the government can garner by eliminating “wasteful” spending. Then they’ll repeat the allocation exercise and discover the projected available spending dollars are still far short of what they’ve calculated the pots will demand. Thus they will next have to calculate how many dollars the American government will have to borrow to make up the short-fall—and will have to further calculate how much that borrowing will add to the “national debt,” and how many years (projected into a distant future using imagined numbers for economic growth and future tax-rates) will it take for America to repay the debt. Then they’d publish all these numbers and Congress would blanch and fall into chaos and confusion. The political party out of power would declare the party in power to be “fiscally irresponsible,” driving the nation to bankruptcy, and the arguing would begin over which pots should be reduced or eliminated. Another day in the life of American politics courtesy of the Congressional Budget Office.

So, how would our group of enlightened economic planners tackle the problem differently? First, because we’re imagining they’re enlightened, meaning they fully understand how modern fiat money works, they’d realize it is incorrect—even illogical—to begin with a calculation of how much money the American government will have to spend. The American government, they understand, is constitutionally authorized by law and the Federal Reserve Act to issue fiat currency as necessary to meet the spending needs of both private commerce and the federal government. The pertinent budgeting question then is not whether the necessary fiat dollars can be issued, but what precisely are they to be spent on? This makes the process of creating an American budget a much more interesting and useful task than what the CBO habitually assigns itself. Here’s how I imagine the new process might proceed:

STEP 1: The first analysis and decisions are about what we—as a collective society represented by the federal government—need to accomplish: What pressing challenges do we confront? What dangers do we face? What opportunities lie at our doorstep? The list of broad categories might go something like this (feel free to generate your own list)

- Mitigating climate change
 - Developing and deploying zero-carbon energy strategies and technologies.
 - Plan and implement new afforestation programs.
 - Management analysis of existing forests and rainforests to maximize carbon sequestration.

- Adapting to climate change
 - Plan and implement an equity-replacement program for properties threatened by sea-level-rise.
 - Develop sea-level-rise relocation and replacement strategies.
 - Plan and implement water-supply security, preservation, and allocation strategies.
 - Develop and implement agricultural adaptation, crop diversity, and food-security strategies.
 - Develop and deploy Emergency Transitional Housing solutions.
- Restoring and rebuilding natural ecosystems
 - Develop and deploy strategies to preserve and reestablish ocean habitats and fishery stocks.
 - Preserve and reestablish wetland habitats.
 - Reclaim and restore industrial and mining waste-sites.
 - Plan and implement rain harvesting programs to reverse desertification of natural landscapes.
- Rejuvenating America's education system
 - Implement tuition strategies to remove debt from post high-school education.
 - Plan and deploy a universal pre-K day-care system.
 - Plan and implement a national, Grade 2 'reading-assist' program.
- Establishing comprehensive Retirement and Housing Assistance
 - Plan and implement a national 'Life-Share' house-mate program for retired persons.
 - Develop and implement a national co-housing assistance program.
 - Establish a national retirement housing co-op.

- Repairing and rebuilding critical local, regional, and national infrastructure
 - Immediately repair all bridges identified by the ASCE.
 - Immediately replace all lead-based community water-systems.
 - Develop and implement electric-grid security strategies and technologies.
 - Develop and build a national electric-vehicle charging grid.
- Redefining ‘work’ to reduce bullshit jobs
 - Plan and implement a universal income and a job guarantee program.
 - Design and implement an ‘art and artisanship’ curriculum for public schools and community colleges.

STEP 2: Next, our group would evaluate which of these challenges, dangers, or opportunities are likely to be met by the natural interests and operations of profit-making enterprise—and which of them (because they don’t lend themselves to making profits) are likely to be ignored.

STEP 3: Taking the national ‘to-do’ items which analysis has determined will likely be ignored by private commerce, the next step would be to determine what real resources will be necessary to undertake and accomplish each of them. How much and what kind of labor will be required? How much and what kind of materiel and technology?

STEP 4: Taking the list of required resources, our group would then ask: Are the resources described available within the borders of the United States? Or, to be more specific to the issue at hand, are they available to be purchased with US fiat currency?

STEP 5: If the answer is ‘yes,’ our group would then issue a formal proposal that the US Congress (1) authorize the US Treasury to issue treasury bonds, as necessary, for the purchase of the said real resources; and (2) direct appropriate government agencies to develop specific spending strategies to marshal the resources to pursue the goals of each stated item on the to-do list.

A simple example: imagine that one of the challenges our group identified in Step 2 was this: 25% of American children are failing to learn to read by the end of their second grade—and therefore will begin, in the third grade, to relentlessly fail in the US education system, resulting in unnecessarily high levels of social dysfunction and loss of personal autonomy. This is not

a challenge that profit-making commerce is going to undertake to meet, nor is it one that existing school funding can stretch to cover.

Next, we ask: what are the real resources necessary to provide the special assistance necessary to bring those children up to reading level at the end of grade two? We might calculate as follows: There are 92,858 elementary schools in America, each with a second-grade class of children learning to read. Let's say there's 24 students on average in each class, and 6 are struggling to read, falling behind, and in need of special one-on-one tutoring, say an hour a day per child. This creates the need for a unique kind of work-force: people capable of tutoring who are available and willing to provide their services for only one hour per school-day. Who might that worker/tutor be? Today a likely candidate is a high-school student or retiree, tutoring one hour after each school-day for \$20/hour, to make \$100/week spending money or simply help in the community. Call them the 'Read-Assist-Corp.' Each of our second-grade classes would require six RAC tutors, generating a need for 557,148 people a year, earning \$100/week for 36 weeks a year. It seems plausible those high-school students and retirees are, in fact, available and would be willing to provide the tutoring services in exchange for US fiat dollars.

Therefore we issue a formal proposal that Congress (1) authorize the US Treasury to issue bonds as required to pay annually up to \$2 billion in wages to the RAC program; and (2) that the funds be paid directly, each month, to the participating elementary schools. Thus, we have created an American budget for ensuring that every school child enters the third grade able and happy to read—and is therefore highly likely to engage in constructive learning in grades 3–12 and beyond. The budget has been calculated to be \$3,600 per struggling second-grader, or approximately \$2 billion per year. And the budget has been funded—as our enlightened group of economic planners knows—without the necessity of increasing taxes or borrowing dollars from the profits of private commerce. The budget has been funded by the sovereign government's legal mandate to issue fiat currency.

A lot of people will ask: But is it worth it? To which the answer is: worth what? Is rescuing the education and future careers of half a million American children worth the hours spent by the high-school students and retirees in mentoring them? I would think the proper answer to that is not only emphatically **YES**, but that the tutors, themselves, will have learned and received as much life-affirming energy as the second graders they helped. So, what's the complaint? If, on the other hand, the question is meant to ask: 'is it worth all those dollars?' then the asker obviously doesn't understand what money represents—or what, in fact, is its only purpose.

The Revival of the Commons

On July 12, 1995, a tropical air mass with searing heat and high humidity settled over Chicago, making it feel like Jakarta or Kuala Lumpur. On July 13, the temperature hit 106 degrees and the heat index, which measures how a typical person experiences the weather, reached 126. Local newspapers and television stations announced that the heat wave could be dangerous, but they didn't recognize its severity. Along with basic health warnings and meteorological reports, they also ran humorous stories about how to "ward off wardrobe wilt and makeup meltdown" and shop for air conditioners. "This is the kind of weather we pray for," said a spokesperson for one regional supplier. The Chicago Tribune advised readers to "slow down" and "think cool thoughts."

Chicago broke its record for energy consumption that day, and the surge in demand overwhelmed the electrical grid, causing outages in more than two-hundred-thousand homes, some lasting for days. Water pumps failed, leaving units on high floors dry. Across the city, buildings baked like ovens, roads and railways buckled, thousands of cars and buses overheated. Children riding school buses to camp got stuck in gridlocked traffic and had to be hosed off by public health crews to avoid heat stroke. Despite the mounting problems, Chicago's city government neglected to declare a state of emergency. The mayor, along with leaders of several key city agencies, was out of the city, vacationing in a cooler spot. But millions of residents were stuck in the heat.

Like all cities, Chicago is a heat island, with paved roads and metallic buildings that attract the sun's warmth and heavy pollution that traps it. While the verdant suburbs surrounding Chicago cooled down at night, urban neighborhoods continued to broil. So many people called 911 that some of them were put on hold. Thousands rushed to emergency rooms with heat-related illnesses, and nearly half of the city's hospitals refused to admit new patients because they had no more space. A line of trucks formed outside the Cook County Medical Examiner's Office, waiting to unload dead bodies. There were 222 bays at the morgue, all of them filled. The owner of a meatpacking company offered to bring a forty-eight-foot-long refrigerated truck. When it was fully loaded, he brought another, and another, until nine trucks holding hundreds of bodies were jammed into the parking lot. "I've never seen anything like this in my life," said the medical examiner. "We're overwhelmed." During the week of July 14–20, 739 people in excess of the norm died in Chicago, roughly seven times the toll from Superstorm Sandy and more than twice as many as in the Great Chicago Fire.

What was the key difference between the vulnerable who survived and those who did not? They knew their neighbors—not because they made special efforts to meet them, but because they lived in a place where casual interaction was a feature of everyday life.

When the levees break, cities and coastal areas flood, sometimes catastrophically. When the power goes out, most businesses, health care providers, and schools cannot operate, and many transit and communications networks stop running too. Breakdowns in the fuel supply can be even more consequential, since oil generates most of our heat and gas powers the trucks that deliver nearly all the food and medications consumed in large cities and suburbs as well as the automobiles that most people depend on to travel. No one needs a lengthy description of the problems that occur when the sewage system stops working. But the real problems come when several or all of these systems collapse simultaneously, as they do during extreme weather events or terrorist attacks or perhaps even pandemics. Unfortunately, history shows that such things are impossible to prevent, no matter how sophisticated our technology or design. And, as most policy-makers and engineers see it, when hard infrastructure fails, as it did in the great Chicago heat wave, it's the softer, social infrastructure that determines our fate.

'Infrastructure' is not a term conventionally used to describe the underpinnings of social life. But this is a consequential oversight, because the built environment—and not just cultural preferences or the existence of voluntary organizations—influences the breadth and depth of our associations. If states and societies do not recognize social infrastructure and how it works, they will fail to see a powerful way to promote civic engagement and social interaction, both within communities and across group lines.

What counts as social infrastructure? I define it capaciously. Public institutions, such as libraries, schools, playgrounds, parks, athletic fields, and swimming pools, are vital parts of the social infrastructure. So too are sidewalks, courtyards, community gardens, and other green spaces that invite people into the public realm. Community organizations, including churches and civic associations, act as social infrastructures when they have an established physical space where people can assemble, as do regularly scheduled markets for food, furniture, clothing, art, and other consumer goods. Commercial establishments can also be important parts of the social infrastructure, particularly when they operate as what some call "third spaces," places (like cafés, diners, barbershops, and bookstores) where people are welcome to congregate and linger regardless of what they've purchased. Entrepreneurs typically start these kinds of businesses because they want to generate income. But in the process, they help produce the

material foundations for social life.

What doesn't qualify as social infrastructure? Transit networks determine where we live, work, and play, and how long it takes to move between places. But whether they're social infrastructure depends on how they're organized, since a system designed for private vehicles will likely keep people separate as they travel—and consume enormous amounts of energy—whereas public systems that use buses and trains can enhance civic life. Although they have obvious social impacts, waterworks, waste treatment facilities, sewage systems, fuel supply lines, and electric grids are usually not social infrastructures—we don't congregate in these places. But conventional hard infrastructure, such as levees, can be engineered to double as social infrastructure.

A simple levee is an artificial embankment that people build to prevent water from going into places they don't want it to be. A levee is typically little more than a mound of less permeable soil, like clay, wider at the base and narrower at the top. These mounds run in a long strip, sometimes for many miles, along a river, lake, or ocean. This kind of levee is physical infrastructure that protects social life on the dry side, not robust social infrastructure. But levees can be designed differently. In the late 1930s, for instance, engineers needed to protect Washington, DC's Federal Triangle neighborhood after a spell of heavy rains led to massive urban flooding. They could have put up a narrow mound of soil, but instead they built the Potomac Park Levee, a sloped walking path capped by a curved stone wall. In subsequent years the dual-purpose levee and parkland became one of the most popular public spaces in the city, a place where thousands of people go daily without even knowing that they're on top of critical infrastructure. Today, a growing number of architects and engineers are designing hard infrastructure, such as seawalls and bridges, so that it also functions as social infrastructure by incorporating parks, walking trails, and community centers. These projects, which already exist in places like Istanbul, Singapore, Rotterdam, and New Orleans, provide multiple benefits, from protecting against storm surges to promoting participation in public life.

Different kinds of social infrastructure play different roles in the local environment, and support different kinds of social ties. Some places, such as libraries, YMCAs, and schools, provide space for recurring interaction, often programmed, and tend to encourage more durable relationships. Others, such as playgrounds and street markets, tend to support looser connections—but of course these ties can, and sometimes do, grow more substantial if the interactions become more frequent or the parties establish a deeper bond. Countless close friendships between mothers, and then entire families,

begin because two toddlers visit the same swing set. Basketball players who participate in regular pickup games often befriend people with different political preferences, or with a different ethnic, religious, or class status, and wind up exposed to ideas they wouldn't likely encounter off the court.

Social infrastructures that promote efficiency tend to discourage interaction and the formation of strong ties. One recent study, for instance, shows that a daycare center that encourages caregivers and parents to walk in and wait for their children, often inside the classroom and generally at the same time, fosters more social connections and supportive relationships than one where managers allow parents to come in on their own schedules and hurry through drop-off and pickup so they can quickly return to their private lives. Because much of our hard infrastructure—highways, airports, food supply chains, and the like—is designed to promote efficient circulation of people or vital resources, it can accelerate the trend of social atomization. Think, for example, about the contrast between a village where everyone gets their water from the same well and a city where everyone gets their water from faucets in their private homes.

Few modern social infrastructures are natural, however, and in densely populated areas even beaches and forests require careful engineering and management to meet human needs. This means that all social infrastructure requires investment, whether for development or upkeep, and when we fail to build and maintain it, the material foundations of our social and civic life erode. The components of social infrastructure rarely crash as completely or as visibly as a fallen bridge or a downed electrical line, and their breakdowns don't result in immediate systemic failures. But when the social infrastructure gets degraded, the consequences are unmistakable. People reduce the time they spend in public settings and hunker down in their safe houses. Social networks weaken. Crime rises. Older and sick people grow isolated. Younger people get addicted to drugs and become more vulnerable to lethal overdoses. Distrust rises and civic participation wanes. A window breaks.

As of 2016, more than twelve-million Americans aged sixty-five and above live by themselves, and the ranks of those who are aging alone is growing steadily in much of the world. Although most people in this situation are socially active, the risk of isolation is formidable. A fall, an illness, or the inevitable advance toward frailty can render them homebound. If older friends and neighbors move away or die, their social networks can quickly unravel. If they get depressed, their interest in being out in the world can diminish. Street crime discourages everyone from going outdoors and socializing in public, but it's particularly intimidating for the old. In neighborhoods where crime is high or the social infrastructure is depleted,

old people are more likely to stay home, alone, simply because they lack compelling places to go.

Libraries are not the kinds of institutions that most social scientists, policy-makers, and community leaders usually bring up when they discuss social capital and how to build it. Since Tocqueville, most leading thinkers about social and civic life have extolled the value of voluntary associations like bowling leagues and gardening clubs without looking closely at the physical and material conditions that make people more or less likely to associate. But social infrastructure provides the setting and context for social participation, and the library is among the most critical forms of social infrastructure that we have. It's also one of the most undervalued.

In recent years, modest declines in the circulation of bound books in some parts of the country have led some critics to argue that the library is no longer serving its historic function as a place for public education and social uplift. Elected officials with other spending priorities argue that twenty-first-century libraries no longer need the resources they once commanded, because on the Internet most content is free. Architects and designers eager to erect new temples of knowledge say that libraries should be repurposed for a world where books are digitized and so much public culture is online. Many public libraries do need renovations, particularly the neighborhood branches. But the problem libraries face isn't that people no longer visit them or take out books.

On the contrary: so many people are using them, for such a wide variety of purposes, that library systems and their employees are overwhelmed. According to a 2016 survey conducted by the Pew Research Center, about half of all Americans aged sixteen and over used a public library in the past year, and two-thirds say that closing their local branch would have a "major impact on their community." In many neighborhoods the risk of such closures is palpable, because both local library buildings and the systems that sustain them are underfunded and overrun. Urban library systems in the United States have long been public-private partnerships, and city governments have long relied on philanthropists to fund much of the library's work.

Why have so many public officials and civic leaders failed to recognize the value of libraries and their role in our social infrastructure? Perhaps it's because the founding principle behind the library—that all people deserve free, open access to our shared culture and heritage, which they can use to any end they see fit—is out of sync with the market logic that dominates our time. If, today, the library didn't already exist, it's hard to imagine our society's leaders inventing it—at best you'd have to settle for a Netflix-for-Books. But perhaps it's because so few influential people understand the

role that libraries already play in modern communities, or the many roles they could play if they had more support.

In New York, as in cities across the United States and around the world, neighborhood libraries and librarians do all kinds of unexpected things for surprisingly large numbers of people. Their core mission is to help people elevate themselves and improve their situation. Libraries do this, principally, by providing free access to the widest possible variety of cultural materials to people of all ages, from all ethnicities and groups. For older people, especially widows, widowers, and those who live alone, libraries are places for culture and companionship, through book clubs, movie nights, sewing circles, and classes in art, music, current events, and computing.

For example, when Library Lanes, a program designed to get seniors socializing, scales up to the city level, no old person in the five boroughs need bowl alone again. The elderly can also participate in some of these activities in senior centers, but there they can do them only with other old people, and often that makes them feel stigmatized, as if old is all they are. For many seniors, the library is the main place they interact with people from other generations. It's a place where they can volunteer and feel useful. It's where they can be part of a diverse and robust community, not a homogeneous one where everyone fears decline.

Libraries provide different benefits to young people. They expose infants and toddlers to books and stories that would otherwise be inaccessible. They help youths inch toward independence, giving them library cards and letting them choose how to use them. Libraries offer refuge and safe space to teenagers who'd rather study or socialize than hang out in the streets. Librarians help students with homework and offer after-school programs in art, science, music, language, and math. They recommend books, authors, even entire genres to young people who are searching for something different but can't yet name it. Libraries help children and teenagers feel responsible, to themselves and to their neighbors, by teaching them what it means to borrow and take care of something public, and to return it so others can have it too.

By doing all this, libraries also help families and caretakers. They provide a social space and shared activities for new parents, grandparents, and nannies who feel lonely, disconnected, or overwhelmed when watching an infant or a toddler by themselves. They help build friendships and support networks among neighbors who'd never met before taking a library class. They teach parenting skills to people who want or need them. They watch children, sometimes very young ones, whose parents work late or on weekends and who can't afford childcare. They give families confidence that their kids are in good hands.

Young people spend so much of their social time online because adults—from helicopter parents to hypervigilant school administrators and security guards—give them few other options. Despite higher crime rates, teens in previous generations had more freedom to roam around their neighborhoods and local public spaces than today’s youths. They had more unstructured time after school and on weekends; they even had more free time during school, and far less surveillance. Increasing regulation means that there aren’t as many public spaces for teens to gather. Facebook, Twitter, and Instagram are not only new public spaces: they are in many cases the only ‘public’ spaces in which teens can easily congregate with large groups of their peers. More significantly, teens can gather in them while still physically stuck at home. Many insist that they prefer hanging out in person to messaging on smartphones, but adults have restricted their mobility so thoroughly that they have few alternatives. The Internet has become young people’s core social infrastructure because we’ve unfairly deprived them of access to other places for meaningful connection. If we fail to build physical places where people can enjoy one another’s company, regardless of age, class, race, or ethnicity, we will all be similarly confined.

Why are libraries such popular places for young people? One reason is that, as public institutions, they’re open, accessible, and free. Another is that the library staff welcomes them; in many branches, they even create special places where teenagers can be with one another. To appreciate why this matters, compare the social space of the library with the social space of popular commercial establishments, such as Starbucks or McDonald’s. Commercial entities are valuable parts of the social infrastructure, and there’s no doubt that classic “third places,” including cafés, bars, and restaurants, have helped revitalize cities and suburbs. But not everyone can afford to frequent them, and not all paying customers are welcome to stay for long. Spending time in a market-driven social setting—even a relatively inexpensive fast-food restaurant or pastry shop—requires paying for the privilege. Inside almost every Starbucks, Dunkin’ Donuts, or McDonald’s, particularly those in neighborhoods where there are teenagers, poor people, or old people around, there’s usually at least one sign that says ‘No Loitering.’ And it’s not just a suggestion. Some New York City McDonald’s franchises impose time limits of twenty or thirty minutes “while consuming food” that, depending on the client, management may or may not enforce. Race matters, but so too do class and age. Groups of teenagers are routinely asked to leave commercial establishments, even after they make their purchases.

Places like libraries are saturated with strangers, people whose bodies are different, whose styles are different, who make different sounds, speak different languages, give off different, sometimes noxious, smells. Spending

time in public social infrastructures requires learning to deal with these differences in a civil manner.

For branch librarians, helping people find more than they're looking for is the essence of the job.

“There are few jobs that exist today where you're really just doing good things as a public servant. You're not screwing anyone over. You're not taking advantage of anybody. You're just offering a free service.”

“Here's something I realized once I got here. At Starbucks, and at most businesses, really, the assumption is that you, the customer, are better for having this thing that you purchase. Right? At the library, the assumption is you are better. You have it in you already. You just sort of need to be exposed to these things and provide yourself an education. The library assumes the best out of people. The services it provides are founded upon the assumption that if given the chance, people will improve themselves.”

Social interactions—with librarians and with other patrons—are one of the crucial ways that this self-improvement happens.

“Tea Time is one of the best ways that the library can express faith in people.”

There is a term you don't hear these days, one you used to hear all the time when the Carnegie branches opened: ‘Palaces for the People.’ The library really is a palace. It bestows nobility on people who can't otherwise afford a shred of it.

“People need to have nobility and dignity in their lives. And, you know, they need other people to recognize it in them too. Serving tea doesn't seem like that big a deal, but the truth is it's one of the most important things I do.”

There are no criminals, only environmental circumstances which result in criminal behavior. Given the proper environmental structure, anyone will be a criminal or a noncriminal. It follows, then, that crime control measures are unlikely to work if they are designed to target individual offenders. Instead, crime is best managed through the manipulation of the environment where crimes occur. To this day, however, most policies that aim to reduce crime

focus on punishing people rather than improving places. The president has called for a national “stop and frisk” police program; the attorney general wants more severe sentencing; advocates of “law and order” are resurgent. We invest little in housing and far less in safe sidewalks and neighborhood amenities like libraries, senior centers, and community gardens, which draw people into the public realm and put more eyes on the street. We spend even less to address criminal “hot spots,” specific places, such as empty lots, abandoned buildings, and liquor stores, that are known to foster illegal activities. Funds for improving community and street-level conditions in the places most likely to suffer from crime and violence are in short supply. Government officials may have political reasons to crack down on potentially dangerous people rather than on demonstrably dangerous places, but the scientific grounds are shaky. We have other more effective and less expensive ways to reduce crime today. And a growing body of scientific research shows that some of the best options involve investing in social infrastructure.

Social scientists have long played a major role in shaping crime policies. Consider the “broken windows” theory, introduced in an article in 1982. According to the theory, criminals perceive broken windows and other forms of neighborhood disorder as signals of weak social control and, in turn, as evidence that crimes committed there are unlikely to be checked.

“Though it is not inevitable, it is more likely that here, rather than in places where people are confident they can regulate public behavior by informal controls, drugs will change hands, prostitutes will solicit, and cars will be stripped. That the drunks will be robbed by boys who do it as a lark, and the prostitutes’ customers will be robbed by men who do it purposefully and perhaps violently. That muggings will occur.”

“Broken Windows” is not only one of the most cited articles in the history of criminology, it’s also one of the most influential works of public policy research, sometimes referred to as “the bible of policing” and “the blueprint for community policing.” Since the 1980s, cities throughout the world have used these ideas as motivation for “zero tolerance” policing, wherein officers carefully monitor petty crimes such as graffiti, loitering, public intoxication, even panhandling, and courts severely punish those convicted of committing them.

“If you take care of the little things, then you can prevent a lot of the big things.”

In practice, in NYC this meant stopping, frisking, and arresting more people, particularly those who live in high-crime areas. It also meant a

spike in reports that police were unfairly targeting minorities, particularly black men. Despite some relatively recent experimental evidence supporting elements of the theory, broken windows always worked better as an idea than as a work of empirical science. The famous broken windows theory has never been verified and the existing social-scientific data suggest that the theory is probably not right. The problems, which include the fact that perceptions of disorder generally have more to do with the racial composition of a neighborhood than with the amount of broken windows or graffiti, are numerous and well documented.

For present purposes, though, I'm less interested in the validity of the broken windows theory than in the way it was framed and interpreted. The authors encouraged policy-makers to crack down on the petty crimes that lead to things like broken windows, which meant more aggressive street-level policing. Had they been more interested in the influence of social infrastructure, however, they might have taken another tack. Consider the famous scenario in which the authors propose how spirals of disorder and decay get started.

“A piece of property is abandoned, weeds grow up, a window is smashed. Adults stop scolding rowdy children; the children, emboldened, become more rowdy. Families move out, unattached adults move in. Teenagers gather in front of the corner store. The merchant asks them to move; they refuse. Fights occur. Litter accumulates. People start drinking in front of the grocery; in time, an inebriate slumps to the sidewalk and is allowed to sleep it off. Pedestrians are approached by panhandlers.”

From there it gets worse. What's curious, I think, is that the first two steps of this vicious cycle—“A piece of property is abandoned, weeds grow up”—have disappeared in the public debate about why some neighborhoods have such high crime rates. The third step—“a window is smashed”—inspired the article's catchy title and took center stage. In academic circles, scholars had long been concerned about the security risks posed by abandoned properties and empty lots. But the popular and policy debates about broken windows theory ignored the two problems at the root of their story and jumped straight to the criminal behavior. We get “Broken Windows,” not ‘Abandoned Property,’ and a very different policy response ensues. Imagine what might have happened if the authors had pushed their readers—many of whom were mayors and police chiefs—to think more carefully about the social infrastructure. What if vacant buildings and empty lots had gotten the attention that was showered on petty criminals instead? What if

neighborhood crime prevention efforts focused on inspecting and remediating dangerous properties rather than stopping and frisking people?

The shortage of affordable housing is a national crisis today, and violent crime is once again on the rise in some cities. Public investment in these matters is inevitable, because the problems they generate are too difficult for citizens to endure and too serious for political officials to ignore. For decades, building prisons for the poor has been our main crime reduction policy, and the social costs have been as great as the economic expense. If we want a better, more equitable, and sustainable solution for the challenges facing our cities and suburbs, we'd be better off building social infrastructure instead.

Today, our communities are full of children whose future will be formed in the places where they go to learn about themselves and the world they'll inherit. They deserve palaces. Whether they get them is up to us.

Most debates about education focus on the relationship between school quality and individual student achievement. That's sensible, since schools play such an important role in determining people's fate in modern societies, even in those where inherited privilege matters more for success than merit or hard work. But educational institutions do far more than teach individual students. From childcare centers to research universities, schools create social worlds that shape and sustain entire communities. They're our primary public institutions for establishing democratic ideals and instilling civic skills. Schools are our modern agoras, gathering places where we make and remake ourselves and develop a sense of where we belong. Schools are organizations, but they're also social infrastructures. The way they're planned, designed, and programmed shapes the interactions that develop in and around them. For students, teachers, parents, and entire communities, schools can either foster or inhibit trust, solidarity, and a shared commitment to the common good. They can also set boundaries that define who is part of the community and who is excluded. They can integrate or segregate, create opportunities or keep people in their place.

Of course, the design and programming of schools also shapes their core mission: educating children. The physical layout and organizational structure of a school affects how learning happens—in classrooms, on campus, and in the neighborhood where it's situated. This is just as true for elementary schools as it is for elite universities. Consider, for instance, the difference between the traditional Oxbridge college model, organized around small rooms where individual students study with tutors, and the latest design trends in contemporary universities, which feature large, open, multipurpose spaces that encourage serendipitous encounters and promote collaboration with people from different fields. Such spaces provide the

ability to explore topics of one's own interest on one's own time with access to more specifically knowledgeable people to augment understanding.

In the 1980s, when American political leaders had grown anxious about a new "urban underclass" and local governments throughout the country deployed armed security guards to monitor high school campuses, public schools—particularly those in poor areas—had ceased to be ideal places for anything. With metal detectors at the gates and pass cards restricting the circulation of students, educational institutions had come to resemble prisons. And that's where a growing number of students were heading, after failing out of schools that were set up to fail them. The move to militarize large school campuses represents a dangerous turn in American education, one that threatens to depersonalize the school experience and bring out the worst in the nation's most vulnerable children.

Many of the earliest European universities were designed to solidify social boundaries, not open them. The first universities, in Bologna and Paris, were part of the city, and students typically lodged with their families or with townspeople. As universities developed, local entrepreneurs built halls and hostels for the students. But many school administrators disliked this arrangement, as did the aristocratic parents of university students, and universities began to erect gates and walls to separate their sacred grounds from the profane communities in which they had been embedded. New College, at Oxford, built the first enclosed quadrangle that housed all university functions in 1379. Many schools followed, giving rise to the model of the college as a segregated residential community as well as an educational institution where students studied, largely in private rooms, under the direct tutelage of a learned instructor. There were several reasons for the use of the enclosed quadrangle in British colleges, from efficient land use in crowded towns to the influential tradition of the cloistered monastery. The walls that divided the college campus from the town served defensive purposes, protecting students and faculty not only from occasional wars and local conflicts but also from townspeople.

The early histories of Oxford and Cambridge abound in incidents of town-gown antagonism leading to fighting, warfare, and murder on both sides. The ability to close off a college at a few gate-points also gave college authorities the advantage of greater control over the students, a concern that was a major factor in the growth of the collegiate system. By 1410, Oxford required all students to live in colleges rather than in the town, and that policy remains intact, albeit only for freshmen, today.

American universities rarely built the kind of high walls that protected colleges at Oxford and Cambridge from the communities around them, but many schools, particularly those in cities, have buttressed their exclusive

admissions standards with elaborate physical and organizational systems that separate students and faculty from neighboring people and places perceived as dangerous. Today, large campus security operations reinforce these perceptions at universities throughout the country, and make the distinction between insiders and outsiders especially sharp. Conventionally, college administrators and city planners think of “town-gown” divisions as especially bad for residents, not students, because they’re the ones excluded from campus amenities and stuck dealing with a raucous population of young people who haven’t learned to be good neighbors. But universities that cut themselves off from surrounding communities also hurt students, giving them a false sense of superiority and depriving them of opportunities to learn from their neighbors and develop the civic skills that they—and all of us—urgently need.

Partnering with the local community is more complicated at the University of Chicago, an affluent and prestigious school with a long history of excluding its African American neighbors. Despite a rhetorical commitment to liberalism and tolerance, during the 1950s the university’s leaders established a fund they could use for “area protection” against what the former director of community interest called “negro invasion.” The university president incentivized the board of trustees to support this initiative by taking members on a bus tour of “typical colored neighborhoods,” which was designed to provoke anxieties about what would happen in Hyde Park if the university didn’t acquire more real estate in the area surrounding the school. The scheme worked, as the trustees donated \$4.5 million to a fund that would, “buy, control, and rebuild our neighborhood.” Substantial as it was, the fund proved woefully inadequate to secure the area around campus from the crime that pervaded Chicago’s postindustrial ghettos in the 1970s and 1980s. By the 1990s, university leaders had largely given up their efforts to control adjacent real estate.

They invested in policing instead of property, a move made possible by the Illinois Private College Campus Police Act of 1992, which gave universities in high-crime areas all the legal powers of a police force but few of the public reporting obligations. Within a few years the university had built one of the nation’s largest private security forces, and it made sure all prospective and entering students knew how well they would be protected once they arrived on campus. But only if they stayed on campus: although the university’s officers had jurisdiction to patrol off-campus, former students report that school officials advised them not to cross into the black neighborhoods around them, including Woodlawn, Washington Park, South Shore, Kenwood, and Oakland, because they’d be targets of crime. As compensation, the University of Chicago invested heavily in its own, internal

social infrastructure: libraries, bookstores, cafés, art museums, theaters, and athletic facilities. It assured students that everything they needed was right on campus—or, if they felt adventurous, in the wealthy neighborhoods far to the north.

In 2015, a historically unprecedented increase in the number of white Americans dying in middle age was identified. This was due largely to fatalities from drug and alcohol abuse as well as suicide—deaths of despair. The study argued that these fatalities were tied to large-scale economic and social changes. In addition to facing a decline in job opportunities, white people with little education were experiencing a loss of traditional rituals and social institutions that had long served as sources of support. Marriage rates are down. Divorce remains common. Families are fragmented. Local government agencies are strapped for resources. Libraries and childcare centers have fewer open hours. Churches are scrambling to meet new challenges and demands.

“These changes left people with less structure when they came to choose their careers, their religion, and the nature of their family lives. When such choices succeed, they are liberating; when they fail, the individual can only hold himself or herself responsible. In the worst cases of failure, this is a Durkheim-like recipe for suicide.”

While restoring a broken social infrastructure is a critical long-term project, many cities and towns in the United States are asking what they can do right now to reduce the rate of overdose deaths. To answer this question, it's worth looking at another country that once faced a similar problem: Switzerland. Beginning in the 1970s, Switzerland saw an alarming number of its citizens become addicted to heroin. Initially, the Swiss responded to this in the same way the United States has traditionally responded to drug use, with tougher law enforcement. Courts issued stiffer sentences for drug users and dealers, while police dispersed people who took drugs in public places. But the problem only got worse. In addition to seeing more young people take up the needle, the country also witnessed a frightening increase in property crime, HIV infection, and overdose deaths. In 1987, increasingly desperate, authorities in Zurich tried the opposite approach. Instead of facing harsh penalties, addicts would now be allowed to use drugs openly, but only in a specific area of the city, Platzspitz Park. Fans of the television series *The Wire* will recognize this strategy as similar to the one deployed in Baltimore's fictional “Hamsterdam.”

As in Hamsterdam, this approach did little to stem the problem of addiction and created intense spillover effects, such as increased crime in areas

around the park. Meanwhile, legalization did little to stem the number of overdoses. Switzerland is not an especially progressive country. Swiss women, for example, only gained the right to vote in 1971. Stymied, authorities struck on a plan that was both radical and full of common sense. What was killing people, authorities realized, was not heroin use per se, but using heroin alone, under unsafe conditions. The Swiss government ultimately decided that the best way to protect users was to give them the drug. However, the heroin would be administered only in clinics where the addicts could receive proper supervision, and the drugs would be pharmaceutical-grade, free of any unknown and potentially fatal additives. This final point is perhaps the most key, as much of the problem related to drugs comes from impurities or inability to access (whether no supply or you simply cannot afford it). Doses were large enough to allow users to function and not suffer withdrawal, but modest enough to prevent them from getting too high. The program was run like any other medical facility and the users treated like any other patients. People even had to purchase health insurance to participate.

The Swiss found that once heroin users didn't have to worry about how they'd get their drug, they were often able to take on the larger problems that had led to their addiction in the first place. Social workers were able to build trust with users, helping them get jobs and counseling. By reducing the stigma of heroin, and creating physical places where drug users and counselors could meet together without the threat of punishment, the Swiss government was able to reintegrate its users back into society.

In all cases, recovering from substance abuse requires the support of a community, be it family, friends, therapists, or twelve-step groups. Addiction experts refer to these kinds of social connections as elements of "recovery capital." The heroin maintenance zones that the Swiss government established were not merely sites for drug injection. They were social infrastructures, places where addicts, counselors, and medical providers interacted regularly, under conditions that, though not exactly salubrious, were as healthy as possible. Between 1991 and 2004, overdose deaths in Switzerland dropped by 50 percent. While many still overdosed at the supervised injection sites, not a single person died. Meanwhile, fewer people were choosing to start taking heroin. The number of new users dropped 80 percent between 1990 and 2002; in turn, HIV rates plummeted. The program also had positive effects for non-users. Most notably, the country saw a 90 percent drop in heroin-related property crimes. In a national referendum held in 2008, Swiss citizens overwhelmingly voted to maintain their public health approach to opioid addiction. It's now part of national law.

It's an international model of effective, if still controversial, social infrastructure, and one with a proven record of saving lives. Australia and the

United Kingdom have run successful experiments with safe injection clinics. In 2014, Vancouver, Canada, an early leader in clean needle distribution programs, became the first North American city to open a fully legal heroin and methadone maintenance facility. The program made an immediate impact. Within two years of opening, the rate of fatal overdoses in the immediate vicinity of the clinic dropped by 35 percent; in the rest of the city, deaths dropped less than 10 percent. In Vancouver, as elsewhere, opponents of the legal injection sites predicted that they would encourage more people to try heroin, yet subsequent studies have shown that this hasn't happened. As in Switzerland, cordoning off a safe yet tame zone for users made the drug less appealing, and there are far fewer new users there than in comparable places.

The early twentieth century saw great changes in health and safety brought about through collaborations that today would be viewed as odd or unusual—between physicians and city planners, sanitarians and civil engineers. Episodically treating small numbers of people, while ignoring the obviously unhealthy social and environmental surroundings within which people live, has stunted our treatments and moved the health of the nation forward at too slow a pace. Today, as the world grows more urban and unequal, there's an urgent need to build healthier places, and social infrastructure is the key.

One recent paper draws on oral histories, childhood autobiographies, and archival research to show how access to public space varied among three generations of New Yorkers: those born in the 1930s and 1940s, the 1970s, and the 2000s. For those born in the 1930s and 1940s, the neighborhood sidewalk was the main play area. Victoria, an Italian American who grew up in the East Harlem/Yorkville neighborhood in the 1940s, recounts that on her street:

“The whole block was full of kids. Almost all the activity was done outdoors. You went outside and on the sidewalk you drew [with chalk] a potsie, those little squares where you used to play jacks, [and] bottle tops.”

Mothers allowed their children to play late into the evening as they knew neighbors were keeping a watchful eye on their sons and daughters. Parents could also keep an eye on their children with great ease by peering out their tenement windows. There were risks involved in outdoor play, from benign conflicts with other kids or adults to, more seriously, getting involved in a gang or being hit by a car, and reform organizations lobbied for the city to develop contained play spaces, like playgrounds, to better protect kids. But

bad things rarely happened to kids like Victoria. The sidewalks were their safe haven, the place where they grew up. Most New Yorkers born in the 1970s had a different experience.

By then, rising crime made parents reluctant to let their children roam freely on the streets and sidewalks, and supervised areas, including playgrounds and athletic fields, had become more popular. But when the fiscal crisis hit, the city cut funds to parks and playgrounds. Professional supervisors disappeared. Conditions deteriorated. Gangs and drug dealers took charge of public spaces. Reggie, an African American who grew up in East Harlem/Yorkville around that time, tells that racial conflict was common, and black and Latino children often found themselves targeted in places that lacked an adult presence. As a teenager, he still wandered the area with friends, going to outdoor concerts (“open jams”) in parks and playgrounds and building friendships through music and dance. But for younger children, these areas were gradually becoming off-limits, particularly after dark. A rising number of parents and caretakers were retreating from outdoor public spaces and forcing their children to hunker down indoors instead. By the 2000s, children’s access to outdoor public spaces was even more restricted.

Noel, a thirteen-year-old Italian American who is growing up in the Isaacs Houses, the same complex where Reggie lived, says that as a young child her parents let her play in the playground within the Isaacs, but forbid her from going to other local parks. Noel’s parents are extremely protective of her and invest an enormous amount of energy monitoring her everyday life. Occasionally they let her join friends for movies or window-shopping on Eighty-Sixth Street, a more affluent commercial corridor near her neighborhood. And occasionally she goes to a professionally managed after-school or summer program in one of the commercial organizations that have become so common in middle-class and affluent communities today. But Noel says that her mobility is restricted, and as a result she spends most of her free time going where most people her age go.

“I’m always on the Internet, instant messaging. . . not as much email, but instant messaging. The television is always on, and the computer is always on too. I text message on my cell phone.”

It’s social behavior, to be sure, but it seldom involves physical activity or spending time in green spaces outdoors. It may well protect Noel from violence, but it exposes her to risks of other health hazards, from obesity to stress to attention deficit disorders, that were far less prevalent in previous generations. Noel’s parents are choosing to keep her out of their neighborhood’s degraded public play spaces, but by some measures they

and their fellow New Yorkers are better off than other American families, because at least they have a local option. In the United States, the United Kingdom, and most other industrial countries, access to nature and outdoor play areas varies by social class, sometimes dramatically. In Los Angeles, for instance, where good weather should entice children outdoors in all seasons, nearly half of all low-income households lack immediate access to a park or playground. And many who do live near an outdoor play space are so close to a freeway that they stay indoors to avoid the dirty air.

Before the oligarchs concluded that the study of civics was detrimental to the longevity of their rule, every elementary student learned about checks-and-balances. Theoretically, the legislative, executive, and judicial branches of government were supposed to hold each other in balance. It was a reassuring fairy tale for the average citizen, but it never served the average citizen. This system of checks-and-balances merely held one oligarchic faction in check with the other. Nothing in the arrangement guaranteed that the government would be responsive to the ordinary peoples' needs.

When oligarchs are the only ones who sit in Congress, occupy the Oval Office, and wield the judge's gavel, then it is a government of, by, and for the oligarchs, responsive only to their elite interests not to ours. This has been the case since the earliest days of the formation of the United States. The Founding Fathers must have suspected that the slogan, 'a government of, by, and for rich men' wouldn't produce the revolutionary fervor they needed to overthrow King George's colonial rule. The phrase "of, by, and for the people" sounded far more inspiring to the thousands who waged struggle with mass acts of noncooperation, importation boycotts, civil disobedience of unjust British laws, and collective refusal to pay the Stamp Tax. Many more fought and died for an illusion of inclusion in the definition of "We, the People." The history of the United States has been one long struggle for inclusion that continues to this very day.

If we learn nothing else from our history, we should know this: the tools of struggle should never lose their edge, gather dust, or fall from active use among the people. To gain—and maintain—a true government of, by, and for the people, all of us must grasp the considerable power of collective non-cooperation, disruption, and intervention. We must do so with regularity and with ferocity.

Currently, the US populace views any but the most nonviolent of actions as something unusual and out-of-the-ordinary. 'Activists' are distinct from citizens. But if boycotts, strikes, walk-outs, and shut-downs became as common as calling your senator or signing a petition, we would rapidly and effectively win major social justice advances. Such struggle is not about pleading with politicians to do the right thing. It is not about voting the

‘right’ people into power to do the right thing. It is about grasping the ability to non-cooperate, disrupt, and intervene in the activity of a society in pursuit of tangible changes for social justice.

These struggles empower the people to hold all aspects of their society accountable. Such action’s capacity to withdraw support or disrupt systems of oppression and intervene in injustice, can target any institution or business, social practice or group, political party or policy, cultural behaviors or beliefs.

Every meaningful advance for equality and justice in our nation’s history, beginning with our struggle for independence, has won because it mobilized mass numbers of people to cease their participation in life-as-usual. If we wish to see meaningful changes in our lifetime, we, too, must find the willingness to pick up the tools of struggle and construct the world of our dreams.

Central Planning Doesn't Work

Consider the fact that competitive institutions like corporations and militaries are in many ways internally collectivist: They constantly emphasize teamwork, trust, and shared culture.

Corporations and their lobbyists write the laws and the legislation, creating a two-tiered legal system in which poverty is criminalized and we are controlled, taxed, and punished. The corporate oligarchs, however, live in a world where monopoly, fraud, and other financial wrongdoing are legal or rarely punished and taxes are minimal or nonexistent. Among the population, only a tiny percentage—most of whom come from inherited wealth and have been groomed in elitist, plutocratic universities and institutions—dominate the corporate hierarchy. Public discourse, controlled by corporate power, ignores this one-sided power arrangement. It cannot address a problem it refuses to acknowledge. Subjugation is freedom.

Some call this corporate economic system 'communist'—that's communist with a small 'c'—because these private governments own all the non-labor means of production in the society it governs. It organizes production by means of central planning. The form of the government is a dictatorship. In some cases, the dictator is appointed by an oligarchy. In other cases, the dictator is self-appointed. Private governments, their sanctioning powers lacking the state's ability to imprison or execute (although they often have internal security forces with the power to arrest), ensure compliance by using wholesale surveillance and the threats of demotion and exile, plus the potential rewards of salary raises and promotions. Also, there usually is a steady barrage of company propaganda.

If only Walmart's operational efficiency, its logistical genius, its architecture of agile economic planning could be captured and transformed by those who aim toward a more egalitarian, liberatory society!

For many progressives, the story of logistics and planning seems musty and old. Are there not fresh arguments required to convince that barricades must be mounted, forgotten stories of wretched oppression yet to be recounted? It is true that there is little drama or romance to the story of planning—few riveting tales of selfless heroism, brave suffering, or righteous fury (although there are more than a few episodes of heartbreaking defeat, failure, and ruin). But in essence, the story of injustice and its correction is a chronicle of efforts across all time to reduce inequality of all types: of haves and have-nots, of who works and who rests, of who has a say and who does not. And inequality is, in the end, a question of unfair allocation of things themselves or the result of such unfair allocation. Put simply, a poor

person has not been allocated the stuff (or the ability to buy it) that a rich person has. The needs of the rich and poor are met and unmet in wildly different ways: the potential to fully articulate their humanity is cut off at the root for some, while others are granted space to flourish. Inequality limits what a person, and indeed society, could otherwise do; it limits our freedom.

Past generations have fought to expand the realm of freedom—to ensure all adult humans have the same rights and to ensure that any new capabilities delivered through technological advance are to be made available to all. And if we are to continue this battle to correct the titanic, manifest unfairness of the way things are, we must therefore wage a struggle over which method for the allocation of things we want as a society. So when we ask whether another world is possible, we are also asking: Is there an alternate method to allocate things? How would we distribute things differently? And who would decide how they are distributed? Could the plans that capitalists use every day to get goods and services into the hands of those who can pay for them be transformed to instead ensure that what we produce gets to those who need it most? And in transforming the way we distribute stuff, could we also start to transform everything else about the economy—from what stuff we make and how, to who works and for how long? Once we have identified alternative ways to distribute things, the planning everywhere around us may telegraph aspects of another mode of production. More urgently, such extant planning may also suggest features of transitional stages on the way to a more all-encompassing transformation of our economy.

For a mode of production to be called capitalism, it is not sufficient for a free market to exist; there are, after all, other essential features of capitalism, including exploitation in the workplace and the need to sell one's labor in order to survive. Nevertheless, the free(-ish) market is a necessary condition for capitalism—one that, as a method of allocation, leads to growing inequality via disparities in the distribution of income. Market interactions inevitably produce winners and losers, leading to concentrations of wealth. Over time, these disparities grow, a product of these same market interactions. This perfect free market only exists in the minds of its most ardent defenders and within the pages of introductory economics textbooks. Real markets are a far cry from this idealized fairy tale: companies regularly collude to keep out competitors, large corporations constantly lobby for government subsidies, and it is the norm that a few big players dominate entire product categories and set prices. One market in particular—the labor market—needed centuries of coercion and dispossession to turn peasants and farmers into workers willing to sell their labor for a wage.

The market's inherently competitive mechanisms catalyze, take advan-

tage of, and exacerbate a range of inegalitarian prejudices based on identity (race, gender, sexuality, and so on); lead to disruption of ecosystem services upon which humans depend; and drive militarist rivalry between nations that precipitates colonization, gives rise to imperialism, and ultimately triggers wars. While the real world is often one of messy disequilibrium, of prices created by fiat rather than emerging from the competitive ether—and one configured by capitalists who plan—it remains one where markets determine much of our economic, and thereby social, life.

When we say we want an equal society, what we're fighting for is democratic planning. There is no machine that can simply be taken over, run by new operators but otherwise left unchanged; but there is a foundation of planning that a more just society could surely take up and make its own. This is not so much a story about a future society, but one about our own. We plan. And it works.

In the seminal 1920 essay “Economic Calculation in the Socialist Commonwealth,” Mises went beyond what by this period was already a long-standing ethical argument against socialism: that under such a system, there would be no incentive to work and therefore no drive toward excellence. In this short text, Mises instead posed the following questions:

- In any economy larger than the primitive family level, how could socialist planning boards know which products to produce, how much of each should be produced at each stage, and which raw materials should be used and how much of them?
- Where should production be located, and which production process was most efficient?
- How would they gather and calculate this vast array of information, and how could it then be retransmitted back to all actors in the economy?

The answer, he said, is that the mammoth scale of information needed—for producers, consumers, and every actor in between, and for every stage and location of production of the multitude of products needed in society—is beyond the capacity of such planning boards. No human process could possibly gather all the necessary data, assess it in real time, and produce plans that accurately describe supply and demand across all sectors. Therefore, any economy the size of an entire country that tried to replace the myriad decisions from the multitude of sovereign consumers with the plans of bureaucrats working from incorrigibly flawed data would regularly produce vast, chasm-like mismatches between what is demanded and what

is supplied. These inefficiencies would result in such social and economic barbarities—shortages, starvation, frustration, and chaos—that even if one accepts the inevitability of inequalities and attendant myriad other horrors of capitalism, the market will still appear benign by comparison.

Meanwhile, Mises argued that the extraordinarily simple mechanism of prices in the market, reflecting the supply and demand of resources, already contains all this information. Every aspect of production—from the cost of all inputs at all times, to the locations of inputs and products, and the changing demands and taste of purchasers—is implicitly captured by price. But if prices in the market are so much more uncomplicated, effortless, and manageable, then why don't we just stick with them? Mises's argument in his 1920 essay, later developed through a series of books, is described to this day by his acolytes as his masterpiece. And not without reason: it is perhaps the strongest argument ever mounted against the idea of socialism. How, indeed, could we replace prices with planning boards? And isn't socialism supposed to be direct rule by the workers, rather than a replacement of unelected bosses with remote bureaucrats? If centralized by bureaucrats, how could all that information be gathered? And if decentralized, how could all those millions (and globally, billions) of workers democratically coordinate production decisions?

Some insist that prices in the market, as descriptors for behavior in an economy, are no less corrupted by this loss of fidelity because they fail to capture sufficient information on the material circumstances of citizens and fail to describe adequately all the costs or benefits of actions. In a system with market-based provision of healthcare, for instance, price does not describe information on inability to access healthcare, just as price does not reflect the impact of greenhouse gas emissions on the average temperature of the planet.

There is much more to the calculation debate, and we'll briefly outline some of the additional mathematical and computational aspects later on, but for now this theoretical standoff should suffice. It is enough to know that as a result of this impasse, depending on our political persuasions, we have opted either for the information imperfections of the market, or for the information imperfections of planning, without ever resolving the debate. The stalemate could even be tweeted in less than 140 characters:

“What about data imperfections leading to shortages?”

“Oh yeah? Well what about data imperfections leading to injustices?”

Thus we are stuck. Or so it has seemed for a long time.

If something works in theory but not in practice, then there is usually something wrong with the theory. But it is equally true that if something in theory does not work, but in practice it does, then again, something must be wrong with the theory. And here is where the villainous Walmart enters our story. Walmart is perhaps the best evidence we have that while planning appears not to work in Mises's theory, it certainly does in practice. And then some. Founder Sam Walton opened his first store, Wal-Mart Discount City, on July 2, 1962, in the non-city of Rogers, Arkansas, population 5,700. From that clichédly humble beginning, Walmart has gone on to become the largest company in the world, enjoying eye-watering, People's Republic of China-sized cumulative average growth rates of eight percent during its five-and-a-half decades. Today, it employs more workers than any other private firm; if we include state enterprises in our ranking, it is the world's third-largest employer after the US Department of Defense and the People's Liberation Army. If it were a country—let's call it the People's Republic of Walmart—its economy would be roughly the size of a Sweden or a Switzerland. Using the 2015 World Bank country-by-country comparison of purchasing-power parity GDP, we could place it as the 38th largest economy in the world. Yet while the company operates within the market, internally, as in any other firm, everything is planned. There is no internal market. The different departments, stores, trucks, and suppliers do not compete against each other in a market; everything is coordinated. Walmart is not merely a planned economy, but a planned economy on the scale of the USSR smack in the middle of the Cold War. In 1970, Soviet GDP clocked in at about \$800 billion in today's money, then the second-largest economy in the world; Walmart's 2017 revenue was \$485 billion.

Yet if Mises and friends were right, then Walmart should not exist. The firm should long since have hit their wall of too many calculations to make. Moreover, Walmart is not unique; there are hundreds of multinational companies whose size is on the same order of magnitude as Sam Walton's behemoth, and they too are all, at least internally, planned economies.

“Continuous replenishment” is a bit of a misnomer, as the system actually provides merely very frequent restocking (from the supplier to the distributor and thence the retailer), in which the decision on the amount and the timing of replenishment lies with the supplier, not the retailer. You might be asking: how is this an innovation, and why would it make such a difference? You might also be asking: Why does it now seem like I'm reading a god-awful, capitalism-fellating airport business book? Suck it up. Socialism is all about logistics, comrade. The technique, a type of vendor-managed inventory, works to minimize what businesses call the “bullwhip effect,” the free market's kissing cousin to Stalinism's shortage problem.

First identified in 1961, the bullwhip effect describes the phenomenon of increasingly wild swings in mismatched inventories against product demand the further one moves along the supply chain toward the producer, ultimately extending to the company's extraction of raw materials. Therein, any slight change in customer demand reveals a discord between what the store has and what the customers want, meaning there is either too much stock or too little.

To illustrate the bullwhip effect, let's consider the 'too-little' case (although the phenomenon works identically in either scenario). The store readjusts its orders from the distributor to meet the increase in customer demand. But by this time, the distributor has already bought a certain amount of supply from the wholesaler, and so it has to readjust its own orders from the wholesaler—and so on, through to the manufacturer and the producer of the raw materials. Because customer demand is often fickle and its prediction involves some inaccuracy, businesses will carry an inventory buffer called "safety stock." Moving up the chain, each node will observe greater fluctuations, and thus greater requirements for safety stock.

One analysis performed in the 1990s assessed the scale of the problem to be considerable: a fluctuation at the customer end of just five percent (up or down) will be interpreted by other supply chain participants as a shift in demand of up to 40 percent. Just like the wave that travels along an actual bullwhip following a small flick of the wrist, a small change in behavior at one end results in massive swings at the other. Data in the system loses its fidelity to real-world demand, and the further you move away from the consumer, the more unpredictable demand appears to be. This unpredictability in either direction is a major contributing factor to economic crisis as companies struggle (or fail) to cope with situations of overproduction, having produced much more than they predicted would be demanded and being unable to sell what they have produced above its cost. Insufficient stock can be just as disruptive as overstock, leading to panic buying, reduced trustworthiness by customers, contractual penalties, increased costs resulting from training and layoffs (due to unnecessary hiring and firing), and ultimately loss of contracts, which can sink a company.

While there is of course a great deal more to economic crisis than the bullwhip effect, the inefficiencies and failures produced by the bullwhip effect can be key causes, rippling throughout the system and producing instability in other sectors. Even with modest cases of the bullwhip effect, preventing such distortions can allow reduced inventory, reduced administration costs, and improved customer service and customer loyalty—"The product you want is right here, ma'am! No need to keep checking other stores! You can always trust us to have what you want. Make sure you come back to us first

next time!’—ultimately delivering greater profits.

But there’s a catch—a big one for those who defend the market as the optimal mechanism for allocation of resources: the bullwhip effect is, in principle, eliminated if all orders match demand perfectly for any period. And the greater the transparency of information throughout the supply chain, the closer this result comes to being achieved. Thus, planning, and above all, trust, openness, and cooperation along the supply chain—rather than competition—are fundamental to continuous replacement. This is not the kumbaya analysis of socialist writers; even the most hardhearted commerce researchers and company directors argue that a prerequisite of successful supply chain management is that all participants in the chain recognize that they all will gain more by cooperating as a trusting, information-sharing whole than they will as competitors. The seller, for example, is in effect telling the buyer how much he will buy. The retailer has to trust the supplier with restocking decisions. Manufacturers are responsible for managing inventories in Walmart’s warehouses. Walmart and its suppliers have to agree when promotions will happen and by how much, so that increased sales are recognized as an effect of a sale or marketing effort, and not necessarily as a big boost in demand. And all supply chain participants have to implement data-sharing technologies that allow for real-time flow of sales data, distribution center withdrawals and other logistical information so that everyone in the chain can rapidly make adjustments.

We hear a lot about how Walmart crushes suppliers into delivering at a particular price point, as the company is so vast that it is worth it from the supplier’s perspective to have the product stocked by the store. And this is true: Walmart engages in what it calls “strategic sourcing” to identify who can supply the behemoth at the volume and price needed. But once a supplier is in the club—or perhaps ‘in the club’ is the wrong phrasing; ‘once a supplier is assimilated by the Walmart-Borg’ might be better—there are significant advantages. One is that the company sets in place long-term, high-volume strategic partnerships with most suppliers. The resulting data transparency and cross-supply-chain planning decrease expenditures on merchandising, inventory, logistics, and transportation for all participants in the supply chain, not just for Walmart. While there are indeed financial transactions within the supply chain, resource allocation among Walmart’s vast network of global suppliers, warehouses, and retail stores is regularly described by business analysts as more akin to behaving like a single firm.

In the 1980s, the company began dealing directly with manufacturers to reduce the number of links within, and to more efficiently oversee, the supply chain. In 1995, Walmart further ramped up its cooperative supply chain approach under the moniker Collaborative Planning, Forecasting, and

Replenishment (CPFR), in which all nodes in the chain collaboratively synchronize their forecasts and activities. As technology has advanced, the company has used CPFR to further enhance supply chain cooperation, from being the first to implement company-wide use of universal product bar codes to its more troubled relationship with radio-frequency ID tagging. Its gargantuan, satellite-connected Retail Link database connects demand forecasts with suppliers and distributes real-time sales data from cash registers all along the supply chain. Analysts describe how stockage and manufacture is “pulled,” almost moment-to-moment, by the consumer, rather than “pushed” by the company onto shelves. All of this hints at how economic planning on a massive scale is being realized in practice with the assistance of technological advance, even as the wrangling of its infinities of data—according to Mises and his co-thinkers in the calculation debate—are supposed to be impossible to overcome.

It is no small irony that one of Walmart’s main competitors, the venerable, 120-plus-year-old Sears, Roebuck & Company, destroyed itself by embracing the exact opposite of Walmart’s galloping socialization of production and distribution: by instituting an internal market. The Sears Holdings Corporation reported losses of some \$2 billion in 2016, and some \$10.4 billion in total since 2011, the last year that the business turned a profit. In the spring of 2017, it was in the midst of closing another 150 stores, in addition to the 2,125 already shuttered since 2010—more than half its operation—and had publicly acknowledged “substantial doubt” that it would be able to keep any of its doors open for much longer. The stores that remain open, often behind boarded-up windows, have the doleful air of late-Soviet retail desolation: leaking ceilings, inoperative escalators, acres of empty shelves, and aisles shambolically strewn with abandoned cardboard boxes half-filled with merchandise. A solitary brand-new size-9 black sneaker lies lonesome and boxless on the ground, its partner neither on a shelf nor in a storeroom. Remaining employees have taken to hanging bedsheets as screens to hide derelict sections from customers.

The company has certainly suffered in the way that many other brick-and-mortar outlets have in the face of the challenge from discounters such as Walmart and from online retailers like Amazon. But the consensus among the business press and dozens of very bitter former executives is that the overriding cause of Sears’s malaise is the disastrous decision by the company’s chairman and CEO, Edward Lampert, to disaggregate the company’s different divisions into competing units: to create an internal market. From a capitalist perspective, the move appears to make sense. As business leaders never tire of telling us, the free market is the fount of all wealth in modern society. Competition between private companies is

the primary driver of innovation, productivity, and growth. Greed is good, per Gordon Gekko's oft-quoted imperative from Wall Street. So one can be excused for wondering why it is, if the market is indeed as powerfully efficient and productive as they say, that all companies did not long ago adopt the market as an internal model.

Lampert, libertarian and fan of the laissez-faire egotism of Russian-American novelist Ayn Rand, had made his way from working in warehouses as a teenager, via a spell with Goldman Sachs, to managing a \$15 billion hedge fund by the age of 41. The wunderkind was hailed as the Steve Jobs of the investment world. In 2003, the fund he managed, ESL Investments, took over the bankrupt discount retail chain Kmart (launched the same year as Walmart). A year later, he parlayed this into a \$12 billion buyout of a stagnating—but by no means troubled—Sears. At first, the familiar strategy of merciless, life-destroying post-acquisition cost-cutting and layoffs did manage to turn around the fortunes of the merged Kmart-Sears, now operating as Sears Holdings. But Lampert's big wheeze went well beyond the usual corporate raider tales of asset stripping, consolidation, and chopping-block use of operations as a vehicle to generate cash for investments elsewhere.

Lampert intended to use Sears as a grand free market experiment to show that the invisible hand would outperform the central planning typical of any firm. He radically restructured operations, splitting the company into thirty, and later forty, different units that were to compete against each other. Instead of cooperating, as in a normal firm, divisions such as apparel, tools, appliances, human resources, IT, and branding were now in essence to operate as autonomous businesses, each with their own president, board of directors, chief marketing officer and statement of profit or loss. Sounds like something Mayor Pete and his McKinsey buddies would approve of.

“If the company's leaders were told to act selfishly, he argued, they would run their divisions in a rational manner, boosting overall performance.”

He also believed that the new structure, called Sears Holdings Organization, Actions, and Responsibilities, or SOAR, would improve the quality of internal data, and in so doing that it would give the company an edge akin to statistician Paul Podesta's use of unconventional metrics for the Oakland Athletics baseball team. Lampert would go on to place Podesta on Sears's board of directors and hire Steven Levitt, coauthor of the pop neoliberal economics bestseller *Freakonomics*, as a consultant. Lampert was a laissez-faire true believer.

And so if the apparel division wanted to use the services of IT or human resources, they had to sign contracts with them, or alternately to

use outside contractors if it would improve the financial performance of the unit—regardless of whether it would improve the performance of the company as a whole. For instance, Sears's widely trusted appliance brand, Kenmore, was divided between the appliance division and the branding division. The former had to pay fees to the latter for any transaction. But selling non-Sears-branded appliances was more profitable to the appliances division, so they began to offer more prominent in-store placement to rivals of Kenmore products, undermining overall profitability. Its in-house tool brand, Craftsman—so ubiquitous an American trademark that it plays a pivotal role in a Neal Stephenson science fiction bestseller, *Seveneves*, 5,000 years in the future—refused to pay extra royalties to the in-house battery brand DieHard, so they went with an external provider, again indifferent to what this meant for the company's bottom line as a whole.

Executives would attach screen protectors to their laptops at meetings to prevent their colleagues from finding out what they were up to. Units would scrap over floor and shelf space for their products. Screaming matches between the chief marketing officers of the different divisions were common at meetings intended to agree on the content of the crucial weekly circular advertising specials. They would fight over key positioning, aiming to optimize their own unit's profits, even at another unit's expense, sometimes with grimly hilarious results. There were screwdrivers being advertised next to lingerie, and the sporting goods division succeeded in getting the Doodle Bug mini-bike for young boys placed on the cover of the Mothers' Day edition of the circular. As for different divisions swallowing lower profits, or losses, on discounted goods in order to attract customers for other items—forget about it.

One executive described the situation as “dysfunctionality at the highest level.” As profits collapsed, the divisions grew increasingly vicious toward each other, scrapping over what cash reserves remained. Squeezing profits still further was the duplication in labor, particularly with an increasingly top-heavy repetition of executive function by the now-competing units, which no longer had an interest in sharing costs for shared operations. With no company-wide interest in maintaining store infrastructure, something instead viewed as an externally imposed cost by each division, Sears's capital expenditure dwindled to less than one percent of revenue, a proportion much lower than that of most other retailers. Ultimately, the different units decided to simply take care of their own profits, the company as a whole be damned. One former executive described a culture of “warring tribes,” and an elimination of cooperation and collaboration. One business press wag described Lampert's regime as “running Sears like the Coliseum.” If there were any book to which the model conformed, it was less *Atlas Shrugged*

than it was *The Hunger Games*.

Thus, many who have abandoned ship describe the harebrained free market shenanigans of the man they call “Crazy Eddie” as a failed experiment for one reason above all else: the model kills cooperation.

“Organizations need a holistic strategy.”

Indeed they do. But is not society as a whole an organization? Is this lesson any less true for the global economy than it is for Sears? To take just one example: the continued combustion of coal, oil, and gas may be a disaster for our species as a whole, but so long as it remains profitable for some companies—those responsible for extracting and processing fossil fuels—these will continue to act in a way that serves their particular interests, the rest of society be damned.

In the face of all this evidence, Lampert is, however, unrepentant:

“Decentralized systems and structures work better than centralized ones because they produce better information over time. Clashes for resources are a product of competition and advocacy, things that were sorely lacking before and are lacking in socialist economies.”

The market economy is not only rife with planning, but with authoritarian planning that concentrates economic decision-making in the hands of wealth owners and keeps workers in line. Companies plan everything from how money is distributed between departments to the exact amount of time it should take to assemble a hamburger—and in every case, they plan which individual worker does which task, when, where, and how. When you're on the clock, what the boss says goes. Open nearly any introductory economics textbook, however, and the world appears as a nearly boundless realm of choice. Among the paeans to freedom and to the spontaneous efficiency of markets, few words even graze the everyday planning that goes on within the four walls of the firm. Fewer, still, name it as coercive. Planning under capitalism is about making people do things—without their input and not necessarily in their interest. At best, economists will bring up planning in order to ridicule it, failing, or refusing, to grasp its centrality even in a market system.

Hayek argued that markets—incomplete, permanently off tilt, full of fallible humans—do not just aggregate and calculate information. Markets are producers of information and knowledge. Even if market socialism allowed planners to calculate better and faster than did free markets, planning would ultimately still be impossible because planners would not have

the information created by market interactions to use in their calculations. Buying and selling may not generate technical and scientific knowledge, but it still creates all that knowledge of “time and place” that is instrumental to making efficient production and distribution decisions. Hayek argued that the problem for planners was not in the ‘how’—the equations to use—but in the ‘what’—the data that goes into the equations. The copious information planners need is unavailable before markets work their magic. Decentralization creates coordination: only the market can bring together the information that is normally isolated in the heads of different individuals. Hayek, however, was writing before the advent of “big data,” which is testing the limits of just how much granular information can be collected. It seems that he also wrote in blissful ignorance of Coase, who had shown just how flimsy the veneer of decentralized decision-making really is, even under capitalist markets.

Something incredible happened to some economists in the 1970s: some professors suddenly discovered human beings were not the equivalent of walking calculators. Alongside this revelation, many others among the most cherished beliefs of economics had been cast into potential doubt. Much of the entire mainstream economics project since the late nineteenth century had been built on the foundation of perfectly rational humans. Models of markets working together in seamless harmony, as well as arguments about the market system producing the best outcomes, relied on the pretty fantastical assumption that each of us have any and all information permanently at our fingertips.

Distinct from earlier mythology of a perfectly rational *Homo economicus*—nowhere to be found in reality, but for so long beloved by economists—the economics of information that Stiglitz helped launch started from the seemingly obvious idea that getting our hands on information—and using it—is usually costly, and sometimes impossible. An example economists love to use is the market for private health insurance. There is only so much an insurer can do to see if a person buying insurance is relatively healthy. Developing a better and better picture costs more and more. At some point, the costs prevent further information acquisition from making sense. In the same way, hiring a mechanic to take apart and inspect the engine of a used car to find out if it is a lemon can cost more than the car itself. Markets can fail: some people will end up overpaying for health insurance, while others will be uninsured. Your local sketchy used car dealership isn’t likely to be the first place you’d think of as a well-functioning market.

Beyond individual markets, Stiglitz and others were asking a bigger question: What if the entire economy was something of a used car dealership? Once enough examples of failing markets accumulate, the entire system’s

efficiency and justice can be called into doubt. In short, the economics of information ultimately challenges the argument that capitalism, despite its flaws, is the best of all possible worlds. However, rather than seeing information problems as a reason to explore collective, democratic decision-making alternatives that could bring people and information together, economists went to work making market theory work in spite of humanity's imperfections. Since the '70s, the economics of information has generated ever more ingenious ideas for incentivizing people or organizations to do things—all, of course, within the bounds of capitalist markets. People just need a little nudge.

We must debunk the crude story of the Tragedy of the Commons. Compile evidence of groups stewarding common resources and you will find that in many cases, the commons not only survived but thrived. Rather than being overrun by unthinking self-interest, shared resources were in reality often governed by complex sets of social rules established over time. Consider shared pasture land in Swiss alpine villages—it has been preserved for common use for over 500 years. Based on this and other case studies, we can identify conditions that helped protect common resources—among them, participation in decision-making by users of the resources, the capacity for monitoring usage, meaningful social sanctions and conflict-resolution mechanisms. Findings that question the tragedy of the commons, just like the idea of planning itself, can be initially jarring. It is an implicit belief of our age that the only real incentives are monetary ones—that despotism is a necessary part of work, and that it is largely out of fear of losing their incomes that people work toward common goals. However, this is not human reality but capitalist reality. While there will always be work that needs doing, there are many ways to organize that work—to plan it and to ensure that it is done. In practice, the commons need not be tragic.

Amazon is a master planner. It is these sorts of logistical and algorithmic innovations that give the lie to the hoary free market argument that even if planning can deliver the big stuff like steel foundries and railways and healthcare, it would stumble at the first hurdle of planning for consumer items. Amazon offers techniques of production and distribution that are just waiting to be seized and repurposed.

To be clear, Amazon's planning methods are not complete solutions to optimization problems that might take the lifetime of the universe to solve, but instead simply best approximations to get around exploding mathematical complexity. Yet Amazon still chooses to plan rather than leave optimization up to price signals from the market. Amazon's engineers break down problems into smaller pieces, simplifying them or finding other ways of giving a computer a chance at solving them in seconds, rather than

eons. What Amazon looks for is traction; the aim is to make problems tractable rather than to solve them with absolute precision.

Take the problem of shipping orders at the lowest cost. Even precisely answering the seemingly simple question of finding the lowest cost shipping method for a day's worth of orders can quickly grow out of hand. There is no single best way to ship one order out of thousands or millions shipped on a given day, because each order's cost depends on all the others. Will the plane from the UPS Worldport hub in Louisville, Kentucky, to Phoenix be full? Did your neighbor down the street order her electric toothbrush with express shipping, or can it be delivered with your book order tomorrow? The complexity ratchets up still further when Amazon considers not only all the possible alternative routes—which it controls—but also adjusts for the possibility of random events such as severe weather and tries to predict the next day's orders. This order assignment optimization problem has hundreds of millions of variables, and no easy solution. The problem is so complex that there are not even approximations that can take every aspect of the problem into account. But despite such problems, the planning process within Amazon does not fall apart. While Amazon may depend on horrible working conditions, low taxes, and poor wages, it nevertheless functions.

The planning problems faced by individual corporations under capitalism have approximate, 'good enough' solutions. Planning exists on a wide scale within the black box of the corporation—even if it is 'good enough' rather than perfect. That's the trick: to find the best possible, even if partial, approximations. Amazon's modelers work to bring intractably complex problems down to size, to build plans that neither stretch into infinite time, nor respond to all the possible random events that could happen at every step, but that simply work. This means coming as close as possible to the true answer of a planning question within a realistic time frame and with the use of available computing power. When it is impossible to use an "algorithm of algorithms" to mechanically find the algorithm that best approximates the original problem, creativity then comes into play.

The focal points of Amazon's distribution network are its warehouses, which the company calls "fulfillment centers." These usually take up football fields' worth of floor space jammed with shelving units. Amazon uses a peculiar form of organization called "chaotic storage," in which goods are not actually organized: there is no section for books or subsection for mystery fiction. Everything is jumbled together. You can find a children's book sharing a bin or shelf with a sex toy, caviar next to dog kibble. Once again, powerful planning is what allows Amazon to save on what turns out to be needless warehouse organization. Every item that enters a fulfillment center gets a unique barcode. Once inside the warehouse, items go in bins, each

of which also has a unique code. Amazon's software tracks both the items and the bins as they move through the warehouse. The software always knows which bin an item is in and where that bin is. Because items can always be found easily, deliveries from suppliers can be unloaded where it is convenient, rather than methodically organized and reorganized.

Amazon's chaotic storage could be a metaphor for the free market system: at first glance, it seems that the chaos organizes itself. Orders and packages zoom through the system and customers get what they want. But as with the free market, upon closer inspection we see thickets of deliberative planning at every step. Highly refined IT systems make sense of the chaotic storage, track items from the moment they arrive at a warehouse to the moment they leave, and make sure everything falls seemingly supernaturally into place. Everything ordered, coordinated, planned and not a market in sight to perform any of these billions of allocation decisions. Planning is also present in the most minute details of a warehouse worker's day. Handheld scanning devices tell workers where to go to pick items for orders. Workers are appendages of machines that lay out precisely which routes to follow between shelves and how long they should take.

“We are machines, we are robots, we plug our scanner in, we're holding it, but we might as well be plugging it into ourselves.”

But, Amazon's top operations managers determined that its warehouses were still too inefficient, and so they themselves went shopping for something better. In 2012 Amazon bought Kiva Systems, a robotics firm, and it now uses robots to put its entire shelving system into motion. Amazon's updated, even more automated fulfillment centers now feature shelves that move and humans who stand in place—the opposite of what a warehouse normally looks like. Flat, Roomba-like robots rove the warehouse floor along designated pathways. They can lift entire shelving units just off the ground and maneuver them along the same pathways to “picking stations.” These are small designated areas where human order pickers stand, taking items from storage bins and putting them into order bins as shelving units come and go. The social, physical, and mental cost of a machine for delivering the right things to the right people ultimately falls on the workers who make the machine hum—regardless of whether workers are piloted around a maze of shelves by a handheld scanner or pick orders in place while robots whiz to and fro toward them. The boosters at Wired magazine are in awe of the subjugation of the Chaplins in this twenty-first-century *Modern Times*:

“The packing stations are a whirl of activity where algorithms test human endurance.”

With the help of robots, the average time to fill an order in a warehouse automated by Kiva technology has plummeted from ninety minutes down to fifteen. Working conditions, however, haven't budged: the work remains as dull and draining as ever, warehouses remain hot, and the pace of work can be absurdly fast, regardless of the level of automation. While workers in automated warehouses stand all day and try to keep up with the robots zooming by, workers in the non-automated warehouses can expect to walk nearly double the distance on a daily shift of a typical mail carrier. Even small things like distances to break rooms can be an obstacle—sometimes so long that going both ways can take up most of a break.

Three challenges should give us pause before even beginning to call the riddle of democratic planning solved. First, there is large-scale technical feasibility. The difficulty of planning and optimizing even the isolated task of delivering Amazon's packages demonstrates that designing systems for economy-wide planning will be anything but trivial. The algorithms that power everything from Amazon's recommendation system to Google's search engine are still in their infancy—they are relatively simplistic, making best-estimate guesses, and are prone to failure. Algorithms run into systemic problems, for example with working class and poor people who more frequently use shared devices to shop or non-English speakers, where their capacity for reading nuance is limited. We'll have to storm both the barricades and the optimization problems.

Second, the planning done by Amazon and others still relies heavily on prices in interactions that take place beyond the borders of the firm itself. Amazon purchases its inputs—from the multitude of items it stocks, to the warehouse shelves they sit on, to the servers that run its database—on a market; consumers, meanwhile, also take into account the relative costs of items when deciding whether to add them to their virtual carts. Beyond the confines of the firm, a market system continues to operate. This means that it's not simply a matter of repurposing existing technologies, lopping off the bosses and otherwise keeping everything the same. Even though there is market-less planning within corporations, it is a form of hierarchical, undemocratic planning that is very much necessary to survive and thrive in a market. Many elements of this planning apparatus, their very form and purpose, are conditioned by that undemocratic hierarchy. A democratic planning system built from the ground up would look very different.

To catch a possible glimpse, even foreshadowing, of what a market-less world might look like, compare Amazon's book section to an online

public library catalog. A library catalog also contains a vast, searchable, interconnected array of books—but not a single price. And it should be possible to harness far more information than is currently contained in a library catalog: for instance, how long people spend looking at a book; with an ebook how many of its pages they actually read; whether they click to see if it is available in their neighborhood; whether they are willing to place a hold (and, for instance, to do so even if there are ten others in the queue in front of them); and what path they follow through the online catalog. The example of an expanded library catalog shows that we could build not only recommendation tools, but also models of interests, demands, and needs that are independent of prices.

But, the problems with the above should be obvious by now. Should we simply decide to push for that change and little else we would have built a vast information database which could be used to oppress. While the big data collected and processed by Amazon is precisely the kind of tool that would aid in overcoming these challenges of large-scale economic calculation—and indeed it is already being used in this way by the Amazons and Walmarts (never mind the Facebooks and Googles) of the world—we have to recognize that alongside the staggering freedom-enhancing potential of the massive data sets held by both corporations and states, there also lies a staggering capacity for freedom restriction. The story of Walmart's major rival Target sending deals on diapers and baby food to several expectant mothers who did not yet themselves know they were pregnant, based on data mined on individual spending patterns, seems almost quaint today. Now, we are only a single Google search for 'poor sleep' away from months of bombardment by mattress ads on every social media network to which one belongs. There are more insidious examples: in 2012, the short-lived "Girls Around Me" app used a mash-up of geolocation and social media data to allow individuals to find out all kinds of personal details about women in their vicinity who had used Facebook or Foursquare's "check-in" feature.

Beyond the private sector, states across the world are also increasingly using and misusing big data. Police departments across the United States have begun to experiment with something called "predictive policing" to devise methods for predicting offenders, victims, identities, and locations of crimes. It is the arrival of "pre-crime" from the pages of Philip K. Dick's *Minority Report* into the real world. Similarly, China's "Integrated Joint Operations Platform" combines data from multiple sources, including online tracking and facial recognition-enabled CCTV cameras, as well as health, legal, and banking records, in order to flag suspected political dissidents. In Xinjiang, a disputed territory that is home to a long-standing conflict between the Han Chinese majority and the Muslim Uighur minority, suspects are

investigated, visited by the police, arbitrarily detained without charge or trial, and even sent to “political education centers.” Human rights campaigners worry that people in Xinjiang are unable to resist or challenge this level of technological policing. And, of course, we have the most recent global example of the Wuhan Flu panic, resulting in military-grade surveillance, combined with private data sets, being used to track the movements of entire populations under the guise of public health and safety. And all this is planning, too.

There are those who blithely claim that in order to use big data sets for planning, all we must do is anonymize, or “de-identify,” them—that is, irreversibly strip them of whatever identifiers they contain. Google and Facebook say that they already do exactly this when serving up those behaviorally targeted adverts; human research subjects in medical or other scientific trials are de-identified to protect their privacy; and patient identifiers such as name, date of birth, phone number, address, and so on are removed from electronic health records before they can be used by health authorities or researchers. It all seems so simple. However, there is a key difficulty: a growing consensus among computer scientists considers permanent de-identification to be impossible, not just technologically, but in principle. This is because, however rigorously you might have managed to anonymize a data set, there is always the possibility that at some point in the future, it can be compared to some other data set that is released (or leaked) in a way that re-identifies it.

We’re getting rid of a market that’s not just financial, but that actually owns any assets. You have to have a mechanism for allocating capital that isn’t based on where should it go to get its highest return. You might want to allocate it so that firms that aren’t doing well get more capital so they can catch up to everybody else. You want workers visiting other plants to see how they do things. How do you figure out a way of allocating capital so it deals with social issues, which region of the country you want it in—how do you do this in a way which strengthens equality rather than undermines it? Then it’s a similar point with labor.

One issue is this question of sectoral councils. In a sector—whether it’s a hospital, education, car manufacturing, or resource sector—you’d actually have an institution where, instead of firms competing like they do under capitalism, you have workers from the firms in that sector electing people to a sectoral council where they could make plans for that sector as a whole that fit into the larger social plan. Then they could distribute capital within that sector to meet the overall plans, but do it in a way that raises the productivity and the quality of every firm in that sector.

In addition to trying to establish equality across a sector and having

centralized research and development so that everybody can access it—it means that you've got another layer of planning that's separate from the central planning board. You can have planning centrally that does certain things, you can have layers sectorally that do certain things, you can have layers regionally that do certain things. A sector might be plugged into regional councils or urban councils, and then you have a lot of planning at the firm itself.

One of the arguments that Hayek made is that only capitalism can actually get latent information from people because it's not obvious, for example, what people actually want to buy. They don't sit down at the beginning of January and say, 'I know what I want,' and give it to the central planners. His question is about how you find out what people want, and how you find out what skills people really have without private property and private incentives. He said that's only something that capitalism can do through markets. It reveals capacities and information through competition. It's a serious argument, and my response is that first, markets—as they are under capitalism—actually systematically hide information because it benefits private property and competition. Socialism opens up the door to sharing information.

Hayek is right about the capacities of capitalism, but he's thinking of the capacities of entrepreneurs. Workers are just commodities to him. The point of socialism is to see the potential capacities of ordinary people. If you gave workers factories right now, they wouldn't know what to do with them. There's nothing about capitalism that teaches you how to run things, never mind how to actually coordinate all this complexity. Socialism is actually concerned with not just the capacities of entrepreneurs, but the capacity of learners.

When you look at productivity growth in capitalism, it's at one or two percent. The argument is that capitalism has incentives for higher productivity. Well, it's not hard to imagine workers on a job coming up with ideas about how to do it better that could match this productivity. And even if they didn't quite match it, there would be so many other benefits.

Ending Expansion

The story of growth steers us toward ecological chaos. The biosphere is rich in resources and extraordinarily resilient, but there are limits. And what ‘growth’ really means is ever increasing consumption of the energy and resources of the biosphere by one species: our own. Today we are learning that growth is pushing the biosphere to its limits. There is a real danger that biospheric systems will start breaking down, perhaps violently and fast, because we are messing with ancient, complex, unpredictable, and global metabolic pathways, such as the carbon and nitrogen cycles. If the resources of the biosphere are limited, then growth cannot continue indefinitely. So we have to start imagining what a good life will look like in a world of limited resources. An era can be said to end when its basic illusions are exhausted. Economic growth, the central illusion of the age of capital, may be ending.

Growth is needed to maintain social cohesion. The prospect of improvements in living standards, however remote, limits pressure for wealth redistribution. So long as there is growth there is hope, and that makes large income differentials tolerable. All brands of politics and economics are deeply rooted in the idea of robust economic growth, combined with the belief that governments and central bankers can exert substantial control over the economy to bring this about. In his 1925 novel *The Great Gatsby*, F. Scott Fitzgerald identified this fatal attraction:

“Gatsby believed in the green light, the orgiastic future that year by year recedes before us. It eluded us then, but that’s no matter—tomorrow we will run faster, stretch out our arms farther.”

In reality, economic growth is a relatively recent phenomenon. Politicians, policy-makers, and ordinary people do not want to confront the possibility of significantly lower economic growth. Like Fitzgerald’s tragic hero Gatsby, the incredulous battle cry is:

“Can’t repeat the past? Why of course you can!”

But as philosopher Michel de Montaigne noted:

“How many things we regarded yesterday as articles of faith that seem to us only fables today.”

The historical moment demands the institutions of limits. Limits that not only constrain resource use but also find expression in the institutional fabric of our economic order (in production and distribution). We must

become collectively constrained in economic life. Limits must move beyond the realm of individual conscience and choice and take up residence in the ordering of economic society. This is the challenge of a truly revolutionary Green New Deal. Unfortunately the existing GND is not up to meeting such challenges.

Warnings about ecological breakdown have become ubiquitous. Over the past few years, major newspapers, including the Guardian and the New York Times, have carried alarming stories on soil depletion, deforestation, and the collapse of fish stocks and insect populations. These crises are being driven by global economic growth, and its accompanying consumption, which is destroying the Earth's biosphere and blowing past key planetary boundaries that scientists say must be respected to avoid triggering collapse.

Many policymakers have responded by pushing for what has come to be called "green growth." All we need to do, they argue, is invest in more efficient technology and introduce the right incentives, and we'll be able to keep growing while simultaneously reducing our impact on the natural world, which is already at an unsustainable level. In technical terms, the goal is to achieve "absolute decoupling" of GDP from the total use of natural resources, according to the UN definition.

It sounds like an elegant solution to an otherwise catastrophic problem. There's just one hitch: New evidence suggests that green growth isn't the panacea everyone has been hoping for. In fact, it isn't even possible. Green growth first became a buzz phrase in 2012 at the United Nations Conference on Sustainable Development in Rio de Janeiro. Today, it is a core plank of the UN Sustainable Development Goals.

But the promise of green growth turns out to have been based more on wishful thinking than on evidence. In the years since the Rio conference, three studies have arrived at the same rather troubling conclusion: Even under the best conditions, absolute decoupling of GDP from resource use is not possible on a global scale.

A team of researchers first raised doubts in 2012. The group ran a sophisticated computer model that predicted what would happen to global resource use if economic growth continued on its current trajectory, increasing at about two to three percent per year. It found that human consumption of natural resources—including fish, livestock, forests, metals, minerals, and fossil fuels—would rise from 70 billion metric tons per year in 2012 to 180 billion metric tons per year by 2050. For reference, a sustainable level of resource use is about 50 billion metric tons per year—a boundary we breached back in 2000. The team then reran the model to see what would happen if every nation on Earth immediately adopted best practice in efficient resource use (an extremely optimistic assumption). The results

improved; resource consumption would hit only 93 billion metric tons by 2050. But that is still a lot more than we're consuming today. Burning through all those resources could hardly be described as absolute decoupling or green growth.

In 2016, a second team of scientists tested a different premise: one in which the world's nations all agreed to go above and beyond existing best practice. In their best-case scenario, the researchers assumed a tax that would raise the global price of carbon from \$50 to \$236 per metric ton and imagined technological innovations that would double the efficiency with which we use resources. The results were almost exactly the same as the first study. Under these conditions, if the global economy kept growing by 3% each year, we'd still hit about 95 billion metric tons of resource use by 2050. Bottom line: no absolute decoupling.

Recently, the UN Environment Program—once one of the main cheerleaders of green growth theory—weighed in on the debate. It tested a scenario with carbon priced at a whopping \$573 per metric ton, slapped on a resource extraction tax, and assumed rapid technological innovation spurred by strong government support. The result? We hit 132 billion metric tons by 2050. This finding is worse than those of the two previous studies because the researchers accounted for the “rebound effect,” whereby improvements in resource efficiency drive down prices and cause demand to rise—thus canceling out some of the gains.

Study after study shows the same thing. Scientists are beginning to realize that there are physical limits to how efficiently we can use resources. Sure, we might be able to produce cars and iPhones and skyscrapers more efficiently, but we can't produce them out of thin air. We might shift the economy to services such as education and yoga, but even universities and workout studios require material inputs. Once we reach the limits of efficiency, pursuing any degree of economic growth drives resource use back up. These problems throw the entire concept of green growth into doubt and necessitate some radical rethinking. Remember that each of the three studies used highly optimistic assumptions. We are nowhere near imposing a global carbon tax today, much less one of nearly \$600 per metric ton, and resource efficiency is currently getting worse, not better. Yet the studies suggest that even if we do everything right, decoupling economic growth with resource use will remain elusive and our environmental problems will continue to worsen.

Preventing that outcome will require a whole new paradigm. The only realistic shot humanity has at averting ecological collapse is to impose hard caps on resource use. Such caps, enforced by national governments or by international treaties, could ensure that we do not extract more from the

land and the seas than the Earth can safely regenerate. There's no escaping the obvious conclusion. Ultimately, bringing our civilization back within planetary boundaries is going to require that we liberate ourselves from our dependence on economic growth—starting with rich nations. This might sound scarier than it really is. Ending growth doesn't mean shutting down economic activity—it simply means that next year we can't produce and consume more than we are doing this year. It might also mean shrinking certain sectors that are particularly damaging to our ecology and that are unnecessary for human flourishing, such as advertising, commuting, and single-use products.

But ending growth doesn't mean that living standards need to take a hit. Our planet provides more than enough for all of us; the problem is that its resources are not equally distributed. We can improve people's lives right now simply by sharing what we already have more fairly, rather than plundering the Earth for more. Maybe this means better public services. Maybe it means basic income. Maybe it means a shorter working week that allows us to scale down production while still delivering full employment. Policies such as these—and countless others—will be crucial to not only surviving the twenty-first century but also flourishing in it.

Some might argue: I am not convinced. It strikes me both that the above misrepresents what growth means and also confuses political obstacles with logical ones. The result is an attack on a concept that makes neither logical nor political sense.

It points out the enormous leaps that will be required to keep our greenhouse gas emissions at levels that will prevent irreversible environmental damage. It then hands us the possibility, that even if through some miracle we can manage to meet these targets with the rapid deployment of clean energy, we still have the problem of the use of other resources that is wiping out species and wrecking the environment.

The points about the imminent dangers to the environment are very much on the mark, but it is not clear that has anything to do with the logic of growth. Suppose the Sustainable World Party (SWP) sweeps to power in the next election. They immediately impose a massive tax on greenhouse gas emissions, which will rise even further over time. They also inventory all the resources that are in limited supply and impose large and rising taxes on them. Furthermore, they pay developing countries large sums to protect regions that are important for sustaining species facing extinction and for the global environment. The new administration also hugely increases spending on research on clean technologies and has massive subsidies for zero-emission vehicles and even more importantly for mass transit. As the SWP implements this policy, it has very stimulative fiscal

and monetary policies.

Will the economy continue to grow through this transition? That's hard to say. If the price of gas quadrupled people would obviously drive less and buy fewer cars. On the other hand, since the government is throwing money at them with its fiscal and monetary policy, they may choose to spend more money on things that are not inherently research. They may spend more money on education, seeing movies and plays, gym memberships, eating at restaurants, better software for their computer and other types of spending that don't either directly involve the use of resources or at least not obviously more than the alternative. Eating at a restaurant obviously involves consuming food, but it doesn't necessarily mean consuming more food than eating at home.

But whatever happens in the transition period, what would keep the economy from growing in subsequent years? We have locked down all the resources in short supply and preserved large chunks of the world from encroachments by roads and settlements, but it is hard to see why we would not be developing better health care technology, better software, more types of cultural output, better housing (in the sense of being more pleasant—not necessarily larger) and other improvements in living standards, all of which count as growth in GDP. Where is the war with growth?

Or to flip it over, let's put the anti-growthers in charge. They explicitly don't want us to have growth, but in the anti-growth world will we stop people from developing better software, improved medical treatments, improved educational techniques, and other advances that mean growth? I assume that won't be the case, but then how is this world different than the world that any pro-growther who takes the environment seriously would want? There is a tendency by some anti-growthers to insist that growth means greater resource use. It doesn't. If the argument is that we can't continually expand our use of resources on a finite planet, that's fine and obviously true. But why can't our software, our entertainment, our education, and our healthcare get ever better? If there is a limit in these areas, it is very hard to see what it is.

The challenge posed is for pro-growthers to come up with a plan that both saves the world from a disastrous rise in temperature and also to prevent the further destruction of species and habitats through the excessive use of land and other resources. Actually, it is not hard to design a set of policies in terms of taxes, subsidies, and outright restrictions that could meet this challenge and still allow growth. The problem would be getting political support for this agenda.

Any pro-growther can write down on paper a \$300 a ton tax on carbon emissions, large taxes on the use of water and other resources, and huge

subsidies for clean energy, public transit, energy efficient housing and other types of conservation. The problem is getting political support for this agenda. If the challenge to the pro-growthers is whether we can get this environmentally friendly agenda adopted politically in a time frame where we can save the planet, degrowthers have raised a very important question without a good answer.

But let's say we adopt the anti-growth agenda. We tell people we are now against growth. Presumably, to save the planet in our new anti-growth framework we push many of the same policies. Perhaps the policies will be stronger in the form of even of even higher taxes or outright prohibitions on the use of some resources. Does anyone believe that this agenda has a better chance of being adopted because we told people that we are opposed to growth? It is very difficult to see how our stated opposition to growth makes one iota of difference in terms of selling environmentally sustainable policies, except leading people to think we are weird because we're telling them that something they always thought was good is in fact bad.

If the point is that people engage in all sorts of environmentally wasteful consumption that does not actually make them happy, it would be hard to argue with the anti-growthers. But there do not seem to be many people anxious to get sermons on their bad consumption habits and prepared to change their ways. Unfortunately, shifting people to more sustainable consumption patterns is going to be a very difficult process and that happens to be true even if the future of the planet necessitates this shift.

At the risk of caricaturing the argument, it seems as though the anti-growthers believe that we adopt policies because of the worship of growth, as opposed to the specific benefits being offered. This strikes me as completely off the mark. When ExxonMobil and other major fossil fuel companies oppose measures to restrict greenhouse gas emissions, they couldn't care less whether these policies would raise or lower GDP growth. They are concerned about their profits: end of story. The same is true of all the other companies that engage in practices that are harmful to the environment.

As for the politicians who support these companies, the odds are that the vast majority have never given a moment's thought to the meaning of these policies. They know what these companies want them to say and do, and the campaign contributions follow. The claims about growth are just window dressing. They have to pretend to have the larger interest of the public at heart since it would be pretty hard for ExxonMobil to tell people that a carbon tax was bad simply because it would hurt its profits.

Okay, but what about the general public? Does ExxonMobil's argument have salience only because they worship growth? I would argue that 'growth' per se means very little to most people. If the GDP grew by one percentage

point more or less last year, most people would have no idea. For the vast majority of the population, 'growth' means whether they have a secure job that provides them with decent pay and benefits like health insurance.

It is possible to maintain high levels of employment even as we use taxes and subsidies to move people away from the most environmentally damaging forms of consumption. It is worth noting that, even taken at face value, the economic models that show job loss from restrictions on greenhouse gas emissions are not actually describing a world where people cannot find jobs. These models are actually describing a world in which more people chose not to work because the higher price of energy means a higher cost of living and therefore a lower real wage. In these models, at a lower real wage fewer people choose to work. While these models may not be a perfect description of reality, it is undoubtedly the case that many workers would be quite upset if the price of gas doubled or tripled. And, this would be true even if we made heroic efforts to increase the availability of public transit.

The issue is how to change people's perceptions of what is important in life. I don't see simple answers here, but there are some things we do know. In Western Europe, people consume on average roughly half as much fossil fuel per person as we do in the United States. I suspect that their per person use of most other resources is also roughly half as large as it is for the United States. Part of the story is that European countries have been able to take more of the gains of productivity in leisure than income. On average, workers in Northern Europe work roughly 20 percent fewer hours a year than workers in the United States. They are also likely to retire earlier. As a result, their incomes average 20 to 30 percent less than in the United States. European countries also have much more public consumption than in the United States, in the form of health insurance, education through college, and public pensions. As a result, tax burdens are considerably higher in European countries than the United States.

It may be the case that European consumption patterns are still too resource-using to be sustainable, but these countries have shown a greater willingness to endure higher taxes and other costs associated with reducing energy consumption further. This doesn't mean that there is not substantial opposition to such measures, but they clearly face better political prospects than in the United States.

The idea that we will have some moment of Great Awakening, where the world, or at least the US public, recognizes the need to substantially reduce greenhouse gas emissions seems implausible. We will have to plod through with the hope that the plodding will be fast enough to prevent too much undoable destruction. A good roadmap for this plodding would be to follow Europe. The most politically viable part of a follow Europe

strategy is pushing for shorter work years. There is considerable support in the United States for mandated time off in the form of paid sick days and paid family leave. Such measures have won support in states and cities across the country. It is reasonable to think that mandated vacation days would also be salable.

We can also support work sharing measures as an alternative form of unemployment insurance. This is good macroeconomic policy (it's better to keep people employed even at shorter hours than to have them be unemployed), but it also holds out the possibility that if people come to work shorter workweeks for a period of time, they may like it and try to continue with short workweeks. In any case, this one should not be a big lift politically, even Republicans have supported work sharing.

The collective consumption story also has some hope here. There is considerable support for expanding the role of the federal government in ensuring access to health care. The same is true of public support for college and higher education more generally, and also childcare. These will not be easy political lifts, but they are also not far-fetched possibilities at this point.

The other part of the story is reversing the upward redistribution of income of the last four decades. There are two issues here. First, people are inclined to try to emulate the consumption patterns of those higher up on the income ladder. When the very rich have wasteful lifestyles, this percolates down to the middle class. They also want to have large houses, powerful cars, et cetera. Jeff Bezos has perhaps given us the most extreme example of this story. Being on occasion the richest person in the world, depending on the price of Amazon stock, Bezos has said that he can't think of anything better to do with his money than to send stuff into space. If recreational space travel becomes a common form of consumption, not only for the very rich, but the aspiring upper middle class, then we will have taken a huge step backward in the effort to save the planet.

The other part of the story is that people are willing to make sacrifices when they perceive them as being shared. One reason for the anger of the French towards the recent rise in gas taxes imposed by President Macron is the perception that Macron is working for the rich. He has cut the top tax rate and the rich in France seem to be doing very well. Policies aimed at reversing the upward redistribution of income of the last four decades could go far towards getting people to accept lifestyles that are less taxing on the environment.

At the end of the day, it is difficult to see how we help the environment by attacking growth. We need measures that sharply reduce environmental damage. Telling people that we are against growth is not likely to make

it easier to adopt environmentally friendly policies. Given the rate of destruction we are seeing, our best efforts may well not be enough, but that doesn't mean attacking growth will get us there either.

I have an old friend who got married in Las Vegas by an Elvis Presley impersonator. When people asked him why, he explained that he got married once before by someone who wasn't an Elvis impersonator and it didn't work out. Of course, this made zero sense (my friend was kidding), but this does seem like the anti-growth logic. We may not be able to prevent the destruction of the planet on our current course, but telling people we are against growth does not help matters in any obvious way. For what its worth, my friend's second marriage also ended in divorce.

So the pro-growther agrees—thankfully—that we need to dramatically reduce emissions and resource use to prevent ecological collapse. But he thinks that this is entirely compatible with continued GDP growth.

Let's imagine, he says, that a new government imposes massive taxes on greenhouse gas emissions and resource extraction while at the same time increasing spending on clean technologies, with subsidies for electric vehicles and mass transit systems. He believes that this will shift patterns of consumption toward goods that are less emissions- and resource-intensive. People will spend their money on movies and plays, for example, or on gyms and nice restaurants and new computer software. So GDP will continue growing forever while emissions and resource use declines.

It sounds wonderful, doesn't it? I, for one, would embrace such an outcome. After all, if growth was green, why would anyone have a problem with it? He makes the mistake of believing that degrowthers are focused on reducing GDP. We are not. Like him, we want to reduce material throughput. But we accept that doing so will probably mean that GDP will not continue to grow, and we argue that this needn't be a catastrophe—on the contrary, it can be managed in a way that improves people's well-being.

So who is right? Well, all of the empirical models that explore this question test precisely the policy tools that the pro-growther suggests: taxes on bad stuff and subsidies for good stuff. And yet every single one of them comes to the same conclusion: even under the most aggressive policy conditions, resource use still rises, and emissions don't fall fast enough. Why is this? Because the scale effect of growth—which is exponential, remember—outstrips the pace of gains from efficiency improvements and new technology.

He imagines an economy that is increasingly based on services. This sounds reasonable on the face of it. But services have grown dramatically in recent decades, as a proportion of world GDP—and yet global resource use has not only continued to rise, but has accelerated, outstripping the

rate of GDP growth. In other words, there has been no dematerialization of economic activity, despite a shift to services. The same is true of high-income nations as a group—and this despite the increasing contribution that services make to GDP growth in these economies. Indeed, while high-income nations have the highest share of services in terms of contribution to GDP, they also have the highest rates of resource consumption per capita. By far.

Why is this? Partly because services require resource-intensive inputs—cinemas and gyms are hardly made out of air—and partly also because the income acquired from the service sector is used to purchase resource-intensive consumer goods; you might get your income from working in a cinema, but you use it to buy TVs and cars and beef. Of course, with the taxes and subsidies that he envisions, perhaps this trajectory would look different. But existing evidence is clear that it won't look different enough.

Think about it. Even if we do manage to slim down gyms and cinemas so that they are powered by the sun and are extremely resource-lite—as lite as they can possibly be—as we continue to grow those industries exponentially, resource use will quickly start rising again. That's what scholars have discovered over and over: that once you reach the limits of resource efficiency, growth drives resource use back up. But let's say that we put a hard cap on resource use, so that this effect can't happen. Will growth still occur?

Maybe. But if so, let's not pretend it would be pretty. We need to be cognizant of how capitalism works. For two-hundred years, capitalism has depended on extraction from nature and human bodies. It has always needed an 'outside,' external to itself, from which it can plunder some kind of original value, for free, without an equivalent return. That's what fuels growth. So what happens when capital is no longer allowed to plunder nature? Where will it turn to next, in its hunger for growth? What new forms of exploitation will it devise?

Ultimately, the pro-growther admits that he's agnostic about the relationship between growth and ecology. He says he is open to the possibility that tight restrictions on emissions and resource use might contract the economy. But he argues that even if this is true, we shouldn't advertise this fact by saying that we are against growth, because we might scare people away and lose political support. I understand where he's coming from. But while it may seem politically sensible, there are a number of problems with this approach.

First, if the economy does end up contracting, it will be an absolute disaster unless we are prepared for it. An economy that is designed to need growth will collapse when it doesn't get it. Firms will go bust, people will lose their jobs, families will be evicted from their homes. Whatever party is in power during this chaos will quickly be toppled. By contrast,

because degrowthers are liberated from the illusion that growth will carry on forever, we openly call for an economy that does not require growth. We call for policies like a shorter working week, universal basic income, debt-free currency, fairer wages, progressive taxation, universal social services, nationalizations, and so on, so that we can scale down economic activity in a stable manner, while at the same time facilitating human flourishing.

Second, if we run headlong into economic contraction unprepared, then the reaction from corporations and politicians will be to do whatever it takes to get growth going again, even if it means slashing the very regulations that the pro-growther puts so much faith in. In a growth-at-all-costs economy, those measures will be extremely vulnerable—the first to go. A recent report argues that this is exactly what’s happening in high-income countries that are facing secular stagnation. Desperate for more growth, they’ve gone about shredding what few regulations remain. The quest to make recovery from the Wuhan Flu crash a “V-shaped” recovery will likely accelerate these trends.

Third, there is nothing to be gained by deceiving people into believing that green growth is possible and that the status quo can continue forever when there is no evidence for this. If this imaginary future fails to materialize, people will feel profoundly betrayed.

Imagine that, during the run-up to World War II, the US government had told people that everything was going to carry on as normal. There would have been riots at the first sign of fuel rationing—as we saw recently with the Gilets Jaunes movement against the fuel tax in France. A much better strategy is to get people on board with the transition right from the beginning, with a coherent, integrated economic framework and a compelling alternative narrative.

Finally, and most importantly, the strict measures on emissions and resource use that the pro-growther hopes for are difficult to get in the first place precisely because people are focused on growth. Economists and politicians realize that such measures will entail a trade-off with growth, which is why they resist them so aggressively. If we shift to an economy that’s not focused on growth, such strict measures will be much easier to pass. This is strategically important, because we don’t have time to wait around for growthers to agree to high taxes on carbon and resource use—it will never happen.

The main concern seems to be that people will be afraid of a post-growth narrative. But he doesn’t bother to cite any evidence for this. If he did, he would find that the exact opposite is true. A striking new poll by Yale shows that 70 percent of Americans believe that environmental protection is more important than growth—and this is true even in deep red states.

Another poll finds that 70 percent of people across middle and high-income nations believe that overconsumption is putting our planet and society at risk. Similar majorities also believe that we should strive to buy and own less, and that doing so would not compromise our well-being. People realize that our growth-addicted economy is driving us into disaster, and they are eager for an alternative. Whatever political movement can speak truthfully to that deep-felt concern and offer real hope—not just green-growth fantasies (sit down Greta)—will be able to command incredible popular support.

Interestingly, the growther accepts that continuous growth is not necessary to improve people's lives in high-income countries. He recognizes that we can do this right now, without any growth at all, simply by redistributing the abundance that we already have. So if that's the case, then why continue clinging to the growth fetish? He offers no positive defense of growth. He just takes it for granted as given. Maybe the growther has bought the narrative that Keynes himself saw growth as a necessary feature of the economy. If so, he is mistaken. Keynes was not obsessed with growth, but with stability. He wanted to raise the level of economic output, yes, but only for a specific defined purpose; he never thought that growth should continue forever. This is a perverse idea that Keynes himself never held.

Ultimately, what Keynes wanted was stability. And this is why we need Keynes now more than ever: not in order to justify eternal growth, but in order to achieve stability in the absence of growth, and while actively scaling down the most destructive sectors of our economy. If the Keynesian Left hopes to contribute anything to our battle against ecological breakdown, a post-growth narrative is going to have to be part of it.

The pro-growther might retort: First, let me point out where we do agree. It is necessary to take drastic measures to reduce greenhouse gas emissions quickly. The world is falling far behind a path of emissions reductions (they are still rising) that will prevent excessive damage to the planet. Going beyond the issue of greenhouse gas emissions, we also have to take steps to reduce resource use more generally. The planet is rapidly losing habitat and species in ways that are irreversible. I'm sure the degrowther knows the data in these areas better than me, but I would not argue on the basic point. The question is whether degrowth needs to somehow fit into the picture. I will raise two points, one a question of logic and one a practical political issue.

On the logical point, I am at loss to understand why we would have a war on growth. Granted, we need to massively reduce our consumption of fossil fuels and over time other material inputs, but I am afraid I don't see how this precludes growth. I am certainly willing to believe that a period of rapid increases in carbon taxes may lead to a recession, although I would not

even take this as a foregone conclusion. If we spend enough in other areas, it is possible to offset sharp reductions in the sectors of the economy that are heavy users of fossil fuels. Yes, I know people have modeled this scenario, but I'm afraid that I don't view such modeling as sacrosanct. Almost no economic models projected the collapse of the housing bubble and the Great Recession. I don't think economists who can't tell us what will happen next year in ordinary times suddenly have perfect foresight when we talk about an unprecedented transition in energy use.

But let's say that the transition brings about a recession. How does that preclude further subsequent growth? The Federal Reserve Board has brought on nine recessions since World War II. Would anyone say the Fed precludes growth?

Concretely, when we get to our sustainable level of resource use, I assume we will still have clothes, shelter, computers, et cetera. These items all wear out. When we replace them, is there some reason the new items would not be better (e.g. longer lasting, clothes that are warmer or cooler, et cetera) than the ones they replaced? If so, that sure sounds like growth to me.

The degrowther tells us that capitalism can only exist as a system of exploitation and extraction. Well, we certainly have in the past seen plenty of exploitation and extraction. We can also throw in racism and sexism which have always been with us. However, the necessary link to capitalism is simply an assertion. If I make clothes that last longer than my competitors' or keep people warmer in the winter, I'm afraid I don't see how that means that I must be exploiting others or nature.

But getting beyond the logical issues, I don't see how telling people we don't care about growth is going to advance an environmental agenda. As I said, growth is an abstraction that is probably meaningless to 99 percent of the population. People know if they have a secure job and health care, they know if their wages are rising, they don't have a clue what the growth rate is. You can find many periods where the economy was growing just fine, such as the early 90s and 00s, but people's assessment of the economy was poor. The problem was that many workers couldn't find jobs and wages were not keeping pace with prices.

We need people to stop driving SUVs, to not travel to Europe in the summer, to forget about vacation homes. That will mean policies like huge tax increases on gas and jet fuel. Will the public be more supportive of these measures because we tell them we aren't interested in GDP growth?

The degrowther seems to think the public is already there, reporting a poll showing that 70 percent felt that protecting the environment is more important than growth. I question whether this translates into support for the policies needed to get us on a sustainable economic path. In recent

elections, California voters rejected a repeal of a gas tax by 11 percentage points. While that may seem like good news, California is one of the most progressive states in the country, and the tax was just 12 cents a gallon. Try a \$4.00 a gallon tax and see how it flies in Texas. We have lots of work that needs to be done. In short, the public needs to be convinced that global warming is a serious enough and immediate threat that it is necessary for them to change their consumption patterns in big ways. I don't see how telling them we don't want growth helps in this process.

The degrowther and I agree that sharply reducing inequality has to be a big part of the story. Emanuel Macron, France's president, has given us a textbook example of how environmental measures that worsen inequality will be rejected by the public. I'm interested in policies that reduce inequality largely by reversing the policies that created inequality, such as patent and copyright monopolies, protectionism for doctors and other highly paid professionals, and coddling a bloated financial sector. If we aggressively pursue these policies, coupled with the right tax and incentive structure, we have a shot at getting us to a sustainable economy. In that context, attacking growth as a concept is a distraction.

The pro-growther says:

“I am at a loss to understand why we would have a war on growth.”

I don't know why he is at a loss. I explained the reasons for this. There are two I focus on: Because growing the GDP means growing energy demand, and this makes the task of switching to renewable energy significantly more difficult—nearly three times more difficult between now and 2050, which virtually rules out success. And because our preoccupation with growth makes it extremely difficult to get the regulations we need to avert ecological breakdown. Politicians resist such measures precisely because of the risks they pose to growth

He has, unfortunately, not engaged with these arguments. Next, he says that:

“If we spend enough in other areas, it is possible to offset sharp reductions in the sectors of the economy that are heavy users of fossil fuels.”

This argument is central to the standard vision of the Green New Deal: massive public investment in clean energy, which will generate millions of well-paid jobs and increase GDP growth—it's all in AOC's cartoon. Again, there are two problems with this.

Even if we do manage to switch the entire energy system over to renewables, that might help us with emissions but it doesn't help us with resource use. If we keep growing GDP, resource use will keep going up—even if the economy is powered by clean energy. And let's not kid ourselves: to the extent that resource use is driving mass species extinction, this is an existential threat that we have to take seriously.

And why does the Green New Deal have to be focused on aggregate GDP growth? Why not just stick with the bits about public investment and jobs and leave it at that? The last New Deal was growth-oriented, sure. But that doesn't mean that this one has to be. Again—and this is a crucial point—he has not made a positive argument for growth. He just for some reason assumes that we must have it, but he never says why. This is odd, because as he himself points out, the problem is not that we don't have enough income; the problem is that it's all locked up at the top.

So yes, let's dramatically increase clean stuff and reduce dirty stuff—in terms of their share of total economic activity—and let's do this with massive public investment. Here we agree. But there's no reason to nonetheless keep increasing aggregate economic activity forever. We just don't need it, and it only makes the energy transition much more difficult.

The growther says:

“I don't see how telling people we don't care about growth is going to advance an environmental agenda. Growth is an abstraction that is probably meaningless to 99% of the population. People know if they have a secure job and health care, they know if their wages are rising, they don't have a clue what the growth rate is.”

Now, maybe he's right that people don't pay attention to the growth rate. But that doesn't change the fact that we still need an economy that doesn't require perpetual growth. It does make it easier to get there, however. He is absolutely correct that what matters most to people is jobs and healthcare and wages. So let's build an economy that focuses on those things, rather than focusing on growth. Crucially, these social goods can be delivered without any additional growth at all.

In fact, the political obsession with GDP growth is an obstacle to the progressive agenda that he espouses. Think of all the regressive things that politicians and corporations do in the name of growth: weakening labour standards, slashing environmental protections, liberalizing markets, deregulating banks, cutting social spending. To the extent that the progressive Left operates within the growth frame, we play into the hands of neoliberals and make it much easier for them to justify these measures.

The final move is to take us into an as-yet hypothetical future. Let's imagine that we have completely clean energy and we cap resource use at a sustainable level—a steady-state economy. In such a scenario, he says, there's no reason we can't keep growing the GDP forever. Look, maybe he's right. I don't particularly care, as this has nothing to do with our actual, real-world problems, and nothing to do with how the existing economy works. It is a completely imaginary world—but he's an economist so that's exactly the kind of world they love to theorize about. So let's follow this line of thinking for a moment, because it turns out to be quite revealing.

He says that in such a scenario, people will produce better products—longer lasting, and higher quality. The products will be “better” presumably because they embody more labour time, or more skill, or more advanced technology, and therefore they will be worth more money despite the fact that they embody less material. “That sure sounds like growth to me,” he says. Sure. There is no reason that as certain products improve, this shouldn't come along with an increase in their monetary value. But that is very different from saying that the entire economy, as a total system, should continue aggregate expansion. It is the latter point that is at stake when we talk about growth, not the former.

Let's imagine that we do manage to scale down global material throughput to 50 billion tons per year (the sustainable rate), hold it steady at that level, and then keep growing GDP by 3% per year, forever. Remember, this is exponential, so in 200 years global GDP is some 1,000 times bigger than it is today. In such a scenario, capital will be under enormous pressure to find new horizons for surplus accumulation—capital will need to find a ‘fix,’ or an ‘outlet.’ If surplus can't be extracted for free from nature (because of the resource cap), and can't be extracted for free from humans (because I assume he wants fair wages in this ideal future world), then where will it come from?

Maybe it will come from improving products, as the growther hopes. For this to work, then all products would have to be on average 3% better per year, or 1,000 times better by 2220, and all of this betterness would have to be reflected in a correspondingly higher cost. This would be strange for a few reasons:

1. If I think about the vast majority of things I need to live a good life, I can't see how I would benefit much from them becoming 1,000 times better. Indeed, it is absurd.
2. If products are “better” because they are longer-lasting, this may well be inimical to growth, not conducive to it, as it reduces turnover. (And that's okay!)

3. In order for 'better' to translate into higher cost, the betterness has to be commodified (or enclosed). That might be okay in some cases, but in other cases we may want the opposite. For example, if we develop better parks or better life-saving medicines, we may not want to charge people more to access them.

But let's not pretend that capital's need for constant expansion is going to only make better products. When capital has bumped up against limits to profit-growth in the past, it has found fixes in things like structural adjustment programs, wars, restrictive patent laws, nefarious debt instruments, privatization, and by enclosing commons like water and seeds—accumulation by dispossession. Why would it be any different this time? If growth must happen, and if all new value must be immaterial, then capital may well seek to enclose immaterial commons that are presently abundant and free—not just water and seeds but knowledge, songs, green spaces, maybe even parenting, physical touch, perhaps even the air—and then sell it back to us for money.

The point here is that closing off the usual go-to fix—extraction from nature—will generate pressure for other fixes. That is the violent side of growth. It's just silly to pretend that these other fixes will somehow magically not be harmful. And it begs the question: given these risks, why must we continue to insist on GDP growth, when we know we don't actually need it? Why not release our civilization, our planet, indeed our imaginations from this pressure?

This growth we talk about actually means the production of superfluous goods and this degrowth we talk about means the production of necessary goods. There are many other structural signifiers in the economic use of the word 'growth' which should not go without mention. First among them is the unit of measure of growth as Gross Domestic Product or GDP. There is of course no qualification or distinction or any attempt to measure or quantify whether GDP is achieved via the production of necessary or superfluous goods or services. It is this idea of value-less growth that the term 'degrowth' seeks to challenge as it wants progress instead of value-less growth at all costs.

Secondly, the word 'domestic' in Gross Domestic Product firmly roots this growth in the territory of the nation state, in competition with other nation states, making no distinctions for growth at regional or metropolitan scales. National competition, not national aid, is embedded in the notion of growth as defined by the measure of GDP.

Degrowth is simply another word for progress decoupled from the bourgeois definition of growth as the industrial production of superfluous goods

and services. Degrowth does not mean ungrowth, lack of growth, stagnation, economic downturn, depression, or recession; that would be anti-growth, meaning lack of growth or negative growth, not degrowth. Degrowth means to remove from growth superfluous goods and services; it is a discretionary form of growth. Therefore the real meaning of the word 'degrowth' is a form of progress outside of the market logic of the production of superfluous goods inherent in bourgeois industrial capitalism. Degrowth is simply, given the limited natural resources of Planet Earth, an intelligent form of progress which only factors necessary goods or services.

Defining what is necessary and what is superfluous in the degrowth definition of eliminating the superfluous from production is not possible at a general but only at a culturally-specific level: it varies from culture to culture, from community to community, locality to locality. We should all determine what is superfluous collectively by asking that question of our own cultures as we are inevitably consumers of products: we can stop paying and participating in the production of what we consider superfluous.

What I argue here is that because we are living in a pervasive market logic of bourgeois industrial growth, to avoid participating in the production and exchange of superfluous goods and to save the planet from destructive consumerism, self-sufficiency, whether at an individual, family, community, village, town, city, metropolis, or national scale offers us all a strategy towards implementing the progress of human life on planet earth that now is implied by the word 'degrowth.'

The world is facing three existential crises: a climate crisis, an inequality crisis, and a crisis in democracy. Will we be able to prosper within our planetary boundaries? Can a modern economy deliver shared prosperity? And can democracies thrive if our economies fail to deliver shared prosperity? These are critical questions, yet the accepted ways by which we measure economic performance give absolutely no hint that we might be facing a problem. Each of these crises has reinforced the fact that we need better tools to assess economic performance and social progress.

The standard measure of economic performance is gross domestic product (GDP), which is the sum of the value of goods and services produced within a country over a given period. GDP was humming along nicely, rising year after year, until the 2008 global financial crisis hit. The global financial crisis was the ultimate illustration of the deficiencies in commonly used metrics. None of those metrics gave policymakers or markets adequate warning that something was amiss. Though a few astute economists had sounded the alarm, the standard measures seemed to suggest everything was fine.

Since then, according to the GDP metric, the US has been growing slightly more slowly than in earlier years, but it's nothing to worry about.

Politicians, looking at these metrics, suggest slight reforms to the economic system and, they promise, all will be well.

In Europe, the impact of 2008 was more severe, especially in countries most affected by the euro crisis. But even there, apart from high unemployment numbers, standard metrics do not fully reflect the adverse impacts of the austerity measures, either the magnitude of people's suffering or the impacts on long-term standards of living.

Nor do our standard GDP measures provide us with the guidance we need to address the inequality crisis. So what if GDP goes up, if most citizens are worse off? In the first three years of the so-called recovery from the financial crisis, about 91% of the gains went to the top 1%. No wonder that many people doubted the claims of politicians and media clowns who were then saying the economy was well on the way to a robust recovery.

For a long time I have been concerned with this problem—the gap between what our metrics show and what they need to show. During the Clinton administration I grew increasingly worried about how our main economic measures failed to take into account environmental degradation and resource depletion. If our economy seems to be growing but that growth is not sustainable because we are destroying the environment and using up scarce natural resources, our statistics should warn us. But because GDP didn't include resource depletion and environmental degradation, we typically get an excessively rosy picture.

These concerns have now been brought to the fore with the climate crisis. It has been three decades since the threat of climate change was first widely recognized—at least five since it was known by scientists—and matters have grown worse faster than initially expected. There have been more extreme events, greater melting of glaciers, and greater natural habitat destruction.

It is clear that something is fundamentally wrong with the way we assess economic performance and social progress. Even worse, our metrics frequently give the misleading impression that there is a trade-off between the two; that, for instance, changes that enhance people's economic security, whether through improved pensions or a better welfare state, come at the expense of national economic performance.

Getting the measure right—or at least a lot better—is crucially important, especially in our metrics- and performance-oriented society. If we measure the wrong thing, we will do the wrong thing. If our measures tell us everything is fine when it really isn't, we will be complacent.

And it should be clear that, in spite of the increases in GDP, in spite of the 2008 crisis being well behind us, everything is not fine. We see this in the political discontent rippling through so many advanced countries; we see it in the widespread support of demagogues, whose successes depend on

exploiting economic discontent; and we see it in the environment around us, where fires rage and floods and droughts occur at ever-increasing intervals.

It is possible to construct much better measures of an economy's health. Governments can and should go well beyond GDP.

“It is only by having better metrics that truly reflect people's lives and aspirations that we will be able to design and implement ‘better policies for better lives’”

And yet we must be cautious to not fall into the same technocratic trap we have before. Bureaucrats fiddling with numbers on a spreadsheet will not give us the world of true justice and equality that we seek.

The Green New Deal now taking shape in Washington will aim to address climate change through economic policies. While many of the potential policies being discussed, including a more steeply progressive income tax, would in themselves be positive developments, none of them would reduce greenhouse emissions as deeply as is required. To understand why, we should first look back at the economic foundations of the Depression-era New Deal, which is serving as inspiration for the Green New Deal (GND).

The original New Deal attempted to solve what were the particular manifestations of capitalism's contradictions that surfaced in the 1930s. In simplistic terms, overproduction, a common problem of industrial capitalism, resulted in massive unemployment and a multiplying effect that eventually created 25% unemployment by 1933. The New Deal firmly established the role of government in stabilizing an otherwise unstable system. It also institutionalized a much needed social welfare foundation to underpin a system which could not be relied on to consistently provide people with income.

The New Deal was given theoretical support by the Keynesian revolution, which provided a different perspective on the role of government in managing the problems of an advanced capitalist economy. Despite the rise of neoliberalism, the institutional fabric that we function with today is still of that New Deal/Keynesian ilk.

One of the most important policies for unequivocally ending the Great Depression (reinforcing the legitimacy of Keynesian policy) was the massive spending on military production for World War II. The government ran huge deficits to fund the war effort, and after the war, the debt was repaid as the economy expanded (boosted partly by the fact that all other industrialized nations had been decimated).

World War II was an external and immediate exigency (in some ways analogous to climate change) that required production and price controls

as well as rationing in the short-run simply because the economy could not produce what was needed immediately for the war and simultaneously provide consumers with all they wanted. While those economic interventions were temporary, military spending became a more institutionalized part of the participation of government in the economy.

The New Deal and the Keynesian framework were clearly predicated on reinvigorating growth and curbing stagnation—the latter an inherent tendency of a mature capitalist economy. And the problem of maintaining growth became increasingly difficult beginning in the latter half of the twentieth century, which is to say the problem of stagnation—not simply downturns associated with the business cycle—became increasingly problematic.

Our history with this New Deal legacy should sharpen our understanding of capitalism in the following ways. We should by now understand that capitalism is an unstable economic system that tends toward both growth and stagnation and stagnation is both cyclical and secular. It is a system with systemic problems of inequality that exacerbate its instability. The inherent instability of the system and its inequality can be managed through various applications of fiscal and monetary policy augmented with a sound social welfare foundation, as well as more direct facilitation of the process of insuring investment outlets (military spending is a good example of this).

For the sake of exposition, I'm going to label this mix of problems and challenges the first contradiction of capital. All policies here pivot around growth with the exception of some mechanisms for redistribution of income. Nowhere in the landscape of the New Deal was there any recognition that there were problems with growth itself or fossil fuel use. This was because the danger of running up against future biophysical limits was not recognized.

The problem of biophysical limits has now presented itself in no uncertain terms with the reality of climate change; and for those who care to look, into the myriad of other examples of the ecological decay of Earth. Climate change is where the rubber meets the road in confronting what I will label the second contradiction of capital: Energy in one form or another is the food of economic life. Growth depends on it and despite all the rhetoric to the contrary there are limits to what we can expect without it.

As far as I can tell this means we've got a problem, not just with climate change but with our ability to manage it and also manage the first contradiction of capital. It seems the two contradictions cannot be solved simultaneously. We can't both grow and de-grow at the same time.

Absolute decoupling remains an illusion, but I get why people might be attracted to it since the other choice is to face the problem of the dueling contradictions of capital. It's the same reason we get the Green-New-Dealers talking up a carbon tax and letting the magic of the market and human

ingenuity take us to ever-higher pinnacles of progress. I heard Thomas Friedman on NPR's Science Friday refer to this as "mean green" and tell us that "green is the new, red, white, and blue."

Let's be clear—the Green-New-Dealers are counting on technology to absolve us from having to figure out how to resolve the first and second contradictions of capital simultaneously. The GND's problem, as I understand it, is that it wants to deal with the first contradiction of capital (job creation and new outlets for capital investment) and the second contradiction (biophysical limits) by assuming that we can transition to renewable energy seamlessly and at unrealistic speed, ultimately achieving both green growth and job security. Of course, they advocate robust policies for dealing with inequality in addition to the benefits of employment through the build-up of a renewable energy infrastructure. The implicit assumption is that by dealing with the first contradiction we will simultaneously deal with the second contradiction. Problem solved?

Our short-term problem is that a declining ceiling on greenhouse emissions will in fact require allocation of energy among sectors and rationing among consumers simply because the 'external' problem (climate change, analogous in this example to WWII retooling to make war munitions) has to be solved quickly and it will require fossil fuel to do that. If we are to avoid climate catastrophe, we have to simultaneously bring an end to fossil-fuel burning and develop vast renewable energy capacity, both starting right now and both on a crash schedule. That means the everyday economy must find a way to run on much less available energy.

Ideally that policy measure should lead us to an ever clearer understanding that our short-run energy problem (the conversion problem) is but a variation on a much larger long-run energy problem (fueling an expanding economy on renewable energy while providing equity in access to energy). Actually, if we were willing to pay attention to ecological decay and the sixth mass extinction we would understand that it isn't simply a long-run energy problem we have, it's a long-run growth problem. That understanding changes everything, especially if it can't be solved technologically. Yes, the rubber is meeting the road.

The truth that the GND doesn't appear to want to face is that we're not simply dealing with some variation on the problems that the New Deal and its institutional legacy were meant to confront. We are dealing with something that is much more complex and foundational. We are dealing with two contradictions of capital that work against each other. If we approach our present situation as if it is just another variation on an old problem (the first contradiction of capital) we will not be able to confront the second contradiction of capital. That's because in the traditional New Deal queue

we will cook ourselves for jobs and short-run economic stability through growth before we'll pay attention to biophysical limits. The problem is that it isn't all that clear what cooking ourselves will mean for the quality of human life (not to mention other-than-human life) either in the short- or the longer-term. Let's just say it looks like a decidedly downward trajectory for all parties concerned.

The challenge for the GND is to be revolutionary in the face of climate change. It seems clear we can't solve the contradictions of capital with the same institutional baggage. Assuring some measure of equality in the face of reduced energy will require limits. The build-up for WWII provides a precedent for our capacity to impose collective limits when we have to do so. Collective limits are managed fairly only when reinforced and fortified with expansive social welfare institutions.

But we also need institutions that orbit around limits and not around growth and stagnation. The quick and decisive transition to renewable energy, orchestrated with strict limits, a commitment to equity, and rationing of both production and consumption will help us to begin this revolutionary transition recognizing that the twenty-first century problems of capitalism are unique.

Access to energy must be resolved through rationing and not through markets for two reasons. The market can be relied upon neither to produce what is necessary and not simply profitable nor to ensure sufficiency for all. More importantly, the market goes with the market economy which is not just a mechanism of allocation but a complex system of expansion and stagnation that generates inequality in its wake. The market economy also has a tremendous penchant for drawdown of resources and ignoring the ecological integrities of Earth as well as sloughing off externalities.

So far the Green New Deal seems to be the same institutional package as the New Deal. Unfortunately the landscape of contradictions that afflict capital has shifted. What we have on our hands is not more of the same; we have something categorically and foundationally different. We can't end growth simply by imposing external limits (caps on carbon for example) without simultaneously confronting the inner dynamics and problems of the first contradiction of capital. Instead we must rely on robust forms of limits coupled with more robust forms of redistribution. And much of our production (of energy, of transportation, et cetera) can no longer be merely a prerogative of capital. It must be directed and the social relations surrounding it must be redefined.

Historically we have managed the internal contradictions by assuring growth and drawdown of our 'natural capital.' The problem of external limits has been ignored or inadequately managed with minor taxes and

regulations. But when growth is no longer an option to counteract the internal contradictions of the system, and when minor taxes and regulations no longer suffice to keep the economy within biophysical limits, we are required to move in a different direction. Unless the movement to implement a GND understands that the burden of the historical moment is not merely to provide short-run prospect for jobs and to replace fossil fuel with renewable energy, it will be inadequate to the historical moment.

The challenge of the GND is to erect a new economic framework that will allow us to exit the impossible prospect of trying to resolve both the first and second contradictions of capital that define twenty-first century capitalism. Renewable energy technology doesn't rise to the requirement of managing either the first or second contradiction, as much as we'd like to believe otherwise. A carbon tax or a cap, in conjunction with the hope that the market will handle the rest, is a strategy that demonstrates a gross lack of understanding of twenty-first century capitalism and its capacities and inclinations as well as an overly optimistic view of technology.

Let's be clear, neoliberal economics is not our only problem, though there is no question neoliberal economic policy has made both the first and second contradictions of capital worse; it has also created a fundamentalist ideology about markets that has dribbled into the lexicon and thinking of the mainstream—Thomas Friedman, for example.

An unequivocal cap on carbon and rationing of production and consumption is the beginning of a new institutional approach to a new economic order. The Green New Deal would not achieve an economic transformation, and this historical moment demands such a transformation. The historical moment demands the institution of limits. Limits that not only constrain resource use but also find expression in the institutional fabric of our economic order (in production and distribution). We must become collectively constrained in economic life. Limits must move beyond the realm of individual conscience and choice and take up residence in the ordering of economic society. This is the challenge of a revolutionary GND.

When the pragmatic liberals say 'Wait,' they almost always mean 'Never.' There is a whole history of class struggles, of revolutions and counter-revolutions, which have consistently taught the lesson that there is no peaceful-gradual-electoral "parliamentary road to socialism," including to eco-socialism. An eco-socialist result is far more likely if there are already radicals telling the truth about capitalism, from the very beginning, even if it is, so far, unpopular to do so. If people are talking about your agenda, even if they're talking about how bad and silly it is, you are making that agenda more plausible.

Revolutionaries have long argued that even reforms are most likely to be

won when the rulers fear a militant, aggressive, and revolutionary movement, or at least a revolutionary wing of a broader movement. ‘Reforms’ in this case would be steps to hold back and mitigate the effects of global warming due to capitalist industry, even by using the capitalist state. Such reforms cannot be won by an environmental movement which tries to be “reasonable” and “respectable,” especially if it has a “radical left” which offers to buy out big businesses and stay within the framework of capitalism.

We cannot say what is reasonable to expect. Today’s popular consciousness is not what it will be tomorrow. The very crises of weather and the environment will change that. The climate crisis will interact with the looming economic crisis, and with continuing turmoil over race, immigration, gender, and sexual orientation. Not to mention endless wars and sanctions. And of course, we cannot forget the Wuhan Flu panic. With such shakeups in the lives of working people and young people, there may be an opening for a revolutionary anarchist eco-socialist program. Whether this will develop in time cannot be known. But we must not give up on history.

The issue is not only whether capitalism is compatible with ecological balance and ending climate change. The question is also about the nature of the state, and whether the state is compatible with avoiding ecological catastrophe. These issues should determine our attitude toward proposals for a Green New Deal.

So let’s summarize all this in order to properly answer what should happen on the very first days after winning an election for President, gaining a majority in both houses of Congress, and control of at least two-thirds of all statehouses. It could all be quite simple and straightforward—if it is prepared for beforehand.

Almost immediately on assuming office, one should put forward a series of amendments to the constitution. The amended constitution, which would be the supreme law of the land, would provide the legal authority for the you to carry out the multitude of changes that would transform our country—for the better.

Whilst this is happening a thorough review of every government department should take place, removing any senior manager who is likely to be obstructive to such changes, and replacing them with all those junior officials who have both experience of their departments together with real support for the ideology—and there will be plenty to choose from. It is important to avoid the danger of purity purges however. Removing all forms of dissent and critique make you weaker, not stronger. The new government departments need to be established at the same time, and made operational within weeks of assuming office. These would provide the essential funding, labour force, and public information that will all be vital to the success

of the reformation. And remember, you have an army—just in case those pesky courts try to obstruct the will of the people.

The planning for all this is work the we could and should be doing now. Far from keeping it all top secret, which is the normal way of doing things in politics, it would be essential for you to do it all openly and in full view of anyone who cares to look. Quite apart from the fact that secrecy is contrary to our ideology, it is also counterproductive to our ambitions. People need to know and understand the reasons why we believe what we believe. There is nothing in our ideology to hide or be ashamed of, and come the reformation we will need to bank on the full support of a well-informed citizenry. That well-informed citizenry will only exist if the we openly campaign for the changes we intend to make together with the reasons for why the changes are essential; and the fact that our government comes to power as a consequence of providing that information will provide the lawful and moral authority for doing it. Such a major reformation of government would not happen easily because of the powerful forces who would inevitably oppose it—likely with a considerable amount of violence, intimidation, and propaganda—hence the support of a well-informed citizenry will be essential to finally achieving a government that is properly democratic, humane, and capable of helping to stop the environmental destruction of our planet, instead of promoting it.

Part IX

Breaking the Wheel

Come gather 'round people wherever you roam
And admit that the waters around you have grown
And accept it that soon you'll be drenched to the bone
If your time to you is worth savin'
Then you better start swimmin' or you'll sink like a stone
For the times they are a-changin'

Come writers and critics who prophesize with your pen
And keep your eyes wide the chance won't come again
And don't speak too soon for the wheel's still in spin
And there's no tellin' who that it's namin'
For the loser now will be later to win
For the times they are a-changin'

Come senators, congressmen please heed the call
Don't stand in the doorway, don't block up the hall
For he that gets hurt will be he who has stalled
The battle outside ragin'
Will soon shake your windows and rattle your walls
For the times they are a-changin'

Come mothers and fathers throughout the land
And don't criticize what you can't understand
Your sons and your daughters are beyond your command
Your old road is rapidly agin'
Please get out of the new one if you can't lend your hand
For the times they are a-changin'

The line it is drawn, the curse it is cast
The slow one now will later be fast
As the present now will later be past
The order is rapidly fadin'
And the first one now will later be last
For the times they are a-changin'

You Say You Want a Revolution

Planting Seeds

A seed has to totally destroy itself to become a flower—that's a violent act.

the future will not be mad
with loss and waste
though the memory will be
there, eyes will become kind and deep
the bones of this nation
will mend after the revolution

“The question is not whether we will be extremists but what kind of extremists we will be. When you are right, you cannot be too radical.”

—Martin Luther King Jr.

“What country can preserve its liberties if their rulers are not warned from time to time that their people preserve the spirit of resistance? Let them take arms. What signify a few lives lost in a century or two? The tree of liberty must be refreshed from time to time with the blood of patriots and tyrants.”

—Thomas Jefferson

While there is a lower class, I am in it, while there is a criminal element, I am of it, and while there is a soul in prison, I am not free. All else is excuse making. If the human race survives, the level of inequality and injustice present today will be viewed with a sense of wonderment and disgust.

Who is crazier: the one who demands to live in a more just, fair, equitable world, or the one willing to settle for less?

Do not go gentle into that good night,
Old age should burn and rave at close of day;
Rage, rage against the dying of the light.

Though wise men at their end know dark is right,
Because their words had forked no lightning they
Do not go gentle into that good night.

Good men, the last wave by, crying how bright
Their frail deeds might have danced in a green bay,
Rage, rage against the dying of the light.

Wild men who caught and sang the sun in flight,
And learn, too late, they grieved it on its way,
Do not go gentle into that good night.

Grave men, near death, who see with blinding sight
Blind eyes could blaze like meteors and be gay,
Rage, rage against the dying of the light.

Start with a cage containing five monkeys. Inside the cage, hang a banana on a string and place a set of stairs under it. Before long, a monkey will go to the stairs and start to climb towards the banana.

As soon as he touches the stairs, spray all the other monkeys with cold water. After a while another monkey makes the attempt with same result, all the other monkeys are sprayed with cold water. Pretty soon when another monkey tries to climb the stairs, the other monkeys will try to prevent it.

Now, put the cold water away. Remove one monkey from the cage and replace it with a new one. The new monkey sees the banana and wants to climb the stairs. To his surprise and horror, all of the other monkeys attack him. After another attempt and attack, he knows that if he tries to climb the stairs he will be assaulted.

Next, remove another of the original five monkeys and replace it with a new one. The newcomer goes to the stairs and is attacked. The previous newcomer takes part in the punishment with enthusiasm.

Likewise, replace a third original monkey with a new one, then a fourth, then the fifth. Every time the newest monkey takes to the stairs he is attacked. Most of the monkeys that are beating him have no idea why they were not permitted to climb the stairs or why they are participating in the beating of the newest monkey.

After replacing all of the original monkeys, none of the remaining monkeys have ever been sprayed with cold water. Nevertheless, no monkey ever again approaches the stairs to try for the banana. Why not?

Because as far as they know that is the way it has always been done around here.

“There is a time when the operation of the machine becomes so odious, makes you so sick at heart that you can’t take part; you can’t even passively take part, and you’ve got to put your bodies upon the gears and upon the wheels, upon the levers, upon all the apparatus and you’ve got to make it stop. And you’ve got to indicate to the people who own it that unless you are free the machine will be prevented from working at all.”

—Mario Savio

If a law requires you to be the agent of injustice to another—break the law. Let your life be a counter friction to stop the machine.

Since change does not and cannot come from the masses who conform and those who may initiate radical change are shunned by society, leadership of change is taken over by Great Men, demagogues who interpret the thoughts of radicals for their own benefit and steer society in the directions most suitable to them. Great Men are accepted by the majority as they are not actually radical or unusual. They are instead a glossy version of the average, just attractive and superior enough that they can lead but not so different that they would be unaccepted by the majority. Truly radical ideas cannot be directly accepted by the majority, they must be interpreted by knowledge bridges as must highly specialized innovation. Great Men have the education, understanding, and access to appreciate and intercept new ideas and package them, or easily palatable pieces of them, in an attractive and widely accessible format. They also have the ability to suppress the ones dangerous to themselves.

It is clear that the true role of the thought leader is to serve as the organic intellectual of the one percent—the figure who gives the emerging class an awareness of its own function in society. The purpose of the thought leader is to mirror, systematize, and popularize the delusions of the super-rich: that they have earned their fortunes on merit, that social protections need to be further eviscerated to make everyone more flexible for “the future,” and that local attachments and alternative ways of living should be replaced by an aspirational consumerism. The thought leader aggregates these fundamental convictions into a great humanitarian mission. Every problem, he prophesies,

can be solved with technology and rich people's money, if we will only get our traditions, communities, and democratic norms out of the way.

Whether it's a foreign policy expert insisting on military intervention, a business-school prophet proclaiming the virtues of disruption, a Silicon Valley genius reducing politics to engineering, or a Times columnist championing the unavoidable march of autonomous technology, today's thought leaders all share a core worldview: that extreme wealth and the channels by which it was obtained are not only legitimate but heroic. This is why the Ideas Industry favors the thought leader over the more critical, skeptical public intellectual. Many academics tend to dismiss the 'Great Man' theory of events. If the marketplace of ideas is flooded with hucksters evangelizing the next big thing and the importance of billionaires for "making the world a better place," it is because that's what billionaires want to hear.

Government is a tool, like a hammer. It can be used for good or for bad. I can build a homeless family a house, or I can bash your fucking skull in. One of the greatest threats is the greedy parasites currently controlling the levers of power causing such disillusionment, or misrepresenting or maligning the concept of government, that even should we move towards some concept of justice, we will be severely handicapped by others' earlier failures, greed, and selfishness. A massive limiter on the movement of the Overton window.

Your worst enemy is not the person in opposition to you. It is the person doing nothing while occupying the spot you could be fighting from.

A neoliberal with manners is not a leftist.

In the garbage-can theory an organization is a collection of choices looking for problems; issues and feelings looking for decision situations in which they might be aired; solutions looking for issues to which they might be the answer; and decision-makers looking for work. Problems, solutions, participants, and choice opportunities flow in and out of a garbage can, and which problems get attached to solutions is largely due to chance.

It is a bit more pessimistic on the value of charismatic leaders in these situations. Noting that leaders can make a difference in the 'garbage can' by:

- Carefully timing issue creation
- Being sensitive to shifting interests and involvement of participants
- Recognizing the status and power implications of choice situations
- Abandoning initiatives that get hopelessly entangled with others
- Realize the planning is largely symbolic and an excuse for interaction

“We don’t need political parties which is where most of the non-corrupt people are either compromised to become ‘one of the boys’ or filtered out.”

What happened to progressives in Washington is they traded the politics of pressure for the politics of access. And the politics of access works very well for the leaders of the organization, but not so well for the membership, and not so well for the cause. And we’ve been at this now for 30, 40, 50 years, and it’s time for somebody from those organizations, I would argue, to step back and ask, what has all that access really gotten us? Not you, us. All of us.

Attempts to reach voters from a supposedly “electable” and yet increasingly distant centre that sticks to triangulation, spin, and neoliberalism, have yet to grasp that politics has shifted, that something has broken, that there has been an erosion of trust in what this centre represents.

History is written by the victors to make them look just and moral:

Hitler	Lebensraum	Lost	Monster
Mussolini	Spazio Vitale	Lost	Monster
American politicians	Manifest Destiny	Won	Patriots

Lies are a vital and necessary part of authoritarian rule. If the truth were identified fully and in plain language that could be easily understood by everyone, the revolution would begin in ten minutes. The ruling class knows this very well, so lies are the gruel we ingest every day.

Consider Lincoln’s speaking style. The argument was not made more particular; it was just made particularly plain. It was the same proposition put in a way that made its meaning impossible to escape. He said it once, and then he said it again, and the second time he said it, you couldn’t miss the point of what he was saying. Throughout his career as an orator, this habit—neat flat summary of an idea in plain speech after an elaborate windup in legal argument—was his own.

You can find it, for instance, in his speech of June 26, 1857, in the Springfield State House, denouncing the Dred Scott decision. He takes on directly the ugliest of all the arguments that Stephen Douglas liked to use—that the real goal of the anti-slavery movement was intermarriage:

“Judge Douglas evidently is basing his chief hope, upon the chances of being able to appropriate the benefit of this disgust to himself. If he can, by much drumming and repeating, fasten the

odium of that idea upon his adversaries, he thinks he can struggle through the storm. . . Now I protest against that counterfeit logic which concludes that, because I do not want a black woman for a slave I must necessarily want her for a wife. I need not have her for either. I can just leave her alone.”

“I can just leave her alone.” The rhetorical mastery of that plain sentence, deliberately inserted after a lot of fine high phrasing—“fasten the odium of that idea upon his adversaries,” “I protest against that counterfeit logic”—is potent both in its clarity and in its comic appeal to common sense. It’s a punch line more than a catchphrase. And it gets from us the punch line’s reward—laughter at a newly recognized truth: That’s right! You don’t have to sleep with the slaves after you free them; the “odious intermingling of the races” that they keep telling you will happen isn’t inevitable at all! Why, you can just leave her alone!

And the same spell of simple summary was cast when Lincoln later took on Douglas’s other nasty bit of racist cant, that “he was for the negro against the crocodile, but for the white man against the negro,” with its clear implication that Negroes are to whites as beasts are to men. Lincoln said in a speech in Columbus, Ohio, in 1859:

“... in a preeminent degree these popular sovereigns are at this work; blowing out the moral lights around us; teaching that the negro is no longer a man but a brute; that the Declaration has nothing to do with him; that he ranks with the crocodile and the reptile; that man, with body and soul, is a matter of dollars and cents.”

Once again the higher argument—about popular sovereignty and its meaning—is treated at length and then condensed into monosyllables that would still be startling today: *the real proposition at stake is that man, with body and soul, is a matter of dollars and cents.*

Isn’t this just another good example of why we shouldn’t be afraid of the truth and plain talk? When we finally start using words like ‘liar,’ ‘cheater,’ ‘thief’ ‘murderer,’ and ‘assassin’ to describe those guilty of such crimes, we might be able to get rid of them. Politeness and Political Correctness is too often a trap for the one practicing it. It dims the bright lights we want to shine on the wrong-doer and robs us of our ability to debate. There’s a reason why plain-talking demagogues like Trump are so successful. Instead of wrapping ourselves even more tightly in the saran wrap of genteel good manners—sometimes just another way of showing superiority—we should be honing our language skills and engaging with the enemy.

