Farm animals are supposed to be stunned and rendered unconscious before they are actually killed. However, some pigs remain conscious when they are strung upside down by their legs in shackles, and they kick and struggle as they are moved along the conveyor belt to have their throats slit. Because of the speed at which the animals are supposed to be stunned and killed, and because slaughterhouse workers are often ineffectively trained, a number of pigs may also survive throat cutting and remain conscious when they arrive at the next station, where they are dropped into scalding water—a procedure done to remove their hair. One worker describes how squealing hogs were left dangling by one leg while workers left to take their lunch breaks, and thousands of hogs were immersed in the scalding tank alive.

"These hogs hit the water and start screaming and kicking. Sometimes they thrash so much they kick water out of the tank. There's a rotating arm that pushes them under, no chance for them to get out. I'm not sure if they burn to death before they drown, but it takes them a couple of minutes to stop thrashing."

"The worst thing, worse than the physical danger, is the emotional toll. If you work in that stick pit for any period of time, you develop an attitude that lets you kill things but doesn't let you care. You may look a hog in the eye that's walking around down in the blood pit with you and think, 'God, that really isn't a bad-looking animal.' You may want to pet it. Pigs down on the kill floor have come up and nuzzled me like a puppy. Two minutes later, I had to kill them—beat them to death with a pipe. I can't care."

The stress workers face from spending hours at a single station where they have to kill (or stun) one hog every four seconds leads to violent outbursts toward the pigs. One worker described such an incident:

"Like, one day the live hogs were driving me nuts. When an animal pisses you off you don't just kill it, you go in hard, push hard, blow the windpipe, make it drown in its own blood. Split its nose. A live hog would be running around the pit. It would just be looking up at me and I'd be sticking and I would just

take my knife and cut its eye out while it was just sitting there. And this hog would just scream.

One time I took my knife—it's sharp enough—and I sliced off the end of a hog's nose, just like a piece of bologna. The hog went crazy for a few seconds. Then it just sat there looking kind of stupid. So I took a handful of salt brine and ground it into its nose. Now that hog really went nuts, brushing its nose all over the place. I still had a bunch of salt left on my hand—I was wearing a rubber glove—and I stuck the salt right up the hog's ass. The poor hog didn't know whether to shit or go blind."

"I've taken out my job pressure and frustration on the animals. There was a live hog in the pit. It hadn't done anything wrong, wasn't even running around the pit. It was just alive. I took a three-foot chunk of pipe—and I literally beat that hog to death. Couldn't have been a two-inch piece of solid bone left in its head. Basically, if you want to put it in layman's terms, I crushed his skull. It was like I started hitting the hog and I couldn't stop. And when I finally did stop, I'd expended all this energy and frustration, and I'm thinking, what in God's sweet name did I do?"

The more desensitized workers become, the greater the buildup of their psychological distress. Most people can experience only so much violence before they become traumatized by it; studies of combat veterans, for instance, demonstrate again and again the profound effect exposure to violence has on the psyche, particularly when one has also been a participant in that violence. Traumatized workers become increasingly violent toward both animals and humans, and develop addictive behaviors in an attempt to numb their distress.

"Most stickers have been arrested for assault. A lot of them have problems with alcohol. They have to drink, they have no other way of dealing with killing live, kicking animals all day long. A lot of guys just drink and drug their problems away. Some of them end up abusing their spouses because they can't get rid of the feelings. They leave work with this attitude and they go down to the bar to forget. Only problem is, even if you try to drink those feelings away, they're still there when you sober up."

Some slaughterhouse workers no doubt enter the industry as sociopaths: individuals who are antisocial, clinically “conscienceless,” and often take pleasure in causing others to suffer. However, one must wonder at an industry that tolerates—indeed, requires—antisocial behaviors such as extreme aggression, remorselessness, and violence.

In 2001, the Washington Post printed an article by Joby Warrick entitled “They Die Piece by Piece.” Warrick explained how, though cattle were supposed to be dead before reaching the cutting room, this was often not the reality. Ramon Moreno, a slaughterhouse worker who’d spent twenty years as a “second-legger”—cutting hocks off carcasses as they sped past at the rate of 309 per hour—described the process to Warrick:

“‘They blink. They make noises,’ he said softly. ‘The head moves, the eyes are wide and looking around.’ Still Moreno would cut. On bad days, he says, dozens of animals reached his station clearly alive and conscious. Some would survive as far as the tail cutter, the belly ripper, the hide puller. ‘They die,’ said Moreno, ‘piece by piece.’”

“In the morning the big holdup was the calves. To get done with them faster, we’d put eight or nine of them in the knocking box at a time. As soon as they start going in, you start shooting, the calves are jumping, they’re all piling up on top of each other. You don’t know which ones got shot and which ones didn’t get shot at all, and you forget to do the bottom ones. They’re hung anyway, and down the line they go, wriggling and yelling. The baby ones—two, three weeks old—I felt bad killing them so I just let them walk past.”

“Nearly every chicken responded with screams and violent physical reactions from the moment they were grabbed by workers and as they went through the line. The screaming of the birds and the frenzied flapping of their wings were so loud that you had to yell to the worker next to you, who was standing less than two feet away, just so he could hear you. I saw an employee kick a chicken off the floor fan and routinely saw chickens being thrown around the room. While one of the workers was talking about football, he ‘spiked’ a chicken onto the conveyor belt, pretending he had scored a touchdown.

I saw about 50 birds being dumped from the transport crates onto the conveyor belt, a distance of approximately eight feet.

The crate tipped them all at once, so they fell on top of each other. The screaming was intense during the whole process. I looked onto the conveyor belt and could clearly see chickens with broken legs and wings, limbs sticking out in unnatural angles.

I noticed that our line leader seemed generally more hostile toward the birds today, even yelling profanities at them when he threw them. During one break, a worker repeatedly slapped a chicken in the face until the line started again. There were so many dead birds on the floor of the hanging room that it was difficult to take a step without stepping on one.”

Calling for the humane treatment of animals, seventeenth-century philosopher Jeremy Bentham argued:

“The question is not, ‘Can they reason?’ nor, ‘Can they talk?’ but rather, ‘Can they suffer?’”

The question of sentience—the ability to feel pleasure and pain—has been at the center of arguments surrounding both human and animal welfare. Historically, members of vulnerable groups have been believed to have a higher tolerance for pain, an assumption often invoked to justify suffering. For instance, fifteenth-century scientists would nail dogs to boards by their paws in order to cut them open and experiment on them while fully conscious, and they dismissed the dogs’ howling as simply a mechanical response—as little different from the noise of a clock whose springs have been struck. Similarly, until the early 1980s, American doctors performed major surgery on infants without using painkillers or any anesthetic; the babies’ cries were explained as mere instinctive reactions. And because African slaves were thought to feel less pain than whites, it was easier to justify the brutal experience of slavery.

There is now evidence that strongly suggests birds not only suffer, but actively seek to anesthetize their pain. Researchers took a group of 120 broiler chickens, half of whom were lame, and offered them two types of feed: normal feed and feed that contained an anti-inflammatory painkiller. The lame chickens consumed up to 50 percent more drugged feed than did the non-lame birds and walked better as a result. A second, similar study found that the more severe a chicken’s lameness, the more of the drugged feed he consumed. Researchers concluded that the birds were likely self-medicating and that they can, and do, suffer.

There have been many particularly touching discoveries made about domestic pigs, if only because a number of research facilities are working to improve factory farming. When a researcher was asked if there had been

any notable characters among the pigs he had studied, he mentioned one old sow. Over the course of her life, she gave birth to 160 piglets. She taught all of them how to build a nest out of straw, and when her daughters grew up, the old sow assumed the role of midwife and helped them prepare for the births of their own babies. The question then becomes, if researchers know so much about the intelligence of pigs, why isn't the image of the smart pig publicized more? I suspect it has to do with eating pork. If people knew what kind of an animal they had on their plate, many would completely lose their appetite. We already know this from primates: could any of us eat an ape?

Sir Paul McCartney once claimed that if slaughterhouses had glass walls, everyone would be vegetarian. He believed that if we knew the truth about meat production, we'd be unable to continue eating animals. Yet on some level we do know the truth. We know that meat production is a messy business, but we choose not to know just how messy it is. We know that meat comes from an animal, but we choose not to connect the dots. And often, we eat animals and choose not to know we're even making a choice. Violent ideologies are structured so that it is not only possible, but inevitable, that we are aware of an unpleasant truth on one level while being oblivious to it on another.

Common to all violent ideologies is this phenomenon of knowing without knowing. And it is the essence of carnism. Inherent in violent ideologies is an implicit contract between producer and consumer to see no evil, hear no evil, and speak no evil. Sure, animal agribusinesses go to great lengths to protect their secrets. But we make their job easy for them. They tell us not to look, and we turn away. They tell us the billions of animals that we never see live outdoors on peaceful farms, and as illogical as this is, we don't question it. We make their job easy because on some level most of us don't want to know the way things really are.

When an invisible ideology guides our beliefs and behaviors, we become casualties of a system that has stolen our freedom to think for ourselves and to act accordingly.

“Facts do not cease to exist because they are ignored.”

Bureaucracy helps render genocide unreal. It diminishes the emotional and intellectual tones associated with the killing. There is only a flow of events to which most people come to say yes. Mass murder is everywhere but at the same time nowhere.

Invisibility can only protect us so much. Hints of the truth surround us: “cruelty-free” veggie burgers at the grocery store; the resilient vein in

the drumstick that's suddenly reminiscent of a living chicken; snapshots of meatpacking plants that occasionally make the news; vegetarian guests at dinner parties; dead piglets hanging in the windows of Chinatown markets; the hog on a spit at the company barbecue; and an endless supply of dead animals in the form of meat. So when invisibility inevitably falters, we need a backup, something to protect us from the truth and to help us quickly recover should we suddenly begin to catch on to the disturbing reality of carnism. We must replace the reality of meat with the mythology of meat.

All the myths are in one way or another related to the Three Ns of Justification: eating meat is normal, natural, and necessary. The Three Ns have been invoked to justify all exploitative systems, from African slavery to the Nazi Holocaust. When an ideology is in its prime, these myths rarely come under scrutiny. However, when the system finally collapses, the Three Ns are recognized as ludicrous. Consider, for instance, the following justifications for why women were denied the right to vote in the United States: male-only voting was “designed by our forefathers”; if women were to vote, it would “cause irreparable damage to the state” and “disaster and ruin would take over the nation.”

The Three Ns are so ingrained in our social consciousness that they guide our actions without our even having to think about them. They think for us. We have internalized them so fully that we often live in accordance with their tenets as though they were universal truths rather than widely held opinions. It's like driving a car—once you've learned to do it, you no longer need to think about every action. But these justifications do more than just direct our actions. They alleviate the moral discomfort we might otherwise feel when eating meat; if we have a good excuse for our behaviors, we feel less guilty about them. The Three Ns essentially act as mental and emotional blinders, masking the discrepancies in our beliefs and behaviors toward animals and explaining them away if we do happen to catch on.

The practical goal of the myths is to legitimize the system. When an ideology is legitimized, its tenets are sanctioned by all social institutions and the Three Ns are disseminated through all social channels. Acting in accordance with the ideology is lawful, and it is considered reasonable and ethical. Consequently, the tenets of competing ideologies are viewed as illegitimate, which is why, for instance, vegetarians cannot press charges against agribusiness owners for the slaughtering of animals. Though all institutions help legitimize the ideology, two in particular play a critical role: the legal system and the news media.

“Custom will reconcile people to any atrocity.”

When we view the tenets of an ideology as normal, it means the ideology has become normalized, and its tenets social norms. Social norms aren't merely descriptive—describing how the majority of people behave—they are also prescriptive, dictating how we ought to behave. Norms are socially constructed. They aren't innate, and they don't come from God (though some of us may have been taught otherwise); they are created and maintained by people, and they serve to keep us in line so the system remains intact. Norms keep us in line by laying out paths for us to follow and by teaching us how to be so that we fit in. The path of the norm is the path of least resistance; it is the route we take when we're on autopilot and don't even realize we're following a course of action that we haven't consciously chosen. Most people who eat meat have no idea that they're behaving in accordance with the tenets of a system that has defined many of their values, preferences, and behaviors. What they call “free choice” is, in fact, the result of a narrowly constructed set of options that have been chosen for them. They don't realize, for instance, that they have been taught to value human life so far above certain forms of nonhuman life that it seems appropriate for their taste preferences to supersede other species' preference for survival. And by carving out the path of least resistance, norms obscure alternative paths and make it seem as if there is no other way to be;

Another way norms keep us in line is by rewarding conformity and punishing us if we stray off course. Practically and socially, it is vastly easier to eat meat than not. Meat is readily available, while non-meat alternatives in many locales must be actively sought out and may be hard come by. Or one's only option is some heavily processed product designed to mimic meat itself. And vegans often find themselves having to explain their choices, defend their diet, and apologize for inconveniencing others. They are stereotyped as hippies, eating disordered, and sometimes antihuman. They are called hypocrites if they wear leather, purists or extremists if they don't. They must live in a world where they are constantly bombarded by imagery and attitudes that offend their deepest sensibilities. It is easier by far to conform to the carnistic majority than eschew the path of least resistance.

Patterns of thought and behavior, established long before we were able to act as free agents, become woven into the fabric of our psyche, guiding our choices like an invisible hand. It is impossible to exercise free will as long as we are operating from within the system. Free will requires consciousness, and our pervasive and deep-seated patterns of thought are unconscious; they are outside of our awareness and therefore outside of our control. While we remain in the system, we see the world through the eyes of carnism. And as long as we look through eyes other than our own, we will be living in

accordance with a truth that is not of our own choosing. We must step outside the system to find our lost empathy and make choices that reflect what we truly feel and believe, rather than what we've been taught to feel and believe.

Carnism distorts reality: Just because we don't see the animals we eat, this doesn't mean they don't exist. Just because the system hasn't been named, this doesn't mean it isn't real. No matter how far they stretch and how deep they run, the myths of meat are not the facts of meat.

Internalized carnism distorts our perception of reality: though animals are living beings, we perceive them as living things; though they are individuals, we perceive them as abstractions—as a bunch of things; and in the absence of any objective, supporting data, we perceive them as though their appropriateness for human consumption is naturally contingent upon their species. For instance, if, despite the system's best efforts, we happen to catch sight of one of the pigs who is to become our meat, we don't perceive him or her as a sentient being, or as someone who has a distinct personality and preferences. Rather, we perceive the pig's "pigness" (dirtiness, slovenliness, et cetera) and his or her "edibility." By perceiving animals in these ways, we employ three defenses that I refer to as the Cognitive Trio.

The Cognitive Trio is comprised of objectification, deindividuation, and dichotomization. These defenses are actually normal psychological processes that become defensive distortions when used excessively, as they must be in order to keep carnism intact. And, unlike some other defenses, these mechanisms are more internal and less conscious and intentional; they are less about what we think than they are about how we think. Each defense in the Cognitive Trio has a unique effect on our perception of animals. But the true strength of the trio lies in how the three work in harmony with one another. Like a musical trio, the whole is greater than the sum of its parts.

“The more you see these lambs without any heads on them, the more you don't think of them as an animal, but as a product that you're working with.”

Objectification is the process of viewing a living being as an inanimate object, a thing. Animals are objectified in a variety of ways, perhaps most notably through language. Objectifying language is a powerful distancing mechanism. Consider how slaughterhouse workers refer to the animals they're going to kill as the objects they are to become, rather than as the living animals they are: chickens are called broilers, pigs are called rashers, and bulls are called beef. And the USDA refers to cows as udders

and animals as units, while meat industries talk about replacement boars or replacement calves. Consider, too, our common usage of the phrase ‘living thing,’ and our equally common failure to recognize this phrase as an oxymoron. Carnism needs us to employ such objectifying language; think of how you might feel if, for instance, you referred to the rotisserie chicken in the restaurant window as someone rather than something, or if you called the barnyard turkey he or she rather than it.

Objectification is legitimized not only through language, but also through institutions, legislation, and policies. For example the law classifies animals as property. When we can buy, sell, trade, or exchange someone as though he or she were a used car—or even parts of a used car—we have literally turned him or her into a piece of live stock. By viewing animals as objects, we can treat their bodies accordingly, without the moral discomfort we might otherwise feel.

“I don’t think of farmed animals as individuals. I wouldn’t be able to do my job if I got that personal with them. When you say individuals, you mean as a unique person, as a unique thing with its own name and its own characteristics, its own little games it plays? Yeah? Yeah, I’d really rather not know that. I’m sure it has it, but I’d rather not know it.”

Deindividuation is the process of viewing individuals only in terms of their group identity and as having the same characteristics as everyone else in the group. Whenever we encounter a group of others, it’s natural for us to think of them, at least in part, as a group. The larger the group, the more likely we are to view the whole over its individual parts; when you think of a nation, for example, you probably think of its citizens primarily as members of a group to which you’ve ascribed a set of shared characteristics. Deindividuation, however, is viewing others only as members of a whole; it is the failure to appreciate the individuality of the parts that make up the whole. Such is the case with our perception of the animals we eat.

For instance, as I mentioned previously, when you think of the pigs raised for pork you probably don’t think of them as individuals with their own personalities and preferences. Rather, you see them as an abstraction, as a group. Like other groups that have been victims of violent ideologies, pigs raised for meat may have numbers rather than names and are considered no different from one another; a pig is a pig and all pigs are the same. But imagine how you would feel if your package of hot dogs included a label with the name, picture, and description of the pig from whom the meat was procured, or if you became acquainted with one of the pigs who was

to become your food. Countless students of mine, as well as the carnists and meat cutters I interviewed in my research, have reported that after getting to know an individual “food” animal, they felt unable to consume that particular animal, and some even felt uncomfortable continuing to eat meat from that species.

“I would have a different outlook on pigs in general if I had a pig as a pet. I would just see my pet every time someone was preparing ribs or something like that.”

