organize their lives around their work? Even when they might be forced to work alongside the same robots training to take their jobs? The obvious answer is to fall back on the old idea that work forms character; and this is precisely what seems to have happened. One could call it a revival of Puritanism, but as we've seen this idea goes much further back: to a fusion of the Christian doctrine of the curse of Adam with the Northern European notion that paid labor under a master's discipline is the only way to become a genuine adult. This history made it very easy to encourage workers to see their work not so much as wealth-creation, or helping others, or at least not primarily so, but as self-abnegation, a kind of secular hair-shirt, a sacrifice of joy and pleasure that allows us to become an adult worthy of our consumerist toys.

What appears to hold true, with only minor variations, for both blue- and white-collar workers virtually anywhere in the world—might be summarized as follows:

1. Most people's sense of dignity and self-worth is caught up in working for a living.
2. Most people hate their jobs.

If work is a form of self-sacrifice or self-abnegation, then the very awfulness of modern work is what makes it possible to see it as an end in itself. Work should be painful, the misery of the job is itself what forms character. Workers gain feelings of dignity and self-worth because they hate their jobs. This is the attitude that seems to remain in the air all around us, implicit in office small-talk. The pressure to value ourselves and others on the basis of how hard we work at something we'd rather not be doing. If you're not destroying your mind and body via paid work, you're not living right. It is, to be sure, more common among middle-class office workers than among migrant farm workers, parking lot attendants, or short-order chefs. But even in working-class environments, the attitude can be observed through its negation, since even those who do not feel they have to validate their existence, on a day-to-day basis, by boasting how overworked they are will nonetheless agree that those who avoid work entirely should probably drop dead.

Bullshit jobs proliferate today in large part because of the peculiar nature of managerial feudalism that has come to dominate wealthy economies—but to an increasing degree, all economies. They cause misery because human happiness is always caught up in a sense of having effects on the world; a

feeling which most people, when they speak of their work, express through a language of social value. Yet at the same time they are aware that the greater the social value produced by a job, the less one is likely to be paid to do it. They are faced with the choice between doing useful and important work like taking care of children but being effectively told that the gratification of helping others should be its own reward, and it's up to them to figure out how to pay their bills, or accepting pointless and degrading work that destroys their mind and body for no particular reason, other than a widespread feeling that if one does not engage in labor that destroys the mind and body, whether or not there is a reason to be doing it, one does not deserve to live.

The more the economy becomes a matter of the mere distribution of loot, the more inefficiency and unnecessary chains of command actually make sense, since these are the forms of organization best suited to soaking up as much of that loot as possible. The less the value of work is seen to lie either in what it produces, or the benefits it provides to others, the more work comes to be seen as valuable primarily as a form of self-sacrifice, which means that anything that makes that work less onerous or more enjoyable, even the gratification of knowing that one's work benefits others, is actually seen to lower its value—and as a result, to justify lower levels of pay. All this is genuinely perverse.

In a sense, those critics who claim we are not working a fifteen-hour week because we have chosen consumerism over leisure are not entirely off the mark. They just got the mechanisms wrong. We're not working harder because we're spending all our time manufacturing PlayStations and serving one another sushi. Industry is being increasingly robotized, and the real service sector remains flat at roughly 20 percent of overall employment. Instead, it is because we have invented a bizarre sadomasochistic dialectic whereby we feel that pain in the workplace is the only possible justification for our furtive consumer pleasures, and, at the same time, the fact that our jobs thus come to eat up more and more of our waking existence means that we do not have the luxury of a life, and that, in turn, means that furtive consumer pleasures are the only ones we have time to afford. Sitting around in cafés all day arguing about politics or gossiping about our friends' complex polyamorous love affairs takes time (all day, in fact); in contrast pumping iron or attending a yoga class at the local gym, ordering out for Deliveroo, watching an episode of *Game of Thrones*, or shopping for hand creams or consumer electronics can all be placed in the kind of self-contained predictable time-slots one is likely to have left over between spates of work, or else while recovering from it. All these are examples of what I like to call 'compensatory consumerism.' They are the sorts of things you can do to

make up for the fact that you don't have a life, or not very much of one.

Conservative voters, I would suggest, tend to resent intellectuals more than they resent rich people, because they can imagine a scenario in which they or their children might become rich, but cannot possibly imagine one in which they could ever become a member of the cultural elite. If you think about it that's not an unreasonable assessment. A truck driver's daughter from Nebraska might not have very much chance of becoming a millionaire—America now has the lowest social mobility in the developed world—but it could happen. There's virtually no way that same daughter will ever become an international human rights lawyer, or drama critic for the New York Times. Even if she could get into the right schools, there would certainly be no possible way for her to then go on to live in New York or San Francisco for the requisite years of unpaid internships.

Even if the son of glazier got a toehold in a well-positioned bullshit job, he would likely, be unable or unwilling to transform it into a platform for the obligatory networking. There are a thousand invisible barriers. If we return to the opposition of 'value' versus 'values' we might put it this way: if you just want to make a lot of money, there might be a way to do it; on the other hand, if your aim is to pursue any other sort of value—whether that be truth (journalism, academia), beauty (the art world, publishing), justice (activism, human rights), charity, and so forth—and you actually want to be paid a living wage for it, then if you do not possess a certain degree of family wealth, social networks, and cultural capital, there's simply no way in. The "liberal elite," then, are those who have placed an effective lock on any position where it's possible to get paid to do anything that one might do for any reason other than the money. They are seen as trying, and largely succeeding, in constituting themselves as a new American nobility—in the same sense as the Hollywood aristocracy, monopolizing the hereditary right to all those jobs where one can live well, and still feel one is serving some higher purpose—which is to say, feel noble.

If that truck driver's daughter was absolutely determined to find a job that would allow her to pursue something unselfish and high-minded, but still paid the rent and guaranteed access to adequate dental care, what options does she really have? If she's of a religious temperament there might be some possibility in her local church. But such jobs are hard to come by. Mainly, she can join the military. An anthropologist who has been carrying out a project studying the archipelago of US overseas military bases made the fascinating observation that almost all of these bases organize outreach programs, in which soldiers venture out to repair schoolrooms or to perform free dental checkups in nearby towns and villages. The ostensible reason for the programs was to improve relations with local

communities, but they rarely have much impact in that regard; still, even after the military discovered this, they kept the programs up because they had such an enormous psychological impact on the soldiers, many of whom would wax euphoric when describing them:

“This is why I joined the army. This is what military service is really all about—not just defending your country, it’s about helping people!”

Soldiers allowed to perform public service duties, they found, were two or three times more likely to reenlist. You might be thinking, ‘Wait, so most of these people really want to be in the Peace Corps?’ And if you look it up you’ll discover, sure enough, to be accepted into the Peace Corps, you need to already have a college degree. The US military is a haven for frustrated altruists.

It’s hard to imagine a surer sign that one is dealing with an irrational economic system than the fact that the prospect of eliminating drudgery is considered to be a problem. Star Trek solved the problem with replicators, and young radicals sometimes talk about a future of “fully automated luxury communism,” which is basically the same thing. A case could easily be made that any future robots and replicators should be the common property of humanity as a whole, since they would be the fruit of a collective mechanical intelligence that goes back centuries, in much the same way as a national culture is the creation of, and thus belongs to, everyone. Automated public factories would make life easier. Still, they wouldn’t actually eliminate the need for Drudgelings. Too many still assume that ‘work’ means factory work, or, anyway, “productive” work, and ignore what most working-class jobs actually consist of—for instance, the fact that workers in “ticket offices” in the London Underground aren’t there to take tickets but to find lost children and talk down drunks. Not only are robots that could perform such functions very far away, but even if they did exist, most of us would not want such tasks performed in the way a robot would perform them anyway. So the more automation proceeds, the more it should be obvious that actual value emerges from the caring element of work. Yet this leads to another problem. The caring value of work would appear to be precisely that element in labor that cannot be quantified.

Since at least the Great Depression, we’ve been hearing warnings that automation was or was about to be throwing millions out of work—Keynes at the time coined the term ‘technological unemployment,’ and many assumed the mass unemployment of the 1930s was just a sign of things to come—and while this might make it seem such claims have always been somewhat

alarmist, what I suggest is that the opposite was the case. They were entirely accurate. Automation did, in fact, lead to mass unemployment. We have simply stopped the gap by adding dummy jobs that are effectively made up. A combination of political pressure from both right and left, a deeply held popular feeling that paid employment alone can make one a full moral person, and finally, a fear on the part of the upper classes, already noted by George Orwell in 1933, of what the laboring masses might get up to if they had too much leisure on their hands, has ensured that whatever the underlying reality, when it comes to official unemployment figures in wealthy countries, the needle should never jump too far from the range of three to eight percent. But if one eliminates bullshit jobs from the picture, and the real jobs that only exist to support them, one could say that the catastrophe predicted in the 1930s really did happen. Upward of 50 percent to 60 percent of the population has, in fact, been thrown out of work.

Except of course, there's absolutely no reason it should have been a catastrophe. Over the course of the last several thousand years there have been untold thousands of human groups that might be referred to as "societies," and the overwhelming majority of them managed to figure out ways to distribute those tasks that needed to be done to keep them alive in the style to which they were accustomed in such a fashion that most everyone had some way to contribute, and no one had to spend the majority of their waking hours performing tasks they would rather not be doing, in the way that people do today. What's more, faced with the "problem" of abundant leisure time, people in those societies seem to have had little trouble figuring out ways to entertain themselves or otherwise pass the time. From the perspective of anyone born in one of those past societies, we'd probably look just as irrational as the Phools to Ijon Tichy.

The reason the current allocation of labor looks the way it does, then, has nothing to do with economics or even human nature. It's ultimately political. There was no reason we had to try to quantify the value of caring labor. There is no real reason we have to continue to do so. We could stop. But before we launch a campaign to reconstitute work and how we value it, I think we would do well to once again consider carefully the political forces at play.

The Mythology of Work

Why Should I?

If you had to find a single statement that Americans from across the political spectrum can agree on, you might settle on ‘we need good jobs to give people a crucial sense of self-worth.’ Fight-for-\$15 activists assert the right to a higher wage, partly so they can stop taking government “handouts” like food stamps. Policy commentators, worried that automation could bring a loss of jobs, prescribe everything from subsidized corporate hiring to federal make-work programs. The congressional leadership’s pitch for its policies hinges almost entirely on encouraging work—and reducing public benefits. But here’s the thing: In historical terms, the pride we take in working for a paycheck is really new. Just 150 years ago, when people talked about the shame of dependency, they were referring to the reality of being forced to hold a job.

Speaking at the Wisconsin State Fair in Milwaukee in 1859, Abraham Lincoln described wage labor as an unfortunate necessity only for the “penniless beginner in the world.”

“If any continue through life in the condition of the hired laborer, it is not the fault of the system, but because of either a dependent nature which prefers it, or improvidence, folly, or singular misfortune.”

In contrast, Lincoln laid out a vision of respectability that required avoiding a job:

“In these free States, a large majority are neither hirers nor hired. Men, with their families—wives, sons, and daughters—work for themselves, on their farms, in their houses and their shops, taking the whole product to themselves, and asking no favors of capital on the one hand, nor of hirelings or slaves on the other.”

Farmers and craftsmen valued this independence in part because their time was their own, as it had been for skilled workers for generations. High piece-rates could provide good wages for skilled men, but they more often elected to take a moderate wage and extensive leisure. Leisure meant time in the alehouse, time eating, drinking, playing marbles, or watching cockfights. Even less-skilled workers and apprentices observed the informal weekly holiday known as Saint Monday if they could afford it, much to the dismay of elites and government officials. One observer in 1864 complained:

“An enormous amount of time is lost, not only by want of punctuality in coming to work in the morning and beginning again after meals, but still more by the general observance of ‘Saint Monday.’”

That was the kind of life craftsmen in Lincoln’s day might have expected for themselves. But, rising industrialization in the late nineteenth century forced many skilled artisans to work for a factory owner rather than for themselves. The Knights of Labor, an early labor union, saw this dependence on an employer—regardless of how much or how little was paid—as “wage slavery,” a condition literally comparable to chattel slavery, which the country had only recently abolished. These unionists argued that working for wages was repugnant because capitalists siphoned off part of the wealth produced by the workers and told them when and how to do their jobs. The only solution:

“The complete emancipation of wealth producers from the thralldom and loss of wage slavery.”

Workers and their unions interpreted that goal in many different ways over the next several decades, sometimes trying to return production to independent craftsmen, other times creating cooperative worker-owned enterprises, or advocating a socialist revolution.

Some workers saw more logic than others in harkening back to a pre-industrial independence. For example, to young, working-class white women, heading to a mill town to work for a wage might have sounded better than staying home on the farm. These women organized strikes to get better pay, but, to many of them, wage work itself was more liberating than not. They knew as farm wives they would have little control over the farm’s profits and little disposable income. These women explicitly rejected the label of “white slaves” that some political reformers and male unionists applied to them. Millworker Harriet Farley mocked the notion that “to put ourselves under the influence and restraints of corporate bodies is contrary to the spirit of our institutions and to the love of independence we ought to cherish.”

“There is a spirit of independence which is adverse to social life itself. And I would advise all those who wish to cherish it to go beyond the Rocky Mountains and hold communion with none but the untamed Indian and the wild beast of the forest.”

Even for skilled white male workers, rhetoric identifying wage labor as wage slavery mostly dried up in the final decades of the century, as large-scale industry came to dominate manufacturing. By 1900, both the Knights of Labor and the ascendant American Federation of Labor (AFL) generally used the phrase ‘wage slavery’ to refer only to particularly awful jobs, especially those held by immigrant and black workers.

While some unionists still held out hope for the abolition of the capitalist system, many turned their practical attention to improving wage work. That required a dramatic shift in focus. Mid-nineteenth-century skilled white male workers had believed that wage work not only degraded their economic status but undermined the independence that lay at the root of republican manhood and republican citizenship. As wage workers, they needed to regain pride and status. For some white, male unionists—particularly those in the relatively conservative AFL—there were two intertwined ways to do that. One was winning higher wages and using the money to construct a respectable life—a carpeted parlor, ornaments on the mantle, a wife who could stay home to care for the family. The other lay in contrasting themselves with female, black, and immigrant workers, who, in their view, lacked both the power and the desire to push for better pay.

“The Caucasian must add to his own individual needs the cost of maintaining a wife and family. There is rent to pay, clothing to be provided, books to buy, and, added to all this, the many little wants that arise out of the condition of a Christian civilization. In contrast Chinamen are content with a fractional interest in the body of a female slave.”

Through the early twentieth century, unionists—including not just skilled white men, but also workers of other backgrounds, who organized in spite of the barriers erected by some white male union leaders—pushed for better jobs. This required not only strikes and demonstrations but also a new economic vision. In an age of big factories, workers recognized that it was no longer possible to reimburse any one individual for the value they added to a product. At the same time, they rejected the emerging economic consensus that supply and demand in the labor market would produce a “correct” wage. Instead, they created a new concept: the “living wage,” amounting to their rightful “share in the products of common toil.”

The labor movement achieved a great deal in this era. Working hours lessened, working conditions improved, and wages rose. By the end of the 1940s, unions and management had essentially reached a truce. Workers repudiated socialism and stopped trying to win a say in how companies were managed. Companies provided pensions and health insurance to many employees and worked to keep employment rates high. For a few decades, things generally went quite well for workers, particularly white, male union members in urban industrial areas. In recent years, of course, things have changed. A concerted political attack has hobbled unions, while globalization and automation have reshaped the economy. Wages for all but the best-paid workers have stagnated, and employee benefits have evaporated, while returns to capital have swelled.

Economists and policy analysts have a lot of different ideas about how we might respond to the conditions of laborers. Some suggest reinstating the post-war social contract. Others argue that the government should expand programs that subsidize the incomes of low-paid workers into a European-style welfare state, or even provide a universal basic income to everyone. With that in mind, here are a few lessons we might draw from the history of workers' opposition to—and then acceptance of—the wage system:

- There's nothing inherently fair about how we get paid. Factory workers won good pay in the twentieth century by rejecting the idea that a particular worker's contribution to a product could be isolated and reimbursed, instead demanding enough pay to live well. With the technological changes of the past century, this idea seems even clearer. In a world—like the one we live in—of mammoth increasing returns to unowned knowledge and to networks, no individual and no community is especially valuable. Those who receive good livings are those who are lucky.
- When we talk about workers' pride, which workers do we mean? Craftsmen who had previously controlled their workplaces and hours were likely to see working in a factory as a loss of independence. Women whose alternative was working for a husband on the family farm weren't. Workers who have never experienced a good factory job may be less likely to be horrified at policies that supplement their wages.
- Worker ownership of the means of production is an American tradition. When union radicals tried to take over factories or foment revolution, they were drawing on a longstanding assumption that people should

keep the returns to their work. Even if the idea now evokes Soviet-themed hipster t-shirts, it stands behind real institutions like sovereign wealth funds and employee-owned companies that we could support and expand.

- To make a new economic paradigm successful, make it comfortable. Working for a wage became a standard part of a good life, rather than a source of shame, to the extent that wages rose. A more comprehensive, European-style set of government benefits might achieve the same success.
- Racism is a very hard problem. As long as white workers can identify “slave wages” or “welfare dependency” with a racial underclass, it’s difficult to fight for broad changes.
- Hard work can be overrated. From the alehouses of the 1860s to the video-game-equipped basements of today, slackers have never gotten a lot of respect from economic and political thinkers. There’s certainly a case to be made for norms that encourage useful work, but there are a lot of holes in the theory that wage labor is the singular key to happiness. For instance, although unemployed people tend to be quite miserable, the same doesn’t hold true for retirees, who have a social mandate to slack off.
- The biggest lesson, though, might be this one: things change. Whether we like it or not, technological advances and geopolitical shifts will alter the ways we work, probably in radical ways. Our values, and the places we find pride and shame, will change with them. There’s no guarantee about what any of this will look like, partly because it will depend on the choices we make about what we’re willing to fight for.

What if nobody worked? Sweatshops would empty out and assembly lines would grind to a halt, at least the ones producing things no one would make voluntarily. Telemarketing would cease. Despicable individuals who only hold sway over others because of wealth and title would have to learn better social skills. Traffic jams would come to an end; so would oil spills. Paper money and job applications would be used as fire starter as people reverted to barter, sharing, or the gift economy. Grass and flowers would grow from the cracks in the sidewalk, eventually making way for fruit trees.

And we would all starve to death. But we’re not exactly subsisting on paperwork and performance evaluations, are we? Most of the things we make and do for money are patently irrelevant to our survival—and to what

gives life meaning. It depends on what you mean by ‘work.’ Think about how many people enjoy gardening, fishing, carpentry, cooking, and even computer programming just for their own sake. What if that kind of activity could provide for all our needs?

For hundreds of years, people have claimed that technological progress would soon liberate humanity from the need to work. Today we have capabilities our ancestors couldn’t have imagined, but those predictions still haven’t come true. In the US we actually work longer hours than we did a couple generations ago—the poor in order to survive, the rich in order to compete. Others desperately seek employment, hardly enjoying the comfortable leisure all this progress should provide. Despite the talk of recession and the need for austerity measures, corporations are reporting record earnings, the wealthiest are wealthier than ever, and tremendous quantities of goods are produced just to be thrown away. There’s plenty of wealth, but it’s not being used to liberate humanity.

What kind of system simultaneously produces abundance and prevents us from making the most of it? The defenders of the free market argue that there’s no other option—and so long as our society is organized this way, there isn’t.

Yet once upon a time, before time cards and power lunches, everything got done without work. The natural world that provided for our needs hadn’t yet been carved up and privatized. Knowledge and skills weren’t the exclusive domains of licensed experts, held hostage by expensive institutions; time wasn’t divided into productive work and consumptive leisure. We know this because work was invented only a few thousand years ago, but human beings have been around for hundreds of thousands of years. We’re told that life was “solitary, poor, nasty, brutish, and short” back then—but that narrative comes to us from the ones who stamped out that way of life, not the ones who practiced it.

This isn’t to say we should go back to the way things used to be, or that we could—only that things don’t have to be the way they are right now. If our distant ancestors could see us today, they’d probably be excited about some of our inventions and horrified by others, but they’d surely be shocked by how we apply them. We built this world with our labor, and without certain obstacles we could surely build a better one. That wouldn’t mean abandoning everything we’ve learned. It would just mean abandoning everything we’ve learned doesn’t work.

One can hardly deny that work is productive. Just a couple thousand years of it have dramatically transformed the surface of the earth. But what exactly does it produce? Disposable chopsticks by the billion; laptops and cell phones that are obsolete within a couple years. Miles of waste dumps

and tons upon tons of chlorofluorocarbons. Factories that will rust as soon as labor is cheaper elsewhere. Dumpsters full of overstock, while a billion suffer malnutrition; medical treatments only the wealthy can afford; novels and philosophies and art movements most of us just don't have time for in a society that subordinates desires to profit motives and needs to property rights.

And where do the resources for all this production come from? What happens to the ecosystems and communities that are pillaged and exploited? If work is productive, it's even more destructive. Work doesn't produce goods out of thin air; it's not a conjuring act. Rather, it takes raw materials from the biosphere—a common treasury shared by all living things—and transforms them into products animated by the logic of market. For those who see the world in terms of balance sheets, this is an improvement, but the rest of us shouldn't take their word for it.

Capitalists and socialists have always taken it for granted that work produces value. Workers have to consider a different possibility—that working uses up value. That's why the forests and polar ice caps are being consumed alongside the hours of our lives: the aches in our bodies when we come home from work parallel the damage taking place on a global scale.

What should we be producing, if not all this stuff? Well, how about happiness itself? Can we imagine a society in which the primary goal of our activity was to make the most of life, to explore its mysteries, rather than to amass wealth or outflank competition? We would still make material goods in such a society, of course, but not in order to compete for profit. Festivals, feasts, philosophy, romance, creative pursuits, child-rearing, friendship, adventure—can we picture these as the center of life, rather than packed into our spare time? Today things are the other way around—our conception of happiness is constructed as a means to stimulate production. Small wonder products are crowding us out of the world.

Work doesn't simply create wealth where there was only poverty before. On the contrary, so long as it enriches some at others' expense, work creates poverty, too, in direct proportion to profit. Poverty is not an objective condition, but a relationship produced by unequal distribution of resources. There's no such thing as poverty in societies in which people share everything. There may be scarcity, but no one is subjected to the indignity of having to go without while others have more than they know what to do with. As profit is accumulated and the minimum threshold of wealth necessary to exert influence in society rises higher and higher, poverty becomes more and more debilitating. It is a form of exile—the cruelest form of exile, for you stay within society while being excluded from it. You can neither participate nor go anywhere else.

Work doesn't just create poverty alongside wealth—it concentrates wealth in the hands of a few while spreading poverty far and wide. For every Bill Gates, a million people must live below the poverty line; for every Shell Oil, there has to be a Nigeria. The more we work, the more profit is accumulated from our labor, and the poorer we are compared to our exploiters. So in addition to creating wealth, work makes people poor. This is clear even before we factor in all the other ways work makes us poor: poor in self-determination, poor in free time, poor in health, poor in sense of self beyond our careers and bank accounts, poor in spirit.

“Cost of living” estimates are misleading—there's little living going on at all! ‘Cost of working’ is more like it, and it's not cheap. Everyone knows what house-cleaners and dishwashers pay for being the backbone of our economy. All the scourges of poverty—addiction, broken families, poor health—are par for the course; the ones who survive these and somehow go on showing up on time are working miracles. Think what they could accomplish if they were free to apply that power to something other than earning profits for their employers.

What about their employers, fortunate to be higher on the pyramid? You would think earning a higher salary would mean having more money and thus more freedom, but it's not that simple. Every job entails hidden costs: just as a dishwasher has to pay bus fare to and from work every day, a corporate lawyer has to be able to fly anywhere at a moment's notice, to maintain a country club membership for informal business meetings, to own a small mansion in which to entertain dinner guests that double as clients. This is why it's so difficult for middle-class workers to save up enough money to quit while they're ahead and get out of the rat race: trying to get ahead in the economy basically means running in place. At best, you might advance to a fancier treadmill, but you'll have to run faster to stay on it.

And these merely financial costs of working are the least expensive. In one survey, people of all walks of life were asked how much money they would need to live the life they wanted; from pauper to patrician, they all answered approximately double their current income. So not only is money costly to obtain, but, like any addictive drug, it's less and less fulfilling. And the further up you get in the hierarchy, the more you have to fight to hold your place. The wealthy executive must abandon his unruly passions and his conscience, must convince himself that he deserves more than the unfortunates whose labor provides for his comfort, must smother his every impulse to question, to share, to imagine himself in others' shoes; if he doesn't, sooner or later some more ruthless contender replaces him. Both blue-collar and white-collar workers have to kill themselves to keep the jobs that keep them alive; it's just a question of physical or spiritual destruction.

Those are the costs we pay individually, but there's also a global price to pay for all this working. Alongside the environmental costs, there are work-related illnesses, injuries, and deaths: every year we kill people by the thousand to sell hamburgers and health club memberships to the survivors. The US Department of Labor reported that twice as many people suffered fatal work injuries in 2001 as died in the September 11 attacks, and that doesn't begin to take into account work-related illnesses. Above all, more exorbitant than any other price, there is the cost of never learning how to direct our own lives, never getting the chance to answer or even ask the question of what we would do with our time on this planet if it was up to us. We can never know how much we are giving up by settling for a world in which people are too busy, too poor, or too beaten down to do so.

Why work, if it's so expensive? Everyone knows the answer—there's no other way to acquire the resources we need to survive, or for that matter to participate in society at all. All the earlier social forms that made other ways of life possible have been eradicated—they were stamped out by conquistadors, slave traders, corporations, that left neither tribe nor tradition nor ecosystem intact. Contrary to capitalist propaganda, free human beings don't crowd into factories for a pittance if they have other options, not even in return for name brand shoes and software. In working and shopping and paying bills, each of us helps perpetuate the conditions that necessitate these activities. Capitalism exists because we invest everything in it: all our energy and ingenuity in the marketplace, all our resources at the supermarket and in the stock market, all our attention in the media. To be more precise, capitalism exists because our daily activities are it. But would we continue to reproduce it if we felt we had another choice?

Instead of enabling people to achieve happiness, work fosters the worst kind of self-denial. Obeying teachers, bosses, the demands of the market—not to mention laws, parents' expectations, religious scriptures, social norms—we're conditioned from infancy to put our desires on hold. Following orders becomes an unconscious reflex, whether or not they are in our best interest; deferring to experts becomes second nature.

Selling our time rather than doing things for their own sake, we come to evaluate our lives on the basis of how much we can get in exchange for them, not what we get out of them. As freelance slaves hawking our lives hour by hour, we think of ourselves as each having a price; the amount of the price becomes our measure of value. In that sense, we become commodities, just like toothpaste and toilet paper. What once was a human being is now an employee, in the same way that what once was a pig is now a pork chop. Our lives disappear, spent like the money for which we trade them.

Most of us have become so used to giving up things that are precious to

us that sacrifice has become our only way of expressing that we care about something. We martyr ourselves for ideas, causes, love of one another, even when these are supposed to help us find happiness. There are families, for example, in which people show affection by competing to be the one who gives up the most for the others. Gratification isn't just delayed, it's passed on from one generation to the next. The responsibility of finally enjoying all the happiness presumably saved up over years of thankless toil is deferred to the children; yet when they come of age, if they are to be seen as responsible adults, they too must begin working their fingers to the bone.

But the buck has to stop somewhere. People work hard nowadays, that's for sure. Tying access to resources to market performance has caused unprecedented production and technological progress. Indeed, the market has monopolized access to our own creative capacities to such an extent that many people work not only to survive but also to have something to do. But what kind of initiative does this instill?

Let's go back to global warming, one of the most serious crises facing the planet. After decades of denial, politicians and businessmen have finally swung into action to do something about it. And what are they doing? Casting about for ways to cash in! Carbon credits, "clean" coal, "green" investment firms—who believes that these are the most effective way to curb the production of greenhouse gases? It's ironic that a catastrophe caused by capitalist consumerism can be used to spur more consumption, but it reveals a lot about the kind of initiative work instills. What kind of person, confronted with the task of preventing the end of life on earth, responds, 'Sure, but what's in it for me?'

If everything in our society has to be driven by a profit motive to succeed, that might not be initiative after all, but something else. Really taking initiative, initiating new values and new modes of behavior—this is as unthinkable to the enterprising businessman as it is to his most listless employee. What if working—that is, leasing your creative powers to others, whether managers or customers—actually erodes initiative?

The evidence for this extends beyond the workplace. How many people who never miss a day of work can't show up on time for band practice? We can't keep up with the reading for our book clubs even when we can finish papers for school on time; we can remember countless details of arbitrary corporate policy yet forget our loved ones' important events; the things we really want to do with our lives end up at the bottom of the to-do list. The ability to follow through on commitments becomes something outside ourselves, associated with external rewards or punishments.

Imagine a world in which everything people do, they do because they want to, because they are personally invested in bringing it about. For

any boss who has struggled to motivate indifferent employees, the idea of working with people who are equally invested in the same projects sounds utopian. But this isn't proof that nothing would get done without bosses and salaries—it just shows how work saps us of initiative.

Let's say your job never injures, poisons, or sickens you. Let's also take it for granted that the economy doesn't crash and take your job and savings with it, and that no one who got a worse deal than you manages to hurt or rob you. You still can't be sure you won't be downsized. Nowadays nobody works for the same employer his whole life; you work somewhere a few years until they let you go for someone younger and cheaper or outsource your job overseas. You can break your back to prove you're the best in your field and still end up hung out to dry.

You have to count on your employers to make shrewd decisions so they can write your paycheck—they can't just fritter money away or they won't have it to pay you. But you never know when that shrewdness will turn against you: the ones you depend on for your livelihood didn't get where they are by being sentimental. If you're self-employed, you probably know how fickle the market can be, too. What could provide real security? Perhaps being part of a long-term community in which people looked out for each other, a community based on mutual assistance rather than financial incentives. And what is one of the chief obstacles to building that kind of community today? Work.

Who carried out most of the injustices in history? Employees. This is not necessarily to say they are responsible for them—as they would be the first to tell you! Does receiving a wage absolve you of responsibility for your actions? Working seems to foster the impression that it does. The Nuremberg defense—"I was just following orders"—has been the anthem and alibi of millions of employees. This willingness to check one's conscience at the workplace door—to be, in fact, a mercenary—lies at the root of many of the troubles plaguing our species.

People have done horrible things without orders, too—but not nearly so many horrible things. You can reason with a person who is acting for herself; she acknowledges that she is accountable for her decisions. Employees, on the other hand, can do unimaginably dumb and destructive things while refusing to think about the consequences. The real problem, of course, isn't employees refusing to take responsibility for their actions—it's the economic system that makes taking responsibility so prohibitively expensive.

Employees dump toxic waste into rivers and oceans.

Employees slaughter cows and perform experiments on monkeys.

Employees throw away truckloads of food.

Employees are destroying the ozone layer.

They watch your every move through security cameras.

They evict you when you don't pay your rent.

They imprison you when you don't pay your taxes.

They humiliate you when you don't do your homework or show up to work on time.

They enter information about your private life into credit reports and FBI files.

They give you speeding tickets and tow your car.

They administer standardized exams, juvenile detention centers, and lethal injections.

The soldiers who herded people into gas chambers were employees.

Just like the soldiers occupying Syria and Afghanistan.

Just like the suicide bombers who target them—they are employees of God, hoping to be paid in paradise.

Let's be clear about this: critiquing work doesn't mean rejecting labor, effort, ambition, or commitment. It doesn't mean demanding that everything be fun or easy. Fighting against the forces that compel us to work is hard work. Laziness is not the alternative to work, though it might be a byproduct of it.

The bottom line is simple: all of us deserve to make the most of our potential as we see fit, to be the masters of our own destinies. Being forced to sell these things away to survive is tragic and humiliating. We don't have to live like this.

“Pay as a remission of taxes to every poor family, out of the surplus taxes, and in room of poor-rates, four pounds a year for every child under fourteen years of age.”

—*Rights of Man*

“It is painful to see old age working itself to death, in what are called civilized countries, for daily bread. Pay to every such person of the age of fifty years the sum of six pounds per annum out of the surplus taxes, and ten pounds per annum during life after the age of sixty. This support, as already remarked, is not of the nature of a charity but of a right.”

—*Rights of Man*

“There could be no such thing as landed property originally. Man did not make the earth, and, though he had a natural right to occupy it, he had no right to locate as his property in perpetuity any part of it.”

—*Agrarian Justice*

“Create a national fund, out of which there shall be paid to every person, when arrived at the age of twenty-one years, the sum of fifteen pounds sterling, as a compensation in part, for the loss of his or her natural inheritance, by the introduction of the system of landed property.”

—*Agrarian Justice*

President Roosevelt brought in the New Deal not only to address the desperation of the Great Depression but to undercut a powerful movement of US citizens who, having been dealt a savage blow by the unregulated free market, were demanding a different economic model. Some wanted a radically different one: in the 1932 presidential elections, one-million Americans voted for Socialist or Communist candidates. Growing numbers of Americans were also paying close attention to Huey Long, the populist senator from Louisiana who believed that all Americans should receive a guaranteed annual income of \$2,500. Explaining why he had added more social welfare benefits to the New Deal in 1935, FDR said he wanted to “steal Long’s thunder.”

In many respects, Hayek was a throwback, romanticizing a lost golden age of idealized unfettered capitalism that arguably never existed for much of the population. But Hayek’s views were more nuanced than many American adherents understood. Many reactionary Americans know only the distorted translation of Hayek’s work that had appeared in *Reader’s Digest*. The conservative publication omitted Hayek’s politically inconvenient support for a minimum standard of living for the poor, environmental and workplace safety regulations, and price controls to prevent monopolies from taking undue profits.

On April 17, 1970, the House of Representatives voted 243 to 155 for legislation that would install a guaranteed annual income for all American citizens in need. In so many words, a substantial majority of Congress said, ‘Fuck work!’ Well, almost. These congressmen weren’t utopians fresh from the commune or the campus, nor bumpkins just off the turnip truck. They were serious citizens with good reasons for their votes. They could read the recommendations of three weighty presidential commissions on dealing with the question of unemployment. And they had empirical grounds for supporting Richard Nixon’s agenda for welfare reform, what he called his Family Assistance Program (FAP). Most important, they could rely on the report of an ongoing income-maintenance study supervised by the Office of Economic Opportunity—where Nixon’s young guns, Donald Rumsfeld and Dick Cheney, presided.

The archconservatives of our time, Rumsfeld and Cheney, spearheaded the effort to install a guaranteed annual income. What novelist could make this up? In fact, this was the logical endpoint of a long and tortured debate. From 1910, when William James published *The Moral Equivalent of War*, until the 1990s, American writers, artists, and intellectuals studied, celebrated, and worried over the impending end of work; meanwhile politicians wondered what to do about it. The lyrical Left and the political mainstream pondered the same problem, or promise: what happens when the work runs out?

Today the Left, broadly construed to include socialists, liberals, and all manner of intermediate positions, has just one answer: full employment. So does the Right, broadly construed to include libertarians, conservatives, evangelicals, and the ample bandwidth in between. All parties want, above all, to create more jobs. But fifty years ago, the Left and the Right agreed on the other answer. To repeat, on April 17, 1970, the House of Representatives voted decisively for legislation that would install a guaranteed annual income for all American citizens in need. Those members of Congress were finally persuaded by a report from the Office of Economic Opportunity (OEO), where Donald Rumsfeld and Dick Cheney presided.

By the time the House of Representatives voted for Nixon's FAP in April 1970, a bipartisan, practically universal consensus was composed of these assumptions:

1. The end of work was in sight because private enterprise could not create enough jobs to sustain anything approaching full employment, and thus could not maintain aggregate consumer demand for a growing output of goods and services.
2. Any transparent or intelligible relation between work and income, between the production and the consumption of goods, had been erased by technological innovation.
3. One way or another, public spending would have to make up the deficit in aggregate demand, and recreate a transparent or intelligible relation between production and consumption, by means of:
 - a) existing welfare programs, and/or
 - b) direct employment by government, and/or
 - c) income maintenance (transfer) payments to households or individuals.

4. Income maintenance (c), or a guaranteed annual income, was the best alternative to existing welfare programs.
5. Any income-maintenance program would have to include both strong incentives to work and robust provisions for child care if it were to pass the test of public opinion and the vote of elected representatives.

Full employment was not the uniform answer to the moral questions and economic issues attending the problem. Journalists, academics, intellectuals, and legislators agreed instead that neither private enterprise nor the government could create enough remunerative jobs. So they searched for alternatives to work—they tried to decouple income from occupations.

We ought to be in the same hunt. Of course we can (a) try to create more jobs by whatever means, public or private, and move toward “full employment”—meanwhile hoping that a more intelligible, more justifiable relation between work performed and income received is created as a result. Or we can (b) acknowledge some obvious facts, as did the people who either conducted those social experiments or voted for Nixon’s FAP in 1970.

Plan A is unrealistic for two reasons. First, private investment can’t serve the purpose of job creation on the scale necessary, no matter what contemporary economists say about its importance. There aren’t enough tax incentives to get the banks and their corporate clients off their asses, and the combined capital/labor-saving quality of recent technological innovation will limit the employment effects of whatever private investments do get made. Second, public investment on the scale necessary can’t be mustered by a gridlocked Congress—or by any Congress. Third, Plan A is punitive, in the sense that it requires everyone to get up and go to work when we can already produce more than we need with less and less labor time.

Plan B proposes that everyone will work less, not more, in keeping with the steady increase of labor productivity and the correlative tendency toward the zero marginal cost of labor. So it guarantees a minimum annual income to every citizen, on the assumption that there’s no way to calculate a justifiable relation between hours worked and dollars earned. Plan A presumes that work must continue to create the character and determine the income of each individual, regardless of how few “good jobs” have survived the past hundred years of technological innovation. Plan B acknowledges that work can’t serve these purposes because there’s just not enough of it, and that we need, accordingly, to look elsewhere for the sources of these essential elements of personal identity and social standing. There’s not enough work to employ most adults at a living wage because we’ve become so productive that the relation between work and income is arbitrary in any

case. As a result, we need to find new ways to justify and new means to enable the consumption of goods—ways and means that aren't determined by the money we make from our jobs. In other words: ***Fuck Work***

How did this once mainstream idea become the exclusive property of left-wing radicals—the so-called Autonomists in Italy or Silicon Valley futurists—to the point where, by now, it appears as a utopian program with no intellectual purchase on the real world?

Nixon's FAP stalled in the Senate because liberals were suspicious of its supposed work requirements. On these grounds, for example, social workers, the most liberal of interest groups, became the most outspoken critics of the legislation. These work requirements were in fact minimal. But they were a necessary part of the ideological package Nixon was selling; for a substantial bloc of voters—not just the Chamber of Commerce—worried that the working poor would quit their jobs and loaf around all day if given the chance. A Gallup Poll in 1968, for example, showed that 58 percent of Americans opposed a guaranteed annual income of \$3,200 to a family of four; the typical sentiment reported by this majority was “nobody should get something for nothing.”

George Shultz, the secretary of the Treasury, addressed these issues in testimony before the House Ways and Means Committee in October 1969. He began by saying that “Work is a major feature of this program.” But he quickly moved to head off liberal objections by explaining that only a third of recipients would have to register with the local public employment office, and that less than one percent of those who did would be “disqualified” from Family Assistance Program eligibility. He emphasized throughout his testimony that poor people wanted to work, anyway. And the data from an ongoing New Jersey experiment would validate this claim. In a follow-up letter to Wilbur Mills, the all-powerful chairman of the House Ways and Means Committee—it's a letter that is both astonishing and poignant in view of today's parochial attitudes toward the issue—Shultz insisted that to get people off welfare and into the workforce, the federal government had to subsidize “quality child care,” exactly as Nixon's FAP proposed to do. Otherwise, he explained, any incentives to get up and go to work would be canceled by the costs of private-sector daycare.

Many believe that work is self-evidently good for us. Why? Why are we stuck in this punitive place from which reality has departed—the place where there must be a job for every “able-bodied individual,” even though we don't know how to create enough of them, and where having a job is a good thing, no matter how pointless, dangerous, or demeaning it is? The short answer is the great romance of work, which I mean as metaphor but not hyperbole—after all, we love to work, and we prove it every day by

showing up at shitty jobs, where we can demonstrate that we're willing to make our own way in this cruel world. It's not just external, economic necessity that drives us. Something else is at stake. What else is there? It's not very complicated. We work because as we do so we can see the changes we're making in the world, on the world, and this vision, derived from an infantile but nonetheless indispensable notion, is what we call freedom—the ability to be causative, to reshape the inherited conditions we didn't choose, to remake ourselves and the world at once.

But if that is true, if work means freedom as well as bondage, I can't just say, well, socially necessary labor is receding—jobs that pay a living wage are disappearing—so let's all forget about work and its pleasures, its rewards, its benefits. I have to explain that something else, that surplus of meaning we find in our jobs and vocations. How, then, to diagnose the psychological imperatives that keep us at work, proceeding on the assumption that every symptom is an attempted cure? And, more to the point, how to imagine an alternative set of imperatives that would let us relax and be less productive? That question boils down to a big one: Can we imagine a different human nature?

The rental of a person is no less fraudulent and absurd than the ownership of one. In the employment contract the employee is rented. In theory and in legal terms the employee is treated as a thing, an instrument—like a rented car. But actually a person cannot be turned into an instrument—cannot be rented by someone else any more than he or she can be owned by someone else. In more theoretical terms, autonomy is inalienable. That is not a normative statement about how things ought to be, but a factual one about how things are. It follows that the employment contract is in fact a fraud.

The liberal and left-wing advocates of full employment assume that the bargaining power of workers, and thus their inclination to organize, will increase as the supply of jobs does. Meanwhile the advocates of labor republicanism and workers' self-management via employee-owned enterprise assume that everybody's identity is necessarily a function of his or her role in the production of goods and services. And the even more left-leaning, avowedly socialist advocates of a labor movement galvanized by new organizing drives assume that only a militant working class can change things for the better. They're all unlikely prisoners—or is it guardians?—of the Protestant work ethic.

Once upon a time, the Protestant work ethic was a leveling, democratizing attitude and social force. It served as a critique of aristocratic exemption from necessary labor because it insisted that everybody had to justify their consumption of goods by their prior production of value—everybody. But from the beginning, with Luther's insistence on a "calling," it was a kind of

“slave morality.” It justified renunciation and abstention from the present in the name of the future: “saving for a rainy day,” in the vernacular, storing up those sacrificed possibilities in the hope that redemption—sacred or secular, entering heaven or cashing out—would follow.

So, when I say Fuck Work, I mean that it no longer functions as either a moral calendar or an economic calculator. You will learn nothing about character by going to work at the minimum wage because the gangsters or the morons at corporate headquarters control your opportunities; you will learn nothing about the rationality of the market because the same people determine your income. I also mean that the slave morality of renunciation and abstention has outlived its usefulness. It’s obsolete for the obvious reason that if we keep working as hard as we can, producing as much as do, we’ll incinerate the planet. Beyond that—is there such a thing?—the deferment of gratification that we call work has by now become more repression than sublimation. It doesn’t merely delay and redirect our desires into socially useful channels; it mutilates them. Once upon a time, going or getting to work was a way of discovering and developing your capacities. By now it’s become a way to avoid yourself.

By saying Fuck Work, I mean—finally—to say that since the correlation of income and work is already incomprehensible and unjustifiable, we need to decouple them, in accordance with what transfer payments, “entitlements,” Wall Street bonuses, and real-life experiments with a guaranteed income have taught us—that, for better or worse, getting something for nothing has no measurable effect on the character of the recipients. That empirical fact propels us into a moral universe where work can’t serve as a reliable index of anything about you. Except that, you have to.

How can we provide incomes for:

1. People who work hard but don’t produce value that has a marketable numerator, by which I mean a return on their investment of labor time—fast-food workers, journalists, academics, filmmakers, and musicians, and the like—and also people whose labor time has been historically undervalued or red-lined due to race or gender.
2. People who don’t work because they can’t, for example elderly men and women, who constitute a growing proportion of every developed nation’s population.
3. People who don’t work—they don’t produce value the labor market might recognize—because they’ve got better things to do.

So conceived, the breakdown of the labor market is not just an economic crisis; it's a moral opportunity to rethink our relation to work, and to think anew about what, and who, we can love.

How can we derive satisfaction from our work if it diminishes ourselves and helps destroy civilization? Good work is not working for a living or to support a family. Good work is living. And the place to perform such work is often not in an office or factory but in our own home. If we do not live where we work, when we work we are wasting our lives, and our work, too.

In Western democracies, we are no longer governed by absolute rulers, but by people 'in authority.' In other words, authority is temporarily vested in an individual, making the person distinct from the function. And such functions are embedded in a broader symbolic structure that collectively sets out rights and obligations. It's not for nothing that authority figures are traditionally assigned external badges of office—a mayor's chain, a judge's wig—so that they can be publicly held to account. The fact that these badges nowadays come across as slightly ridiculous shows how we have lost the ability to distinguish between authority and those who hold it. These days, they tend to be conflated, so that traditional authority, with its symbolic underpinning, is lapsing into brute force. We respond very ambiguously to this trend.

Either we find power suspect and oppose it with might and main, or we go to the other extreme and call for a strong leader who will take action to solve our problems. Often, we do both at once: people want more authority, but get incensed when a teacher punishes their child. 'Who does she think she is?' we might ask, whereas that is actually the key issue; teachers are vested with the authority to teach. If a teacher abuses her position, she must be called to account. But the function itself must be exempt from criticism; otherwise, teaching will become impossible. The loss of a distinction between power and authority, between rulers and those in authority, means that nowadays things too often come down to power struggles. We end up in situations where 'might is right.' Ironically, people seize on this to justify the notion of the survival of the fittest. And, at present, this struggle for survival is particularly apparent in the workplace.

Our politicians are constantly singing hymns to democracy as the best system—this is simply the extension of democracy to the place where we spend most of our time. It's an amazing victory for their propaganda system—to make you work in an environment you often can't stand, and to do it for most of your waking life, and see the proceeds of your labor get siphoned off by somebody at the top, and then to make you think of yourself as a free person.

“People are constantly amazed—they don’t understand how you could possibly run a business like this. But everyone’s been in a group environment. Everyone’s been in a family, or on a team. You know how it works. It’s just all of a sudden, when you think about it in the context of making money or running a business, everyone’s head explodes about it. But I don’t feel like it’s that complicated. People want it to be a lot more complicated than it really is. They can’t even imagine how people would work together to make simple decisions. I like to explain that it’s a democratic organization. This isn’t a foreign concept. You live in America. We say we’re a democracy, but people are so far removed from the concept.”

Beyond a certain level of income, extrinsic rewards have scarcely any effect. Financial stimuli increase motivation only in jobs that don’t involve any thought. As soon as thinking is involved, especially creativity, intrinsic motivation proves far more effective. In fact, in such cases extrinsic motivation—that’s to say, bonuses—has a negative effect, causing people to perform worse than those who are intrinsically motivated. In this region of the world, where the focus is on the knowledge economy, the majority of jobs fall into the second category. Jobs that entail little thought—for example, conveyor-belt work, are largely a thing of the past. In that sector, bonuses do have a positive effect, but ironically enough are rarely awarded. So politicians and captains of industry have everything to gain by dismantling the extrinsic-motivation model as fast as possible. Introducing intrinsic motivation becomes even more of a priority when one considers that the current system of bonuses heightens income inequality—an inequality that has been linked to almost every kind of negative psychosocial effect. Politicians aspiring to represent the interests of the entire community must take account of this fact. The key question is: what constitutes intrinsic motivation? Autonomy, mastery, purpose.

Autonomy and mastery are closely related. Having a say over the organization and content of one’s work enormously increases motivation and commitment. This, in turn, leads to greater mastery and expertise, thereby increasing job satisfaction even more. Its purpose must be perceived as a contribution to something that transcends ourselves; something that we cannot achieve in isolation. This gives us the feeling of belonging to a community, yet still having an individual role to play. This is the balance between sameness and difference, between being part of a greater whole and yet being autonomous.

Many readers will dismiss this with a shrug, and urge me to ‘get real.’

The above approach sounds very nice, they will argue, but the bottom line is that people are in it for the money. And even if this model works, it can only be applied in a limited number of cases involving highly creative work. Both criticisms can easily be countered, as plenty of reliable studies and examples show. People are in it for the money because that's how the system is organized. I have already stressed elsewhere that the current reality is the consequence of a certain economic and social organization; it should not be confused with an absolute reality. Very many people these days derive job satisfaction, and more broadly, self-respect and a feeling of belonging, from work for which they receive little or no pay. Every single voluntary organization bears witness to this.

In childhood, I had no insight whatsoever into my father's consciousness, nor any awareness of what it might have felt like, inside, to do what he had to sit there at his desk and do every day. In this respect, it was not until many years after his death that I felt I truly knew him. I do not believe I knew or could even imagine, as a child, that for almost 30 years, 51 weeks a year, my father sat all day at a metal desk in a silent, fluorescent lit room, reading forms and making calculations and filling out further forms on the results of those calculations, breaking only occasionally to answer his telephone or meet with other actuaries in other bright, quiet rooms. With only a small and sunless north window that looked out on other small office windows in other grey buildings.

Bear in mind that, averaged over a year, even medieval serfs did not work even close to a forty-hour week.

When people are asked why they work what was their uniform answer? A reason to live, which typically translates as a reason to get out of bed and to do the right thing while awake. They wanted something to do, somewhere to go, a place—more than that, actually, an emotional destination—that would help them translate their inchoate, inarticulate desires into a coherent, regular, recognizable set of meanings, and that would, accordingly, give their humdrum, everyday lives some durable shape, some significance. The answer was never 'just for the money,' not even when questioning the morticians and the prostitutes. The job always appeared as a means to other ends, as it must be in a market society, but the ends were invariably an escape from a previous life or a commitment to a different life. Their regulative desire was to become somebody else, to find a future that wasn't already determined by their social origins or inscribed in their own bad decisions.

We work, we engage in social labor, for the same reasons we try to love each other as ourselves—we think it will make a difference.

Work is how we give our lives meaning when religion, party politics and community fall away.

It is easy to explain why evidence shows people who are unemployed feel even worse than people in meaningless jobs. The primary way in which meaningless work causes depression is through a lack of control—and unemployed people have even less control over their lives. They have no financial resources, no social status, and no choices about their lives.

Between 2011 and 2012 the polling company Gallup conducted the most detailed study ever carried out of how people across the world feel about their work. They studied millions of workers across 142 countries. They found that 13 percent of people say they are “engaged” in their jobs—which means they are “enthusiastic about, and committed to their work and contribute to their organization in a positive manner.” Against them, 63 percent say they are “not engaged,” which is defined as “sleepwalking through their workday, putting time—but not energy or passion—into their work.” And a further 24 percent are “actively disengaged.”

“They aren’t just unhappy at work; they’re busy acting out their unhappiness. Every day, these workers undermine what their engaged co-workers accomplish. Actively disengaged employees are more or less out to damage their company.”

The progressive advocates of full employment, for example, from Dean Baker and Jared Bernstein to Thomas Edsall and Mike Konczal, frame their proposals as alternatives to working-class dependence on the dole—in other words, as a way of balancing the budget, heading off the growth of entitlements, and quieting popular (not just Republican) fears of a “nanny state.” If people have jobs, the argument goes, they’re not on welfare, so they’re not just absorbing tax dollars taken from hardworking citizens. Instead, they’re in a stronger position to bargain for better wages and working conditions on their own account. Here is how Edsall summarized the progressive political morality of full employment in December 2013:

“The economics of survival have forced millions of men, women, and children to rely on ‘pity-charity liberal capitalism’ [Edsall is here quoting Konczal]. The state has now become the resource of last resort, consigning just the people progressives would like to turn into a powerful force for reform to a condition of subjugation—living out their lives on government subsidies like Medicaid, the Earned Income Tax Credit, and now Obamacare.”

The only alternative to this vaguely, benignly fascistic version of liberalism, according to Edsall and Konczal, is a “bold” public policy commitment

to full employment, presumably because more jobs mean less dependence on the state for income supplements, a.k.a. transfer payments, entitlements, and government subsidies.

Now, Edsall and Konczal are no reactionaries. Neither are Baker and Bernstein. By any political measure, these are genuine progressives—they're center-left-wingers all. And yet the implications of their argument are profoundly conservative, because they suggest that income without work, whether that means getting an old-fashioned transfer payment like Social Security or a guaranteed income, is of dubious moral value. Notice, to begin with, how the welfare state appears in Edsall's paragraph exactly as it does in Paul Ryan's Republican dream world, as the oppressor of the poor—an insatiable bureaucracy that produces dependence. Then notice how a potential "force for reform" is made pliant, docile, and inert because it doesn't just receive, it relies on government subsidies. If you didn't know any better, you'd think a Tea Party enthusiast wrote this paragraph after finishing *Atlas Shrugged*, particularly in view of the reference to Obamacare as a government subsidy that will subjugate the poor, to be sure, but also create a permanent constituency for the Democrats, the party of "pity-charity liberal capitalism." From this standpoint, there's no middle ground between work, on the one hand, and dependence on the other—between having a job and being subjugated by the state (or the party).

During the 80s, the aggressively pro-business governments of Margaret Thatcher and Ronald Reagan strengthened the power of employers, and used welfare cuts and moralistic rhetoric to create a much harsher environment for people without jobs. These policies were motivated by a desire for social control. After the political turbulence of the 60s and 70s, Conservatives freaked out at the prospect of everyone becoming hippies and abandoning work. They thought: 'What will become of the social order?' There is a fear of freedom—a fear among the powerful that people might find something better to do than create profits for capitalism.

The ruling class has figured out that a happy and productive population with free time on their hands is a mortal danger. And the widespread feeling that work is a moral value in itself, and that anyone not willing to submit themselves to some kind of intense work discipline for most of their waking hours deserves nothing, is extraordinarily convenient for them.

You can't have all these people working less!

They'd be less tired, less anxious, happier, more content. They'd vote more, they'd think more, they'd demonstrate more, they'd write their politicians, they'd party more and write more poetry. Why, they may even wake up and see the mess the one percent and their politicians have created!

We can't have any of that! As a matter of fact we want them working

more, not less, so they can think only to the next bill they have to pay. What's the matter with you?

Culture is not your friend. The glorification of work is a cultural construct perpetuated by a sociopathic and narcissistic elite. Everyone in charge says work is ennobling and necessary. They just think you should do it. Or die.

“Labor is prior to and independent of capital. Capital is only the fruit of labor, and could never have existed if labor had not first existed. Labor is the superior of capital, and deserves much the higher consideration.”

Don't think of it as human labor per se. As beings that form a society—free beings in a free society—we do business by trading favors. We universalized the representation of owed favors in the form of currency. I do you a favor—in many cases this is in the form of labor, production, or service—and you either return the favor or give me money, which I can trade to any other member of my society in return for favors.

Right now it works thus. I go work a shift at the Pepsi plant, I do Pepsi a favor, they give me money. I give my money to Pizza Hut, Pizza Hut does me a favor. Pizza Hut gives some of my money to Pepsi to buy soda to sell, some to companies that make pizza ingredients, et cetera—just a big circle of favors.

Now even when all labor is performed by robots, humans will still need favors from one another, and we could hang on to currency if we wish to maintain the universalization of favor relations, meaning the system wherein if I do a favor for any random person and receive currency in exchange to represent the performance of the favor then I can in turn exchange said currency for a favor offered by anyone else.

This is how we are one big society: we have one currency that in sum represents an index of all the favors we owe each other. Once all labor is replaced by robots, we'll still need favors from one another. So it comes down to who will own the favors owed to the robots? The owner of the robots? And who will own all the robots? We might have the robot king to whom everyone owes favors if they want food and clothes and whatever else is made by robots. And of course there will be few favors that the masses could perform for this one guy that could not be performed by robots.

So you'll either have a universal basic income with nationalized robots or some weird system where robot god men are sort of emperors of humanity, or some distributed and scattered tribal system.

Not only would work be eliminated or vastly reduced by technology, Keynes predicted, but we would also be unburdened spiritually. Devotion to

work was, he deemed, one of many “pseudo-moral principles” that “exalted some of the most distasteful of human qualities into the position of the highest virtues.”

We should do away with the absolutely specious notion that everybody has to earn a living. It is a fact today that one in ten-thousand of us can make a technological breakthrough capable of supporting all the rest. The youth of today are absolutely right in recognizing this nonsense of earning a living. We keep inventing jobs because of this false idea that everybody has to be employed at some kind of drudgery because, according to Malthusian Darwinian theory he must justify his right to exist. So we have inspectors of inspectors and people making instruments for inspectors to inspect inspectors. But why should I inflict more pain upon the world by inventing more tech gadgets, making up more economic theories, and uncovering more knowledge about how the brain can be manipulated through brain research? The true business of people should be to go back to school and think about whatever it was they were thinking about before somebody came along and told them they had to earn a living.

Detach or Die

There is a seemingly endless conflation of work, good, with being a wage slave, not so good. Progressives would do well to focus on justice and that does not include making victims work for restitution. One would think Progressives would wish to end wage slavery, not perpetuate it.

Some people might argue: ‘Humans are social animals. Work provides a community. If you are extroverted and need to be around people during the day, it’s hard to create enough opportunities for interaction on your own.’

I solve that problem with volunteer labor at a local laundry. I do it *only* when my favorite worker is there because I like her, she has a family to support, she is overworked, she is in constant pain from fibromyalgia, has carpal tunnel syndrome and because of the interesting people I get to see there.

How can I afford to do meaningful work for free? Because I’m retired and have a guaranteed income from Social Security and a small pension.

And let’s be honest. A guaranteed job as opposed to a guaranteed income is meant to boost wages by withholding labor from the private sector. But who needs wages with an adequate guaranteed income?

The good have always suffered for the bad. for me, however, this just shows the values of our society are so warped that any concept of societal good is shamed lest someone game the system. Dare we conceive of anything that might help the rest or encourage those who are willing to partake of a better, humane society. I would never expect Republicans to conceive of higher taxes, but does that mean I should give up on the that idea?

Obviously, we all must accept the idea that we have to continue to suffer lest those losers might get something they don’t deserve. As I get closer to retirement I can’t even imagine why people would want to work at a job that doesn’t fulfill themselves. Sadism seems to be highly valued. I won’t sell out my joy so that “loser” doesn’t get that “extra” he/she doesn’t deserve. In my opinion, I ‘lose-lose’ with that kind of mindset.

What a society this is when we have to keep such mean-spirited values.

The goal of humanity never has been to have a job. The real, basic goals of humanity are food, shelter, clothing, health, pleasure, and some measure of freedom. Having a job is not a goal. It wrongly has been assumed to be the only means to obtaining the real goals.

Why do we focus on a means rather than on the real goals, especially when the means may not really be a means to our real goals at all? Does having a job at McDonald’s provide people with the means to their life’s goals? Do most jobs satisfy our life’s goals?

Do you think Bill Gates's goal is to have a job? The British royal family's goal? The Saudi princes' goal? Do you think my goal is to have a job? I want food, clothing, shelter, health, pleasure, and freedom, but I sure don't want a job. I would love for the government to help provide those things.

Why can't more American's have the same benefits as the rich? Answer: Because the rich have convinced the rest of us that such benefits only come with labor "Work sets you free." The rich don't want you to have the same benefits they do. If you did, they wouldn't be rich. You are told that if you don't work, you are a lazy taker—unless you are rich, in which case it's OK to be idle rich, just donate to a charity every now and then. The federal government can provide many of our goals, but the rich have us convinced we should not even expect those goals unless we labor.

Yes, yes, I know, if no one worked, those goals couldn't be accomplished. But that's a diversion. We're not talking about no one working. We're talking about the government paying people enough to accomplish goals for themselves and for others.

Answer me this: How will a Jobs Guarantee accomplish Medicare for All? How will JG accomplish free education for all? How will a minimum wage JG job—that's what is often proposed—allow anyone to accomplish their life's goals?

A JG asks you to settle for poverty or a step above. A JG tells you to forget about climbing the ladder. JG tells you to work 'til you drop. By focusing on JG, we lose focus on what's important and play right into the hands of the rich, who want you to labor and serve them, forever.

Wrong focus; wrong outcome.

As a disabled person myself I would argue it's not jobs that disabled people are necessarily after, it's being able to actively participate in society in a contributing, meaningful and productive way, to be included in something with a purpose, a purpose you believe in. If income is not an issue, most people would still engage in projects. Your son would watch movies all day only because there is no better role to play, we are at a transition stage where disabled people, still considered invalids, are being discovered to be not so invalid.

But I take issue with the notion that disabled people would be happy to do any dead end work. We deserve more and better than that, everyone does.

I'm a deaf person with a talent which tech wants and needs, which just so happens to be ensuring our tech is accessible, inclusive, making it so much better. So disabled people can truly participate in society, to do all the same things tech supposedly does to liberate while making it truly liberating for all.

But we are also socially responsible for finding meaningful and significant work for the talents disabled people actually have, as opposed to getting them to do something stupid because it's something to do and they're disabled and so should be satisfied with whatever they get. We're not vegetables, nobody is. So that goes for non-disabled folks too.

Which brings us to the heart of this UBI/JG discussion, either you're coming to this from a perspective of people should have jobs, any job, because they're basically vegetables or some kind of autonomous machination which goes through motions and capitalism doesn't work without those machinations so there's some kind of moral imperative to labour or wage slavery, and the measure or class of a person is whether they are jobbed machinations/slaves, or UBI/JG is secondary to the question of are people as a whole happy and doing what they'd rather be doing, are they truly participating in society, as part of the human project.

That's the reality most corporations are facing at the moment. The meaning and nature of 'work' itself is undergoing change, becoming 'play,' as capitalism shoots itself in the foot and in the drive for profit either necessitates socialism and classlessness, or mass social upheaval and less profits.

Some think it would take a long time, as in many generations, to begin to know who we are, what we would do and be without a Protestant work ethic. It's almost impossible for most to imagine life in some other form just as it's impossible for most to imagine a democratic process, even within just one party. Idle time scares the beejesus out of so many people I know. I've watched people retire and move to these beautiful Ozark mountains for decades... and do nothing but destroy them, over and over again, out of boredom and idle guilt. I can't remember the last time I cut down a live tree for firewood since there are always mountains of forest being laid to waste.

But we must face the fact most work is useless, crap, BS, and/or outright destructive. The MIC, Health Insurance, and Wall Street come to mind immediately. To enforce human work for the sake of it is to perhaps destroy the big blue marble host at an accelerated rate. If we keep making ourselves act like drones our world will continue to look like it's what we are doing and who we are. Just drive down any street America built post-1960 looking for something aesthetically pleasing, somewhat unique, that isn't either mass produced or designed to fall apart in a few decades or less.

Maybe with a jobs guarantee we should just outlaw bulldozers, chainsaws, 18-wheelers, private jets, dwellings and offices with more than four units, and large farm equipment. If we are going to force labor then give every man and woman a shovel or a hoe with their HS diploma—not a gun, not

an office for predatory FIRE purposes. That way we wont destroy ourselves so quickly.

Joni sang: You don't know what you've got 'til it's gone. What about the people who never knew what was there to begin with?

The problem with a JG and that line of argument, is that JG does not propose to engage people more in public life than a Universal Basic Income, as a UBI is by definition, far more inclusive of all kinds of work that people may do for others. You may even do things that nobody in a society approves of, with an Unconditional Income, like trying to prove that the world is flat, not round.

JG has nothing on enabling people to be active citizens. It's a policy to look backwards, or it's so inclusive that it's basically an unconditional income to everyone. You gotta be willing to take a long shot sometimes—increasingly often, looking at the world as it is today and might increasingly be tomorrow—to properly empower people so they can be active citizens.

So let's say I want to foster rescue dogs, grow most of my own food on a small plot of land, and provide educational support to struggling kids. I could apply for a private grant to cover the dog expenses, but that might also involve oversight, reporting metrics, re-certification, et cetera. I could apply for a government grant to support the tutoring costs, which again is likely to have overhead, approval, reporting metrics, et cetera. In both cases there is an increase in resource cost completely unrelated to the main goal of the tasks.

With a UBI system, none of that exists. I simply support myself and the costs of my projects using that completely string-free money which involves no paperwork, no bureaucrats. How is this not clearly the better system?

A basic income might seem like it is a vast expansion of state power, since presumably it's the government that would be creating and distributing the money, but, in fact, it's the exactly the reverse. Huge sections of government—and precisely, the most intrusive and obnoxious ones, since they are most deeply involved in the moral surveillance of ordinary citizens—would be instantly made unnecessary and could be simply closed down. Yes, millions of minor government officials and benefit advisors would be thrown out of their current jobs, but they'd all receive basic income too. Maybe some of them will come up with something genuinely important to do, like installing solar panels or discovering the cure for cancer. But it wouldn't matter if they instead formed jug bands, devoted themselves to restoring antique furniture, spelunking, translating Mayan hieroglyphics, or trying to set the world record for having sex at an advanced age. Let them do what they like! Whatever they end up doing, they will almost certainly be happier than they are now, imposing sanctions on the unemployed for

arriving late at CV-building seminars or checking to see if the homeless are in possession of three forms of ID; and everybody else will be better off for their newfound happiness. Even a modest basic income program could become a stepping-stone toward the most profound transformation of all: to unlatch work from livelihood entirely.

This is also why conditional versions of the same program, or guaranteed jobs programs, are in no sense variations on—let alone “improved versions of”—the same thing. The key to UBI is the unconditional element, which allows for a massive reduction of the role of government intrusion in citizens’ lives. These supposedly “modified” or “improved” versions either will not do this, or will have the opposite effect.

The current financial system functions as a means to tie the work that is done for corporations to basic essentials such as food and housing in an entirely artificial relationship. Despite an abundance of basic essentials, individuals or entire countries can be deprived of them based on the labour or rights they are providing to corporations. A system where banks, governments, and many other valueless institutions also stand between individuals and basic needs and demand payment completes the creation of true wage slavery where no worker can survive outside the system.

The jobs that corporations and governments have chosen to value are almost entirely busywork, pointless jobs that would not exist in another system, jobs including but not limited to everything in sales, finance, management, politics, and more. The end result of corporate work is far too much product; and products and services that are detrimental to society and the environment. Any attempts to stop corporate work are met with the cry that to do so would cause job loss, which is promoted as a great evil as under this system jobs equal basic essentials. Jobs are always touted as being in short supply, valuable, and difficult to obtain, especially the ‘good’ jobs that pay the most money. Jobs are, of course, not remotely scarce, any child can find hundreds of valuable things to do at any time, but these valuable jobs have not had an artificial monetary value associated with them.

There is little difference, in the real world, between sitting on a park bench all day and sitting in a cubicle filling out spreadsheets, because most jobs are already busy-work. So most people are already doing corvee labor in a totalitarian civilization—digging holes and filling them up again. In a typical office building, the only people who are doing real, productive work are the janitors and maintenance engineers.

Once you realize that most—or, at least, many—government-funded and -forced “bullshit jobs” programs aren’t needed—or wouldn’t be needed if we weren’t irrationally wed to the concept of jobs—the ugly side effects and

torment they cause really leave no option but to call for end of any and all of such nonsense. Yes, Virginia, we really do need to get quite a lot of work done, but this doesn't mean brutalizing lower classes into horrific conditions over the concern that we might experience inflation.

How does that even work? How does UBI cause inflation of food and other real products, but bullshit forced employment—which produces nothing, or at best something that shouldn't need to be produced—which is UBI in everything but name magically doesn't? Concern trolling about inflation has got to be one of the best ideological tools the Western plutocracy has in its arsenal today.

One could make the argument UBI wouldn't work with a rent-based economy because, say, if most homes were rented, landlords would just double rents to grab the additional income. At the very least controls would have to be imposed. And really goes to show you that the problem of “inflation,” absent a shortage of actual goods, is simply the result of greed.

It doesn't matter whether the government chooses to implement a UBI or a JG, if they do so without gutting the FIRE sector and its influence, all these items will do is funnel money to the top—just like Bernie's proposed Wuhan Flu crisis responses. That is not necessarily a sufficient argument against implementing it without those other safeguards in place, but it is certainly something to consider, especially when determining the ultimate scope of the radical change necessary.

In a world where one is going to give money to the rich one way or another, it is of course better to do so via the people, so that they too receive some meager benefit. But this benefit will come at the cost of further empowering the few.

Make no mistake, I'm all in favour of providing that “great experience” of being a “member of the society” to all who like it, but not as a mandatory, no opt-out programme; remember, nymphomaniacs would very much like to see if the government helped people by forcing them to have sex regularly, everywhere and with everyone, and they would claim how much it improves the lives of “beneficiaries.” Everyone else would recognize this as sex-slavery; how about we do this for other, more subtle forms of abuse—and I think ‘rape’ would not be too strong of a word here either.

I implore the ‘work is great,’ ‘society is great’ crowd to wake up and finally recognize the true nature of their demands: you're calling for horrific, hellish, nightmare conditions for those who don't share your enthusiasm.

There are arguments put forward in some quarters that reducing hours of employment will lead to an increase in crime, unhealthy practices, or other negative social effects. It was once considered inconceivable that the world could run without slavery for the exact same reasons people are now

putting forward for retaining wages, our modern slavery. I see them as having an equivalent moral standing. How is arguing that people should be forced to work forty hours a week they would not otherwise have to work because they might otherwise drink, smoke, or commit crimes any different from arguing that the entire population should be placed in prison for an equivalent amount of time as a form of preventative detention?

To hammer on the point: there's no reason why 'work and stay in poverty' should be preferred as an outcome over 'don't work and stay in poverty.'

If a person cannot find work attractive enough to be willing to give time to do it, it is perfectly possible it's the case that labor is currently over-supplied; the marginal disutility of working more exceeds the wage. Using basic survival to threaten them into the labor force is just going to make the problem worse, potentially a lot worse because labor supply does not follow the law of supply when wages are low and basic survival is at stake, so them entering the labor force will expand supply even further as other people start needing to work more to achieve survival as their wages drop.