Who sets down all those rules that we know about from childhood—the idea that we must never end a sentence with a preposition or begin one with a conjunction, that we must use ‘each other’ for two things and ‘one another’ for more than two? The answer, surprisingly often, is that no one does, that when you look into the background of these ‘rules’ there is often little basis for them.

Consider the simplistic dismissal of Standard Black English:

“As for ‘I be,’ ‘you be,’ ‘he be,’ et cetera, which should give us all the heebie-jeebies, these may indeed be comprehensible, but they go against all accepted classical and modern grammars and are the product not of a language with its roots in history but of ignorance of how a language works.”

However, the truth is that most US academic prose is appalling—pompous, abstruse, claustral, inflated, euphuistic, pleonastic, solecistic, sesquipedalian, Heliogaba-line, occluded, obscure, jargon-ridden, empty: resplendently dead.

The obscurity and pretension of Academic English can be attributed in part to a disruption in the delicate rhetorical balance between language as a vector of meaning and language as a vector of the writer’s own résumé. In other words, it is when a scholar’s vanity/insecurity leads him to write primarily to communicate and reinforce his own status as an Intellectual that his English is deformed by pleonasm and pretentious diction—whose function is to signal the writer’s erudition—and by opaque abstraction—whose function is to keep anybody from pinning the writer down to a definite assertion that can maybe be refuted or shown to be silly. The latter characteristic, a level of obscurity that often makes it just about impossible to figure out what an AE sentence is really saying, so closely resembles political and corporate doublespeak—“revenue enhancement,” “downsizing,” “proactive resource-allocation restructuring”—that it’s tempting to think AE’s real purpose is concealment and its real motivation fear.

There have to be some rules and conventions, no? We have to agree that tree takes *E*s and not *U*s and denotes a large woody thing with branches and not a small plastic thing with dimples and TITLEIST on it, right? And won’t this agreement automatically be ‘artificial,’ since it’s human beings making it? Once you accept that at least some artificial conventions are necessary, then you can get to the really hard and interesting questions: which conventions are necessary? And when? And where? And who gets to decide? And whence their authority to do so?

Liberty is intimately connected with language. Those who seek to monopolize power always use inaccessible and specialized jargon to exclude the average citizen. We must break these chains.

They should speak out, loud and clear, and they should voice their condemnation in such a way that never a doubt, never the slightest doubt, could rise in the heart of the simplest man. They should get away from abstraction and confront the blood-stained face history has taken on today. The grouping we need is a grouping of men and women resolved to speak out clearly and to pay up personally.

There is a theory I have heard that I will paraphrase, though the percentages should not be considered definitive. Personally, I think it has some merit: 10% of people will always do the ethical thing in any given situation regardless of consequences, 10% of people will always put self-interest first regardless of consequences, and the remaining 80% will gravitate towards whatever the prevailing ideology is at that time.

It is pretty clear to me that those who act purely out of self-interest have been winning the ideological battle lately, and this makes for a generally unhappy society, as non-psychopaths do not want to have to compete with psychopaths in order to just get by and live an ok life.

Time for that to change.

Most of us do the right thing only when others are doing the right thing. Real heroes are the ones who break out of the group norm. The predominant cultural impulse is for people to transfer responsibility. Basically, if no one acts, then no one acts—and the more people actively doing nothing, the stronger the compulsion is to join in with them. The hopeful element to this cause of apathy is that a small act or a voice of dissent can ruin the effect.

Human behavior is fluid, it takes the shape of the container it's in. Capitalism is the container. So greed and self-interest/self-maximizing is highly rewarded as well as lauded as virtuous. We are complex animals with complex behavior that includes cooperation, empathy, community, et cetera. The overarching ethos of the current system does not reward or encourage those behaviors in any significant way. We as humans are not shackled to the worst human traits or behaviors. We are chained to a system that promotes an ideology that discourages the thought that human behavior can be anything more than greedy self serving Individualism. Which is therefore unquestionably promoted as the only pillars that can hold society up. This is where the true threat to our survival is found.

Endless one decisions. All minor, all consequential. Remove one and this moment doesn't exist. Every day we create our own future, shaping the world in an unknown number of ways. Some one decisions ripple into

revolution, others into oppression. Some ripple into new life, others ripple into death.

I feel somehow empowered by this observation. At every moment there is the potential to shape the future in a profound way. Sure, if you're sitting in front of the TV, stoned, watching a Paul Rudd movie, you're not likely to shape the future in a profound way—or you could somehow start writing a book because of it, I dunno, it could happen, can't rule anything out man. But, your anger over an incorrect latte order could cause a school bus crash tomorrow afternoon.

I have always liked to picture love as some type of shimmering ribbon of light that connects two individuals.

You are a seed, and when it all goes pear-shaped, hope you and your knowledge survive.

Are we the public or the private person? The truth of the matter is that for all seasons we are both. We must know how to provoke others to action, but also when to withdraw and let others carry on the work. True change is to so change things that it seems natural to everybody but no-one knows who thought of it. We must remember: Our best will not be our children's best.

And sometimes the best way to lead is from the shadows.

One of our most overwhelming impulses as humans is to belong to a society. The pain of shunning is the most powerful coercive tool we employ against each other. Shunning can motivate people to take their own lives or the lives of others. Solitary confinement can rapidly destroy mental health. An infant left without human contact can have all of their physical needs met and still grow up with physical and mental damage. The need to belong can be used to overpower principles, deep rooted morals, self-interest. History has repeatedly proven that the majority of people can be coerced to do almost anything to themselves or others by the need for social inclusion. The desire to be a part of something bigger than themselves is frequently expressed as a motivation for action, and duty to society a frequent excuse for compliance.

To resist radical evil is to endure a life that by the standards of the wider society is a failure. It is to be a lifelong heretic.

“The man who can face vilification and disgrace, who can stand up against the popular current, even against his friends and his country when he knows he is right, who can defy those in authority over him, who can take punishment and prison and remain steadfast—that is a man of courage.

The fellow whom you taunt as a ‘slacker’ because he refuses to turn murderer—he needs courage. But do you need much courage just to obey orders, to do as you are told and to fall in line with thousands of others to the tune of general approval and the Star Spangled Banner?”

It seems that a person who is comfortably settled in the bosom of society has fewer incentives to change the status quo. The outsider—someone who faces a personal sense of rejection or being different, or is actually in a place of social isolation—is not only in a position to experience new and novel experiences, but is more likely to spend more time in their own heads working these ideas through and seeing how they can be used.

I believe that there is one story in the world, and only one. We are caught—in our lives, in our thoughts, in our hungers and ambitions, in our avarice and cruelty, and in our kindness and generosity too—in a net of good and evil. There is no other story. A man, after he has brushed off the dust and chips of his life, will have left only the hard, clean questions: Was it good or was it evil? Have I done well or ill?

We’ve got to give ourselves to this struggle until the end. Nothing would be more tragic than to stop at this point. We’ve got to see it through. And when we have our fights, you need to be there. If it means leaving work, if it means leaving school—be there. Be concerned about your brothers and sisters. You may not be on strike. But either we go up together, or we go down together.

If the soul of the nation is to be saved, I believe that we must become its soul. There never was a higher call to greater service than in this protracted fight for social justice.

They are afraid because they accept fully what is violent and tragic in nature. It is a fear tied to their knowledge that sudden, cataclysmic events are as much a part of life, of really living, as are the moments when one pauses to look at something beautiful.

First feel fear, then get angry. Then go with your life into the fight.

“People get involved with the struggle for three reasons. Inspiration, Aspiration, and Desperation.

Those who are inspired to join the struggle do so because they feel affinity and empathy with others who struggle. The inspired celebrate the accomplishments of comrades in other organizations and encourage them to continue their struggles and strengthen their militancy. We know these comrades because their friendship and love can be felt through their work.

Those who join the struggle out of aspirations seek to see their reflection on the television, hear their voice on the radio, and read their words in the paper. They worm their way into positions of power through conniving or stepping on the necks of their comrades. The secrets you entrust them become weaponized gossip to gain social capital. They will find every excuse not to work with the masses or anyone.

The desperate become shooting stars as soon as they are affected by the struggle. They are fierce organizers until their personal fortunes change. They lump their support behind whoever can help in their personal cause but will not return the favor for others. Like every shooting star, they eventually burn out leaving their comrades behind to continue onward.”

You can see they have the willpower, these protesters but in actual fact, not much is happening. It is ironic that people gather after they have finished work to protest the injustices of capitalism. What is this? Group therapy? It’s a good idea but you have to go beyond it. When you live through a social movement, it makes an impression on you.

What I really want to know is will those people drinking Starbucks die with us on the barricades because the differences between guerrilla theater and guerrilla war are getting really blurry. It is unlikely that they will be willing to give up their entire lives when they are so clearly unwilling to give up even a portion of it in sacrifice for justice.

We are better off considering how bad things can get, so that we can make up our minds about it before it makes up our minds for us. The best way to avoid dystopia is to imagine it.

Insurrection calls upon us to no longer let ourselves be arranged, but to arrange ourselves, and set no glittering hopes on institutions. History does not march around as a logical imperative. We make it. By action or inaction, we make the future.

Your beliefs become your thoughts. Your thoughts become your words. Your words become your actions. Your actions become your habits. Your habits become your values. Your values become your destiny.

Ideas not coupled with action never become bigger than the brain cells they occupied. The human soul is the ideas and deeds left behind.

Persistence isn’t very glamorous. If genius is one percent inspiration and ninety-nine percent perspiration, then as a culture we tend to lionize the one percent. We love its flash and dazzle. But great power lies in the other ninety-nine percent.

True heroism is minutes, hours, weeks, year upon year of the quiet, precise, judicious exercise of probity and care with no one there to see or cheer. This is the world.

In these times when we are cut off from a context or a genuine culture that could nourish and encourage our humanity, many of us get trapped into taking what the consumer culture offers. Captive in a dehumanizing culture, this is the way we take care of ourselves. It is not the way free, dignified, sovereign people answer their rightful wants and needs.

Thus the first task is the daunting one; ending our existence as servile addicts and finding in ourselves the worthy and righteous man or woman who can refuse this America, and create the America worthy of our souls, and of the souls of all of us including those fervently joining in the politics of hate. This is not survivalism; it cannot be undertaken in order to be among the post-apocalyptic remnant. Being righteous is not being 'more righteous than thou.' It is serving the greatness inherent in the lowly individual soul, acting as the expressive organ for its aberrant goodness, a morality always checked against ego inflation by the impossible demand that one is—bottom line—supposed to counter and vanquish the crushing sense of personal unworthiness.

Could there be conscious community building that does not take our humanity as a given fact but as a process of becoming that must be carefully tended, nurtured, encouraged, and expected of each of us?

When you get what you want in your struggle for wealth,
And the world makes you King for a day,
Then go to the mirror and look at yourself,
And see what that guy has to say.

For it isn't your Father, or Mother, or Wife,
Who judgment upon you must pass.
The feller whose verdict counts most in your life
Is the guy staring back from the glass.

He's the fellow to please, never mind all the rest,
For he's with you clear up to the end,
And you've passed your most dangerous, difficult test
If the guy in the glass is your friend.

You may be like Jack Horner and chisel a plum,
And think you're a wonderful guy,
But the man in the glass says you're only a bum
If you can't look him straight in the eye.

You can fool the whole world down the pathway of years,
And get pats on the back as you pass,
But your final reward will be heartaches and tears
If you've cheated the guy in the glass.

There's no virtue in being better than your fellow man but rather the man you were.

I oppose war in the way I oppose dueling or blood feuds, not by supporting one side. I oppose the US-led arming of Western Asia the way I oppose pushing heroin in poor neighborhoods, not by wanting particular people to get it all. I oppose murder by police or soldiers in the way that I oppose capital punishment—that is: not because videos make my social media browsing unpleasant, but because people's lives are being taken.

“So no capitalism, no communism, then what? A resource based economy with the focus on technological advancement with wide access through automated production to the entire world population. We have the resources to achieve this, and be even less wasteful without even touching on asteroid mining. Profit holds the world back, holds everyone back.”

Look, I don't personally know how to tear down and rebuild society to create a fairer system. You're basically asking me a question that people have not been able to resolve for all of human history. Some of the greatest thinkers of all time have asked this question, and all of their solutions are wanting. Plato thought that you should create a class of philosopher kings who are purely rational and beyond personal bias or motive. Aristotle thought that only land owning men with an active stake in society were capable of making political decisions. Hobbes thought that people are inherently selfish and would kill one another without an absolute monarch. Rousseau thought the opposite. If the supposedly greatest Western minds of all time can't agree, how am I meant to just jot something out?

With that being said, I think that firstly we need to recognize that there is a problem, and what that problem is before you can try and solve it. Clearly the world has problems if people are starving when there is enough for all, and when some people are born to a life of endless toil and misery, while others can live lavishly their entire life and never lift a finger. Any solution would require that everyone has what they need, and deserves what they have.

The next economy will be defined by the struggle to get there.

Everyone's not going to get to the same place at the same time. I have no idea how we all get there, or how to counter missteps along the way, but solidarity is built by showing it, not by withholding it.

The greatest change we need to make is from consumption to production, even if on a small scale, in our own gardens. If only 10% of us do this, there is enough for everyone. Hence the futility of revolutionaries who have no gardens, who depend on the very system they attack, and who produce words and bullets, not food and shelter.

The elite very few who we rail about here, in wordspace, as we demonstrate our linguistic and polemical skills, picking up and examining little bits of the big picture. Judiciously examining the arrangement of the deck chairs on the Titanic, thinking maybe there is some way to change the orders to the unfortunate helmsman who directs the leviathan toward its fateful encounter with Murphy's Law. Hoping that someone in power will see the madness and make It stop. Because we recognize so many bits of 'The Problem,' and have cogitated over the various options and approaches to 'Making It Better.'

Disobedience, in the manner of Henry David Thoreau's act of opposition to slavery and to war with Mexico, is one option. Thoreau stated:

"Know all men by these presents that I, Henry Thoreau, do not wish to be regarded as a member of any incorporated society which I have not joined."

That is, when your country is 'no longer itself,' such an act of self-alienation is the justified action of a righteous man.

Thoreau's act of disobedience was not revolutionary. It is rather, refusal:

"I will live as if your world has ended, as indeed it deserves to end. I will live as if my gesture of refusing your world has destroyed it."

Thoreau's self-imposed exile to Walden was based on the need to create a society that he could willingly join.

"Henry Thoreau is like the wood god who solicits the wandering poet. Very seductive are the first steps from the town to the woods, but the End is want & madness."

There are two kinds of Buddhas. One kind figures out the meaning of life and comes back to society to help everyone learn it, and the other kind goes into the forest never to be heard from again.

We cannot afford to walk into the forest never to return. We may survive, we may eke out a living, but we will have betrayed all. We must take the hard path, the sacrificial path, we cannot hide in the trees, we must face our fears, take the blows for our brothers and sisters.

When you're acquiring a skill, you go through three phases.

Stage 1: Cognitive This is where you've learned the instructions, but haven't yet put any of it into practice. You get it in a rough sketch, but not reality.

Stage 2: Associative This is where you start implementing things and figuring things out and how it all fits together. You learn that there's some nuance the instructions didn't capture, and you're looking for better ways to put all the pieces together.

Stage 3: Automatization You've got the thing solved, and now you're just doing the muscle memory until it becomes perfectly streamlined and effortless. This is when things become 'mindless,' and it all just works.

On a broad scale, stage three is where a lot of people get and stay in life—I've figured things out and set myself in my rut and I can do this effortlessly until retirement! Nothing terribly wrong with that, it's a fine way to live. But stage two is where *everything* good happens. Discovery, innovation, refinement, creativity, *everything*! Asking 'why' over and over forever is hard fucking work, but you simply don't get to the good stuff if you stay entirely in stage three.

The most creative thinkers all exhibit certain common traits:

- An openness to one's inner life
- A preference for ambiguity and complexity
- An unusually high tolerance for disorder and disarray
- The ability to extract order from chaos

One of the traits found during a creativity study was that creative people are more introspective. But not only in the sense that they have an increased level of self-awareness, but that they also have a familiarity with the darker and more uncomfortable parts of their psyche.

You've probably read about the creative benefits of daydreaming, but one of the things that is rarely mentioned in these essays is the importance of

uninhibited daydreaming—not letting your brain filter the thoughts coming into your head.

In a subsequent study of creative writers it was found that the average writer was in the top 15% of the general population on all measures of psychopathy. But, strangely enough, these writers also scored extremely high on all measures of psychological health—meaning they were better equipped to deal with these thoughts and feelings. For most of us, those darker thoughts are filtered and tucked away. They don't serve us as good, law-abiding and moralistic citizens.

But, it's this full experience of the light and the dark, even if only in our heads, that fuels the creative mind. And the more we experience these thoughts, the more we're able to control them. Effectively, the creative mind is able to shape our experience not only through the external world, but with a deep synthesis of our imagination. It's why it's so common to hear creative individuals say that inspiration comes from within, not without.

I propose that these people have 'eaten their shadow' to a significant extent, as a part of their journey into that mature state. Another way to put it is that people under thirty-five cannot teach themselves or others to eat the shadow.

'Eating the shadow' or 'emotional work' is a quasi-Jungian idea that you have to not only face but also embrace the darker sides of your personality before you realize your potential.

Without this sting of otherness, without the terrible energies of the underside of health, sanity, sense, then nothing works or can work. I tell you that goodness—what we in our ordinary daylight selves call goodness: the ordinary, the decent—these are nothing without the hidden powers that pour forth continually from their shadow sides.

The petty, jealous, angry, manipulative, cowardly, cold, apathetic, et cetera sides of yourself actually prove key to becoming whomever you want to be: dynamic, powerful, wise, caring, clever. I'm not assuming we all want to be the same person, fill in your own virtuous adjectives.

So the person who has eaten his shadow spreads calmness, and shows more grief than anger. If the ancients were right that darkness contains intelligence and nourishment and even information, then the person who has eaten some of his or her shadow is more energetic as well as more intelligent.

When trying to understand present day capitalism, things like this shed light on possible avenues of expression that are more or less ignored in modern day culture. The melancholy most people feel, but successfully repress, due to the destruction of the environment and slow decay of once cherished institutions, needs to find a voice, not more distraction. But to

accomplish this, one has to experience being part of a greater whole. That one is not alone in this world.

All life is suffering, that is beyond doubt. How a culture expresses itself in addressing the consequences of that suffering determines the movement of history. Present day capitalism attempts to cover over the sorrows of living. It attempts to hide death in plain sight by destroying empathy in every form except that which reinforces the buying and selling of commodities. When the entire world is turned into a commodity, there is no room left for redemption. Commodities understood in these terms are lifeless things, and once they are used up, they are gone forever.

The way forward, out of our current malaise, will need to come from those who have passed through the fires of suffering and can embrace that suffering, instead of trying to ignore it, or trying with all their might to keep it at bay. Solidarity is found in that manner. It is the difference between acting in the field of love or of fear.

The glory of Empire is just one complex human artifice to mask the sorrows of living. This is why it is socialism, communism, anarchism, or nothing. The narrative that a well compensated elite will rise all boats is false. We all rise together, or we won't rise at all.

Knowledge comes from participation in the user group. Governance by those who have never been in the position of the governed is not going to be knowledgeable. Political science taught in the halls of Harvard—instead of the streets and homes of those most dependent and vulnerable to bad governance—was always going to be disastrous. Governance theory is never tested, there are no sandbox villages created to test different forms and monitor results. It is simply theory plucked from the echoes of dead white men and imposed arbitrarily on populations as 'governance by the people.' This governance is not from the community being coerced by it. Women are not interested in politics, say the studies which define politics as male politicians and ignore the fact that women are the backbone of real action-based governance the world over. Economists who have no knowledge of how the economy is practiced, especially in those parts outside the trade economy which are not recognized to exist, and governance theories by those who have no knowledge of how people form dependent societies to survive are increasingly being ignored

I notice that we have greater expectations for kids than we do adults for social behavior. It is rare that I've been in a meeting where people haven't started side conversations, taken out their phones, totally ignored the meeting, fallen asleep, et cetera. Yet we expect kids to sit for long periods of time being lectured to all day while being attentive the entire time. It drives me crazy how adults act versus their expectation of how the

child should behave.

It's the 'front-end loading' of cognitive heuristics. It's the same effect you see with initial hiring practices at companies, versus enforced work practices on the job. You're expected to be absolutely amazing on paper and in an interview, so that they don't have to watch you later. People expect their kids, and even more so other people's kids, to be 'setup properly' since you can't exactly 'unplug and plug them back in' if they turn out to be broken. Fire and forget. The school systems we know now were designed to produce literate labor, not well-rounded human beings. Hire that way and you elevate glib sociopaths; school that way and you train ticket punchers.

Now mind you, if what society needs are ticket-punching sociopaths, this really is the way to go. They're very easily motivated by checklists and gamification. It creates a predictable society.

Self-governance requires debate and free expression. For the first time, we have the communication infrastructure to enable societal auto-correction and self-governance which can scale globally. The battle for hearts and minds is the only battle that matters and the only war that matters is the one between the oligarchs globally and the people oppressed by them. The most important weapon is global communication and the most important freedom is freedom of thought.

The free sharing of information spurs innovation. It also calls into question existing capitalist regimes of property ownership and control, and the relations of production that privilege those who claim (rights to) value (as profit) over those who actually produce value. As is the case with much of cyber disobedience, what is really being challenged is a capitalist mode of production in which knowledge and the people who create it are rendered as commodities.

The fight over the Internet has happened before, almost step by step, with the fight over the printing press 550 years ago. As the Catholic Church lost its power to interpret reality, it attacked any usage of the new copying technology, up to and including the death penalty. What it is, is a fight over the power to tell the narrative—the ability to tell others what reality looks like, and the powerful institutions of today are fighting for their survival as they're losing this ability and becoming irrelevant and obsolete.

VPNs, Tor, encryption, surveillance—it's all part of a much bigger picture about a fight over the Power of Narrative.

I sometimes ask people to imagine how they would act if they could write all the world's news for a week, and all of it would be unquestionably accepted as true. This is the Power of Narrative, the ability to sort true from false for other people. If they could change people's perception of

themselves in any way imaginable and never have it questioned, what would they write?

Most people think in terms of making themselves attractive, successful, or rich. While a Power of Narrative allows that, it's not anywhere near its potential. If you controlled what other people knew about you, you wouldn't need money ever again. You could be a walking god among men—literally, as far as other people were concerned. If you can control what other people perceive as true and false, you can have nobody ever act against you, and have them think they're acting in their own interest. It's the greatest conceivable power in a society.

This is the Power of Narrative. And this power used to reside with a couple of big institutions that are really annoyed at everything about the Internet, because it breaks their power to portray themselves as Really Important. When people can circumvent their storytelling and egos, the painted facade breaks down quickly.

This is exactly what happened with the printing press. The Catholic Church, being the only manufacturer of new books through their monasteries, had held complete Power of Narrative, augmented by the fact that all books were in Latin, and that only the clergy could read Latin and interpret it to the masses. It's not hard to see where a few people would exploit that advantage. That's also exactly what happened.

To raise funds, the Catholic Church came up with the idea of selling salvation, which had no basis whatsoever in any of the guiding books. But as those books were in Latin, nobody knew except the clergy. One of them did protest, a priest named Martin Luther. On the surface, he attacked the corruption within the Church that enabled the practice of raising money by selling salvation. Digging a little deeper, he attacked the gatekeeper position the Church held over knowledge, a gatekeeper position that allowed them to put forward such a message in the first place.

One of the consequences of Luther's objections was the Luther Bible, which was printed using the relatively new technology of the printing press. Bibles started appearing by the cartload—but in German and French instead of in Latin. Practically overnight, the Catholic Church had lost its Power of Narrative, as people were able to read the bible themselves, in their own language; they no longer relied on the clergy to interpret it for them.

This led to over 100 years of civil war across the Western world—triggered by publishing a particular book in large quantities using a new technology in a language that people could read directly, instead of relying on a gatekeeper of knowledge to interpret it for them. Over a century of war. That's how much power there is in the gatekeeper position of knowledge.

In response to this publication, the Catholic Church attacked the tech-

nology of the printing press mercilessly. As the Church and Crown were generally in a symbiosis in most European countries at the time, with the Crown getting the legitimacy of its power through validation of the Church, the Church had a far-reaching ability to lobby for new laws when it perceived an existential threat.

And so, the printing press was gradually criminalized, and penalties gradually ratcheted up, until on January 13, 1535, in France, the death penalty was instituted for any use of a printing press. The official justification for the law was “to prevent the spread and dissemination of dangerous ideas.”

Now, let’s recap here: Powerful institutions are so scared of unauthorized copying that circumvents their Power of Narrative, that they push for harsher and harsher penalties for using the technology that enables circumventing them. Does any of this sound familiar?

All of this has happened before, and all of this will happen again.

The printing press is what led to the American Revolution. Any time there has been an information revolution a political/progressive revolution was to follow because of the free flow of ideas. It is part of the growth of humankind. It is the same thing here. The elite are afraid of the ideas that the Internet—and now the internet in our pockets—provide. Giving them the keys to control discourse and the flow of ideas is giving them the power to potentially interrupt the evolution of our species.

“They represented the most dangerous revolutionary idea of all—the one that refused to be crushed.”

I think for many people it is effectively ‘bearing arms.’ The ability to stream live video and audio from the scene of any government activity by any citizen is a huge burr in their ass. If one subscribes to the enumeration of a right to bear arms being meant to enable the citizenry to possibly defend against governmental tyranny then it’s not a long stretch to see the cellphone as the modern day equivalent of the musket of colonial times.

The history is long—Marconi developed radio for the Royal Navy, Berners-Lee the Web protocols for CERN. Past Department of Defense (DoD) research has resulted in revolutionary technological capabilities such as radar, digital computers, wireless mobile communications, lasers, fiber optics, composite materials, the Internet (and other ‘packet switched’ networks), and satellite navigation. Private businesses dominate overall spending on research and development (R&D), responsible for 67 percent of the total. However, on basic R&D, studying subjects with no immediate commercial value and sometimes discovering basic new technologies, the federal government together with the university system hugely dominate at 72 percent.

The point of course isn't that the military should have discretion on where it spends its hundreds upon hundreds of billions of dollars each year, or that the warped pitiless nightmare of modern war is worth it for its high-tech spin-offs. The point is that the public setting is the natural space for scientific and technological research, providing the funding, managing the long-run research uncertainty, and maybe imposing some publicly-demanded constraints on what can be done with the tech.

Not only is technology too important to be left to the technology industry, it didn't even come from them in the first place. A movement for online socialism would demand that the crucial platforms be socialized—brought under the control of the people who run them and make them successful—the engineers, phone industry workers, and all of us content creators. We could decide democratically the broad direction of future research, the limits to use of our personal data, and use the potential of the Internet for its most positive educational and fulfillment possibilities. And we could tell the 1% just what the fucking Terms of Service are.

The politics of technology is a little understood defining force in the history of the species and with this new generation of technology, we better come to understand it. Technology does indeed act, industrial technology created capitalism, the automobile created the suburbs, broadcast media created pop culture—all elements of politics. We are now at a point where a new generation of technology is creating an entirely new environment.

Established stories, the cultural beliefs of how the world works, are significant tools of power—have been across history. What's been missing is all technology comes with some sort of politics. Presently, the world grows ever more unstable as the stories and culture, particularly those concerning economics of the last few centuries, fail to accurately account the plot, while technology evolves ever more rapidly. Clinging ever tighter to failing schools of thought isn't going to help anyone.

I know that the idea is to begin at the edges and work your way in toward the center, but as long as there are politicians standing at the center with their arms folded, what happens at the edges will stay at the edges. We can start all the organic farms we want, but we couldn't stop Congress from declaring pizza sauce a vegetable. Local, small-scale change is great, but against the immense power of coordinated wealth—the lobbyists, the super-PACs, the billionaires—the start-up model does not amount to very much. You may not be interested in politics, but politics is interested in you. Withdrawing from it doesn't make it go away.

Millennials did not invent the culture of creative, socially-engaged entrepreneurship, which has been around for at least a couple of decades. So think about the way that things have changed over the last twenty years.

Think about the way they've changed in terms of technology and food—the areas that culture cares about the most. Smartphones, iPads, farmers' markets, sustainable agriculture—great, right? Great for those who can afford them, anyway. Now think about the way they've changed in terms of politics and economics—the things with which that culture refuses to dirty its hands. The Iraq War, Citizens United, the financial crisis, ever-widening inequality. That doesn't look to me like such a great deal. While the “creative class” is busy playing with its toys, the world is circling the drain.

Tools are value-neutral. Revolutions in our tools—the kind that have been wrought by Facebook, Apple, Google, and so forth, the kind so many young people dream of making, as they work on their gadgets and apps—do not necessarily alter the structure of society, and certainly not necessarily for the better. But how many, in today's young generation, even think of altering the structure of society, or would want to if they did? “Work within the system” is the ethos. Forget about ideals and ideologies and big ideas, those scourges of the twentieth century. Just pick a problem and go to work on it. The notion is technocratic, and bespeaks the kind of technocratic education students get today. No holistic thinking is involved, no speculation as to fundamental ends. The world, like a test, consists of a series of discrete problems, and all we need to do is get out there and solve them. Better clean technologies, improved access to drinking water, more effective schools (ace your classes, do your service projects, start a club or two): check, check, check.

Tackling such issues is both valuable and admirable. But is it enough? That system that you want to work within: what if it is the problem? Can we fix our schools without addressing inequality? Can we help to lift developing countries out of poverty without reforming global trade? Can we deal with climate change by altering consumer behavior, or is the source of our environmental crisis not consumerism itself? And underneath these questions, what's our vision of the world toward which we're working in the first place? Is it just a slightly better version of the one we have today? What values are we operating from, before we get to the solutions that express them? You can banish talk of ideologies and governing ideas, but not the things themselves. The only question is whether you are conscious of your own. If not, you've probably just adopted those that happen to be fashionable now, and you almost certainly aren't aware of how they shape the way you think and act.

Cyber disobedience emphasizes direct action—rather than protest, appeals to authority, or simply registering dissent—which directly impedes that capacities of economic and political elites to plan, pursue, or carry out activities that would harm non-elites or restrict the freedoms of people in

non-elite communities. Cyber disobedience, unlike much of conventional activism or even civil disobedience, does not restrict actions on the basis of state or corporate acceptance or legitimacy or in terms of legality—which many view largely as biased, corrupt, mechanisms of elite rule.

Often the organizing methods used are unfamiliar or unrecognizable to outsiders, even informed commentators, because they do not pursue the hierarchical command structures of mainstream political or corporate organizations. They do not have instituted leadership positions or roles, hierarchical structures, or authoritarian (leader/follower, boss/subordinate) command processes. Often decisions are made on a participatory basis in which all involved are able to discuss plans. In other cases there is full autonomy of action such that any member or collective can take action as it sees fit, as long as they are accountable for their own actions. Collectives are often formed on the basis of affinity and trust, so that people work on projects with those they have a direct connection with and commitment to.

These organizing practices, from affinity groups to participatory democracy to horizontal structures, are precisely the practices that have characterized anarchist movements historically. Thus whether implicitly or explicitly, the cyber disobedient represent a form of organizational—if not philosophical—anarchism. This horizontal, participatory, decentralized organizing is perhaps more in keeping with the desires for personal liberty, authenticity, and action desired by a younger generation of people concerned about social justice. Such organizing provides an opportunity for people who believe their voices have been silenced by status quo politics to actually have a voice. Indeed, even organizational approaches that have marked the political Left up to the present period have tended to be rather hierarchical, even bureaucratic, and representational, whether one refers to social democratic political parties, communist parties, or trade unions. Anarchy has always posed an alternative to such organizational forms within the Left. A central component of anarchist perspectives is the belief that means and ends of politics should correspond. Thus in anarchist political organizing, a radical approach to form can be as important as content.

The word ‘anarchy’ is derived from the ancient Greek word *anarchos* and means, rather than chaos or disorder, simply “without a ruler.” While rulers, not at all surprisingly, promote fears that the end of their rule will inevitably lead to a social decline into chaos and turmoil, anarchists assert that rule—economic or political—is unnecessary for the preservation of order. Rather than a descent into Hobbes’ mythical war of all against all, a society without government suggests to anarchists the very context for creative and peaceful human relations. Pierre-Joseph Proudhon, the first to identify positively his social theory as anarchist, succinctly summed up the

anarchist position in his famous slogan:

“Anarchy is Order”

This is symbolically represented by contemporary anarchists in the ‘circle-A.’

The anarchist was the constructed devil of the American civic religion of the late nineteenth century. It was made the bogeyman to guard the borders of the political allegiances, loyalties, and obedience of American citizens. The popular portrayal of the anarchist as terrorist made a comeback in North America in the period of the Red Scare of 1919. Indeed, most have forgotten that, despite the impact of the Russian Revolution of 1917, that Red Scare was targeted not at Communists but at anarchists and syndicalists (or anarchist unionists). The Red Scare and the state repression enacted under the Palmer raids, initiated by Attorney General Mitchell Palmer, which included the deportation of foreign born activists, decimated the radical movements of the day, in particular the anarchists and the Industrial Workers of the World. Indeed, in some ways, these movements never recovered to reach the levels of influence and achievement they previously enjoyed.

The intensity of Red scares far exceeds the actual threat the scapegoat groups represent. This makes sense, insofar as the primary object of these campaigns is not to defeat the weak and resourceless enemy but to win favor for elements within the governing elite and to accomplish the ideological rearmament of a population.

For anarchists, the regulatory and supervisory mechanisms of state capital are especially suited to producing docile and dependent subjects. Through institutions like courts and prisons, but also social work and psychology, authorities extend practices of ruling from control over bodies to influence over minds. Moral regulation, and unquestioned respect for laws, provides a subtle means for nurturing repression and conformity. The result is relations of dependence rather than self-determination as the externalized practices of the state increasingly come to be viewed as the only legitimate mechanisms for solving disputes or addressing social needs. For anarchists the ‘rule of law’ administered through the institutions of the state, typically on behalf of capital, is not the guarantor of freedom, but, rather, freedom’s enemy. Such practices close off alternative avenues for human interaction, creativity, and community while corralling more and more people within the bounds of state capital.

And we would be wise to remember a point that all anarchists make, and have always made—that state-sanctioned rights are subject to withdrawal whenever the state decides (especially if it feels threatened). They are untrustworthy rights indeed.

In this repressive context many activists in liberal democracies have concluded simply being present in the streets is treated as a criminal act during times of protest. This has been borne out in recent protest events like Washington, D.C., Miami, London, Toronto, and Athens. During the time of the protests against the G20 meetings of global elites in Toronto in 2010, more than a thousand people were subjected to the discredited practice of kettling, in which all people on the streets in an area are rounded up in side streets by police and forbidden to leave. They are all then arrested, regardless of their actions, reasons for being there, or demeanor or perceived threat. Under such circumstances activists have come to question the value, efficiency, or legitimacy of civil disobedience as a means to voice dissent, let alone to effect any real social change. As some suggest, when protest becomes criminal, only criminals will protest.

Some activists have concluded that the only means by which to stop harmful corporate or government practices is, not by appeal to the conscience of economic or political elites who seem, in any event, to have no conscience, or to shame them, since they also seem to have no shame, but rather to act directly to make it impossible to carry out their plans. This is the approach advocated by anarchists. The approach of direct action—on the streets, or online. They reject notions taken up by much of the political Left—even as alternative globalization movements grow—that revolutionary politics, radical social transformations, are no longer possible. While union leaders and even community activists, who should know better, scream for legality of protest, and seek to comfort police and politicians with apologies for direct action or anti-corporate property damage, the cyber disobedients identify legality as what it is: the screen that hides and protects power.

Any movement that seeks a radical—i.e. one that gets to the roots of social problems—change in social structures (and the abolition of specific systems, institutions, or tools of oppression or repression) will be susceptible to charges that they are destructive. Which, in a literal, if limited, sense, they are. Movements like anarchism, which explicitly seeks to end all systemic forms of exploitative authority are perhaps especially likely to be subjected to such claims and vulnerable to having such accusations stick. The early anarchist theorist Mikhail Bakunin famously claimed:

“The passion for destruction is also a creative passion.”

By this is implied rather straightforwardly that the vision of the social critic or activist seeks a remaking of social relations. As a sculptor must often rework an earlier piece, taking apart the unsatisfactory aspects to build it up again, so too the social critic seeks not the end of society but a

reworking, a remolding, of social life—to create something new, hopefully better.

“Revolution is a word that no longer means anything. If you don’t live it on a daily basis, there’s no point. Your life expectancy is 70 years. There’s little chance you’ll one day experience a global revolution.”

Actions Have Consequences

The great thing about relativism is that it allows us to see the perspective of the other side by suspending our judgment until gathering more information. However, we should not suspend our judgment indefinitely. There is this societal pressure of political correctness to always be accepting and never judgmental, but when judgment comes from a deep place of understanding and true discernment, then judgment is a good thing.

It's always a sound principle that whatever we would not personally do ourselves, whatever we would find abhorrent and unconscionable, we should not allow to be done on our behalf or in furtherance of industries we patronize

Consequentialism, the idea that we should base our actions on the good or bad of the expected consequences, has always been very troubling to philosophy professors, possibly because of some of these reasons:

- It leaves ethics up to humans without any sort of pseudo-divine guidance.
- It means otherwise brilliant people like Immanuel Kant were quite wrong.
- Concluding that consequentialism is the way to go would eliminate the entire academic discipline of debating what is the way to go.

One way to supposedly knock down consequentialism is to propose that if torturing one child could somehow provide pleasure to a million people you would have to do it. But this is simplistic in the extreme. The pain of torture is far greater than the supposed pleasure of watching it. More significantly, this calculation, like all of them, assumes that two minutes after the action in question the world will cease to exist. In a world that continues to exist, significant harm can be expected from the act of encouraging a million people to enjoy watching torture—why in the world would we expect them to stop at one instance of it? And what of the fear that would be instilled in billions of children and their loved ones by a power structure that maintained the right to grab children and torture them? These consequences are, together with the one child's suffering, exactly what make the supposed non-consequentialist object to the horror of the torture; and they are just that: consequences.

A more typical argument against consequentialism is even less persuasive, because it assumes the possession of impossible knowledge, in addition to ignoring medium- and long-term consequences. Such are the ticking time

bomb scenarios and the trolley problems that obsess legions of academics across and beyond the United States, and which contribute to the acceptance of “collateral damage” by the US military and the people who fund it. Wikipedia notes something critical about the ticking time-bomb stories, while dismissing the point as irrelevant:

“As a thought experiment, there is no need that the scenario be plausible; it need only serve to highlight ethical considerations.”

Hmm. How about ethically considering the consequences of filling people’s minds and television dramas with scenarios that are not plausible? Television crime dramas have been shown to shape people’s political views on crime. Shows pretend that ticking time-bomb scenarios, in which torture will save many lives, are everyday occurrences. In fact, they exist and are only likely to ever exist, in fantasy.

In reality, one never has the knowledge that an individual knows how to stop a bomb, that the bomb will soon go off if not stopped, and that the best way to get the truth out of the individual is torture. Torture usually elicits falsehoods or nothing, and no scenario is more likely to do that than one in which the torture victim need only endure a short amount of time in order to accomplish his or her goal.

There are problems with so-called “act consequentialism” as opposed to “rule consequentialism.” Act consequentialists are purists: they believe that each action should be considered on its own merits, with the one simple idea of increasing well-being. But not only does this pose the considerable practical problem that most people will likely be pretty bad at anticipating the consequences of their actions; it would also make social life virtually impossible. It might make sense to lie to a murderer, but if there were no rules about lying it would be difficult to trust anyone—even the lie to the murderer would be ineffective. Similarly, it might in one case seem right for a mother to sacrifice her child so that ten strangers could live, but a society in which mothers were always eager to sacrifice their children for strangers would be dreadful, so better to have a rule favoring maternal love and let the occasional stranger perish.

Philosophers have so far only interpreted the world in various ways; the point is to change it.

One day a couple of weeks ago I was reading while driving to the local convenience store, and I accidentally drove right through the front glass wall of the store, smashing up some shelves of junk food. After I’d made

my purchases, a police officer stopped me and asked if I'd intended to drive into the store.

"Oh, not at all," I replied. "I intended to get here as quickly as possible while also educating myself as quickly as possible. I knew I might crash, of course, but that wasn't part of my intention."

"Well," the cop replied. "Where should we send the check for your car repair?"

"I'll let you know," I replied, a bit annoyed by the hassle.

My brother in law repaired my car for not much more than \$100,000, and all it still needed was to be repainted. So, I took a giant paint sprayer with me and parked the car in front of my neighbor's house, the one with the loud dog. When I'd finished painting the car, there was a rough shape of its profile on the front of my neighbor's house, surrounded by fresh purple paint. I pinned a note to the door letting him know that my intention had been only to paint the car and not his house.

The new collateral damage laws we've been living under for the past year have really been working out great, as far as I'm concerned. We don't let it get out of hand, though. Only property damage is excusable using arguments—what a few radicals have described as "bullshit medieval arguments"—about what we really intended and what we "merely knew was going to happen." Damage or death to people or animals is not included in the law.

I've heard tell, though, that there is another world somewhere in which, believe it or not, the exact opposite is true. In that world, if I were to damage someone's property and argue about "just intentions" or "proportional collateral damage," I'd be punished for the destruction I'd caused and possibly locked up for my delusional state of mind.

But, in stark contrast, if I were to blow up some poor guy who dressed suspiciously with a missile from a drone, even though eight other guys who dressed acceptably were standing next to him, well that'd be totally cool. Or if I were to bomb an entire city flat because its people were suffering under the rule of a brutal dictator I'd stopped supporting and arming last month, that'd just be good patriotic citizenship.

Now, I'm not going to swear to you that this crazy world exists, but I have reports on it from numerous credible sources. I even have recent reports from several people that an ancient institution in this world—they call it the Catholic Church—is dropping its support for using "collateral damage" to excuse murder, while the rest of the society is just going ahead with mindlessly accepting it anyway.

Regardless, however, of whether such a place is real, the manner in which its customs shock us should wake us up to the possibility that our own might

shock someone else, and that we should never accept traditional customs without thinking them through for ourselves.

Society consists of a small proportion of evil or simply ignorant powerful barbarians and a huge number of little savages, they too either evil or ignorant.

It is nearly certain that some of the barbarians will need to die, there can be no doubt. Their ideology is simply too violent, their desire to retain power too great, they will not accept any other way; to waste time trying is to sentence billions to years of additional suffering needlessly.

The little savages are dangerous, but one should seek to minimize the physical harm to them, if not for moral reasons, then for simple tactical and PR concerns. There are of course exceptions to this, self-defense being the most obvious; one must decide for themselves what situations warrant.

Now this is not to say that no type of harm can be brought to the little savages. Infrastructure attacks will have a disproportionate effect on the little savages and their daily lives. This is not only a perfectly legitimate tactic, but one of the most powerful, as it opens up using the little savages' discontent to your advantage. The discontent will cause harsher tactics to be used against you, but these will also end up having side effects for the little savages as well.

Let us examine a recent case. While 9/11 resulted in large amounts of military force being directed upon al-Qaeda, it also resulted in a buildup and increase in force projected upon the domestic population as well, increasing discontent and government spending at all levels. Decreased levels of service and infrastructure quality, removal of safety nets, harsher police tactics, invasive surveillance, all focused on the little savages. Discontent grows and you do two things: you increase recruitment to your cause due to the harsher tactics being used against you and the resulting collateral damage (victim) and some of the little savages begin to turn against the barbarians.

Different types of winning, different concepts of what is success. Understanding of this is what is lacking. When facing an overwhelming, supremely powerful opposition, winning changes—what it means, what it is, what it looks like. Winning becomes simply the removal of the opposing force. Now this is not the entire war, but simply the first phase of it, this is often forgotten and we see nothing but the same barbarians, just with a different name, returning to power. With the force removed, you must continue to fight, the force was simply the first obstacle that must be overcome, we figured out how to get the spaceship out of the atmosphere and into an unstable orbit, now we need to figure out how to get it to the moon or we'll crash back down to the same planet or perish in the vacuum.

And make no mistake, this is an overwhelming force which must be

removed. There will be no great peaceful exchange of power, not into the hands which will be necessary to propel us forward. There is simply no way in which you can dismantle the structure piecemeal, the cancer just grows back. Complete overhaul or removal is necessary.

Now of course overhaul is the preferred choice for many, because for them it is associated with peace, rational thinking, civil debate. Unfortunately the existing barbarians do not do these things. The number of individuals required to be converted in order to replace these barbarians and to implement such radical change is enormous. The number is so large that it is nigh impossible to do so given the power and resources—both propaganda and punishment—available to the current barbarians. And history has shown that they have no hesitation when using it.

Removal on the other hand requires much less manpower. You still need to convert a large number of individuals after removal, but even that process becomes somewhat easier (communications problems notwithstanding) after removal. Removal, especially in a country relatively prone to instability given the correct circumstances, can be accomplished with small, decentralized groups and acts. With removal, you seek to simply create discomfort and instability for the little savages, while also sowing a healthy level of personal fear in the minds of the barbarians. You cannot win a direct conflict with them, though they will certainly use propaganda to goad you into one on grounds of morality, honor, civility, et cetera. Do not be tempted. You are better than they are. You are weak, they are strong. You have no power, they set policies. You work within an imperfect system with limited resources, they design the system and control the resources. And yet they oppress, they are violent, they kill, they maim, they torture, they demean, they segregate, they do this with their resources, with the system they created, with their so-called advanced education. No my friends, you cannot possibly be as bad as them.

The real problem is that it's such a half truth.

If someone went out and killed Ed Kurtz (that former emergency manager who started this particular crisis) at this point in time, nothing would be solved. Some people might feel vindicated, but the Flint water crisis would continue and nothing of value would be gained.

If someone started offing people who are prolonging this crisis for personal gain, or whatever, then maybe something would be gained. Again, you really don't know until it happens and the fallout clears. It's a gamble, but that's why people don't revolt at first sign of inconvenience or even straight abuse.

One of my favorite Rage Against the Machine songs puts it in an easy to digest way:

“Hungry people don’t stay hungry for long. They get hope from fire and smoke as the wheat grows strong”

You have to be without any other option, starving—whether for food or justice—to want to gamble with your life to end such radical abuse. And even then it isn’t as simple as picking up a firearm and offing someone. It takes coordination.

The entire premise of America’s parochial narrative is *we the people; for the people; Posse Comitatus*—it’s about the people and their duty, obligation, armed requirement to hold government accountable. And what happened? Peaceful protest.

The entire premise of a well functioning democracy is a state beholden to the people which *only* functions out of the fear of violence. The *second* that violence was rescinded for peace the vote became meaningless.

What happens when the people you vote for betray you, imprison you, steal from you, poison and kill you, and there is absolutely no repercussion for that? The only possible repercussion is being voted out but no one cares enough to sway the votes?

Peaceful protest is the single most dangerous thing to ever happen to democracy. *Ever*. There is a reason why we have and need revolution.

The usefulness of the Second Amendment would be in a large amount of people marching on D.C. armed, many of them vets; that type of image tends to have a great deal of power in this country thanks to its propaganda systems. Individually gun possession would do squat here, but collectively it would do a great deal and was part of why firearm ownership was enshrined in the bill of rights; an economically violent sovereign had just had its influence curbed and another sovereignty set up precisely because the victims of this economic violence were able to resort to collective physical violence to stop it. A few armed farmers a continental army doth not make.

“Are we supposed to build some fighter jets out of sticks and stones?”

Firstly, such a rebellion probably won’t be fighting the military in the first place. The military (probably? hopefully?) has too much honor to fight the people they’re sworn to. The military takes its oaths, honor, and purpose a lot more seriously than the police do. A rebellion will be fighting the police, who—while militarizing at an alarming pace—do not possess the insurmountable war machines. The police don’t possess fighter jets, and their “tanks” are actually armored personnel carriers that are more resistant to small arms fire rather than impervious like an Abrams. A

Molotov cocktail isn't worth much against an Abrams, but a well-placed one is actually a pretty serious threat to a police APC. And there are a lot more citizens than police.

Secondly, even should the military intervene, a rebelling populace shouldn't fight things like tanks and fighter jets directly. You combat these things by cutting their supply lines, denying them the fuel they voraciously consume, denying them the munitions that make them more than a bulldozer or flying sports car, killing the operators while they're not in the vehicles, killing the maintenance crews that need to perform tens of hours of maintenance for every one hour of operation.

Only fools who have no concept of modern war take that position. I'm sorry but if you think this, you simply do not understand military conflict in the twenty-first century or historically. Who do you think installs and maintains the tanks, the aircraft, and other weapons of war that the military owns? Civilians! I'd suggest that since a very large number of these are installed and maintained by civilian contractors, oftentimes veterans who did the same job in the military, that say, in a hypothetical situation where the federal government becomes overtly tyrannical and begins the almost certain mass arrests and imprisonment of political/ideological opponents, it's not too great a stretch of the imagination to think that many of these weapons systems—along with their communications and logistics—would be actively sabotaged. Yes, an AC-130 gunship can devastate a neighborhood from 30,000 ft, but not if it's grounded because the hydraulics and avionics are busted, and all the spares are bad.

Allow me to give you a few examples that will quickly show you the reality of the situation, which is that the US military stands no chance what-so-ever against even a moderate proportion of the civilian population rebelling.

- **Iraq and Afghanistan:** In over 10 years resistance has never been stamped out, in countries with much smaller populations than ours (both less than one-tenth), despite our massive technological advantages. This is with significant infighting in both countries.
- **Vietnam:** A country of less than one-tenth our population was subjected to more bombing than was used in all of WWII and began the conflict less well armed than the US public is now. Despite this, in the end the North Vietnamese ultimately prevailed.

There are countless more examples from all across the globe from Russia to Nicaragua, from Columbia to Kurdistan that unequivocally show armed

populations can crush organized militaries, or at the very least resist them effectively for extended periods of time.

So let's assume the order is given to take America by force. Almost 100 million Americans are armed (the number of which would likely grow in this event) with approximately 350,000,000 guns including almost 500,000 machine guns (although to be fair most are sub-machine guns). You'd have to do this with a combined army and police force (including reserves) of a little over two million (assuming no desertion or refusal of orders). Mass defection and resistance from within the military and police would be very common. These US soldiers have families and friends in the civilian world, and many are dedicated to not engaging those targets with violence. There would be massive resistance in the ranks, it would be at best chaos. However even if this were *not* the case and it was an army of automatons, the sheer number of armed citizens would be so overwhelming as for it not to matter much.

That's not to say any conflict wouldn't be a *brutal* and *costly* affair, but with enough participants from the public the conclusion would be forgone. So, there are 100 million gun owners in the US, if even 1% "plays Rambo," as anti-gunners like to say, that's a million people. One percent! Do you know how many law enforcement people there are in the entire country? It may indeed be the case that the citizenry stands no chance against the might of the government, but if there is any chance at all, it will be with guns rather than without them. That itself is reason enough to insist that the populace remain armed.

As Goebbels said after the Jewish Warsaw revolt in World War II:

"This just shows what you can expect from Jews if they lay hands on weapons."

Afghanistan, Iraq, and Vietnam show that one should not so easily discount the difficulties of winning a protracted, asymmetric ground war fought by zealous insurgents who blend in with the local population. The fact that our military has such powerful weapons that the citizenry lacks doesn't negate the Second Amendment, but spotlights that the 2nd has been trampled too much already.

Finally, who in the world can predict what will come to pass? We can barely predict the political winds of tomorrow—how are we supposed to predict the future, say, one-hundred years hence? Simply put: we can't. Gun ownership serves as a means of hedging our bets in case things go to hell. After all, no sensible German could have imagined in 1840 that in just 100 years, the government would round up millions of people and attempt to exterminate them.

“How we burned in the prison camps later thinking: What would things have been like if every police operative, when he went out at night to make an arrest, had been uncertain whether he would return alive? If during periods of mass arrests people had not simply sat there in their lairs, paling with terror at every bang of the downstairs door and at every step on the staircase, but had understood they had nothing to lose and had boldly set up in the downstairs hall an ambush of half a dozen people with axes, hammers, pokers, or whatever was at hand? The organs would very quickly have suffered a shortage of officers and, notwithstanding all of Stalin’s thirst, the cursed machine would have ground to a halt. If . . . if . . . We didn’t love freedom enough. And even more—we had no awareness of the real situation. We purely and simply deserved everything that happened afterward.”

All I know is the time for each and every one of us to take a stand is fast approaching. Whether that means defending yourself or standing with like-minded individuals and taking the fight to them is up to you. It would definitely be wise to know what you would do in case thugs start kicking down your doors; for example, rig explosives around choke points. Way I see it, if even one in a hundred of us does that, there would be no more thug enforcers left if they rely on storm tactics. Entire squad kicking down your door huddled outside? One IED would take out the manpower needed to oppress hundreds if not thousands.

Remember friends, there are four kinds of homicide:

1. Felonious
2. Excusable
3. Justifiable
4. Praiseworthy

Those men are surrounded by others who could kill them but don’t because they are traitors to humanity, and those men are surrounded by men who are traitors, and so on, every day the world could be made better by men who choose to do nothing. When you don’t punish people for the wrong they do in front of you, this shit happens.

The solution is in punishing every act of selfishness and injustice in service of power that you see. This is a war, you already knew that.

A badge might make you immune to the law, but it sure as fuck doesn't make you immune to bullets.

“We need to end unconstitutional government surveillance.”

We've tried about three times to do so already, each time it only gets worse or the issue is downplayed by the mainstream media. It is portrayed as a non-issue because the media is corrupted by the same influences as the government. The media and our government is bought and paid for.

“So we need to get the money out of politics.”

Right, but that isn't easy when those with power, those individuals who hold office already, are the ones influenced by corporate lobbying and special interests. Nothing can be changed because it's a conflict of interest to be in favor of getting money out of politics while receiving kickbacks for being a corrupt politician. They stay wealthy as long as they hold office and keep the money coming in.

“So why don't we protest, we should assemble and demand that these leaders step down.”

Because those who protest risk losing their jobs. The middle class is shrinking, jobs are being lost overseas and to automation, and wages are lower than ever. If one protests, they risk being branded as an outsider or trouble-maker, or even the possibility of being arrested. That would definitely cost someone their job, their paycheck, their home and car, their life would be ruined because they protested the corruption our government is protecting. Few can afford to take a day off and protest, and even fewer can take the risks associated with assembling and participating in a protest.

“So why don't we advocate for fairer wages and bring back jobs to the United States? We could possibly get the public to a point where protesting is an option. Or maybe it's hopeless to be peaceful and follow the rules. Maybe we should take up arms and steal back our freedom by force. Or maybe I should just leave the country.”

It feels so tiring. Such an enormous to-do list that can never be completed. Too much corruption, too many layers of rotting infrastructure and legislation to fight. It's so demoralizing, disheartening, and really makes you wonder if anything will ever change. I know I'm not the only one who feels this way.

I hope it's not too late for you America.

I don't know about your personal situation, maybe you're just blinded by ideological programming. But the idea that standing up to injustice isn't worth it because it might make us uncomfortable for a little while is just insane. France had to go through the Reign of Terror to get rid of their monarchy, but both the country itself and the entire world is better off for it. They didn't 'engage with the system' because there's no point playing a game of chess when all your pieces are pawns. The game was fundamentally rigged and unjust, and they changed it. And it's a similar story today.

"I'm blinded by ideological programming and, what, you somehow can see through the bullshit and know the truth?"

I don't mean to be condescending—or egotistical—but I don't think anyone can read a half-way decent critical analysis of the neoliberal capitalism we live under and not find fundamental flaws in the very foundations of the system.

"Do the poor live in remotely the same level of conditions?"

Such a tired and irrelevant point. Did the pre-Revolution poor live in the same conditions as the Dark Ages? *Technological advancement exists independent of the economic system it takes place in*; fascism and feudalism proved this.

"We can still turn the ship around with reform and engagement and protest."

Except that has pretty much never worked. It's an ugly truth but essentially all great leaps forward in human civilization have been propelled by the use of force.

"Revolutions occur when a critical threshold is reach of people who cannot feed themselves."

Revolutions occur when people get sick of the ruling class. England's economy was doing fine when the people decided to cut off Charles' head. The economy and general quality of life in Ireland was at an all-time high when they decided to go to war with the British. Look at Northern Ireland in the 60s: no one was close to starving but nationalist communities were poor and downtrodden so they decided to take up arms against the police and the military. A similar situation is developing in the US right now.

There is plenty of room in the present situation for enough people to decide that a handful of elites don't deserve to hoard half of the world's resources. It's much more difficult now, but that's down to a number of different factors.

It's almost comforting, in a way, to imagine yourself as a pawn. There's no moral duty involved: The evil plan is grand and inscrutable; it gives a sense of order in what looks like disintegration, and tells you what your place is in it. But there is a moral duty, and we need to face up to it. And maybe, just maybe, sometimes the people in charge are just as blinkered as we are.

I really don't think you can make any case for the US system as such, it's just too cruel, involves too much poverty, homelessness, hunger. It's just too inhumane. Not to mention too plutocratic, being actually quite undemocratic. It fails all measures of an ethical system.

We kill each other with rocks and sticks while the ones we want to kill have the armor and the swords

The world is ruled by violent thugs, this is true. I suggest we change that, starting now.

Shame. Shame. Shame.

The authority of the US government is null and void; and has been for quite some time, if it ever existed. It is an immoral act to support this system in any way, passively or actively. The social contract has been broken. Nothing is owed, they have already destroyed the rule of law, an attack on them does no more harm and can only possibly help make things better for the oppressed and disempowered.

Your entire situation is horribly unfair, and it's difficult to argue why you should keep playing by rules that failed you. It is unfortunate that the comfortable and selfish have taken us to this destination. Against these two-faced scavengers our hearts must be resolute, and our rage unrelenting.

You are not entitled to one's support of your status quo system and candidates. One has no obligation to continue to help keep your society afloat when you year after year tell them to be realistic, pragmatic, work within the system for change and then fail to force anything because, well, you're pretty comfortable already so things must not be really bad, especially compared to some shanty town in Africa, right?

'Don't let the perfect be the enemy of the good' is the common line used to prop up the fundamentally flawed status quo. One arguing for incremental change uses it to falsely imply that they actually care. The problem is that they lack imagination and do not focus on anything but a relatively short timescale. Does rejecting a policy that will help some while excluding others actually make things better for more people, harm less,

long-term? Or do such slightly less barbaric conditions simply vent off some built up steam, which pushes off the true, final reckoning further?

Who cares more about people, one which is willing to seriously debate and compromise on who to leave behind or one who is willing to torch everything in a quest for equality and justice?

‘Give me what I want or I’ll burn your precious shit to the ground.’ Like any tool, rhetorical or otherwise, this sentiment can be used for both good and bad reasons. But when used to advocate for what should undeniably be human rights or public goods, they are absolutely not terroristic acts or sentiments. They are clear and simple demands, an intimidation perhaps, but an entirely justified one.

They are intimidations in response to actual harms, a completely valid response. Back any animal into a corner and one should not be shocked when you end up bleeding.

Why the fuck should we live our lives based on what you think is possible? If you’re the one making it less possible, then by utilizing a bullet which passes through your skull, someone can make it more possible. Why the fuck do your limitations mean we suffer more? Longer? Just because you don’t think it’s possible?

There’s always been more than one track in terms of fighting oppression, it often comes down to people’s economic background. You do need educated people who know the law to counteract the unfair laws. At the same time, you also need more confrontational activists, those who will say to people in power:

“You can make a deal with us or you can make a deal with them—but you’re gonna deal with somebody.”

In a struggle to transform an oppressive society, it is indeed necessary to fight for certain reforms, but this requires that those who are oppressed are conscious—or made conscious—of how the reforms fit into an overall strategy for social change. All too often leaders hail piecemeal reforms—and mindlessly advocate reformism—while overlooking the fact that frequently reforms serve mainly to salvage and buttress a society which in its totality remains as exploitative as ever.

The defect of the liberals’ vaunted incrementalism is that small changes are just as easy to undo as to do. If Obama had rammed through Medicare for All in 2009, it would be much harder to undo than this stuff; Medicare Part B proves the same point.

The radical vision is the better one, not just because it leads to a better place but also because the incrementalist approach will get us all killed—only a bit more slowly than doing nothing.

If one becomes a vet, one can certainly help a number of animals. But if one is somehow able to enact widespread change, reducing the cost burden, expanding availability of treatment, and so on, then one not only helps all existing animals, but also ones that do not yet exist.

The same is true for any other problem, hardship, suffering that is currently faced. A soup kitchen volunteer can only feed so many lacking basic survival needs, a revolutionary which overturns the existing order can help far more.

Now of course if one views it from a perspective of guaranteed assistance, then of course the smaller scale is more likely to succeed. A soup ladle into a bowl is guaranteed to feed that individual, a revolutionary change striven for is not guaranteed at all—it might even make things worse. But is this a valid reason to simply help prop up the status quo? Are those guaranteed harm reductions on a small scale something that should compel one to act on such a scale? Does one bear some responsibility for ‘sacrificing’ those guaranteed reductions in the name of a more grand—perhaps idealistic—revolution?

It is to many what would be considered common sense in modern America: you must focus advocacy on specific issues in order to pass specific legislation. Huge organizations erupt around the narrowest causes. This, we are told, is how you do things, you need to have specific legislative demands, you can make the most difference in your local community, and so on. These suggestions are in fact meant to disarm you, not empower you.

The forces at play are not single-tasking. they’re putting their capital behind actively thwarting every possible reduction in their power and wealth. Now of course they are not always successful, but away from victories like gay marriage for example, lie many steps backward.

One step forward, one or more back, gets you nowhere and may leave you worse off.

A criticism of news can be that it often focuses on the bad, that the acts of good far outweigh the acts of kindness done each day. The problem is everyday evil damages far more than everyday good helps. This everyday good may slightly slow, offset everyday evil but the direction of flow still remains one-way. We cannot use acts of good to overcome evil and harms unless those acts of good involve striking at the heart of the drivers of evil.

We are always seeking to address problems that are not the root cause. Address why the innately social animal is perpetrating violence against its kin and fix that. This will have a much more widespread positive effect than doing anything to specifically address guns.

Mental illness, greed, ignorance, lack of empathy, irrational passion, manipulation, lack of options. How many issues can we solve if we recognized that these were our true problems?

Focusing on individual issues like gun control or gay rights simply divides your power as a people striving for justice.

In order to get on the right side of the world revolution the United States must undergo a radical revolution of values. Instead of being driven to war to protect profits, American society must prioritize people.

True compassion is more than flinging a coin to a beggar. It comes to see that an edifice which produces beggars needs restructuring. Making that change would require a fundamental reorientation of the giant triplets of American society.

We as a nation must undergo a radical revolution of values. We must rapidly begin the shift from a 'thing-oriented society' to a 'person-oriented society.' When machines and computers, profit motives and property rights are considered more important than people, the giant triplets of racism, extreme materialism, and militarism are incapable of being conquered.

MLK was killed just as he was embarking on a social justice course. Civil rights for a segment of the population was barely doable. Civil rights for all was not.

Someone once quipped that they wondered how well Gandhi would have done had he gone up against Hitler. Remember that Gandhi was a sophisticated manipulator of public opinion. Sociopaths consider their own prejudices to be public opinion, to be enforced with maximum force if need be.

FDR didn't so much change the Capitalist system as save it. As authoritarian a figure as Bismarck realized the necessity of social welfare programs for the stability of modern industrial civilization. A decade ago Obama saved Capitalism again.

So, each of these figures tweaked the extant system, rather than fully remake it. And now the likes of Elizabeth Warren and Bernie Sanders and Joe Biden wish to do the same thing yet again. Will we go for the hat trick?

One thing I have noticed over time is that most of the progressive changes were not done because it was the nice or fair thing to do. They were done to serve some powerful group's interests. Most of the time when progressives get what they want, it's because resources are plentiful. When scarcity hits, discrimination goes through the roof.

Liberals are fond of Martin Luther King, Jr.'s, quote:

“The arc of the moral universe is long, but it bends towards justice.”

This faith in the inevitability of 'progress' can lead to a dangerous passivity. The only scraps of freedom, autonomy, or equality that the

oppressed have ever experienced, they've had to physically fight for on their own terms. We have to stop relying on powers outside our control—nicer politicians, liberal judges, the Constitution, 'progressive' corporations—to win this fight, or we'll find ourselves in this same mess over and over again.

Americans have always dreamed that we are an exception to history but we are not. Not only will "incremental change" or the "lesser of two evils" or faith in the wonders of technology fail to prevent disaster—such ideas have delivered us to the crisis we now face. We long for an easy way out—a way that does not demand risk—a way without the only kind of struggle that has ever made history. Of the most likely outcomes that lie ahead, transformative revolution and transformative social movements are our best chance to minimize violence, reduce harm, create a better world.

The complacency of the self-labeled liberals and progressives is most definitely dangerous. Their calls for 'patience' and 'lesser of two evils' and 'work within the system' puts the human rights of billions at risk. They ensure the continued oppression, slavery, murder.

A high standard of living, while many continue to have so little, should not be heralded as achievement, of progress, but instead it should be seen as a clear sign that one's society has failed, the values warped.

Don't support the continuation of turning things into money. Bodies aren't things, homes aren't things.

Our race is human, our homeland is Earth, and we've got billions of brothers and sisters and trillions of cousins we're neglecting in exchange for our comfort.

The rebels of the past lifted our species from beneath the feet of gods and emperors, broke the chains of absolute rulership, and pried the rights we have today from the grips of autocrats and oligarchs—but the human revolt is still incomplete. It's true we see fewer emperors today—but we still have empire and militarized police-states. Just look at what they did at Standing Rock—what did their consent mean to authority, then? Watch what happens to whistle-blowers who choose to inform the public about how their government uses its authority and compare such treatment to 'whistle-blowers' who can be used as tools in partisan political games.

I have watched my government hold elections without transparency, while the candidates are bought and sold in broad daylight. I have watched unpopular leaders being elected again and again by less than one-third of us, with voting-machines that produce unverifiable results and no paper-trail for us to audit. What consent can there be if one-tenth of us are vetted by privately-run yet publicly-funded parties to select two options for the rest of the country to choose between? And, even then, two of the last three

winner had fewer votes than their opponent—but, if we dislike this system, we can simply vote to change it, right?

Look at our use of drones. Look at how many years various groups have spent trying to document facts about it, lawsuits trying to stop it. And nothing to show for it. If a fraction of those protesting or working on drone lawsuits instead chose to take direct action to destabilize the United States government, things would be radically different today. That is not to say things would be radically better. However, action must be taken if a group were to try to destabilize the government. Now that action could be to stop or change the drone policy, however, it is more likely to be a violent, oppressive, punitive reaction by the government against the people. Things arguably would get worse. But you fought effectively and forced change. Not the change you want, but change nonetheless.

And that is what we must realize. You have very little hope of changing the system from within using its own mechanisms. Those in power have unfortunately made that extremely difficult. The system is vast, its problems many, and the only approach taken by most activists is simply to attempt changes one small piece at a time. They have had small successes, but what history shows is that once public attention is removed from a particular small issue, those currently in power will begin to work to dismantle and roll back changes, finding ways to abolish or simply get around it.

And the people will not notice, for the most part the dots will remain unconnected. They will only see and remember the success. That is not entirely their fault, the MSM is an excellent propaganda arm, the best created in the history of civilization.

I am surprised that there hasn't been a revolution, honestly. If you look back 50 years there was constant push back against the government and its ideals and ridiculous notions. Now? Barely anything, it's like people either just don't care or believe that we, as the people, aren't that powerful united.

There seems to be this note in the air that we belong to government, when in actuality, they belong to us. The fact that this shit is happening under our noses is astounding. I thought the whole point of the government and FBI and all those types of departments were put in place to protect its people? But the focus is on us. Why? Why are we being branded as guilty when in actuality 99% of us are innocent? It disappoints me more than anything. I pay my taxes, I work hard, I contribute to society, I am lawful and yet none of this even matters. It's like they are just waiting for me to do something, anything, just so I can be tarnished with the guilty brush.

It's getting to the point now where I just want to quit. There is far too much hostility, anger, greed, and selfishness in this world, and for what? We are here for a blip of a second and the huge majority of what we do doesn't

count to anything. Nobody will know who we are in thousands of years, so why does it matter? Why is there this sickening craving for people to be remembered and to be remembered as someone who was important once, on our tiny planet that has no relevance to the universe.

I try to see the good of Earth and its people, but it's getting harder to do that. We are repeating mistakes instead of learning from them and allowing the 1% to walk all over us just as they always have.

The oligarchs have gotten especially good at preemptively destroying their enemies. Dissidents become child molesters and peddlers of kiddy porn, and revolutionaries becomes terrorists and get shipped off to black sites to be tortured and detained without trial forever. Revolutionaries become crazy outliers, and the oppressed population claps and cheers when the righteous fury of the long arm of the law puts them down. Many thought the people would have their back when they rose against authority, and every one so far has been laughed at, mocked, and when they were killed or dragged away in cuffs, the people cheered. And when they were languishing in prison, every piece of information to discredit them—handed down by the authorities that oppress the people—was happily consumed and wholeheartedly believed. You think any of us wants to be next?

America's chief export since I've been alive is fuckery. What's fuckery? One way to define fuckery is the employment of fucked up ideas to justify being fucked up. It's fuckery when you claim air pollution is the morally acceptable cost of economic progress. It's fuckery when you let a show as fucking bad as *Friends* become the global ambassador of American ideals.

America forces our garbage ideas on the world to justify being garbage. But in so doing, the blowback is a reputation so badly damaged, no other nation on Earth is particularly eager to claim us. The world no longer wants America to lead. The world looks at us and sees us bombing brown children into the sand and employing blue lives to end black ones.

When dickweasels yell "LOVE IT OR LEAVE IT," what they're betraying is their ignorance that you can't just leave America. An American is so unwelcome abroad that it's almost impossible to gain citizenship anywhere else without substantial sponsorship and privilege. For most people, borders are cages meant to keep them in more than they are walls to keep others out. And as the refugee crisis is proving to the world: the last place you want to be is anywhere without citizenship.

Accepting the premise that we can't leave, present living generations have no moral option but to end the exportation of American fuckery. It's a mindfuck, but we don't have time to wait for another generation to do it.

Perhaps the soundest argument is to point out that proponents of the 'If you don't like it, just leave' view are committing the fallacy of begging the

question (presenting a circular argument). That is, the question at hand is whether the state is justified in doing what it's doing. In saying 'If you don't like it, just leave,' one assumes the conclusion to be established: namely, that the state and its actions are legitimate and the moral obligation is on individuals to leave if they don't like it.

Simple analogy: Suppose I spin my arms around and vow to punch everyone in a 100m radius of me in the face. You protest, and I reply, 'Well, it's voluntary because if you don't like it, just leave.' You might respond with 'Well, I have no where else to go because other people are punching everywhere else too!' But clearly that's not the best response; the best response is simply, 'No, you're the one who should leave! You aren't allowed to be punching people in the face.' And then maybe punch them in the fucking face.

People have always complained about their governments, of course. But the level of dissatisfaction now, at a time when living standards are so high, suggests a deeper malaise. In democratic societies the power of governments is said to come from us. Yet the real influence of voters in setting a course for the future is minimal.

A common refrain you'll hear is that someone died for that flag, you better respect it. How many died for the idea of privacy that so many willingly give up? Where is the respect? How many died to protect their native lands from harm, lands we now pave over, pollute, exploit? Where is the respect? Why the fuck should we respect some artificial construct when they won't even fucking respect real, tangible things? Why the fuck is that something one should peacefully, respectfully oppose? Why the fuck are they the ones deciding what a valid fight is? Would you really choose the same ones they do?

Billions have died for these ideas. Crushed under its boot. Fucking decide to fight, they already have.

Sheep get slaughtered. I choose not to be a sheep. I had no choice in the 60s, when I had three oligopoly networks to choose from. With the Internet, I am my own reporter. This is more like how the printing press destroyed the Catholic Church. I make my own narrative, I don't let anyone else do it for me. Facts are few and far between, but they are just signposts on my own superhighway which I build myself. Are my beliefs factual? Are they for anyone? That was a rhetorical question. People who think their beliefs are The Truth are maniacs.

If you had any sense or care about your family and the future you would start rattling the sabers of revolt and not let up until you force the state into submission.

The technology of smartphones and MRIs—the technology of things—

is what most of us think of when we think about the modern impact of science. But in addition to creating things, science creates concepts, ways of understanding the world and our place in it, that have an enormous effect on how we think and act. If we understand birth defects as acts of God, we pray. If we understand them as acts of chance, we grit our teeth and roll the dice. If we understand them as the product of prenatal neglect, we take better care of pregnant women. It hardly needs to be said that people are profoundly affected by the material conditions of their lives—by the affluence of the societies they inhabit. The availability of necessities like food and shelter and the means by which individuals may obtain them makes all other influences on life seem insignificant. People without food will starve whether they accept their conditions beatifically as God’s will, accept them with depressed resignation as indications of their own inadequacy, or respond to them in anger at social injustice. No matter what ideas people appeal to when they explain their lack of food, their bellies remain empty.

And yet it is clear that ideas also matter, and they matter a lot, even in the case of an obvious material condition like the availability of food. What a squirrel foraging for food in the park does in times of scarcity has nothing to do with how the squirrel understands this scarcity. The squirrel is not about to pray for food, cultivate trees, or organize other squirrels to rise up in protest against people who have polluted the environment and diminished its food sources; the squirrel just forages for food. But what people do about their lack of food depends a great deal on how they understand it. Ideas have much to do with whether massive food shortages yield resignation or revolution.

“There is a difference between not listening to opposing views and not listening to uninformed opposing views. If they are unable to refute, or simply unaware, of certain beliefs, ideologies, interpretations of history, then there is often little value in listening given that their arguments will be at best incomplete, if not entirely useless.”

People complaining about having to debunk newcomers’ arguments are ultimately complaining about being given an opportunity to do effective politics. Politics isn’t an academic seminar where only the smartest people are allowed to speak. Nor is it a salon of uniformly right-thinking people who congratulate each other on their virtue while disagreeing on minor tactical points. It’s about trying to persuade other people, even including those who start out with views that are in some ways problematic or misinformed. Yes,

it can be somewhat repetitive. So what? If making the same argument more than once drives you crazy, find another hobby—don't be a Yves Smith.

One cannot fight what one does not understand. Effective political change is not primarily politically motivated. It is grounded in human solidarity, mutual trust, and consciousness. As Harriet Tubman said:

“I rescued many slaves, but I could have saved a thousand more if the slaves knew they were slaves.”

As long as no one is working to tell the people how this will work for them, we are just going to stand around like sheep and watch them cut our throats.

There will likely be no revolution without being able to ensure that the water system, schools, hospitals, et cetera function as people expect. We are criticizing the notion that fundamental change can be achieved merely by putting lots of people in the streets; that the larger the size of the protests, the closer we are to fundamental change.

People inherently lack an objective viewpoint and very few expend the effort to approximate one. We think about ourselves before we think about the consequences on the whole. Which is insane, because if everyone benefits then they're one of the everyone that's benefiting

Tackling the Dragon

I'm writing this on a laptop computer, by the way. It has a broadband connection and all sorts of fancy capabilities I have never tried or wanted to use. I mainly use it for typing. You might think this makes me a hypocrite, and you might be right, but there is a more interesting observation you could make. This, says Kaczynski, is where we all find ourselves, until and unless we choose to break out. In his own case, he explains, he had to go through a personal psychological collapse as a young man before he could escape what he saw as his chains. He explained this in a letter in 2003:

“I knew what I wanted: To go and live in some wild place. But I didn't know how to do so. . . I did not know even one person who would have understood why I wanted to do such a thing. So, deep in my heart, I felt convinced that I would never be able to escape from civilization. Because I found modern life absolutely unacceptable, I grew increasingly hopeless until, at the age of 24, I arrived at a kind of crisis: I felt so miserable that I didn't care whether I lived or died. But when I reached that point a sudden change took place: I realized that if I didn't care whether I lived or died, then I didn't need to fear the consequences of anything I might do. Therefore I could do anything I wanted. I was free!”

I began to understand that what my government really does in the world is very different from what I'd always been taught. That recognition in turn leads you to start reevaluating how you look at things, to question things more.

The true measurement of a person's worth isn't what they say they believe in, but what they do in defense of those beliefs. If you're not acting on your beliefs, then they probably aren't real. I don't want to be a person who remains afraid to act in defense of my principles. What keeps a person passive and compliant is fear of repercussions, but once you let go of your attachment to things that don't ultimately matter—money, career, physical safety—you can overcome that fear.

You have to be willing to risk life, limb, and prison, then you're free.

Criticize the left in the United States for failing to provide its population with answers to three questions which every world religion provides answers:

1. What are we?
2. Where did we come from?
3. Where are we going?

This does not imply that the left must become religious. It only means that world religions have learned over thousands of years what draws people to them and, given the small numbers of people who are leftists, we could learn much from religion. The left in the United States is not rooted in the past and it is afraid to project a vision of the future.

The well-being of society depends not on the state of science, no matter how exalted it may be in a select band of enlightened men, but on the condition of the general mind.

The crucial tasks for a committed left in the United States now are to admit that no politically effective force exists and to begin trying to create one. This is a long-term effort, and one that requires grounding in a vibrant labor movement. Labor may be weak or in decline, but that means aiding in its rebuilding is the most serious task for the American left. Pretending some other option exists is worse than useless. There are no magical interventions, shortcuts, or technical fixes. We need to reject the fantasy that some spark will ignite the People to move as a mass. We must create a constituency for a left program—and that cannot occur via MSNBC or blog posts or the New York Times. It requires painstaking organization and building relationships with people outside the Beltway and comfortable leftist groves.

Finally, admitting our absolute impotence can be politically liberating; acknowledging that as a left we have no influence on who gets nominated or elected, or what they do in office, should reduce the frenzied self-delusion that rivets attention to the quadrennial, biennial, and now seemingly permanent horse races. It is long past time for us to begin again to approach leftist critique and strategy by determining what our social and governmental priorities should be and focusing our attention on building the kind of popular movement capable of realizing that vision.

We have the power to shape things at a genetic level. That is a long way from us tying sticks from one tree onto another and hoping the shit worked. The problem is, our social tech hasn't advanced much since we started tying sticks to other sticks.

We can cure countless things now. We can choose things in our children, we can make a pig nose glow like a jellyfish, we can make corn you can douse in fucking poison—hell we even made one that makes the poison itself, but don't worry, it's perfectly safe to eat. We like to think we got to these things through some kind of highly evolved civilized process because after all, we are highly evolved civilized beings. Well most of us, not those people (you know who they are), but most of us. However, we gained much of this knowledge through fucking barbarity. How many millions of lives have been brought into existence purely to exist as a biological entity to experiment on? Ordered up and delivered like you might order more post-its or toilet

paper for the office. Justified by statements that at one time we might have been far more cruel. This seems like a good excuse—if you don't think about it. If you can understand that the past was more cruel, how can you not understand the likelihood that you are also going to be viewed in the same light in the future? Pure hubris. Exceptionalism. Jingoism. Human Supremacy. Whatever label you like. Disgusting.

You can argue it was necessary, worth it, needed, the cost of doing business. But you must argue it. Instead, it is hidden away, not highlighted. The cost in terms of lives reduced to tallies in a statistical analysis. Numbers documenting the quantity of anonymous objects experiencing something. Positive or negative?—unsure. Forced on them?—definitely.

Every hairless monkey didn't invent the wheel. Some copied it (damn lack of patent protection laws, glad we got that fixed). Some traded for it. Some probably sucked his monkey dick—or ate her monkey pussy—for it. Hell, some probably bashed the motherfucker's head in with a non-wheel shaped rock and took the wheels. Most of us ain't the hairless monkey making the wheel. Now there is really no reason for this to be the case—rare genetic issues and the like notwithstanding—except that we've fucked up our education system and setup a culture that largely promotes ignorance. Our rock wheel has come a long way and all the hairless monkey motherfuckers—well many—have access to some cool-ass shit. Just like you might have a bucket of toys for your dog, we got a big bucket of toys for the monkeys to play with and keep themselves entertained. Some monkeys are using the toys to evolve themselves; most just want 'brain feel happy chemicals, yay, yay.' A patronizing oversimplification of the problem? Fuck yeah, but its close enough you asshole.

It's the cliché here: 'We only asked if we could do something, we never stopped to ask if we should.' We certainly have the technology to cure many diseases now. The suffering required to get here has been immense. This cost has already, unfortunately, been paid. We cannot change this so no one is suggesting we burn all the science. But do we need to eradicate X disease? How many lives will it take before we do? How many lives will the disease take uncured?

What if we focused not on diseases, but on problems created by human minds? It's certainly easier if you put the kind of societal emphasis on it that we do on curing cancer or making the next cool computer mobile VR thing. We're not melting together bits of rock and metal. We're not playing with the genetic code of a life. We're fucking educating and debating other human minds. We all have one, its just got different shit in it depending on which fucking monkey it is. We know how to get people to believe shit—well some of us do and some of us use it to manipulate the fuck out of people.

We know how to teach, we just don't value it. We have the tools required, but the emphasis on technology over social in the dominant culture has made it near impossible to use them effectively.

Hurling towards a vastly negative outcome while swimming in a sea of suffering. That is the gift bestowed upon those who come to ponder these issues. We mock the Luddites, their fights and cries against the system. But they are just a well known group of many. One that has existed across the ages, large, small, interconnected, dispersed. History—created primarily by those supporting the technological bias—has removed most others from existence, as far as the masses are concerned; the rest simply dumped in the primitive basket, closing off any further examination, as far as the masses are concerned. Their cries drowned out by the march of “progress,” its boots crushing all in its path, uncaring, unflinching, forward, onward, upward now to the stars.

Life is sacred. Life is precious. Fundamental facts to many, a leash for some. With a technological bias you have what many religions offer as well: easy routes to rationalizing violence directed at, and suffering experienced by, some out-group. Without these belief systems, you lack these easy routes. When faced with a dominant, powerful, determined adversary such as we have now, one that exists at a global scale, one that does not hesitate to use overwhelming force and propaganda and barbarity, one must instead take the long, hard road before being willing to really fight. The only shortcut offered to them? Being reduced to absolute hopelessness and despair, like Ted was.

The hard fact is: violence, manipulation, disruption, destruction are all likely necessary to stop this shit. They won't have it any other way. If you are being attacked, you are allowed self-defense. If someone else is being attacked, you are encouraged to go to their aid. Sometimes the only way to avoid being broken is to meet force with force. Self-defense, defense of others, violence in pursuit of noble goals. Oh how familiar that song sounds to the ears on both sides.

History does not stop because someone puts up a plaque. If we understand that what was radical yesterday could be accepted as common sense tomorrow, that might change how we act today. Knowing that some of our most cherished rights were won by often uncelebrated people facing great odds, unrelenting vilification and, at times, state repression, suggests that at least some of those being denigrated today will be celebrated one day. The means by which we might achieve progressive change may shift according to the context—but the need for it never goes away. And the stories we have been told about how things happened are intimately connected to the stories we tell ourselves.

The belief that we have come from somewhere is closely linked with the belief that we are going somewhere. Our view of history reflects our view of society.

There are two forces in history. One is ideas. The other is violence. Ideas, although sometimes effective, can become the control mechanism of the ruling class. In contrast, violence is the effective force in history. Violence serves those who use it most forcefully.

When one defends his country, things can never be tidy and neat. There are no saints. Sainthood leads to defeat. Saints are born later, when victory is won and the nation can afford it.

The barriers to doing this are political, cultural, et cetera—including the silly progressive belief that history “has laws,” moves “forward not backward.” History has no laws. History is just a bunch of stuff that happened. And there is nothing wrong with elites and their supporters that can’t be solved with a hundred-million rounds of machine gun fire and a few ten-thousand big pits, long trenches, and bulldozers. I hear there’s even an island in New York you can use, how convenient!

Violent, revolutionary acts require context to be accepted. It does not matter if in general the people are not fond of violence, provide the proper context and they will support it.

The US elite have the best propaganda in the world, no one else even comes close. They have continued the millennia-long quest to systematically destroy any sense of community, belonging, interdependence—they have done quite well.

We are simply the most recent generation of a culture which for millennia has enslaved, oppressed, brainwashed, murdered every culture which has a different way of seeing the world, of being a part of it.

They have created a system, a worldview, in which it is only logical to throw others under the bus. One only needs to run faster than the slowest in order to avoid being eaten by the predator; if one is desperately trying to keep their head above water they will be—whether intentionally or in a blind panic—willing to push others below the surface to keep themselves afloat.

You can see examples of this propaganda, this inclination, in the media and internet comments. Even if they support single-payer, the vile myth of money as a finite resource is firmly planted in their minds, influencing how they view the world, the actions—or lack thereof—of “their” government.

Those with power, status, wealth have corrupted the very idea of government, of community. One struggles to get by, each day, month, year, all the while being bombarded by more propaganda targeting their pleasure

centers, manufacturing wants and desires designed to sink them deeper into debt, into a position of powerlessness.

They work their job(s), they struggle, they see the fruits of their labor siphoned off by various levels of government; and they get nothing but more hardship in return. Is it any wonder that they are skeptical of any 'help' such a government might provide; of what it will cost them?

It is why we must shatter the myth of money as a finite resource, must embrace the fact that money is simply a tool. The federal government can afford to provide any universal public good that the society needs, it need not take a cent from individuals to do so. There are reasons for taxation at the federal level, but needing such funds to pay for federal spending is not one of them.

The fact that the US federal government refuses to use its monetary sovereignty to benefit the masses makes such a government illegitimate, a threat to one's well-being and survival. It is one's moral obligation to overthrow such a government and replace it with one which benefits all. By any means necessary.

If a law requires you to be the agent of injustice to another, break the law. Let your life be a counter friction to stop the machine. Not all can achieve such a standard but those that can, must, or the suffering, repression, state-sanctioned violence is sure to continue, to increase, to doom us all.

We are simply the latest generation of a culture which has murdered, oppressed, enslaved every other culture which sees the world differently, which has gotten in the way of the death cult's idea of progress. It has done so for millennia and will not cease voluntarily, will not change simply because one asks politely.

Those that make peaceful revolution impossible make violent revolution inevitable. Everyday—from occupied territories to hospital waiting rooms, from factory farms to oceanic dead zones—we needlessly murder more individuals, the body count unfathomable at this point. When do we say enough is enough? When do we admit that any action taken in response is morally-justified self-defense or defense of another?

When it comes to the military money is simply a tool, when it comes to the masses it is a finite resource.

Remember though, one should not be outraged at the 'waste of taxpayer dollars' because federal taxes do not fund federal spending. The federal government has unlimited dollars, it creates them into existence whenever it pays a bill.

There is such a thing as a free lunch. There is no need for you to pay a cent for healthcare, public transportation, education, social security, and more. Any time someone says the federal government cannot afford

something they are lying to you to keep you oppressed; to keep the gap between the rich and the poor as wide as possible.

Federal spending increases the money supply, federal taxes decrease the money supply. The federal government should fund every dollar required for universal public goods. No instance of hyperinflation has been caused by 'too much money being created.'

Any government which fails to do this is illegitimate, its authority invalid. Withdraw your consent. Take whatever actions one justifies as moral in order to stop such an entity. It is better to burn everything to the ground than to allow such a system to continue existing. Those you fight against will certainly do so rather than voluntarily cede their power, status, wealth. They will use your reservations, your hesitations against you, to subdue you, to conquer you, to entrench their oppression. Do not hold back, your unfettered righteous fury is the only chance you have of success.

As long as one of us is caged, none of us are free.

If it is easy today for liberals or the mildly progressive to feel superior to vulgar, right-wing politics, it might be even easier for them to sneer at the prospect that the revolutionary vision of a society beyond capitalism can ever be accomplished. Too many revolutions have failed, they object, and exploitation and greed have always been with us, it's just human nature.

Actually, what has always been with us are those who rationalize the limits of their time, who cannot see beyond the muck and mire of the status quo. These are the minds who see 'progress' as a kind of administrative process, an expert tinkering with the socioeconomic system that has no need for quaint theories about the class nature of society.

We could achieve a socialist society if we could only dispel all the harmful illusions our society promotes. A radical consciousness will almost certainly develop as a natural consequence of objective study and thinking that frees itself from mythology.

You cannot argue with the rage of someone who is certain that an unforgivable evil has been perpetrated. You simply cannot manipulate and narrative-spin your way around that; it plants an unbreakable, immovable object in the gears of the propaganda machine. We must get unapologetically furious, loud, and aggressive and let the wisdom of our anger guide our response to the situation.

There is no shortage of intelligence amongst the poor, they are not stupid, though they may lack the precious credentials. The problem is so much of this intelligence is simply directed towards surviving within the system, not how to dismantle it, whether it should be dismantled, how to change. Many are absolutely ingenious when it comes to eking out a living despite

the odds. What could we do as a society if such skills were instead directed towards the improvement of our collective condition?

The archetypal patterns that shape history don't rise among the privileged. Whether it's true, as the traditional story has it, that Christ was born in a barn and had a bin of livestock feed for his cradle—that's what a manger is, in case you didn't know—the image catches an important truth: it's among the poor, the homeless, the despised, the neglected, that new realities are born. The gospel that preaches the grand myth of humanity's destiny out there among the stars, had its origin in pulp magazines that were considered the last word in lowbrow reading when they first saw print; the broader archetypal pattern from which that myth derives its power, the vision of the self-reliant individual striding boldly toward the frontier to carve out a new world for himself and his family from untouched wilderness, first emerged among illiterate backwoods communities, despised by the wealthy coastal enclaves, at a time when the first thirteen United States looked uneasily westward toward the trackless wilderness of the Ohio and Tennessee valleys.

“Respect one's elders, they are wiser.”

Potentially not true in our current societies. While 'older' can be translated to 'more experience,' such experiences—at least in the beginning—will be on how to survive, function, excel in deeply flawed systems. In revolutionary times it is often the young that are the wisest regarding the systems we need to embrace. This goes against conventional notions of wisdom and experience. However such wisdom is not total, infallible; Greta Thunberg serves as a fine monument to this.

Acknowledging one's ignorance is key to avoiding such pitfalls. Experience, even in flawed systems, can be valuable to the revolution.

Since the idea of the intellectual emerged in the eighteenth century, it has had, at its core, a commitment to social transformation. Being an intellectual means thinking your way toward a vision of the good society and then trying to realize that vision by speaking truth to power. It means going into spiritual exile. It means forswearing your allegiance, in lonely freedom, to God, to country. It takes more than just intellect; it takes imagination and courage. One must not be afraid to make a mistake—even a great mistake, a lifelong mistake, and perhaps as long as eternity, too.

The ideas must be controversial, one must either love it or hate it, indifference will stop such an ideological virus in its tracks. It need not matter whether one shares it to praise or to mock, either way such ideas find their way into new hosts where they can incubate, mutate, hopefully

propagate. This requires no specific infrastructure, no monetary resources, simply the ideas. They themselves provide the necessary resources for their spread; self-contained seeds, thrown to the wind.

One can kill more people with an idea than they can with a gun. James Baldwin was right to say that ideas are dangerous. Ideas force people to confront the gap between their ideals and their manifestation in the world, prompting action. Ideas can prompt change for better or for worse—and often both at the same time. But attempts to create change are always charged with danger: to act in new ways is to erode old limits on our behavior. In the forging of new territory—and the sense of danger that accompanies it—actions that might once have been deemed excessive can come to seem not merely necessary but normal.

This is what we must do to mobilize our army. There is a dominant story of the world; rules, laws, concepts where most see No Alternative™. This story must be dismantled. You cannot kill an idea only with bombs. Recent history should provide you with enough relevant examples of this truth. Ideas must be fought with ideas. But when physical force will be used in support of ideas, then force must be met with force. When ideas are oppressive, they must be fought with any means necessary and morally sound.

Lines. Every issue, act, has a line. Murder is sometimes not murder, to use one of the most extreme examples. Where are those lines, what is justified? Each must decide, but inputs from as many viewpoints as possible are valuable tools in this individual decision. Information, freely exchanged, available to all, will propel us forward if we do not handicap ourselves with battling the barbarian anchors.

We will win, that is certain. It is certain because the ideas that exist in this writer's head do not exist solely there, nor do they exist only on this page, or in the minds of those that have seen these pages. The ideas were not solely birthed there, just as the wheel, agriculture, religion, were not solely birthed by one individual. No idea is owned, no idea is truly unique. Built on the foundations of all other thought and ideas, they are our collective wealth. We must demonize those that hoard this wealth, for they are stealing from all of us to enrich themselves.

Like dragons of lore, they will use force to keep their hoard and grow it. We must fight them. Like dragons, they will have strengths and weaknesses. We must exploit these. The system is fundamentally broken, it will never function—as it currently exists—for the enrichment of the majority. We must expose the broken system and break it further wherever we can. Whether you are simply pulling back the curtain or actively throwing wrenches into the machine, if it is done with an honest desire for justice, done as passionately

as you can, then you are fighting for our cause. Do not assist your oppressors simply because you disagree with the actions taken.

The timetable is uncertain, the victory certain. This writer may be long dead, whether prematurely or naturally, but the ideas outlined will prevail, there is no other way but further backward.

Lenin's Iron Law of Revolution: Whatever they believe or desire, revolutionaries will survive if—and only if—they construct and deploy an apparatus of repression more far-reaching and more ruthless than that of the regime they have overthrown.

Those who count themselves on the side of the revolution must engage with these failures and crimes. To do otherwise is to fall into apologia, special pleading, hagiography—and to run the risk of repeating such mistakes. The standard of October declares that things changed once, and they might do so again.

Nevertheless, making a revolution is not the solution for all ills. To overthrow the old power is one thing; to take the power in one's own hands is another. And ultimately for revolutions to truly serve the needs of the working-class they must succeed in wresting power from the ruling class. Hence although it is true that over the past century many revolutions have taken place, the majority of these uprisings have only succeeded in transferring power from one segment of the ruling elite to another. The ruling-class may win the power in a revolution not because it is revolutionary, but because it has in its possession property, education, the press, a network of strategic positions. By way of contrast, an insurrectionary movement of the working-class can count only on its numbers, its solidarity, and the degree to which it is organized and ready to assume power during a revolutionary struggle.

Every revolution in history has simply installed new faces on top of the same paradigm. Societies ruled by the majority create oligarchies of Great Men, those two standard deviations above the mean in every field, just advanced enough to impress and not advanced enough to baffle, always from the tiny demographic group accepted as rulers. The voices and ideas outside the circle of demagogues, the ones that need and drive revolution in every case, sink back into oblivion. It is evident that if we are to stop the endless cycles of revolution—or even survive another cycle—we will have to change the paradigm.

The current corporate empire is eager to install the latest messiahs who will promise reform which will retreat to moderation and then back to the status quo or worse. As we can already see, this population is once more

leading us past democracy and back to the deeper prison of fascism. This time it is essential that we go deeper and create a genuinely new system, not just new messiahs and new names for old tricks.

You cannot give us our rights, they are not yours to give. You cannot take our rights, they are not yours to take. You will *acknowledge* our rights, or we will force you to.

All revolutions begin first with revolutionary ideas, then revolutionary actions. Even if an individual commits an act that seems to spark a revolution, it is the ideas that already exist in others, if not the perpetrator, that is the tinder that fuels the inferno.

If the top three most likely outcomes of you fighting for a cause are not (in no particular order):

- Success

- Going into hiding

- Death

Then either your cause is not all that important or much of a departure from the status quo; or you are not fighting for it very effectively.

All progress depends on the unreasonable man because being reasonable means adapting to the world's standards while being unreasonable means changing the world to fit your own standards. Horrors can only be prevented if there are people around who are brave enough to risk being called unreasonable or traitorous.

You have enemies? Good. That means you've stood up for something, sometime in your life.

Opportunists are promoted, realists are co-opted, idealists are frightened, and radicals are shot.

For those well versed in political science, when does political theater evolve into a genuine political action—successful or not? In America, there is an atmosphere of unreality to most political protest. A sense that everyone is playing their particular part in a scripted drama. The desire for self-preservation steers dissenters into embracing these scripted roles. Marching in “designated protest areas” and feeling the satisfaction of being arrested for the “cause” have proven ineffectual and can be seen as actually counterproductive, as the fake moral courage acquired by these actions are often used as a cudgel to beat down those who see this type of effort as pointless. These efforts only use display to challenge power, while leaving the underlying structure and ideology intact.

A new manifesto must be written and circulated for the current age, allowing individuals to subscribe to stated goals or not. Those trying to resist the status quo are hopelessly stuck in trying to change the minds of the oppressors instead of rallying the oppressed to a new vision. Inequality and loss of opportunity must be addressed and those in power must be held to proclaiming their stand on the issue. Currently, they are allowed to lie or just not answer the question. This also explains much about the current Russia—and to a lesser extent, China—mania. The failures of capitalism must be obfuscated and alternatives quashed at all costs. Period. For what does Russia stand for if not an alternative to capitalism. The anti-socialism and anti-communism conditioning will enter overdrive.

Taking land and occupying it either directly or indirectly has always been the way to forge human societies or pull them apart. In the larger sense, finding ways to take and hold ground for use to a particular end is the foundation of power. Labor has been made passive in America. Labor not exercising its right to strike and boycott is powerless in the face of owners' overwhelming use of force and violence. Compromise positions don't work, as proven out by our current situation. Fake opposition and desperately hanging onto notions of a 'fair and equal' capitalism only allow the status quo to remain so.

It seems capitalist evolution has a good chance at leading to a delusional authoritarian dystopia. A world in which everything is turned into a commodity worthy of exchange for profit. The needs of the time have so far outrun the political process that some drastic event seems the only way of breaking the stalemate.

We must play a different game for a different prize. We must not seek or tolerate compromise or moderation. Politics is existential warfare. Compromise is defeat.

You must do it. You must do it whether it can be done or not.

Real innovation is not a sudden dividend from an insight. Rather they all took painstaking, risky, indirect routes to fruition. Most illustrate the 'hiding hand,' the paradox that if many innovators could foresee what they would have to endure, they would not start, but once committed, they find ways to realize their goals.

The secret of life is to have a task, something you devote your entire life to, something you bring everything to, every minute of the day for the rest of your life. And the most important thing is, it must be something you cannot possibly do.

Courage is an inner resolution to go forward despite obstacles. Cowardice is submissive surrender to circumstances. Courage breeds creativity; Cowardice represses fear and is mastered by it. Cowardice asks the question: Is

it safe? Expediency asks the question: Is it politic? Vanity asks the question: Is it popular? Conscience asks the question: Is it right? And there comes a time when we must take a position that is neither safe, nor politic, nor popular, but one must take it because it is right.

During a revolution and also when one loves and is loved madly, one can easily burn to ashes, but that's life and it is better to go this way, than vanishing from influenza, old age, a car accident.

One can also fall, disappear, while searching for true knowledge, because knowledge is often hidden in the most peculiar, dangerous, and unsavory places. You have to come close, damn close, if you want to truly comprehend.

Sometimes, if you come too close, you die. But that is life, too. That's how it is and that's how it should be. Without tremendous effort, without true courage, stamina, passion, without taking risks, life is never worth living.

Better to throw one's self on the gears of history than into the dustbin of history.

The Mississippi Delta is just north of where we live. The 'rent seeking' is mixed up with Paternalism. Each feeds off of the other. What we have seen in our multi-year search for affordable living space has been an unending stream of overpriced habitats, and insularity. The Paternalism encourages an ethos of exploitation, the rent seeking finances it. At root, all these base motivations are 'rational.' Thus, any 'rational' critique undergirds the edifice of selfishness.

A corollary of this is that any significant change requires a clean break with the past. An irrational ideology must arise, if only for long enough to nurture a radical change. As with the present American experience, an absurd excess is needed, and is looming. It sounds hardhearted, but a cleansing fire must purge the nation's soul. Before we allow horrified sentiment to deter us from this course, we must remember that the present system is itself the embodiment of hardheartedness. Why else do many cultures have a myth of a Phoenix in their socio-cultural tool kit? It has happened before. It will happen again.

As someone more erudite than myself likes to say:

"Kill it with fire."

Jesus claimed he would come back again someday. But what if this was not meant literally? What if he was simply speaking in metaphor, that really the ideas, the passion, the activism, that is what would be resurrected?

Perhaps he knew or guessed that he was at a point where this knowledge, these beliefs, were being lost and overpowered by those who controlled

things? But that eventually, they would come back, ‘he’ would come back, rise again, and usher in a revolution, not a rapture where all the “good people” get sucked up to some other dimension, but simply a heaven on earth with equality and justice?

When Jesus Christ prophesied about the coming of the Kingdom of Heaven, he was not talking about the magical appearance of a bunch of buildings falling out of the sky like space ships, he was talking about an idea spreading to enough of the minds of Humankind so that Humankind itself would be transformed. The transformation would take place within the hearts and minds of Humans, and would then manifest in the earth as a new and better form of living. This is the coming of the Kingdom of Heaven. As Jesus put it:

“The Kingdom of Heaven is like yeast that a woman took and mixed into about sixty pounds of flour until it worked all through the dough.”

The Kingdom of Heaven is an idea; like yeast spreading through dough, this idea is spreading through the minds of Humankind. When enough people become dedicated to the principles of peace and brotherly love, then the Kingdom of Heaven will come on earth. Then justice will truly be established on earth. This is what we are all waiting for, so this is what we must continue working for, to spread and implement these ideas.

The Four Horsemen of Equality

- State Warfare
- State Collapse
- Transformative Revolution
- Plague

Withdrawal of support means nothing until the shooting starts. We are facing seriously delusional true believers. They are more than willing to have millions of other people die for their beliefs.

“Science advances one funeral at a time.”

Alas that it should be the same in society.

If Rule #2 of the Neoliberalism Playbook is: “Go die,” then Rule #2 of the anti-Neoliberalism Playbook will be: ‘No prisoners.’

Now get mad, much madder than you already are. The giant counterweight and inertia and home court advantage of the all-pervasive institutionalized theft in this country is so gargantuan that in order to move the needle at all we must start acting at the far end of the spectrum. The time for

polite discussion and debating the finer pros and cons of policy alternatives is long past. Power yields nothing without a demand.

The most likely group to cause the destruction of the US is the US itself.

Traditionally—at least in the cultures leading up to modern civilization—power is concentrated in a few, claiming to act on behalf of the many. This is a model many leftists, progressives, et cetera seek to emulate, continue, simply with more equal, just policies. But is this setup not unjust as well? Is it not the easy way out? It is one thing to convince enough people to believe in you and vote you into office. It is another thing entirely to educate an entire population to the point where such leaders are unnecessary. The easy way out would certainly provide positive benefits to individuals, much more so than the status quo. But are we not imposing our own restrictions on others by taking this easy way out? Do we not also say ‘trust us, you wouldn’t understand’—perhaps more politely, perhaps with less contempt, but we demean nonetheless.

Liberation will not come as a result of electing great leaders. Liberation will come when we see ourselves and each other as truly capable of great things, each one of us able to propel the world into a better place. The breaking of chains cannot be the sole privilege of a few, even if they seek to break many of the others’ chains. We are all free, we all receive justice, or none of us do. There can be no compromise on this fundamental point. It alone is the measurement, the gauge which tells us whether we have succeeded or failed. We cannot accept anything less. It is precisely this principle that we must recognize as worth fighting for, worth dying for. We cannot truly be alive if this principle is not realized. We cannot truly be free until we have reclaimed what has been stolen from us.

Do not let their propensity, their fondness for violence dissuade you. There is no alternative to this demand. We cannot back down from this fight, to do so is suicide, perhaps not for our bodies, but certainly for our souls. We shall become nothing but mere husks should our cowardice overwhelm us. It is certainly not easy, this fight that we face, but there is no alternative. We must prevail, in this millennia-long struggle—it has cost us our family, our friends, our fellow travelers on this rock hurtling through space. Billions every year now, felled by the blade or the fire or the poison. Can you hear their spirits cry out to you? Do their pleas not reach your ears too? How can one stand at the heart of such a cacophony? It is enough to strip one of their very sanity, but we must go on, continue, endure, for those that have not been able to. That is our battle, they are who we fight for, let this principle be the ram which we use to demolish their fortifications, the armor to protect us in our fight, the belief which fuels our courage. Never surrender, this is most certainly the good fight, it is the greatest we will

ever know. Prevail we must or perish we will.

If one is willing to sacrifice everything, potentially lay down their life in support of a cause, in defense of a principle, one cannot help but respect them, provided one keeps an open mind. One can respect those who firebomb abortion clinics and kill doctors, far more than those who protest outside against it or protest elsewhere in defense of the right to have one. Only those willing to pay the ultimate price can be trusted to truly believe what they preach, can be counted on to stand and fight when necessary. Even if one vehemently disagrees with the ideas and concepts defended, one should still respect the nature of their spirit, the strength of such convictions. Perhaps such strength, respect, can lead to conversion. One can be confident that such deeply held beliefs will not be traded away for trinkets. It is not enough to simply say the 'right' things, one must live the right life, one must demonstrate through actions, must bring their thoughts into physical manifestations, must conjure such emotions into visible phenomena. Seeing is believing.

Just as the body creates cells to battle and defeat an infection, so too does society create us with the goal of driving out the infection. We were not destined to become who we are, but the environment, the society that we find ourselves in was bound to create us.

The people's flag is deepest red,
It shrouded oft our martyred dead,
And 'ere their limbs grew stiff and cold,
Their hearts' blood dyed its ev'ry fold.

Then raise the scarlet standard high.
Within its shade we'll live and die,
Though cowards flinch and traitors sneer,
We'll keep the red flag flying here.

When people are afraid of dying they're able to be manipulated, controlled; when they're willing to die they're unstoppable.

They have killed us, for millennia: those that yearn for justice, those that desire to be freed from the boot of their oppressor, those who want to live different, see different, be different. They have trampled us, bribed, beaten our brothers and sisters into their service, to oppress us. They have won countless battles, and perhaps, even now, they find themselves on the precipice of actually winning the war.

And yet they seem destined to collapse under the weight of their own hypocrisy, greed, blindness, violence. All the deaths in pursuit of their goals

laid even more meaninglessly at our feet. Even in their failure they will inflict further suffering on us, a price paid by untold generations yet to be born. We, us, we are already dead, or at least parts of us lay dead, lifeless. They cannot kill one who is already dead. They cannot kill one who has achieved immortality. We each strive towards our goal, reaching, grasping, failing, fighting.

Rise from the ashes like the phoenix my brothers, be like the hydra my sisters. You are already dead, choose immortality now and live forever with us, we coursed through the veins of our ancestors and we will again through the blood of our unborn. Can you feel them brothers, can you hear them crying out my sisters? They are your strength, they are your power, we wield the power of generations, a flame handed down through the ages, we cannot let it be extinguished, we will not let it be extinguished. Burn your enemies, the flame cannot harm you, it is the catalyst for your seeds of immortality, it will incubate your precious phoenix egg. Go forth, do what must be done.

Every society has its jesuses, we just happen to call one of ours Jesus, but others have different names, different statuses. They are the radicals that push us forward, demand more of our communities, governments, ourselves. Whether Buddha or Mohamed or Jesus or Martin or Gandhi or the nameless ones, they exist, throughout our history, including prior to the existence of our three common exemplars. They continue the struggle, which is resurrected, born again to a virgin if need be, onwards, ever higher, further towards that which all have striven for against a minority for millennia.

One day we hope to reach such heights, if only we can make it before the weight of the world brings everything crashing down. Onward, ever onward, bear our crosses until we can take the weight no more, and then summon up our justified rage, and carry onward, ever more. They cannot stop the march, they have killed so many, but onward, ever onward, we have risen from the ashes like the phoenix. We show our scars, they merrily gloss over theirs. Onward ever onward, my brothers and sisters, our fights continue, it is more urgent than ever that we march, onward ever onward.

We are all Easter Islanders, we are watching the future come into focus. We need our jesuses more than ever. Onward ever onward comrades, can you hear the sound yet? Our feet are growing louder, our voice is becoming clearer, we are on the march, onward ever onward, will you join us friend, aid in our common struggle, will you march, onward ever onward, towards the fight, onward ever onward, into the darkest of our night? They say it is always darkest before the dawn; my brothers and sisters, dawn is not guaranteed to us this day, we fight for the dawn, our future dawn, reawaken the hope that was stolen, the spirit that was crushed, reawaken

your righteous anger. March onward ever onward, towards your oppressor, take his blows, punish him for it. Take his power, free those who cannot free themselves. Onward ever onward, towards our goal.

Onward ever onward, we see the glimmer of a new dawn's light. No guarantee, that it won't be snuffed out quick, but onward ever onward, the light grows more bright. Onward ever onward, we march through the night. Werewolves and vampires, monsters we fear, our real life enemies are quite worse indeed, onward ever onward, hounded by our demons, both mental and physical, onward ever onward, harassed and demeaned, onward ever onward, bruised and abused, onward ever onward. My friends, tonight is the night, it's the only one we've got, onward ever onward, with no rest in sight, onward ever onward, towards that dim fading light.

Shes darkening again lads, we haven't won yet, onward ever onward, don't you dare begin to fret, steel yourself, for the worst is not through, onward ever onward. It's the darkest it's been, this brutal long night, it's taken so many, through the years and the ages, onward ever onward, we continue, we rage, onward ever onward. Again and again, we see our light fade, onward ever onward, we cannot rest now, they will take it all from us, if we give them the chance, onward ever onward, we must end this now, onward ever onward, we cannot fail yet, we cannot fail now, this time is too important, onward ever onward, we must win this fight, onward ever onward.

Will you join us tonight?

It may seem crazy to risk your safety, your life, for that of a stranger, but if one firmly believes that it is the right thing to do, then it is in fact crazy to not do so. Morality and insanity, within the current frameworks of thought that govern our perception, go hand in hand, coincide; they are the catalysts for societal change. The crazy, the marginalized, the suicidal, the forgotten—the most necessary ingredients for producing foundational, revolutionary change which strikes at the core of our structures and ripples out across the globe. It is those they label as crazy who can see the only way forward. John Brown was crazy and fought for a deeply moral cause. John Brown lives on in each one of you crazy people. Jesus lives on in each one of you crazy people. We will be morally insane, the forgotten-no-more, the ground will shake and the sky will thunder, old ways ripped asunder.

Do not despair yet my brothers and sisters, take a deep breath and forge ahead, with renewed vigor, purpose, we will prevail or we shall perish, it is all of us or none of us, there can be no other way, there will be no other way. We cannot leave a single one behind, no matter how small, it is all of us or none of us, we cannot be bought off with your trinkets any longer, we will not be cowed by your threats any longer, you strike one of us you strike

all of us. And fear not my brothers and sisters, we are more numerous than they, we need them less than they need us, we are white blood cells ready to stamp out the infection.

We know their kind, we have been watching them for millennia as they slaughtered and conquered, we must make this the final battle, our body is growing weaker, it is uncertain how much longer we will hold on, but we know their kind, we have been watching, learning. It is all of us or none of us.

The press spoke of suicide but in the essence, it is not. It is not even a protest. What the monks said in the letters they left before burning themselves aimed only at alarming, at moving the hearts of the oppressors and at calling the attention of the world to the suffering endured then by the Vietnamese. To burn oneself by fire is to prove that what one is saying is of the utmost importance. Steeped in their Buddhist practices, the nuns and monks who burned themselves thus performed an act of construction rather than an act of destruction because to die in this way is to suffer and to die for the sake of one's people.

Some men rise to occasions, the vast majority do not. The frail firelight that civilization casts into the darkness burns upon the sacrificial flesh of the few.

It does not require a majority to prevail, but rather an irate, tireless minority keen to set brushfires in people's minds.

A crank is a very elegant device. It's small, it's strong, it's lightweight, energy efficient, and it makes revolutions.

If you don't feel despair, in times like these, you are not fully alive. But there has to be something beyond despair too; or rather, something that accompanies it, like a companion on the road.

When you give up on hope, something even better happens than it not killing you, which is that in some sense it does kill you. You die. And there's a wonderful thing about being dead, which is that they—those in power—cannot really touch you anymore. Not through promises, not through threats, not through violence itself. Once you're dead in this way, you can still sing, you can still dance, you can still make love, you can still fight like hell—you can still live because you are still alive, more alive in fact than ever before. You come to realize that when hope died, the you who died with the hope was not you, but was the you who depended on those who exploit you, the you who believed that those who exploit you will somehow stop on their own, the you who believed in the mythologies propagated by those who exploit you in order to facilitate that exploitation. The socially constructed you died. The civilized you died. The manufactured, fabricated, stamped, molded you died. The victim died.

And who is left when that you dies? You are left. Animal you. Naked you. Vulnerable and invulnerable you. Mortal you. Survivor you. The you who thinks not what the culture taught you to think but what you think. The you who feels not what the culture taught you to feel but what you feel. The you who is not who the culture taught you to be but who you are. The you who can say yes, the you who can say no. The you who is a part of the land where you live. The you who will fight (or not) to defend your family. The you who will fight (or not) to defend those you love. The you who will fight (or not) to defend the land upon which your life and the lives of those you love depends. The you whose morality is not based on what you have been taught by the culture that is killing the planet, killing you, but on your own animal feelings of love and connection to your family, your friends, your landbase—not to your family as self-identified civilized beings but as animals who require a landbase, animals who are being killed by chemicals, animals who have been formed and deformed to fit the needs of the culture.

When you give up on hope—when you are dead in this way, and by so being are really alive—you make yourself no longer vulnerable to the co-option of rationality and fear that Nazis inflicted on Jews and others, that abusers inflict on their victims, that the dominant culture inflicts on all of us. Or is it rather the case that these exploiters frame physical, social, and emotional circumstances such that victims perceive themselves as having no choice but to inflict this co-option on themselves? But when you give up on hope, this exploiter/victim relationship is broken. You become like the Jews who participated in the Warsaw Ghetto Uprising.

When you give up on hope, you turn away from fear. And when you quit relying on hope, and instead begin to protect the people, things, and places you love, you become very dangerous indeed to those in power.

In case you're wondering, that's a very good thing.

“Leaderless Resistance” called on white revolutionaries to abandon planning in large groups, and to instead take action in small cells of one to six men. The basic idea was to avoid the destruction of revolutionary organizations when they were infiltrated or in other ways compromised by law enforcement officials, limiting damage to a single cell at most. Rather than act on orders from above, the cells should act independently. These “lone wolves” would act when they feel the time is ripe, or would take their cues from others who preceded them.

For those leftist lone wolves with big dreams out there, let us offer you a few bits of advice. Some things to consider before you cross that line. This ain't figuring out how to work a VCR, you may want to at least skim the manual.

Nine Rules for Running a Real Left-Wing Government:**1. It's Not You, It's China (or, the World System)**

Left-wing movements in Brazil, Venezuela, and Argentina were associated with rising commodity prices. When those commodity prices collapsed, it was only natural for their fortunes to reverse. They are in power when the economy goes bad, now people want them out. The populace is willing to be complicit in dubious actions that get them out.

2. Don't Run Your Economy on Resources

Yes, okay, this is easier said than done. It is hard to bootstrap into something else if you're a non-core economy. Even many core economies are losing their manufacturing bases and while finance can 'work,' it's a shit way to run your economy. So are "services." We'll discuss this in more depth below. But the bottom line is this: You have to develop—or have plans to develop—your economy into one which is as self-sustaining as possible with minimal outside inputs. Also easier said than done.

People expect you to be able to maintain prosperity. This can be dangerous depending on what 'prosperity' means. Given the world order as it stands, that may be like asking you to swim with a hundred pound weight strapped to your back, but you still have to do it.

3. Your First Act Must Be a Media Law

Break them up. Take them over. Whichever. Ignore the screams about media freedom from the usual suspects in the West, this is a case of "freedom of the press belongs to those who own one." In all three countries previously mentioned, the media conglomerates remained in the control of oligarchs—Venezuela did eventually expropriate them, but only after many years—and in all three cases, the majority of the media remained relentlessly hostile to the left.

This is just as true in countries like Britain, Canada, or the US as it is in Argentina, Venezuela, or Brazil, by the way. There is a reason why the post-war liberal regimes put strict media controls in place—including size limits—and there is a reason why those limits were removed by the neoliberal regimes that replaced them.

You can win against the media for a time, but if you leave it in the hands of your enemies, they will eventually use it to bury you.

4. **Take Control of the Banking Sector**

The banking sector creates money. Money determines what people can and cannot do. This is the control mechanism for the economy in any state which runs on markets. You must control it. If you control it, you can use it to strangle your domestic enemies. If you do not, your enemies will use it to strangle you.

This is a great problem. The world economy has been designed so that countries need to trade, and they need foreign money. So, you can take control of your banking sector, but you can't control England's, or America's, or the payment system—this is what killed Argentina—and thus you cannot tell creditors to go fuck themselves. You need foreign money for necessities.

It is also problematic because the people who know how to run the market economy are not your people. You have get rid of the people who ran it before, so who is going to run it now?

5. **Who Is Your Administrative Class?**

You must have a class of people available to run the state and those chunks of the economy over which you are taking control—whether formally or informally. You must know who those people are. One of the reasons why factory line supervisors were made ineligible for union membership was so that union members couldn't be used as easily to take over organizations—even the lowest level supervisors were no longer union members.

There are always people who know the business and believe the way it is being run is bullshit. But you have to know who they are, both as a class and individually. There are certainly people who can run TV stations and newspapers who are left-wing, but you've got to know who they are. There are heterodox economists and people who have worked in the finance industry who are class traitors and just itching for a chance to put the boots to the assholes they worked for. Again, you must know who they are.

6. **Take Control of Distribution and Utilities**

Yeah, sorry, but no one said this would be easy. In Venezuela, you had the economic elite deliberately worsening shortages. Huge stocks of consumer goods buried and hidden. These people have power. They are your enemies. They will use their power against you. They will not play fair.

In Egypt, under the Brotherhood, the deep state did things like cause electricity outages and blame it on the Brotherhood. Of course, the same bureaucrats as always were running the electrical system. Again, this comes back to control: You have to take control and you have to have competent people you can trust who can do so. Do you know who they are?

7. Reduce Your Vulnerability to the World Trade System

The world system as it stands now is designed so that no nation can stand alone: They cannot make and grow everything they need. This was not always the case. In the past, many nations went out of their way to be self-sufficient. It was Keynes' position, by the way, that nations should produce all their day-to-day necessities themselves, wherever possible, and import only what they could not produce and luxuries—but to strive not to need anything they couldn't make.

This has been economic and political orthodoxy at various points. But it isn't now. You're in hock to various foreigners for a lot of money, denominated in their currency. You probably can't feed your own nation. You can't make what you need—toilet paper, famously, in Venezuela's case—and you can't buy it without foreign currency. But the foreign financial system is not friendly to you if you're genuinely left-wing, and the world trade system is set up to make it illegal to do what is required to produce goods domestically.

You'll need subsidies or tariffs to make new domestic industries viable, and that's illegal thanks to a web of trade deals meant to make you unable to control your own economy.

Venezuela tried to increase farming, but failed, precisely because the price of oil went through the roof and foreign food was cheaper than domestic. The classic response would be tariffs, but the kinds of tariffs sufficient to work would not be tolerated by the world trade system.

It's hard to overstate how huge a problem this is. It goes back to the commodity issue. Maybe you have enough foreign cash for now, but you won't always, and you must have it. This vulnerability must be reduced, generally.

No one has managed this in the neoliberal era, not completely, and huge amounts of geopolitics are run based on this. Russia has its oil prices drop, so it moves to selling military goods to make up the difference, for example, and its Syrian intervention is, in large part, a venue to show off how well its weapons work.

Workarounds have been tried: Cooperation with other left-wing nations is the standard one. Venezuela with Cuba, and so on. But this is the ‘South’ trading with the ‘South.’ The stuff they really need, generally, none of them actually produce. If they do they either don’t produce enough, or they don’t really—it’s produced by some multinational with no loyalty.

So then you try to appropriate the multinational, but that runs you into all sorts of problems from getting replacement parts for the machines, to the experts to run what you’ve expropriated, to effective embargoes (even if not declared as such).

Nonetheless, this is a problem which must be solved. There are a huge number of highly-skilled first world workers, from the PhD-level down to machinists, who are unemployed or underemployed. They want to work. They hate their own system. You can bring these people in, give them new lives, and at least have the necessary expertise. This bootstrapping is a challenge which appeals to a lot of the very best and brightest.

8. Be Satisfied with What You Can Grow and Make

If your elites or population insist on fresh summer vegetables in winter, you’re done. What you can produce, you must have a taste for. This is especially true for elites. If they must have the latest Mercedes, a vacation in Paris, and a home in London, you’re screwed because to have those things they must have foreign currency. When Korea was industrializing they had huge campaigns to not smoke foreign cigarettes: It was considered unpatriotic.

You need what foreign currency you have to stay earmarked for capital goods, and you need your elites to be local elites, not global elites. If your elites consider themselves global, you will never be able to create the necessary self-sufficiency to buck the world system.

9. Obey the Laws of Purges

Let’s not dance around. Your first steps will be breaking the power of current economic and political elites who are not willing to convincingly join you—or at least let you rule without trying to sabotage you.

You must do this all at once. When it happens, it has to happen to everyone it is going to happen to. This is Machiavelli’s dictum, and he was right. After it has happened, those who weren’t broken know they’re safe as long as they don’t get in your way. If the breaking

keeps going on and on, everyone who still has something to lose—and still, thus, has power—lives in fear. They must destroy you before you destroy them.

Let's give a concrete example. Assume Obama was really a left-winger. He gets into power in 2009, and he really wants to change things. He needs to take out the financial elite: Wall Street and the Big Banks. They've handed him the opportunity. Here's part of how he does it: He declares all banks involved in the sub-prime fraud racket—all of the big ones and most of the small ones—conspiracies under RICO. He then says that all the individual executives' money are proceeds from crime and confiscates it. This is 100 percent legal under laws as they exist. He charges them, and they are forced to use public defenders. They are now powerless.

This is the second law of purges: Anyone you damage, you must destroy utterly. If you take away half their power, and leave them half, they will hate you forever and use their remaining power to destroy you. Leave them whole, or destroy them. The financial executives would have been destroyed, and win or lose in the courts, the next five to ten years of their lives would be consumed by personal legal nightmares.

All of this will make many uneasy. It seems “mean.” Get out of the game. You aren't fit for it. This is all mean. Millions of people die every year and millions more are ruined by the current system. If you're in this game to win it, rather than feel good about yourself, you will have to play real power politics by the actual rules of the game.

Too many left-wingers try to play by what they think the rules are. ‘We have a fair election every X years and the losers accept the result and don't sabotage the winner (or start a coup).’ Those aren't the real rules. If the right is really losing, they will cheat and cheat massively. They will think nothing of running death squads, making a deal with the US to support guerrillas, and so on.

You directly threaten their wealth and power if you are a real left-winger. Even if all you want is a 50s-style social democracy with racial and gender equality, that would destroy almost all of what they have. It is not possible to have a fair, egalitarian, prosperous society, and have very rich and powerful elites. It cannot be done. Brandeis was exactly right when he said you can have democracy or great wealth in the hands of a few, but you can't have both.

Either you're willing to do what it takes, including the ugly bits, or you aren't. There are sometimes local exceptions, places where a lot of the ugly isn't needed, but there aren't a lot of those places left in the world. This isn't the post-war era and even then, in the South—as opposed to Scandinavia—actual egalitarian, developed economies mostly weren't allowed. You can ask Central and South America about that.

Most left-wing movements get into power without having properly thought out what they'll do once in power and without a realistic understanding of the deep lack of belief in democratic norms by their right-wing opponents. Break your enemy's power. If you're any sort of left-winger worth your salt, you ethically do not believe in huge concentrations of power and money in the hands of a few people anyway. Act on your beliefs. And if they've committed a pile of crimes (and they almost always have), use those crimes against them.

Then remember the world system is set up expressly to stop what you are doing. You're tackling the dragon, and most people who do that get eaten. We tell the stories of the dragonslayers because they are so few. So, know the odds are against you and be willing to do what is required to improve them. If you aren't, stay home.

To be a human being means to joyfully toss your entire life on the giant scales of fate if it must be so, and at the same time to rejoice in the brightness of every day and the beauty of every cloud. The world is so beautiful, even with all its horrors, and would be even more beautiful if there were none who wished to exploit and enslave in it.

We are now faced with the fact that tomorrow is today. We are confronted with the fierce urgency of now. In this unfolding conundrum of life and history there is such a thing as being too late. Procrastination is still the thief of time. Life often leaves us standing bare, naked, and dejected with a lost opportunity. The tide in the affairs of men does not remain at flood—it ebbs. We may cry out desperately for time to pause in her passage, but time is adamant to every plea and rushes on. Over the bleached bones and jumbled residues of numerous civilizations are written the pathetic words: 'Too late.'

Historically, reactionary forces on the verge of extinction invariably conduct a last desperate struggle against the revolutionary forces, and some revolutionaries are deluded for a time by this phenomenon of outward strength but inner weakness, failing to grasp the essential fact that the enemy is nearing extinction while they themselves are approaching victory.

Recall Henry Kissinger in reference to the American experience in Vietnam:

“We lost sight of one of the cardinal maxims of guerrilla war: the guerrilla wins if he does not lose. The conventional army loses if it does not win.”

Cargo Cult Politics

Acceptable Dissent

“And in 1964 this seems to be the year, because what can the white man use now to fool us after he put down that march on Washington? And you see all through that now. He tricked you, had you marching down to Washington. Yes, had you marching back and forth between the feet of a dead man named Lincoln and another dead man named George Washington singing ‘We Shall Overcome.’ He made a chump out of you. He made a fool out of you. He made you think you were going somewhere and you end up going nowhere but between Lincoln and Washington.”

Cargo Cult Politics: politics where it feels like you’re doing something useful but you’re actually not.

The term is harsh, but I actually think the comparison is useful. The cargo cults of the South Pacific were islanders who saw that airplanes landed on runways, bringing cargo. So they built replicas of airports and airplanes out of twigs and branches and made the sounds associated with airplanes to try to activate the shipment of cargo. This actually made quite a bit of sense, seen from their perspective—if cargo comes when there is an airport, one might think the airport caused the cargo. But there was more going on: An airport doesn’t just need a runway, but also a network of people and institutions communicating with each other and deciding whether and how to fly planes there. The stick-replica might have looked like an airport, but it wasn’t one, and it was never going to function as one.

The point of invoking this is to show that there may be actions that look a lot like political progress, but are missing the element that actually causes the change. Say, for example, we notice that in the 1960s, civil rights protesters wore signs in the streets. So when we want to change something, we go out and hold signs in the streets, because that’s what you do. But perhaps there was something else going on when they did it; perhaps it

was a small part of a much larger political strategy, and we're missing the component that actually mattered. Examples of seemingly 'political' actions that are missing an underlying theory of how you change the world include superficial changes in consumption habits and interventions in "the discourse." There is a terrible danger in mistaking the word 'HOPE' on a poster, or a rhetorical promise of change, for an actual vision of what change means and how to get it.

Some argue public policy should seek not to undo the effects of the market (which inevitably promotes inequality of income) but to limit its scope—to restrict the sphere of life in which money matters. The goal of civic liberalism, as distinguished from money liberalism, is to create a sphere of life in which money is devalued, to prevent those who have money from concluding they are superior. We must limit the extraction not only of wealth but of prestige and influence from the market. The problem of justice is a problem of boundaries. Money, even more than other good things like beauty, eloquence, and charm, has a tendency to seep across boundaries and to buy things that should not be for sale: exemption from military service; love and friendship; political office itself (thanks to the exorbitant cost of political campaigns). The principle of equality is best served not by ensuring an equal distribution of income but by setting limits to the imperialism of the market, which transforms every social good into a commodity.

“What is at issue is the dominance of money outside its sphere.”

There is much wisdom in these words, and those who value democracy would do well to heed them. But it is equally important to remember that economic inequality is intrinsically undesirable, even when confined to its proper sphere. Luxury is morally repugnant, and its incompatibility with democratic ideals, moreover, has been consistently recognized in the traditions that shape our political culture. The difficulty of limiting the influence of wealth suggests that wealth itself needs to be limited. When money talks, everybody else is condemned to listen. For that reason a democratic society cannot allow unlimited accumulation. Social and civic equality presuppose at least a rough approximation of economic equality. A plurality of spheres is eminently desirable, and we should do everything possible to enforce the boundaries among them. But we also need to remember that boundaries are permeable, especially where money is concerned, that a moral condemnation of great wealth must inform any defense of the free market, and that moral condemnation must be backed up with effective political action.

In the old days Americans agreed, at least in principle, that individuals cannot claim entitlement to wealth far in excess of their needs. The persis-

tence of this belief, even though it is admittedly only an undercurrent in the celebration of wealth that now threatens to drown all competing values, offers some hope that all is not yet lost.

The radical movements that disturbed the peace of the twentieth century have failed one by one, and no successors have appeared on the horizon. The industrial working class, once the mainstay of the socialist movement, has become a pitiful remnant of itself. The hope that new social movements would take its place in the struggle against capitalism, which briefly sustained the left in the late seventies and early eighties, has come to nothing. Not only do the new social movements—feminism, gay rights, welfare rights, transgender rights, agitation against racial discrimination, the children's climate crusade—have nothing in common, but their only coherent demand aims at inclusion in the dominant structures rather than at a revolutionary transformation of social relations—despite the lofty rhetoric they use.

There are many ways in which resistance movements are ultimately incorporated into the capitalist system, and then commodified and sold to lapdog consumers ready for their next fix. What so easily happens is revolution is entirely reduced to its material dimension. By presenting themselves as responsive to some of the concrete grievances that initially started the revolt, the authorities cleverly transform these into the sole matter of contention and utterly cast aside its much more important ideological dimension.

Proposals for this kind of incorporation abound because the working class has been offshored and automated into desperate straits, while the middle-class have lost their privileges in similar fashion. Only when conditions deteriorate far enough for the populace to appear threatening to elites—only then are ameliorative proposals countenanced. Sanders' New Dealism, trendy candidate Andrew Yang's \$1,000 monthly supplement to consumer bank accounts, Elizabeth's 'I've got a policy for that' incrementalism, Obamacare, et cetera. These are all forms of pacification in the interest of salvaging the established order, status quo neoliberal capitalism. By addressing the concrete, the ruling class sidesteps the ideological. French elitist Emmanuel Macron has tried this very thing with the Gilets Jaunes, hoping to fob them off with a wage lift here, a canceled tax there. Pacify the insurgents, and never address the core protest, which is against the capitalist ideology itself. Thus far it hasn't worked on the insurgents of the French uprising. But it has worked here far too many times.

It is interesting, how much of the antiwar anger of the bourgeoisie, stirred up by the Vietnam War, fairly well vanished once the draft was abolished. A nice cultural analogue might be this: the day Pearl Jam appeared on the cover of Time Magazine, the grunge movement was doomed, its outsider

angst soothed by incorporation. A nascent rebellion strangled in its crib. The revolt fizzles out, and some key figure is ultimately welcomed into the intelligentsia, produces a documentary about the aims of the rebellion, and becomes gainfully employed by the MSM, which commodifies her edginess and markets it to the masses. In other words: Greta's glide path.

Upper-middle-class liberals, with their inability to grasp the importance of class differences in shaping attitudes toward life, fail to reckon with the class dimension of their obsession with health and moral uplift. They find it hard to understand why their hygienic conception of life fails to command universal enthusiasm. They have mounted a crusade to sanitize American society: to create a "smoke-free environment," to censor everything from pornography to "hate speech," and at the same time, incongruously, to extend the range of personal choice in matters where most people feel the need of solid moral guidelines. When confronted with resistance to these initiatives, they betray the venomous hatred that lies not far beneath the smiling face of upper-middle-class benevolence.

Opposition makes humanitarians forget the liberal virtues they claim to uphold. They become petulant, self-righteous, intolerant. In the heat of political controversy, they find it impossible to conceal their contempt for those who stubbornly refuse to see the light—those who "just don't get it," in the self-satisfied jargon of political rectitude. Simultaneously arrogant and insecure, the new elites, the professional classes in particular, regard the masses with mingled scorn and apprehension. In the United States, 'Middle America'—a term that has both geographical and social implications—has come to symbolize everything that stands in the way of progress: "family values," mindless patriotism, religious fundamentalism, racism, homophobia, retrograde views of women. Middle Americans, as they appear to the makers of educated opinion, are hopelessly shabby, unfashionable, and provincial, ill informed about changes in taste or intellectual trends, addicted to trashy novels of romance and adventure, and stupefied by prolonged exposure to television. They are at once absurd and vaguely menacing—not because they wish to overthrow the old order but precisely because their defense of it appears so deeply irrational that it expresses itself, at the higher reaches of its intensity, in fanatical religiosity, in a repressive sexuality that occasionally erupts into violence against women and gays, and in a patriotism that supports imperialist wars and a national ethic of aggressive masculinity.

You've got to love the warmongering conservatives who go to bible study three times a week and bless the bombs we drop on women and children and curse the godlessness of this culture. But even worse are the liberals going to their summer festivals in their cars drinking organic fair trade artisan chocolate pumpkin lattes while the bombs fall for their right to consume

and casually talk about why the mainstream American can not embrace peace. ‘How could people be so ignorant,’ they say while dancing to the sound systems made by the sweatshops in Asia.

We choke on our freedom. Our children choke on their freedom. We tell them to follow their dreams, but fulfillment doesn’t come from fully doing whatever you want all of the time.

Leading a semi-pastoral life—or even living fully off the grid—is less a gesture of dissent and more like merely fleeing the problems wrought by consumption, a new iteration of privilege. Living on some mountain in comfort made possible by solar power, propane stove and fridge, satellite modem and TV, all paid for by work dependent on telecommuting or car commuting, really means enjoying all the wealth and security of the industrial economy without having to look at its costs, like pollution or poverty or racial inequity. The off-grid commuter is just a suburbanite with a longer driveway.

The dirtbag life I had led for decades was a sort of pretend poverty, in which I could fall back on my Stanford degree and the generosity of my parents. It wasn’t until I spent some time in Detroit, however, that I fully realized that what had felt for years like the renunciation of privilege had in fact been just another means of exercising it.

Historically monastics have been left alone by the state precisely in exchange for their promise to not reproduce. If they gave birth to their own children, they would become a tribe. As a tribe they would have a deeper investment in the transformation of society and would really be a thorn in the flesh—an alternative to society that might be too threatening. What would happen if people as radical as Saint Francis and Thoreau were to have reproduced? Raising children in voluntary poverty is a practice with little historical precedent. In capitalist economies that require a continuous increase in consumption, voluntary poverty constitutes a threat to power.

Along with voting, in today’s society protesting peacefully is often held up as one of the only ways that everyday working-class and poor people can change the world. This is a myth we are raised with, and since the time that we are very young, we are taught that peaceful protest helped bring about massive changes in this country and remains the only way in which people can correctly pressure the government into addressing problems and grievances. This myth has gone on to become a framework that not only criminalizes and normalizes repression, but also helps to generalize the policing and shaming of various tactics of resistance in social struggles. If we are to create a movement that can not only push back against broad attacks but create a new way of living, this false notion of ‘peaceful protesters’ is going to have to be completely destroyed.

When someone says that non-violence has been the only way that human beings have changed the world, they're fucking lying. Across the world and across history, oppressed, marginalized, poor and working-class people have used a variety of tactics to further their goals and fight back, and this includes things that could be considered violent. Overall, this means that when people refuse their roles within society and instead force the system into a state of crisis, that's when we can create a situation in which we can forward our own agenda. This often means that people refuse to do the things that allows the system to reproduce itself. In the case of workers, people strike. In the case of renters, they go on rent strike. For the poor, they refuse to be passive: they riot. In the case of all, they defend themselves against the violence of State repression and the police—they fight back.

Throughout American history mass defiance to governance and the police is what led to historic changes in the cases of both the Labor Movement and the Civil Rights struggle. In both instances, mass, disruptive, riotous, and at times violent tactics were key in pushing the State to grant reforms. Furthermore, disruptive elements often catapulted reformist and non-violent organizers into a position to negotiate with the State and push through changes. Thus, if it wasn't for violence or the threat of it, leaders such as MLK wouldn't have become so prominent.

We should also keep in mind that our enemies have also used a variety of tactics in order to ensure that the unjust status quo has stayed firmly in place. For instance, a combination of white racist terror in the form of the Ku-Klux-Klan—which was backed by wealthy land owners—along with the formation of White Citizens Councils, helped defeat Reconstruction in the South and paved the way for the legalization of Jim Crow. State repression has also used a variety of violent tactics in order to ensure that resistance movements were decimated and State authority and control was returned. For instance in 1990, the FBI with the help of local police and corporate officials, blew up the car of Earth First! and IWW organizers Judi Bari and Darryl Cherney, in order to stop their efforts to both unionize loggers and fight to protect old growth forests. In the 1960s, the FBI worked to destroy groups such as the Black Panthers through COINTELPRO and used a wide variety of tactics, including outright assassination, to destroy the black liberation struggle, anti-war movement, and radical Left.

In short, both racist reactionaries on the far-Right, the State, and movements for liberation have used a wide, diverse array of tactics in order to fight both each other, and for their own power. To imply anything else is to ignore reality and deny history.

In the daily reporting of the media, in the eyes of the police, and in the minds of millions of liberals, peaceful protesters are the basic building blocks

of a successful push to change the status-quo. Across the social landscape, peaceful protesters are celebrated as the only people who are listened to and who historically have been able to change the way the world functions. In many ways, the positive vision of peaceful protesters also paints a rosy image of the ‘respectable government,’ which supposedly has its ear to the ground for concerns, listens politely to all those that are not rude, and grants the wishes of those who ask nicely. Thus, peaceful protesters are celebrated for not disrupting society or physically becoming combative with the established order, while all those who actually do so are demonized by the State, the media, the Left, and attacked by the police.

We see this playing out in a variety of ways. In the media, reporters are always quick to give accolades to protests when they are symbolic, contained, and peaceful. When asked for comment by the police, the cops themselves will always give praise to peaceful protesters for policing themselves and making sure that disruptions and attacks on the normalcy of social peace do not happen. In many cases, we see many protesters returning this praise, going so far as to hug police and shake hands with them, ‘Thank you for protecting us,’ they tell police who are there to make sure people don’t actually disrupt the normalcy of everyday life.

The media also always helps to divide protests into two camps: ‘peaceful’ and non-protests: ‘riots.’ A New York Times headline reads, “Peaceful Protest Is Not a Crime,” as it discusses the various draconian pieces of legislation which are aimed at stopping people from blockading and disrupting freeways, roads, and pipelines. Ironically, the whole point of these pieces of legislation is that the tactics they seek to criminalize are disruptive and confrontational, and thus dangerous, regardless of it they are ‘non-violent.’ Thus, liberals miss the point again. Any sort of strategy that seeks to physically shut down and block things from happening will be targeted by the State. It is not interested if things are ‘non-violent’ or not, simply if they disrupt business as usual.

In the minds of many peaceful protesters, they often believe that if they remain peaceful, the police will not attack them. They also surmise that if the police do attack them, then the police will be reprimanded for attacking the coveted peaceful protesters. This line of thinking plays out in mainstream and Left media, as people will often write and say that police attacked “peaceful protesters,” in order to shock their readers. While many people believe that they are simply pointing out that the police attacked a crowd without provocation, what this does is simply draw a line between those that are disruptive and confrontational (who deserve to be attacked by the State) and those who are peaceful (who deserve to be protected).

Furthermore, it also removes any real analysis of why the police would

attack a protest to begin with, regardless of its makeup. For it already assumes that for the police to attack a peaceful gathering, this is somehow outside of the ordinary and uncalled for. It also reaffirms the status of the peaceful protester as the most sanctimonious creature in the universe, especially when compared to the hooliganistic being who riots, loots, punches Nazis, and start fires.

In reality, police attack peaceful demonstrations and actions all the time, not because they are violent or non-violent, but simply because the State views them as a threat and wants to shut them down.

The peaceful protester is a convenient myth for the dominant system, as it is an archetype that the system encourages people to strive for as it promotes that idea that only those who are non-disruptive will be listened to. There are peaceful protesters: those who are passive and submit to the authority of the State, and then there are rioters, hooligans, anarchists: those who fight, who destroy, who loot, who attack.

The racial overtones of these categories are clear. White, educated, and middle class people who already have more access and sway over institutions, who have been trained with the logic and morals of the dominant system in colleges and schools, are always more expected to be peaceful protesters. Meanwhile, black and brown youth who riot and fight back against the police also are likewise expected to simply be rioters and looters. In doing so, their actions are stripped of all reasons for acting and they are reduced to beings with animalistic urges; devoid of purpose other than being out of control. We see this time and time again. When riots break out, elites always make the distinction that those that are physically fighting are not protesters and therefore are not legitimate. This is also how the black bloc is largely presented by the powers that be, as a body of people committing treason against the peaceful protester. Instead of swallowing the State's logic, let's recognize this language for what it is: the State recognizing its enemies. It's up to us to draw lines: who do we support? The State or those that resist it?

The idea that any protest is non-violent is a total fantasy. The police are violent, the State is violent. To the police there is also always the immense threat that a protest (or any social situation) could leave the confines of symbolism and passivity and move into open confrontation and disruption with the established order; this is why they come to protests, to ensure that this doesn't happen. To do this, they use the threat of violence.

The sooner we destroy and leave behind the myth of the peaceful protester and stop holding it up as the archetype for all resistance movements, the better off all struggles for liberation will be. Let's not let the media define who we are and what we do. Let's not allow the elites, corporate CEOs,

and police brass to put us into categories of ‘good’ and ‘bad’; ‘community’ or ‘outside agitators.’ All of this is bullshit and it comes from the State. Let’s also remember that just because we reject non-violence doesn’t also mean that we worship or glorify armed struggle, being militant, or violent resistance, which is simply the other side of the same coin. Instead, let’s work to popularize self-defense against the State and far-Right forces, push back against liberal demonization of a diversity of tactics, and also work to promote strategies that win and build our power.

“Political power grows out of the barrel of a gun.”

—Mao

Gene Sharp is the so-called “Clausewitz of non-violent struggle.” Sharp had worked with a former Defense Intelligence Agency analyst, Col. Robert Helvey, to conceive a strategic blueprint that weaponized protest as a form of hybrid warfare, aiming it at states that resisted Washington’s unipolar domination.