“It would feel wrong to eat that meat. I mean, it would feel like I murdered it, you know, that I killed it. And for what? You know what I’m saying? I wouldn’t even conceive of it. If it’s a pet, it’s off limits, you know? Once it dies, you bury it; it’s sort of like a family member.”

“I’d have to be starving before I’d eat my own pet because once I knew him or her really well I would be offended to have to eat my friend.”

“I would not eat something that I would give a name to. For me, that’s like your friend. You are eating an animal that you have a close relationship with.”

Negative reactions to the idea of consuming (or preparing the meat of) a familiar animal are common around the world, and they can be quite powerful. For instance, female Indians from the Quito area in Ecuador bond with their chickens just as Americans do with our dogs and cats, and when circumstances force these women to sell their birds for slaughter, they do so with tears and shrieks.

“Even, like, some animal in a cage with hundreds of other animals, if you make this connection [that he or she is an individual], then it’s kind of on the same parallel as the family pet. How can you kill a family pet? How can you kill a pig that’s in a pen with a hundred others?”

Recognizing the individuality of others interrupts the process of deindividualization, making it more difficult to maintain the psychological and emotional distance necessary to harm them.

“I don’t know, maybe it’s easier to eat animals that have been raised just for the purpose of being eaten. . . where a squirrel runs around your backyard and then to have it on your dinner plate is just kind of disturbing. It’s almost like a division between the animals you see running around outside—they are safe from people eating them.”

Dichotomization is the process of mentally putting others into two, often opposing, categories based on our beliefs about them. In and of itself, classifying others into groups is not problematic. Creating mental classifications is a natural process that helps us organize information. Dichotomies, however, are not just classifications; they are dualistic, and as such, they create a black-and-white picture of reality. What results is a divvying up of the world into inflexible, value-laden categories that are usually based on little or inaccurate information. Dichotomization thus enables us to separate groups of individuals in our minds and to harbor very different emotions toward them.

When it comes to meat, the two main categories we have for animals are edible and inedible. And within the edible-inedible dichotomy, we have a number of other category pairs. For example, we eat domesticated rather than wild animals, and herbivores rather than omnivores or carnivores. Most people won’t eat animals that they deem intelligent (dolphins), but regularly consume those they believe are not very smart (cows and chickens). Many Americans avoid eating animals that they perceive as cute (rabbits) and instead eat animals that they consider less attractive (turkeys).

Whether the categories into which we’ve placed animals are accurate is less important than whether we believe they’re accurate, since the purpose of dichotomization is simply to distance us from the discomfort of eating meat. If we filter our perceptions of animals through categories laden with value judgments, we can, for example, eat our steak while we pet our dog and remain oblivious to the implications of our choices. Dichotomization thus supports justification; it enables us to feel justified eating an animal because, for instance, he or she isn’t smart, isn’t a pet, isn’t cute—isn’t inedible.

Of course, not all edible animals fall neatly into the categories into which we’ve placed them. To maintain the carnistic status quo, then, we retain false assumptions about the animals we eat so that we can continue to classify them as edible. Intelligent pigs and chickens are seen as stupid, and handsome turkeys are viewed as ugly.

When pressed to examine our assumptions, however, the arbitrary and irrational nature of dichotomization becomes apparent.

“Lambs are gentle creatures... It’s, like, a shame they are killed and we eat them. There are a lot of other things that are also gentle, too, that we eat. Cows are. We eat them... I don’t know how to describe it. It seems like everybody eats cow. It’s cheaper. It’s affordable, and there are so many of them. But lambs are just different. They’re smaller or more cuddly. I don’t know. You don’t cuddle a cow. Seems like it’s okay to eat a cow, but it’s not okay to eat a lamb. The difference is weird.”

“It’s easier to think of farmed animals in the abstract. It makes me think of that quote: ‘The death of one person is a tragedy; the death of a group is a statistic.’”

A discussion about the Cognitive Trio would not be complete without mentioning the role of technology in psychological distortions and distancing. Technology reinforces the trio by enabling us to treat certain animals as objects and abstractions—objects, because they literally become units of production on a disassembly line, and abstractions, because the sheer volume of animals killed for meat inevitably deindividualizes them. Indeed, it is only because of technology that widescale meat production is possible: modern methods enable us to eat billions of animals every year without witnessing a single part of the process by which these animals become our food. This mass production of meat, coupled with our removal from the production process, has made us at once more and less violent toward animals than ever before; we are able to kill more animals but are less desensitized to or comfortable with the fact that we’re killing them. Technology has widened the gap between our behaviors and values, and thus enhanced the moral dissonance that the system works so hard to obscure.

But of course, technology often doesn’t eradicate all traces of meat production. And when it doesn’t, we can find ourselves in the uncomfortable position of recognizing that our meat did, in fact, come from a living being.

“I don’t eat pork from a market in town that sells pigs’ feet and whole pigs. I think partially because it reminds me more that you’re not just eating—like the piece of meat didn’t just fall out of the sky. It’s connected to the whole animal instead of just a nicely processed thing that you’re eating by itself for dinner. You have to think about it as a whole creature.”

Nearly everyone is in some degree of denial about how much pain there is in the world, because grasping its full dimensions is, first, impossible, and second, would be paralyzing and make life unbearable. But because we have

to overlook enormous amounts of suffering if we're going to live—have to stop thinking about the old people crying alone in their hospital beds, and the sick children whose every second of life has been spent dying—it is going to be very easy to miss an atrocity in our midst. It has never been a mystery to me how ordinary Germans could ignore what was going on around them. They did it the same way we ignore all of the pain that millions of strangers are going through at any given moment. As long as other people's terror isn't in the room with you, as long as it's off behind barbed wire a few miles away, it's not just easy to ignore but almost impossible to notice. Walk through any American city on a nice day and see how easy it is to forget that the country has two-million people in its prisons. They're off in rural counties, and as long as you don't go looking for them—and as long as you're not among the populations from whose numbers the incarcerated are mostly drawn—none of it will even exist for you.

“For three years, I used to do the same ten minute walk from my apartment to school and back every day. It was only in the third year, after noticing it on a map, that I realized I had been walking directly past a jail with hundreds of inmates in it. People were locked in rooms, living lives, and I passed by unaware.”

Because people slip so naturally into oblivious complicity, it's crucial to actively examine the world around you for evidence of things hidden. What am I missing? What have I accepted as ordinary that might in fact be atrocious? Am I in denial about something that will be clear in retrospect? Every time I apply this kind of thinking to meat-eating, I get chills. Here we have set up mass industrial slaughter, a world built on the suffering and death of billions of creatures. The scale of the carnage is unfathomable. I know sharks aren't particularly sympathetic, but I'm still shocked by the statistic that while sharks kill eight people per year, humans kill eleven-thousand sharks per hour. Yet we hide all of it away, we don't talk about it. Laws are passed to prevent people from even taking photographs of it. That makes me feel the same way I do about the death penalty: if this weren't atrocious, it wouldn't need to be kept out of view. *Mass industrial slaughter*. There's no denying that's what it is. Yet that sounds like something a decent society shouldn't have in it.

I've tried my best to figure out a way to avoid my conclusion, because I know only a small fraction of other people share it. But it's a simple and, to me, inescapable deduction:

1. Nonhuman animals are conscious beings capable of suffering

2. Unnecessarily causing conscious beings to suffer and die is morally reprehensible
3. Humans cause billions of nonhuman animals to suffer and die every year, mostly for their own pleasure
4. By killing and eating animals, humans are doing something deeply wrong. Jeremy Bentham's formulation is still powerful and hard to escape:

“The question is not, Can they reason? nor, Can they talk? but, Can they suffer?”

The difficulty of avoiding this conclusion is what disturbed David Foster Wallace during his time at the Maine Lobster Festival. He realized that it seemed preachy and extreme, but as a thoughtful and philosophically rigorous individual, he couldn't escape the morally troubling implications of boiling lobsters alive. The lobsters just didn't seem to want to be killed, and however normalized the practice may be, however easily we may take it for granted that these creatures are of little moral worth, once you begin to scrutinize these assumptions, to see that they're built on very little, and that a creature does seem to be experiencing something resembling pain, it becomes tough to defend our actions.

I still know I'm taking a risk by using the word 'holocaust.' The dictionary definition may be “any mass slaughter or reckless destruction of life”—and the word even originally referred to the burning of sacrifices, i.e. animals—but there are plenty who are skeptical even of applying the term to other genocides. To speak of a pig holocaust can seem trivializing and insensitive. And yet: once again, ideas that seem true and reasonable by instinct become harder to defend once scrutinized. It's true that how bad you believe the industrial slaughter of animals is, compared to the industrial slaughter of humans, depends on whether you believe suffering is suffering, and the degree to which its gravity depends on the intellectual sophistication of the sufferer. You might also think that certain atrocities perpetrated on 100 million pigs are not as bad as those same atrocities committed against five fully-functioning human beings. A lot depends on your subjective weighting of the value of very different lives, and none of that has any obvious “true” answer. Personally, though, I keep having that feeling of being unable to escape my discomfort: knowing what's out there, knowing the cages, the blood, the billion squeals of pain, I hear over and over those same questions: ‘Why is this different? How can it be justified? What are you choosing not to realize?’ And yet again that same terrible word: holocaust.

Our grandchildren will ask us one day: Where were you during the Holocaust of the animals? What did you do against these horrifying crimes? We won't be able to offer the excuse that we didn't know.

When we bear witness, we are not merely acting as observers; we emotionally connect with the experience of those we are witnessing. We empathize. And in so doing, we close the gap in our consciousness, the gap that enables the violence of carnism to endure.

Virtually every atrocity in the history of humankind was enabled by a populace that turned away from a reality that seemed too painful to face, while virtually every revolution for peace and justice has been made possible by a group of people who chose to bear witness and demanded that others bear witness as well. The goal of all justice movements is to activate collective witnessing so that social practices reflect social values. A movement succeeds when it reaches a critical mass of witnesses—that is, enough witnesses to tip the scales of power in favor of the movement.

“The ordinary response to atrocities is to banish them from consciousness. Atrocities, however, refuse to be buried. Equally as powerful as the desire to deny atrocities is the conviction that denial does not work.”

A reason we resist bearing witness to the truth of carnism is that witnessing hurts. Becoming aware of the intense suffering of billions of animals, and of our own participation in that suffering, can bring up painful emotions: sorrow and grief for the animals; anger at the injustice and deception of the system; despair at the enormity of the problem; fear that trusted authorities and institutions are, in fact, untrustworthy; and guilt for having contributed to the problem. Bearing witness means choosing to suffer. Indeed, empathy is literally “feeling with.” Choosing to suffer is particularly difficult in a culture that is addicted to comfort—a culture that teaches that pain should be avoided whenever possible and that ignorance is bliss. We can reduce our resistance to witnessing by valuing authenticity over personal pleasure, and integration over ignorance.

Witnessing isn't merely something one does; it is how one is. Witnessing isn't an isolated practice, but a way of relating to oneself and the world. It is a way of life that informs our interactions with ourselves and others. And there is no limit to our capacity for witnessing. In fact, because witnessing is empowering, the more we witness, the greater our ability to witness. Like compassion, our capacity for witnessing grows with practice.

The witness stands together, inside, with those who are hurt and with those who are violated; the witness has an extraordinary capacity to stand

in the fires of hatred and violence without increasing those elements. In fact, the deepest form of witnessing is a form of compassion for all suffering beings. In reality, we are never outside observers. We are inside the wound together. It is just that some feel and some are numb. We are inside the very thing that needs to be transformed.

All bystanders are forced to take a side, by their action or inaction; there is no such thing as moral neutrality. Neutrality helps the oppressor, never the victim. Silence encourages the tormentor, never the tormented.

Although those of us who choose to stand with the victim may suffer, there can be no greater honor.

Six Flags: Wilderness

Faking Nature

“I had remained affected for years by the image of a sea lion I’d once seen trying to exit the water with half its body missing. Around here, you didn’t have to look far to find a fate that painful. I had once watched, horrified, as a baby elephant seal that was being pursued by a shark tried with every ounce of its strength to scramble aboard the boat, the panic seared into its bewhiskered little face.

Or a shark-bitten sea lion that had managed to drag itself onto the rocks. The animal had three furrows raked across its torso, each at least two inches deep. The wounds were extreme, though the sea lion would likely survive them; these creatures managed to heal from the most vicious maimings, like torn and mangled lumps of Silly Putty that, when squeezed together, somehow became whole again. Not without visible agony, however—I was struck by the emotion shown on the creature’s face. Its eyes blinked slowly and sadly, and it gave off a deeply resigned air as flies burrowed into its wounds.”

Our reaction to wilderness is an endlessly interesting mixture of sympathy and fear, of love and hostility, of the impulse to embrace and the equally powerful urge to flee. This is the fatal attraction.

Nature demands of us that we pay attention. This society has sheltered us from nature, and one of the reasons why places like Yellowstone are remarkable is that they are ‘nature in your face.’ Most persons would not want their wilderness sanitized. At least I hope they would not. Wilderness is not just another product or commodity to be made safe to prevent product liability litigation. For without those dangers, it would not really be wilderness.

The wilderness environment has always contained certain dangers. To remove them would require changes so sweeping as to do away with most of

the reasons for having national parks. The scene would cease to be revitalizing, stimulating, and inspirational and would instead become artificial and sanitized. To develop a national park is to not have one.

In the years since the field of environmental ethics was born, there have been many different arguments for why we should preserve wilderness and the species within it. Some see nature and species as natural resources, others as having potential pharmaceutical value. Nature provides important services to humans—cleaning our air, say, or providing us with places for physical exercise and mental rejuvenation. Species may be aesthetically beautiful and inspire us individually and culturally, or represent transcendent moral truths. They are records of evolution containing information we need in order to understand life on earth, or their value is their wonder for the human intellect. Wilderness is where humans come from, it's our history as a species, we need it in order to understand the relationship between self and the world. Some believe wild things have the right to exist without human disturbance, or that we should protect them for future generations. For others, the reason to protect wilderness and species is because they exist. Their preservation should need no justification, because their value is intrinsic and independent of human perspective.

In 1982, Robert Elliot penned a paper called "Faking Nature" that rebuked the idea that an ecosystem disturbed or damaged by humans could be restored to its original state or has equal value to wilderness. Nature, wrote Elliot, is "not replaceable without depreciation in one aspect of its value which has to do with its genesis, its history." It seems that today we have to decide whether that genesis in the wild is something we value.

The dominant Western paradigm of thought is characterized by human chauvinism. Throughout history, the ultimate test of perfection in nature has been its usefulness for human purposes. Even the transcendentalists, who revered nature as worshipers would revere their cathedral, assumed this anthropocentric perspective. Ralph Waldo Emerson once wrote that nature is "made to serve. It receives the dominion of man as meekly as the ass on which the Savior rode."

Consider a thought experiment called the "Last Man Argument." Imagine you are the only person on earth. The world system has collapsed. Before you die, you make sure that every living thing in the world will be destroyed and nothing is left. Would you be acting immorally? If you believe the value of nature is its usefulness to humans, the answer is no. But of course, we intuitively feel destroying the world would be horribly wrong. This feeling shows that an entirely new ethic—neither a primitive, mystical, or aesthetic one, nor an economic or even scientific one—needs to be articulated. Human interests and preferences are far too parochial to provide a satisfactory basis

for deciding on what is environmentally desirable. Nature needs to have its own value that merits our moral concern, and species themselves need to become moral objects. They must have intrinsic value. The notion that nature wasn't designed for us, that its value might not be described in economic, scientific, or even spiritual terms, is still fairly radical. There are traces of it in John Muir, who wrote that "the world, we are told, was made especially for man—a presumption not supported by all the facts."

The value of nature is objective and is independent of human values; it preexists us and will outlast us. Perhaps there can be no science without a scientist, no religion without a believer, no tickle without somebody tickled. But there can be law without a lawgiver, history without a historian; there is biology without biologists, physics without physicists, creativity without creators, story without storytellers, achievement without achievers—and value without valuers. From this more objective viewpoint, there is something subjective, something philosophically hazardous in a time of ecological crisis, about living in a reference frame where one species takes itself as absolute and values everything else in nature relative to its potential to produce value for itself.

The philosophy in a national park is to keep things as natural as possible. Man's role in a national park is supposed to not be disruptive. Bison and other animals die in winter; that is natural. When they die, they become a gift of life for other animals: ravens, magpies, eagles, coyotes, and others feed on the carcasses. So the National Park philosophy, in its idealized form, is one of noninterference with natural processes.

The resource at Yellowstone is not forty-thousand elk or four-thousand bison or ten-thousand hot springs or two-hundred lakes. The resource is wildness. And unlike a zoo or a museum or an amusement park, the worth of that wildness depends almost totally on its wholeness. Dangers are a part of that wholeness. While appreciating its wholeness, we must never abandon a healthy respect for wilderness. Wilderness is impersonal. It does not care whether you live or die. It does not care how much you love it.

There are very real dangers in true wilderness, and that is part of our fascination with it. A longtime researcher of wilderness areas has noted in defining them that places where one cannot be killed by a wild animal are not wilderness areas. In fact, the word 'wilderness' comes from wilder, a wild animal. There will always be steep cliffs, deep water, and ornery and unpredictable animals in that messy part of the national habitat not crossed by climate-controlled malls and processed-food emporiums. If people expect a grizzly bear to be benign, or think a glacier is just another variant of a theme-park slide, it's not the fault of the government when something goes fatally wrong.

However, many lawyers believe that true accidents (“acts of God”) occur very rarely, and that someone’s individual negligence is more often a factor in a death incident. Perhaps that is one reason the public does not like lawyers, because we do not wish to believe that.