There are other things people can use their time for, like leisure, skill-building, child-rearing, and improvement of their properties. At a certain point it really might be better for people to willingly choose not to participate and focus on those, at least until the price of labor goes up.

Any for profit system is not going to have social or environmental goals as its mandate—even if it says it does—and a wage paying system is a for-profit system. If profit were removed, all decisions would be made for social goals, prison systems would be trying to rehabilitate prisoners or study to find why they were in violation of the law instead of just warehousing as many as possible, medical research would be trying to improve health instead of selling pharmaceuticals, and agriculture would be devoted to producing the most nutritious food in the most environmentally responsible way. Removing profit would also remove a great deal of the reason for competitiveness, secrecy, and spying within organizations, along with a great deal of the redundancy of competing companies providing identical goods and services.

What seems to be missed by so many critics is the fact that under the current system there are numerous socially beneficial tasks which are done with no compensation whatsoever.

If I make a healthy lunch for my kids I get no acknowledgment or reward; if I make trash food for your kids at McDonald's I'm rewarded. If I take care of my sick parents, again no compensation; take care of others' sick parents in a nursing home and I'm rewarded. Grow my own food sustainably without toxic industrial inputs and runoff? No reward. Do it on an industrial scale

with all the environmental damage that goes with it and I get rewarded.

UBI provides a benefit, compensation, for all of these things and more without the policy having to go into every little detail and possible situation. It increases democracy in that it gives more power to individuals to decide how best to utilize their time, effort, resources. A JG on the other hand involves others deciding.

UBI can discourage consumption as well. How much infrastructure, products, resource extraction exists to support those working jobs they have no desire to do—and do so only so they can eat, have a roof, et cetera—jobs that are not socially beneficial but in fact actually harm society and the environment?

UBI alone is of course not the magic solution that will cure all ills, but it is certainly on the path to ensuring a more just and equal world for both humans and non-humans alike. Less work, less GDP, less extraction, and degrowth. It's either that or societal and environmental collapse with immense harms to both humans and non-humans on the way down. It really couldn't be any more clear. While making people work shitty jobs to 'earn' a living has always been spiteful, it's now starting to seem suicidal.

Remember, if they do not recognize that the federal government is monetarily sovereign or do not advocate putting that power to use to benefit the masses, then it does not matter what they call themselves—Democrat, Republican, Democratic Socialist, Green, Progressive, Conservative—they are a threat to you, your family, your neighbors.

The US government cannot run out of money. This is not some fringe belief but precisely how the government functions today. The issue is that the power to create unlimited money out of thin air is *only* used for things like weapons of war and handouts to the wealthy, powerful few. Those in power absolutely embrace the fact that the US federal government cannot run out of dollars, they're just not interested in using it to help *you*. The only path to an equitable future lies in using the power over the dollar to provide for the masses.

The cult of jobs at any cost will continue to cause suffering for countless individuals. Many people should have no traditional job—we don't need them to. At least 50% of all jobs in this country are either unnecessary or only made necessary in order to support all of the unnecessary jobs.

As long as survival and jobs are linked we will be in ecological overshoot, we will encourage exploitation, pollution, production for production's sake, we will continue to enrich and comfort a few at the expense of the many. An ecological concept of efficiency needs to replace the economic one. Perhaps money can still drive such a system but healthier environments would define

the objective of wage labor. In such a framework, most of what we call laziness would be seen as resource efficiency.

If robots are a problem there is something wrong with the system.

Everyone in the 1970s and 1980s believed automation would lead to increased leisure time as robots would be doing so much of the work. Many boring, dull, and repetitive jobs could be done by robots freeing human beings up for better things. As this has started to come true we are starting to realize how the capitalist system turns this into a massive problem.

Capitalism had started to run into difficulties with over-production by the 1920s and extensive advertising became necessary to shift all the stuff the system could produce. Demand for the goods had to be manufactured along with the goods themselves, which no one really needed.

Consumerism had to be actively encouraged in the thrifty population of the time as they were not used to wasting money on things they didn't really need. Today we have to build storage units to house the surplus stuff from the private sector that people can't fit in their houses. As natural resource limits become apparent such a wasteful system looks as though it's approaching the end of the line.

In the 1950s John Kenneth Galbraith wrote *The Affluent Society*, discussing how they were still bound by pre-1920s ideas where increasing productivity and efficiency were seen as essential although they lived in a land of plenty. By the 1950s the only problem was shifting all the stuff the system produced and advertisers faced an uphill struggle. He also noted how a world of private luxury co-existed with a world of public squalor and there were no advertising campaigns for better schools and hospitals.

We still think in terms of those pre-1920s worries today: productivity and efficiency. Larry Summers and the IMF have noted that demand is the problem that even today's ubiquitous advertising can't overcome.

Capitalism is a way of organizing society. The lower class does the manual work, the middle class does the managerial and administrative work and the upper class live a life of luxury and leisure. Since the dawn of human civilization nearly all societies have been organized along these lines.

The UK Aristocracy were there for the transition from feudalism to capitalism and barely noticed the difference as their life of luxury and leisure continued as before. They are still living the same life of luxury and leisure today as nothing has really changed.

Adam Smith observed:

“The Labour and time of the poor is in civilized countries sacrificed to the maintaining of the rich in ease and luxury. The Landlord is maintained in idleness and luxury by the labour of

his tenants. The moneyed man is supported by his extractions from the industrious merchant and the needy who are obliged to support him in ease by a return for the use of his money. But every savage has the full fruits of his own labours; there are no landlords, no usurers and no tax gatherers.”

It was all much easier to see in the early days of capitalism. In the early nineteenth century things were much the same and the great wealth of the British Empire was claimed by those at the top. The men, women, and children at the bottom of society were housed in slums, worked almost every hour they were awake in the factories of the wealthy and still lived a bare subsistence existence. It was only organized labor movements that brought an end to the “natural” order of 5,000 years of human civilization and those at the bottom had a mechanism for getting a larger slice of the pie.

This internal welfare state to look after the lords of the manor was just the norm in the days when capitalism came into being, today we have moved on and expect everyone to do their bit, even the descendants of feudal warlords (a.k.a. the aristocracy).

We need a system that is efficient and doesn't use advertising to shift the massive excess it produces. Natural resources are approaching their limits. We also need a system that can use improvements in technology like robots to benefit all. A system like capitalism, that makes robots a problem, obviously has fundamental flaws.

It's time for something new, a finite earth cannot cope with this wasteful system. It's time for something new as robots prevent capitalism from being a way to organize society. Either over-production becomes so excessive that even advertising can't cope or far too many members of society become surplus to requirements.

It's time for something new, a system without an internal welfare state for the lords of the manor—it's the twenty-first century. It's working at the moment but its end is near. A better future awaits when we can think of a new system.

There can be no UBI because of “reality”? What bullshit.

There is no reality. Society can be organized in a multitude of systems but we are told we must adhere to a system where the benefits must accrue to the few. Every human is entitled to a base level of the resources that society has, a base level of housing, a base level of food, a base level of water, a base level of income and wealth.

“Demanding a no-strings-attached welfare system, the left seeks to cut government out of social provisioning while at the

same time relying on government for regular financial support. This position, which fails to rethink the structure of social participation as a whole, leaves disquieting political questions unanswered: How will we provide adequate human and material resources for our growing elderly populations? How can we meaningfully restructure social production to address climate change? How do we preserve a place for the arts outside of competitive MFA programs and speculative art markets?”

Ah yes, here we go again, the masses are stupid and lazy and need their meritocratic betters to design a system to keep them in their proper place.

If your goal is that the elderly must be monetized and a product of the capitalist system to profit off of, UBI isn't your solution. People are impoverished *now* taking care of the elderly. A UBI solves the 'taking care of the elderly' for all of those people. Climate change is carbon burning, consumerism, over consumption, over population. Switching to a UBI offers the opportunity to shift to community service and leisure activities. If you desire to have the privilege to select and crush artists, you will want a private patronage system, but the UBI is specifically useful for the arts. People will have time not just to participate in the communities at schools and libraries, and care for pets, children, and the elderly, but the UBI is also the patronage for many genres of artists—painting, music, theater, writing.

This idea that people are lazy and stupid still persists amongst the credentialed class. Get out of your own neighborhoods. I can merely go for a walk and see those lazy stupid people acting in their communities for free. The person that scrapes weeds not just in front of their own space but continues down the sidewalk, volunteers at the thrift store, volunteers at the school. There are people sitting home alone with no mechanism to contribute.

The real issue is that it is apparent that a dozen individuals could pool a meager UBI and do shameful things like grow produce on a tiny plot and start a grocery store together (reducing corporate power to extract tax reductions) or a 'library of things' (reducing Amazon's ability to extract tax deductions). Public schools would have assistants in the classroom, and—horror of horrors—there would be those that would step up and run art, computer, shop, crafts, gardening, et cetera. And the public resources would be the basis of a community instead of corporate rule and the bureaucratic hierarchies controlled by the meritocrats.

When I ask people, 'What would you personally do with a basic income?' about 99 percent of people say: 'I have dreams, I have ambitions, I'm going to do something ambitious and useful.' But when you ask them what they

think other people would do with a basic income, they say—oh, they’ll become lifeless zombies, they’ll binge-watch Netflix all day, smoke pot, fuck and shit out babies.

This program does trigger a big change—but not the one most people imagine. The biggest change will be in how people think about work. When you ask people what they actually do at work, and whether they think it is worthwhile, many people readily volunteer that the work they do is pointless and adds nothing to the world. The key to a guaranteed income is that it empowers people to say no. For the first time, they will be able to leave jobs that are degrading, or humiliating, or excruciating. Obviously, some boring things will still have to be done. That means those employers will have to offer either better wages, or better working conditions. In one swoop, the worst jobs, the ones that cause the most depression and anxiety, will have to radically improve, to attract workers.

Economists have long assumed that there would be a free-rider problem with respect to public goods: if people could partake in public goods without paying for them, they would. But then a number of studies conclusively demonstrated that this hypothesis held true only when the subjects were economists.

“What if we predicated social critique on terms that are not defined by the neoliberal ideology that we wish to circumvent?”

To do this, I propose that we give everyone, unconditionally, an income, as expression of their potential—and natural desire—to contribute to society, and all the prerequisite time that goes into that, and for the very contributions themselves. An unconditional labor value derived income, for all. An income that both enables all kinds of work, and pays that labor value in the same stroke.

From there, additional earned income becomes a matter of how much respect you command, how well you utilize monopolies, and how much you hate your job and require compensation for how much you hate it. But the labor value would be accounted for, unconditionally.

In a world where there’s superstars—and superbrands—who command respect and natural monopolies to make a lot of money, and people writing open source for the greater benefit of everyone else predominantly, it makes sense to make a statement such as that, about labor value, and to pay it to everyone. Mothers and fathers in active care of their children too, could agree, I’d imagine.

But making a list of things that you think might be cool for society, and trying to have tangible compensations for only those, seems problematic, if not to say, counterproductive. Rather recognize *all* the time that people spend, to be decent people among fellow people, to educate themselves formally and informally, be it in the process of being an entrepreneur or in a broader sense. A sense of justice that can only be achieved by the state deciding for its people what is purposeful, will fall flat on its face when it comes to practicality, unless we have artificial super-intelligence. Because you will have to literally know better than the people, what they will appreciate to what extent. And you don't know that. Neither do I."

A basic income and the job guarantee are actually natural complements. In terms of the rules that any sovereign state must comply with—the Universal Declaration of Human Rights—you have the right to a standard of living adequate for the health and well-being of self and of family, and the right to free choice of employment. Two different rights. That means work should be an option.

The idea is, you're not on the treadmill, it's the state that's on the treadmill working continually to fulfill your economic and social rights. It's the state that bears duties, you have rights. So if you want to do something and you need structure, knock yourself out, work for the state or some customer or boss. If you want to spend all the time you can with your kid before the mass extinction starves her, that's fine too.

When you ask people: Do you exist for the state, or does the state exist for you? People are quick to say, I don't exist for the state, that's totalitarianism! But people seem to accept that they exist for the economy. They accept that their life depends on acceptable service to the labor market. Just like I don't exist for the state, I don't exist for the economy. The economy exists for me. That is the revolutionary import of the ICESCR and that's why the US strangled Venezuela when Chavez committed the state to it.

Human rights is a complete, consistent, and coherent alternative to neo-liberal market worship. The idea sounds so strange because the neoliberals use an old trick to get people to hold still for exploitation. In the old days, the parasitic class invented god's will to legitimize an accidental accretion of predatory institutions and customs. Everybody nodded and said, 'I see, it's not some greedy assholes, it's god's will.' After a while everybody said, 'Wait a minute.' The parasitic class had to think fast, so they invented the

economy to legitimize an accidental accretion of predatory institutions and customs. So now you submit to that. Suckers!

“There will be a political reckoning revolving around a 3 day work week with a 6 hour day. We have only so much need for direct human labor input to keep the productive levels of civilization providing for the basic needs of food, clothing, shelter plus advanced medicine and education for culture transmission from one generation to the next. As we went from the 6 day work week with a 12–14 hour work day, to the 5 day, 40 hour work week, we will need to face the fact that are able to get everything we need from less work activity. Not no work at all, just less.

Currently, we are enmeshed in the capitalist mode of production which is coming apart at the seams and the purpose of profit making is being obsoleted by MMT and higher industrial and agricultural productivity. We throw away a lot of food in the advanced nations and do not know what to do with so much stuff—so much ends up in auction houses, eBay, and thrift stores.

Our lives can not be taken up with tribute to corporate capitalism with excessive time given over to commuting and waste of time cubicle sitting. At home, if you have one, there is plenty of work to be done, particularly in taking care of one another from becoming alienated husks of a human being riddled with mental and emotional problems and then other diseases from stress and pollution. Imagine, staying home with your kids and helping them grow up rather than ignoring them—because you love them so much, you will throw your life away to keep health insurance, build up a college fund, a 401k and a house as far away from crime and drugs that you can afford. What used to sound like a plan for many Americans has slipped away from all but the top 20% or so of the income strata.

A political reckoning has begun, and one way or another it will be resolved, because the chaos and volatility will be ended, deliberately. All processes eventually end and our current political construct is no different. It will end and will be replaced with something that does work, is stable and stops the pain of not knowing that spinning out of control from the old order and traditions is finally over, replaced with a predictable set of expectations that most of us can live with.

We can't go on living in a unsustainable manner.”

The answer is not perpetual “job retraining.” The assholes who benefit from trade deals simply keep outsourcing and offshoring job after job after job, or automate them, so there are increasingly no more jobs worth doing to be retrained into. It is not acceptable to tell working people that they must permanently keep retraining as jobs are pulled out from under them.

UBI. Period. Why work if robots are doing it? Work for work’s sake is Puritan bullshit. Time to lose that nonsense. The trust fund rich don’t ever have to actually work a day in their lives. If that’s OK for them, then it’s good for everyone and anyone else. If a trustfunder gets to get paid to party and not work a day in their lives, then that’s good for displaced “losers” of globalization too. Or we force the rich to actually work. Labor, make things and do work that hurts their backs, makes their muscles ache. Force trustfunders to be door greeters at Walmart. Force them to bag groceries, stock Ace Hardware shelves.

What’s good for the goose is good for the gander. If it’s fine for the rich to be “paid” to be idle if they so choose, then it must be made available to *all* people to be idle yet still be paid to live.

It’s really weird. Over a century of increases in productivity, and yet people have to keep working ridiculously long hours for society to meet its basic needs.

Where is all that extra productivity going to?

Most people like to complain about their jobs, but I’m trying to complain about this whole workaday world—this blinkered trek down some career path towards a diabolically mundane vision of the earth as a grab-bag of minerals, and life as a frantic search for status and distraction. It’s hard to complain about something that all-encompassing.

But that’s probably because something this overwhelming begins to look “only natural.” And adults like to pretend they’re serious enough to face reality and not drift off into Utopian fantasies. However, the workaday world is also a fantasy: not a fact of nature, but an artifact of indoctrination. And an inability to question—and bitch at—this dumbed-down way of life is collusion.

The lesson here is that just how important material incentives are to people will depend on how the human workplace is structured. And if we structure it in keeping with the false idea that people work only for pay, we’ll create workplaces that make this false idea true. Thus, it’s not true that “you just can’t get good help anymore.” It is true that you just can’t get good help anymore when you only give people work to do that is deadening and soulless. What it takes to “get good help” is jobs that people want to do. And we’ll see that this aspiration for good work is not “pie-in-the-sky” idealism. It is well within our grasp.

Working hard for the sake of hard work is just dumb if it won't get you food or a comfortable way of life. It's tough not to give up with the system stacked against you.

Once, when contemplating the apparently endless growth of administrative responsibilities in academic departments, I came up with one possible vision of hell. Hell is a collection of individuals who are spending the bulk of their time working on a task they don't like and are not especially good at. Say they were hired because they were excellent cabinet-makers, and then discover they are expected to spend a great deal of their time frying fish. Neither does the task really need to be done—at least, there's only a very limited number of fish that need to be fried. Yet somehow, they all become so obsessed with resentment at the thought that some of their co-workers might be spending more time making cabinets, and not doing their fair share of the fish-frying responsibilities, that before long there's endless piles of useless badly cooked fish piling up all over the workshop and it's all that anyone really does.

I think this is actually a pretty accurate description of the moral dynamics of our own economy.

If the Treasury were to fill old bottles with banknotes, bury them at suitable depths in disused coalmines which are then filled up to the surface with town rubbish, and leave it to private enterprise on well-tryed principles of *laissez-faire* to dig the notes up again—the right to do so being obtained, of course, by tendering for leases of the note-bearing territory—there need be no more unemployment and, with the help of the repercussions, the real income of the community, and its capital wealth also, would probably become a good deal greater than it actually is.

It would, indeed, be more sensible to build houses and the like; but if there are political and practical difficulties in the way of this, the above would be better than nothing.

Good data drive out bad theories. But there's a crucial difference between theories about planets, atoms, genes, and diseases and theories about at least some aspects of human nature. Planets don't care what scientists say about their behavior. They move around the sun with complete indifference to how physicists and astronomers theorize about them. Genes are indifferent to our theories about them also. But this is not true of people. Theories about human nature can actually produce changes in how people behave. What this means is that a theory that is false can become true simply by people believing it's true. The result is that, instead of good data driving out bad data and theories, bad data change social practices until the data become good data, and the theories are validated.

So is a theory about human nature a discovery, or is it an invention? I

believe that often, it is more invention than discovery. I think that ideas, like Adam Smith's, about what motivates people to work have shaped the nature of the workplace. I think they have shaped the workplace in directions that are unfortunate. What this means is that instead of walking around thinking that 'well, work just is what it is, and we have to deal with it,' we should be asking whether the way work is is the way it should be. Like fish that don't know they live in water, we live with such ideas about human nature that are so pervasive that we don't even realize there's another way to look at ourselves.

Ideas or theories about human nature have a unique place in the sciences. We don't have to worry that the cosmos will be changed by our theories about the cosmos. The planets really don't care what we think or how we theorize about them. But we do have to worry that human nature will be changed by our theories of human nature. Human beings are unfinished animals. It is human nature to have a nature that is very much the product of the society that surrounds us. That human nature is more created than discovered. We design human nature, by designing the institutions within which people live. So we must ask ourselves just what kind of a human nature we want to help design.

If we want to help design a human nature that seeks and finds challenge, engagement, meaning, and satisfaction from work, we have to start building our way out of a deep hole that almost three centuries of misconceptions about human motivation and human nature have put us in, and help foster workplaces in which challenge, engagement, meaning, and satisfaction are possible.

Businesses which are organized around a principle of dialogue and co-operative control would be another starting point for a critical mind turned outwards upon the world, and not inwards upon itself. One of the advantages of employee-owned businesses is that they are far less reliant on the forms of psychological control that managers of corporations have relied on since the 1920s. There is no need for somewhat ironic HR rhetoric about the 'staff being the number one asset' in firms where that is constitutionally recognized. It is only under conditions of ownership and management which render most people expendable that so much 'soft' rhetorical effort has to be undertaken to reassure them that they are not. Any faintly realistic account of organizations must recognize that there is an optimal amount of dialogue and consultation, between zero at one end (the Frederick Taylor position) and constant deliberation. Arguing for democratic business structures cannot plausibly mean the democratization of every single decision, at every moment in time. But it is not clear that the case for a dictatorship of management still works either, even on its own terms. If the argument for hierarchies is

that they are efficient, that they cut costs, that they get things done, a more nuanced reading of much of the research on unhappiness, stress, depression, and absence in the workplace would suggest that current organizational structures are failing even in this limited aim.

Consultation or dialogue which is purely there to make employees feel valued is useless and repeats the same error yet again. The goal is not to make employees *feel* valued, but to rearrange power relations such that they *are* valued, a state of affairs that will most likely influence how they feel as a side effect. The practice of democratic dialogue is something people may need help learning so it can be imported into the management of businesses and local communities. This is the real power of institutions: that they actively teach particular ways of feeling, and we have not nearly enough institutions which practically teach democracy. It is a telling indicator of our political culture that instead we teach resilience and mindfulness: silent relationships to the self, rather than vocal relationships to each other.

Anything that offers success in our unjust society without trying to change it is not revolutionary—it just helps people cope. In fact, it could also be making things worse. Instead of encouraging radical action, mindfulness says the causes of suffering are disproportionately inside us, not in the political and economic frameworks that shape how we live. And yet mindfulness zealots believe that paying closer attention to the present moment without passing judgment has the revolutionary power to transform the whole world. It's magical thinking on steroids.

To a large degree, the effects of ideology on how people act will depend on how broadly, how pervasively and how saliently it is purveyed in a culture. When it lives in isolated places, its effects will likely be small and correctable. But when it's in the water supply—when it is everywhere—its effects will likely be much more profound. Entire cultures can be differentiated from one another by the extent to which they are guided by the belief that either intelligence is fixed or that it grows. And studies of intellectual development across these different cultures show that kids living in a culture with a 'growth mindset' exhibit more intellectual development than kids living in a culture with a 'fixed mindset.'

There is another mechanism by which ideology can have an influence. This mechanism—the one that I believe has the most profound effects on our working environments and beyond—operates to change institutional structures in a way that is consistent with the ideology. The industrialist believes that workers are only motivated to work by wages and then constructs an assembly line that reduces work to such meaningless bits that there is no reason to work aside from the wages. The politician believes that self-interest motivates all behavior, that people are entitled to keep the

spoils of their labors, and that people deserve what they get and get what they deserve. Said politician helps enact policies that erode or destroy the social safety net. As a result, people start acting exclusively as self-interested individuals.

“If it’s up to me to put a roof over our heads, put food on the table, and make sure there’s money to pay the doctor and the kids’ college tuition bills, then I’d better make sure I take care of myself.”

When social structures are shaped by ideology, ideology can change the world, sometimes in devastating, far-reaching ways.

It is not hard to imagine how, guided by the ideology fostered by Adam Smith and then elaborated and extended by others, people would come to understand virtually all their behavior, including their relations with their work, and their relations and responsibilities to others, in terms of operative incentives. And as a result, the nature of people’s relation to their work and to others would change. In a world like this, we would not have to worry that financial motives would crowd out moral ones as people thought about when to pick up their kids from daycare, or whether to allow nuclear waste dumps in their communities, because the moral ones would already have disappeared.

There is a norm of self-interest in American society. College students assume, incorrectly, that women will have stronger views about abortion issues than men and that students under the age of twenty-one will have stronger views about the legal drinking age than those over twenty-one, because women and minors have a stake in those issues that men and older students do not. The possibility that one’s views could be shaped by conceptions of justice or fairness, rather than self-interest, does not occur to most people. And yet they are. Empathy, and care and concern for the well-being of others, are routine parts of most people’s character. Yet they are in danger of being crowded out by exclusive concern for self-interest—a concern that is encouraged by the incentive-based structure of the workplace.

Even Adam Smith understood that there was more to human nature than self-interest. *The Wealth of Nations* followed another book, *The Theory of Moral Sentiments*, in which he suggested that a certain natural sympathy for one’s fellow human beings provided needed restraints on what people would do if they were left free to “barter, truck, and exchange one thing for another.” Smith’s view, largely forgotten by modernity, was that efficient market transactions were parasitic on aspects of character developed through non-market social relations. Smith was right about the importance of “moral

sentiments” but wrong about how “natural” they are. In a market-dominated society, in which every aspect of what people do is “incentivized,” these “moral sentiments” may disappear so that nothing can rein in self-interest.

According to some, standards of living began to improve in the late eighteenth century because the development of science led to improved productivity and we learned how to work together, through institutions like the rule of law and democracies with checks and balances.

“Key to both were systems of assessing and verifying the truth. The real and long-lasting danger of the Trump presidency is the risk it poses to these pillars of our economy, its attack on the very idea of knowledge and expertise, and its hostility to institutions that help us discover and assess the truth.”

It would take more space than we have available here to deal with this nonsense, based on the claim that development of the capitalist economy is the result of the application of sweet reason and that the individual Donald Trump has suddenly emerged, as if out of nowhere, to threaten the very pillars of a rational society.

Let us merely point to some historical facts: that in settler capitalist economies such as the US and Australia, capitalist property and market relations were established on the basis of a genocidal war against the indigenous population; that the accumulation of wealth, above all in the birthplace of industrial capitalism, England, and then elsewhere, depended on the intensified exploitation of the working population; that the free market and the system of capitalist property established its global dominance through imperialist wars of conquest, leading to two world wars and a cold war filled with proxy wars in the twentieth century. Moreover, the establishment of the political framework for the profit system was accomplished in the United States by two revolutions—the War of Independence of 1776–83 and the even more bloody Civil War of 1861–65.

Reforms in the interests of the mass of the population in the US and other major capitalist countries were not made to establish a social contract, as some maintain, but were the result of vast social struggles, inspired by and taking their lead from the Russian Revolution of October 1917, and only enacted because of the deep-seated and well-founded fears in the ruling classes that it would spark social upheaval around the globe. This was a political fact of life Roosevelt knew well as he implemented his New Deal, even if many have forgotten it.

As for Trump, his rise to the presidency and the establishment of authoritarian forms of rule, together with the promotion of fascistic ideology,

is the expression of a deep-seated disease of the entire social and economic order. Trump is not an “outsider” but a veritable product of the historical development of American capitalism.

The centrepiece of Stiglitz’s analysis of the ills of the capitalist economy is that they arise from the “adoption of the neoliberal fantasy that unfettered markets can deliver prosperity to everyone.” This view, he continues, must now be put to rest in order that “progressive capitalism,” based on a “new social contract between voters and elected officials, between workers and corporations, between rich and poor, and between those with jobs and those who are un- or underemployed,” can be established.

This view, advanced in various forms by a slew of would-be reformers, from neo-Keynesian economists to the so-called “left” of the Democratic party, is that if only there is a return to some form of the “social compact” of the post-war period, then American capitalist society can enjoy a new lease on life.

But the question none of them ever addresses, let alone answers in any meaningful sense, is why did this so-called social compact—itsself more a fantasy than a reality because post-war America was riven with class and social conflicts—collapse?

It is as if suddenly one morning, around the end of the 1970s, political leaders in the US and around the world woke up on the wrong side of the bed and decided that the ideology of the unfettered free market had to be adopted, destroying the very social order that they had so carefully constructed in order to maintain capitalist rule after the turbulent, and at times revolutionary, struggles of the previous period.

There is no trace of science, economic or otherwise, in such a method. It seeks the source of changes in the capitalist economy in the mindset of politicians, such as Reagan or Thatcher in the 1980s, or in the shifts in the theories of economics from Keynesian state regulation to the free market doctrines of Milton Friedman.

A scientific explanation for the ending of the post-war boom must be sought in the internal, material, objective processes of the capitalist economy, which were the source of the adoption of neoliberalism based on the unfettered domination of the market and finance capital.

In an effort to boost his assertion of the possibility of “progressive capitalism,” Stiglitz harks back to the period following World War II when it appeared that the American Dream, after the devastation of the 1930s, was finally being realized.

“As an economist, I am always being asked: Can we afford to provide this middle class life for most, let alone all, Americans?”

Somehow, we did when we were a much poorer society after World War II.”

The implication is that since America today is a much richer country in terms of the production of material wealth than the post-war period, then it must be possible, under capitalism, to provide the rising living standards that characterized the three decades following the war. Such assertions are based on a fundamental flaw. The driving force of the capitalist economy, its inherent dynamic, is not the provision of more material wealth. Capitalism is driven by the accumulation of profit, the source of which is the surplus value extracted from the working class in the process of production. And here the key question is the rate at which this accumulation takes place, measured by the rate of profit.

The historical development of the post-war boom, its demise, and the evolution of the capitalist economy in the period since then must be examined from this standpoint. America was a “poorer” country in the post-war period in the sense that it produced less material wealth both on an absolute and per capita basis than today. But in that period American capitalism enjoyed stable and even rising profit rates.

This upswing, following the disasters of the 1930s, was the result of global processes. It was the outcome of the extension of the more productive methods of American industrial capitalism to the other major economies—Germany and Western Europe, the UK, Japan, and lesser capitalist powers such as Australia and New Zealand—which significantly increased the mass of surplus value extracted from the working class.

From the standpoint of the capital accumulation process, all reforms and concessions to the working class—rising wages and improved social conditions—represent a deduction from the mass of surplus value available to capital for its expansion. But such was the expansion of the available surplus value in the post-war boom that both rising profit rates and rising living standards were possible. As the saying had it: a rising tide lifted all boats.

To the short-sighted bourgeois academy, it appeared that the fundamental contradictions of capitalism, laid bare by Marx, contradictions that had produced two world wars, fascism, and the Great Depression in the space of just three decades, had been overcome. But the expansion of the post-war boom could not continue indefinitely. By the end of the 1960s and the beginning of the 1970s, profit rates began to turn down. The law of the tendency of the rate of profit to fall, characterized by Marx as the most important law of political economy from the historical point of view, had begun to reassert itself. In essence, this meant that the concessions made

to the working class now came into direct conflict with the requirements of capital accumulation, that is, with the motive force of the profit system.

All attempts to resolve this situation within the framework of the post-war social and economic order failed. Efforts to step up the exploitation of the working class within the existing system of industrial production only produced ever more militant struggles. At the same time, the methods of Keynesian economics, based on the stimulation of the economy through government intervention, only resulted in stagflation. That is, a rise in unemployment coupled with accelerating inflation, which the Keynesian doctrine had ruled out.

Faced with this intractable situation, the ruling classes in the US and the other major economies, now espousing the doctrines of neoliberalism, organized a fundamental restructuring of the capitalist economy. It comprised a series of interconnected components including: the destruction of vast areas of post-war industry; the organization of global production to utilize cheaper sources of labour; and the employment of new computer-based technologies and information systems to slash production costs and intensify the exploitation of labour.

These measures were accompanied by the unleashing of finance capital from the constraints that had been imposed on it during the post-war boom. This enabled it to play a central role in the complete reorganization of industry through takeovers, mergers, and acquisitions, often via the so-called junk bond market, as well as creating the conditions for the accumulation of profit via the stock market and other forms of speculation. The upshot was to institutionalize a system in which the wealth created by the labour of the working class was siphoned up to the heights of society, leading to the stagnation and outright decline in real wages and the creation of the greatest level of social inequality seen at any point in history, in the US and around the world.

Sweeping changes were required in the legal framework to facilitate this domination of finance capital. In an article, Stiglitz points to the key role played by the Reagan administration in beginning this process. But he stops there. The measures adopted under Reagan were only the start. They were continued and deepened under the Clinton administration, of which Stiglitz himself was a part as chairman of the president's Council of Economic Advisers from 1995–97. It was the Clinton administration, with Robert Rubin taking the helm as treasury secretary after 26 years at Goldman Sachs, which ended "welfare as we know it" and repealed the Glass-Steagall Act in 1999, removing the last remnants of the restrictions imposed on finance capital in the 1930s.

While the measures enacted over the past three decades have enabled

an increase in profit rates, there has been no return to the conditions of the post-war boom. The US economy is no longer characterized, as it was in that period, by the growth of investment and the expansion of decent-paying jobs, but by the rise and rise of parasitism and speculation. This has been accompanied by new forms of exploitation, ever-present job insecurity, two-tier wage systems and the growth of casual and just-in-time employment conditions, coupled with the worsening conditions for public employees, above all, teachers.

The US economy is no longer driven by the investment in new production facilities but has become increasingly dependent on the injection of trillions of dollars into the financial system to fund speculation, starting with the decision of the then chairman of the US Federal Reserve, Alan Greenspan, to open the spigots for the banks and finance house following the October 1987 stock market crash.

All of these tendencies and processes have reached new levels in the decade since the financial crash of 2008 such that the US economy and financial system cannot tolerate any return to what were once considered “normal” monetary policies lest this produce a new and even more devastating crisis.

The practical question can't be how to put people back to work, but how to detach income from employment.

The industrial revolution lifted millions of people in the Western world out of poverty. And now that it has spread to people and places that missed the first wave of industrialization, it is relieving the poverty of many millions more. Industrialization has been a spectacular human achievement. But as it has relieved material poverty, it has done so at the price of poverty of spirit. Perhaps this was a necessary price to pay at earlier stages of economic development. But that is no longer the case. When it comes to the transformation of the human workplace, there is really no time like the present.

The impending end of work raises the most fundamental questions about what it means to be human. To begin with, what purposes could we choose if the job—economic necessity—didn't consume most of our waking hours and creative energies? What evident yet unknown possibilities would then appear? How would human nature itself change if the ancient, aristocratic privilege of leisure becomes the birthright of human beings as such?

What is missing is the perspective of the Poor. The people for whom a job is simply something they do to pay the rent, not a central part of their identity. It has not escaped notice that most of the people writing these articles, especially those against a UBI, are of the Professional Class—the bourgeoisie. They are professionals who are valued for their skills and paid

accordingly. The Rich and the Professional Classes both fear that a UBI will be a disincentive to work. But I can say clearly that work is a disincentive to work. People who talk about the ‘nobility and dignity’ of a job have never been the monkeys who work the cash register—or at the very least are so far removed that they can craft a nostalgic picture of simpler times, fewer responsibilities, which completely obscures the soul-crushing drudgery of the task.

Andrew Yang’s UBI proposal is \$1,000 a month, adding up to \$12,000 a year. I have survived off this this amount (this is not an endorsement of Yang’s plan nor his candidacy). It isn’t easy and many sacrifices must be made, but if I’m going to do it, I would rather take a UBI check than rent my life away to some petty tyrant for \$10 or even \$15 an hour. This also dovetails into the idea that even many proponents of a UBI have stated: It should not be so high that someone can live comfortably off of it. With these simple words those comfortable Professional Class writers have stated that the Poor do not deserve the comforts of life without selling off so many of their waking hours. This is nothing more than a restatement of Arthur Young’s words from 1771:

“Everyone but an idiot knows that the lower classes must be kept as poor as possible, or they will never be industrious.”

It has taken about three centuries of browbeating, brainwashing, shaming, abuse, and outright theft to get us to accept wage labor. And it has not really taken hold too deeply. When the money was good we were more willing to accept it. However since neoliberalism has become dominant, the “job creators” have kept more money to themselves. The people, especially the Poor and Working Classes, who hold full time jobs and still cannot get by are beginning to say out loud what we subconsciously have always known: No one gets ahead by working. That’s why the Rich make most of their money off of their investments. In those three centuries, we have allowed the Rich to build a Work Society where all our social relations are based around jobs and employment. This serves the Rich and their needs before anyone else, rather than society as a whole. We see it everyday when professions like corporate lawyers and hedge fund managers earn so much more money than farmers or teachers.

But, in service to their insatiable greed for profits, the Rich are destroying the very Work Society they created. Labor is one of the bigger expenses in any business, and where owners try to cut costs whenever possible. While the Professional Classes like to downplay the impact of automation, “unskilled” workers can see its impact with every self-checkout station and Kiva robot.

But there is a bigger factor in the decay of the Work Society. Long-term careers—and the pensions that come with them—are falling by the wayside, being replaced by the ‘gig economy’ and temp work which does not allow for the formation of social bonds like those careers once did. As the Work Society breaks down, some of the Rich realize they must do something to prevent desperate people with a lot of time on their hands from thinking about how society could be run better. So they came up with their stopgap: the UBI, to keep the people pacified. It is a gamble on their part to keep their privilege, and like all gambling it is not guaranteed to go their way.

We can turn this to our advantage. Once jobs and income are divorced, if we no longer need to depend on their paltry wages to survive, if they want their jobs filled, we can demand several things, including they pay well enough to make people actually want to work for them and treat their employees like human beings. I have known people who stated when a UBI is passed so many businesses will close overnight because none of the employees would show up the next day. While I doubt things will be that drastic, it illustrates why they don’t want the UBI to be too high or too comfortable: so that we will continue to be industrious, as everyone but an idiot knows.

Looking beyond those short-term goals, however, we all know there is so much more to life than work. Not wasting the best parts of our lives at a job will also free us to ask questions, the serious deep questions we need to be asking ourselves now. As late capitalism is destroying the planet in our constant need for production and consumption, we can ask: Can we live without consumerism and planned obsolescence? How do we live without the tyranny of the boss? We can begin to think about what exactly we were put on Earth to do with our lives. Lives that are not relegated to evenings and weekends.

Think of all the people we met over the years. There’s that guy who plays guitar in the bars a few evenings a week and on Saturdays. The woman who is a gifted painter. The armchair historian who can answer any question one may have about the Napoleonic Wars. The little old lady (who still works to cover the gap in her Social Security) who is always crocheting cool little things on her break. We’ve all met these people, they’ve been working alongside us for years for the same crap wages we got.

Many years ago I met an artist who managed to eke out a living selling his stone sculptures. It was not luxurious, but he was happy. When the topic of jobs came up he gave me some of the best wisdom I ever received:

“You don’t want to spend your life doing someone else’s work, do you?”

A UBI is not a perfect solution, and there is still much to be worked out. But it is the first stepping stone. So when the UBI comes, I will gladly take advantage of it. And I won't be the only one.

A full Basic Income would eliminate the compulsion to work, by offering a reasonable standard of living to all, and then either leaving it up to each individual to decide whether they wished to pursue further wealth—by doing a paying job, or selling something—or whether they wished to do something else with their time. Alternately, it might open the way to developing better ways of distributing goods entirely. Money is after all a rationing ticket, and in an ideal world, one would presumably wish to do as little rationing as possible. Obviously, all this depends on the assumption that human beings don't have to be compelled to work, or at least, to do something that they feel is useful or beneficial to others. This is a reasonable assumption. Most people would prefer not to spend their days sitting around watching TV and the handful who really are inclined to be total 'parasites' are not going to be a significant burden on society, since the total amount of work required to maintain people in comfort and security is not that formidable. The compulsive workaholics who insist on doing far more than they really have to would more than compensate for the occasional slackers.

Obviously, moral philosophy tends to assume that the free rider problem is a fundamental question of social justice, outweighing considerations of human freedom, and therefore usually concludes that it would be justifiable to set up a system of surveillance and coercion so as to ensure that not even a small number of people live off of others' work—unless they're rich, in which case that's usually somehow totally okay. My own position is: So what if they do if the alternative is those tools of oppression?

Any UBI payment would have to be enough to live on, all by itself, and it would have to be completely unqualified. Everyone has to get it. Even people who don't need it. It's worth it, just to establish the principle that when it comes to what's required to live, everyone deserves that, equally, without qualification. This makes it a human right, not just charity or duct tape for lack of other forms of income. Then if there are further needs on top of that, say someone is disabled, well, then you address that, too. But only after you establish the right of material existence for all people.

The second, more serious objection raised when someone suggests guaranteeing everyone a livelihood regardless of work is that most will work, but many will choose work that's of interest only to themselves. The streets would fill up with bad poets, annoying street mimes, and promoters of crank scientific theories, and nothing would get done. What the phenomenon of bullshit jobs really brings home is the foolishness of such assumptions. No doubt a certain proportion of the population of a free society would spend

their lives on projects most others would consider to be silly or pointless; but it's hard to imagine how it would go much over 10 or 20 percent.

Already right now, 37 to 40 percent of workers in rich countries feel their jobs are pointless. Roughly half the economy—at a minimum—consists of, or exists in support of, bullshit. And it's not even particularly interesting bullshit! If we let everyone decide for themselves how they were best fit to benefit humanity, with no restrictions at all, how could they possibly end up with a distribution of labor more inefficient than the one we already have? This is a powerful argument for human freedom. Most of us like to talk about freedom in the abstract—even claim that it's the most important thing for anyone to fight or die for—but we don't think a lot about what being free or practicing freedom might actually mean. We need to start thinking and arguing about what a genuine free society might actually be like.

Either we detach income from work, or we kill ourselves, figuratively and literally. Either we guarantee everyone an income, regardless of their productivity, or we declare ourselves brain-dead.

Prior to the industrial revolution, it never seems to have occurred to anyone to write a book asking what conditions would create the most overall wealth. Many, however, wrote books about what conditions would create the best people—that is, how should society be best arranged to produce the sort of human beings one would like to have around, as friends, lovers, neighbors, relatives, or fellow citizens? This is the kind of question that concerned Aristotle, Confucius, and Ibn Khaldun, and in the final analysis it's still the only really important one. Human life is a process by which we, as humans, create one another; even the most extreme individualists only become individuals through the care and support of their fellows; and 'the economy' is ultimately just the way we provide ourselves with the necessary material provisions with which to do so. If so, talking about 'values'—which are valuable because they can't be reduced to numbers—is the way that we have traditionally talked about the process of mutual creation and caring.

I guess I've been asking whether love can replace work—whether socially beneficial labor, the love of our neighbors, can replace socially necessary labor as the criterion we use in calculating the distribution of income and the development of character.

The most basic good in a postindustrial society like ours is information, and it is now free. In other words, the labor market can't assign a remunerative value to the socially necessary labor of producing and distributing information. It's socially beneficial—but it's more or less worthless. The work goes on, but the income you might have accrued from it doesn't. Ask a journalist or a freelance writer, or a musician whose band doesn't tour. So

the question is not how to put us all back to work for a minimum wage—fuck that—it’s how to detach income from time spent on the job. But look, we’ve already done that, too. Wall Street bankers don’t do much of anything except peddle bad paper, but they get paid millions of dollars. Teachers, professors, novelists, journalists, carpenters, musicians, and janitors do everything we say we value—they educate, entertain, they build things, and they clean up after us—but they get paid almost nothing.

It’s been almost a century since we started hearing this lament, this warning, about the end of men as a result of the end of work. John Maynard Keynes wrote in 1930 predicting a leisure society. How did he get it so wrong, predicting increased leisure, less labor time, more pleasure. You might ask, what was he thinking? But the great irony is not that that he predicted less socially necessary labor time—he turns out to have been right about that, regardless of what we’ve done with the time left over—but that he wrote in the throes of the Great Depression, when the sheer brutality of economic necessity was reasserting its social and psychological hold on working people. Keynes rightly worried that we’d let that brutality govern our thinking about the future.

“But, chiefly, do not let us overestimate the importance of the economic problem, or sacrifice to its supposed necessities other matters of greater and more permanent significance.”

His more fundamental concern, though, was that we wouldn’t know what to do with the leisure time that came of labor-saving and capital-saving innovations.

“Thus for the first time since his creation man will be faced with his real, his permanent problem—how to use his freedom from pressing economic cares, how to occupy the leisure, which science and compound interest will have won for him, to live wisely and agreeably and well.”

Keynes knew the deviants, miscreants, and malcontents would be the ones to address this problem.

“The strenuous purposeful money-makers may carry all of us along with them into the lap of economic abundance. But it will be those people, who can keep alive, and cultivate into fuller perfection, the art of life itself, and do not sell themselves for the means of life, who will be able to enjoy the abundance when it comes.”

He was a great deal more pessimistic, or less utopian, than his recent interlocutors have suggested.

“Yet there is no country and no people, I think, who can look forward to the age of leisure and of abundance without a dread. For we have been trained too long to strive and not to enjoy.”

We still fear emancipation from the fear regime imposed by thousands of years of scarcity. We still want to go to work.

Inherited Errors

Fantasy Worlds

The fundamental theories on which the modern science of political economy is based are these:

- That under primitive conditions men lived and live by barter.
- That as life becomes more complex barter no longer suffices as a method of exchanging commodities, and by common consent one particular commodity is fixed on which is generally acceptable and which therefore, everyone will take in exchange for the things he produces or the services he renders and which each in turn can equally pass on to others in exchange for whatever he may want.
- That this commodity thus becomes a “medium of exchange and measure of value.”
- That a sale is the exchange of a commodity for this intermediate commodity which is called “money.”
- That many different commodities have at various times and places served as this medium of exchange—cattle, iron, salt, shells, dried cod, tobacco, sugar, nails, et cetera.
- That gradually the metals, gold, silver, copper—especially the first two—came to be regarded as being by their inherent qualities more suitable for this purpose than any other commodities and these metals early became by common consent the only medium of exchange.
- That a certain fixed weight of one of these metals of a known fineness became a standard of value, and to guarantee this weight and quality it became incumbent on governments to issue pieces of metal stamped with their peculiar sign, the forging of which was punishable with severe penalties.

- That Emperors, Kings, Princes, and their advisers vied with each other in the middle ages in swindling the people by debasing their coins, so that those who thought that they were obtaining a certain weight of gold or silver for their produce were, in reality, getting less, and that this situation produced serious evils among which were a depreciation of the value of money and a consequent rise of prices in proportion as the coinage became more and more debased in quality or light in weight.
- That to economize the use of the metals and to prevent their constant transport a machinery called 'credit' has grown up in modern days, by means of which, instead of handing over a certain weight of metal at each transaction, a promise to do so is given, which under favorable circumstances has the same value as the metal itself. Credit is called a substitute for gold.

Some appealed to alchemy to argue that the monetary status of gold and silver had a natural basis: gold (which partook of the sun) and silver (which partook of the moon) were the perfected, eternal forms of metal toward which all baser metals tend to evolve. When we attribute value to gold, then, we simply recognize this. The same argument was usually invoked to solve the old Medieval puzzle about diamonds and water: Why is it that diamonds are so expensive, though useless, and water, which is useful in all sorts of ways, hardly worth anything at all? Remember, this was long before corporations like Nestlé started buying it all up. The usual solution was: diamonds are the eternal form of water. Galileo, who objected to the entire premise, at one point suggested that those who make such claims should really be turned into statues. That way, he suggested, in inimitable Renaissance style, everyone would be happy, since (1) they would be eternal, and (2) the rest of us would no longer have to listen to their stupid arguments.

Interestingly, most European governments employed alchemists in the seventeenth century in order to manufacture gold and silver for coins; it's only when these schemes definitively failed that the governments moved to paper currency.

All our modern legislation fixing the price of gold is merely a survival of the late-medieval theory that the disastrous variability of the monetary unit had some mysterious connection with the price of the precious metals, and that, if only that price could be controlled and made invariable, the monetary unit also would remain fixed. It is hard for us to realize the situation of those times. The people often saw the prices of the necessities of life rise with

great rapidity, so that from day to day no one knew what his income might be worth in commodities. At the same time, they saw the precious metals rising, and coins made of a high grade of gold or silver going to a premium, while those that circulated at their former value were reduced in weight by clipping. They saw an evident connection between these phenomena, and very naturally attributed the fall in the value of money to the rise of the value of the metals and the consequent deplorable condition of the coinage. They mistook effect for cause, and we have inherited their error. Many attempts were made to regulate the price of the precious metals, but until the nineteenth century, always unsuccessfully.

The governments of the world have, in fact, conspired together to make a corner in gold and to hold it up at a prohibitive price, to the great profit of the mine owners and the loss of the rest of mankind. The result of this policy is that billions of dollars worth of gold are stored in the vaults of banks and treasuries, from the recesses of which they will never emerge, until a more rational policy is adopted.

Future ages will laugh at their forefathers of the nineteenth, twentieth, and twenty-first centuries, who gravely bought gold to imprison in dungeons in the belief that they were thereby obeying a high economic law and increasing the wealth and prosperity of the world.

“A strange delusion, my masters, for a generation which prides itself on its knowledge of Economy and Finance and one which, let us hope, will not long survive. When once the precious metal has been freed from the shackles of laws which are unworthy of the age in which we live, who knows what uses may not be in store for it to benefit the whole world?”

Just about every economics textbook employed today sets out the problem the same way. Historically, they note, we know that there was a time when there was no money. What must it have been like? Well, let us imagine an economy something like today's, except with no money. That would have been decidedly inconvenient! Surely, people must have invented money for the sake of efficiency. The story of money for economists always begins with a fantasy world of barter. The problem is where to locate this fantasy in time and space: Are we talking about cave men, Pacific Islanders, the American frontier?

One can imagine an old-style farmer bartering with the blacksmith, the tailor, the grocer, and the doctor in his small town. For simple barter to work, however, there must be a double coincidence of wants. Henry has potatoes and wants shoes, Joshua has an extra pair of shoes and wants

potatoes. Bartering can make them both happier. But if Henry has firewood and Joshua does not need any of that, then bartering for Joshua's shoes requires one or both of them to go searching for more people in the hope of making a multilateral exchange. Money provides a way to make multilateral exchange much simpler. Henry sells his firewood to someone else for money and uses the money to buy Joshua's shoes. Again this is just a make-believe land much like the present, except with money somehow plucked away. As a result it makes no sense: Who in their right mind would set up a grocery in such a place? And how would they get supplies?

But let's leave that aside. There is a simple reason why everyone who writes an economics textbook feels they have to tell us the same story. For economists, it is in a very real sense the most important story ever told. It was by telling it, in the significant year of 1776, that Adam Smith, professor of moral philosophy at the University of Glasgow, effectively brought the discipline of economics into being.

Adam Smith was determined to overturn the conventional wisdom of his day. Above all, he objected to the notion that money was a creation of government. In this, Smith was the intellectual heir of the Liberal tradition of philosophers like John Locke, who had argued that government begins in the need to protect private property and operated best when it tried to limit itself to that function. Smith expanded on the argument, insisting that property, money, and markets not only existed before political institutions but were the very foundation of human society. It followed that insofar as government should play any role in monetary affairs, it should limit itself to guaranteeing the soundness of the currency. It was only by making such an argument that he could insist that economics is itself a field of human inquiry with its own principles and laws—that is, as distinct from, say ethics or politics.

If we assume that in prehistoric ages, man lived by barter, what is the development that would naturally have taken place, whereby he grew to his present knowledge of the methods of commerce? The situation is thus explained by Adam Smith:

“But when the division of labor first began to take place, this power of exchanging must frequently have been very much clogged and embarrassed in its operations. One man, we shall suppose, has more of a certain commodity than, he himself has occasion for, while another has less. The former consequently would be glad to dispose of, and the latter to purchase, a part of this superfluity. But if this latter should chance to have nothing that for former stands in need of, no exchange can be made

between them. The butcher has more meat in his shop than he himself can consume, and the brewer and the baker would each of them be willing to purchase a part of it. But they have nothing to offer in exchange, except the different productions of their respective trades, and the butcher is already provided with all the bread and beer which he has immediate occasion for. No change can in this case be made between them. He cannot offer to be their merchant nor they his customers; and they are all of them thus mutually less serviceable to one another.

In order to avoid the inconveniency of such situations, every prudent man in every period of society, after the first establishment of the division of labor, must naturally have endeavored to manage his affairs in such a manner, as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as, he imagined that few people would be likely to refuse in exchange for the produce of their industry.

Many different commodities, it is probable, were successively both thought of and employed for this purpose. In all countries, however, men seem at last to have been determined by irresistible reasons to give the preference, for this employment, to metals above every other commodity.”

Adam Smith’s position depends on the truth of the proposition that, if the baker or the brewer wants meat from the butcher, but has (the latter being sufficiently provided with bread and beer) nothing to offer in exchange, no exchange can be made between them. If this were true, the doctrine of a medium of exchange would, perhaps, be correct. But is it true?

Assuming the baker and the brewer to be honest men, and honesty is no modern virtue, the butcher could take from them an acknowledgment that they had bought from him so much meat, and all we have to assume is that the community would recognize the obligation of the baker and the brewer to redeem these acknowledgments in bread or beer at the relative values current in the village market, whenever they might be presented to them, and we at once have a good and sufficient currency. A sale, according to this theory, is not the exchange of a commodity for some intermediate commodity called the “medium of exchange,” but the exchange of a commodity for a credit.

There is absolutely no reason for assuming the existence of so clumsy a device as a medium of exchange when so simple a system would do all that was required. What we have to prove is not a strange general agreement to accept gold and silver, but a general sense of the sanctity of an obligation.

In other words, the present theory is based on the antiquity of the law of debt.

The idea of a historical sequence from barter to money to credit actually seems to appear first in the lectures of an Italian banker named Bernardo Davanzati; it was developed as an explicit theory by German economic historians: Bruno Hildebrand (1864), who posited a prehistoric stage of barter, an ancient stage of coinage, and then, after some reversion to barter in the Middle Ages, a modern stage of credit economy. It took canonical form in the work of his student, Karl Bücher (1907). The sequence has now become universally accepted common sense, and it reappears in at least tacit form in Marx, and explicitly in Simmel—again, despite the fact that almost all subsequent historical research has proved it wrong.

The crucial thing, though, is that by now, this story has become simple common sense for most people. We teach it to children in schoolbooks and museums. Everybody knows it:

“Once upon a time, there was barter. It was difficult. So people invented money. Then came the development of banking and credit.”

It all forms a perfectly simple, straightforward progression, a process of increasing sophistication and abstraction that has carried humanity, logically and inexorably, from the Stone Age exchange of mastodon tusks to stock markets, hedge funds, and securitized derivatives.

Anthropologists have been complaining about the Myth of Barter for almost a century. Occasionally, economists point out with slight exasperation that there’s a fairly simple reason why they’re still telling the same story despite all the evidence against it: anthropologists have never come up with a better one. This is an understandable objection, but there’s a simple answer to it. The reasons why anthropologists haven’t been able to come up with a simple, compelling story for the origins of money is because there’s no reason to believe there could be one. Money was no more ever ‘invented’ than music or mathematics or jewelry. What we call ‘money’ isn’t a ‘thing’ at all, it’s a way of comparing things mathematically, as proportions: of saying one of X is equivalent to six of Y. As such it is probably as old as human thought. The moment we try to get any more specific, we discover that there are any number of different habits and practices that have converged in the stuff we now call ‘money,’ and this is precisely the reason why economists, historians, and the rest have found it so difficult to come up with a single definition.

Our standard account of monetary history is precisely backwards. We did not begin with barter, discover money, and then eventually develop

credit systems. It happened precisely the other way around. What we now call virtual money came first. Coins came much later, and their use spread only unevenly, never completely replacing credit systems. Barter, in turn, appears to be largely a kind of accidental byproduct of the use of coinage or paper money: historically, it has mainly been what people who are used to cash transactions do when for one reason or another they have no access to currency.

Textbooks did not change their story—even if all the evidence made clear that the story was simply wrong. People still write histories of money that are actually histories of coinage, on the assumption that in the past, these were necessarily the same thing; periods when coinage largely vanished are still described as times when the economy “reverted to barter,” as if the meaning of this phrase is self-evident, even though no one actually knows what it means. As a result we have next-to-no idea how, say, the inhabitant of a Dutch town in 950 actually went about acquiring cheese or spoons or hiring musicians to play at his daughter’s wedding—let alone how any of this was likely to be arranged in Pemba or Samarkand.

Consider Western Arnhem Land in Australia, where the Gunwinggu people are famous for entertaining neighbors in rituals of ceremonial barter called the dzamalag. Here the threat of actual violence seems much more distant. Partly, this is because things are made easier by the existence of a moiety system that embraces the whole region: no one is allowed to marry, or even have sex with, people of their own moiety, no matter where they come from, but anyone from the other is technically a potential match. Therefore, for a man, even in distant communities, half the women are strictly forbidden, half of them fair game. The region is also united by local specialization: each people has its own trade product to be bartered with the others. What follows is from a description of a dzamalag held in the 1940s, as observed by an anthropologist:

“Once again, it begins as strangers, after some initial negotiations, are invited into the hosts’ main camp. The visitors in this particular example were famous for their ‘much-prized serrated spears’—their hosts had access to good European cloth. The trading begins when the visiting party, which consisted of both men and women, enters the camp’s dancing ground of ‘ring place,’ and three of them began to entertain their hosts with music. Two men start singing, a third accompanies them on the didgeridoo. Before long, women from the hosts’ side come and attack the musicians: Men and women rise and begin to dance.

The dzamalag opens when two Gunwinggu women of the opposite moiety to the singing men 'give dzamalag' to the latter. They present each man with a piece of cloth, and hit or touch him, pulling him down on the ground, calling him a dzamalag husband, and joking with him in an erotic vein. Then another woman of the opposite moiety to the pipe player gives him cloth, hits and jokes with him. This sets in motion the dzamalag exchange. Men from the visiting group sit quietly while women of the opposite moiety come over and give them cloth, hit them, and invite them to copulate; they take any liberty they choose with the men, amid amusement and applause, while the singing and dancing continue.

Women try to undo the men's loin coverings or touch their penises, and to drag them from the 'ring place' for coitus. The men go with their dzamalag partners, with a show of reluctance, to copulate in the bushes away from the fires which light up the dancers. They may give the women tobacco or beads. When the women return, they give part of this tobacco to their own husbands, who have encouraged them to go dzamalag. The husbands, in turn, use the tobacco to pay their own female dzamalag partners.

New singers and musicians appear, are again assaulted and dragged off to the bushes; men encourage their wives 'not to be shy,' so as to maintain the Gunwinggu reputation for hospitality; eventually those men also take the initiative with the visitors' wives, offering cloth, hitting them, and leading them off into the bushes. Beads and tobacco circulate. Finally, once participants have all paired off at least once, and the guests are satisfied with the cloth they have acquired, the women stop dancing and stand in two rows and the visitors line up to repay them.

Then visiting men of one moiety dance towards the women of the opposite moiety, in order to 'give them dzamalag.' They hold shovel-nosed spears poised, pretending to spear the women, but instead hit them with the flat of the blade. 'We will not spear you, for we have already speared you with our penises.' They present the spears to the women. Then visiting men of the other moiety go through the same actions with the women of their opposite moiety, giving them spears with serrated points. This terminates the ceremony, which is followed by a large distribution of food."

This is a particularly dramatic case, but dramatic cases are revealing. What the Gunwinggu hosts appear to have been able to do here, owing to the relatively amicable relations between neighboring peoples in Western Arnhem Land, is to take all the elements in Nambikwara barter—the music and dancing, the potential hostility, the sexual intrigue—and turn it all into a kind of festive game. One not, perhaps, without its dangers, but—as the ethnographer emphasizes—considered enormous fun by everyone concerned.

What all such cases of trade through barter have in common is that they are meetings with strangers who will, likely as not, never meet again, and with whom one certainly will not enter into any ongoing relations. This is why a direct one-on-one exchange is appropriate: each side makes their trade and walks away. It's all made possible by laying down an initial mantle of sociability, in the form of shared pleasures, music and dance—the usual base of conviviality on which trade must always be built. Then comes the actual trading, where both sides make a great display of the latent hostility that necessarily exists in any exchange of material goods between strangers—where neither party has no particular reason not to take advantage of the other—by playful mock aggression, though in the Nambikwara case, where the mantle of sociability is extremely thin, mock aggression is in constant danger of slipping over into the real thing. The Gunwinggu, with their more relaxed attitude toward sexuality, have quite ingeniously managed to make the shared pleasures and aggression into exactly the same thing.

Remember the language of the economics textbooks?

“Imagine a society without money. Imagine a barter economy.”

One thing these examples make abundantly clear is just how limited the imaginative powers of most economists turn out to be.

The Myth of Barter cannot go away, because it is central to the entire discourse of economics. Recall here what Smith was trying to do when he wrote *The Wealth of Nations*. Above all, the book was an attempt to establish the newfound discipline of economics as a science. This meant that not only did economics have its own peculiar domain of study—what we now call ‘the economy,’ though the idea that there even was something called an ‘economy’ was very new in Smith’s day—but that this economy operated according to laws of much the same sort as Sir Isaac Newton had so recently identified as governing the physical world. Newton had represented God as a cosmic watchmaker who had created the physical machinery of the universe in such a way that it would operate for the ultimate benefit of humans, and then let it run on its own. Smith was trying to make a similar, Newtonian

argument. God—or Divine Providence, as he put it—had arranged matters in such a way that our pursuit of self-interest would nonetheless, given an unfettered market, be guided “as if by an invisible hand” to promote the general welfare. Smith’s famous invisible hand was, as he says in *Theory of Moral Sentiments*, the agent of Divine Providence. It was literally the hand of God.

It’s money that has made it possible for us to imagine ourselves in the way economists encourage us to do: as a collection of individuals and nations whose main business is swapping things. It’s also clear that the mere existence of money, in itself, is not enough to allow us see the world this way. If it were, the discipline of economics would have been created in ancient Sumer, or anyway, far earlier than 1776 when Adam Smith’s *The Wealth of Nations* appeared. The missing element is in fact exactly the thing Smith was attempting to downplay: the role of government policy. In England, in Smith’s day, it became possible to see the market, the world of butchers, ironmongers, and haberdashers, as its own entirely independent sphere of human activity because the British government was actively engaged in fostering it. This required laws and police, but also, specific monetary policies, which liberals like Smith were advocating.

For example, he believed that the relative success of the Bank of England and Bank of Scotland had been due to their policy of pegging paper money firmly to precious metals. This became the mainstream economic view, so much so that alternative theories of money as credit were quickly relegated to the margins, their proponents written off as cranks, and the very sort of thinking that led to bad banks and speculative bubbles in the first place.

For there to even be a discipline called ‘economics,’ a discipline that concerns itself first and foremost with how individuals seek the most advantageous arrangement for the exchange of shoes for potatoes, or cloth for spears, it must assume that the exchange of such goods need have nothing to do with war, passion, adventure, mystery, sex, or death. Economics assumes a division between different spheres of human behavior that, among people like the Gunwinggu and the Nambikwara, simply does not exist. These divisions in turn are made possible by very specific institutional arrangements: the existence of lawyers, prisons, and police to ensure that even people who don’t like each other very much, who have no interest in developing any kind of ongoing relationship, but are simply interested in getting their hands on as much of the others’ possessions as possible, will nonetheless refrain from the most obvious expedient (theft). This in turn allows us to assume that life is neatly divided between the marketplace, where we do our shopping, and the “sphere of consumption,” where we concern ourselves with music, feasts, and seduction. In other words, the vision of the world that forms the

basis of the economics textbooks, which Adam Smith played so large a part in promulgating, has by now become so much a part of our common sense that we find it hard to imagine any other possible arrangement.

It should be clear why there are no societies based on barter. Such a society could only be one in which everybody was an inch away from everybody else's throat; but nonetheless hovering there, poised to strike but never actually striking, forever. True, barter does sometimes occur between people who do not consider each other strangers, but they're usually people who might as well be strangers—that is, who feel no sense of mutual responsibility or trust, or the desire to develop ongoing relations.

Before the advent of money, economic life within a community was a web of mutual debts. People did not behave as self-interested individuals—at least not from the perspective of a single transaction; rather, they would share food, clothes, and luxuries, and trust that their peers would repay the favor in return. When we consider these origins of debt and credit—as a system of mutual aid between people who trust each other—it's no surprise that so many cultures viewed charging interest as morally wrong.

A Persian proverb tells of a Shah who wished to reward a subject who had invented chess, and asked what he would like. The man asked only “that the Shah would give him a single grain of corn, which was to be put on the first square of the chess-board, and to be doubled on each successive square,” until all sixty-four squares were filled with grain. At first the compounding of grain remained well within the physical ability of the kingdom to pay, even after twenty squares were passed. But by the time the hypothetical chessboard was filled halfway, the compounding was growing by leaps and bounds. The Shah realized that this he had promised “an amount larger than what the treasures of his whole kingdom could buy.”

We don't know precisely when and how interest-bearing loans originated, since they appear to predate writing. Most likely, Temple administrators invented the idea as a way of financing the caravan trade. This trade was crucial because while the river valley of ancient Mesopotamia was extraordinarily fertile and produced huge surpluses of grain and other foodstuffs, and supported enormous numbers of livestock, which in turn supported a vast wool and leather industry, it was almost completely lacking in anything else. Stone, wood, metal, even the silver used as money, all had to be imported. From quite early times, then, Temple administrators developed the habit of advancing goods to local merchants—some of them private, others themselves Temple functionaries—who would then go off and sell it. Interest was just a way for the Temples to take their share of the resulting profits.

However, once established, the principle seems to have quickly spread.

Before long, we find not only commercial loans, but also consumer loans—usury in the classical sense of the term. By around 2400 BC it already appears to have been common practice on the part of local officials, or wealthy merchants, to advance loans to peasants who were in financial trouble on collateral and begin to appropriate their possessions if they were unable to pay. It usually started with grain, sheep, goats, and furniture, then moved on to fields and houses, or, alternately or ultimately, family members. Servants, if any, went quickly, followed by children, wives, and in some extreme occasions, even the borrower himself. These would be reduced to debt-peons: not quite slaves, but very close to that, forced into perpetual service in the lender's household—or, sometimes, in the Temples or Palaces themselves. In theory, of course, any of them could be redeemed whenever the borrower repaid the money, but for obvious reasons, the more a peasant's resources were stripped away from him, the harder that became.

It's common to think that charging interest on loans is only fair, and also a good way of encouraging people to lend. But in many ways it's economically dysfunctional, and arguably socially unjust: indeed, the two problems are linked. What's more, it's widely assumed that when we borrow from banks or use our credit cards, we're borrowing existing money that others have deposited there. This is far from the truth, for the money the banks lend is created by them, out of nothing—yet of course they still charge us interest on it. The media and most conventional economists are quick to criticize when a state-controlled central bank 'prints more money,' and to raise the alarm about stoking inflation, but they either don't know or don't want to admit that most new money is routinely created by private banks, with little regulation and public accountability.

The pragmatic defense of interest might apply to lending out and borrowing existing money, but, given that most of us borrow from banks that create credit money out of nothing, it has limited relevance. Whatever we think about the justifications, they are beside the point when it comes to explaining what happens here: lenders charge interest because they can, not because they can show that they deserve it or because it's good for the economy as a whole. And of course the lenders usually charge as much as the market will bear. Whatever the justifications, it fits the definition of unearned income.

For most people, it's natural to think of interest in terms of their own savings and debts, and to assume that loans are always loans of someone else's savings. Banks, it's imagined, lend out our savings to others and make money on the difference between the interest they pay on deposits and the interest they charge on loans. In this view, banks are intermediaries, linking hard-working, prudent savers to investors in the economy's future. This

picture is seriously misleading. It is not just that banks lend out much more than they borrow from us, on the assumption that we and other savers will not draw out our savings all at once. This is the widely taught story of ‘fractional reserve banking.’ The important point is that they have the power to create electronic money in the form of interest-bearing credit (or debt, from the point of view of the borrower) simply by typing the figures into the borrower’s account. They create such deposits rather than wait for them to come in. When we borrow from a bank, or from a credit card company, we are not drawing upon existing money that they already have. In fact ‘lending’ money is hardly the right word, inasmuch as that implies that they’ve already got the thing they’re lending!

Conventional economic theory may claim that investment (lending) is determined by saving, but that is nonsense; it is mostly dependent on the creation of credit money. The prime consideration in assessing whether to make a loan is the risk of default and whether the borrower has sufficient collateral. The costs of production of this credit money are negligible, and so, in this case it is clear that the principal as well as the interest are unearned. Rather than the bank doing the borrower a favour by lending other people’s savings to the borrower, the borrower is doing the bank a favour by allowing it to create money—and a source of unearned income in the form of interest. Banks extract money from the productive sector in a manner that can fairly be described as parasitic. Their interest charges are a private tax on borrowers.

The very fact that one group of people’s debts can be treated by another group as assets—as a reliable source of income—should give us pause.

When economists speak of money, they neglect that all money and credit is debt. That is the essence of bookkeeping and accounting. There are always two sides to the balance sheet. And one party’s money or savings is another party’s debt.

Mainstream economic models describe a world that operates on barter, not on credit. The basic characteristic of credit and debt is that it bears interest. Any rate of interest can be thought of as a doubling time. Already in Babylonia circa 1900 BC, scribes were taught to calculate compound interest, and how long it took a sum to double (5 years), quadruple (10 years), or multiply 64 times (30 years). Martin Luther called usury Cacus, the monster that absorbs everything. And in Volume III of *Capital* and also his *Theories of Surplus Value*, Marx collected the classical writings about how debts mount up at interest by purely mathematical laws, without regard for the economy’s ability to pay.

The problem with debt is not only interest. Shylock’s loan against a pound of flesh was a zero-interest loan. When crops fail, farmers cannot even

pay the principal. They then may lose their land, which is their livelihood. Forfeiture is a key part of the credit/debt dynamic. But the motto of mainstream neoliberal economics is: ‘If the eye offends thee, pluck it out.’ Discussing the unpayability of debt is offensive to creditors.

Anyone who sets out to calculate the ability pay quickly recognizes that the overall volume of debts cannot be paid. Keynes made that point in the 1920s regarding Germany’s inability to pay reparations.

Needless to say, banks and bondholders do not want to promote any arguments explaining the limits to how much can be paid without pushing economies into depression. It is the direction in which the Eurozone is now going, and the United States also is suffering debt deflation.

Paul Krugman and others say that debt doesn’t matter because “we owe it to ourselves.” But the ‘we’ who owe it are the 99 Percent; the people who are ‘ourselves’ are the One Percent. So the 99 Percent Owe the One Percent. And they owe more and more, thanks to the magic of compound interest.

Krugman has a blind spot when it comes to understanding money. In his famous debate with Steve Keen, he denied that banks create money or credit. He insists that commercial banks only lend out deposits. But Keen and the Modern Monetary Theory (MMT) school show that loans create deposits, not the other way around. When a banker writes a loan on his computer keyboard, he creates a deposit as the counterpart.

Endogenous money is easily created electronically. That privilege enables banks to charge interest. Governments could just as easily create money on their own computers. Neoliberal privatizers want to block governments from doing this, so that economies will have to rely on commercial banks for the money and credit they need to grow.