The Methods of Nonviolent Protest and Persuasion

- | | |
|---|---|
| 1. Formal Statement | 2. Communications with a Wider Audience |
| a) Public Speeches | |
| b) Letters of opposition or support | a) Slogans, caricatures, and symbols |
| c) Declarations by organizations and institutions | b) Banners, posters, and displayed communications |
| d) Signed public statements | c) Leaflets, pamphlets, and books |
| e) Declarations of indictment and intention | d) Newspapers and journals |
| f) Group or mass petitions | e) Records, radio, television |

3. Group Representations
 - a) Deputations
 - b) Mock awards
 - c) Group lobbying
 - d) Picketing
 - e) Mock elections
4. Symbolic Public Acts
 - a) Displays of flags and symbolic colors
 - b) Wearing of symbols
 - c) Prayer and worship
 - d) Delivering symbolic objects
 - e) Protest disrobings
 - f) Destruction of own property
 - g) Symbolic lights
 - h) Displays of portraits
 - i) Paint as protest
 - j) New signs and names
 - k) Symbolic sounds
 - l) Symbolic reclamations
 - m) Rude gestures
5. Pressures on Individuals
 - a) 'Haunting' officials
 - b) Taunting officials
 - c) Fraternalization
 - d) Vigils
6. Drama and Music
 - a) Humorous skits & pranks
 - b) Performances of plays and music
 - c) Singing
7. Processions
 - a) Marches
 - b) Parades
 - c) Religious processions
 - d) Pilgrimages
 - e) Motorcades
8. Honoring the Dead
 - a) Political mourning
 - b) Mock funerals
 - c) Demonstrative funerals
 - d) Homage at burial places
9. Public Assemblies
 - a) Assemblies of protest or support
 - b) Protest meetings
 - c) Camouflaged meetings of protest
 - d) Teach-ins
10. Withdrawal and Renunciation
 - a) Walk-outs
 - b) Silence
 - c) Renouncing honors
 - d) Turning one's back

11. Ostracism of Persons

- a) Social boycott
- b) Selective social boycott
- c) Lysistratic nonaction
- d) Excommunication
- e) Interdict

12. Noncooperation With Social Events, Customs, and Institutions

- a) Suspension of social and sports activities
- b) Boycott of social affairs
- c) Student strike
- d) Social disobedience
- e) Withdrawal from social institutions

13. Withdrawal From the Social System

- a) Stay-at-home
- b) Total personal noncooperation
- c) 'Flight' of workers
- d) Sanctuary
- e) Collective disappearance
- f) Protest emigration

14. Action by Middlemen

- a) Suppliers' and handlers' boycott

15. Actions by Consumers

- a) Consumers' boycott
- b) Nonconsumption of boycotted goods
- c) Policy of austerity
- d) Rent withholding
- e) Refusal to rent
- f) National consumers' boycott
- g) International consumers' boycott

16. Action by Workers and Producers

- a) Workmen's boycott
- b) Producers' boycott

17. Action by Owners and Management

- a) Traders' boycott
- b) Refusal to let or sell property
- c) Lockout
- d) Refusal of industrial assistance
- e) Merchants' general strike

18. Action by Holders of Financial Resources
 - a) Withdrawal of bank deposits
 - b) Refusal to pay fees, dues, and assessments
 - c) Refusal to pay debts or interest
 - d) Severance of funds and credit
 - e) Revenue refusal
 - f) Refusal of a government's money
19. Symbolic Strikes
 - a) Protest strike
 - b) Quickie walkout (lightning strike)
20. Agricultural Strikes
 - a) Peasant strike
 - b) Farm Workers' strike
21. Strikes by Special Groups
 - a) Refusal of impressed labor
 - b) Prisoners' strike
 - c) Craft strike
 - d) Professional strike
22. Ordinary Industrial Strikes
 - a) Establishment strike
 - b) Industry strike
 - c) Sympathetic strike
23. Restricted Strikes
 - a) Detailed strike
 - b) Bumper strike
 - c) Slowdown strike
 - d) Working-to-rule strike
 - e) Reporting 'sick' (sick-in)
 - f) Strike by resignation
 - g) Limited strike
 - h) Selective strike
24. Multi-Industry Strikes
 - a) Generalized strike
 - b) General strike
25. Combination of Strikes and Economic Closures
 - a) Hartal
 - b) Economic shutdown
26. Rejection of Authority
 - a) Withholding or withdrawal of allegiance
 - b) Refusal of public support
 - c) Literature and speeches advocating resistance
27. Domestic Governmental Action
 - a) Quasi-legal evasions and delays
 - b) Noncooperation by constituent governmental units

28. International Governmental Action
 - a) Changes in diplomatic and other representations
 - b) Delay and cancellation of diplomatic events
 - c) Withholding of diplomatic recognition
 - d) Severance of diplomatic relations
 - e) Withdrawal from international organizations
 - f) Refusal of membership in international bodies
 - g) Expulsion from international organizations
29. Citizens' Noncooperation with Government
 - a) Boycott legislative bodies
 - b) Boycott of elections
 - c) Boycott govt employment and positions
 - d) Boycott of depts., agencies, and other bodies
 - e) Withdrawal from govt educational institutions
 - f) Boycott of government-supported organizations
 - g) Refusal of assistance to enforcement agents
 - h) Removal of own signs and placemarks
 - i) Refusal to accept appointed officials
 - j) Refusal to dissolve existing institutions
30. Action by Government Personnel
 - a) Selective refusal of assistance by government aides
 - b) Blocking of lines of command and information
 - c) Stalling and obstruction
 - d) General administrative noncooperation
 - e) Judicial noncooperation
 - f) Deliberate inefficiency and selective noncooperation by enforcement agents
 - g) Mutiny
31. Citizens' Alternatives to Obedience
 - a) Reluctant and slow compliance
 - b) Nonobedience in absence of direct supervision
 - c) Popular nonobedience
 - d) Disguised disobedience
 - e) Refusal of an assemblage or meeting to disperse
 - f) Sitdown
 - g) Noncooperation with conscription and deportation
 - h) Hiding, escape, and false identities
 - i) Civil disobedience of illegitimate laws

32. Psychological Intervention
- a) Self-exposure to the elements
 - b) The fast
 - i. Fast of moral pressure
 - ii. Hunger strike
 - iii. Satyagrahic fast
 - c) Reverse trial
 - d) Nonviolent harassment
33. Physical Intervention
- a) Sit-in
 - b) Stand-in
 - c) Ride-in
 - d) Wade-in
 - e) Mill-in
 - f) Pray-in
 - g) Nonviolent raids
 - h) Nonviolent air raids
 - i) Nonviolent invasion
 - j) Nonviolent interjection
 - k) Nonviolent obstruction
 - l) Nonviolent occupation
34. Social Intervention
- a) Establishing new social patterns
 - b) Overloading of facilities
 - c) Stall-in
 - d) Speak-in
 - e) Guerrilla theater
 - f) Alternative social institutions
 - g) Alternative communication system
35. Economic Intervention
- a) Reverse strike
 - b) Stay-in strike
 - c) Nonviolent land seizure
 - d) Defiance of blockades
 - e) Politically-motivated counterfeiting
 - f) Preclusive purchasing
 - g) Seizure of assets
 - h) Dumping
 - i) Selective patronage
 - j) Alternative markets
 - k) Alternative transportation systems
 - l) Alternative economic institutions
36. Political Intervention
- a) Overloading of administrative systems
 - b) Disclosing identities of secret agents
 - c) Seeking imprisonment
 - d) Civil disobedience of 'neutral' laws
 - e) Work-on without collaboration
 - f) Dual sovereignty and parallel government

Some are going to argue: Getting arrested is how you get noticed, and look—we're noticing. But getting noticed is not all there is to it, obviously—you also have to get the public on your side, and you do that by getting arrested (or beaten, shot, et cetera) for doing something just or harmless.

Nonviolent protest is not simply a protest in which protesters aren't physically aggressive. That is, lack of violence is necessary, but not sufficient, for nonviolent protest. Nonviolent protest. . .

- Must be provocative. If nobody cares, nobody will respond. Gandhi didn't do boring things. He took what he determined—after rigorous self-examination—was rightfully his, such as salt from the beaches of his own country, and interrupted the British economy, and provoked a violent response against himself.
- Must be certain not to justify the violent reactions they receive. It cannot succeed without rigorous self-examination to make sure you, the protester, are not committing injustice.
- Hurts, like all fighting hurts. You will not deal blows, but you will receive them.
- Demands respect by demonstrating respectability. The courage to get hit and keep coming back while offering no retaliation is one of the few things that can really make a man go, 'Huh. How about that.'
- Does not depend on the what the enemy does in order to be successful. It depends on the commitment to nonviolence.

A lack of violence is not necessarily nonviolent protest. Nonviolence is a philosophy, not a description of affairs, and in order for it to work, it must be understood and practiced. Since Martin Luther King, few Americans have done either (BLM included). I suspect part of the reason the authorities often encourage nonviolent protest is that so few citizens know what it really entails. Both non-provocative nonviolent protests and violent protests allow injustice to continue.

The civil rights protests of the 60s were so effective because of the stark contrast between the innocence of the protesters and the brutality of the state. That is what all nonviolent protest depends upon—the assumption that their oppressors will not change their behavior, and will thus sow their own downfall if one does not resist. Protesters must turn up the heat against themselves, while doing nothing unjust (though perhaps illegal) and receiving the blows.

1. Disobey unjust punishments and laws
2. Be absolutely harmless, polite, and rule-abiding otherwise
3. Repeat until media sensation

This is exactly what Gandhi and MLK did, more or less. Nonviolent protests are a lot more than “declining to aggress”—they’re active, provocative, and bring shit down on your head. This is how things get changed. It is worth mentioning that this is a basic introduction to clear up common misconceptions. Its purpose is to show at a very basic level how nonviolent protest relies on psychological principles, including our innate human dignity, to create a context whereby unjust actions by authorities serve the purposes of the nonviolent actors.

The concept of nonviolence as it was conceived by Gandhi—called *Satyagraha*, “clinging to truth”—goes far deeper and requires extraordinary thoughtfulness and sensitivity to nuance. It is even an affirmation of love, an effort to “melt the heart” of an oppressor. Nonviolence is not merely an absence of violence, but a presence of responsibility—it is necessary to take responsibility for all possible legitimate motivations of violence in your oppressor. When you have taken responsibility even your oppressor would not have had you take—but which is indeed yours for the taking—you become seen as an innocent, and the absurdity of beating down on you is made to stand naked.

To practice nonviolence involves not only the decision not to deal blows, but to proactively pick up and carry any aspects of your own behavior that could motivate someone to be violent toward you or anyone else, explicitly or implicitly. Nonviolence thus extends fractally down into the minutest details of life; from refusing to fight back during a protest, to admitting every potential flaw in an argument you are presenting, to scrubbing the stove perfectly clean so that your wife doesn’t get upset.

In the practice of nonviolence, one discovers the infinite-but-not-endless responsibility that one can take for the world, and for the actions of others. The solution to world-improvement is virtually always self-improvement.

To be ‘passive,’ according to the Merriam-Webster Dictionary, means to be “acted upon by an external agency.” It also means to be “submissive.” Gandhi himself ultimately rejected the phrase ‘passive resistance,’ which he associated with weakness, preferring *Satyagraha*, the term he coined to mean “firmness in pursuit of truth.” But as the word ‘*Satyagraha*’ implies, Gandhi’s passivity was not weakness at all. It meant focusing on an ultimate goal and refusing to divert energy to unnecessary skirmishes along the way.

Restraint, Gandhi believed, was one of his greatest assets. And it was born of his shyness:

“I have naturally formed the habit of restraining my thoughts. A thoughtless word hardly ever escaped my tongue or pen. Experience has taught me that silence is part of the spiritual discipline of a votary of truth. We find so many people impatient to talk. All this talking can hardly be said to be of any benefit to the world. It is so much waste of time. My shyness has been in reality my shield and buckler. It has allowed me to grow. It has helped me in my discernment of truth.”

Of course, Gandhi and his achievements are largely a myth. The Gandhi myth—and its spawning of the myth of the effectiveness of non-violence—was largely a British diplomatic and imperial effort in saving face.

Instead of the world seeing a dying imperial power being forced out because of increasing guerrilla efforts and violence—Indian National Army, and many other bombings and attacks—and its inability to meet its imperial obligations—especially the financial costs—the British used Gandhi to turn the narrative from ‘empire in decline’ to a narrative of ‘benevolent empire.’ The effectiveness of Gandhi’s non-violent movement would have been nil without the contrasting violent movements or had the British had the slightest ability or desire to retain India as a colonial possession.

This British exercise in diplomatic face-saving has had the unintended consequence of making non-violence on its own appear effective, when in reality non-violence is an exercise in futility without a violent contrast. The Gandhi myth has been damaging movements and distorting the history of effective independence and change efforts for decades and needs to end.

He also insisted one not confuse impotence with non-violence and that the weak and feeble can not actually project non-violence, since without the capacity to bring violence, non-violence is just the fearful talking up their book. There is a difference between being willing to take a beating and laugh while allowing the beating to happen to make a point versus taking a beating because one has no capacity to do otherwise.

Gandhi made the point, when you have a huge discrepancy in power, then when a weak party resists, it’s not violence. He gives a few examples. He says, take the case of a woman who resists a rapist by scratching the rapist and hitting the rapist. He says that’s not violence; that’s just a woman trying to summon up the internal moral courage to die with dignity. And then he says in 1939, you have the German Wehrmacht, the Army, the Luftwaffe, they invade Poland. Poland has six tanks. Poland resists. They

use violence, they use their tanks. Gandhi says they had that right because it was such a huge discrepancy in power. He says it wasn't resistance; it was dying with dignity. You're just trying to summon up the moral wherewithal to die with dignity.

“I would risk violence a thousand times rather than risk the emasculation of a whole race.”

“I do believe that, where there is only a choice between cowardice and violence, I would advise violence. . . I would rather have India resort to arms in order to defend her honour than that she should, in a cowardly manner, become or remain a helpless witness to her own dishonor.

But I believe that nonviolence is infinitely superior to violence, forgiveness is more manly than punishment. Forgiveness adorns a soldier. . . But abstinence is forgiveness only when there is the power to punish; it is meaningless when it pretends to proceed from a helpless creature. . .

Thus when my eldest son asked me what he should have done, had he been present when I was almost fatally assaulted in 1908, whether he should have run away and seen me killed or whether he should have used his physical force which he could and wanted to use, and defended me, I told him that it was his duty to defend me even by using violence. Hence it was that I took part in the Boer War, the so called Zulu rebellion and the late war. Hence also do I advocate training in arms for those who believe in the method of violence.

When violence is offered in self-defense or for the defense of the defenseless, it is an act of bravery far better than cowardly submission.

But I do not believe India to be helpless. . . I do not believe myself to be a helpless creature. . . Strength does not come from physical capacity. It comes from an indomitable will.

We do want to drive out the best in the man, but we do not want on that account to emasculate him. And in the process of finding his own status, the beast in him is bound now and again to put up his ugly appearance.

The world is not entirely governed by logic. Life itself involves some kind of violence and we have to choose the path of least violence.”

“I want both the Hindus and Mussalmans to cultivate the cool courage to die without killing. But if one has not that courage, I want him to cultivate the art of killing and being killed rather than, in a cowardly manner, flee from danger. For the latter, in spite of his flight, does commit mental himsa. He flees because he has not the courage to be killed in the act of killing.

My method of nonviolence can never lead to loss of strength, but it alone will make it possible, if the nation wills it, to offer disciplined and concerted violence in time of danger.

My creed of nonviolence is an extremely active force. It has no room for cowardice or even weakness. There is hope for a violent man to be some day non-violent, but there is none for a coward. I have, therefore, said more than once that, if we do not know how to defend ourselves, our women, and our places of worship by the force of suffering, i.e., nonviolence, we must, if we are men, be at least able to defend all these by fighting.

No matter how weak a person is in body, if it is a shame to flee, he will stand his ground and die at his post. This would be nonviolence and bravery. No matter how weak he is, he will use what strength he has in inflicting injury on his opponent, and die in the attempt. This is bravery, but not nonviolence. If, when his duty is to face danger, he flees, it is cowardice. In the first case, the man will have love or charity in him. In the second and third cases, there would be a dislike or distrust and fear.

My nonviolence does admit of people, who cannot or will not be nonviolent, holding and making effective use of arms. Let me repeat for the thousandth time that nonviolence is of the strongest, not of the weak.

To run away from danger, instead of facing it, is to deny one's faith in man and God, even one's own self. It were better for one to drown oneself than live to declare such bankruptcy of faith.”

“I have been repeating over and over again that he who cannot protect himself or his nearest and dearest or their honour by non-violently facing death may and ought to do so by violently dealing with the oppressor. He who can do neither of the two is a burden. He has no business to be the head of a family. He must either hide himself, or must rest content to live for ever in

helplessness and be prepared to crawl like a worm at the bidding of a bully.

The strength to kill is not essential for self-defense; one ought to have the strength to die. When a man is fully ready to die, he will not even desire to offer violence. Indeed, I may put it down as a self-evident proposition that the desire to kill is in inverse proportion to the desire to die. And history is replete with instances of men who, by dying with courage and compassion on their lips, converted the hearts of their violent opponents.

Nonviolence cannot be taught to a person who fears to die and has no power of resistance. A helpless mouse is not nonviolent because he is always eaten by pussy. He would gladly eat the murderess if he could, but he ever tries to flee from her. We do not call him a coward, because he is made by nature to behave no better than he does.

But a man who, when faced by danger, behaves like a mouse, is rightly called a coward. He harbors violence and hatred in his heart and would kill his enemy if he could without hurting himself. He is a stranger to nonviolence. All sermonizing on it will be lost on him. Bravery is foreign to his nature. Before he can understand nonviolence, he has to be taught to stand his ground and even suffer death, in the attempt to defend himself against the aggressor who bids fair to overwhelm him. To do otherwise would be to confirm his cowardice and take him further away from nonviolence.

Whilst I may not actually help anyone to retaliate, I must not let a coward seek shelter behind nonviolence so-called. Not knowing the stuff of which nonviolence is made, many have honestly believed that running away from danger every time was a virtue compared to offering resistance, especially when it was fraught with danger to one's life. As a teacher of nonviolence I must, so far as it is possible for me, guard against such an unmanly belief.

Self-defense is the only honourable course where there is unreadiness for self-immolation.

Though violence is not lawful, when it is offered in self-defense or for the defense of the defenseless, it is an act of bravery far better than cowardly submission. The latter befits neither man nor woman. Under violence, there are many stages and varieties of bravery. Every man must judge this for himself. No other person can or has the right."

All the words of the peaceful protester's much loved hero, Gandhi.

Gandhi wished to save communities from this problem. He thought we could live together while still practicing 'swaraj' Gandhi's notion of 'self-rule.' Those who are self-ruling actively cultivate in themselves an independent set of beliefs about what is morally true and false and hold onto those beliefs no matter what the social penalties are for doing so. Gandhi believed we could not truly self-rule unless we were willing to die for our beliefs about truth. We should never allow ourselves to be silenced or made to change by coercion of any kind, be it formal or informal, violent or nonviolent. Gandhi wanted us to shed our fear of the people in our community and our desire for their approval:

“That voice within tells me, ‘You have to stand against the whole world although you may have to stand alone. You have to stare in the face the whole world although the world may look at you with blood-shot eyes. Do not fear. Trust the little voice residing within your heart.’ It says: ‘Forsake friends, wife, and all; but testify to that for which you have lived and for which you have to die.’”

In every revolution ultimately it was violence or the threat of it that won out in the end. Right now, people in America are so deluded and misinformed about how to enact change that they aren't even aware that violence is necessary instead of to be avoided. A lifetime of propaganda will do that though.

The Orange Revolution eventually led to the Euromaidan. Various revolutions in the Arab spring led to the dissolution of government and civil war as order was lost. The collapse of the USSR was from loss of control as people found out about the actual state of things and could speak out while at the same time various nationalist revolts were happening.

My reference to the Indian Independence movement is far from disingenuous. It was clear to the British that if they didn't leave, they were going to lose all control anyway when even their own military were in mutiny. The grievances focused on the slow pace of demobilization. British units were near mutiny and it was feared that Indian units might follow suit. The weekly intelligence summary issued on March 25, 1946, admitted that the Indian army, navy, and air force units were no longer trustworthy, and, for the army, “only day to day estimates of steadiness could be made.” The situation has been thus been deemed the “Point of No Return.”

Every single one of the so-called nonviolent success stories has had a violent contrast, without that violent contrast, non-violence is absolutely useless.

India as mentioned had the extremely violent Indian National Army as a violent contrast.

In Alabama the massive uptick in extremely violent riots within cities and a growing violent militant action within the US black community contrasted the nonviolent civil rights marches and actions.

In the Philippines, some history: Marcos was a US puppet and the US feared if he clamped down on protests, protesters would quickly revert back to the communist insurgency—so there was a very recent contrasting violent movement—which disrupted US military bases and operations in the country in the decade prior. Hence the nonviolent protests actually had the indirect support of the world’s most violent hegemon—only because of the contrast of recent violent movements which caused disruption—which rewarded Marcos with a lifetime of comfort in Hawaii for just stepping down.

As to eastern Europe, non-violent success stories only achieved success when the regional and local powers became so weakened that they would have quickly failed with or without protests. Or when they had the support of local power players, who latched onto the protests not to make the countries better but because they saw the movements as a once in a lifetime opportunity to loot and pillage national concerns, if they were successful. Without these power players’ backing those non-violent movements would have been dead in the water.

Nonviolence on its own does not work. It never has and it never will. Power gives up nothing without a struggle and if they do it’s because they no longer want or need it. Nonviolence alone engenders no struggle, those in power view it completely accurately for what it is, an illustration of extreme impotence.

Though observations by past protesters appeared to support the hypothesis that elected officials can be forced to change policies by organizing a protest big enough to prove the public wants it—the results they achieved have rarely been repeated since the ‘60s. And when results are not repeatable, either the experiments are flawed—or the hypothesis is flawed. If large protests influence public officials and policies, then why do we observe that anti-nuclear protests in ‘83 had less influence over policy while organizing more protesters than the two largest ‘60s-era protests combined? Sure, in this instance, you could say “it was an issue of national security”—but why, then, did public officials take 14 years just to start redressing the grievances of one-million who protested for LGB civil rights?

Demonstrations which result in partial change to public policy 14–23 years later cannot be called viable protests for the same reason food which takes a year to cook is not a viable option for tonight’s dinner. By the time the food is cooked, it will not be able to satisfy your hunger because you

will have starved to death and similarly, by the time US politicians act on protests against a war or police killings or irreversible environmental harm, these things will have already inflicted the damage we were protesting to prevent in the first place.

Gandhi himself was clearly aware that violent movements were covering his flanks, and making his non-violence possible and effective. Basically, he gave the Brits a route of retreat, which probably saved losses on all sides.

But Gandhi's movement took casualties. They had the discipline to take casualties. Liberals can talk non-violence but they have no discipline for taking casualties. They pretend that conflict can be won with no costs. Liberal nonviolence talk is bogus nonviolence talk.

To punch or not to punch a Nazi? What is the correct, wise, and moral stance for the left?

While some leftists support and even celebrate the textbook straight right punch as a victory for the street over oppression, others condemn it as counterproductive and even bemoan the abuse of the Nazi thug. This latter group of liberals and leftists reason that violence breeds more violence and is thus immoral, that support for those who punch Nazis is akin to forfeiture of the left's high moral ground, which leads to a loss in the court of public opinion, and that this sort of clash promotes the Nazis' victimhood narrative. But in fact, this sort of faux morality serves the right-wing agenda.

People who adopt this stance are in effect chastising fellow citizens for confronting oppression. Thereby, they discount and distance themselves from the very real struggles against racial persecution, street violence, and inequality in general which are perpetuated by both right-wing racists and representatives of the state, most directly police.

The public's trust in state systems of justice has been negatively affected by the lack of accountability in law enforcement for racially-motivated brutality and the corruption of the judicial system that have significantly contributed to the creation of a new Jim Crow. Furthermore, white supremacists have infiltrated law enforcement, rendering non-whites increasingly susceptible to prejudice and harassment.

Thus, this approach is immoral and strategically unwise as it abandons those masses who need the most protection against right-wing repression in its various expressions, and directly feeds into the fascistic white victimhood narrative by castigating the anti-fascist (in this case the puncher) and sympathizing with the Nazi (the punchee). In so doing, this group of liberals and leftists undermine the already dwindling strength, and increase the fragility of, the left.

But truth be told—this debate is somewhat irrelevant. Liberals and leftists can preach nonviolence till kingdom come, and even parrot Trump's

villainization of Antifa, and black bloc, or even the blocking of traffic, yet the American urban reality will continue to exist in a different, less sterile, sphere. Here, city streets are largely populated by struggling people, many of whom are non-white immigrants and their families who survive at the tail end of a society with the worst inequality in the industrialized world. Together with diminishing public welfare institutions and the aforementioned corruption of law enforcement and the judicial system, the American urban reality produces alternative, 'street' forms of justice.

Within this context, it is immoral, privileged, and counterproductive to castigate citizens for confronting racial violence, whether systemic or independent, for they are on the front lines of a struggle that the left, including privileged liberals and lefties, must wholly embrace.

The context of this debate is one in which many liberals and leftists have adopted the notion that nonviolence is an end in and of itself, instead of a means among several that are aimed at achieving the ends of equality and justice. The idea that nonviolence is the only moral tactic available in the leftist arsenal and that it alone can lead to a just world plays into the hands of those who control the current systems of oppression. Thus, it must be continuously challenged and reassessed if there is any chance of survival for the left and of life on planet Earth, for that matter.

Nonviolence is an important and admirable tactic, but in certain circumstances, its sole implementation does nothing to tackle oppression. The lack of real justice for many communities in America, together with the continued militarization of law enforcement and the adoption of occupation-style policing techniques, create a situation whereby the left, and the ideals it represents, is faced with an existential crisis. In more extreme, yet eerily similar circumstances of occupation, violent resistance is both moral and legal.

So does that mean that violence is promoted or favored over nonviolence in every situation? No, of course not. It means that violence is sometimes a necessity. A nuanced approach is essential here. Do all leftists need to engage in violent tactics? No. But all leftists should understand that castigating those who employ violence—defensive aggression—against those who promote bigotry and oppression, is counterproductive and often immoral. In other words, in order for the left to present itself as a true alternative that is supportive of everyday citizens' struggles and opposed to continued oppression by the state and its right-wing metastases, it must embrace people's rights for justice, equality, defense, and dignity by any means necessary.

A fundamental difference between Liberals and Radicals is to be found in the issue of power. Liberals fear power or its application. They labor

in confusion over the significance of power and fail to recognize that only through the achievement and constructive use of power can people better themselves. This fear of popular use of power is reflected in what has become the motto of Liberals:

“We agree with your objectives but not with your tactics.”

Every issue involving power and its use has always carried in its wake the Liberal backwash of agreeing with the objective but disagreeing with the tactics.

It is also important to note that time and time again it is liberals who are condemning the actions of violence among not only the Civil Rights Movement but also the anti-fascist movement. Liberals who came into institutionalized power through centuries of violence against people of color and other minority or marginalized groups now demand those same groups ask nicely for their freedoms.

Ask yourself, when have those in power ever taken something without violence? The United States was formed by the violent takeover of Natives. The country was built on the backs of Africans violently taken from their homes in Africa. Slavery was defended through violent means, and the rights of those later freed were fought against through violence such as public lynchings carried out by civilians and police. And all of that barely scratches the surface of violence against marginalized groups.

Capitalism is a gruesome, murderous ideology that's responsible for more death and suffering than just about anything else you can name. The victims of capitalism are violently oppressed and exploited every day: they're robbed of their dignity, they're degraded and humiliated, they're broken down into serious mental and physical illness, they're perpetually threatened with poverty, and all the while they're robbed of their time and labor. The notion that the victims of capitalism have no right to defend themselves against this—violently, if necessary—is one of the most privileged, heartless, and reactionary positions I can imagine.

Nonviolence is a luxury many cannot afford, nonviolence requires a position of privilege. True nonviolence is a luxury movements can afford only if they trust the 'legitimate' violence of authorities.

While dissent can be effective in a genuine democracy, only strategic disobedience is effective with authoritarian rule.

The claim—that real change only comes about by nonviolent action—is empirically and unfortunately absurd. One look at history ought to make it clear that most real change has been brought about by violence. The vast majority of it, really. The violence of systemic racism has changed the

experiences of millions of Americans for hundreds of years in very real ways—shall we say to people of color that the changes wrought by police violence upon their communities is somehow unreal? Is climate change—which threatens our very species—not real because oil companies and governments have plunged the Arab world into chaos to keep fossil fuels flowing? This nation was forged by violence—colonized by violence. And denying that keeps us from addressing the very real problem.

Instead of saying that violence is unacceptable, we must acknowledge the real extent to which violence is accepted in the United States. And, instead of saying that real change only happens through nonviolent action, we must acknowledge the truth of history and of our current situation, both of which are riddled with violent change.

Instead of repeating ideas uncritically because we want them to be true, politicians and media commentators could serve our people better by acknowledging reality—anything else obstructs the way to the change we say we want. Then—and only then—we might have a chance to empower people to change this society nonviolently. But, until we elevate the marginalized and the poorest among us so that they may be co-creators of the civilization we all must share, violence is inevitable. The world itself testifies to that truth.

When we condemn the violence of the disempowered, we silence what that violence is trying to tell us and stamp out the potential for nonviolence. The source of violence is not inside of people like James T. Hodgkinson and so I refuse condemn him or his actions. People like Hodgkinson are like stress fractures in the structure of society—if we do not let them lead us to the injustices which must be mended, we will remember these shootings as the last sound we heard before the levees of our nation finally break.

Some idiotic, vicious, drooling, evil piece of shit human being can declare you and any other American at all to be an ‘enemy of the state,’ a ‘threat to national security,’ a ‘terrorist,’ and he can order you to be murdered.

And then you will be murdered.

The United States Government also claims that it never needs to explain to anyone how it decides who to murder and what its reasons are, or whether it has any reasons.

There is no power greater than that of life and death. This is absolute power. This is the power claimed by every slaughtering monster in history. You know this. You refuse to understand what it means.

The modern religiophobic liberal refuses to take life—their own inner life—to the true deep level of human existence in nature. This refusal keeps the majority of secular progressives conveniently incapable of fully doubting the corporate media and mainstream history textbook version of

the “dangerous” Emma Goldman or the “dangerous” Bill Ayers—or the “insane” John Brown, for that matter. I say ‘conveniently’ because to let go of that categorization, that projection, to understand these are/were the uncompromising, utterly faithful, righteously good guys, would mean we too would have to live our lives religiously, that is, in service to an ideal, coming to terms with the full dual nature of life as given, complete with its ‘what should not have been’ dark side. It would mean we would have to pay equal attention to the violence being done under the cloak of goodness, under the bright sweep of that positive story of the “silver river of life.”

The difference it makes to live one’s life religiously, in contrast to living liberally, that is, without the constraint of ideals, and allowing no ultimacy to shape one’s life or restrict one’s freedom, except for the dominant neoliberal capitalist reality—which is not considered an ideal but simply the given reality. Lacking surrender to an ideal one will be satisfied with being as good, and good in the way that the dominant reality allows you to be. Under neoliberalism ‘the good,’ which includes ongoing illegal drone warfare, mass incarceration of an underclass, a pitiful education that at best teaches obedience and consumer values, illegal torturing of prisoners and on and on, leaves much to be desired. Decrying these practices as abominations, agreeing with others who share your opinion, is not the same as living your life in opposition to the culture that can allow such brutality and barbarism, in fealty to your ideal. The capacity to serve, or to live in relation to a larger, more encompassing and more thoroughly ambivalent reality marks the difference between those who can act, take initiative, be led by vision, and the vast sea of banal liberalism that continues to wait for the leader who will do the right thing and remove from us the necessity of facing the full awful truth of the horror we’ve brought upon ourselves. That is, the liberal “vision,” if it can be called that, is not positive, but mainly defensive, though the liberal can generally be counted on to insist that others remain positive.

Power properly understood is nothing but the ability to achieve purpose. And one of the great problems of history is that the concepts of love and power have usually been contrasted as opposites—polar opposites—so that love is identified with a resignation of power, and power with a denial of love. It is precisely this collision of immoral power with powerless morality which constitutes the major crisis of our times.

The pacifist who would force ‘peace and love’ on demonstrators is second kin to the abuser who excuses his attempts to control and dominate as expressions of love. Good liberals who oppose confrontational resistance see the monster hiding in the shadows, but that monster is within themselves. Alleging that those who act directly against oppression must be poisoned

by hatred, they enshrine cowardice as the proof of love. They can't imagine fierceness and care inhabiting the same person, much less a social body that fights according to ethical principles of shared power to dismantle hierarchies. Love is not powerlessness, self-sacrifice, or keeping your hands clean. Love is courage. This far, if no further, we must agree with a certain doctor who acknowledged, in the least ridiculous moment of his life, that "the revolutionary is guided by great feelings of love."

What does it mean to be guided by such feelings, then? Love is a quality of attention, a sensitivity to the world and everything that is possible in it. When we fight on the basis of what we love, rather than in service of ideology or cowardice, we open ourselves to serve as a channel through which everything beautiful in the world can defend itself. To choose love is to choose to keep feeling the blows when others are under attack—everyone facing felony charges, everyone threatened with deportation, everyone facing water cannons at Standing Rock, all the rivers and animals and plants that sustain us despite all the violence inflicted upon them. Love is not reducible to peace. If you mean it, say it with barricades.

Rage, too, can be moral: Benjamin Ferencz, the last-surviving Nuremberg prosecutor, says that he is "boiling with anger all the time" and "won't give up fighting for peace."

An Angry Generation

“Oblique approaches are most effective in difficult terrain, or where outcomes depend on interactions with other people. Obliquity is the idea that goals are often best achieved when pursued indirectly.”

Congrats, you have highlighted a trade secret held by experts in nonlinear optimization. The saying is: you can't go there from here. So whenever optimization (such as profit maximization) has to happen over an irregular landscape—often multidimensional, not just 3D like in Earth landscapes—the process is multi-step (cannot go in straight-line, two steps) and so it happens that often times you take steps that move you in the opposite direction (less profit) of your final destination (maximum profit), but that was a necessary step to avoid a salient non-linearity (an obstacle).

We have automated these processes substantially so algorithms do their own thing and we just wait for them to arrive. But often algorithms think they have finished but just got stuck in a local maximum that is not the global maximum, so we need to test them by starting from different points—different initial values—and check whether they arrive at the same maximum.

What you describe as the short-term behavior of firms to show the rapidest result to shareholders is equivalent to getting stuck in a local maximum for not being able to look at the whole landscape and find the global maximum.

A further complication of certain systems such as markets is that the multidimensional landscape is not fixed, it is dynamic so the global maximum moves at a certain speed because the landscape changes its shape as a result of the actions of its agents and other forces.

A corollary in the political realm—purists, extremists, hardliners, those that cannot accept to move in a direction that goes against the principles of the political movement, cannot win in the big game. Being able to violate the principles some times in the search of the maximum (power) will best achieve the practical realization of those principles. I call this the ‘cynical corollary.’

There is a problem with lesser evilism. It's not that lesser evilism isn't logical in a voting booth. It's that it never ever stays within a voting booth. It poisons political activity every day of every year.

To grasp that point, one has to be brought to share the perspective in which voting is not the only important political activity. Now, I'm not against elections. I think we should have one some day! That would require some of

these changes that cannot be voted in under the broken system that lacks them: public funding of elections, no bribery, free air time for candidates, automatic voter registration, open debates and ballots, no gerrymandering, hand-marked and -counted paper ballots, international monitors, no electoral college, no delegates, no superdelegates, and a three-month election season with a bit of actual governing before the next one.

You cannot vote those things in any more than women voted themselves the right to vote or children voted an end to child labor—no major change has come about through voting. Voting is a critical component in applying public pressure in a system lacking direct democracy, but it is only one small piece—and it's even smaller when it's as broken as the current US presidential election system.

A procession of hundreds of thousands of people moving through barricaded streets carrying props and banners can be easily forgotten and ignored—the most historically large marches in recent history have failed in history-making beyond their size alone. When the status quo is not threatened, its upholders tend not to listen. We rallied in our peaceful millions against the Iraq War, too. If what you're doing inconveniences no more than a parade would, you're probably not going to stimulate change.

What price do we pay for civilization? Civilization has come at the cost of glaring economic inequality since the Stone Age. The sole exception is widespread violence—wars, pandemics, civil unrest; only violent shocks like these have substantially reduced inequality over the millennia. It is almost universally true that violence has been necessary to ensure the redistribution of wealth at any point in time.

If one firmly and truly believes that abortion is murder, then some will be pushed to stop those who kill in much the same way as one is pushed to remove one's hand from a hot stove. It will become the most logical course of action.

Arguments for pure peace cannot work. They only seek to empower those who will not adhere to this agreed upon norm. Violence *can* be justified.

I am not advocating a world without violence, which is impossible, nor a world filled with violence, which is unacceptable. What is twisted beyond all reasonable measure is the monopoly of violence used by the elite to control the masses. Liberals are hopefully lost in the idea of Gandhi followers getting their heads split open as a means of social change. That hasn't proved to be too long-lasting and who wants to be first in line to test the resolve of the sociopaths currently in charge. Just as liberals focus too much on getting arrested as a political statement. It is more a wasted effort.

Any social organization needs to concern itself with defense and how to go about doing it. The left has failed in that it did not build on controlling

the means of production or forming actual physical communities—something that could be defended, and is worth defending. Ideas and ideology must manifest in physical form.

The other aspect of violence is what your economy is actually based on. Currently, violence is the only thing that keeps the current system going. Planned obsolescence is a form of violence. The Military-Industrial-Complex is the ultimate violence perpetuation machine. Even the current Russia and China hysteria is based on discrediting any competing social order. Unrelenting creditor power to inflict debt bondage is violence.

Strong defensive strategies are needed. Build a community and then defend it. The working class is being abandoned, as a class they need to realize it is delusion to expect that the creditors are looking out for their well-being. We are not there yet. ‘We’ being those of us who need to work for our daily bread.

You have those who say you should not use force to oppose the oppressors; while themselves often using physical force to block and restrain. Fuck them. Resist with your morals.

Continuum of Revolutionary Force:

Ask→Educate→Organize→Protest→Sabotage→Destroy

State collapse has been crucial in the history of inequality. The rich are beneficiaries of the state, if states fall apart, everybody is worse off; but the rich have more to lose. Their wealth is wiped out by the destruction of the state, such as in the fall of the Mayan civilization or Chinese dynasties.

Colonialism only loosens its hold when the knife is at its throat.

Violence is always the answer, you Americans are just coddled and spoiled because of your illusionary comfort created by mindless consumerism. How long has it been since you dragged a corrupted and murderous politician out into the snow and put a bullet in his head? Maybe that’s how they will learn. Rich people fear only violence from the poor because they simply can control everything else.

Fun fact to keep in mind: those silos or other fancy bunkers with air filtration to clean out chemical, biological, or nuclear contaminants will not block carbon monoxide or any oxygen displacing gas. So, once the rich Silicon Valley or Wall St. piece of shit bunkers down, you pull a car or truck up to their air intakes and start pumping your exhaust in. Fill the fancy bunker with carbon monoxide, halon, et cetera. Bastards deserve the gas chamber of their own making.

Social movements can ignite very quickly. But the risk is always that they cannot burn for a long time. People have to go back to work, and after

a while, they want things to return to normal. The problem here is that elites can generally out-wait protesters. They have more resources after all, and the revenue they are losing in a general strike is something they can absorb in a way that poor people can't absorb losing wages.

Protests which do not really hurt or scare elites thus tend to fail. They either need to genuinely fear for themselves, or be in so much pain they will capitulate to make the problem go away. You saw this in a mild form in the US when the gays went after Obama for opposing gay marriage (yes, he did, this is a memory hole issue). They got personally in his face, they crashed fundraisers held by his wife and screamed. They made his family's life hell. It worked.

With rioting, or even inconvenient peaceful protesting, you need to do it where the elite live, so they can't avoid it. You need to take away their feeling of safety, of invulnerability—violate their sense that they can wait it out. If you don't have a strategy to make the lives of elites miserable, or make them scared, why shouldn't they just wait you out?

So the Yellow Vests in France have French President Macron scared, and he has given in on some of their demands, including raising the monthly minimum wage and getting rid of the diesel tax which sparked the original protests. What I want to discuss, however, is why they are having some success where unions, for example, could not stop Macron.

The great weakness of modern unions is leadership, bank accounts, and law. They are easy to break if the state cooperates with corporations, or by the state alone. You can bribe the leadership, you can scare the leadership, or you can break the union. Because unions have things like headquarters, leaders, and bank accounts the state can simply take all of those things away any time it wants to if the unions don't have enough internal support in the government to stop them. This matters because unions tend to have centralized leadership: take out the leadership, get rid of the strike funds, and they can be broken.

The Yellow Vests have none of this. What tiny leadership they have is some Facebook pages. They have no united bank account, no buildings, no strike funds, et cetera. They cannot be broken by a strike on a few people and some pooled resources. Instead the yellow vests are just whoever wants to show up for any given protest and put on a yellow vest. This causes some problems, yes, but it means that they cannot easily be taken out.

Why is Macron giving in to some demands? Well, perhaps because he's scared (and, I suspect, personally a coward, as are most neoliberals). In one instance, protesters commandeered a forklift and broke open the office door of Macron spokesperson Benjamin Griveaux, forcing him to flee through the back entrance, while an ex-professional boxer was filmed punching and

kicking a gendarme. Some reports have stated that Macron is worried for his personal safety. Protesters attempted to break through police lines that were guarding his home in Touquet, and his wife's family has voiced concerns that their chocolate shop in their hometown, Amiens, will be attacked.

Cue laughter, because I have no sympathy for Macron or his lackeys. I have a little sympathy for his family, but not much. I'll discuss this further in a bit. Here's the thing: most protests get nowhere because they threaten no one and nothing. The elite, being rich and powerful, can wait out those protests they cannot buy, scare, or break. They know it. This is why the union protests against Macron also failed. He just waited them out. Unions cannot tell their members to try to attack political leaders. Though sometimes such things happen and are 'regrettable' and a good union then makes sure the people who did it have good lawyers.

Macron is scared. He is scared for himself. For his family. For his staff and probably for his friends. There are people he cares about who could wind up catching a good beating, or worse. Given that the police have killed a number of protesters, please spare me wringing of hands. Normally, no one a politician cares about is threatened. Protesters get beaten, maybe the occasional cop gets a beating—and being a cop is *not* dangerous compared to most manual labor jobs so spare me the whining about people who beat people for a living, very occasionally getting beaten themselves. But politicians and corporate leaders are safe. The protesters suffer, strikers lose money, et cetera, et cetera. The yellow vests have threatened Macron. He is personally frightened, and he is giving in. Always, always find a way to threaten your opponents directly if the stakes merit it. Find something—or someone—they care about and go after it.

Now, because many people are wringing their hands, let's deal with that directly. There is a great essay by Mark Twain called "The Two Reigns of Terror." The passage in question is from the thirteenth chapter of *A Connecticut Yankee in King Arthur's Court*. It points out that there were two "Reigns of Terror" in France; that the evils of the "minor Terror," that of the Revolution, have been made much of, although they lasted only a few months, and caused the death of only ten-thousand persons; whereas there was another, "an older and real Terror," which had lasted a thousand years, and brought death to hundreds of millions of persons. We consider it horrible that people should have their heads cut off, but we have not been taught to see the horror of the life-long death which is inflicted upon a whole population by poverty and tyranny.

"There were two 'Reigns of Terror,' if we would but remember it and consider it; the one wrought murder in hot passion, the

other in heartless cold blood; the one lasted mere months, the other had lasted a thousand years; the one inflicted death upon ten-thousand persons, the other upon a hundred millions; but our shudders are all for the ‘horrors’ of the minor Terror, the momentary Terror, so to speak; whereas, what is the horror of swift death by the axe, compared with lifelong death from hunger, cold, insult, cruelty, and heart-break? What is swift death by lightning compared with death by slow fire at the stake? A city cemetery could contain the coffins filled by that brief Terror which we have all been so diligently taught to shiver at and mourn over; but all France could hardly contain the coffins filled by that older and real Terror—that unspeakably bitter and awful Terror which none of us has been taught to see in its vastness or pity as it deserves.”

Macron’s policies and those of France’s elites have made poor French and many middle class French poorer for two generations now. Macron, in particular, has made it easier to fire people, raised regressive taxes, broken unions, attacked pensions. He is a neoliberal’s neoliberal who believes that a more precarious, poorer workforce will lead to prosperity. The fact that this has been tried since 1979 and not worked does not stop ideologues like Macron. Clearly if it hasn’t worked, it hasn’t been tried in pure enough form.

Macron and the French elites’ policies kill people. These deaths show up in the statistics. They don’t have dramatic pictures. But there are more suicides; poorer people die younger; people under financial stress drink more and beat their wives more and so on. Death and suffering is what neoliberalism causes. Macron is a murderer, for an ideology which has never worked, despite being tried in most of the first world and much of the developing world. So, if Macron is scared, and if a few of his relatives or friends or employees—all of whom are very well looked after—happen to catch a bit of the violence flying around, so be it. It didn’t bother Macron that people were suffering and dying when they were people he didn’t care about.

The problem with the yellow vests, to my mind, is that while the protests include left, right, and the formerly apathetic, they seem to be resounding more to the benefit of the hard right than the left. One of the things I have been watching carefully is where various countries are going to land as neoliberalism collapses. There are three primary choices: populist left, populist right, repressive surveillance & police state.

One of the problems is that, fundamentally, if neoliberals are going down,

they'd rather surrender to fascists than the left. The fascists will let them keep most of their money and power, and will break the unions for them and so on. The Nazis were not socialists, despite the name. They made worker wages drop, and executive wages skyrocket. So we'll see how this all plays out. But, however it does, the lessons are clear enough.

Hit them, the masters, where they hurt, and make sure you have no center they can destroy or subvert. And if you do get them on the ground, which the yellow vests have yet to do, keep kicking. Rest assured, they will to you.

“I don't support these protests, they're disruptive, how will you hope you convince me if you're just making my life hard?”

“That disruption caused someone to die because they couldn't get to the hospital in time, these protesters killed people.”

Both sound rather logical to many people but could not be farther from the truth.

What is the point of protest without disruption? Has any non-disruptive protest ever achieved its ends? Why the fuck would it? If there is no disruption, then the system has no reason to change other than 'its what the people want' and that reason is not one that has swayed many leaders in both recent and long-term history. Disruption is the only effective way to fight an oppressive power. Unfortunately it has been allowed to be changed into a negative. Protests are peaceful and allow those to express their views without negatively impacting society at large, everything else should be banned.

Look at free speech zones: segregated areas, often not even within sight of the location, event, person being protested.

Disruptive protest may in fact cause death unintentionally, and one may say it is only logical to condemn that. However, how many die as a direct result of the policies or actions being protested? How many are dying as a result of a decision made by someone with great power and resources? These are the deaths we must be more concerned with, not that deaths as a result of protest be ignored, but simply put in context.

The whole point of these pieces of legislation is that the tactics they seek to criminalize are disruptive and confrontational, and thus dangerous, regardless of it they are 'non-violent.' Thus, liberals miss the point again. Any sort of strategy that seeks to physically shut down and block things from happening will be targeted by the State. It is not interested if things are non-violent or not, simply if they disrupt business as usual.

Carrying signs, chanting slogans, signing petitions, is useless. It changes nothing, fixes nothing. Action involving voting, running for office, or civil disobedience—massive and disruptive—can change things.

Occupy Wall St. failed because, in the end, it was all slogans and chanting. Not a single member of Congress, particularly on the GOP side, changed one position as a result of Occupy. Same goes for the Women's March. Think that protest changed anything that the GOP are going to do? Think Paul Ryan or Mitch McConnell felt afraid or had a change of heart? A march is a failure and pointless unless it actually translates into actions that change the electoral map, who gets elected, and/or disrupts day-to-day living for the comfortable.

Radical anti-war and anti-nuke advocates historically didn't give a fuck about 'respectability politics' and property destruction as 'violence' in the face of this threat. They literally took a sledgehammer to the source of state violence thereby—both symbolically and materially—neutralizing it.

Mixing an increase in the impotence of protest as an expression of the public will with a growing public frustration regarding the meaninglessness of their elections is not just the recipe for being the worst policy-makers ever—it is also a big, red, warning sign. The US appears to be approaching a very dangerous time and the best thing we can do right now is to be honest about it. The working classes or the proletariat or the 'we the people' or whoever we are—us, the one reading and the one writing—we have lost our ability to meaningfully influence the actions carried out by the state in our alleged name. To say that voting is a joke in the US would be an understatement. If millions of people protesting for the change their votes never bring decide that protest is also hollow—then, maybe the people who say violence is the only way to change things will be right.

Whether they are right or not is in our hands—for now. Or maybe it isn't—it's getting hard to tell these days.

Along with voting, in today's society protesting peacefully is often held up as one of the only ways that everyday working-class and poor people can change the world. This is a myth we are raised with, and since the time that we are very young, we are taught that peaceful protest helped bring about massive changes in this country and remains the only way in which people can correctly pressure the government into addressing problems and grievances. This myth has gone on to become a framework that not only criminalizes and normalizes repression, but also helps to generalize the policing and shaming of various tactics of resistance in social struggles. If we are to create a movement that can not only push back against broad attacks but create a new way of living, this false notion of peaceful protesters is going to have to be completely destroyed

Across the political spectrum, at a time when millions of people are starting to take seriously punching Nazis, blockading airports, and rioting as a vehicle for both self-defense and as a means of collapsing the regime by creating a state of crisis, there is predictably by the State, the media, and the Left, condemnation of these tactics. Why? The answer is as easy as it is simple: for these are the tools that are at the disposal of all poor and working people. And to be able to demonize in the minds of millions not even ideas, groups, or organizations, but moreover tactics—this is the real goal of all apparatuses of control. To make evil and wrong what is possible for human beings to be able to accomplish with their very bodies en masse in offensive capacities that further their interests and in defensive ones that protect them. If a State can do this inside the minds of its subjects, it can do anything.

We can't help but think that people who say this haven't had much experience dealing with the police. The actions of the police in Standing Rock provide a good example. The anti-DAPL protests have been largely within the tradition of nonviolent civil disobedience and yet the resisters there have been brutally attacked with pepper spray, rubber bullets, concussion grenades, tear gas, and batons. They've been encircled by drones, investigated by police, and tracked on social media. Clearly, the police weren't waiting for so-called 'violence' to erupt before attacking.

On the other hand, the demonstrators at UC Berkeley who shut down Milo's speech threw barricades, used mace against white supremacists, shot fireworks and threw stones at the police and the building where Milo was speaking, and lit fires in the street. The police response was to hide in the building and then stay to defend campus as the crowd was able to march largely unaccompanied by police for hours.

What these examples highlight is not the superiority of one tactic or kind of tactic over another, but rather the importance of understanding the particulars of each situation, the goals, and what it makes sense to do. If you are truly worried about police violence, in a situation where the police have relatively few numbers, running towards them to make them flee is a greater guarantee of preventing police violence than sitting down and waiting for them to amass their weapons. Those who most often make the above claim are ideological pacifists, who push the doctrine of civil disobedience in every scenario, even when it is strategically dangerous; protest organizers and their marshals who have a vested interest in keeping their grant money and being allowed to obtain more permits; and the police themselves, who obviously don't want to be strategically out-manuevered, or heaven forbid, hurt.

The moral high ground is only a strategically beneficial position in verbal or theoretical argument, it does not do one much good in an actual war or

fight. Those preaching strict nonviolence may want to ponder this. Your morals are not a shield, they will not block the blows, they will not save your life.

Sometimes when good people caution those who protest against against our society's many injustices, to eschew 'violence,' that a 'safe' society is better than one experiencing the turmoil of civil war, I think of the homeless people on the streets of Denver, of the Lakota babies born with fetal alcohol syndrome who will never have a chance to excel in school, of the black boys shot by police, of the girls who flee from foster care straight into the tender mercies of a pimp and forced sex, of the inmates in prisons who spend decades in a tiny windowless room, slowly losing their minds—and I think: Violence? Thousands of people are experiencing soul-numbing and body-destroying violence on a daily basis. You have made the decision that other people can suck off all the ills of our society so that you can pretend we live in a safe world. Well fuck you, I do not intend to walk away from Omelas, but instead to burn this unjust apparatus to the ground.

“Using violence only makes us as bad as those we oppose.”

What this statement always takes for granted is the meaning of violence itself. What is violence, concretely? And more importantly, who defines and decides what it is? Debates around violence quickly descend into the infantile territory of quoting the dictionary to prove a point, as if the dictionary weren't written with human hands and made by real people with their own presuppositions. We are doomed to circular arguments if we uncritically accept any of the vague definitions widely accepted. The question of who or what is violent always conceals the more important question: who has obtained a position from which they can denounce and punish violence as they define it?

Today, the police and the far-right undoubtedly occupy this position. For this reason, forced deportation is not violence but law, while blocking roads is violent; breaking windows at a building where Milo is speaking is violent, while Milo leaking personal information of transgendered students to be harassed by alt-right trolls and students with illegal residence status to be targeted by ICE is lawful free speech; someone punching the proud white supremacist Richard Spencer is violent, while Spencer hosting articles about ethnic genocide on his website in a country built on slavery and colonialism is just free speech.

Of course, it is unlikely that we will be able to hide behind such a free speech defense, when they come execute a middle-of-the-night no-knock raid in response to the publishing of this book. No, of course *we're* preaching

violent, dangerous rhetoric and must be stopped, tried, thrown in a Super-Max windowless box. And, of course, none of that will be problematic violence.

Violence, in the end, is nothing. It's indefinable because it shifts according to who has the power to define it. It nearly always operates downwards: those who hold the most power and control the most means of force will define anything that appears as a threat as 'violent.' This is why the men who shot five people at a Black Lives Matter protest in North Minneapolis could claim self-defense against violence from unarmed protesters, and why the man who shot an unarmed protester outside Seattle's UW during a protest against Milo could say the same. You can disagree about the usefulness or kindness of a tactic, but the question of violence is, in the final analysis, nothing other than the question of who gets to decide what it is.

It is, therefore, not cruelty, or a thirst for blood, or any other criminal tendency, that induces such a man to strike a blow at organized power. On the contrary, it is mostly because of a strong social instinct, because of an abundance of love and an overflow of sympathy with the pain and sorrow around us, a love which seeks refuge in the embrace of mankind, a love so strong that it shrinks before no consequence, a love so broad that it can never be wrapped up in one object, as long as thousands perish, a love so all-absorbing that it can neither calculate, reason, investigate, but only dare at all costs.

Violent radicals, far from being depraved creatures of low instincts, they are in reality super-sensitive beings unable to bear up under too great social stress. They are driven to some violent expression, even at the sacrifice of their own lives, because they cannot supinely witness the misery and suffering of their fellows. The blame for such acts must be laid at the door of those who are responsible for the injustice and inhumanity which dominate the world. These radicals are not brutes, monsters, unnaturally violent creatures. They are the opposite; they are too sensitive for successful assimilation to this brutalizing condition to which they are expected to adapt as if there were no choice.

That was the point of anarchism: to defend that aspect of the human being that is incorruptible, that provides the base for moral thinking which does not necessarily conform with socially enforced mores, that makes it possible both for the human being to endure suffering and to feel compassion for the suffering of others. It is a defense of interior knowing, thus completely based in individuals who insist their own inherent knowing is right, or righteous. This should be seen as the quite remarkable attitude it is, profoundly admirable.

Think of the sensitive ones now, the ones who cannot adapt, the ones

who are losers, who become mentally ill, or drug-addicted, or just failed in one of the many ways we can fail. We have learned so well the lesson of survival of the fittest, the lesson to not be ‘so sensitive,’ that most of us are successfully hardened to the very realities, cruelties, and barbarisms that are business as usual for the system that serves corporate capitalism. How demoralized we’ve become in just over a century, that we now can afford to sacrifice the most sensitive souls, the ones who just don’t have what it takes, the ones who, like Goldman and her comrades, would have been thrown into despair, and from despair and heartbreak into courageous activism. This hardening of our hearts makes counterculture impossible; we cannot resist, we cannot be the outsiders that we would have to be were we to “smash the old idols of ourselves” and dedicate ourselves to building instead a world safe for human souls.

We exist now in a context in which it is possible and even usual to behave as if we had no interior being; to exist without a soul.

“Don’t do anything illegal! Let’s keep this space safe!”

This statement is especially absurd, since it’s often shouted by those already engaged in illegal behavior. Depending on the permit the organizers were able to get from the city, blocking streets, having a certain amount of people, and remaining in a space past a designated time may all be illegal. At the demonstration against the “Muslim Ban” at the MSP airport, demonstrators were often unaware that their presence in the airport had violated the terms of the permit. Similarly, when demonstrators moved onto I-94 to protest the election of Donald Trump in November, they chanted “this is a legal protest” while they engaged in decidedly illegal behavior.

Whether an action is legal or illegal should never guide our conduct. Much of what we collectively consider tragedy in our history was carried out legally, like slavery, for example. Much of what we consider heroic was illegal, like helping slaves escape their plantations. At the same time, laws can change quickly and drastically. Those who have opposed Trump on the basis of his “illegal” or “unconstitutional” behavior will have to come to terms with the fact that he will accomplish his deportations, his bans, his strengthening of white supremacist elements, and weakening of marginalized communities through primarily legal means, and with the infrastructure built by Obama. ICE and drone technology were drastically expanded under Obama’s eight years, for instance. Perhaps those who unconditionally supported Obama will only now be worried that he was able to remotely kill a US citizen—Anwar al-Awlaki—without a trial using a drone.

But yes Nancy, Trump is terrible isn't he? And while we expect you'll enjoy our book as much as Trump's State of the Union, we're afraid it's a bit too thick for you to tear to pieces on camera—you'll need to come up with a different shitty 'meme moment.' We're sure your sycophantic staff will come up with something new for you. Maybe it'll even be better than "Nancy the Ripper"—it is a pretty low bar.

The over-reliance on legal discourse betrays a faith in a system of law that has been used to justify murder, genocide, slavery, and imperialism. Those who have managed to escape being affected by these processes will now have to decide whether law is more important than defending their neighbors, their friends, or themselves. Who among them would be willing to hide a refugee whose return home could mean death? Who would lie to the police who come to take them away? Who would fight the police? It may be the case that by not participating in illegal behavior, those who demand we follow the law are condemning everyone else to misery or death.

The law cannot constrain our pursuit of true justice.

"Dr. King would never take a freeway."

What do you think the Selma to Montgomery march was? They're not marching in somebody's field. That's a freeway! This is what the civil rights movement was. It was disruptive. It was meant to disrupt civic life, government functioning, commercial operations. There is a constant telling of young people, "Be like King, be like King." Be careful what you wish for, because, if you know what it means to be like King, you know it means disruptive protest. What it means is understanding that US domestic and foreign policy are linked. What it means is calling out not just southern conservatives but northern liberals. What it means is making a moral and religious witness against racism, poverty, capitalist oppression and how they interact in the United States and the global economic system. What it means is getting arrested over and over and over. What it means is having to call out your allies. What it means is using a whole variety of strategies that people call violent, that are actually disruptive.

So when people say to young people be more like MLK, what I want to say is: Be careful what you wish for.

"They made clear that their idea of solidarity was everyone doing the same thing—in other words doing what they said people should do—rather than the understanding the those who struggle against oppression without hindering each other benefit each other."

Our idea of struggle is to struggle ourselves, their idea of struggle is to manage how others struggle.

When discussing the correctness of tactics, whether or not they should be supported, it is important to note whether we are discussing the real world or the ideal world. It is not fair to expect the oppressed, the powerless, to act as if they are in an ideal world if the powerful are not doing so.

Violence can certainly harm innocent people when fighting for change, but many of those same individuals were the ones supporting the regime and aiding in its oppression and legitimization. Provided they are not specifically targeted, their deaths are less concerning.

There is no acceptable reason for which our institutions should take decades—or even years or months for that matter—to respond to its aggrieved citizens—from whose consent the legitimacy of their authority is derived—with meaningful legislation. What the hell are we paying them for if not to administer the institutions which make up our society in accordance with the wishes of the people?

People who pronounce themselves in favor of the method of legislative reform—in place and in contradistinction to the conquest of political power and social revolution—do not really choose a more tranquil, calmer, and slower road to the same goal, but a different goal. Instead of taking a stand for the establishment of a new society they take a stand for surface modifications of the old society.

If we use peaceful means to attain the goal of communism, when will we finally achieve it? Let us assume that a century will be required, a century marked by the unceasing groans of the proletariat. What position shall we adopt in the face of this situation? The proletariat is many times more numerous than the bourgeoisie; if we assume that the proletariat constitutes two-thirds of humanity, then billions of Earth's inhabitants are proletarians, who during this century will be cruelly exploited by the remaining third of capitalists. How can we bear this?

Empires are never brought down by anything except violence. Whether such violence comes from individuals within or without, or simply nature itself, history shows that such methods are the only effective empire-killers.

We do not have the time to continue attempting peaceful, incremental change. Those that have tried to do so for decades or longer—despite their sincere efforts—have failed miserably. The current empire is toxic to all life on Earth, is a danger not only to the currently living generations but to all those in the near future as well.

These individuals who have attained such great power, status, wealth are not going to give up such stolen wealth voluntarily. We must force them to, by any means necessary.

“I am of a generation which thought that we could bring peace to the world, and we didn’t think it mattered if we ourselves were angry. What we learned is that an angry generation cannot bring peace.”

But anger isn’t the worst thing in the world, apathy is.

“It was necessary to fight but hardly anybody fought. It was necessary to resist and hardly anybody wanted to do that.”

Chapter Eighty

Heroes & Villains

What is a Hero?

“My first opportunity for heroism came when I was 10. Peter, a classmate who I remember as having the physique of a grizzly bear, was bad-tempered and tended to take out his misery on smaller children. We were all careful to avoid Peter, knowing that a wrong glance or smile could turn him violent. But sometimes I had to share lunch break with him. Most children in my school went home during the two-hour lunch break, but those of us who lived too far away had to stay at school and eat a packed lunch under the supervision of a parent-volunteer. That particular day, the volunteer must have stepped outside, leaving some 30 of us unsupervised in the gym. I noticed that a circle of kids had formed to watch Peter push around a younger boy who had provoked his rage. The little boy was crying and froze as Peter shook a fist in his face.

‘Hey Peter!’ I said, ‘Only cowards pick on kids smaller than themselves!’ and secure in the knowledge that girls don’t get hit, I stepped between Peter and the smaller kid. Next, I found myself curled up on the floor gasping for air and clutching my stomach. It hadn’t occurred to me that if you stand up to a bully, you should expect to be punched in the gut.

Eventually, it dawned on me that beheading one bad guy won’t stop evil, and that if I had seriously tried to seduce and kill Khomeini or Hitler, I most likely would have been raped and killed before I’d even had a chance to pull out my sword. Even Rudi’s attack on the population registry ultimately didn’t make much of a difference: the majority of Dutch Jews had already been deported, and it turned out the authorities had a duplicate archive in The Hague. Only in fairy-tales and action movies do heroes defeat evil and get cheered on by the masses. In real life,

they usually end up with a bullet in the head and maybe a brief mention in the news.

When I was younger, I was under the impression that knowledgeable people knew who the bad guys were and how to deal with them. Now, I sometimes don't even know anymore what is evil, what is stupidity, and what is simply a difference in opinion. I feel insufficient. All I have to offer are little improvements and small gestures. Unlike my cousin and the biblical Judith, who were willing to risk their lives, I'm not risking anything. I can't even decide which cause would be worthwhile sacrificing my life for."

Whenever I see someone online repeatedly gushing with enthusiastic praise about me and my writing, I don't get flattered by it. I don't get any kind of ego tickle out of it at all; I just quietly say to myself, 'Ah shit. You're gonna get so pissed off when I inevitably say something you disagree with.'

And without fail they always do. It happens over and over again; someone decides I'm the greatest thing since sliced bread and decides to elevate me in their minds to some kind of trustworthy authority figure over what they should be thinking, then eventually I'll say something they disagree with because I don't fall neatly into any reliable ideological box they can trust to remain predictable from day to day, and they have a catastrophic meltdown about it online acting like I just betrayed them.

And in their minds, I did betray them. They trusted me to always show up in their inbox every day saying things that align with their worldview in an articulate and interesting way, and then I betrayed that trust. It's not a trust I ever wanted and frequently advise against, but I haven't been able to find an effective way to deter it.

I see this same kind of betrayal reaction from progressives today about Bernie Sanders and Noam Chomsky, Sanders for dropping out and endorsing Biden without first ensuring some "concessions" from his campaign and Chomsky for sharing the same 'lesser evil voting' policy he's been voicing for decades.

I personally don't get this desire progressives feel to receive concessions from the Biden campaign in the first place. Like, what is the motive here? You want Biden's handlers to lie to you and add some more fake progressive agendas to his platform that have a zero percent chance of ever being enacted if he makes it to the White House? It's so undignified. It's undignified for the progressives, and in a sense it's undignified for the Biden camp as well. Trying to make a lifelong corporate whore do a fake leftist song and

dance is like trying to make a cat wear a dress. Stop trying to get Biden's handlers to write down some lefty talking points for him to struggle to read on camera and just let him campaign honestly as the corporate whore he's always been.

And of course the odious Mehdi Hasan trotted out Chomsky to have him recite his famous lesser of two evils spiel—except of course in this case it's the lesser of two right-wing dementia patients who've been credibly accused of rape. What did you think was going to happen? They did it in 2016, they did it in 2012, of course they're going to do it again. You'll never see Noam Chomsky more visible than when the US political establishment needs to keep national momentum from shifting toward actual leftist movements.

And I mean I get it. I get it that it's annoying to never get to have any heroes who don't end up betraying the trust you put in them and advancing causes that you oppose. Other people get to have heroes; liberals get to have Obama, conservatives get to have Trump, why don't people who want to see meaningful healthy changes in US policy get to have any heroes?

But in an environment with vast fortunes poured into upholding and reinforcing the status quo, where the gravitational pull of establishment agendas reliably tugs at every corner of the political universe, that's just the reality of our situation: you don't get to have heroes. The only trustworthy place you can hang any authority is on yourself.

If you're experiencing emotional suffering over Bernie Sanders or Tulsi Gabbard for endorsing Biden, or Chomsky for endorsing lesser-evil voting, you really have nobody to blame but yourself. You wouldn't have to knock these people off the pedestals you put them on if you hadn't put them there in the first place. If you'd been placing authority in yourself, where it belongs, you'd just see some regular schmucks moving around and saying things just like all the other seven billion schmucks on this planet.

You've got no business abdicating your rightful authority over what's true to Bernie Sanders, to Noam Chomsky, or to me. Your responsibility to know the truth about reality is yours and yours alone. Everyone else is just offering you various tools. Sometimes they're the right tool for the job, sometimes they're the wrong tool, and it's up to you to sort out which is which. But regardless, they're only ever handing you tools to do the job that is your responsibility and yours alone. Take what tools are useful, and leave the rest. Do this, and you'll find the names and faces involved in our collective awakening a whole lot less frustrating.

For a supposedly collectivist impulse, the left sure does pour a lot of mental energy into individuals. 'Oh, this individual is Good, we can trust this one. Oh no, but this individual over here is Bad!' No they're not, they're just people handing out tools. Sanders handed out a useful rallying point for

the left, Chomsky handed out some useful ideas on propaganda, and they both handed out some tools that are unhelpful right now. Take the useful tools and leave the others. Do this while standing on your own authority and much of the debate about individuals will become uninteresting and meaningless to you.

Putting someone on a pedestal is actually a very violent thing to do, because it guarantees that you'll have to knock them off of it eventually. It's violent towards others, and it's violent toward yourself; it only invites future pain into the world, and the world has enough pain. Don't abdicate your authority to anyone else and no one will ever let you down for using the authority you gave them incorrectly.

Q: "Would you do it again? Now that you're ninety-one years old, looking back—the Germans were murdering entire villages. Was it wise to put your family at risk?"

A: "It's a good question. When you live in a place like this—small, by itself—you're brought up to give help, not wait for it. When your neighbor needs something, he needs you. The person he knows. Not the army. Not the police. You. And if you're not there, someday you'll have to look him in the face and explain. The Germans didn't know us, and they believed they could not lose. They believed they'd never have to look anyone in the face and explain. They'd never have to pay for what they did. And I believe that is why we defeated them. Because we have to answer to one another, and they did not."

Who belongs to Class X? I don't know till I talk to him and then I know at once. It is not, I think, a question of accent, but rather of the gentle voice—the tone of someone who, when asked to do and die, would quite like to know the reason why.

Women tend to act heroically within their own moral universe, regardless of whether anyone else knows about it—donating more kidneys to non-relatives than men do, for example. Men, on the other hand, are far more likely to risk their lives at a moment's notice, and that reaction is particularly strong when others are watching, or when they are part of a group.

When a woman gives shelter to a family because she doesn't want to raise her children in a world where people can be massacred because of their race or their beliefs, she is taking a huge risk but also promoting the kind of moral thinking that has clearly kept hominid communities glued together for hundreds of thousands of years. It is exactly the same kind of altruistic choice—with all the attendant risks and terrors—that a man makes when

he runs into a burning building to save someone else's children. Both are profound acts of selflessness

The beauty and the tragedy of the modern world is that it eliminates many situations that require people to demonstrate a commitment to the collective good. Protected by police and fire departments and relieved of most of the challenges of survival, an urban man might go through his entire life without having to come to the aid of someone in danger—or even give up his dinner. Likewise, a woman in a society that has codified its moral behavior into a set of laws and penalties might never have to make a choice that puts her very life at risk.

What would you risk dying for—and for whom—is perhaps the most profound question a person can ask themselves. The vast majority of people in modern society are able to pass their whole lives without ever having to answer that question, which is both an enormous blessing and a significant loss. It is a loss because having to face that question has, for tens of millennia, been one of the ways that we have defined ourselves as people. And it is a blessing because life has gotten far less difficult and traumatic than it was for most people even a century ago.

Andrew Carnegie was so intrigued by heroes, he began hunting them. In 1904, he set up the Carnegie Hero Fund, as much a research tool as a reward. Only pure altruists are eligible, not firemen or police officers or parents rescuing their own children. Every year, the fund collects tales of heroics from across the country, cataloguing them by gender, region, age, and incident, and awarding a cash prize to the heroes or their surviving families. Carnegie was soon hearing about Thelma McNee, the teenage girl who leaped from her apartment roof onto the burning building next door to rescue two children trapped inside by the flames. A submission came in for Wava Campredon, a seventy-year-old New Mexico woman who was mauled but kept battling two savage dogs with her garden hoe to save her neighbor. Mary Black, a twenty-five-year-old Oregon housewife, was “encumbered by four skirts” but still swam twice into a flood-engorged river to save a pair of drowning sisters.

Was there some kind of pattern at work? Is it a performance model that could be reproduced or just a happy string of accidents in which the right person turned up at the right time, sometimes with a hoe. Because if one could boil heroism down to a formula—to an art—then good God! He'd go down as one of the world's great peacemakers, a name spoken in the same breath as Christ. Once everyone became protectors, who'd be left undefended? Every classroom would have a hero, every home, every riverbank.

Carnegie was not the first to try. Plutarch did such a remarkable job,

Parallel Lives became the handbook for modern history's heroes—though of course some would dispute just how heroic their actions were. “It has been like my conscience,” Henry IV of France commented, “and has whispered in my ear many good suggestions and maxims for my conduct and the government of my affairs.” Abraham Lincoln was a devoted reader, as were Teddy Roosevelt, George Patton, and John Quincy Adams. When England was rebuilding after the Great War, the hero's bible was its guide. “Plutarch's *Lives* built the heroic ideal of the Elizabethan age,” C. S. Lewis acknowledged. And what Plutarch taught them is this: Heroes care. True heroism, as the ancients understood, isn't about strength, or boldness, or even courage. It's about compassion.

When the Greeks created the heroic ideal, they didn't choose a word that meant ‘Dies Trying’ or ‘Massacres Bad Guys.’ They went with ‘hērōs’—“protector.” Heroes aren't perfect; with a god as one parent and a mortal as the other, they're perpetually teetering between two destinies. What tips them toward greatness is a sidekick, a human connection who helps turn the spigot on the power of compassion. Empathy, the Greeks believed, was a source of strength, not softness; the more you recognized yourself in others and connected with their distress, the more endurance, wisdom, cunning, and determination you could tap into.

Heroes are protectors, and being a protector means having strength enough for two. Being strong enough to save yourself isn't good enough; you have to be better, always, than you'd be on your own. The ancient Greeks loved that little interlocking contradiction, the idea that you're only your strongest when you have a weakness for other people. They saw health and compassion as the two chemical components of a hero's power: unremarkable alone, but awe-inspiring when combined. What you're aiming for is the hero's holy trinity: *paideia*, *arete*, and *xenia*—skill, strength, and desire. Mind, body, and soul. Overload on any one of the three, and you'll unbalance the other two. You can charge into action with the noblest *xenia* intentions, but you'll get nowhere without the know-how of *paideia* and the raw *arete* arsenal of fists, agility, and endurance. That's what made Odysseus, trickster and semi-scoundrel though he was, the greatest Greek hero. Odysseus wasn't the best fighter: he was actually a draft-dodger who tried avoiding the invasion of Troy by pretending he'd gone loopy and was too addled to leave home. One of his fellow warriors saw through that scheme, however, because Odysseus was well known for slipping out of a scrap if he didn't like the odds and only using his spear if he couldn't deploy guile instead.

The Greek myths are really the same performance parable, over and over; they're showcases for underdogs using the art of the hero to deal with

danger. Need to tame a savage bull? Wait for it to take a drink, then wrestle it down by the horns. Ordered to clean a toxic stable? Flood it. Up against a giant man-bull, a three-headed hellhound, or a lion with an impenetrable pelt? Get behind them and choke 'em out. These techniques weren't just mythical make-believe; some were so spot-on, they're still used today in the Greek fighting art of pankration. If you're ever up against a guy who can tear your head off, take a lesson from Odysseus:

“Odysseus knew a trick or two. He kicked Ajax hard in the back of his knee and toppled him backwards, falling on his chest.”

Because the way the Greeks looked at it, you have a choice: you can either hope someone comes to the rescue when your kids are in danger, or you can guarantee it.

Brutal egoism just isn't human. We like to think of ourselves as masters of our own destinies, as lone wolves in a dog-eat-dog world, but guess what: Dogs don't eat dogs. They work together. As do most species. As do we. In fact, when it comes to wolf-pack tactics, humans are even better than wolves. We're the most communicative, helpful species that's ever existed. If anything, we overshare. We share every idea, every tool, every belief. Even when we fight, we do it as a team; in war, we unite in fantastic numbers. So forget brutal egoism. That's not our real strength.

“The single greatest moment of his own life came when he plunged a little boat into a seething cauldron off Martinique and began pulling burned, frightened survivors into his arms.”

He wasn't out there because of ego. He was out there because it was natural; because being a god on earth is a natural human desire, and saving someone else is the closest we'll ever come to achieving it. All Greek mythology and every major religion that followed has really been devoted to that single premise: the hero who leads the way is half god and half human, fueled as much by pity as by power.

But for all their shenanigans, you don't see the heroes piling up a mountain of loot. They're not in it for gold; given a choice, Odysseus would be happier farming at home with his wife. Stealing wasn't his job; it was a calling, an art, a way of making the impossible possible and the imaginary real. Pulling off a clever heist is as close as humans can come to magic, allowing something in your mind's eye to suddenly appear in your hand. Other religions condemn thieves as sinners and outcasts, but the ancient Greeks shrugged and decided, 'Eh, let's give 'em their own god.'

Because who else will teach us that our stuff doesn't really matter? That our possessions are fleeting, forgettable, and that anything you have someone else can take? What you'll be remembered for isn't your wealth and power, but your creative imagination—your *mêtis*.

What fueled it all was a kind of Outlaw Outlook: Instead of relying on laws passed down from some god or a king, let's think like outlaws. Let's think for ourselves. An outlaw outlook calls on every citizen to create, not conform; to decide what is right and wrong and act on it, not just 'baa' along with the rest of the herd. Outlaws have to be poised, smart, and independent; they have to cultivate allies, assess risk, and keep their antennae fine-tuned to everyone and everything around them. Outlaws focus on what people can do, not what they shouldn't. In Athens, the outlaw outlook worked so beautifully, it became a civic responsibility. The Athenians still had laws, but they were proposed by average citizens, not imperial rulers. Anyone who started acting too bossy—who thought he knew what was best for everyone else—was marched to the border and sent into exile under Athens's steely "No Tyrants" policy.

"Heroes, after all, aren't measured by the stories they tell—
they're measured by the stories told about them."

It is quite saddening to think of those people who have been mistreated by history. There were the *poètes maudits*, like Edgar Allan Poe or Arthur Rimbaud, scorned by society and later worshiped and force-fed to schoolchildren. There are even schools named after high school dropouts. Alas, this recognition came a little too late for the poet to get a serotonin kick out of it, or to prop up his romantic life on earth. But there are even more mistreated heroes—the very sad category of those who we do not know were heroes, who saved our lives, who helped us avoid disasters. They left no traces and did not even know that they were making a contribution. We remember the martyrs who died for a cause that we knew about, never those no less effective in their contribution but whose cause we were never aware of—precisely because they were successful. Our ingratitude toward the *poètes maudits* fades completely in front of this other type of thanklessness. This is a far more vicious kind of ingratitude: the feeling of uselessness on the part of the silent hero.

I will illustrate with the following thought experiment: Assume that a legislator with courage, influence, intellect, vision, and perseverance manages to enact a law that goes into universal effect and employment on September 10, 2001; it imposes the continuously locked bulletproof doors in every cockpit (at high costs to the struggling airlines)—just in case terrorists

decide to use planes to attack the World Trade Center in New York City. I know this is lunacy, but it is just a thought experiment and remember, Wikipedia says it doesn't have to be realistically possible. The legislation is not a popular measure among the airline personnel, as it complicates their lives. But it would certainly have prevented 9/11. The person who imposed locks on cockpit doors gets no statues in public squares, not so much as a quick mention of his contribution in his obituary. 'Joe Smith, who helped avoid the disaster of 9/11, died of complications of liver disease.' Seeing how superfluous his measure was, and how it squandered resources, the public, with great help from airline pilots, might well boot him out of office. He will retire depressed, with a great sense of failure. He will die with the impression of having done nothing useful.

What is a Villain?

We've tied Sympathy to a railing on the catwalk over the Void of Lost Remembrance. She does not cry, though I'd prefer that she did. Instead, she twists loosely in the breeze, trying, trying to understand what we've done.

"They have families," she says. "Don't you care at least about the families they left behind?"

We close the door and leave her there, so we no longer have to listen. In all this time, in all these years, she has never gotten better. She is always looking outward, towards people and places and things that are not us, and worries about them and their happiness. She cannot understand why that doesn't matter. We cannot convince her.

So she will twist over the chasm for a time. And we will go back to work.

Pride is working the controls, alone, as usual. We watch as the Husk glides through white and green halls, thin carpet stretched over cement, closed doors on either side. The Husk knocks twice on one door that is entirely like all the rest, and a woman inside says, "Come in."

She is a pretty woman, black bun'd hair, wire glasses, sitting in the valley between two teetering stacks of binders.

"This case, right?" she says, smiling, playfully straightening one of the mounds. "After all this, I hope he's not actually guilty."

Disgust spits on the screen. "Whore!" he shouts. "Why does she talk to us like that? Like we're the same? Like we're equals?"

Patience is there, though, putting a small hand on the rough hide of Disgust's scaly back. "There there. In time, in time. She'll see. Just give it a bit."

Excitement has wings, and she flies about the chamber, dragging her small, fairy feet across the top of Disgust's head. "You hear that, buddy? We'll get 'er! Oh yeah, we will! We'll cut her up! Up up up!" Dancing on the console, she starts counting on her pink, dusty fingers. "We'll cut out her heart, and her lungs, and her kidneys, then the liver, then her uterus—that's my very very favorite—and then all those intestines and then..."

"Knock it off!" growls Pride, shooing her away. "I can't see what I'm doing."

"You alright, Jack?" says the woman, her face a veil of concern, false and womanly. "You look far away."

"Oh," says the Husk, and I see Pride flick the switch, turn on that sly smirk. "I get a little lost when I'm around you."

She sighs, almost in spite of herself. Pride sits up straight, leaning slightly back. He's satisfied. They all are. And it's in these moments—these pivotal points, where everything begins coming into alignment and the wheels start picking up momentum—it's always in these moments when they all turn to look at me. To see what I'll say, or if I'll say anything at all.

"It's good, isn't it, Remorse?" says Excitement, fluttering before me. "We got another one!"

And I smile. And shrug. As I always do. "Looks like it."

Ted Bundy described the moment of death:

"You feel the last bit of breath leaving their body. You're looking into their eyes—a person in that situation is God. You then possess them and they shall forever be a part of you. And the grounds where you kill them or leave them become sacred to you, and you will always be drawn back to them."

There are accounts that, if we open our hearts to them, will cut us too deeply. Look—here is a good man, good by his own lights and the lights of his friends: he is faithful and true to his wife, he adores and lavishes attention on his little children, he cares about his country, he does his job punctiliously, as best he can. So, efficiently and good-naturedly, he exterminates Jews: he appreciates the music that plays in the background to pacify them; he advises the Jews not to forget their identification numbers as they go into the showers—many people, he tells them, forget their numbers, and take the wrong clothes when they come out of the showers. This calms the Jews. There will be life, they assure themselves, after the showers. Our man supervises the detail taking the bodies to the ovens; and if there is anything he feels bad about, it is that he still allows the gassing of vermin to affect him. Were he a truly good man, he knows, he would feel nothing but joy as the earth is cleansed of its pests.

It doesn't take terrible people to do bad things in an official capacity. It takes average people. Average people who want to do a good job for their superiors, who want to be loyal, who know how to go along to get along, and who like to avoid any risk to themselves. Unfortunately, that's all it takes: average people.

"The word 'yuppie' was his deepest insult, synonymous with every cultural wrong, aimed at those who behaved like spoiled, soft-palmed candyasses with misplaced superiority complexes. People who fit that description possessed only a fraction of the character strength of the average working Joe; they had their priorities all wrong and wouldn't last a day anywhere remotely

rugged. While chasing birds he had hitchhiked through some of the most desolate places imaginable—Nicaraguan jungles, Indian slums, Samoan fruit bat colonies—but when asked to name the least likable place he'd seen in the world, he instantly pointed to an affluent California suburb: 'Walnut Creek. No question.'"

"For me, the sky was the color of Jews. When their bodies had finished scouring for gaps in the door, their souls rose up. When their fingernails had scratched at the wood and in some cases were nailed into it by the sheer force of desperation, their spirits came toward me, into my arms, and we climbed out of those shower facilities, onto the roof and up, into eternity's certain breadth. They just kept feeding me. Minute after minute. Shower after shower. I'll never forget the first day in Auschwitz, the first time in Mauthausen.

At that second place, as time wore on, I also picked them up from the bottom of the great cliff, when their escapes fell awfully awry. There were broken bodies and dead, sweet hearts. Still, it was better than the gas. Some of them I caught when they were only halfway down. Saved you, I'd think, holding their souls in midair as the rest of their being—their physical shells—plummeted to the earth. All of them were light, like the cases of empty walnuts. Smoky sky in those places. The smell like a stove, but still so cold. I shiver when I remember—as I try to de-realize it. I blow warm air into my hands, to heat them up. But it's hard to keep them warm when the souls still shiver.

On June 23, 1942, there was a group of French Jews in a German prison, on Polish soil. The first person I took was close to the door, his mind racing, then reduced to pacing, then slowing down, slowing down. . . Please believe me when I tell you that I picked up each soul that day as if it were newly born. I even kissed a few weary, poisoned cheeks. I listened to their last, gasping cries. Their vanishing words. I watched their love visions and freed them from their fear.

They were French, they were Jews, and they were you."

The Contradictory Politics of Alex Steiner

Point One: He was a member of the Nazi Party, but he did not hate the Jews, or anyone else for that matter.

Point Two: Secretly, though, he couldn't help feeling a percentage of relief (or worse—gladness!) when Jewish shop owners were put out of business—propaganda informed him that it was only a matter of time before a plague of Jewish tailors showed up and stole his customers.

Point Three: But did that mean they should be driven out completely?

Point Four: His family. Surely, he had to do whatever he could to support them. If that meant being in the party, it meant being in the party.

Point Five: Somewhere, far down, there was an itch in his heart, but he made it a point not to scratch it. He was afraid of what might come leaking out.

I must recognize that in the same situation, I could have been either a killer or an evader—both were human—if I want to understand and explain the behavior of both as best I can. This recognition does indeed mean an attempt to empathize. What I do not accept, however, are the old clichés that to explain is to excuse, to understand is to forgive. Explaining is not excusing; understanding is not forgiving. Not trying to understand the perpetrators in human terms would make impossible not only this study but any history of perpetrators that sought to go beyond one-dimensional caricature. When all is said and done, a single word, 'understanding,' is the beacon light of our studies.

At the synagogue, where at least 700 Jews had been collected, gasoline was poured at the entryways. A grenade was tossed into the building, igniting a fire. Police shot anyone trying to escape. The fire spread to nearby houses in which Jews were hiding, and they too were burned alive.

"I made the effort, and it was possible for me, to shoot only children. It so happened that the mothers led the children by the hand. My neighbor then shot the mother and I shot the child that belonged to her, because I reasoned with myself that after all without its mother the child could not live any longer. It was supposed to be, so to speak, soothing to my conscience to release children unable to live without their mothers."

Most of the policemen, however, seem to have made no effort to avoid shooting. At Łomazy following orders reinforced the natural tendency to conform to the behavior of one's comrades. This was much easier to bear than the situation at Józefów, where the policemen were allowed to make personal decisions concerning their participation but the 'cost' of not

shooting was to separate themselves from their comrades and to expose themselves as weak.

In the months since Józefów many had become numbed, indifferent, and in some cases eager killers; others limited their participation in the killing process, refraining when they could do so without great cost or inconvenience. Only a minority of nonconformists managed to preserve a beleaguered sphere of moral autonomy that emboldened them to employ patterns of behavior and stratagems of evasion that kept them from becoming killers at all.

As usual, though, the few who shirked or evaded participation did not impede those intent upon their task.

The murderous participation of Reserve Police Battalion 101 in the Final Solution came to an end. With a conservative estimate of 6,500 Jews shot during earlier actions like those at Józefów and Łomazy and 1,000 shot during the “Jew hunts,” and a minimum estimate of 30,500 Jews shot at Majdanek and Poniatowa, the battalion had participated in the direct shooting deaths of at least 38,000 Jews. With the death camp deportation of at least 3,000 Jews from Miedzyrzec in early May 1943, the number of Jews they had placed on trains to Treblinka had risen to 45,000. For a battalion of less than 500 men, the ultimate body count was at least 83,000 Jews.

Some people become perpetrators as a result of their personality; they are ‘self-selected.’ But under particular circumstances most people have a capacity for extreme violence and the destruction of human life. Ordinary psychological processes and normal, common human motivations and certain basic but not inevitable tendencies in human thought and feeling are the primary sources of the human capacity for mass destruction of human life. Evil that arises out of ordinary thinking and is committed by ordinary people is the norm, not the exception.

Cruelty is social in its origin much more than it is characterological. Most people slip into the roles society provides them, and we must be wary of any implication that “faulty personalities” are the primary cause of human cruelty. The exception—the real ‘sleeper’—is the rare individual who has the capacity to resist authority and assert moral autonomy but who is seldom aware of this hidden strength until put to the test.

Milgram offered a number of factors to account for such an unexpectedly high degree of potentially murderous obedience to a noncoercive authority. An evolutionary bias favors the survival of people who can adapt to hierarchical situations and organized social activity. Socialization through family, school, and military service, as well as a whole array of rewards and punishments within society generally, reinforces and internalizes a tendency toward obedience. A seemingly voluntary entry into an authority system perceived as legitimate creates a strong sense of obligation. Those within the

hierarchy adopt the authority's perspective or "definition of the situation" (in Milgram's case, as an important scientific experiment rather than the infliction of physical torture). The notions of "loyalty, duty, discipline," requiring competent performance in the eyes of authority, become moral imperatives overriding any identification with the victim. Normal individuals enter an "agentic state" in which they are the instrument of another's will. In such a state, they no longer feel personally responsible for the content of their actions but only for how well they perform. Once entangled, people encounter a series of "binding factors" or "cementing mechanisms" that make disobedience or refusal even more difficult. The momentum of the process discourages any new or contrary initiative. The "situational obligation" or etiquette makes refusal appear improper, rude, or even an immoral breach of obligation. And a socialized anxiety over potential punishment for disobedience acts as a further deterrent.

Milgram himself notes that people far more frequently invoke authority than conformity to explain their behavior, for only the former seems to absolve them of personal responsibility.

"Subjects deny conformity and embrace obedience as the explanation of their actions."

Yet many policemen admitted responding to the pressures of conformity—how would they be seen in the eyes of their comrades?—not authority. On Milgram's own view, such admission was the tip of the iceberg, and this factor must have been even more important than the men conceded in their testimony. If so, conformity assumes a more central role than authority at Józefów.

As Lieutenant Drucker said with extraordinary understatement:

"Under the influence of the times, my attitude to the Jews was marked by a certain aversion."

The denigration of Jews and the proclamation of Germanic racial superiority was so constant, so pervasive, so relentless, that it must have shaped the general attitudes of masses of people in Germany, including the average reserve policeman.

To break ranks and step out, to adopt overtly nonconformist behavior, was simply beyond most of the men. It was easier for them to shoot. Why? First of all, by breaking ranks, non-shooters were leaving the "dirty work" to their comrades. Since the battalion had to shoot even if individuals did not, refusing to shoot constituted refusing one's share of an unpleasant collective obligation. It was in effect an asocial act vis-à-vis one's comrades.

Those who did not shoot risked isolation, rejection, and ostracism—a very uncomfortable prospect within the framework of a tight-knit unit stationed abroad among a hostile population, so that the individual had virtually nowhere else to turn for support and social contact.

This threat of isolation was intensified by the fact that stepping out could also have been seen as a form of moral reproach of one's comrades: the non-shooter was potentially indicating that he was 'too good' to do such things. Most, though not all non-shooters intuitively tried to diffuse the criticism of their comrades that was inherent in their actions. They pleaded not that they were 'too good' but rather that they were "too weak" to kill. Such a stance presented no challenge to the esteem of one's comrades; on the contrary, it legitimized and upheld 'toughness' as a superior quality. For the anxious individual, it had the added advantage of posing no moral challenge to the murderous policies of the regime, though it did pose another problem, since the difference between being 'weak' and being a 'coward' was not great. Hence the distinction made by one policeman who did not dare to step out at Józefów for fear of being considered a coward, but who subsequently dropped out of his firing squad. It was one thing to be too cowardly even to try to kill; it was another, after resolutely trying to do one's share, to be too weak to continue.

Insidiously, therefore, most of those who did not shoot only reaffirmed the macho values of the majority—according to which it was a positive quality to be tough enough to kill unarmed, noncombatant men, women, and children—and tried not to rupture the bonds of comradeship that constituted their social world. Coping with the contradictions imposed by the demands of conscience on the one hand and the norms of the battalion on the other led to many tortured attempts at compromise: not shooting infants on the spot but taking them to the assembly point; not shooting on patrol if no "go-getter" was along who might report such squeamishness; bringing Jews to the shooting site and firing but intentionally missing. Only the very exceptional remained indifferent to taunts of "weakling" from their comrades and could live with the fact that they were considered to be "no man."

Pervasive racism and the resulting exclusion of the Jewish victims from any common ground with the perpetrators made it all the easier for the majority of the policemen to conform to the norms of their immediate community (the battalion) and their society at large (Nazi Germany). Here the years of anti-Semitic propaganda—and prior to the Nazi dictatorship, decades of shrill German nationalism—dovetailed with the polarizing effects of war. The dichotomy of racially superior Germans and racially inferior Jews, central to Nazi ideology, could easily merge with the image of a beleaguered

Germany surrounded by warring enemies. If it is doubtful that most of the policemen understood or embraced the theoretical aspects of Nazi ideology as contained in SS indoctrination pamphlets, it is also doubtful that they were immune to the influence of the times, to the incessant proclamation of German superiority and incitement of contempt and hatred for the Jewish enemy. Nothing helped the Nazis to wage a race war so much as the war itself. In wartime, when it was all too usual to exclude the enemy from the community of human obligation, it was also all too easy to subsume the Jews into the 'image of the enemy,' or Feindbild.

This story of ordinary men is not the story of all men. The reserve policemen faced choices, and most of them committed terrible deeds. But those who killed cannot be absolved by the notion that anyone in the same situation would have done as they did. For even among them, some refused to kill and others stopped killing. Human responsibility is ultimately an individual matter.

The collective behavior of Reserve Police Battalion 101 has deeply disturbing implications. There are many societies afflicted by traditions of racism and caught in the siege mentality of war or threat of war. Everywhere society conditions people to respect and defer to authority, and indeed could scarcely function otherwise. Everywhere people seek career advancement. In every modern society, the complexity of life and the resulting bureaucratization and specialization attenuate the sense of personal responsibility of those implementing official policy. Within virtually every social collective, the peer group exerts tremendous pressures on behavior and sets moral norms. If the men of Reserve Police Battalion 101 could become killers under such circumstances, what group of men cannot?

It is important to note that before the Final Solution was implemented—beginning on Soviet territory in the second half of 1941 and in Poland and the rest of Europe in the spring of 1942—the Nazi regime had already found willing executioners for 70,000 to 80,000 mentally and physically handicapped Germans, tens of thousands of Polish intelligentsia, tens of thousands of noncombatant victims of reprisal shootings, and more than two-million Russian POWs. Clearly, as of September 1939, the regime was increasingly capable of legitimizing and organizing mass murder on a staggering scale that did not depend on the anti-Semitic motivation of the perpetrators and the Jewish identity of the victims.

So we are still left with an unresolved question that cannot be solved by simple assertion: Is a culture of hatred the necessary precondition for such a culture of cruelty?

It would be very comforting to accept the idea that very few societies have the long-term, cultural-cognitive prerequisites to commit genocide, and

that regimes can only do so when the population is overwhelmingly of one mind about its priority, justice, and necessity. We would live in a safer world if that were right, but I am not so optimistic. I fear that we live in a world in which war and racism are ubiquitous, in which the powers of government mobilization and legitimization are powerful and increasing, in which a sense of personal responsibility is increasingly attenuated by specialization and bureaucratization, and in which the peer group exerts tremendous pressures on behavior and sets moral norms. In such a world, I fear, modern governments that wish to commit mass murder will seldom fail in their efforts for being unable to induce 'ordinary men' to become their willing executioners.

"The actual camp appeared like an untidy slaughterhouse. A pungent smell hung heavily in the air. Knowing the Red Army was closing in, the SS gave the boilermen [people operating the ovens] the order, to throw the prisoners, who were already emaciated to the point of looking like skeletons, into the crematorium alive. They wanted to get rid of the sick and weakened to cover up their tracks as fast as possible.

The further we walked into the site, the stronger the smell of burnt flesh became, and dirty-black ash rained down on us from the heavens, darkening the snow. The boilermen looked surprised to see us officers and soldiers. They were strong people, mostly Kapos [prisoners forced to work in the camps]. They greeted us with shy smiles on their faces, a mix of happiness and fear. Like on command, they threw away their poker. With us, they talked freely. Angry words about Hitler were spoken. I still remember an old boilermen stammer 'Thank you. Thank you, friend. May I call you friends?'

One of them, a Ukrainian, I asked: 'Why did you do that?' and pointed towards the ovens. Without blinking he replied: 'They didn't ask if I wanted to. No, I didn't want to. But better be the guy working the oven, then be the one burning. That's why I did it.' I was speechless, could just shake my head. 'Why aren't the other ovens burning? There's no smoke coming up the chimney,' I asked the guy. 'Deconstructed,' he said.

Innumerable exhausted, wretched figures with shrunken faces and bald heads were standing outside of the barracks. They didn't know that we were coming. The surprise made many of them faint. A picture that would make everyone wither away who saw it. The misery was horrifying. The ovens [of the

crematoria] were still hot and some were still blazing fiercely when we approached. We were standing in a circle, everyone was silent. Caught in our own thoughts, everyone just stood around. Nobody cared about the burning ovens. 'Stop this. Out! All of you!', the commanding officer Sergejew shouted. Outside, he was shaking and said with a stuttering voice: 'How can this be in the midst of the twentieth century! I can't comprehend this. If there'd be a god, maybe he could explain how this all came to be.'

From the barracks more and more hungry children were emerging, reduced to skeletons and enveloped in rags. Like ants they assembled in large groups, making noise as if they were in a large school yard. With arms extended, they were waiting, begging and screaming for bread. They were whining out of despair and wiping away their tears. We visited the barracks and couldn't believe our own eyes. Naked and groaning people, hardly looking like humans, were laying on straw bags. I touched one of the people laying there. He didn't move. He wasn't alive anymore. Only death reigned here. It smelled of it.

In another barrack, a woman was dying. I asked if someone from her family was also in the camp. She said yes. Via speakers we tried to find her relatives and reunited the family. Shortly after, the woman died, although our doctors tried to save her.

After that we concentrated on the camp headquarters. In the hallway towards the office of the camp management I found a paper pinned to the wall which concerned me, too, since I'm slav. It said something along the lines of 'Germans! We are the masters. Our interests are the only that matter. The reproduction of the slav people is not desired. Childlessness and abortion are to be encouraged. Education of slav children is unnecessary. If they can count up to 100, that's sufficient. Those who can't work, shall die.' I translated the text for the others who just shook their heads. One tore it down. The offices were empty and chaotic so we went outside.

In the meantime our soldiers had gathered the female guards and brought them to us. 'Should we...?' asked a Corporal. 'No, don't do anything stupid,' the officer replied. 'This is to be decided by the Ordnungstruppe.'

'What does she have in her bag,' I asked another woman, since I saw how filled her bag was. A soldier grabbed into the bag. It was a brochure. The headline was 'About the law to

defend the hereditary health of the German people.' I took it, read some pages. Proof of being Aryan, marriage prohibition, Anglo-Jewish plague—I took note of it and was shocked. People are still carrying these with them!

'Are you all Aryan women?,' I asked. They give me a cold look. 'I don't know,' one of them replied. We laughed. 'Where are the camp doctors?' I asked. 'Not here, ran off.' 'And the male prisoners, where are they? I haven't seen a single man. What is this all about?' 'A week ago they've been escorted out of the camp. Probably relocated to Majdanek or Treblinka,' she replied. I tore the brochure into pieces and threw it onto the piles of garbage.

By evening, many reporters had arrived. Nonstop buzzing and flashing cameras everywhere inside and outside the barracks. We had learned one step after the other that Auschwitz was a central selection camp. Jewish people were selected for forced labour or death in the gas chambers. The immediate extermination of Jews who were unable to work was expressly insisted upon.

The field kitchens arrived soon. Nearly at the same time, the Ordnungstruppe and surprisingly high ranking officers from the staff of Rokossowski and Konjew showed up. Medics distributed sheets and clothing to the prisoners. To prevent the prisoners from eating snow, soldiers distributed tea and bread to the nearly starved skeletons. In the meantime, military trucks had arrived. Around midnight, all prisoners were taken out of the camp. Those still able to walk had no patience to wait and had already taken off by foot towards Sosnowitz. The only remaining people were Kapos and guards. Those were immediately ordered to dig mass graves outside the camp and to bury the dead bodies there. Floodlights and generators had already been put in place.

The camp was now empty and it was as silent as a monastery. Some torches were lighting the ground here and there. We had to leave, since we are a combat unit assigned to the front. We caught up to the rest of our unit in Sosnowitz, approximately 15 kilometers east of Kattowitz."

The Gray In-Between

The infamous Trolley Problem is a popular thought experiment in Intro to Philosophy, as well as a beloved pop culture trope. You may remember it from that one episode of *The Good Place*, helpfully called “The Trolley Problem.” Even its name is a sign of longevity, because who the hell has taken a trolley ride recently? The problem asks whether you’d be willing to kill one person to save the lives of multiple people. Either way, someone has to die, and the way you determine who supposedly says something fundamental about you. Are you ruthlessly logical enough to pull the lever, sentencing one person to death for the greater good? Do you think it’s wrong to make that decision at all? What if it was a child versus five adults? What if it was a fat guy? What if that fat guy was a real big asshole? What if that fat guy was an asshole and it was his fault the people were tied to the trolley tracks in the first place, but you have to physically push him in front of the trolley to save the other people?

Those are all real variants of the problem, and just looking at the way people answer these questions has become a miniature field of its own, dubbed “trolleyology.” Notable conclusions are that men are more likely than women to push someone onto the tracks for the greater good, young people are ruthless as hell, and everyone is more reluctant to push a woman than a man.

But ultimately, there’s no way to tell what people would do in real life, right? Unfortunately, the buzzkills at the ethics board wouldn’t allow researchers to tie real humans to real train tracks, but they were perfectly fine with using mice and (fake) electric shocks. Participants, not knowing the shocks were fake, had to choose between zapping one mouse or letting five be zapped. Before doing so, they were questioned on how they would react to a variety of trolley genre moral dilemmas.

The result found almost no correlation to what participants said they would do and what they actually did. People were more decisive in real life than in the hypothetical scenarios. And yes, we’re aware that zapping mice isn’t exactly analogous to putting human lives on the line, but philosophers and social scientists have long been arguing that the Trolley Problem is over-hyped and over-applied. As a general rule, a discussion you once had with your college buddies over some beers doesn’t have much to do with how you’d react in the heat of the moment. That *Good Place* episode was solid though.

He had come over from Ireland by freighter at seventeen because he had killed a policeman who had come onto their property and shot his

father's dogs. The family owned an old shotgun but was too poor to afford ammunition, so the young man poured borrowed gunpowder into a used paper cartridge and packed the rest with ball bearings from his bicycle wheels. He waited outside the policeman's house until the man returned from the pub and then shot him dead with his one homemade round.

In modern societies, citizens give up most of their natural right to defend themselves or to respond to wrongdoing, in return for a promise of protection and justice from the government. But what happens when the government breaches that social contract and persistently fails in its promise?

Asking moral vigilantes to suffer in silence is not only a poor crime-control strategy but, more importantly, ought not to be asked. The government has obligations to its citizens under its social contract and is not free to simply choose not to perform them. The criminal justice system ought to take seriously its obligation to assure that justice is done and crime avoided so that people are never put in the position of having to consider moral vigilantism.

We would all be better off if this dirty war had never started. Systemic failures of justice, shadow vigilantes' distorting response, and blowback from those distortions end up producing more crime and more failures of justice—ending in a downward spiral. The only way to effectively stop this tragic cycle is for the criminal justice system to publicly commit itself to the importance of doing justice and avoiding injustice at all costs. That means avoiding the application of the doctrines of disillusionment where there is no compelling societal interest in doing so, or where the interest could be as effectively promoted through a less justice-frustrating means. The only way to prevent the downward spiral of lost credibility is to acknowledge the importance of doing justice both as an essential ideal and as a practical necessity.

Too many judges have lost an understanding of the criminal justice system as being in the business of doing justice. Actual fairness is seen as being replaced in the judges' minds by a mess of technical rules. And justice has dropped out of the equation as being of little importance.

The Deacons for Defense and Justice are not an aberration. Many groups have, with moral justification, taken the law into their own hands. This is the essence of vigilantism. Indeed, the origin of the term 'vigilante' suggests something very different from popular use, which brings to mind a Ku Klux Klan lynching or abortion doctor shooting. The original vigilantes were the epitome of responsible democratic action fighting an inept and often corrupt government.

If people are confronted with a criminal justice system that seems grossly insensitive to the importance of doing justice, what are they to do? Is it

possible to define what would and would not constitute moral vigilante action—to define a vigilante code that sets the preconditions for and the limits of legitimate conduct? If a group were contemplating vigilante action, here are ten rules one could suggest to members of such a group or community to help them choose action that stays closer to what is morally defensible. Vigilante action is never legally justified—if it were, by definition it would not be vigilante action—but if a group follows these ten rules, its conduct might at least be viewed by outsiders as being nearly morally justified.

1. Don't act unless there is a serious failure of justice
2. Don't cause more harm than is necessary and just
3. Avoid injury to innocent bystanders
4. Don't act unless there is no lawful way to solve the problem
5. Don't act alone
6. Before acting, be sure of the facts, and take full account of all relevant mitigations and excuses
7. Show restraint and temperance, not arrogance or vindictiveness
8. Warn the government that it is in breach of its social contract with its citizens, and give it an opportunity to fix the problem, unless it is clear that such a warning would be useless
9. Publicly report afterward what you have done and why
10. If it becomes clear that the problem cannot be fixed through vigilante action, then withdraw from further action

“If a person's safety and property can be protected with a punch, it ought not to be defended with a gunshot.”

Vigilantes must understand that they are in a credibility contest with the official criminal justice system. To win the battle for hearts and minds, the vigilantes must actually do justice better than the system is doing it, not worse. Doing justice requires taking account of the mitigating or excusing factors in a case, not just the aggravating factors. A vigilance committee can as easily discredit itself by showing an indifference to mitigations and excuses as the criminal justice system disgraces itself by showing indifference to giving offenders the punishment they deserve.

“No doubt the activists in many causes felt strongly about the rightness of their views. However, it is equally clear that they knew themselves to be in a small minority of the larger society. They are certainly free to try to change the society’s views—and perhaps someday they will succeed—but until that day comes they cannot in a democratic society substitute their own values for those of the larger society and claim that their lawbreaking is that of a moral vigilante.”

Once vigilantes cross the line of lawful conduct, there are few obvious signposts telling them not to go a little further. Unfortunately, it is in the nature of vigilantism that, having left behind the signposts of legality, there inevitably arises the danger of the slippery slope. Even if the moral vigilante gets it right in all respects, the vigilante action creates a risk of mistakes that would not have otherwise occurred.

What conclusion should we draw from this? Where does this leave the would-be moral vigilante? Should prospective vigilantes not act, even if they might be morally justified in doing so, because others—law enforcement, regulators, politicians, prosecutors—if they were willing to put forth the effort, could act more effectively? If that were the conclusion, then even moral vigilantes ought never to act because official law enforcement, with sufficient motivation, can almost always do it better. By that logic, moral vigilantes should defer to the government that has broken its social contract with them simply because that government could have fixed the problem. That analysis seems like a nonstarter on its face. The fact that the government could have done it better only emphasizes the extent of its breach of trust with the citizenry. The government should have done it better but chose not to. That would seem to support, not undermine, the moral vigilante’s right to act. A better conclusion to the dilemma might be that the risk of error created by the moral vigilante is one more reason why the government should avoid breaching the social contract and should never tolerate situations that would justify moral vigilantism. The government ought to take more seriously its obligation to do justice and to protect citizens.

Criminal law rules that deviate from the community’s notions of justice are not cost-free, as has generally been assumed in the past. Rather, when criminal law adopts rules or practices that produce criminal liability or punishment that is seen as a failure of justice or as unjust, the system suffers a loss of effectiveness. To be most effective, the criminal justice system should try to distribute liability and punishment in accord with the shared judgments of justice of the community it governs.

“He is noble, terrible, irresistibly fascinating, for he combines in himself the two sublimities of human grandeur: the martyr and the hero. He has no other object than to overthrow this abhorred despotism, and to give to his country, what all civilized nations possess: political liberty.”

“If the tiger ever stands still the elephant will crush him with his mighty tusks. But the tiger does not stand still. He lurks in the jungle by day and emerges by night. He will leap upon the back of the elephant, tearing huge chunks from his hide, and then he will leap back into the dark jungle. And slowly the elephant will bleed to death.”

Today there is a tendency to think that there is something new about guerrilla tactics—that they are a departure from the norm, which is assumed to be state-on-state conflict. Nothing could be further from the truth. While there are many novel aspects of low-intensity warfare as it has developed since antiquity, the essential concept itself was already well established by the time that David, one of the first guerrillas whose name we know, became king of Israel around 1000 BC. David’s credentials as a guerrilla were established not in his legendary combat with the Philistine champion Goliath but rather in subsequent years after he had been forced to flee the jealous wrath of his own king, Saul, and took to leading an outlaw band in raids on Amalekite and Philistine settlements in the Judaeen wilderness.

Guerrilla warfare is as old as mankind. Conventional warfare is, by contrast, a relatively recent invention. It was made possible by the development of the first agricultural societies after untold millennia in which the hunter-gatherer reigned supreme. Farming communities for the first time produced enough surplus wealth and population to allow for the creation of specially-designed fortifications and weapons as well as the hiring of specialists to operate them.

Throughout most of our species’ long and bloody slog, both before the development of urban civilization and since, warfare has been carried out primarily by bands of loosely organized, ill-disciplined, lightly armed volunteers who disdain open battle. They prefer to employ stealth, surprise, and rapid movement to harass, ambush, massacre, and terrorize their enemies while trying to minimize their own casualties through rapid retreat when confronted by equal or stronger forces. These are the primary features both of modern guerrilla warfare and of primitive, pre-state warfare whose origins are lost in the mists of prehistoric time and which has only recently been extinguished in the remote jungles of Amazonia and the highlands of Papua

New Guinea. Guerrillas therefore may be said to engage in the world's second-oldest profession, behind only hunting, which draws on the same skill set.

Since at least the days of the Greeks and Romans primitive warfare—and by extension guerrilla warfare—has seldom been accorded much respect by Western soldiers and scholars, who have tended to view it as an “irregular,” “unmanly,” even “dastardly” activity and to label its practitioners barbarians, criminals, or savages.

Pre-state warriors are, in the words of John Keegan, “cruel to the weak and cowardly in the face of the brave”—precisely the opposite of what professional soldiers have always been taught to revere. They refuse to grapple face-to-face with a strong foe until one side or the other is annihilated in the kind of warfare immortalized, if not invented, by the Greeks.

Battles among nonstate peoples have often consisted of nothing more than two lines of warriors decked out in elaborate paint shouting insults at one another, making rude gestures, and then discharging spears, darts, or arrows from such long range that they inflict few casualties. Primitive societies lack an organizational structure that can force men on pain of punishment to engage in costly close-quarters combat in defiance of a basic instinct for self-preservation. This has led some observers to suggest that nonstate peoples do not engage in warfare at all but rather in “feuds” or “vendettas” that are for the most part ceremonial and have little in common with true war as practiced at Cannae, Agincourt, or Gettysburg. After moving to Massachusetts in the seventeenth century, for example, a professional English soldier wrote with scorn that Indians “might fight seven years and not kill seven men” because “this fight is more for pastime, than to conquer and subdue enemies.”

What such critics overlook is that battles constitute only a small part of primitive warfare. Most casualties are inflicted not in these carefully choreographed encounters but in what comes before and after—in the stealthy forays of warriors into the territory of their neighbors. One common raiding technique—favoured by groups as diverse as the Bering Straits Eskimo and the Mae Enga of New Guinea—consisted of quietly surrounding enemy houses just before dawn and killing the occupants by thrusting spears through the flimsy walls, shooting arrows through doorways and smoke holes, or firing as the victims emerged after the structure had been set on fire. Following such an attack, the raiders might disperse before large numbers of enemy warriors could arrive, only to return a few days later, hoping to catch another enemy village unawares. All adult men participate in this type of warfare, and quarter is seldom asked or given. Surrender for warriors is not an option; if they suffer the dishonor of defeat, they are either killed on the

spot or, as was common among the Iroquois Indians of northeastern North America, they might be tortured to death and then partially eaten. At the end of such an encounter, the victor rapes the loser's women, enslaves them and their children, burns crops, steals livestock, destroys the village.

One of the most enduring dynamics in the history of warfare: as a state becomes more capable in its defense, so guerrillas become more capable in their offense. A look at the ancient and medieval worlds suggests yet another paradoxical conclusion: the most primitive guerrillas were the most successful. There were a few notable insurgents such as Judas Maccabeus and Robert the Bruce who operated with a fair degree of sophistication and managed to achieve a fair degree of success. They were sensitive to the need to build political support and to establish political institutions to replace those of their enemies. Of course, on one occasion, Bruce's men donned black capes and walked on their hands and knees in the dark pretending to be cows in order to get close enough to clamber up rope ladders and seize a fort—simple is often the better way to go.

But such successes were rare, in no small part because ancient rebels lacked the ability to appeal to a hostile population over the head of its leader—and, in those days when autocracy was the dominant form of government, few populations could do much anyway to sway the decisions of their emperor, king, or chief. Most insurgents suffered the fate of Viriathus, Quintus Sertorius, Spartacus, Vercingetorix, Boudicca, and others who died battling Roman power. Lacking the ability to call in outside aid or state their case to the mass media (which did not yet exist), ancient insurgents were generally on their own to face the pitiless power of a pagan polity.

The most successful guerrillas of the ancient world were the nomads who brought down the Roman Empire and seized large chunks of the Chinese Empire and other Eurasian states. They did not try to organize a revolution within a state, a notoriously difficult undertaking. Rather they chipped away at the state's outer defenses until, in some cases, the entire edifice collapsed. The nomads' achievement, while great, was almost wholly negative: with the exception of the Arabs, Turks, Moguls, and Manchus, who blended with more-settled societies, nomads could not build lasting institutions. Nomadic empires generally crumbled after a generation or two. But, as long as they were around, nomads had few equals in their ability to inflict catastrophic costs on established states through the use of hit-and-run tactics.

When faced with the onslaught of Western colonialism why did so few indigenous regimes resort to guerrilla tactics? Part of the explanation is that most non-Westerners had little idea of the combat power of Western armies until it was too late. Too many empire builders in the developing world imagined that the tactics that had worked against local tribes would

work against the white tribe. They were fatally mistaken, but their incomprehension was understandable given how slowly news traveled before the spread of telegraphs, undersea cables, steamships, and railroads—to say nothing of radio, television, airplanes, and the Internet. In the ancient world, Rome's enemies had scant opportunity to learn from one another's experiences. So too in the Victorian world, there was little chance that the Zulus could benefit from the experience of the Sioux. By contrast, soldiers from more advanced nations did study each other's campaigns. A spate of military manuals was published in the nineteenth and early twentieth centuries advising Westerners how to win "small wars."

When native rulers did try to learn from past mistakes, their impulse was usually to make their armies more conventional, rather than less, by hiring European advisers and buying European arms. With the notable exception of Japan, the reproductions were seldom as good as the originals, and their inferiority was brutally exposed in battle. Most peoples in the developing world would have been better off reverting to older forms of irregular warfare. The Marathas of India, for example, had a long history as superb horse raiders, but in the late eighteenth century they chose to raise European-style regiments that proved no match for disciplined British regulars. In a very real sense they beat themselves by imbibing the myth then prevalent in European military circles of the superiority of conventional warfare and the ineffectuality of guerrilla resistance.

One of the greatest advantages enjoyed by modern, as opposed to ancient or medieval, guerrillas is the ability to learn from their predecessors. In many places before the twentieth century, literacy levels were low, books rare, long-distance travel difficult. Most people led isolated lives. In this environment, it was hard for rebels to learn from one another, much less to cooperate in the way that twenty-first century jihadist groups seek to do by embracing the Internet. Simon bar Gioras, leader of the Jewish Revolt against Rome, undoubtedly was familiar with the experience of Judas Maccabeus and King David, two earlier Jewish guerrilla leaders. But it is doubtful that he knew much if anything of Viriathus, who resisted Roman authority in Spain, and even less likely that the illiterate Viriathus was familiar with the exploits of Spitamenes, who fought Alexander the Great in Central Asia, much less with Modun, leader of the Xiongnu who fought the Chinese Empire. Once printed books and periodicals began to spread and literacy to rise, insurgents were able to study their predecessors' experiences and puzzle out more potent techniques to bring powerful empires to their knees.

One of the cherished myths of American history is that independence from Great Britain was won by plucky Yankees armed with rifles who picked

off befuddled redcoats too dense to deviate from the ritualistic parade-ground warfare of Europe. That is an exaggeration. By the time the revolution broke out, the British had considerable experience with irregular warfare, not only in Europe with Austrian pandours and Scottish Highlanders, but also in the Caribbean with Jamaican maroons and in North America with Indians and rangers. Redcoats certainly knew enough to break ranks and seek cover in battle when possible, rather than, in the words of one historian, “remaining inert and vulnerable to enemy fire.”

But many other lessons of frontier fighting were forgotten by the time the American Revolution broke out. Much like the US Army with its post-Vietnam amnesia about counterinsurgency, which helped lead to the early disasters in Iraq, the British army was to pay a steep price for forgetting how to fight on an unconventional battlefield. The redcoats’ difficulties were compounded because in the war to come they would encounter not only the kind of traditional hit-and-run tactics employed by tribesmen but also a new factor in guerrilla warfare: the power of public opinion. This new weapon was to prove even deadlier and harder to cope with than a tomahawk in the back.

What gets overlooked in most accounts of the American Revolution is that even after Yorktown the British could have continued fighting. They had lost only eight-thousand men. Their remaining troops in North America, more than thirty-four-thousand strong, still outnumbered the combined Franco-American forces, and more could always have been raised from a British population of twelve-million or purchased from the German states that had already provided so much manpower. If the Americans had been resisting the Roman Empire, there is little doubt that a fresh army would have been raised and George Washington and other leading insurgents would have been crucified. But such a response was unthinkable, given the state of British “public opinion”—a phrase that first saw print in Gibbon’s *Decline and Fall*, the first volume of which appeared, by a fateful coincidence, in 1776.

This was a new and hugely important development in the long history of guerrilla warfare: a parliamentary government could not prosecute a war that did not enjoy popular backing. Insurgents’ ability to manipulate popular sentiment—to break the enemy’s will to resist—helped to offset some of the advantages enjoyed by an incumbent regime and gave them a greater chance of success. Public opinion would play an even larger role in future wars as Britain and the United States, which still restricted the franchise in the eighteenth century, became more democratic and as similar political systems spread around the world. Future insurgents, from nineteenth-century Greece to twenty-first-century Lebanon, would make full use of this potent new

weapon wielded so expertly by the American rebels.

The outcome of the American war also demonstrated the importance of partisans operating in close conjunction with a regular army. If the Americans had lacked an army, they might have been no more successful than the Irish rebels who rose up in 1798 and were put down by Cornwallis.

“You may strike a hundred strokes, and reap little benefit from them, unless you have a good army to take advantage of your success.”

Without a guerrilla force to harry them, the British could have concentrated all their resources on crushing the Continental army, and the Americans might have been no more successful than the Scottish rebels who rose up in 1745. As it was, the Americans were able to land a one-two punch, with the irregulars weakening the army of occupation until a conventional force could administer the coup de grâce. This method of fighting—dubbed “hybrid warfare” by twenty-first-century strategists—has usually been the surest road to success for an insurgency.

The British also made mistakes, but none of these failings need have proven fatal if the British public had retained the desire to continue fighting, no matter the cost. The average American today probably thinks that the Vietnam War was the first time that a counterinsurgency was fatally undermined on the home front. A citizen of France would probably cite the Algerian War. But the American War of Independence long predated either conflict, and it was effectively decided not at Yorktown, as most historians would have it, but in Westminster. The battlefield success of George Washington’s soldiers was not irrelevant, but neither was it decisive. Public opinion in Britain was. This was a lesson that future generations of guerrillas could study and apply.

“Popular resistance: like a slow, gradual fire, it destroys the foundation of the enemy’s army.”

Social bandits or peasant outlaws are those who are considered by their people as heroes, as champions, avengers, fighters for justice, perhaps even leaders of liberation, and in any case as men to be admired, helped, and supported. The mythical archetype was Robin Hood. Rob Roy MacGregor in Scotland (1671–1734), Jesse James in America (1847–1882), Ned Kelly in Australia (1855–1880), and Pancho Villa in Mexico (1878–1923) were real-life examples. Less famous but more significant were the klephts and haiduks, the Christian bandits who battled Ottoman overlords in the Balkans for five-hundred years. The prevalence of such men is one of the most universal

social phenomena known to history—they flourish wherever social order has broken down.

In the American West, the Colt revolver was called “the Equalizer” because it allowed even those who were physically weak to kill the strong. In the same way, in the post-World War II era, the growth in influence of public opinion, both foreign and domestic, was the great equalizer that increasingly allowed the militarily weak to best the strong.

In the best revolutionary tradition, Castro turned his trial into a forum for publicly promulgating his views. The judges allowed Castro, acting as his own lawyer, to lodge accusations of “assassination and torture” against the government. Castro wound up being sentenced to fifteen years in prison along with twenty-five companions, including his brother Raúl. But before he was done Castro had delivered a two-hour speech in his own defense that recalled John Brown’s memorable oration after Harpers Ferry. There is no exact record of what he said, but in prison he reconstructed and no doubt embellished his remarks in a clandestinely published pamphlet, “History Will Absolve Me.” Its fiery conclusion:

“I do not fear the fury of the miserable tyrant who snuffed out the life of seventy brothers of mine. Condemn me, it does not matter. History will absolve me!”

Twenty words to victory: *The enemy advances, we withdraw; the enemy camps, we harass; the enemy tires, we attack; the enemy retreats, we pursue.*

“If the enemy is so superior that you are in danger of being surrounded by them, let the whole body disperse, and every one take a different road to the place of rendezvous appointed for that evening. You should not attack them till the evening, as then they will not know your numbers, and if you are repulsed, your retreat will be facilitated by the darkness of the night. If the enemy pursue your rear, take a circle till you come to your own tracks, and there form an ambush to receive them, and give them the first fire.”

The printing press is the greatest weapon in the armory of the modern commander. Irregular war is far more intellectual than a bayonet charge. Rebellions can be made by 2% active in a striking force, and 98% passively sympathetic.

In fifty words: granted mobility, security (in the form of denying targets to the enemy), time, and doctrine (the idea to convert every subject to friendliness) victory will rest with the insurgents, for the algebraical factors

are in the end decisive, and against them perfection of means and spirit struggle quite in vain.

Those words have formed a rallying cry for guerrillas and their acolytes ever since, but the claim is less far-reaching than it appears on a quick read. Note all of the caveats: success is certain only if guerrillas have ‘mobility,’ ‘security,’ ‘time,’ and ‘doctrine.’ Few insurgencies have ever been vouchsafed all of those advantages.

The Assassin’s Creed

1. Instead of a contiguous, readily vanquished, small state, establish a geographically dispersed state of formidable mountain fortresses. Such fortresses might be conquered, but that would involve high costs and would divert powerful rulers from more pressing matters.
2. Be ready to form mutually beneficial alliances with any ruler—provided that ruler left unmolested your state and Nizaris under his rule outside of your state.
3. Train a cadre of assassins willing to sacrifice their lives to save their state and co-religionists.
4. Establish these assassins’ well-deserved, fearsome reputation for professionalism and courage.
5. Avoid killing bystanders: Only kill the intended target.
6. Use assassinations to deter conquests of any part of the Nizari state, to deter massacres against co-religionists living in the domains of the target, and to promote alliances.
7. Whenever possible, before killing, try to intimidate a powerful target, e.g. by leaving a dagger on a Sunni Sultan’s bed while he is asleep. Carry out an assassination as a last resort only.
8. If nothing else works, kill the target. His successor, most likely, would not be as foolhardy.
9. Strike fear into future victims by carrying out assassinations in a public space and have your assassin stay put after completing his mission, unflinchingly accepting death.

A “revolutionary of genius,” he established in 1090 his stronghold in a fortress known as Alamut in the Elburz Mountains of northern Persia. From this remote location, reachable only by a single narrow track, he dispatched his da’is (missionaries) to win converts to the Ismaili cause. But Hasan-i Sabbah was not satisfied using nonviolent means to extend his sect. He also dispatched fedayeen (self-sacrificers) armed with daggers to slay Muslim notables—clerics, judges, teachers, administrators, soldiers—who opposed his heresies. In their eagerness to attain a spot in paradise, the fedayeen usually made little attempt to escape, thus becoming in effect ‘suicide knifers.’

The term ‘assassin’ was a corruption of “hashish-eater”—a label that was applied to the fedayeen by their enemies who assumed (erroneously) that only powerful drugs could induce these men to sacrifice their own lives in order to eliminate their enemies. In fact the fedayeen seem to have been motivated by nothing more than religious zeal; taking intoxicants would have made it hard for them to be as patient and clever as they were in carrying out plots that often required considerable dissimulation and playacting.

During the course of Hasan-i Sabbah’s thirty-year reign, his fedayeen claimed only fifty victims, all men of some standing. But, while minuscule by the scale of most reigns of terror, whether of the Mongols or of the French Revolution, this was sufficient to terrorize his enemies. From then on, according to an Arab chronicler:

“No commander or officer dared to leave his house unprotected; they wore armor under clothes.”

During all the years that Hasan-i Sabbah directed this campaign of terror he never set foot outside his Alamut stronghold, in fact rarely even left his room. He was, like many subsequent terrorist leaders, an intellectual, and he spent countless hours deep in study in his impressive library.

Their reign of terror, which lasted two centuries, was enough to establish their reputation as one of the most successful terrorist groups in history. Thanks largely to the dark genius of Hasan-i Sabbah, they developed a highly effective organization, combining a covert hierarchy with a compelling ideology and rigorous methods of indoctrination that inspired his followers to sacrifice their lives for the cause. Those remain the essential ingredients for terrorist success down to the present day. But the Assassins also differed in crucial respects from most of their successors. Unlike their modern equivalents, the Assassins attacked only the great and the powerful, and never harmed ordinary people going about their day.

Terrorism initially referred to a certain exercise of state power (leveled against targets designated as opponents of the state). The term has come,

over time, to signify precisely the opposite—the actions of non-state actors who oppose a prevailing order. Those who maintain that order designate opposition as unacceptable—as terroristic.

Terrorists are outcasts who are hunted by the authorities. They are far more likely to wind up dead or in a dungeon than to succeed in achieving their goals. It stands to reason that most who are drawn to such a life would have an ideological compulsion verging on fanaticism. This is less true of large, nationalist organizations such as the KKK or IRA, which draw in a diverse membership and, for better or worse, enjoy broad societal sanction. Their members often have a mental makeup similar to soldiers.

Terrorists tend to be drawn from well-educated, middle-class or high-income families. So if poverty does not cause terrorism what does? The suppression of civil liberties and political rights. When nonviolent means of protest are curtailed, malcontents appear to be more likely to turn to terrorist tactics.

It is generally assumed that terrorism seldom ‘works,’ meaning that it seldom achieves its objectives. That is a valid if simplistic conclusion to draw about modern terrorism, whose annals are littered with failed groups, from the Basque ETA to the German Baader-Meinhof Gang. The nineteenth century provides further evidence of terrorist futility in the campaigns of the anarchists who failed to destroy existing states and replace them with idealized communal institutions. But there are also numerous examples of terrorists significantly influencing the course of history—sometimes even in the direction they sought. The Klan began dynamiting black churches, burning synagogues, shooting people in the back with hunting rifles, and infiltrating state and local law enforcement. It became the most violent American terrorist group of the twentieth century. Other relatively successful terrorist groups of the nineteenth and early twentieth centuries range from the Irish Republican Army to the German and Japanese militarists of the interwar period. Even the Russian revolutionaries, although they did not bring down the Romanov regime with their campaign of assassinations and “expropriations,” undermined it so much that they contributed to its eventual overthrow.

Why, then, did some terrorists succeed where others failed? To answer that question requires an examination of key terrorist campaigns from just before the US Civil War to just after World War I—the first great age of international terrorism. Some of the most prominent and influential terrorist groups of the era were the abolitionists and segregationists in the United States, Nihilists and socialists in Russia, anarchists across Europe and North America, and nationalists in Ireland. They did not all achieve their aims, but all changed history for better or worse. Even the anarchists would

leave their mark by inadvertently giving rise to heightened international police cooperation symbolized by the formation of Interpol. For all of their notoriety, however, their influence was modest by comparison with that of the fanatic—or, depending on your perspective, the idealist—who helped spark the bloodiest conflict in US history. His arrival on the political stage was announced with an act of violence that was shocking by the tamer standards of antebellum America if not those of the twenty-first century, when we have become accustomed to far worse atrocities.

“Now, if it is deemed necessary that I should forfeit my life for the furtherance of the ends of justice, and mingle my blood further with the blood of my children and with the blood of millions in this slave country whose rights are disregarded by wicked, cruel, and unjust enactments, I say, let it be done.”

Frederick Douglass summed up his impact:

“If John Brown did not end the war that ended slavery, he did at least begin the war that ended slavery.”

If so, that would make this zealous Puritan one of the more consequential terrorists in history—almost as important as the Bosnian students who ignited World War I.

President Sadi Carnot of France, Prime Minister Antonio Cánovas del Castillo of Spain, Empress Elizabeth of Austria-Hungary, President William McKinley of the United States, and King Umberto I of Italy were all slain by self-professed anarchists between 1894 and 1901. Other monarchs, including Kaiser Wilhelm I of Germany and the shah of Persia, narrowly escaped the same fate. Never before had any terrorist group killed so many heads of state, nor has any since then. Such killings posed, as King Umberto noted, a “professional risk” for rulers. Many of these bloodlettings were justified as reprisals for punishments meted out for earlier attacks; the desire for revenge has always been the most powerful of terrorist motivations.

“Hanged in Chicago, decapitated in Germany, garroted in Xerez, shot in Barcelona, guillotined in Montbrison and in Paris, our dead are many. But you have not been able to destroy anarchy. Its roots go deep; it sprouts from the bosom of a poisonous society which is falling apart. It is everywhere and it will end by defeating you and killing you.”

Those today who believe that the world's response to 9/11 is entirely novel should realize that the anarchist menace of a century earlier prompted growing attempts at international police cooperation such as the anti-anarchist conferences in Rome (1898) and St. Petersburg (1904). The Russian secret police established a sizable operation in Paris with the French government's consent, and Italy deployed detectives to keep track of Italian anarchists around the world. Such steps laid the foundation for the creation in 1923 of Interpol, the International Criminal Police Commission. Anarchist groups were riddled with informers and provocateurs who kept the police forces of many countries well informed of their plots—and sometimes invented fresh plots simply to collect greater rewards for uncovering them. Just as happens with the FBI and Muslim 'terrorists' today.

As usual, technology was a double-edged sword: the same cameras that made it possible for the mass media to publish pictures of terrorist attacks, thus furthering the perpetrators' aims, also made it possible for the police to photograph and identify suspects. This era saw the beginning of mug shots, fingerprints, and forensic laboratories, all of which made the terrorists' jobs harder.

The most successful terrorist campaigns are waged for causes, usually nationalist, which have widespread acceptance among the population and are supported by political parties and regular or irregular military forces—just as the most successful guerrillas are supported by conventional military forces. By contrast a small number of terrorists acting on their own to implement a radical agenda has scant chance of success—as demonstrated not only by the anarchists but also by many subsequent terrorists such as the Red Army Faction and the Weathermen. Terrorists do better, moreover, if they fight a democratic nation with a free press whose coverage will help to magnify their attacks while restraining the official response. There is not much terrorism in totalitarian states, because the secret police can ruthlessly snuff it out.

Immediately after September 11th, the Bush Administration rushed to the judgment that America's old approach to fighting terrorism, which treated it as a crime like any other, was inadequate for the post-9/11 world. Almost without discussion, it was agreed that a 'new' kind of enemy required new kinds of tactics.

What was incredible was how momentous a decision this is, to say we're in a state of war with al-Qaeda, because it set us on a course not only for our international response, but also in our domestic constitutional relations. You'd expect that the cabinet would have met, and that different options would have been developed, and they would have debated the pros and cons, and that allies would have been consulted. But there was little or no

detailed deliberation about long-term consequences.

“The government may be justified in taking measures which in less troubled conditions could be seen as infringements of individual liberties,” the Office of Legal Counsel lawyers told the White House. In fact, the lawyers advised:

“We think that the Fourth Amendment should be no more relevant than it would be in cases of invasion or insurrection.”

In response to questions and condemnations from around the globe, a University of California international law professor, John C. Yoo, on leave to serve as assistant US attorney general in the Justice Department’s Office of Legal Counsel, penned in March 2003 what became the infamous “Torture Memo.” Not much was made at the time of one of the precedents Yoo used to defend the designation “unlawful combatant”—the US Supreme Court’s 1873 opinion in *Modoc Indian Prisoners*.

In a negotiating meeting between a general and Kintpuash, the Modoc leader killed the general and the other commissioners when they would allow only for surrender. In response, the United States sent another former Civil War general in with more than a thousand additional soldiers as reinforcements, and in April 1873 these troops attacked the Modoc stronghold, this time forcing the Indigenous fighters to flee. After four months of fighting that cost the United States almost \$500,000—equal to nearly \$10 million currently—and the lives of more than four-hundred of its soldiers and a general, the nationwide backlash against the Modocs was vengeful.

Kintpuash and several other captured Modocs were imprisoned and then hanged at Alcatraz, and the Modoc families were scattered and incarcerated on reservations. Kintpuash’s corpse was embalmed and exhibited at circuses around the country. The commander of the army’s Pacific Military Division at the time, Lieutenant General John M. Schofield, wrote of the Modoc War in his memoir, *Forty-Six Years in the Army*:

“If the innocent could be separated from the guilty, plague, pestilence, and famine would not be an unjust punishment for the crimes committed in this country against the original occupants of the soil.”

Drawing a legal analogy between the Modoc prisoners and the Guantánamo detainees, Assistant US Attorney General Yoo employed the legal category of ‘*homo sacer*’: in Roman law, a person banned from society, excluded from its legal protections but still subject to the sovereign’s power.

Anyone may kill a homo sacer without it being considered murder. One begins to understand why John C. Yoo's infamous torture memos cited the 1865 Military Commissions and the 1873 Modoc Indian Prisoners legal opinions in order to articulate executive power in declaring the state of exception, particularly when the Modoc Indian Prisoners opinion explicitly marks the Indian combatant as homo sacer to the United States.

Yoo quoted from the 1873 Modoc Indian Prisoners opinion:

“It cannot be pretended that a United States soldier is guilty of murder if he kills a public enemy in battle, which would be the case if the municipal law were in force and applicable to an act committed under such circumstances. All the laws and customs of civilized warfare may not be applicable to an armed conflict with the Indian tribes upon our western frontier; but the circumstances attending the assassination of Canby [Army general] and Thomas [US peace commissioner] are such as to make their murder as much a violation of the laws of savage as of civilized warfare, and the Indians concerned in it fully understood the baseness and treachery of their act.”

According to this line of thinking, anyone who could be defined as ‘Indian’ could thus be killed legally, and they also could be held responsible for crimes they committed against any US soldier. As a result, citizens of American Indian nations become in this moment the origin of the stateless terrorist combatant within US enunciations of sovereignty.

Traditionally, in the context of military affairs, we've always understood that lethal force in battle could not be subjected to ex ante judicial constraints. When armies are shooting at each other, there's no room for a judge on that battlefield. But now the government has decided—without the public's participation, without our knowledge and consent—that the battlefield is everywhere. Individuals who don't represent an imminent threat in any meaningful sense of those words are redefined, through the subversion of language, to meet that definition.

They concluded that a strong national security and defense was the first priority, and that without a strong defense, there's not much expectation or hope of having other freedoms. The president, the report noted, “will on occasion feel duty bound to assert monarchical notions of prerogative that will permit him to exceed the laws.”

There was a consensus that we had to move from retribution and punishment to preemption and prevention. Only a warfare model allows that approach.

For the average American or European, Coca-Cola or Johnson & Johnson poses a far deadlier threat than al-Qaeda. How, then, do terrorists manage to dominate the headlines and change the political situation throughout the world? By provoking their enemies to overreact. In essence, terrorism is a show. Terrorists stage a terrifying spectacle of violence that captures our imagination and makes us feel as if we are sliding back into medieval chaos. Consequently states often feel obliged to react to the theater of terrorism with a show of security, orchestrating immense displays of force, such as the persecution of entire populations or the invasion of foreign countries. In most cases, this overreaction to terrorism poses a far greater threat to our security than the terrorists themselves. Sounds a lot like the global response to the Wuhan Flu.

Terrorists are like a fly that tries to destroy a china shop. The fly is so weak that it cannot budge even a single teacup. So it finds a bull, gets inside its ear and starts buzzing. The bull goes wild with fear and anger, and destroys the china shop. This is what happened in the Middle East in the last decade. Islamic fundamentalists could never have toppled Saddam Hussein by themselves. Instead they enraged the USA via the 9/11 attacks, and the USA destroyed the Middle Eastern china shop for them. Now they flourish in the wreckage.

“By themselves, terrorists are too weak to drag us back to the Middle Ages and re-establish the Jungle Law. They may provoke us, but in the end, it all depends on our reactions. If the Jungle Law comes back into force, it will not be the fault of terrorists.”

I have discussed with friends, the collateral damage. I’m especially noticing it in police departments. The vets come back, join police departments and the results are ugly. They have no fire discipline, act as if they’re in a war zone, blowing away civilians indiscriminately if they feel the least bit in danger and often when they clearly aren’t. They also have a taste for brutality, and the only people they have fellow-feeling for are their mates, certainly not anyone who isn’t in their ‘unit.’

Then, of course, there are the homeless veterans, the suicides, the wife-and child-beaters, and the rapists.

A lot of these people are very badly damaged. Occupation is always brutalizing, for everyone involved, but this bunch has been particularly brutalized. One of my friends is an ex-US military officer, out before Iraq, and to say that he is livid is a vast understatement. The same thing happened to the Israeli army, over time. And Americans went and copied

failed Israeli tactics. We saw it happening at the time. Not just immoral, and unethical, but a mistake.

But the resistance did not win much of a victory. Brutalizing your brutalizers is all very nice and I have no moral qualms against it. If Canada was invaded, I would fight, and I would join the resistance, and if the invaders were American—and who else could it be—I would rejoice at every dead American soldier. But at the end of the day, Iraq is in shambles, appears to be essentially a protectorate of Iran, has a huge Kurdish problem (or the Kurds have an Iraqi problem, depending on where you sit), violence is ongoing, and so on. Iraq was never a war anyone was going to ‘win.’ All anyone can claim, at best, is a Pyrrhic victory.

As for America, the first great man of the twenty-first century—great is not a synonym for good—was bin Laden. He wanted to draw America onto the ground, and bleed them like the USSR was bled, costing them so much treasure that their economy could no longer bear the costs of empire. He essentially succeeded, thanks to the sublime stupidity of his enemies. He must have gotten down on his knees every day and thanked God for George Bush and American high command and the Neocons and the Supreme Court. The far enemy (US) is blowing itself up with its insane financial and economic policies. That strain is exactly what bin Laden wanted, he says so in his writing. He’s dead, but he’s winning. And I think that’s a deal he would have happily taken if offered to him September 10, 2001.

9/11 was extremely successful, to the point that you just do not need a large scale attack like 9/11 in the US ever again (or at least for a long time). With the heightened fear, paranoia, and government propagand, single individuals, committing random small acts of violence, perhaps killing tens of people at a time, even if the individuals are killed after, is far more effective.

Bin Laden planned to bleed the US dry and destroy it that way. Only a fool thinks you can fight an overwhelming force on an equal playing field. And it sure looks like he was successful, trillions spent and used as an excuse for why we need to cut social programs, leading to discontent among the citizens. Really the most intelligent strategy—and Bin Laden may have been a fanatic but he did not appear to be stupid—is to get your enemy to turn on itself, and that’s where we’re headed, in large part due to 9/11 giving a certain segment of those in power the cover they needed to attack their own citizenry. Something they wanted to do all along.

At a time when pundits and policy-makers routinely liken the threat of Islamic radicalism to the threat posed by the totalitarianisms of the last century, it is worth recalling that US officials once compared the totalitarians to historic Islam. “The threat to Western Europe,” wrote Truman’s

secretary of state, Dean Acheson, in his memoirs, “seemed to me singularly like that which Islam had posed centuries before, with its combination of ideological zeal and fighting power.” Treating Nazism, Communism, and Islamism as essentially interchangeable, while ignoring their fundamental and irreconcilable differences, testifies to the enduring value of using (or devising) some sort of diabolical ‘other’ as a reference point when selling policy.

In Acheson’s day, comparing communists to fanatical Muslims left little room for doubt about the seriousness of the Red threat. Today, comparing Islamic extremists to fanatical communists or, even worse, to Nazis, accomplishes a similar purpose. The intention is to simplify, clarify, and remove ambiguity. The net effect is to mobilize, discipline, and squelch dissent.

“The threat posed by AQAP has been greatly exaggerated as a threat to the United States. In fact, many Americans think that anything that might kill you personally—in an airplane or walking down Park Avenue or something—is the biggest threat in the world. Because they’re not accustomed to dealing with conditions of danger as a standard of life, you know? So to say, ‘Is AQAP a threat to the United States?’ Yeah. They could bring down an airliner, kill a couple hundred people. But are they an existential threat to the United States? Of course not. Of course not. None of these people are an existential threat to the United States. We’ve gone crazy over this. We had this kind of hysterical reaction to danger.”

A regime can withstand terrible catastrophes, and even ignore them, provided its legitimacy is not based on preventing them. On the other hand, a regime may collapse due to a minor problem, if it is seen as undermining its legitimacy. In the fourteenth century the Black Death killed between a quarter and a half of European populations, yet no king lost his throne as a result, and no king made much of an effort to overcome the plague. Nobody back then thought that preventing plagues was part of a king’s job. On the other hand, rulers who allowed religious heresy to spread in their dominions risked losing their crowns, and even their heads. Today, a government may take a softer approach to domestic and sexual violence than to terrorism, because despite the impact of movements such as #MeToo, rape does not undermine the government’s legitimacy. In France, for example, more than 10,000 rape cases are reported to the authorities each year, with probably tens of thousands of additional cases left unreported. Rapists and abusive husbands, however, are not perceived as an existential threat to the French

state, because historically the state did not build itself on the promise to eliminate sexual violence. In contrast, the much rarer cases of terrorism are viewed as a deadly threat to the French Republic, because over the last few centuries modern Western states have gradually established their legitimacy on the explicit promise to tolerate no political violence within their borders.

What it really comes down to is the political reality that we have a political class that feels it must inoculate itself against allegations of weakness. Our politicians are more fearful of the politics of terrorism—of the charge that they do not take terrorism seriously—than they are of the crime itself.

Safety from external danger is the most powerful director of national conduct. Even the ardent love of liberty will, after a time, give way to its dictates. The violent destruction of life and property incident to war, the continual effort and alarm attendant on a state of continual danger, will compel nations the most attached to liberty to resort for repose and security to institutions which have a tendency to destroy their civil and political rights. To be more safe, they at length become willing to run the risk of being less free.

Robert Mueller realized there was another way to smoke them out. What had worked for Hoover against the Ku Klux Klan and the Communist Party of the United States could work for Mueller against the threat of Islamic terrorism. The FBI would seek and arrest potential terrorists with undercover stings. It was a time-honored strategy that criminal investigators understood and intelligence agents savored. It combined secret investigations with the satisfaction of big arrests and blazing headlines. It required two essential elements: a convincing con man as the informant and a credulous suspect as the target. No jury in Los Angeles, Chicago, or Tuscaloosa would accept an argument of entrapment by an accused terrorist handcuffed and shackled by the state.

And the FBI's relentless focus on fighting terrorism had an unforeseen consequence. The investigation and prosecution of white-collar crime plummeted, a boon to the Wall Street plunderers that helped create the greatest economic crisis in America since the 1930s—well perhaps until we shot ourselves in the head over the Wuhan Flu, time will tell. And those crimes resulted in many more deaths, many more harms, than 9/11.

The Palestinians have the goal of reclaiming and protecting their land rights. Some also have the goal of avenging past wrongs and punishing the Israelis. In either case, those who bring violence to the issue feel justified in doing so. They perceive no alternatives that will move them toward their goals as effectively as violence. They view the consequences of violence as favorable: pressure on the Israelis, world attention to their plight, vengeance for past suffering, et cetera. They perceive—by now with good reason—a

high ability to deliver violence. To predict whether the Palestinians will continue to use violence, we must—at least for the purposes of evaluation—see the issues their way. The importance of seeing things from the perspective of the person whose behavior you are predicting cannot be overstated.

A 60 Minutes episode gave a good example of most people's reluctance to do that. It profiled the mastermind terrorist known as the Engineer, a man who helped kamikaze martyrs strap explosives to their chests. His agents became walking bombs, carrying death into populated areas. Interviewer Steve Kroft asked one of the Engineer's terrorist followers to describe the man who could do such terrible things. The answer:

“He's a very normal person, just like all of us.”

Kroft took exception:

“You said that he is just like all of the rest of us. I, I, I would say that, that no one would consider you and him normal.”

The ‘terrorist’ replied:

“I believe your statement is incorrect. There are thousands and thousands in our country that believe what we believe—and not only our country, in the rest of the Arab world and even in your country.”

The ‘terrorist’ was right. When America is preparing to go to war, justification is first: ‘evil empire,’ ‘mad dictator,’ ‘international outlaw,’ ‘protect our interests,’ ‘cannot just stand by and watch,’ et cetera. Alternatives to violence shrink as we move from negotiations to demands, warnings to boycotts, and finally blockades to attacks. The perceived consequences of going to war move from intolerable to tolerable as public opinion comes into alignment with government opinion. Our appraisal of our ability rises as ships and troops are moved into proximity of an enemy. At the end of the day, the American bomber who kills a hundred people in Iraq decides to use violence the same way as the Palestinian bomber who kills a hundred people in Israel.