Frustrated by potential legal problems, the NPS in 1984 solved the problem at Bridge Bay by simply cutting down all of the trees in the campground. Thus those persons prone to bringing meritless lawsuits have only themselves to blame if a campground is not quite as pretty as they might like. The rest of us get to suffer because of them. If, in the future, you find yourself camping in Yellowstone in a campground with no trees, you now know one possible reason.

I think that I shall never see
A thing more dangerous than a tree.
A tree that may in summer wear
A nest of lawyers in her hair.
Upon whose bosom the park can cause pain,
With great bulldozer and with crane.
Poems are made by fools like me,
But only plaintiffs can take away a tree.

“I have yet to go to Yellowstone and not see one of the regulations set up by the National Park Service being broken by one or more person. People take too many chances in the Park. Then, when something happens and a person dies, the Park is held responsible for their actions. Hogwash!”

“We feel there are plenty of signs which tell people to stay on the walks. So many times we saw people off the boardwalks or traipsing along paths that stated no trail. Do people think the signs are there for everyone else but them? We would hate to see fences put up everywhere. It would certainly take away from the beauty of the park. It’s a shame so many people who love Yellowstone or the Tetons or other lovely places will have to suffer because of a few who do not obey the signs put there as warnings.”

He had no feeling for the park’s problems in protecting the bears (and thus part of our heritage), in giving bears a natural environment to live in, or in offering visitors the chance to see wild animals in a wild setting—all well-established, thoroughly legislated purposes of Yellowstone National

Park. He had no regard for the fact that the greatest resource of Yellowstone is its very wildness. When you take that away by sanitizing the place—whether by radio-collaring every bear, by putting up signs every ten feet, or by otherwise overdeveloping the place—you destroy its most important element: wildness. It is not just another consumer product to be made safe. It is no longer able to serve its function if it is paved, fenced, labeled, and regulated into a form palatable to zoo- and television-minded visitors. It cannot stimulate if it is crippled or lessened.

People react to tragedy with rage: They are confused and frustrated and need to strike out. They need to hate or get revenge; they need to blame. They need, most of all, to avoid blaming themselves. Sometimes someone else is handy; sometimes that someone even deserves the blame. But occasional stupidity in park administrators, or occasional tragedy among park visitors, is not a good barometer of the health of the wilderness. When someone is hurt in the park, and the need to blame aches for fulfillment, you can almost count on the innocent environment getting stuck with part of the bill.

“This bear was euthanized by lethal injection on July 30 and her cubs given to Zoo Montana at Billings.”

Many a writer will condemn making wilderness less wild and more tame but do not seem to have much problems with killing a sow and imprisoning her cubs for life over trying to feed her family. Bears preying on humans is *not* an unnatural and unexplainable act. Humans are slower and generally less able to defend themselves than deer or elk, and certainly bison—why wouldn't smart bears eat people? Perhaps fat American visitors could be the salmon of the Yellowstone bears.

Now of course one can make a moral argument that the typical modern American's meat is not fit for consumption, loaded as it is with various toxic surface coatings as well as the accumulated exposure to other toxic substances existing within their fat and muscle tissue. Though really, since we've been dumping so much of this down the drains in one way or another, how much of the same are already found within Kodiak's salmon?

As humans and their activities have spread across the globe to extract resources, plant crops, and build cities and roads, thousands of species inhabit slivers of their previous ranges, surviving in isolated populations with few places to expand and faced with a loss of genetic fitness and an increased vulnerability to climatic shifts, disease, and natural disasters. Tigers, for example, inhabit less than seven percent of the space they inhabited a century ago. Caribou have lost half of their historic range

in the last 100 years. The World Wildlife Fund (WWF) estimates that, on average, vertebrate species populations have shrunk by half since 1990. Anthropogenic global warming has exacerbated the problem of disappearing habitat and shrinking abundance. Few landscapes around the world remain untouched by climate change today. And as they have for millennia, changes in climate are acting as selective pressures on species. For those animals that can't withstand changes to their environments, migrate, or adapt fast enough, their survival often depends on human intervention. An estimated 4,000 to 6,000 vertebrate species will need captive breeding over the next 200 years in order to mitigate extinction threats. Faced with these emergencies, the urgency to do something to save these species seems like a good ethical argument for action. But what actions we take have enormous consequences for the evolution of species.

Conservation is a human ethical construct. It's not science, it's values. The hard truth is that humans could survive in highly modified environments with less species for a very long time. Conservation biologists are scientists whose work, at its core, is an ongoing ethical debate about the future.

Prescriptive evolution stirs a hornet's nest of ethical values in conservation. The conservation ethic of wilderness being separate from human society and the evolution of wild things with their own value or entities with a right to existence, these are values that are held deeply in conservation, and directed evolution starts to become less comfortable for people. If we start meddling in the evolutionary trajectory of some organisms and do it in an intended fashion, not like now when it's unintended, we are making a choice about that species, we are manipulating them and choosing their futures. But most of what we do in conservation biology is already an evolutionary manipulation.

Thinking about how humans might intentionally direct evolution in species to conserve them reveals how little we still grasp of the complex organic process that has resulted in an animal and the relationship between its genes, behavior, and environment. Add the variable of anthropogenic climate change, and this ecological complexity becomes boggling. Climate change has always been a powerful driver of evolution, but it is difficult to predict the speed of change today and the effects on species.

“It's hard to future gaze to the next few hundred years, but unfortunately I think that's what is going to happen: life on this planet will likely be managed. It might not be as totally managed as a zoo or farm animals, but we are getting to that point.

Early on, the goal was to save the organisms from the environment. Bring them into captivity, and if you treated them nicely and not too biased in how you bred them, it won't be an issue. Now there is much more of an understanding that organisms will adapt to those environments. In the process of trying to save them, we change them. The irony of this age is that often the more we intervene to save species, the less 'wild' and autonomous they become."

Consider the case of crows in Hawaii. The captive breeding program changed the crows profoundly, perhaps so much so that they represent a different species. Before, they were kind of like the kings and queens of the forest. They chased the hawks and the hawks had a healthy respect for them. It took four or five years of releasing young birds before the hawks realized that these were different than the ones that used to chase them around and that they were fair game. All of those birds that were originally wild are now gone. All of the birds at the Keauhou Bird Conservation Center have been raised by puppets.

"So I truly feel that whatever happens in the forest now with these birds, it's a different species. Whatever they release now is really starting at evolutionary ground zero. They're going to have to relearn everything—including calls. So, from their language on up they're going to have a huge learning curve."

This is why the experience of seeing such species in captivity is so bittersweet: there is hope in the fact that they are still living—there is still, as a Hawaiian phrase, goes, "*Ke nae iki nei no,*" some breath remaining—and sadness that it is in such a diminished form.

There was a groundswell of enthusiasm for the idea that we could save wildlife. However, in many cases advocates for captive breeding became overzealous, and there wasn't a careful assessment of the needs of these different species; the goal was just captive breeding. It really pissed off people who were concerned with natural habitats and the animals in the wild. These "arks" themselves aren't always effective. The loss of genetic fitness—measured as the number of offspring produced by individuals that survive to reproductive age—can be rapid in captive populations, occurring within several generations and leading to lower reproductive rates and higher offspring losses. Captivity can create selections of traits within populations that improve their survival in captivity but not necessarily in the wild—if they are ever returned at all.

Although most captive breeding programs are intended to produce animals for reintroduction to their habitat, there are few successful cases to point to in which captive animals have become truly self-sustaining or “wild” again. Whooping cranes, for example, must still be taught to migrate by human pilots. When it comes to amphibians, the success rate for reintroductions is particularly low. One study showed that of fifty-eight species that were reintroduced after captive breeding, only eighteen bred successfully in the wild, of which thirteen were self-sustaining. Most tellingly, out of 110 species in captive breeding programs, 52 of the programs had no plan in place for reintroduction at all—their ecosystems didn’t exist anymore.

Proponents of what’s known as *in situ* conservation—preserving animals in their native place—say this is the most destructive aspect of captive breeding; by trying to minimize the chance of extinction, it emphasizes saving animals rather than environments. We’ll never know with any degree of certainty whether these animals can be reintroduced or not. There are a lot of environmentalists who say, ‘If you take a species out of the wild and there is very little possibility of reintroducing them, then you shouldn’t do it.’ But proponents of captive breeding believe it’s better to have the species in the world than to let them disappear, even if the animals that remain in zoos are essentially living museum pieces.

A plan being mooted to save the orangutan, an endangered ape that shares territory with tigers, is to charge tourists a hefty “conservation fee” to see them. Permits to view mountain gorillas in Rwanda cost at least \$500, for example. In the Anthropocene, it is likely that we will have to pay large sums to visit rare creatures that were once more numerous than us.

As I see it, it probably really is good for the soul to be a tourist, even if it’s only once in a while. Not good for the soul in a refreshing or enlivening way, though, but rather in a grim, steely-eyed, *let’s-look-honestly-at-the-facts-and-find-some-way-to-deal-with-them* way. My personal experience has not been that traveling around the country or world is broadening or relaxing, or that radical changes in place and context have a salutary effect, but rather that tourism is radically constricting, and humbling in the hardest way—hostile to my fantasy of being a true individual, of living somehow outside and above it all. To be a mass tourist, for me, is to become a pure late-date American: alien, ignorant, greedy for something you cannot ever have, disappointed in a way you can never admit. It is to spoil, by way of sheer ontology, the very unspoiledness you are there to experience. It is to impose yourself on places that in all non-economic ways would be better, realer, without you. It is, in lines and gridlock and transaction after transaction, to confront a dimension of yourself that is as inescapable as it is painful: As a tourist, you become economically significant but existentially

loathsome, an insect on a dead thing.

There is neither an environmental ethic that is fully developed nor one that has been used extensively to inform policy-making and decision-making. Few park rangers or wildlife biologists—let alone politicians—choose to utilize philosophical concepts in order to answer the questions they face about how and when to protect species.

If pushed to describe the moral roots of their convictions, conservationists generally give utilitarian arguments for species preservation, along the lines that species are intrinsic to ecosystem health, which is in turn intrinsic to human survival. This may be true in the very long view, but the exact opposite is true in the short-term: for people around the world, cutting a tree for fuel, damming a river for electricity, tilling the land for planting, or poaching an animal for money means survival. In order to succeed at their work, few conservationists navigate or even acknowledge this ethical relativity. To them the rightness of saving species is a kind of inviolable truth, even if others think it is a privileged opinion.

“I recently got into a fight with a group of people who live and breathe conservation biology as a religion. The reason I do this is I have to do something. I enjoy working in this realm. I feel like it’s a worthwhile effort and all those things. But I’m not judging the value of my life based on whether or not there’s going to be elephants twenty-five years from now. I’m not sure it’s within my control. I don’t think it’s you have to care about conservation because elephants will be extinct twenty-five years from now. It’s about quality of life, it’s what kind of planet do you want to live on, across the whole spectrum. In the suburbs, do you want to have salamanders and songbirds? Does it make a difference to know that someplace there are lions, or you can go to some place where you don’t see all the impacts of humans?”

Fortunately, well-being and high carbon emissions are not inseparable. Countries achieve high levels of happiness and life expectancy at a fraction of the carbon emissions per head of population produced by many of the richest countries, including Britain and the USA. The truth is that the rich developed societies are very inefficient producers of well-being—particularly those with bigger income differences between rich and poor. According to WHO figures, over 20 percent of the populations of the more unequal rich countries are likely to suffer forms of mental illness—such as depression, anxiety disorders, drug or alcohol addiction—each year. Rates may be three times as high as in the most equal countries. At the same time, measures

of the strength of community life and whether people feel they can trust others also show that more equal societies do very much better. Tackling inequality is an important step towards achieving sustainability and high levels of well-being.

As the populations of the developed world have gained unprecedented standards of comfort and material prosperity, further increases in those standards make less and less difference to well-being. But what has become critical to well-being is the social environment and the quality of social relations. There is abundant research showing that social life and relationships are essential to both health and happiness. However, very large material inequalities mean that status becomes more important and social life is increasingly impoverished by status competition and status insecurities. Social anxieties and our worries about how we are seen and judged are exacerbated. The result is that people start to feel that social life is more of an ordeal than a pleasure and gradually withdraw from social life—as the data show. But by intensifying status insecurities, inequality also drives consumerism, which is the biggest obstacle to sustainability. Any idea that we should consume less will be opposed as if it were an assault on our social standing and quality of life. But by reducing inequality, we not only reduce the importance of social status but, at the same time, we also improve social relations and the real quality of life. Reducing inequality is the first step towards combining sustainability with higher levels of well-being.

Whose interests does conservation serve? In the last few years, some conservationists have attempted to address the notions that biodiversity conservation is out of touch with the realities of poor communities and that national parks and protected wilderness only serve the interests of a global elite. They seek to promote poverty alleviation and economic development as a conservation tool, at times by advocating forestry and agriculture in the belief that a higher standard of living for the poor will ultimately benefit nature conservation.

Sometimes called the “new conservation,” it has come under fire by the old guard who argue that there is no evidence for the proposition that people are kinder to nature when they are more affluent, if only because their ecological footprints increase roughly in proportion to their consumption. They conclude that the new conservation, if implemented, would hasten ecological collapse globally, eradicating thousands of kinds of plants and animals and causing inestimable harm to humankind in the long-run. The fear is that humanitarian-driven conservationists will only demand the protection of nature if that nature is materially valuable to people. These concerns seem more than justified, and yet there is a terrible tension in the fact that so often it is relatively privileged Western scientists demanding that

developing countries like Tanzania not do as the scientists' own countries did for generations. Such tensions could of course be mitigated if not completely resolved, however the power and ability to do so is well outside the capabilities of these scientists.

Consider the case of the Isle Royale wolves, a population that established themselves in the 1940s on an island in Lake Superior by crossing a twenty-mile ice bridge. The wolves survived for decades preying on the island's moose, but in 1980, parvovirus, a disease introduced by domestic dogs, brought the population down to twelve and shrank the genetic pool. In 1997, a lone male wolf crossed the increasingly rare winter ice bridge and became the alpha male of the population. He was virile and territorial, so much so that he displaced one of the island's four packs, driving it into extinction within a couple of years. The wolf, known as No. 93 or "Old Gray Guy," brought a kind of genetic rescue to an ailing population. He spread his genes, producing offspring with higher fitness. But there have not been any new migrant wolves on Isle Royale since. Fifty-six percent of the population's genes are from this one wolf, and the inbred population continues to hover near extinction. The wolf and moose populations on Isle Royale represent one of the longest-running and most closely followed studies of predator-prey relationships in science, and there is intense debate over the right course of action. Should "natural" processes be maintained and the wolves allowed to die out? How much management and intervention is acceptable? Is Isle Royale a wilderness or a laboratory?

Albatrosses appear to challenge the classical view about the negative impacts of genetic depletion on populations. What explains this mystery? It turns out that right whales and albatrosses may share a similar behavior that helps their resilience: both species, it appears, have the ability to avoid inbreeding. In the case of the whales, this could have something to do with their complicated courtship rituals. Female right whales are incredibly promiscuous and throughout the year, a female will roll on her back and call to any nearby males, who swim from miles away to congregate around her. Each male attempts to get close to the female, jostling others in the process, slapping the surface with their flippers and tails, and blowing water. When the female turns right side up for air, the males swim underneath her and try to mate. This maelstrom, called a surface active group, can last for hours but it's not aggressive. Male right whales don't fight each other for the right to mate; instead they practice some of the strongest sperm competition known in the animal kingdom. When it comes time to mate with a female, numerous males might inseminate her, and their sperm race to fertilize her egg. Right whale biologists know by looking at genetic samples gathered by researchers that this fertilization is only successful when the

male has dissimilar DNA from the female. If inbreeding occurs, there is a high rate of spontaneous abortion. The result is that right whale offspring have higher levels of genetic variability than scientists would expect from a population with such a minuscule gene pool. Amazingly, each time a male and female right whale successfully produce a calf, they increase what's called the effective population size of the species, the number of individuals who can contribute genes to the next generation and slow genetic drift.

Right whales are one of the only marine species for which there is a genetic profile for nearly every individual, about 80 percent of the population. But after peering into their DNA and spending tens of millions of dollars in research and protection efforts, scientists can still only guess at basic facts of the animals' existence, such as where noncalving whales go to feed in the winter, or where breeding takes place, or where some whales go to feed in the summer. The more one learns about right whales, the more the species begins to seem like a potent reminder of something easy to forget: in an era of Google Maps and microchips and unabashed faith in technology's power, some things on earth are so big and complex—oceans, climates, whales—they dwarf our comprehension, let alone our ability to control them, for better or worse.

The ability to analyze the mitochondrial DNA of right whales has shown scientists that whalers weren't just killing individual animals: the exploitation of North Atlantic right whales in their historical range—from the west Saharan coast, Azores, Bay of Biscay, western British Isles, and the Norwegian Sea—likely resulted in the extinction of a right whale culture passed through females. This realization makes outlier whales like 1334 who are seen every now and then in strange places that much more fascinating. One of the old names for the North Atlantic right whale is *Noordkaper*, referring to the North Cape of Norway. A male, Porter, showed up there. There are also the oddball sightings off Greenland and Iceland and some in the Gulf of St. Lawrence. Could these outlier whales be retracing ancient migrations in search of food, revisiting places that are the right whale's historical habitat, faint memories of which are inscribed in their DNA? When the whales from the Bay of Fundy disappeared in 2013, is this how they found another place to feed, and is it vulnerable to climate change too?

The larger role that baleen whale species, of which right whales are one, play in the ecosystem and regulating climate has only recently been revealed to biologists. Although few in number relative to other marine species, whales likely act as pumps for recycling nutrition around the ocean, feeding on copepods and krill and then releasing fecal plumes and urine that fertilize water for phytoplankton to grow, which then supports the ocean's food chain from the bottom up. Whaling disrupted this system by reducing

whale populations, in turn likely influencing carbon storage and fish stocks. And so just as climate change may be negatively affecting North Atlantic right whale populations, their recovery may be needed more than ever to help stabilize oceans against the potential impacts of climate change.