The mathematics of compound interest means that economies can only pay their debts by creating a financial bubble—more and more credit to bid up asset prices for real estate, stocks, and bonds, enabling banks to make larger loans. Today’s economies are obliged to develop into Ponzi schemes to keep going—until they collapse in a crash.

The models of the macroeconomy—to forecast the future and to develop policy at institutions like the IMF—often consider finance and banking as just another sector of industry, like construction or manufacturing. How do these institutions consider their model of the financial sector?

The IMF acts as the collection agent for global bondholders. Its projections begin by assuming that all debts can be paid, if economies will cut wages and wipe out pension funds so as to pay banks and bondholders.

As long as creditors remain in control, they are quite willing to sacrifice the 99 Percent to pay the One Percent. When IMF “stabilization” programs end up destabilizing their hapless victims, mainstream media blame the

collapse on the debtor country for not shedding enough blood to impose even more austerity.

Economists often define their discipline as “the allocation of scarce resources among competing ends.” But when resources or money really become scarce, economists call it a crisis and say that it’s a question for politicians, not their own department. Economic models are only marginal—meaning, small changes, not structural.

The only trend that does grow inexorably is that of debt. The more it grows, the more it slows the real economy of production and consumption. So something must give: either the economy, or creditor claims. And that does indeed change the structure of the economy. It is a political as well as an economic change.

When creditor institutions model the financial sector, when they look at prices they only consider wages and consumer prices, not asset prices. Yet most bank credit is tied to asset prices, because loans are made to buy homes or commercial real estate, stocks or bonds, not bread and butter.

Not looking at what is obviously important requires a great effort of tunnel vision. But as Upton Sinclair noted, there are some jobs—like being a central banker, or a New York Times editorial writer—that require the applicant not to understand the topic they are assigned to study. Hence, you have Paul Krugman on money and banking, the IMF on economic stabilization, and Rubinomics politicians on bailing out the banks instead of saving the economy.

If I can add a technical answer: The IMF does not recognize that the “budget problem”—squeezing domestic currency out of the economy by taxing wages and industry—is quite different from the “transfer problem” of converting this money into foreign exchange. That distinction was the essence of the German reparations debate in the 1920s.

Drawing this distinction shows why austerity programs do not help countries pay their foreign debt, but instead tear them apart and induce emigration and capital flight.

Debt is the most fundamental lie in our economy. Money is only supposed to be a tool to move goods efficiently around a market, but for money itself to be a wealth engine is a Ponzi scheme. And we all know how that ends for many participants.

Every economy is a credit economy. Let’s start in Ancient Mesopotamia. Suppose you’re a Babylonian in the time of Hammurabi, circa 1750 BC, and you’re a cultivator. How do you buy things during the year? Well, if you go to the bar, to an ale woman, what she’d do is write down the debt that you owe. It was to be paid on the threshing floor. The debts were basically paid once a year when the income was there, on the threshing floor when

the harvest was in. If the palace or the temples would advance animals or inputs or other public services, this would be as a debt. It was all paid in grain, which was monetized for paying debts to the palace, temples, and other creditors.

The IMF has this Austrian theory that pretends that money began as barter and that capitalism basically operates on barter. This always is a disinformation campaign. Nobody believed this in times past, and it is a very modern theory that basically is used to say: ‘Oh, debt is bad.’ What they really mean is that public debt is bad. The government shouldn’t create money, the government shouldn’t run budget deficits but should leave the economy to rely on the banks. So the banks should run and indebt the economy.

You’re dealing with a public relations mythology that’s used as a means of deception for most people. You can usually ignore just about everything the IMF says. If you understand money you’re not going to be hired by the IMF. The precondition for being hired by the IMF is *not* to understand finance. If you do understand finance, you’re fired and blacklisted. That’s why they impose austerity programs that they call “stabilization programs” that actually are destabilization programs almost wherever they’re imposed.

Money is debt. Being a claim on a debtor, money does not necessarily need a functioning economy. It can be part of a foreclosure process, transferring property to creditors. A financialized economy tends to strip the economy of money, by sucking up to the creditor One Percent on top. That is what happened in Rome, and the result was the Dark Age.

There are two ways not to pay debts: either by annulling or repudiating them, or by foreclosure when creditors take or demand property in lieu of monetary payment.

The first way not to pay is to default or proclaim a Clean Slate. The most successful example in modern times is the German Economic Miracle—the Allied Monetary Reform of 1948. That canceled Germany’s internal debts except for wages owed by employers and minimum working balances.

The United States Government has fought against creation of an international court to adjudicate the ability of national economies to pay debts. If such a court is not created, the global economy will fracture. That is occurring in what looks like a New Cold War pitting the United States and its NATO satellites against the BRICS (China, Russia, South Africa, Brazil, and India) along with Iran and other debtors. The US preferred policy is for countries to sell off whatever is in their public domain when they lack the money to pay their debts. This is the “foreclosure” stage.

Short of these two ways of not paying debts, economies are submitting to debt deflation. That strips income from producers and consumers, businesses

and governments to pay creditors. As the debtor economy weakens, the debt arrears mount up—often at rising interest rates to reflect the risk of non-payment as creditors realize that there is no ‘business as usual’ way in which the debts can be paid.

Debtor countries may postpone the inevitable by borrowing from the IMF or US Treasury to buy out bondholders. This saves the latter from taking a loss—leaving the debtor country with debts that are even harder to annul, because they are to foreign governments and international institutions. That is why it is a very bad policy for countries to move from owing money to private bondholders to owing the IMF or European Central Bank, whose demands are unforgiving.

In the long-term, debts won’t be paid in the way that Rome’s debts were not paid. The money economy itself was stripped, and the empire fell into a prolonged Dark Age. That is the fate that will befall the West if it continues to support the “rights” of creditors over the right of nations and economies to survive.

“From the earliest days of which we have historical records, we are in the presence of a law of debt, and when we shall find, as we surely shall, records of ages still earlier than that of the great king Hammurabi, who compiled his code of the laws of Babylonia in 2000 BC, we shall, I doubt not, still find traces of the same law. The sanctity of an obligation is, indeed, the foundation of all societies not only in all times, but at all stages of civilization; and the idea that to those whom we are accustomed to call savages, credit is unknown and only barter is used, is without foundation. From the merchant of China to the Redskin of America; from the Arab of the desert to the Hottentot of South Africa or the Maori of New Zealand, debts and credits are equally familiar to all, and the breaking of the pledged word, or the refusal to carry put an obligation is held equally disgraceful.”

It is here necessary to explain the primitive and the only true commercial or economic meaning of the word ‘credit.’ It is simply the correlative of debt. What A owes to B is A’s debt to B and B’s credit on A. A is B’s debtor and B is A’s creditor. The words ‘credit’ and ‘debt’ express a legal relationship between two parties, and they express the same legal relationship seen from two opposite sides. A will speak of this relationship as a debt, while B will speak of it as a credit. As I shall have frequent occasion to use these two words, it is necessary that the reader should familiarize himself with this conception which, though simple enough to the banker or financial

expert, is apt to be confusing to the ordinary reader, owing to the many derivative meanings which are with the word 'credit.' Whether, therefore, in the following pages, the word 'credit' or 'debt' is used, the thing spoken of is precisely the same in both cases, the one or the other word being used according as the situation is being looked at from the point of view of the creditor or of the debtor.

A first class credit is the most valuable kind of property. Having no corporeal existence, it has no weight and takes no room. It can easily be transferred, often without any formality whatever. It is movable at will from place to place by a simple order with nothing but the cost of a letter or a telegram. It can be immediately used to supply any material want, and it can be guarded against destruction and theft at little expense. It is the most easily handled of all forms of property and is one of the most permanent. It lives with the debtor and shares his fortunes, and when he dies, it passes to the heirs of his estate. As long as the estate exists, the obligation continues, and under favorable circumstances and in a healthy state of commerce there seems to be no reason why it should ever suffer deterioration.

Credit is the purchasing power so often mentioned in economic works as being one of the principal attributes of money, and, as I shall try to show, credit and credit alone is money. Credit and not gold or silver is the one property which all men seek, the acquisition of which is the aim and object of all commerce.

The word 'credit' is generally technically defined as being the right to demand and sue for payment of a debt, and this no doubt is the legal aspect of a credit today; while we are so accustomed to paying a multitude of small purchases in coin that we have come to adopt the idea, fostered by the laws of legal tender, that the right to payment of a debt means the right to payment in coin or its equivalent. And further, owing to our modern systems of coinage, we have been led to the notion that payment in coin means payment in a certain weight of gold.

Before we can understand the principles of commerce we must wholly divest our minds of this false idea. The root meaning of the verb 'to pay' is: that of "to appease," "to pacify," "to satisfy," and while a debtor must be in a position to satisfy his creditor, the really important characteristic of a credit is not the right which it gives to payment of a debt, but the right that it confers on the holder to liberate himself from debt by its means—a right recognized by all societies. By buying we become debtors and by selling we become creditors, and being all both buyers and sellers we are all debtors and creditors. As debtor we can compel our creditor to cancel our obligation to him by handing to him his own acknowledgment of a debt to an equivalent amount which he, in his turn, has incurred. For example,

A having bought goods from B to the value of \$100, is B's debtor for that amount. A can rid himself of his obligation to B by selling to C goods of an equivalent value and taking from him in payment an acknowledgment of debt which he (C, that is to say) has received from B. By presenting this acknowledgment to B, A can compel him to cancel the debt due to him. A has used the credit which he has procured to release himself from his debt. It is his privilege.

This is the primitive law of commerce. The constant creation of credits and debts, and their extinction by being canceled against one another, forms the whole mechanism of commerce and it is so simple that there is no one who cannot understand it.

But what are the facts? Let us take the situation here in the United States. The government accepts all the gold of standard fineness and gives in exchange gold coins weight for weight, or paper certificates representing such coins. Now the general impression is that the only effect of transforming the gold into coins is to cut it into pieces of a certain weight and to stamp these pieces with the government mark guaranteeing their weight and fineness. But is this really all that has been done? By no means. What has really happened is that the government has put upon the pieces of gold a stamp which conveys the promise that they will be received by the government in payment of taxes or other debts due to it. By issuing a coin, the government has incurred a liability towards its possessor just as it would have done had it made a purchase; has incurred, that is to say, an obligation to provide a credit by taxation, or otherwise for the redemption of the coin and thus enable its possessor to get value for his money.

In virtue of the stamp it bears, the gold has changed its character from that of a mere commodity to that of a token of indebtedness. In England, the Bank of England buys the gold and gives in exchange coin, or bank-notes, or a credit on its books. In the United States, the gold is deposited with the Mint and the depositor receives either coin or paper certificates in exchange. The seller and the depositor alike receive a credit, the one on the official bank and the other direct on the government treasury. The effect is precisely the same in both cases. The coin, the paper certificates, the bank-notes and the credit on the books of the bank, are all identical in their nature, whatever the difference of form or of intrinsic value. A priceless gem or a worthless bit of paper may equally be a token of debt, so long as the receiver knows what it stands for and the giver acknowledges his obligation to take it back in payment of a debt due.

Money, then, is credit and nothing but credit. A's money is B's debt to him, and when B pays his debt, A's money disappears. This is the whole theory of money.

Debts and credits are perpetually trying to get into touch with one another, so that they may be written off against each other, and it is the business of the banker to bring them together. This is done in two ways: either by discounting bills, or by making loans. The first is the more old fashioned method and in Europe the bulk of the banking business consists in discounts while in the United States the more usual procedure is by way of loans.

The process of discounting bills is as follows: A sells goods to B, C, and D, who thereby become A's debtors and give him their acknowledgments of indebtedness, which are technically called bills of exchange, or more shortly bills. That is to say A acquires a credit on B, C, and D. A buys goods from E, F, and G and gives his bill to each in payment. That is to say E, F, and G have acquired credits on A. If B, C, and D could sell goods to E, F, and G and take in payment the bills given by A, they could then present these bills to A and by so doing release themselves from their debt. So long as trade takes place in a small circle, say in one village or in a small group of nearby villages, B, C, and D might be able to get hold of the bills in the possession of E, F, and G. But as soon as commerce widened out, and the various debtors and creditors lived far apart and were unacquainted with one another, it is obvious that without some system of centralizing debts and credits commerce would not go on.

Then arose the merchant or banker, the latter being merely a more specialized variety of the former. The banker buys from A the bills held by him on B, C, and D, and A now becomes the creditor of the banker, the latter in his turn becoming the creditor of B, C, and D. A's credit on the banker is called his deposit and he is called a depositor. E, F, and G also sell to the banker the bills which they hold on A, and when they become due the banker debits A with the amount thus canceling his former credit. A's debts and credits have been "cleared," and his name drops out, leaving B, C, and D as debtors to the bank and E, F, and G as the corresponding creditors. Meanwhile B, C, and D have been doing business and in payment of sales which they have made, they receive bills on H, I, and K. When their original bills held by the banker become due, they sell to him the bills which H, I, and K have given them, and which balance their debt. Thus their debts and credits are "cleared" in their turn, and their names drop out, leaving H, I, and K as debtors and E, F, and G as creditors of the bank and so on. The modern bill is the lineal descendant of the medieval tally, and the more ancient Babylonian clay tablet.

Now let us see how the same result is reached by means of a loan instead of by taking the purchaser's bill and selling it to the banker. In this case the banking operation, instead of following the sale and purchase, anticipates it.

B, C, and D, before buying the goods they require, make an agreement with the banker by which he undertakes to become the debtor of A in their place, while they at the same time agree to become the debtors of the banker. Having made this agreement B, C, and D make their purchases from A and instead of giving him their bills which he sells to the banker, they give him a bill direct on the banker. These bills of exchange on a banker are called cheques or drafts.

It is evident that the situation thus created is precisely the same whichever procedure is adopted, and the debts and credits are cleared in the same manner. There is a slight difference in the details of the mechanism, that is all. There is thus a constant circulation of debts and credits through the medium of the banker who brings them together and clears them as the debts fall due. This is the whole science of banking as it was three-thousand years before Christ, and as it is today. It is a common error among economic writers to suppose that a bank was originally a place of safe deposit for gold and silver, which the owner could take out as he required it. The idea is wholly erroneous and can be shown to be so from the study of the ancient banks.

Whatever commercial or financial transaction we examine, whether it be the purchase of a pennyworth of vegetables in the market or the issue of a billion dollar loan by a government, we find in each and all of them the same principle involved; either an old credit is transferred or new ones are created, and a State or a banker or a peasant is prosperous or bankrupt according as the principle is observed or not, that debts, as they fall due, must be met by credits available, at the same moment.

The object of every good banker is to see that at the end of each day's operations, his debts to other bankers do not exceed his credits on those bankers, and in addition, the amount of the "lawful money" or credits on the government in his possession. This requirement limits the amount of money he has to lend. He knows by experience pretty accurately the amount of the cheques he will have to present for payment to other bankers and the amount of those which will be presented for his payment, and he will refuse to buy bills or to lend money—that is to say, he will refuse to incur present obligations in return for future payments—if by so doing he is going to risk having more debts due by him on a certain day than he will have credits on that day to set against them. It must be remembered that a credit due for payment at a future time cannot be set off against a debt due to another banker immediately. Debts and credits to be set off against each other must be due at the same time

The value of a credit depends not on the existence of any gold or silver or other property behind it, but solely on the solvency of the debtor, and that

depends solely on whether, when the debt becomes due, he in his turn has sufficient credits on others to set off against his debts. If the debtor neither possesses nor can acquire credits which can be offset against his debts, then the possession of those debts is of no value to the creditors who own them. It is by selling, I repeat, and by selling alone—whether it be by the sale of property or the sale of the use of our talents or of our land—that we acquire the credits by which we liberate ourselves from debt, and it is by his selling power that a prudent banker estimates his client's value as a debtor.

Debts due at a certain moment can only be canceled by being offset against credits which become available at that moment; that is to say that a creditor cannot be compelled to accept in payment of a debt due to him an acknowledgment of indebtedness which he himself has given and which only falls due at a later time. Hence it follows that a man is only solvent if he has immediately available credits at least equal to the amount of his debts immediately due and presented for payment. If, therefore, the sum of his immediate debts exceeds the sum of his immediate credits, the real value of these debts to his creditors will fall to an amount which will make them equal to the amount of his credits. This is one of the most important principles of commerce.

Another important point to remember is that when a seller has delivered the commodity bought and has accepted an acknowledgment of debt from the purchaser, the transaction is complete, the payment of the purchase is final; and the new relationship which arises between the seller and the purchaser, the creditor and the debtor, is distinct from the sale and purchase.

One of the popular fallacies in connection with commerce is that in modern days a money-saving device has been introduced called credit and that, before this device was known, all purchases were paid for in cash—in other words, in coins. A careful investigation shows that the precise reverse is true. In olden days coins played a far smaller part in commerce than they do today. Indeed so small was the quantity of coins, that they did not even suffice for the needs of the Royal household and estates which regularly used tokens of various kinds for the purpose of making small payments. So unimportant indeed was the coinage that sometimes Kings did not hesitate to call it all in for re-minting and re-issue and still commerce went on just the same.

The modern practice of selling coins to the public seems to have been quite unknown in old days. The metal was bought by the Mint and the coins were issued by the King in payment of the expenses of the Government, largely I gather from contemporary documents, for the payment of the King's soldiers. One of the most difficult things to understand is the extraordinary differences in the price which was paid for the precious metal by the French

Mint, even on the same day. The fact that the price often, if not always, bore no relation to the market value of the metal has been remarked on by writers; but there is nothing in any record to show on what it was based. The probable explanation is that the purchase and sale of gold and silver was in the hands of a very few great bankers who were large creditors of the Treasury and the purchase of the metals by the Mint involved a financial transaction by which part payment of the debt was made in the guise of an exorbitant price for the metal.

The method by which governments carry on their finance by means of debts and credits is particularly interesting. Just like any private individual, the government pays by giving acknowledgments of indebtedness—drafts on the Royal Treasury, or on some other branch of the government or on the government bank. This is well seen in medieval England, where the regular method used by the government for paying a creditor was by “raising a tally” on the Customs or on some other revenue-getting department, that is to say by giving to the creditor, as an acknowledgment of indebtedness, a wooden tally. The Exchequer accounts are full of entries such as the following:

“To Thomas de Bello Campo, Earl of Warwick, by divers tallies raised this day, containing 500 marks delivered to the same Earl.”

“To... by one tally raised this day in the name of the Collectors of the small customs in the Port of London containing £40.”

The system was not finally abandoned until the beginning of the nineteenth century.

I have already explained how such acknowledgments acquire a value in the case of private persons. We are all engaged in buying and selling, we manufacture commodities for sale, we cultivate the ground and sell the produce, we sell the labor of our hands or the work of our intelligence or the use of our property, and the only way in which we can be paid for the services we thus render is by receiving back from our purchasers the tallies which we ourselves have given in payment of like services which we have received from others.

But a government produces nothing for sale, and owns little or no property; of what value, then, are these tallies to the creditors of the government? They acquire their value in this way. The government by law obliges certain selected persons to become its debtors. It declares that so-and-so, who imports goods from abroad, shall owe the government so much

on all that he imports, or that so-and-so, who owns land, shall owe to the government so much per acre. This procedure is called levying a tax, and the persons thus forced into the position of debtors to the government must in theory seek out the holders of the tallies or other instrument acknowledging a debt due by the government, and acquire from them the tallies by selling to them some commodity or in doing them some service, in exchange for which they may be induced to part with their tallies. When these are returned to the government treasury, the taxes are paid.

How literally true this is can be seen by examining the accounts of the sheriffs in England in olden days. They were the collectors of inland taxes, and had to bring their revenues to London periodically. The bulk of their collections always consisted of exchequer tallies, and though, of course, there was often a certain quantity of coin, just as often there was none at all, the whole consisting of tallies.

The general belief that the Exchequer was a place where gold or silver was received, stored, and paid out is wholly false. Practically the entire business of the English Exchequer consisted in the issuing and receiving of tallies, in comparing the tallies and the counter-tallies, the stock and the stub, as the two parts of the tally were popularly called, in keeping the accounts of the government debtors and creditors, and in canceling the tallies when returned to the Exchequer. It was, in fact, the great clearing house for government credits and debts.

For many centuries, how many we do not know, the principal instrument of commerce was neither the coin nor the private token, but the tally, a stick of squared hazel-wood, notched in a certain manner to indicate the amount of the purchase or, debt. The name of the debtor and the date of the transaction were written on two opposite sides of the stick, which was then split down the middle in such a way that the notches were cut in half, and the name and date appeared on both pieces of the tally. The split was stopped by a cross-cut about an inch from the base of the stick, so that one of the pieces was shorter than the other. One piece, called the "stock," was issued to the seller or creditor, while the other, called the "stub" or "counter-stock," was kept by the buyer or debtor. Both halves were thus a complete record of the credit and debt and the debtor was protected by his stub from the fraudulent imitation of or tampering with his tally.

Tax assessors used such twigs to calculate amounts owed by local sheriffs. Often, though, rather than wait for the taxes to come due, Henry's exchequer would often sell the tallies at a discount, and they would circulate, as tokens of debt owed to the government, to anyone willing to trade for them.

The reader might have noticed one puzzling aspect of the equation: the tallies can operate as money only as long as Henry never pays his

debt. In fact this is precisely the logic on which the Bank of England—the first successful modern central bank—was originally founded. In 1694, a consortium of English bankers made a loan of £1,200,000 to the king. In return they received a royal monopoly on the issuance of banknotes. What this meant in practice was they had the right to advance IOUs for a portion of the money the king now owed them to any inhabitant of the kingdom willing to borrow from them, or willing to deposit their own money in the bank—in effect, to circulate or ‘monetize’ the newly created royal debt. This was a great deal for the bankers (they got to charge the king 8% annual interest for the original loan and simultaneously charge interest on the same money to the clients who borrowed it), but it only worked as long as the original loan remained outstanding. To this day, this loan has never been paid back. It cannot be. If it ever were, the entire monetary system of Great Britain would cease to exist.

Fuck the Debt

The problem is the prevailing myths about the virtues of austerity and fears about easy money. Polls and focus groups regularly find that the story that the government budget is like a family budget has enormous appeal, but few people have a clear enough understanding of the economy to recognize that this analogy is inappropriate. Everyone understands that using credit cards to balance income and spending each month will lead to trouble. The idea that the government's finances are qualitatively different—that the government does not face the same constraints as a family—strikes most people as bizarre and fanciful. The same attitudes apply to expansionary monetary policy. The notion that the government can print money and thereby create wealth seems crazy. Everyone has heard stories of Weimar Germany, or more recently Zimbabwe, where governments facing economic crises sought to resolve their problems by printing money. It is difficult to distinguish the idea of printing money when demand is weak and printing money when the government can't pay its bills. If these two situations look similar to people, it is understandable that they would prefer to be on the safe side and avoid the risk of hyperinflation. This preference for security probably explains the continuing appeal of the gold standard.

There is no simple route for circumventing the large-scale confusion people have about the basics of macroeconomic policy. The public's conservatism on these issues is deeply held and believed to be common sense. Few people spend their time contemplating the dynamics of the economy or studying the history of instances of successful fiscal and monetary stimulus. Unless the public deepens its economic understanding, it will be difficult to overcome the fear of "easy money." This task is not made any easier by the fact that there is a whole industry devoted to fanning these fears.

What is perhaps most incredible is their notion of 'irresponsible.' Their sole measure of responsibility is the size of the government budget deficit and debt, which are for all practical purposes meaningless numbers. If the government puts in place patent protection that requires us to pay an extra \$400 billion a year for prescription drugs, this adds zero to the budget deficit or debt and therefore doesn't concern them. However if it "borrowed" an extra \$400 billion a year to pay for developing new drugs, they would be furious.

The key to understanding the economy for average people is to look at debt. The economy has to spend more and more money on debt service. The reason the economy is not recovering isn't simply because this is a normal cycle. And it's not because labour is paid too much. It's because

people are diverting more and more of their income to paying their debts, so they can't afford to buy goods. Markets are shrinking—and if markets are shrinking, then real estate rents are shrinking, profits are shrinking. Instead of using their earnings to reinvest and hire more labour to increase production, companies are using their earnings for stock buybacks and dividend payouts to raise the share price so that the managers can take their revenue in the form of bonuses and stocks and live in the short-run. They're leaving their companies as bankrupt shells, which is pretty much what hedge funds do when they take over companies.

So the financialization of companies is the reverse of everything Adam Smith, John Stuart Mill, and everyone you think of as a classical economist was saying. Banks wrap themselves in a cloak of classical economics by dropping the history of economic thought from the curriculum, which is pretty much what's happened. And in Canada, my experience there was that the banks have a huge lobbying power over government. In 1979 the provinces of Canada were borrowing money from Switzerland and Germany because they could borrow it at much lower interest rates. I said that this was going to be a disaster, and one that was completely unnecessary. If Canadian provinces borrow in Francs or any other foreign currency, this money goes into the central bank, which then creates Canadian dollars to spend. Why not have the central bank simply create these dollars without having Swiss francs, without having German marks? It's unnecessary to have an intermediary. But the more thuggish banks, like the Bank of Nova Scotia, said, 'Oh, that way's the road to serfdom.' It's not. Following the banks and the Austrian School of the banks' philosophy, that's the road to serfdom. That's the road to debt serfdom. It should not be taken now. It lets universities and the government be run by neoliberals. They're a travesty of what real economics is all about.

Money always has been a public creation. The paper money in our pocket is a form of government debt. The government created it as a kind of IOU when it paid for goods and services. That is how governments supply economies with money. The holders of such currency in turn are in the position of being creditors to the rest of the economy—and pay with this credit (which is given value by the government accepting as payment for taxes).

The public debt—including the money supply—would not exist if the government did not run up debts century after century, just like other countries. The deficit is what creates the economy's monetary base, which rises each year in proportion to the increase in public debt. Unlike personal debts, public debts are not expected to be repaid. To do so would extinguish the money supply. That is what happened in the late nineteenth century in

the United States, and it imposed a serious deflation.

The role of central banks is to create money electronically to spend into the economy to spur economic growth without entailing interest-bearing debt owed to commercial banks and bondholders. That is why financial elites oppose central bank financing of deficits. Bondholders prefer to keep governments on a taut financial leash, with central banks creating money only to bail out banks, not the economy. Bankers accuse governments of depreciating the currency and creating hyperinflation, yet over the past thirty years banks have financed the largest inflation of real estate, stock, and bond prices in history. This certainly is not a more morally responsible form of inflation than government spending.

Wall Street has mounted a propaganda campaign to convince voters that government budgets should be run like household budgets: in balance or even surplus. The difference is that households cannot create money. Removing the constraint of silver or gold backing for money has enabled banks to create credit without limit, except for government regulation and capital reserve requirements. Disabling public regulatory power has left credit creation to the commercial banks, which inflate asset prices on credit, adding interest charges to the economy's ownership structure. Asset-price inflation became the focus of bank lending—and seemed to justify yet more bank lending in an economy-wide Ponzi scheme.

It is mainly anti-labor austerity advocates who urge balancing the budget, and even to run surpluses to pay down the national debt. The effect must be austerity. A false parallel is drawn with private saving. Of course individuals should get out of debt by saving what they can. But governments are different. Governments create money and spend it into the economy by running budget deficits. The paper currency in your pocket is technically a government debt. It appears on the liabilities side of the public balance sheet.

When President Clinton ran a budget surplus in the late 1990s, doing so sucked revenue out of the US economy. When governments do not run deficits, the economy is obliged to rely on banks—which charge interest for providing credit. Governments can create money on their own computers just as well. They can do this without having to pay bondholders or banks.

If the government were to pay off its debts permanently, there would be no money—except for what banks create. That has never been the case in history, going all the way back to ancient Mesopotamia. All money is a government debt, accepted in payment of taxes

This government money creation does not mean that governments can pay foreign debts. The danger comes when debts are owed in a foreign currency. Governments are unable to tax foreigners. Paying foreign debts

puts downward pressure on exchange rates. This leads to crises, which often end by relinquishing political control to the IMF and foreign banks. They demand “conditionalities” in the form of anti-labor legislation and privatization.

In cases where national economies cannot pay foreign debts out of current balance-of-payments revenue, debts should be written down, not paid off. If they are not written down, you have the kind of austerity that is tearing Greece apart today.

Money is literally an imaginary thing. So where does the money come from? Where does most of the money come from when you get a mortgage? Money should be used for social good, not social harms.

It’s pretty simple, if one can’t eat, one might kill you in order to do so; if your society has convinced most that they must consume products to be happy and successful, don’t be surprised when many become desperate and resort to violence in order to achieve those goals. Problematic cultural structures. Violence is not your nature, though much of your written history paints it as such. Violence is a sign of illness in your societies, of broken beings.

Money is only real when it comes to poor people. But money still isn’t real when it comes to blowing them up, imprisoning them, terrorizing them, no, it only becomes real when talking about things that help them.

We didn’t have the trillions to fight the Iraq war. And we didn’t raise taxes—we did the opposite, we cut taxes. And somehow it happened. I’ll be convinced we don’t have money for UBI when I see a war not fought because we don’t have the money.

When it comes to paying contractors, the sky is the limit; when it comes to financing the basic functions of the state, the coffers are empty.

The Citigroup and AIG bailouts were financed with a stroke of the pen. Social Security, Medicare, and other social spending likewise can be financed by the central bank creating money, just as it has created money to bail out Wall Street. Even worse, FICA wage withholding pays for these programs in advance, lending this forced saving to the US Treasury so that taxes can be slashed further for the highest wealth brackets. The difference between public money creation and bank credit is that the public purpose is to promote the public good, not asset-price inflation. National prosperity requires spending money into the economy—for instance, for new capital infrastructure investment, health care, and retirement pensions. Budget surpluses would oblige such spending to be privately financed—which means much higher prices for their services.

In the beginning, sovereign Men created the Laws of America. Now America was formless and empty.

So the Men said, “Let there be money,” and there was money. The Men saw that this was good, so the Men created as much money as they wished, and named the money “Dollars,” and the Men gave the Dollars whatever value they wished.

And the Men commanded the Dollars: “Go forth and multiply.”

In the years that followed, the Men changed the Laws many times. Dollars were commanded to multiply and the value of the Dollars was commanded to change. Many times.

Today, sovereign Men continue to create new Laws, and the new Laws continue to determine the number of Dollars and the value of Dollars. And whenever more Dollars are needed, Men say, “Let the laws change and let there be more Dollars.” And there are more Dollars.

“If the American people ever allow private banks to control the issue of their currency, first by inflation, then by deflation, the banks will deprive the people of all property until their children wake-up homeless on the continent their fathers conquered. The issuing power should be taken from the banks and restored to the people, to whom it properly belongs.”

—Thomas Jefferson

“I believe that banking institutions are more dangerous to our liberties than standing armies.”

—Thomas Jefferson

“The modern theory of the perpetuation of debt has drenched the earth with blood, and crushed its inhabitants under burdens ever accumulating.”

—Thomas Jefferson

“History records that the money changers have used every form of abuse, intrigue, deceit, and violent means possible to maintain their control over governments by controlling money and its issuance.”

—James Madison

Why Private Banking Is Bad:

- It drives systemic inequality by allowing those with more money than they need to exploit those who need money.
- It drives unsustainable, exponential debt growth because the interest cost rises faster than society can create wealth to pay it.

- It discounts the future, driving environmental destruction—it makes a forest worth more as sawed timber than as an ecosystem preserved for future generations.
- It demands exponential GDP growth, rapidly depleting finite natural resources—3% GDP growth means the economy doubles every 24 years which means extracting resources at twice the rate and throwing twice as much away.
- It drives inflation.

The FDIC is a federally funded program. It may be inadequately funded now. Heck, Social Security is “inadequately funded.” But government programs aren’t funded by tax revenues. Where would tax payers get the dollars with which they pay taxes if government didn’t spend them out into the economy first?

People are getting wise to this. According to its own audit, the Fed produced \$16–\$29 trillion to cure the frauds of the financial sector. The public outcry if we couldn’t cover the FDIC’s bets is really our protection against any excuses that FDIC might manufacture.

We can’t run out of money. We make the stuff.

I would argue the basic flaw is treating money as a store of value, when it is an accounting device, essentially a voucher system. We think of it as some commodity to mine from society and the environment, when it actually functions as a social contract. Basically a promise. As such, it is a medium of exchange, but all that is really saved are promises. So we make lots of promises to each other, but we don’t actually trust each other. The only way it really works is to store value in tangible assets, like healthy communities and environments, but that level of social responsibility seems remote in our current culture.

It’s an error to confuse money, which only the government creates, with value, which is created in the social economy. Monetary policy should be designed to facilitate the exchange of values produced, and encourage the production of new value. Money circulates as oil in the gears of the productive economy. Too much, and it floods the process; too little, and the process seizes up.

“MMT makes it sound as if money exists just because the government wills it to exist.”

No, this is inaccurate, MMT says that the government must *spend* money into existence, not just issue a legal fiat. Collecting taxes in the currency

creates a need for the currency. This is historically accurate and can be seen in British colonial history. They imposed taxes on the colonies in pound sterling, which compelled the colonies to find something to export to Britain in order to generate the foreign exchange to pay the taxes.

The debate is over how to get the currency in people's hands. Should the government just cut checks and let citizens spend as they see fit? Or should the government directly employ resources to improve society where the private sector isn't interested? How about where they are?

Someone is going to do the planning, whether it's the public sector or the private sector, planning must be done. When government does the planning, then it's decided democratically—at least in theory. If the government doesn't do the planning, then the private sector is left to do it on its own. This gets chaotic if the private sector doesn't coordinate, or can get parasitic if the private sector colludes against public interest.

Where do the tax payments go? Nowhere—a bank account is debited, the end.

All of this was recognized by Beardsley Ruml, a New Dealer who chaired the Federal Reserve Bank in the 1940s; he was also the “father” of income tax withholding and wrote two important papers on the role of taxes (“Taxes for Revenue are Obsolete” in 1946, and “Tax Policies for Prosperity” in 1964). Let's first examine his cogent argument that sovereign government does not need taxes for revenue, and turn to his views on the role of taxes.

In his 1964 article, he emphasizes:

“We must recognize that the objective of national fiscal policy is above all to maintain a sound currency and efficient financial institutions; but consistent with the basic purpose, fiscal policy should and can contribute a great deal toward obtaining a high level of productive employment and prosperity.”

He goes on to say that the US government gained the ability to pursue these goals after WWII due to two developments. The first was the creation of “a modern central bank” and the second was the sovereign issue of a currency that “is not convertible into gold or into some other commodity.” With those two conditions, “it follows that our federal government has final freedom from the money market in meeting its financial requirements. National states no longer need taxes to get the wherewithal to meet their expenses.”

Why, then, does the national government need taxes? He counts four reasons:

1. As an instrument of fiscal policy to help stabilize the purchasing power of the dollar.
2. To express public policy in the distribution of wealth and of income as in the case of the progressive income and estate taxes.
3. To express public policy in subsidizing or in penalizing various industries and economic groups.
4. To isolate and assess directly the costs of certain national benefits, such as highways and social security.

Highly progressive taxation gives workers more to spend and gives the rich an incentive to pay their workers better to maintain a stable workplace—since if they took the money themselves, it would just mostly go to taxes—thus stimulating demand for more goods and services.

The second effect of a high top income tax rate is to bring stability to the economy. Taxes can be very destructive if kept too low. There seems to be a relationship between tax cuts and economic bubbles. Whenever top marginal tax rates were relatively high—above 60 percent usually—the economy was at its most stable. Economic bubbles were kept in check since the super-wealthy didn't have enormous amounts of hot money to go speculate in the market and working people's wages grew steadily. As a result, the economy as a whole saw sustained growth. But when those top marginal tax rates dropped, the opposite happened. The very wealthy had a lot of extra money with which to go play in the markets and to place enormous bets on everything—start-up tech companies, oil and food commodities, real estate, et cetera—setting up boom-bust cycles that made some people mindbogglingly rich during the boom, but left most Americans holding an empty bag when the bust happened. This was the lesson we thought we learned after Treasury Secretary Andrew Mellon cut the top rate from 73 percent to 25 percent in the 1920s, setting up a frenzy of market speculation and the eventual Great Crash of 1929.

The worship of the golden calf of old has found a new and heartless image in the cult of money and the dictatorship of financial markets, which are faceless and lacking any humane goal. Money has to serve, not rule.

Money is power, influence, control. The argument for taxes is not to take money, but to put an upper limit on power, influence, control. There is no reason why single individuals should wield such power, influence, and control without democratic checks.

The federal government is monetarily sovereign, it creates out of thin air any money it needs to pay for things, it does not use the dollars you

pay in taxes. It simply tells Bank X to credit Y account \$Z and the bank does, those dollars are not transferred from the federal government's bank account, they simply appear.

The government of California is monetarily non-sovereign, it cannot create every dollar it needs, it does rely upon and use the tax dollars you pay in order to cover any costs. It makes no sense for states to pay for anything that could be considered a public good because such money must come from a limited pool of dollars. The federal government has an unlimited pool of dollars to pay for any necessary public good.

Federal government spending increases the money supply, federal taxes reduce the money supply. Inflation is a result of supply not matching demand, not simply the unfettered creation of dollars, there will be no Zimbabwe or any other scary story those with great power, status, wealth want to tell you so that they may continue to have great power, status, wealth.

Every death from despair is a result of the federal government not using its power to create unlimited dollars in ways that benefit the masses.

Put the transaction sequence on a timeline: Before taxes (income taxes) can accrue, someone has to earn income. In order to earn income, someone else has to spend, which is a necessary condition for income. If spending must precede income which must precede taxation, how can taxation fund spending?

Last year's taxes? National Accounts budgeting defines a deficit as this years spending less this year's taxes.

Taxes are a means to force users to use the currency of issue and to control inflation. Taxes can incentivize or disincentivize behavior.

What is it people give to pay these taxes? Dollars. Who holds the patent on dollar production? The Federal government. Why does the Federal government need to take or borrow dollars if it owns the patent on dollar production? It doesn't.

There is a widespread myth that hyperinflations are caused by excessive government money "printing." Perhaps you are among the vast majority who believe this pernicious myth—Wikipedia does. Well, it simply isn't so, and the belief alone is responsible for great misery, worldwide.

Consider these excerpts from the following article: "Fed analysis warns of 'economic ruin' when governments print money to pay off debt":

"St. Louis Fed economists warn in a paper of potential 'economic ruin' if policies that advocate money-printing to pay off government debts are ever adopted."

Immediately, the article provides us with a misunderstanding. “Money-printing” never is used for paying off US federal debt. The federal debt is the total of net deposits into Treasury security accounts. When you buy a T-bill, T-note, or T-bond (a.k.a. “federal debt”), you open a T-security account, and into that account, you deposit the price of the T-security. There, your dollars remain, collecting interest, until the T-security matures, at which time, your dollars—the dollars you deposited plus the interest in the account—are returned to you.

During that entire round trip—you depositing dollars and those same dollars being returned to you—the only so-called money “printing” has occurred daily over a period of years, as your account accumulates interest. The US federal government could pay off the entire US debt today, if it wished, simply by returning the \$20 trillion or so that currently exist in T-security accounts. No money printing or taxes involved.

“A solution some countries with high levels of unsustainable debt have tried is printing money.

‘In this scenario, the government borrows money by issuing bonds and then orders the central bank to buy those bonds by creating (printing) money,’ wrote Scott A. Wolla and Kaitlyn Frerking.

History has taught us, however, that this type of policy leads to extremely high rates of inflation (hyperinflation) and often ends in economic ruin.”

They cite Zimbabwe in the 2007–09 period, Venezuela currently, and Weimar-era Germany, claiming all three faced massive deficits that led to hyperinflation due to money printing. In fact, all three nations provide examples of the real cause of hyperinflation, and it isn’t money printing.

As an aside, money is not printed; it is created via bookkeeping. Money has no physical existence. A dollar bill actually is a title to a dollar. Just as the paper title to a car is not a car, and the paper title to a house is not a house, the paper dollar bill, is not in itself a dollar. The actual dollar is nothing more than a non-physical accounting notation on the government’s books.

The cause of general price increases, i.e. inflation, is shortages. Usually, these are shortages of food or energy. It is shortages, not money “printing” or full employment or excessive demand (as some people claim), that makes prices go up.

Hyperinflation in Zimbabwe began in February 2007. In the late 1990s, the Robert Mugabe government evicted white landowners and gave their

farms to blacks. Many of these “farmers” had no experience or training in farming. As a result, from 1999 to 2009, the country experienced a sharp drop in food production, creating massive food shortages. The non-farmers were unable to obtain loans for capital development (money shortage). Food output capacity fell 45%, manufacturing output 29% in 2005, 26% in 2006 and 28% in 2007, and unemployment rose to 80%. Everything, especially food, was in shortage, which is what caused the Zimbabwean hyperinflation.

Hyperinflation in Venezuela began in November 2016 during the country’s ongoing socioeconomic and political crisis. Since the 1990s, food production had dropped precipitously, with the government beginning to rely upon imported food using the country’s then-large oil profits. In 2003, the government created a currency control board that placed currency limits on individuals, and that caused widespread shortages of goods. In 2005, the government announced the initiation of Venezuela’s own “great leap forward,” following the example of Mao Zedong’s Great Leap Forward. An increase in shortages began to occur that year as 5% of items became unavailable. In January 2008, 24.7% of goods were reported to be unavailable in Venezuela, with the scarcity of goods remaining high until May 2008, when there was a shortage of 16.3% of goods. Shortages increased again in January 2012 to nearly the same rate as in 2008. In 2013, shortage rates continued to increase and reached a record high of 28% in February 2014. In January 2015, the hashtag *#AnaquelesVaciosEnVenezuela* (or *#EmptyShelvesInVenezuela*) was the number one trending topic on Twitter in Venezuela

General shortages caused the Venezuelan hyperinflation. To a large extent these shortages are a result of US sanctions or the actions of the wealthy few in Venezuela along with multinationals attempting to foment unrest resulting in regime change.

The Weimar Republic experienced hyperinflation between 1921 and 1923, primarily in 1923. In April 1921, the Germany Reparations Commission announced the “London payment plan,” under which Germany would pay reparations in gold or foreign currency in annual installments of two-billion gold marks, plus 26% of the value of Germany’s exports. Since reparations were required to be repaid in hard currency, one strategy that Germany used was the mass printing of banknotes to buy foreign currency, which was then used to pay reparations, greatly exacerbating the inflation of the paper mark. The brief German hyperinflation was caused by shortages of hard currency with which to pay for imports of goods, especially food and food production. The resultant shortages caused the general increase in prices, i.e. the German hyperinflation.

In summary, prices rise not because the people have too much money—Germans, Zimbabweans, and Venezuelans certainly didn’t—but because

needed products, mostly food and/or oil, are in short supply.

MMT supporters argue that a country that runs up debts in its own currency can never default, and as long as inflation remains tame, there really are no problems with government deficit spending. They further say that public spending can be used to stimulate the economy, that essentially a deficit in the public sector can be a surplus in the private sector. In this, MMT is absolutely correct, and mainstream economists agree.

Alan Greenspan:

“A government cannot become insolvent with respect to obligations in its own currency.”

Ben Bernanke:

“The US government has a technology, called a printing press (or, today, its electronic equivalent), that allows it to produce as many US dollars as it wishes at essentially no cost.”

St. Louis Federal Reserve:

“As the sole manufacturer of dollars, whose debt is denominated in dollars, the US government can never become insolvent, i.e., unable to pay its bills. In this sense, the government is not dependent on credit markets to remain operational.”

The article continues:

“The total federal government debt is just over \$23 trillion, or 103.2% of GDP.

The Fed itself has come under criticism for ‘money printing,’ which it did in three rounds of quantitative easing during and after the Great Recession.

This came along with keeping its short-term lending rate anchored near zero for seven years.

However, the central bank’s stated aims were to bring down long-term interest rates and stimulate economic growth, not to finance the national debt.

And that is exactly what happened. Despite all the hand-wringing from the deficit hawks, inflation stayed low, the economy grew, and the national debt was not financed.”

Nothing “finances” the national debt if the word ‘finance’ means pays off. The national debt is not like your debt, my debt, business debt, or

state/local government debt. The national debt is just the net total of deposits into T-security accounts, that are paid off by simply returning the money in those accounts.

Some of the most prominent advocates for MMT are Bernie Sanders and Alexandria Ocasio-Cortez, both of whom identify as democratic socialists. Too bad Sanders and Ocasio-Cortez do not really believe what MMT has told them. They continue to search for ways to “pay for” Medicare for All, when the solution hangs right before their eyes: The federal government can and should pay for Medicare for All via deficit spending. And contrary to what Ocasio-Cortez claims, this does not require more borrowing. Most mainstream economists and Wall Street authorities, however, reject the basis that deficits don’t matter absent inflation. Bond market “guru” Jeffrey Gundlach at DoubleLine Capital has called MMT “a crackpot idea,” while former White House economist and Treasury Secretary Larry Summers has labeled it “dangerous.” Just fuck off and die already, Larry.

Most mainstream economists and “Wall Street authorities” do not understand the truth of Monetary Sovereignty. They still disseminate the Big Lie, that federal financing is similar to personal financing, where debt is a burden on the debtor. Federal debt (deposits) is not a burden on anyone—not on the federal government and not on future taxpayers. It is a benefit to the economy and to taxpayers, and does not cause inflation.

Inflation is caused by shortages. In the 1970s in the United States there was a shortage of oil caused by the Arab oil embargoes. During the 1973 Arab-Israeli war, several Arab nations decided to slap the United States for supporting Israel. They cut oil production for four months. Huge public alarm ensued. Passions boiled over as people waited for hours in gas lines; line-jumpers got into fistfights. To a few at the time, the oil shocks seemed to presage the end of the Oil Age. Today most historians and economists instead view the oil shock as a product of mistaken government policies. Arab petro-states could not target individual nations because national oil companies sell oil and gas to what is, in effect, a single worldwide pool controlled by middlemen. Any embargo thus could only raise prices equally across the planet, rather than striking at a single nation.

Or, rather, the Arabs couldn’t have targeted a single nation if President Richard Nixon had not imposed price caps on US oil and gas two years before as an inflation-fighting measure. The embargo cut global oil output by about a quarter, pushing up petroleum prices worldwide. Middlemen could take advantage of the higher prices only if they sold their oil to nations other than the United States, with its price caps. Doing just that transformed a modest global shortfall into a US-specific oil drought.

Because oil is so intrinsic to so many parts of our economy, that caused

shortages, and the resulting increase in the price of oil led to inflation. Similarly, in Zimbabwe, when President Robert Mugabe took away farmland from farmers and passed it out to his cronies, most of them had no farming expertise. Because they didn't know how to farm, the crops failed, and there was a countrywide food shortage. The shortage of food drove up the price of food, which produced a general inflation, which devastated their economy. In fact, the United States regularly brings money into being from nothing. During the banking crisis of 2008–09, the Federal Reserve created tens of trillions of dollars out of thin air, and distributed it to banks, corporations, and even wealthy individuals worldwide. It produced no inflation.

Not a single one of the 56 cases of hyperinflation documented by a Cato study were caused by a central bank that ran amok. In virtually every case, the inflation was not caused by too much money but too few goods. For example, farming collapsed in Zimbabwe, France annexed the Ruhr depriving Weimar Germany of goods. In addition to depriving Germany of 13 percent of its European territories and population, the treaty split wide open two of Germany's three major industrial areas and gave French and Polish industrialists 19 percent of Germany's coke, 17 percent of its blast furnaces, 60 percent of its zinc foundries, and 75 percent of its iron ore.

Inflation is overwhelmingly driven by cost-push variables. Printing money just doesn't do it. If it did, Japan would have exploded decades ago, because they've been trying quantitative easing for nearly 20 years, and they can't move the needle on inflation. And if that's not convincing, remember that according to its own audit, the Fed pushed \$16–\$29 trillion out the door in 2007–08. Where was the inflation then?

So the concern about inflation remains hypothetical, but certainly a useful boogeyman to trot out when we need to tell the poors why they can't have something.

Inflation happens to prices, not money, and it is caused by markets, not by money. Whether the money is gold or paper, if the total that people are spending is more than the total goods and services available to buy, the result is inflation and it happens because demand is greater than what is available. Whatever the currency, spending more money than production can handle will inflate market-prices. Spending is ultimately restrained only by the idle labor and resources available.

If a government continuously spent money into the system without doing anything else, it would result in inflation because the total economic value in the system is unchanged but with a higher total buying power. One of the cool things about money, however, is that it can convince people to do and make things and it is also able to buy materials and tools that people do and make things with. That means, if idle labor and resources are available,

money can be spent without much inflation so long as spending activates that idle labor and resources to add economic value to the society.

In other words, there is no reason to fear deficit spending if that spending employs people who were jobless or provides capital to workers to employ themselves with to develop its value because, when money and value are added simultaneously, inflation does not result. Public infrastructure projects, universal healthcare, a universal basic income, a workers' self-managed jobs guarantee, and tuition-free public universities—programs like these could be tomorrow's reality.

“I'm sadly ignorant when it comes to economics, so answer me this. I understand that if supply is lower than demand, then sellers will jack up prices and this will lead to inflation. But it also seems reasonable to me that if the Fed starts printing dollars to pay for everything, then the market will be flooded with currency and sellers will see this as an opportunity to jack up the prices, thus also leading to inflation.

What you said would imply I'm wrong, but I don't understand why. Mind enlightening me?”

Economics as taught is nonsense propaganda, consider your ignorance a benefit.

The key here is that the federal government has the ability to create unlimited money as well as destroy it (via taxation). Absent price controls, short-term one could theoretically try to gorge themselves at the trough of newly created money, but any excessive profit and income can easily be taxed out of existence, limiting its harm. But possible instability resulting from this greed grab would of course be harmful, so price controls on essential goods would certainly be a good idea, if not a requirement. Please do learn something from the 70s oil embargo though.

However, we currently operate in an environment where the government does not acknowledge their ability to create unlimited money when it comes to public goods, but does so—though behind a smokescreen—when it comes to military expenditures or bank bailouts. We have also allowed private banks to add huge amounts of money into the economy with no inflationary effect. So the threat of inflation is completely overblown.

The possible negative situation you outline is of course also an argument for removing the profit motive, the greed, from the creation and provision of anything deemed essential to survival or what could be described as a public good. Why stop at single payer? Why not an NHS system like the UK—properly funded of course? Why not electricity generation and

transmission? Why not transportation of both people and freight by air, rail, road, water? Why should we allow our communities, our environment, to be influenced so heavily by an unelected few trying to make themselves a profit? Especially when, in event of problems, like the 2008 crash or the 2020 Wuhan Flu panic, government will be stepping in to bail them out—socializing the losses, privatizing the profits, again and again.

The argument against is often that the federal government is inefficient, the profit motive makes one more efficient, this is of course nonsense since at the federal level the resources that matter are real resources, not money. One should certainly press the government to be efficient in its use of finite, real, environmentally impactful resources, but the only concern one need have about monetary efficiency is if the overall monetary policy is widening or shrinking the gap between the richest and the poorest.

Globalization as we know it is unsustainable, not necessarily from a monetary perspective but an environmental one. So you are correct that the massive amount of importation is problematic. In much the same way as some encourage supporting local businesses to keep money and resources flowing within one's own community, we should strive to limit the importation of any resources or goods and encourage every other country to do the same.

As it currently stands, we print huge sums of money to pay for goods from other countries, so far they have been perfectly content to continue accepting the currency—like all fiat currency its value ultimately relies on the faith of those utilizing it. This faith and value is created domestically by being the currency required to pay one's taxes, thereby incentivizing its use. Internationally we incentivize the 'sending back' of dollars with Treasury bonds—temporary removal from circulation—or through exported goods—currency returns and some can be destroyed via existing corporate or income taxes.

More importantly, I think, is that we are not necessarily talking about a massive influx of new currency but a reorganization of where it's coming from. Take healthcare for instance, in a fully government-run system rather than some private insurer or hospital paying \$X for Y widget it's instead the government paying—less since it is the largest and only market in town for such items and has the ability to legislatively dictate prices if need be. Now, of course, the private hospital is using existing dollars while the government hospital is using newly created ones, but provided you have proper monetary policy elsewhere, then taxation is destroying dollars at the same time, limiting the overall growth of the money supply. And were the government to manufacture the essential materials required itself, then you have even less money entering circulation as more of the supply chain would

exist within the government's control and lack the need for a profit motive or even using dollars at all.

If one aims to simply create whatever money is required to fund necessary public goods and no more, combined with a reduction of income inequality, it should be quite an easy feat to stabilize the monetary system and supply. It is the creation of money to fund things that are not in the public interest, whether real estate speculation, CDOs, other derivatives, fidget spinners, et cetera that is a danger to stability, not the government responsibly providing for its citizens.

We must remember that our real limits are finite real resources on a finite planet. Working towards a degrowth economy—the only way we will achieve climate stability—will over time decrease the overall money supply that exists, held both domestically and abroad.

People are largely uninformed when it comes to economics and their country's monetary system. They are way too prone to accept simple nostrums. They don't understand three basic facts:

1. Except in boom times the private sector doesn't optimize employment and therefore demand because of the risk uncertainty inherent in investment.
2. Unlike a private sector clearing bank, a sovereign government doesn't create a liability when it creates money from thin air and this means it can make up for the normal under-optimized investment of the private sector either directly by public investment in goods and services, by issuing tax credits, or reducing taxation.
3. Both clearing banks and government can create too much money from thin air relative to real resources and financial assets and cause abnormal inflation. Only government can regulate to avoid this or take emergency action to mitigate its effects if the source of inflation is outside its country's control.

Just think of how many of our seemingly intractable local and national and global problems could be solved if only America had its own sovereign fiat-money system! Unfortunately, most Americans can't even think about that question because they've never heard a proper explanation of what 'fiat-money' actually is. Here, then, is quick and dirty solution to that problem.

An American Fiat-Money System in Eight Easy Steps:

1. The sovereign US government declares that every citizen and business must, on a regular and recurring basis, pay taxes to the government (or incur a harsh penalty).
2. The government next declares that the only thing it will accept as a tax payment is a particular kind of “fiat-money” which only the government, itself, shall have the right to issue.
3. After these declarations, US citizens and businesses find themselves, instantaneously, with a strong desire to acquire the government’s fiat-money to avoid the harsh penalties of being tax delinquent.
4. In order to satisfy this desire, the government then exercises its declared right and issues the fiat-money—either electronically or with a printing press—and then spends the fiat-money into the private economy so the citizens and businesses can acquire it.
5. The sovereign government can spend its created fiat-money into the private economy in three ways:
 - a) It can directly purchase goods and services from the US citizens and businesses. The government could, for example, purchase the services of the citizens to build a highway or a bridge—or it could pay the citizens to teach children to read.
 - b) The government can mail a check to, or electronically deposit fiat-money directly into the bank accounts of, citizens who because of disability or old-age, are unable to work to obtain the fiat-money they need.
 - c) The government can direct its central bank—which manages the creation of the fiat-money—to automatically, at the end of each business day, issue and make available to the private banking industry whatever new fiat-money is necessary to monetize the profits private industry has generated during that business day.
6. After it has spent enough of its fiat-money into the private economy, the government then makes good on its declared intent: it collects taxes from the citizens and businesses. Now they know the government means business, and will continue to want to earn the fiat-money it issues so they can pay their taxes next time around as well.

7. The difference between the amount of fiat-money the government issues and spends and the amount of fiat-money it collects in taxes would be called the ‘Citizen’s Net Gain’ (CNG) because it is the amount of fiat-money the citizens get to keep after they’ve paid their taxes.
8. If the citizens and businesses begin to acquire more CNG fiat-money than they know what to do with, that could cause the price of everything in the private economy to go up—inflation—which, if not controlled, is undesirable and destabilizing. The sovereign government can control this inflation by a combination of three strategies:
 - a) It can increase the amount of fiat-money it collects in taxes, thus draining more of the excess CNG out of the economy.
 - b) The government can create special interest-bearing savings accounts which the citizens and businesses can put their excess CNG into, thus removing a large quantity of fiat-money from chasing goods and services, and replacing it with a much smaller quantity of fiat-money (the interest payments on the savings accounts).
 - c) The government can direct its central bank to discourage the borrowing of money through the banking industry, which will reduce the amount of private sector profits needing to be monetized.

That’s it. Those eight steps would be the basic workings of an American fiat-money system.

Now that it’s been properly explained, just imagine for a moment what this fiat-money system is able to do. If you’re a business, the system can create fiat-money, as needed, to monetize your profits. If you’re a citizen, the system can create fiat-money to pay you to provide all kinds of useful goods and services to your local community. If you’re a politician, you can propose the government should undertake the accomplishment of some grand and important task—such as providing every citizen with a free and complete education, or providing every citizen with free health-maintenance—without having to explain how you’re going to pay for it, because issuing and spending fiat-money for those kinds of things is what the sovereign government is supposed to do in order for the fiat-money system to properly work. It really does send tingles of exciting possibilities up and down your spine, doesn’t it?

But now let’s stop day-dreaming. Let’s wake-up to the hard-nosed reality that the American fiat-money system we’ve just imagined is the American fiat-money system we already have. The only difference between the money

system we've imagined and the one we are actually using is the terminology we apply to it. We call the government's particular fiat-money 'US dollars.' We call the 'Citizen's Net Gain' our federal budget 'deficit.' We call the savings accounts the government makes available to citizens and businesses 'Treasury bonds'—and we imagine the government is "borrowing" the dollars being deposited in them. Finally, we call the amount of fiat-money that has been sequestered in the Treasury bond savings accounts our 'national debt.' Other than these minor differences in terminology, our American money system is exactly the fiat-money we've just imagined.

The terminology differences, however, have an extraordinary impact: They make it extremely difficult, if not impossible, to rationally use our fiat-money system to accomplish the things we need accomplishing. It's like trying to drive a car with all the pedals mislabeled and the steering gearbox turned upside down: the accelerator is called the brake, the brake is called the accelerator, if you turn the steering wheel counter clock-wise, the car veers to the right, if you push the gear shift to 'D,' the car shoots backward. And meanwhile, the backseat is filled with car-experts and pundits explaining why all the misleading labels are correct, and how everything is supposed to work in the confusing, dysfunctional way that it does.

To restate my question, then: Wouldn't it be great if we had an American fiat-money system that our politicians and economic pundits actually knew how to drive?

It is literally painful to watch our political leaders' efforts to rethink and restructure how we are going levy taxes on ourselves as a collective society. It is like watching a family member struggling with mental illness: the demons being wrestled with are imaginary—yet they have the palpable force somehow of a granite wall. And as the struggle with this palpable monolith unfolds, even we—the clear observers of reality—forget that it is imaginary; when we do remember, the pain becomes excruciating for the simple reason that we know it is completely unnecessary.

Why does our political system choose to believe and struggle with the imaginary constraint that taxes must pay for sovereign spending? How can we explain to ourselves, in the face of this rock-solid demon, that the simple logic of fiat money demonstrates that sovereign spending must occur first, with taxes collected after? How can we reassure our terrified and confused representatives in congress that if our sovereign government collects back fewer dollars than it issues and spends, the difference is not our collective "debt"—it is, in fact, our collective surplus, savings? But the demon will not allow us these explanations.

As is the case with every mental illness, the cruelest aspect to observe is how vulnerable our delusion is to being manipulated and taken advantage of

by those who are self-serving and greedy. We actually believe the rich fat-cat when he tells us that if we choose to make him richer we, the poor strugglers, will be better off! How, we are told, can the rich fat-cat give us a new job if he is not made richer and fatter? We cannot, after all, give ourselves jobs—can we? Our sovereign government—which we cannot seem to understand represents our collective selves—can and must issue and spend fiat-currency. True! But that currency—our demons are whispering—cannot be spent by our collective selves to pay our individual selves wages to accomplish useful things for our families and local communities. The currency instead must be spent to fatten the fat-cat so that he can pay us wages to accomplish useful things for him. The pain of this logic makes you numb.

Our case is made all the more desperate by the fact that our therapists—the economic pundits and budget analyzers—are actively in collusion with the rich fat-cat. We lie down on the couch and are told that we have a deficit. The deficit we have arises from the fact that our sovereign government—which is not really us but, instead, is a conspiring other who wishes nothing more than to confiscate our tax dollars—insists on spending more of those dollars than it can confiscate. So we therefore have a deficit which, even though it is not our fault, we will be forced to somehow make up and repay. Our simple hope that perhaps our tax dollars might provide us with beneficial public goods and services are dashed and trampled by mathematical calculations demonstrating there can never be enough tax dollars to pay for all the public goods we clearly need.

Our only hope is to further fatten the fat-cat so he can accomplish everything for us. If we fatten the fat-cat, he will educate us; he will grow our food; he will build our houses; he will cure our aches and pains; he will put gasoline in our fuel tank. All we have to do is give him everything we have: our farmland, our national parks and forests, our wildlife preserves, our streams and estuaries, our mountain tops. All we have to do is give him our air and our water to do with as he needs. All we have to do is make sure he is rich, because only if he is rich can we hope that he'll give us a job and pay us to do something. We cannot expect him to hire us if he is not rich, can we? No. And we cannot expect him to hire even more of us if we do not make him fatter and richer still. This is all very logical, we are told, as we lie on the couch.

Finally, our prognosis is greatly diminished by the fact that there are influential people—leaders—who know very well that we are delusional, that taxes do not pay for federal spending, that our fiat-money deficit is not a debt that we owe to anyone, that fattening the profits of global corporations neither creates meaningful jobs or causes anything useful to be accomplished for our local communities. They know all these things, yet they

are required—by what?—to remain silent or, at the very least, dissembling in their objections. They cannot come straight out and say: ‘Look here, this tax and deficit calculation is sheer nonsense. It is delusional gobbledygook! The sovereign government has to issue and spend its fiat money before it can collect it back in taxes. And that issuing and spending of fiat money is precisely how the sovereign government can pay us to accomplish everything we agree needs to be collectively accomplished.’ The fat-cat needs to be put in his place. He just gets one vote, like all the rest of us. He doesn’t get to run the whole show. Unless we let him. Which we surely will as long as we suffer our monetary mental illness.

One of the classic fallacies of logic is to believe that what works for one person, will naturally work for everybody, and that therefore surely all of us can do the same thing at the same time and expect a beneficial outcome.

In economics, this is highly unlikely to be true. If everybody tried to sell GM stock at the same time for example, probably really, really bad things are going to happen to the GM stock. It’s going to get pushed downwards, essentially to zero.

Likewise, when a government analogizes its budget to that of a household, bad, bad things happen. It is this very logic of composition that contributed to this terrifying moment in history. The bid to balance the budget has sucked trillions of dollars out of the economy, destroyed productivity, put downward pressure on wages and employment, encouraged unprecedented levels of private and household debt and has encouraged financial deregulation which has led to inflated property, equity, and auto-loan bubbles in a desperate bid to keep the economy afloat.

Contrary to popular opinion, government spending does not leave a debt that future generations must repay, at least not if you use your own currency and are not on a gold standard. This is because a government budget is not the same as a household budget.

A household does not print or issue its own currency. When funds are running low and rent or mortgage payments are coming up, we can’t just put in a phone call to our mates at the RBH (Royal Bank of Households—not a real thing) and tell them to issue more money. But the government can. And does. In fact every time the government spends on public services, it does so by pumping newly created dollars into the economy.

Whether a government can run out of money depends on what kind of government it is, and what kind of money it issues. A Federal Government that issues its own currency—what is known as sovereign currency—and only borrows in its own sovereign currency along with a floating exchange cannot run out of money.

Only the US Federal Government can issue American Dollars. Only the

Australian Government can issue Australian dollars. Only the UK Government can issue pounds. These are what are known as sovereign currencies. A sovereign currency is a currency issued by a Federal Government with the power to create and issue its own legal tender, which it spends into circulation, and then takes back from the private sector in the form of taxes and other compulsory payments to itself. If you or I tried to print US dollars or Australian dollars or pounds we would be counterfeiting. If the US government began issuing Australian dollars, it too would be counterfeiting.

A central bank usually controls the supply of money and sets interest rates. Every time the Federal Government spends, it creates money. It does so by crediting the reserves of commercial bank accounts held at the central bank. In the US, this is The Federal Reserve, known colloquially as The Fed. In Australia it is the Reserve Bank of Australia, in the UK the Bank of England, and so on. The commercial banks in question then credit the bank account of whoever is the beneficiary of that spending. For example: state and local governments or councils and the services they administer: police, hospitals, fire, et cetera. It does this with the assistance of the central bank, which does not control any measure of the supply of money in the economy, but instead controls the rate of interest at which commercial banks can obtain additional reserves when they need them.

On the other hand, state and local governments can run out of money because although their budgets are often largely financed by federal spending, it is the Federal government which limits that funding. State and local taxes along with borrowing by state and local governments are then applied to make up any shortfalls. So if a state government raises its spending without an increase in its funding from the Federal government, it must also raise state taxes, or issue debt, which it will later need to repay. It is not a currency issuer. The Federal Government is in a very different position.

Of course, a federal government can also choose to run out of money by forbidding itself to make any: for example the US debt ceiling. The imposition of this ceiling in the US was originally a political gesture—100 years ago—and has no economic justification or motivation. It has always been lifted when reached and could be scrapped by Congress at any time. So-called debt ceilings are not to be found in most other monetary sovereigns. They are artificial limits.

You can simply say you cannot have more money, in which case you would be putting artificial limit on yourself. Governments can choose to default. Russia, for example, chose to default in 1998, even though it had a sovereign currency. This is the only default on a monetarily sovereign government's debt in modern times. Periodically Republicans in the US context have tried to make us default, by refusing to pass the debt ceiling,

even though the debt is going to go above the ceiling. If they succeeded long enough the US Government would have defaulted on its debt. It would be the stupidest thing in the Western world, but it could be done.

One might liken the US debt ceiling to the infamous scene in cult film *Blazing Saddles* where the newly appointed black sheriff in a confederate town avoids a lynching by threatening to shoot himself in the head. The whole idea of that being funny is that it's nuts. But that is actually what they try to do with the debt ceiling. 'Ok, we'll shoot the US economy in the head.'

Countries that do not have sovereign currencies can run out of money, because they are essentially borrowing in foreign currency. In this context, it makes sense to have a debt ceiling. Then you can default. You can get in lots and lots of trouble if you behave like you have a sovereign currency when you don't.

Countries that could potentially run out of money include Argentina, some of the smaller countries which use the Euro including Greece, Cyprus, Malta, Slovakia, Estonia, Latvia, and Lithuania. Probably less likely if you're France, Italy, Spain, Austria, Portugal, Finland, or the Republic of Ireland but it's not impossible. Any government with obligations in a foreign currency, or in a currency it does not issue, can run out of that currency. The lesson is to keep your own currency, have a floating exchange rate, and not borrow in foreign currency.

Governments which issue currency, which only borrow in that currency, and allow those currencies to float, cannot run out of money. Indeed, in a sense they are not borrowing at all. How can you meaningfully borrow something you create and which in principle you could create at zero cost and without limit?

Countries with sovereign currencies include America, Australia, the UK, New Zealand, China, Canada, and Japan. Argentina for a while had a sovereign currency, but effectively gave away that sovereignty by its actions.

Of course, it is possible to take seemingly sovereign currencies and make them behave as though they are not sovereign, which is generally not a good idea, as Argentina recently found out.

Eventually governments will be forced to confront the truth which is that by treating its budgets like that of a household, they have starved their economies of precious resources, creating global insecurity which have contributed even further to rising social and political tensions. To avoid another financial crisis, governments must, finally, address the health of their economies.

To do this, they will have to change the narrative on government debt and government deficits, and accept that government debt is an essential

substitute for household debt and that government deficits support private incomes and allow for private saving. The question now is whether it will take another crisis for governments to unlearn the lessons they've been getting wrong on the economy for the better part of 30 years.

In saying that taxation is not a funding source for government spending, this analysis puts the focus on taxation as a matter of political and social decision—a decision made from a position of power, not dependence. It allows us to make spending decisions without asking the rich for a damn thing. Imagine we're in a meeting to decide on a new social program and there are two possible ways to set the agenda:

1. Let's figure out how much tax we'll have to collect from the rich.
2. Let's ignore those fuckers and do what we want.

Which is more radical? To answer that question, you have to understand that the second agenda is possible.

“It's not whether or not MMT works, it's a matter of understanding it. Much like the theory of gravity—which was in operation a long time before Isaac Newton formulated his basic tenets describing it—MMT describes how money has been working since the first money systems were in operation. The question is whether or not we're going to acknowledge its workings and use it to build a better society or whether we're going to stay—financially and politically speaking—in a pre-Newtonian world.”

When you're not really sure whether something is right, then belonging to a community that is sure it is right makes you feel confident about it. No one wants to be the only one to believe something they're not certain about. Hence the various schools of economics—perhaps we should call them churches of economics—are all cults, including MMT. Anyone who disagrees with the cult is a threat to the confidence of the cult's beliefs and is liable to be attacked.

Capitalism is a choice, based on values. Fiat money is a choice, based on values. The laws that regulate fiat money, banks, property rights, and so forth are choices, based on values. Or at least, *someone* made those choices somewhere along the way—the rest of us were born into this system and never had any say in the matter, so we may not be aware that the system is a choice and that there are alternatives.

Since the economic system is a choice based on values, there are no natural laws of economics like there are natural laws of physics. MMT cannot be a neutral description of how fiat money works in a capitalist system because there is nothing neutral about fiat money or capitalism. There is nothing wrong with making choices based on values, but let's be honest about it.

For the past four decades, it's been fiat currency for the .01% and gold standard straitjacket ideology for everyone else.

The mainstream view is no longer valid for countries issuing their own non-convertible currencies and only has meaning for those operating under fixed exchange rate regimes,

The two monetary systems are very different. You cannot apply the economics of the gold standard (or USD convertibility) to the modern monetary system. Unfortunately, most commentators and professors and politicians continue to use the old logic when discussing the current policy options. It is a basic fallacy and prevents us from having a sensible discussion about what the government should be doing. All the fear-mongering about the size of the deficit and the size of the borrowings—and the logic of borrowing in the first place—are all based on the old paradigm. They are totally inapplicable to the fiat monetary system.