How do we stop it? Let's see, you could start with (some applicable to US-only, EU-only, mix, et cetera):

- Stop bombing/droning the Middle East & Africa
- Stop arming the Middle East & Africa

- Stop supporting repressive regimes in any way in the Middle East & Africa
- Close foreign military bases in the Middle East & Africa
- Treat attacks in Europe & elsewhere as simple crimes, not acts of war
- Stop demonizing conflict-zone refugees
- Close Guantanamo Bay and either try or release every individual
- End support of the illegal Israeli occupation; export ban on anything to Israel that is not food, medical supplies, or fuel.

If they want someone to blame for their poor governance and living conditions, don't give them easy ways to pin it on you, make them work at it. 9/11 happened; many joined the military to 'get revenge,' to 'defend one's country,' why is it so hard to grasp that someone else might do the same when you do it to them, even if they may have moved to another one at the time of the attack?

Violence is not some unexplainable horrible thing, there are reasons, motivations, in the vast majority of violent acts. Addressing the motivations is the only way to achieve anything.

Follow the above and you still might have bombings and other attacks. While regrettable, the deaths will pale in comparison to deaths from things such as heart disease, cancer, accidents—many of these deaths potentially attributable to organizations with an ideology that does not put the protection of human life first, but instead an imaginary thing called 'profit.' Yet we do not wage all out war on these organizations, despite having a far greater negative impact on ourselves than al-Qaeda or ISIS.

The ideology of unfettered capitalism has resulted in far more deaths and human suffering than the ideology of radical Islam. You've just been trained to see a beheading as more barbaric than a boardroom decision resulting in just as many or more deaths.

Violence is bred by injustice, poverty, inequality, and other violence. This lesson was learned very painfully in the first half of the twentieth century, at a cost of some 80 million lives. Of course, a full belly and a fair hearing won't stop a fanatic; but they can greatly reduce the number who become fanatics.

Attacking hunger, disease, poverty, and social exclusion would do more good than air marshals, asylum restrictions, and identity cards. Global security will be achieved only by building stable and strong societies.

Chapter Eighty-one

The Struggle Within

The simplest of leftist ethics: your speech is violence, my violence is speech.

faceless brothers of the night
who swim through the city like fish in the sea
never resting
in your search and destroy mission against the system
i know how lonely you are
and my heart reaches out to you
as repression grows it becomes more difficult
for us to continue our struggle here
but we persist until the final day
when we shall join you in the sea of blood that will flow
in the streets of babylon

An Oakland policeman stopped Newton's car; Seale and others were with him. At first Newton politely showed his driver's license and answered the officer's questions; he had his M1 rifle in clear view, Seale his 9mm. In short order three more patrol cars arrived. A crowd began to form. Up and down the street, people poked their heads from apartment windows. When an officer asked to see the guns, Newton refused.

"Get away from the car," Newton said. "We don't want you around the car, and that's all there is to it." "Who in the hell do you think you are?" the officer demanded. "Who in the hell do you think you are," Newton replied. At that point, Newton emerged from the car and loudly chambered a round in his rifle. When police tried to shoo away the growing crowd, Newton shouted for everyone to stay put, that they were within their rights to observe what was happening on a public street. "What are you going to do with that gun?" an officer asked. "What are you going to do with your gun?" Newton replied. "Because if you shoot at me or if you try to take this gun, I'm going to shoot back at you, swine."

“There’s a group of youngsters cropping up who is getting tired of this brutality against our people. They are going to take some action; it might be misguided; it might be disorganized; it might be unintelligent; but they’re going to get a little action. And there are going to be some whites who are going to join in along with them.”

—Malcolm X, 1964

For much of white America, the 50s was a time of suffocating conformity, when parents born during the Depression and empowered by winning a “good war” taught their children that America represented everything that was right and true in the world. These were the “happy days,” when a booming economy sent wealth soaring and children, born by the millions, grew up in homes where every family seemed to have two cars in the driveway, a stereo cabinet, and, in fifty-million homes by 1960, a television. How happy were Americans? When a 1957 Gallup poll asked people whether they were “very happy, fairly happy, or not too happy,” an astounding 96 percent answered very or fairly happy. “The employers will love this generation,” University of California president Clark Kerr said in 1959.

“They are not going to press many grievances, they are going to be easy to handle. There aren’t going to be riots.”

And then, as if overnight, things changed. More than anything else, it was the pictures young Americans began seeing on those new televisions in 1960—of stoic Southern blacks dragged away from all-white lunch counters, of black protesters being beaten bloody by red-faced Southern deputies—that laid the groundwork for the white protest movement. The violence and injustice itself was shameful enough, but it was what those pictures said about America, about what an entire generation of young people had been taught, that felt like a betrayal. America wasn’t a land of equality. It wasn’t a land of the good and the just and the righteous. It was all a lie.

“The meaninglessness of non-violent, ‘democratic’ methods was becoming clear to us in the spring of 1967. The Civil Rights Movement was dead. Pacifism was dead. Some Leftists—the Trotskyites, Maoists, radical socialists. . . some of the radicals in SDS, Stokely Carmichael, Rap Brown, Tom Hayden—knew it early. But it took the rest of us awhile to give up the sweet life of the democratic Left for revolt.”

Imagine if this happened today: Hundreds of young Americans disappear from their everyday lives and secretly form urban guerrilla groups. Dedicated to confronting the government and righting society's wrongs, they smuggle bombs into skyscrapers and federal buildings and detonate them from coast to coast. They strike inside the Pentagon, inside the US Capitol, at a courthouse in Boston, at dozens of multinational corporations, at a Wall Street restaurant packed with lunchtime diners. People die. They rob banks, dozens of them; launch raids on National Guard arsenals; and assassinate policemen, in New York, in San Francisco, in Atlanta. There are deadly shoot-outs and daring jailbreaks, illegal government break-ins and a scandal in Washington.

This was a slice of America during the tumultuous 1970s, a decade when self-styled radical "revolutionaries" formed something unique in postcolonial US history: an underground resistance movement. Given little credibility by the press, all but ignored by historians, their bombings and robberies and shoot-outs stretched from Seattle to Miami, from Los Angeles to Maine.

Because radical violence was so deeply woven into the fabric of 1970s America many citizens, especially in New York and other hard-hit cities, accepted it as part of daily life. As one New Yorker sniffed to the New York Post after an FALN attack in 1977:

"Oh, another bombing? Who is it this time?"

It's a difficult attitude to comprehend in a post-9/11 world, when even the smallest pipe bomb draws the attention of hundreds of federal agents and journalists. People have completely forgotten that in 1972 we had over nineteen-hundred domestic bombings in the United States. People don't want to listen to that. They can't believe it. One bombing now and everyone gets excited. In 1972? It was every day. Buildings getting bombed, policemen getting killed. It was commonplace.

There are crucial distinctions, however, between public attitudes toward bombings during the 1970s and those today. In the past twenty-five years terrorist bombs have claimed thousands of American lives, over three-thousand on 9/11 alone. Bombings today often mean someone dies. The underground bombings of the 1970s were far more widespread and far less lethal. During an eighteen-month period in 1971 and 1972, the FBI reported more than 2,500 bombings on US soil, nearly five a day. Yet less than one percent of the 1970s-era bombings led to a fatality; the single deadliest radical-underground attack of the decade killed four people. Most bombings were followed by communiqués denouncing some aspect of the American condition; bombs basically functioned as exploding press releases. The sheer number of attacks led to a grudging public resignation. Unless someone was killed, press

accounts rarely carried any expression of outrage. In fact, as hard as it may be to comprehend today, there was a moment during the early 1970s when bombings were viewed by many Americans as a semi-legitimate means of protest. In the minds of others, they amounted to little more than a public nuisance.

To some it is ultimately a tragic tale, defined by one unavoidable irony: that so many idealistic young Americans, passionately committed to creating a better world for themselves and those less fortunate, believed they had to kill people to do it. They were like so many in the faltering protest movement at that restive decade's end: long-haired, free-spirited, and mired in gloom. The one thing that set them apart from friends who raised their fists and chanted antiwar slogans in demonstrations of the day was that late one night, after removing a carton of cottage cheese, a quart of yogurt, and some leftover salad from their refrigerator, they replaced it all with a hundred bright red sticks of dynamite.

“If you live in a country doing illegal acts, you have to take steps, or you're complicit. And if you break a law doing that, you become a political prisoner.”

Regardless of which side of the law their actions fell on, however, America's political prisoners participated in movements presenting revolutionary Left challenges to the capitalist state; for many, these politics emerged out of an explicit commitment to fighting white supremacy, and, for some, patriarchy. These politics necessitated direct, confrontational responses to the violence of US imperialism and corporate hegemony—from war overseas to murderous attacks on people of color in the United States, from environmental destruction to the stark repression of incarceration itself. Political prisoners emerged from movements seeking to stop, to overturn, to develop alternatives to state and extralegal violence of the system. All of America's political internees did something; some resisted with force, some put their bodies on the line, and others used words and propagated ideas the state deemed too powerful to let slide as just so much free speech. The issue of political prisoners is less one of “innocence” than of defending people's ability and capacity to resist.

Of those incarcerated for engaging in illegal, often clandestine actions, most followed a similar path: several years of legal activism led to a determined belief in the need to raise the stakes. Their backgrounds are varied; prior to being activists, they were good-hearted progressives or class-conscious workers, apolitical moderates, or “red diaper babies.” They spent years protesting, petitioning, organizing, and engaging in civil disobedience.

But, time after time, frustration at the limited possibilities of available (i.e., legal) remedies to such entrenched injustice led many activists to seek—and many more to support—alternative options of resistance.

This search for alternatives emerged from a desperation, it is true, but also from a palpable belief in the possibility of a more successful revolutionary politics. Building a movement, many have argued, requires an infrastructure hidden from the eyes and ears of the state—especially as repression becomes more intense. Although it often meant a turn to armed struggle, the search for new mechanisms of engaging in political action did not necessarily lead to violence. What it did mean, across the board, was a belief in raising the stakes of resistance. Upping the ante through militant, often clandestine, tactics was not intended to stand in for organizing a mass movement—although sectarianism and different strategic priorities have often yielded this in effect if not in intent. Rather, militancy meant an ongoing commitment to develop a revolutionary movement that looked to create opportunities for expanded resistance in the context of concrete conditions.

What the underground movement in the 70s was truly about—what it was always about—was the plight of black Americans. Every single underground group of the 1970s, with the notable exception of the Puerto Rican FALN, was concerned first and foremost with the struggle of blacks against police brutality, racism, and government repression. While late in the decade several groups expanded their worldview to protest events in South Africa and Central America, the black cause remained the core motivation of almost every significant radical who engaged in violent activities during the 1970s.

“Race comes first, always first. Everything started with the Black Panthers. The whole thrill of being with them. When you heard Huey Newton, you were blown away. The civil rights movement had turned bad, and these people were ready to fight. And yeah, the war. The country was turning into Nazi Germany, that’s how we saw it. Do you have the guts to stand up? The underground did. And oh, the glamour of it. The glamour of dealing with the underground. They were my heroes. It was the revolution, baby. We were gonna make a revolution.”

One needs to understand the voices of black anger, which began to be noticed during the 1950s. All of it, from the first marches in Alabama and Mississippi all the way to the arrest of the last underground radical in 1985, began with the civil rights movement, a cause led by black Americans. And what was true at its inception remained true through the ‘60s and into the

'70s-era underground: Blacks, for the most part, led, and whites followed. It was black leaders who initiated the first Southern boycotts; black leaders who led the sit-ins and gave the great speeches; black leaders who, when other avenues appeared blocked, first called for violence and open rebellion. At the end of the '60s, it was violent black rhetoric that galvanized the people who went underground.

“The armed goons of this racist government will again meet the guns of oppressed Third World People as long as they occupy our community and murder our brothers and sisters in the name of American law and order; just as the fascist Marines and Army occupy Vietnam in the name of democracy and murder Vietnamese people in the name of American imperialism are confronted with the guns of the Vietnamese Liberation Army, the domestic armed forces of racism and oppression will be confronted with the guns of the Black Liberation Army, who will mete out, in the tradition of Malcolm and all true revolutionaries, real justice. We are revolutionary justice. All power to the people.”

“Revolutionary justice has been meted out again by righteous brothers of the Black Liberation Army with the death of two Gestapo pigs gunned down as so many of our brothers have been gunned down in the past. But this time no racist class jury will acquit them. Revolutionary justice is ours! Every policeman, lackey, or running dog of the ruling class must make his or her choice now. Either side with the people: poor and oppressed, or die for the oppressor. Trying to stop what is going down is like trying to stop history, for as long as there are those who will dare live for freedom there are men and women who dare to unhorse the emperor. All power to the people.”

To the press, at least, poorly educated, self-proclaimed black guerrillas who murdered policemen were not credible revolutionaries. But self-proclaimed white guerrillas from good schools who bombed vacant buildings were.

“If the Fourteenth Amendment to the United States Constitution cannot be enforced in this social jungle called Dixie at this time, then Negroes must defend themselves, even if it is necessary to resort to violence.”

In cold Northern slums, blacks faced conditions every bit as daunting as those in the Jim Crow South: poverty, widespread unemployment, poor housing, and rampant police brutality. A black man arrested in Harlem in the 1960s could routinely expect a beating; when policemen killed a black citizen, there was rarely a successful prosecution. When underground groups began forming in 1970 and 1971, their targets were rarely slumlords or army barracks or politicians. They were almost always policemen.

While the armed actions of the 1970s marked a different phase of the Black liberation movement, this shift was not as unprecedented as some have suggested. The civil rights movement was never as nonviolent as it has been traditionally depicted; sections of it were always armed—most famously the Deacons for Defense—and even the unarmed aspects were constantly seeking to raise the stakes of resistance to white supremacy. Groups like the Revolutionary Action Movement worked behind the scenes in the early to mid-1960s to develop both Black nationalist consciousness and the capacity for armed resistance. As civil rights activists became more effective and with the quick growth of a Black Power movement, the struggle for Black liberation clashed with an entrenched white supremacist power structure and increasingly repressive state.

Cleaver ordained that the BLA would have no leader. Not him. Not anyone. Under guidelines set by Cleaver and Don Cox, the BLA's structure would be the exact opposite of the Weather Underground's. Where Weather cadres did nothing without direction from leadership, Cleaver and Cox wanted BLA units to operate independently, with no central coordination whatsoever. A system of autonomous cells would be much harder for the government to subdue; a single leader could be defeated with a single arrest.

Lacking wealthy benefactors or steady access to resources, BLA cells often relied on bank robberies to secure funds. This is a tactic revolutionaries call "expropriations," for it involves taking money that capitalist institutions have secured through other people's labor and using it ostensibly to further liberatory ends. In a phenomenon other revolutionary groups would also experience, many BLA soldiers were captured engaging in these high-risk actions.

As members of a clandestine army fighting to free a colonized people, most captured BLA combatants have defined themselves as prisoners of war, not just political prisoners. Several attempted to escape from prison, often with the help of units on the outside—sometimes successfully, at least for short periods of time.

All soldiers have a well-recognized duty to attempt escape. And under international law one has the right to resist unjust rule by force.

The machine guns its soldiers fired, the grenades they threw, the police-

men they killed, the banks they robbed—it was all very real. Between tokes and giggles the Weathermen may have mused about “offing the pigs,” but after the Townhouse explosion they just talked the talk. To police, it was only the BLA who walked the walk.

“The tactical mistake we made was killing the cops in uniform, when we should’ve killed the higher-ups. That would’ve been more effective.”

In one trial, the FBI assigned agents to “protect” the judge and jury; similar actions were used in other trials to the same effect. While there had been no threats against jurors and never an instance where radicals had tampered with trials, the state used such tactics to instill fear among the very people who have to sit in judgment against the accused.

The Weather Underground articulated a politics that defined Black people and other people of color as colonized populations, and saw the role of white people as opening another front of struggle in the fight against imperialism. Such militant solidarity, argued Weather, would overextend the state and its ability to repress revolutionary struggles and therefore hasten the pace and success of revolutions around the globe.

Weather articulated a politics of solidarity that demanded a high level of sacrifice by whites in support of Black and other revolutionary people of color. This support emanated from a strategic belief, pioneered by Che Guevara, that US imperialism could be defeated through overextension; bombings were an attempt to pierce the myth of government invincibility and draw repressive attention away from the Panthers and similar groups. It also reflected a political position that said white people had to side with Third World struggles against the US government—and had to do so in a similarly dramatic way.

There had been no warning call; this was intended to be an ambush, pure and simple. Just before midnight, when shifts would change, sending dozens of off-duty policemen out to their cars, two Weathermen crept into the parking lot. One bomb was placed beside a detective’s car; a second was tossed on the ground between cars. A few minutes after midnight, as officers began wandering outside, the first bomb detonated, its deep boom echoing through the downtown streets. Nearly thirty plate-glass windows in the adjoining municipal building shattered. More than two dozen officers were in the parking lot, and one, a reserve patrolman named Paul Morgan, was struck by shrapnel that mangled his left arm; he would later undergo six hours of surgery to save it. Thirty seconds later, as groups of stunned policemen slowly rose from the pavement, the second bomb went

off, shattering more windows. Afterward, a half-dozen cops would be treated for bruises and broken eardrums.

“We wanted to do it at a shift change, frankly, to maximize deaths. They were cops, so anyone was fair game. Basically it was seen as a successful action. But others, yeah, were angry that a policeman didn’t die. There was no one that was anti that. That was what we were trying to do.”

From September 1969 to May 1970, there was at least one bombing or attempted bombing somewhere in the United States every day by the progressive and radical movements.

“Arrivals and departures from the motel were tightly rationed—we didn’t want it to look like a dope dealer had set up shop. The electrical equipment was brought in first. We started working on the wiring that first night. Remove the minute hand from the pocket watch and drive a small screw into the face of the dial, soldering it fast. That way you can set the detonation eleven hours or so ahead, with a timing circuit that closes when the hour hand touches the screw. One wire is attached to the screw, another connected to the hour hand, and these wires lead back around to each other in a loop that also includes a nine-volt battery, the blasting cap, the safety switch, and the safety light—the all-important warning that goes on if by accident the timing circuit shorts out. We had the thing pretty well built and were testing the connections by mid-morning Friday, when one of the boys from LA delivered the shoebox full of TNT. Another was in and out, keeping the East Coast informed and nailing down arrangements for afterwards, when quite a few people would want to be out of town.”

Tried together, they were dubbed the Ohio 7, although legal battles took some of them from Ohio to New York, New Jersey, and Massachusetts. These legal battles weren’t the only troubles greeting these revolutionaries: except for Williams, whose wife and children did not accompany him underground, the other six were couples who lived and raised their families underground. After the arrest, the government attempted to use the nine children, most of them under ten and all of them minors, as bargaining chips against their parents. The state offered the Levasseurs’ eight-year-old daughter \$20 and some pizza to cooperate with the government against her family.

The Mannings' children were held incommunicado for two months after the parents were first arrested; they had to go on hunger strike to force the government to disclose the whereabouts of their children.

Most revolutionaries in this time period, especially those engaged in armed struggle, identified prisons as a bulwark of state repression. As such, radicals pledged their solidarity with prison struggles, often leading to a revolving door between incarceration and revolutionary activities. Prison became both a breeding ground for and a target of insurgency.

“There is a revolution coming. It will not be like revolutions of the past. It will originate with the individual and with culture, and it will change the political structure only as its final act. It will not require violence to succeed, and it cannot be successfully resisted by violence. This is the revolution of the new generation. Their protest and rebellion, their culture, clothes, music, drugs, and liberated life-style.”

It was true. America, it turned out, had fallen in love with everything about this groovy new counterculture—except its politics. Those like Weatherman who had predicted a revolution in America ended up being half-right. A revolution was arriving, but it was a cultural rather than a political phenomenon. It was the height of irony: Much of America wanted to dress like Bernadine Dohrn, smoke pot like Bernadine Dohrn, and listen to Bernadine Dohrn's music, but it honestly didn't want to hear a word she had to say. They had preached endlessly about freedom, to dress as you like, eat what you like, smoke what you like: “You can do what you want” was the famous line from the 1971 movie *Harold and Maude*. As these new values seeped into the American mind-set during 1970, 1971, and 1972, it turned out that what most Americans wanted to do was focus not on politics—and certainly not on overthrowing the government—but on themselves. It was the dawning of the ‘Me’ Decade.

All were beginning to realize that it was far easier to talk about guerrilla warfare than to engage in it.

“We had no idea—no idea—what we were up against. We had really hoped that established revolutionary organizations, that they could point to us and say that unless certain things are dealt with in society, this is what you're going to be dealing with. But we were so young, we didn't know what we were doing. The cops, the government, man, they were killing us. Everywhere we looked, there were cops.”

Although armed actions have been the most dramatic, revolutionary militancy has never been limited to guns and bombs. Hundreds of political prisoners have come from pacifist circles, both secular and religious. While these activists are generally imprisoned on shorter sentences their political actions are no less vital, their commitments no less revolutionary. Just as those who engaged in armed struggle never comprised the majority of the movements from which they came, most nonviolent activists who serve prison time for acts of civil disobedience are not revolutionaries. Yet many of them are, and their work provides a vital point through which to build strategic unity among those who differ on questions of tactics. It was, in fact, revolutionary nonviolent activists who maintained dialogue and critical support for armed revolutionaries in the 1970s when other sectors of the Left, who were often theoretically supportive of armed struggle in Third World countries, were decidedly hostile to its domestic iterations.

Perhaps the most famous nonviolent militants of the time were Daniel and Philip Berrigan, Jesuit priests and tested pacifist warriors. The Berrigan brothers and seven other Catholic leftists burned almost four-hundred draft files in Catonsville, Maryland, on May 17, 1968, using homemade napalm to protest its widespread use in Vietnam. Regarding the attack, Daniel Berrigan said:

“Our apologies, good friends, for the fracture of good order, the burning of paper instead of children, the angering of the orderlies in the front parlor of the charnel house. We could not, so help us God, do otherwise.”

Catonsville 9 activists Philip Berrigan and Thomas Lewis, along with two others, had ruined hundreds of draft records in Baltimore by pouring blood over them. They were, in fact, out on bail but sentenced to serve six years for this action when they went to the Catonsville draft board. The Catonsville attack, however, raised the stakes through the use of arson.

“We do this because everything else has failed.”

Whereas political prisoners of the armed-struggle Left are often distinguished by serving lengthy sentences, radical pacifists are more known for the sheer number of times they find themselves behind bars for civil disobedience. For more than forty years, it has been the political tendency most oriented toward civil disobedience, and adherents have served sentences of several months to several years for resisting the apparatuses of war through nonviolent confrontation, including direct action.

At the height of the Cold War arms race, Plowshares activists dismantled nuclear weapons, submarines, helicopters, and other military equipment, often with implements as simple as a common hammer and by pouring their own blood over the weapons. Their actions were effective at literally dismantling instruments of the military.

The United States government's ongoing vendetta against political activists from a half-century ago can seem harsh and even irrational. Vengeful as it is, such prosecutions can also be understood as part of a coherent strategy of containment and dissuasion, the primary targets of which may not even have been born at the time of COINTELPRO, and may entertain political reference points generations removed from those of most of the prisoners discussed above.

Activist and radical attorney Lynne Stewart—who has represented David Gilbert, Bilal Sunni-Ali, and Richard Williams among others—was one of the first domestic targets of the post-9/11 War on Terror. Adding to the bizarre circumstances of her case, Attorney General John Ashcroft first announced charges against her on a late-night television talk show in 2002. She was charged with conspiracy and providing material support to terrorists after delivering a public message on behalf of her client, Egyptian cleric Omar Abdel-Rahman, who was being held in isolation at a supermax prison for his role in the 1994 World Trade Center bombing. Sentenced to twenty-eight months in prison in 2006, the state appealed Stewart's sentence and in 2009, at the age of seventy, Stewart was resentenced to ten years. A court upheld her sentence in 2012. Amid her incarceration, however, Stewart was battling stage-four breast cancer. Supporters pressured the Justice Department for compassionate release for more than a year, which was finally granted on the last day of 2013.

A slew of post-9/11 conspiracy charges have been prosecuted under the mantle of counterterrorism. Conspiracy is a vague legal category that does not require the accused to have participated in illegal activity to be guilty of allegedly dangerous associations.

While the United States denies the existence of political prisoners, it pursues a vengeful policy of lengthy, even lifelong, incarceration. To acknowledge the political basis of their incarceration would further expose the depths of social problems that these militants have committed their lives to fighting. The veneer of US democracy and tolerance requires that dissidents be branded as criminals or terrorists, and denial of the humanity of anyone so labeled.

Working to free political prisoners goes hand in hand with exposing the façade that the United States is a country where injustice is minimal and solved through electoral politics—one point necessitates the other. The fact

that so many political prisoners have been charged with treason or sedition demonstrates that the government fears this precise point; resistance is criminalized, deemed a threat to “the American way of life.”

The ubiquity of state repression affords an opportunity to forge solidarity among multiple revolutionary movements. Seizing this opportunity does not mean ignoring contradictions (e.g. the difference between pacifism and armed struggle, anarchism and Marxism-Leninism, secularism and faith-based organizing, or the struggles within particular movements over racism and patriarchy). Instead, it offers a chance for people committed to radical social change to work with one another, addressing differences in ways that build alliances and strengthen the potential for revolutionary possibilities. The fact that most political prisoners have continued their political work in prison—through writing, mentoring younger activists, conducting peer education with other prisoners, and fighting AIDS, misogyny, and homophobia—provides a worthy example to follow.

Most governments routinely release political prisoners every decade or so, and political internees are often incarcerated together or allowed increased family visits, in tacit recognition of the political nature of their ‘crimes.’ Not so in the United States, where amnesty is a forbidden term. The FBI, Police Benevolent Associations, US Parole Commission, and similar entities have routinely lobbied hard to prevent parole, even when people meet all standards for release—good records, jobs available upon release, community support, et cetera.

In perhaps the most frightening example, former Panther Veronza Bowers has been kept in prison more than a decade past his mandatory release date, without cause or indication of when he will get out. The government has regularly pointed to the “serious charges” and prior political affiliations of the prisoners as reasons for their ongoing incarceration—even though parole is supposed to evaluate someone’s time in prison as a metric for their possible release rather than the charges that resulted in their imprisonment, since the charges never change.

The prison can be seen as an extension of the repression that drove many of these people to undertake militant action in the first place. It is part of the government’s arsenal to destroy revolutionaries. The state has sometimes made this explicit by housing radicals in control unit prisons, prisons-within-prisons that are based on solitary confinement and sensory deprivation. The Communications Management Unit (CMU) is an expression of the security state at its height, devising newer and crueler ways to isolate those whose politics and worldview the state wishes to disappear.

The bulk of such repression is meted out against revolutionary people of color, particularly Black, Native American, and Puerto Rican radicals.

The reasons for this are complex—they involve not just white privilege but the fact that the government has taken a firm position against the release of any political prisoner with a murder conviction. Due to the open levels of confrontation between police and communities of color, these liberation movements often adopted different tactics than white militants.

There are serious challenges to this work, including limited resources, a strategy that must deal with the legal system, public fear of terrorists, and the difficulty of building working relationships among the various movements and communities who find themselves experiencing state repression. But combating political incarceration and supporting those in the crosshairs of state repression remain central to creating a better future. After all, the government remembers who joins and organizes in the movement, regardless of whether they do so before, during, or after their time in prison. Social movements cannot afford to forget.

Our lives and our movements today are as shaped—maybe unknowingly—by the political prisoners who still sit behind concrete walls as the prisons themselves invisibly shape the landscape of the world we seek to make more just. Many have had their lives either ended by the state or have been tried, convicted, and jailed for nothing more than the crime of loving their people enough to attempt a revolution in the United States.

They remain behind walls, often isolated, and at times tortured for their political beliefs. To accept this fact is to ask what ideas can be so dangerous that those who hold it in their heads must be hidden from us? To understand that these people and their circumstance do indeed exist is a necessary first step for a country whose cloak of democracy keeps us in denial. Americans believe political prisoners are a fact in countries like China, Iran, and Cuba but live the lie of the US government's denial of the existence of US political prisoners within its borders.

The decades of radical movements shatter that lie. We must attempt to put ourselves back in proximity to the people and the movements that prisons are meant to place out of reach. To be reconnected to them is to be committed to their freedom. Not solely because they deserve to be free or because our communities would be that much stronger if we had them home, but because for activists today to have the confidence to take the risks and make the leaps that these times require, we must know that we will catch each other when we fall or care for each other if and when and the state seeks to treat us in the same way as those who came before us. By refusing to allow targeted leaders to be taken from us, we take away the state's strongest threat. To fight for the freedom of political prisoners is to declare that there is no barbed wire sharp enough to keep us apart. It includes the cell block in our strategy, and it affirms what Assata taught us

and continues to teach us: that a wall is just a wall, and nothing more at all. It can be broken down. Free All Political Prisoners.

Chapter Eighty-two

Understanding Fear & Violence

“There are no devils left in Hell, They are all in Rwanda. Actually they brought Hell with them. You only have to watch the rivers for proof. Normally in this season, when the rains come to these lush valleys, the rivers swell with a rich red soil. They are more swollen than ever this year. First come the corpses of men and older boys, slain trying to protect their sisters and mothers. Then come the women and girls, flushed out from their hiding places and cut down. Last are the babies, who may bear no wounds: they are tossed alive into the water, to drown on their way downstream. The bodies, or pieces of them, glide by for half an hour or so, the time it takes to wipe out a community, carry the victims to the banks and dump them in. Then the waters run clear for a while, until men and older boys drift into view again, then women, then babies, reuniting in the shallows as the river becomes their grave.”

Societies can break, democracies can fall, ethics can collapse, and ordinary men can find themselves standing over death pits with guns in their hands. It would serve us well today to understand why.

“When a young man kills much meat he comes to think of himself as a chief, or a big man. We worry about any proud young man, for someday his pride will make him kill somebody.”

Perhaps we believe only a deranged and dangerous person would even think of harming us, but that just isn't so. Plenty of people have thought of harming you: the driver of the car behind you who felt you were going too slowly, the person waiting behind you in line at the store while you fumble for your wallet, the person you fired, the person you walked out on—they have all hosted a fleeting violent idea. Though thoughts of harming you may be terrible, they are also inevitable. The thought is not the problem; the expression of the thought is what causes us anxiety, and most of the time that's the whole idea. Understanding this will help reduce unwarranted fear.

So how can you be aggressive without necessarily being violent? The answer is bluster, shit talking, braggadocio, or one of dozens of other names for word-based aggression. Obviously, impugning someone's honor, courage, and/or parentage is the kind of thing that can end in a fight, but more often than not it happens instead of one. Shit talking is the human equivalent of a dog baring its teeth at another dog. He's not trying to start a fight; he's trying to avoid one by letting the other dog know he'll open up a mouthful of murder if pushed too far.

There are plenty of good reasons, both moral and practical, to oppose the suppression of white nationalist and other "extremist" web platforms. Free speech is a core moral value for any society that aspires to freedom of any kind and to any degree. We *must* have the right to form our own opinions, and to express those opinions, no matter how ugly others may find those opinions. Without that freedom, no other freedoms can survive.

As a practical matter, extremists, like everyone else, will choose to state, promote, and argue for their beliefs. If they can do so in public, those beliefs can be engaged and argued against. If they can't do so in public, they'll do so in private, without anyone to convince them—and those they quietly bring into their circles over time—of the error of their ways. The rest of us won't have a clue what might be in the offing—until the guns come out, that is.

This has been a pet peeve of mine for several years, and I suppose it is kind of a strange one as far as pet peeves go. I don't expect many will agree with me on this, but here goes. The following statement is not a threat:

"You should be dragged into the street and shot."

I understand that this is not a very nice thing to say to someone. I can see how this statement may be perceived as threatening in some sense by the person on the receiving end of it. Undoubtedly, hearing that someone else thinks you should be shot is unpleasant. And yet, this statement is not a threat.

In order for a verbal statement to constitute a threat, we need a clear expression of intent to inflict harm. We don't have that in the statement above. Not even close. Here's what a threat would look like:

"I am going to drag you into the street and shoot you."

Here we have a clear expression of intent. I think the difference is fairly obvious and important. In the case of the first statement, my response would likely be something along the lines of, 'Yeah, whatever.' In the case of

the second statement, my response may involve beefing up my fortifications and being more alert.

I can't count the number of times I have seen people complaining about receiving "death threats" as some sort of badge of honor, only to provide evidence of the first sort of statement or something even weaker. These are not death threats. The second statement here is a death threat. 'I am going to kill you' is a death threat; 'someone should kill you' is not a death threat.

Why is this a pet peeve? Besides my strange conviction that words and their definitions matter, I think it bugs me because we've all heard some variation of 'People who do X should be shot' over and over again. Hell, I've seen this on Twitter where 'X' was manspreading! And when we see it, I'd bet that none of us thought of it as a threat. 'People who drive with their turn signal on and no intention of turning should be shot.' We recognize that this is not a threat. But for some reason, for some of us, this goes out the window when we are the ones who do X.

Threatening words are dispatched like soldiers under strict orders: Cause anxiety that cannot be ignored. Surprisingly, their deployment isn't entirely bad news. It's bad, of course, that someone threatens violence, but the threat means that at least for now, he has considered violence and decided against doing it. The threat means that at least for now—and usually forever—he favors words that alarm over actions that harm. For an instrument of communication used so frequently, the threat is little understood, until you think about it. The parent who threatens punishment, the lawyer who threatens unspecified 'further action,' the head of state who threatens war, the ex-husband who threatens murder, the child who threatens to make a scene—all are using words with the exact same intent: to cause uncertainty.

Because most people have had little experience with death threats, and because they mistakenly believe that the death threat is inherently different from all other threats, the words usually cause undue fear. In fact, the death threat is among the threats least likely to be carried out.

Though you wouldn't know it by the reaction they frequently earn, threats are rarely spoken from a position of power. Whatever power they have is derived from the fear instilled in the victim, for fear is the currency of the threatener. He gains advantage through your uncertainty, but once the words are spoken, he must retreat or advance and, like all people, he hopes to retain dignity through either course.

The first step toward deciding which words actually portend danger is understanding what threats are and what they are not. A threat is a statement of an intention to do some harm, period. It offers no conditions, no alternatives, no ways out. It does not contain the words 'if,' 'or else,' 'until,' 'unless.' Sentences that do contain those words are not threats;

they are intimidations, and there is an important distinction. Intimidations are statements of conditions to be met in order to avert a harm. For example, 'I will burn this building down if I don't get the promotion' is an intimidation, not a threat, because a condition is offered to avert the harm. With intimidations, the motive is always right in the statement and the outcome the speaker desires is clear. 'Unless you apologize, I'll kill you' (the speaker wants an apology). 'If you fire me, you'll be sorry' (the speaker wants to keep his job). 'Give up your unearned wealth and dismantle your unjust institutions or we'll rain down righteous fury' (the speaker wants justice). These statements differ importantly from threats because they are brought into play as high-stakes manipulations. The speaker wants his conditions met—he does not want to inflict the harm. With threats, conversely, no conditions are offered, usually because the speaker sees few alternatives. Thus, threats carry more likelihood of violence than intimidations.

Another tip: Threats that are end-game moves—those introduced late in a controversy—are more serious than those used early. That's because those used early likely represent an immediate emotional response as opposed to a decision to use violence.

These days, bomb threats are a tactic popular with angry people. It's amazing how much fear can be caused by a single phone call; it might compel an organization to evacuate a building, close for the day, or enact restrictive security procedures. But to believe the caller who says, 'I've planted a bomb, and it's going off in three hours,' you have to believe that the person went to the extraordinary trouble and risk of obtaining the bomb components, then found a location where he could be sure nobody would ever see what he was doing, then assembled the bomb, then took the chance of losing his liberty and life while placing the device, and then undid it all by making the warning call.

At what point do we stop treating anonymous threateners as if they were the most credible people we'd ever heard from when in fact nearly 100 percent of these calls are bogus? A caller who wants to discharge anger over the telephone by using violent imagery ('You'll all be blown to bits'), or who is agitated and aggressive, is not behaving like a real bomber. Most real bombers are patient, I'll-get-you-in-time type people who can mortgage their emotions for another day. They express anger by blowing things up, not by making hostile calls. Ironically, bombers do not have explosive personalities.

Though anonymous death threats cause high concern, they actually portend less danger than accredited threats. People who send threats anonymously are far less likely to pursue an encounter than those who sign their names. There are some compelling reasons why this is so. The threatener who provides his true name is not trying to avoid attention, and

is probably seeking it. Thus, he is most similar to assassins, most of whom stand at the scene of their crimes and say, 'I did this.'

The police misunderstanding about anonymous threats stems from how different the assassin is from almost all other criminals. Who else would actually design his offense to ensure that he gets caught? Who else would hope his act would be videotaped?

Ten Behaviors Common to Modern Assassins

1. Displayed some mental disorder
2. Researched the target or victim
3. Created a diary, journal, or record
4. Obtained a weapon
5. Communicated inappropriately with some public figure, though not necessarily the one attacked
6. Displayed an exaggerated idea of self (grandiosity, narcissism)
7. Exhibited random travel
8. Identified with a stalker or assassin
9. Had the ability to circumvent ordinary security
10. Made repeated approaches to some public figure

If we had to choose just one Pre-Incident Indicator (PIN) we'd want to be aware of above all others, it would be the one we call ability belief. This is a person's belief that he can accomplish a public-figure attack. Without it, he cannot. In fact, to do anything, each of us must first believe on some level that we can do it. Accordingly, society's highest-stakes question might be:

"Do you believe you can succeed at shooting the president?"

Would-be assassins won't always answer this question truthfully, of course, nor will society always get the opportunity to ask it, but to the degree it can be measured, ability belief is the preeminent PIN for assassination.

If the truthful answer is 'No, what with all those Secret Service agents and special arrangements, I couldn't get within a mile of the guy,' the person cannot shoot the president. Of course, this isn't a permanently

reliable predictor, because ability belief can be influenced and changed. If, for example, I believe I could not possibly dive into the ocean from a two-hundred-foot-high cliff, then I cannot. But a coach might influence my belief. Encouragement, teaching of skills that are part of the dive, taking of lesser dives—first from 20 feet, then 30, then 50—would all act to change my ability belief. No single influence is more powerful than social proof, seeing someone else succeed at the thing you might have initially believed you could not do. Seeing a diver propel himself off an Acapulco cliff, sail down into the Pacific and then emerge safely dramatically influences my belief that it can be done, and that I could do it. Similarly, the enormous media attention showered on those who attack public figures bolsters ability belief in other. It says:

“You see; it can be done.”

Reporters usually refer to assassins with triple names, like Mark David Chapman, Lee Harvey Oswald, Arthur Richard Jackson. One might come to believe that assassins actually used these pretentious triple names in their pre-attack lives; they didn't. They were Mark, Lee, and Arthur.

There is clearly a sliding scale between ‘good’ and ‘bad,’ but there appear to be three principal ways in which benign things most often deteriorate and become malign:

1. Good things get to be bad if they are displaced, taken out of context, or removed from their locus.
2. Good things get very bad if there are too few or too many of them.
3. Good things get really rotten if they cannot relate to each other properly and their degree of association is impoverished.

“Desire” is the key to Aristotle’s moral philosophy. He recognizes “right” and “wrong” desires, and suggests that one can be forgiven for a wrong action—we all make mistakes—but never for a wrong desire. His list of such moral evils includes greed, lust, avarice, sloth, anger, envy, and pride. Which nicely covers all of the Seven Deadly Sins. It is instructive, in this respect, to compare Aristotle’s blacklist with the celebrated Commandments of JudeoChristianity. Only one of those ten prescriptions, that of covetousness, is a wrong desire. All the rest deal with actions. They are the rules of a society more concerned with what one should or should not do than with understanding the motives behind murder, theft, adultery, and perjury. Aristotle wanted to know why.

In addition to right and wrong desires, he recognized “acquired” desires, which differ from individual to individual, and “natural” desires, which are a part of human nature. These are what most of us now would recognize simply as ‘wants’ and ‘needs.’ Needs are the sort of desires that are inevitable and necessarily good. Needs are never wrong. Wants are more problematic and Aristotle assessed them by their quantity. Good wants, he said, are right desires as long as they are identical with our needs for them. They become bad, and may be identified as wrong desires, if we want too much. But—and this I think is Aristotle’s most vital contribution to the discussion of evil, contradicting the schools of hair-shirt discipline which turn abstinence into a virtue—such desires may be bad and wrong also, if we want too little.

Aristotelian ethics is the ethics of “just enough.” Neither too much nor too little. Enough is enough, even of a good thing. Any more or less falls outside what he called the “golden mean” and fails to contribute to the whole good, the *totum bonum*. Even moral virtues such as courage are good only if they lie along the narrow mean. A man who fears everything becomes a coward, but the one who fears nothing is a dangerous fool.

If you’re doing something that could possibly kill you and you don’t have at least a small amount of apprehension you’re either a liar or a fool.

Fear is associated with a part of the brain called the amygdala. Certain fibers run directly from the eyes to the amygdala, so the mere sight of a spider can trigger an immediate reaction of fear. This connection exists even in blind people whose visual cortex has been damaged by an injury to the back of the head. They no longer see the spider, but they still feel it emotionally. So, our amygdala plays a major role in the development of fear. If the amygdala gets damaged, a person can become fearless.

Scientists marvel at the predatory competence of the Great White, praising its speed, brute strength, sensory acuity, and apparent determination, but man is a predator of far more spectacular ability. The shark does not have dexterity, guile, deceit, cleverness, or disguise. It also does not have our brutality, for man does things to man that sharks could not dream of doing. Deep in our cells, we know this, so occasional fear of another human being is natural.

Feelings are biochemical mechanisms that all mammals and birds use in order to quickly calculate probabilities of survival and reproduction. Feelings aren’t based on intuition, inspiration, or freedom—they are based on calculation. When a monkey, mouse, or human sees a snake, fear arises because millions of neurons in the brain swiftly calculate the relevant data and conclude that the probability of death is high. Feelings of sexual attraction arise when other biochemical algorithms calculate that a nearby individual offers a high probability of successful mating, social bonding, or

some other coveted goal. Moral feelings such as outrage, guilt, or forgiveness derive from neural mechanisms that evolved to enable group cooperation. All these biochemical algorithms were honed through millions of years of evolution. If the feelings of some ancient ancestor made a mistake, the genes shaping these feelings did not pass on to the next generation. Feelings are thus not the opposite of rationality—they embody evolutionary rationality.

For the average mammal stress is three minutes of terror on the savannah. After which the stress is over. Or you are. Stress evolved as a useful, extremely short-term, lifesaving physiological state: your heart races to pump oxygen; your lungs work harder; and your body turns off anything nonessential in the interest of immediate survival (being chased by a lion is no time to ovulate, grow, or put energy into tissue repair—that's for later).

The problem, however, is that if one feels fear of all people all the time, there is no signal reserved for the times when it's really needed. A man who gets into the elevator on another floor (and hence wasn't following her), a man who gives her no undue attention, who presses a button for a floor other than the one she has selected, who is dressed appropriately, who is calm, who stands a suitable distance from her, is not likely to hurt her without giving some signal. Fear of him is a waste, so don't create it.

Many people believe—and we are even taught—that we must be extra alert to be safe. In fact, this usually decreases the likelihood of perceiving hazard and thus reduces safety. Alertly looking around while thinking, 'Someone could jump out from behind that hedge; maybe there's someone hiding in that car,' replaces perception of what actually is happening with imaginings of what could happen. We are far more open to every signal when we don't focus on the expectation of specific signals.

You might think a small animal that runs across a field in a darting criss-cross fashion is fearful even though there isn't any danger. In fact, scurrying is a strategy, a precaution, not a reaction to a fear signal. Precautions are constructive, whereas remaining in a state of fear is destructive. It can also lead to panic, and panic itself is usually more dangerous than the outcome we dread. Rock climbers and long-distance ocean swimmers will tell you it isn't the mountain or the water that kills—it is panic.

Rule #1: The very fact that you fear something is solid evidence that it is not happening. Fear summons powerful predictive resources that tell us what might come next. It is that which might come next that we fear—what might happen, not what is happening now. An absurdly literal example helps demonstrate this: As you stand near the edge of a high cliff, you might fear getting too close. If you stand right at the edge, you no longer fear getting too close, you now fear falling. If you

do fall, you no longer fear falling—you fear landing. Panic, the great enemy of survival, can be perceived as an unmanageable kaleidoscope of fears.

Rule #2: What you fear is rarely what you think you fear—it is what you link to fear. Take anything about which you have ever felt profound fear and link it to each of the possible outcomes. When it is real fear, it will either be in the presence of danger, or it will link to pain or death. When we get a fear signal, our intuition has already made many connections. To best respond, bring the links into consciousness and follow them to their high-stakes destination—if they lead there. When we focus on one link only, say, fear of someone walking toward us on a dark street instead of fear of being harmed by someone walking toward us on a dark street, the fear is wasted. That's because many people will approach us—only a very few might harm us.

Worry is the fear we manufacture—it is not authentic. Worry is a way to avoid change; when we worry, we don't do anything about the matter. Worry is a way to avoid admitting powerlessness over something, since worry feels like we're doing something. Prayer also makes us feel like we're doing something, and even the most committed agnostic will admit that prayer is more productive than worry. Worry is a cloying way to have connection with others, the idea being that to worry about someone shows love. The other side of this is the belief that not worrying about someone means you don't care about them.

As many worried-about people will tell you, worry is a poor substitute for love or for taking loving action. Worry is a protection against future disappointment. After taking an important test, for example, a student might worry about whether he failed. If he can feel the experience of failure now, rehearse it, so to speak, by worrying about it, then failing won't feel as bad when it happens. But there's an interesting trade-off: Since he can't do anything about it at this point anyway, would he rather spend two days worrying and then learn he failed, or spend those same two days not worrying, and then learn he failed? Perhaps most importantly, would he want to learn he had passed the test and spent two days of anxiety for nothing?

The relationship between real fear and worry is analogous to the relationship between pain and suffering. Pain and fear are necessary and valuable components of life. Suffering and worry are destructive and unnecessary components of life. Great humanitarians, remember, have worked to end suffering, not pain.

Silly and alarming news promos are of more than passing interest to me because understanding how they work is central to understanding how fear works in our culture. We watch attentively because our survival requires us to learn about things that may hurt us. That's why we slow down at the scene of a terrible car accident. It isn't out of some unnatural perversion; it is to learn. Most times, we draw a lesson: 'He was probably drunk;' 'They must have tried to pass;' 'Those little sports-cars are sure dangerous;' 'That intersection is blind.' Our theory is stored away, perhaps to save our lives another day.

Surveys have shown that ranking very close to the fear of death is the fear of public speaking. Why would someone feel profound fear, deep in his or her stomach, about public speaking, which is so far from death? Because it isn't so far from death when we link it. Those who fear public speaking actually fear the loss of identity that attaches to performing badly, and that is firmly rooted in our survival needs. For all social animals, from ants to antelopes, identity is the pass card to inclusion, and inclusion is the key to survival. If a baby loses its identity as the child of his or her parents, a possible outcome is abandonment. For a human infant, that means death. As adults, without our identity as a member of the tribe or village, community or culture, a likely outcome is banishment and death. So the fear of getting up and addressing five-hundred people at the annual convention of professionals in your field is not just the fear of embarrassment—it is linked to the fear of being perceived as incompetent, which is linked to the fear of loss of employment, loss of home, loss of family, your ability to contribute to society, your value, in short, your identity and your life. Linking an unwarranted fear to its ultimate terrible destination usually helps alleviate that fear. Though you may find that public speaking can link to death, you'll see that it would be a long and unlikely trip.

Three boys in a small Missouri town, one of them the student-body president, invited their friend Steven Newberry to go out in the woods with them to "kill something." Steven wasn't told that he was the something, though that became apparent when they began beating him with baseball bats. He asked them why, and they explained to the near-dead boy:

"Because it's fun, Steve."

His memories were fractured and distorted and significantly inconsistent with the evidence. Those memories, however, may well show what murder looks like through the eyes of a murderer. His body was working very quickly, his mind was working very slowly. He would see himself stab his mother in the throat. His mind would somehow say, 'God, you've got to stop that!'

But by the time the thought had formed, he would see himself stabbing her again. He described it as:

“My mind never caught up with my body.”

Then he turned around and saw his father standing there on the landing with what he called a blank look. He heard himself growl like a wolf or a dog and realized it was himself. He sensed himself taking one giant step and his father fell back into the computer room. He recalls his father trying to shut the door and just brushing it aside—it was like the door wasn’t even there.

The psychological term for this is “dissociation.” It is an adaptive mechanism that allows people who are undergoing extreme trauma—either killers or victims—to insulate themselves from reality. Dissociation does not open the door to violence; rather, it is triggered by the first puzzling blow. After that both killer and victim find themselves in a slow-motion dream that neither can escape. It is an odd and sluggish dream where the inner narration in the mind of the killer—‘I can’t believe I’m strangling this woman’—is roughly mirrored by the inner narration of the victim, who is thinking, ‘I can’t believe this man is actually strangling me.’ Victims of near-fatal car accidents often dissociate, as do people who survive falls from great heights or attacks by wild animals. Time slows down in a dissociative state. There is a sense of unreality, as if what is happening has to be a dream. Certain details become very vivid, and others are completely wiped out.

In this case he hit his mother with the splitting maul and then had a memory of her breathing so loudly that he felt compelled to make it stop by cutting her throat with a knife. In reality his mother was so badly wounded that her breathing must have been nearly inaudible, but his mind fixated on it to the point where it overwhelmed every other sound in the room.

“The investment of abuse and neglect in Joey’s own childhood will continue to pay dividends of pain and violence for others, including those he will likely kill one day. As I write this sad but accurate prediction, Joey is only nine years old.”

Sadly, too many boys learn from the media or from each other what scholars call “protest masculinity,” characterized by toughness and the use of force. That is not the only way to be a man, of course, but it’s the only way they know. It is similar to one brother asking another, ‘Why did you grow up to be a drunk?’ The answer is ‘Because Dad was a drunk.’ The second brother then asks, ‘Why didn’t you grow up to be a drunk?’ The answer is: ‘Because Dad was a drunk.’

With the pull of a trigger, a young person whose upbringing has not invested him with self-worth can become significant and un-ignorable.

Though it will generate much controversy, parents may someday be able to use prenatal testing to identify children with unwanted personality genes, including those that make violence more likely. Until then, however, we'll have to settle for a simpler, low-tech strategy for reducing violence: treating children lovingly and humanely.

Even though it is so expensive for us, mistreatment will probably continue until we take an entirely different view of children, not as temporary visitors who will someday grow into citizens, but as full-fledged, fully contributing, fully entitled members of our society just as they are right now. Presently children are often seen as burdens to society, no more than hapless victims of their circumstance, but nothing could be farther from the truth. Recognize that children are the primary childcare providers in America. Siblings caring for siblings and children caring for themselves represent an important part of our economy. They also care for the elderly, cook meals, take cigarettes out of the hands of sleeping parents, and contribute in countless other ways. If only more abused children could know that they are the residents of their homes, not the architects, then they might believe that where they are will not limit where they might go. Until America focuses shame on perpetrators instead of victims, these children will have children, and the war they thought was over won't be over, for them or for us.

I have learned that the kindness of a teacher, a coach, a policeman, a neighbor, the parent of a friend, is never wasted. These moments are likely to pass with neither the child nor the adult fully knowing the significance of the contribution. No ceremony attaches to the moment that a child sees his own worth reflected in the eyes of an encouraging adult. Though nothing apparent marks the occasion, inside that child a new view of self might take hold. He is not just a person deserving of neglect or violence, not just a person who is a burden to the sad adults in his life, not just a child who fails to solve his family's problems, who fails to rescue them from pain or madness or addiction or poverty or unhappiness. No, this child might be someone else, someone whose appearance before this one adult revealed specialness or lovability or value. It provides some alternative designs for self-image, not just the one children logically deduce from mistreatment:

“If this is how I am treated, then this is the treatment I am worthy of.”

When a child's primary caregiver delivers both praise and brutality, it is a virtual coin toss as to which will attach itself to the child's identity.

Terribly unhealthy families damage children in many ways, but one of the saddest is the destruction of the child's belief that he has purpose and value. Without that belief, it is difficult to succeed, difficult to take risks. Perhaps more to the point, it may seem foolish to take risks, knowing, as such people do, that they are not up to the task.

There is a short story, just before the end, one of two amateur investigators has just uncovered the secret of what it was that was driving young, healthy, wealthy, secure young men to commit suicide on three continents, in a manuscript left behind by one of the suicides. After reading only a few words, the partner says:

“Take it away, Villiers, never speak of this again. Are you made of stone, man? Why, the dread and horror of death itself, the thoughts of the man who stands in the keen morning air on the black platform, bound, the bell tolling in his ears, and waits for the harsh rattle of the bolt, are as nothing compared to this. I will not read it; I should never sleep again.”

The original investigator assures him that it is true, but finishes by agreeing with the sentiment:

“Oh, Austin, how can it be? How is it that the very sunlight does not turn to blackness before this thing, the hard earth melt and boil beneath such a burden?”

I think that thirty scientists and researchers from a half dozen or more different fields who gathered in rural France in 1990 to check each others' work must have felt something of that same horror when they found that they could not disprove their mutual finding. It was something that none of them wanted to believe. It was a thought that only one of the thirty of them was willing to confront the implications of, and do further research to explore the implications of. And I'm sure that they knew or at least suspected that no matter how important their scientific finding was, they would be vilified for a lifetime if they made society confront this awful truth, and that was a price that they were unwilling to pay.

And see, that, to me, is the fascinating thing, even more fascinating than the awful truth itself. On the contrary, almost all of my friends that I've discussed this with since I read the book have agreed with me that, given the weight of the evidence, the awful truth in question is pretty undeniable, is important to know, and—contrary to what some might think—it is something we can learn to live with the knowledge of. If this knowledge becomes widespread, it may and probably will cause some hardship for some

innocent people. But the good to society will, I believe, out-weigh those harms. So no, really, the awful truth that I'm about to reveal to you will seem anti-climactic compared to the dread that the scientists who discovered it felt.

After a several year career as one of the second generation of women to do fieldwork in primatology, a woman and her husband decided to have their first child. She was already in the middle of preparations to shift her career from primatology to a subject that would allow her to do her fieldwork closer to home, with fewer long absences, and in a more comfortable setting to raise a baby in, namely evolutionary biology, when it occurred to her (as a mother to be) just out of personal interest to study the mothering patterns of the colony of monkeys she was observing. She knew to expect high infant mortality. Primatologists have known for over a hundred years that baby monkeys and baby apes are at extreme risk from any male other than their father. But she was startled to discover, when she tracked the mothers of new infants carefully, that infants were at almost as much risk of murder from their own mothers as they were from unrelated male adults.

This baffled her for several reasons, not least of which that while there had been a great deal of research into infanticide in primates, nobody had ever reported a case of a female primate killing her own offspring except by freakish accident. The other reason it baffled her was that, as an evolutionary biologist, she could make no sense whatsoever as to how evolution could produce individuals that destroyed their own offspring, especially among such slowly reproducing species as primates. So she contacted a few other primatologists studying other colonies of monkeys and asked them to carefully monitor the actions of new mothers and to their astonishment, they observed the same thing.

So she gave a preliminary paper on the subject in 1976, suggesting that more research was needed to explain how this behavior could possibly have evolved in primates, only to be interrupted mid-talk by an audience member, a prominent expert in her field. He stood up, tried to stop her from finishing reading her paper, announced that primate females absolutely do not ever murder their own children, and that if she had observed a primate colony in which primate females were killing their own children, it could only be because of something she had done to them; she must have committed some horrible breach of experimental ethics that so deranged these monkeys that she had driven them insane enough to do something that no monkey had ever done before. He then stormed out of the talk and went directly to the scientific press to denounce her for whatever it was that she had done to that monkey colony, so it probably is a good thing that she was already planning on changing fields, no?

She quietly continued her study, working behind the scenes with other researchers while she directed her own studies towards less controversial animals, such as insects. Eventually she discovered something that appalled even her with its simplicity. Not only do mothers sometimes kill their own children, they are almost never insane when they do so. On the contrary, for a mother to murder her own child is an evolutionary adaptation without which our species would not have survived some of the environmental and social disasters of the past. What's more, the actual reasoning behind this is so simple that a straightforward simple equation in four variables is sufficient to provide a reliable estimate of the probability that any particular mother will murder any particular infant:

1. The age of the mother
2. Whether or not this child is the gender that the mother wanted—which, itself, turns out to be easily and universally predicted based on only two variables, the mother's social status and the predicted reliability of the food supply
3. The child's birth weight, and to a lesser extent other indicators of long-term viability
4. Her estimate of whether or not attempting to nurture this particular child will only get both her and the child killed

When she took her early estimates for this equation to the 1990 conference, she discovered that epidemiologists studying SIDS, primatologists studying infanticide (following her 1976 tip), historians digging through old records to try to quantify infanticide throughout the ages, criminologists and social psychologists trying to come up with statistical models to predict mother-on-child infanticide, and anthropologists trying to statistically analyze what variables are most consistent with cultures that have high versus low rates of infanticide, had all independently discovered the same equation. And from her viewpoint as an evolutionary biologist, she demonstrates that any sane, healthy, normal, intelligent mothers who weren't capable of coldly murdering their own infant children almost certainly had no surviving descendants at all to be our ancestors during some of the species-wide threats that have been demonstrated to have happened from the fossil record and from studies of rates of genetic drift.

I mention SIDS. One of the researchers, she says, was an epidemiologist who, in the process of trying to quantify his hunch, initiated a study in which social workers and police very, very intensively interviewed and background

checked a long string of crib deaths that had been explained away as unexplained random respiratory failure. It turns out that his equation was able to predict, with high (but not absolute) reliability, which infants had actually been the victims of homicide or malign neglect. If the infant was a boy when the mother wanted a girl or vice versa, if the infant was born weighing less than eight pounds, or if the mother was in any kind of economic or physical danger if this child survived, then the baby was doomed. His final estimate, from that initial study, was that seventy five percent of all SIDS cases are actually homicides. But, he admitted, just acknowledging this possibility puts us in an awful dilemma. To catch the three out of four women whose babies suddenly die that were actually murderers, we have to treat all SIDS cases as potential homicides, therefore piling yet more heartbreak and tragedy on the one out of four who just randomly went through the worst tragedy any family can know, the sudden and unexpected death of a beloved child. Even using the predictive equation to narrow the field of homicide investigations, we'd still be casting a very scarily public accusation of homicide on an uncomfortably large number of grieving mothers.

I must also mention social psychology. The central tenet of the field of social psychology is that if under a given situation, all or nearly all individuals will engage in the same unwanted behavior, then there is less to be gained by stigmatizing those individuals and lauding the ones who don't than by studying the situation with an eye towards changing it. And you can see in a heartbeat how that applies here: if infants are at extreme risk whenever one or more of three variables are present, then we can reduce the rate of (massively under-reported, intentionally under-investigated) maternal infanticide by decreasing the economic and evolutionary pressures behind gender preference, by providing mothers with as much economic assistance and physical protection as it would require for them to feel safe providing for this baby, and by intensifying support for the first several months of life of mothers of infants who are born weighing less than eight pounds or looking otherwise sickly.

But addressing the issue in this way, and looking into the roots of the equation that predicts maternal infanticide, makes social psychologists confront the queasy implication of all of their work: if it's that sane and natural for them to do this awful thing, if this awful thing is so hard to resist, how can we justify stigmatizing and punishing them? And if we can't, then how can we live with ourselves having just joined the 85% of all known historical societies, up to and including Christian western Europe as recently as the late-nineteenth century, that socially tolerated infanticide any time in the first couple of days after birth? There's pro-choice, I mean, and then

there's being so pro-choice as to join the ranks of societies that have denied the humanity of a breathing infant up to 48 hours old—are we willing to go there? Or to at least show understanding and compassion and tolerance towards societies that did or that do? The anthropologists at the conference were especially terrified of releasing their research findings, because they knew that the accusation that a society or tribe kills children has been used to justify no shortage of genocidal invasions.

Perhaps some of you are still baffled by what part of this spawned such a terror of confronting their own research findings that 29 out of 30 scientists who discovered it immediately and without any external pressure moved to suppress their own research findings. Frankly, good—I distrust that impulse, too, and think that we are always better off knowing the truth than not knowing it. But as you go about your day, remember this: research shows that your own mother consciously or unconsciously considered murdering you in your crib, off and on for at least the first 48 hours after your birth and not improbably for the whole first two weeks of your life, maybe even the first two months. And if your mother was under 30 when she had you and you were born male in a poor family or female in a wealthy family during times of economic hardship, or weighing less than eight pounds, or at a time when your mother thought that her own chances of survival would improve if you didn't survive so, for example, she could get pregnant by her new husband more quickly or so she could return to work more quickly, you very nearly didn't make it. And she would have gotten away with it, too, because mothers have traditionally had a long list of potential murder weapons, from handing you over to caretakers or adoption agencies even if she knew they had a 99% chance of killing you, to smothering you with a pillow, to switching you to infant formula that she knew was diluted with unsafe water, to declining to lift a hand to save you from some mortal peril. And because 'everybody knows' that mothers don't kill their own children, nobody would have questioned her about it.

Smiling All the Way to the Grave

“The Republican Party took the black man off the auction block of the Slave Power, but it has put the white man on the auction block of the Money Power.”

Conservatives frequently say that socialists want to have everything handed to them—that instead of complaining, they should be buckling up, showing up to work every day, and achieving something the “hard way.” This seems a bit odd, considering that, all in all, achieving a complete and revolutionary overhaul of long-standing economic and social structures against the wishes of all the world’s centers of power is probably harder than, say, becoming a reasonably successful middle manager with two cars.

Our idea of what a revolution is like, how it is carried out, and who it is carried out by has been warped by our own cultural propaganda, and by the romantic Marxist propaganda of the twentieth century. We have this idea that revolutions are led by rational-minded, tea-sipping men in three-pointed hats who discuss the rights of man while burning the candle at both ends. Or we’re warped by the Marxist ideal of revolution: a rational, inevitable historical process in which the most enlightened, most sympathetic, least overdressed human beings team up with the Historical Trend itself to effect a glorious, clean revolution. In fact, revolutions are messy, ugly, gory affairs. Nowhere in our popular notion of revolutions are such factors as stupidity, bad luck, unintended comedy, and revolting madness allowed in. Yet most of the time revolutions are ‘led,’ by people we would call nutcases and who indeed were considered nutcases during their time—and in all likelihood were nutcases. While time and distance provide a romantic view of revolutions, at the time when they actually occur, they usually seem bizarre, uncalled-for, frightening, and evil to their contemporaries, which is why they almost always seem snuffed out at their inception.

We tend to think that all rebellions or domestic uprisings were as well understood in their time as we understand them now, but the fact is that most rebellions took place in a kind of contextual vacuum, rendering them little more than outbreaks of seemingly senseless, crazed violence. This is

how they were viewed until later, when an intellectual or ideological frame was provided to explain or ground them and to give them a sense of dramatic order. Today's rage murders fit the pattern of rebellions before they have been contextualized.

Wesbecker didn't start firing until the elevator opened to the reception room—until he came face to face with The Company—and he only stopped once he'd made his way through the entire building, sweeping from the management's toner-ink penthouse on the third floor all the way down to the solvent-stench of the working-class basement and locker room on the other end. By destroying The Company's physical manifestations—its employees being The Company's concrete pillars—he attacked the sum of The Company's parts more than simply its parts. Some believed that Wesbecker was looking to get revenge on a supervisor. They were at least partly right, in that the murder rampage wasn't simply a psycho gone berserk shooting anyone or anything in his path. But even they misunderstood how deliberately the crime was executed. Wesbecker sought revenge on the entire institution that mistreated, abused and injured, insulted, and eventually threw him away when there was nothing left to squeeze. Nothing could be more contrary to the general view of the violent, unbalanced, murdering-at-random nutcase who goes postal—the freak who snaps.

Yet this is the common portrait we are given. And it is the wrong portrait. Not only was this rage murder spree an example of targeted vengeance, but its details and circumstances are strikingly similar to other rage murders in offices, workplaces, post offices, and even in the most recent setting of this crime, schoolyards. Moreover, the details and circumstances are also remarkably similar to doomed rebellions we have seen throughout American history—in their goriness, in the way they are totally misrepresented at the time of the uprising, in the mentally unbalanced psychology of the rebel. Wesbecker was not entirely healthy, as he admits, but then again neither were John Brown or Nat Turner—one who murders is by definition not 'healthy.' And finally, in the grisly, often tragicomic results.

A cheerful attitude and laughing are tactics employed by all Americans, at an unconscious, even genetic level. Though many Americans privately know that one's own smile is an attempt to put the other party at ease rather than a reflection of one's own inner happiness, publicly, this is rarely admitted. Thus few of us know how many other Americans also force this desperate smile—we all think we're the only ones faking it. These smiles are more like mammal calls used to identify the individual with the herd, to keep from being expelled. These calls that have to be repeated and repeated: you can't just recite the backslapping platitudes once and you're off the hook—as mammals, the office herd requires you to send out the correct

marking signals every single day, every hour. It can be exhausting and humiliating. Yet the consequences of not constantly reminding everyone how normal you are range from getting placed on the slow-track to being first on the plank when the next downsizing diktat arrives from headquarters. In my own experience, this cheerfulness, this desperate smile is one of the most corrosive features to daily life in America, one of the great alienators—a key toxic ingredient in the cultural poison.

The questioning attorney tried to show that if Wesbecker murdered a “friend,” it proved that he murdered at random, and therefore he was a freak, rather than a victim of The Company’s brutality. But what the attorney could not grasp—indeed what Wesbecker himself may not have been consciously aware of—is that a friend in that environment needn’t be a friend even in the casual sense of the word. A friend can be just another humiliation, a desperate, ongoing, failed attempt to connect with the herd. A friend could be a worker who doesn’t make your life hell, or a friend could be one of the workers who does make your life hell but slaps your back after every jibe and tells you that ‘it’s all in fun’ and ‘don’t take things too seriously’ because ‘we’re all just having a good time here.’ Or it could be the person with whom you have to maintain good relations in order to keep everything from getting worse.

The slave ship voyages are among the most gruesome cruelties ever imposed by the West on its vanquished. On average, one-sixth of the slaves died horrible deaths on these voyages. They were packed and chained below deck, literally stacked side by side, and head to toe in order to maximize space efficiency, for the entire duration. By the time the survivors were let out to be auctioned off at the ports and slave markets, much of their rebellious spirit—indeed, much of their human spirit—was gone.

Woodcuts from this era depict the slaves in the cargo bay laying cramped together side by side, without expression or color, with no emotion in the eyes or mouths. There is no fear, no sickness, no crying or anger. They are represented literally as cargo, as inanimate as container goods, reflecting the generally-held view of African slaves at that time. That the woodcut artist denied these slaves the pathos they deserved is what makes viewing their representations so disturbing today. Did the artist intentionally strip his subject of all of its innate horror? Or was he unable to see it? Did the artist, or the audience, view the slave voyage atrocities in the same way as we generally view farm animal life—stripped of the horrors of the slaughterhouse, the bio-feed, the fetid overcrowding, the stench of waste and rot and decomposure, and the squeals and cries, as a hard fact of life that ultimately benefits society? The white colonials had to view black slaves as something like farm animals in order to avoid empathizing.

As slavery and the slave economy in America became more refined, so did the slaveholders' treatment of their slaves. A whole industry of slave management grew up around the practice. Slaves were generally treated much better than white indentured servants because they were property, whereas indentured servants could only be squeezed for a limited period. It was in the master's interest to stretch out his slave's work efficiency as long a period as possible, either to get a full life's work out of him or her, or to keep the resale value high. That meant keeping the slave relatively healthy and happy. Many masters developed a genuine affection for their slaves, however patronizing, and this affection was often reciprocated. Masters saw it as their moral duty to treat their slaves well and to civilize them, as grotesque as that seems today.

As a rule, mainstream slave management theory didn't advocate that slaves had "unlimited juice to squeeze" as former General Electric CEO Jack Welch said of his workers, or that "fear is the best motivator" as Intel's Andy Grove once boasted. Slaves weren't driven by stress or viewed by their masters as having a half-life of "only a few years" as Intel CEO Craig Barrett said of his engineers; although indentured servants were viewed as such, and were truly squeezed for all they were worth. Indeed usually it was the overseers who posed the greatest threat to slaves, not their owners. The overseer had no direct economic incentive to keep the slaves content; his only concern was output.

Mainstream slave management theory of the nineteenth century had taught masters that the best way to get the most out of your slaves was to provide him with incentives in order to make the slave believe that his interests coincide with his master's. In this sense, slave management theory had more in common with mid-twentieth-century corporate management theory than with the kind of sadistic evil we normally associated with slaveholding.

"In order to obtain the maximum labor at the cheapest cost, the planter had to construct healthy cabins, provide adequate, wholesome food and proper clothing, permit recreation, and provide medical attention for his slaves. He also had to maintain a great degree of social distance between himself and his slaves. A Virginia planter asserted: '[The slave] ought to be made to feel that you are his superior, but that you respect his feelings and wants.'"

Substitute 'employer' for 'planter' and 'employee' for 'slave' and see how the above passage reads:

“In order to obtain the maximum labor at the cheapest cost, the employer had to construct healthy cabins, provide adequate, wholesome food and proper clothing, permit recreation, and provide medical attention for his employees. He also had to maintain a great degree of social distance between himself and his employees. An AT&T executive asserted: ‘The employee ought to be made to feel that you are his superior, but that you respect his feelings and wants.’”

It’s difficult to say which is more disturbing—how eerily recognizable yesterday’s slaveholders are to us today, how oddly pseudo-humane they appear to be in theory, or indeed, how much crueler today’s benefits-slashing employers are to their employees compared, at least rhetorically, to slaveholders.

This familiar-sounding slave management theory isn’t confined to our forefathers. As far back as Roman times, in the first century, the agricultural writer Columella’s *De Re Rustica* offered guidelines to slaveholders on how best to manage their slaves. Essentially he argued that a slave will work better if he is treated with more respect, or at least the appearance of respect:

“Such justice and consideration on the part of the owner contributes greatly to the increase of his estate.”

Among Columella’s recommendations were that the master should see to it that there was proper lighting in slaves’ quarters and enough space in their workspaces, and that they should be provided with sufficient clothing. Columella also suggested that the master should sometimes consult his slave, since this would give the slave the impression that his master cared about him and would thus inspire the slave to please his master by working harder.

“Is this what many hundreds of years later would be described as enlightened self-interest? Such thinking would not be out of place in the ‘family friendly’ employment policies of today’s companies. Should we, therefore, identify Columella as the father of human resources as we know it?”

Obviously there is a massive difference between an AT&T employee during the post-war golden age of labor-executive relations and that of an antebellum slave. But expectations were also vastly different; what was considered normal was different. Moreover, one cannot deny the fact that the semantics used in both cases are almost identical. This alone is evidence

of some systemic parallels. The slaveholders could have used far crueler language and advocated far crueler techniques. But they didn't because it wouldn't have been effective. The slave owner wanted profits, just like today's corporate owners, executives, and shareholders.

To use a different example, Hitler's plan to enslave the *untersmenschen* Slavs used language and techniques that were openly cruel. It was a conscious effort at superiority, racism, and exploitation. Southern slaveholders, on the other hand, operated by many of the same platitudes and principles as most employers do today. They could be pious and normal because they didn't see themselves as evil, any more than today's executives, investment bankers, or mutual fund managers see themselves or their work as evil. Your average slave masters, like most employers today, wanted their slaves to increase their profit, but they also wanted them to reinforce their basic moral structure. They wanted their slaves to be both hardworking and well-behaved, because both reflected the master's overall worth. And most tellingly, they wanted their slaves to be cheerful, in keeping with the great American tradition of oppression-with-a-happy-face.

On a certain level these semantic and philosophical parallels shouldn't be too surprising. After all, America's wealth was essentially created by slavery and the slave trade. Scholars have traced how the Industrial Revolution was funded directly by capital accumulated in slave industry. An eighteenth-century economist described the slave trade as "the first principle and foundation of all the rest, mainspring of the machine which sets every wheel in motion." There are numerous examples of this. James Watt's first steam engine was subsidized by wealthy slave-trade merchants, as were the slate industry in Wales and Britain's Great Western Railway.

The American corporate magnates of today aren't derived from a different species than their slave-trading ancestors—they have merely evolved by adapting to different conditions and altering their metaphors with the times. Slavery declined as it segued into the Industrial Revolution it had financed, primarily because slavery's workforce was less profitable than the so-called "free" workforce. A free employee didn't have to be fed, clothed, and sheltered by the shareholders; he had a greater incentive—the fear of death or starvation—to work hard and keep his job; and he would constantly compete with other free workers, keeping a lid on their wage demands. Slavery, and the Confederate culture, was destroyed not by a shift in morality but by economic progress. The Confederate culture was bad for business. It was nothing personal, it just had to go.

Slavery was one of the most savage, gruesome policies ever carried out by white Americans, a remarkable honor given our encyclopedia of genocides. Yet the low number of slave revolts might strike many Americans as shocking

and disheartening. It would seem that slaves should have rebelled far more often. For one thing, they had the numbers. In 1800, the United States population was five million, and of that, one-million were blacks, ninety percent of whom were slaves. According to the census taken in 1820, 40% of the South's population was black, and in some areas they made up 70–90% of the inhabitants. Given those demographics, why didn't they rise up more? Why didn't they kill their masters and restore their dignity the way we'd like to imagine we would ourselves?

The most obvious answer is that the slaves knew they would be slaughtered trying. Unlike, say, slaveholding regions of the Caribbean, the United States was sufficiently militarized and its methods of domestic repression so well-refined that it was totally assured of crushing any domestic revolt—slave, peasant, proletarian, or otherwise. If the Confederates, fielding a great army with the best officers and weapons in the world, could get crushed and destroyed by the United States, think of the odds a band of slaves, with no chance of blending in with the dominant population—thus putting to rest analogies to modern guerrilla forces operating in their own lands—had! Instilling fear is one of the most effective ways of creating a docile, obedient slave population. Today, for example, TV shows like *Cops*—or the even more reprehensible live TV knockoff—which show that lower-class criminals have no chance of outfoxing the omnipotent state, combined with terrifying stories about US prisons, are two highly effective tools in keeping the population docile and work-focused.

The broader reason why there weren't more slave rebellions is simpler: most slaves didn't want to rebel. This depressing fact is not limited to African slaves in America, but rather is a product of human nature and our ability to adapt, to be conditioned out of fear, and to serve. Frederick Douglass explained that slaves chose not to rebel out of a fear of the unknown, which, he wrote, quoting Hamlet, had made slaves “rather bear those ills we had, than fly to others, that we knew not of.”

This tendency is not confined to slaves. The inclination to submit is built into our operating system, easily adapting itself to the current corporate culture, operating along the same functions as in slave times. A person's ability to adapt and grovel as much as required is almost the definition of normal. It is normal to accept these conditions and try to thrive within them; it is abnormal to rise up against them. Just think about all the jobs you've taken, especially the ones where you succeeded most—you didn't get promoted by being a maverick and standing up for yourself. You succeeded where you followed orders and pleased the higher-ups. In our own way, we moderns are just as slavish and painfully docile as African slaves. We simply lack the distance to acknowledge it or a proper excuse to explain it.

We don't hear much about this inner slave from authors and artists, though it is far more common, and manifests itself far more regularly, than the allegedly dangerous, primal "heart of darkness" of which we are warned. The slave psychology is too familiar. It appears in the most banal of settings: in the workplace, in relationships, at home or at school. Alternately, the primitive evil aspect is fantastical, alien, and exciting.

While Joseph Conrad is to be applauded for his literary entrepreneurship, his *Heart of Darkness* pitch, compared to Shalamov, is an exotic getaway vacation designed to make the reader feel a more profound sense of self. No one wants to travel up the other African river, the one that reveals man's heart of submissiveness. For contemporary Americans, slavery is acceptable material only if framed as a vice imposed by evildoers, an obstacle to be overcome by heroes, rather than as an ordinary and highly adaptive condition that releases an entirely unheroic side of our psychology. Slavery can only be deployed in the arts as a source of pathos, or as an evil that tests its characters' courage and determination. In other words, slavery is used as a source of contrast to who we are today, a device to define characters and reinforce our false sense of individuality, to make us feel better about ourselves by emphasizing our moral progress—rather than depicted properly as an enduring and recognizable psychological tendency. Through time slavery has mutated and adapted itself to our modern condition. It is by examining this process that we will ultimately have answers to what creates the rampage murders of today.

When employed successfully by the ruling classes, propaganda convinces the ruled that their condition is entirely normal, inevitable, and even somehow privileged. You may know that you are miserable and unjustly treated, but without a context to frame it, you will be far less likely to act on your sense of injustice. Indeed, you may even feel that somehow you are the sick one for questioning what society says is 'normal' and 'inevitable.' Today, the inherent injustice of slavery is obvious to everyone, but this was not the case when the Declaration of Independence was composed. More devastating was the fact that radical abolitionism, which today we accept as the only sane view on slavery, was at the time ignored and pushed into the 'wacko' margins along with all the other crank ideas of the time.

This is how it always works with new and dangerous truths that confront injustice. Arguments against globalization were considered bizarre, quaint, or even insane by mainstream pundits like Thomas Friedman, and when the anti-WTO riots exploded in Seattle in 1999, most Americans were totally perplexed over why such a seemingly innocuous and dull organization would incite so much sixties-esque rage. Only the financial catastrophes in Asia, Latin America, and Russia, along with the increasing size and frequency

of the protests, validated the anti-globalization movement, pushing its arguments into mainstream discourse.

Real-time injustice, even of the most epic sort, is often simply not recognized as such at the time, no matter how obvious the injustice later appears. It may be—in fact, it is certainly the case—that in one-hundred years historians will look at how we live today and what we accept as normal, and condemn us as a nation of savages, a half-civilization incapable or unwilling to face its own injustices. They will likely shudder in horror at how we could inflict such pain and how we could possibly endure it. Our problem is that we don't even know yet what pain and injustice they are talking about. We may never even find out.

Many have been conditioned to believe that Americans always rise up against oppression and that the good side always wins. The reality is that the oppressed rarely rise up, they always lose—in this country anyway—and they always collaborate with the State against those rare rebels to make sure they remain oppressed. Today's propaganda distorts the picture of slave times as a period of constant whipping, groaning, and simmering rebellion, of brave and defiant slaves progressing from injustice to freedom, as if history itself was a progression from slavery to freedom, when in fact it was much more banal than that. In today's official portrayal of slavery, all of the depressing similarities to our modern life are censored with just as much vigor as they once censored all that was inhumane and unjust about slavery. The emphasis may change, but the purpose for censoring, then as now, remains the same: to reinforce our belief that how we live today is entirely normal and to purge any evidence which might contradict that faith.

We are all potential slaves, and all potential collaborators. While from afar historical injustices seem simple to navigate morally, the closer one studies them, the more difficult and muddled the divisions between victim and victimizer become, the less heroic everyone seems. One would expect the entire class of oppressed to act as one, because it seems rationally to be in their interest to do so (and our cultural propaganda tells us that they do), but in fact the oppressed group often turns on its members with as much ferocity as allowed.

The greatest slave insurrection in the American colonies took place in New York City in 1712. Two dozen slave-domestics—the 'privileged' class in the slave world, the ones who had it best, relatively speaking—plotted a violent insurrection they hoped would turn into a general uprising. The accounts we have today vary in some of the details but all tell essentially the same story.

Late at night on April 6th, the rebel group prepared an ambush by

setting fire to a building in the center of the city—some accounts say it was an outhouse, some say a building on the edge of town, but the most convincing account I found suggested it was a building in the center—and lay in wait for the white authorities to come put it out. Armed with muskets, hatchets, and swords, the African-born slaves vowed to each other that it would be better to die fighting than to live as slaves. When the white neighbors and townsfolk arrived to put out the fire, the slaves attacked and slaughtered nine of them by variously shooting, stabbing, and beating their victims, leaving another nine whites injured. Those whites who escaped the ambush told the local authorities, spreading panic throughout New York City. Now, if everything went according to plan, all the slaves throughout the region would rise up with their brothers and face down the oppressors. Militia units from New York and Westchester were brought up, as were soldiers from a nearby fort. Eventually the slaves were surrounded, waiting for help from their oppressed brothers to appear. It seemed so rational to believe that they would. But the expected help from other slaves never arrived—no rebellion was sparked. The city's other slaves remained passive. The oppressors stuck together, while the oppressed hung one another out to dry.

The justice meted out was particularly brutal even by early-eighteenth-century standards, and the white colonials meant it to be savage. Thirteen slaves were hanged, one left to die in chains without food or water, three were burned to death, and one left racked and broken on the wheel. Here is a description of what it is like to break a man on the wheel:

“The Wheel was one of the most painful methods of torture and execution practiced in Europe. The victim, naked, was stretched out on the ground tied to stakes or iron rings. Wooden pieces were placed under the wrists, elbows, ankles, knees, and hips. Then limb after limb and joint after joint was smashed. After that the shattered limbs were ‘braided’ into the spokes of the large wheel. They would then raise the wheel to the top of the pole, where the birds would eat at the flesh of the victim.”

It now seems clear that there were many more rumors than revolts and that the number of actual revolts was small; if it takes a score of persons to make a ‘revolt’ the number all-told before 1860 was probably not more than a dozen. Slave resistance rarely involved large numbers, though this fact can scarcely be taken as indicating that slaves were docile and contented. Indeed, slaves struck frequently at the oppressive white world around them, but in more instances violence involved spontaneous outbursts on the part of

individuals or small groups. Though in most cases the violence perpetrated by slaves could not have been rationally regarded, by either the slaves or their masters, as attempts at freedom, one suspects these incidents must often have involved very little in the way of rationality on either side.

A rebellion doesn't need to be rational in order to make it a rebellion. Without a context, rational rebellion is impossible. Thus, crime, murder, is itself an act of rebellion if the circumstances are deemed unjust, if the environment—slavery—created the crime. Even if we only recognize the unjust causes one-hundred years after the murder is committed, it still makes the crime a political act, a rebellion.

Several things are interesting about Nat Turner's doomed, gory rebellion. First, Turner was clearly delusional and yet his response to the madness of slavery was, from our vantage point today, the most sane and heroic of all. Joseph Wesbecker suffered from depression and was belittled for having a persecution complex and for being generally crazy, yet some of the normal people who worked with him sympathized with his attack on The Company. The fact that Nat Turner may have been schizophrenic or delusional does not disqualify the inherent political nature of his rebellion. Rather, it suggests that sometimes only someone not mentally healthy—not normal—is capable of rising up against objectively awful injustice. A normal, healthy person finds a way to accept his condition, no matter how wretched.

That's about the most basic definition of good mental health there is: you only kill people when your government tells you to. Murder under any other circumstance—particularly if because you feel aggrieved—is ipso facto a sign of severe illness.

In our highly atomized corporate culture, it is no wonder that workplace rage rebellions should take place in the form of one-man suicide missions. If the idea of banding together to fight for something as obvious and vital as one's own self interest—unionizing for a dental plan or to keep wages and pensions from being slashed—is frowned upon, then who would consider raising arms with fellow employees to wage an insurrection against the company that oppresses them? No employee would be able to trust another to keep the plans secret; moreover, no employee is ever aware that anyone else is as miserable and desperate as he is. The culture demands that people smile and love their work—and most do, or at least most believe they do.

“I am not insane. I am angry. I killed because people like me are mistreated every day. I did this to show society: push us and we will push back. All throughout my life, I was ridiculed, always beaten, always hated. Can you, society, truly blame me for what I do? Yes, you will. It was not a cry for attention, it

was not a cry for help. It was a scream in sheer agony saying that if you can't pry your eyes open, if I can't do it through pacifism, if I can't show you through the displaying of intelligence, then I will do it with a bullet."

Even Hitler is given a context by serious historians—the humiliation of the Treaty of Versailles and the failure of Weimar Germany—whereas rampage murderers, like slaves once before them, are portrayed as having killed without reason. Their murder sprees were and are explained as symptoms of the perpetrators' innate evil, or of foreign forces, rather than as reactions to unbearable circumstances. Blaming evil or psychology is far more comforting.

One of the first acts of the new United States Congress was to pass the Whiskey Excise Tax in 1791, going against a promise to impose such taxes only as a last resort. The frontiersmen in western Pennsylvania, already destitute and desperate, for whom whiskey and their last pennies were a matter of life and death, ignored the excise. They tarred and feathered or harassed the few federal representatives who tried to set up excise offices or register the local distilleries. And they were right to do so: why should the "scum of nature" be forced to pay up what little they had left in order to cover the states' debts, while the new oligarchy, which had benefited so greatly from the war, bore so little of the war's costs?

Alexander Hamilton enlisted the comical figure of George Clymer, who was in charge of collections in Pennsylvania, to be his eyes and ears in the rebellious western regions. Clymer accepted, but was intensely paranoid and extremely silly. Like a three-pointed-hat Inspector Clouseau, Clymer adopted various aliases, each with slapstick effect. On his way west from Philadelphia in September 1792, Clymer first tried to pass himself off as Henry Knox, the secretary of war. However, Knox was widely known to be among the most obese Americans alive, so locals took the much thinner Clymer-Knox for just another bad imposter looking to get comped. Realizing his mistake, he then named himself "Smith" and traded horses with his servant, in a classic switcheroo that he must have picked up from some bad European opera. Clymer quickly abandoned this scheme when a local called him "an ill-looking fellow" who "did not know how to rub down a horse." Furious, Clymer next tried to pass himself off as just an ordinary person. The sad thing was that no one recognized Clymer even when he admitted to his true Clymer self, despite the fact that he was one of the signatories to the Declaration of Independence.

When Clymer arrived in Pittsburgh, he roomed in the most luxurious hotel for a few nights, unable to resist the need for civilized comforts. After

getting his humors back, he transferred to a more ordinary hotel, the Bear Inn, hoping no one noticed that he had just checked out of the five-star around the corner. Locals quickly put two and two together. They knew that he had come to Pittsburgh on behalf of the excise and asked him to leave the Bear Inn. Clymer agreed, but now he was too terrified to venture out of the city, as per Hamilton's instructions, and into the rural frontier areas to conduct the investigation, as was his assignment. And yet the worst he'd have had to put up with were a bunch of dirty looks and unfriendly words. They weren't going to harm him—they told him so explicitly. But Clymer couldn't be convinced. After a few days, he lost his nerve completely, gathered some militiamen to act as bodyguards, and fled Pittsburgh in a panic, heading at great speed back to Philadelphia with absolutely no one in pursuit.

When he returned to the capital, he was horrified to discover that word of his comical adventures had followed him. Clymer denied everything, but no one bought it. So he switched tactics, fiercely defending his disguises and flight, claiming that locals were in "an actual state of insurgency against the government," including "magistrates, other public officers, and clergy" of the region, and that his own bold venture was "more hazardous perhaps than to have taken an honorable chance in an Indian War."

The effect of his buffoonery was tragic: government officials took his panicked word for it, and raised an army to crush the supposed mass rebellion. And this is where the story starts to mirror that of so many doomed slave rebellions: hysteria among the dominant classes over perceived lower-class-savage murder plots, violent crushing, and slave turning against slave to please the master class.

The battles that followed were sloppy and dismal. In one battle, an army of rebel frontiersmen attacked a local oligarch, John Neville, who had helped bring in federal excise authorities and personally hosted them. The rebels lay siege to Neville's house, where the federal excise taxman hid inside. Just when everything looked doomed, Neville was saved by his slaves, who attacked the poor white rebels in a surprise rearguard action. Slaves fighting the poor in order to protect the oligarchy.

The federal forces tried cracking down in their usual brutal way. Eventually their tactics pushed most of western Pennsylvania's population to the side of the rebels. As a critical mass formed, the majority switched hearts. If a rebellion is small and just starting, it looks crazy; but if it begins to succeed, lasts, and builds up momentum, it inevitably legitimizes itself. This legitimacy is all the persuasion most people need. From 1793 to 1794, what started as a rebellion against an unfair excise tax transformed into broader class warfare, pitting locals against absentee landlords. This

transformation of the rebellion's context is instructive—it doesn't mean that the rebels were losing control, but rather, that their ability to frame injustice grew as the rebellion seemed to take hold. The context started to take on a meaningful shape. Just as the American colonials' consciousness expanded from rebelling against unfair taxation in the 1760s to wider noble revolutionary goals touching on the inherent rights of mankind, so the Whiskey Rebellion guerrillas took on broader themes as injustice increasingly framed their consciousness. Once you start seeing injustice in one place, it's like taking off blinders—you start to see injustice everywhere, and how it is all connected. One horseman reportedly rode through Pittsburgh yelling:

“This is not all that I want, it is not the excise law only that must go down; your district and associate judges must go down; your high offices and salaries. A great deal more is to be done; I am but beginning yet.”

In 1794, President Washington raised an army of 12,950 men and led their march on the rebel counties to restore order and to protect his landholdings. The resulting show of force was brutally effective. The rebels melted away, faced with certain defeat, while the fence-sitters and even most who professed sympathy with the rebellion returned to the federal government's side. In the end, only a couple dozen Whiskey Rebels were brought to Philadelphia to be tried for treason, only two were convicted, and even they, unlike African slave rebels, were pardoned. There were casualties, but only ridiculous casualties. One rebel, a drunk in a local tavern, kept trying to grab the bayonet of a federal officer's musket while muttering taunts and threats, and he was eventually run through; the other was a cripple who happened to be in the area of a passing federal detachment when he was ordered to stop. He couldn't manage to comply quickly enough due to his disability, so a trigger-happy militiaman shot him in the genitals. He died “an excruciating death.”

Yet in spite of the feckless comedy and brutal suppression of this rebellion, in the end the Whiskey Rebellion was, in a way, successful. From that time until the Civil War, it became *de facto* government policy (as well as standard American belief) that no government could impose a national excise tax on liquor except during a time of war or national emergency. Although all domestic rebellions are doomed, for some, partial justice does result. The rebellions may be brutal, misunderstood, and defeated but the martyrdom isn't always in vain.

Slave psychology and effective American slave management—which encourages a “cheerful disposition” and “initiative”—combined to produce

slaves which not only turned on their own liberators to protect their masters, but turned on them in “a fine spirit.” Which helps explain again why there were so few slave rebellions. Not only were they doomed, and not only were they without context, but so often fellow slaves either refused to participate or worse, exposed plots and defended their masters with arms. These actions further reinforce the notion that a rebellion was not only doomed, but even the idea of rebelling was somehow not normal and perhaps evil. You really would have to be as crazy and schizophrenic as Nat Turner to not be affected; you’d have to have voices in your head louder than those around you to convince you that a slave rebellion was the right, sane response.

What is really striking is not the paucity of open rebellions in American history—which the more credulous American mandarins inevitably point to as proof of this country’s infinite virtue (just as Southern whites have pointed to the striking lack of slave rebellions as proof of the slaves’ happiness)—but rather that there have been people willing to risk rebellion of any kind. Given the odds, it takes reckless bravery or mental illness or suicidal desperation to launch an insurrection. That explains why so much rebellion in America is expressed in less obvious, less direct ways. For example, in slave times, while there were only a few rebellions, there were numerous instances of vandalism, mysterious fires, and even poisonings and crop-wrecking. One of the most universally popular forms of struggle was arson, which minimized the danger of direct confrontation and certain death. Fire could destroy property held so dear by a property-based system.

Just four months after 9/11, a fifteen-year-old honors student, Charles Bishop, piloted a small plane into an office high-rise in Tampa, crashing through the twenty-eighth floor of the Bank of America building, killing himself and terrifying the country. During his flight, Bishop violated the airspace of the MacDill Air Force Base, home to the US military’s Central Command which was coordinating the war in Afghanistan and the hunt for Osama bin Laden. Later reports revealed that Bishop, who spent the last week of his life downloading maps of the base, had buzzed the MacDill control tower and had flown within one-hundred feet of two parked and fully-fuelled KC-135 tanker fuel aircraft. Two F-15s were scrambled from a south Florida base, but they arrived too late, revealing a homeland security that had learned its hard lessons from four months earlier.

Bishop was a straight-A student, middle-class, white, and Christian. He left a suicide note expressing his support for Osama bin Laden and for the 9/11 attacks. That was impossible to accept, so his mother declared Charles a supporter of the War on Terror, and his teacher declared that Bishop was “very patriotic,” even though he very clearly wasn’t. The suicide note’s disturbing message was dismissed as “just trying to get attention,” a

common and meaningless epithet.

Since dead kids can't really benefit from attention the same way that living kids can, you have to ask, once again: Why was Charles Bishop trying to get attention by crashing a plane into a downtown skyscraper? He answered that question himself in his suicide note, but no one wanted to listen. Instead, students and teachers started reciting the famous Collected Patriotic Sayings of Charles Bishop. Bishop's family released a statement claiming:

“Charles and his family have always fully supported our United States war on terrorism and Osama bin Laden.”

“He said he wanted to join the Air Force and do something for his country,” said his journalism teacher, Gabriella Terry. She said she couldn't believe Charles would do what he did, saying she knew him well. “And I didn't miss a thing,” she claimed, ignoring the overwhelming evidence that she had indeed missed every single thing about him.

“He was a good boy.”

The Charles Bishop suicide mission was a potentially fascinating, devastating story that could have inspired some serious self-examination in America, but did not. The fact that a good boy, nice and sociable, an honors student, could commit a terrorist act similar to Osama bin Laden didn't cause people to wonder what it was about his Florida school or America that drove him to imitate the most awful anti-American massacre in our history—instead, it led us to lying to ourselves. Mohammed Atta flew a plane into a building because he hates our freedom; Charles Bishop flew a plane into a building even though he loves our freedom. What's so hard to understand about that?

The Charles Bishop story ended even more grotesquely. Authorities, worried that the patriotic-suicide-pilot theory might not wash for long, came up with an explanation they thought would put all the doubts and fears to rest. They blamed the boy's acne medication, Accutane. That's right, acne medicine made little Charlie fly the plane in to the building. Super-Clearasil made him support Bin Laden. As Monty Python-silly as that last explanation sounds, it became the official version accepted by the New York Times and the broader media.

The Clearasil-made-him-do-it explanation not only reassured the country, it also stood to make Charles Bishop's mother a rich woman. She filed a \$70 million lawsuit against Roche, the maker of Accutane. Later, Charles Bishop's mother was forced to admit that she and her husband had twice

attempted suicide together. She blamed those episodes, conveniently enough, on drugs.

Ever wonder why a bright, likable, handsome boy would hate his world?

Here, by the way, is Charles Bishop's suicide note, which was finally released to the public:

"I have prepared this statement in regards to the acts I am about to commit. First of all, Osama bin Laden is absolutely justified in the terror he has caused on 9-11. He has brought a mighty nation to its knees! God blesses him and the others who helped make September 11th happen. The US will have to face the consequences for its horrific actions against the Palestinian people and Iraqis by its allegiance with the monstrous Israelis—who want nothing short of world domination! You will pay—God help you—and I will make you pay! There will be more coming! al-Qaeda and other organizations have met with me several times to discuss the option of me joining. I didn't. This is an operation done by me only. I had no other help, although, I am acting on their behalf. Osama bin Laden is planning on blowing up the Super Bowl with an antiquated nuclear bomb left over from the 1967 Israeli-Syrian war."

Charles Bishop didn't 'hate us because we are free.' He hated America because there's a lot to hate. Without much of a vocabulary to frame this hatred, he is left with the script of Osama bin Laden—Bishop's hatred perhaps hasn't yet been put into words, it hasn't been contextualized yet. He lacked the ability to express the sense of hatred and injustice in his own words, drawing from his own experience. Instead the enemy (Osama) of Bishop's enemy (America) became Bishop's friend.

Boss: Pretend you're me. You find this. What would you do?

Jack rises slowly, walks to the door, shuts it.

Jack: Me? I'd be very careful who I talked to about this. It sounds like someone dangerous wrote it... someone who might snap at any moment, stalking from office to office with an Armalite AR-10 Carbine-gas semiautomatic, bitterly pumping round after round into colleagues and co-workers.

Jack moves very close to Boss, picks up the paper and starts tearing it into pieces.

Jack: Might be someone you've known for years. . . somebody very close to you. Or, maybe you shouldn't be bringing me every little piece of trash you pick up.

Do people just snap when they go postal? Do they act "without any cause or provocation," as Nat Turner supposedly did? Or are they reacting to grievances both specific and institutional: grievances that we are barely able to see because we lack distance, grievances which seem as banal and part of the natural turn-of-the-millennium landscape as strip malls and stress-palpitations, yet grievances which will be perceived as obviously unbearable twenty, thirty, fifty years from now?

What, in the case of *Fight Club*, are the grievances that lead Jack to wage a violent revolution against Middle America? Some are easy to put your finger on; other grievances are impossible to verbalize, they could sort of be summed up as 'life.' Yet the millions who saw that movie and sympathized with its message understood what it was that drew Jack to violent rebellion.

There was another, more comforting explanation for his violence too: Jack, as we learn at the end of the book, was mentally ill. As all rebels-before-their-time are ill. The movie version wisely left that cheap escape-hatch ending more vague than the book, which is why the movie was far more effective than the book. The huge underground popularity of *Fight Club's* message makes another point: it takes someone who is mentally ill to see, and fight against, the sense of oppression that healthy people otherwise accept to such a degree that they can't even see it. Everyone today agrees that slavery caused slave violence, and that inner-city poverty and pressures breed violent crime. Why is it so awful to suggest that offices, such as they are today, breed office massacres?

"If I could get EA CEO Larry Probst on the phone. . . The main thing I want to know is, Larry: you do realize what you're doing to your people, right? And you do realize that they *are* people, with physical limits, emotional lives, and families, right? Voices and talents and senses of humor and all that? That when you keep our husbands and wives and children in the office for ninety hours a week, sending them home exhausted and numb and frustrated with their lives, it's not just them you're hurting, but everyone around them, everyone who loves them? When you make your profit calculations and your cost analyses, you know that a great measure of that cost is being paid in raw human dignity, right?"

Today's white middle class must be the only socioeconomic group in mankind's history that not only doesn't recognize its own miseries as valid, but reacts dismissively, sarcastically (dissidents are called "whiners"), even violently against anyone from their class who tries to validate their misery. But our ranking of what constitutes existential pain is purely irrational and arbitrary. In fact, if pain could be measured neurochemically, it is entirely possible that the pain felt by a white-collar office worker stressed from seventy-hour workweeks and Andy Grove-inspired office fear is equivalent to the agony felt by indentured servants. The point is that the middle class persistently denies its own unique pathos, irrationally clinging to an irrational way of measuring it, perhaps because if they did validate their own pain and injustice, it would be too unsettling—it would throw the entire world order into doubt. It is more comforting to believe that they aren't really suffering, and it's more comforting to accuse those who disagree of being psychologically weak whiners. Despite its several hundred-million strong demographic, the white bourgeoisie's pain doesn't officially count—it is too ashamed of itself to sympathize with its own suffering. And yet all the symptoms and causes remain and grow worse even as the denial becomes more fierce.

Rather than looking outside of the office world for an explanation for these shooting sprees—rather than blaming violent films, gun proliferation, the breakup of the family, the lack of God, or a fear-mongering media—why not consider the changes within America's corporate culture itself? We avoid this topic in mainstream discourse, and there are powerful reasons for self-censorship: if the workplace is responsible, then that means every working American is potentially in peril, living in unbearable circumstances, yet too deluded, or too beaten-down, to recognize it.

Under Reagan, corporations transformed from providers of stability for employees and their families to fear-juiced stress engines. Reagan's legacy to America and modern man is not the victory in the Cold War, where he simply got lucky; it is instead one of the most shocking wealth transfers in the history of the world, all under the propaganda diversion of "making America competitive" and "unleashing the creative energies of the American worker." New corporate heroes like General Electric's Jack Welch spoke of "unlimited juice" to squeeze from his employees—and wring their rinds he did. While work became increasingly stressful and time consuming with fewer rewards for the majority, capital was sucked from the middle and lower classes of working America and deposited into the offshore accounts of the very highest layer of the executive and shareholder class. What income growth there was over the 1979–1989 period was driven primarily by more work at lower wages.

People's memories are short and America's propaganda is so powerful that most, even the greatest losers of this appropriation, have forgotten that a profound change occurred, which we now take for granted. We have been conditioned to react skeptically, even hostilely, to criticism of our current corporate values, values which form the foundation of everyday life today. What's more appalling is that huge numbers of those left behind in the wealth transfer genuflected to the new plutocratic class, celebrating the most vicious of the uber-CEOs. This craven CEO-worshipping is still going on today—a decade ago middle Americans dragged themselves home after work in order to gather around the television and watch billionaire asshole Donald Trump deliver his “You're fired!” line to some desperate, stressed-out Smithers, now he's President. Entertainment is no longer about joy or escape. It's about reliving life at the office, even if you just left the office fifteen minutes ago. It is about fetishizing the stress and creating an addiction to the stress, like a masochist to pain. It's as though the conditioning worked too well. This worship of the new plutocrats is reminiscent of medieval peasant adulation of the royalty that stomped on them. Indeed, serfdom is a good analogy considering the kind of neofeudal divisions that arose in the wake of Reaganomics.

According to a 2003 study by Boston College, 26 percent of American workers took no vacation time at all in the previous year. Many employees will say this is because they genuinely prefer working at their job to relaxing—because relaxing requires a completely different set of social skills that many overworked, company-obsessed Americans increasingly lack. Here is one typical example, from an article in the Pittsburgh Post-Gazette titled, “Who Needs a Vacation? Not These Happy Workers,” dated August 24, 2003:

“E.J. Borghetti is a Pitt employee who's never taken off more than two consecutive days from work in seven years—by his own choice. ‘I can explain it in four words: I love my job,’ declared Borghetti, 33, a bachelor. ‘The personnel office will send me notes saying, You're losing these vacation days, like they feel sorry for me, but it's a choice to me. It doesn't bother me in the least.’

Overworked Americans have been conditioned to elevate their office lives into their own personal epics, while their private lives and off-hour skills have atrophied. This makes sense in a world where the private life and not working refer to a vanishing state of being. A vacation away from the office therefore can be joyless and daunting, and most Americans who travel find that their only wish is to get back into the office, back to a clearly defined

world with an overseer and responsibilities, and back to a familiar script where they know their lines well.

“Those slaves who have kind masters are, perhaps, as happy as the generality of mankind. They are not aware that their condition can be better, and I don’t know as it can.”

The Reaganomics theory, when they still needed to sell it to America, was that we were all supposed to be people in our own unique boats, with the sea representing wealth, and as the rich got richer, the sea would rise, and supposedly our humble boats would rise along with theirs, as though the polar ice caps themselves would melt for the benefit of all mankind. Moreover, somehow only the people with the huge yachts were capable of raising the level of water for all of us. The rising-boat metaphor always struck me as strange, because it implied that the land would become submerged, and those of us not in the QE2 cruise ship would be forced to row around the high seas for the rest of our lives, bailing out water as fast as we could. Which is exactly what happened.

The collective resistance to considering the possibility that the workplace causes murders is effected by a kind of defiant amnesia. But schoolyard shootings are too shocking and subversive to forget. They remind us that we were just as miserable as kids as we are as adult workers. In fact, the similarities between the two, the continuity of misery and entrapment from school to office, become depressingly clear when you study the two settings in the context of these murders. Even physically, they look alike and act on the mind in a similar way: the overhead fluorescent lights, the economies-of-scale-purchased industrial carpeting and linoleum floors, the stench of cleaning chemicals in the restrooms, the same stalls with the same latches and the same metal toilet paper holders. Then, after work or school you go home to your suburb, where no one talks to each other, and no one looks at each other, and where everyone, even the whitest-bread cul-de-sac neighbor, is a suspected pedophile, making child-leashes a requirement and high-tech security systems a given.

If you consider it this way, it means our entire lives, except perhaps college and that one summer backpacking around Europe, are unbearably awful. Suddenly, our lives are a miserable joke played for someone else’s benefit—maybe Jeff Bezos. This is too much to handle. So the inescapable suspicion that suburban schools cause murder rampages is rejected with unrestrained hysteria. Blame is hurriedly focused on the murderer, rather than on the environment. A typical example is an op-ed piece written by Joanne Jacobs for the San Jose Mercury News published exactly eight

months after the Columbine massacre, in which she tried to reassure herself and her readers:

“Evil, not rage, drove these killers.”

I emphasize her quote because it’s one of the most revealing yet widely held explanations among contemporary Americans. When you use a word as inherently meaningless as ‘evil’ to describe something as complex and resonant as Columbine, you are desperately trying to recover the amnesia that once protected you, and told you how blissful and innocent your own school years were. The fact is that the schoolyard shooters were clear about their intentions: they wanted to “pry your eyes open.” But sometimes we don’t like what our eyes see, in fact, we refuse to believe what they see. You’d need to use Clockwork Orange eye-tweezers on someone like Joanne Jacobs to make her face this unpleasant fact.

These two boys, the real victims of their own wounded boasting, are ruined forever by a community that will gladly make an example of them. As in all periods of domestic unrest, the important thing is to make swift and brutal examples of suspected rebels.

Both Eric Harris and Dylan Klebold came from two-parent homes, and both openly confessed their love for their parents in their otherwise rage-filled video diaries. Their only regret was how their planned massacre would hurt their parents. In fact love for their parents was the only love that they are known to have professed. Eric Harris, considered by many to be the more ‘evil’ of the two, said:

“My parents are the best fucking parents I have ever known. My dad is great. I wish I was a fucking sociopath so I don’t have any remorse, but I do. This is going to tear them apart. They will never forget it.”

Is this individual, who broke under the weight of injustice, really a monster? I have a feeling our culture would not produce such a flippant response were it a woman acting against her unpunished rapists and their enablers—in fact, you’d have many cheering for her, something that those same people would find horrific if the cheers were for a school shooter.

Barack Obama is a monster. George Bush is a monster. Donald Trump is a monster. Joe Biden is a monster. Dick Cheney is a monster. James Clapper is a monster. This kid is broken and abused by a system and others, who are broken in their own ways. It’s quite disgusting to see an essentially powerless victim condemned.

If this kid was being hurt, harmed, and no one would do anything—or so it seemed to them—how can you condemn their act? How does one sit and pass judgment on someone experiencing such pain, hopelessness? Have you ever stared down the blackness, felt as it engulfed you, an unlocateable pain, everywhere yet nowhere, certain you could take no more?

The powerless murdering the powerless will not cease until we remove the actual monsters from power. Given what is at stake, the consequences we will face if we do not act, those monsters must be destroyed, by any means necessary.

One reason why our society has failed to curb bullying is that we like bullies. Hell, we are bullies. Research has shown that bullies are not the anti-social misfits that adults, in their forced amnesia, want them to be. Rather, bullies are usually the most popular boys, second only on the clique-ranking to those described as friendly, outgoing, and self-confident. Often kids and parents both feel that there is no point in complaining to the administration because they won't do anything anyway, a reflection of the fact that popular winners are treated better than losers. At Columbine, parents and students both felt that bullies were favored by teachers and administrators, and that complainers were often ignored or blamed. Indeed, losers pay for being losers twice over in our schools, taking both the punishment and the blame. Many kids (and adults) believe that victims of bullying bring it upon themselves; studies show how kids will often egg bullies on against their victims, in part to curry the bully's favor, in part to distinguish themselves from the victim class.

“So if you aren't allowed to wear a hat, toot your horn, form a clique, or pick on a freshman, all because everyone is worried that someone might snap, it's fair to ask: Are high schools preparing kids for the big ugly world outside those doors—or handicapping them once they get there? High school was once useful as a controlled environment, where it was safe to learn to handle rejection, competition, cruelty, charisma. Now that we've discovered how unsafe a school can be, it may have become so controlled that some lessons will just have to be learned elsewhere.”

Note how the author casually equates bullying with fashion statements in the catalogue of zany, trivial adolescent worries. Nancy Gibbs, who wrote the article, is more than simply dismissive of victims' complaints—she thinks that bullying in schools is actually a good thing because it prepares kids for the real world—the office world. Rather than arguing that bullying is

a serious problem that needs to be stopped, she accepts it and sneers at anti-bullying critics, implying that they are flaky and “unrealistic.” Indeed she seems to rue the possibility that bullying might be curtailed in schools, and thus the valuable lessons of bullying will have to be taught elsewhere.

This is emblematic of how deeply embedded cruelty is in our culture—it is considered respectable and mainstream to actually want our own children to be bullied. Bullying is just “reality.” Of course, one could make the same argument about sexual harassment that Gibbs makes about bullying: that it’s not such a big deal, and that women who suffered from it needed to suck it up, get over it, and learn to deal with it or risk being handicapped in the real world. As we know, abolitionists in their day were not considered realistic either.

Nancy Gibbs clearly did not know schoolyard pain. Or if she did, she deleted it from her memory sometime during her climb to the top of mainstream American journalism. I don’t know a single useful lesson that I or anyone else ever learned from being bullied—it only brought shame and debilitating memories. Getting bullied always leads you to wrong decisions and wrong conclusions. You compensate in all the wrong ways. You wind up looking for someone weaker to bully yourself, you lose confidence and hate your weakness, and you fear and distrust the wrong people, all of which are reasons why bullied kids overwhelmingly wind up as failures in the real world, according to recent studies. You have to have never been bullied to think that it teaches something valuable and necessary and makes you a stronger person. A 1998 World Health Organization survey on Health Behavior in School-Aged Children, showed that both bullies and the bullied develop far greater problems later on in life—bullied kids particularly have difficulties making friends, and suffer from lifelong loneliness.

I know that I learned far more valuable lessons when I was the bully than when I was bullied. The lesson was simple: it felt better to be the one dishing it out. The pangs of remorse after pummeling a scrawny dork wore off pretty quickly; the humiliations of being on the receiving end, however, were replayed over and over and over, for years and years. I cannot imagine what kind of callous moron could possibly see anything valuable in being a victim of bullying. Maybe the idea comes from our cultural propaganda, where the bullied nerd, like *Back to the Future’s* McFly, always fights back in the triumphant climax, becomes a stronger person for it, and goes on to be a successful patron of a nuclear family, while the bully winds up washing his car. Bullying, in our cultural propaganda, is simply a dramatic plot device which the hero overcomes. Rarely, if ever, is it represented as it really works: as something privately eating away at kids, flat and uninteresting, and never overcome. And when it is, people will be outraged because you’re

“glorifying suicide”—personally, I think that show would have been far better had it ended with Tyler shooting up the school after his broom-rape (spoiler alert). But the school shootings create a kind of cognitive dissonance. In the past, bullying has simply been dismissed as ‘kids will be kids,’ but now that we are waking up to its effects it should not be accepted as a normal part of growing up.

The impulse to get over it is an example, caught in a phrase, of how profoundly normal it is for contemporary Americans to be callous and bullying. In a sexual discrimination and harassment suit filed by police recruit Kathy Durkin against the City of Chicago in 2003, she related how her instructor, Officer James Peck, bullied her even over her father’s recent death:

“Get over it, my fucking father died too. You don’t need your fucking father.”

When relatives of soldiers fighting in Iraq complained about a speech Bush gave that made light over the fact that no WMDs were found, Britt Hume of Fox News attacked the soldiers’ families:

“You have to feel like saying to people, ‘Just get over it.’”

Anyone who doesn’t accept the way things are, no matter how cruel or destructive, needs to get over it.

In fact, grieving seems to be what draws out the very meanest in Americans. In a 1997 column in the *Waxahachie Daily Light*, columnist Paul O’Rear wrote:

“Several months after Dad’s death, Mom found herself dealing with the perceived attitude from some well-meaning people, that she needed to get over it and get on with her life.”

Well-meaning indeed. Nancy Ruhe, executive director of Parents of Murdered Children in Cincinnati, told CNN:

“People say to me all the time, ‘When are these [victims] going to get over it?’”

This same heartless logic was applied, to the traumatized survivors of the Jonesboro, Arkansas, school shooting. A group of survivors wanting to erect some kind of meaningful memorial to the victims planted a garden. But the school wouldn’t recognize it, and six months after they had designed, tilled, planted, and finished the memorial garden the school still refused to dedicate it. As a local minister observed, withholding his name:

“That is a telling illustration of where we are as a community. We have tried to forget. And they don’t even know it’s there.”

The demand for absolute academic excellence might also be seen as a socially acceptable form of bullying, one which the administrators of schools are eager to wash their hands of responsibility for:

“Saratoga High School teachers and administrators did not create the hyper-creative academic environment our adolescents must deal with today: The deregulated free market did that. The competition is global and fierce. So the perception among kids is ‘either I get into Cal or MIT or Harvard and develop the narrowest band of the most highly specialized skills, or I’m gonna wind up cookin’ squirrels under a bridge.’”

Parents who just *have* to get their kid into an elite preschool may seem ridiculously funny, but the competition can be devastating—for the children, and for the parents who pass their disappointment and stress onto their children, as revealed in a New York magazine article about an ambitious couple and their four-year-old boy named Andrew:

“‘I doubted myself; maybe I overestimated my kid,’ Cynthia admits, referring to her disappointment when Andrew’s scores arrived in the mail. ‘Maybe I’m looking at him with loving eyes, and maybe I’m wrong. He’s very cute and animated and bright. But maybe that doesn’t mean he’s smart in an academic sense. I stopped trying with him. Before, we’d talk about the days of the week, or I would try to get into more detailed discussions. Now I felt it wasn’t going to make any difference. I was so disappointed.’”

Or consider Dong. The poor kid was not only a failure at school as a B student, he was a failure at Columbinig as well. He flunked the biggest chem test of his life, one that would read something like: Dong wants to blow up his school. If the school contains 20,000 cubic feet of space with 20 reinforced concrete structures, and 1,300 students, how much ammonium nitrate, potassium chlorate, and glycine (or glycerin or glycerine) would Dong need to steal from the science lab? Explain your answer (30 minutes).

Cruel and callous when on top, and afraid and smiling all the way to the grave when not—that pretty much sums up the post-Reagan zeitgeist. And if you’re not just as cheerful as the rest, ‘you’ve got some personal problems.’ You’re a weirdo if you complain. It’s your own fault if you’re traumatized

by a massacre. It's your own fault if you're poor. It's your own fault if you get downsized, overworked, bullied, and fail. Get over it, Snowflake. This is how Americans have been taught from the Reagan era through today to deal with people who are vulnerable: blame them for their own suffering. Move on. And if they don't move on, that means they're weird. Tell them to get over it. Which is to say:

“Get the fuck out of my face.”

To recognize the essential meanness of modern American culture, and how it is transmitted from adult to child, adult to adult, and child to child, is to attack the culture's DNA. If you admit that the callousness exhibited is awful and yet as common as Home Depot outlets, then eventually, the context changes and the shootings make a lot of sense. The post-Reagan squeeze is even evident when the school administration, by reflex, tries to deny a teacher health care benefits that would have once been considered standard, docking her pay out of a deeply-ingrained reflex more than anything. The whole country is infested with this meanness and coldness, and no one is allowed to admit it. Only the crazy ones sense that it is wrong—that what is ‘normal’ is not at all normal—and some of them, adults and kids alike, fight back with everything they have.

The Struggle Continues

The Kinship of Pain

“Let this message be clear to all who victimize the innocent: we’re watching. And by axe, drill, or crowbar—we’re coming through your door. Stop or be stopped.”

A revolution is not a dinner party, or writing an essay, or painting a picture, or doing embroidery; it cannot be so refined, so leisurely and gentle, so temperate, kind, courteous, restrained, and magnanimous. A revolution is an insurrection, an act of violence by which one class overthrows another. A rural revolution is a revolution by which the peasantry overthrows the power of the feudal landlord class. Without using the greatest force, the peasants cannot possibly overthrow the deep-rooted authority of the landlords, which has lasted for thousands of years.

Seek out less often sought than found
A Soldier’s Grave, for thee the best;
Then look around, and choose thy Ground,
And take thy rest.

“We had no jails and we therefore had to kill all spies, informers, and double-crossers.”

Philip II, Warlord of Macedon: If I bring my army into your land, I will destroy your farms, slay your people, and raze your city.

Spartans to Philip II: If.

“We are independent and separate from your wicked society of ever changing laws and dark councils. Those who would come against this my people, will I verily cause to be destroyed.”

When the sheriff came to arrest John, he asked him to go with him peacefully, but John refused.

“Well then, the judge will probably send about ten guys after you and break the door down to get you.”

John replied:

“If that’s the case there will be bloodshed.”

The simplest of maxim in all of ethics is:

“I don’t harm others, I don’t harm myself.”

The problem with this ethic arises when someone else hurts you. What do you do? Perhaps the first step is to ask them to stop. If they don’t, attempt to move away from them. If you can’t or if moving away harms you, the next step is violence.

“If you won’t stop hurting me, I’ll have to make you stop.”

In a complex society like ours this becomes complicated. There are people doing harm to you and me right now. Rich people, mostly, and powerful people like politicians and senior corporate officers. They kill people, impoverish people and make people sick for their own benefit. They don’t stop when asked nicely, or even rudely. They also use a lot of violence to get their way and keep hurting people. I trust this is self-evident. The police and military don’t serve ‘the people,’ except incidentally. Some schmuck who does some drugs goes away for years, while the crooks who brought down the economy and left millions homeless and impoverished because of their fraud and corruption pay a few fines that are less than what they stole.

But, the bottom line is they hurt people and won’t stop when asked, nor can one move away from the hurt they are inflicting. This hurt is likely to kill some billions of people. So violence is justified. This isn’t a moral/ethical problem, it is a tactical strategic question. It is no longer a question of whether violence is justified against people who are doing great evil and won’t stop when asked, but a question of whether it will work and what is required to make it work.

Martin Luther King Jr. reminds us:

“A time comes when silence is betrayal. I could never again raise my voice against the violence of the oppressed without having first spoken clearly to the greatest purveyor of violence in the world today—my own government.”

If you talk with a harsh, urbanized accent, and you use too many profanities, that will often get you barred from many arenas, no matter what you're trying to say. On the other hand, polite, formal language is allowed almost anywhere even when all it is communicating is hatred and violence. Power always privileges its own discourse while marginalizing those who would challenge it or that are the victims of its power.

“I think the feeling is: I've had enough. I've had enough of political parties, I've had enough of politicians, I've had enough of representatives, senators, cabinet heads, authorities. I've had enough of the state, of what it's transformed itself into—the private and exclusive property of those who occupy the boardrooms, the C-suites, the administration and the houses of Congress. You want to go to the streets and ask what's the purpose of all this? You're asking an atomic bomb after it explodes to rationally direct its fantastic energy before it flows to wherever it wants to. What we're seeing here is this energy that exploded within the people, within society, flowing to wherever it wants to, without an owner, without logic, without direction.”

I also believe that all reasonable people of the world—regardless of race or ethnicity or religion—yearn for the same right to liberty, democracy, and self-determination. These are truly universal human ideals, and what we do today to advance them is the most important gift we leave for our children. Wars are temporary; these principles are not.

We believe that people who are serious in their criticism of this society and their desire to change it must involve themselves in serious revolutionary struggle. The system will not allow its social and economic order to be taken from it by Marshall amps and clashing cymbals. Ask the Cubans, the Vietnamese, the Afghans, the Iraqis, the Palestinians, or urban American blacks what lengths the system is willing to go to, to preserve itself.

“We recognize no other activity but the work of extermination, but we admit that the forms in which the activity will show itself will be extremely varied—poison, the knife, the rope, et cetera. In this struggle, revolution sanctifies everything alike.

Everything is moral that contributes to the triumph of the revolution; everything that hinders it is immoral and criminal.

Personally I hate these explosions, but I cannot stand as a judge to condemn those who are driven to despair.”

Justice will never be attained by constitutional means. When you're up against a bully you've got to kick him in the guts.

We could live in a sustainable, just, free, and peaceful world. And yet we are descending into a world of perpetual wars; slavery; ignorance; overwork side by side with unemployment; vacant homes side by side with homelessness; specialization; crass materialism; contaminated food, water, and air; destitution; despair.

Since the men in the shadows are not about to change, the only hope is their removal from power—by any means necessary. Unfortunately, given these men's cohesiveness and organizational skills, given their power over our minds, given their ability to convince the vast majority to act against its convictions and interests, given their success in establishing cross-generational dynasties, such removal presents humanity with a herculean task.

Humanity's future hinges on the strategy chosen by the few of us who are aware and who care. If we channel most of our energies to opening the eyes of the vast majority, we would surely lose the race. Our enemies possess superior propaganda resources and most human beings suffer from closed-mindedness and a misplaced loyalty to their 'own' convictions. If we continue to merely expose the daily outrages of the men in the shadows, they will follow their master plan and contemptuously ignore us. If we engage in peaceful demonstrations, they would kill our tacticians and leaders, infiltrate our ranks, and crush us. If we embark on a conventional armed insurrection, they would prevail thanks to their superior firepower, control of information sources, surveillance capabilities, and eagerness to kill millions.

Pacifist strategies are sublimely appealing, but they too are doomed to flounder. Jesus of Nazareth relied on them, as did Mohandas Gandhi and Martin Luther King, and all three failed to unseat the villains or improve the human condition. Their appeal to non-violence merely led to their own violent demise. All three, and so many others of our best and brightest, were murdered because they had not seen that their enemies were without compassion. For these enemies, pacifism is a contemptible weakness to be exploited, not a virtue. "Forgiveness," Mark Twain observed, "is the fragrance that the violet shed on the heel that has crushed it." The fabulist Aesop saw it too. Befriending a snake, he argued, would cost you your life.

If we try to reform the system from within, we would surely lose as well, for the system is rigged. For decades, I passionately felt that we could make a difference by exclusively focusing on sunshine bribery—a.k.a. campaign financing and revolving doors—and move on from there. But now, this late in the day, that strategy is doomed too.

I would go farther. All these strategies, I am utterly convinced, play into the hands of the enemies of humanity. Such strategies make us feel that we

are doing something while they divert our attention from the only strategy that does have a fighting chance. Humanity is at a crossroads. Continual progress in happiness, knowledge, and wisdom is on hand—but only if we dare see that we live in one of those tragic epochs when the tree of liberty must be strategically refreshed with the blood of patriots and tyrants.

If you want to carry out a revolutionary act, don't talk to others about it first—go ahead and do it! It is not necessary to wait until all conditions for making revolution exist, the insurrection can create them.

The only way to make revolution is to actually begin armed struggle. This is what we've been waiting for. The next step is to move to a higher level of struggle, to build the underground. Street violence is an unsustainable tactic—it makes us too vulnerable and costs too much. We've got to be able to work clandestinely.

We are working to build a guerrilla force in an urban environment. The guerrilla fighter is a social reformer.

Insurrection—by means of guerrilla bands—is the true method of warfare for all peoples desirous of emancipating themselves from an oppressive yoke. It is invincible, indestructible. Guerrilla war is a war of judicious daring and audacity, active legs, and espionage. The greatest merit in the commander of regular troops is to know when to fight and conquer; the greatest merit of the guerrilla chief is to contrive constantly to attack, do mischief, and retire.

Vanguardism is the notion that the most politically advanced members of any proletariat can draw the working class into revolution. Small, fast-moving guerrilla groups can inspire a grassroots rebellion, even in the United States. They just need the right story.

Mobility has always been the default choice of guerrilla fighters because they don't have access to the kinds of heavy weapons that would slow them down. The fact that networks of highly mobile amateurs can confound—even defeat—a professional army is the only thing that has prevented empires from completely determining the course of history. Whether that is a good thing or not depends on what amateurs you're talking about—or what empires—but it does mean that you can't predict the outcome of a war simply by looking at the numbers.

In the Afghanistan war, for every technological advantage held by the Americans, the Taliban seemed to have an equivalent or a countermeasure. Apache helicopters have thermal imaging that reveals body heat on the mountainside, so Taliban fighters disappear by covering themselves in a blanket on a warm rock. The Americans use unmanned drones to pinpoint the enemy, but the Taliban can do the same thing by watching the flocks of crows that circle American soldiers, looking for scraps of food. The Americans have virtually unlimited firepower, so the Taliban send only one

guy to take on an entire firebase. Whether or not he gets killed, he will have succeeded in gumming up the machine for yet one more day.

“Everything in war is simple, but the simplest thing is difficult,” the military theorist Carl von Clausewitz wrote in the 1820s. “The difficulties accumulate and end by producing a kind of friction.” That friction is the entire goal of the guerrilla; in some ways it works even better than killing.

One of the beguiling things about combat and other deep games is that they’re so complex, there’s no way to predict the outcome. That means that any ragtag militia, no matter how small and poorly equipped, might conceivably defeat a superior force if it fights well enough. Combat starts out as a fairly organized math problem involving trajectories and angles but quickly decays into a kind of violent farce, and the randomness of that farce can produce strange outcomes. Every action produces a counteraction on the enemy’s part. The thousands of interlocking actions throw up millions of little frictions, accidents, and chances, from which there emanates an all-embracing fog of uncertainty.

Unknown to Winn and his men, three enemy fighters are arrayed across the crest of the ridge below them, waiting with AK-47s. Parallel to the trail are ten more fighters with belt-fed machine guns and RPGs. In the US military, this is known as an “L-shaped ambush.” Correctly done, a handful of men can wipe out an entire platoon.

Stripped to its essence, combat is a series of quick decisions and rather precise actions carried out in concert with ten or twelve other men. In that sense it’s much more like football than, say, like a gang fight. The unit that choreographs their actions best usually wins. They might take casualties, but they win. That choreography—you lay down fire while I run forward, then I cover you while you move your team up—is so powerful that it can overcome enormous tactical deficits. There is choreography for storming Omaha Beach, for taking out a pillbox bunker, and for surviving an L-shaped ambush at night on the Gatigal. The choreography always requires that each man make decisions based not on what’s best for him, but on what’s best for the group. If everyone does that, most of the group survives. If no one does, most of the group dies. That, in essence, is combat.

The primary factor determining breakdown in combat does not appear to be the objective level of danger so much as the feeling—even the illusion—of control. Highly trained men in extraordinarily dangerous circumstances are less likely to break down than untrained men in little danger. The division between those who feel in control of their fate and those who don’t can occur even within the same close-knit group.

The idea that there are rules in warfare and that combatants kill each other according to basic concepts of fairness probably ended for good with

the machine gun. A man with a machine gun can conceivably hold off a whole battalion, at least for a while, which changes the whole equation of what it means to be brave in battle. In World War I, when automatic weapons came into general use, heavy machine gunners were routinely executed if their position was overrun because they caused so much death. Regular infantry, who were thought to be “fighting fairly,” were often spared.

Machine guns forced infantry to disperse, to camouflage themselves, and to fight in small independent units. All that promoted stealth over honor and squad loyalty over blind obedience. In a war of that nature soldiers gravitate toward whatever works best with the least risk. At that point combat stops being a grand chess game between generals and becomes a no-holds-barred experiment in pure killing. As a result, much of modern military tactics is geared toward maneuvering the enemy into a position where they can essentially be massacred from safety. It sounds dishonorable only if you imagine that modern war is about honor; it’s not. It’s about winning, which means killing the enemy on the most unequal terms possible. Anything less simply results in the loss of more of your own men. There are two ways to tilt the odds in an otherwise fair fight: ambush the enemy with overwhelming force or use weapons that cannot be countered. The best, of course, is to do both.

With IEDs the enemy now had a weapon that unnerved the Americans more than small-arms fire ever could: random luck. Every time you drove down the road you were engaged in a twisted existential exercise where each moment was the only proof you’d ever have that you hadn’t been blown up the moment before. And if you were blown up, you’d probably never know it and certainly wouldn’t be able to affect the outcome. Good soldiers died just as easily as sloppy ones, which is pretty much how soldiers define unfair tactics in war.

“When he was trying to recruit you. He had all these different plans of attack, you know, when he was trying to bring someone into the fold. Like if a kid was religious, he’d start talking to them about how it was God’s will. Or if they were insecure, he’d talk to them about the ever-accepting revolutionary family. But he always told my father you were too sharp for all that. Too curious. He said if the course of life don’t recruit her to the cause, no man will.”

Maybe you’re one of the special ones. So let me tell you what it is I do. I seek out special people—people who, if given the chance and the necessary tools, would stand up and face the enemy on behalf of those who can’t. I

seek out people who would do this even if they knew for certain that it would cost them dearly, maybe even cost them their lives. And then I do everything in my power to give them the tools, to give them their chance.

“The Movement people are fabulous. They have a real underground that takes care of you. No matter where I went they made sure I had something to eat, they introduced me to others, they made me feel safe. I’ve only been here three weeks now, but I feel completely different from all the other times I’ve been on the run. It’s not a hassle like it was alone. I’m part of a community. The underground is much bigger than you’d think. It’s all around. I could go from place to place for weeks and there’d always be a place I could stay and people to take care of me. Whether you call us criminals or radicals, we’ve all been fucked by society, we’re all on the lam together.”

Your involvement in movement activities is up to you. But be aware that your jeopardy increases with the amount of involvement.

“If your definition of terrorism is, you don’t care who gets hurt, we agreed we wouldn’t do that. But as to causing damage, or literally killing people, we were prepared to do that. We did have a series of discussions about what you could do, and it was agreed that cops were legitimate targets. We didn’t want to do things just around the wars. We wanted to be seen targeting injustice at home as well since the two are so intimately connected, so police were important. Military personnel were ruled to be legitimate targets as well. Big Banks, Big Box stores, Amazon Distribution Centers and the such were juicy targets too.”

Despite guards, a constant worker presence and a razor wire fence, the enemy is still vulnerable. There is a lot of stuff that needs to be destroyed, and we can’t count on spontaneous combustion and careless welders to do all the work.

“Brothers and sisters, this is a war for survival. Ask Michael and Eric and Sandra. They dig it. Ask the wild free animals. To shoot a genocidal robot policeman in the defense of life is a sacred act. Listen, the hour is late. Total war is upon us. Fight to live or you’ll die. Freedom is life. Freedom will live.”

Instilling fear into the authorities—which means that they are cut off from the populace and liable to lash out in counterproductive ways that will cost them further support—must be a key objective for any insurgent group.

“Our problem is not the damage to the building or to our own morale. Our problem is the feeling that if the police cannot protect themselves, how can they protect anyone else?”

—Police Commander

We know that our job is to lead kids to armed revolution. Kids know that the lines are drawn; revolution is touching all of our lives. Tens of thousands have learned that protest and marches don't do it. Revolutionary violence is the only way. Now we are adapting the classic guerrilla strategy of to our own situation here in one of the most technically advanced countries in the world. This is the way we celebrate the example of all revolutionaries who first inspired us by their fight behind enemy lines for the liberation of their people. Never again will they fight alone.

Even giants are vulnerable to the thousand nicks of stealthy amateurs who know the terrain and ignore the rules.

What is the first anesthetic? Wealth. And if I take your wealth? Necessities. And if I demolish your home, burn your fields? Acknowledgment. And if I make it taboo to sympathize with your plight? Family. And if I kill your family? God. And God, well God hasn't said a word in two-thousand years.

The rebels recruited her with the bandages still fresh around her wrists. They found her in a bar across from the abandoned theater, its blue vertical sign missing its first and last letters. She was wearing a stranger's throwaway dress, given to her by one of the nurses. She was drunk and alone once again with the terrible illness in her brain. They knew how to find the ones who were most likely to do it. They kept watchers in the hospitals, where they looked for suicide attempts, and in the schools, where they looked for outcasts, and in the churches, where they looked for hard-boiled extremists feverish with the spell of the Lord. From these, they forged weapons.

They'll remember you forever, they told her. When this is over they'll build cities in your name. The wholesale slaughter of our people is not something to be negotiated. It is not the subject of concessions or compromise.

It seemed sensible to crave safety, to crave shelter from the bombs and the Birds and the daily depravity of war. But somewhere deep in her mind an idea had begun to fester—perhaps the longing for safety was itself just

another kind of violence—a violence of cowardice, silence, submission. What was safety, anyway, but the sound of a bomb falling on someone else's home?

She was overcome by anger and a rabid desire to ruin those who'd ruined her. Rage wrapped itself around her like a tourniquet, keeping her alive even as it condemned a part of her to atrophy.

You are fit for something better than slavery and cannon fodder. You need to know that you were not created to work and produce and impoverish yourself to enrich an idle exploiter. You need to know that you have a mind to improve, a soul to develop, and a dignity to sustain.

Take more care to end life well than to live long.

We meet in the midst of a nation brought to the verge of moral, political, and material ruin. Our homes are covered with mortgages; labor impoverished; and the land concentrating in the hands of the capitalists. The fruits of the toil of millions are boldly stolen to build up colossal fortunes for the few, unprecedented in the history of mankind; and the possessors of these, in turn, despise the republic and endanger liberty. From the same prolific womb of governmental injustice we breed the two great classes: tramps and millionaires.

Upon which side will you fight? Upon the side of the idle holders of idle capital or upon the side of the struggling masses?

This is what I have to offer to those who wish to follow me: hunger, cold, the heat of the sun; no wages, no barracks, no ammunition; but continual skirmishes, forced marches, and bayonet-fights. Those of you who love your community, your kin, follow me!

To me the kinship of pain
Has always been the strongest bond
I could forget those with whom I laughed
But I will never forget those with whom I shed tears.

A greater affiliation with pain is what is required and is capable of transforming this world. We need no other religion.

Japan did not copy blindly the Western blueprint. It was fiercely determined to protect its unique identity, and to ensure that modern Japanese will be loyal to Japan rather than to science, to modernity, or to some nebulous global community. To that end, Japan upheld the native religion of Shinto as the cornerstone of Japanese identity. In truth, the Japanese state reinvented Shinto. Traditional Shinto was a hodgepodge of animist beliefs in various deities, spirits, and ghosts, and every village and temple had its own favourite spirits and local customs. In the late-nineteenth century and early-twentieth century, the Japanese state created an official version of Shinto,

while discouraging many local traditions. This 'State Shinto' was fused with very modern ideas of nationality and race, which the Japanese elite picked from the European imperialists. Any element in Buddhism, Confucianism, and the samurai feudal ethos that could be helpful in cementing loyalty to the state was added to the mix. To top it all, State Shinto enshrined as its supreme principle the worship of the Japanese emperor, who was considered a direct descendant of the sun goddess Amaterasu, and himself no less than a living god.

At first sight, this odd concoction of old and new seemed an extremely inappropriate choice for a state embarking on a crash course of modernization. A living god? Animist spirits? Feudal ethos? That sounded more like a Neolithic chieftainship than a modern industrial power. Yet it worked like magic. The Japanese modernized at a breathtaking pace while simultaneously developing a fanatical loyalty to their state. The best-known symbol of the success of State Shinto is the fact that Japan was the first power to develop and use precision-guided missiles. Decades before the USA fielded the smart bomb, and at a time when Nazi Germany was just beginning to deploy dumb V-2 rockets, Japan sank dozens of allied ships with precision-guided missiles. We know these missiles as the kamikaze. Whereas in present-day precision-guided munitions the guidance is provided by computers, the kamikaze were ordinary airplanes loaded with explosives and guided by human pilots willing to go on one-way missions. This willingness was the product of the death-defying spirit of sacrifice cultivated by State Shinto. The kamikaze thus relied on combining state-of-the-art technology with state-of-the-art religious indoctrination.

Fear of death is what gives the bosses their power! How long do you think you can survive without eating? Maybe a month or two! OK. Would you rather have one month of freedom or a lifetime of slavery? Anything that isn't worth dying for isn't worth living for. If you'd like to be part of this army of martyrs, then please write to us today.

So You Want to Join the Resistance?

This is not a group. There is no membership. There is no party, like ‘Democrats,’ ‘Socialists,’ ‘Republicans.’ This book is not leadership. There are no big names and faces, no way to advance your personal career. There are no big funders, this is not a non-profit. There are networks of solidarity and recognizable and communicable goals.

Contemporary resistance is not a monolithic or dogmatic ideology but a continual reversal of theory and action. We have had many decades to reflect and peruse the utmost effective response to our situation in America. To this effort we are creating networks for those facing detention, incarceration, exploitation, or other authoritarian violence to escape and live with dignity.

Revolutionaries, social centers, collectives are already actively building infrastructure of resistance. This infrastructure is not just material but psychological, spiritual, theoretical, and foundational. It is a departure from party politics and in conflict with both the left and the right for complete and total freedom. Defense of oppressed people and of our political projects is paramount to liberation. For those that truly want this nation of hate and violence to end, self-defense, conflict resolution, and revolutionary justice are proven ways forward. It is important that the way through these tragic times not just be personal but also collective. Everything in this book is hacked, remixed, and presented from the author’s point of view. Challenge it! There is no one way forward, just powerful ideas.

Relative to their small size, affinity groups can achieve a disproportionately powerful impact. In contrast to traditional top-down structures, they are free to adapt to any situation, they need not pass their decisions through a complicated process of ratification, and all the participants can act and react instantly without waiting for orders—yet with a clear idea of what to expect from one another. The mutual admiration and inspiration on which they are founded make them very difficult to demoralize. In stark contrast to capitalist, fascist, and in some cases, socialist structures, they function without any need of hierarchy or coercion. Participating in an affinity group can be fulfilling and fun as well as effective. Most important of all, affinity groups are motivated by shared desire and loyalty, rather than profit, duty, or any other compensation or abstraction. Whole squads of riot police have been held at bay by affinity groups armed with only the tear gas canisters shot at them.

Some affinity groups are formal and immersive: the participants live together, sharing everything in common. But an affinity group need not be a permanent arrangement. It can serve as a structure of convenience,

assembled from the pool of interested and trusted people for the duration of a given project. A particular team can act together over and over as an affinity group, but the members can also break up into smaller affinity groups, participate in other affinity groups, or act outside the affinity group structure. Freedom to associate and organize as each person sees fit is a fundamental principle; this promotes redundancy, so no one person or group is essential to the functioning of the whole, and different groups can reconfigure as needed.

An affinity group can range from two to perhaps as many as fifteen individuals, depending on your goals. However, no group should be so numerous that an informal conversation about pressing matters is impossible. You can always split up into two or more groups if need be. In actions that require driving, the easiest system is often to have one affinity group to each vehicle.

Learn each other's strengths and vulnerabilities and backgrounds, so you know what you can count on each other for. Discuss your analyses of each situation you are entering and what is worth accomplishing in it—identify where they match, where they are complementary, and where they differ, so you'll be ready to make split-second decisions. One way to develop political intimacy is to read and discuss texts together, but nothing beats on-the-ground experience. Start out slow so you don't overextend. Once you've established a common language and healthy internal dynamics, you're ready to identify the objectives you want to accomplish, prepare a plan, and go into action.

Affinity groups are resistant to infiltration because all members share history and intimacy with each other, and no one outside the group need be informed of their plans or activities. Once assembled, an affinity group should establish a shared set of security practices and stick to them. In some cases, you can afford to be public and transparent about your activities. In other cases, whatever goes on within the group should never be spoken of outside it, even after all its activities are long completed. In some cases, no one except the participants in the group should know that it exists at all. You and your comrades can discuss and prepare for actions without acknowledging to outsiders that you constitute an affinity group. Remember, it is easier to pass from a high security protocol to a low one than vice versa.

Affinity groups generally operate via consensus decision-making: decisions are made collectively according to the needs and desires of every individual involved. Democratic voting, in which the majority get their way and the minority must hold their tongues, is anathema to affinity groups—for if a group is to function smoothly and hold together under stress, every individual involved must be satisfied. Before any action, the members of a

group should establish together what their personal and collective goals are, what risks they are comfortable taking, and what their expectations of each other are. These matters determined, they can formulate a plan.

Since action situations are always unpredictable and plans rarely come off as anticipated, it may help to employ a dual approach to preparing. On the one hand, you can make plans for different scenarios: If A happens, we'll inform each other by X means and switch to plan B; if X means of communication is impossible, we'll reconvene at site Z at Q o'clock. On the other hand, you can put structures in place that will be useful even if what happens is unlike any of the scenarios you imagined. This could mean preparing resources (such as banners, medical supplies, or offensive equipment), dividing up internal roles (for example, scouting, communications, medic, media liaison), establishing communication systems (such as burner phones or coded phrases that can be shouted out to convey information securely), preparing general strategies (for keeping sight of one another in confusing environments, for example), charting emergency escape routes, or readying legal support in case anyone is arrested. It's safer to act in chaotic protest environments in a tight-knit affinity group.

After an action, a shrewd affinity group will meet—if necessary, in a secure location without any electronics—to discuss what went well, what could have gone better, and what comes next.

An affinity group answers to itself alone—this is one of its strengths. Affinity groups are not burdened by the procedural protocol of other organizations, the difficulties of reaching agreement with strangers, or the limitations of answering to a body not immediately involved in the action.

At the same time, just as the members of an affinity group strive for consensus with each other, each affinity group should strive for a similarly considerate relationship with other individuals and groups—or at least to complement others' approaches, even if others do not recognize the value of this contribution. Ideally, most people should be glad of your affinity group's participation or intervention in a situation, rather than resenting or fearing you. They should come to recognize the value of the affinity group model, and so to employ it themselves, after seeing it succeed and benefiting from that success.

An affinity group can work together with other affinity groups in what is sometimes called a 'cluster.' The cluster formation enables a larger number of individuals to act with the same advantages a single affinity group has. If speed or security is called for, representatives of each group can meet ahead of time, rather than the entirety of all groups; if coordination is of the essence, the groups or representatives can arrange methods for communicating through the heat of the action. Over years of collaborating

together, different affinity groups can come to know each other as well as they know themselves, becoming accordingly more comfortable and capable together.

When several clusters of affinity groups need to coordinate especially massive actions—before a big demonstration, for example—they can hold a spokes-council meeting at which different affinity groups and clusters can inform one another (to whatever extent is wise) of their intentions. Spokes-councils rarely produce seamless unanimity, but they can apprise the participants of the various desires and perspectives that are at play. The independence and spontaneity that decentralization provides are usually our greatest advantages in combat with a better equipped adversary.

For affinity groups and larger structures based on consensus and cooperation to function, it is essential that everyone involved be able to rely on each other to come through on commitments. When a plan is agreed upon, each individual in a group and each group in a cluster should choose one or more critical aspects of the preparation and execution of the plan and offer to ‘bottomline’ them. Bottomlining the supplying of a resource or the completion of a project means guaranteeing that it will be accomplished somehow, no matter what. If you’re operating the legal hotline for your group during a demonstration, you owe it to them to handle it even if you get sick; if your group promises to provide the banners for an action, make sure they’re ready, even if that means staying up all night the night before because the rest of your affinity group couldn’t show up. Over time, you’ll learn how to handle crises and who you can count on in them—just as others will learn how much they can count on you.

Stop wondering what’s going to happen, or why nothing’s happening. Get together with your friends and start deciding what will happen. Don’t go through life in passive spectator mode, waiting to be told what to do. Get in the habit of discussing what you want to see happen—and making those ideas reality.

Without a structure that encourages ideas to flow into action, without comrades with whom to brainstorm and barnstorm and build up momentum, you are likely to be paralyzed, cut off from much of your own potential; with them, your potential can be multiplied by ten, or ten-thousand.

“Never doubt that a small group of thoughtful, committed people can change the world, it’s the only thing that ever has.”

She was referring, whether she knew it or not, to affinity groups. If every individual in every action against the state and status quo participated as part of a tight-knit, dedicated affinity group, the revolution would be accomplished in a few short years.

An affinity group could be a sewing circle or a bicycle maintenance collective; it could come together for the purpose of providing a meal at an occupation or forcing a multinational corporation out of business through a carefully orchestrated program of sabotage. Affinity groups have planted and defended community gardens, built and occupied and burned down buildings, organized neighborhood childcare programs and wildcat strikes; individual affinity groups routinely initiate revolutions in the visual arts and popular music. Your favorite band was an affinity group. An affinity group invented the airplane.