An evolutionary ethic is one in which civilized man recognizes the continued existence and evolution of other species as integral to his own existence. Neither our pre-agricultural ancestor, nor the peasant farmer who succeeded him had cause for concern beyond the next meal or the next crop, the former because he used a pool of great species diversity, the latter a pool of self-renewing intraspecific diversity. This came to an end with the advent of scientific selection. Today's concern is with preserving and broadening the genetic base. The time perspective for gene pool conservation might be the next 50 or 100 years—which is merely an acknowledgment of the unparalleled technological transience of our age; we cannot foresee even what kinds of crops will be used at that time. For wildlife conservation the position is altogether different. Concern for its preservation is new, a consequence of our destructive age. Nature conservation is fighting for reserves and for legal recognition. The sights often are set for the short-term, although perpetuity is its ultimate objective. Genetic wildlife conservation makes sense only in terms of an evolutionary scale. Its sights must reach into the distant future.

For centuries, humans have collected the living things around us, stuffing them, sticking them with pins, and squirreling them away to feed the curiosity of scientists and the public in an attempt to try to understand the diversity of life on the planet. By 2050, the number of specimens preserved in the 6,500 or so natural history collections around the world are projected to increase by 500 percent from 2.4 billion. Around three decades ago, scientists began hoarding on a different scale: not specimens but genes.

In some cases, the samples are like snapshots of moments in history that might otherwise be lost: frozen water samples of a wetland might reveal microbes that are critical for restoring the ecosystem a hundred years from now. This unknown potential is part of what makes the samples priceless and ignites the imagination, giving scientists and the public a sense of 'what if' exhilaration and hope. There is a latent potential in these collections: Maybe what's actually going to be useful in the future is the microbial diversity on the samples, maybe that's going to be the true contribution. The potential value of the collection isn't known, and when they talk about these collections, people will say, 'We don't know exactly what they are good for, but they will be good for something.'

We must challenge the notion that banking, and embracing the implicitly hopeful future this practice represents, is unproblematically good. All cryo-

technologies of endangered species conservation have in common the fact that, to a greater or lesser extent, they fail to conserve what many people want to hold on to. There is a kind of reductivism underlying these *ex situ* approaches to conservation in which accessions—be they living birds, seed, or DNA samples—must be held outside of the vast web of relationships that have given rise to and sustained them. We can't put culture in liquid nitrogen, the same way we can't bank the natural communities. No one would say that freezing the DNA of humans preserves what makes us human.

It is deeply problematic to call genetic banking of tissues conservation at all. The idea that having isolated the genome we have somehow captured the essence of an organism and species is incredibly reductive. The notion that behavior is genetically determined is not how developmental processes work. Sadly, this comes up again and again. People are patenting gene sequences as if a genome is a blueprint of an organism.

Genetic banking might seem so appealing today because it suspends political realities and moral conundrums for a future time and place. With its biblical reference to imminent world disaster and its transcendent faith in technoscientific interventions, the Frozen Ark project reflects the moral discourses of global environmental movements that, after the multiple failures of the initiatives envisioned at Rio, are now permeated with urgency and irony. The act of genetic banking reveals a paradox of modern science: as we seek to stem the loss of biodiversity through technological means, this very act compromises the authenticity of wild nature that consists of mutually embedded forms of both cultural and biological life. For all these reasons we should be extremely skeptical of the biological essentialism and faith in technological solutions represented by genetic banking. The idea that the behavioral profile of the animal is reproduced just on the basis of the genes is entirely based on this sense that animals have no learning process, no culture, that they don't learn from—and impart information to—other species. That's just tremendously anthropocentric—that there are no species cultures or relationships beyond biology and that biology can be reduced to genes.

Fundamentally, freezing is a technology of deferral. It's for deferring action to the future. And the future may be a future that never actually arrives. The value of these collections is that they allow us to say look, we know there is a problem and science has been a huge part of creating that problem in terms of the byproducts of industrialization. We don't know what we are going to do, but in the future, other people will have better answers and so we owe it to future generations to preserve some substrate of the world we are destroying.

In all of these cases, the organization's rationale is that humans, as the

drivers of these extinctions, have the responsibility to deliver environmental justice, to make amends, in other words. The fact is, humans have made a huge hole in nature in the last 10,000 years. We have the ability now, and maybe the moral obligation, to repair some of that damage. For de-extinction advocates, our current technological powers mean that the laws of nature are malleable and reversible, and can be bent toward their conception of environmental justice.

De-extinction offers a seductive but dangerously deluding techno-fix for an environmental crisis generated by the systemic contradictions of capitalism. It is not simply that de-extinction draws attention—and economic resources—away from other efforts to conserve biodiversity as it currently exists. The fundamental problem with de-extinction is that it relies on the thoroughgoing manipulation and commodification of nature, and as such dovetails perfectly with biocapitalism. US lawyers have already begun arguing that revived species such as the mammoth would be “products of human ingenuity,” and should therefore be eligible for patenting. Species revival thus slots seamlessly into the neoliberal paradigms of research established by the Bayh-Dole Act of 1980, which legalized the patenting of scientific inquiry, as well as with the intellectual property agreements foisted on the world since the establishment of the World Trade Organization in the mid-1990s.

The biological patent allows a company to own an organism’s principle of generation, its genetic code, rather than owning the organism itself. Biological production is thereby transformed into capital’s primary means for generating surplus value. Under this new regime of biocapitalism, living organisms are increasingly viewed as programmable manufacturing systems.

“Our ability to use technology to engineer nature is itself natural. An ant can make an ant hole, that’s natural, and if we make a skyscraper, that’s natural. But it’s not ancient. I think overall the exploration of our planet and other planets, and exploration of nature and the changing of it—small changes or big changes—help us to appreciate just how vast the whole thing is. It becomes more complex and more diverse the more we change it.”

Arguments for de-extinction feel like a kind of spiritual denial that evolution and extinction are two sides of the same coin, and so long as we choose to fuel our survival as a species through the exploitation of natural resources, extinctions may well be the cost of our appetite for progress. Until we make space for other species on earth, it won’t matter how many animals we resurrect, there won’t be many places left for them to exist.

Science and technology can make us feel that the gulf between human magnitudes and eternal truth has been bridged. We can peer into genomes, locate the beginning of the Big Bang on the outer edges of space, travel down the Grand Canyon via Google Earth, and clone animals. But even as we assume a mythic God-like perspective on the universe, the majority of us who live in the modernized world have no idea how to survive away from civilization. How quickly would we revert to primitive awe if directly confronted with nature's power, alone in the Arctic night? What should we do to save that place and its creatures, and its ability to transform us?

Barbary Churchill Lee, a volunteer caretaker who worked with captive 'alalā from 1976 to 1981, was fired for her controversial decision to bury the body of a female crow, 'Ele'u, that had died on her watch from bird malaria, rather than give the carcass to the government biologists. Walters describes how Lee brought the bird to state officials who culled some of its tissues; she then decided to take 'Ele'u back to the mountain where she had been captured, hiding the bird's remains, in a sense, from science.

"I could not limit myself to thinking like a scientist. I had feelings! I will never forget driving up the mountain at Hualalai with 'Ele'u in a small box on my lap, tears streaming down my face. In my lap I held one of the last broken links between a species' existence and its extinction. There was this deep voice of Hawaiian history and belief in me, telling me that to bury 'Ele'u was the only thing to do. In the old days, warring groups hid the bones of their own for fear the enemies would dig them up and defile them by making fishhooks and other objects. To this day, no one knows where the bones of King Kamahameha are hidden—probably deep in a cave somewhere along the Kohala Coast. I didn't want the enemies of 'Ele'u to have her bones, either, because they would defile them in their own way, leaving them in a freezer or dried on a shelf until they get thrown out. I know burying her wasn't technically the correct thing to do, but it was the right thing to do."

These neoliberal ideologies have come to permeate conservation to such an extent that discussions of biodiversity have become the site for the elaboration of what might be called disaster biocapitalism. Just as disaster capitalism seizes on political calamities to further its accumulative aims, this disaster biocapitalism takes the extinction crisis as an opportunity to ratchet up the commodification of life itself. At the UN Climate Conference in 2007, for example, the UN and the World Bank announced the Reducing

Emissions from Deforestation and Forest Degradation (REDD) scheme, which pays countries of the global South to reduce their deforestation and protect their existing forests. The carbon stored in these forests can then be quantified and sold to polluting industries in the global North, who can buy this stored carbon in order to “offset” rather than reduce their own polluting emissions. REDD was launched without input from indigenous peoples and other forest-dependent communities, and has already been linked to many land grabs and human rights violations. All too often, local land stewards are represented in corporation-controlled international agreements like REDD as destroyers of biodiversity, and are consequently subjected to forced removal so that ecosystems can be privatized and re-engineered as income-generating commodities to be sold on global capital markets.

Building on the REDD paradigm, the UN Convention on Biological Diversity in 2008 launched its own model for marketing “environmental services” through the Business and Biodiversity Initiative, which includes mechanisms for offsets and for the creation of “natural capital.” Within such schemes, the environmental commons of the global South, the planet’s tropical forests and oceans and the myriad creatures who inhabit them, become a source of natural capital that can be quantified and traded on global markets. Biodiversity is thereby transmuted into a generator of offset credits that allow polluting corporations and governments to continue their ecological mayhem. Some of the world’s most prominent conservation-based environmental NGOs have signed on to this disaster biocapitalism, including Conservation International, the Worldwide Fund for Nature, the Nature Conservancy, and the Environmental Defense Fund. Appallingly, many of these conservation organizations are intensifying the social impact of the environmental crisis by encouraging states in the global South to evict indigenous people, who are deemed incapable of managing their land, from conservation areas, creating a new category of “conservation refugees.”

The philosophy of ‘in the long-run we are all dead’ has guided economic development in the First and Third Worlds, in both socialist and capitalist countries. These processes of development have brought, in some areas and for some people, a genuine and substantial increase in human welfare. But they have also been marked by a profound insensitivity to the environment, a callous disregard for the needs of generations to come. It is what we know as the ‘global green movement’ that has most insistently moved people and governments beyond this crippling shortsightedness, by struggling for a world where the tiger shall still roam the forests of the Sunderbans and the lion stalk majestically across the African plain, where the harvest of nature may be more justly distributed across the members of the human species, where our children might more freely drink the water of our rivers

and breathe the air of our cities.

The genomic information of plants, animals, and human beings is the common wealth of the planet, and all efforts to make use of this environmental commons must be framed around principles of equality, solidarity, and environmental and climate justice.

Biological Bigotry

The story goes something like this: Around 350 BC, the Athenians established a memorial to the naval heroics of their founding king, Theseus. They placed his ship in port, where it stayed for centuries. Over the years, the planks of the ship began to decay, so the Athenians replaced the rotting planks with new wood until eventually all of the wood from the original ship was gone. According to the Greek historian Plutarch, the ship became the focus of a popular riddle among philosophers. Was it the same ship? Had the ship changed, and if so, how? Some philosophers believed the ship was still Theseus's, and others contended that it wasn't the same boat at all. Aristotelians believe the form of a thing is its essence, and according to this logic because the ship had the same exact form as the one that was sailed by Theseus, it was the same ship. Heraclitus, however, argued differently. According to him, everything moves on and nothing is at rest; comparing things to the flow of a river, he famously said that no one can step into the same river twice.

This sage wisdom seems to prophesy the modern understanding of biology. We know today that all the component parts of our bodies—our cells—are in a state of constant flux, of dying and regenerating. Are we the same person nonetheless? Over generations of human history, natural selection has played upon the DNA in our cells, changing the sequence of proteins in a never-ending rearrangement of molecules that adds up to human evolution. So am I the same species as my distant ancestors?

What is a species? Scientists tell us that species are the principal units of evolution. But if evolution is a process of changes in the genetic makeup of a population over generations, how can we define species? This riddle is called “the species problem,” and it has everything to do with how we think about nature and the exuberant process called evolution that has produced so many billions of life-forms. Before the nineteenth century, people believed species were divinely created with fixed identities: an animal had an essence that gave it membership in a group with other animals with the same essence. Carl Linnaeus, the Swedish botanist who invented the species classification system, believed that he was cataloging earth's creatures as created by God. After *On the Origin of Species* was published in 1859, it was impossible to rationally refute that species actually changed over time. This made defining a species confusing. Where do they start and end? Darwin himself recognized this problem when he wrote:

“The domestic races of many animals and plants have been ranked by some competent judges as the descendants of aborigi-

nally distinct species, and by other competent judges as mere varieties.”

Understanding the process that created species is intrinsic to understanding what a species is. But this quest has led brilliant minds into scientific and philosophical sinkholes for the last 150 years. And for all our knowledge about biology today, the issue has never been definitively answered. Today there are about twenty-six different “species concepts.” The most simple of these is the biological concept, first developed in the 1940s by the renowned evolutionary biologist Ernst Mayr. Mayr defined species according to their potential for reproducing. He said that species are a group of natural occurring populations that are reproductively isolated from other groups; they can’t interbreed or produce fertile hybrids. A horse and a giraffe, for example, are different species according to the biological concept, because they can’t procreate. This definition has been described as problematically basic. Scientists have discovered a lot of examples of animals that they can’t prove exist according to fixed reproductive rules. Some asexual animals, like starfish and sea anemones, exempt themselves from the mechanics of breeding outright. But we wouldn’t say that the hundreds of species of starfish aren’t species, even if they don’t fulfill the biological concept’s specifications.

Another concept, the phenotypic, defines a species based on shared physical characteristics. But appearances can be deceiving and unhelpful. What degree of difference determines a new species? Differences between populations or individuals might be irregular, the product of environment or what’s called genetic drift, the random disappearance of genes as individuals die or don’t reproduce. The colorful plumage of a male mallard duck looks different from the somber female mallard duck. They’re the same species, but using the phenotypic concept to define why is unhelpful.

In the early 1980s, biologists came up with a new species concept, something they felt better encompassed life in all its abundant variation. Called the phylogenetic concept, it says that species are the smallest cluster of organisms that share a common ancestor. Since the 1980s, molecular genetic analysis has given scientists a very precise tool for determining common ancestry. By focusing on specific markers in an animal’s genotype and comparing it to a related animal, they can determine complex demographic histories including how long ago the animals split from one another into separate branches on the evolutionary tree. The problem is that the phylogenetic concept often ends up splitting species into very small groups, and this can dramatically balloon the number of species we understand to exist on earth. Consider, for example, that the number of lichens in the genus

Niebla goes from eighteen to seventy-one species. Birds of paradise in New Guinea increase from some forty species to as many as 120. In a few unique cases, the phylogenetic definition reduces the number of species within a taxonomic group: the number of deep sea snails shrinks from two to one, and mollusks as a whole decrease by 50 percent.

Adherents to the biological concept call proponents of the phylogenetic concept “splitters,” and in turn, biological conceptors are known as “lumpers.” The conflict between these two groups comes down to whether small differences between organisms don’t really matter, or whether small differences are the very stuff that makes up a distinct species. It may seem like a turgid theoretical debate, but it has big consequences for how we intervene to conserve animals. In 2004, researchers published a study in the *Quarterly Review of Biology* analyzing over 1,200 species previously defined according to Mayr’s biological concept, and reconsidered them according to the phylogenetic concept. The result was that the number of species increased by 48 percent. Even in well-studied groups such as mammals, arthropods, and birds, the authors reported an increase in the number of species as high as 75 percent. Applying a phylogenetic concept also changed the number of species potentially designated as vulnerable and endangered, and they estimated the cost of protecting these “new” species at about \$3 billion in the United States alone.

Introduced populations always start out small, and a big problem for small populations is inbreeding; because there are few animals around, they end up mating with close relatives, even brothers and sisters. Inbreeding brings together deleterious recessive mutations (which normally lurk undetected in large populations), causing malformation, disease, death. But there’s a twist—geneticists had figured out that small populations might go through a process called purging, in which the harmful mutations that make inbreeding so dangerous are lost completely. Any population that successfully negotiated this process would emerge not only immune to the detrimental effects of inbreeding, but fitter, faster, better all round. Because the conditions under which it’s supposed to occur are so restrictive, purging remained merely a theoretical curiosity—until now. Research has shown beyond any doubt that the Louisiana harlequins were successfully purged of their bad mutations in the 1980s and now grow faster and have more offspring than native Asian harlequins. They’re also completely immune to inbreeding—even offspring of matings between siblings show no ill effects at all—which means they can now easily establish from even a tiny starting population. Indeed, we are now in the bizarre situation where harlequins could even be invasive back in their native range, potentially able to brush aside the native population from which they evolved.

The evil quartet of extinction—invasive species, overharvesting, habitat destruction, and fragmentation—if you look at those same factors, they are all associated with rapid evolution. One result of this discovery is that conservation strategies might only preserve species in a very limited sense. Even the term ‘species conservation’ is problematic. Evolution always happens. Always. It’s a kind of ignorance, even arrogance to think you can prevent a species from evolving. This thorny tension is particularly evident in the field of conservation genetics, which, as one authoritative text puts it, seeks to “preserve species as dynamic entities.”

The Pecos pupfish live along the Pecos River from Texas into New Mexico, but because the river has been dramatically altered by damming and channelization, the fish are now isolated in various habitats. There used to be constant gene flow and now we’ve got all these micropopulations with no gene flow and their own evolutionary trajectory. How do you “fix” it? You can augment it but you might also mess up their local adaptations. You could introduce alleles that don’t allow them to adapt to their environment. It’s hard. It’s easier to document the travesty than it is to fix it.

In some instances, the conservation policy has been to prevent species hybridization at any cost. The USFWS in New Mexico euthanized a litter of puppies that they found to be a cross between a rare Mexican gray wolf and a dog in 2011, and then later killed the wolf mother when she was found near dogs again.