We might now consider the opportunity afforded by the new monetary reality. A new sociopolitical reality is possible which throws off the shackles of the old. The government can now act as a currency issuer and pursue public purpose. Functional finance is now the order of the day. For most nations issuing their own fiat currency under floating exchange rates the situation is different to the days of fixed exchange rates. Since the gold window closed a different core reality exists—one which, potentially at least, provides governments with significantly more scope to enact policies which benefit society.

However, the political layer—in the way it interacts with monetary reality—has a detrimental effect on the power of democratic governments to pursue public purpose. In the new monetary reality, political arrangements that sprang up under the old regimes are no longer necessary or beneficial. They can largely be considered as self-imposed constraints on the system; in short the political layer contains elements which are out-of-date, ideologically biased and unnecessary. However, mainstream economists have not grasped this situation—or perhaps they cannot allow themselves to—because of the vice-like grip that their ethics and 'traditional' training has on them.

MMT provides one of the best monetary models out there and highlights the existence of additional policy space acquired by sovereign states since Nixon closed the gold window and most nations adopted floating exchange

rates. We just need to encourage the use of the space to enhance the living standards of ordinary people.

The federal debt will not bankrupt the country, or us, or our grandchildren. The federal government cannot default on obligations denominated in its own currency. It can and will create all the dollars needed to pay dollar-denominated debt.

Nor does the federal government have to borrow money to fund spending. The government is not required to borrow by economic necessity, but by laws and policies—political demands—that require it to “borrow” the difference between what’s spent in the budget and what’s collected in taxes by selling Treasury Bonds. That’s another relic of an obsolete monetary regime, which is designed to make it seem like there’s a relation between the money in those Treasury Securities and government spending when there is not. The “borrowed” money in those securities accounts—dollars that were already in circulation—just sits there; it is not used to “pay for” government programs.

Could the Treasury skip the rigamarole and pay its bills without bonds? Economically, sure. Why doesn’t it? Well, the Fed has regulations governing “overdrafts”—but apart from these, the answer is plain: to do so would expose the ‘public debt’ as a fiction, and the debt ceiling as a sham.

- Federal debt **deposits or investments**
- Federal deficit **economic input**

If the correct words were used, the public would not be deceived. One doubts whether there would be a demand to reduce deposits in the Federal Reserve Bank or cut investments in T-securities. And why would anyone want to stop necessary, beneficial economic input?

The rich run America by bribing politicians via campaign contributions, the media via ownership and advertising, and the economists via university endowments and think tanks. The rich want to widen the gap between the rich and the rest. They do this partly by convincing the American voter that the poor are undeserving and can be helped only by denying them benefits—while the rich continue to reap benefits. The people, believing the euphemisms, have voted against themselves, and they will fight you if you try to tell them the truth. The power of euphemisms is greater than the power of facts.

In science, language is important, partly because language draws a mental picture based on common experience. And if that common experience is not appropriate to the science, the result can be bad science.

Consider the word ‘spin.’ You can visualize a top spinning, or the earth spinning, or even a galaxy spinning, but did you know that electrons have

spin? They do, but they do not spin. According to Scientific American Magazine:

“It is misleading to conjure up an image of the electron as a small spinning object. Instead we have learned simply to accept the observed fact that the electron is deflected by magnetic fields.

If one insists on the image of a spinning object, then real paradoxes arise; unlike a tossed softball, for instance, the spin of an electron never changes, and it has only two possible orientations.

In addition, the very notion that electrons and protons are solid ‘objects’ that can ‘rotate’ in space is itself difficult to sustain, given what we know about the rules of quantum mechanics.”

The term ‘spin,’ however, still remains. If you have been educated to believe that electrons have something termed spin, your understanding of electrons will be wrong if you think of a spinning object, at least according to the latest hypotheses.

The point is that many words have common meanings that are inappropriate and confusing for certain situations in science.

Economics has such words. Here is a short glossary of misleading words in economics:

Federal debt is not debt as you know it. More accurately it is net, all-time deposits into Treasury Security accounts, which are similar to interest-paying, bank savings accounts.

Because ‘debt’ often has negative connotations, banks do not boast about the size of their debt, but they do boast about the size of their deposits, which has positive connotations.

In ordinary language, debt is a burden on the debtor. So, when you hear the federal debt is \$20 trillion, you may visualize this as a huge burden on the federal government and/or on taxpayers. It is neither. Federal debt burdens no one.

Paying off federal debt is not like paying off a mortgage or a car loan. To pay off personal debt, one must have income or assets from which to draw dollars, then transfer those dollars to the creditor.

To pay off federal debt, the federal government needs neither income nor assets. It merely returns the dollars that reside in Treasury Security accounts. The dollars are returned to the account owners.

No tax dollars are involved. Dollars deposited in T-security accounts never leave the accounts. They are not used by the government. They

merely stay in the accounts, accumulating interest until maturity, at which time they and the interest are returned.

The government pays interest into the accounts by creating new dollars, ad hoc.

Because the federal government never takes the dollars from the accounts, returning the dollars is no burden on the government or on taxpayers. It is a simple dollar transfer.

Debt/GDP ratio This ratio is a classic apples/oranges ratio. It attempts to establish a mathematical relationship between two dissimilar things. While federal debt is the net total of deposits into T-security accounts, Gross Domestic Product (GDP) is a measure of spending in the US. The formula is: **GDP = Federal Spending + Non-federal Spending + Net Imports**

Those who decry the amount of total deposits into T-security accounts, often also decry some specific comparisons with total spending. In years past, warnings were issued that if the ratio ever were to reach 60%, then 80%, then 100% and other unsubstantiated and arbitrary figures, horror would befall the economy.

As each level is reached, a new, nearby level is claimed to be the line between fiscal prudence and fiscal disaster.

Today, the US ratio has passed 100% and rising, and the economy is healthy by most measures. One can expect claims that if it ever reaches 110%, surely doom would ensue. The fact that the Debt/GDP ratio has no relationship to economic health, as this table demonstrates, does not seem to restrain the debt hand-wringers.

The Federal “deficit” is the annual difference between federal spending and federal taxing. This does not imply that federal taxes pay for federal spending. They do not.

The federal government creates new dollars, ad hoc, every time it pays a creditor, which it does by sending instructions to the creditor’s bank. The instructions (in the form of checks or wires) tell the bank to increase the balance in the creditor’s checking account.

The instant the bank does as instructed, dollars are created and instantly added to the money supply measures.

The instructions then are routed to the Federal Reserve where, unlike your personal checks), they always are cleared (approved), because

unlike you, your state and your business, the federal government is a large Monetary Sovereign.

Even if the federal government collected \$0 taxes, it still could continue spending, forever. Even with zero income, the federal government never unintentionally can run short of dollars.

Unsustainable is a term sometimes applied to the federal debt, to indicate that the debt is so high, it cannot be sustained. But specifically, what does it mean?

Does ‘unsustainable’ mean the federal government somehow cannot sustain the increasing deposits into T-security accounts? No, that cannot be. Those deposits place no financial burden on the federal government, other than paying interest. And being monetarily sovereign, the US federal government has the unlimited ability to create the US dollars used to pay interest.

Does it mean the economy somehow cannot sustain the deposits? No, that cannot be. Those deposits reflect the addition of growth dollars into the economy, which benefits the economy.

Does ‘unsustainable’ mean the deposits, reflecting growth dollars, also portend hyperinflation? No, contrary to the popular myth, hyperinflation is not caused by an increase in dollars. Rather, hyperinflation (an extreme, general increase in prices) is caused by shortages, usually shortages of food and/or energy (currently, oil).

The myth persists because hyperinflations precipitate government currency printing, with its memorable “wheelbarrows-filled-with-currency” visuals. Ironically, hyperinflations are cured when shortages are cured, which generally requires the government to buy and pay for the scarce food and/or energy. Rather than causing hyperinflations, money creation is necessary to cure hyperinflations.

By contrast, small inflations, of the single-digit variety, can be caused by a decrease in the value of money. A large, monetarily sovereign government exerts total control over the value of its sovereign currency, by controlling the Supply/Demand relationship or by fiat.

The government controls the money Supply by taxing and spending. The government controls money Demand via interest rates. (Raising rates increases the Demand for money, also called “strengthening the currency.”)

Finally, the government controls the value of its currency by fiat, that is by unilaterally lowering or raising the value (also known as “devaluation” and “revaluation”).

In short, no level of federal T-security deposits (“debt”) is unsustainable for a large, monetarily sovereign government.

Balanced budget has a pleasing ring, and many who are ignorant about federal finances often demand that the federal government run a balanced budget. These people claim the federal government should “live within its means” (i.e its income).

However, the federal government, being monetarily sovereign, needs no income, and when it receives income (taxes), that income is destroyed. The federal government has the unlimited ability to create dollars, at will.

People achieve personal balanced budgets by ‘living within their means,’ which is considered prudent.

A federal balanced budget indicates that because federal taxes equal federal spending, the federal government pumps zero net growth dollars into the economy. Thus, a federal balanced budget yields economic stagnation, recessions, and depressions, which historically only are cured by federal budget deficits.

A federal balanced budget (a.k.a. austerity) is the least prudent financial activity a monetarily sovereign government can implement.

Trust funds The federal government operates several bookkeeping accounts that wrongly are termed “trust funds,” among which are Social Security, Medicare Part A, the Highway “trust fund,” and federal pension “trust funds.”

Federal trust funds bear little resemblance to their private-sector counterparts, and therefore the name can be misleading. A ‘trust fund’ implies a secure source of funding. However, a federal trust fund is simply a bookkeeping mechanism used to track inflows and outflows for specific programs.

In private-sector trust funds, receipts are deposited and assets are held and invested by trustees on behalf of the stated beneficiaries. In federal trust funds, the federal government does not set aside the receipts or invest them in private assets.

Rather, the receipts are recorded as accounting credits in the trust funds. The federal government owns the accounts and can, by changing

the law, unilaterally alter the purposes of the accounts and raise or lower collections and expenditures.

More importantly, the monetarily sovereign federal government can increase or decrease the balances of any federal trust funds at the tap of a computer key.

Insolvent, bankrupt, and break the bank are terms used for personal, business and even state/local government accounts. Sadly, these terms also are misleadingly used to describe federal accounts, which cannot become unintentionally insolvent or bankrupt, and the federal “bank” cannot be broken.

Ever since August of 1971, when President Nixon took the US off its last gold standard, the federal government has had the unlimited ability to fund anything—*anything*—merely by deciding to do so.

Organizations like the Committee for a Responsible Federal Budget (CRFB) are paid by wealthy donors to make Americans believe federal finances are like personal finances. The purpose is to prevent the middle- and lower-income groups from complaining about cuts to Medicare, Social Security, and other beneficial programs.

Most recently, Medicare for All has been proposed, but its future is uncertain because of false implanted concerns about federal insolvency.

Costs taxpayers Among the most pernicious myths in all of economics is the oft-repeated notion that federal taxes fund federal spending.

While it is true that state and local taxes fund state and local spending, federal taxes do not fund federal spending. Even if all federal tax collections totaled \$0, the federal government could continue to spend as much as it wished, forever.

The fundamental difference is that while the federal government is monetarily sovereign, state and local governments are monetarily non-sovereign. As the word ‘sovereign’ indicates, the federal government is the issuer and absolute rule over all aspects of its sovereign currency, the US dollar.

By contrast, state and local government are mere users of the dollar; they do not share the federal government’s unlimited ability to create, devalue, or revalue the dollar.

Because the federal government has no need for taxes, federal spending does not cost federal taxpayers anything. All federal taxes are arbitrary penalties on the private sector.

Why then does the federal government collect taxes?

- To control the economy by taxing things it wishes to minimize and by offering tax reductions to things it wishes to encourage.
- To propagate the myth that federal taxes are necessary to fund the government so that the public willingly will pay taxes.
- To please the very rich political donors, who control the government, by helping to widen the Gap between the rich and the rest.

What we know actually is what we believe. And what we believe is heavily influenced by intuition, personal experience, and what we are told.

None of us has the time or ability to research everything, so we believe and even promulgate what ‘feels right,’ without relying on strict proof. So, for instance, Obama said:

“This is my vision for America: A vision where we live within our means while still investing in our future, where everyone makes sacrifices, but no one bears all the burden, where we provide a basic measure of security for our citizens and we provide rising opportunity for our children.”

To most of us, that sounds quite reasonable, even though he really was telling you:

“The federal government finances are limited just like your finances. So be prepared to make sacrifices and don’t complain if you have to bear a burden. The government can give you basic security, but not much more, and don’t expect anything more than just an opportunity, but you’ll have to make sacrifices, work like hell, and still be lucky to escape things like student debt, unaffordable medical bills, inferior housing and transportation, and overall poverty. And don’t expect much from your government except a tax bill.”

Obama, and many others, have told you the Big Lie based on the misleading language of economics.

“The system—and economic theory—is rational and takes into account social and environmental costs.”

People tend to think someone somewhere is regulating things to keep us safe. They look around and see sophisticated technology, gleaming towers in the sky, and what they believe to be is a complex intelligent world. But in truth no one is running the show. The world functions as a mad cash grab driven by neoliberal ideology. Our leaders are driven by power, fame, and money, and exhibit strong psychopathic, sociopathic, and narcissistic traits.

The problems of modern industrial capitalism and its impact on the world is clear—our exploitation of the resources, people, and other species are a direct result of our consumer-based infinite growth model. Just a few of the problems we face are species extinction, climate change, ocean acidification, and a toxic carcinogen-filled trash dump of a planet that reached population overshoot decades ago.

If the system was rational, we would begin planning to lower birth rates to decrease the world's population, and voluntarily provide education, decent, dignified jobs, as well as birth control and contraception to women worldwide.

We live by money values, and think in money terminology. When we discuss healthcare the topic arises about how to pay for it before nearly anything else. The priority isn't on saving lives but how to pay for things. Yes, how will we pay for healthcare when banks can create money on a computer through the magic of fractional reserve banking, which they often use to bail out their crony friends. The money isn't real but the implications of restricting it from the populace are. Money is created out of thin air by the magic of the Federal Reserve, yet we have all heard our bosses, and the pricks in Washington complaining that 'we don't have enough money for that' when it comes to healthcare, improving schools, and humanitarian relief for the poorest parts of the world.

Again, if the system was rational, world poverty would be solved within a few short years. Money destined for weapons and "defense" could be used domestically as well as abroad in Africa, South Asia, and Latin America, and there is more than enough money to pay for a good home, clothing, and food for every family worldwide, with an all-renewable powered energy grid.

The revelation that the rules of money are not immutable laws of nature but are instead created and constantly modified by people opens up possibilities beyond the scope of our current political imagination. The questions become: What sort of society do we want? Do we have the physical resources to support that society? And finally, how the hell do we muster the political will to get there?

Your Brain on FIRE

Wall Street Muggers

Homo homini lupus est Man is a wolf to his fellow man.

I have realized that in order for people to understand a wrong they need to have suffered from that wrong in some way or at least investigated the wrong to its roots. You cannot tell Obamabots or Clintonistas or Bidenites the story of Glass Steagall and Robert Rubin and expect them to understand it. They are of that ilk because they have not suffered from it or they have not taken the time to investigate their suffering and trace it to its source. It takes a hell of a lot of reading to understand how Wall Street manipulates governance. A very large majority of teachers and professors fall into this category—especially if they are the tenured bubble world type. Their lot has kept improving so they think everything is hunky dory. Some who had the misfortune to lose a ton of money via 401Ks in the 2008 crash understand it to some extent. The mischief that Wall Street does is well hidden and opaque and defies translation to layman’s language. This is their strength.

A man took his young daughter to open a savings account. He was excited to begin her training as a saver and wanted to show her the magic of compound interest.

“I remember the thrill of watching my own bank account grow—the money I earned just by leaving it there. We put in fifty dollars, and I had the idea that once a month we would go to the bank and make a deposit. Then we would watch the money grow, along with interest. The next month we went back to make the next deposit, and lo and behold, there was only forty-five dollars in the account. Turned out that the bank was charging for low balances in savings accounts. End of lesson.”

The little girl was crestfallen and the father was angry. He got the bank to return the five dollars and closed her account—and his own.

Banks got big for two main reasons. First, they were allowed to do more than just maintain depository accounts. After the Great Crash of 1929, Congress passed the Glass-Steagall Act, which prevented banks from engaging in both investment banking (what Wall Street does) and commercial banking (what smaller, more local banks that take deposits typically do). Risky investment had led to the crash, and the law was designed to minimize banks' ability to take such risks. Seventy years later, in 1999, Congress passed the Gramm-Leach-Bliley Act, permitting banks once again to engage in both commercial and investment activities. This legislation effectively nullified Glass-Steagall. It allowed commercial banks, investment banks, securities firms, and insurance companies to merge and grow, and the industry became increasingly consolidated. Individual depositors are protected by deposit insurance, which was created in 1933. But as the recent crisis has shown, the consequences of banks' high-risk investment strategies can affect consumers in many different ways.

The second reason banks got so big is that they are no longer extremely restricted in terms of where they can do business. Walking the streets of any major city, where outlets of the largest banks seem to populate virtually every corner, you might find it hard to imagine a time when banks weren't allowed to open branches. But nearly all states restricted branching in the late nineteenth and early twentieth centuries to protect consumers from monopolies. Most of these laws remained in place until the early 1980s. Once banks were allowed to branch, they expanded by opening in new locations and, like giant Pac-Man characters, by gobbling up small banks.

As banks grew and became more removed from the day-to-day needs of their customers, their business models also changed. Over time, they made more and more of their money from fees instead of interest. The larger banks also became more complex. Historically, banks made their money by borrowing and lending, which generated interest income. But events like the savings and loan crisis in the late 1980s and early 1990s, when so many banks failed, illustrated how disastrous that model could be. In order to make banks less vulnerable to volatile interest rates, bank examiners encouraged them to find other ways to make a profit. That's when banks discovered fees—the fees that anger and frustrate nearly everyone I've spoken with.

So-called free checking, the ability to overdraw an account, and variable interest rates on credit cards initially seemed to be good for consumers. But once banks began to see that these products and services could be profitable bad things started happening. The average charge per overdraft went from \$21.57 in 1998 to \$31.26 in 2012. Similarly, average ATM fees more than doubled between 2001 and 2014. Some banks began to charge one or two dollars for paper statements and up to twenty-five dollars for

a replacement debit card. In the past, lower use of alternative financial services and increased use of banks was seen as a measure of success. Not anymore.

“When I sat down and looked at my clients’ bank statements and saw that they had paid \$110 in fees, I often ended up sending them to the check casher instead.

Many consumers have become overly reliant on overdrafts. Some who lack other sources of funds use overdrafts like a short-term loan. Unfortunately, a single overdraft can result in cascading bad checks and hundreds of dollars in charges. Let’s take a look at exactly how this works: Say you have \$100 in your account, and today you have an automatic student-loan payment of \$110 scheduled. The automatic payment will result in a deficit of \$10. The bank will charge a \$34 overdraft fee, which is typical for big banks. You now have a deficit of \$44. Imagine you also use your checking-account debit card that day to purchase \$25 worth of groceries. That purchase will trigger another overdraft, and you will be charged another \$34. For \$135 worth of transactions, you have been charged \$78. But it may not stop there. If the account balance remains overdrawn for five consecutive business days, the bank will charge an extended overdraft fee per item, typically between \$15 and \$35.

It’s quite possible that the chain reaction started with a common miscalculation: you presumed that a check you’d deposited into your account would clear before the student-loan payment came due. But your check took a day longer than usual to clear. Banks depend on these miscalculations. In 2014, Americans paid nearly \$32 billion in overdraft fees, and \$6 billion of it went to the three biggest banks (Chase, Bank of America, and Wells Fargo). That’s just one reason why more than twelve-million Americans manage their money without a bank. A sizable chunk of the consumers who began to depend on overdrafts couldn’t pay them back. The banks eventually closed their accounts. The consumers then ended up in one of the databases, like ChexSystems, that banks use to screen new customers and decide whether they can open an account.

For years, regulators did nothing about banks’ increasing generation of overdraft fees. Dodd-Frank, the 2010 legislation passed in the wake of the financial crisis, took a big bite out of banks’ ability to generate overdraft and other fees, but banks have figured out how to get around it. In May 2014, Haberfeld Associates presented a webinar showing participants how overdraft protection could continue to function as an income stream for banks, even after Dodd-Frank required banks to get customers to opt in

to the service. The paperwork for setting up an account is so opaque that nearly half of all consumers who overdrew their accounts didn't remember opting in to overdraft protection. That's because the paperwork is designed to be unclear. This lack of transparency is one of the primary reasons many check-casher customers don't like going to the bank. In February 2015 the CEO of Habersfeld, wrote an article titled "Add Customers, Grow Profits," in which he advised banks to market free checking accounts to customers and then turn those customers into fee generators.

"Checking accounts are the gateway to a range of other bank products—debit cards, paper checks, overdraft protection—that generate fee income. Having a checking account is typically a consumer's main reason for working with a bank. Sixty-four percent of consumers exclusively use a debit card from that account, and free-checking customers use an average of 4.75 products and services, all of which generate fee income."

Another big-bank practice is called "debit resequencing"—the bank processes the debits and credits to an account in a way that causes account balances to fall faster, thereby boosting potential overdraft fees. In February 2012, Chase settled a class-action suit accusing the bank of charging excessive overdraft fees. In November 2011, Bank of America was ordered to pay \$410 million to customers for wrongfully charging excessive overdraft fees resulting from debit resequencing. Despite these two huge suits and subsequent regulatory action, 44 percent of banks included in a recent study still engage in this practice. The numbers are decreasing, but not enough.

Here's how debit resequencing works. Let's say that on a given date you send two checks—one to your credit card company for \$150 and another to your local electric company for \$75; the credit card company and the electric company try to get their money from your account on the same date. An automatic withdrawal you've set up to pay your rent also hits your account; your rent is \$500. On the date that those three things hit your account, you have a balance of \$100. The bank could clear the \$75 charge first, resulting in two overdraft fees. Instead, many use software that reorders the transactions. This software presents the \$500 charge first, then the \$150 charge, and finally the \$75 charge, and you end up paying three overdraft fees instead of two. Banks make this choice to maximize profit rather than to do right by their customers.

The practice of charging interest, and the upward creep in interest rates, hasn't always been a given. 'Usury,' a word that has come to mean exorbitant or predatory interest rates, originally referred to the practice of charging

any interest at all. The medieval Catholic thinker Thomas Aquinas believed it was wrong to make money from the lending of money, that doing so went against “moral and natural law” and led to inequality. And in *Inferno*, the Italian poet Dante put usurers on the lowest ledge of the seventh circle of hell—lower even than murderers. Times have changed. Arguments now focus not on whether it’s okay to charge interest, but what interest rate is acceptable. But ethics and morality continue to enter the debate.

“Interest caps are more than numbers: they are reflections of society’s collective judgment about moral and ethical behavior, as well as business and personal responsibility. Interest rates embody fundamental values.”

Today, the four largest banks—Chase, Bank of America, Wells Fargo, and Citigroup—collectively hold about half of all US bank assets, a total of \$6.8 trillion, while the remaining 6,395 banks share the other half. The smallest banks—those with less than \$100 million in assets and more likely to be closely tied to their communities—declined by 85 percent from 1985 to 2013. The dramatic drop in the number of banks over the past few decades gives individual consumers fewer choices and banks less incentive to compete to serve customers best. As banks have grown larger and their overall numbers have dwindled, they’ve become less responsive to the needs of consumers. They’ve focused so single-mindedly on profit that they’ve sacrificed the well-being of their customers.

It is impossible to buy a toaster that has a one-in-five chance of bursting into flames and burning down your house. But it is possible to refinance an existing home with a mortgage that has the same one-in-five chance of putting the family out on the street—and the mortgage won’t even carry a disclosure of that fact to the homeowner. Similarly, it’s impossible to change the price on a toaster once it has been purchased. But long after the papers have been signed, it is possible to triple the price of the credit used to finance the purchase of that appliance, even if the customer meets all the credit terms, in full and on time. Why are consumers safe when they purchase tangible consumer products with cash, but when they sign up for routine financial products like mortgages and credit cards they are left at the mercy of their creditors?

There are many parallels between finance and Big Data. Both industries gobble up the same pool of talent, much of it from elite universities like MIT, Princeton, or Stanford. These new hires are ravenous for success and have been focused on external metrics—like grades and SAT scores and college admissions—their entire lives. Whether in finance or tech, the message

they've received is that they will be rich, that they will run the world. Their productivity indicates that they're on the right track, and it translates into dollars. This leads to the fallacious conclusion that whatever they're doing to bring in more money is good. It "adds value." Otherwise, why would the market reward it? In both cultures, wealth is no longer a means to get by. It becomes directly tied to personal worth. A young suburbanite with every advantage—the prep school education, the exhaustive coaching for college admissions tests, the overseas semester in Paris or Shanghai—still flatters himself that it is his skill, hard work, and prodigious problem-solving abilities that have lifted him into a world of privilege. Money vindicates all doubts. And the rest of his circle plays along, forming a mutual admiration society. They're eager to convince us all that Darwinism is at work, when it looks very much to the outside like a combination of gaming a system and dumb luck. In both of these industries, the real world, with all of its messiness, sits apart. The inclination is to replace people with data trails, turning them into more effective shoppers, voters, or workers to optimize some objective. This is easy to do, and to justify, when success comes back as an anonymous score and when the people affected remain every bit as abstract as the numbers dancing across the screen.

Hedge funds have become notorious for stripping assets and loading companies down with debt, leaving bankrupt shells in their wake. Looting is only demonized when it's dark-skinned people looting cheap physical goods.

"The real problem came from a nasty feeling I started to have in my stomach. I had grown accustomed to playing in these oceans of currency, bonds, and equities, the trillions of dollars flowing through international markets. But unlike the numbers in my academic models, the figures in my models at the hedge fund stood for something. They were people's retirement funds and mortgages. In retrospect, this seems blindingly obvious. And of course, I knew it all along, but I hadn't truly appreciated the nature of the nickels, dimes, and quarters that we pried loose with our mathematical tools. It wasn't found money, like nuggets from a mine or coins from a sunken Spanish galleon. This wealth was coming out of people's pockets. For hedge funds, the smuggest of the players on Wall Street, this was dumb money."

To understand how hedge funds operate at the margins, picture a World Series game at Chicago's Wrigley Field. With a dramatic home run in the bottom of the ninth inning, the Cubs win their first championship since

1908, back when Teddy Roosevelt was president. The stadium explodes in celebration. But a single row of fans stays seated, quietly analyzing a slew of results. These gamblers don't hold the traditional win-or-lose bets. Instead they may have bet that Yankees relievers would give up more walks than strikeouts, that the game would feature at least one bunt but no more than two, or that the Cubs' starter would last at least six innings. They even hold bets that other gamblers will win or lose their own bets. These people wager on many movements associated with the game, but not as much on the game itself. In this, they behave like hedge funds.

By 2008, actual commodity sellers and buyers were completely marginalized in the market by speculators, who accounted for 80 percent of all futures purchases. And with their price manipulations, these derivative bombs cratered our economy with high gas prices. Then there were food prices. Started toward the end of the first Bush administration, the Goldman Sachs Commodity Index is the signature derivatives market in the world. And the betting lines for speculators include energy resources such as oil and gas and food such as cattle, wheat, corn, and soybeans, among other things. Food wasn't immune from the speculator frenzy. Nothing had changed about the wheat, but something had changed about the wheat market. Robber barons, gold bugs, and financiers of every stripe had long dreamed of controlling all of something everybody needed or desired, then holding back the supply as demand drove up prices. That's exactly what speculators were doing—buying up huge amounts of wheat contracts and holding on to them until they could be sold at a higher price. This had catastrophic effects on the global food supply. The global speculative frenzy sparked riots in more than thirty countries and drove the number of the world's food insecure to more than a billion. The ranks of the hungry had increased by 250 million in a single year, the most abysmal increase in all of human history.

Collateralized debt obligations, or CDOs, were a weapon of mass financial destruction that helped blow up the residential mortgage market in 2008. Since then, financial engineers have launched a strikingly similar instrument, the collateralized loan obligation, or CLO. With Wall Street having already wrecked the housing market and thrown millions of properties into foreclosure, private equity groups are now snapping up those houses and renting them. The rental streams are then bundled into financial instruments and sold in an unregulated market—paralleling the financial industry's behavior with CDOs a few years before, merely substituting rents for mortgage payments.

Derivatives: Complex financial instruments that allow banks and wealthy investors to make bets worth trillions of dollars on such events as

whether or not a company's bonds will fail. If these bets were considered insurance policies, which they obviously are, then they would be subject to regulations insuring that buyers and sellers had enough reserves to cover losses, just like any insurance company.

The Quarterly Report on Bank Trading and Derivatives Activities—a little-known report from the Office of the Comptroller of the Currency (OCC) came out recently. I am sure 99% of our population has never heard of it. However, doesn't the title alone pique some interest: Banks do trading? They trade derivatives? There's a report on it? By our government? Every quarter? I spent some time looking through the report. I share four scary points about it and banking:

1. US banks held \$172 trillion in derivatives at the end of 2017. This amount is 11 times the value of all the assets all the US banks own.

So, the banks are placing \$172 trillion in bets on these “instruments” called derivatives, but they don't have the reserves to cover them. To be fair, that \$172 trillion is called the “notional value” of the derivatives, the amount banks would have to come up with if they actually had to buy or sell the underlying asset or debt of every derivative they hold at full value. Under normal circumstances that is unlikely. So the OCC tried to come up with a more realistic way to quantify risk. They call it “Value at Risk” (VaR), a figure much lower than the notional value. Its definition still mystifies me. However, an earlier OCC Report indicates it still mystifies them too! It states:

“Banks use VaR to quantify the maximum expected loss over a specified time period and at a certain confidence level in normal markets. VaR is not the maximum potential loss. In the 1929 and 2008 crashes, banks counted on a certain confidence level in normal markets.”

Who knew markets would be abnormal and “confidence” way out of whack? (Actually, some did, and they profited immensely from it!) Further, banks are supposed to be depositories who keep our money safe, and who make loans based on that money. Why are they doing all this gambling? They are hedging their bets. Playing in derivatives is no longer investing, but trading. In other words, banks are not lending money to create goods or services, but trading it with each other to try to win from each other. If they win their bets, it adds nothing to the real economy, or to depositors—only to bigger profits

for the bank owners—\$5 billion in the 4th quarter of 2017. Trading is non-productive money. It adds no goods or services to the economy.

2. The four largest US banks—JPMorgan Chase, Citibank, Goldman Sachs, Bank of America—hold 90% of all derivatives traded by US banks. The largest 25 banks account for nearly 100%.

So, the derivatives game is one banks play solely with each other. What's wrong with this picture? They are using the public's deposits as security to gamble for their own profit. This gambling has nothing to do with helping the economy, depositors, or borrowers. Have you tried getting a mortgage or business loan from one of the big four lately? Isn't that why we gave banks the privilege of being able to lend up to nine times the capital they actually have in the first place—to facilitate the exchange of goods and services among people by making loans?

3. According to the Bankruptcy Act of 2005, in a bank crash, derivative holders stand in front of depositors to be paid off.

In other words, if a bank makes enough bad bets and it crashes, it can take what's in our checking or savings accounts to pay off its derivative debts—which would be to other banks. It can even legally take what is in our safe deposit boxes! In short, banks can take our money to pay off their gambling debts to each other! Not only does bank gambling add nothing to depositors; it actually puts us at risk.

4. Financial institutions prefer derivative strategies using swaps and options to achieve the targeted returns, since derivatives are recorded off balance sheet and do not require as much capital as borrowings.

Gambling by the banking casino is unproductive money; it produces no goods or services for us. So, yes, the problem of money actually is political, going back to how the Fed and banking was set up in 1913, and the laws enacted by subsequent Congresses to legitimize bank gambling.

In 2014, after hedge fund Level Global Investors made \$54 million by shorting Dell Computer stock based on insider information from a Dell employee, Global Investors' co-founder Anthony Chiasson claimed he didn't know where the tip came from or whether the leaker benefited from the leak, and that few traders on Wall Street ever know where the inside tips they use come from because confidential information is, according to Chiasson's lawyer, the "coin of the realm in securities markets." Chiasson

was convicted nonetheless. But in December 2014, the court of appeals overturned Chiasson's conviction, ruling that Chiasson was so far removed from the leak that he could not possibly have known the source of the information or whether the tipper received a "substantial benefit" in return.

The court thereby made official what had been the unofficial law on the Street: It's all about who you know. If, for example, the CEO of a company gives his golfing buddy a confidential tip about what the company is about to do, and the buddy tells a hedge-fund manager who then makes a fortune off that confidential information, the winnings are perfectly legal. Because confidential information is the "coin of the realm" on Wall Street, it's likely that a significant portion of what is earned on the Street is based on information unavailable to average investors. Insiders fix the market for their own benefit.

Founded in 1977, Apple required funds to invest in more production facilities and to buy companies with complementary patents that it needed to expand. However, Apple only received a portion of the proceeds of this stock issue. Its underwriters, headed by Morgan Stanley and Hambrecht & Quist, initially priced the stock at only \$14 a share, but enough orders poured in to price it at \$22 by the opening bell. Being oversubscribed (given the underwriters' low pricing), Apple's price rose by 32 percent to \$29 a share, valuing the company at \$1.8 billion by the end of the day. A first-day jump means that a company's stock is worth more than the underwriter promises to raise. This underestimation of the market enables early subscribers—so-called preferred customers, usually institutional investors and a few prominent individual players—to make a killing. Giving them a chance to buy low-priced shares to turn around and sell at a price gain during the first few hours of hectic trading helps the underwriter attract a loyal following of investors. The bigger the hit-and-run windfall the underwriter can offer these clients, the larger a client base it builds up for future offerings. This investor base is permanent; most companies issuing new stock are only one-time hits, so underwriters low-ball their promises to companies going public. The result is that financial speculators make more than the companies that actually create real value.

Underwriters thus have a conflict of interest with the companies whose stock they float. In addition to charging their underwriting fee (as high as seven percent for new businesses), the more they understate what a company is worth, the bigger the gains they and their favored customers quickly make by flipping its shares to a later buyer at the more reasonable market price established by the end of the first trading day or week. A "successful" issue is one where the stock price may double from the opening to the closing bell. Company officers, venture capitalists and other initial long-term holders will

see the value of their shares rise, but the company itself receives only the opening sales price. The underwriter and its clients may end up making as much on the sale that it orchestrates as the company and its founders receive for all the years of effort that they put into creating the business.

By 2010, the richest one percent of Americans owned 35 percent of the value of American-owned shares, both directly and indirectly through their pension plans. The richest 10 percent owned more than 80 percent. Yet most Americans did not benefit from the bull market because they were not able to save enough to invest much, if anything, in stocks. The bottom 90 percent owned just 19.2 percent, directly or indirectly. In 2014, more than two-thirds of Americans were living from paycheck to paycheck.

Employees who invest part of their paychecks into the stock market through corporate-sponsored pension funds are harmed when, for example, the funds charge them higher than normal fees and then rebate the excess to the corporation in the form of discounts on other financial services. The information the corporation does not share with its employees amounts to a conflict of interest, tantamount to fraud. But this practice has been found to be perfectly legal.

One of the great lies being spread in our time is that at big companies like General Motors and Ford there are not enough workers on the job today to sustain the pension benefits of those already retired. Current workers are not supposed to benefit those who came before. Each worker forgoes part of his or her current pay for a benefit in the future. Federal law requires that a pension be funded in advance by setting aside money for that benefit. Thus, over the life cycle of a company, as it grows from a single worker to a giant enterprise, and then passes into history, the number of workers on the payroll at any moment is not relevant to whether each worker collects the benefits deferred until old age.

If it is possible to make large profits by finding devious ways to trick customers, then banks and other corporations will devote substantial resources to finding devious ways to trick customers. Instead of devoting resources to figuring out how to better serve customers, banks will devote resources to finding ways to put rules in contracts that allow them to profit at their customers' expense. The 'buyer beware' argument means that consumers would have to spend much more time reviewing contracts and that firms would devote more resources to deceiving customers. That is hardly an economically optimal outcome.

The Greatest Ponzi Scheme on Earth

“I suspect that we are throwing more and more of our resources, including the cream of our youth, into financial activities remote from the production of goods and services, into activities that generate high private rewards disproportionate to their social productivity. I suspect that the immense power of the computer is being harnessed to this ‘paper economy,’ not to do the same transactions more economically but to balloon the quantity and variety of financial exchanges.”

“In many deceits, the victim overlooks the liar’s mistakes, giving ambiguous behavior the best reading, collusively helping to maintain the lie, to avoid the terrible consequences of uncovering the lie.”

“The things that are legal in finance are far more destructive than what is illegal in finance.”

“All truth passes through three stages. First, it is ridiculed. Second, it is violently opposed. Third, it is accepted as self-evident.”

Proposal One: A business owner approaches a group of investors and says:

“I’m selling shares of my company. If you invest in my business, you’ll receive a note that says you own a piece of the company, and if the business makes money, you’ll receive a share of the profits. The note is transferable, so you can also sell it to other investors. If you’re lucky, you might even receive more than you paid.”

Proposal Two: A business owner approaches a group of investors and says:

“I’m selling shares of my company. When you invest, you’ll receive a note that says you own a piece of the company. However, you won’t receive any money from the business, and the company is not obligated to pay you anything, ever. But, you can make money by selling the note to other people. You might get lucky and get more than you paid.”

Now, which proposal do you think early investors would have considered, and which do you think they would have avoided? Which one sounds like a legitimate business investment, and which one sounds like a shady scam? History shows that when stocks were first introduced to investors, they were designed to perform like the first proposal, where companies paid dividends and shared profits with investors. But today, the common stocks that are being issued to investors behave like the second proposal, where shareholders receive nothing from the business, and the only realistic way investors can make money is by selling their shares to other investors.

One of the biggest myths about stocks is the idea that profits from stocks come from the earnings and growth of the underlying company. The assumption is, when a company makes money, they share the profits with their investors. But in practice, most public companies never pay dividends, and when they make money, which can be millions or even billions, they keep everything. The reality is, profits from stocks come from other investors who are buying and selling stocks. When an investor buys a stock for \$10 and sells it for \$11, that \$11 comes from another investor, someone who will then start hunting for yet another investor who will give him or her \$12, and so on. This is actually a negative-sum situation because the underlying company isn't involved in the transaction. The investors are just cannibalizing each other for profits, and there are fees attached to every transaction. It's one thing if everyone acknowledges this negative-sum gambling scenario and people just want to gamble. But the stock market is sold as a positive-sum investment system, and investors believe the system produces more money than they contribute. This is why most of the money that goes into the stock market comes from pension plans and retirement funds, and why 18-year-old kids are allowed to open online trading accounts.

Investment finance is different from other businesses because everyone involved—from the bankers to the analysts, to the advisors, to the investors and the companies that need investments—all want one thing and one thing only: cash. This is not the case when we look at a normal business like a restaurant. The restaurant that sells food wants cash, but the people who give the restaurant cash are end-users who want food in return, not more cash. This simple and essential fact is why the logic of investing is incredibly illogical. When it comes to stock transactions, the person selling the stock wants cash, but so does the person who is buying the stock. There are no end-users. Everyone involved wants more money back than they contribute, and no one pays attention to where the money is coming from. It's probably because no one wants to know where the money is really coming from. The problem is, the money investors take out of the system is coming from other investors who are putting money into the system, and the stock market is

just a system that shuffles cash between investors. It is a system where current investors' profits are strictly dependent on the inflow of money from new investors. Such a system is also known as a 'Ponzi scheme.'

Most people understand that a Ponzi scheme is a scam, but what most people don't realize is that a Ponzi scheme can also produce a lot of winners. It's not a scam where everyone loses money. A lot of investors who are involved—and unaware of the scam—can make money too. Bernard Madoff ran the biggest Ponzi scheme to date. After his \$50 billion scam was exposed in 2008, investigators found that more than half of his accounts showed a profit. The total amount of money lost in his scam was greater of course, but as far as the accounts were concerned, more than half of them actually showed a net profit—as in, those accounts withdrew more than they contributed. The fraudulent aspect of a Ponzi scheme is not its inability to produce winners. The issue is in the mechanics and where that money comes from, and how investors who make money are taking it from other investors who also want to make money.

If the stock market is a giant ponzi scheme, then why are there so many textbooks on stock analysis? Why is it taught in schools, and why do finance academics and professionals treat it as something legitimate? Do not underestimate the power of fallacies. The sad truth is, falsehoods and immoral practices can be treated as normal and routine, and persist for centuries before corrections are made. Remember that it took humanity thousands of years to realize that human slavery is a barbaric practice that is not essential to a functioning economic system—and even then we've not really managed to eradicate it. The investment finance industry, especially the portion that deals with stocks, is primarily built on fallacies. The reason why finance professionals do not see the stock market as a Ponzi scheme is because they believe the credibility for an idea rests on repetition, tradition, and people who recite it, rather than proof, logic, or facts.

The first fallacy and I believe the most fundamental falsehood that leads to other false ideas, is the notion that stocks are equity instruments that represent ownership. Finance professionals will argue:

“The stock market can't be a Ponzi scheme because the value of a stock represents value in a company, and ownership instruments are being exchanged in the transactions.”

But, there's practically no truth to this idea because the value of a stock has no legitimacy. It is just an arbitrary number derived from a Ponzi-exchange process, and the value is not backed by anything. A share of Google can trade around \$900, but Google explicitly states in writing

that the par value of their stock is only \$0.001. Google also says they do not pay their investors any dividends, and their Class C shareholders have no voting rights. So, if you own a share of GOOG, you won't receive any money from Google's business activities, you won't be allowed to vote on any corporate issues, and Google isn't obligated to pay you anything more than \$0.001 for that share you bought for \$900. Does that really sound like a legitimate ownership instrument?

Before the 1900s, stocks paid dividends. History shows that stocks were designed to be legitimate equity instruments with a profit-sharing agreement between the shareholders and the companies they owned. Capital gains, the Ponzi profits from other investors in the 'buy low and sell high' gamble was meant to be a secondary form of profit. It was never meant to be the primary or only way for investors to make money. Stocks were not intended to be Ponzi assets that are destined to be shuffled between investors indefinitely, but they mutated in a very disturbing way over the past century. Finance people refer to stocks as "equity" instruments, but it's nothing more than an artificial label. Today's stocks are fundamentally different things from the equity instruments they once were.

The second fallacy, which is a product of the first fallacy, is the idea that the asset value of a stock is the same thing as cash. When people see a share of Google that's trading at \$900, they'll just assume that's \$900 in real money. However, cash and asset value are nothing alike. They are from two entirely different worlds of our reality.

As of September 2017, the NASDAQ and NYSE had a combined value of over \$30 trillion and growing—and here I am, talking about the imminent demise of the stock market. The reason why this astronomical number and potential future market growth doesn't concern me is that a \$30 trillion market value means investors believe they are entitled to possess \$30 trillion in real money. But there is only \$1.6 trillion of cash circulating in the US economy, and \$3.8 trillion in existence in the entire US economic system, which includes the money in your wallet right now. If the \$30 trillion of market value, or even a fraction of it, had any truth to it, we should be able to close the market tomorrow and send investors home happy with their stocks and all that value. But, we all know what would really happen. If the market closed tomorrow, every investor holding stocks would be in a world of hurt trying to realize the value of their stocks without the inflow of cash from new investors. Stocks are priced in terms of cash, but they are virtually worthless unless they can be converted into cash.

The third fallacy is the idea that the stock market is positive-sum for investors and the system produces more wins than losses. This idea is essential to the existence of the investment finance industry because it lets

finance firms label their products and services as investing rather than gambling.

If you look at the SEC's website, you will find blatantly contradictory information. In one area, they define a Ponzi scheme as:

“An investment fraud that involves the payment of purported returns to existing investors from funds contributed by new investors.”

But in another area they advertise the following as a way for investors to make money with stocks:

“Capital appreciation, which occurs when a stock rises in price.”

For people who are unfamiliar with stocks and missed the irony: What the SEC defines as capital appreciation can only be realized through the process of investors buying and selling stocks and exchanging money with each other—which is exactly how the SEC defined a Ponzi scheme.

The biggest scams are legal in practice. It's the stuff that regulators and newspapers do not focus on because they are constructed from the ideas taught at universities and treated as quotidian positions in the job market. Those who engage in these activities do not look or sound like criminals. They have beautiful offices in prime locations and advanced degrees from respected schools like Harvard, UC Berkeley, MIT, and the like. They are female, male, young, old, Asian, White, Black, Hispanic, Middle Eastern. They have great work ethics, and most of them are not bad people. But good people can do bad things without realizing it—and intelligent people can choose to remain ignorant of their own reality.

The thing that really hit home was knowing that there was someone else out there who didn't think like the rest of the industry did—and realizing that sometimes the entire world really is crazy. Just because you think differently doesn't mean you are wrong. My critics will say this is the work of a conspiracy theorist, and my words are more likely to bring trouble than success. But, the annoying thing about truth is, it's hard to ignore after you see it. And, it really bothers me when our world's biggest scam artists are lauded as the world's wisest investors and innovators. Now, the nice thing about truth is, it's not concerned with criticism. Truth is grounded in logic, and logic will transcend the test of time. Whether people realize the truth today, tomorrow, or centuries from now, the truth in these pages will be realized because knowledge evolves towards what is true.

“HB had been reporting 18% annual returns. Their performance chart looked like a smooth, upward slope with no volatility, jumps, or dips. But where was this profit coming from? They issued loans rolled up with fees, but all they were doing was lending out money. Nothing was paid back. They started financing policies in late 2006, so when I went to work there in 2007, the two-year loans had not come due yet. How could they be reporting these fantastic profits when none of the loans had been paid back?”

The answer is: it was recorded with a process called accrual accounting. HB was reporting unrealized phantom profits in real time on the assumption that it would materialize in the future. It turns out that such a smooth, upward-sloping line on a performance chart can only be created with accrual accounting, as the profits reported are assumed, and therefore, are not subject to any real gains and losses. Applying the accrual accounting process to a more transparent business would be like a restaurant that reports profits every month for two years without selling any food. Then, on the last day, expects to sell enough food to make up for what they reported over the two-year period. It seems ludicrous when we apply this accounting process to a real business, but it is the norm for convoluted investment transactions, like premium financing and other esoteric financial strategies.

Accrual accounting lets firms account for imaginary profits in real time, even when there is no guarantee it will ever materialize in the future. Two essential conditions make this type of accounting possible: One, the asset has to be illiquid, and two, the asset has to be difficult to price. This makes the assumed value of the asset impossible to validate and refute, which essentially allows the fund manager to mark the value of the asset according to his or her imagination.

“The lines between investing and gambling are artificial and thin. Maybe the best definition of investing is gambling with the odds in your favor.”

Investing: A scenario where the odds are quantitatively defined and favorable for the investor (favorable meaning greater than 50% success rate).

Gambling: A scenario where the odds are quantitatively defined and not favorable for the investor (equal to or less than 50% success rate), or a scenario where the odds cannot be quantitatively defined at all.

There is no definitive way of calculating the odds of success in the stock market, and therefore, stocks and stock-related instruments are all different forms of gambling.

At one point, Deutsche Bank wanted to set up a synthetic life settlement market that cut out the insurance companies altogether. They tried to construct a portfolio that tracked the lives of a few thousand people and let investors bet on when they were going to die. As ridiculous as this idea sounds, it would be a good thing in the sense that it would give financial institutions a way to gamble on artificial insurance products and keep them away from real insurance products that affect those who need insurance. But like most financial innovations, it's all just another way for people to shuffle money. It gives people in finance something to do, but it serves no purpose for society as a whole.

“Everything we did felt like gambling . The stuff I learned in school was only good for coming up with intelligent-sounding bullshit that made it sound like we knew what we were talking about: ‘Yes, the equity market is acting a little funny right now. But stocks tend to behave a little strange when we’re looking at an inverted yield curve in the bond market. But that’s all right. The important thing is what’s happening in commodities. We’re not seeing any contango, and as long as oil is moving inversely against stocks, it’ll act as a nice hedge for any portfolio.’ It sounds intelligent, which is why the monkeys on CNBC can debate these points all day, but it’s all bullshit.

The analysis techniques from school were useless. The biggest problem with the information in textbooks is that they all had fixed assumptions. Factors like the interest rates, discount rates, and correlation were all fixed values that were given to you. If you plug those things into a formula and execute a process the right way, you’ll get a definitive answer. But in the real world, those fixed assumptions are not fixed . At any given moment, the Federal Reserve can announce a change in the interest rate and the correlation between two assets can move from positive to negative.”

The reason why people keep throwing money into Wall Street is because they believe in the ‘Idea of Investing,’ which basically says that it’s possible to make money with money—let your money work for you—and it can be done in an intelligent way that is safe and fundamentally different from gambling. The idea of investing creates a demand for investment services,

but this idea is also entirely artificial and unproven. As a society, we've learned to accept the idea of investing as a normal part of life—we work; we save; we invest for retirement, college, et cetera—but if we traced the origin of investment profits, we would also see that the idea is extremely illogical. We can break down the stock investment process with a physical example because cash, the only thing investors care about, can be physical and, for the most part, is finite.

Think of the investment system as a bucket and common stocks as paper napkins. Throw the napkins into the bucket with \$100 of real cash. Spin the bucket around, mix it up, shake it up, and ask, 'How can we get \$110 of cash out of that bucket?' The simple answer is, we can't. The paper that makes contact with cash doesn't miraculously turn into cash, and the cash inside the bucket won't magically multiply. The only way to get \$110 out of that bucket is if someone else puts in another \$10—and that someone else is pretty much always another investor who wants to get back more money than they put in.

Stock value appreciation strategies—buy low, sell high—assume that the source of profits come from an infinite pool of money created by the stock market and that it is available to anyone with the right tools. But the stock market is not an infinite pool of money that people can draw from. Money that is taken out of the market comes from the pockets of other investors. There is no such thing as a magic bucket that can turn synthetic instruments into real cash. The money that people see in their stock investment accounts is not real; it does not exist, which is why those balances can rise and fall sharply at any given moment.

The obvious way to investigate the positive-sum assumption for stocks is to add up all the cash profits and losses from investors over the years and see if the net balance is positive. This is also where we run into a big problem: no one knows how much money investors have lost in the stock market. There is no database that keeps track of investor losses, and from what I understand, the industry doesn't want to track such data either.

“Are you kidding me? Wall Street would never let it happen. That would make everything we're doing look extremely questionable.”

It's obvious that people in finance have made a lot of money from the stock market, and so have the companies that issue the stocks. But what we don't know is whether or not investors—the ones who are contributing all the money—have made money from the stock market, or if the system is even positive-sum. The burden of proving the positive-sum assumption

rests with the finance professionals and academics. They are the ones who make money from selling stocks and stock-related services, so they have the responsibility of showing why it is favorable for the investors who are paying their fees. This is also something they have never done before. On the other hand, critics of the stock market do not have to show why the system is illegitimate or negative-sum because it is an artificial system that shuffles cash and ambiguous promises, something that is extremely questionable to begin with—and something that remains false until proven true. This clarification of responsibility for the burden of proof is obvious but necessary. Finance professionals tend to ignore the obvious.

“Long hours in finance don’t mean shit. All the extra hours we work are spent thinking up ways to gamble, ways to shuffle other people’s money, and new ways to take other people’s money.”

The published works in math and physics have helped advance our understanding of technology and medicine with tangible results. The published works in finance are developed to help the industry shuffle other people’s money and collect fees, at best, or create economic, societal, environmental disasters, at worst.

Finance professionals are some of the most “productive” and “industrious” people in the world, but unlike other industries, there is little evidence their efforts will lead to anything of value. If you give a janitor or dentist an extra hour to work, they will provide a more sanitary environment or a happier patient. If you give a financial analyst extra time to work, they might come up with a scheme that leads to the next financial crisis. Make no mistake about it: the collapse of 2008 and every financial crisis before it and after it could not have happened without an army of financial professionals working overtime in the years leading up to it.

“So if you got a client who bought stock at \$8 and now sits at \$16, and he’s all fucking happy. He wants to cash in. Liquidate. Take his fucking money and run home. YOU DON’T LET HIM DO THAT! Because that would make it REAL! NO! What do you do? You get another brilliant idea. A special idea. Another ‘situation,’ another stock—to reinvest his earnings and then some. And he will, every single time, because they are fucking addicted. And you just keep doing this, again and again and again. Meanwhile, he thinks he’s getting shit rich, which he is—on paper. But you and me, the brokers. We’re taking home cold-hard cash via commission, motherfucker.”

“Education makes the wise slightly wiser, but it makes the fool vastly more dangerous.”

A few years ago, I watched a finance professor at the University of Chicago start his Introduction to Asset Pricing class by showing a graph:

“This is if you invested one dollar in 1926 in stocks and how much money you would have at each date (without inflation). If your great-grandfather or grandmother put one dollar in stocks in 1926, you would have about \$250 Real Dollars today.”

This is a common example used in many Introduction to Finance courses. It's meant to show how people can make money from stocks and make the stock market appear positive-sum. But this example is also entirely flawed. The first problem is how the professor did not consider all the investors that are involved. He describes how an early investor in 1926 can buy into the market for \$1 and cash out for \$250 a little less than a century later, and live happily ever after. However, he does not consider the fact that a new investor is also going to be down \$250. The professor's technique of concluding stories prematurely on a high note, and focusing on the winners, is common in finance and it can make any shady scenario look positive-sum.

The second problem, and the more important one, is the universal error of assuming asset value as a cash equivalent. The professor says “money” and “real dollars” when he is referring to an assumed asset value and not ‘money’ or ‘real dollars’ at all. His chart does not represent “how much money you would have at each given date.” It represents how much money the early investor from 1926 thinks he is entitled to at each given date. But in reality, the investor is really down \$1 because that is how much he paid for the stock. The universal error of not distinguishing the difference between an assumed asset value and cash gives people a false perception of reality.

Tangible goods like a house take time, labor, and resources to reproduce. They are difficult to replicate and finite in quantity. On the other hand, imaginary things like stocks can be issued by anyone. They are easy to replicate and can be infinite in quantity. Ultimately, it's all about legitimacy. A real estate transaction has legitimacy because the value of the property is backed by the physical value of the property itself. The value of a dollar has legitimacy because the value is backed by the United States government (and you need it to pay taxes to that government). The value of a bond is also legitimate because there is a defined entity that is responsible for repaying the face value of the bond. However, the value of stocks has no legitimacy because neither the underlying company or anyone else has any obligations to repay the shareholders anything.

Bubbles are positive feedback loops. It starts when any group of stocks begin to rise. The updraft encourages more people to buy the stocks, which causes more media coverage, which causes even more people to buy, which creates big profits for early stockholders. The successful investors tell you at cocktail parties how easy it is to get rich, which causes the stocks to rise further, which pulls in larger and larger groups of investors. But the whole mechanism is a kind of Ponzi scheme. People in finance will agree that bubble scenarios are created with a Ponzi-like process. But what is the real difference between a bubble scenario and what finance professionals call normal growth? What is actually causing the appreciation in stock prices? The only difference between the bubble and growth scenario is speed—how fast the prices are rising. But speed does not cause the inflation in stock prices. It just implies that the inflation is happening quickly. The thing responsible for the rising stock prices in both bubble and growth scenarios is additional cash from new investors.

The majority of the stock market is made up of common stocks, which are basically notes with the company's name on them, but they don't guarantee any dividends or payments. In some cases, like with Google's class C shares, which make up the majority of the company's shares, they don't even come with voting rights. Common stock shareholders are not entitled to any operational profits from the business, and the only practical way investors can make money is by selling their shares to other investors using the Ponzi process. There are exceptions, of course. Companies like Microsoft and McDonald's have a history of paying regular dividends—whether the amounts paid are reasonable compared to the profits the companies earn can be subjective, but they do pay their investors on a regular basis. However, these are exceptions, and we can't use exceptions to generalize what is the norm for common stocks in the overall market.

Finance people will argue that all common stockholders do have a "claim" to dividends, but this is not a legitimate claim. There is a difference between something that can happen versus something that is legitimately likely to happen. In practice, most public companies never pay dividends because they are not obligated to. They can always make up an excuse for why they can't pay, and there are enough fine print and legal loopholes in their documents to let them get away with it. This is why companies like Google, which is about as mature and successful as a public company can get, have never paid dividends. A shareholder's "claim" to dividends is meaningless because the normal practice is: public companies do not pay dividends, and shareholders receive nothing from the business.

A common stock in the open market is treated like a game of hot potato among investors. It gets passed around from player to player, no one wants

to hold it as an end product, and every player wants more money back than they put in. The companies that issued the stocks often won't contribute any money to the game, but they'll encourage the frenzy from the sidelines with phrases like 'We're going to make our share value grow and our shareholders happy!' This is why I refer to common stocks as Ponzi assets.

According to historians, the first stocks came into existence in the early 1600s in Europe, and the first joint-stock companies were in the shipping and trade business. The fact that the first stocks were related to the shipping industry was not a coincidence. If you think about it, shipping was an expensive and risky business that also had very low hands-on work involvement by owners. The owners secured the financing, but they didn't have to go on the long voyages themselves. It was a situation where ownership and operation were divorced. It was an ideal situation for silent investors—people who want to own a business without getting their hands dirty. And naturally, in return, investors also expected to receive a portion of the business profits.

Back then, people didn't get involved in something that didn't pay dividends. It is documented that companies like the Dutch East India Company—which was also believed to be the first joint-stock company to issue stocks—and the South Seas Company paid annual dividends that yielded between 12%–62%. This means if the stock was \$100 a share, the investor would receive anywhere between \$12–\$62 for every share he or she owned every year. This shows that the first public companies didn't just pay dividends, but they paid reasonable and regular dividends. Those companies didn't pay something unscheduled and trivial, they shared a reasonable amount of profits with their investors and paid them on a regular basis. It shows how vital dividends were for the investors. And, it also shows how much the underlying companies respected their investors' participation, ownership, and profit-sharing agreement.

The practice of paying dividends was not unique to early European stocks; it was also the norm for American companies until the twentieth century. Virtually all stock returns during the 1800s came from dividends, not capital gains. The behavior of financial markets in the 1800s, because of the returns to investors, was fundamentally different before and after 1914. One reason why dividends were important was that most people invested in bonds at the time and thought stocks were risky. Dividends weren't just important to the early European investors; they were an intrinsic part of early US stocks as well.

There are two ways investors can make money with stocks: dividends and capital gains. These two profiteering methods are fundamentally different. Profits from dividends come from the business, whereas profits from

capital gains come from other investors. This is a material difference that regulators and people in finance ignore, but it is literally the difference between legitimate investment profits and Ponzi profits, and the difference between a real equity instrument and a gambling instrument. If you eliminate dividends from stocks, the stock becomes a fundamentally different financial instrument. History clearly shows that stocks were designed to pay dividends. But today, the common stocks that are being sold to investors behave nothing like the way stocks are supposed to function. The early stocks before the 1900s were indeed real equity instruments because they paid dividends. They had a legitimate connection to the business because investors' profits came from the business. The early stocks were not just Ponzi assets that investors traded; the money investors made was directly dependent on the success of the underlying businesses. There's even evidence that says the very first stock market crash, which took place in London in 1720, was triggered after the South Seas Company missed its dividend payment.

Sure, investors at the time also made money speculating on capital gains; however, their profit was not entirely dependent on the Ponzi process like it is now. Dividends were not just a source of profit for investors—they were not just an ornamental accessory when the idea of the stock was first conceived. Dividends were an essential component that legitimized stocks as real equity instruments in a company. It established a connection between stocks and the underlying businesses through a profit-sharing agreement. History shows that dividends made stocks legitimate investment instruments. Dividends were the primary source of profits for investors, and the only reason the first investors invested in stocks. The presence of dividends in an investment is also in-line with what we expect from basic intuition and logic: If people invest in a company, then they should expect to receive a share of the profits from the business they own. Frankly, it would be a little disturbing if the investors didn't expect it.

Stocks are transferable securities, so there's always the possibility of making money through capital gains. But capital gains were meant to be a secondary source of profit for the investment—a side bet from selling legitimate equity instruments that paid dividends. The possibility of earning capital gains does not bridge a connection between the stock and the underlying company. It does not legitimize stocks as real equity instruments because it does not establish a genuine investment and profit-sharing relationship between the shareholders and the business. The legitimacy of stocks as an equity instrument is dependent on dividends, not capital gains. There is nothing in history that shows stocks were designed around the idea of capital gains, nor is it logical to think that an owner of a company is not

entitled to any profits from the underlying business. Investors back then weren't stupid. They wouldn't have gambled on the new stock investment instrument if there was no profit sharing agreement or legitimate promise of repayment from the underlying company. Investors would have invested in government bonds, which they were familiar with and the idea of stocks would have been dead on arrival. Stocks came into existence because of dividends, and stocks without dividends are nothing more than Ponzi assets.

The common stocks that dominate the stock market today are not equity instruments—they are a mutated form of what legitimate equity instruments once were. When people refer to stocks as equity instruments now, it is nothing more than a false, artificial label. The same people who think common stocks are legitimate equity instruments are also the same people who know nothing about the real history of stocks. They are unaware of the fundamental differences between the early stocks when the idea of the joint-stock company was first conceived, and the common stocks that dominate the market now. The early stocks were legitimate equity instruments because they paid dividends, and the common stocks today are Ponzi assets because they don't.

If, when discussing retirement plans with Mom and Dad, Dad were to pull out a dusty binder full of baseball cards and say, 'This should get us through,' you'd look at him with horror. Yet if he were to pull out the latest statement from his broker, you'd be relieved. You shouldn't be.

Regulating the current system properly is easy. All we have to do is apply some common sense:

Dividends: If companies are profitable, they have to share the profits with their investors. If a company is not profitable and cannot pay dividends, then their stocks cannot be transferred and traded for Ponzi profits.

Vocabulary: Firms cannot be allowed to use the word 'invest' when they are selling unproven gambles.

Clawbacks: Finance professionals cannot be allowed to keep the money they never earned. If they lose money for their clients, they have to give back all the money they took in the process—all fees and commissions. From the CEOs to the analysts, everyone has to give back everything they took.

The clawback idea is meant to place the finance industry under the same logical principle that applies to other industries, by not rewarding incompetence and failure. If you hire a plumber to fix the sink, and he ends

up destroying your entire kitchen, chances are you won't owe the plumber any money, and he will be liable for the damages. Without clawbacks, finance professionals can destroy a lot of kitchens, get paid, get new clients and destroy more kitchens. The former CEO of Bear Sterns, Alan Schwartz, received a total compensation of \$37.3 million in 2006 and he was listed as one of Fortune's 25 Highest-paid men. After his firm collapsed in 2008, Alan admitted to a Financial Crisis Inquiry Commission:

“I believe that we've never believed we had the ability to predict the next market movement.”

Alan is now a managing partner at the financial services firm Guggenheim Partners. Some people will say, ‘But clawbacks can seriously deter people from working in the finance industry.’ And yes, that is exactly what clawbacks are meant to do. It is a rule that is designed to deter people from stockjobbing and gambling away other people's money. If a service cannot provide something of value to the consumer, then that service has no reason to exist. When people sell unproven gambles as investments it becomes a scam. Gambling is not a fraudulent activity, it's just a risky one. Gambling is only fraudulent when it is sold as an investment, and this type of sales is the backbone of the investment finance industry.

Dividends, gambling, and clawbacks are ideas that can help reform the current system. However, these ideas aren't new, and will probably only have a temporary effect even if they are implemented. Of course, these ideas are worth trying again, especially now with the awareness of the universal error. But, I'm more in favor of abolishing the stock market system altogether. My conclusion, which may not be the correct or best conclusion, is that a meaningful way to reform the system might not exist. On one hand, there's nothing wrong with the idea of breaking up a company into smaller shares of equity, and I don't think the idea of a joint-stock company will ever disappear. However, history clearly shows us that the existence of this simple and pure idea will breed people who will devise ways to game the system for their own benefit, and in the process, diminish the economic benefits the system is designed to produce. Even if Wall Street goes through major reforms, with enough time, people will find loopholes and ways to corrupt it.

On the other hand, it is clear that no one can pull \$30 trillion out of their ass to bail out the current investors, and this bomb is only going to get bigger over time. The stock market is built on fallacies and imagination. There is nothing logical or sustainable about it, and I can't see the current system surviving another millennium. I do not see all the details on the

path to its destruction, but I believe it will implode and vanish at some point in the future. I did not write this to criticize the investment system. I wrote it to show how the features of the stock market meet the definition of a Ponzi scheme, and make a case for why the biggest scam in the history of our species should be dismantled. An economy without a stock market might sound inconceivable right now, but I think it's a reality we will have to face sooner or later. One way or another, investors will realize the stocks they are holding will never yield its cash equivalent. Despite how tranquil and nice things seem right now—and possibly for years or even decades to come—the messy business of dealing with the trillions in imaginary value will reveal itself. If Ponzi schemes are destined to collapse, then so will the market systems that share the same mechanics and logic.

One thing even finance people will agree with is that it's not a matter of 'if' the stock market will crash again but 'when.' I don't know when the next crash will happen or what the experts will blame it on, but I'm certain the crashes we've witnessed thus far are just symptoms of a disease—foreshadowing something far more destructive. At some point there will be one magnificent crash that will end the stock market permanently. The market will not be able to bounce back from it because unlike the dot-com crash or the housing bubble—which were blamed on indirect issues like failing businesses and bad loans—this last unrecoverable crash will be the result of something direct and fundamental: investors pulling their money out of the system as they realize the reality and how their wealth is tied to the massive Ponzi scheme we now call the stock market. Little by little, the reality of it all will sink in, and over time, it will become impossible to ignore. This final crash will change the face of our economic and financial system. Its destruction is unimaginable, but we will evolve from it. Hopefully.

There is something fundamentally wrong with an industry that has convinced investors they are entitled to \$30 trillion that doesn't exist. There is something fundamentally wrong with an industry that sells imaginary products without any proof of their legitimacy or value. And there is something fundamentally wrong with an industry that pays people unimaginable amounts of money for creating absolutely nothing. I have no doubt that centuries from now, kids in middle school will study our history and say:

“People didn't know the difference between \$30 trillion of imaginary money and real currency? They actually believed colorful charts on screens could help them gamble? They just completely ignored the history of stocks, all the market crashes, and the lack of academic proofs? Were people really that stupid?”

Looking back, we now realize that a functioning economy is not dependent on the barbaric practice of trading people like property. Over time, we will also realize that it is not dependent on trading cash for unaccountable promises.

Junk Economics

A society's analytic concepts determine the kind of reality it creates. That is why parasites start by taking control of their host's brain. Neoliberal enzymes aim to sedate the industrial host into believing that the financial sector is part of the real economy, not external to it and extractive. That is the first myth. Modern national income and GDP accounting formats treat tollbooth systems and other rent seeking as "output." Bankers claim to obtain their salaries and bonuses by "creating wealth" (adding to GDP). But they demand to be rescued by taxpayer bailouts (or new central bank money creation) when the bubble that they finance bursts, dispelling the economic fictions they have created. The "service" that bankers claim to provide—managing the economy's money in ways that increase prosperity—turns out to be a neo-rentier economy based on unearned wealth and income.

A second myth is that all debts can be paid without deranging social values and polarizing economies by transferring property to creditors. This fiction is maintained by denying the tendency for debts to grow exponentially beyond the ability to be paid out of current income. An illusion is fostered that paying creditors by selling off public infrastructure will add to productivity and efficiency. The reality is rent seeking.

A parallel financial myth is that corporate raiders "create wealth" by pump-and-dump tactics of stock buybacks and higher dividend payouts instead of long-term investment. Financial lobbyists use these myths to numb popular awareness that today's overgrowth of debts can be paid only by imposing widespread poverty. As a cover story for their asset grabs, creditor elites cloak themselves in a libertarian denunciation of governments as being reckless by running budget deficits and central banks for monetizing public spending into the economy. Public investment, regulatory checks, and progressive taxation are accused of being deadweight overhead. By ignoring the degree to which banks lend to inflate prices for real estate, stocks, and bonds, this ideology aims to persuade voters to let rentiers dismantle progressive government and reverse centuries of democratic reform. High finance seeks to appoint its representatives to run the central bank, Treasury, and key regulatory agencies instead of elected administrators governing in the economy's long-term interest.

Structural Changes Since the 80s

1. Interest rates, which determine prices for bonds, stocks, and real estate

PRE-1980: Steady rise to a peak of 20%, causing bond prices and other asset prices to fall.

POST-1980: Falling interest rates fuel a bull market in bonds that extends to stocks and real estate.

2. Wage levels

PRE-1980: Steady rise in real wages and living standards, especially under “guns and butter” policy.

POST-1980: Stagnant real wages, with more being paid for debt service, housing, and Social Security taxes.

3. Political philosophy

PRE-1980: Social democratic policy: a rising government role, and “Keynesian” public spending as counter-cyclical stabilization.

POST-1980: Neoliberal deregulation and privatization, dismantling social spending programs and public infrastructure investment.

4. Tax philosophy

PRE-1980: Progressive income taxation, and taxing of real estate and financial wealth.

POST-1980: Tax shift off real estate and other FIRE-sector wealth and high incomes onto wage earners (heavier FICA tax) and consumers (sales taxes and value-added tax).

5. Wealth and income distribution

PRE-1980: Trend toward more equal distribution of wealth and income.

POST-1980: Widening polarization of wealth and income in the hands of the One Percent.

6. Bank regulation

PRE-1980: Separation of retail banking and speculative investment banking under Glass Steagall.

POST-1980: Repeal of Glass Steagall in 1999 lets Wall Street create holding companies to absorb commercial banks, savings banks, and S&Ls. From Chile to the post-Soviet Union, bank subsidiaries control industrial affiliates in grupos and conglomerates.

7. Law enforcement

PRE-1980: Prosecution of financial fraud and crime, especially after the S&L crisis of the 1980s.

POST-1980: Decriminalization of financial and accounting fraud, especially under Eric Holder.

8. Pension planning

PRE-1980: Wages deferred in the form of defined-benefit pension plans to provide retirement security, mainly by investment in the stock market. (Pension-fund finance capitalism.)