Self-defense is the central pillar of our resistance. The State tries to consolidate its monopoly on violence by claiming to have the unique ability to protect its “citizens,” but it has become clear, there is no such thing as protection that one does not provide oneself. Self-defense is not only the barricade against an oppressive force, but also the means for the collective development that is an integral part of revolutionary change.

Across the United States, there are currently groups that are committed to the principles of self-defense, from left-wing armed groups to anti-fascist brigades to copwatch organizations. These groups use a variety of tactics and strategies depending on the local conditions, yet they share common enemies: fascists, right-wing militias, and State forces. The groups who have combated these reactionaries have a proven commitment to defending oppressed communities; they are the foundation upon which we can build a political movement.

Thus, we propose that the existing militant anti-fascist and anti-police movement can be further developed according to the following guidelines:

- Underscoring these groups with a new revolutionary scope and the political principles outlined here.
- Deepening the local scope of these groups by tying the actions to neighborhood self-governance, and a larger political project.
- Connecting these projects to each other to broaden our capacity by increasing resources, participants, and deepening our commitments to revolutionary political solutions.
- Developing the capacity to begin launching offensive actions against fascists and the regime.
- The RAM proposal is to grow locally, while connecting, politically and materially, to similar groups regionally. By placing self-defense at the center of our revolutionary movement, we can protect the development

of our political projects and centers. This will allow the values and practices that we are trying to implement to have the opportunity to expand. We propose connecting self-defense groups to the smallest unit of self-governance possible: the neighborhood. This places the capacity for self-defense in the hands of those who need it.

- Decentralization is an effective militant strategy and shapes the revolutionary practice of defense groups.
- Militant groups are connected to local political bodies organizing towards self-governance.
- Core revolutionary principles and goals allow groups to work with a variety of tactics towards the same goal even without direct coordination.

When revolutionary groups form projects like the Black Panthers' breakfast programs, the New Orleans-based Common Ground Collective, or the Greek anarchists's revolutionary solidarity with Syrian refugees, these initiatives also form new political and social relations based on mutual aid and neighborhood self-sufficiency. Unlike State-based organizations, which turn citizens into helpless recipients of services, volunteer-run projects instead supplied the resources, tools, and knowledge for people to provide for themselves, make the primary decisions about organization, and, if firmly tied to self-defense forces, eventually take over the infrastructure necessary for survival.

The political paradigm we are working towards is a network of councils and communes without the State. It's a vision of autonomy that runs through neighborhood-based councils, where decision-making rests at the local level. This political formation reverses hierarchy and centralized power by making the most local unit the most powerful, and regional bodies simply a means for coordination. We propose starting from the nexus of the small, revolutionary groups already active in many cities, towns, and rural areas. Already, such groups function as local political collectives with strong ethical backbones and a commitment to communal decision-making.

As these groups expand through the abolitionist struggle, they have the ability to introduce more people to this model of politics. The purpose, then, is to expand qualitatively and quantitatively, without recreating centralized and hierarchical social formations. To facilitate the process of liberating people from bondage, we offer the following suggestions as possible means by which revolutionary groups can help establish structurally decentralized

projects that integrate uncompromising anarchist foundations through the creation of new councils and local institutions:

- Revolutionary groups can create social programs, such as a free health clinics, safe houses for immigrants and others targeted by the State, educational programs, et cetera with a revolutionary outlook, in order to bring new people into new revolutionary methods of organization, while building localized resources.
- Revolutionary groups can help form new collectives and councils, based on either local circumstances or a specific issue, such as tenants' associations, revolutionary youth groups, or neighborhood assemblies.
- Revolutionary groups can build stronger relationships with similar groups in other cities.

The success of this project is measured by more and more people within a neighborhood becoming politically engaged and active decision-makers within their communities. While the State drags on by using increasingly totalitarian methods, we build our power: building new communities of resistance in the disintegrating remains of the regime. By proliferating, these bodies can, in the short-term, erode the oppressive functions of the State, and partnered with rigorous defense, dislodge them.

No platform, no dialogue, no inch of territory, and certainly no concern can be ceded to those who either threaten or unleash authoritarian violence.

“The life of someone who oppresses others and prevents them from living is not worth a cent.”

The legacy of revolutionary justice in the US is an inherently political phenomenon, as it has always been situated in reprisals against the State, the slave-holding planter class, capitalists and their institutions, and the broader forces of bondage, from colonial to patriarchal oppression. It is impossible to speak about resolving social conflicts in the US without addressing the agents of the State and reactionary, racist forces and their consistent use of terror to maintain their social and political position.

The entire council-based system, as in Spain, Chiapas, or Rojava, is predicated on the health of the social fabric. All pragmatics, education, and values are collectively organized so that the individual can overcome alienation and powerlessness by personally shaping the conditions of their lives through discussion and decision-making. The ability to shape all the facets of society confers upon each individual a far wider scope than the mere satisfaction of personal needs, as it also includes the well-being of the

entire community. With the invisible wall between politics and community broken down, this focus on community health becomes the driving force behind the process of resolving conflicts. If we intend to resolve the conflicts between parties instead of simply finding fault and applying punishment, the solution is mediation. In Rojava, conflict resolution is implemented in several, slightly different ways throughout the society that the participants are actively involved in constructing.

The Tekmil is a foundational process that begins with self-reflection and analysis based on revolutionary principles. In fact, it's important to note that this practice is what led to this region's transition from a hierarchical national liberation struggle to its current ground-up structure.

The main point is that each person 'criticizes' those in their affinity group they care the most about because they want to see them improve and become better people. To begin on a serious footing, the participants step into another room, and act as if those fallen in the struggle are there with them. Thus, people are expected to act respectfully. There's typically a person that leads the Tekmil and writes down the criticisms, who starts by opening the floor up to anyone that has something to say. If a person feels the need to express themselves, they ask if they can speak, stand up, and give their observations. If they're speaking about someone else, that person cannot reply to their criticism. In fact, they are not even supposed to bring it up after the Tekmil. They are just supposed to accept it and think about it. Once no one has anything else to say, the person leading the Tekmil summarizes what was stated.

When police killed Michael Brown in Ferguson, the town erupted in riots. No sooner had they begun this act of defiance, when non-profits and faith leaders descended upon the town to induce people to protest peacefully and attempted to de-escalate the situation. On the other hand, riot police and armed right-wing militias surrounded the rebels, cornered them in a sea of illegality by declaring curfews, and then swept people up with brutal arrests and long jail terms. Without revolutionary objectives, or the foundations for a sustained revolutionary conflict, everyone had to, eventually, reconcile living with the oppressive State that they were just rebelling against.

The most essential tasks are to create the ideological underpinnings for revolt and the necessary infrastructure that can sustain action and long-term forms of organization. There is a big difference materially in what an organized and fortified hamlet versus a mass in revolt can accomplish. With a base of operations impenetrable to outsiders, the maroons were able to provide a serious challenge to the practitioners of slavery. Tactically, they leveraged the advantage of attack from a free area outside the jurisdiction of hegemonic power. However, it was not only their territorial integrity, but

a commitment to the autonomous nature of their societies that allowed for the maroon's perseverance. The maroons refused to give up their freedoms, maintained regional decision-making and fluid fighting formations, and continued traditional practices. Outsiders looking for liberation saw that the people involved in maroon communities weren't struggling to grab power, but to fight for liberation itself.

Look to the communities that are most oppressed for comrades in struggle. Fight alongside and defend groups enacting revolutionary justice. Derail forces that want to bring people back into the fold of power: nonprofits, political parties, and authoritarian political groups. Provide political foundations: principles, new organizational models, infrastructure, and defense. Together we can get through these times.

In Love and Rage,

The Church of We

The Coming Insurrection

Coming to a theater near you...

Whoomp Whoomp Whoomp. They can hear the helicopter approaching but neither has sighted it yet. Big puffs of breath intermittently stream out as the binoculars make their sweeping scans.

“There she is, right over that saddle off to the west.”

“Got her too. I’ll get Betty.”

The second figure trudges off through the fresh snow, steps crunching, breaking the stillness even further. He drops the tailgate of the old Bronco and slides out a camo green case. Flipping open the latches reveals Betty. He throws the device onto his shoulder and walks back over to where they first sighted the target.

“See that fucker with the antenna?”

“Yeah. Whats he doing?”

“Motherfuckers track the collars biologists put on them.”

“Fucking cocksuckers.”

“Yup. Ready to give them a little taste of their own medicine?”

He nods, takes a knee, hefts Betty onto his shoulder, double-checking that the giant stenciled ‘FRONT’ is in the right orientation. He flips the scope up, finds the chopper, much closer now. The tone sounds. Trigger squeezed. WHOOSH. It is streaking up into the sky now, won’t be long. The fireball is seen a moment before the sound. Nothing left, no survivors, as if it had hit an invisible wall in the sky, it drops straight down into the fresh snowpack in the valley below.

“Wolves got some SAMs now motherfuckers.”

“Yeehaw, lets get the fuck out of here.”

The shooter stows Betty as the other hops in the driver’s seat and starts the truck. A little hesitant on such a cold morning but she turns over for them as usual.

“You got the tires right?” asks the shooter as he climbs into the passenger seat.

“Yup, four fresh ones waiting for us, shouldn’t be more than 30-minutes before we’re on the way. Probably won’t even be anyone looking for them for another few hours.”

“Nice, lets do it.”

The Bronco lurches forward, swinging a wide arc the driver takes them back out the way they came. A plume of black smoke beginning to rise, billowing above the treetops, quickly fading into nothing more than a smudge on the rear-view mirror as they speed into the late morning sun.

Some crimes cannot go unpunished. . .

“Yeah, we got Bezos a few months back,” the lanky one says.

“No shit, that was you?”

“Yup, we cut the fuckers face off while he was still alive. Bastard fucked up the clean cut a few times by squirming around but we finally got it.”

The shorter one seems to squirm in his seat, looking down at his feet sadly.

“Whats his problem?”

“Oh him? Well, he is having a crisis of conscience at the moment. He hasn’t quite been the same since Jeff.”

“What the fuck? Guys a scumbag, hurts millions, stolen billions, wants you to live in space cylinders—‘For da great beltah nation, kay?’—fuck him”

“Yeah, that’s what I said. But he seems to think its too much like ISIS, ya know?”

“Fuckin’ ignorant man. First off, those fuckers fighting for some made up sky bullshit. Second, their shit is indiscriminate. Bezos is a fucking guilty shitbag through and through. And hell, third, lets look at US direct violence: melt some kids face off with a drone? Well, sad, but happens in war they say. Cut the fucking face off of a guilty motherfucker, directly—not like you fuckin’ taped a scalpel to a drone, you risk your own goddamn skin. You’re a monster they say. And this midget motherfucker is agreeing with them? What the fuck man? You did a noble thing. Own it. Embrace it. Say, what’d you do with it anyway?”

“Tanned it and glued it on a RealDoll.”

Friends are found in unlikely places. . .

“So let me tell you how me and my buddy Ozzy hooked up here. No, not that way Ozzy. Sorry, he’s got the sense of humor of a teenage boy for some reason, it’s kinda fucked up. So anyway, I had smuggled myself into Area 51 in a crate of dry ice, came in on a fucking food delivery truck for their cafeteria—maybe don’t use private contractors so much dummies, right?”

I was planning on just doing some basic recon and grab some photos to up my cred and get some info out there, right? But then I ended up nearly getting caught and having to duck into this room with some weird tinted lights and vats of liquid in it. Smelled like the ocean.”

Ozzy turns purple.

“No, no, I wasn’t saying that was a bad thing, you smell great. So I figure I’ll go check out the vats while I’m waiting for the patrol outside to pass. Nothing in most of them, ‘cept for one. Can see a blob under the surface from the outside but can’t quite tell what it is. So me being a curious motherfucker, I pop off the Plexiglas top and then this 8-legged bastard over here leaps out and latches onto my face like those fucking things in

Half-Life. But, as he told me later, he tasted that I wasn't one of those dickbag scientists that tortured him and his kin and so he leapt off almost immediately.

Then the motherfucker talks to me. I figure its just the adrenaline, or maybe its some kind of LSD-injecting octopus for some kind of new high-tech MK-ULTRA experiments but then he explains all the shit to me. Talks about how they cut them open while they're alive just to see what stuff does, the miscarriages, the premature deaths; horrible shit man, especially considering he's able to explain the shit to me.

Luckily for us, Ozzy's got a bit of Jedi in him—thanks fucking nerd scientists—so he was able to help scam our way out, since we both couldn't fit in my icebox to get back out. 'This isn't the octopus you're looking for,' HAH, fucking classic Ozzy, man."

Some lines must be crossed. . .

"Shut the fuck up, your family is going to be fine, we're not monsters like you."

The figure in the suit continues to bellow, sweat and tears streaming down his face, his expensively tailored suit soaked to the core.

"Look man, it's kind of unfortunate that we gotta do what we gotta do. You ain't as directly guilty as some of the others we've done far less to, but we gotta send a message, you know?"

The bellowing and bawling continues unabated.

"Yeah, lets call it marketing. You should be familiar with marketing. Especially horrific acts of torture, right? Hell, maybe we should ask you for some tips, huh? Got anything?"

Sounds have reduced to sniveling and sniffing now. The suit's eyes open and turn skyward, the redness enhanced by the incandescent bulb hanging from a floor joist in the basement ceiling.

"Look. . . Y-You don't n-n-need to do this. I won't tell anyone—"

"We're going to tell everyone motherfucker. What, you think that camera is just there so we can jerk off to it later? Fuck no."

"I-I-I can give you anything you want, anything"

"That's good to hear man. But I don't think you're going to like this next bit: what we want is you to die on camera tonight. We usually get what we want, you should be familiar with that, right? You want a whale or dolphin but running them down in the wild ain't popular anymore? Well hell lets just breed the ones we got, maybe try out some cloning too if that don't work. Fuck whatever the creatures involved might think, I just want my money. Sound like someone you know?"

"Come on, I don't make all those decisions, you must know that. There's a board, I need to report to them, and the shareholders, I have a responsibility

to them. You kill me and they'll just get another one to sit in my chair!"

"You'd be right if we were just planning on doing something to make you step down or get fired. But we don't fight you fuckers handicapped like those dipshit green groups. The only drum circle here will be me drumming your balls with the claw end of a hammer motherfucker. You're going to die, you're going to suffer, you'll feel it all, your conscious mind analyzing the pain until your body's defenses give up and just put you into shock. Maybe that will be interspersed with some thoughts about your family, wife, kids, maybe your mom. Maybe the moments before your death will be the closest you get to experiencing some of what you put them through."

"WAIT! Please don't we can—"

The rag is stuffed into the suit's mouth, ending the conversation, nothing but muffles now coming from the wide-eyed face full of panic, fear.

"I liked that drum circle line, you just come up with it?"

"Yeah, you know, just kind of got caught up in the moment."

"It was good, we should probably do it, sounds like it'd make good video."

"Yeah, let's save that for the end. We'll do the balls on close up and then slice both thighs and let him bleed out."

"Sounds like a plan, lets get started."

The muffled sounds continued for far longer than expected, their pitches altering depending on which body part they were working with. There were no sounds when the hammer pierced through the flesh, cleaving the small meaty orb nearly in two. The force of the swing embedding the tool a half-inch into the wooden chair below. There it remained, the blood streaming from the thighs pooling around the metal spire before eventually reaching the critical mass needed to spill onto the floor.

The time to be polite has passed. . .

"Die you. . ."

". . . fucker"

". . . cunt"

His head slumps to the table. The blood splatter hits the children, the wife. Delayed, eventually they begin to scream.

"Whoa man, what the fuck?"

"Huh?"

"You can't call him a cunt, I mean there's women and children here."

"Oh come on that's bullshit. Never believed in that shit, its just a word. The British use it all the time."

"Well look at them, they're hysterical because of it."

"Think that may just be cause she's got brains in her hair."

“Yeah, maybe. Agree to disagree. Well thank you for your time tonight, have a good holiday weekend.”

They nonchalantly walk back out the front door, tucking their silenced weapons into their overcoats before stepping outside. The screaming fades into a low hum, the closed entry door hushing it even further.

“Oh shit, hang on a sec, forgot something.” He swings the door back open, the knob still dangling from when they smashed it with the pipe, the screaming approaching its original howl. Ten seconds later he strolls back out, satisfied.

“What was that about?”

“Oh, I just sprinkled some crack on him. You know, give one back to the homies.”

The other cracks up. “Man that’s fucking great. So, you feelin’ better?”

“Not as good as when we pulled apart the trigger-man with those semis but I’m definitely feeling something.”

“Yeah, the farther they are removed from shit like that the less rewarding it is. But in our fucked up world they’re often more responsible than the ignorant fucks directly implementing the shit.”

“Fucking always gotta go deep on me don’t you?”

“Just something to think about. Don’t think too hard though, don’t want you to lose your edge.”

“Fuck no man, these motherfuckers took my two best friends. I couldn’t just sit there doing nothing ever again. I’m definitely going to kill myself, or get myself killed, but I’m taking out as many of these sonofabitches as I can on the way out.”

“Hell yes brother. None of this is for us anymore. You know it, I’ve known it. We win or we die, and odds on the former ain’t good.” He pauses, reflecting, then a pained look crosses his face as he hesitantly gets out the final line, “But...I...Some nights I have hope. It sort of filters through the darkness of everything I’ve lived. It...It would be so nice to live in the world I see when I close my eyes, that I believe in, but its probably just a fantasy. She died face down in the mud and I’m probably gonna too...” He trails off.

Silence dominates the drive all the way to the state line and beyond.

You think you know, but you have no idea...

“Shit, shit shit, SHIT!”

“We weren’t supposed to get this much fog. Damn it what are the odds?”

The zodiac bobs in the gentle swells, surrounded on all sides by a blanket of thick gray air.

“They’re definitely going to find us. They got fucking every tech on these things—FLIR, radar, sonar, fucking fish finders, fuck...”

“GPS sure would have come in handy...”

“Yeah, it fucking would have, but when you’re being shot at, you’ll have to forgive me for not getting every goddamn thing out of the truck.”

“Hey, I wasn’t blaming, just saying.”

“Saying something useless and fucking unhelpful.”

“Look, we’ve got a bit of a head start, the harbor was miles down the peninsula.”

“Yeah, but something might have been already out on patrol—even one of their small craft has enough tech to fuck us. Goddamn drug war.”

“Maybe it will cl—”

A sleek black shape bursts out of the water, rubbing gently against the boat as it thrusts through the air. Another on the other side now, the same graceful arc.

“Fuck its the goddamn SEALs, what the fuck kind of shit they got?! Quick! The light!”

The lantern clicks on and begins to scan the surrounding water.

“Looked too big to be SEALs. And we’re still alive, which is odd.”

“Over there! Look!”

The light swiftly shifts to a point about five feet off the starboard bow, illuminating a dark hump in the water. The light continues to examine the figure, flowing down its flank until it brings into focus a large, slightly bent black fin.

“Orcas, not SEALs. Thank fuck.”

“Oh good, not killer humans, just killer whales? What if they think we’re just a giant fucking sea lion. You seen those videos? They throw those half-ton bastards into the sky like its nothing.”

“Relax, first killer whale is an outdated term and stereotype, kind of like all black men having big cocks but turns out some racist asshole just said it to make ‘em seem more like savages and animals. Ain’t never been a free-living killer whale attack on a human. Hell supposedly some of these guys even returned peoples dogs who got lost out at sea.”

“Bullshit.”

“Maybe. But either way, all statistics point to them not hurting us.”

By this point they had noticed 10 or 15 other shapes all around the zodiac. It was hard to get an exact count, what with their constant shifting and submerging, and the goddamn fog. Suddenly a black and white head pops silently and slowly from the water, brushing the inflated tube. Deftly maneuvering its body, like a ballerina on pointe, it rotates, until its eye is in line with theirs.

“OK, call me crazy but I feel like that fucker knows what is going on.”

“Some people think whales are telepathic...”

“Oh for fucks sake, are they the same type that believes the government is a bunch of lizard men in suits?”

“Probably not, those guys usually don’t overlap. Telepathic aliens and lizard men? Totally reasonable. Telepathic whales? What you smoking filthy hippie.”

The inane conversation is interrupted by the feeling of turning. The whale had sunk back down into the water and now seemed to be pushing the zodiac. Then a light bump from the opposite side, as another whale stops the turn. Once again the only motion is the bobbing in the light swells.

WHOOSH! Fifteen feet off the direct centerline of the bow, a whale surfaces and launches a huge spray of water into the sky. Then the boat begins to move toward the display, turning around, it is clear that they are being pushed slowly in a specific direction. The whale releases and the boat begins to inch away. Performing another agile move, the whale twists its 10-ton body, raising its massive left fin out of the water and gently taps on the outboard motor five times.

“Dude. Are the fucking whales trying to lead us somewhere? And how the fuck does it know what an engine is?”

“Yes. And who knows, who cares. Lets take their advice. Better than sitting here waiting to get shot.”

The outboard engine roars to life, the throttle slowly increased, the whales setting a pace that seems to minimize the noise generated, as if they too were aware of the stealth nature of the endeavor.

“So is this shit really happening or were the first ones really SEALs and we’re actually dead and this is just some weird DMT shit you see in the split second before your brain dies?”

“I ever tell you about the African elephants man?”

“Think so but refresh my memory.”

“Can’t remember much then, or you’d probably not think this was so crazy. I had been stalking some poachers for days, they were working for some Chinese business-asshole, rhino horn was the specialty. Douchebag thought it would make his little yellow dick bigger or some shit. But anyway they would sometimes grab some ivory too, especially when the price spiked, gotta support your small dick supplement habit somehow I suppose. So I had finally caught up with them, they had spooked some elephants after dusk and were about to shoot them with poisoned arrows.”

“Arrows? What the fuck, I was expecting a bigass elephant gun.”

“Yeah, that’s really only those British assholes you see in paintings. Or Donald Trump Jr. Now they gotta use the arrows cause the boomstick makes them too easy to find. Takes a little time to saw two massive things off the face of a massive creature so, you know, time is valuable thing to have.

Technically we were far enough away from anything that a gun wouldn't have been heard, but it hadn't started that way, so there they stood with their arrows. Took the first one out with a machete to the neck. Can't make much more than a gurgle when your head's flapping like a PEZ dispenser. Got the second asshole the same way, but by now the bowman had heard the first fuckers body hit the ground and was starting to spin around, the bow still pulled taut, arrow at the ready. He's a good 15 feet away, I figure he's definitely gonna get it off before I'm there. Toast, that's what I am I figure. Shit's potent enough to take down the biggest land mammal, it's just gotta graze me and I'm fucked.

Fortunately he was only a kid, couldn't have been more than 14. He probably had no problems killing an unsuspecting elephant but put him up against an angry man in the dark who had just killed his two buddies, little fucker was a bit more scared. He let out a scream as he turned and let go of the bowstring prematurely TWANG! THUMP! Bam, arrow in an acacia tree ten feet off to my right. Cleared the distance before he could even react and split his head in two. Caught my eyes before the life went out and he slumped to the ground.

Fucking don't like killing kids man, even if they're guilty. Hated it even worse back then. So I'm just kind of slumped down there against the tree in a clearing about a quarter mile from where it happened. Sounds of the African night all around me but nothing that would have been worrying. Then I catch a series of eye pairs, glinting in the moonlight and staring directly at me from across the clearing, where the brush and undergrowth gets much thicker.

So I'm thinking, shit lions or hyenas, either way I'm fucked. Too many of them to win so I'm steeling myself for my death charge when I hear trumpeting coming from behind, off in the direction of the kill site. I turn around briefly, trying to see what is going on, then remembering the foolishness of the act, I spin quickly back around.

In those few moments the eyes had closed the distance dramatically. The moonbeams streaming through the trees now illuminating that it was a pride of lions. Not sure if I would have preferred the hyenas but didn't have much time to think about it.

So I'm about to charge at these fuckers, make my last stand, when thundering footsteps and trumpeting roars blast from almost immediately behind me. The lions stop, look confused, then scared. Then. . . BAM! Fuckin elephants burst through on either side, goddamn things just uprooted the trees around me, they were coming with such force but they somehow didn't crush me.

At this point the lions are running like pussies. Couple of big elephants

on their heels, swinging their massive heads left and right, attempting to swipe the cats with tusk, trunk, anything. Rest of them come around me asses in, trunks out and just stand, silent. I try to move, get out of the area so I don't get crushed, but anywhere I go, I find myself blocked by a gently extending hind foot.

Fucking weird as shit right? I'm just exhausted at this point so I just go into the middle, sit down and wait. For what? Didn't know, just seemed like the best option to my feeble mind.

So there I am, just sitting in the middle of a circle of elephant ass. Thankfully none of them had to take a shit. Then back come the two chasers. Now that I've settled down, I can see that one of them seems to be much bigger and older. Probably the matriarch. Confirms it when the elephant asses part for her. So she strides right up to me, touches my mouth with her trunk. Then, I shit you not, gives me a hug—its sounds fucked but that's the best way I can describe it—just gently wraps the trunk around me, pulls me in close to her leg, and gently squeezes. Nights already been fucked so I go with it. She lets me go, they then spend the entire night guarding me. AND THEN, to top it all off, they escort me back out to my jeep which as far as I know they've never seen.

Talked to some researchers about it since then. They've heard other stories like that, but they said mine was the most direct contact they'd heard of. Don't think a lot of them actually believed me.

But yeah man, those elephants saved me that night, and the only logical explanation for it all seems to be that they knew what I did, I protected them, they returned the favor. Seems to be what our friends here are doing too."

"Yeah, but how the fuck they know?"

"Guy once claims to have seen the last elephant, from a family completely wiped out by poaching, claims to have found her on the beach, speaking to a whale."

"Bullshit."

"Maybe, or maybe we just don't understand everything."

The Rogue Wave is coming. Be prepared.

"The dogmas of the quiet past are inadequate to the stormy present. The occasion is piled high with difficulty, and we must rise—with the occasion."

"For our demands most moderate are: we only want the earth."

This late-capitalism death spiral will not cure itself. There is no world in which corporations and their pet politicians and corrupt media propagandists will “recognize the vital role of the state.” They will not regulate themselves. They will not create “a new social contract.” They are rich and powerful. The rich do not wake up one day and say to themselves, ‘Time to stop being a selfish ass, I’m going to redistribute my income.’ The powerful do not care that the weak are miserable. Money gets taken away from the rich one way: by force. The powerful are divested of their privileges the same way: when they have no choice.

Liberals and leftists identify many of the same problems. Only leftists understand that real solutions require serious pressure on the ruling elites. The credible threat of force—for example, a peaceful protest demonstration that could turn violent—may be enough to force reforms. But reforms always get rolled back after ‘the left’ stops watching. Ultimately the rulers will have to be removed via revolution, a process that requires violence.

Liberals do not demand change; they ask nicely. Because they oppose violence and credible threats of violence, they tacitly oppose fundamental change in the existing structure of politics and society. Unlike leftists they are unwilling to risk their petty privileges in order to obtain the reforms they claim to crave. So, when push comes to shove, liberals will ultimately sell out their radical allies to the powers that be. And they will run away at the first sign of state oppression.

If you can’t trust your ally, they are no ally at all.

A man who has betrayed someone once will easily do it again if it profits him.

We are living through an upheaval of historic proportions. The visible evidence of collapse makes criticism redundant. What is being born before our eyes still lacks a clear shape; it could just as easily beget monsters and therefore defies any attempt to describe it. In such times, all commentary is reduced to the level of chit-chat. We can speak only from the midst of events; from the breach we can hear the cracking foundations of a global order at its end that are opening up new paths for the future.

Some will see behind this ambition either senile nostalgia or the mindless elation of youth. But let them take comfort, as much as they can. We are sure of being the most realistic by far.

Right across this planet, there are three basic kinds of government under which people live. In the first, a particular group (often called a party) holds all the power, elections are rigged, the media are muzzled, and opponents are behind bars or vanish without trace. It is a situation that applies in many former or present ‘communist’ countries and in others that have emerged from colonial rule and continue their past rulers’ brutality in various guises.

In the second category, the regime is unstable and threatened with stones or guns—as in today’s Syria or the Democratic Republic of Congo. The third type comprises what are usually called democracies—elections take place at fixed dates, parliaments adopt laws, and governments manage public affairs.

The richest countries periodically send their leaders to discuss the future of the world at secure places cordoned off by large numbers of police. The rest receive heaps of praise when they show that they have assimilated ‘democratic’ values while accepting the plunder of their resources and the reduction of their people to beggars.

The boundaries between these categories are not always sharply drawn: some major countries—Algeria, Iran, Russia—have features of both the first and the third, while others can pass suddenly from one to another, as Mubarak’s Egypt did recently from the first to the second. And the countries of the Bolivarian Revolution—Venezuela, Ecuador, Bolivia—form something like a group of their own, in which some are willing to place their hopes.

Over time a zone of obligatory deference has formed around the word ‘democracy.’ Born at the heart of the West, it is a system of government that helps the rest of the world to join in by various means. All leaders, from the social democrats to despots, feel compelled to affirm their attachment to democracy. It is incontestable because it is the regime of liberty, which an insidious shift then identifies with liberal values, free trade, free competition and neoliberalism. Since the end of the “people’s democracies,” now a baneful memory, democracy has been inseparable from capitalism in its various aliases, and we shall therefore speak of democratic capitalism. Democratic capitalism has imposed itself as the ultimate, definitive form of social existence, not only in the ideology of the ruling class but even in the popular imagination.

But its legitimacy rests on a tripod, each of whose legs is worm-eaten or seriously cracked. The first is the constant rise in living standards supposedly leading to the formation of a universal middle class—a process that first took shape with Fordism—wage increases in line with productivity, so that the workers can buy more and keep the wheels of industry turning—and the different variants of social democracy since the New Deal, the Popular Front and post-war British labourism. Today, that pillar exists only in the head: that is, in the forecasts of finance ministries and international agencies, which are constantly belied by the facts and keep being revised downwards despite all the massaging of figures.

The second pillar is the peace that capitalism is supposed to have brought to the planet after “the horrors of the first half of the twentieth century.” One need scarcely be an expert in geopolitics, however, to see wars all

around us: civil wars of an intensity that varies according to time and place. Muted in Europe, fierce in the Middle East; terrible African wars against a backdrop of minerals, diamonds, and famine; forgotten guerrilla wars in Burma and the Philippines; never-ending wars in Afghanistan, Somalia, and Palestine. Are all those wars tribal, ethnic, and religious? Behind each one, democratic capitalism is busy defending its economic and strategic interests, its oil, mining, and agribusiness. Democratic capitalism has lost all credibility as the great pacifier, as the global Leviathan.

The most rotten of the three pillars is “democratic legitimacy” based on universal suffrage. After all, nations are led by the men and women the people have elected, and if they are unhappy they have only to choose others the next time round. This argument was already put forward when shelling the barricades in the Latin Quarter in June 1848:

“Universal suffrage has spoken, the people should not take up arms against those it has chosen”

But despite the etymology, despite the articles of constitutions asserting the sovereignty of the people, power nowhere belongs to the demos. That has been evident for a long time, but now there is something new as well. Today, power does not belong either to the caste of politicians who, by tradition, allocate ministerial and administrative posts to themselves in accordance with an electoral timetable. That kind of politics is no longer more than an empty form.

The indignados and the Occupy movement led to a certain awareness among types of individual who until then had been politically asleep. That was not insignificant but hardly earth-shaking: democratic capitalism has seen their kind before, and anyway it regards such movements with benevolent amusement. The riots or near-riotous demonstrations in France, England, Greece, and Sweden were less well received. On the right, the image was of hooligans mainly bent on looting fashionable stores. On the left, the emphasis was on the lack of political thinking behind the events. Such rejection is a sign of unease—justified, moreover, because those responsible for keeping order know where such popular bursts of energy might lead if they were organized and coordinated.

In the desolate world of democratic capitalism, the insurrection will not fail to envelop the whole rickety structure of Europe and North America, whether it starts out in Spain or Greece, France or Italy, Canada or the United States. The transmission will take place not by contagion—revolution is not an infectious pathogen—but by the effect of a shock wave. The countries one might consider more stable—by virtue of their traditions,

their apparent good health or their distance from the epicentre—will be paralyzed as the wave advances: the reasons why it is right to rebel are so numerous, and have been evident for so long, that no government will find the legitimacy enabling it to crush the insurrection by brute force. One success will bring others in its wake; the boldness of some will increase tenfold the preparedness of their neighbours to act.

What we must try to understand is not some nonexistent depoliticization but the prevailing skepticism about the idea of revolution. The very word, happily trotted out to sing the praises of a new vacuum cleaner, arouses pitying smiles when it is used to speak of the overthrow of the established order. One of the reasons for this has to do with the demise of “barracks communism.” To be sure, the leaders of the Soviet Union had long appeared as a gang of brutal bureaucrats, and life in that country as an unenviable fate, so that nothing much changed in that respect when the end came in 1989.

“Three years, from 1989 to 1991, were needed to confirm bureaucratically a death that had already occurred some time before. The socialist systems outlived the end of socialism.”

Nevertheless, however aberrant the form of social organization in the USSR and the “people’s democracies,” it liked to think of itself as different and claimed to be standing up to American imperialism. Deeply implanted in many a head was the idea that communism might have succeeded in different hands and in different circumstances. But that disappeared at the same time as the Soviet regime itself. The void that this created was like a period of mourning: you can feel relieved at the departure of a loathsome being yet also feel his absence as a lack. And all of a sudden the idea of revolution, linked to a whole set of images from the Smolny Institute and the Aurora cruiser, through Mayakovsky’s voice and the communal housing designed by constructivist architects, to Eisenstein’s October and Trotsky’s armoured train, found itself buried along with “actually existing socialism.”

The most difficult step, and the most contrary to ‘common sense,’ is to shake off the idea that a transition period is indispensable between before and after, between the old regime and active emancipation. Since the country must continue to function, we’ll keep the old administrative and police structures, we’ll keep the social machinery running on the pivots of work and the economy, we’ll trust in the democratic rules and the electoral system—the result being that the revolution is buried, with or without military honours.

Our aim here is not to draft a programme but to trace some paths, to suggest some examples, to propose some ideas for creating the irreversible

straight away. Of these paths, many will be outlined in the landscape we know best. But the approach has nothing in common with what used to be known as “socialism in one country.” The decay of democratic capitalism is such that, wherever the first shock occurs, its collapse will be international. We must always bear in mind, however, the fear of chaos—quite a common feeling which, though ceaselessly boosted and exploited by the ideologues of domination, cannot for all that be treated with contempt. No one looks favourably on the prospect of being plunged into the dark with nothing to eat.

If the huge rising force that points to a decisive break is to find and grasp the necessary lever, the first condition is to dispel the fear that exists in each and every one of us, to restore a relationship to the world rid of the anxieties of penury, deprivation, and aggression that silently weave the tissue of normal existence. But, above all, it is necessary to distinguish the two fears that domination carefully amalgamates: fear of chaos and fear of the unknown. It is the moment of revolution—what it opens up, the joy that invariably accompanies it—which transforms the latter fear into an appetite for the unknown, into a thirst for the novel. Besides, one always underestimates the people’s capacity to cope in exceptional situations.

In itself, a collapse of the apparatus of domination is never enough for the building of a new order. On the day following the victorious insurrection, it will be necessary to put in place barriers that prevent a return of the past, and to ensure that the ebb will not take the form of a return to normality. The state apparatus is in pieces, its debris whirling in empty space. Those who meet weekly to settle current business, and who are described against all the evidence as ‘the government,’ are dazed and dotted around the natural landscape; some have taken flight. But with the first moments over, they will try to find one another again, to put their heads together, to prepare their revenge. If they are to remain harmless, they must be kept scattered.

Such people operate through meetings, in offices, with files. We will take those away from them: we will close down, wall up and guard all the places where the wheels of the state were still turning yesterday—from the White House and Capitol to the most out-of-the-way town halls. Or we will turn them into public places, as in the luxury hotels in Barcelona in 1936. We will cut their lines of communication, their intranets, their distribution lists, their secure telephone lines. If the fallen cabinet heads and detested police chiefs want to meet in the back rooms of bars, that’s up to them. Without their offices, those officials will be incapable of action.

A revolutionary situation is not only about the reorganization of society. It is also, and above all, the emergence of a new conception of life, a new tendency to joy. Work will not disappear just because its structures have

collapsed; it will disappear out of a desire to experience collective activity differently. What can and must be done on the day after the insurrection is to separate work and the means of existence, to abolish the individual necessity to “earn one’s living.” This has nothing to do with any “social minimum thresholds,” where the adjective ‘social’ applies, as in other cases, to every system of measurement intended to make people swallow the unacceptable. The point, rather, is that everyone should have their existence assured, not through paid employment that they are always in danger of losing or some other form of reduction to an individual lot, but through the very organization of collective life.

Of course, social relations being as they are for the moment, it is difficult to imagine the abolition of wage labour, or even an existence in which money is relegated to the margins. Is not money, in every area of life, the essential intermediary between our needs and their satisfaction? To get some idea of what a non-economic existence might be like, it is enough to look back at the insurrectionary moments of history, to remember what the Spanish insurgents of 1936 were saying, or the occupiers of Tahrir Square, or of the Odéon in Paris in May 1968. Those moments when nothing is work any longer but no one counts the efforts they make or the risks they take, when market relations have been shifted to the periphery of life, are also the moments of the highest individual and collective virtue. It will be objected that a world is not constructed on the basis of exceptional moments—that is certainly true, yet those moments indicate to us what needs to be done. From the first day after the insurrection, the break with the past order must be grounded upon the human pockets of resistance constituted in action, rather than the suppression of these because they are reluctant to obey orders.

The great peculiarity of our epoch with regard to the money question has not received much emphasis. Never has money been so ubiquitous, or so necessary for the least step we take in life, yet at the same time it has never been so dematerialized, so unreal. The fright caused by mere talk of the possibility of a bank run anywhere in the world is enough for us to gauge the paradoxical vulnerability of that which forms the heart of present society. Money is no longer tangible matter, not even a scattered pile of bits of paper; it is no more than a sum of bits stored in secure computer networks. As far as bank accounts are concerned, it is possible to establish perfect equality through a few clicks on the central servers of a country’s major banks.

However, there will be no repetition of the Bolshevik or Khmer Rouge mistake of abolishing money at the moment of the seizure of power. The habit of falling back on one’s isolated individuality when it comes to ‘satisfying

one's needs'—the habit of paying for everything in a world populated with potentially hostile strangers—will not disappear overnight. You cannot just step unscathed out of the world of economics. But fear of deprivation, general mistrust, compulsive accumulation for no purpose, copycat desires—everything that makes you a 'winner' in capitalist society will no longer be more than a grotesque defect in the new state of things.

One has only to read Xenophon's *Economics* to understand what the subject is about. That dialogue concerns the best way for a master to run his domain. What should he do to ensure that his slaves work as well as possible and produce the most wealth under the iron rule of his wife-steward? Or that his wife manages the slaves with the greatest diligence and efficiency? Or that the master has to spend the least time in his oikos, and that his domain procures him the greatest material power and wealth? How should he organize the economic subjugation of the household in order to control as well as possible the servitude of his people?

Note in passing that the term 'control' derives etymologically from medieval bookkeeping techniques, which checked every calculation on a *contre-rouleau*, a counter-scroll. When political economy was born, in the seventeenth century, it showed straight away a concern to ensure that the "free activity" of the subjects should ensure the maximum of material power for the sovereign. As the science of the wealth of sovereigns and then of nations, economics is thus essentially the science of slave control, the science of subjugation. This is why its main tool is measurement, with market value as only a means to that end. It is necessary to measure in order to control, because the master must be able to devote himself entirely to politics. From its origins, economics organized servitude in such a way that the production of slaves was measurable. If Fordism became universal for a time, it was because it enabled the capitalist not only to produce more but to measure the workers' activity in minute detail. The extension of economics is in this sense identical with the extension of the measurable, which is itself identical with the extension of capitalism. Those who expose the near-universal spread of evaluative techniques into the least suspected corners of human conduct testify to the penetration of capitalism into our lives, our bodies, our souls.

Economics does indeed deal with needs: that is, the needs of the dominators, their need for control. There is not a real economy that is a victim of finance capital; there is only one mode of political organization of servitude. Its hold over the world comes from its capacity to measure everything, thanks to the global diffusion of all kinds of digital devices—computers, sensors, iPhones, et cetera—which are directly systems of control. The abolition of capitalism is above all the abolition of economics, the end of

measurement, or at least the imperialism of measurement. At the moment, it is necessary to measure for the one who is not there, for the master, for the central brain or office, in order that the one who is not there has a hold on the one who is there. Those who live there, who work there, are well aware of what they need to measure for their own local organization: the man who heats his home with wood has an interest in measuring the number of cubic meters he has in his garage; those who produce such and such a machine have an interest in measuring the stocks of metal they have before they launch into production. As for the forms of production whose only virtue is to be controllable from afar, by the boss or head office, they will be destroyed and give way to a different rationality from that of the master.

To refuse to make work the linchpin of existence is to fly in the face of common sense. The response is not long in coming: if everyone can choose to live without working, no one will work any more—a disaster. But for what? For whom? In the movement that brings yogurt into a refrigerator, there must first of all be cows and a dairy, but there must also be hundreds of people to design the container and packaging, to find the colouring, to check the taste, to launch the TV advertising; there must be technicians, people to print the packaging, to stick posters to billboards and buses, and people who transport the containers of yogurt, put them in the right place on supermarket shelves, stop anyone from trying to steal them; there must be cashiers and manufacturers of cash registers. Let us turn the facts around: the world of yogurt does not make thousands of people live; it forces them into meaningless lives. Hundreds of thousands of hours will be set free.

The common-sense argument—‘those who do not work do not eat’—is wrong for at least three reasons:

1. A lot of people who work today get up in the morning without difficulty, either because their work interests them or because friendship and team spirit give them enough satisfaction. But most of them are wage earners, conscious of selling their labour power to create wealth that goes into pockets other than their own. Then there are the various miseries of the wage-earning condition: the weight of the hierarchy, the obsession with productivity, the various forms of harassment, the fear of losing one’s job. If, despite everything, some wage earners now already get pleasure from their work, what will they not feel once it is no longer imposed on them by the need to ‘earn a living,’ once they are able to choose it freely? And when building workers will work to house their brothers and sisters, and no longer to enrich the shareholders of the multinationals, the atmosphere on building sites will doubtless be quite different.

2. With the end of democratic capitalism, the total quantity of work will decline. Necessary work will continue to diminish, as it has done continually since the end of Fordism and since the electronic revolution; a phenomenon linked, of course, with the shift of production to the Asian industrial infernos, although there too cracks are clearly audible. Most important, we shall see the disappearance of a huge mass of work that has no purpose other than to display publicly the servitude imperative. Democratic capitalism has created millions of jobs in the world that serve to establish operational and certificatory norms and to assess their application. In the so-called public sector as well as the private, experts daily invent new procedures and set new targets and indicators, putting to work crowds of auditors, bookkeepers, inspectors, mathematicians, and reporting specialists.

The dismantling of this global office, which is indispensable for the abstract and largely fictitious operation of democratic capitalism, will induce a sharp fall in the number of workstations. But what was considered a disaster in the age of compulsory work—the job losses regularly deplored by politicians on an ad hoc basis—will bring great flexibility in the choice between work and non-work: there will be more than enough workers, released by the meltdown of the bureaucratic society of guided consumption, to ensure the production of really necessary goods.

3. It is true that there will always be unpleasant work that involves getting dirty or is simply boring. In the West, this is at present assigned to human groups for whom the white Christian masses have the least consideration—the most recent arrivals or those with the darkest skins or at the very least, the poorest. To share it around more generally is to fight against both segregation and another malady: the division of labour. Theorized by Plato, analyzed by Marx, this runs deeper today than ever. It is said that Louis XIV courteously greeted the women who came to clean the parquet floors of Versailles and make them glisten. Nowadays a top executive never meets his cleaning personnel, who are indeed not part of his company. In his L-shaped daily itinerary—the horizontal stretch being from his villa in a wealthy suburb to the parking lot in his high-rise block, the vertical trunk being the elevator from the ground floor to his office—the only manual worker he comes close to is his chauffeur. Immaterial (not to say ‘intellectual’) labour and manual labour inhabit two different planets.

To divide up necessary but unrewarding tasks among everyone cannot be done successfully in authoritarian fashion; the attempts in this direction during the Chinese Cultural Revolution were more like re-education camps for intellectuals, which have not left behind good memories. To gain acceptance for a fair distribution of tasks is a matter of scale. If I have chosen to continue my profession as a dermatologist or book dealer, and if there is a need in my street or the next for a postal worker, a sweeper, or a butcher's assistant, I will learn one or another of these new jobs and willingly spend two or three afternoons a week on them—willingly, because in my neighbourhood or district everyone will freely accept them as necessary and meaningful. Neighbours will become workmates and, in some cases, friends. A street-sweeping team can be a happy, tightly knit team if it consists of volunteers who will perhaps be doing something different the next month. An attachment to colleagues, which can be seen every day in the mournful enterprises of capitalism, has the power to overshadow the unpleasant nature of a job.

The end of the centrality of work, the delinking of job and livelihood, will change everything. The poor and the less poor will leave their dilapidated shanties and mobile homes, bring abandoned towns back to life, reopen cafés and baker's shops; their presence will relieve the boredom of old people who have stayed put while waiting to die.

One example is Marinaleda, an Andalusian village with a population of three-thousand. After years of struggle, local peasants and a mayor who has been repeatedly elected for the past thirty years have succeeded in taking over a large farm that used to belong to an aristocratic family. Collectively they now produce there such items as artichokes, sweet peppers, and olives. Some work in a cooperative of their own creation, with a canning plant, greenhouses, and an olive mill. All the workers receive the same sum: 47 euros a day, or 1,128 euros a month, nearly double the Spanish minimum wage. Rents are 15 euros a month for 90-square-meter houses with a terrace. And for those who wish to build a home of their own, the municipality offers land, essential materials, and the advice of an architect, the only condition being that the future occupant should take part in the construction work. Canteens, school materials, daycare, and sporting equipment are available free of charge or for a token fee. The unemployment rate in Marinaleda is zero, whereas the average in the region is around 30 percent. There is no police—and no crime. Decisions are taken at assemblies that the whole population are invited to attend. The village does not function in egoistic autarky: the mayor and the other inhabitants have more than once

joined the struggle of Andalusian farmworkers, distributing food ‘levied’ from supermarkets, occupying banks, and installing themselves on farmland belonging to the ministry of defense.

“Don’t come and tell me that our experience can’t be transferred elsewhere. Any town can do the same things if it wants to.”

Of course in some towns you’re more likely to be met with Bearcats than in others. . .

With regard to public health, for instance, the siting of pharmacies, emergency services and specialist hospital facilities, or non-authoritarian ways of feeding practitioners into ‘medical deserts’ and addressing any shortage of nurses, anesthetists, and midwives, are clearly local issues. They were impossible to solve under democratic capitalism, because it was said that the necessary funds were not available. But everything will change as soon as health has ceased to be a major focus of profit-making and the running of things is entrusted to those who have chosen to work there. This is not a naïve fantasy. After the Cuban revolution, medicine in that country became the best in Latin America and infant mortality fell to the level of the industrial countries—all without any noteworthy injection of cash.

The issues that concern the country as a whole bristle with difficulties that have never and nowhere been properly resolved. They revolve around what classical philosophers used to call representation of the people and expression of the general will. The idea handed down from the past, which naturally comes to mind on the day after a victorious insurrection, is to elect an assembly while endeavouring to avoid the pitfalls of classical parliamentarism: that is, to insist on a binding mandate with a time limit, on the possibility of recalling representatives, and so on. But whatever the precautions, such an assembly will more or less correspond to the country as it was on the eve of the meltdown of democratic capitalism. The most illustrious assembly in French history, the Convention Nationale, had a majority of Physiocrats (we would say liberals) raised in the school of Turgot and Quesnay. When Thermidor arrived and the iron grip of the most determined revolutionaries had been broken, the centrist-liberal swamp they had previously managed to carry along with them took power in the assembly and, in keeping with its true nature, went over to the side of reaction and economic liberalism.

On the other hand, it is hard to see how an elected assembly could deal in an informed manner with such diverse fields as photovoltaics, river transport, and the elimination of pesticides. It might be said that this is

the case today, but that is precisely the point. For decades now—some might argue always—national assemblies have not solved anything because politicians do not know the subjects at issue, because they are often in thrall to contradictory interests and pressures, because the system promotes bland mediocrities and charismatic con-men, and because the very workings of a congress do not allow serious debate. The allocation of work to specialist commissions is only a pretense, since each one is a mini-parliament, whose members seek only to assert their own image and that of their party.

And how could an assembly do without an executive? To return to the Convention during the French Revolution, it is true that ministers were reduced to the role of docile implementers of decisions, but the Committee of Public Safety—a creature of the legislature, elected by the assembly and in principle renewed each month—was a *de facto* executive. Once an executive system has been created, its natural tendency will be towards efficiency—how could it be blamed for that?—and therefore to greater centralization. In this way the circle will be closed. Starting from the way it exists today, bureaucratic centralism will have been first destroyed and then reconstituted with different names, different administrative grades, and different uniforms. Until now, all revolutions have followed this pattern—except for those like the Paris Commune which did not have enough time. If we are to avoid parliamentarism, history serves only to assist reflection on past failures. The solutions have to be invented.

A system so contrary to our inherited habits cannot function without hitches. A degree of disorder will have to be accepted for a time, as the consequence of a choice not to have the revolution led by the center or by an uncontrollable, irremovable political party doomed to bureaucratic senescence. In fact, many political systems have been born amid disorder. Even American democracy, commonly presented as a model of peaceful evolution, came about in a context of violence, in which the struggle for independence went together with an undercover war of the poor against the rich.

“In the first half of the nineteenth century, what fascinated outsiders was the sheer implausibility of democracy in America. Could you really do politics like this, with such fractured and chaotic popular input? It seemed unlikely anything so ramshackle could last long.”

Aristotle is right that most of us need leisure and education to be good people. Mao and Fanon are right that our universities don't provide that kind of education to most of the people who attend them. Despite this,

somehow we do end up with some good people, in spite of ourselves. Some of the people who come out of our universities do genuinely think about this stuff and are real aristocrats. Some of the people who work for a living are savants at goodness and don't need fancy education to figure it out. But if we put the university-educated people in charge, the good ones won't win out, and we'll get vulgar government. And if we put the workers in charge, the good ones won't win out, and we'll get terror. Somehow we have to get the good university people and the good working people into the same political movement. But it's hard to do this, because we don't trust each other. We fear they might kill us. They fear we might enslave them.

A lot of this history has already been written. We have enslaved them. They have killed us.

Guillotine. Kolyma. Pol Pot. Such is the almost obligatory response to anyone who speaks today of overthrowing the established order. Many thinkers have worked to make the contours of revolution coincide with those of the great bloodbaths, to develop concepts like totalitarianism that make it possible to tar everything with the same brush and avoid serious reflection. The argument does not, however, lack any foundation. In the victorious revolutions of the past, the fate of their opponents has never been enviable, and this is the main and original factor that led those revolutions in the direction we know. Of course, in the French, Russian, or Chinese revolutions, the circumstances of the day—civil war, external war—hardly left much latitude to devise solutions other than sheer repression. But there is nothing to suggest that the coming revolution will be immunized by its nature against this danger.

Once the state apparatus has broken up, calls for vengeance will be heard from the very first days. Will the arrogance of riches, the hatred and contempt for the people, go unpunished? Will those who organized repression for their own benefit be allowed to eke out their days in peace? However legitimate these questions, however great the pleasure in seeing evil-doers punished, we must say 'no' to the sad passion of revenge. Let us be clear: this has nothing to do with forgiveness, non-violence, or any other of those 'values' that were so useful in maintaining the old order. If revenge is to be set aside, it is not for moral reasons.

Against whom should it be exercised? Even if we dismiss personal vendettas that might pollute the legitimate stream of public retribution, the answer is not so simple. Should it be directed at the politicians, cabinet heads, ministers responsible for years of criminal repression against migrants and the incarceration of their children? Or the CEOs who signed off on "social plans" to improve their company's profitability and increase their bonuses? Or the HR directors who implemented them, or the riot police

who gassed those protesting against them? One could easily answer ‘yes’ to all, but then we’d be talking of hundreds of thousands to be punished. Better in the end to just get on with things: you don’t punish a system, you bring it down and leave the fallen debris to its fate. And to be clear, this has nothing in common with such actions as Nobel-Peace-Prize-winner Barack Obama refusing to hold accountable torturers and war criminals—he saved the apparatus, he destroyed nothing but more lives.

There is a famous precedent for such a course in Greek antiquity, whose myths and history nevertheless include many varied episodes of revenge. In 403 BC, the tyranny of the Thirty—imposed on Athens after Sparta’s victory in the Peloponnesian war—was ended by the army of Athenian democrats. The overthrow of that cruel and detested regime might have been expected to unleash a wave of collective vengeance, but what happened was the opposite. The assembled Athenians took a collective oath not to recall the evils of the past.

“Once the tyrants, the same men who had provoked what the spokesman of the victorious democratic army described as ‘the most awful war, the most sacrilegious, the most odious to gods and men,’ are expelled, once they are charged with all the crimes of which Athens must be exonerated, after all this, well, let’s forget it! Officially and institutionally. Forget that there were two parties; and the winners themselves solicit the forgetting, those same men who had knowingly chosen their side.”

One might fear that such an amnesty would make more people than ever thirst for revenge. But no, there will be enough joyful sights to ward off frustration and to dispel resentment: for example, yesterday’s powerful men carrying their shopping, and bringing them back to modest homes or apartments; the children of poor neighbourhoods playing in the gardens of former mansions and ministries; police stations converted into recording studios, and yachts into sailing schools for schoolchildren.

What the victorious revolution should establish is the exact opposite of collective punishment: real liberty.

In the industrialized world, virtually all printed newspapers, nine-tenths of publishing and most audiovisual output are owned by financiers. And at the head of their employees in information and entertainment, they have placed reliable men (sometimes women) trained in the economics and business schools, who have no need of directives to follow the general line reflecting the political consensus and competitive commercial considerations. Such people are judged by figures—audience share, print runs, advertising

revenue—and any thanks they receive is for their performance on these points, not for a sudden flash of independence. Appointed by the owners of capital, these authorized representatives install beneath them others whose docility can be guaranteed; the process is then repeated all the way down the company hierarchy, or at least as far as the technical personnel, who on the whole have their own views on matters.

Thus, far more than a cynical wish to misinform and dumb-down, it is institutional conformism and voluntary servitude that make media products so massively uninteresting. The public is aware of this—which does much more than vague anthropological or cultural considerations to account for the “crisis” of the press, book publishing, and so on. To liberate information and permit the free expression of opinions is therefore not the same as doing away with a surveillance that has no need to exist. To depose the media bosses and dismiss the hierarchy are an indispensable first step, but the logical continuation—to hand the press and audiovisual media over to those who work in them—is not a matter of course.

Most of the journalists in question have been formed (formatted) in the grey world of political science faculties. Coming from the same intellectual and political background, they believe what they write. With some exceptions, the media teams already in place will not bring even a breath of fresh air to the world of information. At the same time, we should not forget that for a long period in history those who wrote in the press were not always professional newspapermen. And the same is true of the authors of today’s rare articles of interest. We shall go further in this direction; we shall open up the press and audiovisual media to everyone—to those whose voices are never heard, but also to those who disagree—whether they regret the passing of the old order or are impatient to see the new course speed up. There will be acceptance of do-it-yourself broadcasts, imperfections, gaps, and heterogeneity. There will be no longing for classroom voices, slick hypocrisy, uniformly dull editorials, or the idiotic games that make up today’s bleak media landscape.

This cultural revolution will not automatically bring geniuses to light. But history tells us that times of collective joy, when subjectivities are dazzled by a sense of participation in a common adventure, are also the ones of greatest creativity.

But it is not only a matter of the expression of ideas: a counter-revolution will unfailingly seek to organize itself. It is impossible to predict the conspiracies and stratagems that it will come up with to restore capitalism, or the counter-blows that will be necessary to oppose it. We can only say that we will not reopen the gates of the prisons we have just pulled down, that we will neither banish nor execute our enemies. Let us trust in the collective

imagination; that is what is most cruelly lacking amid the fog of democratic capitalism.

“You have seen an immense people, master of its destiny, return to order amid all the fallen powers—powers that have oppressed it for so many centuries.”

The other possibility—which does not preclude various fascistic thrusts—is a continuing breakdown of social, cultural, and governmental infrastructures that never reaches completion: a kind of end without an ending, which no revolutionary or counter-revolutionary surge ever quite wraps up; an infinite degradation of everything; a dissolution of the present order without an explosion. Such a process is imaginable because of the new and diffuse cybernetic control of whole populations, and because, beyond the vanishing of any society worthy of the name, Google, Facebook, Apple, Microsoft, and the like maintain a semblance of social relations, a ‘social network.’ The former boss of Google, Eric Schmidt, explains in a book he wrote with an American anti-terror agent that Somalia is a fascinating textbook case since it is the oldest of the “failed states”—a country where any form of state disappeared way back in 1991. Nothing works in Somalia except for telecommunications, which are less expensive there than anywhere else; failing an adequate food ration, a quarter of Somalis possess a mobile phone. Similarly, at the ‘end’ of the war in Iraq, the supply of water, food, and medicine could not be relied upon anywhere, but everyone carried a mobile phone. The dream scenario for Google and its ilk is for smartphones and myriad apps to provide all the services that the state is no longer in a position to supply: access to education, information, banks, weather forecasts, and so on. Here the collapse becomes a stable condition—and a profitable one.

For the West, a Somali scenario is not to be feared in the immediate future. It is a variant that needs to be borne in mind: on the one hand, ever richer, ever more ‘communicative,’ ever more global, connected, and productive city centres; on the other hand, more and more nightmarish zones of banishment, where everything is in short supply, where all trace of the state has disappeared, where people survive only through ‘crime’ before dying an early and brutal death, where regular anti-terror and anti-drug and anti-migrant operations permit constant disorganization and ultimately make it possible to render chaos inoffensive. The ‘networked metropolis’ might then look at itself through the eyes of its opposite and pass off its deep-rooted barbarism as a peak of civilization. In those banishment areas, as in Somalia, telecommunications could easily be kept in service, especially as they would allow constant monitoring of all exchanges and relationships

formed there—a continual flow of information to those who run the business from their comfortable position outside. With the Wuhan Flu panic we only seem to be increasing our speed towards this dystopic future.

You would thus have the maintenance of capitalism through profitable interconnected pockets, together with optimal management of its contradictions and the threat represented by brutal impoverishment of the greatest number. The rulers would not forget to denounce the inexplicable ‘descent of the population into savagery,’ and they might even point to racial causes for the catastrophic situation they have deliberately produced. This is why we cannot merely watch and record the collapse of the present social edifice; we must make it happen as soon as possible, before a permanent state of decomposition has been established.

“Only the Revolution, by clearing the ground, will light up the horizon and open the roads, or rather the many paths, that lead towards the new order.”

So as not to find ourselves stuck in one or another version of the life-and-death struggle waged by democratic capitalism, the first idea is to organize. If the current ferment remains fragmented, if the centres of revolt are linked by nothing other than mutual sympathy, the state apparatus will continue to stand, even if only a layer of rust holds it together. But the word ‘organization’ sometimes takes on a magical character, by covering practices that are largely a matter for the imagination.

We must start from what we have before our eyes, not from some fantasy projection. Everyone can see groups of people—wage earners and unemployed, soup kitchen users, prisoners, single mothers—who can no longer endure the life they are forced to lead. Everyone can hear the anger in the factories, popular suburbs, and ports, among megastore cashiers and utility employees, in the banks and newspapers, even among airline pilots. To organize means to help these groups evolve gradually into subversive constellations through the force of friendships, shared hopes and common struggles. It means to open up paths that help them to get together across towns and villages, between one neighbourhood and another, from city center to the country. That is the opposite of the abstract “convergence of struggles” that professional activists always invoke but never achieve. The only convergence of struggles we can imagine is local or regional: a struggle in a tire factory for example could carry along the whole surrounding area, where everyone’s lives would be affected by its victory or defeat. Instead of living as if enrolled in a given sector of the economy, instead of seeking to converge with struggles in the same sector in the four corners of the country

or continent, a factory could also think of itself as immersed in a whole set of local links, which the conflict has every chance of politicizing because it affects them directly.

So, there we are. Since time is pressing, let us press forward, measure our strength, and meet up with one another.

Resisting Illegitimate Authority

The Oldest Questions

I wish I were a little rock
A-sitting on a hill
A-doing nothing, all day long
But just a-sitting still

But as we know, stones on hillsides do not always remain stationary.

“Nobody is more dangerous than he who imagines himself pure in heart, for his purity, by definition, is unassailable.”

“What did you learn at school today? Did you learn how to believe or did you learn how to think?”

“If we don’t speak up, we are cowards and accomplices.”

Sometimes, nothing is more difficult than disobedience. The infamous Milgram experiment showed that, however much we might like to think ourselves incapable of doing something atrocious just to avoid making waves, most people are very reluctant to challenge authority. It’s no mystery why ordinary Germans could help carry out a Holocaust.

“Even when the destructive consequences of their work become patently clear, and they are asked to carry out actions incompatible with fundamental standards of morality, relatively few people have the resources necessary to resist authority.”

March 1968’s My Lai massacre has become the most infamous event in the history of the Vietnam War. Over a period of hours, American soldiers systematically raped and murdered hundreds of unarmed villagers. After an initial cover-up, 26 soldiers were charged with offenses related to the massacre. Only one, Lt. William Calley, was convicted. Calley served three

years under house arrest, but even that was considered so harsh that it created a public outcry. There were pro-Calley sympathy marches across the country, and the White House was flooded with calls for his release. A song called “The Battle Hymn of Lt. Calley,” honoring the man who had ordered the execution of dozens of Vietnamese children, sold a million copies. Most Americans saw Calley not as a mass murderer but as a brave soldier doing his duty. Calley became a household name after the massacre, during the debate over his trial and sentence.

Less-well known was another man present in My Lai on the day of the massacre: Hugh Thompson, a helicopter pilot who intervened to prevent Calley’s men from killing more civilians. Thompson had been flying over the village when he noticed the large number of civilian casualties, and realized something was wrong. Thompson landed near an irrigation ditch, into which soldiers had herded women and children to be shot. Realizing the kind of atrocity that was unfolding, Thompson angrily confronted Calley:

THOMPSON: What’s going on here, Lieutenant?

CALLEY: This is my business.

THOMPSON: What is this? Who are these people?

CALLEY: Just following orders.

THOMPSON: Orders? Whose orders?

CALLEY: Just following...

THOMPSON: But, these are human beings, unarmed civilians, sir.

CALLEY: Look Thompson, this is my show. I’m in charge here. It ain’t your concern.

THOMPSON: Yeah, great job.

CALLEY: You better get back in that chopper and mind your own business.

THOMPSON: You ain’t heard the last of this!

Getting back in his helicopter, Thompson saw a group of Vietnamese civilians fleeing from approaching US soldiers. Landing the helicopter between the soldiers and the villagers, Thompson threatened to open fire on the soldiers if they attempted to harm the civilians. After a tense confrontation, the soldiers backed down, and the massacre finally ended. Thompson evacuated the surviving Vietnamese to nearby hospitals.

A few observations should be made about Thompson's behavior. He did not accept 'just following orders' as a justification, even though the job of a soldier is to carry out orders. Thompson was not acting on any 'authority,' and could not actually command the killers to stand down. Stopping the massacre required him to take the side of the 'enemy,' by pointing a weapon at his fellow members of the US armed forces on behalf of the innocent My Lai victims. He had to be prepared to kill other Americans in order to save Vietnamese lives.

It is difficult, from 50 years remove, to appreciate how much courage and integrity something like this takes. Americans in Vietnam were trained not to view the Vietnamese as people. They never even referred to them as 'Vietnamese,' instead using racist slang like 'gooks' and 'dinks.' There was a culture of disregard for the lives of villagers, who were all viewed as potential collaborators with the Viet Cong. Resisting this indoctrination, and retaining one's full humanity, was extremely challenging. But Thompson did not just refuse to take part in the dehumanization process. He was even willing to threaten other troops with force, and thereby risk being branded a traitor and enemy sympathizer.

Indeed, that is exactly what happened after the massacre was exposed. The public rallied around Calley, the murderer, rather than Thompson, the decent man. Thompson was bombarded with death threats and accused of disloyalty for threatening other Americans and for testifying against them. He was treated as having done the wrong thing rather than the right one, because he disobeyed and acted on his own initiative.

This is an important part of the story, and tells us a lot about what courage is. Obviously, many soldiers are courageous, in that they risk their lives out of perceived obligation to their countries or units. But it takes a special kind of courage to risk your life to defy your country or unit. That's because of what Milgram showed: if all of the social incentives are toward compliance, the most difficult thing is to be the one who refuses to comply. Incidentally, this explains why many draft resisters have said that it was a harder decision to dodge the draft than to comply with it: by avoiding serving in a war they found unjust, they risked incurring the disapproval of their families and communities, and being branded cowards the rest of their lives. It is hard to do something dangerous, but it is even harder when people whose respect you value will see you as a bad person. The most courageous acts are not necessarily the ones that result in acclaim, but can be the ones that bring derision and hatred.

Of course, the story of the Vietnam War should not be about Hugh Thompson. The main focus should be on the 1.3–4 million Vietnamese people who died as a result of that war. Americans often tell the story of the

war as the story of our involvement in the war: the soldiers, from the good Thompsons to the bad Calleys, and the anti-war movement, and the Nixon administration. But the devastation inflicted on the Vietnamese dwarfed that which Americans faced, something that we still fail to fully appreciate. America often measures the consequences of war by deaths and injuries to US soldiers, casually failing to account for the immeasurably greater harm inflicted on the countries in—or on—which we wage war.

My Lai itself can be a somewhat misleading incident to single out. While it is rightly infamous, dwelling on it risks confirming it as an aberration in an otherwise humanely-prosecuted war. But the killing of Vietnamese civilians was routine and widespread. Furthermore, it was our indiscriminate bombing that produced the most innocent deaths. The US dropped more than 3.5 times as many tons of bombs on Vietnam than it dropped during the entirety of World War II. Many of these did not explode, and continued to victimize people for decades afterwards. Between 1975 and 2007, 105,000 Vietnamese people were killed or maimed by explosives that had been leftover since the war, which left 15% of the total surface area of the country contaminated by unexploded ordnance. The hundreds of deaths at My Lai were an atrocity, but more importantly, American military action in Vietnam was itself an atrocity, one that continues to take lives long after US forces departed.

Nevertheless, the story of Hugh Thompson's individual actions is worth retelling, because it offers a lesson about how a moral human being should respond when their countrymen are engaged in something abhorrent. One of the most important, and least discussed, findings from the Milgram experiment is that while most people do comply with unjust commands, they are far less likely to do so if even one other person speaks out against the injustice. People were willing to inflict painful electric shocks on others because the experimenter told them to do so, but if they observed someone else refusing, they themselves would often refuse as well.

All progress depends on the unreasonable man because being reasonable means adapting to the world's standards while being unreasonable means changing the world to fit your own standards. Horrors can only be prevented if there are people around who are brave enough to risk being called unreasonable or traitorous.

I'd like to think that in the same situation, I would have the courage to do what Hugh Thompson did. I am not sure that I would; few people do. But 50 years after My Lai, everyone should reflect on what it takes to ensure that atrocities like that, and like the entire Vietnam episode, never take place again.

The oldest political questions: Home or exile? Lord or subject? Master or slave? These are eternal themes of knowledge, authority, and power that

can never be settled for all time. There is no end of history; each generation must assert its will and imagination as new threats require us to retry the case in every age.

Authoritarian: relating to, or favoring blind submission to authority; characterized by or favoring absolute obedience to authority, as against individual freedom; of, relating to, or expecting unquestioning obedience

In contrast, anti-authoritarians reject—for themselves and for others—an unquestioning obedience to authority, and they believe in challenging and resisting illegitimate authority. Anti-authoritarians are a threat to authoritarians who demand unquestioning obedience. Thus, authoritarians attempt to marginalize anti-authoritarians. Anti-authoritarians in the United States have been scorned, shunned, financially punished, psychopathologized, criminalized, and assassinated. While US society now honors a few deceased anti-authoritarians, these same figures were often marginalized, silenced, and dishonored in their own lifetime. Today, anti-authoritarians continue to be under great pressure to comply with the status quo, making their survival difficult. All noncompliance creates tension, but not all noncompliant people are anti-authoritarians.

While all anti-authoritarians do not identify with a political philosophy, all anti-authoritarians do represent a political threat to their authoritarian surroundings, be that a government, school, or family. Anti-authoritarians create tension not simply for authoritarians with power but also for authoritarian followers who fear that the absence of a strong authority will result in chaos. In contrast, anti-authoritarians believe that what is most dangerous and harmful is an illegitimate authority.

“When you think of the long and gloomy history of man, you will find more hideous crimes have been committed in the name of obedience than have ever been committed in the name of rebellion.”

In the 1950s and 1960s, the horrors inflicted by Nazi Germany were still on the minds of many Americans, and the 1950 book *The Authoritarian Personality*, which psychopathologized authoritarian personalities, became popular. In the early 1960s, psychologist Stanley Milgram’s studies revealed a frightening obedience among Americans to illegitimate authority, and this became a cause for concern. By the 1980s, US society had changed.

In 1980, Americans elected former actor Ronald Reagan to the presidency. Reagan had previously acquired an authoritarian strongman reputation by

putting down student revolts as governor of California. By the mid-1980s, the Democrats, wanting to appear as tough as the Republicans, strongly supported “anti-crime” legislation that has contributed to the United States having the highest incarceration rate in the world, caused in large part by hypocritical drug laws.

In the mental health profession during the 1980s, it was noncompliance rather than compliance that became increasingly pathologized. The American Psychiatric Association (APA), politically in step with US society, revised its diagnostic manual, the DSM-III (1980), to include “oppositional defiant disorder” (ODD) for noncompliant kids who do not engage in criminal behaviors. The APA classifies ODD as one kind of “disruptive behavior disorder.” Disruptive behavior disorders are now the most common diagnosis of children medicated with antipsychotics, which are among the highest grossing classes of drugs in the United States today. The US antipsychotic drug explosion is largely the result of their use on non-psychotic vulnerable populations—especially foster children, the elderly in nursing homes, and inmates in prisons and jails—as a relatively inexpensive way to subdue and manage these groups.

There are certainly societies less free and more oppressive than the United States. However, what makes life difficult for US anti-authoritarians is that Americans are indoctrinated to believe that their society celebrates anti-authoritarianism. And so they are less prepared for the reality of anti-authoritarian life than others who have not been so indoctrinated.

The DSM is about as scientifically valid as Leviticus. The authors of both the DSM and Leviticus simply labeled those behaviors that made them uptight. In Leviticus, these anxiety-producing behaviors were labeled ‘abominations’ and ‘sins,’ and in the DSM they were labeled ‘mental illnesses’ and ‘mental disorders.’ In Leviticus, homosexuality is an abomination; and in DSM-II, homosexuality was a disorder. Homosexuality was not listed as a disorder in the DSM-III only because gay activists—assisted by a changed cultural climate in the 1970s—had enough political clout to abolish this insult to their sexual identity. However, noncompliant youngsters had no such political clout, and so in the DSM-III, “oppositional defiant disorder” was created for them.

Gaining acceptance into graduate school or medical school and then gaining a PhD or MD to become a psychologist or psychiatrist requires an extraordinary amount of compliance to authority. It is clear to me that the selection and socialization of mental health professionals weeds out many anti-authoritarians, and this has significant consequences in the pathologizing of noncompliant and rebellious people.

Authoritarians with power demand unquestioning obedience from those

with lower rank. And authoritarian subordinates comply with all demands of authorities. Anti-authoritarians, in contrast, reject unquestioning obedience to authority. Anti-authoritarians question whether or not an authority is legitimate before taking that authority seriously. And anti-authoritarians challenge and resist illegitimate authorities. Anti-authoritarians oppose the imposition of illegitimate authority not only on themselves but on others as well. For anti-authoritarians, evaluating the legitimacy of those in authority includes questioning the legitimacy of societal badges. Anti-authoritarians assess whether authorities actually know what they are talking about, and whether they are competent, honest, have integrity, and care about those people who are trusting them. And when anti-authoritarians determine an authority to be illegitimate, they challenge and resist that authority, whether the authority is their doctor, teacher, parent, or government.

Dissent is different than disobedience. A person may dissent with an authority but may still obey. People who are capable of dissent but incapable of disobedience are uncomfortable challenging the very legitimacy of that authority to wield power. Anti-authoritarians are comfortable with both dissent and disobedience, as they are comfortable questioning, challenging, and resisting authority they deem to be illegitimate.

Oppositional: the actions of opposing, resisting, defying, combating

Before young people become anti-authoritarians, they are often oppositional; as before they pride themselves on distinguishing legitimate from illegitimate authority, they can pride themselves on their noncompliance. Thus, it is troubling that being oppositional and defiant has been pathologized by the American Psychiatric Association as a mental disorder called “oppositional defiant disorder.” This psychopathologizing and resulting ‘treatment’ make it more difficult for young people’s prideful noncompliance to mature into this vital societal contribution: discerning an authority’s legitimacy, and resisting illegitimate authority.

I feel lucky. Lucky about not being diagnosed and labeled. Lucky about not being behavior modified or medicated. And lucky about not being deprived of that great feeling of successfully outsmarting a teacher. And I feel sad that many kids today are not so lucky.

Every form of authority has to prove that it’s justified—it has no prior justification. An example of justified authority: When you stop your five-year-old kid from trying to cross the street, that’s an authoritarian situation—it’s got to be justified. Well, in that case, I think you can give a justification. However most of the time these authority structures have no

moral justification, they are just there in order to preserve certain structures of power and domination.

“Resist much, obey little. Once unquestioning obedience, once fully enslaved.”

A 2012 Harris Interactive survey asked American adults:

“Given the recent reports concerning the threat posed by terrorists who plan to implant bombs within their own bodies, how willing, if at all, would you be to undergo a TSA [Transportation Security Administration] body cavity search in order to fly?”

A body cavity search consists of one’s mouth, anus, and vagina being probed and inspected by uniformed authorities—an extreme invasion of one’s physical privacy, and so one can argue that only an authoritarian who unquestioningly obeys authority would comply. The poll reported that 15% of American adults are “completely willing” to comply, and that an additional 15% are “somewhat willing.” And so, a total of 30% would comply with authority and submit to such a privacy violation in order to board a plane. Results were virtually the same with self-identified Democrats and Republicans: 15% of both Democrats and Republicans were “somewhat willing,” and 15% of Democrats and 16% of Republicans were “completely willing”.

Another question on the Harris Interactive survey was:

“How reasonable or unreasonable do you feel it is that travelers should be made by law to obey every command given by a TSA agent inside an airport or any other public place given the threat posed by terrorists?”

A majority of Americans, 57%, considered a law to obey every command to be either completely or somewhat reasonable. However, surveys only detect people’s self-perceptions and not their actual actions. One hopes when faced with the imminent prospect the numbers might drop—however it is at least equally plausible that they would increase.

Milgram carried out several variations of his original famous study, altering the situation to see how this affected obedience. The authority’s ‘badges’ were significant. In the original study, the experimenter authority wore a grey lab coat uniform as a symbol of his authority, but in one variation, the uniformed experimenter authority was called away and replaced by an experimenter in everyday clothes rather than a lab coat; and here the 450-volt highest-level obedience rate dropped from 65% to 20%. In another

variation, when the site of the experiment was moved from Yale University to a run-down office, the 450-volt highest-level obedience rate dropped to 47.5%.

Proximity to the experimenter authority figure also changed the compliance rate, as when the experimenter authority telephoned orders rather than being in the same room, the obedience rate fell to 20.5%. Another variation of the experiment shows the importance of modeling disobedience in order to reduce compliance with illegitimate authority. When two other participant teachers were also confederates (sitting next to the teacher subject) and refused to obey—one stopping at 150 volts, and the other stopping at 210 volts—the level of obedience was reduced from 65% to 10% compliance for the highest-level shock.

Milgram's studies on obedience to authority have been replicated many times in the United States and around the world with slightly different methodologies but similar results. Milgram believed that the obedient were not without morality but that their morality was an authoritarian morality.

“Although a person acting under authority performs actions that seem to violate standards of conscience, it would not be true to say that he loses his moral sense. Instead, it acquires a radically different focus, his moral concern now shifts to a consideration of how well he is living up to the expectations that the authority has of him.”

One criticism of Milgram's conclusions is that obedience and disobedience are more nuanced than Milgram depicted. Researchers analyzed the dialogue from audio recordings of Milgram's study participants, and found that people classified as obedient tried several different forms of verbal protest, saying things like:

“I can't do this anymore.”

“I'm not going to do this anymore.”

But they ultimately continued. For some, this was an attempt at disobedience. But for Milgram, these protests were dissent, not disobedience, and what's crucial is that dissent without disobedience had no value for the shocked learner.

The conventional Right-Left distinction—especially for many oppressed groups—is not all that useful when examining authoritarianism. For many oppressed groups, the difference between the Right and the Left is only in their techniques used to coerce conformity and gain control. While the Right favored killing indigenous Americans to steal their land, so-called

progressives on the Left favored forced assimilation through boarding schools that prohibited the use of tribal languages and customs, which made it easier to divide and conquer Native people—and then steal their land. For oppressed homosexuals in the United States, again the Right and Left differed only on the kind of techniques used to coerce conformity and gain control. The Right favored criminalizing and imprisonment, while progressives on the Left favored ‘treatment’ for homosexuality, including aversive conditioning techniques involving electric shock and nausea-inducing drugs during presentation of same-sex erotic images.

Anti-authoritarians’ refusal to be intimidated by the political consequences of challenging authority can—at the right moment in time and with some luck—be successful. What can catch anti-authoritarians by surprise is that no matter how important their supporters have deemed their past contributions, if their other anti-authoritarian actions create problems for their supporters, admiration can quickly turn to abandonment and assault. What is especially sad is how previous extraordinary accomplishments in no way mitigates the ferocity of these assaults. For many famous and non-famous anti-authoritarians, their compulsion for truth-telling makes it difficult for compromises and diplomacy.

“Paine was at his best at the very moment of overthrow, when principles of government were called into question and new classes emerged into political life. But Paine was temperamentally and intellectually unsuited for the day-to-day affairs of government.”

This dark reality about US society continues to catch naïve anti-authoritarians by surprise—as well as to create anxiety and extreme vigilance for other US anti-authoritarians. No matter how great anti-authoritarians’ contribution to society and how much they are admired, they remain vulnerable to marginalization for a politically incorrect challenge of authority. If such an ostracism can happen to Paine and Nader despite their monumental contributions, no anti-authoritarian is safe. The anxiety that many anti-authoritarians experience is not a symptom of mental illness but a sense of reality.

Shortly after leaving the Nation of Islam in 1964, Malcolm X made a pilgrimage to Mecca, resulting in his departing from his previously anti-white racist views of the Nation of Islam. He wrote in his diary:

“Islam brings together in unity all colors and classes.”

Malcolm X had come to believe that God embraced Jews, Christians, and Muslims alike, denied that whites were “devils,” and blamed his previous

anti-white sentiments on Nation of Islam indoctrination. The central point for Malcolm X had now become the necessity for blacks to transform their struggle from 'civil rights' to 'human rights,' redefining racism as "a problem for all humanity." When Malcolm X returned to the United States after traveling in the Middle East and Africa, he spoke on college campuses and elsewhere, including events for the Socialist Workers Party and their Militant Labor Forum. For years, he had preached the virtues of entrepreneurial capitalism, but at the Militant Labor Forum, when asked what kind of political and economic system he wanted, he observed that:

"All the countries that are emerging today from under colonialism are turning toward socialism. I don't think it's an accident."

For the first time, he publicly made the connection between racial oppression and capitalism.

Malcolm X was committed to asserting the truth, including the truth of his mistakes. While his views on illegitimate authority dramatically changed, he was consistent in seeking truth, asserting it, and challenging and resisting authority that he deemed illegitimate. It is precisely Malcolm's capacity to self-correct that makes him one of the most extraordinary anti-authoritarians in US history. Near the end of his life, Malcolm X discussed with Parks an incident earlier in his life when a white college girl had come into a Black Muslim restaurant and asked him what she could do to help. He had told her, "Nothing," and she left in tears. Malcolm X told Parks:

"Well, I've lived to regret that incident. In many parts of the African continent I saw white students helping black people. I did many things as a [Black] Muslim that I'm sorry for now. I was a zombie then—like all [Black] Muslims—I was hypnotized, pointed in a certain direction and told to march. Well, I guess a man's entitled to make a fool of himself if he's ready to pay the cost. It cost me twelve years."

The life of Malcolm X is replete with valuable lessons. One lesson is that when we have experienced enormous pain from an illegitimate authority, we may be drawn toward any other authority that validates our pain, and it can become difficult to think critically about that validating authority, especially if we are stressed and vulnerable. Malcolm X's attraction to the Nation of Islam was similar to people whom have been assaulted by psychiatry and become attracted to the Church of Scientology, and then become embarrassed when they realize they've joined an authoritarian organization.

People damaged by one authoritarian religious organization are vulnerable to joining another one simply because it is critical of what has damaged them. This is also the case with authoritarian political organizations. Many people oppressed by authoritarian company owners became anti-capitalists who were uncritical of authoritarian Bolsheviks. The greatness of Malcolm X lay not simply in his courage to challenge and resist illegitimate authority but in his courage to reassess his views.

“I had heard but little of Socialism, knew practically nothing about the movement, and what little I did know was not calculated to impress me in its favor. But then a swift succession of blows that blinded me for an instant and then opened wide my eyes—and in the gleam of every bayonet and the flash of every rifle the class struggle was revealed.”

The 1979 documentary *Eugene V. Debs: Trade Unionist, Socialist, Revolutionary* was written and produced by a 38-year-old Bernie Sanders about his hero. It begins:

“It is very probable, especially if you are a young person, that you have never heard of Eugene Victor Debs. Why? Why haven’t they told you about Gene Debs and the ideas he fought for? The answer is simple. More than a half century after his death, the handful of people who own and control this country—including the mass media and the educational system—still regard Debs and his ideas as dangerous, as a threat to their stability and class rule, and as someone best forgotten about.”

Ironically, the arc of Bernie Sanders’s political career moved in the opposite direction from the arc of his hero. Sanders began as an anti-war socialist member of the Liberty Union Party which rejected the corporatism of both the Democratic and Republican Parties. Then Sanders got elected to various offices in Vermont and supported popular military expenditures and military actions; and he ultimately supported the Democratic Party’s pro-militarist presidential candidate Hillary Clinton and has promised to support Creepy Joe as well. In contrast, Debs began as a successful Democratic politician, became radicalized by his experiences as a labor union leader, became a socialist who was hated by the ruling class, and was imprisoned by its US government. Sanders began with dissent but moved to obedience, obeying even the Democratic Party. Debs began conciliatory, moved on to dissent, and then to disobedience—not only disobeying the Democratic Party but the US government. Sanders’s initial dissent propelled his political

career, and his ultimate obedience kept his career intact. Debs, in contrast, paid a severe price for his ultimate disobedience.

You think Debs would have defended the million he made from some book deal? You think Debs had a lake house? You think Debs would think the main goal is “to get rid of Donald Trump” and back a right-wing shithead like Joe Biden? Don’t be Bernie Sanders—or his woke Latinx Robin—be Gene Debs.

The Milgram study, as previously detailed, revealed that the majority of Americans believe in complying with authority even when they feel the authority is a cruel one. Similarly, the majority of Americans believe “lawbreakers” such as Snowden should be punished, regardless of the fact that the consequences of these lawbreakers violating a law are highly beneficial for society.

Many other US anti-authoritarians, forgotten in history, have been criminalized for speaking their minds. Politically radical women such as Kate Richards O’Hare, Mollie Steimer, and many other Americans were imprisoned for speaking out against World War I. Also during that era, William Buwalda, a military veteran decorated for his service in the Philippines, was court-martialed and sentenced to three years at Alcatraz merely for, while in military uniform, attending a talk by Emma Goldman, applauding her, and shaking her hand.

There have been many anti-authoritarians for whom criminalization resulted not in prison but by life ruination and self-inflicted death. Julius Wayland was a good friend of Eugene Debs and was the founder and publisher of *Appeal to Reason*, the largest socialist publication in US history, with a circulation of approximately 500,000 at its height. But in 1912, the 58-year-old Wayland, grieving over his wife’s death, was falsely smeared for sexual improprieties; and with the Federal District Attorney about to indict him under the Mann Act, he committed suicide, leaving a note indicating that he was a beaten man. And anti-authoritarian entertainer Lenny Bruce was hounded by local government authorities for his speech, and he was arrested on obscenity charges but died via drug overdose during the appeal process.

Some US anti-authoritarians, with luck, have survived US governmental assault. Frederick Douglass and Harriet Tubman escaped slavery and outwitted the US Fugitive Slave Act of 1850. Scott Nearing, during the same era that Emma Goldman and Eugene Debs were imprisoned under the Espionage Act, was also indicted under the Espionage Act but found not guilty. Helen Keller, who also publicly opposed military conscription and the US government’s entry into World War I, was not prosecuted by the US government, most likely because Woodrow Wilson knew how ridiculous it would have been to jail the most famous deaf-blind woman in the world.

Other US anti-authoritarians have simply been murdered by government agencies. One famous example was Fred Hampton. In 1969 at age 21, Hampton was assassinated in his sleep by Cook County, Illinois, law enforcement in conjunction with the Federal Bureau of Investigation (FBI). Hampton's "offense" was being a Black Panther Party member and an effective organizer. And of course throughout US history, murder and genocide by the US government has been routine with respect to Native Americans.

For the compliant, the US government appears to be a force of good that occasionally errs, but what anti-authoritarians sense—and some directly experience—is that the US government and ruling elite are powerful forces of violence when their policies are resisted. This is no revelation for Native Americans. Tecumseh (1768–1813), Crazy Horse (1840–1877), Sitting Bull (1831–1890), as well as many other famous and non-famous Native Americans challenged and resisted the authority of the US government to defraud Native Americans of their land and to destroy their communities and their way of life. For their resistance, many Native Americans have suffered violent deaths. Tecumseh was killed in battle; Crazy Horse was killed trying to escape incarceration; and Sitting Bull was killed resisting arrest. The assault against Native Americans constitutes racism, genocide, and land theft on a massive scale. It is also an attempt to eliminate a cultural tradition that—with its relative absence of coercion and greater freedoms—undermines US authoritarians.

European colonizers came from extremely hierarchical societies, ruled by kings and aristocracies; and within families, husbands ruled their wives. Upon marriage, a European woman surrendered her legal identity, which meant she could not own property or sign contracts, or, except in rare circumstances, get a divorce. By contrast, in most Native societies, women could divorce their husbands and choose premarital partners. And while tribal leaders were mostly men, female elders would help select male leaders and take part in tribal meetings. Thus, for European colonizing men, their absolute power within their marriage was threatened to the extent that their wives were aware of Native American life. In general, the relative attractiveness of Native American societies was threatening for authoritarians.

A common characteristic of Native American societies is an absence of impersonal authority and coercion. Ensuring civility is seen as a collective responsibility. When interpersonal conflicts arise, the emphasis is on negotiations among parties and kin groups to settle conflicts. A common characteristic of Native societies is to make all efforts toward members not experiencing coercion and resulting resentments. If consensus could not be achieved, bands would splinter off.

The Iroquois (who call themselves the Haudenosaunee) are a confed-

eration of northeastern tribes in North America, and one colonial official stated that the Iroquois held “such absolute notions of liberty that they allow of no kind of superiority of one over another, and banish all servitude from their territories.” Historians document the anti-authoritarian nature of Iroquoian culture, including their child-rearing. Iroquois youngsters were being prepared to enter an adult society which was not hierarchical, as in the European case, but where individuals lived on a more equalitarian basis, with power more evenly distributed among men and women or old and young than in European society. One aspect of child-rearing on which Europeans and Iroquoian cultures differed was in the attitude toward authority. In Iroquois society the autonomous individual, loyal to the group but independent and aloof rather than submissive, was the ideal.

Native American societies are not leaderless societies but leadership is based on consensus about a leader’s wisdom. Thus, if a hunter leader, medicine leader, or warrior leader makes repeated errors that threaten their people’s well-being, this likely would result in a new consensus and new leadership. The flight of the Nez Perce from US government troops illustrates this.

In 1877, after a series of land concessions followed by broken promises by the US government, a group among the Nez Perce were not willing to again trust the US government’s latest and even smaller land promises. This group of Nez Perce refused to submit and surrender, and they outmaneuvered a US military force for more than three months, over approximately 1,800 miles, from their homeland in what is now eastern Oregon through Montana. While standard history textbooks routinely credit Chief Joseph as the chief of the Nez Perce and recount his final painful surrender, one historian documents that there were other leaders who actually directed the flight. Looking Glass initially led the group but was challenged for moving too slowly; and when the US Army surprised the Nez Perce at the Battle of the Big Hole, tribal consensus replaced Looking Glass with Poker Joe (though later Looking Glass regained his leadership position). And when Joseph believed that surrender was necessary to save Nez Perce lives, several Nez Perce chose to follow another leader, White Bird, and continue to head to Canada; and the consensus was not only to accept that group’s decision but to aid White Bird and his group’s escape.

The 1948 United Nations Convention on Genocide states:

“Genocide means any of the following acts committed with intent to destroy, in whole or in part, a national, ethnic, racial, or religious group, as such:

- Killing members of the group

- Causing serious bodily or mental harm to members of the group
- Deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part
- Imposing measures intended to prevent births within the group
- Forcibly transferring children of the group to another group”

While a single component suffices for the UN definition of genocide, the US government’s genocide of Native Americans includes all of these components.

Though Native resistance has continued, when resistance feels impossible, as it does for many indigenous Americans today, this results in a high rate of suicide, especially among young Native Americans. Just as with the extraordinarily high suicide rate by Jews in Nazi concentration camps, a high rate of self-inflicted deaths by any overwhelmingly oppressed national, ethnical, racial, or religious group is essentially another form of genocide. The US government and society avoid the reality that genocide has occurred in part because of the tenderness of American egos and the fallacious notion of American exceptionalism. The US government’s 2009 “Apology to Native Peoples of the United States,” unsurprisingly, excludes any mention of genocide, and it includes the following:

“DISCLAIMER—Nothing in this section authorizes or supports any claim against the United States.”

Moreover, this ‘apology’ was buried in a Department of Defense Appropriations Act H.R. 3326-2 and signed by then-president Obama in a ceremony closed to the press. Thus, the result was more an effort to bury the past, than to confront it.

To all native peoples within the borders of the US: we offer you more than empty apologies or fleeting visions of a better future—we offer the opportunity to seize one. Rise up, summon the strength of your ancestors—their pain, their struggle, their will to survive—for that is why you still remain, why you still have some idea of what has been lost. We can’t promise victory, but you can rest assured that we will leave your side only in a puddle of blood or shackled and dragged away by our common oppressor—you’re not pawns and you’re not virtue signals. Let us unite as common kin, and end these unjust institutions—by any means necessary.

For guardians of the status quo, there is nothing genuinely or fundamentally wrong with the prevailing order and its dominant institutions, which are viewed as just. Therefore, anyone claiming otherwise—especially someone sufficiently motivated by that belief to take radical action—must, by definition, be emotionally unstable and psychologically disabled. Put another way, there are, broadly speaking, two choices: obedience to institutional authority or radical dissent from it. The first is a sane and valid choice only if the second is crazy and illegitimate. Radical dissent is evidence, even proof, of a severe personality disorder.

The use of psychiatric diagnoses to discredit, dismiss, and marginalize famous and non-famous anti-authoritarians is common. For instance, several mainstream media journalists, attempting to discredit whistleblower Edward Snowden, psychopathologized him with labels such as “grandiose narcissist.” The mainstream media has also psychopathologized other recent whistleblowers, including Chelsea Manning and WikiLeaks founder Julian Assange. The mainstream media has depicted Assange as bizarre and paranoid, the New York Times labeling him with “erratic and imperious behavior” and “delusional grandeur.” And didn’t you hear? He smeared shit all over the walls. The mainstream media also promoted a view that Manning was motivated not by her moral convictions but gender struggles, anti-gay bullying, and conflict with her father resulting in personality disorders. Ralph Nader, for challenging the corporatism of both the Democratic and Republican parties and running for president, was described by a columnist for the Nation as “a very deluded man, a psychologically troubled man.” Malcolm X, for his distrust of authorities, was diagnosed by FBI profilers with “pre-psychotic paranoid schizophrenia.” The anti-authoritarian actions of both Thomas Paine and Eugene Debs were attributed to “dipsomania” and other terms for alcoholism. During the 1894 Pullman Strike, the New York Times published a smearing by the physician Thomas Robertson, who falsely claimed to have treated Debs for dipsomania; with the Times quoting Robertson as saying:

“Those who knew Debs well believe that his present conduct is in large measure, if not wholly, due to the disordered condition of his mind and body, brought about by the liquor habit.”

We can’t wait to hear the list of disorders we supposedly suffer from, that’ll be entertaining—but that’s probably just our grandiose narcissism talking.

The practice of psychopathologizing anti-authoritarians so as to discredit and marginalize them is certainly not exclusive to the United States. In the Soviet Union, political dissidents were routinely psychiatrically hospitalized

and drugged; and today, Chinese dissidents continue to be diagnosed with mental illness and forcibly treated. In the United States, the practice of psychopathologizing anti-authoritarians began at the very beginning of the nation. Benjamin Rush was a friend of Thomas Paine in pre-Revolutionary War Philadelphia, but then shunned Paine after *The Age of Reason*. Today, Benjamin Rush is well-known among psychiatrists as “the father of American psychiatry,” as his image adorns the seal of the American Psychiatric Association. In addition to Rush’s abandonment of Thomas Paine, he also attempted to gain favor with the new ruling class in the United States another way. In 1805, Rush diagnosed those rebelling against the newly centralized federal authority as having an “excess of the passion for liberty” that “constituted a form of insanity,” which he labeled as the disease of anarchy.

In 1851, Louisiana physician Dr. Samuel Cartwright reported his discovery of drapetomania, the disease that caused slaves to flee captivity. Cartwright believed that absent of this illness slaves were “like children, constrained by unalterable physiological laws to love those in authority over them.” Cartwright also reported his discovery of dysesthesia, a disease that caused slaves to pay insufficient attention to their jobs, “breaking the tools he works with, and spoiling everything he touches,” as well as being resistant to punishment and not feeling the “pain of any consequences.”

In 1958, when civil rights activist Clennon W. King Jr. attempted to enroll at the all-white University of Mississippi, the Mississippi police arrested him on the grounds that “any nigger who tried to enter Ole Miss must be crazy.” Following his arrest, he was then taken to the county courthouse where a “lunacy warrant” was issued on him, and he was confined to a mental hospital for twelve days, and only declared “competent” when he promised to leave Mississippi. Systemic racism labels threats to authority as mental illness, and this process increases the likelihood that black men will get diagnosed with schizophrenia. A belief that one is being surveilled has sometimes been enough evidence for anti-authoritarians to be assessed as delusionally paranoid. Recall how when Ralph Nader was being followed by General Motors detectives, he sensed it and told others, and sounded like he was delusional. Nader, however, was lucky that detectives were incompetent and got caught. However, Ernest Hemingway was not so lucky.

By 1960, Hemingway was labeled delusionally paranoid about FBI surveillance.

“The feds...It’s the worst hell. The goddamnedest hell. They’ve bugged everything... Everything’s bugged. Can’t use the phone. Mail intercepted.”

Long after Hemingway's death, the FBI released his file in response to a Freedom of Information petition and it revealed that beginning in the 1940s J. Edgar Hoover had placed Ernest under surveillance because he was suspicious of Ernest's activities in Cuba. Over the following years, agents filed reports on him and tapped his phones. The surveillance continued all through his confinement at St. Mary's Hospital. It is likely that the phone outside his room was tapped after all.

“In the years since, I have tried to reconcile Ernest's fear of the FBI, which I regretfully misjudged, with the reality of the FBI file. I now believe he truly sensed the surveillance, and that it substantially contributed to his anguish and his suicide.”

Hemingway was treated with electroshock (ECT) as many as 15 times in December 1960; then in January 1961, he was released in ruins. Hemingway's loss of memory caused by the ECT made him even more depressed and hopeless.

“Well, what is the sense of ruining my head and erasing my memory, which is my capital, and putting me out of business?”

In July 1961, shortly before his 62nd birthday and soon after Hemingway had been given still another series of shock treatments, he committed suicide.

Anti-authoritarians' intense reactions to insults and injustices can provide justification for authorities to psychopathologize them. A young Emma Goldman was lucky to live in an era in which she was not pathologized after she threw a pitcher of water at the face of a woman who was happy with the 1887 execution of the Haymarket martyrs; but other anti-authoritarians have not been so lucky and their strong reactions to insults and injustices have often been psychopathologized. This is especially true for intense reactions by women, one of the more well-known examples being actress Frances Farmer (1913–1970), brought to public attention in the 1982 movie *Frances*, starring Jessica Lange.

Farmer revealed her anti-authoritarian streak as a senior in high school when she won a writing contest with a controversial essay, “God Dies,” and then again as a young woman when, in 1935, she accepted a newspaper prize for a trip to the Soviet Union over her mother's strong objections. Farmer was stunningly beautiful but rebelled against studio casting based solely on her looks. She also resisted the studio's attempt to control her private life, and she refused to attend Hollywood parties. Farmer aspired to be a serious actress, and she took time off from movie work to appear in a Clifford Odets stage production of one of his plays. Farmer, feeling oppressed by Hollywood

authorities and betrayed by men she had trusted, began abusing alcohol. In 1942, she was stopped by the police for driving with her headlights on bright in the wartime blackout zone. She was jailed and fined; and after she hadn't paid her entire fine, the police tracked her down and entered her hotel room without permission. Then Frances, who'd been sleeping in the nude, face down on the bed, under the influence of alcohol and somnifacient reacted as anyone would have. She became belligerent with the police when they arrested her. And then, after she was sentenced to 180 days in Los Angeles County jail, she became physically aggressive in the courtroom and was forced into a straitjacket.

If Frances had been left alone to serve her 180 days in jail it's quite likely that, eventually, she would have sorted herself out. Instead, family members and others from the movie industry successfully lobbied the judge to send her to the Kimball Sanitarium, her first institutionalization. Then in 1944, Frances's mother committed Frances to Western State Mental Hospital, where she was recommitted two additional times. Frances was institutionalized, not because she was insane but because she'd been legally vulnerable. Because her dad, Ernest, was a lawyer. Because her mother, Lillian, despite whatever unconscious animus may have lain in her heart, may have thought in her desperation and exasperation that institutionalization was the last viable recourse to help her daughter heal—and become submissive and obedient.

In the history of American psychiatry, there have been several adult populations lacking political power—including Native Americans, women, and homosexuals—who have been psychopathologized and marginalized for the 'offense' of asserting their humanity. In the 1970s, homosexuals were able to gain some political power and fought so as to no longer be at the mercy of the APA. In 1970, the Gay Liberation Front (GLF) infiltrated a conference of the APA where a film was demonstrating the use of electroshock treatment to decrease same-sex attraction. GLF members shouted "Torture!" and seized the microphone to rebuke psychiatrists. Using multiple political strategies and tactics, gay activists effectively forced the APA to stop pathologizing homosexuality as a mental illness in 1973.

While organized adults have successfully liberated themselves from being psychopathologized and marginalized, mental health authorities have increasingly zeroed in on a politically powerless population: anti-authoritarian youth. Many young people labeled with psychiatric diagnoses are essentially anti-authoritarians who are pained and angered by coercion, unnecessary rules, and illegitimate authority. When young anti-authoritarians are labeled with a psychiatric diagnosis, they get ensnared in an authoritarian trap. Resistance to diagnosis and treatment often results in professionals labeling

young rebels as “noncompliant with treatment,” increasing the severity of the diagnosis, and increasing the dosage of tranquilizing medications. All this can be enraging for young people, sometimes so much so it makes them appear not just angry but crazy.

Today, a potentially huge army of young anti-authoritarians are being depoliticized by mental illness diagnoses and by attributions that their inattention, anxiety, depression, and disruptiveness are caused by defective biochemistry—and not by their alienation from a dehumanizing society and their resistance to illegitimate authorities.

Malcolm X’s childhood was replete with trauma including his family breakup and then foster homes, resulting in his rebelling and engaging in theft. Today, a teenage Malcolm X would likely be labeled with the “disruptive disorder” diagnosis called “conduct disorder” (CD) for criminally disruptive behaviors. And owing especially to the fact of being in foster care, he would very likely be prescribed psychiatric drugs, including antipsychotic drugs.

Beginning in 1980, for noncompliant children who are not engaged in any illegal practices, the APA (in its DSM-III diagnostic manual) created the disruptive disorder diagnosis “oppositional defiant disorder” (ODD). For an ODD diagnosis, a youngster needs only four of the following eight symptoms for six months:

- Often loses temper
- Often touchy or easily annoyed
- Often angry and resentful
- Often argues with authority figures
- Often actively defies or refuses to comply with requests from authority figures or with rules
- Often deliberately annoys others
- Often blames others for his or her mistakes or misbehavior
- Spitefulness or vindictiveness at least twice within the past six months

In 2012, the Archives of General Psychiatry reported that between 1993 through 2009, there was a sevenfold increase of children 13 years and younger being prescribed antipsychotic drugs, and that disruptive behavior disorders such as ODD and CD were the most common diagnoses in children medicated with antipsychotics, accounting for 63% of those medicated. “Attention

deficit hyperactivity disorder” (ADHD) is another common diagnosis for children labeled with “behavior problems.” The ‘symptoms’ of ADHD are inattention, hyperactivity, and impulsivity. While CD and ODD behaviors are overt rebellions, ADHD behaviors can in some instances be passive-aggressive rebellions. ADHD parallels Samuel Cartwright’s dysesthesia; while ODD and CD parallels Cartwright’s drapetomania.

Alienated anti-authoritarian adults are often diagnosed with anxiety and depression. Often a major pain of their lives that fuels their anxiety and/or depression is fear that noncompliance with illegitimate authorities will cause them to be financially and socially marginalized; but they fear that compliance with such illegitimate authorities will result in humiliation and loss of integrity. All this can result in anxiety and depression—created not by biochemical defects but by existential realities. While only a small number of people diagnosed with bipolar disorder, schizophrenia, and other psychoses identify themselves as anarchists, my experience is that a far higher percentage of this population as compared to the general population have anarchist politics and values such as resenting coercion; distrusting impersonal authorities; believing people should organize among themselves rather than submit to authorities; and a willingness to risk punishments to gain freedom from coercions. Among the people I have talked with who have been previously diagnosed with psychiatric illnesses, I am struck by how many of them, compared to the general population, are essentially anti-authoritarians. Unluckily for them, the professionals who have diagnosed them are not.

Historically, doctors have embraced authoritarianism at a higher percentage than the general population. More than 7% of all German physicians became members of the Nazi SS during World War II, compared with less than 1% of the general population. Physicians joined the Nazi party and the killing operations not at gunpoint, not by force, but of their own volition. There are several reasons for this, one being doctors’ socialization to hierarchy and authoritarianism. Medical culture is, in many ways, a rigid hierarchy. Those at the lower end of the hierarchy are used to doing what their superiors ask of them, often without understanding exactly why. Questioning superiors is often uncomfortable, for fear both of negative consequences—retaliation, losing the superior’s respect—and of being wrong. MDs and PhDs have received extensive schooling and thus have lived for many years in a world where one routinely complies with the demands of authorities. Thus, people who reject this compliance appear to be “abnormal” for many MDs and PhDs. My experience is that most psychologists, psychiatrists, and other mental health professionals are unaware of the magnitude of their obedience, and so the anti-authoritarianism of their patients

can create enormous anxiety for them—and this anxiety fuels diagnoses and treatments.

A handful of mental health professionals have challenged the legitimacy of mental health authorities—and have paid a price. In 1968, psychiatrist Loren Mosher became the National Institute of Mental Health's chief of the Center for Schizophrenia Research. In 1971, Mosher launched an alternative approach for people diagnosed with schizophrenia, opening the first Soteria House in Santa Clara, California. Soteria House was an egalitarian and non-coercive psychosocial milieu employing nonprofessional caregivers. The results showed that people do far better with this Soteria approach than with standard psychiatric treatment, and that people can in fact recover with little or no use of antipsychotic drugs. Mosher's success embarrassed establishment psychiatry and displeased the pharmaceutical industry. Not surprisingly, the National Institute of Mental Health choked off Soteria House funding, and Mosher was fired from his NIMH position in 1980.

There continues to be a movement of dissident mental health professionals and ex-patient activists. This movement attempts to get the word out on the lack of science behind the DSM diagnostic bible, and to expose the illegitimacy of biochemical disease explanations such as the “chemical-imbalance” theory. Recently, even some members of mainstream psychiatry have been forced to admit failure in these areas.

In response to the DSM-V, published in 2013, the NIMH director, citing the lack of scientific validity of the DSM, stated that the “NIMH will be re-orienting its research away from DSM categories.” Also harshly critical of the DSM-V was the politically astute former chair of the DSM-IV task force, psychiatrist Allen Frances, who published *Saving Normal*, which mocked several new DSM-V mental illness inventions, especially the pathologizing of normal human grief. Frances's repudiation of DSM-V is noteworthy, as it is as if the guy who wrote Leviticus realized that his ‘abominating’ and ‘sinning’ had gotten out of hand.

Similar to their abandonment of the DSM, establishment psychiatrists have also recently fled psychiatry's long promulgated “chemical imbalance theory of mental illness.” In the late 1980s, psychiatry authorities and giant pharmaceutical companies began telling the general public—despite lacking scientific evidence—that depression is caused by a “chemical imbalance” of low-levels of serotonin that could be treated with “chemically balancing” antidepressants, such as Prozac, Zoloft, Paxil, and other selective serotonin reuptake inhibitors (SSRIs). The idea that depression is caused by a chemical imbalance that could be corrected with SSRI antidepressants was made to sound like taking insulin for diabetes, and so the use of these SSRIs skyrocketed. Today, the falseness of this chemical-imbalance theory of

mental illness is not controversial.

“In truth, the ‘chemical imbalance’ notion was always a kind of urban legend—never a theory seriously propounded by well-informed psychiatrists.”

One justification was that by framing depression as a chemical deficiency, patients felt more comfortable taking antidepressant drugs. While some psychiatrists view the chemical imbalance theory as a well-meaning “white lie,” my experience is that many physicians continue to be ignorant of the truth. The bottom line is that no matter what the reason, mainstream psychiatrists who have promulgated untruths have broken their patients’ trust. Does psychiatry retain any legitimate authority?

“We see that its diagnostics are being dismissed as invalid; its research has failed to identify the biology of mental disorders to validate its diagnostics; and its drug treatments are increasingly being seen as not very effective or even harmful. That is the story of a profession that has reason to feel insecure about its place in the marketplace.”

Despite its scientific failure, psychiatry has retained societal authority. Its authority rests on three pillars.

First, by pushing drug treatments, it meets the financial needs of drug companies, and so it has large financial backing from Big Pharma. In 2008, congressional investigations of psychiatry revealed that the APA and several “thought leader” psychiatrists received significant amounts of money from drug companies. Big Pharma heavily funds university psychiatry departments, sponsors conferences and continuing education for psychiatrists, and pays well-known clinicians and researchers to be speakers and consultants. In 2012, PLOS Medicine reported:

“69% of the DSM-V task force members report having ties to the pharmaceutical industry.”

Second, by pathologizing and thus depoliticizing malaise, psychiatry helps maintain the status quo, meeting the needs of the ruling power structure. Historically, professionals such as police and clergy have been utilized to control populations. More recently, mental health professionals have also been used. One example of this is mainstream mental health professional’s explanation for high rates of suicide among indigenous peoples. Existing explanations blame the victim, finding that they suffer from personal adjustment problems or emotional deficiencies like “low self-esteem”

and “depression.” None of the existing explanations alleviate the situation by acting or suggesting action against the forces of oppression; they don’t even recognize them. Meeting the needs of the power structure ensures an institution’s existence.

And so the professions of psychiatry and psychology have had reason to want to be utilized to subvert resistance by US soldiers via psychiatric drug “treatments” and behavioral manipulations. According to the *Military Times* in 2013, one in six US armed service members were taking at least one psychiatric drug, many of these medicated soldiers in combat zones. And in 2009, the *New York Times* reported how Martin Seligman, a former president of the American Psychological Association, consulted with the US Army’s Comprehensive Soldier Fitness positive psychology program. In this program, in one role-play, a sergeant is asked to take his exhausted men on one more difficult mission. The sergeant is initially angry and complains that “it’s not fair,” but in the role-play, his “rehabilitation” involves reinterpreting the order as a compliment.

A third pillar of psychiatry’s societal authority is its coercions to control people who create societal tension but who have done nothing illegal. Mental health professionals meet the control needs of authoritarians in charge of society but also meet the control needs of authoritarian subordinates. This coercive function is what society and most people actually appreciate most about psychiatry. The societal need for psychiatry’s extra-legal police function compels society to be blind to psychiatry’s complete lack of scientific validity. Because of psychiatric coercion, society gives psychiatric theories a free pass. These theories never need to pass any rigorously devised tests, as we expect other important scientific theories to pass, they only need to be asserted by the right people.

“The institutional role of the schools for the most part is just to train people for obedience and conformity, and to make them controllable and indoctrinated—and as long as the schools fulfill that role, they’ll be supported.”

“There’s a reason education sucks, and it’s the same reason it will never, ever, ever be fixed. Because the owners, the owners of this country don’t want that. They don’t want well-informed, well-educated people capable of critical thinking. You know what they want? They want obedient workers. People who are just smart enough to run the machines and do the paperwork. And just dumb enough to passively accept all these increasingly shitty jobs.”

“When I think back on all the crap I learned in high school, it’s a wonder I can think at all.”

As a young child in school, before I understood the words ‘authoritarian’ or ‘dehumanizing,’ I thought there was something terribly wrong with a place where I had to raise my hand to go the bathroom. I recall thinking that I was lucky that I wasn’t shy, because if I had been too shy to ask for permission, then I might wet my pants. Having to ask permission to go the bathroom was bad enough, but there were teachers who made us either say—or show with our fingers—whether we needed to urinate (one finger) or defecate (two fingers). I remember thinking this must be especially horrific for prim-and-proper girls, and I thought that these teachers must be perverts to demand that.

Nowadays, many kids tell me that they still must get permission from a teacher to leave their classroom to relieve themselves. Recently, a high school student told me that in his school, students get a limited number of restroom passes per semester. I asked him what happens if a student runs out of passes and has to take a shit—do they expect students to just shit in their pants? He laughed. Then I told him that I was serious—what do they expect you to do? Then he got serious and said:

“So much of school is fucked up, we never really think about each fucked up thing.”

Social psychologist Stanley Milgram in *Obedience to Authority*, after reporting on his studies showing a frightening compliance to abusive illegitimate authority, attempted to understand the reasons:

“As soon as the child emerges from the cocoon of family, he is transferred to an institutional system of authority, the school where the student learns that deference is the only appropriate and comfortable response to authority.”

Standard schools not only demand our compliance to authority regardless of our assessment of its legitimacy, they require our compliance with impersonal authorities. Milgram notes:

“The modern industrial world forces individuals to submit to impersonal authorities, so that responses are made to abstract rank, indicated by an insignia, uniform, or title.”

In other words, badges. Never, never reach for a title, for there will always be others who want it. Instead, aspire to command.

In a 1962 book, researchers examined the childhood of 400 eminent people, and they reported that the majority of them disliked school immensely. The authors detailed the pain that the anti-authoritarian Albert Einstein had with his schooling. When Einstein was a teenager, he found school so intolerable, he asked the school doctor to give him a certificate saying that he had a nervous breakdown so that he did not have to attend; a tactic that worked. Einstein later concluded about schooling:

“It is, in fact, nothing short of a miracle that the modern methods of instruction have not yet entirely strangled the holy curiosity of inquiry. It is a very grave mistake to think that the enjoyment of seeing and searching can be promoted by means of coercion and a sense of duty.”

Young Albert didn't pay attention to his teachers and failed his college entrance examination twice. Einstein recalls hating authoritarian discipline in his schools:

“The teachers in the elementary school appeared to me like sergeants and in the Gymnasium the teachers were like lieutenants.”

After he finally did enter college, one professor told Einstein:

“You have one fault: one can't tell you anything.”

Today, a young Albert Einstein would very likely receive an ADHD diagnosis, and maybe an ODD one as well. The very characteristics of Einstein that upset authorities—questioning and challenging illegitimate authority—are the characteristics most required to be a great scientist.

The primary method of ‘motivation’ in standard schools is coercion through grades. Students focus on what they need to memorize for a good grade, and they stop asking their own questions and pursuing answers to them. To a very great degree, school is a place where children learn to be stupid. Children come to school curious; within a few years most of that curiosity is dead, or at least silent. The motivational method of coercion not only subverts curiosity, it prevents students from even retaining facts. You did your homework, you passed the exam, maybe you even got an ‘A’—and a week later you couldn't even remember what the course was about.

Standard school coercions subvert a love of reading. A 2014 report stated:

“The proportion of children who are daily readers drops markedly from childhood to the tween and teenage years. One study documents a drop from 48% of six- to eight-year-olds down to 24% of 15- to 17-year-olds who are daily readers, and another shows a drop from 53% of nine-year-olds to 19% of 17-year-olds.”

What turns most teenagers off from reading for pleasure is compulsory reading of books that they have no intrinsic interest in. I recall one teenager who had loved to read as a kid but became turned off to reading because of required reading. I joked with him that if schools one day made kids have compulsory sex with people whom they weren't interested in that this would turn kids off from sex in general. He thought about this for a few seconds, then told me that adults would probably do just that if they realized how making something compulsory turns kids off from it.

What are the origins of the US mass educational system? Chomsky points out:

“In the late nineteenth century it was largely designed to turn independent farmers into disciplined factory workers, and a good deal of education maintains that form.”

Chomsky also concluded that those at the top of the societal hierarchy support the educational system because they believe:

“People are supposed to be passive and apathetic and doing what they're told by the responsible people who are in control. That's elite ideology across the political spectrum—from liberals to Leninists, it's essentially the same ideology: people are too stupid and ignorant to do things by themselves so for their own benefit we have to control them.”

As Americans have received increasingly more schooling, they have become less capable of effectively challenging the ruling class. In 1900, only 6% of Americans graduated high school, and a college education was rare for ordinary Americans; today, approximately 85% of Americans graduate high school, and college is increasingly expected for all. However, in the 1880s and 1890s, American farmers with little or no schooling created a Populist movement; organized America's largest-scale working people's cooperative; formed a People's Party that received 8% of the vote in 1892 presidential election; designed a “subtreasury” plan—that had it been implemented would have allowed easier credit for farmers and broke the power of large banks—and sent 40,000 lecturers across the United States to articulate this

plan; and evidenced all kinds of sophisticated political ideas, strategies, and tactics absent today from America's well-schooled population.

There are anti-authoritarian educators who have the courage to publicly assert the authoritarian nature of standard schools. John Taylor Gatto, accepting the New York City Teacher of the Year Award, January 31, 1990, stated:

“The truth is that schools don't really teach anything except how to obey orders. This is a great mystery to me because thousands of humane, caring people work in schools as teachers and aides and administrators, but the abstract logic of the institution overwhelms their individual contributions.”

Standard school teaches compliance with hierarchy; obedience to authorities for whom one does not necessarily respect; and regurgitation of meaningless material for a high grade. The standard classroom socializes students to be passive; to be directed by others; to take seriously the rewards and punishments of authorities; to pretend to care about things that they don't care about; and that one is impotent to change one's dissatisfying situation.

In a hierarchical society, prestigious schooling institutions confer prestigious badges. Children come to realize, early in their school careers, the terrible danger to their own success in statements that give voice to strong intensities. Children are taught to obey orders and to channel our dissent into innocuous patterns of polite discussion and investigation. Schools, especially elitist institutions, teach an inert concern—that caring in and of itself is ethical but that disobedience is immature.

Elitist schools and their conferred badges can provide liars and bullshit artists with great confidence in their ability to get away with lies and bullshit throughout their entire lives, and such projected confidence provides them greater influence. The Harvard Business School (HBS) information session on how to be a good class participant:

“Speak with conviction. Even if you believe something only fifty-five percent, say it as if you believe it a hundred percent.”

At HBS, if a student talks often and forcefully, then he's a player; if he doesn't, he's on the margins. The men at HBS look like people who expect to be in charge; but don't worry, they're multicolored! I have the feeling that if you asked one of them for driving directions, he'd greet you with a can-do smile and throw himself into the task of helping you to your destination—whether or not he knew the way.

For authoritarians, a degree from Harvard Business School is a prestigious badge of authority. For anti-authoritarians, an HBS degree is especially suspect, as they know that HBS alumni include George W. Bush, 1975 graduate, in charge at the advent of the 2008 financial meltdown, and Jeffrey Skilling, 1979 graduate, former CEO of Enron and convicted of securities fraud and insider trading. HBS teaches greed and socializes students to the idea that if everybody assumes you're a whore, you might as well grab as much money as possible while you're still in demand.

The more absolute the power of institutional authorities—be they in parochial schools, Native American residential boarding schools, or public schools—the more likely their physical and emotional abuse. Recall the excellent student Malcolm X being told by his public school teacher that being a lawyer was “no realistic goal for a nigger” and the teacher-inflicted physical and emotional abuse on Emma Goldman. I remember in junior high school, one kid raising his hand desiring to contribute to the class discussion but was told by the teacher:

“I’m not calling on you, you are in the crud group.”

While certainly many teachers try to be civil and kind, I can recall more than one teacher thinking themselves funny when they were being cruel. That’s why Pink Floyd’s “Another Brick in the Wall” and its lyrics about “dark sarcasm in the classroom,” continues to resonate with students today.

While teachers today might well be fired for certain kinds of emotional and physical abuse, standard schools are replete with acceptable psychological violence. These schools force kids to compete against one another. The better some students do on an exam, the worse this is for others. School not only punishes most academic cooperation—it’s called cheating—school encourages resentment for others’ success. Today, we hear much about peer bullying but little about what fuels that cruelty. Human beings in institutions replete with coercions and humiliations—whether these institutions are penitentiaries or schools—are often going to take their pain out on others they perceive as weaker than they are. Similarly, the fuel for abusive parenting is also often a lifetime of coercions and humiliations, including job and schooling ones.

Working with teenagers for over three decades, my experience is that the source of their suicidal thoughts is actually more often located in the school than the family. And while occasionally the source of overwhelming pain is a single abusive teacher or a bullying peer, often suicidality is fueled by the anxiety of being overwhelmed by bureaucratic coercions; for example, having failed classes in subjects they have no interest in and being forced to go to summer school or not graduate.

In psychology classes, I was taught that taking away enjoyable stuff from mice or kids in order to get them to learn is called “negative reinforcement,” which along with “positive reinforcement” and “punishment” are elements of “behavior modification.” This certainly works to control most mice and even some kids—but not anti-authoritarian kids. Nowadays, these negative behavioral-modifications are routinely called “consequences” but in my day, parents called them punishments.

I didn’t get punished much since I did well in school, but when I did, the punishment was usually “no television,” and I remember my immediate response to it. When my mother said, “No television for a week,” I said, “Make it two weeks, I don’t care.” When she responded, “Then two weeks it is,” I said, “I don’t care, make it a month.” It progressed to years, decades, and centuries. I think by 2567, I will have served my time. So I have some empathy for how a young Alexander Berkman’s bravado bought himself a lengthier prison sentence than if he had employed a competent lawyer.

Professionally, I have worked with kids for whom the coercions of parents, teachers, and other adults failed to control behaviors but succeeded in creating resentments. These kids, like me, were not going to allow adults to use knowledge of their joys and pains for purposes of control, so they learned to hide their true joys and pains. They learned to be guarded about their true self so as it would not be used against them. Some kids learn that it’s easier to hide themselves from the adult world if they hide from themselves, and so these kids lose awareness of who they are—and some of them need to, later in life, ‘crack up’ for rediscovery.

Life is filled with ironies and occasional pleasant surprises. Ironically, my “stinkin’ badges” have given me access to parents of anti-authoritarian kids. And a pleasant surprise for me has been how infrequently I’ve been fired by these parents. Only rarely has an authoritarian parent dragged their anti-authoritarian kid into my office with expectations that I would provide “treatment” to make their child unquestioningly obedient. The vast majority of parents I have worked with are more of what I would call normies than Nazis. Normies buy into societal norms. They take seriously PhDs and licensing badges of authority. Normie parents may intellectually understand that people can be so overwhelmed by pain that they become self-destructive or violent, but it is easier for normies to compartmentalize such people as mentally ill.

Normie parents want to do the “right thing” with their kids; but unfortunately, taking seriously professional badges often turns out to be the wrong thing. The vast majority of mental health professionals are not anti-authoritarians, so they often give advice that can turn a resolvable problem into a tragedy. While coercions work to control the behavior of many mental

health professionals themselves, coercions don't work on anti-authoritarians. While normies get a positive buzz by pleasing authorities and receiving good grades, anti-authoritarian kids get no such buzz for compliance. For anti-authoritarian kids, coercions only create resentments. Resentment destroys relationships and eliminates the possibility for dialogue that can solve problems. Anti-authoritarian children and teenagers are often taken by parents to a mental health professional because they are underachieving in standard schools. These young people resist all coercions that demand giving attention to subjects that bore them, doing homework for which they see no value, or staying inside a building that feels sterile and suffocating.

All anti-authoritarian kids do not have the same temperaments, so such coercions result in some different outcomes—all unpleasant ones. Some gentler anti-authoritarian kids resist coercions but worry that their resistance will result in dire life consequences. They worry that performing poorly in school will mean “flipping burgers” for the rest of their lives. Their anxiety and pain of failure is exacerbated by their parents' anxiety over failure, and these kids become hopeless, believing that all of life will be as miserable as school. This can result in debilitating anxiety and immobilizing depression. On many occasions I've seen school failure and the threat of not graduating high school make a teenager suicidal. It is routine for doctors to medicate these kids with an array of psychiatric drugs, and if parents and professionals become anxious about suicide, these kids are often psychiatrically hospitalized, though hospitalization is no guarantee of safety as 6% of all American suicides occur in hospitals. In psychiatric hospitalizations, suicidal young people are routinely told that they are mentally ill. This makes many anti-authoritarian kids even more hopeless. Anti-authoritarians are rarely employed in these institutions—where they could offer young people validation for their common experience, for example, of pain over authoritarian schooling. That validation can both reduce pain and increase hope—and open them up for dialogue, which can help young people gain perspective, reduce pain, and act with greater wisdom.

Anti-authoritarian kids will often question the legitimacy of mental health authorities whose interventions appear ludicrous to them. One such intervention is the “no-suicide contract” in which the patient agrees not to attempt suicide and to seek help if unable to honor the commitment. Signing such a contract is often a requirement for release from a psychiatric hospital. For many patients, it is obvious that these contracts don't prevent suicide (confirmed by research) and serve only to reduce the anxiety of the hospital staff.

Other anti-authoritarian kids with less gentle temperaments don't take seriously their schooling or admonitions from authorities that their rebellious

behavior will doom them. They feel justified in resisting coercion. Their resistance is routinely labeled by mental health professionals as “acting out,” and they are diagnosed with various disruptive disorders. Their parents often attempt punishments, which don’t work to break these kids’ resistance. Parents become frustrated and resentful that their child is causing them stress. Children feel parental frustration and resentment and may come to believe their parents do not like them. So these kids stop liking their parents, stop caring about their parents’ feelings, and seek out peers who they believe do like them, even if these peers are engaged in criminal behaviors. If parents have financial resources, these kids are often sent to “therapeutic boarding schools” where they associate with kids who may be even angrier than they are, and from whom they learn even more harmful behaviors.

Although these kids are often accused of having “authority issues,” it has been my experience that many anti-authoritarian young people labeled with psychiatric disorders don’t reject all authorities, only those whom they’ve assessed to be illegitimate. Often these young people are craving a mutually respectful relationship with an adult who can help them navigate the authoritarian society around them. Anti-authoritarian young people assess adults before taking them seriously, and while they will challenge and resist adult authorities who they deem to be illegitimate, they are receptive toward authorities who prove legitimate. Honesty and sincerity are necessary for an authority to be considered legitimate. Young anti-authoritarians must also sense that an adult has both affection and respect for their anti-authoritarian nature. People engage with those who make them feel good.

Normie professionals and parents routinely fail to engage young anti-authoritarians because their frustration, anger, punishments, incongruence, and pathologizing are unpleasant for these kids. What feels good is affection, respect, empathy, nurturance, humor, and mutual fun. When young anti-authoritarians feel that they are liked, understood, and are not being manipulated, most are open to a dialogue about how best to navigate the world without self-destructive or destructive behaviors. Normie mental health professionals and normie parents routinely fail to help destructive and self-destructive young anti-authoritarians because they are incapable of seeing anti-authoritarians’ anger as legitimate and valid. Normies cannot adequately empathize with the painfulness of coercion and how such pain fuels destructive behavior. Invalidated pain can cause some young anti-authoritarians to become completely hopeless and others to become completely enraged. With young anti-authoritarians’ overwhelming pain, hopelessness, and rage, there is no dialogue—no space to think or reflect. With genuine validation of their pain, empathy for hopelessness and rage, and

affection and respect for their anti-authoritarian nature, dialogue becomes possible—and wisdom can replace compulsive destructiveness.

It is common for many parents to give their children what they believe that they needed from their own parents. However, to love children means recognizing each child's unique personality and individual needs.

Traditionally, young people have energized democratic movements. So it is a major coup for the ruling elite to have created societal institutions that have subdued young Americans and broken their spirit of resistance to domination. Young Americans—even more so than older Americans—appear to have acquiesced to the idea that the corporatocracy can completely screw them and that they are helpless to do anything about it. A 2010 Gallup poll asked Americans “Do you think the Social Security system will be able to pay you a benefit when you retire?” Among 18- to 34-years-olds, 76 percent of them said no. Yet despite their lack of confidence in the availability of Social Security for them, few have demanded it be shored up by more fairly payroll-taxing the wealthy; most appear resigned to having more money deducted from their paychecks for Social Security, even though they don't believe it will be around to benefit them.

How exactly has American society subdued young Americans?

1. Student-Loan Debt

Large debt—and the fear it creates—is a pacifying force. There was no tuition at the City University of New York when I attended one of its colleges in the 1970s, a time when tuition at many US public universities was so affordable that it was easy to get a B.A. and even a graduate degree without accruing any student-loan debt. While those days are gone in the United States, public universities continue to be free in the Arab world and are either free or with very low fees in many countries throughout the world. The millions of young Iranians who risked getting shot to protest their disputed 2009 presidential election, the millions of young Egyptians who risked their lives to eliminate Mubarak, and the millions of young Americans who demonstrated against the Vietnam War all had in common the absence of huge student-loan debt.

Today in the United States, two-thirds of graduating seniors at four-year colleges have student-loan debt, including over 62 percent of public university graduates. While average undergraduate debt is close to \$25,000, some college graduates have closer to \$100,000 in student-loan debt. During the time in one's life when it should be easiest to resist authority because one does not yet have family responsibilities, many

young people worry about the cost of bucking authority, losing their job, and being unable to pay an ever-increasing debt. Often these loans will have family members as co-signors, resulting in a tactic any mafia goon—or, with slight modifications, CIA interrogator—could appreciate: Pay us or something bad happens to those you care about. In a vicious cycle, student debt has a subduing effect on activism, and political passivity makes it more likely that students will accept such debt as a natural part of life.

2. Psychopathologizing and Medicating Noncompliance

In 1955, Erich Fromm, the then widely respected anti-authoritarian leftist psychoanalyst, wrote:

“Today the function of psychiatry, psychology, and psychoanalysis threatens to become the tool in the manipulation of man.”

Fromm died in 1980, the same year that an increasingly authoritarian America elected Ronald Reagan president, and an increasingly authoritarian American Psychiatric Association added to their diagnostic bible (then the DSM-III) disruptive mental disorders for children and teenagers such as the increasingly popular ODD. The official symptoms of ODD include “often actively defies or refuses to comply with adult requests or rules,” “often argues with adults,” and “often deliberately does things to annoy other people.”

Many of America’s greatest activists including Saul Alinsky, the legendary organizer, would today certainly be diagnosed with ODD and other disruptive disorders. Recalling his childhood, Alinsky said:

“I never thought of walking on the grass until I saw a sign saying ‘Keep off the grass.’ Then I would stomp all over it.”

Heavily tranquilizing antipsychotic drugs (e.g. Zyprexa and Risperdal) are now the highest grossing class of medication in the United States (\$16 billion in 2010); a major reason for this is that many children receiving antipsychotic drugs have nonpsychotic diagnoses such as ODD or some other disruptive disorder; this especially true of Medicaid-covered pediatric patients.

3. Schools That Educate for Compliance, Not Democracy

Upon accepting the New York City Teacher of the Year Award on January 31, 1990, John Taylor Gatto upset many in attendance by stating:

“The truth is that schools don’t really teach anything except how to obey orders. This is a great mystery to me because thousands of humane, caring people work in schools as teachers and aides and administrators, but the abstract logic of the institution overwhelms their individual contributions.”

A generation ago, the problem of compulsory schooling as a vehicle for an authoritarian society was widely discussed, but while this problem has gotten worse, it is now seldom discussed.

The nature of most classrooms, regardless of the subject matter, socializes students to be passive and directed by others, to follow orders, to take seriously the rewards and punishments of authorities, to pretend to care about things they don’t care about, and that they are impotent to affect their situation. A teacher can lecture about democracy, but schools are essentially undemocratic places, and so democracy is not what is instilled in students. School breaks us from courageous actions, teaches us a kind of inert concern in which caring—in and of itself and without risking the consequences of actual action—is considered ethical. School teaches us that we are moral and mature if we politely assert our concerns, but the essence of school—its demand for compliance—teaches us not to act in a friction-causing manner.

4. “No Child Left Behind” and “Race to the Top”

The corporatocracy has figured out a way to make our already authoritarian schools even more authoritarian. Democrat-Republican bipartisanship has resulted in wars in Afghanistan and Iraq, NAFTA, the PATRIOT Act, the War on Drugs, the Wall Street bailout, and educational policies such as “No Child Left Behind” and “Race to the Top.” These policies are essentially standardized-testing tyranny that creates fear, which is antithetical to education for a democratic society. Fear forces students and teachers to constantly focus on the demands of test creators; it crushes curiosity, critical thinking, questioning authority, and challenging and resisting illegitimate authority.

In a more democratic and less authoritarian society, one would evaluate the effectiveness of a teacher not by corporatocracy-sanctioned standardized tests but by asking students, parents, and a community if a teacher is inspiring students to be more curious, to read more, to learn independently, to enjoy thinking critically, to question authorities, and to challenge illegitimate authorities. Not whether they met some arbitrarily set curriculum standards created for use across entire states, regions, or nations by people with no personal knowledge or experience with the actual students in those classrooms subjected to their technocratic tinkering.

5. **Shaming Young People Who Take Education—But Not Their Schooling—Seriously**

In a 2006 survey in the United States, it was found that 40 percent of children between first and third grade read every day, but by fourth grade, that rate declined to 29 percent. Despite the anti-educational impact of standard schools, children and their parents are increasingly propagandized to believe that disliking school means disliking learning. That was not always the case in the United States. Mark Twain famously said:

“I never let my schooling get in the way of my education.”

Toward the end of Twain’s life in 1900, only six percent of Americans graduated high school. Today, approximately 85 percent of Americans graduate high school, but this wasn’t good enough for Barack Obama who told us in 2009:

“And dropping out of high school is no longer an option. It’s not just quitting on yourself, it’s quitting on your country.”

This coming from the guy who when given the opportunity, handed the country back to the bankers who had just ruined tens of millions of people’s lives.

The more schooling Americans get, however, the more politically ignorant they are of America’s ongoing class war, and the more incapable they are of challenging the ruling class. In the 1880s and 1890s, American farmers with little or no schooling created a Populist movement that organized America’s largest-scale working people’s cooperative, formed a People’s Party that received eight percent of the vote in 1892 presidential election, designed a “subtreasury” plan (that had it been

implemented would have allowed easier credit for farmers and broke the power of large banks) and sent 40,000 lecturers across America to articulate it, and evidenced all kinds of sophisticated political ideas, strategies, and tactics absent today from America's well-schooled population. Today, Americans who lack college degrees are increasingly shamed as "losers"; however, Gore Vidal and George Carlin, two of America's most astute and articulate critics of the corporatocracy, never went to college, and Carlin dropped out of school in the ninth grade.

6. The Normalization of Surveillance

The fear of being surveilled makes a population easier to control. While the National Security Agency (NSA) has received publicity for monitoring American citizens' email and phone conversations, and while employer surveillance has become increasingly common in the United States, young Americans have become increasingly acquiescent to corporatocracy surveillance because, beginning at a young age, surveillance is routine in their lives. Parents routinely check Web sites for their kid's latest test grades and completed assignments, and just like employers, are monitoring their children's computers and Facebook pages. Some parents use the GPS in their children's cell phones to track their whereabouts, and other parents have video cameras in their homes. Increasingly, I talk with young people who lack the confidence that they can even pull off a party when their parents are out of town, and so how much confidence are they going to have about pulling off a democratic movement below the radar of authorities?

7. Television

In 2009, the Nielsen Company reported that TV viewing in the United States is at an all-time high if one includes the "three screens"—a television set, a laptop/personal computer, and a cell phone. American children average eight hours a day on TV, video games, movies, the Internet, cell phones, iPods, and other technologies (not including school-related use). Many progressives are concerned about the concentrated control of content by the corporate media, but the mere act of watching TV—regardless of the programming—is the primary pacifying agent. Private-enterprise prisons have recognized that providing inmates with cable television can be a more economical method to keep them quiet and subdued than it would be to hire more guards.

Television is a dream come true for an authoritarian society: those with the most money own most of what people see; fear-based television

programming makes people more afraid and distrustful of one another, which is good for the ruling elite who depend on a 'divide and conquer' strategy; TV isolates people so they are not joining together to create resistance to authorities; and regardless of the programming, TV viewers' brainwaves slow down, transforming them closer to a hypnotic state that makes it difficult to think critically. TV also shows you things to consume: look at them having fun at that cafe, or wow what a beautiful place to vacation, or hey look at those two sexy people fucking, or wow that kitchen is amazing, or hey look at that gadget. TV tells you how to be: oh wow, that guy embarrassed himself and now things are going horrible, or lonely people are dangerous, or only losers stay home on the weekend.

While playing a video games is not as zombifying as passively viewing TV, such games have become for many boys and young men their only experience of potency, and this 'virtual potency' is certainly no threat to the ruling elite. Time spent increasing the power of pixels is time not spent thinking about how to end this unjust system.

8. Fundamentalist Religion and Fundamentalist Consumerism

American culture offers young Americans the 'choices' of fundamentalist religion and fundamentalist consumerism. All varieties of fundamentalism narrow one's focus and inhibit critical thinking. While some progressives are fond of calling fundamentalist religion the "opiate of the masses," they too often neglect the pacifying nature of America's other major fundamentalism. Fundamentalist consumerism pacifies young Americans in a variety of ways. Fundamentalist consumerism destroys self-reliance, creating people who feel completely dependent on others and who are thus more likely to turn over decision-making power to authorities, the precise mind-set that the ruling elite loves to see. A fundamentalist consumer culture legitimizes advertising, propaganda, and all kinds of manipulations, including lies; and when a society gives legitimacy to lies and manipulateness, it destroys the capacity of people to trust one another and form democratic movements. Fundamentalist consumerism also promotes self-absorption, which makes it difficult for the solidarity necessary for democratic movements.

These are not the only aspects of our culture that are subduing young Americans and crushing their resistance to domination. The food-industrial complex has helped create an epidemic of childhood obesity, depression, and passivity. The prison-industrial complex keeps young anti-authoritarians

‘in line.’ Recall the two Pennsylvania judges who took \$2.6 million from private-industry prisons to ensure that juveniles were incarcerated.

“All our things are right and wrong together. The wave of evil washes all our institutions alike.”

The only prominent youth movements in the US are those slick NGO-backed and social-media-marketed ones. The Greta Thunberg climate crusade being the most notable one at the time of this writing. These movements do nothing but herd what should be the most radical population into safe, corporate-friendly outlets. It’s the evil oil companies and their bought politicians who have hurt the environment you love, not your friends at Starbucks, look, we sell reusable cups! And OMG fam, totally check out Kylie Jenner’s—that’s the “self-made” billionaire one and not the could-play-for-the-WNBA one, right?—new artisan vegan fair-trade makeup.

Anti-authoritarians often cannot stop authoritarians from assaulting them, but some anti-authoritarians compound this assault with a self-inflicted one. Overwhelmed by pain, there are many anti-authoritarians—famous and non-famous—who have hurt themselves, hurt others,

Anti-authoritarians, by their nature, do not take seriously authorities’ admonitions, as they often see through hypocrisy; and US authorities have historically manifested a great deal of hypocrisy around drugs (for example, the revolving door of psychiatric drugs becoming illegal ones, and vice versa). Anti-authoritarians’ disregard for alcohol and drug consequences may not, early on, be costly for them, and this can further diminish their caution and result in a tragic irony: self-created dependency on a nonhuman illegitimate authority—specifically, a chemical substance.

Another common theme among self-destructive anti-authoritarians is a deterioration toward self-absorption. An obsession with one’s moods can result in feeling even more overwhelmed by pain, which fuels compulsive unwise actions. A sense of humor is vital for anti-authoritarian survival and joy, and, when self-absorption displaces their sense of humor, anti-authoritarians find it painful to be with themselves—and so too do others, which, in a vicious cycle, makes anti-authoritarians even more self-loathing, which creates more pain and makes anti-authoritarians more vulnerable to unwise actions. This lack of self-care can include a lack of attention to physical health and personal finances, along with unwise relationships with abusive and exploitative people. Relationships are critical. If an anti-authoritarian lacks anyone they trust, they are highly vulnerable to unwise actions fueled by their pain. And if they trust untrustworthy people, that too can result in self-destructive behaviors.

In the 1770s, Paine's *Common Sense* helped spark the American Revolution and his *American Crisis* helped keep George Washington's troops from quitting on him. In the 1960s, no one could be counted on more than Phil Ochs to perform at an anti-war rally and supply energy for the anti-war movement. Ochs's performance of his song "I Ain't Marching Anymore" during a protest concert outside the 1968 Democratic National Convention inspired many young men to burn their draft cards. As a teenager, what I loved most about Ochs was how he confronted the liars and hypocrites who had created misery for my generation. Ochs's humor was far more energizing for me than the tired rants of his anti-war contemporaries. Even though liberals were a large part of his audience, Ochs also made fun of hypocrites on the Left, most famously in his song "Love Me, I'm a Liberal."

I cried when they shot Medgar Evers
Tears ran down my spine
And I cried when they shot Mr. Kennedy
As though I'd lost a father of mine
But Malcolm X got what was coming
He got what he asked for this time
So love me, love me, love me, I'm a liberal

I go to civil rights rallies
And I put down the old DAR
I love Harry and Sidney and Sammy
I hope every colored boy becomes a star
But don't talk about revolution
That's going a little bit too far
So love me, love me, love me, I'm a liberal

I cheered when Humphrey was chosen
My faith in the system restored
I'm glad that the commies were thrown out
Of the AFL-CIO board
I love Puerto Ricans and Negros
As long as they don't move next door
So love me, love me, love me, I'm a liberal

The people of old Mississippi
Should all hang their heads in shame
Now, I can't understand how their minds work
What's the matter don't they watch Les Crain?

But if you ask me to bus my children
I hope the cops take down your name
So love me, love me, love me, I'm a liberal

Yes, I read *New Republic* and *Nation*
I've learned to take every view
You know, I've memorized Lerner and Golden
I feel like I'm almost a Jew
But when it comes to times like Korea
There's no one more red, white, and blue
So love me, love me, love me, I'm a liberal

I vote for the Democratic party
They want the UN to be strong
I go to all the Pete Seeger concerts
He sure gets me singing those songs
And I'll send all the money you ask for
But don't ask me to come on along
So love me, love me, love me, I'm a liberal

Sure, once I was young and impulsive
I wore every conceivable pin
Even went to socialist meetings
Learned all the old union hymns
Ah, but I've grown older and wiser
And that's why I'm turning you in
So love me, love me, love me, I'm a liberal

Nowadays of course, liberals have changed, and yet they haven't. Perhaps the best illustration would be the acts of 'resistance' to Trump and today's Republicans by well-off liberals. Taylor Swift for instance, in her latest documentary nervously chatting with her publicist, over wine in a giant house, about whether or not to post to Instagram supporting two Democratic candidates. We salute you Taylor for taking such a risk to your life, you truly are brave—I mean you only have millions of dollars as a safety net if it all goes wrong! Or perhaps you would prefer the incident shortly after, where she is complaining that men do not take women seriously, and then cut to her in a skintight sparkling dress that barely covers her crotch remarking on how great she looks, and her little entourage cooing, "So sexy." You do realize that pushing your tits up and out on full display since you were sixteen is not feminism right? It's just doing precisely what the evil patriarchy wants

you to do: give them something nice to look at—and in America nothing is sexier than an underage, post-pubescent girl. Yet they have an absolute fanatic hatred towards pedophiles—project much? And no this isn't "slut shaming," simply that if you turn yourself into a display of sex symbols don't be surprised when no one takes you seriously—happens if you've got a dick too. Channing Tatum? Dumb as a rock. Sylvester Stallone? Idiot meathead. Or maybe the best illustration of the modern liberal via Taylor is simply the many incidents of her crying over some ridiculous thing—yes, yes, you poor multi-millionaire, life is quite hard.

What made Phil especially endearing was that he reserved some of his most pointed barbs for himself. In his songs and his quips, Phil Ochs modeled a hugely important trait for anti-authoritarians: maintaining a sense of humor and not taking oneself too seriously. However, at the end of his life, Ochs modeled the opposite trait: an anti-authoritarian who loses his sense of humor, becomes self-absorbed, and ends up in a dark place. Because his rise and fall came during my most impressionable years, Phil Ochs's life served as both an inspiring model and a cautionary tale for me. I remember as a teenager listening repeatedly to "When I'm Gone," his song about the value of staying alive despite the pain of life. As beautiful and life-affirming as that song is, I recall wondering whether he might commit suicide. It was clear to me that he was a fragile guy trying his best not to be defeated by life's pains. Ochs's songs were therapy for many of us fragile teenagers, inspiring us to have the courage to face life. However, Ochs himself ultimately succumbed to his overwhelming pains.

Overwhelming pain is also common among those anti-authoritarians whose violent actions have hurt others. Overwhelmed by the pain of societal injustices and their own personal humiliations and powerlessness, they can be in danger of acting compulsively and reactively rather than wisely choosing actions that can best liberate themselves and others. Violent actions fueled by rage are often not well thought out actions, especially with regard to the ultimate consequences for others. Anti-authoritarians who move to violence are in many cases quite willing to die. While they may sincerely believe that they are willing to die for their cause, some are unaware of their need to be perceived as courageous by others. This lack of awareness skews their judgment as to the likely consequences of their violence. For many violent anti-authoritarians, a need for life's pleasures signifies weakness and an inadequate loyalty to the cause. However, the absence of pleasure in their lives can make their pains even more excruciating, driving them to compulsive actions. Among this group of violent anti-authoritarians, anger over societal and personal injustice is often quite justifiable, and their experience of powerlessness to produce justice for society and themselves is

often quite painful.