The entrenched belief is that evolution is a march of progress—a stooped, hairy figure of a primate growing into an ape-ish Neanderthal and eventually an upright, civilized, modern human. This concept of historical progression is ingrained upon us in elementary school, and it makes evolution seem intuitive and completely rational: human consciousness is so complex in its powers that it must be the apex of an inevitable trajectory. But the paleontological record reveals this concept of evolution is a sham. Life on earth is not shaped like a cone that extends upward toward increasing diversity and complexity, eventually resulting in us.

The proof is in the Burgess Shale, a fossil field in British Columbia first discovered in 1909. Over 530 million years ago, tens of thousands of marine creatures were fossilized in a limestone quarry that preserved not only their bones but also all of their soft tissues in exquisite detail. These creatures evolved during the Cambrian explosion, when life on earth underwent massive diversification and the blueprint for virtually all modern animals appeared. Initially, paleontologists thought these fossils belonged in existing taxonomic categories, but then in the 1970s, they discovered this was a colossal mistake. The Burgess Shale contained a range of original anatomical designs unparalleled today, indeed, a greater diversity than all

the marine life put together in our modern oceans. These fossils are proof that evolution is not a narrow beginning and a constantly expanding upward range. Rather it is more like breathing, the chest rises, reaches a point, contracts, reaches a point, begins expansion again.

A crucial thing to remember is that although we talk of animals and plants advancing and retreating as the glaciers waned and waxed, only the first part of that is literally true. Although species did spread north as the ice melted, those northern colonists generally died out when the ice returned. That is, there was no actual retreat, and the only populations that survived the whole cycle were those that remained in the southern refugia, mostly adjusting to rising and falling temperatures by ascending and descending the nearest mountain. So, although the English are fond of referring to their oaks as “English oaks,” the oaks that thrive in England today spent more than 99 percent of the last two-and-a-half-million years in Iberia and are more accurately ‘Spanish.’ Not only that, but the refugium that provided specific colonists seems to be rather random, so English oaks in a previous interglacial may well have been Greek, or perhaps Italian.

I was going to say that I plan to debunk the myth that alien species constitute the second largest global threat to biodiversity (after habitat destruction). But on reflection I think that assertion has been debunked so often (yet is endlessly repeated) that it no longer deserves the status of a myth, and is best described merely as a straightforward lie. Not only are alien species not the second biggest threat to biodiversity, they aren’t the third, or fourth, or even the fifth largest cause. Nor are invasive species one of the most important threats to the continued survival and well-being of mankind. The lives of large numbers of people are all far more likely to be ended or made miserable by war, disease, pollution, climate change and shortages of energy, minerals, food, and—above all—fresh water.

The zebra mussel is widely credited with causing severe environmental and economic damage, and, specifically, it is reckoned to be the main threat to the survival of North American freshwater unionid bivalves. Unionids are certainly in big trouble, and several species are already extinct, but their problems began long before the introduction of zebra mussels to America in the 1980s. A familiar cocktail of habitat destruction and degradation (arising from building dams, water abstraction, erosion, and eutrophication), pollution, overharvesting and loss of the host fish that parasitic unionid larvae need to complete their life cycles are all implicated. Indeed there’s every reason to believe that the decline of unionids would have continued even if the zebra mussel had never arrived.

As is often the case, blaming an alien for filling the gap left by declining natives looks like shooting the messenger, reflecting the usual unwillingness

to recognize that the real problem is us humans, and our unwillingness to take the hard decisions needed to improve things. The zebra mussel illustrates nicely another odd feature of our attitude to alien species: an unwillingness, and indeed often a blank refusal, to accept that alien species might have any redeeming features whatsoever. As far as aliens are concerned, the balance sheet has only a debit column.

It's not the fact of human intervention that removes nativeness forever, it's the timing and scale of human intervention. In Britain, no one is quite sure if you have to be around before the Neolithic, or before the Romans, or even the Normans, to be native. If you're inoffensive (and threatened) enough, like the white-clawed crayfish, before 1500 seems to be good enough. In America, the modern interpretation of 'native' seems to mean before 1492, even though pre-Columbian Americans domesticated plants and indulged in long-distance trade. In Australia, beating Joseph Banks to landfall makes you native, despite plenty of evidence that plants and animals were moved around the wider region for millennia before the Endeavour pitched up in Botany Bay in 1770. In other words, pre-technological, pre-European societies, however advanced, and whatever they may have got up to, are often—but not always—exempt from the definition of human agency. It's not always easy to tell, of course, since the definition of nativeness is frequently adjusted ad hoc to help to prop up human preferences decided on the basis of other criteria. Just as well, too, since a too strict application of nativeness would require the return of Europe to a pre-Neolithic ecological state.

A core belief that follows directly from niche theory is that niches are central to understanding why communities contain the number of species they do: specifically, that the available niches are all occupied and that the community is therefore saturated. In a saturated community, it's difficult by definition for a new species to gain a foothold. But if one does become established, that means fewer resources for the ones already present, leading sooner or later to the local extinction of a resident species. The almost universal finding of experiments, however, is that communities are not saturated and that local diversity can easily be increased.

As of the end of 2007, there was no evidence that any plant had been lost from the USA, or from any US state, as a result of competition from an alien plant. In fact after 400 years of European settlement, establishment of aliens has led to an increase of about 18 percent in the number of species in the US flora (excluding Hawaii and Alaska), while only 0.6 percent of native plant species have been lost. In other words, a ratio of colonization to extinction of about 24 to 1 for the USA as a whole, with similar values for individual states. Even in Hawaii, much more heavily invaded, the ratio is 12 to 1. At the much smaller scale of US counties, the pattern is the same,

with many new colonists and very few losses of native species. Moreover, the counties with the most natives always have been, and continue to be, the most invaded by aliens.

The biodiversity of Pangaea exactly equals the sum of the present biodiversity of the Earth's various continents. It may seem surprising that homogenization does not necessarily mean low diversity, but we don't need to travel back in time to Pangaea to have that confirmed. Because ocean currents easily transport fish and coral larvae over distances of thousands of kilometers, coral reefs over vast areas are effectively closely connected and contain mostly the same species, yet remain one of the most diverse communities in the world. Both theory and coral reefs agree: In the future, different regions of the world will be more similar than they are now. They will also be more diverse.

However, before you break open the champagne at the news that moving species around at our present rate will increase local biodiversity, and have little or no effect on global biodiversity, it's worth recalling that that's not all we're doing. We have already altered three-quarters of the Earth's ice-free land surface, and by 'altered' I mean made it much less able to support the animals and plants that used to live there. Again island biogeography tells us what that means: if we leave a quarter of the Earth for wild animals and plants, we eventually end up with a quarter as many species as we started with. Many of these survivors will be species that we have moved to new continents, and many of them will be species that don't too much mind a planet that consists mostly of crops, cities, and roads. But blaming them for that sorry state of affairs would be foolish.

The view of the biosphere you learned in school, of natural biomes, disturbed to varying extents by humans, is seriously out of date. The modern world is essentially a mosaic of new 'anthropogenic biomes' (croplands, plantations, settlements, cities, rangelands), with here and there natural ecosystems embedded within them. It's because so much of the world has been transformed so dramatically that there is now a consistent winning syndrome. In a world before significant human influence, there was room for everyone, and all available tickets in life's lottery had some chance of winning. It's only in the last few thousand years, and especially in recent centuries and decades, that being a rat or a weed has turned out to be the golden ticket in life.

To reiterate, and to make sure we don't lose sight of the basic point, winning and losing has little or nothing to do with being alien or native. Invasive aliens are winners by definition, but so are many natives. If we profoundly transform the landscape in a way that suits a small suite of fast-growing, effectively dispersed plants, then that's what we get, with the

aliens that fit this description expanding along with the natives. If Britain had no alien plants, we would still have a landscape dominated by plants that no one likes very much, except they would be exclusively natives: coarse grasses, nettles, brambles, ragwort, docks, dandelions, thistles, bracken, and hogweed. In the UK, as elsewhere, successful species, alien or native, are symptoms of change rather than drivers of that change, and all they are telling us is that they are very pleased with the changes we have made to their environment.

The critically endangered island fox (*Urocyon littoralis*) declined precipitously in the mid-1990s, for reasons that were not in doubt: predation by golden eagles. Golden eagles are of course a native North American species, but they were attracted to the island in large numbers by the presence of non-native feral pigs. The answer was clearly to remove the pigs, but ecologists predicted that, if pigs were removed first, the large eagle population would focus more on the foxes, probably leading to their extinction. No one wanted to harm the eagles, so a programme of live trapping was begun, resulting in the removal of 44 eagles from the island; only then was it considered safe to eradicate the pigs.

Nevertheless, the foxes hardly recovered, and it was subsequently discovered that not only had one pair of golden eagles been missed, this pair happened to be fox specialists. Once this pair of eagles was tracked down and removed, there was a modest recovery of the foxes, although numbers remain low. Underlying the whole saga, as so often, was a man-made environmental problem—in this case, the loss of bald eagles from the island during the 1950s owing to contamination of the surrounding sea with DDT. The highly territorial bald eagle competes with the golden eagles for nest sites, so it was not only the abundant pigs, but also the absence of competitors, that allowed golden eagles to move to the island in large numbers. Bald eagles have now been reintroduced to the island, and with any luck the foxes will now be safe. Bald eagles themselves take the occasional fox, but are primarily fish-eaters.

A study of attempted plant eradications in California showed that plants that occupy an area of no more than one hectare can usually be eradicated, but the probability of success declines rapidly as the infested area increases beyond this. One hectare is a tiny area—only slightly larger than a football pitch—so in practice this means eradication has to begin long before there's any possibility of knowing whether a plant will eventually cause any kind of problem—in fact, almost before the plant has been detected. Optimists have likened eradication to a 100% lump sum payment, after which the job is done and no further payments are necessary. Experience, on the other hand, suggests most attempted eradications have more of the character of a

small down payment, with a promise of further installments that continue indefinitely.

Sometimes the unintended ramifications of a biological control introduction are so complex, just thinking about them makes your head hurt. Consider the attempt to control European spotted knapweed (*Centaurea stoebe*) in North America, using two European flies (*Urophora spp.*) that lay their eggs in the flower heads of the knapweed and massively reduce its seed production (although not enough to actually control the weed). One reason control was ineffective is that the fly larvae rapidly became a favoured food of native deer mice. This extra food meant that the population of deer mice increased and as a result more of them became infected by a hantavirus (which also infects humans).

At the same time, as the mice ate knapweed seed heads containing fly larvae, they also inadvertently consumed whole knapweed seeds that they then deposited in their dung, thus providing a novel dispersal mechanism for the weed. Not only that, but knapweed seeds eventually turned up in the fecal pellets of great horned owls that had presumably eaten deer mice, thus providing long-distance dispersal far in excess of anything the weed might have achieved on its own. Finally, if you're still with me, deer mice are actually big seed-eaters, but don't like the taste of knapweed seeds. So the greater numbers of deer mice (caused by a diet of nutritious fly larvae) ate more seeds of native plants, reducing their establishment from seed.

Despite all the evidence to the contrary, politicians persist in behaving as though ecologists actually understand how ecosystems work (which they sort of do) and can predict their future behaviour (which they can't). Beliefs that would be hilarious if they weren't so tragic.

Rachel Carson had it right over 50 years ago in *Silent Spring*:

“By their very nature chemical controls are self-defeating, for they have been devised and applied without taking into account the complex biological systems against which they have been blindly hurled.”

Invasive alien trees can be useful for restoring native forest. In Puerto Rico, native pioneer trees could cope with natural disturbances such as drought, hurricanes, floods, and landslides, but are mostly unable to colonize land that has undergone deforestation, extended agricultural use, and eventual abandonment. In these sites, low-diversity pioneer communities of invasive trees develop, but over time native trees invade. Alien pioneers may dominate for 30–40 years but the eventual outcome, after 60–80 years, is a diverse mixture of native and alien species, but with a majority of native

species. In the absence of the initial alien colonists, abandoned agricultural land tends to become pasture and remain that way almost indefinitely.

By way of an example of a more enlightened approach, consider *Psidium guajava*, a tropical tree that has been widely introduced outside its native South and central America and is regarded almost everywhere as a successful and unwelcome pest. Despite this reputation, in Kenya guava has real potential as a tool in the restoration of tropical forest. Studies of isolated guava trees in farmland showed that they were extremely attractive to a wide range of fruit-eating birds. In the course of visiting them, birds dropped seeds beneath the guavas, many of them from trees in nearby fragments of rainforest, and many of these seeds germinated and grew into young trees. Surprisingly, distance to the nearest forest didn't seem to matter at all—trees up to 2 km away (the longest distance studied) were just as good as trees much nearer to forest fragments. Guavas establish easily on degraded land, and each tree is potentially the nucleus of a patch of regenerating rainforest. Of course, most seedlings that grow beneath guavas are just more guavas, but guava is an early-successional tree that soon dies out when overtopped by bigger trees, and it does not actively invade primary forest.

A common feature of both these examples, and of many similar instances, is the difficulty we humans seem to have in thinking on the right timescale. As abandoned land in Puerto Rico is colonized by a virtual monoculture of alien trees, and as the tenure of this alien blanket extends to 20, 30, or even 40 years, the harder it becomes to resist the conviction that something must be done. In the face of mounting clamour from conservationists, local residents, and the media, a policy of patient optimism becomes harder and harder to sustain. Yet this is the right policy, because on the timescale of the development of mature forests, even if not that of local politics or conservation funding programmes, 30 or 40 years is no more than a moment. The end product, a mixed forest of native and alien trees—but with a majority of natives—may not be what you might have wished for in an ideal world, but it's a whole lot better than anything likely to come from any attempt to interfere.

Palaeoecologists naturally think in terms of millennial timescales and tend not to be very impressed by how the world happens to look right now. Instead they see species responding in their own individual ways to environmental change, constantly coming together and separating into what ecologists like to call communities, but which in reality are only stills from a movie. Pause the movie a few millennia later, or even a few decades or years, and you get a different snapshot. At some scale, all species are invaders and all ecosystems are novel.

From starlings to flatworms, and wool aliens to wheat, it's hard at first

sight to see what all these introduced species have in common, but in fact all do share one elusive quality: they thrive around people. For plants and animals introduced deliberately for food, as pets or for ornament, that's obvious, but it's equally true for accidental introductions. Before they could be moved by human agency, those New Zealand flatworms had to find their way into plant pots, wool aliens onto domesticated sheep, rats and brown tree snakes onto ships, and zebra mussels into the ballast water of ships. The sheer volume of modern trade and travel means that any species that likes the company of *Homo sapiens* or his buildings, vehicles, pets, gardens, livestock, or fields will eventually find itself dispersed to new pastures.

At the same time that we are dispersing species in unprecedented numbers, we're also making such dispersal more and more necessary. Species have always found it useful to be able to disperse to new habitats, but habitat destruction and fragmentation make effective dispersal more vital than ever, if species are to survive. In addition, there is the growing threat of climate change, which means that everything has to move, sooner or later. How fast does this migration have to be? The instantaneous velocity of climate change varies a good deal from place to place, but has a global mean of 0.42 km/yr. That's a little over a meter a day, which doesn't sound like much, but it means that only eight percent of the Earth's protected areas have "climatic lifetimes" of more than a century. In other words, in 92% of reserves the temperature of the reserve's coldest part will exceed the present temperature of its warmest part in only 100 years. Of course, individual species may have climatic tolerances that allow them to survive in changed climates, or they may be able to make small migrations to different aspects or altitudes. But, for many species, confined to mountaintops or particular types of geology, surrounded by unsuitable habitats (especially urban or intensive agriculture) or facing insurmountable barriers such as water, dispersal may be difficult or impossible.

The question is not whether species should be moved, but which species should be moved. A 'no translocation' policy simply stacks the odds even further in favour of raccoon, weeds, aphids, mealybugs, and all the other common, widespread, easily dispersed anthropophiles. Assisted migration of endangered species is a small step in the direction of allowing them to compete on a playing field that still slopes uphill, but slightly less steeply than before. Critics argue that moving species is "playing God," but we're playing God already; it just happens to be a rather Old Testament sort of God, one who has taken to heart the maxim that "the Lord helps those who help themselves," and interpreted this to mean that those who are in no position to help themselves don't deserve any help at all.

British botanists continue to argue about the smallflowered tongue orchid

(*Serapias parviflora*), previously known only from mainland Europe, which was found growing in Cornwall in 1989. Orchids produce vast numbers of extremely tiny, light seeds, and it's entirely possible that they blew across the Channel. If they did, then the tongue orchid arrived without human assistance, which means it qualifies as a native (and for careful protection). Then again, it's equally likely that seeds fell out of someone's trouser turn-ups or arrived stuck to the sole of someone's shoe, or possibly that it was deliberately planted. If any of those is the case, then it's just another bloody weed, to be ruthlessly exterminated.

So low has the stock of introduced species fallen that it is now possible to commence a scientific paper with the line, "Many ecosystems worldwide are dominated by introduced plant species, leading to loss of biodiversity and ecosystem function," in the certain knowledge that no one will be surprised by such a statement, and certainly that no one will ask for it to be supported by any actual evidence. Of course, this text is pure boilerplate, not intended to trigger the firing of many—or even any—neurons in the reader's brain, maybe not even intended to be read at all. Nor do those who wrote it necessarily believe it; at least, not in the sense of having arrived at that conclusion by weighing the evidence. It's just something that gets routinely stuck on the front of any paper about alien species.

Introduced crops and livestock account for 98 percent of all food produced in the US, with a value of \$800 billion per year. So, however much we discover (or imagine) aliens are costing us, it's going to be small relative to that. When adding up the costs of introduced species, it's traditional to ignore anything on the positive side of the balance sheet, so just make a mental note of that and move on.