POST-1980: Pension plans downsized into defined-contribution plans or wiped out in bankruptcy. Money managers invest pensions in LBOs and financial speculation.

9. Accounting and the quality of statistics

PRE-1980: Strong government regulation ensures accurate financial and economic statistics. Arthur Andersen closed down for its role in Enron's fraud.

POST-1980: "Mark to model" accounting and off-balance-sheet subsidiaries ("Enron-style") make corporate statistics increasingly unrealistic in order to avoid taxes.

10. Debtor/creditor legislation

PRE-1980: Increasingly humanitarian treatment of debtors via lenient bankruptcy laws and debt forgiveness.

POST-1980: Personal bankruptcy is made more difficult as the debt overhead rose for households, business, and government. Indebted governments are coerced to privatize the public domain by selling it to rent-extracting private buyers.

11. International trade and finance

PRE-1980: The trade balance normally reflects competition based on relative prices and costs of living.

POST-1980: Costs for labor and industry increasingly reflect interest, land rent, monopoly rent and other FIRE-sector dynamics, not direct production costs.

What's so pernicious about the morality of debt is the way that financial imperatives constantly try to reduce us all, despite ourselves, to the equivalent of pillagers, eyeing the world simply for what can be turned into money—and then tell us that it's only those who are willing to see the world as pillagers who deserve access to the resources required to pursue anything in life other than money.

The neo-rentier objective is threefold: to reduce economies to debt dependency, to transfer public utilities into creditor hands, and then to create a rent-extracting tollbooth economy. The financial objective is to block governments from writing down debts when bankers and bondholders over-lend. Taken together, these policies create a one-sided freedom for rentiers to create a travesty of the classical Adam Smith view of free markets. It is a freedom to reduce the indebted majority to a state of deepening dependency, and to gain wealth by stripping public assets built up over the centuries.

In place of classical political economy, today's foundation myth is that all income and wealth is earned productively—as if there were no economic rent (unearned income) as a legacy of feudalism's rentier privileges, and no inherited wealth or insider giveaways. Yet these have been the shaping forces of history. That is why they were the focal point of classical political economy—to free society from such privileges and bias.

A rising element of cost in the modern world reflects the pricing of infrastructure services. Public investment traditionally has sought to minimize such costs. But banking viewed great infrastructure projects such as railroads and canal building—capped by the Panama and Suez Canals—as major opportunities to profiteer at the economy's expense. Underwriting fees and speculative gains have been as important as interest extraction, while fraud and kleptocracy always have been rife. That is how America's railroad barons, monopolists, and trust builders became the nation's power elite a century ago, and how post-Soviet oligarchs seized public assets after the neoliberal 1991 “reforms.” This is what makes financialization antithetical to classical economy's value and price theory.

Privatization of public utilities, like water and railways, a hallmark policy of neoliberalism, decisively favours rentier income.

Most European countries kept basic infrastructure in the public domain—roads and railroads, communications, water, education, health care and pensions—so as to minimize the economy's cost of living and doing business by providing basic services at cost, at subsidized rates, or even freely. The financial sector's aim is not to minimize the cost of roads, electric power, transportation, water, or education, but to maximize what can be charged as monopoly rent.

The United States was early to privatize railroads, electric and gas utilities, phone systems, and other infrastructure monopolies, but regulated them through public service commissions to keep prices for their services in line with the basic costs of production. Yet since the 1980s these natural infrastructure monopolies have been taken out of the public domain and privatized with little regulation. The pretense is that by financing privatization

of public enterprises, bank credit and financialized management help make economies more efficient. Thatcherism has been a disaster, most notoriously in the former Soviet economies since 1991; Carlos Slim's telephone monopoly in Mexico; US pharmaceutical companies and cable TV. The reality is that debt service (interest and dividends), exorbitant management fees, stock options, underwriting fees, mergers, and acquisitions add to the cost of doing business. Financial lobbyists have re-defined free markets as freedom from public ownership or regulation.

It was not industry but railroads—which European countries kept in the public domain—that provided the basis for America's stock market, which was used largely to create trusts and monopolies. Its heroes were insiders gaining fortunes by stock market raids, politicking for land giveaways, manipulating stock prices and issuing bonds to themselves and, of course, friendly politicians and lawmakers. As matters have turned out, this is the financial system that has won the struggle for survival.

Most futurists a century ago believed that public regulation was needed to keep predatory finance and rent-seeking in check. But bankers and financiers successfully instituted a deregulatory economic philosophy and have seized control of governments to use its money-creating power to subsidize high finance, while leaving creditors “free” to stifle the economy's real growth with debt deflation.

Today's financial interests denounce public regulation and rentier taxes as socialism. But ‘socialism’ was not initially a term of invective for classical theorists. John Stuart Mill was called a Ricardian socialist because classical economists were moving toward reforms they themselves characterized as social—and hence, as socialist. Most reformers referred to themselves as socialists of one kind or another, from Christian socialists to Marxist socialists and reformers across the political spectrum. The question was what kind of socialism free market capitalism would evolve into.

The Reform Era leading up to World War I expected the natural evolution of industrial capitalism to steer savings, wealth, credit, and new money creation productively. Like other natural monopolies or special privileges, finance was to become a public utility, situated in the public domain or at least alongside a public banking option. Instead, the past century's expansion of predatory credit has been reinforced by de-taxing interest, land rent, financial speculation, debt leveraging, and “capital” (asset-price) gains. At issue is what the economy does with the surplus of productive capacity and savings over and above its break-even needs. Industrial profits are being diverted away from new capital investment to support stock market prices and enrich the One Percent. Instead of using financialized wealth to build up the economy, managers are diverting corporate income and bank lending

mainly to increase the market price of their assets, and to build up their financial claims on the economy in the form of debts owed to banks and bondholders.

The financial sector now occupies the dominant position that landlords did in times past. Debt service plays the extractive role that land rent did. Unlike the rental income that landlords were assumed to inject into the economy for luxuries and new capital investment, creditors recycle most of their receipt of interest into new loans. This increases the debt burden without raising output or living standards.

Wall Street paints its activities in as positive a light as possible, as if to justify its enormous salaries as being earned productively rather than at the economy's expense. This smiley-face picture also serves to rationalize its tax breaks and, most recently, its bailouts. Academic models echo a view of the stock and bond markets raising funds mainly for new industrial investment, innovation, and employment, while making savers richer. Yet finance rarely ever in history has played a productive role funding capital formation in industrial plants and equipment or research and development. Since antiquity, workshops and factories, farms and other capital assets traditionally have been self-financed. Until the early Industrial Revolution the means of production were owned outright. The idea of productive credit to finance new investment in means of production was an alien concept down through the mid-nineteenth century, and even then the investment was mainly for railroads and canals, not industry. Credit arrangements were used to bridge the time gap between production and sale, between planting and harvesting, and especially for commerce over large distances. But not to invest in manufacturing.

This strategy remains in effect today. Most US and European corporations pay for their capital investment out of their current earnings, not by borrowing from bondholders or banks. The financial system extends credit mainly to buy property already in place, from real estate (the focus of most bank lending today) to entire companies. This shift in ownership adds to debt without increasing output, merely transferring ownership. Existing stockowners are bought out by new owners who issue high-interest bonds and borrow takeover loans from banks. And corporations borrow increasingly to buy up their own stock, and even to pay dividends, creating gains by inflating asset prices.

Financial sector advocates have sought to control democracies by shifting tax policy and bank regulation out of the hands of elected representatives to nominees from the world's financial centers. The aim of this planning is not for the classical progressive objectives of mobilizing savings to increase productivity and raise populations out of poverty. The objective of finance

capitalism is not capital formation, but acquisition of rent-yielding privileges for real estate, natural resources, and monopolies. These are precisely the forms of revenue that centuries of classical economists sought to tax away or minimize. By allying itself with the rentier sectors and lobbying on their behalf—so as to extract their rent as interest—banking and high finance have become part of the economic overhead from which classical economists sought to free society.

To promote this tax shift and debt leveraging, financial lobbyists have created a smokescreen of deception that depicts financialization as helping economies grow. They accuse central bank monetizing of budget deficits as being inherently inflationary—despite no evidence of this, and despite the vast inflation of real estate prices and stock prices by predatory bank credit.

Instead of acknowledging the reality of predatory rentier behavior, financial lobbyists depict lending as being productive, as if it normally provides borrowers with the means to make enough gain to pay. Yet little such lending has occurred in history, apart from investing in trade ventures. Most bank loans are not to create new means of production but are made against real estate, financial securities, or other assets already in place. The main source of gain for borrowers since the 1980s has not derived from earnings but seeing the real estate, stocks, or bonds they have bought on credit rise as a result of asset-price inflation—that is, to get rich from the debt-leveraged Bubble Economy.

The key to making money from money is for creditors to lend it at interest. Most families today simply seek to break even each month while carrying their home mortgage, student loan, and an auto loan if they need to drive to work. Merely avoiding further credit-card debt is a victory in coping with their immediate economic demands. More affluent borrowers hope to realize speculative gains from real estate, and the economy's wealthiest layer uses hedge funds to raid corporations or, more recently, to buy real estate at distress prices. The common hope is to ride the wave of asset-price inflation for real estate, stocks, or bonds bought on credit.

A financial bubble is the kind of inflation that Wall Street loves, in contrast to wage and commodity price inflation. A bubble raises the price of financial assets and property relative to living labor, and the power of inheritance over non-heirs. Asset-price inflation is the primary dynamic explaining today's polarization of wealth and income. Yet most newscasts applaud daily rises in the stock averages as if the wealth of the One Percent, who own the great bulk of stocks and other financial assets, is a proxy for how well the economy is doing. What actually occurs is that financing corporate buyouts on credit factors interest payments and fees into the prices that companies must charge for their products. Paying these financial charges

leaves less available to invest or hire more labor. Likewise for the overall economy, the effect of a debt-leveraged real estate bubble and asset-price inflation is that interest payments and fees to bankers and bondholders leave less available to spend on goods and services. The financial overhead rises, squeezing the real economy and slowing new investment and hiring. Wealth created by rising asset prices fueled by interest-bearing debt thus sucks income out of labor and industry.

The financial sector's greatest trick has been to convince the 99 Percent that "the economy" can be judged by how well it benefits the One Percent. Mainstream media echo Federal Reserve speeches to convince the public that saving the banks meant saving the indebted economy—by giving banks a large enough bailout to start lending again. It was as if what labor and industry needed to survive was more borrowing to pay their debt service, not a debt writedown.

All this is contrary to what classical economists urged. Their objective was for governments elected by the population at large to receive and allocate the economic surplus. Presumably this would have been to lower the cost of living and doing business, provide a widening range of public services at subsidized prices or freely, and sponsor a fair society in which nobody would receive special privileges or hereditary rights.

There is a great deal of confusion about the nature of the financial sector in a modern economy. The financial industry plays an essential function in processing payments, providing insurance, allowing families to save for the future, and allocating capital to those who want to invest or borrow. However, the services it provides are almost entirely intermediate goods in that they facilitate economic activity; they are not end products that provide benefits in and of themselves, like housing, health care, or education. In this regard the financial sector is like the trucking industry. Trucking, like finance, is essential to the economy. We need it for moving raw material to factories and finished products to stores. But an efficient trucking industry is a small trucking industry: we want to have as few resources as possible devoted to getting goods from point A to point B. This means that we don't want to see a huge expansion in employment in the trucking industry or an explosion in the number of trucks and warehouses just to move the same quantity of goods. The same story applies to the financial industry. We should want to see as few resources as possible committed to it, the minimum needed to enable it to support the productive economy. Instead, we have seen a massive expansion of the financial sector, from 4.5 percent of GDP in 1970 to 7.4 percent in 2015.

We don't benefit from having more types of financial instruments and derivatives unless these instruments make it easier to accomplish one of the

sector's functions. Similarly, we don't benefit from more frequent trading of stocks, bonds, or other assets unless the additional trading somehow leads to better allocation of capital or makes our savings more secure.

A basic point of economic theory that economists don't like to talk about is that reducing the rents going to a high-income person is a gain for the rest of us. This is a crucial point, since it is necessary to recognize that policies designed to reduce the incomes of high-end earners are not just a matter of being gratuitously nasty to those who were lucky enough to be successful. Whether or not these policies are nasty, it is important to recognize that the money enjoyed by these high-end earners comes from somewhere; it is not manna from heaven. And where it comes from is often the pockets of the rest of us.

Imagine a person who has a huge annual income without doing any productive work. He is an extremely successful counterfeiter, supporting himself by printing \$1 billion a year in high-quality counterfeit bills. No one recognizes the bills are counterfeit, and so he can spend this money in the same way as anyone else. At first glance, we might be inclined to think this counterfeiter is an asset to the economy. After all, he spends his money employing people to build and maintain his house and grounds. He provides jobs when he buys cars, boats, and other consumption goods, or eats lavish meals at expensive restaurants. Perhaps he even starts a foundation that helps to finance children's health care or other useful ventures. This counterfeiter looks like a great job creator and a socially minded person who gives poor children a chance. If this story made sense then the best economic policy would be to train people to become effective counterfeiters. But it doesn't make sense; there is a big problem in this picture.

With his money, the counterfeiter is diverting resources that would have otherwise been available to the rest of us. The classic story would be that the counterfeiter is bidding up wages and the prices of various goods and services that are in short supply. This would lead to inflation. The Federal Reserve Board would then respond to this inflation by raising interest rates. Higher interest rates would reduce demand for housing and discourage investment and consumption. If we take the classic story strictly, the increased spending by our counterfeiter would be fully offset by reductions in other spending elsewhere in the economy. Our counterfeiter has effectively found a way to tax the rest of us with his fake bills.

Actually, there is an important exception. When the economy is below "full employment" then our counterfeiter would be doing a public service. In that situation, we need increased demand in the economy. Ideally, the government would take responsibility for boosting demand and would increase spending in areas like infrastructure and education that provide

benefits to the country as a whole. But if the government was unwilling to take steps to boost demand, then the counterfeiter would be providing a public service. His personal spending patterns may not be the best way to boost demand and create jobs, but it does have this positive effect.

Keep the counterfeiter in mind when assessing any argument about the rents earned by CEOs, Wall Street traders, and other high-end earners. If these people actually contribute an amount of output equal to their earnings, then they are not pulling resources from the rest of us. In other words, if individual CEOs or Wall Street traders actually add \$30 million to the economy with their work, then we have additional output that corresponds to their \$30 million annual income. They may even add more than \$30 million to the economy, effectively making the rest of us wealthier. However, if they add less than \$30 million, then their income comes to some extent at the expense of the rest of us. In the extreme case, where the highly paid CEO or Wall Street trader adds nothing to the economy's output, they are in an identical situation to the counterfeiter. Their income is a pure drain on the economy, which must come out of the pockets of the rest of us.

As a practical matter, most high-end earners are probably not like the counterfeiter who does nothing productive—though they probably share much of his harms—but insofar as they are paid more than is necessary for their services, their excess pay does come at the expense of the rest of us. This means that if a CEO is paid \$30 million, but someone else would do as good a job for one half or one third of the pay, then the rest of us are effectively subsidizing this person's pay. The channels through which the money goes from the rest of us to the high-end earners may not always be clear, but their good fortune nonetheless imposes a cost on the rest of us.

The financial sector earns rents at the expense of the rest of the economy in five main areas:

1. As the cost of trading stocks, bonds, and other financial assets has declined over the last four decades with the development of computers and the Internet, trading volume has exploded and a variety of complex financial instruments have been created. Despite the sharp decline in costs, the amount of money spent on trading has nearly quintupled relative to the size of the economy. The increased volume and complexity of trading have not in any obvious way improved the allocation of capital or made financial markets more stable. They have, however, made many hedge fund partners and traders at large banks extremely wealthy.
2. Since lenders assume the government will act to support large financial institutions if they get into trouble, large banks enjoy the benefits of

implicit too-big-to-fail insurance, which enables them to borrow at lower interest rates than would be justified by their financial situations. In 2014, the IMF valued the implicit subsidy at \$25 billion to \$50 billion annually.

3. Often, tasks that could be performed more efficiently by the government are instead parceled out to the financial sector. If the privately-run defined contribution pension system were run as efficiently as the Thrift Savings Plan for federal employers, perhaps \$50 billion a year in rent—a low-range estimate—could be put to productive uses.
4. The financial industry is able to take advantage of consumers through complex and deceptive contracts. At one time many debit card issuers charged large overdraft fees without telling customers they faced these charges. Though this practice has since been banned by the Federal Reserve Board—customers must now opt for overdraft coverage, supposedly knowing the fees they face—there are many other areas where the industry imposes terms that most consumers would likely not agree to if they understood them.
5. Tax shelters have long been a mechanism for corporations and wealthy individuals to escape tax liability. But often overlooked is the tax shelter industry itself, where the individuals and corporations that engineer the tax shelters receive large rents. This is a major source of profits for the private equity industry, which has great expertise in gaming the tax code.

The immediate effect of eliminating hundreds of billions of dollars of waste in the financial sector through a financial transactions tax and cracking down on abuses by the industry would be similar to the effect of shutting down a massive counterfeiting operation. The counterfeiting operation both directly employs people to print money and get it into circulation. It also indirectly employs people based on the spending of the counterfeiters. Exposing the bills as counterfeits will put all these people out of work. Nonetheless, shutting down counterfeiters is still considered to be good economic policy. The assumption is that the people now employed as a result of the fake bills will instead be reemployed in the real economy. Eliminating waste in finance that isn't facilitating the working of the productive economy has the same impact as shutting down counterfeiters. It should lead to clear benefits as a whole, even if there are short-term costs as people need to adjust to an economy where they are not dependent on the spending of the counterfeiters or high-flyers in the financial industry.

It is generally less clear to ordinary workers that they stand to gain by measures that limit the incomes of those at the top. They may see such efforts as vindictive, rather than as an essential part of a policy to reduce inequality. If the high-end earners have enough market power to protect their income, then direct efforts to boost the incomes of those at the middle and bottom will ultimately prove largely futile by exactly the logic described above. Suppose that the CEOs, Wall Street traders, highly paid medical specialists, and the rest are able to fully protect their income against any increase in prices. In other words, their pay increases by enough to fully offset any additional expenses they must pay to sustain their standard of living. Imagine in this case that unions are able to successfully add another 10 percent of the workforce to their ranks and then push up wages for this big chunk of the workforce. Other things equal, this will lead to higher prices and therefore higher inflation. If the Fed is committed to an anti-inflation policy, it will raise interest rates sharply. This will push people out of work and put downward pressure on the wages of a large segment of the workforce.

It is possible that newly unionized workers end up better off in this story, but that will not be the case for low- and middle-income workers generally. Insofar as the unionized workers benefit, it will be at the expense of other comparably situated workers. That is, unless there is an actual cut in the income of those at the top. For this reason, pushing down the incomes of the rich is not a question of vindictiveness; it is a necessary condition for creating the possibility of broadly based wage growth. If doctors, lawyers, CEOs, and Wall Street-types are paid less, then we should see lower prices for a wide range of goods and services. And this means higher real wages.

The main remedies some propose are a wealth tax—especially on inherited estates—and a return to steeper progressive income taxation. The idea of taxing higher income brackets more without regard for whether their gains are earned “productively” or in extractive rentier ways represents a victory in dissuading critics from focusing on the policy aim of Adam Smith and other classical economists: preventing “unearned” income from being obtained in the first place. They recognized not only that rentier revenue (and capital gains) is earned in a predatory and unproductive way, but also that land rent, monopoly rent and financial charges are mainly responsible for the rising wealth of the One Percent as compared to that held by the rest of society.

Smith generalized the concept of rent as passive, unearned income—and used the labor theory of value to extend this idea to finance as well as land ownership:

“The labour and time of the poor is in civilized countries

sacrificed to the maintaining of the rich in ease and luxury. The landlord is maintained in idleness and luxury by the labour of his tenants. The moneyed man is supported by his exactions from the industrious merchant and the needy who are obliged to support him in ease by a return for the use of his money. But every savage has the full enjoyment of the fruits of his own labours; there are no landlords, no usurers, no tax gatherers.”

What makes classical economics more insightful than today’s mainstream orthodoxy is its focus on wealth ownership and the special privileges used to extract income without producing a corresponding value of product or service. Most inequality does not reflect differing levels of productivity, but distortions resulting from property rights and other special privileges. Distinguishing between earned and unearned income, classical economists asked what tax philosophy and public policy would lead to the most efficient and fair prices, incomes, and economic growth.

The largest banks, brokerage houses and money managers have no interest in promoting popular understanding that what they are touting as a road to prosperity is really a path to their own gains. Consequently, they back academic theory reassuring people that every crash (“self-correcting cyclical downturn”) leads to a recovery that will carry homeowners and other debtors to new heights—as long as the 99 Percent retain “confidence” (a euphemism for gullibility) in the system and let Wall Street insiders jump ship first.

Why haven’t democracies been able to convince politicians to subordinate the financial sector to serve industrial prosperity instead of siphoning off its gains? What happened to the century of classical economics that created policies to avert this fate? Economics has fallen prey to learned ignorance and trained incapacity making it unable to cope with the most pressing problems at hand. Decorated with complex mathematics as if it were an objective natural science, mainstream economics has become a lobbying effort to dismantle government power to regulate and tax rentiers. Well-subsidized models promote a trickle-down rationalization for the status quo, as if it were produced by inexorable economic laws. Free market ideologues then reason backward to construct a logic “proving” that economies become lower-cost and more efficient by lowering wage levels, removing taxes on wealth, cutting back public spending, and privatizing infrastructure monopolies.

In the resulting symbiosis between bankers and other rentiers, debt is created mainly to purchase rent-extracting privileges and other rent-yielding properties, turning their economic rent into interest and related financial fees. Nearly all new credit since 1980 has been extended to the FIRE sector—credit to transfer ownership of assets while running the economy into debt,

not to create new wealth. The fatal assumption is that making money by debt leveraging or kindred engineering is as productive as investing in new means of production. The intended effect is to leave financial management to technocrats, who turn out to be bank lobbyists toting around a few academics as useful idiots embedded in well-subsidized think tanks. Much as the oil industry subsidizes Junk Science to deny how carbon emissions contribute to global warming, so Wall Street subsidizes Junk Economics to deny that debt pollution plunges economies into chronic austerity and unemployment. Their conclusion is that no public regulation is needed, and no cleanup charges to compensate for the damage being caused.

Today's vested interests fight viciously to suppress their concept of economic rent and the associated distinction between earned and unearned income. It would save today's reformers from having to reinvent the methodology of what constitutes fair value. Censoring or rewriting the history of economic thought aims at thwarting the logic for taxing rent-yielding assets.

Taxing land rent would collect what nature provided freely (sunlight and land) and hence what should belong to the public sector as the tax base.

Low property tax is largely responsible for the heavy debt burden on real estate, because whatever the tax collector relinquishes is available to be paid to banks as debt service.

Rentiers have a love-hate relationship with inflation; when money gets cheaper, the interest they are paid is worth less: lending a \$1,000 for a year at 3% interest when inflation is 3% means that their unearned income is effectively zero. But low or near-zero real interest rates are good news for borrowers, and good for the economy because they minimize the deadweight costs. Not surprisingly, powerful rentier interests lean on governments to prioritize limiting inflation. Of course, since borrowers are also consumers, unless their incomes keep abreast of inflation, they lose out from inflation on the prices of consumer goods. The neoliberal governments of the 1980s and 1990s covertly supported rentiers by publicly supporting consumers' interests in price stability. But there's one kind of inflation that rentiers love: asset inflation; this is neoliberalism's dirty secret. It redistributes wealth from those who lack assets and have to rely on earned income to those who have them and can use them to get unearned income.

The buyer who takes out the biggest mortgage to pay the bank the most gets the asset. So real estate ends up being worth whatever banks will lend against it.

Now that land ownership has been democratized—on credit—a majority of most populations (two-thirds in the United States, and over four-fifths in Scandinavia) no longer pay rent to landlords. Instead, homeowners and commercial property investors pay most of the rental value to bankers as

mortgage interest. In the United States, bankers obtain about two-thirds of real estate cash flow, largely by reducing property taxes. The more the financial sector can reduce the government's tax take, the more rent is available for new buyers to pay interest to banks for loans to buy property. This explains why the financial sector backs anti-tax "Tea Party" protests.

As labor's wages rose above subsistence levels a century ago, economic futurists depicted a post-industrial leisure economy. Left out of account was that the passport to middle-class status involved democratizing property ownership and education on credit, driving labor into debt to buy housing and, more recently, to get an education.

Money creation is now monopolized by banks, which use this power to finance the transfer of property—with the source of the quickest and largest fortunes being infrastructure and natural resources pried out of the public domain of debtor countries by a combination of political insider dealing and debt leverage—a merger of kleptocracy with the world's financial centers.

Instead of central banks monetizing deficit spending to help the economy recover, they create money mainly to lend to banks for the purpose of increasing the economy's debt overhead. Since 2008 the US Federal Reserve has monetized at least \$4 trillion in Quantitative Easing credit to banks. The aim is to re-inflate asset prices for the real estate, bonds, and stocks held as collateral by financial institutions (and the One Percent), not to help the real economy recover.

For the past eight centuries the political aim of value theory has been to liberate nations from the three legacies of feudal Europe's military and financial conquests: land rent, monopoly pricing, and interest. Land rent is what landlords charge in payment for the ground that someone's forbears conquered. Monopoly rent is price gouging by businesses with special privileges or market power. These privileges were called patents: rights to charge whatever the market would bear, without regard for the actual cost of doing business. Bankers, for instance, charge more than what really is needed to provide their services.

The history of property acquisition is one of force and political intrigue, not labor by its existing owners. The wealthiest property owners have tended to be the most predatory—military conquerors, landed aristocracies, bankers, bondholders, and monopolists. Their property rights to collect rent for land, mines, patents, or monopolized trade are legal privileges produced by the legal system they control, not by labor. Medieval land grants typically were given to royal companions in return for their political loyalty.

When Argentina suffered a massive default in 2001, the global press, including *Time* and the *New York Times*, went so far as to propose that Patagonia be ceded from the country as a defaulted debt payment mechanism.

The New York Times article followed one published in the Buenos Aires financial newspaper *El Cronista Comercial* called “Debt for Territory,” which described a proposal by a US consultant to then-president Eduardo Duhalde for swapping public debt for government land.

Downsizing finance will not, in itself, avert the threatened privatization of the post office, water systems, roads, and communication, or cure the high cost of privatized medical insurance and other infrastructure. Once you remove the debt drain and rentier burden from industrial capitalism it will still leave in place the familiar old class tensions between employers and their workers. This will still leave the familiar labor problems of industrial capitalism—the fight to provide fair working conditions and basic necessities to all citizens, as well as to avoid war, environmental pollution, and other social strains.

However, the rise of financial power is working against all these objectives, preventing society from healing itself. Hooking traumatized labor on the debt treadmill is a major factor deterring workers from pressing for wage increases and better workplace conditions. Without resolving the debt overhead and providing a public option for banking services, the other problems are made much worse.

Who Owns Who?

Open-Air Debtors' Prisons

“If you owe the bank a hundred-thousand dollars, the bank owns you. If you owe the bank a hundred-million dollars, you own the bank.”

—American Proverb

L. Frank Baum's book, *The Wonderful Wizard of Oz*, which appeared in 1900, is widely recognized to be a parable for the Populist campaign of William Jennings Bryan, who twice ran for president on the Free Silver platform—vowing to replace the gold standard with a bimetallic system that would allow the free creation of silver money alongside gold. As with the Greenbackers, one of the main constituencies for the movement was debtors: particularly, Midwestern farm families such as Dorothy's, who had been facing a massive wave of foreclosures during the severe recession of the 1890s. According to the Populist reading, the Wicked Witches of the East and West represent the East and West Coast bankers (promoters of and benefactors from the tight money supply), the Scarecrow represented the farmers (who didn't have the brains to avoid the debt trap), the Tin Woodsman was the industrial proletariat (who didn't have the heart to act in solidarity with the farmers), the Cowardly Lion represented the political class (who didn't have the courage to intervene). The yellow brick road, silver slippers, emerald city, and hapless Wizard presumably speak for themselves. 'Oz' is of course the standard abbreviation for ounce. Some have even suggested that Dorothy herself represents Teddy Roosevelt, since syllabically, 'dor-o-thee' is the same as 'thee-o-dor,' only backwards.

As an attempt to create a new myth, Baum's story was remarkably effective. As political propaganda, less so. William Jennings Bryan failed in three attempts to win the presidency, the silver standard was never adopted, and few nowadays even remember what *The Wonderful Wizard of Oz* was originally supposed to be about.

Debt is a social relation between lender and borrower, not merely a sum of money. Put like that, it may seem too obvious to mention, but we easily forget it in a world where debt is an ‘asset’ that can be bought and sold and can become an object of financial speculation, and where we read of debts as pure quantities—often of astronomical size—with little or no indication of who owes what to whom. Historically, the most important form that this social relation takes is between those who have spare cash and those who lack cash. In such cases, the economic inequality between the relatively rich and the relatively poor is a precondition of the debt relation being set up in the first place.

If the real interest rate—interest after adjusting for inflation—is zero, then the transaction is at least equal, even if the context that prompted it is not. But if the real rate of interest is positive, the inequality increases because repayments exceed the amount borrowed, and in effect the lender can take advantage of the relative weakness of the debtor. Unless the debtor defaults, when the loan is paid off the net flow of money is from the poor to the rich. Interest payments thus allow the better-off to Hoover up money from those with low incomes. On a global scale, loans—usually called aid—to Third World countries produce a net flow from poor countries to rich: in 2005 an estimated \$40.4 billion of aid to the very poorest countries yielded \$43.2 billion in debt service.

While rates of interest that merely compensate for inflation could be argued as reasonable, so that the value of the money that’s repaid to the lender is the same as that of the loan in the first place, the more rates of interest exceed the rate of inflation, the more unacceptable they are.

“All that we had borrowed up to 1985 was around \$5 billion, and we have paid about \$16 billion; yet we are still being told that we owe about \$28 billion. That \$28 billion came about because of the injustice in the foreign creditors’ interest rates. If you ask me, what is the worst thing in the world? I will say it is compound interest.”

—Olusegun Obasanjo

I met a girl. As it happened, she didn’t actually know what the IMF was, so I offered that the International Monetary Fund basically acted as the world’s debt enforcers—“You might say, the high-finance equivalent of the guys who come to break your legs. Think of them as Economic Hitmen.” I launched into historical background, explaining how, during the ‘70s oil crisis, OPEC countries ended up pouring so much of their newfound riches into Western banks that the banks couldn’t figure out where to invest the

money; how Citibank and Chase therefore began sending agents around the world trying to convince Third World dictators and politicians to take out loans (at the time, this was called “go-go banking”); how they started out at extremely low rates of interest that almost immediately skyrocketed to 20 percent or so due to tight US money policies in the early ‘80s; how, during the ‘80s and ‘90s, this led to the Third World debt crisis; how the IMF then stepped in to insist that, in order to obtain refinancing, poor countries would be obliged to abandon price supports on basic foodstuffs, or even policies of keeping strategic food reserves, and abandon free health care and free education; how all of this had led to the collapse of all the most basic supports for some of the poorest and most vulnerable people on earth. I spoke of poverty, of the looting of public resources, the collapse of societies, endemic violence, malnutrition, hopelessness, and broken lives.

“But what was your position?” she asked.

“About the IMF? We wanted to abolish it.”

“No, I mean, about the Third World debt.”

“Oh, we wanted to abolish that too. The immediate demand was to stop the IMF from imposing structural adjustment policies, which were doing all the direct damage, but we managed to accomplish that surprisingly quickly. The more long-term aim was debt amnesty. Something along the lines of the biblical Jubilee. As far as we were concerned,” I told her, “thirty years of money flowing from the poorest countries to the richest was quite enough.”

“But,” she objected, as if this were self-evident, “they’d borrowed the money! Surely one has to pay one’s debts.” It was at this point that I realized this was going to be a very different sort of conversation than I had originally anticipated. Where to start? I could have begun by explaining how these loans had originally been taken out by unelected dictators who placed most of it directly in their Swiss bank accounts, and ask her to contemplate the justice of insisting that the lenders be repaid, not by the dictator, or even by his cronies, but by literally taking food from the mouths of hungry children. Or to think about how many of these poor countries had actually already paid back what they’d borrowed three or four times now, but that through the miracle of compound interest, it still hadn’t made a significant dent in the principal. I could also observe that there was a difference between refinancing loans, and demanding that in order to obtain refinancing, countries have to follow some orthodox free-market economic policy designed in Washington or Zurich that their citizens had never agreed to and never would, and that it was a bit dishonest to insist that countries adopt democratic constitutions and then also insist that, whoever gets elected, they have no control over their country’s policies anyway. Or that the economic policies imposed by the IMF didn’t even

work. But there was a more basic problem: the very assumption that debts have to be repaid.

“Well, I know that sounds like common sense,” I said, “but the funny thing is, economically, that’s not how loans are actually supposed to work. Financial institutions are supposed to be ways of directing resources toward profitable investments. If a bank were guaranteed to get its money back, plus interest, no matter what it did, the whole system wouldn’t work. Say I were to walk into the nearest branch of the Royal Bank of Scotland and say ‘You know, I just got a really great tip on the horses. Think you could lend me a couple million quid?’ Obviously they’d just laugh at me. But that’s just because they know if my horse didn’t come in, there’d be no way for them to get the money back. But, imagine there was some law that said they were guaranteed to get their money back no matter what happens, even if that meant, I don’t know, selling my daughter into slavery or harvesting my organs or something. Well, in that case, why not? Why bother waiting for someone to walk in who has a viable plan to set up a laundromat or some such? Basically, that’s the situation the IMF created on a global level—which is how you could have all those banks willing to fork over billions of dollars to a bunch of obvious crooks in the first place.”

‘Surely one has to pay one’s debts’—the reason it’s so powerful is that it’s not actually an economic statement: it’s a moral statement. After all, isn’t paying one’s debts what morality is supposed to be all about? Giving people what is due them. Accepting one’s responsibilities. Fulfilling one’s obligations to others, just as one would expect them to fulfill their obligations to you. What could be a more obvious example of shirking one’s responsibilities than reneging on a promise, or refusing to pay a debt? It was that very apparent self-evidence, I realized, that made the statement so insidious. This was the kind of line that could make terrible things appear utterly bland and unremarkable.

This may sound strong, but it’s hard not to feel strongly about such matters once you’re aware of the effects. In the highlands of Madagascar there was an outbreak of malaria. It was a particularly virulent outbreak because malaria had been wiped out in highland Madagascar many years before, so that, after a couple of generations, most people had lost their immunity. The problem was, it took money to maintain the mosquito eradication program, since there had to be periodic tests to make sure mosquitoes weren’t starting to breed again and spraying campaigns if it was discovered that they were. Not a lot of money. But owing to IMF-imposed austerity programs, the government had to cut the monitoring program. Ten-thousand people died. Young mothers grieving for lost children. One might think it would be hard to make a case that the loss of ten-thousand

human lives is really justified in order to ensure that Citibank wouldn't have to cut its losses on one irresponsible loan that wasn't particularly important to its balance sheet anyway. But here was a perfectly decent woman—one who worked for a charitable organization no less—who took it as self-evident that it was. After all, they owed the money, and surely one has to pay one's debts.

The very fact that we don't know what debt is, the very flexibility of the concept, is the basis of its power. If history shows anything, it is that there's no better way to justify relations founded on violence, to make such relations seem moral, than by reframing them in the language of debt—above all, because it immediately makes it seem that it's the victim who's doing something wrong. Mafiosi understand this. So do the commanders of conquering armies. For thousands of years, violent men have been able to tell their victims that those victims owe them something. If nothing else, they 'owe them their lives'—a telling phrase—because they haven't been killed.

Debt is not just victor's justice; it can also be a way of punishing winners who weren't supposed to win. The most spectacular example of this is the history of the Republic of Haiti—the first poor country to be placed in permanent debt peonage. Haiti was a nation founded by former plantation slaves who had the temerity not only to rise up in rebellion, amidst grand declarations of universal rights and freedoms, but to defeat Napoléon's armies sent to return them to bondage. France immediately insisted that the new republic owed it 150 million francs in damages for the expropriated plantations, as well as the expenses of outfitting the failed military expeditions, and all other nations, including the United States, agreed to impose an embargo on the country until it was paid. The sum was intentionally impossible (equivalent to about 18 billion dollars), and the resultant embargo ensured that the name 'Haiti' has been a synonym for debt, poverty, and human misery ever since.

In a region of the eastern Himalayas, where as recently as the 1970s, the low-ranking castes—they were referred to as “the vanquished ones,” since they were thought to be descended from a population once conquered by the current landlord caste, many centuries before—lived in a situation of permanent debt dependency. Landless and penniless, they were obliged to solicit loans from the landlords simply to find a way to eat—not for the money, since the sums were paltry, but because poor debtors were expected to pay back the interest in the form of work, which meant they were at least provided with food and shelter while they cleaned out their creditors' outhouses and reroofed their sheds. For the “vanquished”—as for most people in the world, actually—the most significant life expenses were

weddings and funerals. These required a good deal of money, which always had to be borrowed. In such cases it was common practice for high-caste moneylenders to demand one of the borrower's daughters as security. Often, when a poor man had to borrow money for his daughter's marriage, the security would be the bride herself. She would be expected to report to the lender's household after her wedding night, spend a few months there as his concubine, and then, once he grew bored, be sent off to some nearby timber camp, where she would have to spend the next year or two as a prostitute working off her father's debt. Once it was paid off, she'd return to her husband and begin her married life. Where's this shit in your economics textbook?

The bulk of the national debts of England, France, and the others were based in money borrowed not to dig canals and erect bridges, but to acquire the gunpowder needed to bombard cities and to construct the camps required for the holding of prisoners and the training of recruits. Almost all the bubbles of the eighteenth century involved some fantastic scheme to use the proceeds of colonial ventures to pay for European wars. Paper money was debt money, and debt money was war money, and this has always remained the case. Those who financed Europe's endless military conflicts also employed the government's police and prisons to extract ever-increasing productivity from the rest of the population.

The conquest of the Americas began with mass enslavement, then gradually settled into various forms of debt peonage, African slavery, and "indentured service"—that is, the use of contract labor, workers who had received cash in advance and were thus bound for five-, seven-, or ten-year terms to pay it back. Needless to say, indentured servants were recruited largely from among people who were already debtors. In the 1600s there were at times almost as many white debtors as African slaves working in southern plantations, and legally they were at first in almost the same situation, since in the beginning, plantation societies were working within a European legal tradition that assumed slavery did not exist, so even Africans in the Carolinas were classified as contract laborers.

Of course this later changed when the idea of 'race' was introduced. And when African slaves were freed, they were replaced, on plantations from Barbados to Mauritius, with contract laborers again—though now ones recruited mainly in India or China. Chinese contract laborers built the North American railroad system, and Indian "coolies" built the South African mines. The peasants of Russia and Poland, who had been free landholders in the Middle Ages, were only made serfs at the dawn of capitalism, when their lords began to sell grain on the new world market to feed the new industrial cities to the west. Colonial regimes in Africa and Southeast Asia regularly

demanded forced labor from their conquered subjects, or alternately, created tax systems designed to force the population into the labor market through debt. British overlords in India, starting with the East India Company but continuing under Her Majesty's government, institutionalized debt peonage as their primary means of creating products for sale abroad.

This is a scandal not just because the system occasionally goes haywire but because it plays havoc with our most cherished assumptions about what capitalism really is—particularly that, in its basic nature, capitalism has something to do with freedom. For the capitalists, this means the freedom of the marketplace. For most workers, it means free labor. Marxists have questioned whether wage labor is ultimately free in any sense—since someone with nothing to sell but his or her body cannot in any sense be considered a genuinely free agent—but they still tend to assume that free wage labor is the basis of capitalism. And the dominant image in the history of capitalism is the English workingman toiling in the factories of the industrial revolution, and this image can be traced forward to Silicon Valley, with a straight line in between. All those millions of slaves and serfs and coolies and debt peons disappear, or if we must speak of them, we write them off as temporary bumps along the road. Like sweatshops, this is assumed to be a stage that industrializing nations had to pass through, just as it is still assumed that all those millions of debt peons and contract laborers and sweatshop workers who still exist, often in the same places, will surely live to see their children become regular wage laborers with health insurance and pensions, and their children, doctors and lawyers and entrepreneurs.

The Atlantic slave trade can be imagined as a giant chain of debt-obligations, stretching from Bristol to Calabar to the headwaters of the Cross River, where the Aro traders sponsored their secret societies; just as in the Indian Ocean trade, similar chains connected Utrecht to Capetown to Jakarta to the Kingdom of Gelgel, where Balinese kings arranged their cockfights to lure their own subjects to gamble their freedom away. In either case, the end product was the same: human beings so entirely ripped from their contexts, and hence so thoroughly dehumanized, that they were placed outside the realm of debt entirely.

But the end of the slave trade did not stop the enslavement. One the most famous and disturbing cases was the great Putumayo scandal of 1909–1911, in which the London reading public was shocked to discover that the agents of the subsidiary of a British rubber company operating in the Peruvian rainforest had created their very own Heart of Darkness, exterminating tens of thousands of Huitoto Indians—who the agents insisted on referring to only as “cannibals”—in scenes of rape, torture, and mutilation that recalled the very worst of the conquest four-hundred years earlier.

In the debates that followed, the first impulse was to blame everything on a system whereby the Indians were said to have been caught in a debt trap, made completely dependent on the company store:

“The root of the whole evil was the so called patron or ‘peonage’ system—a variety of what used to be called in England the ‘truck system’—by which the employee, forced to buy all his supplies at the employer’s store, is kept hopelessly in debt, while by law he is unable to leave his employment until his debt is paid. The peon is thus, as often as not, a de facto slave; and since in the remoter regions of the vast continent there is no effective government, he is wholly at the mercy of his master.”

The “cannibals” who ended up flogged to death, crucified, tied up and used for target practice, or hacked to pieces with machetes for failure to bring in sufficient quantities of rubber, had, the story went, fallen into the ultimate debt trap; seduced by the wares of the company’s agents, they’d ended up bartering away their very lives. A later Parliamentary inquiry discovered that the real story was nothing of the sort. The Huitoto had not been tricked into becoming debt peons at all. It was the agents and overseers sent into the region who were, much like the conquistadors, deeply indebted—in their case, to the Peruvian company that had commissioned them, which was ultimately receiving its own credit from London financiers. These agents had certainly arrived with every intention of extending that web of credit to include the Indians, but discovering the Huitoto to have no interest in the cloth, machetes, and coins they had brought to trade with them, they’d finally given up and just started rounding Indians up and forcing them to accept loans at gunpoint, then tabulating the amount of rubber they owed. Many of the Indians massacred, in turn, had simply been trying to run away.

In reality, then, the Indians had been reduced to slavery; it’s just that, by 1907, no one could openly admit this. A legitimate enterprise had to have some moral basis, and the only morality the company knew was debt. When it became clear that the Huitoto rejected the premise, everything went haywire, and the company ended up caught in a spiral of indignant terror that ultimately threatened to wipe out its very economic basis.

For most of human history—at least, the history of states and empires—most human beings have been told that they are debtors. Historians, and particularly historians of ideas, have been oddly reluctant to consider the human consequences; especially since this situation—more than any other—has caused continual outrage and resentment. Tell people they are inferior,

they are unlikely to be pleased, but this surprisingly rarely leads to armed revolt. Tell people that they are potential equals who have failed, and that therefore, even what they do have they do not deserve, that it isn't rightly theirs, and you are much more likely to inspire rage.

For the last five-thousand years, with remarkable regularity, popular insurrections have begun the same way: with the ritual destruction of the debt records—tablets, papyri, ledgers, whatever form they might have taken in any particular time and place. After that, rebels usually go after the records of landholding and tax assessments. In the ancient world, all revolutionary movements had a single program: Cancel the debts and redistribute the land.

One might say that these conflicts over debt had two possible outcomes. The first was that the aristocrats could win, and the poor remain “slaves of the rich”—which in practice meant that most people would end up clients of some wealthy patron. Such states were generally militarily ineffective. The second was that popular factions could prevail, institute the usual popular program of redistribution of lands and safeguards against debt peonage, thus creating the basis for a class of free farmers whose children would, in turn, be free to spend much of their time training for war.

Aristotle himself noted the connection when he emphasized that the constitution of a Greek state could be predicted by the main arm of its military: aristocracies if they relied on cavalry (since horses were very expensive), oligarchies in the case of heavy infantry (since armor was not cheap), democracy in the case of light infantry or navies (since anyone could wield a sling or row a boat)

Coinage played a critical role in maintaining this kind of free peasantry—secure in their landholding, not tied to any great lord by bonds of debt. In fact, the fiscal policies of many Greek cities amounted to little more than elaborate systems for the distribution of loot. It's important to emphasize that few ancient cities, if any, went so far as to outlaw predatory lending, or even debt peonage, entirely. Instead, they threw money at the problem. Gold, and especially silver, were acquired in war, or mined by slaves captured in war. Mints were located in temples—the traditional place for depositing spoils—and city-states developed endless ways to distribute coins, not only to soldiers, sailors, and those producing arms or outfitting ships, but to the populace generally, as jury fees, fees for attending public assemblies, or sometimes just as outright distributions, as Athens did most famously when they discovered a new vein of silver in the mines at Laurium in 483 BC. At the same time, insisting that the same coins served as legal tender for all payments due to the state guaranteed that they would be in sufficient demand that markets would soon develop.

Much of our contemporary moral and religious language originally emerged directly from these very conflicts. Terms like ‘reckoning’ or ‘redemption’ are only the most obvious, since they’re taken directly from the language of ancient finance. In a larger sense, the same can be said of ‘guilt,’ ‘freedom,’ ‘forgiveness,’ and even ‘sin.’ Arguments about who really owes what to whom have played a central role in shaping our basic vocabulary of right and wrong. The fact that so much of this language did take shape in arguments about debt has left the concept strangely incoherent. After all, to argue with the king, one has to use the king’s language, whether or not the initial premises make sense. If one looks at the history of debt, then, what one discovers first of all is profound moral confusion. Its most obvious manifestation is that most everywhere, one finds that the majority of human beings hold simultaneously that (1) paying back money one has borrowed is a simple matter of morality, and (2) anyone in the habit of lending money is evil.

What, precisely, does it mean to say that our sense of morality and justice is reduced to the language of a business deal? What does it mean when we reduce moral obligations to debts? What changes when the one turns into the other? And how do we speak about them when our language has been so shaped by the market? On one level the difference between an obligation and a debt is simple and obvious. A debt is the obligation to pay a certain sum of money. As a result, a debt, unlike any other form of obligation, can be precisely quantified. This allows debts to become simple, cold, and impersonal—which, in turn, allows them to be transferable. If one owes a favor, or one’s life, to another human being—it is owed to that person specifically. But if one owes forty-thousand dollars at 12-percent interest, it doesn’t really matter who the creditor is; neither does either of the two parties have to think much about what the other party needs, wants, is capable of doing—as they certainly would if what was owed was a favor, or respect, or gratitude. One does not need to calculate the human effects; one need only calculate principal, balances, penalties, and rates of interest.

If you end up having to abandon your home and wander in other provinces, if your daughter ends up in a mining camp working as a prostitute, well, that’s unfortunate, but incidental to the creditor. Money is money, and a deal’s a deal. From this perspective, the crucial factor is money’s capacity to turn morality into a matter of impersonal arithmetic—and by doing so, to justify things that would otherwise seem outrageous or obscene. The factor of violence may appear secondary. The difference between a debt and a mere moral obligation is not the presence or absence of men with weapons who can enforce that obligation by seizing the debtor’s possessions or threatening to break his legs. It is simply that a creditor has the means

to specify, numerically, exactly how much the debtor owes.

World religions are full of a kind of ambivalence. On the one hand they are outcries against the market; on the other, they tend to frame their objections in commercial terms—as if to argue that turning human life into a series of transactions is not a very good deal. What I think even these few examples reveal, though, is how much is being papered over in the conventional accounts of the origins and history of money. There is something almost touchingly naïve in the stories about neighbors swapping potatoes for an extra pair of shoes. When the ancients thought about money, friendly swaps were hardly the first thing that came to mind. True, some might have thought about their tab at the local ale-house, or, if they were a merchant or administrator, of storehouses, account books, exotic imported delights. For most, though, what was likely to come to mind was the selling of slaves and ransoming of prisoners, corrupt tax-farmers and the depredations of conquering armies, mortgages and interest, theft and extortion, revenge and punishment, and, above all, the tension between the need for money to create families, to acquire a bride so as to have children, and use of that same money to destroy families—to create debts that lead to the same wife and children being taken away.

“Some of our daughters are brought unto bondage already:
neither is it in our power to redeem them.”

One can only imagine what those words meant, emotionally, to a father in a patriarchal society in which a man's ability to protect the honor of his family was everything. Yet this is what money meant to the majority of people for most of human history: the terrifying prospect of one's sons and daughters being carried off to the homes of repulsive strangers to clean their pots and provide the occasional sexual services, to be subject to every conceivable form of violence and abuse, possibly for years, conceivably forever, as their parents waited, helpless, avoiding eye contact with their neighbors, who knew exactly what was happening to those they were supposed to have been able to protect. Clearly this was the worst thing that could happen to anyone—which is why, in the parable, it could be treated as interchangeable with being “turned over to the jailers to be tortured” for life. And that's just from the perspective of the father. One can only imagine how it might have felt to be the daughter. Yet, over the course of human history, untold millions of daughters have known—and in fact many still know—exactly what it's like.

One might object that this was just assumed to be in the nature of things; like the imposition of tribute on conquered populations, it might

have been resented, but it wasn't considered a moral issue, a matter of right and wrong. Some things just happen. This has been the most common attitude of peasants to such phenomena throughout human history. What's striking about the historical record is that in the case of debt crises, this was not how many reacted. Many actually did become indignant. So many, in fact, that most of our contemporary language of social justice, our way of speaking of human bondage and emancipation, continues to echo ancient arguments about debt. It's particularly striking because so many other things do seem to have been accepted as simply in the nature of things. One does not see a similar outcry against caste systems, for example, or for that matter, the institution of slavery. Surely slaves and untouchables often experienced at least equal horrors. No doubt many protested their condition. Why was it that the debtors' protests seemed to carry such greater moral weight? Why were debtors so much more effective in winning the ear of priests, prophets, officials, and social reformers? Why was it that officials like Nehemiah were willing to give such sympathetic consideration to their complaints, to inveigh, to summon great assemblies?

What makes debt different is that it is premised on an assumption of equality. To be a slave, or lower-caste, is to be intrinsically inferior. We are dealing with relations of unadulterated hierarchy. In the case of debt, we are dealing with two individuals who begin as equal parties to a contract. Legally, at least as far as the contract is concerned, they are the same.

If we really want to understand the moral grounds of economic life, and by extension, human life, it seems to me that we must start instead with the very small things: the everyday details of social existence, the way we treat our friends, enemies, and children—often with gestures so tiny (passing the salt, bumming a cigarette) that we ordinarily never stop to think about them at all. Anthropology has shown us just how different and numerous are the ways in which humans have been known to organize themselves. But it also reveals some remarkable commonalities—fundamental moral principles that appear to exist everywhere, and that will always tend to be invoked, wherever people transfer objects back and forth or argue about what other people owe them.

While people will tolerate terrible poverty—and do, daily, all over the world without revolution or war—they will not tolerate a rapid change from economic circumstances they expect to those they don't. Revolutions are most likely to occur when a prolonged period of objective economic and social development is followed by a short period of sharp reversal. Revolution occurs when reality breaks away from anticipated reality.

Workers have been watching their standard of living get whittled away for decades and up till now they had always been able to come up with

ways to get by. The first adjustment they made was when women entered the workforce. Families added that income, you got to keep your boat, or your second car, or your vacation, and everything was OK. Next, people ran up debt on their credit cards. Then, people began pulling home equity out, borrowing against their houses. All three of those things have kept the middle class from having to sink down into abject poverty. But now all three coping mechanisms are at an end. There were no more family members to send to work, the expiration date had passed for the home-equity MasterCard, and still wages sank. Is there a fourth economic savior out there, or do you think that maybe we have reached the end?

Perverted Promises

Economists often encourage us to think of economies as masses of exchanges. I give you this money in exchange for that thing you want to sell. Once we have made the exchange, our obligations to each other are at end. But debt relations are not like this, for they last until they're paid off. This leads us to an argument against usury: interest charges make a claim on the future. Because lending at interest must ultimately be backed by increased output of goods and services, it requires continual growth, though at present the amount of debt far exceeds what economic growth can pay off. In the last forty years, the world has been more successful at creating claims on wealth than it has at creating wealth itself. Which may actually have been a good thing for the biosphere.

At a micro-scale, individual borrowers may be able to pay off interest by cutting their current spending—'accepting austerity,' we might say. But at the scale of a whole economy, things work differently: if many cut their consumption, this means that firms' sales go down, causing them to lay off workers; and those who lose income find it still harder to pay off debts. So government-imposed austerity only makes things worse, stifling the growth that is needed to pay off the debt. Unless debts are canceled—the creditors "take a haircut," as they say in financialese—economic growth is needed to enable debtors to pay off interest. Debt with interest places demands on economies that may be simply unachievable, and are likely to be environmentally unsustainable. And insofar as they control the future, debts project the lenders' dominance into the future.

It seems to me that we are long overdue for some kind of Biblical-style Jubilee: one that would affect both international debt and consumer debt. It would be salutary not just because it would relieve so much genuine human suffering, but also because it would be our way of reminding ourselves that money is not ineffable, that paying one's debts is not the essence of morality, that all these things are human arrangements and that if democracy is to mean anything, it is the ability to all agree to arrange things in a different way. It is significant, I think, that since Hammurabi, great imperial states have invariably resisted this kind of politics. Athens and Rome established the paradigm: even when confronted with continual debt crises, they insisted on legislating around the edges, softening the impact, eliminating obvious abuses like debt slavery, using the spoils of empire to throw all sorts of extra benefits at their poorer citizens, who, after all, provided the rank and file of their armies, so as to keep them more or less afloat—but all in such a way as never to allow a challenge to the principle of debt itself.

The governing class of the United States seems to have taken a remarkably similar approach: eliminating the worst abuses (e.g. debtors' prisons), using the fruits of empire to provide subsidies, visible and otherwise, to the bulk of the population; in more recent years, manipulating currency rates to flood the country with cheap goods from China, but never allowing anyone to question the sacred principle that we must all pay our debts.

If Clean Slates seem so radical as to be nearly unthinkable today, it is mainly because rentier ideology has suppressed awareness of most of civilization's customary proclamations spanning three-thousand years, from Mesopotamia and Egypt to Athens, Sparta, and Judea. Proclaiming Clean Slates to restore economic balance—annulling the accumulation of debts when they grew beyond the ability to be paid—kept pre-Roman civilizations financially stable. Mosaic Law placed this principle at the core of Jewish religion (Leviticus 25). Yet modern Christianity all but ignores the fact that in Jesus's first sermon (Luke 4) he unrolled the scroll of Isaiah and announced his mission to proclaim the Year of the Lord, as the Jubilee Year was known. Under the Ptolemies, the Greek dynasty that ruled Egypt after Alexander, periodic clean slates had become institutionized. It's well known that the Rosetta Stone, written both in Greek and Egyptian, proved to be the key that made it possible to translate Egyptian hieroglyphics. Few are aware of what it actually says. The stela was originally raised to announce an amnesty, both for debtors and for prisoners, declared by Ptolemy V in 196 BC.

It should not be surprising that the lesson of financial history is that debts that can't be paid won't be. The great policy question of our time is how not to pay them: Will nations permit creditors to foreclose and take the public and private assets into their hands, holding populations in bondage? Or will they declare a clean slate and start again?

Debts that can't be paid, won't be. The question is: how won't they be paid? There are two ways not to pay. The most drastic and disruptive way (euphemized as "business as usual") is for individuals, companies, or governments to sell off or forfeit their assets. The second way to resolve matters is to write down debts to a level that can be paid. Bankers and bondholders prefer the former option, and insist that all debts can be paid, given the "will to do so," that is, the will to transfer property into their hands. This is the solution that mainstream monetarist economists, government policy and the mass media popularize as basic morality. But it destroys Economy #1 to enrich the one percent who dominate Economy #2.

The disabling force of debt was recognized more clearly in the eighteenth and nineteenth centuries (not to mention four-thousand years ago in the Bronze Age). This has led pro-creditor economists to exclude the history of

economic thought from the curriculum. Mainstream economics has become pro-creditor, pro-austerity (that is, anti-labor) and anti-government (except for insisting on the need for government bailouts of the largest banks and savers). Yet it has captured Congressional policy, universities, and the mass media to broadcast a false map of how economies work. So most people see reality as it is written—and distorted—by the One Percent. It is a travesty of reality. Spouting ostensible free market ideology, the pro-creditor mainstream rejects what the classical economic reformers actually wrote.

Every economy is planned. The question is, who will do the planning: banks or elected governments? Will planning and structuring the economy serve short-term financial interests (making asset-price gains and extracting rent) or will it promote the long-term upgrading of industry and living standards? Banks denounce public investment and a tax shift off wages onto rentier wealth as “the road to serfdom.” But strong public regulation is needed to prevent economies from polarizing between debtors and creditors, and to block the financial sector from imposing austerity and setting the economy on the road to debt peonage.

What has caused this basic shift away from debt cancellation is the privatization of credit. In Sumer and Babylonia the temples and the palace were the source of credit. In medieval Japan it also was the temples that were the creditors. Most people ran up debts, in Japan, to the temples for sake since the temples were also sake-makers. There were revolts against the sake-makers to cancel the debts, and they were successful.

The problem is the privatization of credit. The government today could cancel the student debts that are owed to the government. But they can't cancel the debts that are owed, say, to David Rockefeller or to other banks—to somebody else. Even the University of Chicago right-wingers, in the 1930s, proposed a 100% reserve. The idea is that banks should not be able to create credit, meaning create debt. When you create credit, you're creating somebody's debt. That should be a government function, because the government can relieve the debts.

The bankruptcy law was re-written in 2005 with the help of Joe Biden. It made it almost impossible to declare bankruptcy. It used to be you could declare bankruptcy and have a clean slate, on an individual basis, not a social basis, but now even that has been closed here. And for student loans you can't have bankruptcy at all.

Modern creditors avert public cancellation of debts (and making banks a public utility) by pretending that lending provides mutual benefit in which the borrower gains—consumer goods now rather than later, or money to run a business or buy an asset that earns enough to pay back the creditor with interest and still leave a profit for the debtor. This scenario of productive

lending does not typify the banking system as a whole. Instead of serving the economy's production trends, the financial sector (as presently organized) makes the economy top-heavy, by transferring assets and income into the hands of an increasingly hereditary creditor class.

Canceling debts was politically easiest when governments or public institutions—temples, palaces, or civic authorities—were the major creditors, because they were canceling debts owed to themselves. This is an argument for why governments should be the main suppliers of money and credit as a public utility.

“Well you're right, that's the problem: How do you popularize it all? What do you do today?”

The first thing is I think you have to frame it in the big picture. The way you get to people is to say: We're at a turning point in history. If we don't solve the problem of economic polarization, which is caused mainly by debt, we're going to go into another dark age. We're going to have neo-feudalism. We're going to have neo-serfdom, except that you're not going to be tied to the land like serfs were. You can live wherever you want, but wherever you are, you're going to have to pay about 40% of your income just for housing. And you're going to have to pay for water, and you're going to have to pay for the other needs. This is the new kind of serfdom. You have to re-frame what the economy is about in a way that people can understand.

And you need a multi-pronged approach to fight on four or five fronts. You need academics so that nobody can say you don't know what you're talking about. You need an organ, a periodical; you need books; you need to make use of the Internet; you need films; and you need a political group. You need to institutionalize this idea and give it a critical mass of coherence, and I think that's what you folks are a part of, right now.

Unless you are very affluent, you can't beat this spiral. You will save, and then they will raise tuition, and you will save, and they will raise tuition. No matter what you do, when the time comes for your child to enroll in college, they will take all your savings, and still demand you put a second mortgage on your house, drain your retirement accounts, or put your child in debt peonage for decades.

If you are affluent enough to save enough to keep pace with the price acceleration, you are benefiting (massively) from the immoral, extreme exploitation of your fellow citizens here, and your fellow humans abroad. So it is in your financial as well as moral interest to push for both free college tuition and a debt jubilee, to free your fellow citizens from financial enslavement and end the cycle of oppression.

There is no version of this paradigm where you have any right to be livid if some people are freed of their financial enslavement. Either freeing them frees you, as well, or freeing them only hurts you because you are one of their captors, and have already benefited only too well from this ugly system.

A debt is just the perversion of a promise. It is a promise corrupted by both math and violence. If freedom—real freedom—is the ability to make friends, then it is also, necessarily, the ability to make real promises. What sorts of promises might genuinely free men and women make to one another? At this point we can't even say. It's more a question of how we can get to a place that will allow us to find out. And the first step in that journey, in turn, is to accept that in the largest scheme of things, just as no one has the right to tell us our true value, no one has the right to tell us what we truly owe.

Impersonal Relations

Death, Honor, Taxes

Why did so many early kingdoms make subjects pay taxes at all? This is not a question we're used to asking. The answer seems self-evident. Governments demand taxes because they wish to get their hands on people's money. But if Smith was right, and gold and silver became money through the natural workings of the market completely independently of governments, then wouldn't the obvious thing be to just grab control of the gold and silver mines? Then the king would have all the money he could possibly need. In fact, this is what ancient kings would normally do. If there were gold and silver mines in their territory, they would usually take control of them. So what exactly was the point of extracting the gold, stamping one's picture on it, causing it to circulate among one's subjects—and then demanding that those same subjects give it back again? This does seem a bit of a puzzle. But if money and markets do not emerge spontaneously, it actually makes perfect sense. Because this is the simplest and most efficient way to bring markets into being.

Let us take a hypothetical example. Say a king wishes to support a standing army of fifty-thousand men. Under ancient or medieval conditions, feeding such a force was an enormous problem—unless they were on the march, one would need to employ almost as many men and animals just to locate, acquire, and transport the necessary provisions. On the other hand, if one simply hands out coins to the soldiers and then demands that every family in the kingdom was obliged to pay one of those coins back to you, one would, in one blow, turn one's entire national economy into a vast machine for the provisioning of soldiers, since now every family, in order to get their hands on the coins, must find some way to contribute to the general effort to provide soldiers with things they want. Markets are brought into existence as a side effect. This is a bit of a cartoon version, but it is very clear that markets did spring up around ancient armies. Despite the dogged liberal assumption—again, coming from Smith's legacy—that the

existence of states and markets are somehow opposed, the historical record implies that exactly the opposite is the case. Stateless societies tend also to be without markets.

It is one thing to explain why early states demanded taxes (in order to create markets). It's another to ask "by what right?" Assuming that early rulers were not simply thugs, and that taxes were not simply extortion—and no Credit Theorist, to my knowledge, took such a cynical view even of early government—one must ask how they justified this sort of thing. Nowadays, we all think we know the answer to this question. We pay our taxes so that the government can provide us with services. This starts with security services—military protection being, often, about the only service some early states were really able to provide. By now, of course, the government provides all sorts of things. All of this is said to go back to some sort of original "social contract" that everyone somehow agreed on, though no one really knows exactly when or by whom, or why we should be bound by the decisions of distant ancestors on this one matter when we don't feel particularly bound by the decisions of our distant ancestors on anything else. All of this makes sense if you assume that markets come before governments, but the whole argument totters quickly once you realize that they don't.

I might note that this assumption echoes the logic of neoclassical economic theory, which assumes that all basic institutional arrangements that define the context of economic activity were agreed to by all parties at some imaginary point in the past, and that since then, everything has and will always continue to exist in equilibrium. Contemporary social contract theorists incidentally make a similar argument, that there's no need to assume that this actually happened; it's enough to say it could have and act as if it did.

Sacrifice is called "tribute paid to Death." Or such was the manner of speaking. In reality, as the priests knew better than anyone, sacrifice was directed to all the gods, not just Death—Death was just the intermediary. Framing things this way, though, did immediately raise the one problem that always comes up, whenever anyone conceives human life through such an idiom. If our lives are on loan, who would actually wish to repay such a debt? To live in debt is to be guilty, incomplete. But completion can only mean annihilation. In this way, the 'tribute' of sacrifice could be seen as a kind of interest payment, with the life of the animal substituting temporarily for what's really owed, which is ourselves—a mere postponement of the inevitable.

More precisely, it offered the sacrificer a way to break out of a world in which everything, including himself, was a creation of the gods, to fashion an immortal, divine body, ascend into heaven, and thus be born into a world

he made himself where all debts could be repaid, to buy back his abandoned mortal body from the gods.

Why were cattle so often used as money? In Homer, when people measure the value of a ship or suit of armor, they always measure it in oxen—even though when they actually exchange things, they never pay for anything in oxen. It is hard to escape the conclusion that this was because an ox was what one offered the gods in sacrifice. Hence they represented absolute value. From Sumer to Classical Greece, silver and gold were dedicated as offerings in temples. Everywhere, money seems to have emerged from the thing most appropriate for giving to the gods.

If the king has simply taken over guardianship of the primordial debt we all owe to society for having created us, this provides a very neat explanation for why the government feels it has the right to make us pay taxes. Taxes are just a measure of our debt to the society that made us. But this doesn't really explain how this kind of absolute life-debt can be converted into money, which is by definition a means of measuring and comparing the value of different things. This is just as much a problem for credit theorists as for neoclassical economists, even if the problem for them is somewhat differently framed. If you start from the barter theory of money, you have to resolve the problem of how and why you would come to select one commodity to measure just how much you want each of the other ones. If you start from a credit theory, you are left with the problem of how to turn a moral obligation into a specific sum of money, how the mere sense of owing someone else a favor can eventually turn into a system of accounting in which one is able to calculate exactly how many sheep or fish or chunks of silver it would take to repay the debt. Or in this case, how do we go from that absolute debt we owe to God to the very specific debts we owe our cousins, or the bartender?

The answer provided by primordial-debt theorists is, again, ingenious. If taxes represent our absolute debt to the society that created us, then the first step toward creating real money comes when we start calculating much more specific debts to society, systems of fines, fees, and penalties, or even debts we owe to specific individuals who we have wronged in some way, and thus to whom we stand in a relation of "sin" or "guilt."

This is actually much less implausible than it might sound. One of the puzzling things about many theories about the origins of money is that they almost completely ignore the evidence of anthropology. Anthropologists do have a great deal of knowledge of how economies within stateless societies actually worked—how they still work in places where states and markets have been unable to completely break up existing ways of doing things. There are innumerable studies of, say, the use of cattle as money in eastern or southern Africa, of shell money in the Americas (wampum being the most

famous example) or Papua New Guinea, bead money, feather money, the use of iron rings, cowries, spondylus shells, brass rods, or woodpecker scalps. The reason that this literature tends to be ignored by economists is simple: “primitive currencies” of this sort is only rarely used to buy and sell things, and even when they are, never primarily to buy and sell everyday items such as chickens or eggs or shoes or potatoes. Rather than being employed to acquire things, they are mainly used to rearrange relations between people. Above all, to arrange marriages and to settle disputes, particularly those arising from murders or personal injury.

There is every reason to believe that our own money started the same way—even the English word ‘to pay’ is originally derived from a word for “to pacify, appease”—as in, to give someone something precious, for instance, to express just how badly you feel about having just killed his brother in a drunken brawl, and how much you would really like to avoid this becoming the basis for an ongoing blood-feud.

Debt theorists are especially concerned with this latter possibility. This is partly because they tend to skip past the anthropological literature and look at early law codes—taking inspiration here, from Philip Grierson, who in the ’70s, first suggested that money might first have emerged from early legal practice. Grierson was an expert in the European Dark Ages, and he became fascinated by what have come to be known as the “Barbarian Law Codes,” established by many Germanic peoples—Goths, Frisians, Franks, and so on—after the destruction of the Roman Empire in the 600s and 700s, soon followed by similar codes published everywhere from Russia to Ireland. Certainly they are fascinating documents. On the one hand, they make it abundantly clear just how wrong are conventional accounts of Europe around this time “reverting to barter.” Almost all of the Germanic law codes use Roman money to make assessments; penalties for theft, for instance, are almost always followed by demands that the thief not only return the stolen property but pay any outstanding rent (or in the event of stolen money, interest) owing for the amount of time it has been in his possession. On the other hand, these were soon followed by law codes by people living in territories—Ireland, Wales, Nordic countries, Russia—that had never been under Roman rule and these are, if anything, even more revealing. They could be remarkably creative, both in what could be used as a means of payment and on the precise breakdown of injuries and insults that required compensation:

“Compensation in the Welsh laws is reckoned primarily in cattle and in the Irish ones in cattle or bondmaids (*cumal*), with considerable use of precious metals in both. In the Germanic

codes it is mainly in precious metal. In the Russian codes it was silver and furs, graduated from marten down to squirrel. Their detail is remarkable, not only in the personal injuries envisioned—specific compensations for the loss of an arm, a hand, a forefinger, a nail, for a blow on the head so that the brain is visible or bone projects—but in the coverage some of them gave to the possessions of the individual household. Title II of the Salic Law deals with the theft of pigs, Title III with cattle, Title IV with sheep, Title V with goats, Title VI with dogs, each time with an elaborate breakdown differentiating between animals of different age and sex.”

This does make a great deal of psychological sense. I’ve already remarked how difficult it is to imagine how a system of precise equivalences—one young healthy milk cow is equivalent to exactly thirty-six chickens—could arise from most forms of gift exchange. If Henry gives Joshua a pig and feels he has received an inadequate counter-gift, he might mock Joshua as a cheapskate, but he would have little occasion to come up with a mathematical formula for precisely how cheap he feels Joshua has been. On the other hand, if Joshua’s pig just destroyed Henry’s garden, and especially, if that led to a fight in which Henry lost a toe, and Henry’s family is now hauling Joshua up in front of the village assembly—this is precisely the context where people are most likely to become petty and legalistic and express outrage if they feel they have received one groat less than was their rightful due. That means exact mathematical specificity, for instance, the capacity to measure the exact value of a two-year-old pregnant sow. What’s more, the levying of penalties must have constantly required the calculation of equivalences. Say the fine is in marten pelts but the culprit’s clan doesn’t have any martens. How many squirrel skins will do? Or pieces of silver jewelry? Such problems must have come up all the time and led to at least a rough-and-ready set of rules of thumb over what sorts of valuable were equivalent to others. This would help explain why, for instance, medieval Welsh law codes can contain detailed breakdowns not only of the value of different ages and conditions of milk cow, but of the monetary value of every object likely to be found in an ordinary homestead, down to the cost of each piece of timber—despite the fact that there seems no reason to believe that most such items could even be purchased on the open market at the time.