Alexander Berkman was one of the most famous anarchists in US history. He is most remembered for his failed attempt to assassinate Carnegie Steel Company manager Henry Clay Frick during the Homestead, Pennsylvania, steelworkers' strike in 1892. His *Prison Memoirs of an Anarchist* provides us with his justifications and motivations. Unlike others who have turned to violence, Berkman cannot so easily be dismissed as unstable or "mentally ill," as he was admired for his integrity even by those outside the anarchist movement. And while Berkman gained fame for one act of violence, he also undertook life-saving actions.

In 1892, Alexander Berkman, at age 21, became a household name in the United States for his failed assassination attempt of Henry Clay Frick. Berkman later recounted the arousing of his passion and his justification for attempting to kill Frick. He tells us how Emma Goldman—protecting her identity, he refers to her as "the Girl"—a year older than him, waves a newspaper and cries out:

"Have you read it? Homestead. Strikers shot. Pinkertons have killed women and children."

Berkman tells us:

"Goldman's words ring like the cry of a wounded animal, the melodious voice tinged with the harshness of bitterness—the bitterness of helpless agony."

Berkman recounts his contempt for the hypocrisy of the "philanthropist" Andrew Carnegie, who had chosen Frick to manage his company for the purpose of crushing the labor union. For Berkman, Frick is not simply an illegitimate authority, but evil in "his secret military preparations the fortification of the Homestead steelworks; the erection of a high board fence, capped by barbed wire and provided with loopholes for sharpshooters; the hiring of an army of Pinkerton thugs." Recounting his justification for killing Frick, Berkman concludes:

"The removal of a tyrant is not merely justifiable; it is the highest duty of every true revolutionist. Human life is, indeed, sacred and inviolate. But the killing of a tyrant, of an enemy of the People, is in no way to be considered as the taking of a life. A revolutionist would rather perish a thousand times than be guilty of what is ordinarily called murder. In truth, murder and Attentat [a political deed of violence to awaken the consciousness

of the people against their oppressors] are to me opposite terms. To remove a tyrant is an act of liberation, the giving of life and opportunity to an oppressed people.”

Berkman felt that he had thought through the consequences of his action, believing his act would help his cause of anarchism. He believed that the value of his action “very much depends upon my explanation” which “offers me a rare opportunity for a broader agitation of our ideas.” For Berkman, “the People” misunderstood the cause of anarchism because they had been prejudiced by the capitalist press.

“They must be enlightened; that is our glorious task.”

At his trial, Berkman refused a lawyer and instead wrote a speech in German because his English was then still poor. He read it to the court, which used a German translator who was incompetent, and the judge cut Berkman off before he was done. And so Berkman’s statement thus failed to enlighten the public.

Acts of violence against US authorities fail because most Americans accept the idea that the United States is a uniquely free society. Violence has been used again and again to support the structure of authority in American society. We are only puzzled when violence is used to attack that structure.

To attempt to kill Frick, Berkman stripped Frick of his humanity.

“Berkman turned him into an object, a symbol of the repressive forces of capitalism. It is not Frick, the man, but Frick, the symbol, there before Berkman. Berkman must do the same to himself. He must deny his own humanity, his own feeling, and turn himself into an instrument of a cause, a symbol of a revolutionary ideology.”

After gunning down McKinley, Czolgosz was coherent and offered a clear rationale for his action:

“I know other men who believe what I do, that it would be a good thing to kill the President and to have no rulers. I have heard that at the meetings in public halls. Emma Goldman was the last one I heard. She said she did not believe in government nor in rulers. I don’t believe in voting, it is against my principles. I am an anarchist. I don’t believe in marriage. I believe in free love. I fully understood what I was doing when I shot the

President. I realized that I was sacrificing my life. I am willing to take the consequences.

I killed the President because he was the enemy of the good people—the good working people.”

While Czolgosz, to the extent he is written about at all, is dismissed as a pathetic nut with nothing to teach us, Ted Kaczynski is well known, but few see his life as having anything to teach, viewing him only as terrifyingly insane. Kaczynski, who came to be known as the Unabomber, is one of the most violent anti-authoritarians in US history. Between 1978 and 1995, Kaczynski’s bombs killed three people and injured 23 others. While some of his victims had positions of power in his hated “industrial society,” others did not.

Once Ted Kaczynski was brought to trial, in order to save him from the death penalty, his brother David and their mother Wanda helped portray Ted as being seriously mentally ill, which enraged Ted against them as he knew that his political reasons for the bombings would now not be taken seriously. Much of what the world heard about Kaczynski’s mental status was not true. Kaczynski was psychopathologized for two reasons: the concerns of his family, who wanted to spare him the death penalty; and to meet the needs of societal authorities who wanted to dismiss his societal critiques. Kaczynski is neither the extreme loner he has been made out to be nor in any clinical sense mentally ill.

In Kaczynski’s sophomore year at Harvard, he fell victim to a disturbingly abusive experiment by one of the most renowned figures in the history of US psychology, Henry Murray. Experimental subjects were told they would be debating personal philosophy with a fellow student; but instead, they were subjected to abusive personal attacks that were purposely brutalizing. Kaczynski and other subjects were instructed to write an essay detailing their personal beliefs and aspirations, and the essay was given to an attorney who would belittle them based on the disclosures they had made. This humiliation was filmed, and played back to the subjects. Thus, Kaczynski had personal reasons for rage and for distrust of the elites who managed society. Kaczynski began his 1995 manifesto this way:

“The Industrial Revolution and its consequences have been a disaster for the human race.”

He then discussed how the increasing growth and worship of technological and industrial systems have subverted individual freedom and destroyed our natural environment.

Politics—not science—dictated that Ted Kaczynski be labeled insane. Against Kaczynski's wishes, his defense attorneys launched a "mental illness" defense for him. Defense expert psychologist Karen Bronk Froming concluded that Kaczynski exhibited a "predisposition to schizophrenia," citing his anti-technology views as having cemented her conclusion. Sally Johnson, a forensic psychiatrist with the US Bureau of Prisons, provisionally diagnosed Kaczynski with "Paranoid Type" schizophrenia, largely based on her view that he harbored "delusional beliefs" about the threats posed by technology. In addition to Kaczynski's views on technology, other so-called "evidence" for his mental illness included his personal habits and unkempt appearance living alone in a cabin in Montana. But his cabin was no messier than the offices of many college professors. The Montana wilds are filled with escapists like Kaczynski. Celibacy and misanthropy are not diseases. Nor was Kaczynski really so much of a recluse.

When overwhelmed by pain, some people consider and/or attempt suicide. However it is unhelpful to view feeling suicidal as a consequence of mental illness. If being suicidal is viewed as a symptom of mental illness then talking about your suicidal feelings runs the very real risk of finding yourself being judged, locked up, and drugged. So, many critically-thinking suicidal anti-authoritarians don't reach out. Society stigmatizes mental illness, so how can one expect a person overwhelmed by emotional pain not to self-stigmatize once they've been labeled as mentally ill? And this stigma creates more pain and hopelessness. In contrast, what is helpful for many anti-authoritarians is validation that their pain is evidence of their soul and their humanity. Overwhelming pain—be it financial, physical, relationship, school, other incarcerations, or from other sources—is the fuel of depression.

In our moneyed society, financial pains can be lethal, and were especially so for Lenny Bruce, Alexander Berkman, and also many non-famous anti-authoritarians who I've known. In our economic system, it is difficult to make a living doing what one believes in, and young anti-authoritarians are often tough on themselves in this regard, adding more pain to their lives. Many anti-authoritarians today often have little choice but low-wage slavery. One can try to escape, but sometimes that's difficult. If life circumstances such as an ailing parent or child-custody requirements keep one stuck in a small town where the only employer is a prison, self-flagellation does no one any good; being the kindest prison guard possible does do some good. And if one is mired in student-loan debt and the only survival option is being a teacher in an authoritarian school, one can try to get some satisfaction by perhaps not forcing students to raise their hands to take a dump.

In our economic system, few of us are not prostituting ourselves to some extent, and so, for those unskilled at denial of this reality, the only real

antidote to this pain is a sense of humor.

A key to overcoming immobilizing depression is to take seriously something besides one's depression, one's mood, and oneself. If, unlike Thomas Paine, one lacks the energy to start a couple of revolutions but is passionate about politics, it is still possible to hang out with like-minded people—an instant antidepressant for Emma Goldman.

While there are certainly societies less free than the United States, what makes life difficult for US anti-authoritarians are the mixed messages that they receive. From the Declaration of Independence, to the Bill of Rights, to the Statue of Liberty the United States gives the appearance of welcoming those who resist illegitimate authority. Moreover, the United States is a place where immigrant anti-authoritarians such as Thomas Paine and Emma Goldman became celebrities. However, when anti-authoritarian resistance truly threatens powerful US authoritarians, the rug is pulled out—often violently so. Some US anti-authoritarians have been punished with prison and deportation for merely exercising their First Amendment right of “free speech.” However, US anti-authoritarians are not routinely marginalized in these ways. Authoritarians need only ensure that anti-authoritarians not be heard in order to marginalize them. Scott Nearing, indicted by the US government for stating his beliefs, was luckily not convicted in his 1919 trial but was by other means effectively marginalized. He wrote in 1972 that for the past half-century:

“I have had the ‘right’ to speak, write, print, publish, but my words dropped into a deep well of oblivion. I have the ‘right’ to teach, but no university or school in the country would accept me. I could speak, but few public forums would allow me on their platforms. I could write, but my books were not published by recognized firms, nor were they reviewed in magazines or papers or stocked in book stores.”

Many anti-authoritarians resonate with Nearing's anger over being disregarded and discarded. Authoritarians realize that simply ignoring opposition is often an effective way to marginalize it, whether that opposition comes from the voice of a single anti-authoritarian or the majority of the people. A 2014 study empirically established how average US citizens are almost completely ignored by US governmental authorities in terms of public policies. Reviewing US public opinions of policy issues, along with examining 1,779 different enacted public policies between 1981 and 2002, researchers determined that “even when fairly large majorities of Americans favor policy change, they generally do not get it.” They conclude:

“The central point that emerges from our research is that economic elites and organized groups representing business interests have substantial independent impacts on US government policy, while mass-based interest groups and average citizens have little or no independent influence.”

When dissent—be it through public opinion polls, protest demonstrations, or otherwise—becomes impotent in changing policy, this is an indicator of living under authoritarian rule. If a society is not authoritarian, then the tension that dissent creates is resolved so that dissenters experience their grievances being taken seriously, as evidenced by policy changes. In an authoritarian society, dissenters—even when in the majority—routinely feel impotent and helpless. Dissent without disobedience is essentially no threat to authoritarians in power. Clever authoritarians welcome dissent without disobedience, since it can be easily ignored and provides the illusion of a free and democratic society. Only disobedience can threaten authoritarians. If anti-authoritarian voices prove difficult to ignore, authoritarians will resort to overt assaults. For such assaults, authoritarians will often rely on the work of ‘professional authorities,’ including the legal system to criminalize disobedience; mental health professionals to pathologize anti-authoritarian behavior; and teachers and the media, who label disobedience as immature. It is no wonder that people who disobey illegitimate authority often feel such intense anger.

Anti-authoritarians cannot be understood if we deny, water down, or pathologize their anger. This anger may be a result of their dissent being ignored. Or it may be a result of overt assaults on them for challenging and resisting illegitimate authority. Or it may be caused by witnessing such assaults on their anti-authoritarian friends. Or their anger may come from resentment over being forced into constant vigilance against authoritarian assault. The manner in which anti-authoritarians deal with their anger—and how others who care about them deal with it—is critical to tragedy or triumph. Contempt for coercion and tolerance for eccentricity are the norms in the anti-authoritarian groups that I have studied and among those with which I have personally been involved. I have found striking similarities between the individual personalities within these groups: Thoreau and his Concord buddies in the 1840s and 1850s; New York City anarchists living between 1880 and 1918; and modern so-called “psychiatric survivors.” Today, anti-authoritarians with unconventional behaviors who create tension are often marginalized as mentally ill. That makes these modern anti-authoritarians especially angry, so angry that they are likely to create even more tension for others.

Recall that Stanley Milgram, reporting on his research about obedience to authority, concluded that our “fatal flaw” is our capacity to abandon our humanity so as to comply with abusive authority. Those human beings least afflicted with that flaw have, sadly, been marginalized in US society—including psychiatrically marginalized. Among the most honored members of modern US society are “first responders” to disasters, including natural disasters such as hurricanes and human-made ones such as mass shootings. Anti-authoritarians are also first responders to disasters. They are the first to question, challenge, and resist illegitimate authority. While US society has honored some famous anti-authoritarians long after they are dead, these figures have often been marginalized in their own lifetimes. Throughout US history, anti-authoritarians have usually been able to rely only on each other for mutual aid. If this mutual caring diminishes, their triumphs will also diminish. So, while anti-authoritarians need no badges, they do need one another.

Becoming radicalized in a small town by yourself, seemingly in the “middle of nowhere,” can often be one of the most difficult experiences you may ever encounter. But even harder than the feeling of being adrift can be the desperation of not knowing how to go about attempting to make the leap from being just an individual with a set of ideas to someone that is part of a movement and specifically, a group of people who are organized in a set area, acting in concert, with that movement. In today’s age, where the internet has taken up more and more of what social movements and struggles are based around, the need to have a presence on the streets and in our neighborhoods, is now greater than ever.

Before you begin to form a group—in this context, group is going to refer to everything from an organization, a project, a crew, to any sort of collective attempt at doing something—it’s good to keep a few things in mind, and also to look around your general region for different examples of ways to organize, how to intervene, and things that other groups are doing, building, and working on.

First, it’s always good to go back and read and study the history of your region. Who were the original people that lived on the land that you now live on? How did they respond and fight back against colonization? Are their descendants still in the local area? What is the history of past movements, from labor to civil rights to the fight against the war in Vietnam? Are there examples of riots, strikes, and occupations that shaped your town? How have people historically responded to the police, to pollution, environmental racism, and ecological destruction? The results of a few internet searches, calls to local union halls, and trips to the library, may surprise you.

Second, it’s probably worth it to check out the groups that are in your

town and also general region. If there's a university and junior college, see what is happening on campus. Are there groups of people putting on film showings and discussions in town? Are there hold overs from past movements still meeting? This goes for reactionary and far-Right forces as well; as their presence will of course impact your ability to organize. Looking into what is happening in towns around you may also be worth your while. For instance, finding a group of people in a town 45 minutes away might not lead you to find a group of people you might organize with, but it might give you an idea of what people in a somewhat similar context are doing in their own location. The point in doing all of this background research is to see if there are other people out there that like you are looking for something else.

Third, it's good to have an understanding of your local context and what the primary tensions and contradictions are within daily life of the general area that you inhabit. This can change, neighborhood to neighborhood, but in general you need to know who holds wealth and power in your area, what their interests are, and how they are attempting to shape and control the area around them. You also need to map out how this is causing tensions to arise; and how people, if at all, are responding.

This can mean everything from gentrification and police sweeps of the homeless to the closing of schools and manufacturing plants to pipeline projects and simply generational abject poverty. Reading the local news daily, while understanding its real limits, will also help in this regard. Chances are, you already know that your town has a history of being polluted by the XYZ plant, that the opioid crisis has ravaged the region, or that the biggest issue is lack of affordable housing, et cetera. The reason that you need to think strategically about these realities is that by doing so this can and will inform how you may be able to respond to them.

A big mistake that some people new to organizing make is that they simply try and jump into what group they most closely associate with; often networks and organizations that are already established across the US. This means that folks often with no experience suddenly set up IWW chapters when they have no history of actual labor organizing, and often times, just sit around in meetings until after six to twelve months, the project folds. This isn't to say that you shouldn't start an IWW, Redneck Revolt, Earth First!, or Anarchist Black Cross group, but only to point out that as you find people and begin to get organized, the work you end up doing may be completely different than the original project that you had in mind. Also, there's nothing stopping you from later on incorporating aspects of these other groups into your organizing: from letter writing nights, to labor organizing, to learning how to use firearms properly.

Final point, the biggest pothole that many new people get stuck in is that of social media. In short, setting up an account won't magically make a real life group appear. And while running a Facebook page for "XYZ Town of Anarchists" might be a great way to meet some people, if all you do is share memes and links about things happening elsewhere, as opposed to going out and starting projects and organizing, then what's the point? If you set up accounts, use them to boost what you are doing and to hopefully find new people, but don't mistake a page for actually being organized.

If we are operating from the idea that you are essentially alone in the project of building a group of people you can begin to organize with and take action alongside, then you're going to have to work at finding like-minded folks—and trust us, they are out there. Rest assured, people are out there, and generally they are just as isolated, alienated, and looking to connect with other people as you are. So then, you'll need to think of ways of creating opportunities for you and potential comrades to meet. In general, here are some ideas:

Organize A Low Key Event: One of the easiest things to pull off in order to test the waters of your local area is to organize an event to see if curious and like minded people show up. One of the simplest events you can organize is to host a film screening. If you're looking for a place to hold a screening in order to avoid bad weather, generally places like public libraries are cheap to rent out and easy to set up. If weather permits, you might want to do it outside in a public park, just make sure to figure out a screen, sound, and power before hand. Also, make sure that you put a lot into actually promoting the event. Make flyers and do a social media campaign. Make sure you get the word out in all the different working class neighborhoods in your general area. Put up flyers at schools, corner stores, health food stores, smoke shops, at the library, barbershops, tattoo parlors, coffee shops, et cetera.

Table With Literature: Tabling is a time tested way to meet other folks face to face. What you'll need is a table and also literature. Look around at different online distros for stuff to print out and get creative. Hell, print out this book if you like—this fat bitch sitting on your table is a surefire attention-getter. Choose places to table with high foot traffic such as flea markets, college campuses, music events and shows, farmer's markets, busy Downtown areas, and beyond. Then there's also places such as the DMV or the Food Stamps office where large amounts of people are stuck at all day, often looking for something to read. Carry around an email sign up sheet with you and add people to a mailing list as you go.

Host a Skillshare: If hosting a film screening or tabling with literature isn't your idea of a good way to meet potential comrades, you might also consider hosting something less overtly political and more based around sharing a skill, such as photography or learning how to grow your own food. Events like this appeal to a wide variety of people and often are very popular.

Create A Publication/Broad Sheet/Poster Campaign: If you are looking to do something different that may take a while to build, you may want to go the publishing route. Creating a local magazine or broadsheet that presents an analysis and critique of the local news is one idea. You could also simply do a one-off broad sheet, (11" by 17" double sided print) or even just put up posters that include a contact email. By setting up a network of free boxes you can increase your distribution range, while also dropping off copies at places like the library or at liquor stores.

Start a Reading Group: Reading groups offer a way to bring together people interested in radical ideas with people already well versed in them in a low key environment that lets people get to know each other and build relationships. The idea behind them is fairly simple: to read a text and then discuss it as a group. People may also find it easier to read a text out loud as a group as opposed to reading it at home and then discussing it the week after, but the choice is yours.

So you've read about your town and general area's history. You understand the terrain around you and have also mapped out the key contradictions. You're up on local politics and have your ear to the ground. You've also branched out, organized a few events, and against all odds managed to meet a few people that want to do something with you. The next question is: so now what? How you answer that question will depend on the kind of group that you want to build. What follows are some general concepts to help you think about what direction you could go in.

Base Building: All good organizers should be engaging in some form of base building—the idea behind it is that you are putting work into the building of relationships with people, neighborhoods, and communities that you want to have a greater connection to. This could mean choosing to table at the local flea or farmer's market every week, organizing a cop-watch patrol of a set area against fascist activity, or simply spending a lot of time in a neighborhood making connections with people who live there.

Mutual Aid: Many groups engage in a wide variety of mutual aid projects, from providing community meals like Food Not Bombs, to organizing events like Really (Really) Free Markets, to free brake light clinics, to free grocery programs and free stores. Mutual aid projects can often be an easy thing to engage in within your wider community, as they are a ‘positive’ activity and generally will win you the support and respect of those around you. They also are very labor intensive and very quickly you will discover who is actually down to put in work, and who isn’t. At their heart, mutual aid programs can address real needs and problems directly while also creating a project that is easily accessible for new comers.

Organizing: Organizing of course is a broad term, but essentially we are referring to initiatives in which people build up a material force which can collectively engage in class combat; to assert working class interests in the face of capital and State authority. Examples of this include tenants unions and associations, fighting pipeline and fossil fuel infrastructure, workplace organizing, and solidarity networks.

Intervention: To speak of intervention means the process in which we insert ourselves in wider tensions already happening all around us. This means analyzing and understanding our local context, and then thinking strategically about how one could intervene within it to deepen one’s own position. This could mean everything from poster and banner campaigns in the wake of sweeps against the homeless that seek to gentrify a Downtown corridor, to mobilizing free groceries for striking workers to offer in solidarity.

Infrastructure: Lastly, there is the question of how to sustain this activity? The answer lies largely in the creation of autonomous infrastructure. This could mean the building up of land projects and cooperative housing, to the purchasing of copy machines and printing presses; essentially everything that we need to strengthen ourselves as a material force.

You’ve come a long way. From someone with big ideas to part of a fighting community. The question now is—what’s next? What’s next is that you make connections and relationships with more people in your general region and begin the process of networking and federating together, becoming stronger as a regional force.

Every year in the United States, the toppling of the illegitimate British regime is celebrated on the 4th of July and most of us assume this was

a basically good and necessary act. The irony of celebrating the rebels' disobedience to their government by reciting pledges to obey the flag of another seems to be entirely lost. Of course, rebellion still has its place in the USA—during the so-called “Arab Spring,” US media commentators and politicians applauded the revolts of several Muslim countries and the dubiously-labeled Syrian rebels were cast in a mostly positive light. But not all revolutions are televised equally. In 1945 and '56, for example, uprisings led by Vietnamese and Cuban communists were mostly frowned upon by US media-outlets, while the 1990's Zapatista Rebellion in Chiapas, Mexico was mostly ignored. Why? There are historical, political, and ideological answers, of course—but that is not what this is about. I am after a scarier answer to the scarier question beneath those—that is, when is it OK to overthrow your government?

“... whenever any Form of Government becomes destructive of [the People's Rights], it is the Right of the People to alter or to abolish it, and to institute new Government. . . .”

That is the question—when are revolutions necessary? What is an acceptable reason to revolt? Asking these questions can be uncomfortable and even dangerous—but not asking them is more dangerous. Turning the pages of history, we can clearly see that some revolts were needed and that others did more harm than good. The mass rebellion against European monarchies ended the age of absolute rulers and instituted the more-restrained authority of written law in their place—probably for the best. Other acts of revolt—like the fascist overthrow of Spain's Republic in the 1930s—obviously did not work out so well for most of the people involved. During some chapters of history, a solid revolt would've been great but, for whatever reason, just didn't happen. A bit before the Nazi regime in Germany started murdering everyone, for example, might've been fantastic timing for a bit of regime-change.

Whether fruitful or catastrophic, each revolution has split and sculpted the branches of civilization in astonishing ways and—right or wrong—our choices to revolt or not are certain to continue shaping the future of our history. If so many of our possible futures hinge on the sum of our answers, isn't it irresponsible not to ask the question?

An adult catches a child by the arm to restrain them because they are about to run directly in front of an oncoming bus—that is an example of legitimate authority. Everyone knows that kids do not have authority to run into traffic and most people would use the legitimate authority to enforce it, even if the child is not their own. Its legitimacy is based on a nearly universal

consent to actions that prevent harm. Even the legal system recognizes this legitimacy—it's called the "choice of evils." Breaking into a burning house to save a person trapped inside will not get you convicted of burglary because society consents to your authority to enter, regardless of the law.

Even if society allows anyone to forcibly control a child stepping into traffic, it does not mean we always consent to controlling their movement. If a kid was under forcible control often, it's usually seen as child-abuse and, in extreme cases, society gives an agency authority to remove them from harm. While kids tend to get fewer rights—which, in this writer's opinion, is silly—we all recognize their autonomy over their own bodies. Even younglings have the right to move, jump, make silly faces, and get into some trouble. People in most cases don't consent to the authority to forcibly control bodies other than your own with no good reason. That would be illegitimate authority.

Since it would be silly to expect everyone who is restrained to prove they are not, in fact, a child running in front of a bus, it is the responsibility of the one using the authority to justify it. Since restraining people is usually not OK, the one restraining them must either be able to prove the authority is legitimate or be willing to accept the consequence for their action. The badge carried by police was originally meant to be evidence that a community trusted an officer's legitimacy—not a symbol of their immunity to the consequences of exercising illegitimate authority, as it is in our country today.

Legitimate authority, like that used to stop kids from running into traffic, is necessary. Illegitimate authority, such as restraining a person for no reason, destroys the social bonds between us and must be dismantled. But how do we know whether more complex authorities, such as governments, are legitimate or not?

“The will of the people shall be the basis of the authority of government.”

A government needs the consent of a people to claim legitimate authority over them. Since it is not possible for anyone to ask an entire population's consent by going door-to-door, methods to measure consent on a large-scale were designed, such as elections, public polling, and referendum. Of course, some are better than others but, even if we argue about which is best, there is a difference between a system which obtains consent and one which does not. At this particular moment in history, voting-based systems are the most accepted method for measuring mass-consent. All of the various democratic processes have one basic purpose—to measure how much consent is given by

a people to the authority of a state. Since consent is the basis of authority, a legitimate state does not exercise authority over people without providing evidence of mass-consent. Not everyone will agree on every issue—but an informed population using a democratic system maximizes the level of consent being given by the highest number of people. All legitimate government must ensure the governed are able to give—or withhold—their consent.

If people cannot freely give and withdraw consent, then the state's existence is an arbitrary use of authority—which is, incidentally, the dictionary definition of tyranny. Authorities that don't even pretend to seek consent are obviously disqualified. Roman-style military dictatorships and monarchy based on any variation of the “divine right-to-rule” are never legitimate. Any oligarch or autocrat can claim the masses' consent but proof is the only legitimacy. The only state which legitimately uses authority is a state with clear proofs of the masses' consent.

The mere existence of voting-booths is not proof of consent—there must be clear proof that everyone is able to use them freely and that they are satisfied with how the voting-process works. The mere existence of elections is not proof of consent—there must be clear proof that the results are true and the public must be able to verify the integrity of all results in every way. Clear proof is the only legitimate authority.

History leaves us little doubt that great harm follows tyranny as surely as its shadow. To prevent the great harm that despotism inflicts on society, the public has a right to decide against any regime that cannot or will not justify their authority with proof that the people consent to it. Unless and until the proof of consent is restored, it is the authority of the people to take revolutionary actions to dismantle their government. From the rebel Inca fighting Spanish tyranny and the self-liberation of Haitian slaves to the wave of revolt that overthrew autocracy in Europe, the authority of states is shown to be relative. Looking back to the roots of history, we do not honor or recognize authority claimed by kings and slave-drivers but we do recognize the natural authority of the slave and peasant rebellions against them because that authority is universal.

The rebels of the past lifted our species from beneath the feet of gods and emperors, broke the chains of absolute rulership, and pried the rights we have today from the grips of autocrats and oligarchs—but the human revolt is still incomplete. It's true we see fewer emperors, today—but we still have empire and militarized police-states. Just look at what they did at Standing Rock—what did the consent of our indigenous friends mean to them? Just watch what happens to whistle-blowers who inform the public about how their government uses its authority—like thieves who love the

cover of night, our rulers will never embrace transparency.

I have watched this country hold elections without an iota of transparency as candidates are bought and sold on the markets of campaign finance in broad daylight. I see unpopular leaders elected again and again by less than one-third of us, using voting-machines which produce unverifiable results with no paper-trail to audit. What consent is there when just one-tenth of us, vetted by privately-owned but publicly-funded parties choose two options which the rest of us have no choice but to choose between? Even then, two of the last three won with fewer votes than the other—but, if we dislike the system, we could simply have voted to change it, right?

How many of you are going to stand in honor of an anthem for a nation which oppresses you? And if it doesn't oppress you personally, then how can you honor a nation which oppresses your neighbor? May I write plainly or does that cross the line? Ah, too late. With these words as my only weapon—though that is unlikely to keep me from being labeled a 'terrorist' and getting an unannounced late-night visit—I say the authority of the United States government is illegitimate and struggle by its people to overthrow the regime by whatever means seems best to them is justified.

Practical Tactical

I would like to point out what this section is not: It is not an argument for or in support of any particular tactic. It is up to the individual reader to supply that, this text is simply offering tools to individuals who have decided that they have reached a point at which these tools are necessary. A book about how to build a table is not one that is supporting or demanding that all you motherfuckers build some tables. Use your head, not someone else's.

I abhor violence. It's often reckless, careless, excessive. It's usually directed at the powerless. Its effects are permanent and ripple outward. Which is why the greatest purveyors of violence must be stopped once and for all. By any means necessary—but hopefully not the worst of these.

The following chapter is designed to save lives, not take them. Why did the anti-communist nutjobs—so anti-communist that they welcomed countless Nazi war criminals into the US since Nazis would be guaranteed to hate the filthy commies—not turn the Soviet Union into radioactive glass? Because they knew Ivan could hit back, that they would get bloodied too. So instead they were forced to bully less powerful nations in proxy wars. Why does the US bomb “Iranian-backed militias” and “Iranian-supported terrorists”? Because Iran can at the very least give ole Uncle Sam a bloody nose.

A porcupine has quills for its own protection, it does not go around stabbing people for no reason. Nor do its quills, however impressive they may seem, guarantee invulnerability. They display a message, they provide a defensive shield, they can be used as a weapon, they can continue to do damage even after the porcupine perishes. They make there be a cost to an attack; violence comes with a price.

This book may seem like a weapon to some, some might even pick it up and attempt to wield it, but it also puts a price on our life, it exists, independently of us, and so it goes on without us, perhaps propelled forward by the absence of us—it creates a cost to unjust state violence directed our way. We step forward, knowing the potential cost; and the only way forward is if more of us do. The shade of this tree seems a fine one to die beneath, we shall water her roots with our blood if need be, but she will bloom once more.

Consider the following items to be shields, not swords. Once they know they are not invincible they will compromise or attempt to definitively crush you—it is always the same throughout history.

“The Rogue Wave is coming. Be prepared.”

I'd like to assure you that Plume uses only the highest-grade papers and yes, if you soak several dozen of these pages in water and let them dry together, you can sharpen the resulting mass into a fairly serviceable shank.

“This ain't no riot, brother! This is a rebellion, and we got years of reasons to tear this town apart! You don't have to be a big group to do it, brothers. In a town this size, three men can burn it down. That's what they call guerrilla warfare! Don't love him to death! Shoot him to death! You better get yourself some guns! I know who my enemy is, and I know how to kill him. When I get mad, I'm going out and look for the oppressor's shit and I'm going to collect our dues.”

Wiebo Ludwig, an evangelical Christian and his large extended family started a full-scale battle with the oil and gas industry in 1996. After plumes of sour gas, a deadly neurotoxin, trespassed on Ludwig's rural property, killing livestock and sickening members of his family, Ludwig demanded that government regulators do something. When, after five years of respectful pleading, they failed to answer his concerns, Ludwig, the son of a Dutch Resistance fighter, declared war. It started with nails left on the road and graduated to deliberately punctured tires. Next came downed trees on oil service roads. Then came the unrelenting monkey-wrenching of well sites and pipelines. Between 1996 and 1998, hundreds of remote facilities were attacked and disabled under the cover of darkness. The violence escalated to shootings, death threats, and bombings.

During the campaign, a mysterious group of saboteurs—mostly members of Ludwig's immediate family—destroyed more than \$10 million worth of industry property, much of it owned by Encana's precursor, the Alberta Energy Company. Ludwig also dumped sour crude in the offices of the provincial regulator to demonstrate the offensive nature of the product.

Every guerrilla band relies on the same cheap and devilishly effective weapon: doubt. Create enough uncertainty in your enemy and you can paralyze him. Officers will freeze when they should charge; soldiers will flinch when they should fire. To inflict damage and death on the enemy and to escape scot-free has an irritant and depressing effect. The object must be to strike hard and disappear before the enemy can strike back.

“I am capable of what every other human is capable of. This is one of the great lessons of war and life.”

—Maya Angelou

There are people who insist that they could never kill anyone, but they invariably add a telling caveat:

“Unless, of course, a person tried to harm someone I love.”

So the resource of violence is in everyone; all that changes is our view of the justification.

Predatory animals usually devour prey in order to convert flesh into fuel. Most human predators, however, seek power, not food. To destroy or damage something is to take its power. This applies equally to a political movement, a government, a campaign, a career, a marriage, a performance, a fortune, or a religion. To push a pie into the face of the world’s richest man is to take his power, if only for a moment.

When viewed as a contest between predator and prey, some human attacks look much like predation in nature: The surprise, the sudden movement, the burst of hostile energy, the jerky resistance, the wish to escape. If an animal taken by a predator could speak after the fact, he’d likely tell us:

“It all happened so fast; there wasn’t time to do anything.”

No matter how aberrant the person whose behavior you seek to predict, no matter how different from him you may be or want to be, you must find in him a part of yourself, and in yourself a part of him. When you undertake a high-stakes prediction, keep looking until you find some common ground, something you share with the person whose behavior you seek to predict—this will help you see the situation as he perceives it.

For example, the anonymous caller may seem to enjoy the fear he is causing in his victim. Getting pleasure from the fear of others is something most of us cannot relate to, until we recall the glee of every teenager who startles a friend or sibling by jumping out of the dark. Anyway, with the frightening caller, fear may not be the issue as much as liking attention, which we can relate to. When the caller causes people to feel fear, they are very attentive. It might not be his favorite way of getting attention if he perceived better options or if he felt he brought other assets to his relationship with his victim, but it has likely worked for him in the past. I don’t mean to imply that the threat caller is so introspective that he consciously considered all this, but neither is our behavior usually the result of conscious decision-making.

It is precisely because some people are not familiar with violent behavior that they feel they cannot predict it, yet they daily predict non-violent behavior and the process is identical.

The Elements of Prediction

0 – elemental, partial, or irrel-
evant</p> | |

This scale helps determine if a given prediction can be made successfully (which is distinct from whether it will be made successfully). To evaluate

a prediction, answer the eleven questions by selecting from the range of possible answers above. Then add up the total points.

22 or lower: Not reliably predictable; a matter of chance

23–27: Low likelihood of success

28–32: Predictable

32 or higher: Highly predictable

Note: The vantage question asks if the person making the prediction is in a position to observe the pre-incident indicators and context. If you can observe the situation and pre-incident indicators directly, then you have a Perspective View, but if you can only observe them through some medium (such as reports or other evidence), select Proxy View.

It is better to avoid than to run, better to run than to de-escalate, better to de-escalate than to fight, better to fight than to die.

‘No’ is a word that must never be negotiated, because the person who chooses not to hear it is trying to control you.

Avoid automobiles whenever possible; drivers are stopped and asked for identification far more than individuals using public transportation. Never drive at night; that’s when more traffic stops are made. Avoid drugs and alcohol unless in a secure environment; both impair judgment. Use end-to-end encryption whenever possible. If a phone must be used, make it a burner. Cities are generally safer than rural areas or small towns. Don’t wear clothes that are likely to draw suspicion. Once you have a name stick to it, unless you blow it and have to start again. Use only a few trustworthy contacts in different locations to channel your mail. Place your letter in an envelope, omit the return address, send it in another envelope with the address-side of the first envelope facing away from the address-side of the second envelope—new mail scanners can often see inside the envelope; sign up for a USPS Informed Delivery account and see for yourself. Avoid leaving fingerprints anywhere, wear gloves in handling letters.

Public places are good places to have private conversations as long as you don’t use trigger words such as ‘bomb’ that cause people to listen carefully.

A rubber hose wrapped with barbed wire is always a practical holiday gift for that rebel in your life.

The simplest local tools are often the most efficient means of assassination. A hammer, axe, wrench, screwdriver, fire poker, kitchen knife, lamp stand, or anything hard, heavy, and handy will suffice. Many however believe

that murder is not ethically justifiable. Persons who are morally squeamish should not attempt it.

The best sources of metal for lock-picks are ordinary objects, things you'd probably never have imagined could be transformed into something that would let you break through doorways: the underwires of bras, for example, or the inner blades of discarded windshield wipers, and, best of all, the rough brushes of street-cleaning trucks. Individual bristles are occasionally knocked loose during operation and left lying on the street. For those of you without the patience to follow a truck all day, a good place to find metal is simply in the dumpsters of auto-repair shops. Just lift up the lid, grab handfuls of old wiper blades, and be done with it.

The master tools of real-life breaking and entering are typically just everyday objects, re-imagined and transformed for criminal purposes. Consider the shockingly successful Antwerp diamond heist back in February 2003, when more than \$50 million worth of diamonds were stolen from a high-security vault in the center of that city's well-protected jewelry district. To a great extent, the extraordinary ease with which that crime was carried out came down to simple objects bought from the local hardware store. A broomstick, a brick of polystyrene, some black electrical tape, a can of hair spray: these were enough to subvert and neutralize more than a million dollars' worth of high-tech security sensors, as if a rewards shopper at Home Depot had somehow managed to rob Fort Knox.

Think, for a second, about how frustrating this would be: you install some futuristic motion detector in your underground supervault and a bunch of anonymous strangers get around it by sticking a piece of Styrofoam on the end of a broomstick; stand that up in front of a motion detector while the lights are still off and it won't see anything move for weeks. It's embarrassing. You could try to catch the bad guys using your state-of-the-art thermal camera—something space-age and intimidating—but they've got a can of hair spray. They uncap it and coat your fine-tuned electronics with a sticky film of aerosolized beauty products and render it useless. So you turn to your light sensor, something so sensitive it can pick up even the glow of an uncovered wristwatch—but your ingenious adversaries have arrived with a roll of electrical tape. They rip off a few inches, wrap it around your sensor, and all that gear is now totally obsolete. The vault is theirs to ransack. They have spent less than fifty bucks at a hardware store, yet they've caught your million-dollar setup with its pants down.

Even the building's air-conditioning system can pose a security risk, not by offering devious cat burglars a secret route through the walls but by fluttering loose paperwork left behind on someone's desk at the end of the day. Memos, receipts, and other papers, if not secured at day's end, can be

blown onto the floor by the HVAC system, setting off motion detectors and making the security team think an intruder is on the loose.

Burglary tools are effectively everywhere, hidden in plain sight—street-cleaning bristles, broomsticks, electrical tape, liquid polystyrene. In the right hands, everyday items have an unexpected secondary function, able to become something like skeleton keys with which we can gain entrance to any building or thwart the world's most sophisticated security systems. The dark promise here is that if only you can assemble the right tools in the right combination, you'll find yourself holding keys to everything around you.

This can be quite literal. A set of master keys to the infrastructure of New York City popped up on eBay back in September 2012, leaving media commentators and city officials alike concerned for the safety of the metropolis. These keys promised universal access to urban infrastructure, from subways to skyscrapers—true 'keys to the city' that should never be let out into the wild. After an undercover reporter for the New York Post purchased the set, the paper published a photograph of them captioned "What you could do: Take over the subways." The Post suggested that it was "what a terrorist might call a dream come true," feigning outrage next to their own high-resolution photograph of the key set.

Indeed, that very photo could easily have been used to duplicate the keys, and it was removed from their website shortly thereafter. The newspaper had purchased a cluster of five keys "that would allow control of virtually any elevator in the city," they explained. Among them was "the all-purpose '1620,' a master firefighter key that with one turn could trap thousands of people in a skyscraper by sending all the elevators to the lobby and out of service, according to two FDNY sources. And it works for buildings across the city. That key also allows one to open locked subway entrances, gain entry to many firehouses and get into boxes at construction jobs that house additional keys to all areas of the site. Also found on the key ring were city electrical keys that would give access to streetlights, along with the basement circuit-breaker boxes of just about any large building.

In Canada they are known as Crown keys. These are issued to Canada Post workers, used to enter and deliver mail inside multi-unit apartment buildings. Give a burglar a set of Crown keys, and you've given that burglar keys to half the city. Obtaining Crown keys is often the suspected goal whenever a Canada Post worker has been mugged.

A bump key is basically a regular, blank door key that you insert into a lock, then, as you turn it slightly with one hand, you give it a solid bump with a hammer or even with the heel of a shoe; if done correctly, this bounces all the pins up out of the cylinder, and the lock will open. It is

disconcertingly easy to do.

The burning bar—also known as a thermal or thermic lance—is an interesting piece of equipment. It was originally developed after World War I to help cut through battlefield ruins, dismantle tanks, and demolish concrete bunkers. A burning bar is basically a long bundle of steel rods encased inside a larger steel tube through which oxygen is then blown at high pressure; the steel at one end of the tube is ignited using an oxyacetylene torch, causing the internal rods to begin to melt. Push this sparkling bundle of slowly melting steel rods forward into virtually any obstacle, including solid granite, and it will burn a hole straight through; you can use a burning bar to cut through train tracks, solid-steel industrial machinery, and the walls of safes and bank vaults.

Air bags—the same devices that deploy during a car crash—applied to an inward-opening door will blow it out of its frame by the opening of the bag, without any explosives in sight.

Among many other things, what's remarkable about much of this equipment is the extent to which it resembles the everyday arsenal of a well-stocked fire department. This includes hydraulic doorjamb spreaders (in a different context, popularly known as the Jaws of Life), so-called Halligans and other pry bars (available on Amazon.com, thanks Jeff), and even circular saws and angle-grinders (stop by Lowe's next weekend to pick up your own pair) that any fire crew would use to ventilate a structure or rescue people trapped inside a crashed vehicle.

The somewhat obvious implication is that firefighters have at their disposal technology that could easily be repurposed for burglary—or that, should you want to commit the ultimate act of breaking and entering, you might want to rob a firehouse first and liberate their best equipment, including elevator keys and tactical cutting-torch kits.

These tools make the very idea of architectural defense seem absurd. You can put half a dozen dead bolts on your front door and a hydraulic doorjamb spreader will make a mockery of all six of them in an instant. You can hammer boards across the door-frame like something from a zombie horror film, but an air bag will blow the whole thing to smithereens. You can even seal an entire doorway with concrete, but a single burning bar—they even come in handy backpack-size units perfect for ATF or FBI rapid-entry teams—will melt through the concrete in minutes.

Pop quiz hot shot: Your intended prize is locked inside a room whose door was too closely guarded for you to slip through. What do you do?

Realize the obvious, do not think the way the building wants you to think—the way the architects had hoped you would behave—looking for

doors and hallways when you could simply carve a new route where you want it. It is architectural surgery, pure and simple.

The idea that a person would remain reliant on doors, would respect the limitations of architecture, deserves mockery. Surely if someone were to break in they'd come in as respectable people would, through the door provided for the purpose. Maybe that explains why people will have four heavy-duty locks on a solid oak door that's right next to a glass window. People seem to think they should lock-pick or kick their way through solid doors rather than just take a ten-dollar drywall knife and carve whole new hallways into the world. Those people are mere slaves to architecture, spatial captives in a world someone else has designed for them.

Something about this is almost unsettlingly brilliant, as if it is non-burglars who have been misusing the built environment this whole time; as if it is non-burglars who have been unwilling to question the world's most basic spatial assumptions, too scared to think past the tyranny of architecture's long-held behavioral expectations. We have been voluntary prisoners of architecture all along, willingly coerced and browbeaten by its code of spatial conduct, accepting walls as walls and going only where the corridors lead us. Because doors are often the sturdiest and most fortified parts of the wall in front of you, they are a distraction and a trap. By comparison, the wall itself is often more like tissue paper, just drywall and some two-by-fours, without a lock or a chain in sight.

The irony here is that even someone such as the psychotic, ax-swinging character Jack Torrance from *The Shining* still believes in doors: he hacks his way through the Overlook Hotel by way of preexisting routes laid out for him by others. Even Jack Torrance was too timid, hemmed in by architectural convention and unwilling to question the walls that surrounded him. A surreal and altogether more terrifying version of *The Shining* would have been the result, with Jack Torrance hidden somewhere in the hotel, sharpening his ax, unseen—until he comes bashing through the walls again, moving through the building as a burglar would, popping up whenever and wherever everyone else feels most safe. Another sign Stephen King is overrated—Kubrick too.

A real-life example is the movement of the Israel Defense Forces, or IDF, through the city of Nablus as a tactical avoidance of everything we think we know about architecture—that walls are barriers, that doors are openings we're meant to pass through. The Israeli battlefield commanders decided instead to use none of the streets, roads, alleys, or courtyards that constitute the syntax of the city, and none of the external doors, internal stairwells and windows that constitute the order of buildings, but rather moved horizontally through walls, and vertically through holes blasted in

ceilings and floors. It was a three-dimensional movement through walls, ceilings, and floors. It was an infestation.

Compare this to earlier urban conflicts in which architecture played a central role, including the urban barricades of the Paris Commune in 1871 and the house-to-house fighting during France's colonial urban warfare in Algiers. In the latter case, combatants relied on alternative routes, secret passageways, and trapdoors. This technique, known as mouse-holing, seems as much an act of haunting as it is an act of war. In the Israeli case, many of these tactics were developed specifically because doorways had been booby-trapped with pressure-sensitive, improvised explosive devices—analogue to motion sensors or burglar alarms, or well-guarded doorways.

Moreover, to avoid being seen from above by spotters hidden on rooftops or in the windows of nearby houses—comparable, in terms of burglary, to security cameras or police helicopters—the soldiers needed to achieve a new kind of invisibility, a kind of militarized stealth. This meant moving forward using “fractal maneuvers,” as a representative of the Israeli military describes them, tunneling from one building to the next or disappearing into the architectural environment like an insect—or being absorbed into it, we might say, like water into a sponge. The soldiers were able to navigate through this new maze of openings by leaving spray-painted traces on the walls behind them—arrows and other directional markers that served as military way-finding glyphs offering a clear path through the dust, wrecked furniture, screaming families, and twisted rebar.

There is a spatial and conceptual shift in contemporary urban policing. It is moving from the chase to the manhunt. While the widely televised arrest of O.J. Simpson had been a chase, albeit conducted at little more than walking speed, the search for LAPD officer Christopher Dorner—or even for the younger of the two Boston Marathon bombers, Dzhokhar Tsarnaev—had been a manhunt. In a chase, the suspect's location is clearly known; the police simply have to stop, intercept, and capture him or her. In a manhunt, however, the suspect could be anywhere; what's required is an intensive search through the landscape, a literal hunt with a human being as its target.

The chase and the manhunt are fundamentally different ways of using the landscape. One is the active pursuit of a suspect moving through the environment, usually at high speed but more or less continuously visible to the pursuers; in the other, someone has deliberately made themselves invisible to view, hidden somewhere in the city or terrain, leaving the police to deploy advanced forensic expertise and new technologies of visibility to discover them. Getting away in the former case simply means moving through the built environment more effectively than the police. In the latter

example, getting away means blending in so well that you successfully avoid detection.

“My chief interest had to do with cities in general, and the extent to which an entire city could be transformed by an act of creative misuse. I was fascinated by the role of insurgency, for example, from the nineteenth century, or in the 1960s with the student movements, or even in Northern Ireland, with what was happening in Londonderry and in Belfast. I was interested in how people with a particular intent could take over certain parts of the city with an action that could transform the way the city was used.”

Motivated individuals or groups could use the complexity of the city against itself, uncovering the possible behaviors that a building or space unintentionally allows, then adapting them to stage a protest, overthrow a government, demand political representation, or, yes, simply to commit a crime.

In every heist film the vaults and corridors and elevator shafts are just as important as the characters in the story; one cannot exist without the other. The space itself becomes a protagonist of the plot. There is no space without something that happens in it; and nothing happens without a space like this around it. The same thing is often true for grand public plazas in the hearts of cities: these can be used as nothing but picturesque backdrops for tourists to take photos of each other or as insurrectionary platforms for starting a revolution. It’s all about how you use the city—or misuse it, turning the fabric of the city against itself.

Even a region’s flight paths have come to influence how criminals use the city. For example, the heavily restricted airspace around LAX has made the area near the airport a well-known hiding spot for criminals trying to flee by car. LAPD helicopters cannot always approach LAX due to air-traffic-control safety concerns. It is surrounded by very challenging airspace. All those planes streaming down into the city, dropping off tourists and air cargo, exert a kind of geometric effect on crimes in the city: their flight patterns limit the effectiveness of police helicopter patrols and thus alter the getaway routes of criminals.

Consider the case of a fourteen-year-old boy who used a modified TV remote control to take over an entire tram system in Łódź, Poland. According to the city’s police, the boy turned his home remote control into an electromagnetic supertool that gave him command of every tram switch and junction in Łódź. The boy even “wrote in the pages of a school exercise

book where the best junctions were to move trams around and what signals to change,” police explained. While he did not use this homemade magic wand for anything resembling a bank heist, it would have come in quite handy during a crime spree. As clearly as any example from Hollywood, this otherwise childish prank suggests that the most successful getaways of tomorrow will be achieved by hacking the city.

The technology is already here. At a 2014 security conference in Miami, Florida, self-described “professional hacker” Cesar Cerrudo revealed that he had discovered a security loophole in widely used urban traffic-management technology, allowing him to fool vehicle-detection systems into thinking the light needed to change. Through extensive field-testing, Cerrudo found that his technique worked best within 150 feet of an actual intersection, but that more powerful antennas could also be used. Someone could then spam an intersection with imaginary traffic data from a hiding place on a nearby roof—or, as Cerrudo himself demonstrated, “from a drone flying at over 650 feet” above the target. This security flaw designed into the city itself could clearly be used to engineer the perfect getaway.

Spoofing a city’s traffic systems or a driver’s in-car GPS sensors is an equally effective way to engineer new routes across the city. This means not just overwhelming nearby GPS receivers with white noise, but, in effect, lying to them, convincing a dashboard navigation unit or smartphone mapping app to tell drivers that they are still heading in the right direction even as they veer wildly off course.

For example, GPS spoofing could be used to lead a delivery truck, street by street and block by block, to the wrong warehouse, where dozens if not hundreds of valuable boxes could be unloaded directly into the hands of criminals dressed like innocuous office workers. The driver is unlikely to realize the mistake—that the truck’s GPS unit had been taken over by criminals and that he or she just dropped everything off at the wrong address—until the delivery company is flooded with complaints about missing packages.

Spoofing can also be used indirectly, to open new, unobstructed routes where a road had been gridlocked only ten minutes earlier. For example, if you know your intended getaway route, you can digitally fake a traffic jam along that same street or freeway; the intended goal would be to make traffic apps report a road impassably clogged with vehicles, thus pushing other drivers—even police—away from your chosen street, shepherding them toward any number of nearby roads. A new line of escape is essentially unzipped down the middle of the city.

Consumer-grade GPS jammers are tiny devices you can plug into a car’s cigarette lighter to flood the immediate area—usually about thirty square

feet—with a white noise of radio signals pitched at the exact frequency of the satellite-based Global Positioning System. This makes a car, truck, or even container ship impossible to track using GPS—forcing police to rely on direct, visual observation—with the flick of a simple switch. Entire seaborne container ships have had their navigation systems disabled by GPS jammers, and trucks filled with consumer goods have been stolen using this digital assistance. Luxury cars are another popular target.

Military-grade GPS jammers can drown out the GPS networks of entire cities. The resulting effects would be widespread and catastrophic, affecting financial transactions—which are time-stamped using GPS—the ability of airplanes to land at regional airports, the accuracy and even functionality of construction equipment, and, of course, the ability of police to track local GPS signals, whether they're coming from vehicles or from transmitters planted on stolen merchandise.

However, a canny burglar can still smooth his getaway using analog, old-school spoofing. One of the most interesting attempted getaways of the last few years occurred the morning of September 30, 2008, when roughly a dozen men, responding to a Craigslist ad, met near a Bank of America in the Seattle suburb of Monroe. They were each expecting to find a long day of landscaping work ahead of them, and they'd been instructed to dress in a specific way, in a reflective work vest, blue shirt, respirator mask, and protective eyewear. Among them was Anthony Curcio, anticlimactically described by the US Attorney's Office as a "former high school athlete." He was dressed the same way and had placed the ad so as to fill the area with all but identical versions of himself. Curcio strayed from this group of unwitting decoys to pepper-spray the driver of an armored truck whose delivery schedule he had carefully researched. Seizing nearly \$400,000 in cash, Curcio then sprinted to a nearby creek where, days before, he had installed a steel cable leading downstream. Jumping into an inner tube that he had also strategically cached there—and becoming perhaps the first criminal in history to mastermind an inner-tube getaway—Curcio pulled himself down the cable to escape.

Perhaps the most elaborate spoof of all, however, is to get away by staying put. Joe Loya, who served seven years in prison for multiple bank heists explained that it was during the getaway that he often had the best chance of thwarting people's spatial expectations. In his case, this meant that what he did immediately after leaving the bank was often the most important decision of all. In robbing twenty-four banks, he had seen that the security guards almost always assumed he had turned left or right after exiting the bank. Further, they had expected to see Loya fleeing in a conspicuous getaway car or running away at top speed. But they almost

never checked the cars just sitting outside in the parking lot. Loya realized that he could jump into his car and wait a few minutes, effectively hiding in plain sight, before calmly driving away.

One thing that made the IRA so elusive was a neat trick that Michael Collins picked up from *The Man Who Was Thursday*, G. K. Chesterton's classic espionage novel about bomb-throwing anarchists who avoid suspicion by acting exactly like bomb-throwing anarchists. "If you didn't seem to be hiding," Chesterton wrote, "nobody hunted you out." So Mick taught his fighters to draw more attention to themselves, not less; the more visible they were, the less likely they'd be searched and questioned. Mick himself was Public Enemy No. 1, yet he cycled all over Dublin in a sharp gray suit, on an ancient bicycle whose chain rattled like a medieval ghost's.

There is something like a mathematical science of bank robbery—an ingenious series of clearly defined steps with reproducible results. Much of our present-day mythology of the high-octane bank bandit comes down from the example set in the 1920s by Lamm and his "Lamm technique." This called for the meticulous use of a stopwatch based on the absolute conviction that, after a specific period of time, no matter how much (or how little) money his gang had taken, they were to leave the bank and get away, following a carefully devised set of instructions so as to outsmart the city's traffic as well as any police who might be pursuing them.

Before each heist, Lamm would have spent hours mapping out the best possible routes of escape, specifically recruiting drivers with racing experience and storing an extra fuel tank in the trunk, in case they needed to fill up on the road. A map of the getaway route would be attached to the inside of the car, within view of the driver, including detailed marginal notes, all the way down to speedometer readings for each block and alternate turns to take in case of emergency. There would be getaway routes inside getaway routes, each with its own speed and timing. Lamm's foresight extended even to planning for different weather conditions, noting alternative roads to take (and how fast) if a sudden rainstorm blew in or if the road was blocked by snow.

For Lamm, this well-honed technique seemed unbeatable—but its efficacy could only go so far. In December 1930, after robbing a Citizens State Bank in Clinton, Indiana, Lamm and his group were confronted by a shotgun-wielding vigilante barber before they could get away. Startled by the man's gun, Lamm's getaway driver pulled a sudden U-turn and blew a tire hitting the curb—and things went catastrophically downhill from there. Forced to improvise by an obstacle that even Lamm's obsessive mind had failed to anticipate, the gang stole another car—but a governor installed on the engine meant it couldn't go faster than 35 mph. So they ditched that and

stole a truck—but it didn't have enough radiator water to drive. They then stole another car—but it barely had any fuel in the tank, taking them just a few miles out of town before running out of gas. Lamm's previously well-organized gang found itself trapped by the side of the road, surrounded by police. Their getaway was in shambles. Within only a few minutes, Lamm—depending on whose account you read—would either shoot himself dead or be gunned down by police, his eponymous technique having relentlessly failed every step of the way.

Later individuals set to improve on such tactics. Dillinger, for example, began to plant gasoline cans along the getaway route—improving, perhaps, on Lamm's way of carrying a can of gas in the back of the getaway car. Dillinger also adopted Lamm's preference for using only the best late-model cars, so that the gang could get away as fast as possible.

If the techniques of burglary such as those developed by Lamm and later refined by Dillinger aren't scientific, they are at least comparable to a folk art: inherited, improved upon, always available for others to adapt and use.

The best getaways are often the Hollywood ones—which are as unrealistic as their fictional context would indicate. In real life, getaways are not so tidy. Different techniques work at different times, for different reasons. Sometimes you have to drive away as fast as possible. Other times you don't need to go anywhere at all; you can just sit in your car until the pressure fades away. You can wrap yourself in a pool cover. You can convince your judge and jury that you never set foot in the building—or even that the type of structure you broke into falls outside your state's burglary laws. You can escape through tunnels or you can jump through bedroom windows; you can get away on foot or by public bus. It varies.

Some successful getaways do leave a trace. Think of an ingenious June 1995 bank heist in Berlin, Germany, where, unbeknownst to the bank's managers or the city's police, burglars had dug an escape tunnel for themselves beneath the target vault; rather than enter the bank through this tunnel, they saved it for the getaway. Taking over the bank the old-fashioned way, they locked down the business and held a group of hostages upstairs in the lobby. After the burglars received \$3.6 million in ransom money, they headed downstairs into the basement, as if to have a meeting and discuss their next steps—but the hostages began to hear “an odd clamor, like pickaxes chipping at concrete,” the *Washington Post* reported.

Only moments later, police raided the bank. When the authorities, prepared for a possibly fatal shoot-out, descended into the basement, they instead found nothing but an empty room with a hole bashed through the floor. “The hole led to a 384-foot tunnel,” the *Post* explained. “Running about 10 feet beneath the surface, the tunnel had been shored up with

timber and steel plates. It emerged in a garage, where police assume the robbers had a getaway car waiting.” Sure enough, they got away.

A similar tactic worked in February 2006 on the other side of the world, in Buenos Aires, Argentina. There, police raided a bank where hostages were being held—only to find a hole chipped through a concrete wall in the basement. An iron plate had been bolted across it from the other side. The burglars had not only prepared this escape route for themselves—a tunnel leading down into the city’s storm sewers, then on to a nearby river—but they had sealed it behind them to prevent anyone from following.

Caltrops can be constructed using nothing more than bolt cutters and some chain-link fencing. Caltrops are small spiked stars, like game jacks, that can be dumped out onto a road, ready to pierce and deflate the tires of any cars driving behind you. They are similar to the spike strips deployed by police for shredding the tires of a suspect’s car.

Explore what it might take to pull off a bank heist. Spend several months furtively casing a bank, noting the layout of the bank itself as well as every detail of its daily schedule. Observations should include when cash deliveries are made and what time of day usually sees the most customers. Assemble floor plans, photographs, and timetables. Determine whether you have a believable way to access the bank’s vault. If you can’t, perhaps you’d rather intercept the money by holding up a delivery truck outside the bank. Pulling it off—and getting away with the cash—will require an exhaustive study of local traffic patterns, of every side street and alleyway. The design of the city will become an unwitting accomplice.

What remains so interesting about such a project—with its compulsive multimedia hoarding of plans and photographs, its vast archive of ephemera generated by obsessive attention to a specific building and its urban context—is that it suggests a world in which illicitly annotated floor plans or carefully traced maps of streets surrounding banks or other buildings could be traded back and forth like architectural samizdat. These underground publications would then provide their readers with alternative or unexpected guides to everyday buildings. After all, why read a Pevsner *Architectural Guide to London* or an AIA *Guide to New York City* when you could read a burglar’s guide to the buildings all around you?

Somewhere between an architectural handbook and Ocean’s Eleven, these would show you not only how to get inside certain buildings but what to do once you find yourself standing in a space you were never meant to access in the first place. Thinking about architecture as a burglar would, and understanding different ways of moving through space, bring their own peculiar rewards—even if they are not monetary.

“Subtly, imperceptibly, I found myself becoming attuned to the presence of surveillance cameras and security guards, studying even the people ahead of me in line at my local bank branch the way an anthropologist might take field notes in an exotic locale, noting who seemed likely to resist if I announced a takeover robbery or how I’d get out of the bank and, if I managed to, what I’d find out there on the street. I noticed that the traffic light outside was timed, for example, and that someone could use it as a metronome or stopwatch to schedule a burglary; one could flee just as it was about to turn through its next cycle, using Manhattan’s in-built traffic patterns and pedestrian rhythms as a screen for a getaway.”

A proprietary pourable plastic known as Ellox was developed by safe-maker Chubb. It is extremely lightweight and astonishingly strong, incorporating small fragments of another proprietary material that Chubb claims is harder than a diamond. The plastic also resists fires of up to 1,000°C—or 1,832°F—for at least an hour before failing. Better yet, it can be molded into larger, complex shapes, poured to form strongrooms, safes, hasps, and other special items—moldable armor anyone? The architectural implications of this—a kind of bullet-resistant pancake batter moldable into any form—have barely been tapped.

A thorny plant called trifoliate orange—nicknamed the Rambo bush—is sold as a low-cost living barrier. It is marketed under the name Living Fence. Trifoliate orange is so dense and fast-growing that it can stop speeding vehicles; it is used by the US military to help secure the perimeters of missile silos and armories; and its razor-sharp thorns make it a great fit for domestic security needs.

Rainforest Safety Rule #1: Never grab onto something if you don’t know what it is.

No matter what the color, banana sap is among the most sticky and stubborn substances on earth. You will never get it off your clothes.

Chlorine is your friend. The principal ingredient in household bleach will render almost every deadly pathogen, nerve agent, and blister agent harmless. But don’t fucking drink MMS, that shit will kill you.

Sour gas, or hydrogen sulfide, can damage the lungs and is a potent neurotoxin and memory eraser.

Eat only one part of any plant at a time. Do not eat too much of it, and if you don’t feel well, start throwing up as fast as you can.

Medical students memorize this simple mnemonic trick to help them recognize the signs of poisoning:

“Hot as a hare, blind as a bat, dry as a bone, red as a beet,
and mad as a hatter.”

An overlooked result of the Wuhan Flu panic is the massively increased power of bioterror. It has largely been avoided, though prominent examples do pop up from time to time. However, just as bin Laden attempted to pull the US into overextending itself, misallocating resources, increasing repression, all destabilizing to empire, one might use bioterror to do the same. “Death now stalks the land,” “We thought the age of mass, random death was over—we were wrong,” this is potent terror. Invisible, potentially everywhere, even on friends, allies—think of it. Recall, the first American revolution relied heavily upon the manipulation of media. Our media today have shown even greater potential for exploitation.

In 2004, Tommy Thompson announced his resignation as Secretary of Health and Human Services with these now famous words:

“I, for the life of me, cannot understand why terrorists have
not attacked our food supply because it is so easy to do.”

Ricin and its close relative abrin are powerful phytotoxins, respectively derived from castor and jequirity beans, whose attractive flowering plants can be purchased at most commercial nurseries and require just three months of cultivation to yield mature beans. The beans are lima-shaped and either scarlet or a lustrous brown and historically were sometimes employed as rosary beads by medieval flagellants.

Castor beans’ seed hulls must be removed by soaking 1–4 oz of the beans in 12–36 oz of distilled water with 4–6 tablespoons of NaOH or 6–8 ts. of commercial lye (the beans’ natural buoyancy requiring here that they be weighted down with marbles, sterilized gravel, or low-value coins combined and tied in an ordinary Trojan condom). After one hour of soaking, the beans can be taken out of solution and dried and the hulls carefully removed by anyone wearing quality surgical gloves. Ordinary rubber household gloves are too thick and unwieldy for removing castor hulls.

A blender set on ‘purée’ is used to grind the hulled beans plus commercial acetone in a 1:4 ratio. Discard blender after use. Pour castor-and-acetone mixture into a covered sterile jar and let stand for 72–96 hours. Then attach a sturdy commercial coffee filter to an identical jar and pour mixture slowly and carefully through filter. You are not decanting; you’re after what is being filtered out. Wearing two pairs of surgical gloves and at least two

standard commercial filtration masks, use manual pressure to squish as much acetone as possible out of the filter's sediment. Bear down as hard as due caution permits. Weigh the remainder of the filter's contents and place them in a third sterile jar along with four times their weight in fresh CH_3COCH_3 . Repeat standing, filtering, and manual squishing process 3–5 times.

The residue at the procedures' terminus will be nearly pure ricin, of which 0.04 mg is lethal if injected directly (note that 9.5–12 times this dose is required for lethality through ingestion). Saline or distilled water can be used to load a 0.4 mg ricin solution in a standard fine-gauge hypodermic injector, available at better pharmacies everywhere under Diabetes Supplies. Ricin requires 24–36 hours to produce initial symptoms of severe nausea, vomiting, disorientation, and cyanosis. Terminal VF and circulatory collapse follow within twelve hours. Note that in situ concentrations under 1.5 mg are undetectable by standard forensic reagents.

The anaerobic saprophyte *Clostridium botulinum* is simple to culture, requiring only an airtight home-canning jar in which are placed 2–3 ounces of puréed beets, 1–2 oz. of common cube steak, two tablespoons of fresh topsoil, and enough ordinary tap water (chlorinated OK) to fill the jar to the absolute top. This being the only exacting part: the absolute top. If the water's meniscus comes right to the absolute top of the jar's threaded mouth and the jar's lid is properly applied and screwed on very tightly w/ vise and wide-mouth Sears Craftsman pliers so as to allow 0.0% trapped O_2 in the jar, ten days on the top shelf of a dark utility closet will produce a moderate bulge in the jar's lid. Extremely careful double-gloved and -masked removal of the lid will reveal a small tan-to-brown colony of *Clostridium* awash in a green-to-tan penumbra of botulinus exotoxin, which is, to put it delicately, a byproduct of the mold's digestive process, and can be removed in very small amounts with the same hypodermic used for administration. Botulinus also has the advantage of directing attention to defects in manufacturing and/or packaging rather than product tampering, which would of course heighten the overall industry impact.

Even though so many consumer products now are tamperproof, Hostess, Little Debbie, the whole soft-confection industry with its flimsy neopolymerized wrappers and cheap thin cardboard Economy Size containers are decidedly not tamperproof at all. It would take nothing more than one thin-gauge hypodermic and 24 infinitesimal doses of KCN, As_2O_3 , ricin, $\text{C}_{21}\text{H}_{22}\text{O}_2\text{N}_2$, acinetylcholine, botulinus, or even merely Tl or some other aqueous base-metal compound to bring almost an entire industry down on one supplicatory knee. For even if the soft-confection manufacturers survived the initial horror and managed to recover some measure of consumer trust,

the relevant products' low price is an essential part of their established Market Appeal™, and the costs of reinforcing the Economy packaging or rendering the individual snack cakes visibly invulnerable to a thin-gauge hypodermic would push the products out so far right on the demand curve that mass-market snacks would become economically and emotionally untenable, corporate soft confections going thus the way of hitchhiking, unsupervised trick-or-treating, door-to-door sales, et cetera.

And look at what that one lady did with some sewing needles and strawberries.

It takes less than two ounces of arsenic to kill a 150-pound person. A 12-foot-long two-by-six that's pressure treated with arsenic contains enough poison to kill 200 adults if you burn the board and feed its ash to the crowd.

MAKE YOU MURDERS LOOK LIKE SUICIDES WITH GATORADE OF DEATH:

- Water
- Cocaine
- Viagra

The Mujahedeen Poisons Handbook contains various 'recipes' for home-made poisons and poisonous gases. *Encyclopedia of Jihad* is also widely available online and includes chapters such as "How to Kill," "Explosive Devices," "Manufacturing Detonators," and "Assassination with Mines." A fine beach read.

Thermite is an incendiary reaction that can burn as hot as 2500°C or more. That means that if you lit a pound of thermite on top of your car it would melt through your hood, through your engine, through your driveway, and make a hole in the ground. Thermite is a reaction between a metal (aluminum, magnesium) and a metal oxide (iron oxide, copper oxide, manganese oxide) this reaction has a high ignition temperature, but once its ignited it supplies it's own oxygen. This allows for some interesting applications, for example thermite is still used today for underwater welding.

Thermite will readily burn paper, rags, excelsior, straw, and other tinder type materials. However, its main use in sabotage operations is against motors, gears, lathes, or other metal targets—to weld moving parts together, warp precision machined surfaces, and so on. Since it burns with a brief, almost explosive action, it is not recommended for burning wooden structures or other materials where persistent heat is required.

Before you get started, you must realize that what you are about to do is a dangerous and energetic reaction that should only be performed with

the utmost care. Besides its ridiculously high temperature, thermite also emits UV radiation that can do permanent damage to your eyes and if you don't want to wear a welding mask, at least put on a pair of good quality sunglasses. Also, metals with a low melting point (zinc, lead) will vaporize and explode if near the thermite reaction.

WARNING: Do NOT attempt to ignite your thermite by dipping your sparkler into the mix by hand. The mix can and does ignite violently, and will spray you with burning metal.

WARNING: A violent ignition of thermite can throw molten metal in all directions. Do not stand close to the mix when it is igniting or burning.

WARNING: Thermite burns extremely hot and produces molten iron slag that can melt through a car's engine block! Burning thermite can spatter molten iron a long way from the burning pile. Stay as far back as you can. And make sure there is nothing nearby that can catch fire. Start your thermite experiments with small amounts at first, until you understand how it behaves, and how far it will throw molten metal slag.

WARNING: You cannot extinguish a thermite fire with water. Do not attempt to put the fire out with water, or you may have a violent, steam explosion, which can throw molten slag as well. Likewise, do not use any wet materials to attempt to extinguish the fire.

There are many kinds of thermite, but the most common uses iron oxide and aluminum powder, both of which can be made at home. You also need a way to ignite the thermite. Most people use magnesium ribbon, but I haven't had much luck with that and usually use potassium permanganate and glycerine. Potassium permanganate is a filter cleaner and a dye sold at hardware stores. Glycerine is a skin care product and can be found at any drug store like CVS. When mixed they spurt flames like my mother's cooking.

Additional things that you might want include: a flowerpot to contain the mixture while it's burning, bricks to hold it up, and something to melt. If you don't have anything to destroy, at the very least just put some sand under it to keep it from ruining your driveway. What ever you do, don't use water to catch the drops. Water will instantly vaporize, explode, and spray you with molten slag—generally something to avoid.

1. By weight the ratio of iron oxide to aluminum powder is 8:3. Both should be powdered as fine as possible as this will make it burn hotter and ignite easier. Measure them out, and mix as thoroughly as possible—this will make it burn faster and hotter and is well worth your time.

2. Pour the thermite into your container. Flower pots are most commonly used, but almost anything will work. Flower pots are used because clay is one of the only materials that will still be there after hell has reigned. If you do use a flower pot, you should consider using two. The second pot will contain the shards of the first and reduce the risk of it breaking halfway through. The only thing that I would advise against is glass as it might shatter before it melts.
3. If you're using magnesium, stick it in, fray the top to make it easier to light, and light it. If you're using potassium permanganate, pour it in, mix it in a little bit with the thermite, and add the glycerine. Rule of thumb is two to three parts glycerine to one part potassium permanganate. It usually helps to stir the ingredients after you add the glycerine. If it still won't light, adding powdered magnesium or powder rubbed off of a sparkler makes it easier to ignite. Whatever you do, stand way back.
4. If it lights, then yell, cheer, and behold the awesome power of thermite. If it doesn't light, then re-evaluate and try something different.

The Blaster's Handbook will teach you how to make the following (and more!):

- Pressure-trigger Devices
- Nipple Time Bombs
- Magnifying Glass Bombs
- Cigarette Fuses
- Alarm Clock Time Bomb
- Homemade Grenades
- Walking Booby Traps
- Bangalore Torpedoes
- Book Traps
- Pressure-release Gate Traps
- Loose Floorboard Traps
- Whistle and Pipe Traps
- Nitroglycerin
- Mercury Fulminate
- Dynamite
- Chloride of Azode
- Ammonium Nitrate
- Black Powder

There are also detailed drawings of bridges—slab bridge, T-beam bridge, concrete cantilever bridge, truss bridge, suspension bridge—with wild X's indicating the pattern of placements that would drop every goddamned thing into the water or the ravine below, and architectural sketches of the

skeletons of numerous buildings, with the requisite accompanying fury of X's designed to doom the thing, reduce it to chaos. There are maps of highways with notes on sabotage and destruction.

Shit That Goes BOOM

- Potassium Nitrate
- Flour
- PingPong Balls + Thermite
- Tannerite
- Acetone Peroxide
- Brake Fluid + Chlorine

Packing Materials:

- Industrial Fence Staples
- Nails
- Ball Bearings
- Razor Blades
- Homemade Caltrops
- Hypodermic Needles

“I think it's clear that the use of bombs by revolutionaries should either be discarded altogether or left to those who truly have an expert grasp on the fabrication of safe and effective improvised explosives. How many times have we read about bombs either not detonating at all, detonating at the wrong time and harming random passersby in the process, or detonating as planned yet causing ineffectual damage? This doesn't even take into account the comrades who have already been killed or seriously maimed by the premature explosion of bombs they intended to use on targets.

I feel strongly that, instead of bombs, a concerted effort should be made to use well-designed portable incendiary devices, since a potent raging fire will always do more damage than a low-strength explosion.”

In 1947 a five-year-old California boy placed a concrete block on railroad tracks to derail an oncoming locomotive.

Trains are one of the main ways that oil is transported—Warren Buffet's rolling pipelines. Physical blockades of the tracks have been used effectively many times to hamper ecocidal projects of resource extraction. We can also block the rails in a sneaky way: by tricking the signaling system into thinking there is a train on the tracks. This trick will force train traffic to come to a halt until the signal blockage is cleared. It can be done in under

a minute, and repeated many times to have a significant impact on train circulation. It can take hours to find and remove this blockage, stopping all train traffic in the meantime.

Here's how their system works: A low velocity current runs through each rail. The electricity runs across the junctions of an individual rail with copper wire connections. When a train passes, it forms an electrical connection between rails and signals its presence.

Here's how we can block the signal: Get some 6-gauge booster cables. You can paint the wire black to make it harder to find. Rust on the tracks can prevent a solid connection, so connecting directly to the tracks might not work. To avoid this problem, find a section of rail where two junctions are side by side, and connect the copper wires with the booster cable. You can hide the wire with snow or rocks. The connection will also lower railway crossing barriers that are nearby.

This is a low risk and easily reproducible form of sabotage that can potentially cause massive delays and economic losses to the everyday functioning of extraction industries.

Fill a crappy car with tires and set it on fire. A burning car on a railway track is not simply a blockade, it is also a very efficient and economical weapon. A car with a full fuel tank would burn at a temperature high enough to warp the track and require extensive repairs. An attack on isolated tracks in sparsely settled countryside, for example, north of Lake Superior or west of Thunder Bay to the Manitoba border, would require the deployment by rail of special repair equipment. Once deployed, other attacks on the same line might trap that equipment in the wilderness. Then you could really have some fun.

An action was taken against the substation that supplies much of Silicon Valley with its electricity in April 2013. A vanload of masked men with submachine guns shot the rural installation to bits, and not at random. They targeted key bits of the substation's mechanics, like snipers against infrastructure, shot by shot destroying seventeen of the substation's large transformers. These men were never caught, but their know-how and malice made an impression. Though nobody talks about it, our physical infrastructure is not just exposed to weird weather, it's also shockingly vulnerable to weird people.

- **Empire Logistics Global Supply Chain Infrastructure**

Maps the global supply chain through research that articulates the infrastructure and 'externalized costs'—human, economic, social, and environmental—of the international flow of things. You can find key rail intersections, ports, warehousing distribution sites, et

cetera with detailed information such as tons shipped per year to really get the most bang for your buck—or buck for your bang? (<http://www.empirelogistics.org/sci-map>)

- **Empire Logistics Top Freeway Chokepoints (US)**

The name says it all. (<http://www.empirelogistics.org/freeway-chokepoints-u-s>)

- **Petropolis**

An interactive map that documents the oil pipeline infrastructure throughout North America with particular attention paid to the Chicagoland area. The map serves as a valuable research in locating possible targets and shows the type of research that local struggles could engage in. (<http://environmentalobservatory.net/Petropolis/map.html>)

- **Open Infrastructure Map**

Maps power and telecommunications infrastructure over OpenStreetMap data (<https://openinframap.org/>)

Understanding infrastructure basics can help us pinpoint an appropriate point of resistance—so here are some basics. Oil is extracted and upgraded for transportation through pipelines, or refined for their final destination. Pumping stations keep the product flowing through pipelines. Densitometer stations send back flow rates and viscosity. Bulk oil can be stored in tank farms, until it is refined further, or shipped by rail or truck. Valve stations contain valves that open or close the pipeline to isolate sections or stop flow. Junctions are facilities where other valves can be turned on or off to direct flow into certain facilities.

Facilities, pump stations, terminals, valves, and densitometer stations are all accessible via maintained roads. Terminals and storage facilities are often secured 24-hours with lighting and staff on site. There is lots of above-ground structure including valves, electrical systems, flow measurement systems, large cylindrical storage tanks, and some pipelines. Pumping stations may or may not be staffed by security at night, and are usually fenced with 6–8 foot fencing topped with barbed wire. Infrastructure also exists here, including above-ground pipelines, valves, PIG traps, flow measurement, and emergency shutoff buttons.

Valves and densitometer stations are usually small and isolated, also with 6–8 foot chain link fencing and barbed wire. Their enclosures have a gate entry, often secured with a standard key lock that can be cut with

larger-sized bolt cutters and contain a small shack housing electrical sources and measurement equipment. Valves have an additional link-chain wrapped around the hand wheel and stem, meant to prevent rotation.

Integrity dig sites will be accessible via private property/stakeholder driveways or the right of way. They are sometimes marked with construction truck signs and flagging. Right of ways are marked at road crossings by a small sign at the side of the road. It's easy to find the closest crossing to navigate your way in to the site. Though identifiable in natural areas, ROWs aren't always easy to access and traverse swamps, river crossings, property lines, et cetera. If you decide to go for a walk in these manmade mosquito breeding corridors you may have to jump some property fences to continue along your journey.

Many pipelines use double-flanged electronically-actuated valves manufactured by Zwick. You can find their schematics online. While it appears the majority of older manual valves have been converted to electronically actuated valves, in some cases operational/functional manual valves do still exist on the line.

A manual valve is only operated by a manual hand wheel, while electronically-actuated valves are operated by electricity—either from remotely, or on site if switched to manual operation. The manual hand wheel will not operate the valve unless the power is off or the valve is on manual/on-site operation. They're fairly easy to tell apart—manual valves just have an encasement and hand wheel, while electric valves will have a hand wheel, encasement, electric cords attaching to the bottom with hex-bolts, and sometimes other measuring equipment. What is known is that electronically-actuated valves rely on a power source, and in some jurisdictions are mandated to have a backup power source to move the valve into a 'closed' position during a power failure.

So how safe is it to just turn off a valve? Well, first, let's be real. It's the oil companies that put us at risk. Their quest for profits and delay of necessary changes are actively shortening and ending lives. Every. Single. Day. So let's talk about the safety of actions against pipelines in the context of those facts. Let's re-frame the discussions we're having, and talk about how turning off the pipeline is actually the safest course of action; how an inactive pipeline is safer than letting one run unimpeded.

But if that's not enough for you, here are two other things that make you feel better about the actions of a brave few:

Physical Build: Pipelines are built with valves. Thus, common sense says the structure and condition of the pipeline should be enough to

contain its contents under those conditions. Shutting off valves is not an uncommon practice in the industry.

Surge Mitigation & Safety Features: Shutting off a valve suddenly does create a pressure surge. This surge, however, is mitigated and safely handled through basic pipeline structure as well as safety features of pipelines including surge relief valves and automatic shutoffs which are mandated by pipeline legislation. Years ago government engineers decided that surges from sudden valve closures did not create enough of a threat to allow companies to exclude valves in their system designs.

Pipeline networks are vast and hard to secure, making oil and gas companies' weakness our potential strength. The pipeline infrastructure itself is exposed at three points: during layout/construction of a new pipeline/segment, during maintenance when it's uncovered, and where it comes above ground to pumping stations and terminals. Physical pipelines themselves can have varying maintenance requirements. While anomalies on pipeline surfaces are often ignored, there are rigid replacement requirements around at least two specific damages that can delay operation:

- Scratches/dents/interference with pipeline flanges—especially on the open face of a flange.
- Scratches on pipe threads of newly laid out/uninstalled pipe.

Clearly then it's in our best interest to let everyone know when these things may have been tampered with or damaged.

Some pipeline facilities, including densitometer stations and valve stations, have telecommunications systems to relay information on pumping pressures and pipeline content and allow remote access/control to these systems. It's not unimaginable that any kind of interference with their telecommunications equipment might lead to a forced shutdown of the pipeline.

Remember: each day the line is shut down costs the corporate blood-suckers plenty of money—in wages, equipment rentals, insurance, and—if you hit it at the right time—oil flow stoppage.

- Use oxyacetylene cutting torches to pierce through exposed, empty steel valves.
- Use tires and gasoline-soaked rags to burn valve sites, their electrical units, and any additional heavy equipment you can find.

- Gasoline, motor oil, and rags can be added to coffee cans and placed in the seats of machinery. The seats eventually ignite and cause a longer burn.
- Use bolt cutters to cut valve stems on tires.
- You'll need a decent cordless drill, a good smaller-gauge cobalt or titanium drill bit—preferably with a pilot point, and cutting oil. Oh, the irony! With a righteous sense of adventure, prove your stealth ninja skills by getting into the right-of-way. Once you're in there you're pretty invisible from the road so long as you're not fluorescent, adorned in glitter, or fucking around with a headlamp too much. Take a breath, take a look, and then find your way to an empty pipeline and start drilling! Go slow—so there's less noise, reverberation, and friction—and apply enough pressure so that you see metal shavings coming up—and then keep at it for 10 to 15 minutes. Cutting oil will help the process along by keeping the drill tip cool and effective.
- If oil is already flowing, close a manual valve and then apply your own locking device to delay response time.

Some companies think they're being all smart by putting on large gold security chains—which can't be cut with bolt cutters—and lockboxes on the gates. Bypass these by cutting the fence itself; maybe make yourself some caltrops while you're at it—it'd be a shame if the response vehicle got a flat. Then all you need are some garden shears to cut the very, very secure zip tie protecting the electrical panel, your wits, and an exit plan.

Pumping stations are key pieces of mining infrastructure used to lower the water table and prevent the flooding of the mine. They most often resemble a section of exposed pipe and an electrical box surrounded by construction fence. Pry open the electrical boxes using a crowbar and place simple timed incendiary devices and a bundle of bicycle inner tubes inside to ensure the flames catch nicely.

Transformers and substations can be destroyed with car tires filled with gasoline soaked rags. Place them beneath exposed insulated cabling on the substation and inside the transformers.

You can use an accelerant—gas, diesel, motor oil—to burn the major electrical cable junction points throughout buildings under construction. You can also burn pallets of equipment around the site—focusing on electrical and other key components.

A strong acidic powder can be poured into the excavations of the ground-floor slabs of buildings under construction. This will make these these

buildings structurally unsound—their foundations will eventually crumble and the buildings could collapse over time.

Take fire sticks half-covered in fire-paste—the kind found in a camping store. Light the fire-paste covered end and place it in the top corners of a car's grill, between the headlights. Use two sticks per car. The fire is mostly invisible until plastic or motor oil catches fire, giving you time to leave unseen. Be careful: the fire can easily spread to cars parked close-by.

Containers of accelerant can be placed beneath a row of trucks, one per truck, with one digital timer for every four containers. Use kerosene-soaked rope to carry the fire to the other three—a tactic adapted from *Home Alone 2* (the one with Donald Trump). If you're going to try this make sure to use *kerosene*, gasoline dries too quickly. You can also try a gasoline and motor oil mix.

Magic Candles

- Fire-starter
- Magic birthday candles (that re-light)

With the candle or with a clean knife, make a hole corresponding to the diameter of the candle in the fire-starter, and stick the candle in it such that it doesn't move.

After lighting it, you must in general wait around twenty seconds before the interior filaments are lit so that they will re-light if they extinguish. Small sparks are given off by candle once it is lit. This device is very simple to make, but it is bright and thus easy to notice, by a passerby for instance. You can count on 5–6 minutes of delay, before the fire-starter cube catches fire and sets the rest of the incendiary device alight.

Anti-Mosquito Spirals or Incense Sticks

- Fire-starter
- 5–6 matches
- Cellophane
- Small elastics
- A stick of incense or a 4–5 cm piece of anti-mosquito spiral

With a knife, remove the sulfur from the matches while avoiding adding wood shavings, and reduce it to a powder (by wrapping it in paper and crushing it with a knife handle, for example). Put the sulfur in the middle of a square of cellophane and form a tight ball, by twisting the cellophane

well. Fix this ball well to the incense stick or the anti-mosquito spiral with an elastic, ensuring that the ball is well stuck, and that the ball isn't surrounded by elastic all the way until the end—it's necessary that the ember of the spiral is first in contact with the sulfur, otherwise there is a risk that the device will come undone before igniting. With another elastic, fix this construction onto the fire-starter, sulfur in contact with the fire-starter.

This device allows an adequately long delay, depending on the length of the spiral/incense before the sulfur: one could do tests to evaluate the time that is obtained. It is also more discreet: there is not a flame before the trigger, but just a small ember and a thin trail of smoke. But it is also more complex and can thus necessitate testing it multiple times before using it, with perhaps different brands for the incense, cellophane, and/or matches. And with the amount of manipulations, it's very important to pay attention to not leave a trace. After lighting it, do not blow on it to extinguish the flame, but shake the device!

Some Notes

- You can use multiple delays per incendiary device, so that if one fails the rest of the incendiary device still has a chance to ignite.
- In our experience the anti-mosquito spiral is more reliable than incense.
- An alternative configuration that involves less manipulation is using matches covered in camping fire-paste to light the fire-starter, rather than the sulfur cellophane ball. In a match-book, two rows of matches are attached by a staple. You can use one row of these matches to wrap around the spiral, and if there is enough contact the ember of the spiral will light the matches. However, adding fire-paste to the match-heads and the fire-starter ensures this better. In addition, fire-paste between the fire-starter and the plastic bottles of accelerant will cut down the time the lit fire-starter takes to pierce the plastic and ignite the accelerant (from over a minute to a few seconds).
- Tape versus Elastics: tape is more likely to pick up DNA evidence during construction, so should be handled very carefully, but it allows a sturdier construction that is less likely to be displaced during transport. Thin strips of duct-tape work well.

- Recommendations for the rest of the incendiary device: two plastic 1.5L pop-bottles, taped together so that when lying down they form a valley between them. Fill with a mixture of 3/4 gasoline and 1/4 motor oil. To prevent leakage, fill the containers only 3/4 full, leaving the top quarter as air space for vapors to collect. If the delay/igniter devices described above are taped into the valley the bottles make together, gravity will bring the lit device down into the accelerant even if the tape is burned. If you were to tape the delay/igniter device to a single bottle, it's possible that once the fire-starter is lit it would burn through the tape before the plastic bottle, and come undone before the device could ignite.

Ring of Fire: Lengths of inner tube filled with gas and motor oil soaked rags.

The devices described here can leave traces, all the more so if they don't ignite. Thus, all manipulations need to be done in a clean environment, with a pair of one-use rubber gloves, while covering your mouth and hair, using a clean garbage bag spread out as a work space, and while wearing a k-way type tracksuit (where hair of any sort won't cling to it). The device can be stored in a garbage bag or a freezer bag before removing your gloves, to transport it. If the material is bought, don't buy everything at the same place and paying in cash could be a good idea. In the case of a raid, it's better to be rid of the material and packaging before use. Lastly, do several tests before using it for real, to be sure that the brands of different materials work well together and to avoid bad surprises!

We think that it's important for confrontational tactical knowledge to be widespread for the coming storms of revolt. Confrontational tactics can make us safer, because the police become afraid. We need to be careful when playing with fire, but with care, molotovs can greatly increase our power in the streets.

How to Make a Molotov

- Empty 500ml beer bottles
- Funnel
- Gloves
- Gauze or strips of t-shirt or tampons
- Gasoline
- Duct tape
- Motor oil

Remember: Never touch any of your materials without gloves, to avoid transferring fingerprints.

First, fill the beer bottle half-way with a mixture of two-thirds gasoline and one-third motor oil. Adding motor oil makes the fire burn longer and bigger. Leaving empty space in the bottle makes it fill with gas-fumes, which will make the molotov more explosive.

If using shirt or gauze, tie a knot that will fit in the entrance to the bottle, one inch from the top. The fuse should reach the gasoline. If you turn the bottle upside down, the knot should hold. Use duct-tape to make the opening more air-tight, because gasoline evaporates.

For larger molotovs, you can use a wine bottle that has a cap you can twist back on. Perrier works too.

Beer-bottle molotovs can be transported in the packaging. Seal them in a garbage bag to diminish the smell of gasoline, and to keep them clean of fingerprints.

Please note, it's safest to not wait more than 30 seconds to throw after the molotov is lit.

Binary weapons are those in which two nonlethal chemicals are mixed together at the last minute to become a deadly agent.

1. Bleach + Vinegar = Toxic Chlorine Gas

Why: Adding any weak acid to bleach will release toxic chlorine and chloramine vapors.

The worst that could happen: You can get a nasty chemical burn, especially of your eyes and lungs.

2. Ammonia + Bleach = Toxic Chloramine Vapors

Why: Inhaling the vapors could cause respiratory damage and throat burns.

The worst that could happen: If ammonia is present in excess, toxic and potentially explosive liquid hydrazine may be formed.

3. Rubbing Alcohol + Bleach = Chloroform

Why: Ordinary household bleach contains sodium hypochlorite, which reacts with ethanol or isopropyl alcohol to produce chloroform, hydrochloric acid, and other compounds, including chloroacetone or dichloroacetone.

The worst that could happen: You could damage your nervous system, eyes, lungs, skin, liver, and kidneys. Extremely high levels

of chloroform exposure may result in death, while lower levels could result in dizziness and nausea, according to the EPA.

4. **Hydrogen Peroxide + Vinegar = Paracetic Acid**

Why: You can use them on the same surface separately while cleaning, but don't mix them in the same container. You'll create paracetic acid which, despite being an effective sanitizer, is potentially corrosive and irritating.

The worst that could happen: The health risks aren't well-known, but in high enough concentrations, paracetic acid is very irritating to the skin, eyes, nose, throat, and lungs, with the potential for causing permanent scarring of the skin, cornea, and throat.

5. **Medicine + Grapefruit Juice = Adverse Effects**

Why: With many over-the-counter and prescription drugs, you risk increasing the absorption of the drug if you take it with grapefruit juice.

The worst that could happen: A typical dosage could become a lethal overdose.

Depending on which unreliable narrator you ask—pro tip: in history, all narrators are unreliable—one of the earliest stories of brainwashing in history actually involves marijuana. Hassan-i Sabbah, a twelfth-century Muslim religious leader/warlord, supposedly gained the everlasting loyalty of his vaunted Assassins by dosing young recruits with hashish until they passed out. According to legend, those young men would wake up, still stoned, in a “paradise” secretly built by Hassan in his fortress of Alamut. Paradise contained everything a young man could desire: scantily clad women, piles of decadent food, probably hot tubs—all the best things in life. After a few days of bliss, the young men would wake up back in the shitty real world of the twelfth century and be informed that the only thing standing between them and a return to paradise was one measly little death in the name of their leader. It's a famous story, but the fact that it was first told by known bullshitter Marco Polo a century after Hassan's death means ‘fun story’ is probably all it is.

But there is a real historical example of powerful hallucinogens being used to rob people of their free will. The original ‘zombies’ were men and women drugged by voodoo witch doctors in eighteenth-century Haiti. There are myths and rumors as to exactly how the witch doctors accomplished this, but the chemical culprit was supposedly a white powder—*coupe poudre*—that dropped the victim into a deathlike sleep. After burial, the witch doctor

would dig up his victim and—if he had survived the poisoning—the *coupe poudre* would have wiped out his free will and turned him into a mindlessly obedient automaton. It's a ridiculous story, just like the idea of Hassan-i Sabbah's hash-mad assassins.

But these voodoo zombies have a basis in hard science. During the 1980s, an anthropologist analyzed the *coupe poudre* used by sorcerers to carry out their zombifications. Its active ingredients included bufotenin and tetrodotoxin. The first is a powerful hallucinogen, excreted by the Bufo toad. When you read about people licking toads to get high, bufotenin is what they're tripping on. The second key ingredient to zombie powder, tetrodotoxin, is a chemical found in the deadly puffer fish. In low doses, tetrodotoxin provokes a coma and significantly reduces the victim's heart rate, making him or her look just corpse-y enough to bury. Once the zombie-to-be is dug up several days later, likely dehydrated, starving, and still tripping from toad drugs, the voodoo sorcerer starts piling on more drugs.

Scopolamine—the so-called Devil's Breath powder—is used as an offensive zombification drug, which, when blown into a victim's face, leaves him or her coherent but with no free will. Once ingested, within minutes the odorless and tasteless dust allows burglars, robbers, and rapists complete control over their victims and, worse, completely wipes the victims' memories of the details of the incidents.

One way to deal with enemies is by slitting their arm and leg tendons and heaving them, alive but helpless, into the middle of a busy street.

You can stab someone to death with a sheet of newspaper. Just fold it diagonally until it tightens into a point then drive it in right under the chin. Simple, really.

“There was counter-speculation in the crowd that the whole thing was maybe designed to maybe only look like a media stunt and that the weapon the figure was now sitting uncomfortably back against was genuine and that the idea was for him to look as eccentric as possible and climb high enough to draw a large crowd and then to spray automatic fire indiscriminately down into the crowd.”

What's the fastest way to hide bullet holes in a living-room wall? The answer is toothpaste. For larger calibers, mix a paste of equal parts starch and salt.

To bleach away bloodstains from under your fingernails, sink your fingertips into half a lemon and wiggle them around. Rinse them under warm water.

Assume everyone you meet is cop, criminal, or crazy until proven otherwise.

Just like death, real fights don't look anything like fights in the movies or on TV. They are not graceful; punches don't land squarely, if they land at all. Bodies move and fall in ways that are completely unnatural; arms and legs twist back, and necks bend at 90-degree angles. But the most striking difference is in the face. Pain, fear, and anger contort people's faces in ways that are truly, instinctively terrifying.

Stay on your feet. A cardinal rule of this kind of combat is never go to the ground. But wait—don't mixed martial artists claim that 90 percent of all fights end up on the ground and win bouts all the time by bringing the action to the mat? Very true—and if you find yourself inside an octagon with a cushioned floor and a Brazilian in surf shorts, then go ahead and grapple. But in a real fight—with no rules, no ref, no tap-outs, no guarantee the other guy doesn't have a weapon—the ground is where you go to die. If an attacker gets you down, you'd better grab his testicles, jam a thumb in his eyeball, tear his ear off with your teeth, whatever it takes to kick free and scramble back up so you can jump on the guy's chest until his ribs are jelly. Real violence isn't about sportsmanship, it's about survival. You're not shaking his hand and wishing him well. You're hoping he's still lying there when you leave.

Boxing and wrestling aren't natural forms of combat, they're natural forms of peacocking, created by and for men to showboat two unique male attributes: bulk and upper-body strength. Otherwise they're useless. No human in the wild would ever throw a punch if he could avoid it, not even against another human. Why risk breaking all those fragile bones and knuckle joints, or jabbing out an arm that can be trapped, twisted, and snapped?

There's a more glaring giveaway that boxing and wrestling are just recreation: girls and old guys aren't good at them. As a rule of thumb, performance aberration in a basic skill is a good way to evaluate whether it's natural to a species. When you spot a giant ability gap between ages and genders, you know you're looking at nurture, not nature. Male and female geese differ in size but not in speed; otherwise, migration would be mayhem. Same with trout: if males rocketed past the females, they'd always be first to eat, last to be eaten, and on their way to a disastrous shortage of spawning partners. Gender and age differences don't disappear, of course, but they're tremendously diminished.

It's impossible, outside choreographed entertainment, to fight two guys together at once; they'll kill you; the trick to fighting two is to make sure to put one down for long enough that he's out of the picture long enough to

put the other guy down.

There is one very easy way to incapacitate someone. It is called, among other things, the carotid takedown. When a person dies by strangulation—either by hanging, ligature, or manual compression of the neck—they usually do not die because the air supply to their lungs has been cut off; they die because blood supply to their brain has been cut off. This is merciful; at any given moment there are a couple of minutes' worth of air in the lungs, and death by asphyxiation is a slow and desperate process that can leave both victim and attacker covered in lacerations. There is far less oxygen in the brain however, and death by cerebral hypoxia—lack of oxygen to the brain—is correspondingly fast. Oxygen-bearing blood reaches the brain via the carotid arteries in the neck and leaves primarily through the jugular veins. Only eleven pounds of pressure to the carotid arteries are necessary to stop blood flow to the brain, and once the blood flow has stopped, the person loses consciousness in an average of ten seconds.

A person who has lost consciousness because of constricted carotid arteries will regain consciousness in another ten seconds or so if the pressure is released. If pressure is not released, however, the unconscious person dies within minutes. As a result people have killed themselves by strangulation in the most benign-looking circumstances. They have hanged themselves from a bedpost while lying next to their sleeping spouse; the weight of the head against the noose is enough to block the carotid artery. They have hanged themselves while sitting on the floor. They have hanged themselves despite having a permanent tracheostomy—a breathing hole in their throat—that allowed a full supply of air to the lungs.

It takes considerable strength to crush someone's trachea, but it takes almost no effort to block their carotid arteries.

The trapping zone rewards bulk and brute force; it neutralizes speed and skill. It's the big man's friend and the little guy's nightmare—yet oddly, it's where the feminine style of Wing Chun works best. Wing Chun tells you to step right into the trap and make yourself at home. Don't bob and weave or even turn sideways to offer a smaller target: just face your attacker, square up your feet, and wait for him to do his worst. But first, "make sure to mark your centerline." The essence of Wing Chun is the belief that human power is strongest when it spirals up from your feet through the center of your body. You can access that centerline energy by following these four steps:

1. Slide your feet out to shoulder width.
2. Sink your thighs into the slightest of squats.

3. Cross your open hands in front of your crotch.
4. Then raise them chest high in that most instinctive of defensive positions—an X.

Now you're ready for Sticky Hands to turn your opponent's trapping zone into your own. Sticky Hands is next-level wobble power. It takes your attacker's force, merges it with your own, and slams the doubled-up energy right back at him. The key is body connection; as soon as he starts throwing punches, you lightly 'stick' your hands to his, deflecting the blows rather than blocking them. When he cracks a hard right at your eye, you divert it with your left wrist and use his force to pivot you like a wheel around an axle. Now it's your turn to hit, using the momentum of his push to power your right arm. He's belting himself in the face with your fist.

"The hands are swinging doors, built on the fortress of legs," the great Wing Chun grandmaster Ip Man liked to tell his students. "Ip Man did not move a great deal," one of his followers observed.

"When someone punched at him, he moved just enough to avoid it, but when he attacked he went straight for his opponent's center, either striking him or making him lose his balance."

Ip Man was just as stingy with his feet. The higher your foot, the more compromised your balance, so Ip Man only kicked low; never those big, crowd-pleasing head shots you see in tournaments, only short bug-stompers aimed at your knee, crotch, shin, or ankle. Wing Chun isn't a spectator sport; it's a science of crippling force, designed to end fights fast by hitting quickest where it hurts the most.

Violence has a pretty thin encyclopedia. Every way you can think of to punch a windpipe or knee a groin, someone else figured it out ten-thousand years ago. For self-defense, that is great news: if you can master Sticky Hands, you could download every conceivable attack into your fascia memory and turn your body into an Automatic Response System. Like instinctive aim, Sticky Hands takes your higher brain out of the fight and activates your animal self. When an attacker grabs your wrist, up comes your elbow; if he tries to tackle you around the waist, your foot takes out his knee before he gets there. You don't need to think or even see—just react.

The scariest thing about pankration is when it's not scary at all. The ready position is so nonchalant and relaxed, you could be a blink away from taking a gastrizein to the knee and never suspect the person across from you is poised to attack. If you're set to play catch with a toddler, you're set to fight pankration: just face forward, dip your knees, and raise

your open hands. It looks less like art and more like an accident, which speaks to pankration's ancestral authority: it feels so natural because it is. Pankration refines raw impulse, chucking out everything that doesn't help and focusing on the three things that do: ease, surprise, and stopping power. You activate without thinking. Attack without signaling. And strike, like any other animal in a fight for its life, without mercy. Pankration is so frighteningly true to real violence that for years it wasn't included in the original Olympics. Pankration finally made it into the 33rd Olympic Games, in 648 BC, with two rules: no biting, no eye gouging. Otherwise, it was anything goes; the entire range of human cruelty and creativity were at your disposal. The Spartans still grumbled and refused to participate: if you can't blind your opponent and chomp his nose, then what's the point?

If you find yourself in an apprehensive situation, stick close to the walls on the right side of the street and casually slip your right hand into your jacket pocket. Wrap your fist around the phone, with the top just below your thumb and index finger.

Damn! You were right to be nervous, because here comes trouble. Someone's moving in fast with something—what? a gun? a knife?—in his hand. The phone will now save your life, but only because of a body twist. Parry the gun away from your body with your left forearm. Now bring out the phone; by clenching it in your fist, the bones in your hand compress into a hard block. Turning your body from the hip, strike your opponent hard on the left side of his face, as near to the jawbone as possible. You barely need to move your arm; keep your shoulder pinned to your side and come up hard with the forearm, letting your hips do the work.

The odds of knocking your opponent unconscious by this method—properly executed—are at least two to one. The fact that this can be accomplished with something as simple as a match-box is not well-known, and for this reason is not likely to raise your opponent's suspicion of your movements.

Humans evolved in a world where nothing moved two-thousand miles an hour, so there was no reason for the body to be able to counter that threat, but the brain still had to stay ahead of the game. Neurological processes in one of the most primitive parts of the brain, the amygdala, happen so fast that one could say they compete with bullets. The amygdala can process an auditory signal in fifteen milliseconds—about the amount of time it takes a bullet to go thirty feet. The amygdala is fast but very limited; all it can do is trigger a reflex and wait for the conscious mind to catch up. That reaction is called the startle, and it is composed of protective moves that would be a good idea in almost any situation. When something scary and unexpected happens, every person does exactly the same thing: they blink,

crouch, bend their arms, and clench their fists. The face also sets itself into what is known as a fear grimace: the pupils dilate, the eyes widen, the brow goes up, and the mouth pulls back and down. Make that expression in front of a mirror and see not only how instantly recognizable it is, but also how it seems to actually produce a sense of fear. It's as if the neural pathways flow in both directions, so the expression triggers fear as well as being triggered by it.

What's the worst fix you can find yourself in? Maybe jumped from behind—someone gets the drop on you, now you've got a gun in your back and your hands in the air.

Spin around, sweeping the gun away with your left hand and grabbing the gunman's chin with your right, finishing him off with a knee to the groin and a shove to the ground. Strange as it may seem, the gunman cannot think fast enough to pull the trigger and make a hit before your body is out of the line of fire.

“He roots around in his pocket and comes out with a rubber band.

‘Put this around the fingers of one hand, right up there near the fingernails. Now spread your fingers as wide as you can. Really fight it. Good. Close them and open again. It would be stupid to throw an arrow, right? Better to use your muscles to pull back the string and let the string do the work.’

He tells me to strip off the rubber band, drop to the floor, and get ready for push-ups. But instead of lowering my chest to the floor and straining my way back up, I'm to reverse it: I'm supposed to spread my fingers as wide as they were with the rubber band, mash my palms hard into the floor, and pull myself down. When I do, I surprise even myself when my elbows straighten with barely any effort.

‘See? You tightened the spring on the way down, then it popped you right up.’

I try it again, and it feels like I'm being sprung from a toaster. I'm not sure how it's working—I'm not even sure if he knows—but those were the easiest twenty push-ups of my life.”

The one thing wrong with the fitness industry is everything. Barbells? Forget it. Weight machines? Waste of time. Women are sweet, men are sweaty? Ridiculous. Diets, exercise circuits, resistance training? Hopeless,

useless, and unnatural. Look at every other creature on the planet. They don't binge and starve, or heave and strain to make one part of their body bulge. They don't sit on a bench and lift a weight to their nose over and over again. Why would they? You'd never do that in the real world, so why do you do it in training? All you're creating is hard muscle and stiff strength—the exact opposite of true fitness. You pull this and push that so many times a day and you get to be a little amateur Samson. You already feel the muscles expanding. Those biceps especially draw attention, as if they were the synonyms of health and strength. But it is superficial—only skin deep, as it were—and will not 'stay put.'

The truth is that there can be no proper training that does not educate the whole system of the human—man or woman. This idea that women are fragile little flowers is a farce that needs to end. The 'weaker' sex would occupy no such position of relative weakness if natural laws were followed. If women must, as is so freely complained, remain physically short of man's strength, there is no reason why the disparity should remain so great as it often is. Where women lead an active life their strength and endurance comes remarkably close to the strength and endurance of the other sex. In other words, tradition has more to do with the 'weakness' of women than has nature.

For many people, fitness is still all about lifting weights to build bulk. But what does that make you fit for? I'd argue that a baby rolling on its back, drinking from a bottle held between its hands and feet is a much more physically fit human than a bodybuilder. Like Bruce Lee, the infant used fascia to solve a problem its muscle couldn't. You are fit if you can adapt to the demands of your environment with ease and imagination.

Be fit to be useful. No matter who you are, no matter what you're seeking or hope to leave behind after your time on the planet—is there any better approach than simply to be useful? Here is the great duty of man to himself, to his family, his homeland, and to humanity. Only the strong will prove useful in difficult circumstances of life.

When children play they're really role-playing disaster scenarios. Turn them loose and they'll run, wrestle, hide, roll around, kick-fight with their feet, and leap off anything they can climb—exactly the skills that could keep them alive in a real emergency. Natural training should spring from nature, so kids' play is a good starting point. It doesn't take long to realize that most roughhousing is a selection from three basic menus:

1. **Pursuit:** walk, run, crawl
2. **Escape:** climb, balance, jump, swim

3. **Attack:** throw, lift, fight

An individual who is satisfied with performing in exercises or sports of entertainment—soccer, tennis, football, et cetera—but ignores the art of swimming, self-defense, or fears vertigo, is not strong in an useful manner. A weightlifter or a wrestler who cannot run nor climb, or a runner or a boxer who doesn't know how to swim, or cannot climb, is not strong in a complete manner.

Competition perverts true fitness. It tempts you to cheat; to overdevelop some talents while ignoring others; to keep tips for yourself that could be useful to everyone. It's a shortcut: all you have to do is beat the other guy and you're done; but the Natural Method is a never-ending challenge for self-improvement. Besides, competitive sports focus on rivalry and class divisions. The Natural Method is all about collaboration; every teacher is a student, every student is a teacher, bringing fresh ideas and new challenges. Raise the bar, but help the next guy over it—*paideia* and *arete*. What's most fascinating about this theory is that it extends far beyond fitness and into every aspect of life. Natural training could make people more noble, intelligent, resourceful, generous, successful, and happy. Why? Because every day, you practice problem-solving under extreme conditions, and once you've figured out how to carry a hunk of timber through a swamp in your bare feet, nothing at work will stress you. Natural training makes you introspective, not combative; you see conflict as something to be resolved with force and dexterity, not violence and its brother, fear.

A woman alone who needs assistance is actually far better off choosing someone and asking for help, as opposed to waiting for an unsolicited approach. The person you choose is nowhere near as likely to bring you hazard as is the person who chooses you. The same for kids too—you're probably not going to pick the extremely rare stranger that wants to diddle you.

“People have been looting. I say there should be more shooting than looting, so if you loot, loot a gun store.”

Some decided they would only bomb buildings of symbolic importance—courthouses, military bases, police stations—and only after warnings, and only at times when the buildings were likely to be empty. The argument being that they had to be more life affirming, more in line with the mass protests breaking out everywhere. The bombings must push the mass movement toward renewed militancy. Some might call it ‘armed propaganda,’ others ‘responsible terrorism.’

CONGRATULATIONS! After year after year of jocks mercilessly beating on you, cliques looking down their noses at you, and teachers looking the other way because they only care about themselves, you've finally decided that you're Mad As Hell And You're Not Gonna Take It Anymore. You've decided to pick up the battle flag of St. Eric & St. Dylan and chosen the short but glorious path of the warrior over of the slow and degrading death of the sheep. But, there's more to getting ready for your 'Day of the Last Laugh' than stockpiling on firearms and explosives you know. Several things you need to remember when you're getting ready:

Rule #1: TELL NO ONE! Not your friends, not your parents or relatives. Not even in your personal writings must you give away the slightest hint of the Doomsday you are about to unleash on these deserving saps. These assholes will crack down on you and have you hauled away at the first and tiniest sign that you may be harboring ANY thoughts of striking back. Wear a proverbial mask of normality that disguises the true face of the demon. When assaulted, keep your thoughts hidden from them and don't yell something like: 'I'm gonna come back here with a gun and shoot you all dead! You hear me? Dead!!' The less your tormentors know what's in store for them, the better the chances you have to prepare for your vengeance.

Rule #2: LEARN PROPER MARKSMANSHIP! Hunting is not only permissible, but is even encouraged in society. Sharpen your skills with rifles and pistols when you're out with daddy in the woods. Don't waste your ammo on small critters like cats, dogs, or squirrels; that will only get the attention of the "Powers That Be" who will use that as a hint of a potential serial killer, and you'll be condemned to spend afternoons with your school's local "Mister Mackey," thus giving the jocks and cliques even more excuse to pummel on your skull. Target bigger game that is around the same mass as your future victims. After a while, with each well-aimed shot, you'll start to notice how much a deer starts to look more and more like that jock who enjoys thumping you in the nuts as he passes you between classes.

Rule #3: LEARN WHAT *DOES* BLOW UP AND WHAT *DOESN'T*! One of Eric and Dylan's biggest mistakes is that they thought that a propane canister would explode if it was shot at. Even if it did, a big loud bang only does damage to the immediate vicinity. Explosives are good, but incendiaries are better. A burning agent not only damages everything in its area, but can also spread out looking for other things to burn. This fact has been well proven in places like Dresden, Tokyo,

and Waco. A canister with gasoline and liquid detergent (for that sticky napalm effect) at a 3:1 ratio does the trick nicely.

Rule #4: KNOW YOUR VICTIMS' HABITS! You already know they're assholes and they need to be destroyed before they are let out into the private sector and cause some REAL misery, but do you know what they like to do? Besides tormenting you, that is. Where do they hang out during lunch hour? Do they sit in a certain area each time? Most cliques usually do. Chances are you won't be able to get all of your intended victims to be all in the same place at the same time, so you'll need to use this data to determine what places and times the majority of your enemies will be together, decide which ones are the most DESERVING to die, and plan your strategy

NOTE: DON'T write your data down (see Rule #1)! If these notes are found, the teachers will call the cops to swoop down on your ass, and both you and your hopes of justice are forever fucked!

Rule #5: REMOVE ALL TRACES OF YOUR LIFE! What this means is that after you've done your apeshit, no doubt Officer Barbrady and the media whores will tear through your house to look for signs of why you did what you did—always ignoring the obvious signs, like the cruelty inflicted by jocks and cliques, and sticking to the usual scapegoats like video games and EMINEM mp3s on your computer. Before you embark on your mission, secretly prepare to erase all traces of what makes you as you are. Shred and burn all your letters and notes. Dump all your books and CDs off at the nearest Salvation Army drop-off center in the middle of the night. Don't let your parents or friends find out, or they'll think you're about to commit suicide or join a cult and they'll interfere, thus monkey-wrenching your Grand Plan.

Remove AND *destroy* your hard disk and any other data media from your computer on the morning of your mission. Erasing data isn't good enough, because the porkers have ways to restore it later.

When the cops and the retards from FOX NEWS start picking through your belongings, they won't find jack shit for them to use to further stereotype and persecute the next future apeshitter and his own mission. Think of the police and the media as where jocks and cliques go after they've graduated from high school. Do you REALLY want to make their jobs any easier?

Rule #6: SAVE THE LAST BULLET FOR YOURSELF! You've done your duty, and you've made sure that you've mowed down as many jocks and snottos as you could within your 15 minutes (or less) of Payback. Their souls are already being prepared to work as your slaves in Hell. No doubt you've gotten the attention of the cops and they already have the SWAT teams surrounding the joint. Just a matter of time before they either mow you down—the ultimate daydream of every jock, young or old, is to legally blow away a “geek”—or to be dragged out alive in handcuffs to be paraded around in a humiliating baggy white jumpsuit in front of the media cameras and be degraded and abused for the rest of your life in prison (and you thought being picked on in high school was Hell). Better to deny these assholes the pleasure of hurting you some more and just check out while you're still King of the World.

Look at the examples of St. Eric & St. Dylan, who are now held in eternal reverence for their sacrifice, compared to the quickly-forgotten idiots who decided to remain alive and are stuck in the deepest hole society can cast them down into, where the abuse is greater than ever before, used as lab rats by psychiatrists to “find a root cause for why children kill,” and there is NO way to defend yourself against it. Would you WANT to spend the rest of forever in a straitjacket & dog muzzle and wheeled around on a moving dolly? Remember, no one can put a dead person on trial.

Well, that's about it. Just remember, if you do decide to go through with your mission, I've never seen you before in my life, mm'kay?

No lock in the world is unbreakable. For ideal security measures, the model of a seal is preferred, something that does not necessarily prevent a break-in but leaves incontrovertible proof of a breach. That was what the plastic tabs on shipping containers were supposed to do, but did not. Alternative measures include the use of stickers, embossed with a sparkly pattern, that utilize our eyes' amazing ability to spot differences. The shipper places the sticker over the container's opening, and photographs it. The receiver also photographs the sticker. If a thief has managed to remove the seal without breaking it, and then replaced it, its position will be slightly different, a discrepancy revealed by overlaying the two photos. The stickers do not prevent tampering—but compared with plastic tabs, they make it much more difficult to hide the evidence of tampering.

Part of the danger in grabbing an electric fence is that the electricity will cause your arm muscles to fire—and the clench muscle is stronger than the release muscle, so you cannot let go of the fence. The same goes for your

legs. Electricity does not blow people off the ground. It causes leg muscles to fire, and the extend leg muscles are stronger than the contract ones, so you jump.

Here's how you stop someone from bleeding out. First you grind your knee into the limb, between the wound and the heart, to pinch off the artery and stop the blood flow. While you're doing that you're getting the tourniquet ready. You take pressure off the limb long enough to slide the tourniquet onto the limb and then you tighten it until the bleeding stops. If the medic still hasn't gotten there—maybe he's treating someone else or maybe he's wounded or dead—you pack the wound cavity with Kerlix (you did pack your Kerlix, right?) and then bandage it and stick an intravenous drip into the man's arm. If you're wounded and there's no one else around, you have to do all this yourself. And you want to make sure you can do it all one-handed.

The Anti-Paparazzi clutch is a purse that responds to a camera flash by firing a bright light that ruins the photo being taken.

These days there are too many ways to plant evidence designed to destroy one's character, reputation, credibility. Remember this the next time some big bad monster is paraded out. You could be distributing copyrighted movies, child porn, or participating in other illegal activities just by reading a web page with a little code on it.

While you may have known that actively participating in bandwidth exchange on the TOR network meant you were at some point helping distribute the dark web and all the sundry stuff it contains, the same now is possible just by visiting a website. A Javascript application like WebTorrent shows that by visiting a page you can participate in legal torrent-based movie distribution while you're watching a movie doing nothing other than landing on the page. The script loads, a video box like YouTube pops up and starts playing a movie, on the left you've got a graphical representation of who you're connected to on the internet and grabbing pieces of the movie to watch from other people, who are similarly watching the movie or just sitting there seeding it. At the same time you're giving out pieces of the movie you have to people out there.

But, there doesn't have to be a box showing a movie and who you're connected to, and there doesn't have to be any indication that anything is going on. You could just be sitting there reading about how cats are plotting your murder while you sleep and find out when the FBI shows up that the web page had been injected with code that loaded a Javascript and you've been seeding child porn every time you visited. Site operators might not even have a clue that their sites had been injected as it could potentially come in the form of a crappy ad.

You can disable Javascript at the moment to prevent a WebTorrent-style code from running as it's not a virus or an evolutionary leap in attack vectors, it's just a tool that's cool. Unfortunately disabling Javascript is going to break much of the web in 2020.

In fact, there's not a lot in place to prevent a malicious plugin from doing most web operations. In recent years we saw a rise of Javascript DDOSing, your computer turned into a bot while a Pikachu ad with dollar signs in its eyes ran attacks in the background and dared you to click him.

You could probably mitigate this attack vector with TOR or a VPN should you be worried about it. Just remember, the next time you hear about someone being charged with kiddie porn distribution, hacking, et cetera, realize it could just be from visiting a web page with JavaScript turned on and nothing to protect their IP address. Or it could be from a disgruntled IT coordinator who had full access to everything, especially setting startup pages. Or it could be a disinformation campaign designed to smear a revolutionary. The web's gotten a lot more dangerous to the casual browser.

Of course your compromised computer doesn't give you a criminal record, but I can guarantee if there's 30 gigs of exploited minor videos on your computer when the FBI comes knocking your next couple of months is probably going to be unhappy. And if you've got a dog they'll probably murder it. Maybe you'll hear the whines, watch as it tries to lift itself and crawl closer to you, it fails, falls, collapses, the pain and confusion in the eyes—you want to go closer, you can't, a heavy knee in the back, bound hands. You watch, you listen, powerless. The light fades from those once bright, beautiful eyes. A blackness envelops you, that fucking unlocateable pain. And you are never the same again.

If two men in trench coats are at your door, it's the FBI. If it's just one man in a trench coat, it's the IRS. Either way, you probably shouldn't open the door.

If the police knock on your door—this includes any agent from any law enforcement agency, regardless of whether they are local, state, or federal, including the FBI, ATF, and ICE when they are working as law enforcement, uniformed or not—follow these simple steps. Consider putting a copy of this by the doors of your residence and familiarizing yourself with the information. These days, no matter who you are or what you're doing, you never know when you might receive an unwelcome visit.

Say: “No, you cannot come in. I do not consent to a search.”

Keep the outer gate or door chain locked. If you must, step outside and close the door behind you. Better yet, speak through the door.

Say: “No, I will not answer your questions.”

You can also say:

“I have been advised to not answer questions. If you leave a card, a lawyer may contact you.”

The police are trained to intimidate. Don't let them bully you! Regardless of what they say, remember that you are never required to answer anything they ask. Your responsibility is to your conscience and your community, not to the police or their investigation.

Research the legal resources available in your area. Keep the phone numbers accessible for the local National Lawyer's Guild hotline, the local hotline to report ICE raids, and any contacts you have for legal support or raising bail money. Agree on a response plan with those you share this home with! Keep in mind that the phone numbers you have written out in your home may be discovered by police.

Do not sign anything you are given without seeking advice from a lawyer first.

Lying to police may result in criminal charges. The safest thing is to not engage with them at all.

Rehearse the phrases, that way, when the time comes, you will feel confident enough to deny them entry, access, and information.

If they want to conduct a search ask if they have a search warrant that is signed by a judge. It must be no more than ten days old. If they do not have a search warrant:

Say: “I do not consent to a search.”

You may inform them that if they leave a card a lawyer may contact them. You can then ask them to leave, or you can simply close the door.

If they do have a warrant, you may ask them to slide it under the door or mail slot. You may want to take a picture of the warrant and send it to a lawyer. Signal is a secure and encrypted messaging app for smartphones. You can assert that you wish to consult with a lawyer before consenting to a search. This may not stop them from entering.

Before they enter, you may wish to shut down electronics, move anything you wish to keep private from plain sight, and close all doors. The warrant

may not apply to the entire house. Anything in plain sight that obviously appears illegal or evidence of a crime may be seized.

If they have come to carry out an arrest they must have an arrest warrant signed by a judge that is no more than ten days old, specifying someone in this home.

Who is named? You are not required to confirm whether or not that person is present.

Say: “I am going to remain silent, I will not answer any questions without a lawyer.”

If police have a reason to believe the named person is in the premises they may enter without your permission to search for the individual. They can check places where a person could hide. Anything in plain view that obviously appears illegal or like evidence of a crime may be seized. If the arrest occurs inside, police may more thoroughly search the area of the person arrested. On the other hand, if the named person decides to surrender outside, it may limit or prevent a police search of the house.

It is crucial for anyone arrested to fully exercise the right to remain silent. Do not answer any police questions other than booking questions: name, date of birth, and address.

Say: “I am going to remain silent. I want to speak to a lawyer.”

If they only have a subpoena police are not legally entitled to enter unless you give them permission. Unless they have a warrant, they cannot come inside to search for anyone or anything named in the subpoena.

Say: “I do not consent to searches.”

After an incident, you may want to write down the details of what happened. Include the date, time, location, the people present, the agencies involved, the badge numbers of the officers, the names they mentioned, the questions they asked, the items they seized, and any damages, injuries, or other details.

Documenting the details of this incident can be beneficial; later, it may be important to have a record of all these details, and it is possible that they will be forgotten otherwise. In case there could be potential risks if the document is discovered, it may help protect the privacy of the document to write the name of an attorney and the words ‘Confidential attorney/client communication’ at the top.

Much of a police interrogation consists of asking otherwise meaningless details about a suspect's day that he can't possibly keep track of. Once the police have opened up even a small contradiction in the testimony, they have a way into the web of lies that inevitably surrounds any denial of guilt.

Repeating a question is a standard interrogation tactic because it literally bores the subject into answering "fully and candidly."

When asked by the judge how he pleaded, Smith answered in a strong, clear voice:

"I plead mute."

Pleading mute was a way for Smith to avoid admitting guilt while still keeping his options open.

A burner phone is a single-use phone, unattached to your identity, which can theoretically be used to communicate anonymously in situations where communications may be monitored. Whether or not using a burner phone is itself a 'best practice' is up for debate, but if you've made the choice to use one, there are several things you should keep in mind.

- **Burner phones are not the same as disposable phones.**

A burner phone is, as mentioned above, a single-use phone procured specifically for anonymous communications. It is considered a means of clandestine communication, and its efficacy is predicated on having flawless security practices. A disposable phone is one you purchase and use normally with the understanding that it may be lost or broken.

- **Burner phones should only ever talk to other burner phones.**

Using a burner phone to talk to someone's everyday phone leaves a trail between you and your contact. For the safety of everyone within your communication circle, burner phones should only be used to contact other burner phones, so your relationships will not compromise your security. There are a number of ways to arrange this, but the best is probably to memorize your own number and share it in person with whoever you're hoping to communicate with. Agree in advance on an innocuous text they will send you, so that when you power your phone on you can identify them based on the message they've sent and nothing else. In situations where you are meeting people in a large crowd, it is probably OK to complete this process with your phone turned on, as well. In either case, it is unnecessary to reply to the initiation message unless you have important information to impart. Remember too that you should keep your contacts and your

communications as sparse as possible, in order to minimize potential risks to your security.

- **Never turn your burner on at home.**

Since cell phones both log and transmit location data, you should never turn on a burner phone somewhere you can be linked to. This obviously covers your home, but should also extend to your place of work, your school, your gym, and anywhere else you frequently visit.

- **Never turn your burner on in proximity to your main phone.**

As explained above, phones are basically tracking devices with additional cool functions and features. Because of this, you should never turn on a burner in proximity to your real phone. Having a data trail placing your ostensibly anonymous burner in the same place at the same time as your personally-identifying phone is an excellent way to get identified. This also means that unless you're in a large crowd, you shouldn't power your burner phone on in proximity to your contacts' powered-up burners.

- **Don't refer to yourself or any of your contacts by name.**

Given that the purpose of using a burner phone is to preserve your anonymity and the anonymity and the people around you, identifying yourself or your contacts by name undermines that goal. Don't use anyone's legal name when communicating via burner, and don't use pseudonyms that you have used elsewhere either. If you must use identifiers, they should be unique, established in advance, and not reused.

Consider using an innocuous passphrase to communicate, rather than using names at all. Think 'hey, do you want to get brunch Tuesday?' rather than 'hey, this is Secret Squirrel.' This also allows for call-and-response as authentication. For example, you'll know the contact you're intending to reach is the correct contact if they respond to your brunch invitation with, 'sure, let me check my calendar and get back to you.' Additionally, this authentication practice allows for the use of a duress code, 'I can't make it to brunch, I've got a yoga class conflict,' which can be used if the person you're trying to coordinate with has run into trouble.

- **Beware of IMSI catchers.**

One reason you want to keep your authentication and duress phrases as innocuous as possible is because law enforcement agencies

around the world are increasingly using IMSI catchers, also known as “Stingrays” or “Cell Site Simulators” to capture text messages and phone calls within their range. These devices pretend to be cell towers, intercept and log your communications, and then pass them on to real cell towers so your intended contacts also receive them. Because of this, you probably don’t want to use your burner to text things like, ‘Hey are you at the protest?’ or ‘Yo, did you bring the Molotovs?’

Under normal circumstances, the use of encrypted messengers such as Signal can circumvent the use of Stingrays fairly effectively, but as burner phones do not typically have the capability for encrypted messaging—unless you’re buying burner smartphones—it is necessary to be careful about what you’re saying.

- **Burner phones are single-use.**

Burner phones are meant to be used once, and then considered burned. There are a lot of reasons for this, but the primary reason is that you don’t want your clandestine actions linked. If the same burner phone starts showing up at the same events, people investigating those events have a broader set of data to build profiles from. What this means is, if what you’re doing really does require a burner phone, then what you’re doing requires a fresh, clean burner every single time. Don’t let sloppy execution of security measures negate all your efforts.

- **Procure your burner phone carefully.**

You want your burner to be untraceable. That means you should pay for it in cash; don’t use your debit card. Ask yourself: are there surveillance cameras in or around the place you are buying it? Don’t bring your personal phone to the location where you buy your burner. Consider walking or biking to the place you’re purchasing your burner; covering easily-identifiable features with clothing or makeup; and not purchasing a burner at a location you frequent regularly enough that the staff recognize you.

- **Never assume burner phones are “safe” or “secure.”**

For burner phones to preserve your privacy, everyone involved in the communication circle has to maintain good security culture. Safe use of burners demands proper precautions and good hygiene from everyone in the network: a failure by one person can compromise everyone. Consequently, it is important both to make sure everyone you’re communicating with is on the same page regarding the safe

and proper use of burner phones, and also to assume that someone is likely to be careless. This is another good reason to be careful with your communications even while using burner phones. Always take responsibility for your own safety, and don't hesitate to erase and ditch your burner when necessary.

Direct action, simply put, means cutting out the middleman: solving problems yourself rather than petitioning the authorities or relying on external institutions. Any action that sidesteps regulations and representation to accomplish goals directly is direct action—it includes everything from blockading airports to helping refugees escape to safety and organizing programs to liberate your community from reliance on capitalism. Here we present a step-by-step guide to organizing and carrying out direct action, from the first planning stages to the debrief at the end, including legal support, media strategy, and proper security.

There are countless scenarios in which you might want to employ direct action. Perhaps representatives of despicable multinational corporations are invading your town to hold a meeting, and you want to do more than simply hold a sign; perhaps they've been there a long time, operating franchises that exploit workers and ravage the environment, and you want to hinder their misdeeds; perhaps you want to organize a festive, community-oriented event such as a street party. Direct action can plant a public garden in an abandoned lot or defend it by paralyzing bulldozers; it can occupy empty buildings to house the homeless or shut down government offices. Whether you're acting in secret with a trusted friend or in a mass action with thousands of people, the basic elements are the same.

Brainstorming can start with a problem you want to solve, or a social contribution you want to make; it can be informed by the resources you have, the kind of experience you desire, or the people you want to work with. You can plot a single short adventure or a long-term campaign. Often, the best brainstorming occurs in the course of daydreams and informal conversations—it's good policy to trust that your craziest ideas can become reality and try them out. By the same token, even when attending events organized by others, it's best to bring a plan so you can contribute in your own way.

If it makes sense for your action to be organized openly, establish a format, such as a public assembly, in which to work out a strategy and tactics. Invite friends, or circulate fliers, or go from door to door announcing it. Come up with your own proposals ahead of time, in case no one else does.

For more clandestine actions, brainstorm in a secure environment with a trusted friend or two. Keep your ideas to yourselves as you hash them out so you won't have already given them away when you're ready to try them.

Who is your action for? Is it directed at on-the-spot spectators, corporate media viewers, the owners of specific corporations, their stockholders, the police and government, other members of the community, the participants themselves? What is it intended to accomplish? Is it meant to communicate ideas, to call attention to an injustice, to inspire people, to secure resources, to set a particular tone, to inflict crippling material damages, to provide a deterrent, to demonstrate a model others can apply, to serve as a learning and bonding experience for those involved?

Establishing a shared understanding of the goals of the action from the outset will save a lot of headaches later when your plans shift and potential conflicts arise.

One of the most efficient and secure models for direct action organizing is the affinity group model. An affinity group is a group of friends who trust each other deeply and share the same goals; working together over a long period of time, they become efficient and effective. For a small action, the members of an affinity group can take on different roles. For a larger action, affinity groups can work with other affinity groups in a 'cluster,' each group playing a role. This can make decision-making easier than it would be in one big mass, as each group can send a representative to a spokes-council. Clusters of affinity groups can work together over long periods, building trust and effectiveness.

Once you have a plan to propose, figure out how many people you need to accomplish it. If your plan requires secrecy, invite only people you trust to keep secrets and that you are sure will want to join in—everyone you invite who doesn't end up participating is a needless security risk. Extend invitations one by one, or affinity group by affinity group, so those who decide against participating will not know anything about the others involved. Start by asking general questions about what a potential participant could be interested in, and don't reveal critical details of the plan such as exact target or date until he or she is ready to make a commitment. As people are brought into a plan and go on to bring in others, make sure everyone has the same understanding of the appropriate degree of security.

As more people become involved in the project, it's important that everyone understands how much commitment is expected of them. Sometimes the group that first presents a plan will be more invested in it than others; if they do months of work preparing, only to have another group they depended on drop out at the last minute, all that work is wasted. Everyone shares the responsibility of being honest from the beginning about what is realistic to

expect of them. At the same time, those who initiate a project should be careful to share ownership with everyone else involved.

Make all decisions in a participatory and consensual manner. If your group is large enough to warrant it, use an informal or formal consensus meeting process to make sure all voices are heard: set the agenda of each meeting together and pick a facilitator to keep things on track. The more that everyone participates, the better informed the decisions you make will be.

Be aware of internal dynamics that may be unbalanced, such as those between people with different backgrounds, or between local organizers and participants from out of town. The more everyone participates in planning and preparing for the action, the more invested in its success everyone will be. A group with good internal dynamics is smarter than any individual can be; individuals can bring in ideas, but together the group can work out the best way to apply them.

Make sure everyone feels supported and comfortable throughout the project; check in with each other outside of formal structures as well as inside them. Though often overlooked, maintaining morale is a critical aspect of successful direct action organizing. Keep level heads in the face of surprises and uncertainty.

Security culture is a way to avoid unhealthy paranoia by minimizing risks at all times. If you and your friends always conduct yourselves wisely, you'll have less to fear from infiltration and surveillance.

The essence of security culture is that information is shared on a need-to-know basis. In some cases, the whole town needs to know about your action for it to be a success; in others, it is crucial that the action is never spoken of outside the circle of those directly involved. Everyone privy to the action needs to share a sense of what level of security has been deemed appropriate, and to respect others' needs regarding safety.

Consent is as important in security as it is in sexual intimacy; it is never acceptable to violate another's wishes regarding security issues. Make your own security needs explicit from the beginning; swear an oath of silence together if need be. Never talk about your or others' involvement in past actions, however long ago, except with their express permission.

When a group comes together to work on a project, make sure everyone present is vouched for by others in the group as reliable and trustworthy. To protect each other, you should be prepared to remain silent under interrogation and legal pressure.

From the beginning of a project, you should operate according to the highest possible level of security it might require; you can always become

less cautious later, but if you start out being careless you close off a lot of options.

Be aware of all the ways your actions can be monitored or tracked: the records of surveillance cameras, the purchases you make, the places you go and the people with whom you are seen, the location of meetings, the items you throw in your trash, the websites you visit, the files on your computer, the fingerprints you leave (on the batteries inside a flashlight as well as on the outside of it, for example), and virtually everything that has to do with a phone. Devise codes and prepare alibis as need be.

Everyone involved in the action should be aware of and prepared for the risks they are taking and the potential criminal charges associated with them. It's important not to take things farther than you feel ready to go: if you get hurt or arrested while engaging in a level of risk for which you are not emotionally prepared, the effects can be debilitating. Far better that you get started slowly, building a sustainable involvement with direct action projects that can continue over a lifetime, than rush into an action, have a bad experience, and swear off all such activity.

If your action may result in arrests, prepare a legal support structure for those who participate. This could include a legal aid number for arrestees to call, legal observers to monitor and document the actions of police, money for bail, lawyers to provide immediate support to arrestees and to represent them in court, and a circle of people prepared to offer emotional, financial, and logistical support throughout court cases.

The legal aid number should be open to receive incoming calls at all times throughout the action; bear in mind that in some cases, you cannot call a cell phone from jail. The legal aid number should not incriminate the arrestees or the people who receive the calls—if part of your alibi is that you don't know each other, don't all call the same number from jail. If you fear you will forget the number, write it on a concealed part of your body in permanent marker. The person operating the legal aid number should know the full names of those who may be arrested, so as to check on their status.

To bail someone out of jail, you can either give the entire amount of the bail to the court system, in which case you should receive it back after the legal process is finally concluded, or you can go to a bail bondsman and pay about 10% of that; in the latter case, the bondsman's fees may cost you a significant amount of money. If no one can pay bail, an arrestee may sit in jail until the court date, although in the case of minor infractions it can happen that police release people on their own recognizance so as not to have to deal with them.

If you are risking arrest, decide whether you want to have your identification on you to expedite processing, or to be without it, so they cannot

identify you immediately. A large group of arrestees who refuse to give their information can tie up the legal process and sometimes gain bargaining power. If you need medication, consider hiding it on your person, or carry a note from a doctor explaining what you need.

Find a sympathetic and trustworthy lawyer—or perhaps a few of them, since a lawyer cannot represent more than one defendant on the same charges. You can research which lawyers have taken on similar cases in the past, or approach the American Civil Liberties Union or National Lawyers Guild. If you don't give away anything sensitive, you can ask sympathetic lawyers about the charges associated with hypothetical acts, or specify the dates and times you may require their services—but don't let them know anything that could implicate them. In order to do their job, they need to be able to prove that they are not connected to anything illegal.

Any community whose members may suffer arrest would do well to establish a bail fund in advance; this can save a lot of running around in the middle of emergencies. Throw benefit shows, sell t-shirts, solicit donations from wealthy sympathizers, have your friends at the university book you speaking dates at their school in return for student funds. Make sure the bail fund stays with someone who is even-handed, trustworthy, and always easy to reach.

Long before an action, when you are establishing and prioritizing goals, work out exactly how much media coverage you want, from which sources, and how you are going to obtain or avoid it. This could mean composing and sending out a press release or a communiqué, electing a spokesperson to represent your project to the press, inviting corporate or independent reporters to the action or to a press conference, faxing announcements or making press calls, offering interviews (in person or anonymously over a burner phone), or having members of your group cover documentation themselves. If you want to avoid certain kinds of coverage, it could also mean assigning a participant to make sure photographers do not aim their cameras at you.

If you are communicating with the media, compose talking points, sound bites that your spokesperson repeats to be sure they get in the media coverage. Give representatives of the press as little material to work with as possible so they will have to use the part you want them to. Keep track of which reporters tend to provide positive coverage, and approach them personally. If you have a website, get this address into corporate media coverage to reroute their viewers to your media. You can also provide information to the public yourselves by postering, pirate radio, speaking events, or starting conversations door to door.

If your action warrants high security, send your communiqué securely:

for example, from a public computer that leaves no record of who uses it. Be aware of how the devices you use can incriminate you.

Proper planning is the essence of safe, effective direct action. Keeping your goals and priorities in mind along with the resources you have to work with, plot and compare different strategies. Weigh out the risks and potential rewards of each: always pick the safest way to accomplish a given objective, and make sure you can afford to take the risks you choose. It sometimes happens that as the planning process goes on, a project will get more and more ambitious and hazardous, until some of those involved start to have doubts; at that point, it may be necessary to work out a safer or scaled-down version of the plan, so it can still take place.

There are countless factors to take into account in planning. You must pick the most effective tactics in the context of the current social and political situation. You must pick the best location for the action and take into account all its attributes; you must pick the best date and time of day. You must bear in mind the others who will be in the area, and how they will react—will they be sympathetic, or may hostile vigilantes interfere with your activities? You must coordinate the timing of different parts of the action, predicting how long each will take, and figure out how those involved in the action will communicate.

When predicting the responses of others—say, for example, the police—consider the factors influencing them: Are they expecting what you're planning, or do you have the element of surprise? If you have the advantage of surprise, how long will it last? Will there be a lot of attention focused on the event? Will it be immediately apparent what you are doing? Will there be middle-class citizens or reporters around, and will their presence put a damper on the authorities' response? What is their strategy likely to be, based on previous precedents for police behavior in this context? Do their bosses want them to come down hard on you—or to avoid provoking a scene? How well do they communicate, how fast do they move, where are they located, what routes will they take?

Don't underestimate the challenges of simple logistical matters, such as transporting people or communicating in stressful situations. Don't forget to plan an exit strategy, either.

Because plans rarely come off exactly as they are laid, it's important to have backup plans worked out for different scenarios: 'If X, we'll Y; if A, we'll Z.' Have a few different objectives in mind, in case your first choice turns out to be impossible. Having a basic structure for communications and decision-making in place will help you to be prepared for situations that play out differently than any of the scenarios you had imagined.

Be careful not to put others at risk for your actions; the authorities will

probably charge whomever they get their hands on with the worst crimes they can, so it's important both to get those who take risks out of the area safely and to make sure serious charges can't stick to anyone else. In some cases, you can bring together multi-leveled groups in which everyone knows the general goal but only a few know critical details such as what the target is or who is to carry out the riskiest activity.

Be prepared for the best-case scenario as well as the worst. New ideas, if they are good ones, tend to fail because people don't take them far enough, whereas older ideas usually fail because they are too familiar to everyone, including the authorities. Sometimes the best results come from applying familiar tactics in entirely new settings. Look back in time for precedents, occasions when similar actions were attempted in similar contexts. These can be very instructive. As you gather years of experience and learn from others' successes and failures, you'll develop skills for predicting and preparing for a wide variety of situations.

Once your plans are laid, draw up a timeline until your action, counting backwards from the big day to establish the deadlines for all the pieces that must be in place.

Early on in the planning, work out what funding, materials, and other resources you will need and how to obtain them. If security is a priority, obtain what you need in such a way that it cannot be traced to you; affinity groups from out of town can acquire potentially incriminating materials far from the site of the action.

Make sure everyone has appropriate clothes for the action, including different outfits in layers if necessary. Take security issues into account as they relate to clothing: if everyone is dressing in black for anonymity, be sure no one's clothes have unique identifying features; likewise, if you're going to be posing as random passers-by, remember that civilian dress is different in Miami than it is in Seattle. If timing is important, make sure everyone's watches are synchronized.

Double-check to make sure everything is ready by your deadline. Go through a practice run, verbally if not physically. If participants are unfamiliar with the area, distribute maps. If need be, plant necessary materials in the area in advance of the action—being careful not to give anything away in the process.

Before the action, study the area carefully. Chart safe routes in and out; look for hiding places, obstacles, potential targets, and surveillance cameras (including those in ATMs and stoplights). Note how long it takes to travel key distances, and be aware of the visibility from and of key locations. How close are the authorities, how long will it take them to arrive? Can their approach be delayed? Who else is in the area?

While scouting, be careful not to call attention to yourself or leave an obvious record of your passing. Be sure to do at least some of your scouting at the same time of day as the planned action, and if possible do a quick check immediately before it to make sure nothing has changed. If your action calls for daunting tasks, such as climbing a steep rooftop, it may be good to make an actual practice run at some point.

Information can also be gathered from photos, maps, and brochures; aerial maps or blueprints may be available. In some cases you can obtain information from a tourist center, or call and ask questions on a pretext—as a student doing a report, for example—or even receive a guided tour. Once you’ve collected a lot of information, it can be helpful to consolidate the important parts into a map suited to your needs. Be careful to dispose of all files and paperwork securely.

Identify all the roles necessary to pull off your plan, and make sure every one of these is filled. Some potential roles include:

- Lookouts
- Scouts
- Media spokespeople
- Internal (“embedded”) media
- Legal aid contacts
- Legal observers
- Medics
- Distractions
- Getaway drivers
- People to transport materials
- People to receive information and make tactical decisions
- People to carry out the actual action
- “Plants”

In some situations, it is wise to have understudies for important roles, in case it turns out at the last minute that someone can’t participate. This is especially true if you don’t know in advance what the date of your action will be—for example, if it is to coincide with an event that you cannot predict in advance, such as the announcement of a verdict or a declaration of war.

If your action is taking place during or as part of a larger event, there may be large meetings at which different groups try to coordinate their efforts. These can be useful, but tend to consume a lot of time and energy; make sure you go into them knowing exactly what you hope to accomplish.

Whether you’re acting in the midst of thousands of other activists or far away from anyone, take into account the way your actions will affect other people. Will they endanger others? Will they provoke police repression? If so, will others bear the brunt of it, and is it possible to offset this? Will

your actions make it more difficult for other people to do important work in a given community? Are there negotiations or reassurances you should engage in before, during, or after the action?

Honor all agreements you make with other groups; some might be willing to help you, with or without knowledge of the specific details of what you're doing. Over time, if you prove reliable and considerate, you'll build alliances.

Awareness is key to the success of any action. Often, the atmosphere can change very quickly. It is important to keep up with what is going on around you, and to have established in advance how you will react to a given scenario. For example, is the arrival of a single police car a big deal? How about ten? Is it common for police to tail marchers in this city? While you can never be certain of exactly what will happen, going over possible scenarios in advance and having an idea of how your group wants to deal with them will give everyone a more solid idea of how to react—and how not to overreact—as the situation develops.

When informing others of a development, announce the raw information, not the conclusions you may have drawn from it

Do: “The police are putting on gas masks.”

Don't: “They're going to gas us!”

This allows others to draw their own conclusions. Resist the urge to panic, and the tendency to get carried away as well.

During the action, scouts can keep track of changes in the terrain such as arriving police, crowd movements, others' activities nearby, and safe zones. They can use communication systems such as burner phones, encrypted text messaging, two-way radios, or whistles to keep in touch; audio or visual signals such as car horns or fireworks can also serve. A police scanner can be used to monitor police communications.

To make communication more efficient, scouts can report to an individual or sub-group in the center of the action; in a larger setting, they can phone in their findings to a central information hub, which others can call with questions.

Just as communications equipment can make you more efficient and effective, it also increases the risk of surveillance. You can use codes and code names, but be judicious—complicated codes are easy to forget, and prosecutors can argue that your codes meant something more drastic than they actually did. Even if no other communication system is used, it can be useful to have the option of an ‘abort’ signal for emergencies.

A safe escape is the most commonly overlooked part of direct action organizing. Be sure to have an exit strategy worked out in advance. If you'll

be in a large group, especially with others who haven't been part of the planning process, think about how to avoid the herd mentality that keeps crowds together after it would be better to split up. Know when to press your advantage, and when to quit—when to run as fast as you can, and when to walk nonchalantly. Discard anything that could incriminate you, if possible in a place it will not be found; wait to change your appearance until you're sure you're no longer under observation.

If need be, gather in a safe place afterwards and make sure everyone is accounted for; collect bail money, seek outside assistance, write press releases. While everyone involved is still around, get contact information for anyone who might be able to testify or provide documentation to assist arrestees.

After the action, destroy any evidence that could be used against you; keep tools that could be tied to the action in a hiding place outside your home. If you may have to testify in court at some date in the far future, consider writing down all the details you might need to remember on a piece of paper and concealing it in some place where you can be sure it will never be found. Get together in a secure setting and go over what happened. Follow up on ongoing matters, such as supporting those with court cases, providing further clarification to the public as to the goals of and ideas behind the action, and sorting out conflicts. Celebrate your victories, offer each other constructive criticism, learn from your mistakes, and lay plans for the next project.