Take the South American fire ant, reputed to be costing the US \$2 billion per year, although as usual much of this is not the cost of actual damage caused by the ant but the costs of control. But how much of a problem is the fire ant? Here's what Rachel Carson had to say in *Silent Spring*:

"During most of the forty-odd years since its arrival in the United States the fire ant seems to have attracted little attention. The states where it was most abundant considered it a nuisance, chiefly because it builds large nests or mounds a foot or more high. These may hamper the operation of farm machinery. But only two states listed it among their twenty most important insects pests, and these placed it near the bottom of the list. No official or private concern seems to have been felt about the fire ant as a menace to crops or livestock.

With the development of chemicals with broad lethal powers, there came a sudden change in the official attitude towards the fire ant. In 1957 the United States Department of Agriculture launched one of the most remarkable publicity campaigns in its history. The fire ant suddenly became the target of a barrage of government releases, motion pictures, and government-inspired stories portraying it as a despoiler of southern agriculture and a killer of birds, livestock, and man. A mighty campaign was announced, in which the federal government in cooperation with the afflicted states would ultimately treat some 20,000,000 acres in nine southern states.”

Carson then spends some time carefully examining the claims that the fire ant is a serious threat to agriculture, wildlife, and human health, dismissing all of them. *Silent Spring* is by its very nature a passionate, polemical book, but Carson reserves some of her most vitriolic invective for the blanket spraying of dieldrin and heptachlor against the fire ant:

“Never has any pesticide programme been so thoroughly and deservedly damned by practically everyone except the beneficiaries of this ‘sales bonanza.’ It is an outstanding example of an ill-conceived, badly-executed, and thoroughly detrimental experiment in the mass control of insects, an experiment so expensive in dollars, in destruction of animal life, and in loss of public confidence in the Agriculture Department that it is incomprehensible that any funds should still be devoted to it.”

A final irony is that one of the principal sins laid at the door of the fire ant by the US chapter of Biological Invasions is a decline in the bobwhite quail, but, as Carson reported, the highly toxic organochlorine pesticides used against the fire ant all but eliminated quail from the treated areas. There’s no doubt fire ants can have negative effects on quail, but it’s a huge leap to infer that the ants are responsible for the bird’s long-term decline. In fact, as usual, an alien species is taking the rap for a deeper problem.

These accounts of the costs of aliens in the US are so badly drafted that it would be hard not to laugh if the estimates they contain were not taken so seriously. But the real lesson is not any particular instance of incompetence or chicanery, but what it tells us about the mindset of those who have allowed themselves to be swept along by the invasions industry. Essentially it’s obligatory to accept the notion that alien species have only negative effects. Thus the “costs” of alien species have a rather peculiar interpretation for those of us used to putting together the credit and debit

sides of a balance sheet to arrive at a net cost. Not only that, but the ‘costs’ themselves need not include anything that actually leaves you worse off as a result of the existence or activities of a particular species. They can also include—or, indeed, consist entirely of—the costs of attempting to control the species, plus the costs of clearing up the mess left by such attempts, even if there’s little evidence of any original harm (e.g. purple loosestrife or spotted knapweed), or if such attempts are never likely to succeed without tackling a deeper underlying problem (e.g. tamarisk). Of course these costs are real, in the sense that they represent actual dollars spent—the question is whether it was money worth spending. The final lesson is that, whenever you hear eye-wateringly colossal sums mentioned in the context of costs of alien species, you should always enquire exactly what these costs are supposed to include, and where they came from.

Why are we quick to blame invasive species for anything and everything that appears to be going wrong, yet very slow to blame overfishing, pollution, habitat loss, overgrazing, climate change, intensive agriculture and all the other much more fundamental causes of our environmental problems? It’s tempting to say that the real problems are just too big, too diffuse and basically too damned expensive; tackling them in a way likely to make any difference would probably involve reductions in our standard of living, or at least changes in the way we live our lives. All that’s true, but there are even deeper psychological reasons, connected to our evolutionary history and the way we assess risks. We find it hard to get worked up about abstract, impersonal threats—however big their potential damage—so malaria, climate change, and obesity don’t get anything like the attention they deserve. On the other hand, we are acutely sensitive to threats from clearly identifiable, discrete agents, so our anxiety about terrorists, violent criminals, and pedophiles is out of all proportion to any harm we are likely to suffer at their hands.

Where do invasive species fit in? You might imagine they would belong with things that we have trouble taking seriously, like influenza and tuberculosis, but you’d be wrong. The popular media, and even scientists to some extent, have succeeded in personalizing the threat from invasive species by describing them as a “menace” or a “plague,” and crucially even attributing malicious intentions to them: “evil aliens.” Purple loosestrife alone has been described in newspaper reports as an “invader,” “menace,” “pest,” “plague,” “killer,” “scourge,” “monster,” “public enemy number one,” “enemy of wildlife,” “time bomb,” “disaster,” “nightmare,” “rogue,” “strangler,” “barbarian,” and, my personal favourite, the “Freddy Krueger of plants.” Even the relatively neutral word ‘alien,’ used by scientists in a value-free way to define non-native species, raises troubling political and

moral issues when used casually, and an unthinking nativism may have roots in xenophobic and racist attitudes, or at least reinforce such attitudes if employed carelessly.

Nativeness is not a sign of evolutionary fitness or of a species having positive effects and classifying biota according to their adherence to cultural standards of belonging, citizenship, fair play, and morality does not advance our understanding of ecology. Our attitude to alien species seems rooted in a mythical past where foreign species invaded pristine native habitats, but in a world completely transformed by humans, all species now find themselves effectively strangers. The hope that the native species that were happiest before that transformation will continue to be so seems likely to be disappointed. This is not to suggest that conservationists abandon their efforts to mitigate serious problems caused by some introduced species, or that governments should stop trying to prevent potentially harmful species from entering their countries. But conservationists and land managers should organize priorities around whether species are producing benefits or harm to biodiversity, human health, ecological services. In other words, treat species on their merits, where those merits are defined by the best available scientific evidence.

The problem lies in looking at the world in a way that makes the notion of alien species threatening ecosystems or species not a hypothesis but a truism. For example, invasion biologists worry a lot about biodiversity, but only native biodiversity; introduced species are not allowed to contribute to biodiversity. Thus alien species can never add to biodiversity, they can only reduce it, not because there's anything special about them, but because we've chosen to define biodiversity in a way that makes that inevitable. Much the same applies to the concept of "harming" ecosystems. If one defines as 'harm' any significant change a non-native species causes, the statement that non-native species harm ecosystems represents a tautology. Thus, if the presence of zebra mussels means clearer water, more aquatic plants, more fish and more wildfowl, then that's harmful by definition, presumably because the previous water clarity, plants, fish, and wildfowl were just right. Of course, muddier water and fewer plants, fish, and wildfowl would have been harmful, too. What we seem to have here is an appeal to a vague concept of ecosystem 'health' or 'integrity,' where it's never quite clear what either term means, although it's implicit that alien species are inimical to both.

Ecology should not—cannot—act as an authority that promotes one vision of nature at the expense of others. Value-judgments lie outside the borders of science; if a wetland, formerly dominated by *Typha* (cattail or reedmace), is now dominated by purple loosestrife, no science can tell

us that is a bad outcome, or a good one. By pretending that it can, we risk losing the one thing that is absolutely essential to the conservation of biodiversity, which is the informed consent of the public. It's been pointed out, although one gets the impression it hasn't really been grasped, that attempted eradication or control is a waste of time if active support (or at least passive cooperation) is required of people who believe the target species to be useful, desirable, attractive, or simply harmless.

The not unreasonable tendency of film and television to focus on extraordinary nature in apparently pristine habitats already tends to endorse the impression that real nature is found only in remote, special places, far from where most of us live. Promoting the idea that alien species somehow don't count, and are in fact some kind of living pollution can only increase what already threatens to become a serious disconnect between people and nature, and between people and scientists. Most of us live in cities, and our daily contact with nature, if we have one at all, is predominantly with introduced species. Even native species are effectively exotic in cities, in the sense that they have colonized an entirely artificial, human-transformed environment.

The scientific view that such species have no value or meaning is the exact opposite of most people's experience, as evidenced by the long history of contact with cultivated plants and domestic animals. The conservation argument has to make sense to the public, and a rigid separation of indigenous and exotic does not make sense. In fact, the public are ahead of the scientists in this respect; they intuitively grasp that in the world they inhabit every day, some species (some alien, some native) are clearly well adapted, while others are not, and they frequently neither know nor care that some of the well-adapted species don't 'belong.' As one invasion biologist put it (without irony):

“The public does not readily distinguish between native and non-native species: as long as an animal looks nice and is not threatening people or causing undue harm, the public tends to view species equally.”

Quite—you just can't trust the idiot public to get anything right, can you? Fucking deplorables. Not having been educated to venerate the idea of nativeness, they are just as likely to value novelty, beauty, diversity, or rarity. In fact, of course, so does the conservation community, privileging the native and denigrating the exotic only when it suits them.

When biologically-based claims have such a range of political usages—however dubious, and however unfairly drawn some may be—it becomes particularly incumbent upon us to examine the scientific validity of the

underlying arguments, if only to acquire weapons to guard against usages that properly inspire our ethical opposition. For if the biological bases are wrong, then we hold a direct weapon; and if they are right, then at least we understand the argument properly, and can accurately drive the wedge that always separates factual claims from ethical beliefs.

“Any argument for preferring native plants must rest upon some construction of evolutionary theory—a difficult proposition because evolution is so widely misconstrued and, when properly understood, so difficult to utilize for the defense of intrinsic native superiority.”

We need to understand Nature doesn't make mistakes, that Earth is, at minimum, four-billion years old, and that earth has been engaging in this process a lot longer than our species has existed. We need to understand that processes that no scientists understand are occurring on both very large and very small scales. So, when we see “invasive” plants moving wholesale into new ecosystems, we need to ask in all humility, What are they doing? What is their purpose? For the most part, invasion biology is not interested in asking these questions, but only in building a case for demonization. That's not good science. That's the stuff that cults are made of.

We should commence any attempt to control alien species with our eyes wide open. We should be certain, from an honest, objective analysis of the best available evidence of its positive and negative impacts, that our intended target is causing net harm. We should be sure that the alien species itself is the problem, and not merely a symptom of an underlying environmental problem. Nor should we tinker with our definitions of ‘native’ and ‘alien’ to suit our prejudices. When we come to try to add up the economic and environmental costs of alien species, we should not define those costs in a circular, question-begging way, such that alien species are harmful by definition. And, although this should be too obvious to need saying, I'm going to say it anyway: the costs of trying to control a species should not—logically, cannot—form any part of the justification for attempting that control in the first place.

We should also be reasonably confident that the benefits of control will outweigh the costs, bearing in mind that since eradication is rarely an option the costs of control may extend indefinitely into the future. If eradication really is the aim, we should recall that most eradication attempts, even when all the indicators are positive (which they rarely are), end in failure. Since many alien species thrive in disturbed, early-successional environments, we should consider the possibility that our control attempts themselves may

create more of these conditions and thus make things worse. We should be mindful that many invasions go through an initial boom phase, but eventually settle down at a lower level, not least because of adaptation by both the invader and the invaded ecosystem; accordingly, we should try not to react in panic to the early stages of an invasion.

Last but not least, we should choose targets, methods, and strategies that offer some prospect of success. While one can reasonably argue that things would have been worse if no control had been attempted, something is wrong when, after a 15-year programme costing nearly half a billion dollars, the area of South Africa occupied by introduced plants has actually increased.

Adopting the approach outlined above, which in reality is no more than a belated outbreak of common sense, will waste a lot less time and money on wild-goose chases. We will also, by crying wolf less often, run a much lower risk of alienating the public. There is a deep well of goodwill towards attempts to manage introduced species, but it's not bottomless, and we squander it on lost causes at our peril. I also suggest that we should stop expecting too much from ecology. The ability to predict in advance which species will become invasive is the Holy Grail of invasion biology, but such predictions and the Grail seem to share the unfortunate property of not actually existing. Looking for traits of invasive species is an interesting intellectual exercise that is likely to keep a few ecologists in employment for the foreseeable future, but all the evidence suggests it's unlikely to be of much practical use.

Finally, in a world in which the spread of alien species is only one small part (and far from the most important) of the complete transformation of the biosphere by human activity, we should stop thinking that we can turn the clock back to some pristine, pre-human golden age, even if we had any idea what that pristine state looked like.

Spaceship Earth

I Ain't No Fuckin' Fish-Frog

In normal evolution for sexual organisms, it goes like this: A mommy and daddy creature love each other very much. They get together and make a bunch of babies. Nature, red in tooth and claw, culls the inferior babies. The survivors become the new mommies and daddies.

Planet Earth is at exactly the right distance from the sun to create the right temperature for human life, and its atmosphere has the ideal oxygen level. How convenient! Instead of seeing purpose in this situation, however, any biologist will turn the causal connection around and note that our species is finely adapted to the planet's circumstances, which explains why they are perfect for us. Deep ocean vents are an optimal environment for bacteria thriving on their super-hot sulfuric output, but no one assumes that these vents were created to serve thermophile bacteria; rather, we understand that natural selection has shaped bacteria able to live near them.

The backward logic of these philosophers reminds me of a creationist I once saw peel a banana on television while explaining that this fruit is curved in such a way that it conveniently angles toward the human mouth when we hold it in our hand. It also fits perfectly in our mouth. Obviously, he felt that God had given the banana its human-friendly shape, while forgetting that he was holding a domesticated fruit, cultivated for human consumption.

“If a man prefers to look for his kindred in the zoological gardens, it is no concern of mine; if he wants to believe that the founder of his family was an ape, a gorilla, a mud-turtle, or a cockroach, he may do so; but when he insists that I shall trace my lineage in that direction, I say No Sir! I prefer that my genealogical table shall end as it now does, with Cainan, which was the son of Seth, which was the son of Adam, which was the son of God.”

There are many reasons that people oppose the idea of human evolution, and one may have to do with mind perception. People find it difficult to imagine a mind being created or destroyed. Conservation of mind means that it is difficult to imagine the powerful human mind coalescing out of a set of intrinsically mindless processes. The mutation and recombination of genes is a process with no more mind than a rainstorm, and yet science suggests that it is responsible for our entire mind, both our agency and our experience.

People are happy to describe physical processes (e.g. having an immune system) as the result of evolution, but they are far less comfortable with ascribing mental processes to evolution—especially love. If you believe in God, however, there is no amazing creation of mind *ex nihilo*, as He can merely pass on a small piece of His own mind to others, like lighting a torch from an eternal central flame. This belief is reenacted symbolically in Catholic baptism, when infant children are presented with a candle lit from the flame of the Paschal candle, representing the light of Christ now burning in the newly baptized child.

A large part of every scientific discovery, Darwin's included, involves paying attention to the long ignored.

Contrary to the common assumption, Charles Darwin did not originate the idea of evolution. By the middle of the nineteenth century the mere fact of evolution had been around for a long time, and most thinkers of the time were perfectly content to leave it at that. The absence of a theory to explain evolutionary change didn't trouble them, wasn't experienced as a pressure, as it was by Darwin. He knew there had to be some intelligible mechanism or dynamic that would account for it, and this is what he went looking for—with well-known results. In his *Origin of Species* he wasn't announcing the fact of evolution; he was trying to make sense of the fact.

The idea of the evolution of life was one that Charles Darwin's own grandfather, Erasmus, had written a poem about five years before his birth:

First forms minute, unseen by spheric glass,
Move on the mud, or pierce the watery mass;
These, as successive generations bloom,
New powers acquire and larger limbs assume;
Whence countless groups of vegetation spring,
And breathing realms of fin and feet and wing

Yet—and this is what set him apart from most of the naturalists of his day, with their stamp-collector's mentality—Darwin always thought as he saw; “I am a firm believer that without speculation there is no good and original

observation,” he wrote once. Darwin’s turn of mind was encyclopedically visual, relentlessly explanatory—he asked a why question about everything he looked at, but his answer to every why question that he asked was to look again at exactly what.

Intelligence comes in two kinds: the ability to break down a general proposition into specific instances and the ability to sum up specific instances in a general proposition—the analytic ability and the aphoristic gift. Most have to settle for one. G. K. Chesterton and George Bernard Shaw both had the supreme gift of summing up an argument in a phrase, but couldn’t for the life of them see the practical consequences of an idea that sounded good when you said it—for example, what an honor-and-agriculture society would actually be like in modern times, or what the result of a planned economy run by a Superman would actually become.

Darwin had both kinds of intelligence, but what makes him exceptional in intellectual history is that neither kind came in crisp, neat tones of conventional smartness. He could break things down, and he could build things up, but he couldn’t do either one simply or neatly. This was surely the source of his father’s frustration with him, and of his frustration with himself; it is exactly the trait that, most often, makes bright kids look dumb. Darwin was smart without being quick—he had no aphoristic intelligence, no ability to make a concise summary of a point. His intelligence worked at length, over time, and in the accumulation of incidents rather than in the incisive example. This was why even as an adult Darwin believed himself to be, despite the evidence of all his books, which are industry and accomplishment enough for any man, a slow or awkward writer. He wasn’t; he was just a particular kind of writer, not a phrase maker or a caricaturist but an argument maker and a pointillist.

Science is a collection of stories about facts, not a mere collection of data dumps. Darwin’s theory about subsidence jumped far beyond any data that lay at hand; Darwin had seen relatively few coral reefs, and of course neither he nor anyone else could ever have observed a volcano sink and a reef form around it. It was the first instance of the power of what would become typical Darwinian reasoning: what looks big, beautiful, and designed is just chance plus time—a volcano sinks, and tiny animals take advantage.