There is something very compelling in all this. For one thing, the premise makes a great deal of intuitive sense. After all, we do owe everything we are to others. This is simply true. The language we speak and even think in, our habits and opinions, the kind of food we like to eat, the knowledge that

makes our lights switch on and toilets flush, even the style in which we carry out our gestures of defiance and rebellion against social conventions—all of this, we learned from other people, most of them long dead. If we were to imagine what we owe them as a debt, it could only be infinite. The question is: Does it really make sense to think of this as a debt? After all, a debt is by definition something that we could at least imagine paying back. It is strange enough to wish to be square with one's parents—it rather implies that one does not wish to think of them as parents any more. Would we really want to be square with all humanity? What would that even mean? And is this desire really a fundamental feature of all human thought? Another way to put this would be: Are primordial-debt theorists describing a myth, have they discovered a profound truth of the human condition that has always existed in all societies, and is it simply spelled out particularly clearly in certain ancient texts from India—or are they inventing a myth of their own? Clearly it must be the latter. They are inventing a myth.

If we look through the work of ancient theologians, we find that most were familiar with the idea that sacrifice was a way by which human beings could enter into commercial relations with the gods, but that they felt it was patently ridiculous: If the gods already have everything they want, what exactly do humans have to bargain with? Exchange implies equality. In dealing with cosmic forces, this was simply assumed to be impossible from the start. The notion that debts to gods were appropriated by the state, and thus became the bases for taxation systems, can't really stand up either. The problem here is that in the ancient world, free citizens didn't usually pay taxes. Generally speaking, tribute was levied only on conquered populations. This was already true in ancient Mesopotamia, where the inhabitants of independent cities did not usually have to pay direct taxes at all. Similarly, Classical Greeks looked upon direct taxes as tyrannical and avoided them whenever possible. Taxes were not inevitable and were often seen as marks of conquest.

In other words, Benjamin Franklin was wrong when he said that in this world nothing is certain except death and taxes. This obviously makes the idea that the debt to one is just a variation on the other much harder to maintain.

What makes the concept of society so deceptive is that we assume the world is organized into a series of compact, modular units called 'societies,' and that all people know which one they're in. Historically, this is very rarely the case. Imagine I am a Christian Armenian merchant living under the reign of Genghis Khan. What is 'society' for me? Is it the city where I grew up, the society of international merchants (with its own elaborate codes of conduct) within which I conduct my daily affairs, other speakers of Armenian,

Christendom (or maybe just Orthodox Christendom), or the inhabitants of the Mongol empire itself, which stretched from the Mediterranean to Korea? Historically, kingdoms and empires have rarely been the most important reference points in peoples' lives. Kingdoms rise and fall; they also strengthen and weaken; governments may make their presence known in people's lives quite sporadically, and many people in history were never entirely clear whose government they were actually in. Even until quite recently, many of the world's inhabitants were never even quite sure what country they were supposed to be in, or why it should matter.

So if we are born with an infinite debt to all those people who made our existence possible, but there is no natural unit called 'society'—then who or what exactly do we really owe it to? Everyone? Everything? Some people or things more than others? And how do we pay a debt to something so diffuse? Or, perhaps more to the point, who exactly can claim the authority to tell us how we can repay it, and on what grounds?

Return again to that word, 'society.' The reason that it seems like such a simple, self-evident concept is because we mostly use it as a synonym for 'nation.' After all, when Americans speak of paying their debt to society, they are not thinking of their responsibilities to people who live in Sweden. It's only the modern state, with its elaborate border controls and social policies, that enables us to imagine society in this way, as a single bounded entity. This is why projecting that notion backwards into Vedic or Medieval times will always be deceptive, even though we don't really have another word.

What does it mean to imagine our responsibilities as debts? To whom do we owe our existence? We could put it this way. We owe our existence above all:

- To the universe, cosmic forces, to Nature. The ground of our existence. To be repaid through ritual: ritual being an act of respect and recognition to all that beside which we are small.
- To those who have created the knowledge and cultural accomplishments that we value most; that give our existence its form, its meaning, but also its shape. Here we would include not only the philosophers and scientists who created our intellectual tradition but everyone from William Shakespeare to that long-since-forgotten woman, somewhere in the Middle East, who created leavened bread. We repay them by becoming learned ourselves and contributing to human knowledge and human culture.

- To our parents, and their parents—our ancestors. We repay them by becoming ancestors.
- To humanity as a whole. We repay them by generosity to strangers, by maintaining that basic communistic ground of sociality that makes human relations, and hence life, possible.

Set out this way, though, the argument begins to undermine its very premise. These are nothing like commercial debts. After all, one might repay one's parents by having children, but one is not generally thought to have repaid one's creditors if one lends the cash to someone else.

These examples are all about overcoming separation: you are free from your debt to your ancestors when you become an ancestor; you are free from your debt to the sages when you become a sage, you are free from your debt to humanity when you act with humanity. All the more so if one is speaking of the universe. If you cannot bargain with the gods because they already have everything, then you certainly cannot bargain with the universe, because the universe is everything—and that everything necessarily includes yourself. One could in fact interpret this list as a subtle way of saying that the only way of “freeing oneself” from the debt was not literally repaying debts, but rather showing that these debts do not exist because one is not in fact separate to begin with, and hence that the very notion of canceling the debt, and achieving a separate, autonomous existence, was ridiculous from the start. Or even that the very presumption of positing oneself as separate from humanity or the cosmos, so much so that one can enter into one-to-one dealings with it, is itself the crime that can be answered only by death. Our guilt is not due to the fact that we cannot repay our debt to the universe. Our guilt is our presumption in thinking of ourselves as being in any sense an equivalent to Everything Else that Exists or Has Ever Existed, so as to be able to conceive of such a debt in the first place.

One might even say that what we really have, in the idea of primordial debt, is the ultimate nationalist myth. Once we owed our lives to the gods that created us, paid interest in the form of animal sacrifice, and ultimately paid back the principal with our lives. Now we owe it to the Nation that formed us, pay interest in the form of taxes, and when it comes time to defend the nation against its enemies, to offer to pay it with our lives. This is a great trap of the twentieth century: on one side is the logic of the market, where we like to imagine we all start out as individuals who don't owe each other anything. On the other is the logic of the state, where we all begin with a debt we can never truly pay. We are constantly told that they are opposites, and that between them they contain the only real

human possibilities. But it's a false dichotomy. States created markets. Markets require states. Neither could continue without the other, at least, in anything like the forms we would recognize today.

We have already accumulated endless debts before we get to the age at which we can even think of paying them. By that time, there's no way to calculate to whom we even owe them. The only way to redeem ourselves is to dedicate ourselves to the service of Humanity as a whole.

“Up in our country we are human! And since we are human we help each other. We don't like to hear anybody say thanks for that. What I get today you may get tomorrow. Up here we say that by gifts one makes slaves and by whips one makes dogs.”

Rather than seeing himself as human because he could make economic calculations, he insisted that being truly human meant refusing to make such calculations, refusing to measure or remember who had given what to whom, for the precise reason that doing so would inevitably create a world where we began comparing power with power; measuring, calculating, and reducing each other to slaves or dogs through debt. It's not that he, like untold millions of similar egalitarian spirits throughout history, was unaware that humans have a propensity to calculate. If he wasn't aware of it, he could not have said what he did. Of course we have a propensity to calculate. We have all sorts of propensities. In any real-life situation, we have propensities that drive us in several different contradictory directions simultaneously. No one is more real than any other. The real question is which we take as the foundation of our humanity, and therefore, make the basis of our civilization.

One popular theory of the origins of the state, that goes back at least to the fourteenth-century North African historian Ibn Khaldun, runs precisely along these lines: nomadic raiders eventually systematize their relations with sedentary villagers; pillage turns into tribute, rape turns into the “right of the first night” or the carrying off of likely candidates as recruits for the royal harem. Conquest, untrammelled force, becomes systematized, and thus framed not as a predatory relation but as a moral one, with the lords providing protection, and the villagers, their sustenance. But even if all parties assume they are operating by a shared moral code, that even kings cannot do whatever they want but must operate within limits, allowing peasants to argue about the rights and wrongs of just how much of their harvest a king's retainers are entitled to carry off, they are very unlikely to frame their calculation in terms of the quality or quantity of protection

provided, but rather in terms of custom and precedent: How much did we pay last year? How much did our ancestors have to pay?

The same is true on the other side. If charitable donations become the basis for any sort of social relation, it will not be one based on reciprocity. If you give some coins to a panhandler, and that panhandler recognizes you later, it is unlikely that he will give you any money—but he might well consider you more likely to give him money again. Certainly this is true if one donates money to a charitable organization. Such an act of one-sided generosity is treated as a precedent for what will be expected afterward.

Whenever the lines of superiority and inferiority are clearly drawn and accepted by all parties as the framework of a relationship, and relations are sufficiently ongoing that we are no longer simply dealing with arbitrary force, then relations will be seen as being regulated by a web of habit or custom. Sometimes the situation is assumed to have originated in some founding act of conquest. Or it might be seen as ancestral custom for which there is no need of explanation. But this introduces another complication to the problem of giving gifts to kings—or to any superior: there is always the danger that it will be treated as a precedent, added to the web of custom, and therefore considered obligatory thereafter. Xenophon claims that in the early days of the Persian Empire, each province vied to send the Great King gifts of its most unique and valuable products. This became the basis of the tribute system: each province was eventually expected to provide the same “gifts” every year.

Often, such arrangements can turn into a logic of caste: certain clans are responsible for weaving the ceremonial garments, or bringing the fish for royal feasts, or cutting the king’s hair. They thus come to be known as weavers or fishermen or barbers. This last point can’t be overemphasized because it brings home another truth regularly overlooked: that the logic of identity is, always and everywhere, entangled in the logic of hierarchy. It is only when certain people are placed above others, or where everyone is being ranked in relation to the king, or the high priest, or Founding Fathers, that one begins to speak of people bound by their essential nature: about fundamentally different kinds of human being. Ideologies of caste or race are just extreme examples. It happens whenever one group is seen as raising themselves above others, or placing themselves below others, in such a way that ordinary standards of fair dealing no longer apply. In fact, something like this happens in a small way even in our most intimate social relations. The moment we recognize someone as a different sort of person, either above or below us, then ordinary rules of reciprocity become modified or are set aside. If a friend is unusually generous once, we will likely wish to reciprocate. If she acts this way repeatedly, we conclude she is a generous

person, and are hence less likely to reciprocate.

We can describe a simple formula here: a certain action, repeated, becomes customary; as a result, it comes to define the actor's essential nature. Alternately, a person's nature may be defined by how others have acted toward him in the past. To be an aristocrat is largely to insist that in the past, others have treated you as an aristocrat—since aristocrats don't really do anything in particular, most spend their time simply existing in some sort of putatively superior state—and therefore should continue to do so. Much of the art of being such a person is that of treating oneself in such a manner that it conveys how you expect others to treat you: in the case of actual kings, covering oneself with gold so as to suggest that others do likewise. On the other end of the scale, this is also how abuse becomes self-legitimizing. In the United States, if a middle-class thirteen-year-old girl is kidnapped, raped, and killed, it is considered an agonizing national crisis that everyone with a television is expected to follow for several weeks. If a thirteen-year-old girl is turned out as a child prostitute, raped systematically for years, and ultimately killed, all this is considered unremarkable—really just the sort of thing one can expect to end up happening to someone like that. She has been transformed.

One can judge how egalitarian a society is by whether those ostensibly in positions of authority are merely conduits for redistribution, or able to use their positions to accumulate riches. The latter seems most likely in aristocratic societies that add another element: war and plunder. After all, just about anyone who comes into a very large amount of wealth will ultimately give at least part of it away—often in grandiose and spectacular ways to large numbers of people. The more of one's wealth is obtained by plunder or extortion, the more spectacular and self-aggrandizing will be the forms in which it's given away. And what is true of warrior aristocracies is all the more true of ancient states, where rulers almost invariably represented themselves as the protectors of the helpless, supporters of widows and orphans, and champions of the poor. The genealogy of the modern redistributive state—with its notorious tendency to foster identity politics—can be traced back not to any sort of “primitive communism” but ultimately to violence and war.

The slave trade, of course, represented violence on an entirely different scale. We are speaking here of destruction of genocidal proportions, in world-historic terms, comparable only to events like the destruction of New World civilizations. Neither do I mean in any way to blame the victims: we need only imagine what would be likely to happen in our own society if a group of space aliens suddenly appeared—armed with undefeatable military technology, infinite wealth, and no recognizable morality—and

announced that they were willing to pay a million dollars each for human workers, no questions asked. There will always be at least a handful of people unscrupulous enough to take advantage of such a situation—and a handful is all it takes. It is an all-too-familiar strategy, deployed by fascists, mafias, and right-wing gangsters everywhere: first unleash the criminal violence of an unlimited market, in which everything is for sale and the price of life becomes extremely cheap; then step in, offering to restore a certain measure of order—though one which in its very harshness leaves all the most profitable aspects of the earlier chaos intact. The violence is preserved within the structure of the law. Such mafias, too, almost invariably end up enforcing a strict code of honor in which morality becomes above all a matter of paying one's debts.

The African slave trade was, as I mentioned, an unprecedented catastrophe, but commercial economies had already been extracting slaves from human economies for thousands of years. It is a practice as old as civilization. The question I want to ask is: To what degree is it actually constitutive of civilization itself? I am not speaking strictly of slavery here, but of that process that dislodges people from the webs of mutual commitment, shared history, and collective responsibility that make them what they are, so as to make them exchangeable—that is, to make it possible to make them subject to the logic of debt. Slavery is just the logical end-point, the most extreme form of such disentanglement. But for that reason it provides us with a window on the process as a whole. What's more, owing to its historical role, slavery has shaped our basic assumptions and institutions in ways that we are no longer aware of and whose influence we would probably never wish to acknowledge if we were. If we have become a debt society, it is because the legacy of war, conquest, and slavery has never completely gone away. It's still there, lodged in our most intimate conceptions of honor, property, even freedom. It's just that we can no longer see that it's there.

How can human economies, with their social currencies—which are used to measure, assess, and maintain relationships between people, and only perhaps incidentally to acquire material goods—be transformed into something else? We cannot begin to think about such questions without taking into account the role of sheer physical violence. In the case of the African slave trade, this was primarily violence imposed from outside. Nonetheless, its very suddenness, its very brutality, provides us with a sort of freeze-frame of a process that must have occurred in a much slower, more haphazard fashion in other times and places. This is because there is every reason to believe that slavery, with its unique ability to rip human beings from their contexts, to turn them into abstractions, played a key role in the rise of markets everywhere. What happens, then, when the same process

happens more slowly?

It would seem that much of this history is permanently lost—since in both the ancient Middle East and the ancient Mediterranean, most of the really critical moments seem to have occurred just before the advent of written records. Still, the broad outlines can be reconstructed. The best way to do so, I believe, is to start from a single, odd, vexed concept: the concept of honor, which can be treated as a kind of artifact, or even as a hieroglyphic, a fragment preserved from history that seems to compress into itself the answer to almost everything we've been trying to understand.

On the one hand, violence: men who live by violence, whether soldiers or gangsters, are almost invariably obsessed with honor, and assaults on honor are considered the most obvious justification for acts of violence. On the other, debt. We speak both of debts of honor, and honoring one's debts; in fact, the transition from one to the other provides the best clue to how debts emerge from obligations; even as the notion of honor seemed to echo a defiant insistence that financial debts are not really the most important ones; an echo, here, of arguments that, like those in the Vedas and the Bible, go back to the very dawn of the market itself. Even more disturbingly, since the notion of honor makes no sense without the possibility of degradation, reconstructing this history reveals how much our basic concepts of freedom and morality took shape within institutions—notably, but not only, slavery—that we'd sooner not have to think about at all.

Of course we have already seen why governments might have incentive to do so: the existence of markets was highly convenient for governments, and not just because it made it so much easier for them to provision large standing armies. By insisting that only their own coins were acceptable as fees, fines, or taxes, governments were able to overwhelm the innumerable social currencies that already existed in their hinterlands, and to establish something like uniform national markets.

Readers of Equiano's book are often troubled by one aspect of the story: that for most of his early life, he was not opposed to the institution of slavery. At one point, while saving money to buy his freedom, he even briefly took a job that involved purchasing slaves in Africa. Equiano only came around to an abolitionist position after converting to Methodism and falling in with religious activists against the trade. Many have asked: Why did it take him so long? Surely if anyone had reason to understand the evils of slavery, he did. The answer seems, oddly, to lie in the man's very integrity. One thing that comes through strikingly in the book is that this was not only a man of endless resourcefulness and determination, but above all, a man of honor. Yet this created a terrible dilemma. To be made a slave is to be stripped of any possible honor. Equiano wished above all else to regain what had been

taken from him. The problem is that honor is, by definition, something that exists in the eyes of others. To be able to recover it, then, a slave must necessarily adopt the rules and standards of the society that surrounds him, and this means that, in practice at least, he cannot absolutely reject the institutions that deprived him of his honor in the first place.

It strikes me that this experience—of only being able to restore one's lost honor, to regain the ability to act with integrity by acting in accord with the terms of a system that one knows, through deeply traumatic personal experience, to be utterly unjust—is itself one of the most profoundly violent aspects of slavery. It is another example, perhaps, of the need to argue in the master's language, but here taken to insidious extremes. All societies based on slavery tend to be marked by this agonizing double consciousness: the awareness that the highest things one has to strive for are also, ultimately, wrong; but at the same time, the feeling that this is simply the nature of reality. This might help explain why throughout most of history, when slaves did rebel against their masters, they rarely rebelled against slavery itself.

Throughout history, moral justifications for slavery are rarely taken particularly seriously even by those who espouse them. For most of human history, most people saw slavery much as we see war: a tawdry business, to be sure, but one would have to be naïve indeed to imagine it could simply be eliminated.

Tiv horror stories about men who are dead but do not know it or who are brought back from the grave to serve their murderers, and Haitian zombie stories, all seem to play on this essential horror of slavery: the fact that it's a kind of living death.

This ability to strip others of their dignity becomes, for the master, the foundation of his honor. There have been places—the Islamic world affords numerous examples—where slaves are not even put to work for profit; instead, rich men make a point of surrounding themselves with battalions of slave retainers simply for reasons of status, as tokens of their magnificence and nothing else.

It seems to me that this is precisely what gives honor its notoriously fragile quality. Men of honor tend to combine a sense of total ease and self-assurance, which comes with the habit of command, with a notorious jumpiness, a heightened sensitivity to slights and insults, the feeling that a man (and it is almost always a man) is somehow reduced, humiliated, if any "debt of honor" is allowed to go unpaid. This is because honor is not the same as dignity. One might even say: honor is surplus dignity. It is that heightened consciousness of power, and its dangers, that comes from having stripped away the power and dignity of others; or at the very least, from the knowledge that one is capable of doing so. At its simplest, honor is

that excess dignity that must be defended with the knife or sword (violent men, as we all know, are almost invariably obsessed with honor). Hence the warrior's ethos, where almost anything that could possibly be seen as a sign of disrespect—in inappropriate word, an inappropriate glance—is considered a challenge, or can be treated as such.

Yet even where overt violence has largely been put out of the picture, wherever honor is at issue, it comes with a sense that dignity can be lost, and therefore must be constantly defended. The result is that to this day, 'honor' has two contradictory meanings. On the one hand, we can speak of honor as simple integrity. Decent people honor their commitments. This is clearly what honor meant for Equiano: to be an honorable man meant to be one who speaks the truth, obeys the law, keeps his promises, is fair and conscientious in his commercial dealings. His problem was that honor simultaneously meant something else, which had everything to do with the kind of violence required to reduce human beings to commodities to begin with.

What's unusual about Irish legal material is that it's all spelled out so clearly. This is partly because Irish law codes were the work of a class of legal specialists who seem to have turned the whole thing almost into a form of entertainment, devoting endless hours to coming up with every possible abstract possibility. Some of the provisos are so whimsical ("if stung by another man's bee, one must calculate the extent of the injury, but also, if one swatted it in the process, subtract the replacement value of the bee") that one has to assume they were simply jokes. Still, as a result, the moral logic that lies behind any elaborate code of honor is laid out here in startling honesty.

What about women? A free woman was honored at precisely 50 percent of the price of her nearest male relative (her father, if alive; if not, her husband). If she was dishonored, her price was payable to that relative. Unless, that is, she was an independent landholder. In that case, her honor price was the same as that of a man. And unless she was a woman of easy virtue, in which case it was zero, since she had no honor to outrage. What about marriage? A suitor paid the value of the wife's honor to her father and thus became its guardian. What about serfs? The same principle applied: when a lord acquired a serf, he bought out that man's honor price, presenting him with its equivalent in cows. From that moment on, if anyone insulted or injured the serf, it was seen an attack on the lord's honor, and it was up to the lord to collect the attendant fees. Meanwhile the lord's honor price was notched upward as a result of gathering another dependent: in other words, he literally absorbs his new vassal's honor into his own.

Attacking a peasant under the protection of a lord was the same as

raping a man's wife or daughter, a violation of the honor not of the victim, but of the man who should have been able to protect them.

When most of us think of a Mediterranean villager's sense of honor, we don't think so much of a casual attitude toward money as of a veritable obsession with premarital virginity. Masculine honor is caught up not even so much in a man's ability to protect his womenfolk as in his ability to protect their sexual reputations, to respond to any suggestion of impropriety on the part of his mother, wife, sister, or daughter as if it were a direct physical attack on his own person. This is a stereotype, but it's not entirely unjustified. One historian who went through fifty years of police reports about knife-fights in nineteenth-century Ionia discovered that virtually every one of them began when one party publicly suggested that the other's wife or sister was a whore.

Why is it so insulting to suggest that a man's sister is trading sex for money in the first place? This is one reason I say that concepts of honor still shape our perceptions in ways we're not aware of—there are plenty of places in the world where the suggestion that a man's wife is trading sex for profit, or that his sister is engaged with multiple partners, is more likely to be greeted with bemused good humor than with murderous rage. We've already seen examples in the Gunwinggu and the Lele.

There is reason to believe that it is in such moral crises that we can find the origin not only of our current conceptions of honor, but of patriarchy itself. This is true, at least, if we define "patriarchy" in its more specific Biblical sense familiar from the book of Genesis: the rule of fathers, with all the familiar images of stern bearded men in robes, keeping a close eye over their sequestered wives and daughters, even as their children kept a close eye over their flocks and herds. Readers of the Bible had always assumed that there was something primordial in all this; that this was simply the way desert people, and thus the earliest inhabitants of the Near East, had always behaved. This was why the translation of Sumerian, in the first half of the twentieth century, came as something of a shock.

In the very earliest Sumerian texts, particularly those from roughly 3000 to 2500 BC, women are everywhere. Early histories not only record the names of numerous female rulers, but make clear that women were well represented among the ranks of doctors, merchants, scribes, and public officials, and generally free to take part in all aspects of public life. One cannot speak of full gender equality: men still outnumbered women in all these areas. Still, one gets the sense of a society not so different than that which prevails in much of the developed world today. Over the course of the next thousand years or so, all this changes. The place of women in civic life erodes; gradually, the more familiar patriarchal pattern takes shape, with its

emphasis on chastity and premarital virginity, a weakening and eventually wholesale disappearance of women's role in government and the liberal professions, and the loss of women's independent legal status, which renders them wards of their husbands. By the end of the Bronze Age, around 1200 BC, we begin to see large numbers of women sequestered away in harems and—in some places, at least—subjected to obligatory veiling.

In fact, this appears to reflect a much broader worldwide pattern. It has always been something of a scandal for those who like to see the advance of science and technology, the accumulation of learning, economic growth—'human progress,' as we like to call it—as necessarily leading to greater human freedom, that for women, the exact opposite often seems to be the case. Or at least, has been the case until very recent times. A similar gradual restriction on women's freedoms can be observed in India and China. The question is, obviously, Why? The standard explanation in the Sumerian case has been the gradual infiltration of pastoralists from the surrounding deserts who, presumably, always had more patriarchal mores. There was, after all, only a narrow strip of land along the Tigris and Euphrates rivers that could support intensive irrigation works, and hence, urban life. Civilization was thus from early times surrounded by a fringe of desert people, who lived much like those described in Genesis and spoke the same Semitic languages. It is undeniably true that, over the course of time, the Sumerian language was gradually replaced—first by Akkadian, then by Amorite, then by Aramaic languages, and finally, most recently of all, by Arabic, which was also brought to Mesopotamia and the Levant by desert pastoralists.

While all this did, clearly, bring with it profound cultural changes as well, it's not a particularly satisfying explanation. Former nomads appear to have been willing to adapt to urban life in any number of other ways. Why not that one? And it's very much a local explanation and does nothing, really, to explain the broader pattern. Feminist scholarship has instead tended to emphasize the growing scale and social importance of war, and the increasing centralization of the state that accompanied it. This is more convincing. Certainly, the more militaristic the state, the harsher its laws tended to be toward women. But I would add another, complementary argument. Historically, war, states, and markets all tend to feed off one another. Conquest leads to taxes. Taxes tend to be ways to create markets, which are convenient for soldiers and administrators. In the specific case of Mesopotamia, all of this took on a complicated relation to an explosion of debt that threatened to turn all human relations—and by extension, women's bodies—into potential commodities. At the same time, it created a horrified reaction on the part of the (male) winners of the economic game, who over time felt forced to go to greater and greater lengths to make clear

that their women could in no sense be bought or sold.

It's also important to emphasize that Sumerian men do not appear, at least in this earliest period, to have seen anything troubling about the idea of their sisters having sex for money. To the contrary, insofar as prostitution did occur—and remember, it could not have been nearly so impersonal, cold-cash a relation in a credit economy—Sumerian religious texts identify it as among the fundamental features of human civilization, a gift given by the gods at the dawn of time. Procreative sex was considered natural (after all, animals did it). Non-procreative sex, sex for pleasure, was divine.

The most famous expression of this identification of prostitute and civilization can be found in the story of Enkidu in the epic of Gilgamesh. In the beginning of the story, Enkidu is a monster—a naked and ferocious “wild man” who grazes with the gazelles, drinks at the watering place with wild cattle, and terrorizes the people of the city. Unable to defeat him, the citizens finally send out a courtesan who is also a priestess of the goddess Ishtar. She strips before him, and they make love for six days and seven nights. Afterward, Enkidu's former animal companions run away from him. After she explains that he has now learned wisdom and become like a God—she is, after all, a divine consort—he agrees to put on clothing and come to live in the city like a proper, civilized human being.

Already, in the earliest version of the Enkidu story, though, one can detect a certain ambivalence. Much later, Enkidu is sentenced to death by the gods, and his immediate reaction is to condemn the courtesan for having brought him from the wilds in the first place: he curses her to become a common streetwalker or tavern keeper, living among vomiting drunks, abused and beaten by her clients. Then, later, he regrets his behavior and blesses her instead. But that trace of ambivalence was there from the beginning, and over time, it grew more powerful. From early times, Sumerian and Babylonian temple complexes were surrounded by far less glamorous providers of sexual services—indeed, by the time we know much about them, they were the center of veritable red-light districts full of taverns with dancing girls, men in drag (some of them slaves, some runaways), and an almost infinite variety of prostitutes. There is an endlessly elaborate terminology whose subtleties are long since lost to us. Most seem to have doubled as entertainers: tavern-keepers doubled as musicians; male transvestites were not only singers and dancers, but often performed knife-throwing acts. Many were slaves put to work by their masters, or women working off religious vows or debts, or debt bondswomen, or, for that matter, women escaping debt bondage with no place else to go. Over time, many of the lower-ranking temple women were either bought as slaves or debt peons as well, and there might have often been a blurring of roles between priestesses who performed

erotic rituals and prostitutes owned by the temple (and hence, in principle, by the god), sometimes lodged within the temple compound itself, whose earnings added to the temple treasuries. Since most everyday transactions in Mesopotamia were not cash transactions, one has to assume that it was the same with prostitutes—like the tavern-keepers, many of whom seem to have been former prostitutes, they developed ongoing credit relations with their clients—and this must have meant that most were less like what we think of as streetwalkers and more like courtesans. Still, the origins of commercial prostitution appear to have been caught up in a peculiar mixture of sacred (or once-sacred) practice, commerce, slavery, and debt.

A source for commercial prostitution was the pauperization of farmers and their increasing dependence on loans in order to survive periods of famine, which led to debt slavery. Children of both sexes were given up for debt pledges or sold for “adoption.” Out of such practices, the prostitution of female family members for the benefit of the head of the family could readily develop. Women might end up as prostitutes because their parents had to sell them into slavery or because their impoverished husbands might so use them. Or they might become self-employed as a last alternative to enslavement. With luck, they might in this profession be upwardly mobile through becoming concubines. By the middle of the second millennium BC, prostitution was well established as a likely occupation for the daughters of the poor. As the sexual regulation of women of the propertied class became more firmly entrenched, the virginity of respectable daughters became a financial asset for the family. Thus, commercial prostitution came to be seen as a social necessity for meeting the sexual needs of men. What remained problematic was how to distinguish clearly and permanently between respectable and non-respectable women.

When we refer to ‘respectable women,’ then, we are referring to those whose bodies could not, under any conditions, be bought or sold. Their physical persons were hidden away and permanently relegated to some man’s domestic sphere; when they appeared in public veiled, they were effectively still ostentatiously walking around, even in public, inside such a sphere. Women who could be exchanged for money, on the other hand, must be instantly recognizable as such. This dynamic also led, over the course of millennia, to a systematic demotion of sexuality itself from a divine gift and embodiment of civilized refinement to one of its more familiar associations: with degradation, corruption, and guilt.

‘Patriarchy’ originated, first and foremost, in a rejection of the great urban civilizations in the name of a kind of purity, a reassertion of paternal control against great cities like Uruk, Lagash, and Babylon, seen as places of bureaucrats, traders, and whores. The pastoral fringes, the deserts and

stepped away from the river valleys, were the places to which displaced, indebted farmers fled. Resistance, in the ancient Middle East, was always less a politics of rebellion than a politics of exodus, of melting away with one's flocks and families—often before both were taken away.

In either case, between the push of commoditization, which fell disproportionately on daughters, and the pull of those trying to reassert patriarchal rights to “protect” women from any suggestion that they might be commoditized, women's formal and practical freedoms appear to have been gradually but increasingly restricted and effaced. As a result, notions of honor changed too, becoming a kind of protest against the implications of the market, even as at the same time (like the world religions) they came to echo that market logic in endless subtle ways.

The sudden abundance of chattel slaves completely transformed the nature of Greek society. First and most famously, it allowed even citizens of modest means to take part in the political and cultural life of the city and have a genuine sense of citizenship. But this, in turn, drove the old aristocratic classes to develop more and more elaborate means of setting themselves off from what they considered the tawdriness and moral corruption of the new democratic state.

Already by the age of Socrates, while a man's honor was increasingly tied to disdain for commerce and assertiveness in public life, a woman's honor had come to be defined in almost exclusively sexual terms: as a matter of virginity, modesty, and chastity, to the extent that respectable women were expected to be shut up inside the household and any woman who played a part in public life was considered for that reason a prostitute, or tantamount to one. The Assyrian habit of veiling was not widely adopted in the Middle East, but it was adopted in Greece. As much as it flies in the face of our stereotypes about the origins of “Western” freedoms, women in democratic Athens, unlike those of Persia or Syria, were expected to wear veils when they ventured out in public. The evidence is overwhelming, but until recently has been largely ignored. The practice began as an aristocratic affectation, but by the fifth century, all respectable women “were veiled daily and routinely, at least in public or in front of non-related men.”

We don't really know how to think about debt. Or, to be more accurate, we seem to be trapped between imagining society in the Adam Smith mode, as a collection of individuals whose only significant relations are with their own possessions, happily bartering one thing for another for the sake of mutual convenience, with debt almost entirely abolished from the picture, and a vision in which debt is everything, the very substance of all human relations—which of course leaves everyone with the uncomfortable sense that human relations are somehow an intrinsically tawdry business, that our

very responsibilities to one another are already somehow necessarily based in sin and crime. It's not an appealing set of alternatives.

In human economies, when this ability to rip people from their contexts does appear, it is most often seen as an end in itself. One can already see a hint of this among the Lele. Important men would occasionally acquire war captives from far away as slaves, but it was almost always to be sacrificed at their funeral. The squelching of one man's individuality was seen as somehow swelling the reputation, the social existence, of the other. In what might be called heroic societies, of course this kind of addition and subtraction of honor and disgrace is lifted from a somewhat marginal practice to become the very essence of politics. As endless epics, sagas, and eddas attest, heroes become heroes by making others small. In Ireland and Wales, we can observe how this very ability to degrade others, to remove unique human beings from their hearths and families and thus render them anonymous units of accounting—the Irish slave-girl currency, the Welsh washerwomen—is itself the highest expression of honor.

In heroic societies, the role of violence is not hidden—it's glorified. Often, it can form the basis of one's most intimate relations. In the *Iliad*, Achilles sees nothing shameful in his relation with his slave-girl, Briseis, whose husband and brothers he killed; he refers to her as his "prize of honor," but almost in the very same breath, he also insists that, just any decent man must love and care for his household dependents, "so I from my heart loved this one, even though I won her with my spear."

That such relations of intimacy can often develop between men of honor and those they have stripped of their dignity, history can well attest. After all, the annihilation of any possibility of equality also eliminates any question of debt, of any relation other than power. It allows a certain clarity. This is presumably why emperors and kings have such a notorious tendency to surround themselves with slaves or eunuchs.

There is something more here, though. If one looks across the expanse of history, one cannot help but notice a curious sense of identification between the most exalted and the most degraded; particularly between emperors and kings, and slaves. Many kings surround themselves with slaves, appoint slave ministers—there have even been, as with the Mamluks in Egypt, actual dynasties of slaves. Kings surround themselves with slaves for the same reason that they surround themselves with eunuchs: because the slaves and criminals have no families or friends, no possibility of other loyalties—or at least that, in principle, they shouldn't. But in a way, kings should really be like that too. As many an African proverb emphasizes: a proper king has no relatives either, or at least, he acts as if he does not. In other words, the king and slave are mirror images, in that unlike normal human beings

who are defined by their commitments to others, they are defined only by relations of power. They are as close to perfectly isolated, alienated beings as one can possibly become.

At this point we can finally see what's really at stake in our peculiar habit of defining ourselves simultaneously as master and slave, reduplicating the most brutal aspects of the ancient household in our very concept of ourselves, as masters of our freedoms, or as owners of our very selves. It is the only way that we can imagine ourselves as completely isolated beings. There is a direct line from the Roman conception of liberty—not as the ability to form mutual relationships with others, but as the kind of absolute power of “use and abuse” over the conquered chattel who make up the bulk of a wealthy Roman man's household—to the strange fantasies of liberal philosophers like Hobbes, Locke, and Smith, about the origins of human society in some collection of thirty- or forty-year-old males who seem to have sprung from the earth fully formed and then have to decide whether to kill each other or begin to swap beaver pelts.

European and American intellectuals, it is true, have spent much of the last two-hundred years trying to flee from the more disturbing implications of this tradition of thought. Thomas Jefferson, that owner of many slaves, chose to begin the Declaration of Independence by directly contradicting the moral basis of slavery, writing “we hold these truths to be self-evident, that all men are created equal, and that they are endowed by their Creator with certain inalienable Rights”—thus undercutting simultaneously any argument that Africans were racially inferior, and also that they or their ancestors could ever have been justly and legally deprived of their freedom. In doing so, however, he did not propose some radically new conception of rights and liberties. Neither have subsequent political philosophers. For the most part, we've just kept the old ones, but with the word ‘not’ inserted here and there. Most of our most precious rights and freedoms are a series of exceptions to an overall moral and legal framework that suggests we shouldn't really have them in the first place.

Formal slavery has been eliminated, but, as anyone who works from nine to five can testify, the idea that you can alienate your liberty, at least temporarily, endures. In fact, it determines what most of us have to do for most of our waking hours, except, usually, on weekends. The violence has been largely pushed out of sight. But this is largely because we're no longer able to imagine what a world based on social arrangements that did not require the continual threat of tasers and surveillance cameras would even look like.

The End of History

Primitive money was not originally a way to pay debts of any sort. It was a way of recognizing the existence of debts that cannot possibly be paid. This argument is worth considering in detail. In most human economies, money is used first and foremost to arrange marriages. The simplest and probably most common way of doing this was by being presented as what used to be called 'bride-price': a suitor's family would deliver a certain number of dog teeth, or cowries, or brass rings, or whatever is the local social currency, to a woman's family, and they would present their daughter as his bride. It's easy to see why this might be interpreted as buying a woman, and many colonial officials in Africa and Oceania in the early part of the twentieth century did indeed come to that conclusion.

The practice caused something of a scandal, and by 1926, the League of Nations was debating banning the practice as a form of slavery. Anthropologists objected. Really, they explained, this was nothing like the purchase of, say, an ox—let alone a pair of sandals. After all, if you buy an ox, you don't have any responsibilities to the ox. What you are really buying is the right to dispose of the ox in any way that pleases you. Marriage is entirely different, since a husband will normally have just as many responsibilities toward his wife as his wife will have toward him. It's a way of rearranging relations between people. Second of all, if you were really buying a wife, you'd be able to sell her. Finally, the real significance of the payment concerns the status of the woman's children: if he's buying anything, it's the right to call her offspring his own.

As anthropologists often note, the fact that one traces descent through the female line does not necessarily mean that women themselves have a lot of power. It can; it did among the Iroquois, and it does among Minangkabau right now. But it doesn't necessarily.

Nothing was both so indiscriminating, and so desirable, as money. True, Greek aristocrats would ordinarily insist that they were not attracted to common porn, and that the courtesans, flute-girls, acrobats, and beautiful boys that frequented their symposia were not really prostitutes at all (though at times they also admitted that they really were), they also struggled with the fact that their own high-minded pursuits, such as chariot-racing, outfitting ships for the navy, and sponsoring tragic dramas, required the exact same coins as the ones used to buy cheap perfume and pies for a fisherman's wife—the only real difference being that their pursuits tended to require a lot more of them. We might say, then, that money introduced a democratization of desire. Insofar as everyone wanted money, everyone, high

and low, was pursuing the same promiscuous substance. But even more: increasingly, they did not just want money. They needed it.

This was a profound change. In the Homeric world, as in most human economies, we hear almost no discussion of those things considered necessary to human life (food, shelter, clothing) because it is simply assumed that everybody has them. A man with no possessions could, at the very least, become a retainer in some rich man's household. Even slaves had enough to eat. Here too, the prostitute was a potent symbol for what had changed, since while some of the denizens of brothels were slaves, others were simply poor; the fact that their basic needs could no longer be taken for granted were precisely what made them submit to others' desires. This extreme fear of dependency on others' whims lies at the basis of the Greek obsession with the self-sufficient household.

The same tensions can be observed between neighbors, who in farming communities tend to give, lend, and borrow things amongst themselves—anything from sieves and sickles, to charcoal and cooking oil, to seed corn or oxen for plowing. On the one hand, such giving and lending were considered essential parts of the basic fabric of human sociability in farm communities, on the other, overly demanding neighbors were a notorious irritant—one that could only have grown worse when all parties are aware of precisely how much it would have cost to buy or rent the same items that were being given away.

With the appearance of money, it could also become unclear what was a gift, and what a loan. On the one hand, even with gifts, it was always considered best to return something slightly better than one had received. On the other hand, friends do not charge one another interest, and any suggestion that they might was sure to rankle. So what's the difference between a generous return gift and an interest payment?

One day Nasruddin's neighbor, a notorious miser, came by to announce he was throwing a party for some friends. Could he borrow some of Nasruddin's pots? Nasruddin didn't have many but said he was happy to lend whatever he had. The next day the miser returned, carrying Nasruddin's three pots, and one tiny additional one.

"What's that?" asked Nasruddin.

"Oh, that's the offspring of the pots. They reproduced during the time they were with me."

Nasruddin shrugged and accepted them, and the miser left happy that he had established a principle of interest. A month later Nasruddin was throwing a party, and he went over to borrow a dozen pieces of his neighbor's much more luxurious crockery. The miser complied. Then he waited a day.

And then another. On the third day, the miser came by and asked what had happened to his pots.

“Oh, them?” Nasruddin said sadly. “It was a terrible tragedy. They died.”

In a heroic system, it is only debts of honor—the need to repay gifts, to exact revenge, to rescue or redeem friends or kinsmen fallen prisoner—that operate completely under a logic of tit-for-tat exchange. Honor is the same as credit; it’s one’s ability to keep one’s promises, but also, in the case of a wrong, to ‘get even.’ As the last phrase implies, it was a monetary logic, but money, or anyway money-like relations, are confined to this. Gradually, subtly, without anyone completely understanding the full implications of what was happening, what had been the essence of moral relations turned into the means for every sort of dishonest stratagem.

Yet if debt was morality—and certainly at the very least it was in the interest of creditors, who often had little legal recourse to compel debtors to pay up, to insist that it was—what was one to make of the fact that money, that very thing that seemed capable of turning morality into an exact and quantifiable science, also seemed to encourage the very worst sorts of behavior? It is from such dilemmas that modern ethics and moral philosophy begin.

I think this is true quite literally. Consider Plato’s *Republic*, another product of fourth-century Athens. The book begins when Socrates visits an old friend, a wealthy arms manufacturer, at the port of Piraeus. They get into a discussion of justice, which begins when the old man proposes that money cannot be a bad thing, since it allows those who have it to be just, and that justice consists in two things: telling the truth, and always paying one’s debts. The proposal is easily demolished. What, Socrates asks, if someone lent you his sword, went violently insane, and then asked for it back (presumably, so he could kill someone)? Clearly it can never be right to arm a lunatic whatever the circumstances.

The old man cheerfully shrugs the problem off and heads off to attend to some ritual, leaving his son to carry on the argument. The son, Polemarchus, switches gears: clearly his father hadn’t meant ‘debt’ in the literal sense of returning what one has borrowed. He meant it more in the sense of giving people what is owed to them; repaying good with good and evil with evil; helping one’s friends and hurting one’s enemies.

Demolishing this one takes a little more work: are we saying justice plays no part in determining who one’s friends and enemies are? If so, wouldn’t someone who decided he had no friends, and therefore tried to hurt everyone, be a just man? And even if you did have some way to say for certain that one’s enemy really is an intrinsically bad person and deserves harm, by

harming him, do you not thus make him worse? Can turning bad people into even worse people really be an example of justice? But it is eventually accomplished.

At this point a Sophist, Thrasymachos, enters and denounces all of the debaters as milky-eyed idealists. In reality, he says, all talk of 'justice' is mere political pretext, designed to justify the interests of the powerful. And so it should be, because insofar as justice exists, it is simply that: the interest of the powerful. Rulers are like shepherds. We like to think of them as benevolently tending their flocks, but what do shepherds ultimately do with sheep? They kill and eat them, or sell the meat for money.

Socrates responds by pointing out that Thrasymachos is confusing the art of tending sheep with the art of profiting from them. The art of medicine aims to improve health, whether or not doctors get paid for practicing it. The art of shepherding aims to ensure the well-being of sheep, whether or not the shepherd (or his employer) is also a businessman who knows how to extract a profit from them. Just so with the art of governance. If such an art exists, it must have its own intrinsic aim apart from any profit one might also get from it, and what can this be other than the establishment of social justice? It's only the existence of money, Socrates suggests, that allows us to imagine that words like "power" and "interest" refer to universal realities that can be pursued in their own right, let alone that all pursuits are really ultimately the pursuit of power, advantage, or self-interest. The question, he said, is how to ensure that those who hold political office will do so not for gain, but rather for honor.

Heroic honor no longer works in a world where commerce, class, and profit have so confused everything that peoples' true motives are never clear. How do we even know who our enemies are? Finally, Plato presents us with cynical realpolitik. Maybe nobody really owes anything to anybody. Maybe those who pursue profit for its own sake have it right after all. But even that does not hold up. We are left with a certainty that existing standards are incoherent and self-contradictory, and that some sort of radical break would be required in order to create a world that makes any logical sense. But most of those who seriously consider a radical break along the lines that Plato suggested have come to the conclusion that there might be far worse things than moral incoherence. And there we have stood, ever since, in the midst of an insoluble dilemma.

For most of the great urban civilizations of the time, the early Iron Age was a kind of pause between empires, a time when political landscapes were broken into a checkerboard of often diminutive kingdoms and city-states, most often at constant war externally and locked in constant political debate within. Each case witnessed the development of something akin to a

drop-out culture, with ascetics and sages fleeing to the wilderness or wandering from town to town seeking wisdom; in each, too, they were eventually reabsorbed into the political order as a new kind of intellectual or spiritual elite, whether as Greek sophists, Jewish prophets, Chinese sages, or Indian holy men. Whatever the reasons, the result was the first period in history in which human beings applied principles of reasoned inquiry to the great questions of human existence. All these great regions of the world, China, India, and the Mediterranean, saw the emergence of remarkably parallel philosophical trends, from skepticism to idealism—in fact, almost the entire range of positions about the nature of the cosmos, mind, action, and the ends of human existence that have remained the stuff of philosophy to this day. No really new ideas have been added since that time.

Without mass literacy, neither the emergence of mass intellectual movements, nor the spread of Axial Age ideas would have been possible. By the end of the period, these ideas had produced a world where even the leaders of barbarian armies descending on the Roman empire felt obliged to take a position on the question of the Mystery of the Trinity, and where Chinese monks could spend time debating the relative merits of the eighteen schools of Classical Indian Buddhism.

Within human economies, motives are assumed to be complex. When a lord gives a gift to a retainer, there is no reason to doubt that it is inspired by a genuine desire to benefit that retainer, even if it is also a strategic move designed to ensure loyalty, and an act of magnificence meant to remind everyone else that he is great and the retainer small. There is no sense of contradiction here. Similarly, gifts between equals are usually fraught with many layers of love, envy, pride, spite, communal solidarity, or any of a dozen other things. Speculating on such matters is a major form of daily entertainment. What's missing, though, is any sense that the most selfish ("self-interested") motive is necessarily the real one: those speculating on hidden motives are just as likely to assume that someone is secretly trying to help a friend or harm an enemy as to acquire some advantage for him- or herself. Neither is any of this likely to have changed much in the rise of early credit markets, where the value of an IOU was as much dependent on assessments of its issuer's character as on his disposable income, and motives of love, envy, pride, et cetera could never be completely set aside.

Cash transactions between strangers were different, and all the more so when trading is set against a background of war and emerges from disposing of loot and provisioning soldiers; when one often had best not ask where the objects traded came from, and where no one is much interested in forming ongoing personal relationships anyway. Here, transactions really do become simply a figuring-out of how many of X will go for how many of Y, of

calculating proportions, estimating quality, and trying to get the best deal for oneself. The result, during the Axial Age, was a new way of thinking about human motivation, a radical simplification of motives that made it possible to begin speaking of concepts like ‘profit’ and ‘advantage’—and imagining that this is what people are really pursuing, in every aspect of existence, as if the violence of war or the impersonality of the marketplace has simply allowed them to drop the pretense that they ever cared about anything else. It was this, in turn, that allowed human life to seem like it could be reduced to a matter of means-to-end calculation, and hence something that could be examined using the same means that one used to study the attraction and repulsion of celestial bodies.

If the underlying assumption very much resembles those of contemporary economists, it’s no coincidence—but with the difference that, in an age when money, markets, states, and military affairs were all intrinsically connected, money was needed to pay armies to capture slaves to mine gold to produce money; when ‘cutthroat competition’ often did involve the literal cutting of throats, it never occurred to anyone to imagine that selfish ends could be pursued by peaceful means. Certainly, this picture of humanity does begin to appear, with startling consistency, across Eurasia, wherever we also see coinage and philosophy appear.

Wherever the military-coinage-slavery complex began to take hold, we find political theorists propounding similar ideas. Kautilya was no different: the title of his book, *Arthashastra*, is usually translated as “manual of statecraft,” since it consists of advice to rulers, but its more literal translation is “the science of material gain.” Like the Legalists, Kautilya emphasized the need to create a pretext that governance was a matter of morality and justice, but in addressing the rulers themselves, he insisted that “war and peace are considered solely from the point of view of profit”—of amassing wealth to create a more effective army, of using the army to dominate markets and control resources to amass more wealth, and so on. In Greece we’ve got Thrasymachos. True, Greece was slightly different. Greek city-states did not have kings, and the collapse of private interests and affairs of state was in principle universally denounced as tyranny. Still, in practice, what this meant was that city-states, and even political factions, ended up acting in precisely the same coldly calculating way as Indian or Chinese sovereigns. Anyone who has ever read Thucydides’ Melian dialogue—in which Athenian generals present the population of a previously friendly city with elegantly reasoned arguments for why the Athenians have determined that it is to the advantage of their empire to threaten them with collective massacre if they are not willing to become tribute-paying subjects, and why it is equally in the interests of the Melians to submit—is aware of the results.

Another striking feature of this literature is its resolute materialism. Goddesses and gods, magic and oracles, sacrificial ritual, ancestral cults, even caste and ritual status systems, all either disappear or are sidelined, no longer treated as ends in themselves but as yet mere tools to be used for the pursuit of material gain.

That intellectuals willing to produce such theories should win the ears of princes is hardly surprising. Neither is it particularly surprising that other intellectuals should have been so offended by this sort of cynicism that they began to make common cause with the popular movements that inevitably began to form against those princes. But as is so often the case, oppositional intellectuals were faced with two choices: either adopt the reigning terms of debate, or try to come up with a diametrical inversion.

Mo Di, the founder of Mohism, took the first approach. He turned the concept of 'li' (profit) into something more like 'social utility,' and then he attempted to demonstrate that war itself is, by definition, an unprofitable activity. For example, he wrote, campaigns can only be fought in spring and autumn, and each had equally deleterious effects:

“If in the spring then the people miss their sowing and planting, if in the autumn, they miss their reaping and harvesting. Even if they miss only one season, then the number of people who will die of cold and hunger is incalculable. Now let us calculate the army’s equipment, the arrows, standards, tents, armor, shields, and sword hilts; the number of these which will break and perish and not come back. So also with oxen and horses.”

His conclusion: if one could add up the total costs of aggression in human lives, animal lives, and material damage, one would be forced to the conclusion that they never outweighed the benefits—even for the victor. In fact, Mo Di took this sort of logic so far that he ended up arguing that the only way to optimize the overall profit of humanity was to abandon the pursuit of private profit entirely and adopt a principle of what he called “universal love”—essentially arguing that if one takes the principle of market exchange to its logical conclusion, it can only lead to a kind of communism.

The Confucian ideal of *ren*, of humane benevolence, was basically just a more complete inversion of profit-seeking calculation than Mo Di’s universal love; the main difference was that the Confucians added a certain aversion to calculation itself, preferring what might almost be called an art of decency. Taoists were later to take this even further with their embrace of intuition and spontaneity. All were so many attempts to provide a mirror image

of market logic. Still, a mirror image is, ultimately, just that: the same thing, only backwards. Before long we end up with an endless maze of paired opposites—egoism versus altruism, profit versus charity, materialism versus idealism, calculation versus spontaneity—none of which could ever have been imagined except by someone starting out from pure, calculating, self-interested market transactions.

Axial Age spirituality is built on a bedrock of materialism. This is its secret; one might almost say, the thing that has become invisible to us. But if one looks at the very beginnings of philosophical inquiry in Greece and India—the point when there was as yet no difference between what we'd now call 'philosophy' and what we'd now call 'science'—this is exactly what one finds. 'Theory,' if we can call it that, begins with the questions: 'What substance is the world made of?' 'What is the underlying material behind the physical forms of objects in the world?' 'Is everything made up of varying combinations of certain basic elements—earth, air, water, fire, stone, motion, mind, number—or are these basic elements just the forms taken by some even more elementary substance?' In just about every case, some notion of God, Mind, Spirit, some active organizing principle that gave form to and was not itself substance, emerged as well. But this was the kind of spirit that only emerges in relation to inert matter.

The war between Spirit and Flesh, then, between the noble Idea and ugly Reality, the rational intellect versus stubborn corporeal drives and desires that resist it, even the idea that peace and community are not things that emerge spontaneously but that need to be stamped onto our baser material natures like a divine insignia stamped into base metal—all those ideas that came to haunt the religious and philosophical traditions of the Axial Age, and that have continued to surprise people ever since—can already be seen as inscribed in the nature of this new form of money.

It would be foolish to argue that all Axial Age philosophy was simply a meditation on the nature of coinage but this is a critical starting place. One of the reasons that the pre-Socratic philosophers began to frame their questions in the peculiar way they did, asking, for instance: What are Ideas? Are they merely collective conventions? Do they exist, as Plato insisted, in some divine domain beyond material existence? Or do they exist in our minds? Or do our minds themselves ultimately partake of that divine immaterial domain? And if they do, what does this say about our relation to our bodies?

What we see then is a strange kind of back-and-forth, attack and riposte, whereby the market, the state, war, and religion all continually separate and merge with one another. Let me summarize it as briefly as I can:

1. Markets appear to have first emerged, in the Near East at least, as a side effect of government administrative systems. Over time, however, the logic of the market became entangled in military affairs, where it became almost indistinguishable from the mercenary logic of Axial Age warfare, and then, finally, that logic came to conquer government itself; to define its very purpose.
2. As a result: everywhere we see the military-coinage-slavery complex emerge, we also see the birth of materialist philosophies. They are materialist, in fact, in both senses of the term: in that they envision a world made up of material forces, rather than divine powers, and in that they imagine the ultimate end of human existence to be the accumulation of material wealth, with ideals like morality and justice being reframed as tools designed to satisfy the masses.
3. Everywhere, too, we find philosophers who react to this by exploring ideas of humanity and the soul, attempting to find a new foundation for ethics and morality.
4. Everywhere, some of these philosophers made common cause with social movements that inevitably formed in the face of these new and extraordinarily violent and cynical elites. The result was something new to human history: popular movements that were also intellectual movements, due to the assumption that those opposing existing power arrangements did so in the name of some kind of theory about the nature of reality.
5. Everywhere, these movements were first and foremost peace movements, in that they rejected the new conception of violence, and especially aggressive war, as the foundation of politics.
6. Everywhere too, there seems to have been an initial impulse to use the new intellectual tools provided by impersonal markets to come up with a new basis for morality, and everywhere, it foundered. Mohism, with its notion of social profit, flourished briefly and then collapsed. It was replaced by Confucianism, which rejected such ideas outright. We have already seen that reimagining moral responsibility in terms of debt—an impulse that cropped up in both Greece and India—while almost inevitable given the new economic circumstances, seems to prove uniformly unsatisfying. The stronger impulse is to imagine another world where debt—and with it, all other worldly connections—can be entirely annihilated, where social attachments are seen as forms of bondage; just as the body is a prison.

7. Rulers' attitudes changed over time. At first, most appear to have affected an attitude of bemused tolerance toward the new philosophical and religious movements while privately embracing some version of cynical *realpolitik*. But as warring cities and principalities were replaced by great empires, and especially as those empires began to reach the limits of their expansion, sending the military-coinage-slavery complex into crisis, all this suddenly changed. In India, Aśoka tried to re-found his kingdom on Buddhism; in Rome, Constantine turned to the Christians; in China, the Han emperor Wu-Ti, faced with a similar military and financial crisis, adopted Confucianism as the philosophy of state.

Of the three, only Wu Ti was ultimately successful: the Chinese empire endured, in one form or another, for two-thousand years, almost always with Confucianism as its official ideology. In Constantine's case the Western empire fell apart, but the Roman church endured. Aśoka's project could be said to be the least successful. Not only did his empire fall apart, replaced by an endless series of weaker, usually fragmentary kingdoms, but Buddhism itself was largely driven out of his one-time territories, though it did establish itself much more firmly in China, Nepal, Tibet, Sri Lanka, Korea, Japan, and much of Southeast Asia.

8. The ultimate effect was a kind of ideal division of spheres of human activity that endures to this day: on the one hand the market, on the other, religion. To put the matter crudely: if one relegates a certain social space simply to the selfish acquisition of material things, it is almost inevitable that soon someone else will come to set aside another domain in which to preach that, from the perspective of ultimate values, material things are unimportant; that selfishness—or even the self—are illusory, and that to give is better than to receive. If nothing else, it is surely significant that all the Axial Age religions emphasized the importance of charity, a concept that had barely existed before. Pure greed and pure generosity are complementary concepts; neither could really be imagined without the other; both could only arise in institutional contexts that insisted on such pure and single-minded behavior; and both seem to have appeared together wherever impersonal, physical, cash money also appeared on the scene.

It would be easy enough to write the religious movements off as escapist, as promising the victims of the Axial Age empires liberation in the next world as a way of letting them accept their lot in this one, and convincing the rich that all they really owed the poor were occasional charitable donations.

Radical thinkers almost invariably do write them off in this way. Surely the willingness of the governments themselves to eventually embrace them would seem to support this conclusion. But the issue is more complicated.

First of all, there is something to be said for escapism. Popular uprisings in the ancient world usually ended in the massacre of the rebels. Physical escape, such as via exodus or defection, has always been the most effective response to oppressive conditions since the earliest times we know about. Where physical escape is not possible, what, exactly, is an oppressed peasant supposed to do? Sit and contemplate her misery? At the very least, otherworldly religions provided glimpses of radical alternatives. Often they allowed people to create other worlds within this one, liberated spaces of one sort or another. It is surely significant that the only people who succeeded in abolishing slavery in the ancient world were religious sects, such as the Essenes—who did so, effectively, by defecting from the larger social order and forming their own utopian communities.

Or, in a smaller but more enduring example: the democratic city-states of northern India were all eventually stamped out by the great empires, but the Buddha admired the democratic organization of their public assemblies and adopted it as the model for his followers. Buddhist monasteries are still called *sangha*, the ancient name for such republics, and continue to operate by the same consensus-finding process to this day, preserving a certain egalitarian democratic ideal that would otherwise have been entirely forgotten.

Finally, the larger historical achievements of these movements are not, in fact, insignificant. As they took hold, things began to change. Wars became less brutal and less frequent. Slavery faded as an institution, to the point at which, by the Middle Ages, it had become insignificant or even nonexistent across most of Eurasia. Everywhere too, the new religious authorities began to seriously address the social dislocations introduced by debt.

Everywhere, the age began with the collapse of empires. Eventually, new states formed, but in these new states, the nexus between war, bullion, and slavery was broken; conquest and acquisition for their own sake were no longer celebrated as the end of all political life. At the same time, economic life, from the conduct of international trade to the organization of local markets, came to fall increasingly under the regulation of religious authorities. One result was a widespread movement to control, or even forbid, predatory lending. Another was a return, across Eurasia, to various forms of virtual credit money.

Granted, this is not the way we're used to thinking of the Middle Ages. For most of us, 'Medieval' remains a synonym for superstition, intolerance, and oppression. Yet for most of the earth's inhabitants, it could only be

seen as an extraordinary improvement over the terrors of the Axial Age. One reason for our skewed perception is that we're used to thinking of the Middle Ages as something that happened primarily in Western Europe, in territories that had been little more than border outposts of the Roman Empire to begin with. According to the conventional wisdom, with the collapse of the empire, the cities were largely abandoned and the economy "reverted to barter," taking at least five centuries to recover.

Even for Europe, though, this is based on a series of unquestioned assumptions that crumble the moment one starts seriously poking at them. Chief among them is the idea that the absence of coins means the absence of money. True, the destruction of the Roman war machine also meant that Roman coins went out of circulation; and the few coins produced within the Gothic or Frankish kingdoms that established themselves over the ruins of the old empire were largely fiduciary in nature. Still, a glance at the "barbarian law codes" reveals that even at the height of the Dark Ages, people were still carefully keeping accounts in Roman money as they calculated interest rates, contracts, and mortgages.

When coins go out of circulation, after all, the metal doesn't simply disappear. In the Middle Ages—and this seems to have been true across Eurasia—the vast majority of it ended up in religious establishments, churches, monasteries, and temples, either stockpiled in hoards and treasuries or gilded onto or cast into altars, sanctums, and sacred instruments. Above all, it was shaped into images of gods. As a result, those rulers who did try to put an Axial Age-style coinage system back into circulation—invariably, to fund some project of military expansion—often had to pursue self-consciously anti-religious policies in order to do so. Probably the most notorious was one Harsa, who ruled Kashmir from 1089–1101, who is said to have appointed an officer called the "Superintendent for the Destruction of the Gods." According to later histories, Harsa employed leprous monks to systematically desecrate divine images with urine and excrement, thus neutralizing their power, before dragging them off to be melted down. He is said to have destroyed more than four-thousand Buddhist establishments before being betrayed and killed, the last of his dynasty—and his miserable fate was long held out as an example of where the revival of the old ways was likely to lead one in the end.

And Chinese monetary theory was always chartalist. This was partly just an effect of size: the empire and its internal market were so huge that foreign trade was never especially important; therefore, those running the government were well aware that they could turn pretty much anything into money, simply by insisting that taxes be paid in that form.

Yes, cities shriveled, and many were abandoned, but even this was

something of a mixed blessing. Certainly, it had a terrible effect on literacy; but one must also bear in mind—and this remains true today—that cities can only be maintained by extracting resources from the countryside. Roman Gaul, for instance, had been a network of cities, connected by the famous Roman roads to an endless succession of slave plantations, which were owned by the urban grandees. After around 400 AD, the population of the towns declined radically, but the plantations also disappeared. In the following centuries, many came to be replaced by manors, churches, and even later, castles—where new local lords extracted their own dues from the surrounding farmers. But one need only do the math: since Medieval agriculture was no less efficient than ancient agriculture—in fact, it rapidly became a great deal more so—the amount of work required to feed a handful of mounted warriors and clergymen could not possibly have been anything like that required to feed entire cities. However oppressed Medieval serfs might have been, their plight was nothing compared with that of their Axial Age equivalents.

The Middle Ages proper are best seen as having begun not in Europe but in India and China, between 400 and 600 AD, and then sweeping across much of the western half of Eurasia with the advent of Islam. They only really reached Europe four-hundred years later.

The most characteristic Medieval institutions and ideas arrived so late in Europe that we tend to mistake them for the first stirrings of modernity. We've already seen this with bills of exchange, already in use in the East by 700 or 800 AD, but only reaching Europe several centuries later. The independent university—perhaps the quintessential Medieval institution—is another case in point. Nalanda was founded in 427 AD, and there were independent institutions of higher learning all over China and the Near West—from Cairo to Constantinople—centuries before the creation of similar institutions in Oxford, Paris, and Bologna.

Our image of the Middle Ages as an 'age of faith'—and hence, of blind obedience to authority—is a legacy of the French Enlightenment. Again, it makes sense only if you think of the 'Middle Ages' as something that happened primarily in Europe. Not only was the Far West an unusually violent place by world standards, the Catholic Church was extraordinarily intolerant. It's hard to find many Medieval Chinese, Indian, or Islamic parallels, for example, to the burning of witches or the massacre of heretics. More typical was the pattern that prevailed in certain periods of Chinese history, when it was perfectly acceptable for a scholar to dabble in Taoism in his youth, become a Confucian in middle age, then become a Buddhist on retirement. If there is an essence to Medieval thought, it lies not in blind obedience to authority, but rather in a dogged insistence that the

values that govern our ordinary daily affairs—particularly those of the court and marketplace—are confused, mistaken, illusory, or perverse. True value lay elsewhere, in a domain that cannot be directly perceived, but only approached through study or contemplation. But this in turn made the faculties of contemplation, and the entire question of knowledge, an endless problem.

We are used to thinking of bureaucratic interventions—particularly the monopolies and regulations—as state restriction on “the market,” owing to the prevailing prejudice that sees markets as quasi-natural phenomena that emerge by themselves, and governments as having no role other than to squelch or siphon from them. I have repeatedly pointed out how mistaken this is, but China provides a particularly striking example. The Confucian state may have been the world’s greatest and most enduring bureaucracy, but it actively promoted markets, and as a result, commercial life in China soon became far more sophisticated, and markets more developed, than anywhere else in the world. This despite the fact that Confucian orthodoxy was overtly hostile to merchants and even the profit motive itself. Commercial profit was seen as legitimate only as compensation for the labor that merchants expended in transporting goods from one place to another, but never as fruits of speculation. What this meant in practice was that they were pro-market but anti-capitalist.

This seems bizarre, since we’re used to assuming that capitalism and markets are the same thing, but in many ways they could equally well be conceived as opposites. While markets are ways of exchanging goods through the medium of money—historically, ways for those with a surplus of grain to acquire candles and vice versa (in economic shorthand, C-M-C’, for commodity-money-other commodity)—capitalism is first and foremost the art of using money to get more money (M-C-M’). Normally, the easiest way to do this is by establishing some kind of formal or de facto monopoly. For this reason, capitalists, whether merchant princes, financiers, or industrialists, invariably try to ally themselves with political authorities to limit the freedom of the market, so as to make it easier for them to do so. From this perspective, China was for most of its history the ultimate anti-capitalist market state. Unlike later European princes, Chinese rulers systematically refused to team up with would-be Chinese capitalists (who always existed). Instead, like their officials, they saw them as destructive parasites—though, unlike the usurers, ones whose fundamentally selfish and antisocial motivations could still be put to use in certain ways.

In Confucian terms, merchants were like soldiers. Those drawn to a career in the military were assumed to be driven largely by a love of violence. As individuals, they were not good people; but they were also necessary to

defend the frontiers. Similarly, merchants were driven by greed and basically immoral; yet if kept under careful administrative supervision, they could be made to serve the public good. Whatever one might think of the principles, the results are hard to deny. For most of its history, China maintained the highest standard of living in the world—even England only really overtook it in perhaps the 1820s, well past the time of the Industrial Revolution.

It's quite possible to turn honor into money, almost impossible to convert money into honor. In Islamic society, the merchant became not just a respected figure, but a kind of paragon: like the warrior, a man of honor able to pursue far-flung adventures; unlike him, able to do so in a fashion damaging to no one.

The veneration of the merchant was matched by what can only be called the world's first popular free-market ideology. True, one should be careful not to confuse ideals with reality. Markets were never entirely independent from the government. Islamic regimes did employ all the usual strategies of manipulating tax policy to encourage the growth of markets, and they periodically tried to intervene in commercial law. Still, there was a very strong popular feeling that they shouldn't. Once freed from its ancient scourges of debt and slavery, the local bazaar had become, for most, not a place of moral danger, but the very opposite: the highest expression of human freedom and communal solidarity, and thus to be protected assiduously from state intrusion. There was a particular hostility to anything that smacked of price-fixing.

One much-repeated story held that the Prophet himself had refused to force merchants to lower prices during a shortage in the city of Medina, on the grounds that doing so would be sacrilegious, since, in a free-market situation, "prices depend on the will of God." Most legal scholars interpreted Mohammed's decision to mean that any government interference in market mechanisms should be considered similarly sacrilegious, since markets were designed by God to regulate themselves. If all this bears a striking resemblance to Adam Smith's "invisible hand"—which was also the hand of Divine Providence—it might not be a complete coincidence. In fact, many of the specific arguments and examples that Smith uses appear to trace back directly to economic tracts written in Medieval Persia.

For instance, not only does his argument that exchange is a natural outgrowth of human rationality and speech already appear both in both Ghazali (1058–1111), and Tusi (1201–1274); both use exactly the same illustration: that no one has ever observed two dogs exchanging bones. Even more dramatically, Smith's most famous example of division of labor, the pin factory, where it takes eighteen separate operations to produce one pin, already appears in Ghazali's *Ihya*, in which he describes a needle factory,

where it takes twenty-five different operations to produce a needle.

It is becoming more and more clear that a great deal of Enlightenment thought traces back to Islamic philosophy: Descartes' *cogito*, for example, seems to derive from Ibn Sina (a.k.a. Avicenna), Hume's famous point that the observance of constant conjunctions does not itself prove causality appears in Ghazali, and Immanuel Kant's definition of enlightenment in the mouth of a magic bird in the fourteenth-century Persian poet Rumi.

The differences, however, are just as significant as the similarities. One telling example: like Smith, Tusi begins his treatise on economics with a discussion of the division of labor; but where for Smith, the division of labor is actually an outgrowth of our "natural propensity to truck and barter" in pursuit of individual advantage, for Tusi, it was an extension of mutual aid:

"Let us suppose that each individual were required to busy himself with providing his own sustenance, clothing, dwelling-place and weapons, first acquiring the tools of carpentry and the smith's trade, then readying thereby tools and implements for sowing and reaping, grinding and kneading, spinning and weaving. Clearly, he would not be capable of doing justice to any one of them. But when men render aid to each other, each one performing one of these important tasks that are beyond the measure of his own capacity, and observing the law of justice in transactions by giving greatly and receiving in exchange of the labor of others, then the means of livelihood are realized, and the succession of the individual and the survival of the species are assured."

As a result, he argues, divine providence has arranged us to have different abilities, desires, and inclinations. The market is simply one manifestation of this more general principle of mutual aid, of the matching of, abilities (supply) and needs (demand)—or to translate it into my own earlier terms, it is not only founded on, but is itself an extension of the kind of baseline communism on which any society must ultimately rest.

Ghazali's take on the division of labor is similar, and his account of the origins of money is if anything even more revealing. It begins with what looks much like the myth of barter, except that, like all Middle Eastern writers, he starts not with imaginary primitive tribesmen, but with strangers meeting in an imaginary marketplace:

"Sometimes a person needs what he does not own and he owns what he does not need. For example, a person has saffron but needs a camel for transportation and one who owns a camel

does not presently need that camel but he wants saffron. Thus, there is the need for an exchange. However, for there to be an exchange, there must be a way to measure the two objects, for the camel-owner cannot give the whole camel for a quantity of saffron. There is no similarity between saffron and camel so that equal amount of that weight and form can be given. Likewise is the case of one who desires a house but owns some cloth or desires a slave but owns socks, or desires flour but possesses a donkey. These goods have no direct proportionality so one cannot know how much saffron will equal a camel's worth. Such barter transactions would be very difficult."