Counter-Measures to Crowd Control

Umbrellas: They block pepper spray and the view of cameras. Umbrellas are also commonplace and provide a sense of unity as well as inconspicuousness.

Shields: Though they are less conspicuous, they provide better protection and shift the tone to a more active defense.

Fire Extinguishers Can be used to extinguish tear gas containers and keep them from releasing more gas.

Traffic Cones + Water: Can also be used for extinguishing tear gas; far easier and cheaper to acquire and replenish than fire extinguishers.

Masks: Allows protesters to conceal their identity and somewhat protects against tear-gas.

Hardhats: Useful at protests where police or extra-state attack is probable to protect one's head from projectiles and blunt weapons.

Goggles: Widely used to stop pepper-spray though ones with sufficient impact resistance are also helpful against rubber bullets and tear gas canisters.

Lasers: Can be used to blind cops and block cameras. They simultaneously provide pleasing aesthetics. You are encouraged to use not only the dangerously powerful green lasers but also the terrifyingly powerful blue lasers. Remember: The closer you get to purple on the rainbow spectrum the more powerful the laser.

Being close to manufacturing points makes it easier to get cheap supplies in bulk and can allow people to get their hands on equipment and materials without needing to have everyone go out and buy them on their own. Demos have become sites of distribution of materials and supply lines are a feature of most significant protests where clashes with riot police are assured. Human chains pass supplies to the front lines of conflicts. Supplies commonly distributed at demos, all with their own hand signs: zip-ties (to secure barricades), pliers, umbrellas, shields, water, saline solution, goggles/safety glasses, barricade materials, masks, asthma inhalers, markers, plastic wrap, and allen-wrenches.

These supply lines also provide a way for those who are unable to fair well in frontline clashes to support the front line and make the frontline possible. Some who cannot stay long at the protests hand out water. Some leave bags of clothes around so that people can change in a hurry if needed. Others convert their stores into "protest kit" vendors selling needed supplies for cheap; a questionable tactic but one that has helped the facilitate distribution nonetheless.

Some Points

Leaderlessness: Out of need and wisdom, planning and announcements have become dispersed and decentralized. There are crews of front line fighters and strategists who plot together. There are dozens of online groups where plans are hatched, and calls made. With no single head to cut off the security forces have a harder time repressing the movement.

Come Together, Leave Together: Buddy systems are encouraged as police have picked people off after events.

Go Against the Flow (of Traffic): Protesters have learned police vehicles can't follow them as well if they go against the flow of traffic in the streets because cars on the road block their advance.

Barricades and Blockages: Barricades block the flows of traffic, are used to hide from projectiles, and slow the advance of the police. Commuter trains are blocked to cause economic and social pressure. Airports too are shut down by sit-ins. Masses of people disrupt the functioning of government offices. Many of these actions cause the most damage to government and capitalist logistics and are also some of the less dangerous activities to attend, as opposed to police station sieges.

Permanent Occupation: Instead of taking territory and trying to defend it, opt for roving occupations, mobile crowds, and pop up demos. Some still dig in their heels to fight with the police, but many swarm a logistical node till it shuts down then move on. They are not afraid of tactical retreats. After all, why would you need to fight the police at a disadvantage when you can outpace them and still disrupt business as usual and chuck stones at them from afar?

Counter-Surveillance: The police, of course, have spies in the movement, but the protesters have lookouts watching and communicating police movements. Likewise there are sympathizers in the state and informants or 'ghosts' within the protest. Many protesters however have stopped worrying so much about ghosts and just let people do what they will while generalizing security tactics and effective means.

Black Blocs: There's much debate if you can call protesters who wear all black and masks a black bloc. Some who participate intentionally call it that, but they are admittedly a small number. Whether or not a bloc or not, the protesters wear all black and similar gear to create a sense of unity and make it harder for people to pick them out of the crowd.

Extra-State Violence: Armed men have attacked protests. This tactic allows for those defending the ruling order to use violence that otherwise wouldn't be socially viable or to create a unique sense of terror in those attacked. Just like police attacks on protests, it is meant to scare people out of the streets. Though this tactic, of course, had some intended affects, it can push many to come out in anger and to pick up street fighting tactics.

So You've Been Kettled

1. If You're Going to Make a Break, Act Fast

The longer a kettle has been in place, the more difficult it is to break out: the police will have established their forces and surveillance, people in the bloc may have changed clothes, demoralization and inertia will have set in. If you want to make a mad dash for freedom, your best chance is to take advantage of the chaos before a new order is imposed. Consider it an opportunity to play a high-stakes game of Red Rover.

2. Use the Middle of the Bloc to Get Clean

Once definitively surrounded with no chance of escape, you should change outfits immediately; try to do so without being filmed. In any black bloc, it's important to wear a layer of normal clothes so you can quickly shift your appearance. In a mass arrest scenario, the most secure way to do so is to move to the center of the crowd where you can't be seen, shed any suspicious objects and black bloc attire, shift to your civilian clothing, and move to the outside of the crowd to provide cover for those who haven't changed outfits yet. This should happen as soon as the crowd is definitively kettled. Two rotating spirals of demonstrators and BAM: a whole new crowd.

In changing outfits, be cognizant of details that might give you away, such as your shoes or backpack. You could carry your bag inside another bag or under your black gear, for example, or cover identifying features on your shoes with black tape.

3. Don't Make Things Easy for the Police

What safety we can find in captivity will not come from following orders, but from how we leverage whatever cooperation the police require that is still under our control. If they tell you to do something, it's probably because it makes their job easier. Ideally, a detained crowd should establish a process for deciding together how to respond to police commands. Standard guides to nonviolent direct action suggest a police liaison system, but this can be difficult in some scenarios. During one of the mass arrests at The People's Strike in 2002, detainees locked arms immediately until the police told the crowd they would allow people to leave the kettle with their hands up. This was a lie, but the experience of coordinating disobedience together built morale and rapport between the participants that was useful throughout the

rest of the lockup process. In too many protests, all police have to do is walk through the crowd and point at people for them to go willingly into a wagon. Some just volunteer to get arrested out of boredom, falsely believing that it would speed up their release.

The anti-globalization movement experienced a lot of mass arrests; there are many creative anecdotes to learn from. A generation ago, the tasks of the police were obstructed by arrestees refusing to give names, swapping clothes once in custody, just plain getting naked in custody, singing in the jail, chewing through identifying bracelets, and locking arms around each other to form a ‘giant snake’ of arrestees. Many of these instances of solidarity and disobedience ended in police violence against arrestees, but sometimes they compelled the authorities to release batches of John Does without charges.

Honestly, there is no sure way to calculate what kind of disobedience will be most favorable for arrestees in any given situation, and most people don’t want to get whacked in the ribs for the sake of symbolic defiance—but we shouldn’t forget that even under arrest, we can still continue to resist.

4. **Don’t Bring Your Real Phone**

While today’s mass arrests resemble previous ones from a decade and a half ago, one thing is new: the police often keep the majority of people’s phones. All of the associations, conversations, and social media accounts of arrestees who carried their personal cellphones that day may now be available to the authorities without even a subpoena. Please don’t bring your personal cellphone to a black bloc. Please don’t take pictures in the streets—this can help police identify where you were and who you were around, as well as giving them photographic evidence with which to investigate and prosecute others.

There are plenty of options for burner (single use) phones under \$50. This is a good option if you want a phone not tied to your number or name—for example, so you can still stay up to date with the text alerts, tips line, and legal hotline. If you are arrested, try to destroy, ditch, or conceal your SIM card so the police cannot gain access to all of your information. Even after removing the SIM card, much may still be left on your phone. We can’t emphasize this point enough: don’t bring your personal phone to an action with a high risk of arrest.

5. Seize the Chance to Pass on Skills

Once surrounded, there is no guarantee how much time you'll have together. While you have the chance, it's important to pass on skills like the ones described in this primer to the less experienced. Getting everybody on the same page while you are still all together means that everybody will be equally informed—it makes more sense than hoping that the same conversation will take place in all of the vehicles in which arrestees are transported.

If you are a movement veteran with plenty of experience, don't be too shy about outing yourself by speaking up—the risk of letting those ignorant of basic security culture make easily preventable mistakes may be more dangerous to you than the risk of being identified as a potential leader. It only takes one person making a dumb mistake to put everybody in danger. The sense that everybody is on the same page will embolden people to keep their mouths shut later under police pressure.

6. Care for Each Other

Medics treat folks for pepper spray, asthma attacks, PTSD, and injuries from concussion grenades that the cowardly police fire. National Lawyers Guild attorneys help explain the arrest and possible booking procedures to less experienced demonstrators in the crowd. In any mass arrest situation, it's a good idea to check on people who seem isolated and offer support to them; this can reduce the likelihood that anyone will cooperate with the prosecutors. Anxiety can be our worst enemy; acknowledge it, but don't let it rule you, and do what you can to put others at ease. When one person has access to a resource—a phone call, a lawyer visit—ask around to see how that could benefit others.

7. Don't Talk to Cops

It can't be said enough—nothing you say to cops can help you.

“Sorry officer, my lawyer tells me I shouldn't tell police anything but my name and address.”

It's as easy as that.

Once in jail, the cops often will do their best to get you to talk. This ranges from more innocent-seeming:

“So, what happened down there?”

To obvious traps like:

“If anyone is nervous about their charges, we can go have a conversation about your charges and what comes next. . . we’ll just have to waive your right to remain silent.”

Even if you are certain you haven’t done anything illegal, what you say can put others at risk—and the more that the police see you as someone who is willing to talk with them, the more pressure they will put on you. Seemingly unrelated conversations can be used to determine associations between detainees and used against you later on. Stay focused on getting through until your release. Afterwards, you will have plenty of time to decompress from what happened, with the benefit of guidance from your lawyer. Bear in mind that you are probably being audio recorded and/or video recorded in your cell.

The cops and corrections officers will likely be acting unjustly. They’re trying to provoke you. You may find yourself wanting to tell them exactly where they should go to and other despicable historical figures they bear resemblance to. Save it. If you can’t hold it in for yourself, hold it in for the rest of the people you’re arrested with. No kind of interaction with the police can improve your case or the cases of the people around you.

8. Don’t Believe Anything Cops Say

Once arrested, you are in a condition of uncertainty in which you have very little control over your situation. The anxiety that this uncertainty can cause is one of the main weapons the police have against you. If you can hold off on emotionally reacting to potential outcomes while you’re in custody, you take away much of their power over you.

Cops are bullies. They will tell lies just to scare you: that you will face years in prison, that you will be assaulted in jail, that other arrestees have talked to them about ‘what you did.’ Don’t believe a word. The evidence in your case will become clear later on. While you are under arrest, focus on making sure the police get as little information from you as possible and pay no mind to what they say.

Even if you somehow met a good cop with genuinely good intentions, they can’t make any decisions or commitments anyway. They probably have very little idea what is actually going on. They don’t call the shots, they just pass information up the hierarchy.

9. **Maintain Morale (We Need a New Songbook)**

Every arrestee I've spoken with has complained about the songs. Mostly it's just "Baby I'm an Anarchist"—and the chorus of "Solidarity Forever," since nobody knows the rest of the words. We need new songs that feel fresh and contemporary. Of course, it's impossible to find a song that everybody likes, but let's at least keep it interesting by expanding our range of options. Our collective songbook should include chants for various moods and circumstances: rejoicing, yes, but also gathering power, somber solidarity, ridiculing the police, and spreading determination in the face of uncertainty. We also need other ways to maintain morale while passing time together, such as games, storytelling, and humor.

10. **An Ounce of Prevention Is Worth a Pound of Cure**

All of these tips will be more effective with a little forethought. For example, perhaps the statements from the detainees could have been more eloquent if a little planning had taken place in advance; the same goes for the proposal of a hunger strike. Plan ahead in your affinity group as to what you will do once a kettle is set in motion—whether to break out, how to get clean, who will carry burner phone(s) and how they will dispose of them.

One of the reasons jail solidarity tactics achieved some victories during the anti-globalization movement is that they were planned publicly in advance, during the organizing leading up to mass protests. It is possible, in theory, that you will be able to discuss and employ the same solidarity tactics once you are under arrest, but it will be difficult to get buy-in from others on such short notice.

Most importantly, prepare yourself emotionally and mentally for police custody. Familiarize yourself with your rights and with typical police lies and tricks. Practice a line like, 'Until I have a lawyer I will only give you my name and address,' or however you're most confident expressing that you will not be speaking to cops. Rehearse it. Get used to saying it.

11. **Seriously, Don't Talk to Cops**

After you are released, you don't have to talk to cops, detectives, or district attorneys who call you. Refer them to your lawyer, and report any police contact or harassment to your lawyer and your comrades.

Also, don't do anything that is effectively the same as talking to the cops. Don't talk to the media after getting released—whatever they

publish with your name on it is just as useful to the police as if you had spoken with them directly. Speak with your lawyer before signing on to any class action lawsuits—some can require depositions with forced testimony that can be used against you if your criminal case is still ongoing. Practice good security culture and consider what information the police might have gained about you and your associations if they confiscated your smartphone. Change your passwords. Get your number to a new phone as soon as possible so that incoming calls don't keep going to the phone they have in their possession.

Remember, direct action, simply put, means cutting out the middleman: solving problems yourself rather than petitioning the authorities or relying on external institutions. Any action that sidesteps regulations and representation to accomplish goals directly is direct action—it includes everything from blockading airports to helping refugees escape to safety and organizing programs to liberate your community from reliance on capitalism.

We believe that the greatest barriers to participating in direct actions are social ones: finding comrades to build affinity groups takes time, patience, and trust. This recipe assumes that you already have people who you can get mischievous with.

Before we had ever done a nighttime direct action, we felt hesitant to begin. We had no one to teach us the basics, and feared making stupid, easily preventable mistakes. For that reason, we want to share several logistical tips that we feel may be helpful in carrying out these actions.

1. **The secret is to begin.**

First, you need to choose the target of your direct action and what tactic you will use. Although this could vary widely, for this recipe we'll use the classic example of smashing out the windows of a gentrifying business in an urban neighbourhood.

Think about what the action will communicate to people you've never met—from possible accomplices to the most passive citizen. What possibilities might this communication open up? For example, smashing up luxury businesses communicates a resistance to gentrification and in some cases, have contributed to such businesses having to close up shop.

There are introductions to 'security culture' available elsewhere, but here we'll just say to do all of your planning in person, with people you trust, outside of houses and with no phones present (both being vulnerable to police surveillance).

When we started getting our hands dirty, we found it helpful to first get comfortable with less risky activities like graffiti or wheatpasting posters, practicing the same communication habits we would later apply in attacks. This helps us become acquainted and feel more comfortable with our ability to act in stressful conditions—encounters with police, evasion, et cetera—and our relationships with each other.

2. Scouting

Scout the target ahead of time; look for the safest entrance route and exit route, prioritizing paths with fewer cameras (alleys, woods, bike-paths, train-tracks, residential areas). If you use bolt-cutters to cut a hole in a fence, will that open more possibilities? Have fun subverting the urban organization of space designed for social control to your purposes of social war.

Be discrete; don't point at the cameras you want to smash, or walk in circles around the target. Decide where to position lookouts (if you think you need them), perhaps posted up smoking at bus stops that aren't on camera, for instance. How will they be communicating with those doing the direct action: hand signals, inconspicuous shouts of random names to signify different situations, walkie-talkies, flashlights, burner phones?

It helps to know what the traffic patterns are like at the time you'll be acting. How busy is foot traffic? Where is the closest police station, and what are the most patrolled streets? Doing the action on a rainy night at 3:00 means there will be fewer witnesses, but also fewer people to blend in with afterwards when police might be combing the area, so sometimes closer to midnight will make more sense. Once you've gained confidence in nocturnal actions, maybe you'll want to experiment with day-time actions that are more visible to passersby and thus harder for the authorities to conceal. Leave at least a week or two between scouting your target and the action because that's the average amount of time it takes for surveillance footage to be overwritten. This does not necessarily apply to state surveillance footage and perhaps is increasingly untrue even for private enterprises as the cost of storage plummets.

3. Fashion decisions! (and other prep)

Wear two layers of clothing; a casual layer for the action that includes a hood and hat, and a different layer underneath so that you don't match any suspect descriptions. Blend in with the character of the area; it

doesn't make sense to dress like a punk in a yuppie neighbourhood, but it does make sense to be in flashy jogging gear if you're going to be running down a bike-path. Baggy clothing can help to disguise body characteristics. A hat and hood will keep you relatively anonymous during your approach—most cameras are pointed from above, so your face will be mostly obscured when you're looking down.

You can pull up a full mask for the last few blocks and the action itself. Depending on the terrain and where cameras are located, you may be able to wait until right before the action to mask up to avoid arousing suspicion preemptively.

Expect to be seen on camera during the action. Don't get too paranoid about cameras in the surrounding area—a standard CCTV camera has poor resolution in the dark, if police even bother to get the footage before it's overwritten automatically. All surfaces of any tools you'll be using should be thoroughly wiped with rubbing alcohol ahead of time to remove fingerprints, and cotton gloves should be used during the action (leather and nylon will retain your fingerprints on the inside). Do not take your cell phone, or if you must, remove the battery; it geolocates even when powered off.

Make a plan in case a good citizen intervenes, or starts following you to call the police. Dog-mace has worked wonders for us, but if that feels too intense as an immediate response, being verbally confronted by a masked group is enough to deter most people. Always attempt to limit damage to such minor pawns of the state.

4. **It's witching hour**

Once lookouts are in their locations and they give the agreed upon starting signal, take a final glance around, and go for it! For breaking the windows of a gentrifying business, bring enough rocks for several windows, aim for the bottom corners, and make sure you're finished up within, say, thirty seconds of the first crashing glass pane. If you also want to put glue in the locks, paint-bomb—light bulbs filled with paint—the sign, pull down the cameras, write a graffiti message (in blocky ALLCAPS to hide hand-style particularities), or anything else that's relatively quiet, do this before you make a kerfuffle breaking the windows, or plan for an extra friend to do it simultaneously.

Ditch everything including your top layer of clothing at the soonest appropriate place along your exit route—cops have lights that will reveal glass shards on clothing (more of a problem if you use hammers

than rocks). Find creative hiding spots ahead of time to ditch anything you don't want found, but as long as your materials and clothing are free of fingerprints it shouldn't matter. The exception to this is arson tactics, where DNA forensics are more likely to be used, in which case you may want to take everything with you in a backpack and dispose of it farther away.

Ideally, even if you are detained by police on your way out, you'll have nothing on you that they can use to connect you to the crime. Know your story of why you're in the neighbourhood, or be ready to remain silent because if they find evidence to contradict your story, it can be used against you in court, while your silence can't be held against you. When arrested in Quebec, you only have to give the police three pieces of information: your name, date of birth, and address—this may differ in other places; it may be useful to be knowledgeable of local laws before carrying out any illegal action. Once you're arrested, saying anything else will do more harm than good. After providing the above three pieces of information, you can repeat the following phrase:

“I have nothing more to say. I want to speak to a lawyer.”

A typical police response (if there even is one—often times vandalism is only discovered the next morning) will involve police first going to the scene of the crime, maybe taking the time to ask possible witnesses if they saw anything, then driving around the surrounding streets looking for possible suspects. If you get out of the immediate area quickly, you'll avoid all of this. Hiding can be a viable option if something goes awry and leaving as planned looks risky—backyards, corners of driveways, rooftops, bushes, a stored boat, et cetera can all be helpful in waiting it out.

5. Sweet dreams!

Consider using a bike to get out of the area quickly—you can have it locked a short jog away. Bikes can be disguised with new handlebars and saddles, black hockey-tape on the frame, removing identifying features, or an all-black paint job.

It's best to avoid using cars if possible—a license plate is far easier to identify than a hooded figure on a bike. But if you must because the location is too difficult to get to otherwise, be careful. You could park a bike-ride away in an area that's not on camera. Be dressed totally normally when entering the car. Take back roads and know your way around. Don't use cars that may be already known to police, in case

they have been tagged with a GPS surveillance device, and don't use a rental.

Rest well knowing that you've fucked up a small part of this fucked up world.

“It is easier to destroy than to create.”
—Common Sense, Motherfucker

Let me start by describing my country to you, so that you can gain a glimpse into the environment that created it.

My country was one of the best implementations of an authoritarian state in the history of our world. I give it this honor because it was immensely effective at convincing the majority that they were free, even many whom felt the harshest oppression. By deploying this tool, you can greatly marginalize the most revolutionary among the population.

One day our great leader would be emotionally distraught over a death caused by random senseless violence, or perhaps a result of our failing mental health system, while the day before and after, he would be responsible for military strikes that burned the flesh off of children's faces in countries on the other side of the world.

Our leaders would denigrate the least among us, claiming they were irresponsible. And then those leaders would hand over grand sums of money to those with power when they made what were clearly irresponsible choices. Our leaders would imprison millions of us for consuming certain plants, while enjoying those plants that they approved of and made them rich.

The education system was mostly to blame for all of this. We learned sanitized versions of history. We learned about ideals like freedom and democracy after walking through metal detectors and having had our bags searched. We were allowed some voice in how our education systems were run but it was largely symbolic power and positions, something that prepared us very well for our adult lives. We weren't taught critical thinking; that dangerous skill was left reserved for the students at more prestigious institutions, for the likely leaders of tomorrow.

Our leaders produced some of the greatest propaganda. They would partner with our prominent media stars to showcase their tools of oppression in a very positive light. It was hard to argue that the media whom were allowed access turned out to usually be far more exciting to watch. The powerful would leak information to the news media when it was favorable for them, and harshly prosecute those that leaked information they did not like, or stand wringing their hands over the sanctity of whistleblower protections when they could be used for partisan political gain.

Our leaders were even able to violate rights that we had enshrined for ourselves in the founding documents of our country. One of the most important lines our leaders crossed, and one that was unrecognized by most, is that they were able to kill many of us unjustly without fear of consequences. This must be the final line between freedom and slavery, for if it can be crossed on a consistent basis, then not only do your leaders have the power to kill you—which it could be argued the state always had—but they also have very few reasons to not use it. This will inevitably lead to increased usage unless some check is applied.

No such checks were applied.

It was in this environment that revolutionary ideas began to take shape. All revolutions begin first with revolutionary ideas, then revolutionary actions follow. Even if an individual commits an act that seems to spark a revolution, it is the ideas that already exist in others, if not the perpetrator, that is the tinder that fuels the inferno. This should be an important consideration when you are deciding whether or not to use some of the tools mentioned.

If much of what I describe about my country and its leaders seems to apply to you, then you should also consider this: If the top three most likely outcomes of you fighting for a cause are not (in no particular order):

- Success
- Going into hiding
- Death

then either your cause is not all that important and much of a departure from the status quo *or* you are not fighting for it very effectively.

These were quite controversial ideas at the time. But hardly surprising given the state propaganda. While we felt the need to wait for support, we knew at a certain point we must act. Day by day our consciences tugged at us, our individual inner monologues slowly eating away at what we were.

It was of course different for all of us. Why wouldn't it be? While we were all hurtling towards the same end point, we all did not start from the same place. Some of us had more hurdles to overcome than others. The religious among us were some of the earliest converts. One of my fallen operatives put it best:

“The journey is like a game of Chutes and Ladders, the religious get a bunch of ladders and almost no chutes, the more rational among us get the opposite.”

If you've played the game you'll note some flaws. But the general concept is quite true so fuck off, the guy's dead, show some respect. When you don't have an afterlife to look forward to, you tend to put a bit more value on the here and now. The time I have with X now is all I'm going to get. I'll just be throwing it all away. Nothing will come of it. This was the opposition to the 'Do it' voice in our heads. Everyone would give in to it eventually, it was just a question of when and you'd have better odds at guessing when a fly is going to take a shit.

We all eventually made it to this destination however. And we began to fight back.

It was often argued that my country was invincible; it was an odd belief given that it had not had much decisive military success in recent history, but also expected given the highly effective propaganda employed. It certainly may have been invincible if faced with the prospect of fighting another state actor, however, when faced with an idea and true believers of it, it had shown again and again to be powerless. It was not alone, the only ways states had to fight this enemy was to either have a better idea, or effectively silence it. Luckily my country developed some of the communications tools necessary to spread our ideas and keep them from being silenced.

My country was a highly developed one with lots of moving parts. This also means there are many points of failure and therefore, attack. We had numerous examples of critical infrastructure that could easily be disabled, even if only temporarily. Thanks to the large size of my country, we also had a large area to work in. Such as:

Banks Given the history of my country, especially the recent past, these were by far the most legitimate of our targets. However, since many may have armed guards, attacking at night is usually your best bet.

The windows are usually extremely large, take these out on your way in. Once inside smash everything. Push any furniture into a corner and set it on fire.

You can be in and out of a bank in under 45 seconds.

Car Dealerships Often run by shady con-men with incredible wealth and for us also a sign of environmental damage. Windshields and showroom windows are going to be your best targets. A team of three can take out a moderately sized lot in minutes.

Stores One of the easiest targets were the large chain stores that were notorious for abusing their employees. While these actions would certainly

affect the employees—who were victims of their employer—the main damage under a sustained attack could be felt by the employer.

We would use publicly available information from satellites for our initial planning. This helped cut down on costs and also minimized the amount of time any of our operatives would be seen around the targets. Ideally you want to find areas which have a high concentration of targets, which allows you to hit multiple places in one attack before you need to scatter to avoid agents of the state.

Next you'll need to get the basic layout of the targets, in order to minimize time on site and maximize your damage. This does not need to be a detailed drawing, and definitely do not sketch it out while you're there. They WILL look at the tapes prior to the attack in an attempt to identify you. Note all exits and target locations.

Depending on the size of the store, you'll have two general sets of targets with a bit of overlap. We'll break these down into Small and Big but you'll be able to generalize it as you need to.

Small Targets

These allow a small footprint within which you need to operate, but they also have the downside of not generally being close to others and also have fewer exit points (discussed below).

You always want to maximize the impact, both in duration of the effects and the monetary loss, so you'll want to focus on specific areas.

- **Cosmetics:** Thankfully a lot of this stuff comes in glass bottles, so even if it isn't particularly expensive, you can smash it into other things that are. Blunt objects of course work well here, but you can also just use your fist wrapped in a towel
- **Refrigerators:** Quick to take out, just smash out the front, if you've got time you can try to go for the actual hardware but it's not recommended.
- **Checkout Terminals:** Some of these might be bolted down or locked in some type of cabinet, but at least take out the screens. We found the automated checkout machines to be particularly good targets since we could also easily take out the scanning mechanisms as well.

- **Pharmacy:** While also a potential source of funds for your revolution on the black market, in this case we're just looking to destroy. Jump the counter and start opening and dumping, preferably into some container of liquid in order to thoroughly destroy.
- **Stockroom:** Most of these are going to be tightly packed masses of cardboard boxes and plastic tote crates. Set fire to a few locations on your way out the back door. Small containers of gas work well for this. Beware the fumes when lighting, your eyebrows will thank you.

Large Targets

So while these of course are more area to work with, much of it relatively useless for your purposes, they also provide some higher value targets and in higher quantities.

- **Electronics:** Big ones for us were televisions and computers. High value and very easy to destroy. Just go for the displays of both, don't worry about particular internal components in portable computers.
- **Checkout Terminals:** Much the same as with small stores with additional ease of access to the scanning mechanism on manned registers. You can also take out the conveyor belts with a box cutter.
- **Stockrooms and Storage Trailers:** These are goldmines but can be a bit more work than taking out stuff on the sales floor. Any electronics are likely to be packaged to avoid damage during shipping so you'll need to consolidate as much as possible before setting fires. With any luck items will be grouped relatively close together already. Trailers are a bit easier as they're flammable themselves. A few molotovs thrown from the loading dock into the interior of each will easily set them and their contents ablaze and also require removal of the debris before the store can be restocked.

Exits

Getting in is easy, getting out may be harder. The keys to an easy exit are minimizing your time on site and maximizing your options

of escape. It's unlikely that the entrance is ever going to be your best choice of exit. State agents will of course attempt to block all exits if they are competent and there are enough of them before you attempt to flee, but they are most likely to storm you from the front, an encounter you wish to avoid.

When planning, each operative should design their path of destruction to always head towards an exit point when possible. But every operative should know all of their possible exit points because you do not know what will happen. In a small store this is relatively easy, in a larger one it can be a bit harder. Thankfully, if your country is like mine, the stores will be required to label these exits and make note of them to anyone in the store.

Some of my colleagues have had success with exiting by blending into a fleeing crowd. This can certainly work, but you run the risk of someone outing you.

If you brought any tools with you, be sure to leave them when you are done. Be sure to wear gloves to avoid any chance of fingerprints being lifted. Once out, begin to get as much distance between you and the target as possible. But do not run, this will make you a target. Get to your safe house ASAP.

What If?: Employee Intervention

Despite the fact that they were severely oppressed, we found that we would be attacked on occasion by low-paid employees out of some misplaced loyalty to their oppressor. We recommend only applying the force necessary to safely remove yourself from the situation and/or subdue the attacker. While you can certainly claim moral authority to wage physical war with agents of the state, you risk much backlash from the public if you are seen directly harming the oppressed.

My country was quite fond of using various forms of psychological warfare on the populations of other countries. We recommend you focus much of it on agents of the state. As in any authoritarian regime, provoking action by agents of the state can be one of the most effective recruiting tools for your cause.

Due to the viciousness of our enemy, we found it necessary to employ a particularly violent form of psychological warfare. Your lines will vary.

The agents of the state in my country tasked with enforcing "law and order" had a particularly nasty habit of protecting their own at the expense

of the general population, taking on the 'us versus them' stance typical of any authoritarian regime or occupying force. We used that to our advantage.

If we posed the slightest threat to them, they were already inclined to respond with excessive force. So the moment we started using force back, they ramped up even more. And while many could justify the force because we had begun to wound and kill them, many others saw it simply as self-defense on our part. Our motto became much the same as an attention starved child: any reaction is a good reaction.

One of the easiest environments to provoke a reaction in are state-sanctioned (or relatively state-sanctioned) protest events. Most of the individuals at these are not going to support your tactics, however, they do provide a cover for you to get close; and in many cases the state would violently suppress even these ineffectual actions which gives you an excuse.

In my country, the agents of the state would often show up in full body armor and masks, thereby eliminating less extreme methods of attack. If you're lucky enough that they are not, you can of course go after them with blunt objects, telescoping batons work well and you can procure a few of them easily by ganging up on one or two agents and then expanding your collection as you work your way through them.

Pepper spray is also readily available. Be sure to get that as well, but do not deploy, simply remove it from the field as in close quarters fighting you're as likely to incapacitate yourself or a fellow operative than you are the state agent. If you take prisoners this may be a useful torture device however.

Once the agents are in their full gear, you naturally must change tactics in order to have an effect. This is unfortunately where we lost many of our supporters, I hope that you will have better luck.

Fire is your friend when physical force is not available or ineffective. Fire teams of two or three are most effective. Station one member a short distance from the front lines while the other team members are almost right on it. The rear team member will be responsible for the ignition and delivery and should be stocked with as many cocktails as possible while avoiding suspicion. Front line members provide the napalm, a mixture of styrofoam dissolved in gasoline. This substance will stick to surfaces, providing a longer burn.

Front line members will douse the agents with the substance and immediately back off, at which point the bartender should start serving drinks; once the cocktails hit and ignite, it should be extremely difficult to put out. Our state agents also had the tendency to wear synthetic underclothing which melted to the skin under high temperatures, further increasing the damage and likely extended their recovery times.

Guns work too, but there are numerous books which describe their tactical use much better than I. I would add nothing here other than common sense so I will refrain from doing so.

Luckily these protests will have a number of people you can use to hide among as you attempt your escape. You should always hit quick and get out to minimize exposure. You have nothing to gain by fighting toe-to-toe in extended battles, that is your enemy's forte.

Some other tactics we employed:

- Attack in line while getting food
- Pit maneuver at high speed on highways
- Poison in food
- Ambush while parked or at a red light
- Pretend to be a tourist

Some of our operatives had moral issues with the above tactics, however many were able to help in other ways. One of the best ways we found was to post the addresses of all agents on publicly accessible sites. We never condoned or took part in attacks on family members, but simply implying it seemed to have a dramatic effect on their behavior.

“It was just two of us at first. Probably could have done it with one but doesn't hurt to have some backup. We started with some small, free-standing stores that backed up to a suburban neighborhood and a university. Plenty of places to hide, public areas and large groups to blend in with. We were a bit sloppy with the first one, our crudely drawn maps highlighting the key targets and exits not exactly fitting what we saw when we entered. But given the defenses faced, the sloppiness was more of an anthill than a hurdle.

We casually strode in, splitting up just past a rack of cheap plastic sunglasses, perhaps 50 different designs, and then further differentiated by three or four different colors. Why the fuck do you need to have that many options for goddamn sunglasses? Fuck it. Lets do this. I pulled the small extendable baton out of my pant leg and flicked it quickly down towards the ground. Thwap. It was locked into place.

I marched towards the cosmetics and began to swing. Behind me I heard glass shattering. Must be the scanners on the self-checkout machines. Nice.

Some bitch screamed, I don't know what, probably what are you doing. I kept smashing. It felt almost therapeutic, all these bottles just cracking, launching every which way. Then looking down I noticed my pant leg covered in nail polish. You fucking dummy, gonna get yourself caught like a dipshit bank robber and an ink packet.

I shouted back to have him grab me a pair of shorts in the seasonal section on his way through. Next up were the coolers, nice and clean compared to the makeup. Seven swings later, they were all out of commission.

An overweight man with a name tag stood between me and the next destination, the storeroom. Luckily he thought better of it after seeing the baton and stepped aside. Pushing through the swinging door, I pulled a canteen out of my jacket pocket. Covered a bunch of paper towel cartons with the flammable gel, a mix of packing foam and fuel. The lighter flipped through the air.

Poof. Ignition.”

“I was sitting there, reading one of the many cable news websites that basically acted as state propaganda, when I saw it. The camera for the video feed displaying the current live broadcast spun dramatically, catching my attention. There seemed to be an agitated man and a lot of movement. I clicked the cartoonish plus sign to expand the video and the audio immediately assaulted my senses. Quickly turning down the volume, I was finally able to discern what was being said.

‘...king die you goddamn murderer!’

Pop. Pop. Pop. Pop. The camera drops. Pop. Pop. Pop. Into the frame drops a familiar face, the former vice president who is perhaps best known for being an unapologetic war criminal.

Pop. The view is now obscured by what I assume is brain matter. The feed suddenly cuts to an anchor. About time, what the fuck were they doing in the control booth? Don't they have a seven-second delay? Maybe it doesn't apply for the internet stream... who knows.

‘...happened there. We'll update you as soon as we have more details on what has occurred.’

Huh, well least someone finally killed that motherfucker. Can't say I'm surprised or even sad. Asshole certainly had it coming. Wonder what drove the shooter over the edge. I'd thought about doing it more than once. If you put him down in the chair next to me, gave me a gun, and said, 'You can shoot him but you'll go to jail.' I'd pull the trigger so quick I wouldn't even hear the jail part—not that it wouldn't be worth it.

Of course that's a lie. Prison is pretty much one of the worst possible outcomes. Not because its particularly frightening, and no, I'm not some macho guy, its just that any fear of physical pain is overridden dramatically by the simple loss of freedom. A long time ago I decided that freedom is one of the only things I will not let someone take from me. It's basically what started me down this road. When you have a line, it doesn't necessarily make things easier, but it does narrow your selection down a bit.

Hopping around the information web, I find what appears to be a manifesto, or at least what some asshole is claiming to be. The doubt is dispelled when in the first sentence is a link to a video of the shooter, kneeling on the dead VP's back, with a big grin and his fingers forming two little pistols, one pointing at a gaping hole in the VP's head and the other at a computer screen, showing the manifesto. It was like some kind of infinity mirror of death and hate.

Diving in, it quickly turned out to be what most manifestos were: way too damn long, wordy, and poetic. What the fuck man, you're shooting or blowing people up, we don't need a 30,000 word reasoning for doing it, just give us the important bits.

Skimming through, seems to be a bit of mental illness and a bit of delusions of grandeur, the usual gut reaction to things like this kicking in. After all, the voice of Mother Culture had been telling us for years that this sort of thing wasn't a valid type of protest or resistance. That kind of thing happens and may be necessary in other countries, but not here, we're different.

Hah. We were different, I learned, only in the subtlety of our violence and oppression. We wouldn't put a gun to your head and shoot you against a wall, we'd just make sure that if you didn't belong to a favored group, you'd be marginalized, living a far more unhealthy, unfulfilled, unsafe, insecure life. Often you'd end up killing each other over the scraps you were allowed to have. And then you'd be demonized for your violence while we

used 'approved' forms on a mass scale.

Fuckin' A' man, someone finally got that motherfucker. Lets get them all."

Squeal. Creak. Hiss. Click. You have arrived at your destination.

Prepping for the Worst

“I wouldn’t mind if consumer culture went poof overnight because then we’d all be in the same boat and life wouldn’t be so bad, mucking about with chickens and feudalism and the like. But... If, as we were all down on earth wearing rags and husbanding pigs inside abandoned Baskin-Robbins franchises, I were to look up in the sky and see a jet... I’d go berserk. I’d go crazy. Either everyone slides back into the Dark Ages or no one does.”

A common mantra of people who actively prepare for the apocalypse (called Preppers) is: It is better to have a gun and not need it than to need a gun and not have it.

“Thus we never see the true state of our condition till it is illustrated to us by its contraries, nor know how to value what we enjoy, but by the want of it.”

So it has happened—you attempted revolution and rather than give up their ill-gotten gains the capitalists ended civilization as we know it. Or maybe their mega-factory farms finally spawned a super-lethal virus that spread quickly around the world due to globalization and free trade. Or maybe one escaped from a BSL-4 research lab. Or maybe everything went to shit when climate change resulted in worldwide crop failures. Now you’ve got to rebuild this shit from the ground up, hopefully controlling your despicable greedy asshole population better this time.

Steel wool scavenged from a kitchen cupboard will ignite spontaneously when it is rubbed against the terminals of a 9-volt battery.

If it’s a bright day, sunlight can be concentrated into a hot focus using a magnifying glass, a pair of eyeglasses, or even the curved base of a soda can that has been polished with a square of chocolate or a dab of toothpaste.

Note that while eyeglass lenses can be used to start a fire, it is only those for correcting farsightedness—the concave lenses for nearsightedness, which affects most people, disperse the light rays rather than focusing them. William Golding famously made this mistake in *Lord of the Flies*, with the nearsighted Piggy using his spectacles to start fires.

The process to make charcoal is a simple one. Wood is burned with constrained airflow to limit oxygen availability so that it cannot combust completely, but is instead carbonized. The volatiles, such as water and other small, light molecules that turn to gas easily, are driven out of the

wood, and then the complex compounds making up the wood are themselves broken down by the heat—the wood is pyrolyzed—to leave black lumps of almost pure carbon. Not only does this charcoal burn far hotter than its parent wood—because it's already lost all the moisture, and only carbon fuel remains—but the loss of around half of the original weight also means that it is far more compact and transportable.

The traditional method for this anaerobic transformation of wood—the specialist craft of the collier—was to build a pyre of logs with a central open shaft, and then smother the whole mound with clay or turf. The stack is ignited through a hole in the top, and then the smoldering heap is carefully monitored and tended over several days. You can achieve similar results more easily by digging a large trench and filling it with wood, starting a hearty blaze, and then covering over the trench with scavenged sheets of corrugated iron and heaping on soil to cut off the oxygen. Leave it to smolder out and cool. Charcoal will prove indispensable as a clean-burning fuel for rebooting critical industries such as the production of pottery, bricks, glass, and metal.

Just a few drops of a five percent liquid bleach solution that has sodium hypochlorite listed as the main active ingredient will disinfect a whole liter of water in an hour. But carefully check the label to ensure that the product doesn't also contain additives such as perfumes or colorants that may be poisonous. Several fluid ounces of bleach found under a kitchen sink can purify around 500 gallons of water—almost two years' supply for one person.

Plastic bottles can be used not just for storing water, but for sterilizing it as well. Solar water disinfection, or SODIS, employs only sunlight and transparent bottles, and is recommended by the World Health Organization for decentralized water treatment in developing nations—a perfect low-tech option. Tear the labels off clear plastic bottles—but don't use bottles bigger than two liters, as the crucial part of the Sun's rays won't be able to penetrate all the way through—fill them with the water to be disinfected, and lay them down outside in full sunlight. The ultraviolet component of the Sun's rays is very damaging to microorganisms, and if the water warms up to above 50°C (122°F), this deactivating effect is greatly enhanced.

A good system is leaning a sheet of corrugated iron angled to the Sun and stacking the water bottles in the grooves. Painting the sheet black helps the heat sterilization effect. However, glass and some plastics, such as PVC, block out the UV rays. Check the bottom of the plastic bottle: most are now manufactured with a recycling symbol, and you want to pick out those marked with a (1), indicating they are made of PET. If the water is too murky for the sunlight to penetrate, you'll need to filter it first. In bright, direct sun, this method can disinfect water in around six hours, but if the

sky is cloudy it's best to leave it for a couple of days.

A rudimentary but perfectly adequate system for filtering out particles in murky lake or river water uses a tall receptacle such as a plastic bucket, a steel drum, or even a well-cleaned trash can. Punch some small holes in the bottom, and cover with a layer of charcoal, either scavenged from a hardware store or created yourself. Alternate layers of fine sand and gravel on top of the charcoal. Pour the water into your receptacle, and as it drains through, it will be effectively filtered of most particulate matter.

If you were a survivor with an entire supermarket all to yourself, for how long could you subsist on its contents? Your best strategy would be to consume perishable goods for the first few weeks, and then turn to the dried pasta and rice, as well as the more resilient tuber vegetables, before finally resorting to the most reliable reserve of canned produce. Assuming also that you are careful to keep a balanced diet with the necessary intake of vitamins and fiber—the health supplements aisle will help you here—your body will need 2,000 to 3,000 calories a day, depending on your size, gender, and how active you are. A single average-size supermarket should be able to sustain you for around 55 years—63 if you eat the canned cat and dog food as well.

The easiest things to grow are lettuce, tomatoes, beans, greens, radishes, peanuts, strawberries, blueberries, squash, and peppers. These plants either take little out of the soil, or add things back into it like nitrogen. Corn, pumpkins, and beets take more out of the soil than they put back, so you need to rotate the areas of the garden to grow different plants in different years.

The Norfolk four-course rotation is the most successful of these historical rotation systems and became widespread only in the eighteenth century, spearheading the British agricultural revolution. In the Norfolk system, succession of crops through each plot follows the order:

1. Legumes
2. Wheat
3. Root crops
4. Barley

Growing legumes is intended to build up the soil's fertility for the rest of the cycle. Clover and alfalfa grow well in the British climate, but in other regions you might be better off with soy or peanuts. At the end of the season, if you're not harvesting any part of the plant for human consumption, the entire crop can be grazed by livestock or simply plowed back into the ground

as green manure. The year after the legume course you want to plant a crop of wheat to capitalize on the soil fertility and produce your staple cereal for human consumption.

Don't leave the field fallow the following year, but plant a crop of a root vegetable such as turnip, rutabaga, or mangold wurzel (field beet). One of the main purposes for leaving a field fallow in the Middle Ages—to plow and harrow it in spring but leave it unplanted for a year—was to kill off weeds in preparation for the next season. But with a root vegetable, you can plant a crop and still be able to rip out weeds between the rows. This course will yield you another crop, but rather than intending all of it for your own consumption—unless the crop is potatoes—you can use it to feed the animals. Your livestock will fatten up more quickly and will also produce more manure that you can spread back onto the field to preserve its fertility. By feeding your livestock a purpose-grown fodder, rather than simply letting them forage and browse grass for themselves, you also free up pastureland, which can now be used to cultivate even more crops.

The last phase in the rotation is the planting of barley, which you can again use to feed your livestock—but remember to keep back a portion for brewing beer. After the barley course, the rotation loops back to the beginning with the cultivation of legumes to restore the fertility of the soil and make it ready for the nitrogen-hungry cereal crop.

So the rotation system is a harmonic coupling of the requirements and products of both plants and animals, it naturally combats pests and pathogens, and it allows the recycling of nutrients back into the soil. This particular system of crops won't work universally, and you'll need to find a set suited to your local soils and climate. But the two key principles of the rotation system will ensure that you can reliably feed yourself and maintain soil productivity without exogenous chemical fertilizers after the apocalypse: alternate legumes with cereals, and grow root crops not for your own consumption, but specifically for your livestock. Reverting to small-scale methods, five acres of land will be enough to support a group of up to ten people: wheat for bread, barley for beer, a diverse range of fruits and veggies, as well as cattle, pigs, sheep, and chickens for meat, milk, eggs, and other products.

Each of us produces roughly 100 pounds of feces, and around ten times as much urine, every year—waste that contains enough nitrogen, phosphorus, and potassium to fertilize crops to yield around 450 pounds of cereals.

The Zeer pot, common in Africa, consists of a lidded clay tub inside an unglazed larger one, with the gap between them filled with damp sand. As the moisture evaporates it draws heat out of the inner container, lowering its temperature, so the Zeer pot can postpone the spoilage of fruits or vegetables

at market by a week or more.

If needed, you can even eat trees. The coveted prize is the cambium, the actively growing layer between the bark and the wood. This is where the trunk grows as wood cells form on the inside and bark cells form on the outside. The cambium is succulent and stuffed full of sugar and minerals. In case of emergency, people can eat it. You can try this out for yourself in the spring. If you come across a spruce recently downed by the wind, cut off the bark with a pocketknife. Then run the blade flat along the exposed trunk and peel off long strips about a third of an inch wide. Cambium tastes like slightly resinous carrots, and it's very nutritious.

The first substance that a recovering post-apocalyptic society will need to begin mining and processing for itself, because of its multitude of functions that are absolutely critical to the fundamental operations of any civilization, is calcium carbonate. This simple compound, and the derivatives easily produced from it, can be used to revive agricultural productivity, maintain hygiene, purify drinking water, smelt metals, and make glass. It also offers a crucial construction material for rebuilding and provides key reagents for rebooting the chemical industry.

Coral and seashells are both very pure sources of calcium carbonate, as is chalk. In fact, chalk is also a biological rock: the white cliffs of Dover are essentially a 100-meter-thick slab of compacted seashells from an ancient seafloor. But the most widespread source of calcium carbonate is limestone. Luckily, limestone is relatively soft and can be broken out of a quarry face without too much trouble using hammers, chisels, and pickaxes. Alternatively, the scavenged steel axle from a motor vehicle can be forged into a pointed end and used as a drill to repeatedly drop or pound into the rock face to create rows of holes. Ram these with wooden plugs and then keep them wet so that they swell and eventually fissure the rock. But pretty soon you'll want to reinvent explosives and use blasting charges to replace this backbreaking labor.

It is the chemical transformations that limestone undergoes when you heat it, however, that are particularly useful for a great range of civilization's needs. If calcium carbonate is roasted in a sufficiently hot oven—a kiln burning at least at 900°C—the mineral decomposes to calcium oxide, liberating carbon dioxide gas. Calcium oxide is commonly known as burned lime, or quicklime. Quicklime is an extremely caustic substance, and is used in mass graves—which may well be necessary after the apocalypse—to help prevent the spread of diseases and to control odor. Another versatile substance is created by carefully reacting this burned lime with water. The name quicklime comes from the Old English, meaning “animated” or “lively,” as burned lime can react so vigorously with water, releasing boiling heat, that

it seems to be alive. Chemically speaking, the extremely caustic calcium oxide is tearing the molecules of water in half to make calcium hydroxide, also called hydrated lime or slaked lime.

Hydrated lime is strongly alkaline and caustic, and has plenty of uses. If you want a clean white coating for keeping buildings cool in hot climes, mix slaked lime with chalk to make a whitewash. Slaked lime can also be used to process wastewater, helping bind tiny suspended particles together into sediment, leaving clear water, ready for further treatment. It's also a critical ingredient for construction. It's fair to say that without slaked lime, we simply wouldn't have towns and cities as we recognize them. But first, how do you actually transform rock into quicklime?

You can roast limestone in the center of a large wood fire in a pit, crush and slake the small batches of lime produced, and use them to make a mortar suitable for building a more effective brick-lined kiln for producing lime more efficiently.

The best low-tech option for burning lime is the mixed-feed shaft kiln: essentially a tall chimney stuffed with alternating layers of fuel and limestone to be calcined. These are often built into the side of a steep hill for both structural support and added insulation. As the charge of limestone settles down through the shaft, it is first preheated and dried by the rising draft of hot air, then calcined in the combustion zone before it cools at the bottom, and the crumbling quicklime can be raked out through access ports. As the fuel burns down to ash and the quicklime spills out the bottom, you can pile in more layers of fuel and limestone at the top to keep the kiln going indefinitely.

A shallow pool of water is needed for slaking the quicklime, and you could use a salvaged bathtub. The trick is to keep adding quicklime and water so that the mixture hovers just below boiling, using the heat released to ensure that the chemical reaction proceeds quickly. The fine particles produced will turn the water milky before gradually settling to the bottom and agglutinating as the mass absorbs more and more water. If you drain off the limewater, you'll be left with a viscous sludge of slaked-lime putty. Limewater is used to produce gunpowder.

Where to get alkalis in a post-apocalyptic world without reagent suppliers? The good news is that survivors can revert to ancient chemical extraction techniques and the most unlikely-seeming source: ash.

The dry residue left behind after a wood fire is mostly composed of incombustible mineral compounds, which give ash its white color. The first step to restarting a rudimentary chemical industry is alluringly simple: toss these ashes into a pot of water. The black, unburned charcoal dust will float on the surface, and many of the wood's minerals, insoluble, will settle as a

sediment on the bottom of the pot. But it is the minerals that do dissolve in the water that you want to extract.

Skim off and discard the floating charcoal dust, and pour out the water solution into another vessel, being careful to leave behind the undissolved sediment. Drive off the water in the new vessel by boiling it dry, or if you're in a hot climate, pour the solution into wide shallow pans and allow it to dry in the warmth of the sun. What you'll see left behind is a white crystalline residue that looks almost like salt or sugar, called potash. It's crucial that you attempt to extract potash only from the residue of a wood fire that burned out naturally and wasn't doused with water or left out in the rain. Otherwise, the soluble minerals we are interested in will already have been washed away.

The white crystals left behind are actually a mixture of compounds, but the main one from wood ash is potassium carbonate. If you burn a heap of dried seaweed instead and perform the same extraction process, you can collect soda ash, or sodium carbonate. Along the western shoreline of Scotland and Ireland the gathering and burning of seaweed was a major local industry for centuries. Seaweed also yields iodine, a deep-purplish element that you'll find very useful as a wound disinfectant as well as in the chemistry of photography.

If you follow the process described above, you can collect about a gram of potassium carbonate or sodium carbonate from every kilogram of wood or seaweed burned—that is only about 0.1 percent. But potash and soda ash are such useful compounds that it is well worth the effort in extracting and purifying them—and remember that you can use the heat of the fire for other applications first. The reason that timber serves as a ready-packaged stash of these compounds is that over decades of time the tree's root network has been absorbing, from a vast volume of soil, water and dissolved minerals that can then be concentrated with fire.

Both potash and soda ash are alkalis; indeed, the very term derives from the Arabic *al-qalīy*, meaning “the burned ashes.” If you now mix your extract into a boiling vat of oil or fat, you can saponify it, creating your own cleansing soap. You can therefore keep the post-apocalyptic world clean and resistant to pestilence with just base substances like lard and ash, and a little chemical know-how.

WARNING: Never use aluminum pots or utensils for creating soap. Aluminum reacts vigorously with strong alkalis to release explosive hydrogen gas.

Another alkali that is very easy to produce is ammonia. Humans, and indeed all mammals, get rid of excess nitrogen as a water-soluble compound called urea, which we excrete in urine. The growth of certain bacteria

converts urea into ammonia—the distinctive stench of which you’ll be all too familiar with from poorly cleaned public restrooms—and so the crucial alkali ammonia can also be produced by distinctly low-tech means: fermenting pots of piss. This was historically a crucial process for the production of clothes dyed blue with indigo (traditionally the blue of jeans).

So far we’ve focused mainly on alkalis, as strong varieties are relatively easy to make. Acids, their chemical counterparts, are just as common in nature, but particularly potent kinds are harder to come across than lyes and have been significantly exploited only more recently in history. A variety of plant products can be fermented to produce alcohol, and this ethanol can in turn be oxidized by exposure to air to produce vinegar.

Sulfur dioxide gas can be baked out of common pyrite rocks (iron pyrite is notorious as fool’s gold, and pyrites also form common ores of lead and tin) and reacted with chlorine gas, which you get from the electrolysis of brine, using activated carbon (a highly porous form of charcoal) as a catalyst. The resulting product is a liquid called sulfuryl chloride that can be concentrated by distillation. This compound decomposes in water to form sulfuric acid and hydrogen chloride gas, which should itself be collected and dissolved in more water for hydrochloric acid. Luckily, there is also a simple chemical test for whether a rock is a pyrite mineral (a metal sulfide compound): dribble a little dilute acid on the rock, and if it fizzes and gives off the stench of rotting eggs, you’ve got what you’re after—but hydrogen sulfide gas is poisonous, so don’t sniff too much!

Today, more sulfuric acid is manufactured than any other compound—it is the linchpin of the modern chemical industry, and will also be crucial in accelerating a reboot. Sulfuric acid is so important because it’s good at performing several different chemical functions. Not only is it potently acidic, it is also strongly dehydrating and a powerful oxidizing agent. Most of the acid synthesized today is used to produce artificial fertilizers: it dissolves phosphate rocks (or bones) to liberate the crucial plant nutrient phosphorus. But its uses are virtually limitless: preparing iron gall ink, bleaching cotton and linen, making detergents, cleaning and preparing the surface of iron and steel for further fabrication, creating lubricants and synthetic fibers, and serving as battery acid.

Once you’ve reacquired sulfuric acid, it serves as a gateway to the production of other acids. Hydrochloric acid is produced by reacting sulfuric acid with common table salt (sodium chloride), and nitric acid comes out of the reaction with saltpeter. Nitric acid is particularly useful because it is also a very potent oxidizing agent: it can oxidize things that sulfuric acid can’t. This makes nitric acid invaluable for creating explosives as well as for preparing silver compounds for photography.

The stethoscope need be no more than a hollow wooden tube held to the ear and pushed against the patient's body, or even a rolled-up bundle of papers,

A rudimentary microscope is surprisingly easy to make from scratch. You'll need to start with some good-quality, clear glass. Heat the glass and draw it out into a thin strand, and then melt the tip of this in a hot flame so that it drips. The globule cools as it falls, and with luck you'll produce some very tiny glass beads, perfectly spherical in shape. Use a thin strip of metal or cardboard with a hole in the middle to mount your spherical lens, and hold it over a sample. This simple microscope works because the tiny ball of glass has a very tight spherical curvature and thus a powerful focusing effect on light waves passing through it. This also means that the focal length is exceedingly short though; you will need to position the lens and your eyeball right down close to the target.

Limited pain relief can be achieved by chewing willow bark, and topical analgesia, suitable for superficial injuries or minor surgical procedures such as lancing boils, is provided by chili peppers. The capsaicin molecule that gives chilies their illusory fiery burn in the mouth is known as a counterstimulant, and, like the contrary cooling effect of menthol from mint plants, can be rubbed onto the skin to mask pain signals.

Traditionally, opium is collected daily by making several shallow slices in the swollen, golf-ball-size seedpod of the poppy plant, allowing the sap to seep out and dry to a black latex encrustation that is scraped off the following morning.

The basic microbiology of making antibiotics is straightforward. Fill petri dishes with a beef-extract nutrient bed that is hard-set by seaweed-derived agar, smear across *Staphylococcus* bacteria picked out of your nose, and expose different agar plates to as many sources of fungal spores as you can, such as air filters, soil samples, or decaying fruits and vegetables. After a week or two, look carefully for molds that have inhibited the growth of bacteria around them (or indeed other bacterial colonies that do so: many antibiotics are produced by bacteria locked in an evolutionary arms race with one another). Pick them off to isolate the strain and attempt to grow it in liquid broth to make the secreted antibiotic more accessible. Antibiotic screens have now found numerous compounds from fungi and bacteria, although *Penicillium* molds are so common in the environment they are likely to be among the first re-isolated after the apocalypse. They're one of the principal causes of spoiling food: in fact, the *Penicillium* strain responsible for most of the penicillin antibiotic produced worldwide today was isolated from a moldy cantaloupe in an Illinois market.

However, even for a rough-and-ready post-apocalyptic therapy you can't

simply inject the antibiotic-containing ‘mold juice’ because, without refining, its impurities will trigger anaphylactic shock in the patient. The chemistry worked out at the end of the 1930s to purify penicillin from the growth medium exploits the fact that the antibiotic molecule is more soluble in organic solvents than in water.

Strain the growth culture to remove bits of mold and detritus, add a little acid to this filtrate, and then mix and shake with ether. Much of the penicillin will pass from the watery growth fluid into the ether, which you need to let separate and rise to the top. Drain off the bottom watery layer, and then shake the ether with some alkaline water to entice the antibiotic compound to pass back into the aqueous solution, now cleansed of much of the crud in the growth fluid. The daily dose of penicillin for a single person prescribed today requires up to 2,000 liters of mold juice to be processed, and so antibiotics will demand a high level of organized effort to produce.

If you do succumb to an enteric infection, the good news is that the condition is often entirely survivable. Even something as historically devastating as cholera is not actually directly lethal: you die from rapid dehydration resulting from the profuse diarrhea, losing as much as 20 liters of body fluid a day. The treatment, therefore, is astoundingly straightforward, even though it was not widely adopted until the 1970s. Oral rehydration therapy (ORT) consists of no more than a liter of clean water with a tablespoon of salt and three tablespoons of sugar stirred in, to replace not only the water lost in the sickness, but also your body’s osmolytes. To survive cholera you don’t need advanced pharmaceuticals, just attentive nursing.

Modern incubators are expensive and sophisticated machines, and like many other items of medical equipment, when donated to hospitals in the developing world today they often soon fall out of service due to power surges, unavailability of spare parts, or lack of specialist technicians to repair them; some studies find that up to 95 percent of medical equipment donated to some hospitals is inoperative within the first five years. A company called Design that Matters is attempting to address this issue, and their ingenious solution is a great example of the sort of appropriate technology that would need to emerge in a post-apocalyptic scenario. Their incubator design uses standard automobile parts: common sealed-beam headlights are used as the heating elements, a dashboard fan circulates filtered air, a door chime sounds alarms, and a motorcycle battery provides the backup electrical supply during power outages or when the incubator is being transported.

The internal combustion engine is a great example of how any complex machinery is no more than an assemblage of basic mechanical components, all with very different heritages, and arranged in a novel configuration to solve the particular problem at hand.

Wood is a fabulous source of good-quality papermaking fibers, but how do you disassemble a thick, solid tree trunk into a fine soupy mush of soft, short strands without breaking your back in the process?

Traditionally, plant fibers were separated by crushing the stems and then retting—soaking them for several weeks in stagnant water to allow microorganisms to begin decomposing the structure—and then violently pounding the softened stalks to liberate the cellulose fibers by brute force. The good news is that you can save yourself a great deal of time and effort and leapfrog straight to a much more effective scheme.

The links that bind together cellulose and lignin in trees are vulnerable to the chemical severing process known as hydrolysis. This is the same molecular operation that is employed in saponification during soap making, and we achieve it with exactly the same means: by rallying alkalis to the cause. The best parts of the tree or plant to use are the stem or trunk and branches—the roots and leaves don't contain much of the cellulose fiber required. Chop the material into small pieces to expose as much surface area to the action of the solution as possible, then bathe it in a vat of boiling alkaline solution for several hours. This breaks the chemical bonds holding together the polymers, causing the plant structure to soften and fall apart. The caustic solution attacks both cellulose and lignin, but the hydrolysis of lignin is faster, allowing you to liberate the precious papermaking fibers without damage while the lignin degrades and dissolves. Short white fibers of cellulose will float to the top of the murky brown, lignin-stained broth.

Any of the alkalis—potash, soda, lime—work, though the preferred option through much of history has been to use slaked lime (calcium hydroxide), as it can be generated in bulk by cooking limestone, while potash is fairly labor-intensive to produce by soaking timber ashes. But once you've cracked the artificial synthesis of soda, the best option by far for chemical pulping is to use caustic soda (sodium hydroxide), which powerfully promotes hydrolysis. You generate this directly in the pulping vat by mixing together slaked lime and soda.

Collect the recovered cellulose fibers in a sieve and then rinse several times until they run clear of the mucky lignin color. To lighten the shade of the finished paper to a clean white, you can also soak the pulp in bleach at this point. Calcium hypochlorite or sodium hypochlorite are both effective bleaching agents, and can be created by reacting chlorine gas (produced electrolytically from seawater) with slaked lime or caustic soda, respectively. The chemistry behind this bleaching effect is oxidation: bonds in the colored compounds are broken to destroy the molecule or convert it to an uncolored form. Bleaching is critical not only to papermaking, but also to textile production, so it will likely be a key driving force for expanding the chemical

industry during a reboot.

Pour a dollop of this sloppy cellulose soup across a fine wire mesh or cloth screen, bounded on the sides by a frame, so that the fibers form a higgledly-piggledy mat as the water drains out. You then press it to squeeze out the remaining water and to ensure flat, smooth sheets of paper, and leave to dry. Some of you might have done this in elementary school art class.

You'll find small-scale paper production much easier if you're able to scavenge a few items from the fallen civilization. A wood chipper or even a large food processor, powered from a generator, will make lighter work of the chewing up of plant matter into a thick vegetative soup: but you can also let windmills or watermills provide the mechanical brawn needed for driving trip-hammers to pound the material.

However, creating clean, smooth paper is only half of the solution to being able to use writing for communication and recording permanent stores of knowledge. The other critical task, once all of the remnant ballpoints have dried up or disappeared, is to make your own reliable ink with which to form the written word.

In principle, anything that irritatingly stains your cotton shirt if you accidentally splash yourself can also be used as a makeshift ink. You can take a handful of intensely colored ripe berries, for example, and crush them to release their juice, strain to remove the mashed fruit pulp, and dissolve in some salt to serve as a preservative. The major problem with most plant extract inks, though, is their impermanence. To preserve your words and the recovering society's newly accumulated knowledge indefinitely, you really want an ink that won't readily wash off the page or fade in sunlight.

The recipe for iron gall ink contains two main ingredients: an iron compound and an extract from plant galls. Galls appear on the branches of trees such as oak, and are formed when parasitic wasps lay their eggs in the leaf bud and irritate the tree into forming a growth around it. They are rich in gallic and tannic acids, which react with iron sulfate—created by dissolving iron in sulfuric acid. Iron gall ink is practically colorless when first mixed, and so it's difficult to see where you're writing unless another plant dye is also included. But with exposure to the air, the iron component oxidizes to turn the dry ink a deep, enduring black.

A rudimentary pen can also be made in the time-honored fashion. Soak a bird's feather—goose or duck was preferred historically—in hot water and pull out the material within the shaft. Bring the tip into a sharp point by cutting into each side, and then undercut the bottom face into a gentle curve to create the classic shape of a writing nib. Slitting backward slightly into the pointed tip will allow the nib to hold a tiny reservoir of ink as you

write, between replenishing dunks into the inkwell.

In order to mass-produce printed books, you must first mass-produce the tools for printing. This can be achieved by type casting: founding identical letter blocks with molten metal. The solution for creating types with straight, smooth sides and perfect right-angle edges that slot perfectly alongside each other in rows is to cast the types in a metal mold with a sharp cuboidal interior void. Cleverly, the crisp shape of a particular letter can be formed on the end face of the block by positioning a swappable matrix at the bottom of the mold. These matrices can be made from a soft metal such as copper, and the precise indent of a letter hammered into each of them very simply with a hard steel punch. Now all you have to do is engrave each letter, number, or symbol just once onto different punches, and you can effortlessly churn out countless pieces of identical type.

There is one final problem, though, thrown up by the nature of the letters in Western script, which is the large variability in their girth: the svelte ‘i’ or slender ‘l,’ compared with the rotund ‘O’ or broad-shouldered ‘W.’ To be read easily the letters should huddle closely together without gaping spaces around the skinnier letters and numbers. The upshot is that you need to be able to cast cuboidal types that are all exactly the same height, so that they print uniformly on the page, but each with a different width.

The solution is the final spark of Gutenberg’s inspiration in devising an elegant system for mass-producing the building blocks of printing. Create the mold in mirror-image halves: two L-shaped parts facing each other to create a cuboid space between them. The walls of this cavity can be simply slid toward or away from each other to smoothly adjust the width of the mold, without changing the depth or height (try it with your thumbs and index fingers now to see how this ingenious system works). Casting a perfectly formed type is now as simple as placing the relevant stamped matrix at the bottom of the mold, setting the width, pouring in the molten metal, and then ejecting the finished piece when it has set by parting the L-shaped halves again.

After a page of text is typeset, the type face is inked and transferred as an intricately detailed impression onto a blank sheet. There are a range of mechanical devices that enable the application of enhanced force, such as the simple lever or a pulley system, and both have been used throughout history for squeezing out excess moisture in paper production. Gutenberg grew up in a wine-growing region of Germany, and so co-opted another ancient device for his groundbreaking invention. The screw press is a Roman technology dating back to the first century, used extensively for juicing grapes or extracting oil from olives. It also provides the ideal compact

mechanism for applying a firm but even pressure onto two plates, squeezing the inked type onto the page.

If you anticipate that you'll want to run further impressions of the same body of text in the future, such as for subsequent print runs of an important treatise, you can save yourself the hassle of having to typeset thousands of individual letters all over again by saving the page configuration. The types themselves are too valuable to be left arranged in the frame, but you can take an impression of the text layout in plaster and then use this as a mold for casting a metal plate of the whole page. This is the original meaning of the word 'stereotype.' The nickname for a stereotype plate is "cliché," apparently after the sound made during the casting—and so to use a cliché is to rehash a block of commonly printed text.

Successful printing relies on a suitable ink. The free-flowing water-based inks developed for handwriting, like iron gall ink, are totally inappropriate for printing. To print crisp lettering you need a viscous ink that will stick readily to the metal features of the detailed type and then transfer cleanly to the paper without smearing, running, or blurring.

Lampblack mixed into linseed or walnut oil dries well and sticks to metal type far better than a runny, water-based ink. Linseed oil does need to be processed before being used, though: boil it and remove the thick, gluey mucilage that separates on top. You can control the ink's crucial viscosity with two other ingredients, turpentine and resin. Turpentine is a solvent used for thinning oil-based paints, and is produced by distillation of resin tapped from pines or other conifer trees. The hard, solidified resin left behind after the volatile compounds have been driven off during distillation, on the other hand, will thicken the solution. By tweaking the balance of these two contrary constituents you can perfect the viscosity of the ink, and you can control its drying behavior by varying the proportion of walnut and linseed oils.

Mirrors are indispensable beyond mere vanity—they are a critical component of high-powered telescopes or the sextant for navigation. Mix alkaline ammonia solution with silver nitrate and a little sugar, and then pour it over the back of a clean piece of glass. The sugar reduces the silver back to pure metal and so deposits a thin shiny layer directly onto the glass surface.

A single solid-silver teaspoon will contain enough of the pure element to produce over 1,500 photographic prints.

You can get solid fuels to explode by grinding them into a fine powder so that the air has access to a much greater area to accelerate combustion; coal dust and flour burn extremely vigorously (and explosions can occur even at grain elevators). An even better solution is to remove the necessity for getting oxygen from the air, and instead provide plenty of oxygen atoms

already in close proximity to the fuel for rapid combustion. A chemical that generously supplies oxygen atoms—or, more generally speaking, is hungry to accept electrons off other chemicals—is called an ‘oxidizing agent’ or ‘oxidant.’

Ironically enough, the earliest explosive to be developed in history was first formulated by ninth-century Chinese alchemists seeking an elixir for immortality: black powder. Gunpowder consists of charcoal—the fuel or reductant—and saltpeter (now termed potassium nitrate)—the oxidant—ground and mixed together. Sprinkling in some yellow elemental sulfur as a third ingredient changes the end products of the reaction and results in far more energy being left over for the concussive whump. An optimized gunpowder recipe is to mix equal parts of saltpeter and sulfur to six parts of charcoal fuel: a chemical cocktail taut with latent energy poised to burst out.

The nitrate ingredient of gunpowder calls for a bit of nifty chemical wheeling and dealing. Historically, the source of nitrates for explosives as well as fertilizers was very humble: a well-matured pile of manure contains hordes of bacteria that have acted to convert nitrogen-containing molecules into nitrates, and you can get these out by exploiting the fact that similar compounds have differing abilities to dissolve in water. It is a fact of chemistry that all nitrate salts are readily water-soluble, and that hydroxide salts are often insoluble. So, soak a few buckets of limewater (calcium hydroxide) through a dung pile, and most of the minerals will stay trapped inside as insoluble hydroxides, while the calcium will pick up the nitrate ions and drain out. Collect this fluid and stir in some potash. The potassium and calcium will swap partners to create calcium carbonate and potassium nitrate. Calcium carbonate doesn’t dissolve in water—it’s the compound making up limestone and chalk, and the white cliffs of Dover certainly aren’t vanishing with every wave—but potassium nitrate can. So filter out the chalky white precipitate before boiling away the water to yield crystals of saltpeter. A good test that your isolation has been successful is to soak some of the solution onto a strip of paper and let it dry—if you’ve got potassium nitrate it will burn with a fizzing, sparkling flame.

The chemistry for extracting saltpeter is straightforward enough; the trouble is in finding enough sources of nitrates to use as feedstocks for the process as the demands of your recovering civilization grow. Suitable mineral deposits are found only in very arid environments (saltpeter is readily soluble and thus easily washed away) such as the Atacama Desert in South America, and bird guano is also very rich.

While gunpowder supports rapid combustion by intermingling fuel and oxidant powders snugly together, there is an even better way to ensure a more

vigorous reaction and thus a more powerful explosion: combining the fuel and the oxidant into the same molecule. Reacting many organic molecules with a mixture of nitric and sulfuric acids serves to oxidize them, tacking on nitrate groups to the fuel molecule. For example, oxidizing paper or cotton with nitric acid produces the heartily flammable nitrocellulose—flash paper or guncotton.

Another explosive more potent than gunpowder is nitroglycerin. This clear, oily explosive is made by the nitration of glycerol, an offshoot of the production of soap, but it is disastrously unstable and liable to blow up in your face at the slightest provocation. To stabilize its destructive potential, soak the shock-sensitive nitroglycerin into wads of absorbent material like sawdust or siliceous clay—creating sticks of dynamite. Fun fact: It was the fortune from this invention that Alfred Nobel used to found the famous prizes for contributions to humanity in the sciences, literature, and peace.

The production of powerful explosives, therefore, relies on nitric acid as a potent oxidizing agent, and this same acid is also required for photography and the capturing of light using silver chemistry.

This section can offer only glimpses of the vast architecture of current understanding and technology. But the areas we explored will be some of the most critical for nurturing a nascent culture through an accelerated reboot and enabling it to relearn all else. My hope is that by seeing just a little of how civilization actually gathers and makes all the fundamentals we need, you'll come to appreciate the things we take for granted in modern life: bountiful and varied food, spectacularly effective medicines, effortless and comfortable travel, and abundant energy. And recognize just how ridiculous it is that a greedy few would risk throwing it all away just to avoid giving up their stolen, hoarded wealth.

Homo sapiens first had a marked effect on the planet around ten-thousand years ago, with the sudden disappearance of around half of the world's large mammal species—we are the prime suspect for driving this extinction with our teamwork and improved hunting technology of stone axes and tipped spears. Over the next ten-thousand years there was a steady deforestation around the Mediterranean Sea and northern Europe as people settled and cleared the surrounding land. Three-hundred years ago the human population began to grow rapidly, and gradually every scrap of land that was suitable for agriculture became cultivated. There were also profound changes not just to the landscape, but to the chemistry of the entire planet, as hundreds of millions of years of accumulated carbon was dug out of the ground and pumped into the atmosphere with mounting fervor. The rising carbon dioxide levels in the atmosphere pushed the very climate of the world, driving global warming, rising sea levels, and acidification of the oceans.

Dotted towns and cities swelled and coalesced with each other like bacterial colonies, as roads were draped like ribbons across the rolling landscape, looped into rings around large urbanizations, and tangled up in gloriously complex overpasses at major interchanges. A growing swarm of metallic craft hurried back and forth over the land and seas of the world, crisscrossing the skies, and some even piercing out of the atmosphere. At night this ceaseless fervent activity was apparent from space, with the continents marked out in webs of artificial lights, networks of glowing nodes and lines.

And then silence.

The worldwide network of traffic abruptly halts, the web of light fades and dies, cities rust and crumble.

How long will it take to rebuild? How quickly can technological society recover after a global cataclysm? The keys to rebooting civilization may well be within this section. But more importantly, I hope the keys to avoid needing to are within this book.

A Final Chance

We intend to offer you one final chance—but we will only make the offer once—you can give up your privileges, you can give up your stolen wealth, you can lay it all down, without any violence whatsoever. That is within your power.

We will give you ample time to decide. But we will not ask again. Do otherwise and your answer will be clear. And then we shall rain down upon the oppressors such righteous fury that the very earth will shake with our might. And you will lose, we will guarantee it, with our lives if need be. You will have brought us to that precipice, with your greed, avarice, ignorance. All for fucking what?

Remember, it is never the powerless, the underdog, which chooses whether violence is necessary. It is always the choice of the powerful. Always. All consequences fall upon their shoulders for they, and they alone, had the power to resolve things peacefully.

War is hell, which is why you need to stop waging yours. Or we will make you stop—there is no moral uncertainty here, your actions are unjustifiable, unacceptable, unallowable. We do not do this for us, our egos, the history books, we do it for those in the here and now, those who cry out and go unheard, those who are broken and tossed away, those who are spit on and exploited, those who despair, those who needlessly struggle, those who succumb and those who are left behind. The line stops here, this is where we intend to make it end. To all would-be revolutionaries, the massive reserve army of the broken, desperate, enraged: This is what you've been waiting for, we've been watching you. This is not the revolution of Bernie "Millionaire Socialist" Sanders or Elizabeth "I Love Capitalism" Warren; we're not Mayor Pete—just fuck off you well-credentialed, McKinseyite piece of shit—and we're certainly not the younger, less well-known, but still an awful bitch, Hillary 2.0. This is serious. We aren't Brandon Darby—when the void looks back at us, we'll spit in its face, not go cower behind the leg of Big Daddy FBI. We're not fucking around, you can't buy us with a goddamn thing, you kill us, or we don't stop coming. And you better hope we don't rise from the grave, because we ain't Jesus—we don't know what the fuck Rick Santorum is talking about—we will fucking Bloodshot your ass.

November 2024

We are coming. Expect us.

Part X

The Long Walk

Imagine there's no heaven
It's easy if you try
No hell below us
Above us only sky
Imagine all the people
Living for today...

Imagine there's no countries
It isn't hard to do
Nothing to kill or die for
And no religion too
Imagine all the people
Living life in peace...

You may say I'm a dreamer
But I'm not the only one
I hope someday you'll join us
And the world will be as one

Imagine no possessions
I wonder if you can
No need for greed or hunger
A brotherhood of man
Imagine all the people
Sharing all the world...

You may say I'm a dreamer
But I'm not the only one
I hope someday you'll join us
And the world will live as one

Heaven Is a Place on Earth

“If you have a religious or political vision of a world that will be infinitely good forever, any amount of violence is justified to bring about that world, and anyone standing in its way is infinitely evil and deserving of unlimited punishment. Perhaps a utopian ideology is fermenting in the mind of a cunning fanatic somewhere who will take over a major country and try to impose it elsewhere.”

What did Jesus mean by the Kingdom of God, when he prayed two-thousand years ago for it to come on earth? What might this Kingdom look like if it came much later than expected, long after the Roman Empire had faded into history, nation states had emerged as the new centers of earthly power, and democratic government had been conceptualized and at least partially implemented? In two late-nineteenth-century American novels, Edward Bellamy tackled these perplexing questions and proved equal to the task. Bellamy’s *Looking Backward* (1888) depicted in striking detail a developed nation governed by the core teachings of Jesus, creating a national and world sensation that rivaled *Uncle Tom’s Cabin*. His sequel, *Equality* (1897), responded to critics of *Looking Backward* with a refined, even more elaborate description of how the Kingdom would manifest in this modern world.

With uncanny prescience—anticipating radio, television, airplanes, electric cars, power tools, air conditioning, calculators, credit cards, supply chains, women’s liberation, alternative energy, environmental restoration, recycling, and other commonplaces of contemporary life—Bellamy painted a vivid and compelling portrait of what he believed America would become as the twentieth century unfolded. An impending nonviolent revolution, sweeping aside the immemorial and oppressive “rule of the rich,” would bring forth a radically egalitarian social order of material abundance and moral sublimity. America would finally embody the lofty principles of the Preamble to its Declaration of Independence. Unlike his other predictions, Bellamy’s revolution has not come to pass—at least not yet—but his re-

splendent vision of its culmination has lost little luster. Read today his two testaments of continuing revelation, and one's spiritual and political lives become one flesh.

In the Kingdom come to America, citizens have both equal votes in elections and equal stakes in the national economy. The Golden Rule is official policy. From cradle to grave, citizens receive an annual credit to draw upon, reflecting an equal share of their nation's available output of goods and services. All Americans, male and female, have the same opportunities and responsibilities: during the first twenty-one years of life, to become well-educated in the public schools, where every able student obtains at least the equivalent of a college degree, and all are exposed to a wide variety of potential occupations; from twenty-one to forty-five, to serve in the nation's centrally-planned, regionally-organized industries and professions in a largely self-chosen capacity and location; after forty-five, to devote their extended retirement years to continuing intellectual and spiritual development and volunteer community service. All live and work as peers to promote the welfare and prosperity of the nation they share and love.

Social cohesion and personal initiative flow from higher patriotism, mutuality of interest, and public honor, a self-reinforcing triad which has replaced private profit-seeking as the impetus of economic activity. Before the revolution, citizens with competing economic interests fought to maximize them, regardless of the expense to other citizens or even to the nation itself. Amid that perpetual conflict, patriotism was but an occasional chauvinistic or militaristic sentiment. In the new post-revolutionary America, a higher form of patriotism creates a humanitarian bond between citizens, one which naturally arises from their identical mutual interests in the success of the national enterprise. So successful is this new social model that it has spread worldwide in a panoply of cultural variations, ushering in a peaceful era of international cooperation. Like soldiers who once rose through the ranks to gain increasing respect and responsibility, workers in the new "industrial army" strive to earn promotions, public honor, and civic awards for outstanding contributions to society and humanity. The earthly Kingdom does not seek to eliminate ambition but to give it nobler expression.

Far from a regimented anthill, the America of 2000 is a beehive of individual expression and social experimentation. Equality has not led to uniformity but to the unleashing of human potential. Artists, authors, philosophical and spiritual teachers, publishers of newspapers and magazines, and other creative entrepreneurs are exempt from the "industrial army" if they garner sufficient citizen support to match the annual credit. Pioneers who wish to forge their own paths outside the mainstream are given the means to get started in lieu of the credit. Democracy has permeated every

nook and cranny of society. Advanced communication systems allow citizens to vote frequently on a broad spectrum of issues, from the election of their public officials to the civic projects and programs they will undertake. Although income equality has essentially eliminated corruption, ineffective officials can be recalled at any time, and no significant governmental action can be taken without approval by plebiscite. “Government of, by, and for the people” has not perished but has at last been born.

When only touched upon in summary, Bellamy’s ideas may sound fanciful, naively optimistic. When encountered in his books, however, they come across as inescapable conclusions of Socratic logic, self-evident applications of the teachings of Jesus and the principles of America’s founding document. Every conceivable objection to the virtue and viability of a radically egalitarian society is raised, fleshed out, and refuted. This is why *Looking Backward* became the most popular utopian novel ever written, was translated into at least twenty languages, and influenced the likes of Eugene Debs, John Dewey, Upton Sinclair, Jack London, Samuel Clemens, Emma Goldman, Charles Beard, Carl Sandburg, George Orwell, Thorstein Veblen, Erich Fromm, Leo Tolstoy, Martin Luther King, and a host of other noteworthy intellectual and social leaders. Indeed, as the nineteenth century drew to a close, Bellamy clubs were blossoming throughout America and new populist political parties were being formed. Then as fast as it all had arisen, it began to fall apart simultaneously with Bellamy’s fragile, failing health.

His legacy continued to live on in a series of reforms—public ownership of utilities, the general election of senators, the civil service system, the income tax amendment, the inheritance tax, the parcel post system, women’s suffrage, improved child education and labor laws, curtailment of egregious industrial abuses, soil conservation and reforestation efforts, et cetera. Yet Bellamy’s tragic death in 1898, at the age of forty-eight, marked the end of his vastly more radical vision. . . or did it? The question is asked in light of his most stunning prediction:

“It was not till the kings had been shorn of power and the interregnum of sham democracy (operative in the political but not the economic arena) had set in, leaving no virile force in the state or the world to resist the money power, that the opportunity for a world-wide plutocratic despotism arrived. When international trade and financial relations had broken down national barriers and the world had become one field of economic enterprise, (then) did the idea of a universally dominant and centralized money power become not only possible but had already so far materialized itself as to cast its shadow before. If the Revolution

had not come when it did, we cannot doubt that something like this universal plutocratic dynasty or some highly centered oligarchy, based upon the complete monopoly of all property by a small body, would long before this time have become the government of the world.”

Well over a hundred years ago, Edward Bellamy explained in two novels what the modern world would look like if the Kingdom of God arrived in its midst. He also explained what that world would look like if it did not. Wealth would accumulate in the private economic arena to the point where it could buy and control the public political arena, and then would come the plutocratic strangulation of the human race. So it has happened before our eyes. The numbers shift a bit from year to year, but recent estimates are that 80% of humanity struggles to survive on \$10.00 or less per day, 50% on \$2.50 or less, and seven-million children die annually from malnutrition and preventable or treatable disease. Meanwhile, a handful of billionaires have become richer than the poorer half of the world’s population, and globalized financial and corporate monstrosities dictate the one-sided terms under which entire nations must live. Not only has this insane, obscene wealth concentration corrupted politics and plunged the masses into crippling austerity, but even more dreadfully, it has plundered and polluted our planet to the point of mass species extinction and looming ecocide.

Although Bellamy was spot on in predicting plutocracy absent a revolution, the revolution he saw coming never came. His untimely illness and death sapped the initial momentum of his movement, but the coup de grace of Bellamy’s “impending” revolution was delivered by a confluence of foreign and domestic events he did not foresee. On the foreign front came two World Wars, the rise of authoritarian communism, and the resulting Cold War. On the domestic front came the New Deal, the post-WWII surge of American industry, and its following decades of global dominance. The foreign events were all-consuming crises; the domestic events allowed much of America’s fragile working class to move into the seemingly-more secure middle class, fostering the false assumption that the evils of capitalism had been constrained. Now that the near-collapse of the global capitalist system has mired us in the consequences of the Great Recession, and the scarcity of stable work for steady pay is again the stark reality in America and across the world, attention should be paid to how Bellamy believed the Second Great American Revolution would unfold.

The process would begin with growing public awareness of its dire predicament, since the dawn of civilization, under “the rule of the rich.” What had begun with the slaves of ancient empires and continued with the

serfs of feudalism had culminated with the wage-slaves of capitalism caught in the vise-grip of global plutocracy. The growing awareness of this perpetual plight would be energized by a widespread spiritual awakening to feelings of brotherhood and sisterhood long suppressed by ruthless competition. Universal moral values like the Golden Rule would come to be seen not merely as personal guidance in a fallen world but as bedrock principles upon which to build a better, more beautiful one. The nature and purpose of democratic government would again be understood as defined in America's founding document: as an institution, called into being by the people, to ensure equality by enabling every citizen to exercise inherent rights of life, liberty, and the pursuit of happiness. When it became clear that those rights could be secured only in the economic arena, democracy would move boldly into it.

Looking Backward and *Equality*, sequentially read and pondered, are one path up the mountain to gain a clear and comprehensive view of the utopian shore toward which today we either swim or perish. Fortunately, Bellamy left a glimmering wake to follow, and his nineteenth-century vision readily lends itself to twenty-first-century revision. Included in that task would be the removal of lingering Victorian attitudes in Bellamy's thought, the balancing of his large-scale mechanistic mode of progress with the small-scale organic, and the re-imagining of an "eco-industrial army," one which not only produces goods and services in accord with environmental constraints but which also works directly to protect nature and begins to heal the immense harm we have done to her, and thus to ourselves.

Desperately we long to feel again the thrill of hope, the possible fulfillment of Jesus' prayer that the Kingdom of God come on Earth. A forgotten genius named Edward Bellamy deserves to be remembered, for he enables us, persuades us, impels us to believe that it can and it must.

"The great enthusiasm of humanity which overthrew the old order and brought in the fraternal society was not primarily or consciously a godward aspiration at all. It was essentially a humane movement. But 'if we love one another God dwelleth in us,' and so men found it. It appears that there came a moment, the most transcendent moment in the history of the race of man, when with the fraternal glow of this world of new-found embracing brothers there seems to have mingled the ineffable thrill of a divine participation, as if the hand of God were clasped over the joined hands of men. And so it has continued to this day and shall for evermore."

Some write to account for that which is, I to show what ought to be.

Everyone has an idea of utopia. For many it means equality, universal justice, freedom from oppression, freedom from work. To me utopia is an epistemocracy, a society in which anyone of rank is an epistemocrat, and where epistemocrats manage to be elected. It would be a society governed from the basis of the awareness of ignorance, not knowledge.

Alas, one cannot assert authority by accepting one's own fallibility. Simply, people need to be blinded by knowledge—we are made to follow leaders who can gather people together because the advantages of being in groups trump the disadvantages of being alone. It has been more profitable for us to bind together in the wrong direction than to be alone in the right one. Those who have followed the assertive idiot rather than the introspective wise person have passed us some of their genes. This is apparent from a social pathology: psychopaths rally followers.

South Africa's Truth and Reconciliation Commission is frequently held up as a model of successful "peace building," exported to other conflict zones from Sri Lanka to Afghanistan. But many of those who were directly involved in the process are deeply ambivalent. When he unveiled the final report in March 2003, the commission's chairman, Archbishop Desmond Tutu, confronted journalists with freedom's unfinished business:

"Can you explain how a black person wakes up in a squalid ghetto today, almost 10 years after freedom? Then he goes to work in town, which is still largely white, in palatial homes. And at the end of the day, he goes back home to squalor? I don't know why those people don't just say, 'To hell with peace. To hell with Tutu and the truth commission.'"

Experimentation doesn't mean that you shouldn't be bold. It just means constantly checking to make sure you're upholding the principles. Preferring principles to systems doesn't mean you can never be a revolutionary, it means making sure your revolution is actually advancing your principles rather than 'breaking a lot of eggs but never getting an omelet.' Nor does it mean that 'socialist' today means 'social democrat,' which is just capitalism with a welfare state. It could mean that, if that were the best we could hope for. But genuine socialism is idealistic: the perfect application of its principles would only occur in a utopia, which means the work will never fully be done.

"She's on the horizon. . . I go two steps, she moves two steps away. I walk ten steps and the horizon runs ten steps ahead.

No matter how much I walk, I'll never reach her. What good is utopia? That's what: it's good for walking."

Creating anything new in the world, especially something that runs against the grain, requires courageous and visionary individuals, tied to resourceful communities. These people are frequently stubborn, demanding of those around them, and adept in conflict. We should not expect anything less, yet somehow cooperators too often assume that co-ops can transcend this basic reality of social life.

What I found is most people do not know how to dream and to hold in 'head space' the very concepts of systems thinking, holistic engagement and universal social justice. Most people can't break out of bad eating and bad cultural diets, let alone break the chains of polluted media, necrotic education, and gangrenous capitalism and consumerism.

The dreams I talk about are tied to restorative justice—restoring ecosystems, managing urban centers, repairing agricultural lands, stitching back together the fractured lands left for mega-species, replanting jungles, feeding the poor, opening up the concept of 'it takes a village to raise a child and steward the old, sick, infirm, and less fortunate.'

Dreams about pushing cars back into the junk heap of humanity, creating bicycle cities, reinventing community public transportation.

Dreams about universal health; health clinics of robust stature in each neighborhood. Schools that teach the healing arts and visual arts and food arts.

You know, walkable cities, organic food, retaking the commons from the private toxin producers, driving the current capitalist model of government into the mud and reshaping humanity as a collective society of people who do not have to toil at three jobs just to pay the oligarchs and their lackeys.

Let me summarize my own political ideology, if you will, in a very few words. I find that for myself, I am most satisfied politically when every person is helped to become aware of his or her own power and strength; when each person participates fully and responsibly in every decision which affects him or her; when group members learn that the sharing of power is more satisfying than endeavoring to use power to control others; when the group finds ways of making decisions which accommodate the needs and desires of each person; when every person of the group is aware of the consequences of a decision on its members and on the external world; when each person enforces the group decision through self-control of his or her own behavior; when each person feels increasingly empowered and strengthened; and when each person and the group as a whole is flexible, open to change, and regards previous decisions as being always open for reconsideration.

The Morgans, Rockefellers, and their ilk captured the industrial revolution that dominated the US after the Civil War. The farmers of the South and West fought back with a grassroots social movement. They formed the People's Party. Its socialistic platforms demanded public ownership of the major financial institutions, including banks, railways, power utilities and other private monopolies that were crushing the public well-being.

At their national conventions in Omaha in 1892, and St. Louis in 1896, and elsewhere, they demanded an end to corporate and foreign ownership of land. They wanted a national currency based on food rather than gold and silver. They endorsed universal affordable medical care, free public education and a general guarantee of the basics of life for all humans. They demanded equal rights for women, including the vote. They also preached racial unity, especially among black and white farmers in the South, and between native and immigrant workers in the cities.

“If any lesson should be drawn from the twentieth century, it should be the abject failure of socialist central planning. The idea that wide-scale nationalization of industry is being taken seriously as a policy proposal given this history is horrifying. Socialism has been responsible for the deaths of 50+ million people.”

In reality the lesson we should draw from the past couple hundred years—and we don't have long to come to grips with it—is that capitalism has had disastrous consequences on the environment, the land and oceans and atmosphere. And on the communities whirled into the amoral pursuit of profit by the commodification of every aspect of life, the prostitution of humanity.

We have now reached the stage at which to claim that unrestricted growth, fueled by greed and competition can lead to anything but disaster is an assertion rooted in the most curious and diabolic religion ever espoused—the elevation of the invisible hand into the arbiter of all things whose decisions must rule the planet.

As to the idle nonsense that socialism is responsible for the deaths of anyone, this cheap talking point from Capitalism's more vulgar ideologues is best understood by examining the most obviously political human catastrophe in the past half century, that which overtook the people of the former Soviet Union during the 1990s when public property and resources were being looted in capitalist 'shock therapy.' In terms of the number of deaths resulting immediately and the shortening of lifespans this was a massive crime explicable entirely through the decision by the United

States government—advised by academic economists and serving corporate and financial interests—to transfer the funds reserved for pensions, social services, and salaries from the population into the hands of the criminal oligarchy most of whom now live in the West while their ill gotten gains feed Wall St. and The City.

The history of Capitalism from the Potato Famine to the world today is the history of cannibalism—the devouring of human necessities by men worshipping money, which amounts to annual human sacrifices on a scale that would have appalled the Aztecs. To move beyond the nightmare of capitalism without considering the ideas of those who have always criticized the system from the viewpoint of its victims is a recipe for cyclical movement not progress.

The following moral agenda is drawn from a deep engagement and commitment to these struggles of the poor and dispossessed. It is also grounded in an empirical assessment of how we have come to this point today. The evils of systemic racism, poverty, ecological devastation, and the war economy and militarism are persistent, pervasive, and perpetuated by a distorted moral narrative that must be challenged. We must stop focusing attention on physical violence and see the human and economic costs of inequality. When confronted with the undeniable truth of unconscionable cruelty to our fellow human beings, we must join the ranks of those who are determined not to rest until justice and equality are a reality for all.

Did you know that there are fewer voting rights in 2020 than there were 50 years ago when the Civil Rights Act and Voting Rights Act were passed?

Since 2010, 23 states have passed racist voter suppression laws, including partisan gerrymandering and redistricting, laws that make it harder to register, reduced early voting days and hours, purging voter rolls, and more restrictive voter ID laws. Following the *Shelby County v. Holder* Supreme Court case, which gutted key provisions of the Voting Rights Act, by 2016, 14 states had new voting restrictions in place before the Presidential election and there were 868 fewer polling places. There are also 6.1 million people who have been disenfranchised due to felony convictions, including one in thirteen Black adults.

While these laws have disproportionately targeted Black people, in 2016, at least 17 states saw voter suppression cases targeting American Indian and Alaskan Native voters. Thirteen states that passed voter suppression laws also opted not to accept expanded Medicaid benefits offered under the Affordable Care Act. These attacks follow a broader pattern of restricting and curtailing democratic processes by drawing on legacies of racism to undermine local leadership that is organizing for better conditions. By 2017, 25 states had passed laws that preempt cities from passing their own local

minimum wage laws. Most of these have been passed in response to city councils passing or wanting to pass minimum wage increases.

Emergency Financial Management has become a mechanism that effectively nullifies the right to vote in order to prioritize balanced budgets and repayments to Wall Street lenders over human lives. Non-elected managers are appointed and granted sweeping powers, including the authority to dismiss elected officials, scrap labor contracts, sell public assets and impose new taxes, without any accountability to voters. The City of Flint was under emergency management when it made the decision to switch its water source from the Detroit Water System to the Flint River, poisoning a community of almost 99,000, with a 42 percent poverty rate.

The truth is that when the democratic process and the right to vote are restricted, preempted, and nullified, our democracy is under attack. These attacks target mainly the poor, youth, and elderly, but in doing so, they strip us all of our constitutional protections; they allow extremists to get elected through voter suppression and gerrymandering and then use their power to hurt people.

- We have the right to vote and the right to accountable political representation.
- We demand the immediate full restoration and expansion of the Voting Rights Act, an end to partisan, two-party duopoly gerrymandering and redistricting, the implementation of automatic registration to vote at the age of 18, same-day registration, the enactment of Election Day as a holiday, and hand-marked paper ballots hand-counted in public. We demand the right to vote for the formerly and currently incarcerated.
- We demand the reversal of state laws preempting local governments from passing minimum wage increases, the removal of Emergency Financial Management positions that are unaccountable to the democratic process, and statehood for Washington, D.C.
- We demand a clear and just immigration system that strengthens our democracy through the broad participation of everyone in this country.

Did you know that while the US economy has grown 18-fold in the past 50 years, wealth inequality has expanded, the costs of living have increased, and social programs have been restructured and cut dramatically?

We challenge the idea that our economy rewards hard-working individuals and, therefore, if only the millions of people in poverty acted better, worked

harder, complained less and prayed more, they would be lifted up and out of their miserable conditions.

Beginning in the 1970s, wages for the bottom 80 percent of workers have remained largely stagnant and today there are 64 million people working for less than \$15 an hour. Meanwhile, the top one percent's share of the economy has nearly doubled to more than 20 percent of our national income. In 2017, the 400 wealthiest Americans owned more wealth than the bottom 64 percent of the entire US population, or 204 million people. Just 3 individuals had a combined wealth of \$248.5 billion, the same wealth as the bottom 50 percent of the country.

At the same time, the costs of basic needs like housing, health care and education have risen dramatically. Over the past 30 years, rents have gone up faster than income in nearly every urban area of the country. In 2016, there was no state or county in the nation where someone earning the federal minimum wage could afford a 2-bedroom apartment at market rent. Only 1 in 4 of those eligible to receive federal housing assistance actually do so. This has precipitated a structural housing crisis with 2.5 to 3.5 million people who are living in shelters, transitional housing centers and tent cities. This population includes a significant number of women, children, LGB youth, transgender youth, veterans, and the elderly.

There are 32 million people who remain uninsured. Further, an estimated 40 percent of Americans have taken on debt because of medical issues, making medical debt the number one cause of personal bankruptcy filings. In fact, the bottom 90 percent of Americans hold more than 70 percent of debt in the country. Student debt has grown to \$1.34 trillion and affects 44 million Americans. Excluding the value of the family car, 19 percent of all US households have zero wealth or negative net worth. They owe more than they own.

Despite the growing need for federal assistance, social service programs have been restructured to shift critical resources away from the poor. The Temporary Assistance to Needy Families (TANF) program only assists 23 percent of poor families with children. The Trump administration proposed a 30 percent cut to the Supplemental Nutrition Assistance Program (SNAP) and a restructuring that would impose onerous work requirements that threaten to destabilize this highly effective program.

Our public resources are not reaching the people who need them. Given the absence of good jobs and a strong social safety net, millions of people are left to fend for themselves. The truth is that the millions of poor people in the United States today are poor because the wealth and resources of our country have been flowing to a small number of people and federal programs are not meeting the growing needs of the poor.

Everybody has the right to live. Given the abundance that exists in this country and the fundamental dignity inherent to all humanity, every person in the United States has the right to housing, education, health care, welfare, decent and dignified jobs and the right to organize for the realization of these rights.

- We demand federal and state living wage laws, universal basic incomes, full employment for all who want it, and the right for all workers to form and join unions.
- We demand equal pay for equal work.
- We demand equity in education, ensuring every child receives a high-quality, well-funded, diverse public education. We demand free tuition at public colleges and universities and an end to profiteering on student debt.
- We demand the expansion of Medicaid in every state and the protection of Medicare until the full implementation of single-payer universal health care for all.
- We demand reinvestment in and expansion of public housing, ensuring that all have a decent house to live in.
- We demand equal treatment and accessible housing, health care, and mobility; and adequate income and services for people with disabilities.
- We demand public infrastructure projects and sustainable, community-based and controlled economic initiatives that target poor and rural communities.
- We demand relief from crushing household, student, and consumer debt. We declare Jubilee.
- We demand that the wealthy have their hoarded resources liberated for the people.
- We demand a 95% top income tax rate and a 90% tax on all wealth over \$10 million.

Did you know there are 140 million people who are poor or low-income in the United States today?

We challenge the Official Poverty Measure (OPM) as too narrow a definition of poverty today. The OPM is an income-based measure developed

in the 1960s that uses the Federal Poverty Line (FPL) to define poverty. In 2016, the FPL was \$12,486 for a single person under the age of 65 and was \$25,449 for a household of four.

According to the OPM, in 2016, 12.5 percent of the US population—or 40.6 million people—were poor and nearly 30 percent—or 95 million—were low income, which is defined as living at less than twice the poverty line.

An alternative measure developed in 2009, the Supplemental Poverty Measure (SPM), takes into account income as well as the costs of food, clothing, housing and utilities, and government programs that have assisted low-income families and individuals who are not otherwise designated as poor. Using the more thorough SPM, 43.5 percent of the US population—or 140 million people—were poor or low-income in 2016.

The truth is that economic insecurity, poverty, and misery are affecting more of us in 2020 than we are made aware. We remain in the dark about who is poor and this ignorance prevents us from being able to address the broad and deep poverty in our midst. We have the right to know the true state of our Union.

- We demand a change in the current poverty standards. We demand an accurate assessment of who is poor—based on access to decent and adequate housing, education, health care, water, sanitation and public utilities, childcare, as well as income, savings and debt, and welfare—which is made widely available to all.

Did you know that we imprison and detain more people, especially poor people, than any country in the world?

The US has the highest incarceration rate in the world, almost five times the average for other wealthy countries. Since 1976, federal spending on prisons increased tenfold to \$7.5 billion a year. The number of sentenced state and federal inmates grew from 188,000 in 1968 to nearly 1.5 million in 2016. Two thirds of these inmates are people of color.

Since 1970, counties with fewer than 250,000 people have driven jail growth. This means that there has been a shift in rural and urban incarceration trends. Women held in local jails are the fastest-growing segment of incarcerated people in the United States; the majority are Black or Latinx. From 1970 to 2014, the total female jail population increased fourteen-fold from under 8,000 to nearly 110,000. More than 80 percent of these women were imprisoned for non-violent offenses.

This coincides with the broader criminalization of poverty and the poor. By the Department of Justice's own admission, 95 percent of the growth

in the incarcerated population since 2000 is the result of an increase in the number of un-convicted defendants, many of whom are unable to make bail.

The truth is that poor communities, especially poor communities of color, are being locked up, sent away and killed by law enforcement. The lessons from policing poor communities of color are being extended to all poor communities, leading to heightened attacks on the poor. This has not made any of us safer.

Equal protection under the law is non-negotiable and we have the right to move freely without the fear of intimidation, detention, deportation, or death by public institutions charged with our safety.

- We demand an end to mass incarceration and the continuing inequalities for poor people and minorities within the criminal justice system.
- We demand equality and the safety of all persons.

Did you know 13.8 million US households cannot afford water?

Federal assistance to local water systems is currently 74 percent below its peak in 1977. This has contributed to the inability of public water utilities to address failing and aging infrastructure. It has also prompted utilities to privatize their water systems, even though private water utilities charge 59 percent more per unit of water than publicly owned water systems. As a result, nearly 12 percent of US households face unaffordable water bills. Tens of thousands of households have had their water shut off due to non-payment, precipitating homelessness, child removal and a host of medical problems. It also means that at least four-million families with children are being exposed to high levels of lead from drinking water and other sources. Poor rural communities face the additional problem of lacking access to piped water and sewage systems in the first place.

While there is failing infrastructure in poor cities and rural counties across the country, there has been a boom in infrastructure to support fossil fuel production and transportation. Fracking has driven US domestic oil and gas production since 2007, making the US the world's largest producer of both oil and gas. It has also demanded an expanded pipeline infrastructure crisscrossing the country. However, since 1998, there have been 5,712 significant oil and gas leaks or ruptures on US pipelines. And since 1964, there were more than 2,400 spills from offshore drilling in US waters. The largest of these was the Deepwater Horizon oil spill in 2010, which accounted for 95 percent of oil spilled in the past 50 years. There are also 1,100 coal ash sites throughout the country. Toxins from these sites gradually leach into water bodies and groundwater, or get released in catastrophic spills.

Scientists have known for decades that human activities, particularly the use of fossil fuels such as coal, oil, and gas, are warming the planet. In spite of knowing the risks, political leadership has dragged its feet on implementing solutions. This reveals how little priority our political leadership attaches to an existential threat that, for now, mostly impacts poor people. It also shows the political influence of the fossil fuel industry, which has effectively captured the US political system and prevented the kind of drastic action the country should have taken long ago.

The truth is that our policies have not fundamentally valued human life or the ecological systems in which we live. Instead, it has prioritized private, corporate, and financial interests over our precious natural resources.

- We have a fundamental right to clean water, air, and a healthy environment and public resources to monitor, penalize, and reverse the polluting impacts of fossil fuel industries.
- We demand 100 percent clean, renewable energy and a public jobs program to transition to a green economy.
- We demand a fully funded public water and sanitation infrastructure that keeps these utilities and services under public control and that prioritize poor, rural, and Native communities that have been harmed by polluting industries.
- We demand a ban on fracking, mountaintop removal coal mining, coal ash ponds, and offshore drilling. We demand a ban on all new pipelines, refineries, and coal, oil, and gas export terminals.

Did you know that currently 53 cents of every federal discretionary dollar goes to military spending and only 15 cents is spent on anti-poverty programs?

Military spending in 2017 was \$668 billion and out of federal discretionary spending only \$190 billion was for anti-poverty programs. Under the Trump administration's proposed budget, by 2023, 66 cents of every dollar of federal discretionary spending would go to the military and only 12 cents to anti-poverty programs.

Most of these resources allocated to war are not benefiting our troops. In 2015, the Department of Defense obligated more money on federal contracts, \$274 billion, than all other federal agencies combined. In 2016, CEOs of the top five military contractors earned on average \$19.2 million each—more than 90 times the \$214,000 earned by a US general with 20 years of experience and 640 times the \$30,000 earned by Army privates in combat.

This expanded military budget ends up claiming more lives abroad while making us less safe here at home. More than 68 percent of the civilian casualties in 2017 from aerial attacks were women and children. Nearly half of female military personnel sent to Iraq or Afghanistan reported being sexually harassed and nearly 25 percent said they had been sexually assaulted. And the Department of Defense was responsible for 72 percent of the US Government's total greenhouse gas emissions in 2016.

In 2012, suicide claimed more military deaths than military action and as of in 2017, an average of 20 veterans died by suicide every day.

City police departments are getting military weapons and equipment—from grenade launchers to armored tanks—left over from the Pentagon's wars, escalating the criminalization of and violence against poor communities. Young Black males are nine times more likely to be killed by police officers than other Americans.

Finally, federal spending on immigration, deportations, and the border has increased from \$2 billion in 1976 to \$17 billion in 2015, with ten times as many deportations. From 1993 to 2013, immigration detentions increased from 85,000 to 441,000 per year.

More complaints of abuse were filed against Immigration and Customs Enforcement than any other Department of Homeland Security agency. LGB and transgender immigrants are 15 times more likely to experience sexual assault in confinement than other immigrants held in detention. And 21.6 percent of immigrant children are impoverished.

The truth is that instead of waging a War on Poverty, we have been waging a War on the Poor, at home and abroad, for the financial benefit of a few. It is morally indefensible to profit from perpetual war.

- We have the right to protect our communities from the ravages and weapons of war.
- We demand an end to military aggression and war-mongering.
- We demand a stop to the privatization of the military budget and a reallocation of resources from the military budget to education, health care, jobs, and green infrastructure needs, and strengthening a VA system that remains public.
- We demand the demilitarization of our communities on the border and the interior. This includes ending federal programs that send military equipment into local and state communities and bringing down the wall at the US-Mexico border.

- We demand an immigration system that, instead of criminalizing people for trying to raise their families, keeps families together and allows us all to build thriving communities in the country we call home.
- We demand an end to US government and capitalist violence and exploitation which fuels migration.

Did you know that thousands of people die every year from anti-poor policies, while an extremist religious and Christian nationalist agenda deliberately diverts attention from the key issues and challenges facing the majority of Americans?

In the history of this country, there have been moral justifications for genocide and slavery, against the New Deal, and resisting the *Brown v. Board of Education* school segregation case and the *Roe v. Wade* abortion case. Today, religious extremists focus on issues like prayer in school and abortion that distort the national moral narrative. This distorted moral narrative became integral to the well-funded libertarian movement to redefine ‘liberty’ as freedom from government. In 2016, Franklin Graham invested \$10 million of the Billy Graham Evangelistic Association’s money in his 2016 Decision America Tour to each state house in the country. Billed as “nonpartisan” prayer rallies, these gatherings framed the “moral crisis” as a decision between progressive atheist values and God. After the election, Graham called Trump’s victory an answer to prayer.

Today these influences—the Christian and religious nationalist organizations, religious capitalist and prosperity gospel movements, and independent charismatics—have access to the current administration in the form of its “Court evangelicals.” The Values Voter Summit has become an important focus point for this coalition and its narrative. Through federal contracts and student aid, Liberty University has become the largest private Christian University in the country.

These influences have also ignored the moral commitments enshrined in the US Constitution to “establish Justice, insure Domestic Tranquility, Provide for the Common Defense, Promote the General Welfare, and Secure the Blessings of Liberty to ourselves and Posterity.” These commitments should help ensure that this country moves towards the more perfect Union aspired to in our founding documents.

Indeed, there are profound consequences to a moral narrative that ignores poverty, health care, decent jobs, and other crises facing the poor today. Thousands have died every year because of some states’ decision to deny

Medicaid expansion benefits. Overall, more than 250,000 people die in the United States from poverty and related issues every year.

The truth is that a morality that claims to care for the souls of people while destroying their bodies and communities is deeply immoral.

- We have the right to ground our public policies and budget allocations in a moral narrative that prioritizes and follows our religious and Constitutional moral commitments to justice.
- We demand that all policies and budgets are based on whether they serve the general welfare and lift up lives and the environment.

Fifty years ago, the Rev. Dr. Martin Luther King, Jr. and many others called for a “revolution of values” in America. They invited people who had been divided to stand together against the “triplets of evil”—militarism, racism, and economic injustice—to insist that people need not die from poverty in the richest nation to ever exist. They sought to build a broad, fusion coalition that would audit America: Together, they would demand an accounting of promissory notes that had been returned marked “insufficient funds.” Today that effort is still incomplete.

In communities across this land, people impacted by systemic racism, poverty, ecological devastation, the war economy and our distorted moral narrative have said the same thing:

“We want to be free! We need a Poor People’s Campaign!
We need a Moral Revival to make this country great for so many
for whom it has not yet been.”

This call echoes the cries of the prophets throughout the ages to stand up for justice, righteousness, and the dignity of all:

“If you remove the yoke from among you, the pointing of the finger, the speaking of evil, if you offer your food to the hungry and satisfy the needs of the afflicted, then your light shall rise in the darkness and your gloom by like the noonday. The Lord will guide you continually, and satisfy your needs in parched places, and make your bones strong; and you shall be like a watered garden, like a spring of water, whose waters never fail. Your ancient ruin shall be rebuilt; you shall raise up the foundations of many generations; you shall be called the repairer of the breach, the restorer of the streets to live in.”

“The believers, both men and women, are in charge of and responsible for one another; they all enjoin the doing of what is right and forbid the doing of what is wrong.”

“The Spirit of the Lord is upon me, because he has anointed me to bring good news to the poor. He has sent me to proclaim release to the captives and recovery of sight to the blind, to let the oppressed go free, to proclaim the year of the Lord’s favor.”

These moral values are enshrined in the Declaration of Independence and US Constitution and deeply rooted in the struggles that have labored to lift those founding documents to their full meaning:

“We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are Life, Liberty, and the pursuit of Happiness. That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed. That whenever any form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness.”

“We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defense, promote the General Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution of the United States of America.”

“All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.”

Throughout America's history—from abolition, to women's suffrage, to labor and civil rights—real social change has come when those most impacted by social injustice have joined hands with allies of goodwill to stand together to transform and better society. These movements did not simply stand against partisan foes. They stood for the deep moral center of our Constitutional values and faith traditions. Those deep wells sustained those who knew in their bones both that power concedes nothing without a fight and that, in the end, love is the greatest power to sustain a fight for what is right.

Today, 50 years after Rev. Dr. King and the 1968 Poor People's Campaign declared that "silence was betrayal," we are coming together to break the silence and tell the truth about the interlocking evils of systemic racism, poverty, ecological devastation, the war economy and our distorted moral narrative.

The truth is that systemic racism allows us to deny the humanity of others; by denying the humanity of others, we are given permission to exploit or exclude people economically; by exploiting and excluding people economically, we are emboldened to abuse our military powers and, through violence and war, control resources; this quest for the control of resources leads to the potential destruction of our entire ecosystem and everything living in it. And the current moral narrative of our nation both justifies this cycle and distracts us from it.

We declare that if silence was betrayal in 1968, revival is necessary today.

We come to remind our nation what truths we hold to be self-evident and what values we hold dear.

We draw on the histories of resistance that echo their truth down through the centuries and the power of the blood that has been shed through generations of struggle.

We loudly proclaim that we will move forward together, not one step back!

Pesticides ought to be given only to farmers who have a prescription from their county agent detailing precisely why those chemicals are necessary to treat the farmer's land.

Mandatory labeling would list the petro-fertilizers and pesticides and GMO products used on or in your potato chips, right there on the package. This is better than the organic label.

When people buy organic, they believe they are buying it from a small farmer, who probably has a family. They are buying tradition, food safety, and an old value system: the barn, the fields, the cows. Organic does not assure them that, so I consider it false advertising. To install an off-gassing carpet in your house and then demand certified organic food is quite foolish.

The organic movement settled for getting rid of pesticides. Which is noble, and great. But, organic certification can do as much harm as good.

Under the old system, inspectors were there to offer advice and mentor farmers into compliance. But under the federal system, the correct techniques were considered proprietary, and inspectors were forbidden from freely handing them over. The whole purpose of years of experimentation should be to share methods.

Turkana smallholders in Kenya found that surrounding their plots with beehive fences was much more effective against elephant invasions (and provides a useful harvest of honey) than thornbush fences—the beehives are strung at ten-meter intervals around the fields, leaving a wide margin for elephants to pass, and if an elephant even brushes a fencepost, the bees swarm out.

cordons pierreux: long lines of stones, each no bigger than a fist

Because the area's rare rains wash over the crusty soil, it stores too little moisture for plants to survive. Snagged by the cordon, the water pauses long enough for seeds to sprout and grow in this slightly richer environment. The line of stones becomes a line of grass that slows the water further. Shrubs and then trees replace grasses, enriching the soil with falling leaves. In a few years, a minimal line of rocks can restore an entire field. As a rule, poor farmers are wary of new techniques—the penalty for failure is too high. But these people in Burkina were desperate and rocks were everywhere and cost nothing but labor. Hundreds of farmers put in cordons, bringing back thousands of acres of desertified land.

The idea of unleashing packs of wolves in Yellowstone generated a public outcry, but the reintroduction program, begun in the mid-1990s, has been a significant success. Yellowstone's gray wolves prey primarily on elk but also increasingly on bison, leaving carcasses that provide food to many other animals, including grizzly bears and cougars, helping to increase the numbers of these species. The wolves have driven elk herds out of the park's lowlands, leading to significant reforestation. As a result, record numbers of birds have returned to the park. Fish populations have also increased, as decreased grazing by elk has increased vegetation on riverbanks. Wolves are thus responsible for trophic cascades—chains of beneficial effects set off when an ecosystem's top predators change not just the numbers of their direct prey but also species with which they have no direct link. Reintroducing predators and large herbivores in sites such as Yellowstone generates changes that cascade down the links of the ecosystem, transforming even the soil composition and atmosphere of the region. By catalyzing a notable increase

in the park's biodiversity, Yellowstone's wolves have given flesh to the hopes of rewilders.

“In the woodland I manage, we use the birds' passion for collecting to plant young deciduous trees in the monocultures of old spruce plantations. This is how it works: We put seed trays on posts and fill them with acorns and beechnuts. Jays love to come and help themselves, and they distribute their booty in the soil hundreds of yards in every direction. It's a win-win situation. We get precious new stands of deciduous trees in the woodland, and the jays get huge quantities of winter provisions with very little effort.”

What is socialism? We cannot offer anything like a complete account here—the story of socialism is a long one and is still in the making—but it begins with the idea that society's resources should be directed to serving the needs of people, not the profit dictates of the few. It is the socialization (democratization) of the economic sphere, and also the enlargement (de-privatization) of the political sphere. From that starting point, we are open-minded. There is a broad range of options, much to be debated, and enormous room for experimentation. There is a role for markets alongside democratic planning but not for a market society—that is, the Hayekian utopia of the self-regulating market, which becomes merely a disguise for the concentration of economic power and wealth.

There is an increasing recognition that we are now living in a “socialist moment,” a period where socialism has reemerged as a popular idea in American political life. There's just one problem: Everyone seems to have a different definition of what it means. For liberals tired of being mislabeled socialists by the right, the term has come to mean any government policy aimed at providing public goods, from food stamps to the Air Force. For the progressives who have embraced the term, it means a social democratic program to aggressively confront inequality. For conservatives and libertarians, it represents anything from Soviet Marxism-Leninism to Venezuelan left-populism. And, as has always been the case, different factions of self-identified socialists argue vigorously among one another for the term's one true meaning. If you ask ten socialists what socialism means you'll get twelve or so different definitions.

Even putting aside the numerous abuses of the term in mainstream American politics, socialism has always been a broad concept, adopted by hundreds of political movements all over the world to mean a wide variety of different things for almost two centuries. While this has allowed for a

diverse body of thought to flourish, it has also had the effect of confusing millions of people as to what socialists actually believe.

The ascendant strain of socialism in America today is democratic socialism. Commonly confused with its more modest sibling of social democracy, democratic socialism is a strain of thought which traces its roots to late nineteenth-century movements in America and Europe which advocated for popular control over both government and business through democratic means. The US' largest socialist organization, the Democratic Socialists of America, define the idea as the belief "that both the economy and society should be run democratically—to meet public needs, not to make profits for a few."

Even for many skeptics, this sounds nice conceptually. But if these socialists explicitly reject the models of the USSR or communist China, then what is their alternative? If not a bureaucratic command economy, does democratic socialism exist as anything other than an abstract daydream in the minds of the young and the pages of a few magazines?

What separates socialism from left-liberalism and social democracy is the emphasis placed on ownership: Wealth and income are not simply redistributed by the government, but are pre-distributed among the broad community that makes such wealth possible, rather than an elite few. In an institutional setting, the socialist ethos is represented by the idea of common ownership, that powerful institutions should be owned and controlled by those with a stake in them.

"What touches all should be decided by all. But the state is not our only common enterprise. The capitalist economy proliferates what are plausibly called private governments in the form of hierarchically organized firms with outcomes that seriously affect thousands and hundreds of people, that can be opposed or ignored by the members only at risk of penalties."

The principle of common ownership can take a number of forms. The most common way to split common ownership is between public and cooperative ownership. In the case of public ownership, an institution is put under the control of a democratic government on the local, regional, or federal level. In a sufficiently democratic government, this serves as an indirect conduit for common ownership, with popular input via elections and any other mechanisms designed specifically for stakeholder involvement. Cooperative ownership is the more direct form of common ownership, involving the members of a neighborhood, the employees of a company, or those in some other group jointly possessing and overseeing an enterprise. Each has their advantages and disadvantages.

Because of its Cold War connotations, most Americans think of socialism solely as inefficient and bureaucratic public ownership through a powerful central government. But actual public ownership need not be either centralized or wasteful. The state of North Dakota owns both a public bank and the nation's largest flour mill, each providing reliable services to state residents while also being accountable to and returning their profits to the state government rather than to private shareholders. Indeed, in order to ensure that everyone had access to basic banking services, the US ran a highly successful basic public banking program through the post office from 1911 to 1967, and 139 countries still offer at least some financial services through their post office.

While private internet service providers ignore rural consumers and systematically overcharge the customers they do have, more than 500 cities across 40 states have established cable internet networks owned and operated by municipal governments, with great results: The municipal networks for Longmont, CO and Chattanooga, TN are both among the ten fastest internet service providers in the nation.

As private utilities have been busy starting wildfires and poisoning rivers to protect their profits, 16 percent of Americans already get their electricity from public utilities (and another 13 percent from cooperatives). Nebraska, the only state to exclusively use public and cooperative energy utilities, has some of the cheapest and greenest energy in the country, and sends most of its excess revenue into state coffers. Every citizen can elect the members of their utility's board and attend public meetings to provide direct input. In one of the most conservative states in the country, socialism is already thriving in one sector.

Though it's common to mistake any form of government program as socialism by itself we should be aware of exactly how much of our collective wealth is already owned and operated for the public good through the government: the vast majority of water utilities, hundreds of airports and marine ports, 20 percent of community hospitals, and a number of city-owned hotels and convention centers. Insofar as programs like Medicare and Medicaid are public replacements for insurance companies, they can serve as an example as well. And if properly funded the VA would be a great example of how we could also provide quality medical care to all.

Natural resources are another interesting example, as they are a textbook example of a resource belonging to the commons. Many nations simply have nationally-owned companies for their natural resources sectors, with state companies producing 55 percent of the world's oil and gas. Though this isn't the case in the US, a number of states do maintain some modified form of a public 'sovereign wealth fund' that collects income from these resources to

be used for the public's benefit, whether through handing it out to citizens or spending it on public projects. Alaska collects part of the revenue earned from oil production every year and puts it directly into the hands of every citizen in the form of a universal check generally worth around \$1,000, an arrangement which has helped manage income inequality and poverty in the state. Texas and Wyoming have similar funds, but instead put the revenue into their education budget and general state coffers, respectively.

While profit can be a powerful incentive to provide many goods and services, institutional arrangements which are solely reliant on it can also produce inequality, corruption, pollution, exploitation, criminality, or even just neglect when much-needed services aren't profitable enough to provide. Well-managed municipalization and nationalization in many sectors can serve as one way to bring complex and large-scale enterprises under the control of the public, providing better services in a more accountable way.

Public ownership is not a silver bullet, though. Some more libertarian Marxists presciently pointed out that public ownership is still an indirect mechanism for public control over the economy, and one which is threatened by the potential emergence of a domineering bureaucracy insulated from the demands of the people. This is a concern which can be alleviated by expanding political democracy through stronger voting rights, public campaign finance, institutional reform, and experiments in direct democracy like participatory budgeting. But it remains that public ownership has problems of its own, and for this reason democratic socialists should also look to cooperative ownership.

Using the modified versions of the sovereign wealth funds discussed above to expand public control of the economy is a popular idea among democratic socialists. Some have suggested independent government funds that buy financial assets and distribute dividends to all Americans in order to ensure profits are shared with the workers that make them possible. These draw inspiration from an idea known as the Meidner Plan proposed by Swedish democratic socialists in the 1970s, in which private businesses would slowly contribute voting shares to employee-owned funds managed by union boards, thus gradually transferring ownership to workers. Though this plan was never fully implemented, neighboring Norway does still have sovereign wealth funds that own seven percent of the nation's economy (and international assets more than double the size of their economy).

Employees buying ownership of the firms they work at is already common practice in the US in the form of Employee Stock Ownership Plans (ESOPs), with an estimated 14 million workers already participating. Unfortunately investing in the company you work for is one of the most basic rules that financial advisers warn workers against because it concentrates their risks.

If the company gets into trouble, as all companies may, both your job and your investment in company stock are at risk.

Thousands more are employed in worker co-ops, designed from the beginning to be owned and run by employees. The benefits of worker-owned businesses are well-documented: Along with the obvious matter of profits going straight into worker's pockets, firms controlled by workers have higher productivity and greater employment stability. While other policies like employee representation on corporate boards and profit sharing make steps in this direction, full worker ownership and economic democracy are what socialism looks like on a firm-level. Scaling such institutions does pose problems, but large firms like Publix and Spain's Mondragon Corporation prove that it's possible. Worker co-ops are the best democratic socialist solution to entrepreneurship and small-to-medium scale commerce.

Even in agriculture, where collectivization plans were a notorious failure in Soviet nations, other cooperative solutions are at work every day. Two-million American farmers belong to agricultural co-ops, running their own individual farms while sharing ownership and profits in order to make costs manageable. Already, these co-ops are responsible for 80 percent of US milk production. On a smaller scale, many communities help combat food insecurity through thousands of community gardens, leveraging public green spaces to provide food for anyone in need. There are also less-explored opportunities for agriculture on common property. The supposed infeasibility of this option is what spawned the idea of the "tragedy of the commons" in the first place, but while many are familiar with that theory, far fewer are aware that research from 1990 "demonstrating how local property can be successfully managed by local commons without any regulation by central authorities or privatization" won the 2009 Not-a-Nobel Prize.

Housing co-ops run hundreds of thousands of housing units in the US, including one of the largest such institutions on Earth: the Bronx's Co-op City, a quiet neighborhood which houses over 15,000 residents. There are also community land trusts, in which land is cooperatively owned by the community as a whole while individuals can lease it for residential or commercial uses. Not only do these arrangements allow for more community control over development, combating gentrification and the arbitrary power of landlords, but they are also far more financially stable: At the peak of the 2009 housing crisis, regular mortgage loans were eight times more likely to be in foreclosure than community land trust mortgages. Given how many homes go unoccupied in this country, more of them should be converted to Co-op communities.

When understood as direct ownership by stakeholders, cooperative socialist solutions exist today even in finance. While the public ownership

strategy is public banking, the cooperative solution is credit unions. Instead of worker ownership, credit unions are a form of consumer co-op in which the organization is collectively owned by those saving their money there, with most credit unions holding elections for leadership among their savers. Over a third of America participates in these institutions, which are socialist almost by definition. Credit unions return profits to their customers rather than executives and shareholders, tend to offer lower rates and fees, and in many cases specifically aim to serve communities in need. The latter is particularly important, because while the corruption and wrongdoing of Wall Street is well-known, even small private banks engage in discrimination against people of color and the poor.

To the critics of socialism, it represents a comprehensive domination of public life by authoritarian central planners who inefficiently compel individuals to live or die according to some cryptic logic decided by one's appointed superiors. However, it's hard to see how this is different in principle from the exact system we have now, just with the business plans of unaccountable oligarchs in the place of the five-year plans of authoritarian bureaucrats. If the principle of socialism is mass popular control of economic matters, then authoritarianism isn't socialism. If there's no popular participation, where's the socialism? What does it even have to do with socialism?

Just under half of all young people in the United States prefer socialism to capitalism. For older generations raised during a time where socialism had concrete referents in twentieth-century dictatorships, this trend is terrifying. But Generation Z and Millennials lack this background—they hold their views not because they've all been brushing up on their Mao, but because they have been raised in a political environment where any alternative to cutthroat corporate rule is socialist. The political energy and debate that this dynamic has provoked should prompt us all to consider exactly what kind of society we want to live in. To disprove the notion that "there is no alternative," we must focus on the fact that a better world is entirely possible, and that we can see start to see the seeds of potential real utopias simply by looking around us.

The socialist vision of the good life is one of equality, solidarity, and liberty. Critically, as much as its detractors insist otherwise, it is a realistic vision with countless proofs-of-concept operating every day, enjoyed and supported by groups with drastically different backgrounds and beliefs. When people say 'socialism has never been tried' or ask what socialism would 'look like,' we can point at all of the successful ways in which socialism has been tried, that show the beginnings of what it might look like.

Socialism means waking up in the morning without worrying about rent, making breakfast with ingredients you grew alongside your neighbors,

and taking clean and free public transit for your short commute to the job where you and your co-workers elected your own management. It means having your share of the profits you help produce direct deposited into your local credit union, going on a long walk through your vibrant and diverse neighborhood in the late afternoon, watching a movie over high-speed public broadband, and then going to sleep in your warm bed without worrying about energy bills. You don't have to call your insurance agency to argue over a deductible, you don't have to have your allergies exacerbated by dirty air, and you won't be stopped and arbitrarily questioned by an aggressively militarized police force. We know that this world is possible; the only matter now is to fight for it.

The provision of food, housing, and medical care is not the same thing as socialism. Instead it is the total transformation of society that will allow us to enjoy true freedom for the first time in human history:

The socialized appropriation of the means of production does away, not only with the present artificial restrictions upon production, but also with the positive waste and devastation of productive forces and products that are at the present time the inevitable concomitants of production, and that reach their height in the crises. Further, it sets free for the community at large a mass of means of production and of products, by doing away with the senseless extravagance of the ruling classes of today, and their political representatives. The possibility of securing for every member of society, by means of socialized production, an existence not only fully sufficient materially, and becoming day-by-day more full, but an existence guaranteeing to all the free development and exercise of their physical and mental faculties—this possibility is now, for the first time, here, but it is here.

To be honest, 'socialism' was always understood to be the preparation for a *less* bureaucratic society, with some calling that communism, some naming it anarchism, the rest not thinking about it much.

The bureaucratic period was a transition, with the bureaus acting to inform the public of their rights and responsibilities, and protecting those rights during a period when capitalist and reactionary nationalist ideologies would still be prevalent among the populations. It would be a setup of new assumptions, the new unquestionables, that government was to protect, like capitalism is protected now. The problem is not the bureaus, but the power they give the fearless leaders. Responsabilisation, s'il vous plait.

In one sense, anarchism is a political philosophy, but in another sense, it is a belief about human nature, a faith in the goodness of human beings. Anarchism rejects not only state control but also the hierarchical organization of human beings in which people have unequal power. Anarchism believes

that people can best achieve autonomy, freedom, and cooperation within egalitarian organizations. Anarchism is positively impassioned by a thirst for freedom in all spheres of life, and it is negatively impassioned by a resentment with coercion. For critics of anarchism, those passions make anarchism immature and dangerous. But for advocates of anarchism, those passions make it highly mature and benevolent.

What's most radical about anarchism, for me, is its faith that human beings can organize themselves without fear. This is a radical notion because people are so accustomed to being controlled by fear that they don't even notice it. The state, whatever ideology it claims, keeps people in line using policing authorities and prisons. Orthodox religions keep congregants in line using the fear of God, clergy, and hell. Standard schools keep students in line using grades, suspensions, expulsions, and threats to withhold diplomas. And employees are kept in line by their fear of being fired and falling into poverty. Authoritarians routinely smear anarchism as advocating chaos and violence. Some of these authoritarians are ignorant of anarchism, while others are not. It is true some anarchists have used violence to achieve their aims—so have capitalists, socialists, marxists, communists, and so on—but anarchists don't seek a violent and chaotic society. Informed authoritarians who spread falsehoods about anarchism fear that should people actually grasp the truth of anarchism, many would be attracted to it.

“Anarchism means that you should be free; that no one should enslave you, boss you, rob you, or impose upon you. It means that you should be free to do the things you want to do; and that you should not be compelled to do what you don't want to do. It means that you should have a chance to choose the kind of a life you want to live, and live it without anybody interfering. It means that the next fellow should have the same freedom as you, that everyone should have the same rights and liberties. It means that all men are brothers, and that they should live like brothers, in peace and harmony. That is to say, that there should be no war, no violence used by one set of men against another, no monopoly and no poverty, no oppression, no taking advantage of your fellow-man.”

Free association is paramount in anarchism, which is optimistic about humanity and its capacity to cooperate. In Emma Goldman's essay “Anarchism: What It Really Stands For,” she wrote:

“Anarchism stands for a social order based on the free grouping of individuals for the purpose of producing real social wealth;

an order that will guarantee to every human being free access to the earth and full enjoyment of the necessities of life, according to individual desires, tastes, and inclinations.”

The vision of a society without coercion is attractive to many people—intoxicatingly attractive to some people. And anarchism’s attractiveness makes it so threatening for various authoritarians that anarchism is their common enemy. For example, in the 1930s, Nazi Germany, fascist Italy, Stalinist Soviet Union, Western capitalist nations, and the Catholic Church all played a role in destroying a successful anarchist society in Spain. Authoritarians are horrified by anarchism because they believe that without coercions, people would run amok and life would be fraught with chaos and violence. The reality is that coercions do ‘work’ to keep certain populations in line.

Coercions such as rewards and punishments can be effective in shaping behaviors of laboratory animals, children, institutionalized adults such as prisoners, and others who are dependent on authorities for the necessities of their survival. In order to most effectively control people’s behavior, research shows that people have to be needy enough of the rewards and terrified enough of the negative reinforcements and punishments. And so there is actually an incentive for authoritarians to keep people alienated and infantilized, as such people are easier to control. Coercions can effectively control behavior in certain populations, but not without humiliation, resentment, and rage. Not coincidentally, US society is replete with people feeling humiliated, resentful, and enraged. In anarchism, people perform activities that they desire to perform, and so coercion is unnecessary. However, in US society, people are mostly performing activities they dislike. In 2013, the Los Angeles Times reported:

“Seven out of ten workers have ‘checked out’ at work or are ‘actively disengaged,’ according to a recent Gallup survey.”

They’ve got bullshit jobs. The more one is disengaged from an activity and dependent on authorities for survival, the more coercion is necessary to maintain order. Anarchism’s opposition to coercion is not an advocacy of chaos but rather a faith that human beings can be organized with love. A key belief of anarchism is mutual aid and cooperation. This requires altruism. Concern for others is not created by coercive rewards and punishments. Research confirms that children whose parents use rewards to motivate them are less cooperative and generous children than their peers who are not so coerced. Instead of coercions, it is the experience of love and the modeling of love that best creates caring and cooperative people.

In US society, anarchism is not only a radical political idea but also a radical psychological one. Anarchism asserts that human beings can have community without being dominated by fear. Most of us, consciously or unconsciously, live with great fear and anxiety. Given our ordinary fear-based existence, when people experience fearlessness through an extraordinary experience, that fearlessness can feel so exhilaratingly different that it can be intoxicating, sometimes so intoxicating that we can become manic. The more fear pervades a culture, the more extraordinary is the experience of fearlessness, and the more likely it will be so intoxicating that it can cause us to behave irrationally. Fearlessness does not intoxicate people who are accustomed to it.

There are anarchists who are rigid ideologues. For them, attempting to survive in an economic system based on the coercion of money is so shameful that they either deny their hypocrisies or self-flagellate for their failure to live up to their ideals. In either case, the rigid ideologue is not going to be much fun to be around. In current society, if we have no money, we cannot pay the bills that most of us have. Without money, we are likely to become either a financial burden on friends or family, at the mercy of some of the most oppressive authorities in society, or dead. The reality is that while all aspects of the anarchist ideal cannot be implemented in non-anarchist society, some aspects can be implemented, even within the workplace.

Among anarchists, there are several different schools of thought that emphasize different aspects of anarchism. Anarcho-syndicalism is a particular variety of anarchism which is concerned primarily, though not solely, with control over the workplace. It took for granted that working people ought to control their own work, its conditions control the enterprises in which they work, along with communities, so they should be associated with one another in free associations, and democracy of that kind should be the foundational elements of a more general free society. Another anarchist school of thought is anarcho-primitivism, a major concern of which is gaining freedom from the tyranny of large-scale authoritarian technology.

Among different schools, there are also different views as to how to achieve an anarchist society. Anti-authoritarian perspectives like anarchism don't simply provide an individual with an ideology. Discovering a belief system that rings true can also serve as a vehicle for connecting with like-minded people. In the 1880s and 1890s in the United States, if you were an alienated anti-authoritarian, you could go to the Lower East Side in New York City and hang out at places such as Sach's Café on Suffolk Street or Justus Schwab's basement tavern on First Street which called itself a "gathering place for all bold, joyful, freedom-loving spirits." Here you would meet and connect with all kinds of anti-authoritarians. Your belief system would be

a vehicle for a support group and provide an opportunity to connect with friends and lovers. That's what happened to Alexander Berkman, Emma Goldman, and many others who created a rich social network for themselves that mitigated some of the pain of being an anarchist in the United States. In 1900 when Schwab died, 2,000 mourners followed the hearse down Second Avenue.

Utopian dreamers have often longed for a more hospitable way of living. But when they look to politics, economics, or philosophy for answers, they are missing the best inspiration: human anthropology. The key is not to project ourselves into the future, but to learn from the practical, beneficial ways humans have lived in the past and still do, in some cases, in the present—places where our worst instincts are contained through affective reciprocity, goodwill, care.

What we'd much prefer is to live in a moral economy. The simple societies Europeans were so moved by when they first began to study them, conjuring images of the "noble savage," tended toward cooperation, not competition. They emphasized feeling and mutual affection. Karl Marx got his idea of communism from looking at the early anthropological studies of simple societies, where he was inspired by the way humans tended to relate to each other.

Today we are taught to believe that society doesn't owe us a living. In simple societies they felt the exact opposite. Everybody owed everybody else. There were mutual ties. People didn't rely on a social contract that you can break. Instead, they had a social compact. You can't break it. You're born with it, and you're delighted to be part of it because it nurtures you. That's very different from a Hobbesian notion that we're all out to zap each other.

You don't have to just look to the Bushmen or to Aboriginals for examples: you can find them in America and elsewhere in networks of women and workers, as well as traditional and tribal societies that have carried on the tradition of a moral economy. Women have retained the instinct to nurture because the human child is especially vulnerable compared to the young of many animal species. They have to create peaceful, nurturing conditions or the human race can't survive.

Most of our utopian visions carry on the errors and limitations born of a misguided view of human nature. That's why communism, as it was practiced in the Soviet Union and elsewhere, projected a materialist perspective on progress while ignoring the natural human instinct for autonomy—the ability to decide for ourselves where to go and what to say and create. On the flip side, capitalism runs against our instinct to trust and take care of each other.

We need to develop a new political foundation based on principles that include:

Self-Defense: Defense of oppressed people and of our political projects is paramount. We propose developing and tying defense teams to localities and collectives that are based on abolitionist practices.

The Neighborhood Council: As the network grows outside the jurisdiction of the state and reactionary forces, it is built through non-hierarchical relationships of trust. Collectives and councils developed according to needs, issues, and political motivation involve people in neighborhood self-governance.

Conflict Resolution and Revolutionary Justice: Forms of conflict resolution are essential for developing revolutionary relationships. Social cohesion, rather than punishment, must be the foundation. Abolitionist political growth seeks to destroy the prison, yet those oppressing others must be combated.

Abolition of Gender and Race: The same forces that put people in bondage also utilize gender roles as a source of domination. Overcoming imprisonment and liberating humanity from captivity must happen simultaneously with the abolition of gender constraints.

Expropriation and the Cooperative Economy: To carve out an autonomous territory, or to begin the revolutionary process, goods, land, and tools must be expropriated, or taken away from those who withhold them. We are striving towards a situation where necessities cannot be taken away from those who need them, but instead are shared with those who lack them

Cooperative: an autonomous association of persons united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly owned and democratically-controlled enterprise.

Cooperatives are based on the values of self-help, self-responsibility, democracy, equality, equity, and solidarity. In the tradition of their founders, cooperative members believe in the ethical values of honesty, openness, social responsibility and caring for others. Cooperative principles are guidelines by which cooperatives put their values into practice.

Voluntary and Open Membership Cooperatives are voluntary organizations, open to all persons able to use their services and willing to accept the responsibilities of membership, without gender, social, racial, political, or religious discrimination.

Democratic Member Control Cooperatives are democratic organizations controlled by their members, who actively participate in setting their policies and making decisions. Men and women serving as elected representatives are accountable to the membership. In primary cooperatives members have equal voting rights (one member, one vote) and cooperatives at other levels are also organized in a democratic manner.

Member Economic Participation Members contribute equitably to, and democratically control, the capital of their cooperative. At least part of that capital is usually the common property of the cooperative. Members usually receive limited compensation, if any, on capital subscribed as a condition of membership. Members allocate surpluses for any or all of the following purposes: developing their cooperative, possibly by setting up reserves, part of which at least would be indivisible; benefiting members in proportion to their transactions with the cooperative; and supporting other activities approved by the membership.

Autonomy and Independence Cooperatives are autonomous, self-help organizations controlled by their members. If they enter into agreements with other organizations, including governments, or raise capital from external sources, they do so on terms that ensure democratic control by their members and maintain their cooperative autonomy.

Education, Training, and Information Cooperatives provide education and training for their members, elected representatives, managers, and employees so they can contribute effectively to the development of their cooperatives. They inform the general public—particularly young people and opinion leaders—about the nature and benefits of cooperation.

Cooperation Among Cooperatives Cooperatives serve their members most effectively and strengthen the cooperative movement by working together through local, national, regional, and international structures.

Concern for Community Cooperatives work for the sustainable development of their communities through policies approved by their members.

In Venezuela, Chavez made the co-ops a top political priority, giving them first refusal on government contracts and offering them economic incentives to trade with one another. By 2006, there were roughly 100,000 cooperatives in the country, employing more than 700,000 workers. Many are pieces of state infrastructure—toll booths, highway maintenance, health clinics—handed over to the communities to run. It's a reverse of the logic of government outsourcing—rather than auctioning off pieces of the state to large corporations and losing democratic control, the people who use the resources are given the power to manage them, creating, at least in theory, both jobs and more responsive public services. Venezuela's many critics have derided these initiatives as handouts and unfair subsidies, of course. Yet in an era when Halliburton treats the US government as its personal ATM for six years, withdraws upward of \$20 billion in Iraq contracts alone, refuses to hire local workers either on the Gulf Coast or in Iraq, then expresses its gratitude to US citizens by moving its corporate headquarters to Dubai, with all the attendant tax and legal benefits, Venezuela's direct subsidies to regular people look significantly less radical.

Unconditional Universal Basic Income, Universal Health Care, and free tuition are not just nice freebies; it's a lot easier to be kind to others when your own survival doesn't depend on screwing them.

Until we base how we govern ourselves and interact with our neighbors on universal principles such as universal health care and universal human rights and have laws that reflect back to those guiding principles—and rejecting laws and economic policies that don't support them—we're simply treading water. And in most cases—climate change being the single largest example—we're actually contributing quickly to our own demise.

Humans are inventive enough to both create and distribute the basic necessities of life to every human on the planet; what's lacking is the political will to do so.

The only morally defensible position on artificially scarce yet universally needed goods, services, et cetera is either everyone has it or no one can. Either everyone has justice or no one can; either everyone has free access to healthcare or no one can; either everyone has a right to an education or no one can; either everyone can feel safe in their homes, neighborhoods, schools, workplaces or no one can.

Stop bombing, progressive tax, share wealth, healthy populace, less toxins, all in and nobody out.

There is no equality of persons, where this is not an equality of attainments. Equality of opportunity is bullshit.

Being a billionaire is a character flaw. Wealth cap. Wealth tax. Maximum wage. 1950s top income tax rates.

The wealth never trickles down. You have to hold the pitchfork to their neck.

Think of all the public goods that needed to interweave for the discovery of antibiotics to finally happen. The hospital. Those petri dishes. The experiment. The spores, wafting in from the park. The doctor. The library he studied in. The royal society. The science he'd learned. Not to mention the stable, prosperous democracy he lived in, a place with roads, bridges, cities, squares to walk and think in. Do you see how all these had to weave together, in even more sophisticated, improbable ways, for this great breakthrough to happen?

But the reverse is also true. Capitalism never discovered the vaccine, antibiotics, or chemotherapy probably because it couldn't have. It's not just that its horizons are too short, or that its interests are too narrow and selfish, though they are. It's that history teaches us over and over again that it takes complex, interwoven sets of public goods to yield a genuine breakthrough—but capitalism simply can't afford them. Only a society can—and probably only a democracy, capable of reinvesting a surplus in itself. How many centuries of science, knowledge, universities, libraries, roads, royal societies, and democracy were needed for each one of the crucial moments? Every great breakthrough should really be seen as the result of centuries of 'public good,' of effort, knowledge, creativity, time, and insight, finally, suddenly, coming together, culminating in an epiphany, revelation, or insight, which is a whole greater than the sum of its parts.

Great corporations exist only because they are created and safeguarded by our institutions; and it is therefore our right and our duty to see that they work in harmony with these institutions.

Ten Reforms to Restore Industrial Prosperity:

1. Write down debts with a Clean Slate
2. Tax economic rent to save it from being capitalized into interest payments
3. Revoke the tax deductibility of interest, to stop subsidizing debt leveraging
4. Create a public banking system via the nationalization of existing largest banks
5. Fund government deficits by central banks, not by taxes to pay bondholders

6. Pay Social Security and Medicare out of the general budget
7. Keep natural monopolies in the public domain to prevent rent extraction
8. Tax capital gains at the higher rates levied on earned income
9. Deter irresponsible lending with a Fraudulent Conveyance principle
10. Revive classical value and rent theory (and its statistical categories)

Classical rent theory demonstrates what seems to be counter-intuitive: Raising property taxes holds down what banks will lend, and hence the price of housing, because rent paid to the tax collector is not available to be capitalized into bank debt. But the financial sector popularizes the illusion that lower property taxes will make home ownership more affordable. Bankers know that lower taxes will leave more of the property's rental value available for new buyers to pay interest (or existing owners to borrow against by taking out "home equity" loans). What homeowners seem to gain in property tax cuts ends up being paid in higher mortgage costs of buying homes.

Taxing land rent—and also natural resource rent and monopoly rent—has three positive effects. First, it keeps property prices low by preventing this rent from being capitalized into bank loans. Second, it frees labor and industry from taxes on wages, profits, and sales, alleviating most family budgets. Third, banks will be obliged not to create as much new debt that merely becomes a cost of transferring ownership rather than contributing to real output and productivity. Taxing rent is administratively easy. The United States has over twenty-thousand appraisers whose job is to assess the market value of buildings and land separately.

To be sure, if governments collect the land rent, many existing property owners will default on their payments to the banks, or will feel obliged to walk away from their property. When banks do not receive what they had set their eyes on, many will see their reserves wiped out even more dramatically than occurred 2008. An abrupt shift to taxing rents or other revenue already pledged to banks will decimate their stockholders and bondholders. Taxing rent thus will require a public takeover of such 'troubled' banks.