Such ideas were composed in what he later called “a mental riot,” where, as he said at the time, he chose “to let conjecture run wild.” He thinks wild thoughts—that there’s nothing so remarkable about man, with all his brainpower, appearing on earth; the amazing thing is that mind appeared at all. Man’s rise is “nothing compared to that of the first thinking being.” He follows strange lines of thought: what if animals are as worthy of humane treatment as the slaves he had seen treated so cruelly on his voyage? After

all, all living things “may partake from our origin in one common ancestor; we may be all netted together.” Netted together—drawn together not in one neat hierarchical chain of being but entrapped in one common web of life. The ladder of life is replaced in a phrase with the growing bush of organisms. “Plato,” he writes, “says in *Phaedo* that our ‘necessary ideas’ arise from the preexistence of the soul, are not derivable from experience.—read monkeys for preexistence.” Read monkeys for preexistence. Metaphysics is instantly collapsed into biology.

Darwin’s notebooks of 1838 mark the real beginnings of his evolutionary thought and are a monument in the history of the modern mind—they are among the most charming and ingenuous monuments ever made, a coral reef of many small free speculations that has since turned into bedrock. The more purely observational Darwin of *The Beagle* is gone, and his mind now races from poetry to psychology to philosophy and back again. The line between the empirical and the philosophical—for that matter between the scientific and the literary—is broken, ‘disrespected’ as kids say today, in a way that makes something genuinely new to thought. Philosophical concepts are tested by natural facts, and natural facts are always searched for what they mean about man and history.

Truth had both to be said and to be softened, and at length.

He struggles to place philosophy on a natural footing:

“Origin of man now proved. Metaphysics must flourish. He who understand baboon would do more toward metaphysics than Locke.”

His mind is testing, probing, reading, and taking in evidence equally from the classics and from his own observation. At the core is a new practice—the old philosophical ideas of aesthetics and attraction, of what sexual allure is and what makes beautiful things look beautiful to us, can be tested not by more philosophy but by actual evidence from observation. And behind the new practice looms a new idea, his “theory”—that mankind is not a shining poem apart but one page in the long history of life, which blends seamlessly from one era to another and one species to another, and where when man wiggles his ears he is recalling his primeval past: He who understand baboon would do more toward metaphysics than Locke.

He is already a materialist and aware of the extent of his materialism. “Mine is a bold theory,” he admits at one moment, but it is not a crude one: matter, the ancestral past, shapes our minds and our appetites; our minds make ideas, and the ideas change matter. He sees that the constant human need for causation makes “savages” think that a god must cause thunder

and lightning. But what really interests him is that the inborn urge toward explanation makes it happen, that even science begins in the basic struggle to understand, the theory-making propensity common to all living things:

“All science is reason acting/systematizing on principles, which even animals practically know (art precedes science—art is experience & observation).”

Art is “experience & observation” in the sense, one gathers, that it can record behavior without supplying explanation—we don’t need to know what causes Hamlet to find him interesting.

He mocks man’s arrogance. In one of the “transmutation” notebooks he writes:

“If all men were dead then monkeys make men.—Men make angels.”

That is, the monkeys would seem the most astounding of all creatures, set apart from the rest of creation, while creatures with gifts like man’s would be seen as supernatural. But he doesn’t deny men’s agency, or our minds. There is a lovely, telling small note where, just after his reflections on monkey expressions, he writes:

“Nothing shows how little happiness depends on the senses more than the fact that no one, looking back to his life, would say how many good dinners he had had; he would say how many happy days he had spent in such a place.”

We have sensual experience, animal appetites, and arrive at the idea of happiness. Happiness is made of many dinners, but the dinner provokes a concept larger than just their enumeration. Sensation becomes conceptual thought. The mind turns good dinners into happy days.

Yet Darwin did understand clearly, and began to brood at length on, what he eventually called the “wedge” of death, the reality that his new theory implied that death and suffering and pain were, from some point of view, creative but not justified. It wasn’t that suffering was for your own good, or for the good of the species; suffering just was. It might in the long-run produce innovation, but that wasn’t its point. Its point was—well, its point was a dagger pointed at the heart of “natural theology,” which insisted that nature, though cruel seeming in individual cases, was purposefully benevolent seen whole. The infliction of suffering in that view implied not a long-term direction but a perfected balance, a plan; we suffer for a purpose. This kind of Panglossian hopefulness Darwin dismissed.

“Pain & disease in world, & yet talk of perfection.”

Even if civilized people could temper the Malthusian horror for man, nothing could alter it in the long course of nature. Death was the thing that weeded out life. The process might have a history, but it didn't seem to have a moral or, really, a point.

Darwin looked for evidence in the homely, the overlooked, the undervalued, and the artisanal. This enterprise of learning from the low—of making the mere naturalist and fancier into a peer of the scientist—was an effort to shift the sources of knowledge and models of thought.

The point that Darwin wishes to make through the agency of dogs and birds, though not directly demonstrative of his thesis, is brilliantly illustrative of it. If a wolf—within a time frame so short that it can almost entirely be recorded, and by means so simple that they can be mastered even by illiterate people—could be transformed through selective breeding into everything from a Great Dane to a toy Pekingese, then surely Nature, working on a time scale so much greater, could produce even more dramatic transformations—say, monkey to man. Similarly, if one kind of pigeon can become all kinds of pigeons—some to deliver mail and others just to pout and look pretty—then one kind of animal could surely become many others as it descended through time and the pressures of specialized niches.

Instead of entering the argument by the front door of the temple, where people debate the origin of the earth and the destiny of man, Darwin, with an artless shrug, enters through the back door of a barn. Do we really know what happens when animals change? Well, yes, he says, and here's what we know, very exactly. Nor is this a mere gesture occupying a page or two ('one need only look at the rich achievements of the domestic breeder to see. . .') and pointing in a general way toward an acknowledged truth. Darwin offers instead a complex and exhaustive demonstration of how animal domestication and breeding work, by someone who has been in the shed with the birds and the eggs. We learn countless details about how pigeon fanciers change pigeons, and about how cattle vary in pasture. His immersion in the field enables him not only to make his primary point at length but also to make a critical secondary point: that even when domestic breeders aren't trying to vary their cattle, the cattle vary anyway, through isolation and inbreeding. Change happens when you want it to happen, and when you don't.

“Life. . . uh. . . finds a way.”

The remarkable thing about Darwin as a writer is not how skillfully he uses metaphor but how artfully he avoids it. He argues by example, not by

analogy; the point of the opening of *The Origin* isn't that something similar happens with domesticated breeds and natural species; the point is that the very same thing happens, albeit unplanned and over a much longer period. The notebooks and letters and earlier drafts show that analogies—not least the very idea of “selection,” nature conceived as breeder—were powerful tools for him, as for anyone else, but it was part of his shrewdness to use them parsimoniously in his exposition.

The habit of “sympathetic summary,” what philosophers now call the “principle of charity,” is essential to all the sciences. It is the principle that a counterargument to your own should first be summarized in its strongest form, with holes caulked as they appear, and minor inconsistencies or infelicities of phrasing looked past. Then, and only then, should a critique begin. This is charitable by name, selfishly constructive in intent: only by putting the best case forward can the refutation be definitive. The idea is to leave the least possible escape space for the ‘but you didn't understand’ move. Wiggle room is reduced to a minimum. This is so admirable and necessary that it is, of course, almost never practiced.

Sympathetic summary, or the principle of charity, was formulated as an explicit methodological injunction only recently. In some ways, of course, the practice is very old; we know what we know about the Gnostics because of what Christian writers tell us of their views before refuting them. But we can't entirely trust their account because their only goal is to make the other guy look bad by making his case look ridiculous. The principle of charity is to make the other guy's argument look good (before, of course, making yours look even better). It was not commonplace, either in Darwin's time or before. Mill, for instance, or Huxley, both press down on the sarcasm pedal even as they start to play the organ of their invention.

All of what remain today as the chief objections to his theory are introduced by Darwin himself, fairly and accurately, and in a spirit of almost panicked anxiety—and then rejected not by bullying insistence but by specific example, drawn from the reservoir of his minute experience of life. This is where we get it all wrong if we think that Wallace might have made evolution as well as Darwin; he could have written the words, but he could not have answered the objections. He might have offered a theory of natural selection, but he could never (as he knew) have written *On the Origin of Species*. For it is not only a statement of a thesis; it is a book of answers to questions that no one had yet asked, and of examples answering those still faceless opponents. Years later, Wallace would write to Darwin urging him to take on Spencer's aggressive politicized term “survival of the fittest” in place of his “natural selection.” Darwin calmly explained that the virtue of natural selection was that it was a sister phrase to ‘artificial

selection,' which everyone conceded, whereas 'survival of the fittest' was awkward and might raise political specters.

Darwin tells us himself that he forced on himself the habit, whenever he came across a fact that might be inconvenient for his thesis, of copying it down and paying attention to it, and that this, more than anything else, gave him his ability to anticipate critics and answer them. The idealized notion of the scientist who seeks out falsifications has been mocked, and with good reason. The usual response of the theorist who has predicted that all swans are white, when faced with a black swan, is not 'Look, my idea is wrong!' but 'You call that a swan?' But Darwin's long years in the domestic Eden had also been years in the wilderness, years when he had the chance to brood in a solitary way on what might be wrong with what he was thinking. His objections to his own theory were strenuous but impersonal—or, rather, because they were self-made, they were offered in the same tone, and with the same rigor, as the positive doctrines. In the back-and-forth of actual debate, as our grandfathers would have said, personalities intrude. In the back-and-forth of a self-made contest, both sides have a shot.

Although scientific theories imply their falsifications, they rarely list them. Darwin's does. This was in part a pose, or to put it another way, a stance, a persona. Darwin in his letters is clearly not particularly respectful of the objections that were raised to his theory. But it was something more than canny; it supplies an inner voice, a sound of rational anxiety, a recognition of fallibility and of seriousness that gives his great book an oddly unbullying tone despite being a thrusting, far from tentative or timid argument.

Darwin's special virtue in this enterprise is that he had to summarize, sympathetically, views contrary to his own that did not yet exist except in his own imagination. His special shrewdness lay in making as large an emotional meal of the objections in advance as could be made; he preempted his critics by introjecting their criticisms. He saw what people might say, turned it into what they ought to say, and then answered.

For a new scientific theory to become a model in its time, vastly influential outside its immediate claims, it has to release thinking people from a bond that they had long recognized as too narrow and help them interrogate the world in a new way. What really matters is not that the answers suggest a new metaphor for amateurs but that it shows a new kind of question to other pros. Other scientists have to say not, 'How smart of him to discover that,' but 'How extremely stupid of me not to have thought of that! If only I'd stopped to ask!'

Of course, Darwin's ideas came out of the light of his day—in what other light could they have been made? But his mind was a prism; the light of his

time changed crucially as it passed through, and showed a new and different spectrum.

The analogy linking Darwin's ideas on nature with free market ideas on nations, for instance, though still insisted on by his biographers James Moore and Adrian Desmond, is surely forced. There are resemblances between Darwin's theory of what has been called a "blind watchmaker" who governs natural selection and Adam Smith's doctrine of an "invisible hand" that governs markets. The likeness lies in the idea of a system that has order and pattern without agency, that works efficiently and even elegantly without anyone's having designed it: I buy a house; you buy a house; we put up a fire station to keep me from burning down your house, and we hire a policeman to keep you from burgling mine, and next thing you know, wanting nothing but our own selfish good, we have a neighborhood and a city.

In the same way in nature, a frog eats a bug; the next frog who happens to have a longer tongue comes along and eats more; the greenest of the bugs being preyed on hide best against the lily pads, and before you know it, we have long-tongued frogs attempting to eat ever-greener insects in an ongoing little lily pad world. Organization emerges without the interference of planning. The natural city isn't zoned.

But the differences between nature and the market in time scale and intention are much greater than the resemblances. Adam Smith's invisible hand is really the concerted action of a thousand small acts of calculation; Darwin's great sorter is the cumulative result of a thousand blind acts of copulation. Animals in evolutionary biology don't want to extend their family line, to produce progeny or improve, or even extend, their species; they just want to get laid. The variation that may result—the longer-tongued frog, the greener bug—is, quite literally, a lucky bastard. No male salmon impregnates salmon eggs with the idea of making more salmon. Not even every human group knows that sex will lead to offspring. There is a difference between an invisible hand and a blind watchmaker. One is the result of the immediate interacting of human intentions; the other, of the long-term accidents of animal lust. Greed is good because personal prosperity almost always becomes general; sex is not good because it improves the breed. Sex is sex, and the breed gets better by chance and time, by the oddities of random mutation and the winnowing of natural selection.

If you concentrated on the evolutionary part, which is, as Darwin knew, an old and long-present idea, one of Granddad's tall tales, then you could make it into a kind of progressivism—an explanation of eternal change and social improvement with a vitalist charge. If you concentrated on the natural selection part, the struggle for survival, you could make it into an endorsement of free markets or imperialism or anything else you liked. The

real point, which Darwin understood and was clear about, was that the book got its charge where the two ideas combined to make a third, entirely new one: that things that look fine-tuned by engineering can be made by the compounds of accident, ages, lust, and hunger.

In an odd way, John Stuart Mill, whose *On Liberty* used Darwin's reluctance to publish as an argument for tolerance, may have eaten the social marrow of the theory better than anyone else. His argument for liberty wasn't just, or especially, for the brave Giordano Brunos of the world, who speak scientific truth in the face of the Inquisition and the fire. It was also for the oddballs. It is desirable for people to be eccentric:

“Eccentricity has always abounded when and where strength of character has abounded; and the amount of eccentricity in a society has generally been proportional to the amount of genius, mental vigor, and moral courage which it contained.”

The idea that odd sorts and variations were to be valued for the sake of progress, that bizarre variation was the key to the growth of knowledge, may have been a more truly wise extension of the Darwinian idea to human social life than any other in its day.

How can you imagine time in a way that seems to make sense of our own lives and emotions? For that, far more than God and man, is what Darwin is really always returning to: life and time, life and time, and their complements, death and sex, and how they make the history of life. In Darwin's work, from *The Beagle* to the earthworm, time moves at two speeds: there is the vast abyss of time in which generations change and animals mutate and evolve, and then there is the gnat's-breath, hummingbird-heart time of creaturely existence, where our children are born and grow and, sometimes, die before us. The space between the tiny but heartfelt time of human life and the limitless time of Nature became Darwin's implicit subject, running from *The Beagle* to *The Origin*.

Religion had always reconciled quick time and deep time by pretending that the one was in some way a prelude to the other—a prelude or a prologue or a trial or a treatment. Artists of the Romantic period, in an increasingly secularized age, thought that through some vague kind of transcendence they could bridge the gap. They couldn't. Nothing could. The tragedy of life is not that there is no God but that the generations through which it progresses are too tiny to count very much. There isn't a special providence in the fall of a sparrow, but try telling that to the sparrows. The human challenge that Darwin felt, and that his work still presents, is to see both times truly—not to attempt to humanize deep time, or to dismiss quick time, but to make enough of both without overlooking either.

Darwin's compassion for even the simple creatures who died horribly in nature was real; the caterpillar eaten away from inside by the ichneumon wasp's larvae genuinely made him doubt that any good deity could oversee the world. Death was the one fact whose force could not be argued out, only accepted. It couldn't be brought down to earth by the most painstaking of descriptions. It called him to seek some form of transcendence, some meaning beyond the human cycle of breathing and eating and dying, even while resisting the supernatural meanings of faith. His constant sense of the presence of death helps explain why he came to a new, almost mystical sense of the power of time—time the explanatory force, the justifying force that gives meaning to life by asking us to think in the very long-term. Unable to see life vertically, in terms of the verdict of heaven, he came to see it horizontally, in terms of the judgment of time.

Even Darwin's way of being wrong was the right way of being wrong. As Huxley wrote immediately after the publication of *The Origin*:

“Twenty years hence naturalists may be in a position to say whether this is, or is not, the case; but in either event they will owe the author of *On the Origin of Species* an immense debt of gratitude. We should leave a very wrong impression on the reader's mind if we permitted him to suppose that the value of that work depends wholly on the ultimate justification of the theoretical views which it contains. On the contrary, if they were disproved tomorrow, the book would still be the best of its kind.”

The best of its kind because it asks the right questions in the right spirit, and enlarges the human mind by its very existence.

Darwin used the narrow language of natural observation—of close amateur looking—to change our ideas of life and time and history. Darwin is most fully himself, most alive, in the volumes of narrow observational science that he published regularly in between his speculative books. The end of his life's work, which seems to some a descent, a dying fall—those worms and that vegetable mold—seemed nothing of the kind to him. Nor should it to us. It's the last Darwinian statement: truth comes from close scrutiny of the way things are, with the mind demanding every moment to know how the hell they got that way. The tininess is the point.

Unfortunately the spread of pop Darwinism undermines the strength of the humanities—the tradition of the novel, and poetry and history as authority on human affairs—and of the authority of the people who have mastered those parts of culture to speak in an intimidating way on broad

subjects. Edmund Wilson, Lionel Trilling, even T. S. Eliot—none of them really understood even the rudiments of evolutionary theory yet no one, a scant two generations ago, questioned their right to speak on human affairs not just with wisdom but with authority, with a claim to have mastered the real fount of human wisdom about human life. More important even than our faith in God is allegiance to our Magi. The common reader is now more likely to go to Daniel Dennett or Richard Dawkins, to Steven Pinker or Steve Jones, for that kind of authority, translating academic expertise into moral exhortation. And doing it in the same way: a bit of data, a touch of interpretation, and a lot of moral exhortation, as here. The authority, for good or ill, has passed from the humanities proper to the sciences improper, from literary studies to popular science, and with that passage has come an inevitable and understandable reaction.