Ghazali also notes that there might also be a problem of one person not even needing what the other has to offer, but this is almost an afterthought; for him, the real problem is conceptual. How do you compare two things with no common qualities? His conclusion: it can only be done by comparing both to a third thing with no qualities at all. For this reason, he explains, God created dinars and dirhams, coins made out of gold and silver, two metals that are otherwise no good for anything.

From this it also follows that lending money at interest must be illegitimate, since it means using money as an end in itself:

"Money is not created to earn money."

In fact, he says, "in relation to other goods, dirhams and dinars are like prepositions in a sentence," words that, as the grammarians inform us, are used to give meaning to other words, but can only do because they have no meaning in themselves. Money is thus a unit of measure that provides a means of assessing the value of goods, but also one that operates as such only if it stays in constant motion. To enter into monetary transactions in order to obtain even more money, even if it's a matter of M-C-M', let alone M-M', would be, according to Ghazali, the equivalent of kidnapping a postman.

Whereas Ghazali speaks only of gold and silver, what he describes—money as symbol, as abstract measure, having no qualities of its own, whose value is only maintained by constant motion—is something that would never have occurred to anyone were it not in an age when it was perfectly normal for money to be employed in purely virtual form. Much of our free-market doctrine, then, appears to have been originally borrowed piecemeal from a very different social and moral universe.

It's hard to overstate this. Even the famous Laffer Curve, by which the Reagan Administration in the 1980s tried to argue that cutting taxes

would increase government revenue by stimulating economic activity, is often called the Khaldun-Laffer curve because it was first proposed, as a general principle, in Ibn Khaldun's 1377 *Muqaddimah*.

The spread of Islam allowed the market to become a global phenomenon, operating largely independent of governments, according to its own internal laws. But the very fact that this was, in a certain way, a genuine free market, not one created by the government and backed by its police and prisons—a world of handshake deals and paper promises backed only by the integrity of the signer—meant that it could never really become the world imagined by those who later adopted many of the same ideas and arguments: one of purely self-interested individuals vying for material advantage by any means at hand.

The revival of Roman law—which began from the assumption of absolute private property—put new intellectual weapons in the hands of those who wished to argue that, at least in the case of commercial loans, usury laws should be relaxed. The great discovery in this case was the notion of *interesse*, which is where our word 'interest' originally comes from: a compensation for loss suffered because of late payment. The argument soon became that if a merchant made a commercial loan even for some minimal period (say, a month), it was not usurious for him to charge a percentage for each month afterward, since this was a penalty, not rental for the money, and it was justified as compensation for the profit he would have made, had he placed it in some profitable investment, as any merchant would ordinarily be expected to do.

What jumps out, in comparison with the Muslim world, are these links of finance, trade, and violence. Whereas Persian and Arab thinkers assumed that the market emerged as an extension of mutual aid, Christians never completely overcame the suspicion that commerce was really an extension of usury, a form of fraud only truly legitimate when directed against one's mortal enemies. Debt was, indeed, sin—on the part of both parties to the transaction. Competition was essential to the nature of the market, but competition was (usually) nonviolent warfare. There was a reason why the words for 'truck and barter' in almost all European languages were derived from terms meaning "swindle," "bamboozle," or "deceive." Some disdained commerce for that reason. Others embraced it. Few would have denied that the connection was there.

The striking thing is that the Confucian condemnation of the merchant, and the Islamic celebration of the merchant, ultimately led to the same thing: prosperous societies with flourishing markets, but where the elements never came together to create the great merchant banks and industrial firms that were to become the hallmark of modern capitalism.

Why did nothing like modern capitalism emerge? I would highlight two factors. First, Islamic merchants appear to have taken their free-market ideology seriously. The marketplace did not fall under the direct supervision of the government; contracts were made between individuals—ideally, “with a handshake and a glance at heaven”—and thus honor and credit became largely indistinguishable. This is inevitable: you can’t have cutthroat competition where there is no one stopping people from literally cutting one another’s throats. Second, Islam also took seriously the principle, later enshrined in classical economic theory but only unevenly observed in practice, that profits are the reward for risk. Trading enterprises were assumed to be, quite literally, adventures, in which traders exposed themselves to the dangers of storm and shipwreck, savage nomads, forests, steppes, and deserts, exotic and unpredictable foreign customs, and arbitrary governments. Financial mechanisms designed to avoid these risks were considered impious. This was one of the objections to usury: if one demands a fixed rate of interest, the profits are guaranteed. Similarly, commercial investors were expected to share the risk. This made most of the forms of finance and insurance that were to later develop in Europe impossible.

Where did the Western image of the solitary knight-errant, wandering the forests of a mythic Albion, challenging rivals, confronting ogres, fairies, wizards, and mysterious beasts come from? The answer should be clear by now. Really, this is just a sublimated, romanticized image of the traveling merchants themselves: men who did, after all, set off on lonely ventures through wilds and forests, whose outcome was anything but certain. And what of the Grail, that mysterious object that all the knights-errant were ultimately seeking? Perhaps the Grail was a symbol inspired by the new forms of finance. Where earlier epic heroes sought after, and fought over, piles of real, concrete gold and silver these new ones, born of the new commercial economy, pursued purely abstract forms of value. No one, after all, knew precisely what the Grail was. Even the epics disagree: sometimes it’s a plate, sometimes a cup, sometimes a stone. In one instance it was a jewel knocked from Lucifer’s helmet in a battle at the dawn of time. In a way it doesn’t matter. The point is that it’s invisible, intangible, but at the same time of infinite, inexhaustible value, containing everything, capable of making the wasteland flower, feeding the world, providing spiritual sustenance, and healing wounded bodies. It would best be conceived as a blank check, the ultimate financial abstraction.

Legally, our notion of the corporation is very much a product of the European High Middle Ages. The legal idea of a corporation as a “fictive person” (*persona ficta*)—a person who is immortal, who sues and is sued, who holds lands, has a seal of his own, who makes regulations for those

natural persons of whom he is composed—was first established in canon law by Pope Innocent IV in 1250, and one of the first kinds of entities it applied to were monasteries—as also to universities, churches, municipalities, and guilds.

While we are used to assuming that there's something natural or inevitable about the existence of corporations, in historical terms, they are actually strange, exotic creatures. No other great tradition came up with anything like it. They are the most peculiarly European addition to that endless proliferation of metaphysical entities so characteristic of the Middle Ages—as well as the most enduring. Still, the ground was only really prepared for capitalism in the familiar sense of the term when the merchants began to organize themselves into eternal bodies as a way to win monopolies, legal or *de facto*, and avoid the ordinary risks of trade.

Money always has the potential to become a moral imperative unto itself. Allow it to expand, and it can quickly become a morality so imperative that all others seem frivolous in comparison. For the debtor, the world is reduced to a collection of potential dangers, potential tools, and potential merchandise. Even human relations become a matter of cost-benefit calculation. Clearly this is the way the conquistadors viewed the worlds that they set out to conquer. It is the peculiar feature of modern capitalism to create social arrangements that essentially force us to think this way. The structure of the corporation is a telling case in point—and it is no coincidence that the first major joint-stock corporations in the world were the English and Dutch East India companies, ones that pursued that very same combination of exploration, conquest, and extraction as did the conquistadors. It is a structure designed to eliminate all moral imperatives but profit. The executives who make decisions can argue—and regularly do—that, if it were their own money, of course they would not fire lifelong employees a week before retirement, or dump carcinogenic waste next to schools. Yet they are morally bound to ignore such considerations, because they are mere employees whose only responsibility is to provide the maximum return on investment for the company's stockholders.

After the earliest years of the gold and silver mines described by Motolinia, where millions of Indians were simply rounded up and marched off to their deaths, colonists settled on a policy of debt peonage: the usual trick of demanding heavy taxes, lending money at interest to those who could not pay, and then demanding that the loans be repaid with work. Royal agents regularly attempted to forbid such practices, arguing that the Indians were now Christian and that this violated their rights as loyal subjects of the Spanish crown. But as with almost all such royal efforts to act as protector of the Indians, the result was the same. Financial exigencies ended up

taking precedence. Charles V himself was deeply in debt to banking firms in Florence, Genoa, and Naples, and gold and silver from the Americas made up perhaps one-fifth of his total revenue. In the end, despite a lot of initial noise and the (usually quite sincere) moral outrage on the part of the king's emissaries, such decrees were either ignored or, at best, enforced for a year or two before being allowed to slip into abeyance.

All this is disturbingly reminiscent of global politics nowadays, in which the United Nations, for example, will urge poor countries to make education free and available to everyone, and then the International Monetary Fund—which is, legally, actually a part of the United Nations (if only all UN functions were so effective)—will insist that those same countries do exactly the opposite, imposing school fees as part of broader “economic reforms” as a condition of refinancing the country's loans.

In the Axial Age, money was a tool of empire. It might have been convenient for rulers to promulgate markets in which everyone would treat money as an end in itself; at times, rulers might have even come to see the whole apparatus of government as a profit-making enterprise; but money always remained a political instrument. This is why when the empires collapsed and armies were demobilized, the whole apparatus could simply melt away. Under the newly emerging capitalist order, the logic of money was granted autonomy; political and military power were then gradually reorganized around it. True, this was a financial logic that could never have existed without states and armies behind it in the first place. As we have seen in the case of Medieval Islam, under genuine free-market conditions—in which the state is not involved in regulating the market in any significant way, even in enforcing commercial contracts—purely competitive markets will not develop, and loans at interest will become effectively impossible to collect. It was only the Islamic prohibition against usury, really, that made it possible for them to create an economic system that stood so far apart from the state.

Protestant thinkers all continued to make the old Medieval argument about *interesse*: that interest is really compensation for the money that the lender would have made had he been able to place his money in some more profitable investment. Originally, this logic was just applied to commercial loans. Increasingly, it was now applied to all loans. Far from being unnatural, then, the growth of money was now treated as completely expected. All money was assumed to be capital.

With such things happening, it is hardly surprising that men like Thomas Hobbes came to imagine the basic nature of society as a war of all against all, from which only the absolute power of monarchs could save us.

The peasants' visions of communistic brotherhood did not come out of

nowhere. They were rooted in real daily experience: of the maintenance of common fields and forests, of everyday cooperation and neighborly solidarity. It is out of such homely experience of everyday communism that grand mythic visions are always built. Obviously, rural communities were also divided, squabbling places, since communities always are—but insofar as they are communities at all, they are necessarily founded on a ground of mutual aid. The same, incidentally, can be said of members of the aristocracy, who might have fought endlessly over love, land, honor, and religion, but nonetheless still cooperated remarkably well with one another when it really mattered (most of all, when their position as aristocrats was threatened); just as the merchants and bankers, much as they competed with one another, managed to close ranks when it really mattered. This is what I refer to as the ‘communism of the rich,’ and it is a powerful force in human history.

The same applies to credit. There are always different standards for those one considers friends or neighbors. The inexorable nature of interest-bearing debt, and the alternately savage and calculating behavior of those enslaved to it, are typical above all of dealings between strangers. Inside the small towns and rural hamlets, where the state was mostly far away, Medieval standards survived intact, and credit was just as much a matter of honor and reputation as it had ever been. The great untold story of our current age is of how these ancient credit systems were ultimately destroyed.

Amity and friendship are the foundation of all human and civil society—they constitute that true, natural justice on which the whole legal structure of contracts, courts, and even government must necessarily be built. Thomas Hobbes’ *Leviathan*, published in 1651, was in many ways an extended attack on the very idea that society is built on any sort of prior ties of communal solidarity. Hobbes might be considered the opening salvo of the new moral perspective, and it was a devastating one. When *Leviathan* came out, it’s not clear what scandalized its readers more: its relentless materialism—Hobbes insisted that humans were basically machines whose actions could be understood by one single principle: that they tended to move toward the prospect of pleasure and away from the prospect of pain—or its resultant cynicism—if love, amity, and trust are such powerful forces, Hobbes asked, why is it that even within our families, we lock our most valuable possessions in strongboxes? Still, Hobbes’ ultimate argument—that humans, being driven by self-interest, cannot be trusted to treat each other justly of their own accord, and therefore that society only emerges when they come to realize that it is to their long-term advantage to give up a portion of their liberties and accept the absolute power of the King—differed little from arguments that theologians like Martin Luther had been making a century earlier. Hobbes simply substituted scientific language for biblical references.

I want to draw particular attention to the underlying notion of ‘self-interest.’ It is in a real sense the key to the new philosophy. The term first appears in English right around Hobbes’ time, and it is, indeed, directly borrowed from *interesse*, the Roman law term for interest payments. When it was first introduced, most English authors seemed to view the idea that all human life can be explained as the pursuit of self-interest as a cynical, foreign, Machiavellian idea, one that sat uncomfortably with traditional English mores. By the eighteenth century, most in educated society accepted it as simple common sense.

Why ‘interest’? Why make a general theory of human motivation out of a word that originally meant “penalty for late payment on a loan”? Part of the term’s appeal was that it derived from bookkeeping. It was mathematical. This made it seem objective, even scientific. Saying we are all really pursuing our own self-interest provides a way to cut past the welter of passions and emotions that seem to govern our daily existence, and to motivate most of what we actually observe people to do—not only out of love and amity, but also envy, spite, devotion, pity, lust, embarrassment, torpor, indignation, and pride—and discover that, despite all this, most really important decisions are based on the rational calculation of material advantage—which means that they are fairly predictable as well. Just as the physical world is ruled by the laws of movement no less is the moral universe ruled by laws of interest. And of course it was on this assumption that all the quadratic equations of economic theory could ultimately be built.

The very idea that human beings are motivated primarily by “self-interest,” then, was rooted in the profoundly Christian assumption that we are all incorrigible sinners; left to our own devices, we will not simply pursue a certain level of comfort and happiness and then stop to enjoy it; we will never cash in the chips let alone question why we need to buy chips to begin with. And as Augustine already anticipated, infinite desires in a finite world means endless competition, which in turn is why, as Hobbes insisted, our only hope of social peace lies in contractual arrangements and strict enforcement by the apparatus of the state.

The story of the origins of capitalism, then, is not the story of the gradual destruction of traditional communities by the impersonal power of the market. It is, rather, the story of how an economy of credit was converted into an economy of interest; of the gradual transformation of moral networks by the intrusion of the impersonal—and often vindictive—power of the state. English villagers in Elizabethan or Stuart times did not like to appeal to the justice system, even when the law was in their favor—partly on the principle that neighbors should work things out with one another, but mainly because the law was so extraordinarily harsh. Under Elizabeth,

for example, the punishment for vagrancy (unemployment) was, for the first offense, to have one's ears nailed to a pillory; for repeat offenders, death. See America's poor? You've got it good, you just get to slave for Uber or Amazon.

The same was true of debt law, especially since debts could often, if the creditor was sufficiently vindictive, be treated as a crime. In Chelsea, around 1660, Margaret Sharples was prosecuted for stealing cloth, "which she had converted into a petticoat for her own wearing," from Richard Bennett's shop. Her defense was that she had bargained with Bennett's servant for the cloth, "but having not money sufficient in her purse to pay for it, took it away with purpose to pay for it so soon as she could: and that she afterwards agreed with Mr. Bennett of a price for it." Bennett confirmed that this was so: after agreeing to pay him 22 shillings, Margaret "delivered a hamper with goods in it as a pawn for security of the money, and four shillings ninepence in money." But "soon after he disliked upon better consideration to hold agreement with her: and delivered the hamper and goods back," and commenced formal legal proceedings against her. As a result, Margaret Sharples was hanged.

The criminalization of debt, then, was the criminalization of the very basis of human society. It cannot be overemphasized that in a small community, everyone normally was both lender and borrower. One can only imagine the tensions and temptations that must have existed in a community—and communities, much though they are based on love, in fact, because they are based on love, will always also be full of hatred, rivalry, and passion—when it became clear that with sufficiently clever scheming, manipulation, and perhaps a bit of strategic bribery, they could arrange to have almost anyone they hated imprisoned or even hanged. What was it that Richard Bennett really had against Margaret Sharples? We'll never know the back-story, but it's a pretty safe bet that there was one. The effects on communal solidarity must have been devastating. The sudden accessibility of violence really did threaten to transform what had been the essence of sociality into a war of all against all. It's not surprising then, that by the eighteenth century, the very notion of personal credit had acquired a bad name, with both lenders and borrowers considered equally suspect. The use of coins—at least among those who had access to them—had come to seem moral in itself.

I do not want to argue that the more familiar narrative of "primitive accumulation," of the enclosure of common lands and rise of private property, the dislocation of thousands of one-time cottagers who became landless laborers, is false. I simply highlight a less familiar side of the story. It's especially helpful to highlight it because the degree to which the Tudor and Stuart periods were actually marked by a rise of enclosures is a heated

matter of debate. The use of debt to split communities against themselves is meant in the same vein as the argument about the role of witchcraft accusations in reversing popular gains of the late Middle Ages and opening the way to capitalism.

Consider Adam Smith:

“It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages.”

The bizarre thing here is that, at the time Smith was writing, this simply wasn't true. Most English shopkeepers were still carrying out the main part of their business on credit, which meant that customers appealed to their benevolence all the time. Smith could hardly have been unaware of this. Rather, he is drawing a utopian picture. He wants to imagine a world in which everyone used cash, in part because he agreed with the emerging middle-class opinion that the world would be a better place if everyone really did conduct themselves this way, and avoid confusing and potentially corrupting ongoing entanglements. We should all just pay the money, say 'please' and 'thank you,' and leave the store.

What's more, he uses this utopian image to make a larger point: that even if all businesses operated like the great commercial companies, with an eye only to self-interest, it wouldn't matter. Even the “natural selfishness and rapacity” of the rich, with all their “vain and insatiable desires” will still, through the logic of the invisible hand, lead to the benefit of all. In other words, Smith simply imagined the role of consumer credit in his own day, just as he had his account of the origins of money. This allowed him to ignore the role of both benevolence and malevolence in economic affairs; both the ethos of mutual aid that forms the necessary foundation of anything that would look like a free market (that is, one which is not simply created and maintained by the state), and the violence and sheer vindictiveness that had actually gone into creating the competitive, self-interested markets that he was using as his model.

Nietzsche, in turn, was taking up Smith's premises, that life is exchange, but laying bare everything—the torture, murder, mutilation—that Smith preferred not to have to talk about. Now that we have seen just a little of the social context, it's difficult to read Nietzsche's otherwise puzzling descriptions of ancient hunters and herdsman keeping accounts of debts and demanding each others' eyes and fingers without immediately thinking of

Casimir's executioner, who actually did present his master with a bill for gouged eyes and severed fingers. What he is really describing is what it took to produce a world in which the son of a prosperous middle-class reverend, such as himself, could simply assume that all human life is premised on calculated, self-interested exchange.

Consider the following lines, often attributed to Lord Josiah Charles Stamp, director of the Bank of England:

“The modern banking system manufactures money out of nothing. The process is perhaps the most astounding piece of sleight of hand that was ever invented. Banking was conceived in iniquity and born in sin. Bankers own the earth; take it away from them, but leave them with the power to create credit, and with the stroke of a pen they will create enough money to buy it back again. If you wish to remain slaves of Bankers, and pay the cost of your own slavery, let them continue to create deposits.”

It seems extremely unlikely that Lord Stamp ever really said this, but the passage has been cited endlessly—in fact, it's probably the single most often-quoted passage by critics of the modern banking system. However apocryphal, it clearly strikes a chord, and apparently for the same reason: bankers are creating something out of nothing. They are not only frauds and magicians, they are evil, because they're playing God.

If Medieval moralists did not raise such objections, it was not just because they were comfortable with metaphysical entities. They had a much more fundamental problem with the market: greed. Market motives were held to be inherently corrupt. The moment that greed was validated, and unlimited profit was considered a perfectly viable end in itself, this political, magical element became a genuine problem, because it meant that even those actors—the brokers, stock-jobbers, traders—who effectively made the system run had no convincing loyalty to anything, even to the system itself.

Hobbes, who first developed this vision of human nature into an explicit theory of society, was well aware of this greed dilemma. It formed the basis of his political philosophy. Even, he argued, if we are all rational enough to understand that it's in our long-term interest to live in peace and security, our short-term interests are often such that killing and plundering are the most obviously profitable courses to take, and all it takes is a few to cast aside their scruples to create utter insecurity and chaos. This was why he felt that markets could only exist under the aegis of an absolutist state, which would force us to keep our promises and respect one another's property. But what happens when we're talking about a market in which it is state debts

and state obligations themselves that are being traded; when one cannot really speak of a state monopoly on force because one is operating in an international market where the primary currency is bonds that the state depends on for its very ability to marshal military force?

We are used to seeing modern capitalism—along with modern traditions of democratic government—as emerging only later: with the Age of Revolutions—the industrial revolution, the American and French revolutions—a series of profound breaks at the end of the eighteenth century that only became fully institutionalized after the end of the Napoleonic Wars. Here we come face to face with a peculiar paradox. It would seem that almost all elements of financial apparatus that we've come to associate with capitalism—central banks, bond markets, short-selling, brokerage houses, speculative bubbles, securitization, annuities—came into being not only before the science of economics (which is perhaps not too surprising), but also before the rise of factories, and wage labor itself. This is a genuine challenge to familiar ways of thinking. We like to think of the factories and workshops as the 'real economy,' and the rest as superstructure, constructed on top of it. But if this were really so, then how can it be that the superstructure came first? Can the dreams of the system create its body?

All this raises the question of what 'capitalism' is to begin with, a question on which there is no consensus at all. The word was originally invented by socialists, who saw capitalism as that system whereby those who own capital command the labor of those who do not. Proponents, in contrast, tend to see capitalism as the freedom of the marketplace, which allows those with potentially marketable visions to pull resources together to bring those visions into being. Just about everyone agrees, however, that capitalism is a system that demands constant, endless growth. Enterprises have to grow in order to remain viable. The same is true of nations. Just as five percent per annum was widely accepted, at the dawn of capitalism, as the legitimate commercial rate of interest—that is, the amount that any investor could normally expect her money to be growing by the principle of *interesse*—so is five percent now the annual rate at which any nation's GDP really ought to grow. What was once an impersonal mechanism that compelled people to look at everything around them as a potential source of profit has come to be considered the only objective measure of the health of the human community itself.

There is, and has always been, a curious affinity between wage labor and slavery. This is not just because it was slaves on Caribbean sugar plantations who supplied the quick-energy products that powered much of early wage laborers' work; not just because most of the scientific management techniques applied in factories in the industrial revolution can be traced back to those

sugar plantations; but also because both the relation between master and slave, and between employer and employee, are in principle impersonal: whether you've been sold or you're simply rented yourself out, the moment money changes hands, who you are is supposed to be unimportant; all that's important is that you are capable of understanding orders and doing what you're told.

Men like Smith and Bentham were idealists; even utopians. To understand the history of capitalism, however, we have to begin by realizing that the picture we have in our heads, of workers who dutifully punch the clock at 8:00 and receive regular remuneration every Friday, on the basis of a temporary contract that either party is free to break off at any time, began as a utopian vision, was only gradually put into effect even in England and North America, and has never, at any point, been the main way of organizing production for the market, ever, anywhere. This is actually why Smith's work is so important. He created the vision of an imaginary world almost entirely free of debt and credit, and therefore, free of guilt and sin; a world where men and women were free to simply calculate their interests in full knowledge that everything had been prearranged by God to ensure that it will serve the greater good. Such imaginary constructs are of course what scientists refer to as 'models,' and there's nothing intrinsically wrong with them. Actually I think a fair case can be made that we cannot think without them. The problem with such models—at least, it always seems to happen when we model something called 'the market'—is that, once created, we have a tendency to treat them as objective realities, or even fall down before them and start worshiping them as gods. 'We must obey the dictates of the market!'

Still, if there is anything that the last several hundred years of world history have shown, it's that utopian visions can have a certain appeal. This is as true of Adam Smith's as of those ranged against it. The period from roughly 1825 to 1975 is a brief but determined effort on the part of a large number of very powerful people—with the avid support of many of the least powerful—to try to turn that vision into something like reality. Coins and paper money were, finally, produced in sufficient quantities that even ordinary people could conduct their daily lives without appeal to tickets, tokens, or credit. Wages started to be paid on time. New sorts of shops, arcades, and galleries appeared, where everyone paid in cash, or alternately, as time went on, by means of impersonal forms of credit like installment plans. As a result, the old puritanical notion that debt was sin and degradation began to take a profound hold on many of those who came to consider themselves the respectable working classes, who often took freedom from the clutches of the pawnbroker and loan shark as a point of

pride, which separated them from drunkards, hustlers, and ditch-diggers as surely as the fact that they weren't missing teeth.

I can attest to the degree that, for those who spend most of their waking hours working at someone else's orders, the ability to pull out a wallet full of banknotes that are unconditionally one's own can be a compelling form of freedom. It's not surprising that so many of the economists' assumptions have been embraced by the leaders of the historic workers' movements, so much so that they have come to shape our visions of what alternatives to capitalism might be like. The problem is not just that it is rooted in a deeply flawed, even perverse, conception of human freedom. The real problem is that, like all utopian dreams, it is impossible. We could no more have a universal world market than we could have a system in which everyone who wasn't a capitalist was somehow able to become a respectable, regularly paid wage laborer with access to adequate dental care. A world like that has never existed and never could exist. What's more, the moment that even the prospect that this might happen begins to materialize, the whole system starts to come apart.

There may be a deep, profound relation between gambling and apocalypse. Capitalism is a system that enshrines the gambler as an essential part of its operation, in a way that no other ever has; yet at the same time, capitalism seems to be uniquely incapable of conceiving of its own eternity. Could these two facts be linked? I should be more precise here. It's not entirely true that capitalism is incapable of conceiving of its own eternity. On the one hand, its exponents do often feel obliged to present it as eternal, because they insist that it is the only possible viable economic system; one that, as they still sometimes like to say, "has existed for five-thousand years and will exist for five-thousand more." On the other hand, it does seem that the moment a significant portion of the population begins to actually believe this, and particularly, starts treating credit institutions as if they really will be around forever, everything goes haywire. Note here how it was the most sober, cautious, responsible capitalist regimes—the seventeenth-century Dutch Republic, the eighteenth-century British Commonwealth—the ones most careful about managing their public debt—that saw the most bizarre explosions of speculative frenzy, the tulip manias and South Sea bubbles.

Much of this seems to turn on the nature of national deficits and credit money. The national debt is, as politicians have complained practically since these things first appeared, money borrowed from future generations. Still, the effects have always been strangely double-edged. On the one hand, deficit financing is a way of putting even more military power in the hands of princes, generals, and politicians; on the other, it suggests that government owes something to those it governs. Insofar as our money is ultimately

an extension of the public debt, then whenever we buy a newspaper or a cup of coffee, or even place a bet on a horse, we are trading in promises, representations of something that the government will give us at some time in the future, even if we don't know exactly what it is.

This is incidentally why complaints about the immorality of deficits are so profoundly disingenuous: since modern money effectively is government debt, if there was no deficit, the results would be disastrous. True, money can also be generated privately, by banks, but there would appear to be limits to this. This is why US financial elites, led by Alan Greenspan, panicked in the late 1990s when the Clinton administration began to run budget surpluses; the Bush tax cuts appear to have been designed specifically to ensure that the deficit was maintained.

The French Revolution introduced some profoundly new ideas in politics—ideas which, fifty years before the revolution, the vast majority of educated Europeans would have written off as crazy, but which, fifty years afterward, just about anyone felt they had to at least pretend they thought were true. The first is that social change is inevitable and desirable; that the natural direction of history is for civilization to gradually improve. The second is that the appropriate agent to manage such change is the government. The third is that the government gains its legitimacy from an entity called 'the people.' It's easy to see how the very idea of a national debt—a promise of continual future improvement (at the very least, five percent annual improvement) made by government to people—might itself have played a role in inspiring such a revolutionary new perspective. Yet at the same time, when one looks at what the philosophers who first proposed that notion of what we now call 'civilization' were actually arguing about in the years immediately leading up to the revolution, it was even more about the danger of apocalyptic catastrophe, of the prospect of civilization as they knew it being destroyed by default and economic collapse.

We are used to thinking of the Enlightenment as the dawn of a unique phase of human optimism, borne on assumptions that the advance of science and human knowledge would inevitably make life wiser, safer, and better for everyone—a naïve faith said to have peaked in the Fabian socialism of the 1890s, only to be annihilated in the trenches of World War I. In fact, even the Victorians were haunted by the dangers of degeneration and decline. Most of all, Victorians shared the near-universal assumption that capitalism itself would not be around forever. Insurrection seemed imminent. Many Victorian capitalists operated under the sincere belief that they might, at any moment, find themselves hanging from trees. In Chicago, for instance, a friend once took me on a drive down a beautiful old street, full of mansions from the 1870s; the reason, he explained, that it looked like that, was that

most of Chicago's rich industrialists of the time were so convinced that the revolution was imminent that they collectively relocated along the road that led to the nearest military base. Almost none of the great theorists of capitalism, from anywhere on the political spectrum, from Marx to Weber, to Schumpeter, to von Mises, felt that capitalism was likely to be around for more than another generation or two at the most.

One could go further: the moment that the fear of imminent social revolution no longer seemed plausible, by the end of World War II, we were immediately presented with the specter of nuclear holocaust. Then, when that no longer seemed plausible, we discovered global warming. This is not to say that these threats were not, and are not, real. Yet it does seem strange that capitalism feels the constant need to imagine, or to actually manufacture, the means of its own imminent extinction. It's in dramatic contrast to the behavior of the leaders of socialist regimes, from Cuba to Albania, who, when they came to power, immediately began acting as if their system would be around forever—ironically enough, considering they in fact turned out to be something of a historical blip.

Perhaps the reason is because what was true in 1710 is still true. Presented with the prospect of its own eternity, capitalism—or anyway, financial capitalism—simply explodes. Because if there's no end to it, there's absolutely no reason not to generate credit—that is, future money—infinity. Recent events would certainly seem to confirm this. The period leading up to 2009 was one in which many began to believe that capitalism really was going to be around forever; at the very least, no one seemed any longer to be able to imagine an alternative. The immediate effect was a series of increasingly reckless bubbles that brought the whole apparatus crashing down.

Since Nixon's floating of the dollar, it has become evident that it's only the wizard behind the screen who seems to be maintaining the viability of the whole arrangement. Under the free-market orthodoxy that followed, we have all been asked, effectively, to accept that the market is a self-regulating system, with the rising and falling of prices akin to a force of nature, and simultaneously to ignore the fact that, in the business pages, it is simply assumed that markets rise and fall mainly in anticipation of, or reaction to, decisions regarding interest rates by Alan Greenspan, or Ben Bernanke, or whoever is currently the chairman of the Federal Reserve.

One element, however, tends to go flagrantly missing in even the most vivid conspiracy theories about the banking system, let alone in official accounts: that is, the role of war and military power. There's a reason why the wizard has such a strange capacity to create money out of nothing. Behind him, there's a man with a gun. True, in one sense, he's been there

from the start. I have already pointed out that modern money is based on government debt, and that governments “borrow” money in order to finance wars. This is just as true today as it was in the age of King Phillip II. The creation of central banks represented a permanent institutionalization of that marriage between the interests of warriors and financiers that had already begun to emerge in Renaissance Italy, and that eventually became the foundation of financial capitalism.

For those who don’t know how the Fed works: technically, there are a series of stages. Generally the Treasury puts out bonds to the public, and the Fed buys them back. The Fed then loans the money thus created to other banks at a special low rate of interest (“the prime rate”), so that those banks can then lend at higher ones. In its capacity as regulator of the banking system, the Fed also establishes the fractional reserve rate: just how many dollars these banks can “lend”—effectively, create—for every dollar they borrow from the Fed, or have on deposit, or can otherwise count as assets. Technically this is 10 to 1, but a variety of legal loopholes allow banks to go considerably higher.

The US military, unlike any other, maintains a doctrine of global power projection: that it should have the ability, through over 800 overseas military bases, to intervene with deadly force absolutely anywhere on the planet. In a way, though, land forces are secondary; at least since World War II, the key to US military doctrine has always been a reliance on air power. The United States has fought no war in which it did not control the skies, and it has relied on aerial bombardment far more systematically than any other military—in its recent occupation of Iraq, for instance, even going so far as to bomb residential neighborhoods of cities ostensibly under its own control. The essence of US military predominance in the world is, ultimately, the fact that it can, at will, drop bombs, with only a few hours’ notice, at absolutely any point on the surface of the planet. No other government has ever had anything remotely like this sort of capability. In fact, a case could well be made that it is this very power that holds the entire world monetary system, organized around the dollar, together.

As many have remarked, the three countries that switched to the euro—Iraq, Iran, and North Korea—were precisely those singled out by Bush as his “Axis of Evil.” Of course we can argue about cause and effect here. It’s also significant that the core euro-using states such as France and Germany uniformly opposed the war, while US allies were drawn from euro-skeptics like the UK.

If history holds true, an age of virtual money should mean a movement away from war, empire-building, slavery, and debt peonage (waged or otherwise), and toward the creation of some sort of overarching institutions, global

in scale, to protect debtors. What we have seen so far is the opposite. The new global currency is rooted in military power even more firmly than the old was. Debt peonage continues to be the main principle of recruiting labor globally: either in the literal sense, in much of East Asia or Latin America, or in the subjective sense, whereby most of those working for wages or even salaries feel that they are doing so primarily to pay off interest-bearing loans. The new transportation and communications technologies have just made it easier, making it possible to charge domestics or factory workers thousands of dollars in transportation fees, and then have them work off the debt in distant countries where they lack legal protections.

Insofar as overarching grand cosmic institutions have been created that might be considered in any way parallel to the divine kings of the ancient Middle East or the religious authorities of the Middle Ages, they have not been created to protect debtors, but to enforce the rights of creditors. The International Monetary Fund is only the most dramatic case in point here. It stands at the pinnacle of a great, emerging global bureaucracy—the first genuinely global administrative system in human history, enshrined not only in the United Nations, the World Bank, and the World Trade Organization, but also the endless host of economic unions and trade organizations and non-governmental organizations that work in tandem with them—created largely under US patronage. All of them operate on the principle that (unless one is the United States Treasury), “one has to pay one’s debts”—since the specter of default by any country is assumed to imperil the entire world monetary system, threatening to turn all the world’s sacks of (virtual) gold into worthless sticks and paper.

The near-total collapse of the US financial industry, which despite having been very nearly granted rights to make up money at will, still managed to end up with trillions in liabilities it could not pay, bringing the world economy to a standstill, eliminated even the pretense that debt imperialism guaranteed stability.

By the end of World War II, the specter of an imminent working-class uprising that had so haunted the ruling classes of Europe and North America for the previous century had largely disappeared. This was because class war was suspended by a tacit settlement. To put it crudely: the white working class of the North Atlantic countries, from the United States to West Germany, were offered a deal. If they agreed to set aside any fantasies of fundamentally changing the nature of the system, then they would be allowed to keep their unions, enjoy a wide variety of social benefits: pensions, vacations, health care, and, perhaps most important, through generously funded and ever-expanding public educational institutions, know that their children had a reasonable chance of leaving the working class entirely. One

key element in all this was a tacit guarantee that increases in workers' productivity would be met by increases in wages: a guarantee that held good until the late 1970s.

Largely as a result, the period saw both rapidly rising productivity and rapidly rising incomes, laying the basis for the consumer economy of today. Economists call this the "Keynesian era" since it was a time in which John Maynard Keynes' economic theories, which already formed the basis of Roosevelt's New Deal in the United States, were adopted by industrial democracies pretty much everywhere. With them came Keynes' rather casual attitude toward money. Keynes fully accepted that banks do, indeed, create money "out of thin air," and that for this reason, there was no intrinsic reason that government policy should not encourage this during economic downturns as a way of stimulating demand—a position that had long been dear to the heart of debtors and anathema to creditors.

When the Keynesian settlement was finally put into effect, after World War II, it was offered only to a relatively small slice of the world's population. As time went on, more and more people wanted in on the deal. Almost all of the popular movements of the period from 1945 to 1975, even perhaps revolutionary movements, could be seen as demands for inclusion: demands for political equality that assumed equality was meaningless without some level of economic security. This was true not only of movements by minority groups in North Atlantic countries who had first been left out of the deal—such as those for whom Dr. King spoke—but what were then called "national liberation" movements from Algeria to Chile, or, finally, and perhaps most dramatically, in the late 1960s and 1970s, feminism. At some point in the '70s, things reached a breaking point. It would appear that capitalism, as a system, simply cannot extend such a deal to everyone. Quite possibly it wouldn't even remain viable if all its workers were free wage laborers; certainly it will never be able to provide everyone in the world the sort of life lived by, say, a 1960s auto worker in Michigan or Turin with his own house, garage, and children in college—and this was true even before so many of those children began demanding more.

The result might be termed a crisis of inclusion. By the late 1970s, the existing order was clearly in a state of collapse, plagued simultaneously by financial chaos, food riots, oil shock, widespread doomsday prophecies of the end of growth and ecological crisis—all of which, it turned out, proved to be ways of putting the populace on notice that all deals were off.

The moment that we start framing the story this way, it's easy to see that the next thirty years, the period from roughly 1978 to 2009, follows nearly the same pattern. Except that the deal, the settlement, had changed. Certainly, when both Ronald Reagan in the United States and Margaret Thatcher

in the UK launched a systematic attack on the power of labor unions, as well as on the legacy of Keynes, it was a way of explicitly declaring that all previous deals were off. Everyone could now have political rights—even, by the 1990s, most everyone in Latin America and Africa—but political rights were to become economically meaningless. The link between productivity and wages was chopped to bits: productivity rates have continued to rise, but wages have stagnated or even atrophied:

This was accompanied, at first, by a return to “monetarism”: the doctrine that even though money was no longer in any way based in gold, or in any other commodity, government and central-bank policy should be primarily concerned with carefully controlling the money supply to ensure that it acted as if it were a scarce commodity. Even as, at the same time, the financialization of capital meant that most money being invested in the marketplace was completely detached from any relation to production of commerce at all, but had become pure speculation.

All this is not to say that the people of the world were not being offered something: just that, as I say, the terms had changed. In the new dispensation, wages would no longer rise, but workers were encouraged to buy a piece of capitalism. Rather than euthanize the rentiers, everyone could now become rentiers—effectively, could grab a chunk of the profits created by their own increasingly dramatic rates of exploitation. The means were many and familiar. In the United States, there were 401(k) retirement accounts and an endless variety of other ways of encouraging ordinary citizens to play the market; but at the same time, encouraging them to borrow. One of the guiding principles of Thatcherism and Reaganism alike was that economic reforms would never gain widespread support unless ordinary working people could at least aspire to owning their own homes; to this was added, by the 1990s and 2000s, endless mortgage-refinancing schemes that treated houses, whose value it was assumed would only rise, “like ATMs”—as the popular catchphrase had it, though it turns out, in retrospect, it was really more like credit cards.

Then there was the proliferation of actual credit cards, juggled against one another. Here, for many, “buying a piece of capitalism” slithered undetectably into something indistinguishable from those familiar scourges of the working poor: the loan shark and the pawnbroker. It did not help here that in 1980, US federal usury laws, which had previously limited interest to between seven and ten percent, were eliminated by act of Congress. The key legislation was the “Depository Institutions Deregulation and Monetary Control Act” of 1980, which struck down all federal usury laws: ostensibly, in reaction to the rampant inflation of the late 1970s, though of course they were never restored when inflation was brought back under control, as it

has in the last quarter-century. It left state interest ceilings in place, but institutions like credit-card companies were allowed to observe the laws of the state in which they are registered, no matter where they operated. This is why most are registered in South Dakota, which has no maximum interest rate.

Just as the United States had managed to largely get rid of the problem of political corruption by making the bribery of legislators effectively legal—it was redefined as ‘lobbying’—so the problem of loan-sharking was brushed aside by making real interest rates of 25 percent, 50 percent, or even in some cases (for instance for payday loans) 120 percent annually, once typical only of organized crime, perfectly legal—and therefore, enforceable no longer just by hired goons and the sort of people who place mutilated animals on their victims’ doorsteps, but by judges, lawyers, bailiffs, and police.

There are even debt TV shows, which have a familiar religious-revival ring to them. There are accounts of shopaholic binges during which you don’t know what came over you and everything was a blur, with tearful confessions by those who’ve spent themselves into quivering insomniac jellies of hopeless indebtedness, and have resorted to lying, cheating, stealing, and kiting cheques between bank accounts as a result. There are testimonials by families and loved ones whose lives have been destroyed by the debtor’s harmful behaviour. There are compassionate but severe admonitions by the television host, who here plays the part of priest or revivalist. There’s a moment of seeing the light, followed by repentance and a promise never to do it again. There’s a penance imposed—snip, snip go the scissors on the credit cards—followed by a strict curb-on-spending regimen; and finally, if all goes well, the debts are paid down, the sins are forgiven, absolution is granted, and a new day dawns, in which a sadder but more solvent man you rise the morrow morn.

Here, risk-taking is in no sense the vessel of the divine. Quite the opposite. But for the poor it’s always different. In a way, it might be seen as the perfect inversion of the prophetic voice of Reverend King’s “I Have a Dream” speech: whereas the first post-war age was about collective claims on the nation’s debt to its humblest citizens, the need for those who have made false promises to redeem themselves, now those same humble citizens are taught to think of themselves as sinners, seeking some kind of purely individual redemption to have the right to any sort of moral relations with other human beings at all.

At the same time, there is something profoundly deceptive going on here. All these moral dramas start from the assumption that personal debt is ultimately a matter of self-indulgence, a sin against one’s loved ones—and therefore, that redemption must necessarily be a matter of purging and

restoration of ascetic self-denial. What's being shunted out of sight here is first of all the fact that everyone is now in debt (US household debt is now estimated at on average 130 percent of income), and that very little of this debt was accrued by those determined to find money to bet on the horses or toss away on fripperies. Insofar as it was borrowed for what economists like to call discretionary spending, it was mainly to be given to children, to share with friends, or otherwise to be able to build and maintain relations with other human beings that are based on something other than sheer material calculation. One must go into debt to achieve a life that goes in any way beyond sheer survival.

This is, incidentally, also the best response to conventional critiques of the poor as falling into debt because they are unable to delay gratification—another way in which economic logic, with all its human blind spots, skews any possible understanding of consumers' actual motivations. Rationally, since CDs yield around 4% annually, and credit cards charge 20%, consumers should save as a cushion and only go into debt when they absolutely have to, postponing unnecessary purchases until there's a surplus. Very few act this way, but this is rarely because of improvidence (can't wait to get that flashy new dress) but because human relations can't actually be put off in the same way as imaginary "consumer purchases"—one's daughter will only be five once, and one's grandfather has only so many years left.

Ultimately, it's sociality itself that's treated as abusive, criminal, demonic. To this, most ordinary Americans—including Black and Latino Americans, recent immigrants, and others who were formerly excluded from credit—have responded with a stubborn insistence on continuing to love one another. They continue to acquire houses for their families, liquor and sound systems for parties, gifts for friends; they even insist on continuing to hold weddings and funerals, regardless of whether this is likely to send them skirting default or bankruptcy—apparently figuring that, as long as everyone now has to remake themselves as miniature capitalists, why shouldn't they be allowed to create money out of nothing too?

Granted, the role of discretionary spending itself should not be exaggerated. The chief cause of bankruptcy in America is catastrophic illness; most borrowing is simply a matter of survival (if one does not have a car, one cannot work); and increasingly, simply being able to go to college now almost necessarily means debt peonage for at least half one's subsequent working life. Still, it is useful to point out that for real human beings survival is rarely enough. Nor should it be.

In the wake of the subprime collapse, the US government was forced to decide who really gets to make money out of nothing: the financiers, or ordinary citizens. The results were predictable. Financiers were "bailed out

with taxpayer money”—which basically means that their imaginary money was treated as if it were real. Mortgage holders were, overwhelmingly, left to the tender mercies of the courts, under a bankruptcy law that Congress had a year before made far more exacting against debtors. Nothing was altered. All major decisions were postponed. The Great Conversation that many were expecting never happened.

Capitalism cannot really operate in a world where people believe it will be around forever. For most of the last several centuries, most people assumed that credit could not be generated infinitely because they assumed that the economic system itself was unlikely to endure forever. The future was likely to be fundamentally different. Yet somehow, the anticipated revolutions never happened. The basic structures of financial capitalism largely remained in place. It's only now, at the very moment when it's becoming increasingly clear that current arrangements are not viable, that we suddenly have hit the wall in terms of our collective imagination.

There is very good reason to believe that, in a generation or so, capitalism itself will no longer exist—most obviously, as ecologists keep reminding us, because it's impossible to maintain an engine of perpetual growth forever on a finite planet, and the current form of capitalism doesn't seem to be capable of generating the kind of vast technological breakthroughs and mobilizations that would be required for us to start finding and colonizing any other planets. Yet faced with the prospect of capitalism actually ending, the most common reaction—even from those who call themselves progressives—is simply fear. We cling to what exists because we can no longer imagine an alternative that wouldn't be even worse.

My own suspicion is that we are looking at the final effects of the militarization of American capitalism itself. In fact, it could well be said that the last thirty years have seen the construction of a vast bureaucratic apparatus for the creation and maintenance of hopelessness, a giant machine designed, first and foremost, to destroy any sense of possible alternative futures. At its root is a veritable obsession on the part of the rulers of the world—in response to the upheavals of the 1960s and 1970s—with ensuring that social movements cannot be seen to grow, flourish, or propose alternatives; that those who challenge existing power arrangements can never, under any circumstances, be perceived to win.

To do so requires creating a vast apparatus of armies, prisons, police, various forms of private security firms and police and military intelligence apparatus, and propaganda engines of every conceivable variety, most of which do not attack alternatives directly so much as create a pervasive climate of fear, jingoistic conformity, and simple despair that renders any thought of changing the world seem an idle fantasy. Maintaining this

apparatus seems even more important, to exponents of the free market, even more than maintaining any sort of viable market economy. How else can one explain what happened in the former Soviet Union? One would ordinarily have imagined that the end of the Cold War would have led to the dismantling of the army and the KGB and rebuilding the factories, but in fact what happened was precisely the other way around. This is just an extreme example of what has been happening everywhere.

Economically, the apparatus is pure dead weight; all the guns, surveillance cameras, and propaganda engines are extraordinarily expensive and really produce nothing, and no doubt it's yet another element dragging the entire capitalist system down—along with producing the illusion of an endless capitalist future that laid the groundwork for the endless bubbles to begin with. Finance capital became the buying and selling of chunks of that future, and economic freedom, for most of us, was reduced to the right to buy a small piece of one's own permanent subordination. In other words, there seems to have been a profound contradiction between the political imperative of establishing capitalism as the only possible way to manage anything, and capitalism's own unacknowledged need to limit its future horizons lest speculation, predictably, go haywire. Once it did, and the whole machine imploded, we were left in the strange situation of not being able to even imagine any other way that things might be arranged. About the only thing we can imagine is catastrophe.

To begin to free ourselves, the first thing we need to do is to see ourselves again as historical actors, as people who can make a difference in the course of world events. This is exactly what the militarization of history is trying to take away. Even if we are at the beginning of the turn of a very long historical cycle, it's still largely up to us to determine how it's going to turn out.

Perhaps it's naïve to look for any new breakthrough from the puritanical legacy of the old patriarchal rebellion. Perhaps it will come out of feminism. Or Islamic feminism. Or from some as yet completely unexpected quarter. Animal rights and liberation movements would seem to be a likely candidate due to the larger and more varied moral outrage capable of being generated against the system. Who's to say? The one thing we can be confident of is that history is not over, and that surprising new ideas will certainly emerge.

The one thing that's clear is that new ideas won't emerge without the jettisoning of much of our accustomed categories of thought—which have become mostly sheer dead weight, if not intrinsic parts of the very apparatus of hopelessness—and formulating new ones. This is why I spent so much time talking about the market, but also about the false choice between state and market that so monopolized political ideology for the last centuries that

it made it difficult to argue about anything else. The real history of markets is nothing like what we're taught to think it is. The earlier markets that we are able to observe appear to be spillovers, more or less; side effects of the elaborate administrative systems of ancient Mesopotamia. They operated primarily on credit. Cash markets arose through war: again, largely through tax and tribute policies that were originally designed to provision soldiers, but that later became useful in all sorts of other ways besides.

It was only the Middle Ages, with their return to credit systems, that saw the first manifestations of what might be called market populism: the idea that markets could exist beyond, against, and outside of states, as in those of the Muslim Indian Ocean—an idea that was later to reappear in China with the great silver revolts of the fifteenth century. It usually seems to arise in situations where merchants, for one reason or another, find themselves making common cause with common people against the administrative machinery of some great state. But market populism is always riddled with paradoxes, because it still does depend to some degree on the existence of that state, and above all, because it requires founding market relations, ultimately, in something other than sheer calculation: in the codes of honor, trust, and ultimately community and mutual aid, more typical of human economies. This in turn means relegating competition to a relatively minor element. In this light, we can see that what Adam Smith ultimately did, in creating his debt-free market utopia, was to fuse elements of this unlikely legacy with that unusually militaristic conception of market behavior characteristic of the Christian West. In doing so he was surely prescient. But like all extraordinarily influential writers, he was also just capturing something of the emerging spirit of his age. What we have seen ever since is an endless political jockeying back and forth between two sorts of populism—state and market populism—without anyone noticing that they were talking about the left and right flanks of exactly the same animal.

The main reason that we're unable to notice, I think, is that the legacy of violence has twisted everything around us. War, conquest, and slavery not only played the central role in converting human economies into market ones; there is literally no institution in our society that has not been to some degree affected. Even how our conceptions of 'freedom' itself came to be transformed, through the Roman institution of slavery, from the ability to make friends, to enter into moral relations with others, into incoherent dreams of absolute power, is only perhaps the most dramatic instance—and most insidious, because it leaves it very hard to imagine what meaningful human freedom would even be like.

If this book has shown anything, it's exactly how much violence it has taken, over the course of human history, to bring us to a situation

where it's even possible to imagine that that's what life is really about. Especially when one considers how much of our own daily experience flies directly in the face of it. As I've emphasized, communism may be the foundation of all human relations—that communism that, in our own daily life, manifests itself above all in what we call 'love'—but there's always some sort of system of exchange, and usually, a system of hierarchy built on top of it. These systems of exchange can take an endless variety of forms, many perfectly innocuous. Still, what we are speaking of here is a very particular type of calculating exchange. The difference between owing someone a favor, and owing someone a debt, is that the amount of a debt can be precisely calculated. Calculation demands equivalence. And such equivalence—especially when it involves equivalence between human beings (and it always seems to start that way, because at first, human beings are always the ultimate values)—only seems to occur when people have been forcibly severed from their contexts, so much so that they can be treated as identical to something else, as in: 'seven martin skins and twelve large silver rings for the return of your captured brother,' 'one of your three daughters as surety for this loan of one-hundred-fifty bushels of grain.'

This in turn leads to that great embarrassing fact that haunts all attempts to represent the market as the highest form of human freedom: that historically, impersonal, commercial markets originate in theft. More than anything else, the endless recitation of the myth of barter, employed much like an incantation, is the economists' way of fending off any possibility of having to confront it. But even a moment's reflection makes it obvious. Who was the first man to look at a house full of objects and to immediately assess them only in terms of what he could trade them in for in the market likely to have been? Surely, he can only have been a thief. Burglars, marauding soldiers, then perhaps debt collectors, were the first to see the world this way. It was only in the hands of soldiers, fresh from looting towns and cities, that chunks of gold or silver—melted down, in most cases, from some heirloom treasure, that like the Kashmiri gods, or Aztec breastplates, or Babylonian women's ankle bracelets, was both a work of art and a little compendium of history—could become simple, uniform bits of currency, with no history, valuable precisely for their lack of history, because they could be accepted anywhere, no questions asked. And it continues to be true. Any system that reduces the world to numbers can only be held in place by weapons, whether these are swords and clubs, or nowadays, "smart bombs" from unmanned drones.

It can also only operate by continually converting love into debt. I know my use of the word 'love' here is even more provocative, in its own way, than 'communism.' Still, it's important to hammer the point home. Just

as markets, when allowed to drift entirely free from their violent origins, invariably begin to grow into something different, into networks of honor, trust, and mutual connectedness, so does the maintenance of systems of coercion constantly do the opposite: turn the products of human cooperation, creativity, devotion, love, and trust back into numbers once again. In doing so, they make it possible to imagine a world that is nothing more than a series of cold-blooded calculations. Even more, by turning human sociality itself into debts, they transform the very foundations of our being—since what else are we, ultimately, except the sum of the relations we have with others—into matters of fault, sin, and crime, and making the world into a place of iniquity that can only be overcome by completing some great cosmic transaction that will annihilate everything.

Take microlending. What is most attractive about microlending is what it is not, what it makes unnecessary: any sort of collective action by poor people, coming together in governments or unions. The international development community now knew that such institutions had no real role in human prosperity. Instead, we were to understand poverty in the familiar terms of entrepreneurship and individual merit, as though the hard work of millions of single, unconnected people, plus cellphones, bank accounts, and a little capital, were what was required to remedy the third world's vast problems. Millions of people would sell one another baskets they had made or coal they had dug out of the trash heap, and suddenly they were entrepreneurs, on their way to the top.

The key to development was not doing something to limit the grasp of Western banks, in other words; it was extending Western banking methods to encompass every last individual on earth. Microlending is a perfect expression of Clintonism, bringing together wealthy financial interests with rhetoric that sounds outrageously idealistic. Microlending permits all manner of networking, virtue-seeking, and profit-taking among the lenders while doing nothing to change actual power relations—the ultimate win-win.

There's a second reason the liberal class loves microfinance, and it's extremely simple: microlending is profitable. Lending to the poor, as every subprime mortgage originator knows, can be a lucrative business. Mixed with international feminist self-righteousness, it is also a bulletproof business, immune to criticism. The million-dollar paydays it has brought certain microlenders are the wages of virtue. This combination is the real reason the international goodness community believes that empowering poor women by lending to them at usurious interest rates is a fine thing all around.

As strategies for ending poverty go, microlending appears to be among the worst that has ever been tried, just one step up from doing nothing to help the poor at all. It doesn't empower women, it makes them into

debtors. It encourages people to take up small, futile enterprises that have no chance of growing or employing others. Sometimes microborrowers don't even start businesses at all; they just spend the loan on whatever. Even worse: the expert studies that originally sparked the microlending boom turn out, upon reexamination, to have been badly flawed. Nearly every country where microlending has been an important development strategy for the last few decades is now a disaster zone of indebtedness and economic backwardness.

Such is the state of the conversation in the mainstream literature. My purpose here has been less to engage with it directly than to show how it has consistently encouraged us to ask the wrong questions. There is a widespread belief that poverty is caused by a lack of credit. It's only if the industrious poor have access to loans from stable, respectable banks—rather than to loan sharks, or, presumably, credit card companies, or payday loan operations, which now charge loan-shark rates—that they can rise out of poverty. So actually they are not really concerned with poverty at all, just with the poverty of some people, those who are industrious and thus do not deserve to be poor. What about the non-industrious poor? They can go to hell, presumably—quite literally, according to many branches of Christianity. Or maybe their boats will be lifted somewhat by the rising tide. Still, that's clearly incidental. They're undeserving, since they're not industrious, and therefore what happens to them is really beside the point.

For me, this is exactly what's so pernicious about the morality of debt: the way that financial imperatives constantly try to reduce us all, despite ourselves, to the equivalent of pillagers, eyeing the world simply for what can be turned into money—and then tell us that it's only those who are willing to see the world as pillagers who deserve access to the resources required to pursue anything in life other than money. It introduces moral perversions on almost every level. 'Cancel all student loan debt? But that would be unfair to all those people who struggled for years to pay back their student loans!' This argument makes about as much sense as saying it would be unfair to a mugging victim not to mug their neighbors too. The argument might perhaps make sense if one agreed with the underlying assumption—that work is by definition virtuous, since the ultimate measure of humanity's success as a species is its ability to increase the overall global output of goods and services by at least five percent per year.

The problem is that it is becoming increasingly obvious that if we continue along these lines much longer, we're likely to destroy everything. That giant debt machine that has, for the last five centuries, reduced increasing proportions of the world's population to the moral equivalent of conquistadors would appear to be coming up against its social and ecological

limits. Capitalism's inveterate propensity to imagine its own destruction has morphed, in the last half-century, into scenarios that threaten to bring the rest of the world down with it. And there's no reason to believe that this propensity is ever going to go away. The real question now is how to ratchet things down a bit, to move toward a society where people can live more by working less.

I would like, then, to end by putting in a good word for the non-industrious poor. At least they aren't hurting anyone. Insofar as the time they are taking time off from work is being spent with friends and family, enjoying and caring for those they love, they're probably improving the world more than we acknowledge. Maybe we should think of them as pioneers of a new economic order that would not share our current one's penchant for self-destruction.

The People's Money

Our Money

How can a fairy—a small, winged humanoid—perform her duties with regard to teeth? Of course she's probably capable of carrying one tooth, maybe a few, but once you bring coins into the matter that's where the physics really falls apart.

Or how can Santa visit every house on Christmas Eve? Well first, as a fictional creation, he clearly has the power to do whatever his creators and supporters say he can do. But convincing children he is real requires the actual physical labors of hundreds of millions of people.

I recently read that Modern Monetary Theory (MMT) is defined as the proposition that the federal government can borrow as much money as it needs so long as the interest rate it pays is less than the growth rate of the GDP. The short article went on to argue why this was a dangerously false premise. Thus, MMT got shot with two bullets in one paragraph: first by defining it in a way that negates its most fundamental principle—that the federal government doesn't need to borrow fiat currency in order to spend fiat currency—and second, by declaring MMT to be not only false, but dangerous.

It's remarkable how stubbornly tenacious mainstream economic thinking is about misunderstanding and fearing MMT. The fundamental belief that refuses to be shaken is that for a sovereign government to spend, it must first claim—either through taxation or borrowing—some portion of the profits of private commerce. This immediately sets in motion complex calculations about what percentage of those profits can be claimed for government spending before the profit-making capabilities of private commerce itself are harmed (because the capital that would otherwise be used for expansion, is being appropriated for government spending). When that point is reached, the calculations insistently predict, private commerce will cease to grow—perhaps even shrink—which perversely will then reduce the amount of currency available for the government to claim a portion of; if, under those

circumstances, the government continues nevertheless to increase its spending (by insistently increasing its taxing or borrowing), private commerce will be driven to shrink even further, setting in motion a disastrous downward spiral. The calculations, in other words, are structured to demonstrate that government spending per se strangles the goose that lays the eggs—and, therefore, it is rational to argue that government spending should be limited, and specifically that it should not exceed some calculated percentage of GDP; which, of course, in most calculations of this sort, it already does!

Why is it so difficult for MMT to get itself properly understood—and, once understood, to get itself over the hump of this narrative calculation?

“Yes, yes, that’s all well and good, but the fact is the federal government does not own the Federal Reserve. It is owned by the private banking industry.”

Whether or not this is technically correct—and the reality of it is so ambiguous that arguing the point on one side or the other is futile—what it means, of course, is that it is meaningless for MMT to argue that the sovereign US government creates US dollars by fiat and then spends them into the private economy—because it is the Federal Reserve, in fact, that creates US fiat dollars, and it does so only to service the needs of private commerce. The Federal Reserve cannot, by law, create US fiat dollars for government spending. It can create them, as necessary, to maintain the liquidity of the reserve banking system—which generates the loans that support the profit-making enterprise of private commerce—but it cannot create fiat dollars and deposit them in the US Treasury’s spending account. Therefore, the fundamental belief that cannot be shaken (as described above) is unshakable because it is, apparently, based in reality. Operationally, it seems, the sovereign federal government really does have to claim—through taxation or borrowing—some portion of the profits of private commerce (fiat dollars created by the Federal Reserve) in order to have dollars to spend.

MMT therefore is made difficult not because it must disprove a false “truth,” but because the “truth” which it is trying to replace cannot seem to be disproved so long as one accepts words to have their conventional meanings. This dilemma is often brought to light with the question: if the Central Bank and the Treasury are really two components of the same sovereign entity, why are they not set up that way? If the Federal Reserve can create sovereign fiat dollars at will, why limit this ability only to the meet the “demands” of the operations of the reserve banking system in support of private commerce? Why is it not structured to also enable the Federal Reserve to create fiat dollars as “demanded” by the spending needs

of the federal government in support of the collective good—as is implicitly (and often explicitly) suggested by the advocates of MMT?

Because the banks—despite the fact they grudgingly allowed themselves to be “regulated” by a federal agency—“own” the banking system. And being owners, they have a natural prerogative to guard against what they fear most, which is dilution of the value of the fiat currency they use—that they might loan out dollars that have one value, and then be repaid with dollars having a lower value (inflation). Fiat dollars created in support of private commerce, the thinking must go, will not produce inflation because the money supply increases commensurate with the production of the goods and services private commerce produces for people to buy. More dollars equals more goods and services, therefore the value of the dollars relative to the goods and services to be purchased remains more or less constant. A good argument, but not a proven explanation of the dynamics of inflation.

On the other hand, fiat dollars created directly for government spending (the argument continues) would not typically create more goods and services for people to buy; instead, after the government spends them (for example, to make a welfare payment) they simply increase the number of fiat dollars competing for the existing goods and services produced by private commerce. In other words, creating fiat dollars for the purpose of government spending inevitably must dilute the value of the currency—and the banks will realize their greatest fear: getting repaid with dollars less valuable than what they loaned out. Therefore, the banking industry, from the very beginning, when the Federal Reserve system was created, made sure it was structured so this could not happen. The federal government, if it is short on spending money, is required to issue treasury bonds to make up the short-fall—an operation which became known by the pejorative term “deficit spending.”

Given the context of this understanding, it seems perfectly reasonable that mainstream economic thinking (which is primarily the thinking of the banking and financial industries) clings so tightly to the unshakable belief that a sovereign government, in order to spend, must first claim, through taxation or borrowing, a portion of the profits of private commerce—as well as all the other “rational” axioms that build upon that belief:

- That to avoid the appropriation of too much capital from private commerce, government taxing and borrowing must be limited to some small percentage of GDP
- That limited government is, therefore, implicitly desirable—and expanded government implicitly to be feared as endangering the profits of private commerce

- That to keep government limited, social welfare and safety net services should primarily be the responsibility of voluntary private charity and philanthropy rather than federal spending
- That any federal regulation hindering the ability of private commerce to generate profits hurts the collective good, because hindering profits ultimately hinders the profit-share the collective good can claim or borrow
- Any kind of federal welfare payments are inherently inflationary because they give people money to spend without producing anything for them to spend the money on

Is there a chink in the armor of this narrative that might give MMT an opening? Is there a seed of misunderstanding in the “truth” that it presents? The place to look, I think, is the fundamental notion that federal spending absorbs and threatens the availability of capital for private commerce. If that is true, then it is, indeed, reasonable that federal spending should be curtailed and limited—which means it is reasonable that the activities and responsibilities of the federal government itself should be curtailed and limited. If it is not true, however, a completely different rationale is required to argue that the sovereign government’s efforts, responsibilities, and spending on behalf of the collective good of its citizens, should be limited.

In other words, to look from a slightly different angle, is it possible for the sovereign government’s spending, in the interest of the collective good, to expand by orders-of-magnitude beyond current spending—without increasing rates of taxation or diluting the value of the currency—while private commerce remains fully and happily capitalized to pursue its profit-making enterprises? MMT answers ‘yes.’ The key to this answer lies in seeing a flaw in the conventional “truth” of treasury bonds, the reality of what treasury bonds legally represent and, consequently, the value and usefulness they have in the operations of private commerce.

To uncover the flaw, begin with the question: why would a private bank (or anybody else in private commerce) trade real, genuine, spendable sovereign fiat dollars for a treasury bond representing fiat dollars that can’t actually be spent for, say, ten years? Does the US Treasury coerce the purchase of its bonds? In fact, banks and big spenders and players in private commerce pretty much line up to trade their fiat dollars for the Treasury’s bonds like cattle line up at a hay-trough. Why? Hunger—not for the crunch of hay, but for safe, guaranteed, no-work-required profits. Safe, guaranteed, no-work-required profits are not something easily found in the world of

private commerce. They are much appreciated and sought after, however, because the biggest headache in private commerce, if the truth be told, is figuring out what to profitably do with profits. There is a staggering amount of profit in private commerce that hasn't figured out what to do next. If it does nothing, it simply shrinks due to "background inflation." If it rushes to invest itself recklessly, without the concerted and creative efforts required by successful private enterprise, it risks being lost completely. Thus, the US treasury bond is a godsend for private commerce: the players trade their excess capital (sovereign fiat dollars) for the interest-bearing treasury bonds and make a profit without having to creatively exercise their brains or worry about anything at all—except, perhaps, whether the United States is going to collapse as a sovereign government.

What makes the treasury bond even more magical, however, is that if, say, a big opportunity comes along to invest real sovereign fiat dollars in a killer profit-making venture—no problema! The secondary market for US treasury bonds—other folks who can't imagine, right now, what to do with their private commerce profits—provides instantaneous liquidity: the treasury bond can be traded for the real sovereign fiat dollars needed to make the killer investment.

Given this transparent and virtually seamless interchangeability between US fiat dollars and US treasury bonds, it is clear the treasury bond represents something fundamentally different than the government's borrowing of dollars from private commerce. The fiat dollars supposedly borrowed are, in fact, replaced with another kind of fiat dollar represented by the treasury bond. Therefore, it is *incorrect* to imagine or say that the issuing of treasury bonds subtracts capital from private commerce. In fact, the opposite occurs: first, the fiat dollars represented by the bonds are greater than the fiat dollars private commerce traded for the bonds (because the bonds are interest-bearing); second, when the federal government subsequently spends the fiat dollars it received in trade, they are spent back into the market of private commerce. The net result of the entire operation, therefore, is that private commerce now has substantially more capital available to invest than it had before the trade.

The conventional meaning of the term 'borrow'—as applied to the US Treasury's operation of issuing treasury bonds—then, is the seed of misunderstanding that lies at the heart of MMT's dilemma. Correcting the misunderstanding should make it possible for MMT's logic not only to be accepted, but for that logic to prevail in future dialogs about what the federal government can undertake to accomplish—and pay for—in the collective interests of society:

- US fiat dollars are promissory notes for federal tax credits—of which the federal government has an infinite supply (and for which there is infinite demand)—so long as US citizens and businesses are required by law to pay federal taxes.
- The federal government does not borrow fiat dollars from private commerce; it trades new fiat dollars, issued by the US treasury in the form of treasury bonds, for existing fiat dollars in the private market (created by the Federal Reserve); the government then spends the fiat-dollars it has traded for back into private commerce.
- What is called “federal government borrowing,” in the lexicon of mainstream “truth,” is actually and operationally the issuing of new fiat dollars by the US treasury—and these new fiat dollars are what, operationally, enable the government to purchase goods and services for the collective benefit of society.
- “Deficit spending” by the federal government, therefore, does not increase something called the “national debt” because the holders of treasury bonds already have their money. This is why no one is knocking on the federal government’s door asking for the national debt to be repaid.
- Federal spending, therefore, does not require the government to claim a portion of the profits of private commerce; and increasing federal spending, therefore, does not require increasing that claim—either through taxing or ‘borrowing.’
- Federal spending, through the issuing of treasury bonds, in fact results not only in the creation of useful public goods and services, but in the expansion of capital in the private markets.

It is therefore possible to understand that fiat money creation by the sovereign government has two sources—the Federal Reserve, which creates fiat dollars as necessary to meet the liquidity demands of private commerce, and the US treasury, which creates fiat dollars (in the form of treasury bonds) to meet the demands of federal spending beyond what can be covered by tax collections.

Two related philosophies about federal finances are MMT (Modern Monetary Theory) and MS (Monetary Sovereignty). MMT and MS agree on the following principle:

“Taxes are not needed to ‘pay for’ (federal) government spending. The logic is reversed: government must spend (or lend) the currency into the economy before taxpayers can pay taxes in the form of the currency. Spend first, tax later is the logical sequence.”

In other words: The US government cannot run short of dollars. Federal taxes are not needed in order for the US federal government to spend. The US government, being monetarily sovereign, has the unlimited ability to create its own sovereign currency, the US dollar. The US government can never unintentionally run short of dollars. Even if all federal tax collections totaled \$0, the federal government could continue spending, forever. The articles you read about the “unsustainable” federal debt are, very simply, wrong. There is no level of US dollar obligations the federal government cannot easily sustain.

“The US government has a technology, called a printing press (or, today, its electronic equivalent), that allows it to produce as many US dollars as it wishes at essentially no cost.”

—Ben Bernanke

“Central banks can issue currency, a non-interest-bearing claim on the government, effectively without limit. A government cannot become insolvent with respect to obligations in its own currency.”

—Alan Greenspan

“As the sole manufacturer of dollars, whose debt is denominated in dollars, the US government can never become insolvent, i.e., unable to pay its bills. In this sense, the government is not dependent on credit markets (borrowing) to remain operational.”

—St. Louis Federal Reserve

Some who hear this for the first time jump to the question: ‘Well, why not just eliminate taxes altogether?’ There are several reasons. First, it is the tax that “drives” the currency. If we eliminated the tax, people probably would not immediately abandon use of the currency, but the main driver for its use would be gone—being required to pay government fees and fines in dollars.

MMT argues:

“The second reason to have taxes is to reduce aggregate demand. If we look at the United States today, the federal government spending is somewhat over 20% of GDP, while tax revenue is somewhat less—say 17%. The net injection coming from the federal government is thus about 3% of GDP. If we eliminated taxes (and held all else constant) the net injection might rise toward 20% of GDP. That is a huge increase of aggregate demand, and could cause inflation. Ideally, it is best if tax revenue moves countercyclically—increasing in expansion and falling in recession. That helps to make the government’s net contribution to the economy countercyclical, which helps to stabilize aggregate demand.”