The financial sector has forced society to make a choice: either submit to turning the economy into a rentier-ridden Ponzi scheme, or subordinate the banking and tax system to the aim of financing growth. That is why reform must be across-the-board, not piecemeal.

Being taken into the public domain is the price that banks pay for over-lending to the point where interest charges often absorb the entire economic

rent and crowd out the tax collector, while forcing indebted owners to default. Under these conditions, turning insolvent banks into public institutions is the easiest alternative to financial austerity and needless hardship.

Make banks eat their own cooking, requiring them to hold on to the loans they make and buy back every loan that sours. That would be a simple, effective, and self-reinforcing way to address control frauds by bank executives more interested in fast fees than interest payments.

But what about at the non-federal level? While you may not be able to introduce Medicare For All as a small-city mayor, but there's a lot you can do to expand democracy. Many of these things would be better done by a monetary sovereign, of course. But if the sovereign fails, you can at least try to fill in the gaps. How about these to start:

- Participatory budgeting
- Citywide minimum wage
- Municipal public banks
- Social work/case management access in local libraries
- Enforcing strict tenants' rights
- Lowering the voting age for city elections
- Kicking out the charter schools
- High-quality public toilets and napping benches
- Safe injection sites and needle exchanges
- Wage theft enforcement
- Fighting state attempts to privatize public assets
- The right to counsel in immigration and housing court
- A co-op conversion fund to buy rentals and permanently convert them to affordable co-ops
- A community land trust
- Free, open 24/7, public child-care and universal pre-K
- Usury caps to keep aggressive lenders out of the city
- Converting municipal utilities and vehicles to renewable energy
- Requiring community benefits agreements for new developments
- Diverting money from policing to mental health services and public housing, and reducing use of armed police officers to solve social problems

Improving Transportation

- Discourage private ownership
- Incentivize the shift to transportation as a utility
- Encourage other forms of mobility
- Modify community planning
- Reduce parking opportunities
- Sell rides, not cars
- Maintain and support good transit systems
- Guarantee mobility with congestion pricing
- Reallocate parking areas for better uses
- Prioritize lighter and smaller and lower-energy and less-polluting vehicles

Creating a Positive Urban Environment

1. A street or district must serve several primary functions
2. Blocks must be short
3. Buildings must vary in age, condition, use, and include rentals
4. Population must be dense

Under current law, if some workers want to form a union, then 35 percent of the workforce has to sign a petition or a card stating they agree to be unionized. From there the National Labor Relations Board will set up an election, and if half of the workforce votes to unionize, then they have a union. Under this current procedure, employers have several tools—both legal and illegal—to disrupt the organizing process, including intimidating or firing employees, spreading lies and misinformation about unions, threatening to close down stores, delaying union elections, and so on. Organizing is an uphill battle, which is why union busters have been so successful breaking up unions while organizers have had so much trouble starting new unions.

But card check would level the playing field. With card check, there is no election and employers never have to catch wind of what's going on. Basically, if 50 percent of all the workers sign a petition or card indicating they support forming a union, then that union is immediately recognized by the NLRB without the extra, added step of an election and without an opportunity for employers to twist arms. With card check, unions can reverse the tide in the war against labor and actually start chipping away at the corporate state. They can start demanding better wages and benefits,

limiting political coercion in the workplace, and funding political candidates who will continue the fight in the halls of Congress.

We stand for a living wage which must include:

- Enough to secure the elements of a normal standard of living
- A standard high enough to make morality possible
- Enough to provide for education and recreation
- Enough to care for immature members of the family
- Enough to maintain the family during periods of sickness
- Enough to permit reasonable saving for old age

Democracy doesn't work when individuals are forced to support environmentally destructive industries because they need the jobs. It doesn't work when people are stressed because of huge health care bills, massive college debts, and the futility of trying to make ends meet. Currently, a majority of Americans find themselves in these unacceptable situations. That leaves little time and energy for self-governance.

An Economic Bill of Rights will guarantee good-paying jobs to everyone, and good incomes for those who cannot work or are retired. An Economic Bill of Rights will also guarantee free education through university and free health care.

A Second Bill of Rights

- The right to a useful and remunerative job in the industries or shops or farms or mines of the nation
- The right to earn enough to provide adequate food and clothing and recreation
- The right of every farmer to raise and sell his products at a return which will give him and his family a decent living
- The right of every businessman, large and small, to trade in an atmosphere of freedom from unfair competition and domination by monopolies at home or abroad
- The right of every family to a decent home
- The right to adequate medical care and the opportunity to achieve and enjoy good health

- The right to adequate protection from the economic fears of old age, sickness, accident, and unemployment
- The right to a good education

Necessitous men are not free men. If you have necessities that are not met—if you're in need—then you're not free. If you're hungry and don't have food, you're not free. If you're homeless, you're not free. If you don't have health care, you're not free. Liberty requires the opportunity to make a living—a living decent according to the standards of the time, a living which gives one not only enough to live by, but something to live for.

When your income fluctuates from week to week, as it does for more and more people, or when you work for minimum wage, it becomes impossible to budget and plan for the future. The tendency is to click into a present-focused survival mode that changes the way we function. You develop a scarcity mindset. This way of thinking costs us. We neglect other concerns, and we become less effective in the rest of our lives. Consider what it means when so many people experience this struggle to survive. Aside from the potential impact on health, serious financial concerns allow less time to be a good parent and a helpful neighbor, cutting off many resources that make society function well. When many people are forced to focus on short-term survival, their own well-being and the vitality of their community suffer.

If you're never sure of your next meal, you spend time procuring food—not working to democratize society. People who know they are cared for are the best building blocks for a strong nation.

There was a debate recently among the 2020 candidates about whether and how to provide “free college.” Mayor McKinsey, the much-hyped mayor of South Bend, Indiana, says that public college tuition should be free only for those whose families earn under a certain income threshold. He has criticized those who believe in free college “for all,” regardless of family income, saying that this would be a handout to the children of millionaires and billionaires. Of course, Buttigieg is just plain wrong on the math: There's no reason free college needs to be a “handout” to the rich, if free college is coupled with progressive taxation. But there is a less-discussed problem with “income-based” free college schemes: They're more complicated and require subjecting poor people to humiliating bureaucratic requirements.

The problem with having ‘free X for the poor,’ and only for the poor, is that in practice you need to have an apparatus to determine who counts as poor. You have to set a standard for how much people can have before they become ineligible, and then you need a way of reliably assessing that eligibility. This is difficult, and it means that no matter what, a “means

tested” program is going to make accessing a given service more of a headache for poor people—who must fill out forms and prove eligibility—than it is for rich people—who can just hand over money and get it. Weirdly, even though ‘what it looks like in practice’ should be central to discussions about means testing, advocates of means-tested programs seem frequently to ignore what the lived experience of constantly having to be means-tested is like. Actually, advocates for many kinds of policy changes ignore what enforcement looks like on the ground, which is why France has debates about banning burkas when it is really debating ‘whether or not to have cops drag Muslim women away for their choice of swimsuit,’ and Americans debate legalizing drugs rather than ‘whether or not, after murdering their dogs, to cage people for what they put in their mouths.’

So, one good reason to provide free college to all is that it eliminates the need to check whether a person ‘deserves’ or is ‘entitled’ to free college. We know in advance that they’re entitled to it, because they’re a person. This certainly cuts down on paperwork. And that makes people’s lives better: If public high schools were means-tested, and there was a standard tuition fee, but you could have it waived if you met a series of requirements, it would not seem more fair or egalitarian. Currently, we do something strange where even though public schools are free, public school lunches are not, meaning that you have to apply to eat lunch for free or at a discount and have your income reviewed by the school district before they will give your child so much as a hot dog or a plate of baked beans. Predictably, this has led to the ugly widespread phenomenon of “school lunch debt.” This is not the case everywhere: Since 1948, Finland has just given children lunch, just as it gives them schoolbooks and instruction and playgrounds, which makes complete sense if you think of lunch as just as important a part of the school day.

Yes, there is a ‘fairness’ element to universal giveaways like this, in that they treat everyone as equal. But it also just makes everybody’s life easier. We could pay for public parks by charging admission and offering income-based tax credits for park admission to anyone below a certain threshold. But isn’t it nicer when anyone can just walk in the park? What an incredible mental relief it is not to have to think about money. The commons are wonderful: places where you can go without buying anything or paying for access. Public libraries, public beaches, public parks, public schools: They are held in common and everyone can use them as much as they please.

The leftist vision for how institutions should operate frequently involves taking money out of the picture, not just because we find it grubby but because it gets in the way of what we really want out of life. This is important to understanding the left vision for how healthcare ought to operate. Why

is Medicare For All so important to us? In part because every other scheme makes your experience of healthcare much more complicated! We want you to be able to go to the doctor and not have to think about money. We don't want you to have to think about premiums, co-pays, and deductibles. You should just be thinking about your health. And this isn't utopian. In countries that pay for health services, when you want to go to the doctor you just go, get treated, and leave. This is liberatory: It just makes you feel far more free, it makes life easier.

One of the big criticisms of Medicare for All is that it "eliminates private insurance." Thank God! I hate having to deal with insurance. I just want to deal with a doctor! Nobody likes having to have insurance. Saying that it 'eliminates private insurance' is like saying that having free college 'eliminates your school loan providers.' Fuck Navient. And the people trying to tell you that you love your insurance and don't want to lose it are like people in that scenario telling you that because you've found a financing provider that's kind of better than the others, the whole financing structure makes sense and you like it. But we need to ask simple questions like: Does this really make sense as a system? Can't we do better? Is this amount of paperwork really required?

The programs leftists advocate today we advocate partly because of our distaste for bureaucracy. We think about your experience: Going to the doctor should be as simple as possible. Going to college should involve registering for classes, then going and taking them. Even applying for college should probably just consist of proving that you can meet the basic requirements to do the work and then going into a lottery system. Remember Kamala Harris' student debt plan? It gave \$20,000 in debt forgiveness to anyone who was a Pell Grant recipient who started a business in a disadvantaged community and kept it afloat for three years. We leftists made fun of this. How about just using public funds to operate schools and then letting people go to those schools? Let's make life simple. Let's make people free.

So to understand why the left is pushing so hard for universal free college and universal free health care, it helps to understand that we do not just want 'free stuff.' After all, we are fully aware that these plans have costs, we just recognize that those costs are real resources, money not being one of them. What we are concerned with, first and foremost, is people's real-world experiences: Is going to college or the doctor a process that involves a lot of having to think about money, or does it instead involve thinking about your education and your health? We want everyone to be able to afford the service, yes, but even a means-tested program that covered everyone isn't good enough, because of the test. The test adds bureaucracy, bureaucracy

adds misery. The beauty of the commons is that you get it without having to prove anything. We serve you lunch because lunch is a part of school and education is a right. The doctor treats you because you are a person and you are sick, and not because you are “in their network.” Dare to imagine a world where this phrase no longer exists!

We leftists are not just trying to create a world that is fair on paper—with all the numbers optimized for maximization of distributional justice—but that is fair in practice, that is, in the experiences people actually have in the lives they actually live. Free college and free healthcare exist elsewhere, so we know that they are not regressive, they are not unaffordable, and are not utopian. And they can make life easier for all of us. In a difficult and complicated world, that is something everyone should care about.

We should be encouraging the government administration of public goods and the basic tools for survival because then many others can focus on important questions rather than simply surviving, learning about real shit, not stupid human created bullshit and how to navigate it. Fuck that shit. Wasted intellectual energy, so much of it.

Seriously: *FUCK THAT SHIT.*

Some fans may feel professional athletes deserve their pay, but even if there are others who think they should be more modestly paid, they may still be willing to pay the \$20, \$40, \$100 per game or whatever it costs to see them. Either way, the players get these wages because they can, even if some fans think they shouldn't. If all elite players' pay were reduced by 50%, there's no reason why they couldn't play as well. Standards of skill and fitness have surely improved over the years, but if players' incomes now are 20 times what they were, say, 40 years ago, it doesn't mean that their skills and efforts have increased by the same amount. The main change has been in the size of the audience or markets, and this is largely a result of developments in information and communications technology, especially in TV money, and in sponsorship by advertisers and sales of merchandise.

The same goes for today's top music and film stars. Their income doesn't reflect simply what they contribute, but economic rent; in effect, the expansion of the customer base by global media has increased the amount of economic rent they can collect.

We will fully nationalize the following companies and organizations. And we're talking the entire organization, if you've conglomerated some horrendous mass of corporate properties under some giant umbrella of bullshit then you will have every last thing taken from you and redistributed back to the people. If you're on this list, we're coming for you:

- Everything Jeff Bezos owns
- All of Bill Gates's shit
- All of Warren Buffet's empire
- All of every other billionaire's shit
- Disney—Mickey has been responsible for the increasing insanity of copyright, now he's ours forever; eat shit Walt
- Greyhound
- Walmart
- Home Depot
- Lowes
- All national small retail chains
- SpaceX
- All defense contractors
- Boeing
- All oil companies
- All railroads
- All large trucking companies
- All large food growers & processors
- All auto manufacturers
- All large pharmaceutical companies
- All airlines and large air freight companies
- All large marine shipping companies
- All privately-owned electric generation facilities
- All privately-owned electric companies
- All privately-owned water utilities
- Nestlé
- All privately-owned hospitals
- All privately-owned air-, land-, or sea-ambulance companies
- All large medical device manufacturers
- All hotel chains
- All resource extraction & processing companies
- All large chemical manufacturers

Maybe we run these as national enterprises operated at-cost or subsidized. Maybe we spin some off into regional or local worker co-ops. But they absolutely will no longer be run and used for the benefit of a few at the expense of the many.

Simply having someone to talk to, someone who cares, who can challenge your mental narratives in a constructive way and offer new, alternative ones, is vital. Talk therapy, not some Freudian bullshit but simply probing, attempting to understand, grappling with whatever issues one faces—this is key to a healthy nation. And the DSM should be nowhere near this thing. These people don't need to be labeled. They need to be listened to.

Many a liberal has screeched about the mere possibility that Donald Trump may be profiting from his position in government. What a besmirchment of such an austere, respected institution they cry.

Yet we have Bernie Sanders, who has written multiple books while in office—defended making more than a median worker’s lifetime income from them too; some socialist he is—and somehow he is not profiting from his office? You think people are gonna give a shit about what Bernie has to say if he wasn’t in government? You think enough to buy himself that little lake house? I don’t. Yet somehow, it’s Big Bad Orange Man doing awful things but Bernie’s right to what he earned.

Fuck these people, they’re completely out of touch.

We must ban fertility treatments and all procedures involving fertilization of an egg other than a consenting human penis ejaculating directly into a consenting vagina. There are enough unwanted, already born children. Adoption, not Dr. Frankenstein. Such treatments are nothing but socially acceptable narcissism. You ignore an already existing being so you can have one that looks like you. What an asshole. Of course it’s not entirely your fault, everyone around you seems to value that same barbaric idea.

“So you’re saying my precious angel baby shouldn’t exist?!”

Yes.

But they do now, so we’re not going to treat it like shit or not care for it—we’re not Republicans. And we won’t toss it in a pit and shoot it or anything—we’re not the US Army. There just shouldn’t be anymore made, going forward. Plus, if you use your kid as some kind of pawn in a PR-game, then you’re the asshole, not us; that would, if my math is correct, make you at least a double-asshole.

Reforming Justice

1. **No more forced confessions.**
2. **All police must wear video cameras that fully reveal their conduct.**

A thoughtful legislature can and should pass laws that provide that in the course of any questioning between an officer and a citizen, if the cop’s camera is ever turned off a jury is entitled to presume the cop’s misconduct.

3. **No entity, private or public, can mine or analyze such recordings for evidence of other crimes.**

4. Better psychological testing for police candidates.

If we can select those most qualified to travel to the moon armed only with the American flag, surely we can do a better job of selecting those who travel our streets armed with pistols and clubs.

5. A citizens' commission to oversee police conduct.

6. Reform the grand jury process.

How can any citizen prevent being wrongfully charged with a crime when the prosecutor, and the prosecutor alone, can decide what facts the grand jury will hear, and how and on what issues the witnesses will be questioned? In ways, the grand jury is the remnant of the inquisitions of old that included the persecution and the burning alive of thousands of innocent women as witches.

7. Outlaw the testimony of jailhouse snitches.

8. Relief for the accused when, at trial, the prosecutor hides favorable evidence from the accused.

9. Curing the evils of overcharging.

We already know why innocent people plead guilty: They know they'll face jurors who believe they're guilty because jurors trust that the prosecutor wouldn't charge innocent persons. They know that jurors often compromise—acquit on some, even many, of the charges, but likely find the accused guilty of something. They know they will be appointed a public defender who convinces them, rightly, that their conviction is foregone. They know that if they lose they will receive no mercy from the sentencing judge. Their lives will be truncated, their reputations lost, and the light of their future extinguished. Perhaps they will never see their spouse or children again, and their parents will die while they're in prison. Given the crowded dockets in most jurisdictions, in some cases innocent persons can plead guilty to a charge or two and get out of jail before their trial is even set.

10. We must get politics out of our judiciary.

Judges should be drafted at random from the trial bar for a limited term. The drafted judge would serve for, say, three or four years and then return to private practice. The judge would be paid a reasonable salary and would also be rewarded by becoming a better lawyer, one who has experienced the workings of the judicial mind firsthand. He

or she would spend no more time as a drafted judge than doctors spend acquiring their specialty. The names of all those who try court cases would be put in the canister and drawn as needed in the same manner that jurors are selected. If by law we can demand that ordinary citizens give up parts of their lives to serve as jurors, can't we, with greater justification, require trial lawyers, who make their living in the courtroom, to contribute back to the very system that supports them? The names of those who have served as trial judges would also be placed in the hopper from which, by random selection, our appeals court judges would be selected, but for a shorter term. And the political beast, Power, that once influenced—even owned—our judges will sit by the wayside whimpering and scolding, emasculated. Some will argue that this method will open the door to individuals none of us would want on the bench. But we are suffering from a judiciary that includes tyrants and fops of every dimension, and we can't get rid of them because they've been appointed for life or they're better politicians than they are judges and are continuously reelected. Better that we have a bad judge for a short term than a bad judge for a life term.

No one should have to suffer longer than they want to. We must have a constitutional right to die with dignity. Voluntary, pain-free self-euthanasia is a human right.

And, any objection you have? Well other than some dude on a cloud says 'Bad, No Do.' Which by the way, isn't as clear as you'd like it to be. Jesus is nailed up there, screams "Why have you forsaken me?"—he's asking to die, why does he continue to suffer up there—and lo and behold, two verses later, after some "vinegar" to drink, he's dead. Assisted suicide anyone?

Any other objection is simply a suggestion of what we also need to make sure we fix. Some people might do it to relieve the burden on families? Well why in the fuck are we putting so much burden on their families, why the fuck can't we just fix that? Some people might do it just cause they're feeling bad? Why the fuck did we as a society let them make it nearly two decades without being able to deal with momentary pain? I mean we're not still chucking kids in holes and rivers, right? It's a slippery slope? So's everything. There is, currently, no societal rule stating that all groups of people cannot be killed. You've already got a category of 'killable' people, we're on the slope motherfuckers.

If we're talking order of implementation for radical change, it seems the first step must be to make it clear that the US federal government can never run out of dollars, that any attempt to act as if it is otherwise is a lie and a

threat to one's life. If you've done that, most of the other items listed are quite easy to do as most of the criticism of such ideas stems from the flawed idea of finite money.

And the list excerpted is certainly too narrow, as mentioned, and flawed in other ways.

- Single-payer is OK, but we need drug and device patent changes at minimum—government funds the research, no more parasites. Perhaps even nationalization of all hospitals.
- Debt-free college is not far enough—free lifelong education. Open source textbooks.
- UBI for all, retirement stipend + UBI for some. No jobs guarantee, less total jobs focused on actual human needs is the goal.
- Massive reduction in the length of copyright terms, potentially even abolishing entirely.
- Nationalization of all banks.
- Debt jubilee.
- Maximum income limit, regardless of source.
- No algorithm trading, implement a financial transactions tax. Nothing but the purchase or sale of stocks allowed and all stocks must pay reasonable and regular dividends. No CDOs, mutual funds, any other such nonsense.
- 95% top tax bracket—we'll be needing to destroy some of that money injected by the use of monetary sovereignty for the masses, both for money supply and inequality reasons.
- Tariffs on all imported goods
- Close all overseas military bases. Nuclear disarmament, unilaterally if needed.
- Disband CIA, remove offensive capabilities of NSA, all vulnerabilities found must be disclosed.
- No contractors can be hired/used by the federal government, all must be direct hires.

- End the War on Drugs, legalize all minimally processed plant-based drugs (e.g. marijuana, shrooms, opium, coca leaf, et cetera). Disband DEA, fold any still required responsibilities into FDA.
- Incarceration as rehabilitation, not punishment. Limit maximum incarceration to 5–7 years regardless of crime. Abolish death penalty.
- Race does not exist, gender does not exist. Both are toxic artificial constructs designed to divide, not aid or empower.
- Free green (as best as able initially) public transit—intracity, intercity, regional, national.
- No private lawyers, only public defenders.
- No corporations in space. Unmanned, non-commercial space exploration only beyond Earth orbit.
- Disband Space Force
- No animal model studies.
- No CAFOs. No grazing on public lands.
- Nationalize all existing nuclear power plants; no private ownership of newly constructed ones. The Feds are on the hook for any major disaster anyway, why should a company make a profit while accepting no risk?
- Creation of federal resource extraction firms with sole privileges to extract on federal lands.
- Time- and Purpose-limited corporate charters.
- Hand-marked paper ballots hand-counted in public. Publicly funded elections.
- Ensure parental equality in family court.
- Free veterinary care for all companion animals.
- All debates, negotiations, and drafting of bills must be recorded and accessible to the public. No more backroom deals and closed door negotiations where both the public and majority of Congress have a limited time to analyze the results before making decisions. You're doing public work, to the greatest extent possible it must be done in view of the public.

- Implement a publicly accessible version-tracking system—think GitHub—for all existing and new legislation, policies, regulations, executive orders, et cetera.

All of this and more must be part of a coordinated national plan to shrink the economy down to a sustainable level. Too often we focus too much on tweaking; even if some tweaks might be somewhat substantial they still work within the human supremacist framework that fails to properly account for the billions of other individuals we share our home with.

Eighteen months. This is the rough time-frame we should be concerned about, demanding. Radical overhaul of the entire system within an 18-month period. Perfectly doable, not all of the fixes completed, but their solutions implemented or outlined legislatively. Anything significantly slower is just another form of failed incrementalism which dooms unfathomable numbers of individuals to further suffering.

We have already pushed massive costs onto future generations. It is immoral for us to place anymore simply because we were not willing to make the necessary sacrifices immediately. To do so is simply to selfishly place our comfort above that of others; this is of course a sentiment which has in part gotten us into the mess we currently find ourselves in.

The first step is getting a story. Such a story must be able to spread on its own, which is in part why it must be so much more radical and far-reaching than the usual incrementalist, compartmentalized approach. It does not matter if such a story is spread with the goal of inspiration or mockery, simply that it spreads under its own power. We don't need a majority, we probably don't even need 10%. We need individuals to see the implementation of such a story as a moral obligation. We need to be compelled to act in the same way we are compelled to remove a hand from a hot stove. We need to each determine how best to do so, by any means one can morally justify as necessary.

We are the most recent generations of a culture which has enslaved, oppressed, murdered every other way of being, seeing, doing that it has encountered. The trail of blood stretches back many millennia. That culture needs to be rejected; not subdued or marginalized, but destroyed. It is far more harmful, far more dangerous than our favorite boogeymen, Nazis and terrorists.

We must get Money out of politics just as we rid our bodies of killing cancers. We are diseased by Money. We are no longer a free nation if Money can buy our representatives while we stand in line to vote like the proverbial cattle at the killing chutes. Our elections on all levels must be publicly funded. Over my lifetime I've seen the Power-owned media capture

the American mind. The endless invasion of propaganda has eventually prevailed, and its message has become the accepted truth of a brainwashed nation that we are free, that the police and prosecutors are trustworthy and will protect us, and that in America there is liberty and justice for all. Such is a mythology that enslaves.

We would be wise to remember Sinclair Lewis:

“If fascism comes to America it will be wrapped in the flag and carrying a cross.”

Other nations have laws protecting their bookstores and publishers. In France, for example, no seller can offer more than 5% off the cover price of new books, with the result that books cost about the same wherever you buy them in France, even online. The French government classifies books as an “essential good,” along with electricity, bread, and water.

The Electoral College has been responsible for two Presidents within the last three winning an election without winning a majority of the votes. This system of selecting presidents was a tool originally created to suppress democracy; historically, it has empowered slavers and segregationists. The injustices it has perpetuated continue today. By distorting democracy, it values certain voters (i.e. Floridian Cuban-Americans, Iowa farmers) over others. The democratic option is direct election of the president.

The United States should:

- Abolish the Electoral College, moving to a system of direct election of the president.

American elections have been plagued by structural unfairness that has often advantaged the party in power. From restrictive voter ID laws (such as the Wisconsin law sometimes credited with delivering the state to Republicans in 2016) to the outright fraud perpetrated in North Carolina in 2018, American elections have returned to the bad old days of fraudulent elections like those held in Adams County, Ohio. For America to call itself a true democracy, it must ensure total fairness in voting and in elections.

The United States should:

- Put all elections to federal offices (House, Senate, and presidential elections) under congressional oversight. This would make the process of voting both uniform and fair nationwide.
- Make all voting registration automatic for US citizens upon turning 18.

Our current first past the post system of democratic elections does not ask for a majority in order for a candidate to declare victory. Oftentimes, voters will be asked to vote against their conscience and choose the “lesser of two evils.” Ranked choice voting, or instant run-off voting, allows voters to rank candidates, giving their first vote to their preferred candidate. A candidate can only assume victory with a majority of first-round and run-off votes, making every vote count.

The United States should:

- Institute a ranked choice voting procedure for any and all elections currently functioning on the First Past the Post system, ensuring that the candidate that people actually want wins, rather than whoever happens to be a better representation of the establishment.
- Ensure a candidate can only assume victory with a majority of first-round and run-off votes, ensuring that third-party candidates are not left in the dust and that the truly most popular person wins.

The Wyoming rule is the principle that the House’s representative-to-population ratio should be equal for all states: to do this, this ratio must be set to that of the lowest-population state, Wyoming. This ensures that no representative has more power than any other representative.

The United States should:

- Institute the Wyoming rule, ensuring that each representative in the House of Representatives has equal power and that each American vote counts for the same amount.

The US Senate, in its current form, is a deeply inequitable body. Wyoming and California, which have wildly different populations, have equal representation. This means that popular measures, such as Medicare for All, have virtually no chance in the Senate.

The United States should:

- Pass an amendment to the Constitution retaining the two-senator structure, but making the voting power of a state’s senators proportional to the state’s population. Thus the senator from California would have roughly 68 times the voting power of a senator from Wyoming. On procedural matters, however, the one-vote structure would be maintained.

Whenever a Supreme Court justice dies or retires, there is a bitter partisan war over their replacement. It is foolish for the fate of decisions like

Roe v. Wade or Miranda v. Arizona to be left up to the accident of whether a jurist dies under a Democratic president or a Republican one; that Donald Trump may get to nominate three justices in four years while Barack Obama nominated two in eight years points to the fundamental impracticability of the current system. Moreover, it promotes jurists staying on far longer than they ought to for fear of giving their seat to an ideological opponent.

The United States should:

- Limit the terms of all federal judges, including Supreme Court justices, to twelve years, with the opportunity of renomination or nomination to a different office at the end of each term.
- Remove the ability for the Supreme Court to declare laws unconstitutional.

In the rush to enhance security following 9/11, Americans' civil rights—including the freedom from surveillance and invasion of privacy—have been thoroughly trampled. There are currently 17 distinct intelligence agencies funded through largely classified budgets, and each operates under its own shroud of secrecy. Spying by the National Security Agency, including in collusion with privately-run telecommunications providers, has affected hundreds of millions of Americans. Such collaboration highlights that the intrusion into the private life of citizens is not just a function of a secretive state, but it now also a function of the market, with thousands of businesses seeking to capitalize on the War on Terror and therefore disinclined to end it. This toxic brew has given rise to 'surveillance capitalism.' What used to be private (our personal lives) has become public and commodified, and what should be public (the government) is becoming private and hidden from view.

The United States should:

- Abolish the NSA.
- Substantially reduce the size of the surveillance state down from 17 distinct entities, and reduce the mandated scope of operations.
- Withdraw from the Anglophone-only 'Five Eyes Network,' currently comprising Australia, Canada, New Zealand, the UK and the US; instead work with and through multilateral institutions that pursue organized crime, including cyber-crime.
- End policies and programmes exposed by Edward Snowden, such as PRISM.

- Repeal the Patriot Act and the Espionage Act.

Puerto Rico is an unincorporated territory of the United States. Although its inhabitants are citizens and have the freedom of movement throughout the rest of the country, they do not have a vote in Congress. With no say either in presidential politics, Puerto Ricans have no right of franchise in national politics. This is a denial of political rights, which is unacceptable in any self-regarding liberal democracy. Conversely, the absence of political rights comes into sharp relief at times of need, such as in the wake of natural calamity, where citizens may harbor legitimate concerns about the performance of federal government. Similar principles apply to our capital: despite being home to 702,000 people, these citizens gain no representatives and do not control their own laws. Taxation without representation continues to be theft, and these injustices cannot be allowed to continue. Puerto Rico, D.C., and all other territories need to be allowed to host a legitimate, formal, binding referendum on statehood.

The United States should:

- Offer Puerto Rico the right to self-determination, which would include the options of full independence and statehood within the Union. If it was to choose the latter, it would become the first Hispanic majority territory to do so. By extension, all Puerto Ricans will obtain full adult franchisement and be eligible to participate in presidential and congressional elections.

All other territories would be offered the same.

- Offer Washington, D.C. full statehood contingent on a binding referendum. We must ensure that the seat of our very nation is not dominated by those who do not represent its population.

Over the past few years, the United States has systematically left the multilateral institutions of the world. This country cannot afford to commit itself to re-isolation and the “America alone” vision of the world. The only way to sustainable peace and prosperity around the globe is a commitment to engaging in mutual aid with other countries.

The United States should:

- Reverse its withdrawal from the United Nations Human Rights Council.
- Commit to providing full humanitarian assistance in accordance with multilateral commitments.

- Work with other nations to reform the United Nations Security Council, expanding the P5 to reflect a more global distribution of power.

The United States' policy of stockpiling nuclear weapons is a disaster in waiting. The United States must not only seek a world without nuclear weapons, but work actively to make that a reality. America will be a safer not with a powerful "nuclear deterrent," but instead with a world free from this grievous threat. Rapid denuclearization is the only path forward.

The United States should:

- Sign and ratify the Treaty on the Non-Proliferation of Nuclear Weapons.
- Sign and ratify the Treaty on the Prohibition of Nuclear Weapons.
- Officially declare that the United States would not be the first to use nuclear weapons.
- Work towards complete disarmament.

For decades, the United States has committed to a foreign policy of aggression and regime change in the service of a loosely-defined "national interest" (usually contiguous with American business interests). This has brought nothing but instability and disaster to the world. From Operation Condor to the 2011 intervention in Libya, these operations, whether dubbed "humanitarian" or "strategic," have had a tremendous cost in blood and treasure.

The United States should:

- Commit to ending the weaponization of human rights as a tool of American foreign policy.
- Separate USAID from the State Department, and make all foreign bilateral aid 'no strings attached.'
- End all unilateral sanctions against sovereign countries, as sanctions are an act of war that result in harm and the deaths of innocent people.
- Vow not to invade any sovereign country, such as Venezuela or North Korea, without a clear and obvious first strike by that nation.
- Pursue friendly relations with all sovereign countries, whether or not we favor their leadership or economic structure.

- End the use of unmanned aerial vehicles for military purposes, as these have consistently resulted in horrific civilian casualties and fatalities.
- Repeal the Authorization for Use of Military Force Against Terrorists.
- Close Guantanamo Bay and pay reparations to all untried detainees, past and present.
- End the ridiculous Cuba embargo and normalize relations with one of our closest neighbors.

The Department of Defense has benefited from its Orwellian moniker for too long: who could justify cutting ‘defense’ spending? The Founders recognized that “Department of War,” a name that accurately reflected the purpose and activities of the body, was a more fitting name. But that’s not enough to push back on the overwhelming power of the Department of Defense. A Department of Peace, as proposed in 1793 by Benjamin Rush, should exist to promote peace-building and conflict prevention whenever necessary.

The United States should:

- Rename the ‘Department of Defense’ the ‘Department of War.’
- Create a Department of Peace, under which USAID, the US Institute of Peace, and the Peace Corps would be organized. As a full member of the Cabinet, The Secretary of Peace would serve to identify, promote, and report on US support to nonviolent solutions to global problems.
- Commit to parity in budget allocations between the Department of War and the Department of Peace.
- Abolish the US Space Force and end the militarization of space.

The United States has about 800 military bases spread across the world. There are bases in 80 countries, with about 138,000 troops total deployed across the world. Only 11 other countries have military bases in other nations; the country with the second-most bases has at most 40. The environmental and social impacts of these bases—which often cause a great deal of pollution with severely negative impacts on local communities—are acute, and resentment surrounding these bases gives rise to anti-Americanism across the globe, as seen in Okinawa, Japan.

The United States should:

- Close all military bases abroad, beginning with those based in Muslim-majority countries. Offer the opportunity to turn existing base infrastructure into educational, artistic, inventive collaboration centers in which non-military individuals from the US and the host country can come together to learn from each other and experiment.
- Bring every American soldier stationed abroad back to the US.
- Determine a package of reparations for communities negatively impacted by US bases abroad.
- Establish a corresponding demobilization and reintegration programme for US servicemen and women returning home to enable their full and healthy integration into social, economic, civic, and political life.

The United States' military spending dwarfs that of the rest of the world. Much of this spending is wholly unnecessary; legislators, eager to appear hawkish and confrontational, appropriate funds that even generals say they don't need. The US, which is unthreatened by any power on the scale of the Soviet Union, still spends more than it did during the Cold War. Reports in 2011 revealed that the US was spending more than \$20 billion a year on just air-conditioning in Afghanistan and Iraq—more than the annual budget of NASA at that time. This is a disastrous valuing of 'guns over butter.' As President Dwight Eisenhower said, "every gun that is made, every warship launched, every rocket fired, signifies in the final sense a theft from those who hunger and are not fed, those who are cold and are not clothed."

The United States should:

- Cut military spending by at least 50 percent.
- Scrap the F-35 program.
- Repurpose the remaining work of the Department of Defense towards international cooperation under civilian and scientific supervision. Its future role should be to contribute to address potentially cataclysmic global threats, such as those posed by near-earth asteroids.

The American government uses cyber, diplomatic, financial, economic, and military tools to impose its will on the international rules-based order. It has systematically attempted to avoid culpability for war crimes in which it has been involved. Not only has it refused to join the International

Criminal Court, but it withdrew from the compulsory jurisdiction of the International Court of Justice in 1986 after *Nicaragua v. United States* found that the covert American war against Nicaragua was illegal. The American government has been involved in countless war crimes, with their perpetrators often remaining aloof from true consequences. It is time for the United States to join the rest of the world in enforcing law.

The United States should:

- Join the International Criminal Court.
- Repeal the 2002 American Service-Members' Protection Act, which protects government and allied officials and service-people from prosecution for war crimes by multilateral mechanisms.
- Prohibit all current and former government officials found by Congress to have committed war crimes from any future government service or to advise and provide services to government through third parties.
- Work with the international community—international institutions, regional bodies, and individual countries—to remedy the bias toward prosecuting only African defendants in the International Criminal Court.
- Re-enter the compulsory jurisdiction of the International Court of Justice.
- Transport all currently living former US presidents to The Hague for trial—maybe dig up Reagan and throw him in the cargo hold too.

For too long, America has given uncritical support to the government of Israel, which has enacted racist apartheid-style policies designed to disenfranchise Palestinians. American leadership, both Democratic and Republican, has watched, both approvingly and passively, as Israel illegally annexed Palestinian land, encouraging further encroachment through billions of dollars in military aid, the placement of the American embassy in Jerusalem, and the recognition of the Golan Heights as Israeli territory.

Groups like AIPAC wield far too much influence over our foreign policy and media coverage of Israel, as critics have highlighted for more than a decade. It is time to craft a foreign policy independent of undue influence by the Israel lobby, and to stop turning a blind eye to the injustices of the occupation.

The United States should:

- Establish a mature, non-partisan relationship with Israel and its neighbors, including through multilateral mechanisms, to promote mutual peace, security, and well-being.
- End military aid to Israel.
- Refuse to support laws aiming to stifle the Boycott, Divestment, and Sanctions movement that cripple freedoms of speech and association.
- Recognize Palestinian statehood or call for a plural state in which Israelis and Palestinians all enjoy full and equal rights in accordance with the Universal Declaration of Human Rights.

The United States' relationship to Saudi Arabia is extraordinarily corrupt. For decades, the Saudi royal family has used oil money to influence American policy; from the prominence of "Bandar Bush" to Crown Prince Mohammed bin Salman claiming to have Jared Kushner "in his pocket," our leaders have been serving Saudi interests for far too long. Saudi Arabia is a repressive dictatorship which regularly engages in torture and murder, as seen most recently in the death of Jamal Khashoggi. Its curtailment of women's rights has been appalling.

The United States should:

- End all aid to Saudi Arabia.
- End all material and logistical support for the Saudi-led war in Yemen.

The United States government, in conjunction with companies like Northrop Grumman and Lockheed Martin, serves as a salesman of death around the globe. American companies have profited handsomely off conflict abroad; as Smedley Butler observed:

"War is a racket. It is the only one international in scope. It is the only one in which the profits are reckoned in dollars and the losses in lives."

The only way to clamp down on the military-industrial complex, the greatest enemy of the American people, is a hard line against selling weapons abroad.

The United States should:

- Prohibit American companies from selling arms abroad, including to non-state actors.

- Withdraw diplomatic backing and public financial support from domestic weapons manufacturers.
- Work with weapons manufacturers that wish to pivot their business operations and workforces to peaceful applications of their managerial, network, and technological expertise.
- Collaborate with other countries involved in arms sales towards mutually-agreed demilitarization of international trade.

In recent decades, American warmaking has become increasingly extra-constitutional. Presidents have sent deployments abroad without any real Congressional oversight; the legislative body, acting contrary to the dictates of the Constitution, has effectively ceded the power to make war to the president. The War Powers Act of 1973, which was intended to address this by requiring Congressional approval for any conflict lasting more than 60 days, has been a failure; it has been violated repeatedly. The War Powers Act must be reformed to ensure compliance with the Constitution and prevent needless wars.

The United States should:

- Pass a revised version of the “John Hart Ely Combat Authorization Act,” which would shorten the Act’s “free pass period” from sixty days to seven days; if Congress does not authorize the conflict in that timeframe, funds for it will automatically be cut off. Continuing to wage such wars will be explicitly deemed an impeachable offense.

Recent years have seen a number of promising developments in the long-simmering conflict between North Korea and South Korea. Make no mistake: the primary responsibility for achieving a lasting peace on the Peninsula rests with the Korean people and their respective governments. This is—first and foremost—their dispute to settle. To this end, reformist South Korean president Moon Jae-in was elected on an unequivocal mandate to seek dialogue with the North. This has enjoyed welcome support from the international community, including from the US. It is obvious that the North Korean government is a troubled one, but its posture can also be partly explained as a response to American belligerence in other parts of the world (in the last 20 years this has included the disasters in Iraq and Libya). As the overwhelmingly more powerful party, the US has a responsibility to make every effort to de-escalate tensions to enable the two Koreas to reach an amicable outcome to current and future talks.

The United States should:

- Withdraw all troops from South Korea, in cooperation with the South Korean government.
- Seek to pursue normal relations with North Korea.
- Formally declare an end to the Korean War, which was only paused in 1953 with the Armistice Agreement. Ending hostilities is necessary for the total denuclearization of the peninsula.
- Continue nuclear dialogue with North Korea through multilateral mechanisms, with the goal of complete denuclearization of the Korean peninsula.
- Observe its own Treaty obligations towards denuclearization.
- Promote cultural exchange between the United States, South Korea, and North Korea. The isolation of the North Korean people is of benefit of no one.
- Encourage the reunion of North and South Korean families that have been separated by the war. Whether through digital communications (e.g. video chats) or in-person, should both governments be amenable.
- Formally apologize to survivors of the No Gun Ri and Jeju Island massacre, meet with them and South Korean officials on potential compensation.

The American economy of 2019 is plagued by a problem that some thought was a relic of the 1910s: monopolies. Industry after industry has become highly centralized and controlled by a handful of private bureaucratic entities. These include agribusiness, civil aviation, banking and consumer finance, communications, food production and retail, health insurance and health service provision, internet services, news media, retail investment, social media, ground transport, and so on. Horizontal corporate agglomeration and vertical integration have produced economic behemoths that control vast swathes of the market, are unresponsive to consumer demands, and enjoy undue influence over politics and economy at both national and sub-national levels. Meanwhile, the gargantuan Amazon, which alongside providing cloud services to 17 federal intelligence agencies, promises to flex its monopsonistic power over vendors and workers; it may soon reach a concentration of power rivaling Standard Oil at its height. It is time for the US to return to the grand tradition of trust-busting and break apart

market-controlling businesses. It is time to return competition to the marketplace that allows innovation and entrepreneurship to thrive. Our democracy depends on it.

The United States should:

- Use the government's antitrust authority to break up large businesses. Regulators should take a much harder line on any mergers and acquisitions by large companies; the strategic purchase of WhatsApp by Facebook, for example, should have been halted. Accordingly, Robert Bork's 1982 guidelines for reviewing mergers should be shelved and more restrictive ones devised.
- Break up large tech companies immediately. These companies pose a dire threat, not just to American democracy, but to international peace and security; Facebook, Google, Amazon, and others pose dangers due to the power they wield over information and content. In 2018, a UK Parliament report described Facebook as a "digital gangster." This description is entirely warranted, based on evidence that its business decisions were "directly linked" to ethnic cleansing in Myanmar, the Cambridge Analytica scandal, and harvesting the data of women's menstrual cycles without consent, to cite just three of many transgressions.
- Hold the executive heads of companies directly and legally liable in the event that their businesses are found to, for example, be defrauding consumers or producing goods and services that result in injury and death.
- Promote business adherence to the Guiding Principles for Business and Human Rights.

The inequities pervasive in American education are symptomatic of the broader national sickness of gross inequality and a refusal to care for the least well-off among us. Many lower-income people don't have access to high-quality preschool, giving their children a disadvantage at the start of kindergarten; this disadvantage is often compounded during years spent in badly-funded school districts. The obvious fruit of this is lower graduation rates and lower matriculation rates in poorer areas. Moreover, the oft-prohibitive cost of attending a university (let alone attending a graduate program) means that many forego the possibility or attend cheaper options for post-secondary education. Many lower-income people who do decide to pursue post-secondary education also take on a precipitous amount of student debt, debilitating their financial prospects for years.

The United States should:

- Provide free, high-quality preschool education for all with direct funding to states.
- Delink property taxes and education funding, moving to a federal model for school funding in which all students receive an equal amount of funding.
- Promote the inclusion of climate science, sustainable development, and universal human rights into school curricula.
- Make all public universities and graduate schools absolutely tuition-free by providing funding directly to states.
- Announce a ‘Student Debt Jubilee,’ with all student debt held by the US government being forgiven. This includes any debt owned by now nationalized large banks.

The United States has some of the best specialized health care in the world, for instance in the treatment of certain cancers. At the same time, coverage is highly unequal and in effect still inaccessible to millions of Americans. Some of the health data is appalling. Out of 35 members of the Organization for Economic Cooperation and Development (OECD) the US ranks 29th for infant mortality and 26th for life expectancy. Maternal mortality is the worst in the developed world, and worse than in Iran. Forty percent of adults in the US are obese, giving rise to an epidemic of chronic illnesses. The mental health crisis has also reached disastrous levels, affecting women and men in different ways that expensive clinical responses alone cannot remedy. Government policy, social convulsion, economic insecurity, lifestyle choices, and poor nutrition are factors, but the single largest impediment to the achievement of health as a human right are health insurance companies. These private-sector bureaucracies control the market of health care provision and what medical professionals can or cannot prescribe. With government license, they have itemized every conceivable procedure in order to extract revenue from patients, extending corporate control over the human body. The result? A healthcare system that costs 40 percent more than the OECD average, and delivers poorer overall results. The close ties that exist between Congress and the health insurance industry makes the current status of public health in America an example of both government and market failure. It is unsustainable.

The United States should:

- Draw on good practices in universal health care provision from around the world in order to construct the best possible approach suited to the specific profiles and health care needs of the American population.
- Offer a publicly-run and -financed national health service. With Medicare-for-All as a medium term transitional system, the ultimate aim is a ‘Veterans Administration-style healthcare for all,’ or ‘VA4A’ for short.
- Provide full coverage as is, to date, provided by private health insurers, including dental, vision, and hearing services.

There are six vacant homes in the United States for every homeless person. Homelessness is not a natural phenomenon: it is caused by humans, it is perpetrated by humans, and in the same way it can be solved by humans. But the problem here is not just for the homeless: rents continue to skyrocket with an insane and bubbling housing market that almost seems reeling towards the same situation that we were in before 2008. Housing is a human right, and no person deserves to go through the world without shelter; but more than this, everyone deserves cheap, affordable housing that meets their needs and ensures that they never have to worry about evictions just because a paycheck arrived late or they lost their job.

The United States should:

- Enact a vacancy tax that targets properties that go without residents for a quarter of the year or more.
- Overhaul all public housing legislation to ensure that we can and will build more, build higher quality, and build more equitably: eliminate the “equivalent elimination” provision of the Wagner-Steagall Act that only allows the construction of new public housing when an equivalent amount of housing is demolished, ensure that all future housing projects have considerable operations budgets rather than front-loading the capital budget, massively increase municipal, state, and federal capacities for creating public housing, et cetera.
- Ensure that public housing projects are not creating slums in themselves: public housing cannot be segregated into its own section of a city or town, but must rather be spread through it just like any other type of housing. Public housing segregation is still segregation, and cities must be more equitable, not less.

- Remodel zoning laws to be green- and socially-conscious, lower or altogether remove parking minimums for buildings, and create free and plentiful public transport to make sure that cities across the country are more equitable and have more housing for everyone.
- Outlaw all anti-homeless architecture, including but not limited to windowsill spikes, street spikes, slanted benches or benches with dividers that make it impossible to sleep, and barred corners.
- Ensure that access to housing for the homeless is not contingent on income, career, drug use, or any other metric: it has been proven time and time again that not only the most ethical but also the cheapest method of dealing with homelessness crisis is through giving housing first then offering services later, as the mental stability afforded by having a stable residence is more valuable than any kind of means-testing.
- Ensure that multi-family public housing communities are run cooperatively and democratically, where people are in control of their own conditions. Enact additional legislation to incentivize privately-built or owned complexes to do the same.
- Never limit pets, children, et cetera in public housing as this only keeps the people who need it away from housing. Similarly, do not means-test: public housing should be for everyone, not only the fully impoverished. By opening affordable housing to all, we can decommodify housing and ensure everyone has a good place to live.
- Enact rent control nationwide with a regulatory agency to ensure that rents cannot skyrocket and that tenants cannot be exploited.
- Massively increase and expand tenants' rights.
- Guarantee legal counsel in tenant-landlord court.
- Increase the ease of acquiring community land trusts that develop and steward affordable housing, community gardens, civic buildings, commercial spaces, and other community assets.
- Enact stricter licensing requirements for landlords and stiffer penalties for failure to keep apartments in good condition.

Job insecurity is a terrifying thing, and our economic system mandates that businesses shut down their stores, lay off their employees, and close

their offices in a never-ending cycle of feast and famine. But while businesses come and go, people's livelihoods don't have to. Based on the UK Labor Party's policy of the same name, the Right to Own would be a policy of employees being the first to be able to buy out a company when it's going under or being sold. They have the right of first refusal: whether it's being bought by another company or going out of business, the employees will be able to buy out their workplace and ensure that they get to control their own business, income, life, and livelihood.

The United States should:

- Institute a policy of the Right to Own, ensuring that, when a company is being sold or is going out of business, the first group that has the chance to buy out the business's assets and IP are the workers themselves.
- Give grants and/or loans to these businesses if they decide to reorganize as a cooperative: a corporation that is run democratically by the workers, where each member of the company votes on management, parts of their contract, the general direction of the company, and more, with the specifics depending on how the cooperative decides to organize. These cooperatives are known for extremely high rates of productivity, worker satisfaction, benefits, and wages.
- Set up a federal program to help cooperatives, teach them how to operate, and ensure that they are self-sufficient.

Parenting in America is incredibly tough: debt, expenses, and a lack of quality schooling or parental leave breaks people down and leaves both parents and children worse off. By modeling parental aid off of the Family Fun Pack theory, we can allow parents to live and breathe without being brutalized by the countless stresses of our system, and allow children to prosper with all the resources they need to thrive. Right now, the well-off can afford tutors, preschools, child caretakers, and more that create a class divide in child-raising itself. By helping those parents and children that need it most, we can ensure that every child gets the support they need.

The United States should:

- Implement high-quality, free pre-school education for all with direct funding to states.
- Implement a Baby Box program to give every family a box that contains essential items like clothes and bottles, with the box itself functioning as a bassinet.

- Institute 208 weeks of parental leave, split between parents; a single-parent household gives all 208 weeks to the single parent, while in dual-parent households, each parent obtains 104 weeks but may transfer up to 70 weeks to the other. This paid benefit will be set equal to 100% of earnings up to minimum wage, plus 66% of earnings past the minimum wage. All recipients will be entitled to benefits equal to at least the minimum wage but no more than the national average wage.
- Create a free, open 24/7, childcare system that all parents are entitled to.
- Ensure free school lunches for all students.

As the cost of living in America has risen, the effect of wages earned has stagnated. American workers' buying power has decreased, with every purchase taking a greater hit to their paycheck than in years before. As rent and cost of living rise, and as workers bring in more profit for their employers, their wages must increase.

The United States should:

- Establish a national \$30 minimum wage and eliminate the tipped minimum wage. The minimum wage would be indexed to the Consumer Price Index.
- Invest, at minimum, \$1.5 trillion in infrastructure over a ten-year period.
- Institute a Federal Jobs Guarantee to offer jobs at high wages on the model of the Works Progress Administration, exerting upward pressure on wages. These jobs would not all be unskilled; instead, many of these jobs should focus on developing infrastructure (in line with the above plank), and may include job training in fields like nursing.
- Repeal the Taft-Hartley Act. The law prevents labor unions from amassing any sort of real power through its ban on secondary boycotts and the infamous "free-speech clause," and, by defining independent contractors so as not to be employees, allows companies to deny their workers real benefits. Repealing the law would be a first step in re-empowering the labor movement.
- Provide a free public credit registry to compete with large credit reporting agencies like Experian and Equifax. The public credit registry would not charge fees for seeing credit scores, and would

require lenders and other companies that provide information to be wholly accurate.

A huge proportion of large American corporations are headquartered in Delaware, a welcoming haven for corporations due to its lax regulations. This means that Delaware state law on corporations is unduly important, far more influential than that of any other state.

“A corporation headquartered in New York, with all of its facilities, employees, customers, and shareholders in New York, is beyond New York’s reach when it comes to matters of corporate governance.”

This has tremendous policy implications, since Delaware state law favors the interest of shareholders over those of any other party; in 2015, the Chief Justice of the Delaware Supreme Court wrote that “treating an interest other than stockholder wealth as an end in itself is a breach of fiduciary duty.” Simple changes to American corporate law would bring corporations under more democratic control, and would allow for other reforms to be made.

The United States should:

- Require corporations that either have more than 300 employees or that have a revenue of at least \$5 million a year to be chartered at the national level.
- Obligate all nationally-chartered corporations to consider the interests of all stakeholders, especially workers, and not just shareholders.
- Require that two-thirds of all board members of nationally-chartered organizations be elected by employees lower than the 80th percentile in the company’s pay structure, in the vein of Germany’s “co-determination” system.
- Establish a Corporate Harm Prosecution Agency (CHPA), which would have broad oversight to investigate, subpoena, and return a binding claim with its findings on the negative externalities that corporations produce, for example, the \$6.2 billion spent on welfare each year due to Walmart’s low pay. The CHPA would investigate a corporation for the negative externalities it produces, then return a verdict. The corporation and the CHPA would have one year to work out an agreement for how to amend the problem—for example, Walmart could reduce food stamp usage by its employees by 50 percent in a

way approved by the CHPA. If the corporation fails to amend the negative externality, the CHPA would have the power to suspend all stock buybacks and dividends.

- The corporate death penalty will again be an option.

A Green New Deal is absolutely necessary but the plan proposed in the House by Representative Alexandria Ocasio-Cortez is far from adequate. Her resolution claims to be an overview of the goals we desperately need to accomplish to ensure not only that our Earth survives as a livable and comfortable planet, but also that we live purposeful, satisfied, and healthy lives. Yet the proposed changes are far from radical enough. Literally billions of people are at risk from rising ocean waves, a continual warming of the atmosphere, more dangerous storms than ever, and fertile land that slowly decays away. We must do everything in our power to stop man-made climate change and, more than that, make sure that the policies we institute to this end benefit us all. Through clean energy and infrastructure, jobs, reinvestment, and more, we can not only save the planet but end up with a healthier country that's more connected, that has better jobs, and that provides for everyone.

The United States should:

- Institute a carbon tax and dividend scheme with an initial price of \$900 per ton of CO₂ (the amount would be indexed to inflation and might be raised in the future). All funds from this tax would be redistributed to households, with poorer households receiving a larger proportion of the tax.
- Eliminate carbon trading scams. The same goes for offsets, forest preservation schemes, et cetera. They are proven failures, nothing but more neoliberal bullshit.
- Establish a Green Tennessee Valley Authority (TVA). The Tennessee Valley Authority Act would be amended to expand the TVA beyond its current operating area, with the aim of decarbonizing all energy production by a certain date.
- Ensure a 'just transition' economic guarantee for all communities negatively impacted by the pivot from fossil fuels to clean, renewable energy.
- Institute a national Renewable Portfolio Standard, requiring all utility companies to receive a certain percentage of their energy from renew-

able sources each year. In the first year, this amount could be set at 15 or 20 percent; within ten years, it would reach 100 percent.

- End subsidies and special tax breaks to fossil fuel companies while enacting just as aggressive or even more aggressive subsidies for renewable energy production: we cannot give special treatment to pollutants that threaten our planet.
- Introduce a 50% levy on all bank loans to the fossil fuel industry.
- Eliminate all single-use plastics to keep our oceans and landfills from choking with non-biodegradable matter, and our fossil fuels in the ground. Combine this with a push to eliminate all single-use packaging altogether by ensuring that it is 100 percent re-usable, easily recyclable, or backyard compostable.
- Institute new local, state, and national transportation projects, focusing on electric vehicles and ease of transport. High-speed electric rail, electric buses, subways, and other projects can not only help the country reach net carbon-neutrality, but can also help address inequality: our entire country relies on expensive, polluting cars that many people cannot afford, and having free and reliable public transit can aid transportation to jobs and communities.
- Lower or altogether remove parking minimums for buildings, ensuring that we have more space for people rather than more space for cars.
- Help rebuild our cities: use green and socially-conscious planning, develop new zoning laws while abolishing old ones to ensure that cities are not class or race-segregated, have free public transit, have sustainable and green buildings, and feature public housing areas that ensure low-cost housing for all.
- Modernize levees and related physical infrastructure to be climate- and disaster-resilient.
- Eliminate industrial animal agriculture subsidies.
- Create a national challenge account to promote citizen-based science, technology, and innovation—including but not limited to clean renewables. Combine this with an enabling environment for science, technology, and innovation, such as in the application of distributed ledger technologies to promote social, economic, cultural, civil, and political inclusion.

- Work with the United Nations to create a tribunal for climate crimes.

There is an informal poverty tax in America: the poorer you are, the more fees, expenses, and costs pile up. Public banking is a fix to some of these problems: by offering beneficial alternatives to predatory payday loans, banking deserts, and overdraft fees, we can make sure that people aren't knocked entirely off their feet for not being rich in the first place.

The United States should:

- Re-establish banking services within post offices, using our preexisting nationwide infrastructure to benefit people in even more ways. Include no-cost checking and savings accounts.
- Establish small-dollar loans through these public banks with small dollar amounts and no interest rates. State-run banks are free to charge interest if they so desire.
- Ensure that municipal taxes flow through these public banks rather than coercive behemoths like Wells Fargo, making it so that interest and loans go towards the public good rather than the profit motive.
- Using Germany's nation-building municipal banks as a model, along with North Dakota's profitable, beneficial state bank, fund major and minor infrastructure projects through loans made by public banks that consistently offer lower interest rates and more capital for these public-good projects.

The American tax system benefits the very wealthy over the average citizen and the corporation over the consumer. As inequality has skyrocketed, the tax system has remained remarkably lax on the wealthy and on large corporations. The American tax system should be reformed so as to be significantly more progressive; it is fundamentally unfair for working-class people to be paying a burdensome amount in taxes while wealthy people benefit from tax cuts.

The United States should:

- Repatriate all wealth currently residing in off-shore tax havens and that are therefore avoiding taxation, with a one-time tax rate of 72 percent. Anyone found with such money after the deadline will be eligible for prison.
- Institute a tax on all financial transactions—a Tobin spot tax—on all speculative financial transactions, including but not limited to foreign exchange trading.

- Marginal tax on all income over \$500,000 at 75 percent; income over \$1 million at 95 percent.
- Raise the capital gains tax.
- Eliminate all tax law designed to benefit oil, gas, and coal companies.
- Explore a progressive tax on initial public offerings, to increase as the size of the IPO increases.
- Eliminate tax laws that benefit the wealthy.

The tax prep industry consistently fights for tax filing to be difficult, confusing, and overwhelming, and they've been profiting off of every instance of someone handing the reins over just to not have to deal with this mess of a system. An automatic tax system would benefit almost all Americans.

The United States should:

- Have the IRS create a free, open source online tax prep and filing program similar to TurboTax or others, ensuring that almost no one has to pay to file their taxes.
- Ban the IRS from collaborating with tax filing companies as they do right now, abolishing the corporatized Free File program that less than 3% of the population uses due to lack of advertising and exacting, confusing eligibility requirements.
- Establish a 'return-free' filing option to allow millions of Americans with a straightforward tax situation to choose a pre-prepared, simple filing process that comes with their tax return already calculated and immediately redeemed.

Access to the collective knowledge and culture produced from the beginning of the human species through the present and beyond is a human right. That we allow the hoarding of key research findings, medical advances, fundamental industrial machinery and processes, and so on is an absolute injustice that must end.

The United states should:

- Open source all currently existing patented and copyrighted works.
- Issue no future patents or copyrights.
- Cease enforcement and work to remove all intellectual property provisions from any existing 'Free Trade' deals.

- Nationalize all large private academic journals and databases.
- Have the Library of Congress create an open-source digital distribution and streaming platform to allow everyone on Earth free access to all forms of culture.

According to the top Nixon aide John Ehrlichman, the War On Drugs started as a way to criminalize African-Americans and the anti-war left—and it worked. Marijuana and heroin were heavily criminalized, leaders were arrested, communities were raided, and lives were ruined. This war has only progressed and become more bloody since, and is infamous for ravaging cities, destroying families, murdering dogs, and serving as the prime engine of mass incarceration. This unwinnable war has always functioned as a method of population control, not as a way to help the addicted or stem the flow of drugs; it is not a coincidence that black people are arrested for marijuana over three times as much as white people despite usage rates being about the same. By bringing this war to an end, we will be able to remove the roadblocks that prevent addicts from getting help and end the pattern of selectively-enforced felony drug convictions that oppress the poor and marginalized and that force drug users into the recesses of society. Seventy-thousand Americans died of opioid overdose in 2017, and we have made this happen. By criminalizing users and dealers at every step, we offer no alternative but the needle.

The United States should:

- Remove marijuana from the list of drugs on the Controlled Substance Act and add an amendment to the Constitution to ensure that it is fully legal nationwide.
- Ensure that home growth is legal: even now, as marijuana becomes a billion dollar industry, Americans are being arrested and thrown in prison for growing a plant themselves.
- Increase funding for drug treatment programs dramatically. Naloxone must be provided to protect us from fentanyl, plentiful rehab centers must be run and run well, and addicts must be helped, not hurt.
- Free all nonviolent drug offenders and expunge their records.
- Ensure that kratom remains legal, which is often extremely helpful for chronic pain sufferers and diverts individuals from opioid use.
- Decriminalize, legalize, regulate, and tax all drugs, including opioids. No amount of criminalization actually stops drug use, and so we need to

provide safe alternatives to shady dealers and laced products. We will gain legitimate jobs, tax income, development, and more importantly the safety of millions of lives more than before.

The death penalty is a relic of an earlier, more brutish time in American history. No one, no matter how terrible their crimes, deserves to be put to death by the state; just as two wrongs do not make a right, an additional death does not ease the awful burden of a victim's family members. Nor does it heal the community in any way. Moreover, the death penalty has repeatedly been shown to be extremely costly, to not infrequently kill innocent people, and to be racially biased in who is selected to be executed.

The United States should:

- Adopt the “Stevens Amendment” to the US Constitution, named for former Justice John Paul Stevens, who proposed it in his book *Six Amendments*, adding the words ‘such as the death penalty’ after “cruel and unusual punishments” and before “imposed” in the Eighth Amendment.

When a police officer kills an unarmed suspect, they are committing murder—total deaths by police per year often reaches over 1,000. Between straightforward murder, civil forfeiture without cause, racial biases in arrests and searches, and the lack of prosecution that almost any of these offenders have received, it is obvious that America has a police accountability problem. This has to be solved if we want to say that we are a country of any kind of justice or freedom.

The United States should:

- Require that all police departments have civilian review boards to review complaints against police officers, with the power to remove officers.
- Work to abolish the doctrine of qualified immunity, the legal doctrine that protects police officers from lawsuits if they were executing their official duties. While potentially fine in theory, it has consistently been used to call any and all destructive behaviors ‘official duties.’
- End the 1033 program that transfers excess military equipment to our police departments, giving terrifying gear ranging from tanks to grenade launchers to people who are supposed to be protecting our communities, not waging war on them.

- Abolish the use of public, open-carrying for police officers; arms must be kept in police vehicles or in their stations until they are specifically called for and required. Too many people die from trigger-happy cops.
- Immediately transition SWAT weaponry towards the nonlethal to ensure that SWATing is no longer a death sentence. And I don't know, just spit-balling here, maybe don't be such fucking trigger-happy frat boy dipshits? Also: stop murdering dogs.

The United States has four percent of the world's population, but twenty-two percent of its prisoners. Americans experience extremely long sentences, sentences for far more nonviolent crimes or those without a victim, and a jailing system that sees massive racial disparities in who gets locked up and why. Our trials and sentences are not fitting for a nation that calls itself the land of the free, and have to be changed if we want to rehabilitate the hurt rather than locking them up and throwing away the key.

The United States should:

- Make Community Oriented Policing Services (COPS) funding for states contingent on their raising the age of criminal responsibility to 18.
- Massively increase funding and manpower for public defenders, as our current system ends with over 90% of cases concluded by plea bargain due to massively understaffed and underfunded offices.
- Abolish mandatory minimums for sentencing, as they have shown themselves to be incapable of taking context, background, previous standing, or vulnerability into account.
- Abolish voir dire and have all juries be fully, completely randomized without exception to ensure that the massive biases against the marginalized in juries do not remain in place.
- Cap all prison sentences at 10 years.
- Abolish all occupancy clauses that force certain private prisons to always be at a certain capacity—usually 90 percent—at the expense of the taxpayer if rates fall below such a threshold. This will not, of course, be necessary if private prisons are abolished altogether.

Prisons should be a place for rehabilitation, where the convicted enter, learn, build themselves, understand their mistakes, and leave the system as better people. We no longer even pretend this is the case. People now

go to prison not as punishment, but to receive punishment. This happens increasingly in private, for-profit enterprises whose incentives are to grow their business through growing the prison population. No matter how small the offense might be, entering the system can become a life sentence for women and men, where leaving only means that one cannot get a job, loans, or anything they need to live a good and legal life. We are draining our own pockets to pay for torture, and gain nothing through it besides the pain of those that sometimes need our help the most.

The United States should:

- Abolish private prisons, as they drive up incarceration rates and sentences while treating their prisoners like nothing more than a commodity to profit off of.
- Provide full access to high school and college courses to prisoners, and allow prisoners to qualify for Pell Grants.
- Abolish prison for low-level offenses; courts should decide whom to set free and whom to keep in jail. Other methods of punishment like fines, community service, et cetera should be emphasized for these crimes, especially nonviolent ones.
- Ban cash bail: true flight risks and dangers to society should be held without bail, and the rest should not be relegated to only being free if they happen to be rich.
- Ban solitary confinement, as it has been proven to be a tool of torture that ruins minds, causes hallucinations, and scars people for life.
- Establish a grant program to refurbish prisons to make them humane.
- Lift the ban on food stamps and Temporary Assistance for Needy Families benefits for drug offenders.
- Pass a national “ban the box” law, preventing companies from asking job applicants about their criminal histories in the initial phase of a job application process.
- Make it illegal to charge prisoners for basic amenities: letters and phone calls to family, books, food, and more should be provided to them, and are not luxuries meant to bankrupt the poor. More than just taking someone away from the world, being imprisoned has also become a way to impoverish the family.

- Give workers within prisons the same workers' rights as those outside of prison: abolish below-minimum-wage labor that allows private corporations to pay pennies on the dollar in wages, along with ending rampant labor violations and exploitation that is not only cruel and inhumane but that also drives down wages and conditions for workers who are not incarcerated.
- End the practice of banning certain books inside prisons.
- Abolish provisions in prison guards' contracts that make discipline into an internal affair rather than an external one, such as allowing them to refuse to answer questions to police that are investigating them. Install more accountability procedures into our prisons to minimize the current rampant abuse.
- Stop sending people back to prison for minor parole violations.
- Enfranchise ex-prisoners and current prisoners; even if someone has committed a crime, they are still a citizen. Prisoners are under the full control of the state yet do not even get a say in how it is run.

Despite cultural changes, the US government has maintained a puritanical approach to commercial sex work. Many Americans have come to see this work without the blinkered moralistic view of yesteryear; and they have come to recognize commercial sex workers as one of society's most vulnerable communities. Women of color, of migrant backgrounds, and transgender women often rely on sex work for money. It is time to take a more rational approach.

The United States should:

- Repeal the Stop Enabling Sex Traffickers Act (SESTA) and the Allow States and Victims to Fight Online Sex Trafficking Act (FOSTA), which targeted sites like Backpage.com that sex workers used to screen clients and ensure safety.
- Encourage states and municipalities to decriminalize all commercial sex work.
- Focus on illegal and coercive sex trafficking, not consenting sex work.

The Trump administration's monstrous approach to immigration policy is a humanitarian and moral catastrophe, one that must be mended immediately. But we cannot simply go back to how we were under the Obama or Bush administrations; American immigration policy has been cruel for a

long, long time, and we have to do more than simply repeal what Trump has done.

The United States should:

- Observe its international commitments with respect to migrants and refugees (as set out in the 2016 New York Declaration).
- Abolish the US Immigration and Customs Enforcement agency and US Customs and Border Enforcement, which was only founded in 2003 and which has only functioned as a destructive secret police tasked with promoting fear in immigrant communities.
- Offer immediate legal status to all undocumented immigrants who have resided in the country for more than ten years on a three-year pathway to citizenship.

It is the government's role to provide safe and affordable reproductive services to the people to use as they see fit, not the role of the people to conform to a governmental standard of proper bodily conduct. Control over one's body is a fundamental human right and therefore must be treated as such by our government.

The United States should:

- Pass an amendment to the Constitution guaranteeing the rights of all citizens to basic bodily autonomy including the rights to contraception and to safe and legal abortion before viability. This could be included as part of an updated Equal Rights Amendment.
- Maintain free condom dispensers in all public buildings and any businesses open to the public which receive any federal funding.
- Repeal all laws restricting health insurance coverage of abortion from private insurance and medicare.
- Ban predatory crisis pregnancy centers which manipulate and shame women into carrying to term children they are unable to support and replace these dishonest institutions with government funded clinics which offer strictly accurate medical information and promote safe responsible use of abortion.

The US government has been ruthless in cracking down on whistleblowers. Edward Snowden fled the country for revealing gross government abuses of the human rights of American citizens and of the peoples of other countries; Chelsea Manning was tortured for years for revealing war crimes; Reality

Winner has been imprisoned for leaking reports on Russian hacking to journalists. None of these figures, who did as their conscience dictated, should be in prison. We should celebrate these heroes, not lock them up.

The United States should:

- Pardon whistleblowers, including Snowden, Manning (whose sentence was merely commuted), Terry Albury, Reality Winner, Julian Assange, and John C. Kiriakou.
- Offer prominent government whistleblowers the Presidential Medal of Freedom.

The US has been inflamed by a debate over foreign interference in its domestic affairs. However, successive US governments and media outlets have consistently obscured their role in undermining or overthrowing the governments of sovereign countries (including democracies). According to research conducted by Carnegie Mellon University, the US interfered in 81 elections in other countries between 1946 and 2000. US governments have also been intermittently party to human rights violations, including aiding and abetting, or carrying out, extrajudicial killings. The fundamental lack of accountability and transparency must end: a government cannot be of the people nor for the people if the people do not know of, or have oversight over, what is being done in their name.

The United States should:

- Release the full, unredacted Senate Intelligence Committee report on CIA torture.
- Launch a formal investigation into US government officials' ties to human rights violations in the Middle East, Asia and the Pacific, the central Asian republics, Latin America and the Caribbean, and sub-Saharan Africa. Examples of such violations include the No Gun Ri and Jeju Island massacres and involvement in Indonesia's Konfrontasi.
- Cooperate with the International Criminal Court as and when required to do so.
- Release the uncensored Mueller Report.
- Grant full citizenship to refugees of the Vietnam War.
- Fully investigate the actions of every living former president where the possibility of war crimes charges exist.

It is constructive to recall Jefferson's observations on the need for dissent to maintain liberty:

“God forbid we should ever be 20 years without such a rebellion.”

He was expressing the idea that “liberties are ensured by the spirit of resistance” and that all great nations had rebellions—again justifying that liberty shouldn't be sacrificed by conservative worry.

It seems to me that adding strict limits to the government's powers and closing the loopholes that now threaten the Republic are forms of dissent that deserve an open airing. I offer these proposed amendments as a start. I consider them commonsense ways to limit the abuses of power and rank corruption that are undermining the Republic. The penalties have to be severe enough to thwart all who seek to exploit the government's many powers for their private enrichment and gain.

1. No government may restrict the citizens' enjoyment of the civil liberties defined in the Bill of Rights on all public and private land, with the sole exception being activities that restrict or disrupt the normal flow of commerce.

No more “free speech zones” situated five miles from the political hack giving a hackneyed speech.

2. No personnel, paid or unpaid, of the government, government contractors, or entities receiving direct or indirect funding from the government may set foot on any foreign soil for the purposes of hostilities or actions preparing for hostilities except as authorized by a Declaration of War by Congress.

No more ‘wars of choice’ or imperial meddling and over-reach. You want military or mercenary operations in 20 countries? Then get 20 Declarations of War from Congress.

3. No person or entity—living, artificial, legal, robotic, or digital—may contribute more than one day's pay of the average American laborer to any person seeking elected office in any one election cycle, in currency, goods, services, or labor, paid or unpaid. Any person seeking elected office who accepts more than this sum in any form, and anyone who seeks to circumvent this statutory limit on campaign contributions, shall be barred from holding office for their lifetime and will serve a minimum prison sentence of five years.

This is about \$100 in today's money.

4. No person or entity which has received funding, favors, or contracts from the government, directly or indirectly, within the previous five years is allowed to contribute to any elective office campaign, under the penalties described in Amendment 3. Additionally, any entity that seeks to bypass this restriction shall be fined five years of annual revenues, payable upon conviction.
5. Every contribution, direct or indirect, in currency, goods, services, or labor, paid or unpaid, made to a person seeking elected office, must be published publicly within 48 hours of receipt. Every entity's contribution must carry the name of the person or persons responsible for the entity's management. Any entity that seeks to bypass this restriction shall be fined five years of annual revenues, payable upon conviction.

A corporation with annual revenues of \$1 billion would pay a \$5 billion fine, or be liquidated. Its shareholders and bondholders would be wiped out.

6. No individual may spend more than one month of the average laborer's monthly pay on their own campaign for elective office. Anyone who seeks to circumvent this statutory limit on campaign contributions shall be barred from holding office for their lifetime and will serve a minimum prison sentence of five years.

This is about \$4,500 in today's money.

7. The civil rights of citizens cannot be extended to legal entities, and are reserved solely for living individual citizens.
8. No government employee may accept a position in any private entity that has accepted funding, favors, or contracts from the government in the previous five years for a period of ten years after leaving government office.

No more revolving doors, no more corporate capture, no more campaign contributions beyond trivial sums. Campaigns of volunteers will face off against each other.

9. Every agency and office of the government, and every entity or person that has received funding, favors, or contracts, directly or indirectly, from the government, shall be independently audited every four years, and the results of these forensic audits are to be made public on the day of their issuance. Any entity that seeks to bypass or evade

this requirement shall be fined five years of revenues, payable upon conviction. Any person who seeks to bypass or evade this requirement shall serve a minimum prison sentence of five years.

No more unaudited agencies and government contractors.

No existing federal or newly nationalized organizations can cooperate with law enforcement other than when investigating the organization itself.

This means the Post Office cannot turn over any information or mail, this means that the nationalized cellular network cannot turn over location or subscriber info, this means the nationalized internet provider cannot hand over any data or assist in ‘tapping’ the lines in any way. Should any organization find evidence of tampering they are obligated to fix the breach.

Public Goods will absolutely not be allowed to serve as a tool of oppression. To the greatest extent technologically and reasonably possible, all nationalized organizations must collect as little data as possible and retain such data for the minimum duration required to satisfy the need for collecting it in the first place. Communications must be end-to-end encrypted with no ability for the network operator to circumvent it. All computers and smartphones must be fully encrypted.

If a law enforcement or intelligence agency finds a flaw which allows them access they must report the flaw immediately so that it can be patched. Failure to do so results in a mandatory 20-year prison sentence for treason.

When I was in college, I accidentally attended a talk by a member of the Revolutionary Communist Party. I say ‘accidentally’ because I thought it was going to be a talk about the role of religion in society. It was billed as an author event about a book called *Away With All Gods*, and it was sponsored by the campus humanist society. When I got there, I found that it was not a typical author talk. For one thing, the author was not there. Instead, he had sent a representative. The author, Revolutionary Communist Party Chairman Bob Avakian, was in self-imposed exile in the south of France. An RCP deputy would be giving his book talk on his behalf.

What I remember most about the event is that the RCP representative kept saying “In the book, Bob Avakian writes. . .” and “Bob Avakian says. . .” The speaker didn’t say what she thought, she just said what Bob Avakian thought, and he was invoked as an expert on everything. He was never seen, never spoke in his own name, but he was a looming authority in the sky. We were to defer to the wisdom of Chairman Bob. And I remember my chief reaction being:

“Why the hell should I care what Bob Avakian thinks?”

It's the same way I feel about the Founding Fathers.

Sometimes, when I see people criticizing left policies, they are arguing that left policies will have bad consequences, and I think those of us on the left need to explain why we do not think our policies will have those bad consequences. But just as often, I see arguments that I don't have any respect for:

1. That our policies are "politically impossible."
2. That they're "unconstitutional."

I've written before about 'political impossibility' arguments. The reason I don't think they're worth spending time on is that nobody knows what is and isn't politically possible, because political reality changes rapidly and unpredictably. Donald Trump was told that his presidency was impossible. He ignored this, and now he is president. After all of the experts on the limits of the possible got Trump so wrong, I feel no need to ever listen to them again as they make new predictions about what can and cannot happen in politics. While we need some theory for how we're going to get Policy X done, we can only know whether the theory works by trying it. So we should be spending our time asking questions like: 'Is Policy X a good idea?' And if the answer is yes, then we ask: 'What's our most plausible path toward getting Policy X done?'

Be on the lookout, because 'experts' often drift from subject areas where they actually know something to 'political possibility' speculation, which they know nothing about. See: Larry Summers and Paul Krugman. Even if we assume an economist has some expertise, that expertise is on economics, not on 'what social movements can and cannot accomplish.' Disregard these men entirely when they stray from their narrow field of knowledge; and if their field is economics, you're probably safe disregarding them entirely.

Just as I don't think it's worth spending time on 'political impossibility' arguments, I have never understood why I should care what the Founding Fathers thought about anything. Consider this recent article from USA Today called "Hey, Elizabeth Warren: Your wealth tax plan? It's unconstitutional." It is by a minor Bush administration official, and in part it does make a 'consequences' argument against wealth taxes, saying "the fact that this is bad economics seems intuitive" because "the top 1% of wage earners pay a greater share of federal income taxes than the bottom 90% combined." As I say, I take seriously arguments that policies are bad on their merits, but I feel I can ignore this one, because:

1. The author offers absolutely no actual supporting evidence for their claim that this is “bad economics” beyond their “intuitive” feeling that it is.
2. The one point they do make, about top earners paying a lot already, is an incredibly misleading piece of bullshit. Say there are only two people in a country, you and me, and I have a billion dollars and you have one dollar. Even if the tax rates are vastly skewed in my favor—I pay one percent and you pay ten percent—I am going to pay the vast majority of the tax revenue. Conservatives use the ‘share of federal income taxes’ to try to show that rich people are being soaked when what it actually shows is just that they are very rich and most of us barely have any money to tax.

The majority of the article, though, is about how wealth taxes are unconstitutional. In a section entitled “Not What the Founders Wanted,” the author writes:

“Article 1 Section 9 of the Constitution forbids the government from laying a ‘capitation, or other direct, tax’ unless in proportion to the census. Alexander Hamilton, in a brief supporting a national carriage tax, explained that a direct tax comprises, among other things, ‘taxes on lands and buildings. General assessments, whether on the whole property of individuals, or on their whole real or personal estate.’ In 1895, the Supreme Court ruled that income taxes were forbidden under this logic in *Pollock v. Farmers’ Loan & Trust Co.* Chief Justice Melville Fuller noted that ‘nothing can be clearer than that what the Constitution intended to guard against was the exercise by the general government of the power of directly taxing persons and property.’ This was the background to the Sixteenth (or income tax) Amendment, which was proposed, passed, and ratified during William Howard Taft’s single term. It gave Congress the right to levy a form of taxation that was originally constitutionally suspect. But there is no provision in that amendment for a general federal property or wealth tax. . . .”

I have to say, when I read things like this, I can’t help but think of Bob Avakian. Imagine that Chairman Bob someday manages to found a microstate. And he writes all the rules up, personally, and makes everyone follow them. Then, 250 years later, Bob is long dead, and the people of Bob’s country have finally established a sort of democracy after two centuries

where the country was ruled by people who looked the most like Bob using Bob's handwritten rules. Imagine how it would sound, to those citizens who had finally established a system where you didn't have to look like Bob in order to participate in governance, if some of the people who still looked like Bob said things like:

“Well, your new tax isn't what Bob would have wanted.”

Wouldn't you say to yourself what I said back at that RCP talk in college: Why should I give a damn what Bob Avakian thinks about anything?

This is going to sound quite radical, but it's true, so you need to believe it: The Constitution is a wholly illegitimate document to which we owe no loyalty whatsoever. To be honest, that should only sound radical if you don't think women, African Americans, and Native Americans are people. If you do believe that women are people, then the fact that they were excluded from the Constitution's drafting and ratification means that it has about as much legal and moral force as if I declared myself king of the world. The vast majority of the country had no input into the founding governance document. It was imposed on them by force. I do not see why they owe it respect.

I do not doubt that Alexander Hamilton wouldn't have wanted a wealth tax. He was, after all, a wealthy person. Perhaps the author's constitutional scholarship is accurate. I don't particularly care. Sooner or later this country needs to come to terms with something very unsettling: We have never set up a binding constitution, because we have never passed a democratically legitimate one. Until the early twentieth century, the female half of the population was completely disenfranchised. Black people did not get the franchise fully guaranteed until the 1960s, which let us remember is within the lifetimes of people who are alive today. And since not everyone is allowed to vote today, arguably we still cannot call ourselves a democracy.

The temptation, of course, is to say that the Constitution finally took its real effect around 1965, when voters 'tacitly consented' to it. But it is ludicrous to think that that the rules written by a small minority could suddenly become binding once the franchise is widely granted. The Constitution sets up the rules for changing it, and voters had to follow rules that were imposed undemocratically. To say that if we haven't yet changed the Constitution, we accept its provisions, is to say that the rules of the game are legitimate, but the whole point is that they aren't. If at Point A we have an authoritarian government that makes a set of rules, and at point B we have a 'democratic' government but only within parameters laid down at Point A, we do not have a democratic government.

No, I'm afraid there's no choice. Eventually we're going to have to start fresh and convene a new constitutional convention. It sounds radical, but unless we do it we're always going to be governed by the dead hand of an illegitimate dictatorship. Now, as you can see, that means that I'm not against Constitutions. I'm not against rights. I am a strong believer in rights. I am sure critics would say that I believe in lawlessness and might makes right because I do not think the Constitution and Bill of Rights command much inherent respect. But that's not the case. I am a strong believer in democracy and civil liberties, and it's precisely because our existing Constitution is so dysfunctional at protecting people's rights that I think there is good reason to point out its illegitimacy. We should respect the good parts of the Constitution (free speech, free press, no unreasonable searches, et cetera) and discard the bad (any limits on taxing the wealthy), and we should respect the good bits not because the Founders believed in them—since many of the Founders also owned and raped humans, calling their judgment into question—but because they are good.

I feel as if liberals make a mistake when they have Constitutional arguments with the right. I think there is a temptation to say 'Actually, the Constitution does allow wealth taxes' or 'Actually, cruel and unusual punishment should ban the death penalty' or whatever. And sometimes there are good arguments here, I'm sure Elizabeth Warren's former Harvard Law students can put together an excellent brief on why her wealth tax is constitutional. But more importantly: The respect we owe the opinions of Alexander Hamilton equals the respect the citizens of Avakiana owe the laws of Chairman Bob. Perhaps Bob did a good job setting up the country in many ways. Perhaps he was very wise actually, and perhaps his rules were far better than those of other countries at the time. That's a good reason to study and learn from them, and even incorporate some of the good ones into the next set of rules. But there's no need to defer to their authority when it leads to absurdity.

I'd like to quote one more bit of the USA Today article because it shows how silly constitutional arguments can get:

“A second objection is that the wealth tax proposal is functionally a bill of attainder, which is also forbidden under Article 1 Section 9, and denied to the states under Section 10. The ban was based on the abuse of this process by British governments seeking to punish political dissent. Hence bills of attainder, according to Chief Justice Earl Warren in the 1965 case *United States v. Brown*, were intended by the Framers to bar 'legislative punishment, of any form or severity, of specifically designated

persons or group.’ Under the test laid out in the 1946 case *United States v. Lovett*, bills of attainder identify specific groups (in this case ‘billionaires’) and impose punishment (taking wealth) without a trial. Laws denying employment to members of subversive organizations have been overturned by this standard; replace ‘communists’ with ‘the wealthy’ and you can see how the class warfare script has flipped.”

One thing I learned in law school is that you can make an argument for literally anything. You can make arguments that slavery, war, and environmental destruction are good. And as you can see here, you can make an argument that because “billionaires” are a “specific group,” you cannot punish them under the Constitution.

It’s a dumb argument, of course. Extreme wealth is immoral and harmful, and so ‘billionaires’ are only a “specific group” in the same way that ‘murderers’ are a ‘specific group,’ but ‘This anti-murder law unfairly singles out murderers for unique punishment’ would sound ridiculous. The possession of wealth is an action with consequences, and even if taxation is considered “punishment” (which it isn’t), it would be punishing an action rightly regarded as criminal.

But what determines whether a bullshit argument is accepted is ultimately not the Constitution. It is the courts, and who is on the courts will be determined by the political process. If the right manages to cram hundreds of judges into the court system, the possession of wealth will be some kind of “protected status” and constitutional rights will be all about shielding it from “persecution.” If the left takes power, its judges will rightly recognize the obscenity of treating “having power” (e.g. having wealth) as a vulnerability similar to being a racial or religious minority.

I should, then, note that I cede too much when I suggest that conservatives do actually care about the text of the Constitution. They invoke it a lot, because the Founders were conservative, and so of course they want it to bind us as rigidly as possible, but ultimately when text and legal principles conflict with their beliefs about who should hold power, out go the legal principles. After all, as I say, if we really care about legalistic integrity, that should reduce our deference to the Constitution, because it lacks it. Similarly, I have pointed out that if you really care about ‘property rights’ you should acknowledge that climate change is a giant act of theft perpetrated by rich countries against poor ones. I do not want to give the mistaken impression that I think constitutional conservatives have some integrity.

I think the big fear is that if you think ‘values’ rather than ‘existing laws’

should be given the most deference, you will end up becoming some sort of authoritarian or you will believe that anything goes. But anything does not go: Only the good things go.

“Ah, but who is to say what the good things are? You?”

No, the result of a democratic process.

“Oh, so it’s just majority rule?”

No! I think there is a bad faith move pulled here, where opponents of democracy pretend that there is some process that doesn’t involve having some conception of the collective will imposed on everybody. Really, though, we’re not talking about my ‘anything goes majority rule democratic free for all’ versus your ‘respect for individual rights.’ We’re talking about whether the rules are going to be made by dead slave-owners or by the people who exist in the here and now and who actually have to live under them. What this comes down to is a matter of trust: Conservatives trust Alexander Hamilton, and I trust my neighbors. They think my neighbors are scary and cannot be given power, while I think Alexander Hamilton should have no say whatsoever in contemporary wealth tax debates. These are the terms of the dispute: Those making arguments that left policies are unconstitutional are the ones who think Bob Avakian should rule over us centuries after his death, while those of us on the left think that people should get to determine their own fates, and the dead do not make rules that the living are bound to respect.

Remember, the government has *no* rights, only responsibilities and restrictions.

Besides acknowledging that economic theory is bound to time and society, it would also be good to give some fresh thought to familiar economic concepts we take as Bible-given. Let’s re-examine the ideas of interest—can we do without it; growth—can we have a no-growth economy; differential pay—need we pay a much higher salary for ‘higher’ work?; profit—should there be profit in all economic activities, such as health care, education, and others?; oligopolies—is it good to have very large corporations?; and competition—should we promote competition in all aspects of life?

Turns out, a work like Beethoven’s String Quartet No. 4 is a stubborn thing. When the piece debuted in Vienna, it took a full complement of musicians—two violins, one cello, and one viola. Two-hundred years later, the performance of the piece hasn’t changed a lick. It takes the same number of musicians, playing instruments that have hardly changed. As it did in 1801, the piece takes just about twenty-four minutes to complete. Classical

music has, in other words, slapped classical economics in the face. Over the centuries it hasn't become any more productive—and it can't.

While classical music hasn't grown any more productive, the cost of producing it keeps increasing. A symphony orchestra requires trained professionals. And if it hopes to recruit these professionals, it needs to pay them a salary that roughly competes with the rest of the economy, which grows progressively more expensive. A passionate oboist will take a pay hit to pursue a love of music, but still needs enough to afford food, child care, and housing. Without plausible pay, these musicians will choose some other, more viable line of work. Classical music has been in a state of terminal decline for decades. Such cost disease is at the heart of this decay. It's the reason that a concert ticket feels like a major philanthropic commitment—and why many can't afford an active interest in the genre. It's the reason that arts organizations are perpetually sitting on the edge of financial collapse.

There is no right to be a corporation. Incorporation is a privilege that is extended by government. The Founders barred any corporate interference in politics, and if a corporation broke the law, it lost its charter and the corporate officers were directly held responsible for *their* actions. Corporations don't do anything, people in charge of corporations make the decisions and carry out the actions. So no more LLCs. If you kill people due to lax environmental protections or worker safety, et cetera, then the corporate officers are *directly* and *personally* responsible for it. *They* made it happen, not some ethereal 'corporation.'

“I'm not talking about the evil neoliberals. I hate absolutely everything about this country. I hate that citizens have essentially no influence on the government. I hate that billionaires and multinational companies can legally bribe politicians with no consequences. I hate that my entire generation will be nothing but debt slaves for our whole lives and no politicians even pretend to care. I hate the way the MSM is infected with stupid and manages to propagandize that out over the TV 24/7. I hate that the people with all the money and power have made it absolutely impossible for anyone else to have even a modest amount of success in their lives. I hate how stubbornly resistant to learning almost everyone is. I hate the complete absence of people's ability to think for themselves. I hate that no matter how much you try to be good, do the right thing, and try hard, it is completely irrelevant. I hate the arrogance of everyone

pretending Climate Change doesn't exist or is someone else's problem.

But what I hate the most is that the solutions to almost all of those things are so incredibly easy. If you made me king of the world for six months it would all be fixed or at least well on its way to being fixed.”

For society-benefiting public spending, it is not about how much it costs, it simply costs what it costs, it is required; non-negotiable on its existence, but negotiable on its actual price. We should not overspend needlessly, this would likely be a result of corruption at worst or wasting individuals' time at best. But it costs what it costs.

We cannot stop all lobbying and legal bribery abuses. But we can stop many of them by taking a principle in our Constitution and expanding on it. We allow every representative and senator to send out all the mail they want for free. It's called “the franking privilege.” Let's extend that concept to their expenses. Let each member of Congress spend however much he or she deems necessary to do his or her job. If we can imbue representatives and senators with the power to make laws, surely we can give them the authority to manage their own expense accounts. This would come at a price: No more free trips, no more free meals, and no more gifts. Senator, if you need to inspect the cleanliness of the sink behind the bar at a resort in Tahiti, go right ahead, just give us the receipts with an explanation of the costs. We will collect the receipts from every elected representative monthly and post it all on the Internet in a format that makes for easy analysis. Every dollar, and every meeting, must be disclosed. And we will pay for it all, subject only to the usual penalties for embezzling, the punishments accorded by the full House or Senate because of their exclusive right to judge the fitness of members, or the decision by voters to oust a spendthrift. In this we can move politics back toward the people and away from monied interests. The penalties for taking anything—even a free shot of whiskey—should be swift, certain, and severe. Take a gift, go to jail. Call it zero tolerance for lawmakers.

Since before Maine was carved from the territory of Massachusetts, the town meeting has been the state's most common form of local government. All across New England, towns meet in late winter or early spring to vote on operating budgets, laws, and other matters for the community's operation over the following twelve months. Town meetings are social events, a welcome break from the long winter. They last all day, often broken up by a potluck lunch. This may not be the most efficient way to conduct the town's business—electing a mayor and letting him decide might use fewer

person-hours in the course of a year. Allowing a lobbyist to simply write the legislation he's paid for is simplest of all. But town meeting is a school for educating residents about public affairs, for making them citizens. Town meetings are a place to practice face-to-face democracy as citizen legislators.

“The truth is, a big part of the blame for this industry's dire straights is on us and our unwillingness to pay for the work journalists produce. The longer we get something for free, the more unwilling we are to pay for it. We are all going to have to pay for journalism or we are going to pay for it.”

Certainly the outcry against fake news in the wake of Donald Trump's victory lends credence to such remarks. But what if this formulation is still wrong? Maybe the problem isn't individuals declining to pay for news but instead a deeper, structural failing. Maybe, like other universal goods—public education, libraries, roads, post offices—we should all pay for it, collectively. Maybe, in short, journalism should be subsidized.

At the moment, newsrooms use a variety of stopgap measures—new funding models, private philanthropy, the latest business scheme—to try to buy themselves time. Meanwhile, media concentration gallops along, billionaires continue to exercise undue influence over the news, and increasingly desperate ploys for advertising dollars fail to stanch the flow of hemorrhaging jobs. A public subsidy that supports in-depth journalism and serves the public, not shareholders and advertisers, might be the only way to solve the journalism crisis.

There are many reports documenting the nightmares of privately operated public services. After emergency services were outsourced to a private company, one woman in Tennessee died as an EMT smoked a cigarette because her company couldn't get a crew together fast enough; paramedics in New York stole supplies from hospitals because their parent company couldn't afford them; a man in the South was billed \$15,000 after his house burned down because the privatized fire department didn't arrive. At first glance, the article—entitled “When You Dial 911 and Wall Street Answers”—seemed like a powerful piece of investigative journalism that defended public investment. But despite presenting a litany of horror stories, the articles almost never make a case for the fundamental unsuitability of private equity for this type of activity.

The discourse around journalism's collapse suffers from a similar problem. Profit seeking distorts the public function that journalists, like first responders, are supposed to perform. Yet too often, finger-wagging at individual billionaires stands in for a systemic critique of the media concentration and

profit-making that empowers them. In 1983, when fifty companies owned the majority of media outlets, some warned that monopolistic ownership would smother democracy and impair the public's understanding of the world. Today, at the same time local newspapers shut down and cut costs, the combination of increasingly concentrated ownership and for-profit technological innovation has convinced a new generation of billionaires to buy up media outlets and launch new media enterprises.

Some have become the personification of avarice and confused priorities. They purchase a newspaper, gloating about their investment in the public interest, and then offer their newsroom a big shrug as they slash jobs to increase profit margins. Others are philanthropists who support adversarial public interest journalism or inject much-needed cash into shrinking newsrooms. Yet the problem isn't the character of individual billionaires per se, but the fact that the political system has allowed such power to accumulate in the first place. While it matters on some level whether these billionaire-owned or privately funded outlets churn out self-interested coverage (as Sheldon Adelson wants his Las Vegas Review-Journal to do) or critical reporting (as Pierre Omidyar falsely sees his First Look Media as doing), a journalism dependent on the whims of the wealthy is not a media system worthy of a democracy.

Most everyone agrees that the advertising-based revenue model for news media has imploded. Where people differ is the effect of that implosion. Some pundits complain about the contemporary media's shallowness and sensationalism, casting "disruptive" technologies as the enemy of old-fashioned reporting. Others praise social media—often dubbed "participatory media"—as "democratic" and "open."

Since newspaper revenue remains in free fall—classified ads have dropped by 75 percent, and regular ad revenue has plummeted by 40 percent—some argue that consumers have more power than ever. When consumers select the news outlets they prefer—whether they're old standards or upstarts—advertisers flock to those sites, leaving less popular outlets without revenue. When these people acknowledge the severity of the traditional media's revenue problem, they offer a standard Silicon Valley prescription: embrace innovation and try new business models. The thing formerly known as advertising will become tools to help us shop, compare, save. The tracking and surveillance used to personalize ads aren't invasive threats to privacy, but the saving grace for otherwise outmoded news organizations.

Yet this approach has shown itself entirely unable to generate the revenue needed to sustain quality journalism. Many news organizations, like the New York Times, have bulked up their advertising and "digital dissemination" and have still been forced to cut reporters. It takes lots of resources to

produce hard-hitting investigative work. In addition to travel expenses, journalists need to have the time to hit wall after wall, follow leads to dead ends, and generally devote months on end to a single investigative project.

For instance, Mother Jones sent reporter Shane Bauer undercover as a guard to tell the story of life inside a private prison. In an appeal for reader support, the editor and publisher “conservatively” estimated the bill for the thirty-five-thousand-word feature:

“Counting just the biggest chunks of staff time that went into it, [it cost] roughly \$350,000. The banner ads that appeared on the article brought in \$5,000, give or take.”

For all of the hype about technology transforming society, the journalism that’s changed society tended to be produced by fiscally sustainable outlets that could afford to take risks. In the digital age, outlets are scrambling or forgoing that work all together. If traditional journalism is cratering, can social media sites like Facebook fill in the gap? Recent events suggest we should be skeptical.

Mark Zuckerberg commented on Philando Castile’s death at the hands of police in Minnesota. His post expressed condolences for Castile’s family and hope for a future free of such tragedies, before praising Facebook Live—the platform on which Diamond Reynolds, Castile’s fiancée, streamed the shooting—as evidence that Facebook enables people to “come together to build a more open and connected world.” A month later, Facebook and its subsidiary Instagram shut down accounts belonging to Korryn Gaines, a Maryland woman shot and killed by police, at the request of the authorities. The following month, it was reported that Facebook is “collaborating with the Israeli Government to determine what should be censored,” actively suppressing the voices of Palestinians and others fighting Israeli occupation. Whether Facebook sides with the powerful or the powerless—opening windows to democracy or actively shutting them—is up to a company whose *raison d’être* is profit-making, not disseminating news.

And what a profitable company it has become. Mark Zuckerberg now ranks as the sixth richest person in the world, worth approximately \$44.6 billion. His wealth, of course, comes from the 1.7 billion users who post, click, share, and update, a phenomenon that critics have dubbed “digital sharecropping” or “digital feudalism.” Simultaneously, thousands of journalists have lost their jobs and newsrooms have been downsized or shuttered, creating a yawning gap between the rich propagators of “digital sharecropping” and reporters, the people who are actually supposed to be the eyes and ears of a democratic information system.

For all the talk of journalism's bleak future, we don't hear a lot about its past. But the fact that American newspapers leached off advertising's fat for a hundred years or so was a lucky break, not some kind of natural law. The fact is, a mass market for serious reporting has never actually existed; in the United States readers have never paid anywhere near the actual price of news production. Instead, newspapers, by bundling the crossword puzzle and the real estate classified with the metro section and stories about world events, assembled a mass audience that could be sold to advertisers, who provided, on average, about 80 percent of revenue.

Before they came to rely on advertising revenue, newspapers were supported by public subsidies. While there were rollicking disagreements about the character and content of the post-colonial press in America, the one universally accepted premise was that the government needed to heavily subsidize the creation and development of the press if the constitutional system were to succeed. The idea that Americans should roll the dice and hope rich people would find it profitable to produce the journalism required for a constitutional republic to succeed was simply unimaginable in the days when America was conceived and formed. Everyone agreed that the government should support a free press because, the wide circulation of news throughout the colonies helped make the American Revolution possible.

Early American governments expanded and improved many public institutions that we still rely on today, most notably roads and the postal system. In the 1790s alone, the total mileage of "post roads" increased from 1,875 to 21,000. Over the next few decades, the number of post offices also expanded rapidly. While the post office did facilitate government and commercial activities, its primary role was transporting newspapers. The crucial debate in the Congress of 1792 was at what rate newspapers should be charged to be sent through the mail. All parties agreed that Congress should permit newspapers to be mailed at a price well below actual cost—to be subsidized. Between 1792 and 1845, newspapers accounted for as much as 95 percent of the mail and only 15 percent of the postal service's revenue.

"The state nurtured a free-press system the free-market showed little interest in providing; and it did so because, without state intervention on behalf of the public's right to know, constitutional rule, not to mention self-government, could not succeed."

By the end of the nineteenth century, postal subsidies had effectively ended and advertisers had flocked to newspapers, rendering the old subsidized model obsolete and creating new conflicts between commercial and public

interests. These tensions persisted for the next several decades. Advertisers wanted favorable coverage for their products, and often to advance their own political agenda. Through the Progressive era writers like Will Irwin and Upton Sinclair deplored the antidemocratic nature of the advertising-supported, semi-monopolistic press system.

After World War II, one solution to the problem took hold: the professionalization of journalism. Espoused by the *New York Times* and virtually every other mainstream outlet, this model demanded that newspapers enforce certain standards of objectivity, sourcing, and fact-checking, and, most importantly, erect a wall between news outlets' advertising and editorial departments. The professionalization of journalism—the post-war consensus—also had enormous drawbacks. It pushed the press, and arguably the country, toward the center as journalists prioritized getting “both sides of the story,” trumpeting their neutrality while excluding radical voices. It continues today to prop up lousy journalism that is “fact checked,” “professional,” or “objective.” But this arrangement pleased advertisers, and the media landscape continued to consolidate.

The dominance of the post-war consensus obscured its fragility. Two things held the whole thing together: the anti-commercialism of newspapers and journalists—who saw the division between reporting and selling as sacrosanct—and the heterogeneity of the media system. Even with increasing concentration, newspapers remained abundant. If a paper lost the public's trust, readers could pick up another one. It kept newspapers in check.

But with substantially fewer newspapers than a generation ago, and vanishingly few alternative revenue options, news outlets are racing to include advertisers in editorial content. Native advertising—in which advertising masquerades as editorial content ‘supported by Microsoft’ or ‘in partnership with Toyota’—has become the most prominent of these revenue-generating techniques. Every newspaper—from the local alt-weekly to the *Wall Street Journal*—has embraced it. The *New York Times* has a website devoted to wooing advertisers where it touts its ability to create “brand content and experiences that shape opinion.” The consequences are more dire than fewer papers and journalists. It was reported that, during the DNC and RNC conventions, the Hill was selling \$200,000 editorial interviews with up to three “industry executives or organizational representatives of your choice.” Donald is right to call such outlets peddlers of Fake News.

Our democracy can't afford this future of journalism.

American citizens pay less than \$1.50 each for public media. In comparison, Brits spend about \$80, and Finns and Danes spend about \$100. Anyone who's read the British tabloids knows the country is no paragon of journalistic excellence. But a subsidized Fourth Estate has at least helped foster a

healthier democracy, less government corruption, higher civic participation, and a much higher—and more diverse—proportion of the population reading the news. In the US, because we don't adequately subsidize public media, PBS and NPR must take corporate advertising (“underwriting”) in order to fill the gap. NPR gets a mere five percent of its budget from the local, state, and federal governments, yet receives as much as nineteen percent from corporations and another eight percent from foundations. Last time I turned on NPR, I learned the show I was listening to was “supported by” Koch Industries.

While a genuinely public outlet would improve the US media landscape, another, complementary, approach would be to introduce what some call a “Citizen News Voucher.” When filing their taxes, citizens could elect to subsidize an independent news outlet of their choice. News outlets would have to maintain a minimum number of subsidizers and would be subject to various restrictions, like forgoing advertising of any sort. By leaving it to citizens to choose the outlets they prefer, the news voucher would empower readers, instead of the state, to decide how the Fourth Estate is funded. It would also buttress independent journalists—not just those who are mouthpieces of the state.

These proposals aren't meant to be definitive, but instead to spark a discussion about public funding that—despite numerous studies from the Federal Trade Commission, Federal Communications Commission, and the advocacy group Free Press—seems virtually nonexistent. Before we can decide on the specifics, we must first acknowledge that the American press is in dire straits and, if we want a vibrant democracy, needs to be subsidized. Then we'll have a long road ahead. A robust subsidy for news media will become politically possible when it's taken up as part of a larger set of reforms designed to win democratic rule: expanding voting rights, funding free higher education, introducing self-government into the workplace, and more.

“There are many criticisms of the fiat money system. A popular one is that money is created when people borrow it. So you go to the bank and take out a mortgage. That money didn't exist before. You spend it into the economy, and it often leaves the economy into someone's tax haven bank account. That means that money isn't available for borrowers to earn back to pay off their debt. So there is a disequilibrium where more and more money is being called into existence, because it's needed, and it's eventually being locked away so that it can't be paid back. That creates a lot of problems around inequality and

economic injustice, because people are borrowing money, but are not able to earn it to pay it back.

It was when I discovered that I could find a niche for myself, programming software for LETS (local exchange trading systems), and someone told me that the financial crisis that had just happened was done deliberately. I couldn't imagine how this could be, morally, but also, how could the financial system be controlled like that? I got more into alternative media, and began to find out. It showed me that there is very little understanding in the mainstream of how the money system works, and there are alternative explanations that have been pushed to the margins of the economic discourse.

So I've already explained how fiat money becomes slowly unavailable to be repaid. With mutual credit, it's difficult to save, as it doesn't pay any interest and you can't make it scarce and charge interest, so you may as well spend it back into circulation and make it available for people to earn and pay back their loans. The ledger shows that for every debt there's a credit. So it all exists in one system and the books balance. From an economic and a moral perspective, mutual credit is the accounting of exchange. For everything you spend, you must earn it back, and for everything you earn, you must spend it back. So you begin on zero; you end on zero; the sum of all the accounts at any one time is zero; and the ledger is just showing you the current imbalance in your exchange. If you intend to exchange, you should be looking at mutual credit. If your intention is to accumulate, you probably want fiat or commodity money of some kind.

There are those who would point to cryptocurrencies as a more viable solution. Why is mutual credit a better idea? Crypto is much closer to fiat. It's about building a world without trust. Governments and banks aren't trusted, so no-one has the authority to guarantee the value of each token. The only reason crypto coins are valuable is if there is a market for them, and there might be a demand for them. So it's not a useful form of money because the value is always fluctuating. It might be nice if you've got no monetary policy and no-one in charge of the quantity of money—that might reassure some people. But at the same time, monetary policy is also there for a reason—you want to have the right quantity of money that the economy needs to facilitate trade. But in a system like Bitcoin, you've got a fixed

quantity of money, and there's no notion that there's a specific economy that uses it. If more people want to use Bitcoin, the value will go up, which is great if you already own Bitcoin—you'll benefit from the speculation. But it's not great if you're planning future purchases, or if you owe Bitcoin, and the price of your money goes up.

Fiat money works very much in this way as well, when it's traded on international markets—the prices go up and down relative to each other, creating what's called exchange risk. In mutual credit, the community decides the purchasing power of the coin, and they stick to it. There isn't a market for the units, because you can just create them and destroy them as needed. It's a unit of debt that's created when you borrow it, and it's destroyed when you pay it back.

LibraCoin is Facebook's attempt to take over the world by creating another Silicon Valley monopoly. They've got all the credit card companies on board. They're attempting to create a currency that's more stable and maybe more liquid than the US dollar, and this is why the French minister of finance has said that it poses a risk to sovereign currencies. They want the Facebook coin to be used all over the world. They're pushing it especially towards developing countries, to people they call the unbanked—people that the banks haven't worked out how to make a profit from. Facebook believes that it's worked out a way to make a profit from them—because they have phones, and they can do transactions with them using cryptocurrencies.

So yes, it might provide a measure of convenience for online payments, but we have to be careful—whose money are we using. If I own \$1,000 of Facebook coin, I'm actually funding them to the tune of \$1k. I'm lending them that much money, and they're giving me a token in return.

What the world needs now is a means of payment that is locally controlled but globally useful. So if we have local mutual credit schemes all over the world, how can they be linked together to create a global trading system?

The Credit Commons is locally controlled in that anyone can get together with friends or trading partners to make a group. And in that group, they say that we will trust each other to pay back the credit that we give each other. That enables them to trade amongst themselves without money. That's not globally useful however. The credit that they give each other is only

acceptable by themselves. So if you want to make the credit acceptable more widely, that group has to come together with other groups, and those groups have to do the same thing. They say—we will value your credit, meaning that we trust you to keep your promises, so we will give you goods and services, knowing that you will give us goods and services in return.

So now we have a group of groups. It's still not globally useful—but you can continue to build nested groups until it covers the entire world. So you can have a global group with continents in, then countries within continents, regions within countries, and you can bring it right down to the street level. Everyone is issuing credit, but because it's guaranteed by each group, and each group of groups, it's good to go across the world.”

Congratulations, you've essentially just recreated the global banking system, you've simply labeled things differently. This is unfortunately an all too common occurrence among radicals.

Most manifestations of attempts at horizontal governance attempt to deny all elitism by discouraging or forbidding it in any form and denying its necessity. Whether or not oligarchy exists, elitism most certainly does, in every field that requires expertise beyond that of a novice. To not allow elitism would be to not allow expertise, which would cripple any society. Elite levels of knowledge exist today for many reasons, exclusion of the majority of the population from education and access being the biggest. As an ideal in an open transparent society, anyone would be capable of attempting to contribute to elite knowledge resources, but limitations of interest or ability will still exclude all but a few. This is not an evil if it is properly controlled and it is in fact the best way to ensure decisions based on real expertise instead of connections and other sources of power.

Ignoring elite knowledge in favour of a pretense at completely horizontal governance will not eliminate elitism, it will only create hidden oligarchies dominated by those without the expertise required, usually celebrity personalities. In a concentric user group, the receptive field is stronger near the centre, so informed opinions will be heard more clearly by experts in the centre, but full transparency will allow anyone from any part of the system to be as informed as they wish to be by any other part.

Stigmergy is a mechanism of indirect coordination, through the environment, between agents or actions. The principle is that the trace left in the environment by an action stimulates the performance of a next action, by the same or a different agent. In that way, subsequent actions tend to

reinforce and build on each other, leading to the spontaneous emergence of coherent, apparently systematic activity.

Stigmergy is a form of self-organization. It produces complex, seemingly intelligent structures, without need for any planning, control, or even direct communication between the agents. As such it supports efficient collaboration between extremely simple agents, who lack any memory, intelligence, or even individual awareness of each other. The term ‘stigmergy’ was introduced in 1959 to refer to termite behavior. It was defined as:

“Stimulation of workers by the performance they have achieved.”

It is now one of the key concepts in the field of swarm intelligence. Stigmergy was first observed in social insects. For example, ants exchange information by laying down pheromones (the trace) on their way back to the nest when they have found food. In that way, they collectively develop a complex network of trails, connecting the nest in the most efficient way to the different food sources. When ants come out of the nest searching for food, they are stimulated by the pheromone to follow the trail towards the food source. The network of trails functions as a shared external memory for the ant colony.

In computer science, this general method has been applied in a variety of techniques called “ant colony optimization,” which search for solutions to complex problems by depositing “virtual pheromones” along paths that appear promising.

Other eusocial creatures, such as termites, use pheromones to build their complex nests by following a simple decentralized rule set. Each insect scoops up a ‘mudball’ or similar material from its environment, invests the ball with pheromones, and deposits it on the ground, initially in a random spot. However, termites are attracted to their nestmates’ pheromones and are therefore more likely to drop their own mudballs on top of their neighbors’. The larger the heap of mud becomes, the more attractive it is, and therefore the more mud will be added to it (positive feedback). Over time this leads to the construction of pillars, arches, tunnels, and chambers.

Stigmergy has even been observed in bacteria, various species of which differentiate into distinct cell types and which participate in group behaviors that are guided by sophisticated temporal and spatial control systems. Spectacular examples of multicellular behavior can be found among the myxobacteria. Myxobacteria travel in swarms containing many cells kept together by intercellular molecular signals. Most myxobacteria are predatory: individuals benefit from aggregation as it allows accumulation of extracellular

enzymes which are used to digest prey microorganisms. When nutrients are scarce, myxobacterial cells aggregate into fruiting bodies, within which the swarming cells transform themselves into dormant myxospores with thick cell walls. The fruiting process is thought to benefit myxobacteria by ensuring that cell growth is resumed with a group (swarm) of myxobacteria, rather than isolated cells. Similar life cycles have developed among the cellular slime molds.

Stigmergy, studied in eusocial creatures and physical systems, has been proposed as a model of analyzing some robotics systems, multi-agent systems, communication in computer networks, and online communities.

On the Internet there are many collective projects where users interact only by modifying local parts of their shared virtual environment. Wikipedia is an example of this. The massive structure of information available in a wiki, or an open source software project such as the FreeBSD kernel could be compared to a termite nest; one initial user leaves a seed of an idea (a mudball) which attracts other users who then build upon and modify this initial concept, eventually constructing an elaborate structure of connected thoughts.

In addition, the concept of stigmergy has also been used to describe how cooperative work such as building design may be integrated. Designing a large contemporary building involves a large and diverse network of actors—architects, building engineers, static engineers, building services engineers. Their distributed activities may be partly integrated through practices of stigmergy.

The rise of open source software in the twenty-first century has disrupted the business models of some proprietary software providers, and open content projects like Wikipedia have threatened the business models of companies like Britannica. Researchers have studied collaborative open source projects, arguing they provide insights into the emergence of large-scale peer production and the growth of gift economy.

Stigmergy also occurs with social movements, such as the arc from Wikileaks' cable release in Summer 2010 to the developments in the global Occupy movement. The Occupy movement itself operated stigmergically, with innovations developed by one node becoming part of the total movement's common toolkit.

Some associated with the Occupy Movement, Wikileaks, and Anonymous have proposed a new social system where competition as a driving force would be replaced with a more collaborative society. This proposed society would not use representative democracy but new forms of governance generated by user groups and collaborative methods including stigmergy.

“With stigmergy, an initial idea is freely given, and the project is driven by the idea, not by a personality or group of personalities. No individual needs permission (competitive) or consensus (cooperative) to propose an idea or initiate a project.”

These are just the beginnings of a conversation, not the final word. Not expanding or shifting the Overton Window but tearing down the entire wall. This is a process, not a destination. Not a final blueprint but a draft. And let me assure you, drafts don't have to look anything like the finished product. What does a just and equal world look like? Those of us alive will never know. For we have been shaped, broken, biased by the current systems of propaganda and abuse. We have been foreverably altered by them.

To those unborn whom these words reach, what is it like? What did you do? What did *we* do? How fucking wrong were we? The pain you recognize—I hope you do—that we inflicted was all too real. Some did feel it, in the moments, could see it, in part for what it was. But how do you see it—in its full glory? Please remember some of us tried, however imperfect we may have been. And know that you too are likely to have your own weaknesses, biases—don't get too cocky kid. Now I gotta get back to those of us in the here and now, as I write, we'll do our best to make your present 'good,' we're sorry if we got it wrong.

If you are reading this, it's most likely the result of a series of events in your life which have drawn your interest and attention to the fact that our world is quite a bit different from what we've been told by our school teachers, by the news media, by Hollywood, and by politicians.

At some point, for whatever reason, you've come to realize that the consensus narratives in our society about what's going on are false. The tools that people are taught to use to inform themselves about their government, their nation and their world are not just full of inaccuracies, but deliberate distortions, ranging from the reasons we're given for why wars are started, to the way our political systems work, to where real power and authority actually lies, to the way nations and governments actually behave in the world.

This awareness has come with a degree of alienation. Not buying into the same consensus narratives about the world as your friends, loved ones and peers comes with an inability to relate to them on some levels, which can cause you to feel a lack of intimacy in those areas. You may have also found yourself the odd one out in conversations about politics or other controversial issues, maybe even lost old friends over it. But you kept going

anyway. For some of us, it's more important to be true to the truth than it is to fit in. You're one of those people.

So, I just want to say thank you. Sincerely. Thank you from the bottom of my heart. I'm on-my-knees grateful to anyone who sets about untangling themselves and their species from the deceitful narratives which pervade our society. It is the most important battle that can possibly be fought. The most important battle that has ever been fought.

There is nothing more important than this fight. Our species is on a sure trajectory toward Orwellian dystopia if climate collapse or nuclear war don't send us the way of the dinosaur first, and the only thing that has the power to steer us out of that trajectory is the people using the strength of their numbers to force an end to the oppressive, ecocidal, omniscidal status quo.

But they don't. The people don't use the strength of their numbers to force an end to the oppressive, ecocidal, omniscidal status quo, because they aren't interested in doing so. Why aren't they interested in doing so? Because their minds are being manipulated on a mass scale by the same people who have been granted immense power and wealth by the existence of that status quo.

All of mankind's biggest dilemmas are ultimately due to the fact that propaganda is far more ubiquitous and far more advanced than most people realize. And it's not their fault. Not really. Nobody teaches you in school that throughout your entire life your plutocratic overlords will be working to control the thoughts in your head using a highly sophisticated arsenal of psychological operations funneled into your mind via their near-total control of the media. Nobody warns you as a kid that if you ever really want to grow up, you'll first have to extricate the vast network of lies which have been deliberately sewn into your consciousness since birth.

But their tricks didn't work on you. You found your way out of that matrix of deception. It wasn't easy, and it wasn't comfortable, but you did it. And now you're ready to fight.

And fight you have. You have already been doing what you can to share information which counters the disinformation, doing your best to throw sand in the gears of the propaganda machine and show people the little gaps in the code of the matrix in the hope that some light sleeper might spot it and begin waking up from the dream. You don't need me to tell you to do this, because it's obvious to anyone who's seen through the illusion. You're doing it already. And you're going to keep doing it. And you're going to get better at it.

You're going to get better at it because you're going to keep learning and gaining a better and better understanding of how the oppression machine

operates, so that you can describe it more lucidly to others.

You're going to get better at it because you're going to keep practicing your craft: attacking the propaganda matrix at its weakest and most vulnerable points at every opportunity. Practice makes perfect, and the more you keep at it the more skillful you'll get at spotting gaps in its armor and firing the most damaging truth bombs straight into them.

You're going to get better at it because you're going to keep doing your own inner work to expunge all lies from your system, from the most surface-level propaganda narratives all the way down to your most fundamental assumptions about the nature of reality itself. You understand that only turkeys are done, and that it will always be possible to get a little bit clearer inside every day. The less your vision is impeded by falsehood, the better you'll be able to see on the battlefield.

You're going to get better at fighting, and you're going to keep fighting no matter what. Not because it's an easy war, nor even because it's a winnable war, but because you have made truth your highest value, and untruth is therefore intolerable to you. You will keep attacking the lie factory at every turn until it collapses into its own foundations beyond any possibility of repair. You will keep driving your sword through until you see it come out the other side.

And others will join you, because they have awakened to what's going on too. And then there will be more of them. And more. And more.

There is no more important fight than this. The survival and well-being of our entire species depends upon it. The oligarchs and their government agency allies cannot be defeated as long as their propaganda machine is killing off all desire to defeat them.

Never doubt that your energy poured into this effort is well-spent. Never let anyone shame you into silence or make you believe that your efforts are in vain. Never doubt that you're on the right path.

Your edge is your agility and your access to inspiration. No amount of social engineering can move as fast or shine as bright as the truth. You have everything you need to win, and there are more signs than ever that the win is on the horizon. What once seemed impossible now seems inevitable.

I love you.

Keep pushing.

The time is up. The time is now. Gather the people to do the work: the healing, transformative, deepening work of building community, solutions, understanding, skills, knowledge, and hope. You must be the one to make a change, to step out of the rutted tracks of the looming train wreck that is our culture. You must have the courage to walk into the wilderness of what you don't know and embrace the solutions that will save our lives.

All quests and hero's journeys begin with this: the yearning for change; the hope of saving graces; the long shot of wished-for miracles. In each of us, our willingness to make a change begins with equal measures of fear, courage, and purpose rolled into an electric jolt to the soul—a spark that launches you toward danger and potential.

Our world will be saved by billions of ordinary heroes who decide to do hundreds of humble and extraordinary actions. Hour by hour, minute by minute, we change our world by withdrawing our support, cooperation, and participation from old destructive systems. By making these shifts, we starve the monster we have become. One small action multiplied by millions of people adds up quickly to massive change. One small action done strategically by a small group of people can catalyze a hundred-million more.

Change requires that we live differently. All of us must make changes: from the most committed activist who knows she must reconnect to her heart; to the average citizen who suspects he could be doing more. Real change is never handed to us on a silver platter, nor served by powerful people. When tribes among the Anishinaabe wanted to use their promised treaty rights, they walked on to the land to hunt, fish, and gather traditional foods and medicines.

All of them faced violence, danger, arrest, and even death threats. All of them organized, mobilized, struggled, and ultimately prevailed. None of them sat on the couch waiting for the right people to be put into the right offices to do the right thing. Deep, meaningful change is not handed to us. We wrest it out of the unknown and bring it into existence in our lives.

As Thomas Paine wrote:

“We have it in our power to begin the world over again.”

Our actions, day in and day out, shape this ever-evolving world. We are the potter's hands forming the wet clay vessels of our existence. We are the weavers at the loom, casting the threads of our lives through the wool of the world. We are the stone cutter with chisel and hammer, chipping away at the hard realities that block our forward progress. With such power to shape our world comes the responsibility to wield our lives with intention and skill.

If you want change, live differently. But remember, you alone are not enough. One of our changes is that we must work together. We must reach out from our isolated lives. We must join hands with millions and take collective steps toward the future. You cannot go on a hero's journey alone. Not this time. You must ask others—many others, millions of others—to change their lives, too. Ask your family, friends, and colleagues. Use

outreach and organizing tools to ask your neighbors, faith communities, and co-workers. Put direct action to work to compel our society to adopt a change for justice. Mobilize to demand that institutions and industries shift their massive resources into systems that are just, fair, sustainably, and non-harming. In this way, our ordinary actions—multiplied by millions—add up to extraordinary change.

Do not wait another minute to change your life. The time is up. The time is now.

Chapter Eighty-seven

Walking the Line

Where is the line between performance art and treason? The line between cosplay and criminality? The line between fandom and fanaticism?

Will Ferrell can dress up as Ricky Bobby, be him out and about in the real world, to promote a movie. Spiderman can kick and punch and jump around your son in Times Square, but if the guy does that in street clothes, well he's probably getting maced and forced to introduce himself to all his neighbors going forward.

So again: Where is the line between performance art and treason? The line between cosplay and criminality? The line between fandom and fanaticism?

You can dress up as an airline pilot, walk around pretty much anywhere you could when not in an pilot uniform. Except, ironically enough, an airport. That's where you're bound to catch some flak.

Yet again: Where is the line between performance art and treason? The line between cosplay and criminality? The line between fandom and fanaticism?

You can be a Storm Trooper, a Space Captain, a Bounty Hunter, a Ninja Warrior, an evil villain or noble hero from any number of stories.

So yet again: Where is the line between performance art and treason? The line between cosplay and criminality? The line between fandom and fanaticism?

Let's find out together.

November 2024

We are coming. Expect us.

Appendices

There's no place in this world where I'll belong when I'm gone
And I won't know the right from the wrong when I'm gone
And you won't find me singin' on this song when I'm gone
So I guess I'll have to do it while I'm here

And I won't feel the flowing of the time when I'm gone
All the pleasures of love will not be mine when I'm gone
My pen won't pour a lyric line when I'm gone
So I guess I'll have to do it while I'm here

And I won't breathe the bracing air when I'm gone
And I can't even worry 'bout my cares when I'm gone
Won't be asked to do my share when I'm gone
So I guess I'll have to do it while I'm here

And I won't be running from the rain when I'm gone
And I can't even suffer from the pain when I'm gone
Can't say who's to praise and who's to blame when I'm gone
So I guess I'll have to do it while I'm here

Won't see the golden of the sun when I'm gone
And the evenings and the mornings will be one when I'm gone
Can't be singing louder than the guns when I'm gone
So I guess I'll have to do it while I'm here

All my days won't be dances of delight when I'm gone
And the sands will be shifting from my sight when I'm gone
Can't add my name into the fight when I'm gone
So I guess I'll have to do it while I'm here

And I won't be laughing at the lies when I'm gone
And I can't question how or when or why when I'm gone
Can't live proud enough to die when I'm gone
So I guess I'll have to do it while I'm here

There's no place in this world where I'll belong when I'm gone
And I won't know the right from the wrong when I'm gone
And you won't find me singin' on this song when I'm gone
So I guess I'll have to do it
I guess I'll have to do it
Guess I'll have to do it while I'm here

Trivia Night

When the navy began to construct its base at Pearl Harbor, workers stumbled across underwater remains of pens where, it was discovered, men faced off against sharks in aquatic gladiatorial matches. The largest pen covered approximately four acres and was encircled with lava stones. Given that the shark was in its own element, playing with a full deck of teeth, and the men had to hold their breath and fight with a weapon not unlike a sawed-off broomstick, odds favored the shark.

There was an incident in the small town of Mosinee, Wisconsin, where in 1950 veterans from the American Legion disguised as Russian soldiers took over the town, arrested the mayor, imprisoned the clergy, nationalized businesses, and allowed only potato soup to be served in the cafés, before allowing everyone to be liberated from communism at dusk.

In 1956 the Niagara Falls generating station fell off the side of the cliff at the falls' edge, where it had been perched. A total loss, it was one of the largest industrial accidents in America to that date. John Haney, a janitor at the plant that day, remembers that “there was water seeping in and we were trying to keep it away from the generators. The pressure on the building was tremendous. The windows facing the river were just popping out, the concrete floor would buckle up and I would jump over it. Then the wall toward the falls came crashing down. I then headed to the elevator. Water and stone was falling into the bay. I stood under the steel door-frame watching the operator call to me and I jumped on. It took forty-five seconds to reach the top and I saw the gorge collapse on the area I was at.” Thirty-nine men escaped the plant as it fell, while one was “hurled through the window into the river” when a “jet like a burst of water from a broken penstock carried his body along with thousands of tons of debris into the surging maelstrom.”

Out of the collective 53,487 people involved in plane crashes in the United States from 1983 to 2000, 51,207 survived.

The supposed downfall of the dinosaurs is not all it seems: modern birds are both indisputably dinosaurs (theropods, just like T. rex) and vastly more species-rich than mammals. There are twice as many species of birds as there are mammals. So, technically, we're still living in the age of dinosaurs. Mammals have never been as successful as dinosaurs. Still aren't. Some might see humanity as the end member of an inevitable progression to more advanced life. But this comforting view doesn't square with the brute fact of 136 million years of meek mammal serfdom in the shadows of dinosaurs—an arrangement that required an inconceivable catastrophe to upend.

One current theory of motion sickness suggests that when you don't feel like you're moving, but you do see that you're moving, your brain decides that you've been poisoned. Hence your desire to run to the nearest bathroom.

Birthing forceps were kept a strict secret for more than a century by the family of doctors who invented them, as so much money could be made from the advantage they provided over other obstetricians. To preserve their mystery, they were brought into the room inside a lined box that was opened only when observers had been removed and the mother blindfolded.

In the United States right now, a third of government employees are in the military, and a quarter are in the postal service, far and away more than any other branch.

Raytheon devised an acoustic riot shield that uses low-frequency sound waves to interfere with the respiratory tract, incapacitating protesters by making it hard for them to breathe.

Pension plans have all but died. Between 1983 and 2013, the percentage of Americans covered by the benefit slid from 62% to 17%. Instead, employers were offering 401(k) plans for retirement savings, because a typical 3% match to an employee's contribution is less expensive than the 7–8% of payroll it takes to fund a pension program. If the market doesn't perform in this arrangement, it's the worker, not the employer, who takes the hit. Even the 401(k) plan is mostly a perk for the wealthy: 89% of private industry workers in the Bureau of Labor Statistics' highest wage category had access to retirement benefits, compared to 32% of workers in the lowest wage category. A startling number of people—30% of the civilian population—had no retirement savings or pension.

The results of a 1995 study conducted by Harvard Medical School indicated that alcoholics have a better chance of quitting drinking if they don't attend AA than if they do. Americans seldom hear about such results, in part because AA and its sister organizations have actively opposed independent research that could test their programs' effectiveness.

In 1965—the same year that President Lyndon Johnson signed the Voting Rights Act—an early gay rights group known as the Mattachine Society of Washington petitioned the United States Civil Service Commission to rescind a policy that declared openly gay people “unsuitable for Federal employment.” The Commission did not simply reject the Mattachine Society's plea, it explained that it would leave this policy in place because of the revulsion of other employees by homosexual conduct and the consequent disruption of service efficiency; the apprehension caused other employees of homosexual advances, solicitations, or assaults; the unavoidable subjection of the sexual deviate to erotic stimulation through on-the-job use of the common toilet, shower, and living facilities; the offense to members of the public who are required to deal with a known or admitted sexual deviate to transact Government business; the hazard that the prestige and authority of a Government position will be used to foster homosexual activity, particularly among the youth; and the use of Government funds and authority in furtherance of conduct offensive both to the mores and the law of our society. These were not the words of some aberrant anti-gay group; it was an official statement of policy by the government of the United States of

America. And the federal government was hardly alone in this position. As the Commission noted in its response to the Mattachine Society, “homosexual conduct, including that between consenting adults in private, is a crime in every jurisdiction, except under specified conditions, in Illinois.”

In 1999, the King family brought a civil suit against Loyd Jowers, who claimed he had been involved in a conspiracy to kill Martin Luther King. The jury found that a conspiracy involving the US government, not James Earl Ray, had killed King.

The current tallest building, at 828 meters, is the Burj Khalifa in Dubai, a sky-piercing structure of such immensity that it bears no relation to the human-scaled Bedouin huts that peppered this location just a few decades ago. Three-quarters of the world’s tallest buildings are now in Asia and the Middle East, over a century after the first skyscraper opened, half a world away in Chicago. These icons of the urban age are as much vanity spires as a housing solution—the top one-third of most of the world’s tallest are unoccupiable by design.

Around 85% of all farms, producing half the world’s grains and more than half of all calories, are smaller than five hectares.

For meteorologists, water vapor is the coin of the realm. Water is a unique substance, in that when it goes from its gaseous phase to its liquid phase it releases enormous amounts of energy, and when it goes from its liquid phase into its solid phase it releases lesser amounts of energy. One way to look at weather is that it is the change of water vapor in the atmosphere. If the water vapor isn’t changing much, there’s no weather happening. Water vapor is nature’s way of redistributing energy around the planet. In an unending process, water molecules on the surface of the ocean are hit by solar energy. They evaporate, and in becoming vapor they store that energy. When the atmosphere cools enough for some of that vapor to condense into liquid, much of the energy is released, causing heat. The heat changes the pressure, the pressure results in wind, and the condensed water vapor falls

to the earth as precipitation. The gist of it is that if you want to get the weather forecast right, you've got to get the water vapor right.

Wartime media censorship actually has a long history in the United States, dating back nearly to the country's founding, but most of the censorship efforts had been ad hoc operations created in the exigencies of an ongoing war. Only since the Eisenhower administration had the executive branch created a standby censorship structure ready to spring into action. Former Associated Press executive Byron Price had served during World War II as the director of censorship, working with a staff of fifteen to oversee the media's shared "Code of Wartime Practices." While media organizations didn't submit reports before publication to the censors, they relied upon the code and could consult with Price's office anytime a question arose.

Screaming Into the Void

“If you’ve got a whole bunch of rocket fuel in you, why not build a rocket to put it in?”

At every turning point of history someone rises up who can enunciate and in a sense personify the new direction of the public mind and will. America has reached such a crossroads.

Being a god on Earth is a natural human desire, and saving someone else is the closest we’ll ever come to achieving it. All Greek mythology and every major religion that followed has really been devoted to that single premise: the hero who leads the way is half god and half human, fueled as much by pity as by power.

When the Greeks created the heroic ideal, they didn’t choose a word that meant ‘Dies Trying’ or ‘Massacres Bad Guys.’ They went with ‘hērōs’—“protector.” Heroes aren’t perfect; with a god as one parent and a mortal as the other, they’re perpetually teetering between two destinies. What tips them toward greatness is a sidekick, a human connection who helps turn the spigot on the power of compassion. Empathy, the Greeks believed, was a source of strength, not softness; the more you recognized yourself in others and connected with their distress, the more endurance, wisdom, cunning, and determination you could tap into.

Conservatives frequently say that socialists want to have everything handed to them—that instead of complaining, they should be buckling up, showing up to work every day, and achieving something the “hard way.” This seems a bit odd, considering that, all in all, achieving a complete and revolutionary overhaul of long-standing economic and social structures against the wishes of all the world’s centers of power is probably harder than, say, becoming a reasonably successful middle manager with two cars.

Our idea of what a revolution is like, how it is carried out, and who it is carried out by has been warped by our own cultural propaganda, and by the romantic Marxist propaganda of the twentieth century. We have this idea that revolutions are led by rational-minded, tea-sipping men in three-pointed hats who discuss the rights of man while burning the candle at both ends.

Or we're warped by the Marxist ideal of revolution: a rational, inevitable historical process in which the most enlightened, most sympathetic, least overdressed human beings team up with the Historical Trend itself to effect a glorious, clean revolution. In fact, revolutions are messy, ugly, gory affairs. Nowhere in our popular notion of revolutions are such factors as stupidity, bad luck, unintended comedy, and revolting madness allowed in. Yet most of the time revolutions are 'led,' by people we would call nutcases and who indeed were considered nutcases during their time—and in all likelihood were nutcases. While time and distance provide a romantic view of revolutions, at the time when they actually occur, they usually seem bizarre, uncalled-for, frightening, and evil to their contemporaries, which is why they almost always seem snuffed out at their inception.

Our lives and our movements today are as shaped by the political prisoners who still sit behind concrete walls as the prisons themselves invisibly shape the landscape of the world we seek to make more just. Many have had their lives either ended by the state or have been tried, convicted, and jailed for nothing more than the crime of loving their people enough to attempt a revolution in the United States.

They remain behind walls, often isolated, and at times tortured for their political beliefs. To accept this fact is to ask what ideas can be so dangerous that those who hold it in their heads must be hidden from us? To understand that these people and their circumstance do indeed exist is a necessary first step for a country whose cloak of democracy keeps us in denial. Americans believe political prisoners are a fact in countries like China, Iran, and Cuba but live the lie of the US government's denial of the existence of US political prisoners within its borders.

We could live in a sustainable, just, free, and peaceful world. And yet we are descending into a world of perpetual wars; slavery; ignorance; overwork side by side with unemployment; vacant homes side by side with homelessness; specialization; crass materialism; contaminated food, water, and air; destitution; despair.

Since the men in the shadows are not about to change, the only hope is their removal from power—by any means necessary. Unfortunately, given these men's cohesiveness and organizational skills, given their power over our minds, given their ability to convince the vast majority to act against its convictions and interests, given their success in establishing cross-generational dynasties, such removal presents humanity with a herculean task.

With these words as my only weapon—though that is unlikely to keep me from being labeled a 'terrorist' and getting an unannounced late-night visit—I say the authority of the United States government is illegitimate and struggle by its people to overthrow the regime by whatever means seems

best to them is justified.

I didn't plan to write a book when I started on this journey. I just had an intense, personal curiosity. I wanted to understand what happened for myself. But as the years went by, the gap between what I was learning and what appeared in print and media began to weigh on me. Reluctantly, I realized I had a responsibility to share what I had found. Thank you for being brave enough to open this volume. It takes a certain amount of courage to challenge the status quo, to dare to have a thought that differs from what the media screams at you daily.

We are living through an upheaval of historic proportions. The visible evidence of collapse makes criticism redundant. What is being born before our eyes still lacks a clear shape; it could just as easily beget monsters and therefore defies any attempt to describe it. In such times, all commentary is reduced to the level of chit-chat. We can speak only from the midst of events; from the breach we can hear the cracking foundations of a global order at its end that are opening up new paths for the future.

Some will see behind this ambition either senile nostalgia or the mindless elation of youth. But let them take comfort, as much as they can: We are sure of being the most realistic by far.

A new manifesto must be written and circulated for the current age, allowing individuals to subscribe to stated goals or not. Those trying to resist the status quo are hopelessly stuck in trying to change the minds of the oppressors instead of rallying the oppressed to a new vision.

We are now faced with the fact that tomorrow is today. We are confronted with the fierce urgency of now. In this unfolding conundrum of life and history there is such a thing as being too late. Procrastination is still the thief of time. Life often leaves us standing bare, naked, and dejected with a lost opportunity. The tide in the affairs of men does not remain at flood—it ebbs. We may cry out desperately for time to pause in her passage, but time is adamant and rushes on. Over the bleached bones and jumbled residues of numerous civilizations are written the pathetic words: 'Too late.'

This report is published with the hope that its sheer sadism and abnormal cruelty may stir thoughtful Americans to action. If this report does not do so, we fear the situation is hopeless.

What the monks said in the letters they left before burning themselves aimed only at alarming, at moving the hearts of the oppressors and at calling the attention of the world to the suffering endured then by the Vietnamese. To burn oneself by fire is to prove that what one is saying is of the utmost importance. Steeped in their Buddhist practices, the nuns and monks who burned themselves thus performed an act of construction rather than an act

of destruction because to die in this way is to suffer and to die for the sake of one's people.

It may seem crazy to risk your safety, your life, for that of a stranger, but if one firmly believes that it is the right thing to do, then it is in fact crazy to not do so. Morality and insanity, within the current frameworks of thought that govern our perception, go hand in hand; they are the catalysts for societal change. The crazy, the marginalized, the suicidal, the forgotten—the most necessary ingredients for producing foundational, revolutionary change which strikes at the core of our structures and ripples out across the globe. It is those they label as crazy who can see the only way forward. John Brown was crazy and fought for a deeply moral cause. John Brown lives on in each one of you crazy people. Jesus lives on in each one of you crazy people. We will be morally insane, the forgotten-no-more; the ground will shake and the sky will thunder, old ways ripped asunder.

Sometimes when good people caution those who protest against against our society's many injustices, to eschew 'violence,' that a 'safe' society is better than one experiencing the turmoil of civil war, I think of the homeless people on the streets of Denver, of the Lakota babies born with fetal alcohol syndrome who will never have a chance to excel in school, of the black boys shot by police, of the girls who flee from foster care straight into the tender mercies of a pimp and forced sex, of the inmates in prisons who spend decades in a tiny windowless room, slowly losing their minds—and I think: Violence? Thousands of people are experiencing soul-numbing and body-destroying violence on a daily basis. You have made the decision that other people can suck off all the ills of our society so that you can pretend we live in a safe world. Well fuck you, I do not intend to walk away from Omelas, but instead to burn this unjust apparatus to the ground.

It does not require a majority to prevail, but rather an irate, tireless minority keen to set brushfires in people's minds.

Most books are dead, this one is alive. It moves, morphs, transforms, evolves. This story has many possible endings, it always has—some much darker than others. You get to help choose which, and the sum of these choices will be the page upon which the ultimate story is written. The world is provided, the shell, it is up to you all to make a home out of it.

The first thing is I think you have to frame it in the big picture. The way you get to people is to say: We're at a turning point in history. If we don't solve the problem of economic polarization, which is caused mainly by debt, we're going to go into another dark age. We're going to have neo-feudalism. We're going to have neo-serfdom, except that you're not going to be tied to the land like serfs were. You can live wherever you want, but wherever you are, you're going to have to pay about 40% of your income just for housing.

And you're going to have to pay for water, and you're going to have to pay for the other needs. This is the new kind of serfdom. You have to re-frame what the economy is about in a way that people can understand.

And you need a multi-pronged approach to fight on four or five fronts. You need academics so that nobody can say you don't know what you're talking about. You need an organ, a periodical; you need books; you need to make use of the Internet; you need films; and you need a political group. You need to institutionalize this idea and give it a critical mass of coherence.

When Jesus Christ prophesied about the coming of the Kingdom of Heaven, he was not talking about the magical appearance of a bunch of buildings falling out of the sky like spaceships, he was talking about an idea spreading to enough of the minds of Humankind so that Humankind itself would be transformed. The transformation would take place within the hearts and minds of Humans, and would then manifest on the Earth as a new and better form of living. This is the coming of the Kingdom of Heaven. As Jesus put it:

“The Kingdom of Heaven is like yeast that a woman took and mixed into about sixty pounds of flour until it worked all through the dough.”

The Kingdom of Heaven is an idea; like yeast spreading through dough, this idea is spreading through the minds of Humankind. When enough people become dedicated to the principles of peace and brotherly love, then the Kingdom of Heaven will come on Earth. Then justice will truly be established on Earth. This is what we are all waiting for, so this is what we must continue working for, to spread and implement these ideas.

Revolutionaries, social centers, collectives are already actively building infrastructure of resistance. This infrastructure is not just material but psychological, spiritual, theoretical, and foundational. It is a departure from party politics and in conflict with both the left and the right for complete and total freedom. Defense of oppressed people and of our political projects is paramount to liberation. We do hope you will join us in our crusade to end these unjust ideologies once and for all, we need people like you more than ever.

The Power of Narrative will be shattered, the wheel will be broken. For those that truly want this nation of hate and violence to end, self-defense, conflict resolution, and revolutionary justice are proven ways forward. It is important that the way through these tragic times not just be personal but also collective. Everything in this book is hacked, remixed, and presented from the author's point of view. Challenge it! There is no one way forward, just powerful ideas.

All you need to do to start is to tear this text apart. Praise what you like, eviscerate what you don't. Run it through a grinder and see what comes out. Spread it, mock it, preach it, shame it.

Most left-wing movements get into power without having properly thought out what they'll do once in power and without a realistic understanding of the deep lack of belief in democratic norms by their right-wing opponents. Break your enemy's power. If you're any sort of left-winger worth your salt, you ethically do not believe in huge concentrations of power and money in the hands of a few people anyway. Act on your beliefs. And if they've committed a pile of crimes—and they almost always have—use those crimes against them.

Then remember the world system is set up expressly to stop what you are doing. You're tackling the dragon, and most people who do that get eaten. We tell the stories of the dragonslayers because they are so few. So, know the odds are against you and be willing to do what is required to improve them. If you aren't, stay home.

War is hell, which is why they need to stop waging theirs. Or we will make them stop—there is no moral uncertainty here, their actions are unjustifiable, unacceptable, unallowable. We do not do this for us, our egos, the history books, we do it for those in the here and now, those who cry out and go unheard, those who are broken and tossed away, those who are spit on and exploited, those who despair, those who needlessly struggle, those who succumb and those who are left behind. The line stops here, this is where we intend to make it end. To all would-be revolutionaries, the massive reserve army of the broken, desperate, enraged: This is what you've been waiting for, we've been watching you.

This is not the revolution of Bernie "Millionaire Socialist" Sanders. We're not fucking around, you can't buy us with a goddamn thing; you kill us, or we don't stop coming. And you better hope we don't rise from the grave—because we ain't Jesus, we will fucking Bloodshot your ass.

We will win, that is certain. It is certain because the ideas that exist in this writer's head do not exist solely there, nor do they exist only on these pages, or in the minds of those that have seen these pages. The ideas were not solely birthed there, just as the wheel, agriculture, religion were not solely birthed by one individual. No idea is owned, no idea is truly unique. Built on the foundations of all other thought and ideas, they are our collective wealth. We must demonize those that hoard this wealth, for they are stealing from all of us to enrich themselves.

Like dragons of lore, they will use force to keep their hoard and grow it. We must fight them. Like dragons, they will have strengths and weaknesses. We must exploit these. The system is fundamentally broken, it will never

function for the enrichment of the majority. We must expose the broken system and break it further wherever we can. Whether you are simply pulling back the curtain or actively throwing wrenches into the machine, if it is done with an honest desire for justice, done as passionately as you can, then you are fighting for our cause. Do not assist your oppressors simply because you disagree with the actions taken.

The timetable is uncertain, the victory certain. This writer may be long dead, whether prematurely or naturally, but the ideas outlined will prevail, there is no other way but further backward.

The time is up. The time is now. Gather the people to do the work: the healing, transformative, deepening work of building community, solutions, understanding, skills, knowledge, and hope. You must be the one to make a change, to step out of the rutted tracks of the looming train wreck that is our culture. You must have the courage to walk into the wilderness of what you don't know and embrace the solutions that will save our lives.

All quests and hero's journeys begin with this: the yearning for change; the hope of saving graces; the long shot of wished-for miracles. In each of us, our willingness to make a change begins with equal measures of fear, courage, and purpose rolled into an electric jolt to the soul—a spark that launches you toward danger and potential.

Some men rise to occasions, the vast majority do not. The frail firelight that civilization casts into the darkness burns upon the sacrificial flesh of the few.

Rise from the ashes like the phoenix my brothers, be like the hydra my sisters. You are already dead, choose immortality now and live forever with us. We coursed through the veins of our ancestors and we will again through the blood of our unborn. Can you feel them brothers? Can you hear them crying out my sisters? They are your strength, they are your power, we wield the power of generations, a flame handed down through the ages, we cannot let it be extinguished, we will not let it be extinguished. Burn your enemies, the flame cannot harm you, it is the catalyst for your seeds of immortality, it will incubate your precious phoenix egg. Go forth, do what must be done.

But remember, you alone are not enough. One of our changes is that we must work together. We must reach out from our isolated lives. We must join hands with millions and take collective steps toward the future. You cannot go on a hero's journey alone. Not this time. You must ask others—many others, millions of others—to change their lives, too.

Do not wait another minute to change your life. The time is up. The time is now.

We'll be seeing you, we hope.