The implicit assumption of the above paragraph is that the private sector’s money supply drives inflation, and the way to control inflation is to reduce the private sector’s money supply.

In a similar vein:

“Low or moderate inflation may be attributed to fluctuations in the real demand for goods and services, or changes in available supplies such as during scarcities. However, the consensus view is that a long sustained period of inflation is caused by money supply growing faster than the rate of economic growth.”

But this is wrong. A “long sustained period” of money supply growth cannot exceed a “long sustained period” of economic growth. The money supply cannot grow faster than economic growth. The two are interdependent in the formula for GDP:

Real GDP = Real Federal Spending + Real Non-federal Spending + Real Net Exports

A decrease in taxes would increase the “Non-federal Spending” factor and GDP by the same amount. By formula, tax decreases increase GDP.

Inflation usually is defined as a general increase in prices. Another way to say it is inflation reduces the purchasing power of each unit of currency. There are two levels of inflation: Intentional and unintentional. The intentional form is the amount that the central bank believes is helpful for a growing economy. The US Federal Reserve has as its target rate: 2% inflation. When annual inflation drifts above or below the 2% target, the Fed quickly raises and lowers interest rates—raises rates to combat inflation; lowers rates to stimulate inflation. The Fed also lowers interest

rates to stimulate economic growth, which follows the common myth that stimulating growth and stimulating inflation require the same actions.

The Fed's target rate of inflation is maintained by interest rate control, which controls the demand for, and purchasing power of, US dollars. Increasing the demand for dollars reduces inflation; decreasing the demand for dollars encourages inflation.

But what about high inflation—a.k.a. hyperinflation—say of 50% or 50,000% annually, or more. Such hyperinflation incidents are always caused by shortages of food and/or energy—usually oil. The famous Zimbabwe hyperinflation is a typical example. The government took farmland from white farmers and gave it to blacks who did not know how to farm. The inevitable food shortage caused hyperinflation. In response, rather than trying to cure the food shortage, the Zimbabwe government began printing more currency. This provided the illusion that currency printing caused the hyperinflation, when in fact, the hyperinflation caused the currency printing.

Think of a typical scenario this way: The inflation-adjusted money supply goes up. Where does the additional real money go? The vast majority goes to spending, which by definition, increases real GDP. One might argue that some is saved, but since saved dollars are not spent, they cannot contribute to aggregate demand. All increases in the real money supply increase real GDP. Further, and most importantly, all decreases in the real money supply (because of taxes) decrease real GDP. Thus taxes, rather than being effective moderators of inflation, actually are recessive.

Recession is not the opposite of inflation. The two can occur simultaneously. The opposite of inflation is deflation. Taxes do not cause deflation. Deflation—price decreases—is caused by excess supplies of goods and services. Thus, removing currency (via taxes) from the economy would have done nothing to cure the inflation, though it would have reduced real (inflation-adjusted) GDP economic growth, while it impoverished the populace.

There are several ways to prevent or cure inflation, but taxation is not one of them. Taxation merely takes dollars from the private sector and delivers them to the federal government, where your tax dollars are destroyed. Taxation does nothing to address the fundamental cause of inflation: Shortages.

Consider again, Zimbabwe: Rather than taxing, designed to reduce the currency supply (while impoverishing the people), or printing currency to increase the currency supply (thereby reducing the already diminished value of Zimbabwe's money), the Zimbabwe government should have taken steps to increase the food supply. This might have included paying to educate Zimbabwe's farmers and/or paying experienced farmers to manage farms or

paying to import food from other nations. These steps would have required the Zimbabwean government to spend more money to correct inflation—a counter-intuitive response, but the only one based on financial reality.

Any time a nation experiences an unwanted level of inflation, the correct early step is to increase interest rates, thus increasing the demand for, and the value of, the nation's currency. If the inflation has grown beyond interest rate increases as a sole solution, additional steps are needed.

You must determine what exactly is causing the inflation. If the cause is a shortage of food or energy the government must either import the needed food or energy, or fund ways to increase the domestic production of food or energy. If the government is monetarily non-sovereign (an EU nation or a US state, for instance), and cannot afford to fund imports or fund domestic production of the scarce commodities, it immediately should begin the process of issuing its own sovereign currency—it should make itself Monetarily Sovereign.

You, who understand Monetary Sovereignty, know that:

- Value and quantity are determined by laws.
- Before there was the United States of America, there were no US dollars.
- Our monetarily sovereign federal government created an arbitrary number of original US dollars from thin air, simply by writing laws.
- By those laws, our federal government continues to create US dollars from nothing. So long as the government does not run short of laws, it will not run short of dollars.
- Thus, unlike state and local (monetarily non-sovereign) governments, the federal government neither needs nor uses tax dollars to pay its bills. It simply creates dollars, ad hoc, as it always has done from the very first day. That is the fundamental difference between federal finances and state & local government finances.

Whenever you hear that the federal government, or any agency or program of the federal government—Social Security, Medicare, the Supreme Court, et alia—can become insolvent, know that any such insolvency would be intended by the government. Otherwise, no federal agency or program can ever be insolvent, even if zero taxes are collected. Because federal financing is so unlike state and local government financing, and unlike business financing and unlike personal financing, many people can be confused by the differences.

People know they need income in order to pay their bills, so they wrongly assume the federal government also needs income. It doesn't. People see the government collecting taxes, so they wrongly assume these taxes are needed for the federal government to pay its bills. They aren't. Because it is monetarily sovereign, the federal government has no need for taxes or for borrowing or for any other form of income. This confusion between personal finances and federal finances is supported by such articles as the following, from *The Atlantic* and the *US News & World Report*:

“The United States is falling apart because—unlike Canada and other wealthy countries—the American public sector simply doesn't have the funds required to keep the nation stitched together.”

Immediately, the article goes off the tracks, never to return. When using “public sector” does the author refer to the federal government or to state and local governments? He may be confused himself, for what is true for the latter is false for the former.

“A country where impoverished citizens rely on crowdfunding to finance medical operations isn't a country that can protect the health of its citizens. A country that can't ensure the daily operation of Penn Station isn't a country that can prevent transportation gridlock.”

The federal government has the financial capability to fund comprehensive, no-deductible Medicare for every man, woman, and child in America. In contrast, if Penn Station is funded by state and local government agencies, it very well can run short of dollars. The author, either intentionally or unintentionally, fails to differentiate.

“The Organization for Economic Cooperation and Development (OECD), a group of 35 wealthy countries, ranks its members by overall tax burden—that is, total tax revenues at every level of government, added together and then expressed as a percentage of GDP—and in 2014, the United States came in fourth to last. Its tax burden was 25.9 percent—substantially less than the OECD average, 34.2 percent. If the United States followed that mean OECD rate, there would be about an extra \$1.5 trillion annually for governments to spend on better schools, safer roads, better trained police, and more accessible health care.”

We aren't told which of those "wealthy countries" is monetarily sovereign and which is monetarily non-sovereign. Canada, Australia, China, and Japan, for instance, are monetarily sovereign. They never can run short of their own sovereign currencies, so can afford to pay any invoice denominated in their sovereign currencies, without levying taxes. By contrast, Germany, Italy, France, and Greece are monetarily non-sovereign. They do not own a sovereign currency; they use the euro which is the sovereign currency of the European Union, and not under the control of any one nation. Thus, these countries do need taxes in order to pay their bills.

The author mentions "every level of government." So, while a monetarily sovereign government never can run short of its sovereign money, states, counties, and cities can run short. Unfortunately, in the world today, not one nation acts as a monetary sovereign. Every nation on earth functions as though is monetarily non-sovereign. When Canadian governments need more money, they raise taxes. Canadians are not thrilled when this happens. But as Justice Oliver Wendell Holmes Jr. put it, taxes are the price paid "for civilized society." Fact: When the Canadian national government needs more money, it creates the Canadian dollars, ad hoc. When any local Canadian governments need more money, they must raise taxes or borrow. Completely different. The author repeatedly confuses the two, hinting at a serious lack of knowledge about economics.

"After doubling to \$20 trillion since 2009, the national debt is now projected to soar to an unfathomable \$92 trillion over the next 30 years."

To 'lend' to the federal government, you invest in a T-security. You instruct your bank to transfer dollars from your checking account to your T-security account at the Federal Reserve Bank (FRB). The so-called "national debt," is not like personal debt. It actually is the total of deposits in T-security accounts at the world's safest bank, the FRB.

To pay back the principal on these deposits (which it does every day), the FRB merely transfers existing dollars from the T-security accounts, back to the checking accounts of the T-security owners. This is no burden whatsoever on the federal government or on the FRB. The dollars exist. It's just a money transfer.

"At that point, depending on interest rates, between 60 and 100 percent of all individual income taxes will go toward paying the interest on this debt."

Wrong: No federal taxes “go toward paying the interest on this debt.” When federal taxes are collected, they disappear from the money supply. This is different from state and local taxes, which remain in the money supply. Thus, federal taxes effectively are destroyed upon receipt. To pay its bills, including interest, the federal government sends instructions—not dollars—to creditors’ banks. The instructions, in the form of checks or wires, instruct the banks to increase the balances in the creditors’ checking accounts. At the moment the banks obey those instructions, brand new dollars are created.

“What is driving the federal budget into bankruptcy? Health care spending.”

The above is a classic statement of the Big Lie. As we have seen, the federal government cannot go into bankruptcy. Given its unlimited ability to create the laws that create dollars, it never can run short of dollars. The author blames health care spending for a non-existent problem.

“Critics denounce Republican attempts to ‘slash health care spending.’ In reality, their proposals would slow the growth of health care spending relative to the current baseline projections—projections that are completely unsustainable anyway.”

Federal health care spending is not unsustainable. The federal government could spend ten times the projected amount and still, that would not be unsustainable, as the federal government has the unlimited ability to pay bills denominated in dollars.

“We also have a Medicare system that currently collects \$140,000 in lifetime taxes from the typical retiring couple and then provides them with \$422,000 in benefits (all adjusted into net present values). Multiply this by 77 million retiring baby boomers, and Medicare’s long-term shortfall is measured in the tens of trillions of dollars.”

The federal government neither needs nor uses taxes to pay benefits. It destroys tax dollars upon receipt, and it creates brand new dollars, ad hoc, by paying bills.

You may ask:

- Why do these fuckwads so dramatically misstate the facts about federal financing?
- Why do they confuse monetary sovereignty with monetary non-sovereignty?
- Why does the federal government collect taxes it doesn't need?

The United States, and indeed the world, are run by the very rich. The primary motive of the very rich is to widen the income, wealth, power gap between them and the rest. There are two ways for the rich to widen the Gap: lift themselves up, or push the rest of us down. The Big Lie that federal taxes fund federal spending pushes the rest of us down in two ways: It takes money directly from our pockets (especially such regressive taxes as FICA and sales taxes). And it provides the false “deficits are unsustainable” excuse that keeps us from receiving federal benefits. The Big Lie takes money out and prevents money from coming in.

To promulgate the Big Lie, the rich bribe the politicians via campaign contributions and promises of lucrative employment later. The rich bribe the media via advertising dollars and outright ownership of media. The rich bribe the economists via contributions to universities and employment at think tanks. By controlling all sources of economics information—the politicians, the media, and the economists—the rich are able to brainwash the public into believing their taxes must be increased and their benefits must be decreased—in short, the Gap between the rich and the rest must be widened.

I do not know whether these particular fuckwads have been told by their respective publications to write the Big Lie, or whether they themselves have been bribed, or whether they simply are ignorant of basic economics. At least one of these must be true.

But in any event, their articles are just small examples of the ongoing misinformation that has been pumped into the private sector for many years—the Big Lie that costs you so much, every day of your life. Were it not for the rich sponsoring the Big Lie, the Seven Steps to Prosperity could already be in force, and your life would be far better than you can imagine. The single most important problems in economics involve the excessive income/wealth/power Gaps between the have-mores and the have-less. Wide Gaps negatively affect poverty, health and longevity, education, housing, law and crime, war, leadership, ownership, bigotry, supply and demand, taxation, GDP, international relations, scientific advancement, the

environment, human motivation and well-being, and virtually every other issue in economics.

Seven Steps To Prosperity:

1. Eliminate FICA

FICA is the most regressive tax in American history, widening the Gap by punishing the low and middle-income groups, while leaving the rich untouched. The federal government, being monetarily sovereign, neither needs nor uses FICA to support Social Security and Medicare.

2. Federally funded Medicare—Parts A, B & D, plus long-term care—for everyone

3. Provide a universal basic income to every man, woman, and child in America

4. Free education (including post-grad) for everyone

Monetarily non-sovereign state and local governments, despite their limited finances, support grades K-12. Because state and local funding is so limited, grades K-12 receive short shrift, especially those schools whose populations come from the lowest economic groups. And college is too costly for most families. An educated populace benefits a nation, and benefiting the nation is the purpose of the federal government, which has the unlimited ability to pay for K-16 and beyond.

5. Tax the very rich more, with higher progressive tax rates on all forms of income.

Some might argue against increasing anyone's federal taxes. After all, the federal government has no need for tax dollars, and all taxes reduce Gross Domestic Product, thereby negatively affecting the entire economy, including the 99.9%. But narrowing the Gap requires trimming the top. It simply would not be possible to provide the 99.9% with enough benefits to narrow the Gap in any meaningful way. Bill Gates reportedly owns \$100 billion or more. To get to that level, he must have been earning \$10 billion a year. Pick any acceptable Gap—1,000:1?—and the lowest paid American would have to receive \$10 million a year—unreasonable.

6. Federal ownership of all banks

Banks have created all the dollars that exist. Even dollars created at the direction of the federal government, actually come into being when banks increase the numbers in checking accounts. This gives the banks enormous financial power, and as we all know, power corrupts—especially when multiplied by a profit motive. Although the federal government also is powerful and corrupted, it does not suffer from a profit motive, the world's most corrupting influence.

7. Increase federal spending on the myriad initiatives that benefit America's 99.9%

Save this reference as your primer to current economics. Sadly, much of the material is not being taught in American schools, which is all the more reason for you to use it.

The mainstream attack on MMT is nothing less than an attempt to disguise the glaringly obvious error at the center of the mainstream view of economic thinking. Mainstream economics is a nihilistic theory devoid of moral anchor. Mainstream economics ceased to explore the operation of the real economy decades ago and has become an intellectual exercise that assumes the organization of modern society is justified simply because that is how it is. While some mainstream economists may want to tinker around the edges to make the system more fair, few really want to call into question the organizing realities. The biggest reality they do not wish to face is that money is a symbolic creation rather than an actual productive resource.

Mainstream economics abandoned any attempt to justify the payments to capital owners when they surrendered the field to post-Keynesians at the end of the Cambridge controversies. Capital is not paid due to its productivity. Capital is paid as a residual that is left over after production occurs. Capital is simply another form of rent. With the abandonment of any attempt to justify the role capital plays in the production process mainstream economists ventured further and further into the intellectual woods. They began to abandon any semblance of justifying the payments to capital. The distinctions between capital as machinery and capital as money blurred and the mainstream literature simply stopped caring about the topic. Money is capital, and control of money gives the lords of finance a right to call upon the income stream of society, why would anybody question that?

Machinery and money capital are the same thing in the writings of most mainstream economists. This line of thinking places the banking industry, not the engineering community, as the source of economic progress. The ability of the bank to make a loan is how the house is built. The ability of

the bank to finance the creation of a new business is the origin of the value of that business. Or so the mainstream vision presumes.

The ability to fund the action is the power of capital. Capital, in this mainstream vision, is the power to fund the activities of the people who wish to take action. The mainstream has spent decades building up a theory based upon the assumption that funding of activities is the justifying reason for capital to be paid its income. The reasoning of the mainstream is simple: finance risks its wealth in order to pay people to take economic actions and that risk is the reason finance should be paid. Finance funds those actions through the selfless acts of savings done by the titans of finance and that savings is costly in terms of sacrificed personal consumption. The payment is clearly justified, within this perspective, because each act of financing risks the loss of that sacrifice.

MMT calls into question this fundamental justification of the power of the financial elites. By showing that money is a creation of the state and banks it threatens the very myth that underpins the massive stream of income diverted to the overlords of finance. MMT shows that government creates money through the act of spending and destroys it through taxation. MMT forces economists to admit that banks do not fund lending through savings. Instead MMT shows that savings is the result of borrowing and that the lords of finance literally create the money they lend with the wave of a hand. If the money is simply created by whim, it is much harder to justify the incredible payments these financiers obtain.

Mainstream theorists do not attack these fundamental points of MMT, they pretend that their actual issue is with the outcomes of uncontrolled government spending. Of course MMT would never justify such an inflationary policy. Instead MMT demystifies the true source of power in finance and this is what is feared. MMT points out that money is a creation of society and currently we have given a monopoly on that creation to the financial elites who have used that monopoly to extend their personal power. They have used that monopoly to build mansions and private jets while letting millions go without educations and healthcare. They have used that monopoly to empower themselves as economic overlords while indebting their fellow citizens without justification.

MMT has the gall to point out that society is only at the mercy of these titans for as long as we choose to be. Mainstream economists are afraid because MMT practitioners have pointed out that the emperor has no clothes. For as long as nobody was hearing what MMT was saying the emperor could dance, but now the emperor's aides are afraid the citizens might be listening.

Since the Democrat's presidential debates, the attacks on "progressive"

candidates for their “unrealistic” proposals to address the biggest challenges we face as a collective society have intensified dramatically. The primary criticism is the enormous price-tag associated with each of the big-ticket issues they propose to undertake: universal healthcare, mitigating climate-change, eliminating college debt, free pre-school daycare, re-envisioning and rebuilding America’s infrastructure, a job guarantee and a universal basic income for every citizen. The attacks come from both conservative Republicans and centrist and right-wing Democrats, each of whom are avowed believers in fiscal responsibility and balanced federal budgets.

Unfortunately, while there is growing sympathy with the progressive goals themselves, the advocates of those goals still don’t have a convincing explanation or formula for how the federal government will pay for it all. The best they can come up with is that we’ll increase taxes on the super-wealthy and the big corporations—or that it’s simply unacceptable, conceptually, that the world’s richest democracy cannot manage to achieve these goals for a healthy society. So long as these are the progressive narratives—even if they manage to win the upcoming elections, which with Creepy Joe and Superwoke-VP-to-be-named-later at the helm is unlikely—the goals will never be achieved. To create genuine, widespread support for undertaking the big-ticket issues we face, it will be necessary to explain to America how its monetary system actually works.

So, how do we get there? So far, the Modern Money narrative is bumping hard against an even harder ceiling of disbelief. Even the progressive political advocates themselves cannot—or will not—make a direct attempt to explain it. This, of course, is pragmatically understandable: the first candidate who makes the attempt will likely not survive the pushback of public ignorance and misinformation. Nevertheless, until this challenge is tackled, we can write off the ‘progress’ in ‘progressivism.’ A strategy needs to be established and implemented to create a Modern Money Explanation and frame it to be easily understood and politically palatable.

I recently watched the blood drain from Erin Burnett’s cheeks as she announced on CNN, with one of her most consternated expressions ever, that Bernie Sanders had “admitted” his Medicare-for-All program would “cost” \$40 trillion. Her blanched expression said it all: How could he even be dreaming that the federal government was going to pony up \$40 trillion to pay for America’s healthcare? I’d like to up the ante: it won’t cost \$40 trillion, but \$320 trillion! The narrative we’re trying to create must help Erin (and everyone else) wrap their intelligence around that scale of number—and realize that, in and of itself, it is both immensely meaningful and totally meaningless.

How do I figure? First, Bernie’s \$40 trillion price tag is calculated for a

10-year period. But why arbitrarily use a decade's calculation? Are people going to stop needing healthcare ten years from now? A more meaningful calculation, I would argue, is over a lifetime—so I'm figuring 80 years. Let's proclaim it then: at today's prices, Medicare-for-All will require a payment of \$320 trillion for each generation of Americans!

Next, we must consider in what sense this number has meaning. Erin's facial capillaries are clearly responding to the perception that when I spend money what happens is that, first, I have to get it from somewhere, second I spend it in exchange for something else and, third, I consequently don't have it any more. For a person, this is clearly what happens. Erin's mistake, however, is imagining that the currency issuing US federal government is like a person, or a family, or a business. This factually is not the case.

To see why, first consider what the \$320 trillion represents. Does it represent a finite amount of some thing the federal government needs to get its hands on—or does it represent the measurement of something, as in 'three-hundred feet of ribbon'? If America were still on the gold-standard, and the government had to be able to redeem every US dollar for 32oz of precious metal, then \$320 trillion would factually represent a finite amount of gold (which would vaporize Medicare-for-All in an instant, because there is not anywhere close to \$320 trillion worth of gold on the planet).

If, instead, \$320 trillion is a measurement of something, two questions arise:

1. What is being measured?
2. Is it possible for that thing to get so large that we run out of units of measurement? Can a ribbon get so long that we run out of 'feet'?

The answer to the first question is: our calculated \$320 trillion represents and measures the amount of healthcare services a generation of American citizens will need to obtain over their lifetime. Whether you think it's an absurdly big number is irrelevant. It is what it is, and there are only three ways it could be made smaller:

- Reduce the amount of healthcare services the generation will need.
- Reduce the cost of the healthcare services via price controls, nationalization, intellectual property reform, et cetera.
- Change the unit of measurement—i.e. define the 'foot' to be longer so the ribbon is, say, only 200 feet long when you measure it instead of 300.

The answer to the second question is established by the US Federal Reserve Act (established, in other words, by “fiat”). This democratically imposed component of the American social contract gave the Federal Reserve (American’s central bank) the authority to create units of measurement—US currency—as needed to measure whatever length of ribbon the American people choose to produce and consume. It was not always the case this could be made to happen. Prior to the US Federal Reserve Act, when the US—at the demand of east-coast financiers—was returning to the gold-standard after the Civil War, southern and western farmers in America produced, at every harvest, ribbons and ribbons of corn and cotton which they could not sell for the simple reason there was not enough currency to measure it—creating, year after year, extraordinary hardships and economic crisis. The Federal Reserve Act changed that.

Which means that if a generation of American citizens decides they want or need to consume \$320 trillion worth of healthcare services, the Federal Reserve is authorized to create the US currency necessary to enable it to happen. The only impediment would be if there aren’t enough doctors, nurses, radiologists, examination rooms, surgical suites, bandages, drugs, et cetera available to provide for the demand—in which case the citizens will, obviously, only consume what’s available (and the Federal Reserve will create the commensurate amount of currency).

In other words, just because we have a theoretically infinite number of ‘feet’ to measure ribbon with doesn’t in itself produce an infinite amount of ribbon. Or, to put it another way: the issue isn’t whether there’s enough ‘feet’ to measure—pay for the production and consumption of—our ribbon, but rather how much ribbon is actually available to be measured. Erin’s real concern, therefore, should be whether America’s boundaries contain enough real resources that can be marshaled to provide \$320 trillion worth of healthcare over the course of a generation.

This brings us to the second aspect of why Erin should let her cheeks return to their rosy blush: From a monetarily sovereign government’s perspective the \$320 trillion price tag for a generation of healthcare doesn’t represent a cost, it represents an earnings. Specifically, it represents what a very large sector of American businesses and citizens are going to earn by the act of providing healthcare services to America. In other words, unlike the personal perspective (after the spending occurs the money is gone) the monetary sovereignty view sees that in order for money to be earned it must first be spent. This may sound like a chicken-and-egg paradox—which happens first, does the money get spent, or does it get earned so that it subsequently can be spent? From the Federal Reserve’s perspective, however, there is no paradox at all: if new money needs to be spent in America, the

Fed simply creates it.

There are certain rules and procedures that must be followed, of course. It doesn't happen arbitrarily because someone thinks it should happen. It happens in response to something. So, how does the Fed know when new money needs to be created? One way it knows is when, at the end of an American business day, there are more checks and interbank transactions to be cleared at the central bank than there are Reserves held in the various bank's Reserve accounts. This means the banks collectively have created more "bank-dollars" (which are claims on their Reserves) through loan operations than there are Reserves to back up the claims. When this occurs, the Fed automatically creates new dollars to cover the shortfall. A shortfall is not ever allowed to occur because the entire US financial system depends on the certainty that, at the end of every business day, all the legitimate claims on bank Reserves clear.

But the Fed does not just give the new dollars to the bank's Reserve accounts for free. What happens is the Fed keystrokes the new dollars into the needful bank's Reserve account in exchange for some collateral ponied up by the bank. The Fed now holds the bank's collateral, and the bank holds the new dollars in its Reserve account—which enables the claims on those Reserves, generated by its expanded loan activity, to be fulfilled. Voila! New money that American enterprise has demonstrated it needs—by virtue of the willingness of people and businesses to borrow, and the willingness of banks to loan—has been created. Presumably, when the bank's outstanding loan is repaid with interest, it will redeem its collateral from the Fed using the profits derived from that interest.

Private debt, then, driven by the expectations of profit-making enterprise, is one of the primary instigators of new money creation by the Federal Reserve. There is another driver, however, equally important, that is shrouded in even greater (if that is possible) and more obfuscating confusion: the creation of new money by the Fed's purchase of US treasury bonds on the open market. What our explanation needs to make clear is that this operation is not only a money-creating action, the dollars it generates are specifically targeted toward the non-profit enterprises of the public good.

The Treasury is the spending arm of the US government. If Medicare-for-All is implemented, the \$320 trillion will be spent by the Treasury. The dollars the Treasury spends come from the Fed, who remember, conjures them out of thin air.

But what about the debt some will say. And treasury bonds, they're involved! Is a treasury bond a 'debt' or not?

Ask yourself: could the Treasury pay for things—like, say, Medicare expenses—directly with treasury bonds, instead of first trading those bonds

for Reserves, and then using the Reserves to pay the Medicare invoices? Assuming there's no statute to prevent such payments, the only question is whether the Medicare providers would accept the treasury bonds as payment. If they were, in fact, willing to do that, then the Treasury, when it created a bond, would not be creating a 'debt,' but would be creating 'money,' as it was needed, to fulfill the spending assignments appropriated by Congress. But why would a Medicare provider—or a climate mitigation contractor, or a community college administrator, or a pre-school daycare operator—agree to accept a treasury bond for payments promised instead of US dollars?

The answer is because US treasury bonds have a liquidity that is virtually equal to cash: anyone who receives a treasury bond as payment can easily and quickly trade it for US dollars. This interchangeability is unique to US treasury bonds. Corporate bonds or municipal bonds do not have the same liquidity for the simple reason that they each entail some level of real risk that the entity issuing the bond will be unable to redeem it or make its promised interest payment. Why do treasury bonds and corporate-municipal bonds differ in this regard?

To see why, consider that corporations and municipalities—like small businesses and households—must earn the dollars necessary to redeem their bonds. If things don't go as planned—if corporate profits fall, or local tax revenues decline—the future revenues the bond redemption depends on fail to materialize, and the bondholder loses all or some of his investment. The corporation or the municipality cannot simply issue new dollars as necessary to make the bond good. Which is precisely what the US Federal Reserve can and does do, without fail, in the case of US treasury bonds.

The US federal government, then, does not have to collect tax revenues in order to redeem treasury bonds. It does not depend on future revenues to repay its "debts." If you want proof of this, simply consider that over the course of US history, the federal government has issued and redeemed over \$20 trillion worth of bonds which have not been destroyed by taxes. How can the federal government do this while American families, businesses, corporations, and local governments cannot?

When the US Treasury issues its bonds, it is actually issuing new money. Whether that money is spent directly to the suppliers of goods and services—who then trade it for dollars from the banking industry—or is traded first to the banking industry for dollars, which are then spent by the Treasury, is an instance of Einstein's equivalence principle: if you can't tell the difference between two things, they are the same thing. US treasury bonds, then, are nothing more than 'future dollars' that have value today precisely because their future value, and the interest premium they bear, is the most ironclad, risk-free, guarantee that exists in the modern world today. And the US

Treasury is authorized to create these ‘future dollars,’ as needed, to pay for any expenditures authorized by Congress.

A very simple operation—coordinated between the US Treasury and the Federal Reserve banking system—makes it possible for the Treasury to spend today the future dollars it creates with its treasury bonds. I’ll make this short:

1. The Treasury issues a treasury bond.
2. The Federal Reserve keystrokes new reserves—equal to the value of the treasury bond—into one of its banks’ Reserve account in exchange for some collateral.
3. The bank trades the new Reserves to the Treasury in exchange for the treasury bond.
4. The Federal Reserve returns the bank’s collateral in exchange for the treasury bond.

End result: The Treasury has new spending money equal to the value the treasury bond just issued. The bank is returned to the same position it originally held. The Fed has on its balance sheet the newly issued treasury bond. The Fed now owns something it logically doesn’t need at all, ever—future dollars.

The US Treasury has created the money it needs to buy (from the American people themselves) the non-profitable goods and services that Congress has determined, through its democratic processes, are in the best interests of America’s collective society. Of course, even this process is far more complex than it needs to be.

‘Reserves’—that esoteric term in money-talk that postures to explain everything but explains nothing at all—have been much in the news of late. The Wall Street Journal even tried, recently, to explain what they are! They didn’t do such a great job. That’s unfortunate because, properly explained and understood, Reserves hold a big key to the political befuddlement—especially acute in the present election cycle—about what we can afford to accomplish as a collective society. This includes paying for real solutions to the six, money-intensive, life-defining dilemmas America now confronts:

- | | |
|---|-----------------------|
| 1. Healthcare | 4. Affordable housing |
| 2. Student debt | 5. Climate change |
| 3. Early childhood care and development | 6. Bullshit jobs |

It is therefore well worth the effort, I think, to attempt an explanation of Reserves that might actually be grasped by the collective consciousness of our political dialog.

To accomplish that, I need a good metaphor to get started. Since I'm an architect, what comes to mind is exploring the structure of a building to discover what is holding up what—and discovering in the process, perhaps, some rooms with surprising views. It's a strange edifice (I warn you) that often seems unnecessarily complicated. But, observed with patience, it has its own peculiar beauty and logic—and, in the end, it's this strange beauty and logic that reveals what we can, in fact, do about the six dilemmas just listed. So, hold onto your brain-handles. We'll go slow and easy, so no one gets lost.

Without going into the history of the term, let's simply begin by saying that in America today Reserves are the sovereign fiat money issued by the US government. They are also the only official, real US dollars that the federal government will accept as payment for taxes, fees, or fines owed to the government—which is why, by definition, they are America's fiat money.

Having started with that statement, it may seem odd to you that the US government, itself, issues the very thing that it wants to get paid with. You might ask, 'If that's the case, why doesn't it just issue the money to itself, and leave me out of it?' As it turns out, that might not be a totally ridiculous question, though the answer might not be the tax-freedom you're hoping for. Reserves—modern fiat money—are strange things indeed, but they do, in the end, have a structure that can make sense out of the world.

One of the strangest things about Reserves—even fascinating—is that you can't get your hands on them. They exist only as digital entries inside America's central bank—created and canceled by keyboard strokes on an electronic balance sheet maintained by the US Federal Reserve—the Fed.

Reserves, then—even though they are the real US fiat dollars—are not the money American citizens and business borrow and spend every day. That money comes in two other forms: Federal Reserve Notes (the cash dollars we have tucked in our wallets) and bank-dollars which is the money we have on balance in our demand bank-accounts (checking and money-market accounts). What is the relationship between these other forms of money that we actually use every day and Reserves?

The relationship is very simple: Federal Reserve Notes (cash dollars) and bank-dollars are claims on the Reserve dollars posted on the electronic balance sheet at the Fed. So, while you can't get your hands on Reserves, you can make a claim on them when you actually need them. This is not something you need to worry about accomplishing—it happens, automatically, as needed, when you spend your cash or write a check.

This happens because of the way the central bank is structured. Every private bank in the Federal Reserve System has its own Reserve account at the Fed. In its Reserve account, each bank keeps track of the real sovereign US fiat dollars it is in control of. Remember, these are just digital entries on the electronic balance sheet—very much like the scoreboard at a basketball game. The Fed can debit Reserves from one bank's Reserve account and credit them to another's, 'keeping score,' if you will. The Fed can also simply issue new Reserves and add them to one account or another—again, with keystrokes—in exchange for another asset (collateral). Importantly, the US Treasury also has a Reserve account at the Fed—which is the spending account for the US federal government: Not only does the federal government expect to be paid with Reserves, it only makes payments, itself, with Reserves.

At this point, you're no doubt asking one big question: *WHY?* Why is it set up like this? Before we look into an answer to that question, however, let's make sure we understand how the structure of the building we're exploring actually works.

Here's an example of how you can exercise your claim on Reserves: Let's say you owe Uncle Sam \$1,000 in taxes. Uncle Sam demands that you pay him with Reserve-dollars. How do you do that? You write a check from your account at Bank-A to Uncle Sam for \$1,000. At the end of the business day, Uncle Sam presents the check it has received to the Fed for "clearing." In the clearing process, the Fed debits 1,000 Reserve-dollars from the Reserve account of your Bank-A, and credits 1,000 Reserve-dollars into the Treasury's Reserve account. Your check is "cleared" (canceled), 1,000 bank-dollars are debited from your checking account at Bank-A—and your taxes are marked 'PAID.'

Here's another example: You write a \$1,000 rent check from your Bank-A to your landlord who uses Bank-B. What happens? At the end of the business day, the landlord's bank sends your check, deposited by the landlord, to the Fed for clearing. During the clearing process, your claim on your bank's Reserves is exercised: 1,000 Reserve-dollars are debited from your bank's Reserve account and are credited to the Reserve account of the landlord's bank. Your check is canceled and, lastly, 1,000 Bank-B bank-dollars are credited to the landlord's account, while 1,000 Bank-A bank-dollars are debited from your account.

In each case, from your perspective, it appears that you are simply using the bank dollars in your checking account to pay someone—the government or your landlord—\$1,000. Hidden from you is the other operation in which your bank-dollars exercise their claim on Reserves at the Fed, causing the actual payment to be made with Reserves—real US fiat dollars.

There's one more thing we need to understand before we get to the question about why things are structured this way: If the US government's central bank—the Fed—issues Reserves, who issues the bank-dollars that are the claims on the Reserves? As the name implies, they are created by private banks—but by what process? The Fed has a lawful mandate to simply issue Reserves by fiat—out of thin air. But what is a private bank's mandate to create bank-dollar claims on the money created by the Fed?

The key is to see that a private bank can only issue claims on the Reserves that reside in its own Reserve account at the Fed. Because this is key, it is useful to have a quick understanding of how each bank acquires, in the first place, those Reserves it can create claims on: The Fed issues the Reserves (with keystrokes) and credits them to a bank's Reserve account in exchange for some collateral provided by the bank. Coming up with this collateral is a necessary component of becoming licensed as a federal reserve bank. The Fed stipulates what the collateral must be. Once the Reserve account is established, the bank can begin to issue the bank-dollars which are claims on those Reserves in its account.

A bank issues its bank-dollars by making loans to individuals and businesses. When Bank-A loans you, say, \$10,000 to make home-improvements, it credits your Bank-A checking account (using keystrokes, of course) with 10,000 bank-dollars. These are now your claims on the Reserves Bank-A holds at the Fed. You then write checks to various contractors and vendors, and those checks are presented for clearing at the Fed where your claims on Bank-A's Reserves are exercised.

This little example seems to suggest that a bank must be careful not to create more bank-dollar claims than it actually has in its Reserve account to meet those claims. As is famously known, however, banks create many more bank-dollars than they have in Reserves. How can this be? Doesn't that mean the clearing process at the Fed will break down—that eventually you'll write a check on your Bank-A account, only to find that it can't clear because Bank-A's Reserves have already been tapped out by other claims? There's a couple of reasons why, in modern times, this cannot happen—if everyone keeps their fingers crossed.

The first reason is that banks have come to understand that, on any given business day, only a tiny fraction of the bank-dollars they've issued will make claims on their Reserves at the Fed. The remainder—the vast majority—will remain passively silent in their various checking accounts, or in checks written but not yet deposited. Also, if a given bank is used by a large segment of a local, regional, or national population, the recipients of many checks written will deposit them back in the same bank—in which case they do not go through the Fed's clearing process at all, but simply

result in a tally on the bank's own bank-dollar balance sheet. A final 'also' is this: if banks in the federal reserve system stay, more or less, at the same scale of operations, during the Fed's clearing process any one bank should be credited, from other banks, about the same number of Reserves as it's debited.

The second reason banks 'safely' create many more bank-dollars than they have in Reserves is because the Fed has put in place, and operates, a number of fail-safe mechanisms which ensure that, every business day, the clearing process will always be successfully completed. Your check on Bank-A will always clear (assuming you have sufficient bank-dollars in your account to cover it). For our purposes here, we don't need to know or understand the details of the fail-safe systems the Fed operates—except one: As a last resort, the Fed can, and will, simply issue new Reserves, as necessary, and credit them (in exchange for collateral) to the Reserve account of whatever bank comes up short in the clearing process. It has to do this—otherwise the whole structure collapses.

Why is our modern fiat money system set up this way? Why not just have a single 'money' that we all use—the government, the banks, all of us—and be happy with that? It would be nice to say the answer is because well-intentioned and forward-thinking people thought a Reserve/bank-dollar system would best serve our needs. The real answer, however, is that under the circumstances of history, it was the best solution that could be cobbled together that all the stakeholders would agree upon (and using the term 'agree' is being generous).

In the century leading up to the Federal Reserve Act of 1913, America struggled mightily with its money system. These struggles became a crisis after the Civil War. Basically, there were three problems:

1. The value of money was suspect.

There was no national currency—only bank-dollars issued by different banks around the country. While these dollars generally promised to be exchangeable for gold, the amount of gold held by each bank to back up its promise was often suspect. Merchants had to be concerned which bank-dollars they were being paid with. This was a significant impediment to national commerce.

2. The clearing process between banks often broke down.

Transactions written on an account in Bank-A and submitted for deposit in Bank-B were often not accepted by Bank-B if it was suspicious that Bank-A might not be able to back up the promises of its bank-dollars. In the 1800s there were a series of banking crises in

which this clearing process between banks broke down, resulting in severe economic distress.

3. **There simply wasn't enough money.**

As things unfolded after the US Civil War, this turned out to be the biggest problem of all. The civil war had been paid for with Abraham Lincoln's fiat money—"greenbacks" that were printed and circulated to buy everything from mules to musket balls. A great many debts were racked up during the war—mostly to big banks on the East Coast. When the war ended, these East Coast banks refused to accept the greenback dollars as payment for the debts. They demanded to be paid, instead, in gold.

The only problem was there was not enough gold in the country to redeem the greenbacks and underwrite the need for an expanding money supply the new post-war commerce was demanding. The result was that southern and western farmers were unable to sell their crops for dollars. Instead, because of the lack of money in the system, they were forced to begin selling their crops for store credits. This began the era of the corrupt "crop-lien" system with its "furnishing merchants" who, over time, put the farmers so deeply in debt they were forced to become sharecroppers on what had once been their own farms. This, in turn, precipitated what nearly became a successful grassroots political revolution over the issue of money and, ultimately, led to the Federal Reserve Act of 1913.

Creating the US Federal Reserve banking system was a long and hard-fought political battle. In the end, the Reserve/bank-dollar system was created because it was the only structure everyone could agree upon that solved the three money problems just described.

Private banks could still issue their own bank-dollars—a prerogative they fought tooth and nail to maintain—but now, since the different bank-dollars were all claims on the same Reserve dollars, they could be treated equally in the marketplace. As intended, today it is impossible to distinguish between one bank's bank-dollars and another's.

The risk and uncertainty were removed from the clearing process for transactions between different banks. That process was now conducted, at the end of each business day, by the Fed itself—with the guarantee that every legitimate check or bank transfer cleared. Interstate commerce was free to blossom, and the epidemic of bank crises essentially came to a halt.

Large as these first two benefits were, the third benefit was, by far, the most significant: The most important fact about the Federal Reserve

system is that it was structured and put in place to enable the money supply that served American Enterprise to expand—as necessary—to meet the needs of what it was decided American Enterprise wanted to undertake and accomplish. After the post-Civil War money crisis, all stakeholders understood a simple fact of logic: If the labor, materials, energy, technology, and ingenuity exist to undertake and accomplish something—and it is desirable that it should be accomplished—it makes no sense to say that it can't be done because there isn't enough money in the system to pay for the doing of it. 'Money,' in other words, is not a limiting resource. To say that, as a collective society, we don't have enough money to do something makes as much sense as saying we don't have enough numbers to count something.

The Federal Reserve System, then, was cobbled together to solve these three problems. No one claimed it was the perfect solution. There were many compromises made to reach consensus in in the US Congress. The banking interests didn't want politics and the government to run the show. The government didn't want the bankers to have exclusive control over something that the common good, ultimately, depended on. The Fed, then, became a partnership—partially under the banker's control, partly under the control of the federal government.

The only questions to be asked, then, are two:

1. Who will create the money when it's needed?
2. Who will decide when the creation of additional money is justified?

Regarding the first question, since the Reserves used today are fiat money, their only source is a sovereign government. In our case, the authorized agent of the US government, for this purpose, is the Federal Reserve. The Fed, then, creates all Reserve fiat dollars (with keystrokes to an electronic balance sheet) no matter for what purpose. No one else is authorized to do so.

Regarding the second question, there are two answers, depending on whether the new Reserves are needed for private enterprise or public enterprise. What we'll explore now are these two very different rooms under the roof of our Federal Reserve edifice. While they have connecting hallways, and many of the occupants wear two hats, they serve two distinctly different needs of our collective society.

The distinguishing thing about private enterprise is that its guiding principle is to make a financial profit. Any beneficial goods and services constitute a by-product of private enterprise's underlying motive. This fact becomes apparent when you consider that if a good or service cannot be produced profitably—even if it is arguably beneficial or desirable—private

enterprise will not produce it. Or, if a produced good or service proves to be unexpectedly unprofitable—even though beneficial—private enterprise will cease producing it.

This implicit structure of private enterprise gives rise to the need for public enterprise: the undertaking of things that are beneficial (even existentially essential) for the collective good, but which do not, or cannot, produce financial profits. This includes goods and services which, to be profitable, demand prices that large segments of society cannot afford to pay. Public enterprise also undertakes beneficial things which may, unfortunately, someday in the future, become a profitable enterprise, but which, in their exploratory or start-up stages, involve too much financial risk for private enterprise to undertake. Private enterprise selling back the results of public investment is unfortunately an all too common occurrence.

Private and public enterprise share certain things in common. First, they share access to the real resources necessary to provide goods and services: labor, technology, materiel, energy, specialized skills, et cetera. Each of the enterprises pays money to marshal these resources to achieve its goals. Private enterprise hires American workers to build things and do things—and public enterprise does the same.

The two enterprises also share the same source of money used for the paying—the Reserve fiat dollars issued by the Federal Reserve. Private enterprise creates claims on those Reserves with bank-dollars, while public enterprise spends the Reserves directly. When public enterprise spends directly, the US Treasury—the spending arm of the federal government—causes Reserves to be credited to the Reserve account of the bank associated with the spending recipient; in turn, the recipient's bank credits bank-dollars to the recipient's checking account. Private and public enterprise, then, both depend on Reserves for their spending; each, however, has a different process by which it 'calls for' the Reserve dollars it requires.

If private enterprise sees a lot of opportunities to spend money for profit-making ventures, and the banks agree the opportunities look good—meaning they will likely make profits as well—the banks create bank-dollars and loan them to private enterprise to undertake the ventures. The banks don't calculate, first, whether they have enough Reserves to support the claims those new bank-dollars will make on their Reserve account at the Fed. They make the loan first, and then later (if necessary) borrow any additional Reserves necessary to cover the claims.

In aggregate, then, the private banks decide how many bank-dollars are issued (based on their calculations for potential profits) and the Fed responds by creating any new Reserve fiat dollars necessary to cover the resulting clearing processes in the system. The new Reserves are issued by

the Fed in exchange for collateral from the private banks. The collateral is held by the Fed on what is known as its 'balance sheet.' If it 'expands its balance sheet,' it is creating new Reserves. If it 'winds down' its balance sheet, it is trading collateral for existing Reserves—which it then simply cancels, erasing them from the system.

Banks are able to leverage the creation of many more bank-dollars than they have Reserves to back them up. The Fed, then, is only required to issue new Reserves if that leverage changes. One thing that would change the leverage is if private enterprise in America decided to expand its profit-making ventures—and the banks obliged by creating new bank-dollars exceeding the Reserve capacity of the aggregate clearing process. When that happens, the Fed, as a matter of course, issues the new Reserves that are necessary.

In the same way that private enterprise can call upon the Fed to issue new Reserves to accomplish its goals, public enterprise can do the same. It goes about doing this, however, in a different way.

The public enterprise process begins with the US Congress—representing the democratic will of the American public (in theory)—voting to undertake the production of some specified goods or services which benefit the whole society. Congress appropriates new dollars to be spent for the stated purpose. As the spending agent for Congress, the US Treasury then sets about acquiring the new dollars that Congress has directed it to spend. It does this in coordinated partnership with the Federal Reserve system. This is one of the most labyrinthine parts of our edifice's corridor system—so, now we'll slow down to appreciate it. Hold tight to your brain-handles again!

As we've noted, just like each of the private banks in the Reserve system, the US Treasury has a Reserve account at the Fed. This is the federal government's spending account. Where do the Reserves in the Treasury's spending account come from?

Simply by virtue of Congress' appropriations, the Treasury is compelled to acquire whatever it needs in its spending account at the Fed. The Treasury doesn't say to Congress, 'Oh, sorry, we don't have enough dollars to pay for that!'—just like the private bank doesn't say to a well-heeled loan applicant, 'That's a great business proposition and resume, but we're simply out of money at the moment!' If you'll notice, the Treasury only claims it's about to run out of dollars when small-minded politicians play small-minded games to gain some small-minded advantage on the political stage. Instead, when the Treasury is directed to spend dollars it simply instigates its own unique process within the Federal Reserve System which compels additional Reserves to be credited to its spending account. Here's how it works—please note that it is unnecessarily complicated, I only include it as a clear example

of the nonsense which hides behind complexity “you’re not educated enough to understand.”

1. The Treasury issues something which it uniquely has the capability of creating: a believable certificate of future Reserves called a ‘treasury bond.’ This action commands a few moments of our attention: Anyone can create a ‘bond’—a written promise to pay a certain amount of dollars at some point in the future. But, for obvious reasons, not everyone’s such promise is equally believable. A corporate bond, for example, depends on the corporation’s ability to generate future profits to keep its promise. “Junk bonds” are promises made by businesses who pose a substantial risk that they won’t be able to produce those profits necessary to redeem the bond. A treasury bond, in contrast, is not a promise that depends on future profits at all, but only on the legal authority of the Fed to issue new Reserves.

But how are the future Reserves of the treasury bond converted into present Reserves in the Treasury’s spending account?

2. The Treasury, working in tandem with the Federal Reserve system, trades its future Reserve bonds for present Reserves, which are then credited to its spending account. This trading occurs on what is called an “open market”—which simply means a) the entities are doing the trading voluntarily, and b) the Fed is not participating directly in the trading (bypassing the voluntary participants). Some of the present Reserves the Treasury receives in trade are new Reserves, created by the Fed, and some of them are existing Reserves that were residing in the various banks’ Reserve accounts.

Again, this requires a moment of our attention on two fronts:

- a) Why would private banks want to trade their existing Reserves for future Reserves?
- b) If the Fed is not allowed to participate directly, by what process do the Fed’s new Reserves make their way into the spending account of the Treasury?

To answer these questions, let’s observe a treasury bond issue operation from where we now stand—at this particular intersection of corridors in the Federal Reserve edifice. The first thing we notice, over in the direction of private enterprise, is that there are a lot of bank-dollars in private checking accounts that aren’t needed for rent, or car-payments, or groceries. They’re surplus bank-dollars that are looking for a safe

investment to hide in until, someday in the future, they need to be spent for something. Where are those bank-dollars going to hide?

Some of them will hide in the stock-market, but that's a bit scary. A lot of them, in fact, will want to hide in the future Reserve treasury bonds the Treasury is getting ready to issue. When the Treasury issues its bonds, then, there is typically a substantial interest over in private enterprise to trade some of its bank-dollars for treasury bonds. As we know, these bank-dollars are claims on existing Reserves at the Fed. When the trade is made then, the claimed Reserves, represented by the traded bank-dollars, are credited to the Treasury's spending account.

It's important here to note three things:

- a) This is a completely voluntary action on the part of private enterprise. It is done purely out of self-interest, for the purpose of putting its surplus bank-dollars in a super-safe hiding place.
 - b) While the action is done out of self-interest, however, there's an unnoticed 'elephant in the corridor' as a result: By the act of trading existing Reserves for future Reserves, private enterprise is, in fact, *investing* in the goals and undertakings of public enterprise. This 'elephant,' I think, is something you want for sure to snap a picture of!
 - c) In the bond-issue operation we're now observing, the Treasury is needing to trade \$30 billion in future Reserves for \$30 billion in present Reserves—but private enterprise has only ponied up \$10 billion. Where will the additional \$20 billion come from?
3. The Fed has a group of its largest private banks—called "Primary Dealers"—with which it has a special set of arrangements. Specifically, the Primary Dealer banks are the ones who manage the trades between the future Reserve treasury bonds and the existing bank Reserves. As part of the arrangement, it is understood that if all the Treasury's bonds are not spoken for, some further trading is instigated, which the Primary Dealers participate in. Namely, the following:
- a) The Primary Dealers trade collateral to the Fed for new Reserves the Fed issues specifically for the purpose. In the operation we're presently observing, the Fed issues \$20 billion in new Reserves in exchange for the collateral.

- b) The Fed now has on its balance sheet the Primary Dealers' collateral, and the Dealers have in their Reserve accounts \$20 billion new Reserves.
 - c) The Primary Dealers then trade the \$20 billion new Reserves to the Treasury for the remaining \$20 billion in future Reserve treasury bonds that have not been claimed by private enterprise—thus crediting the Treasury's spending account with the balance of the \$30 billion it needs to meet Congress' spending directive.
 - d) The Primary Dealers then trade the newly acquired \$20 billion in future Reserve treasury bonds to the Fed—in exchange for the collateral they initially posted to start the operation.
4. The Fed now has on its balance sheet not the collateral of the Primary Dealers, but the \$20 billion in future Reserve bonds issued by the Treasury. The Fed holds these future Reserves on its balance sheet until the bonds mature—at which point the future Reserves must be made into present Reserves. What does the Fed do then?

It ought to do something that, on its face, seems rather silly: It ought to issue \$20 billion in new Reserves and pay them to itself (since it is holding the bonds that just matured). But the Fed has no need for Reserves because it is not a 'spender' of Reserves, but only the 'issuer' of Reserves. The Fed doesn't even have an account to keep Reserves in—for the simple reason that when the system calls for new Reserves, it is authorized to issue them by pushing buttons on an electronic keyboard. To keep from looking silly—trying to deal with something it has no need for, nor any place to keep—the Fed simply cancels the treasury bonds it is holding and the \$20 billion in future Reserves are never made 'real.'

The same thing happens when the Fed winds-down its balance sheet (as we observed earlier)—trading collateral it has received in exchange for Reserves in the private banking system. The Fed simply makes the trade, then cancels the Reserves it has received—essentially reincorporating them into its mandate to create Reserves as necessity (and either private or public enterprise) calls for.

There's not anything further we really need to see on our tour of the Federal Reserve money system. We've observed all that's necessary, I think, to now have a meaningful discussion of what's *really* important: why we can, in fact, as a collective society, afford to pay ourselves to undertake and

accomplish what's necessary to actually address the six, money-intensive, life-defining dilemmas America now confronts:

1. Healthcare
2. Student debt
3. Early childhood care and development
4. Affordable housing
5. Climate change
6. Bullshit jobs

Please feel free, by the way, to add to this list—but before we argue priorities, let's understand and agree that we unequivocally *do* have the financial resources, as a democratic society, to confront them.

But why should the people of this country, who empowered their elected Congress to coin money and regulate its value, need to pay interest to anyone for the use of their own money? So far as creating money is concerned, what's the difference between you creating money to build things that make profits, and us creating money to build things that we decided we need to have?

The big surprise to some on our tour of the Federal Reserve system is that the Fed (America's central bank)—as it is presently authorized to operate—can create money, as necessary, to support not only the undertakings of private enterprise, but the undertakings of public enterprise as well. Please recall that public enterprise produces needed goods and services which private enterprise cannot produce at a profit or, to make its profit, must set prices higher than what most citizens can afford to pay. To accomplish what private enterprise cannot, therefore, the US Treasury, as directed by Congress, pays US citizens and businesses directly to produce the goods and services of public enterprise.

The fact, that the Federal Reserve system is able to create the money required for this spending, is a surprise because we, the American voters, have always been led to believe that public enterprise is financed by a different method: namely, some combination of taxing private profits & income and borrowing from the investment capital of private enterprise. What we discovered, instead, is that taxes do not fund the Treasury's spending—and the funding is derived from operations that have nothing to do with 'borrowing' in any meaningful sense of the term.

The federal government, we discovered, doesn't ever borrow anything—and what we are persuaded to think of as a 'national debt' is, in fact, merely a bookkeeping tally of some portion of the undertakings of public enterprise. It is not something that has to be repaid to anybody in the future; it is not something that future tax collections will have to reimburse. Nor is

there a limit on the number of Reserves that can be created to pay for public enterprise: what is limited is not the availability of fiat money (the Reserves of the Federal Reserve system), but the real resources—skilled labor, technology, energy, materiel—which the Reserves are used to employ. If the need for some public enterprise exists, and the real resources are available to meet the challenge, the Reserves can be issued, as necessary, to employ those resources.

The implications of this ‘surprise discovery’ are game-changing. As I write, for example, Elizabeth Warren has just released her long-awaited formula to pay for Medicare-for-all—a \$50 trillion federal spending commitment. Playing the old game, Ivy League Pocahontas’ formula pulls out all the stops on raising taxes on the super-wealthy and large corporations—and pieces together a multitude of spending adjustments and projected cost savings to miraculously come up with the money necessary to pay American medical providers to provide medical care to Americans. Elizabeth has, of necessity, carefully manipulated all these pieces within the old-game formula so it doesn’t appear the government has to borrow dollars—a proposition which American voters have been trained to view as political suicide.

Mission accomplished! Except, having now stretched the old-game formula as far as it apparently can go to accomplish goal number one of public enterprise (universal healthcare) we are left to wonder about some of the other major, money-intensive, public enterprise challenges we presently face as a collective society such as:

1. Student Debt—\$1.6 trillion plus \$47 billion per year for free tuition at state colleges
2. Early childhood care and development—\$70 billion per year
3. Affordable housing—\$350 billion for 7 million units
4. Climate change—\$90 trillion for the currently totally inadequate “Green New Deal.”
5. Bullshit Jobs—total cost: unknown

That’s a total of at least \$110 trillion over the next decade—after we’ve paid for universal health care—for the undertakings of public enterprise that are genuinely, if not existentially, needed by the citizens of modern American society. How is the old-game formula going to work with a number like that? And what’s going on, anyway? Have we suddenly, in the twenty-first century, become exceedingly and unreasonably profligate in our needs?

You can't help but consider how fortuitous the surprise discovery we made in our Federal Reserve tour really is. As it happens, modern society seems to have evolved to a point where the old-game formula is, mathematically, simply incapable (as exemplified in the calculations above) of addressing the major challenges modern society confronts. Specifically, there seems to be a dramatic increase in the kinds of goods and services modern society needs, but which the profit model of private enterprise cannot provide—or cannot provide at a price that a large percentage of society's membership can afford to pay.

To effectively function, then, modern society requires a new approach to public enterprise—and a new understanding of how US citizens and businesses will be paid to undertake and implement it. What our tour of the Federal Reserve system has shown us is this goal can be accomplished within the existing operations of the Federal Reserve system. If only we could clearly see it.

Let's briefly look, one by one, at the previously listed money-intensive challenges we're currently facing. The first four can be considered with just a few casual observations:

1. Universal Health Care

Before World War I, health-care goods and services involved a relatively limited and straightforward set of technologies and skills. Doctors did simple surgeries, set bones, applied poultices, prescribed homeopathic tinctures, administered morphine and, for the most part, watched, comforted, and advised both patients and families. A doctor's bill, almost by definition, was limited to a certain magnitude simply by the limitations of what a doctor could undertake to do, or what medications could be prescribed.

In today's modern society, of course, things couldn't be more different. There's hardly a human medical condition that cannot be ameliorated or totally cured by the application of advanced technologies and pharmacology—or so they claim. These are administered in highly technical hospital complexes attended by specialized teams of highly trained physicians and aides. Illnesses or conditions that a few generations ago were simply accepted as one's lot in life, or end-life, can now be routinely treated—and cured. And the doctor's bill can now be virtually as unlimited as the amazing outcomes provided—and intellectual property monopolies awarded.

The problem, of course, is that only a fraction of American citizens has the income and/or wealth to buy these outcomes. To be profitable—

or even to be provided at cost (out of empathetic generosity)—the modern medical services of private enterprise must be priced beyond the means of most members of modern society. The ethical choice of modern society is stark: either a large percentage of citizens must go without available medical services—or public enterprise must step in and make up the difference.

2. Student Debt

It should not be a surprise that modern American society has generated a student debt crisis. Two or three generations ago most young people, embarking on a career in life, didn't need a college education. Most employment involved manual skills. Employment that required technical thinking or management skills could be obtained by apprenticing or learning on the job. College was reserved either for learning highly complex/professional skills—e.g. medicine, law, mathematics, and science—or as a badge of upper-class identity in the fine arts.

In modern society, the availability (and social status) of manual employment has dramatically declined. Production and management skills, in virtually every employment field and endeavor, have become highly technical and specialized—requiring expensive, post-high school degrees and training before a career can be embarked upon. In itself, this could be viewed as a positive evolution except, of course, for one big problem: Most career-aspiring youth do not have the financial resources to buy the required higher education and, as a result, are forced into substantial debt to do so. The perversity of being pushed into debt in order to begin earning a living is one of the most extraordinary structures modern American society has yet produced—and it weighs heavily on many crucial aspects of our collective well-being, including family formation and consumer markets.

The only remedy to this evolved structure of modern society is for higher education—and specialized technical training—to be undertaken as a public enterprise. What could possibly be, by the way, a more logical investment by collective society in itself?

3. Early Childhood Care and Development

Only three generations ago, the challenge of early childhood care and development—outside the realm and context of the parental family—did not exist. Pre-school children grew up in, and were nurtured by, an extended family context which covered the bases of their needs and early acclimation to the norms of becoming a socially productive

individual. Families paid nothing for these services—other than the hours donated as parent, grandparent, aunt, uncle, or neighbor.

Transition, now, to modern American society: Extended family structures have been spatially fractured and displaced. Grandparents, aunts, uncles, and cousins are, typically not around to donate childcare hours to a young family. Neighbors are typically only casual acquaintances, at best—and hardly open to stepping in for a few hours of care. The difficulty is exacerbated by the fact that, in most modern families, both parents are obliged to be employed to earn wages adequate to meet basic living expenses. Or, most problematic of all, many families have only a single parent—usually working more than one job to make up for the lack of a second income. The modern pre-school child, as a result, is virtually abandoned.

Private enterprise, of course, provides childcare services which “solve” this problem of modern society. Except the price for these services—even if it simply covers operating costs and expenses—must be set far beyond the ability of most families to pay. Result: either modern society must suffer the uncalculated (to date) consequences of a generation of poorly nurtured and acclimated children—or public enterprise, in defense of itself, must produce high quality childcare, as needed, for every American family.

4. **Affordable Housing**

Before the two World Wars, most Americans lived and worked in rural communities that revolved around agriculture and subsistence economies. Housing for the most part was a simple structure, providing shelter from the elements and an organizational matrix for the tools, implements, and subsistence activities of family life. A dwelling was something that could be put together with hard-nosed, hands-on-and-neighbor-assisted labor—and there was plenty of land-space (due to the successful genocide) to be owned or rented in the rural communities for that purpose.

In the non-subsistence, consumer-structure of modern society, most citizens (in order to have access to employment and education) must live in high-density megalopolises where a dwelling space is, of necessity, created by an entirely different process—a process that unfolds within a highly regulated and technical context. And while private enterprise, with great relish, rapidly produces dwellings in these complicated urban contexts, its necessary profit and overhead demands that prices

for the dwellings be set far higher than what a growing number of families can afford to pay.

If every American family is to have access to an affordable dwelling, public enterprise must play a major role in the construction and/or ownership operations of strategic segments of the housing industry.

In each of the cases just described, the structure of modern society has evolved to create a human need for goods and services—or a technical level of goods and services—which previously did not exist. And while private enterprise has the real resources to produce those goods and services, it either cannot do so within a profit-making structure, or it must set prices at a level beyond what a significant membership of society can afford to pay. Another way of visualizing this imbalanced structure is to say that private enterprise, in producing the goods and services that modern society uniquely needs, is no longer able to provide adequately compensated employment for a large segment of that society's members—thus enabling them to be consumers of the goods and services. This endemic under-employment, relative to the goods and services that an average citizen needs to buy to live an existence of relative health and well-being, has become, in fact, the primary structural disconnect of modern society itself. And it is this disconnect (among other things) which is necessitating the dramatic growth in public enterprise.

Of all the structural changes modern society is imposing on its citizens, however, the most challenging are the next two items our list. By comparison, the four we've just briefly considered—devastating as they may be to the well-being of families and collective society—are mere aggravations. The ultimate magnitude of the necessity for public enterprise—and of the Federal Reserve system's ability to create the fiat money necessary to marshal efforts to undertake that enterprise—becomes apparent when we consider, now, the challenges of 1. Climate change 2. Bullshit jobs

Let's consider these in reverse order because, as we'll see, the former may well be the savior of the latter.

- **Bullshit Jobs**

At least 50% of all jobs done in this country consist of bullshit or are only done to support other bullshit jobs. From zero-nutrition fast food to road crews widening highways, the time and resources spent are supporting bullshit. Those jobs you're not allowed to do because of the Wuhan Flu panic?—mostly bullshit, shouldn't exist. This fact is absolutely unacknowledged by mainstream society. Claiming such a high percentage is absolute blasphemy. As is advocating the

destruction of what we traditionally call ‘jobs.’ Yet it is true and likely understated.

Because these facts are not acknowledged, no accurate accounting of the total cost—in time, dollars, resources—of these bullshit jobs exists. But they are certain to be immense and affect the ability to successfully solve many of our other problems.

- **Climate Change**

Part of the challenge of climate change is the idea that we need to be essentially using the same amount of renewable energy, or even perhaps more if we are to bring the developing- and third-world up to a reasonable living standard. This is of course an absolute fiction—we cannot do this, not using existing technology and likely not ever.

But we do not need to use the same amount of energy, even should the third-world standard of living be raised (which it should). Much of what we do is extremely wasteful, in ways we do not even recognize, such as the case of bullshit jobs. The removal of bullshit jobs is one of the first key steps to implementing any climate-friendly version of degrowth; of beginning to ensure a just and equitable division of resources for all, both human and non-human alike.

If we remain wedded to the idea of jobs, of full employment, we will destroy ourselves.

It was my intention, at this point, to focus on the unfolding reality that climate change will soon prove to be the most dramatic challenge modern society is facing—and will be the challenge that necessitates, by far, the greatest need for goods and services produced by public enterprise. More to the point, climate change will generate the greatest need—by far—for implementing and managing a “modern money” perspective in America’s economy. I realize now it will be ineffective (and perhaps futile) to discuss the extraordinary level of public spending that climate-change will necessitate without, first, attempting to address two related issues:

1. The stridently insistent warnings about inflation
2. The conundrum of the necessity for increased consumption

I’ll begin this effort with a simple premise: It is willfully self-harming to confront a collective need—for which the labor and materiel are available to provide a remedy—but refuse to employ that labor and materiel by arguing that doing so will create an imbalance in the monetary system. This, for all

practical purposes, is precisely what is being argued when direct sovereign spending is withheld from public enterprise out of fear of inflation. At that precise point, it seems to me, the tail begins wagging the dog—and there is very little concern for the dog itself.

To visualize the issue, let's imagine ourselves a decade hence, and all the money-intensive challenges we've earlier outlined (supported by our "modern money" perspective) have largely been met by the efforts of public enterprise. It's the year 2030, and millions of Americans who previously struggled to get available health care can now walk into any doctor's office, neighborhood clinic, or hospital emergency room with their universal coverage card. Millions of recent college graduates have seen their old tuition debts canceled—and every high-school grad can now pursue higher education or technical training debt-free. Millions of children are now entering grade-school having been fully nurtured and prepared, during their pre-school years, to engage in becoming educated—and millions more, just coming out of maternity wards, are guaranteed high-quality pre-school care, if their family needs it. Millions of families, who previously struggled to find adequate housing at a price they could afford, are now part of a national housing co-op that builds and owns dwelling units and co-housing villages in every American community. Finally, we've succeeded in implementing the Green New Deal, transitioned primarily to zero carbon energy systems, and brought carbon emissions close to the stated parameters of the IPCC. In accomplishing all this, we've also established a public enterprise economy that has put millions of Americans back to work nurturing, restoring, and rebuilding the health and diversity of our natural habitats and ecosystems, as well as designing and building climate-adaptive human habitats, systems, and communities. We have, in short, made great strides toward our collective well-being.

There is, however, a problem. The problem is not that the \$110 trillion price tag we'd initially placed on these accomplishments came in closer to \$200 trillion. It turns out that the Federal Reserve system was able to produce, for the purposes of public enterprise, \$200 trillion in Reserves just as easily as it could have produced \$110 trillion. The problem we now confront, in 2030, is that the \$200 trillion has been paid to American citizens and businesses for producing the goods and services just outlined! American families and businesses, in other words, now possess \$200 trillion more to spend on food, clothing, housing, automobiles, electronic appliances, labor, and material than they otherwise would have. From many perspectives this could be viewed as a genuinely good thing: a middle-class lifestyle has been extended, presumably, to a larger percentage of society, and private enterprise is positioned to thrive on that expanded market. From another

perspective, however, there is a big problem—and an even larger conundrum. First: the big problem.

The simple logic of our old-world money narrative warns us that, because of that additional \$200 trillion in spending power, prices for consumer purchases in 2030 must have dramatically risen to accommodate the extra money. Or, viewed from another perspective, the value of the US dollars in everyone's bank accounts must have dramatically fallen. This, in a nutshell, is the predicted problem of price inflation we received dire warnings about a decade ago (back in 2020) when this talk about a new need for public enterprise began.

The only previous experience America has had with this dynamic, however, indicates that, if properly understood and managed, it is not a threat, but an opportunity. That previous experience was the US mobilization for World War II. During the war, public enterprise expanded dramatically, employing, in one way or another, virtually every American citizen. Prices did go up—but were held in check in two ways:

1. Strict wartime rationing of most consumer goods
2. Payrolls that were partially made with war-bonds (i.e. future dollars)

When the war was over, and the future dollars were made real, the sudden increase in consumer purchasing power was absorbed by the dramatic increase in the new production capabilities of private enterprise—capabilities that were built by the public enterprise of the war effort itself. It would be reasonable to imagine this same dynamic has now unfolded in 2030. All those public enterprise efforts we've just described have resulted in expanded opportunities for private enterprise to offer goods and services for profit—with the expanded middle-class market standing ready (with all that money they've earned through public enterprise) to be the consumers.

But maybe not. Maybe—as we were just warned by two economists at the St. Louis branch of the Federal Reserve itself—now, in 2030, we'd be experiencing hyperinflation, just like “Germany in 1921–23, Zimbabwe in 2007–09, and Venezuela currently.” It's disappointing that in their zeal to discredit the newly emerging “modern money” perspective, these economists found it prudent not to explain—or even point out—that in each of those instances of genuine hyperinflation, the root cause was not “printing money”—as they infer “modern money theory” is all about—but something else instead. To say that printing money is the cause of hyperinflation, it turns out, is like saying that flames are the cause of fire.

“Germany in 1921–23, Zimbabwe in 2007–09, and Venezuela currently,” all shared the same set of matches and kindling for starting the flames of

hyperinflation: a virtual total collapse of the production activities of their society. They stopped producing—or, in the case of Venezuela, and in part due to sanctions, importing—the things that people buy with money and so, naturally, the money that existed—and continued to be issued to meet government obligations—drove up prices of the few things remaining on the store-shelves.

Quick message to the St. Louis Fed from the year 2030: America hasn't stopped producing things for consumers to buy. There are many more things to buy than in 2020 when the push for public enterprise began. So why should we imagine that we've turned out to be suffering from hyperinflation? In fact, as we now enter the fourth decade of this century, we have a much bigger problem to confront—a conundrum we should have been actively strategizing about much earlier than a decade ago.

The conundrum faced by today's modern society is a Catch-22 of existential proportions: To confront the modern challenges society faces, public enterprise must step in and pay citizens and businesses massive quantities of currency to undertake strategic efforts that private enterprise cannot. To avoid serious disruptions from inflation, goods and services for private consumption must expand, commensurately, with the public enterprise spending.

However, we have reached a tipping point where the typical goods and services of private consumption cannot be expanded without exceeding—and then collapsing—the “carrying capacity” of the Earth's natural resources and regenerative systems. The ramifications of this conundrum—this Catch-22 of the twenty-first century—define the ultimate challenge, it seems to me, of modern human society. It appears that something truly magical must occur if we are to go forward with a viable, livable future.

Let's imagine pulling together a group of enlightened economic planners to create an American budget for, say, the years 2020–2024. What might they come up with? To begin with, how might they even go about thinking about how to create an American budget?

It's not so obvious as, for example, the way the Congressional Budget Office (CBO) might go about it. The CBO would begin by tallying up how much money America's government will have to spend in the years 2020–2024. Then they'd allocate those projected dollars to various pots of spending—with some calculation about what the spending needs will be for each pot. In the middle of this exercise, they'll discover that the spending needs for the pots far exceed the number of dollars they've projected America's government will have to spend. So, they'll tweak the tax revenue numbers, projecting that economic growth in this or that sector will generate more tax collections for the government, and they'll search for a bevy of cost-savings