There is no struggle between science and art or between evolutionary biology and spiritual faith; there is a constant struggle between the spirit of free inquiry and the spirit of fundamentalist dogma. That struggle is the story of human intellectual history. Atheism is no guarantee of humane conduct. Stalin and Hitler borrowed religious ideas, certainly, but they weren't believers. Nothing is any guarantee of humane conduct, except an insistence on it. In this sense, though Darwinism implies no politics, not even a liberal one, it does imply a philosophy. It implies an intense awareness that all categorical or essentialist claims about living things are overdrawn—anyone who says that all cases of this thing or that thing are naturally one way or another is saying something that isn't so. It also teaches a great respect for the rule of variation, and the particular case. Mill's theory that eccentricity is necessary in society was intuitively closer to Darwin's theory of nature than the other grander theories. There are no neat lines between organisms. There are, truly, no straight lines in nature. The world is a gently graded blending of individual cases into apparent groups. Repetition is the habit of nature, but variation is the rule of life.

Humane materialism might be a good name for it—the recognition that there is a space between what we know and what we feel, and that our lives have to be lived as best we can live them within that space.

Though it may seem a remote possibility to us now, during the formation of the human brain the fear of being grabbed by sharp claws, dragged into a dark hole, and eaten alive was not an abstraction.

Fellow Travelers

“The world is full of magic things, patiently waiting for our senses to grow sharper.”

If novelty endlessly arises in the course of time, how can one be sure that humanity is the pinnacle of the entire cosmic evolutionary process?

In the microbiome of the human body, only a portion of our cells, genetically speaking, are human in origin. The rest are bacterial.

As unborn babies, we live in an environment that is normally completely germ-free—the womb. For nine months, we have no contact with the outside world except through our mother. Our food is predigested, our oxygen is prebreathed. Our mother’s lungs and gut filter everything before it reaches us. We eat and breathe through her blood, which is kept free of germs by her immune system. We are sheathed in an amniotic sac and encased in a muscly uterus that is corked with a thick plug like a big earthenware jug. All this means not a single parasite, virus, bacterium, or fungus—and certainly no other person—can touch us. We are more sterile than an operating table flooded with disinfectant. This situation is unusual. Never again in our lives will we be so protected and so isolated. If we were designed to remain germ-free once we leave the womb, we would be very different creatures. But that is not the case, so all living things of any size have at least one other living thing that helps them in some way and is allowed to live on or in them in return. This explains why our cells are constructed in such a way that bacteria can easily dock with structures on their surface, and it explains why certain bacteria have coevolved with us over many millennia.

If we could see more than meets the eye, we could watch as a clump of cells grows into a human being in a woman’s belly. We would suddenly see how we develop, roughly speaking, from three tubes. The first tube runs right the way through us, with a knot in the middle. This is our cardiovascular system, and the central knot is what develops into our heart. The second tube develops more or less parallel to the first along our back. Then it forms a bubble that migrates to the top end of our body, where it stays put. This tube is our nervous system, with the spinal cord, including the brain, at the top and myriad nerves branching out into every part of our body. The third tube runs through us from end to end. This is our intestinal tube—the gut. The intestinal tube provides many of the furnishings of our interior. It grows buds that bulge out farther and farther to the right and left. These buds will later develop into our lungs. A little bit lower down, the intestinal tube bulges again and our liver has begun to develop. It also forms our gall bladder and pancreas. But, most importantly, the

tube itself begins to grow increasingly clever. It is involved in the complex construction of our mouth, creates our esophagus, with its ability to move like a break dancer, and develops a little stomach pouch so we can store food for a couple of hours. And, last but not least, the intestinal tube completes its masterpiece—the eponymous intestine or gut.

The masterpieces of the other two tubes—the heart and the brain—are generally held in high regard. We see the heart as central to life since it pumps blood around the body. The brain is admired for its ability to create a dazzling array of new mental images and concepts every second. But the gut, in most people’s eyes, is good for little more than going to the toilet.

When what’s left of our food reaches the internal sphincter, that muscle’s reflex response is to open. But it does not just open the floodgates and let everything out, leaving the outer sphincter to deal with the deluge. First, it allows a small “taster” through. The space between the internal and external sphincter muscles is home to a large number of sensor cells. They analyze the product delivered to them, test it to find out whether it is solid or gaseous, and send the resulting information up to the brain. This is the moment when the brain realizes, ‘It’s time to go to the toilet!’ Or maybe, ‘It’s just a bit of wind.’

A whole crew of ingenious organs works so perfectly and efficiently together that, in an adult human being, they require no more energy than a 100-watt light bulb. Each second, our kidneys meticulously filter our blood—much more efficiently than a coffee filter—and in most cases they carry on doing so for our entire lives. Our lungs are so cleverly designed that we use energy only when we breathe in. Breathing out happens without any expenditure of energy at all. If we were transparent, we would be able to see the beauty of this mechanism: like a wind-up toy car, only bigger, softer, and more lung-y. While some of us might be sitting around thinking, ‘Nobody cares about me!’, our heart is currently working its seventeen-thousandth twenty-four-hour shift—and would have every right to feel a little forgotten when its owner thinks such thoughts.

The appendix leaves only good germs alive and attacks anything it sees as dangerous, and this also means a healthy appendix acts as a storehouse of all the best, most helpful bacteria. Its practicality comes into play after a heavy bout of diarrhea. That will often flush away many of the typical gut microbes, leaving the terrain free for other bacteria to settle. This should not be left to chance. And this is when the appendix team steps in and spreads out protectively throughout the entire large intestine.

Saliva is basically filtered blood. The salivary glands sieve the blood, keeping back the red blood cells, which are needed in our arteries, not in our mouth. But calcium, hormones, and some products of our immune system

enter the saliva from the blood. That explains why each person's saliva is slightly different. Try to not think about this the next time you're kissing your sweetie.

The psychedelic weirdness of dreaming can be explained by the brain's topography: The part of your mind that controls emotions (the limbic system) is highly active during dreams, while the part that controls logic (the prefrontal cortex) stays dormant. This is why a dream can feel intense and terrifying, even if what you're seeing within that dream wouldn't sound scary if described to someone else. This, it seems, has become the standard way to compartmentalize a collective, fantastical phenomenon: Dreaming is just something semi-interesting that happens when our mind is at rest—and when it happens in someone else's mind (and that person insists on describing it to us at breakfast), it isn't interesting at all. Which seems like a potentially massive misjudgment. Every night, we're all having multiple metaphysical experiences, wholly constructed by our subconscious. Almost one-third of our lives happens inside surreal mental projections we create without trying. A handful of highly specific dreams, such as slowly losing one's teeth, are experienced unilaterally by unrelated people in unconnected cultures. But these events are so personal and inscrutable that we've stopped trying to figure out what they mean.

Dreams used to have a much larger role in the popular culture—people would discuss dreams in normal conversation and it was common for people to keep dream diaries. So why did that drop off, but things like astrology somehow stayed popular? I mean, one is an actual thing that happens to everyone, and the other is a system put in place that obviously can't be real. This idea that we're connected to other realities is somehow no longer worth considering at all, even though the multiverse theory and string theory is increasingly prominent, and more and more scientists are reluctantly conceding that certain things about the universe lead to that very possibility.

So two things are happening simultaneously: We're moving into this period where our view of the universe is kind of a 'What the fuck? How could that be?' scenario, where there's this possibility of endless alternative realities across space, totally based on conjecture—yet our dreams are supposed to mean nothing? The fact that we're in a parallel world every night is just supposed to be meaningless? I mean, the same scientists that are trying to explain away our dreams are also telling us things about the universe that are so mind-boggling that we almost can't describe them.

There is this thinking that at the moment you die, maybe all the dimethyl-tryptamine (DMT) that remains in your brain tissue gets used at once. And what's interesting is that all the bestselling books about near-death experi-

ences are always about people getting close to God and seeing relatives and having this calm, wonderful experience. What they never tell you about are the people who have near-death experiences that are not good, and in fact incredibly unsettling. Which really just tells me that we bring so much of ourselves to these so-called afterlife moments, and that maybe this is something we need to prepare ourselves for.

There is an unrealized relationship between sleeping and dying, specifically the sensation of having one's life "flash before your eyes" in a near-death episode. That event is the ultimate dream experience, possibly driven by a flood of dimethyltryptamine. Is it possible that our normal nightly dreams are vaguely connected to this dramatic eventuality? If so, a spiritual person might argue this means dreams are preparing us for something quite important; using the same information, a secular person might argue this means dreams are micro-versions of a massive chemical event that happens only at the very end of life. But either way, such a scenario should drastically alter the significance we place on the content of dreams. Right now, we don't think the content of dreams matters at all. If we end up being wrong about the psychological consequence of dreaming, it will be the result of our willingness to ghettoize an acute cognitive experience simply because it seems too difficult to realistically study.

Most people cannot conceive of an end to themselves. Most people believe they will exist forever, in a place called heaven or in a wheel of karma and reincarnations. That's both the breadth and the limit of human imagination. We exist. We cannot imagine that someday we will not exist. The conceptual limits of the human mind, for most of us in an everyday way, lie remarkably confined by what we've already experienced.

"No man is liberated from fear who dare not see his place in the world as it is; no man can achieve the greatness of which he is capable until he has allowed himself to see his own littleness."

Maybe we ourselves are organisms inside some cosmic superbeast. What we call the universe is nothing more than a bubble of flatulence in its monstrous, gurgling gut, and we can no more comprehend its complexity and purpose than *E. coli* could imagine what makes a human tick or fathom the vast expanse of time that separates its lifespan from our own.

There is a collection of roughly twenty numbers that seem to dictate how the universe works. These are constants like 'the mass of an electron' and 'the strength of gravity,' all of which have been precisely measured and never change. These twenty numbers appear inconceivably fine-tuned—in fact, if these numbers didn't have the exact value that they do, nothing in

the universe would exist. They are so perfect that it almost appears as if someone set these numbers. But who could have done that? Some people would say God.

But the simulation hypothesis presents a secular answer: that these numbers were set by the simulator. That's a rational possibility: that someday, in the future, we'll be able to simulate universes with such verisimilitude that the beings within those simulations believe they are alive in a conventional sense. They will not know that they are inside a simulation. And in that case, there is a simulator—maybe some kid in his garage in the year 4956—who is determining and defining the values of the constants in this new universe that he built on a Sunday morning on a supercomputer. And within that universe, there are beings who will wonder, 'Who set the values of these numbers that allow stars to exist?' And the answer is the kid. There was an intelligent being outside that universe who was responsible for setting the values for these essential numbers. So here is a version of the theological story that doesn't involve a supernatural anything. It only involves the notion that we will be able to simulate realistic universes on futuristic computers.

Part of what makes the simulation argument so attractive is the way its insane logic solves so many deep, impossible problems. Anything we currently classify as unexplainable—ghosts, miracles, astrology, demonic possession—suddenly has a technological explanation: They are bugs in the program (or, in the case of near-death experiences, cheat codes). Theologians spend a lot of time trying to figure out how a righteous God could allow the Holocaust to happen, but that question disappears when God is replaced by a teenager in the year 4956—weird kids love death. Moreover, the simulation hypothesis doesn't contradict God's existence in any way; it just inserts a middle manager.

Of course, sharp-eyed readers might already be seeing the similarities between the simulation hypothesis and countless theological explanations for the world. Is this another instance of taking the currently available knowledge and technologies to craft a narrative which explains the world and one's place in it?

Imagine two men in a bar, having a beer conversation. One man believes in God and the other does not, and they are debating the nature of morality. The man who believes in God argues that without the existence of a higher power, there would be no reason for living a moral life, since this would mean ethics are just slanted rules arbitrarily created by flawed people for whatever reason they desire. The man who does not believe in God disagrees and insists that morality matters only if its tenets are a human construct, since that would mean our ethical framework is based not on a fear of

supernatural punishment but on a desire to give life moral purpose. They go back and forth on this for hours, continually restating their core position in different ways.

But then a third man joins their table and explains the new truth: It turns out our moral compass comes from neither God nor ourselves. It comes from Brenda. Brenda is a middle-aged computer engineer living in the year 2750, and she designed the simulation that currently contains all three of their prefab lives. So the difference between right and wrong does come from a higher power, but that higher power is just a mortal human. And the ethical mores ingrained in our society are not arbitrary, but they're also not communal or fair—they're just Brenda's personal conception of what a society should believe and how people should behave. The original two men finish their beers and exit the tavern. Both are now aware they've been totally wrong about everything. So what do they do now?

For a moment, each man is overcome with suicidal tendencies. 'If we are not even real,' they concurrently think, 'what is the meaning of any of this?' But these thoughts quickly fade. For one thing, learning you're not real doesn't feel any different from the way you felt before. Pain still hurts, even though no actual injury is being inflicted; happiness still feels good, even if the things making you happy are as fake as you are. The 'will to live' still subsists, because that will was programmed into your character (and so was a fear of death). Most critically, the question of 'What is the meaning of any of this?' was just as present yesterday as it is today—the conditions are different, but the confusion is the same. Even if you're not alive, life goes on. What changes is the purpose.

The universe is so efficient at the job of making stars and turning them into black holes that it could almost have been designed for the job. Perhaps the whole thing might be a black hole itself. Viewed in this light—if one can talk that way about something that swallows light—black holes graduate from one-way tickets to oblivion to being seeds of new universes. The result of one of an older generation of black holes going about its natural business of reproducing itself. Which suggests that our universe, in its turn, may have been born in just this way, out of a black hole somewhere else. And if the analogy with sexual reproduction is the right one for this process, it is possible that each time a new universe is born it alters the rules slightly, mutating in the way that life does, setting up the possibility of competition between a whole generation of related universes, which opens up the way for natural selection to work amongst them, favoring those most likely to survive and to reproduce again.

The natural laws in our universe could be the result of natural selection. Black holes could give birth to universes, each with slightly different charac-

teristics. And only those with the ability to develop black holes and spawn baby universes proliferate.

If you keep on extrapolating, you will find that the density required to form a black hole with a mass equal to the mass of the observable universe would be roughly the same as the average density of matter in the universe! We may be living inside a black hole.

Imagine each step you take represents around 100 years of history. The simple conceit has stupefying implications. Let's begin our walk; we'll start in the present and head back. As you lift up your heel there's no Internet, one-third of the earth's coral reefs reappear, atomic bombs violently reassemble, two world wars are fought (in reverse), the electric glow on the night side of the planet is extinguished, and—when your foot lands—the Ottoman Empire exists. One step. After twenty steps, you stroll by Jesus. A few paces later the other great religions begin to wink out of existence: first Buddhism, then Zoroastrianism, then Judaism, then Hinduism. With each footfall, the cultural milestones get more staggering. The first legal systems and writing disappear, and then, tragically, so does beer. After only a few dozen steps—before you can even reach the end of the block—all of recorded history peters out, all of human civilization is behind you, and woolly mammoths exist. That was easy. You stretch your legs and prepare for what couldn't be much longer of a walk. Perhaps it's a short stroll to the dinosaurs, and a little farther still to the trilobites. No doubt you'll be at the formation of the earth by sundown. Not so. In fact, you would have to keep walking for 20 miles a day, every day, for four years to cover the rest of the planet's history. And to reach the big bang you'd have to keep trudging at the same pace for almost another decade.

“You develop an instant global consciousness, a people orientation, an intense dissatisfaction with the state of the world, and a compulsion to do something about it. From out there on the moon, international politics look so petty. You want to grab a politician by the scruff of the neck and drag him a quarter of a million miles out and say, ‘Look at that!’”

Earth, with its 24-hour day, is just 0.3 percent wider at the equator—27 miles on a diameter of just under 8,000 miles. If you stand at sea level anywhere on the equator, you'll be farther from Earth's center than you'd be nearly anywhere else on Earth. And if you really want to do things right, climb Mount Chimborazo in central Ecuador, close to the equator. Chimborazo's summit is four miles above sea level, but more important, it

sits 1.33 miles farther from Earth's center than does the summit of Mount Everest.

The oxygen produced by plants, the oxygen that all multi-cellular life on Earth requires, comes from the oxygen in water, not, as everyone assumed, the oxygen in carbon dioxide.

The sun supplies our planet with a constant flow of 120,000 terawatts of energy, which powers our entire world from bacteria to plants and animals, to weather systems and chemical cycles. Humanity uses around the same amount of energy in a year as the sun provides in an hour.

A Chipewyan guide named Saltatha once asked a French priest what lay beyond the present life:

“You have told me heaven is very beautiful. Now tell me one more thing. Is it more beautiful than the country of the muskoxen in the summer, when sometimes the mist blows over the lakes, and sometimes the water is blue, and the loons cry very often? That is beautiful. If heaven is still more beautiful, I will be glad. I will be content to rest there until I am very old.”

Aren't we all tired of capitalism? Haven't most of us gotten sick of the drudgery, the monotony, the exploitation, sucking up to our bosses and management who pretend to care about the average worker? The drive to consume more and more has degraded all art, values, and sense of community in the US. Capitalists literally are holding the people of the Earth in bondage. As liberal democracy crumbles in the West, the risk of neo-fascism continues to rise in North America and Europe.

It's worth examining why the US has TV shows like *Hoarders*, where truly sick people have problems collecting useless crap, and where viewers publicly shame and judge the afflicted. Yet, where is the outrage at the real hoarders, the billionaires, the banks, and the military industrial complex? This is serious hypocrisy, a cultural blind spot: a double standard that is not being addressed by our society.

Why does society not ask arch-capitalists the obvious questions: when is enough, enough? Who needs a billion dollars? Once you can provide a comfortable life for your family, children, and grandchildren, what is the point of hoarding your money in bank accounts and lording over a monopolizing mega-corporation? Where does this endless desire for more come from?

It's fairly obvious that a failure to confront death is closely linked to the bottomless appetite exhibited by capitalists. The perceived need to construct towers, monuments, mansions, and manufactured narratives of

their own greatness is proof. Not to mention how many of the super-rich have chosen to become cryogenically frozen post-mortem: this is in outright denial of their own mortality, and the necessity of death so that future generations may live. In failing to confront death, any object can be used as a crutch, an addiction.

Addiction is linked to social isolation and lack of community, which the capitalist class creates by artificially creating specialized divisions of labor, alienation, and class differences. Addiction leads to a disconnection from what some would call a ‘reality principle,’ leading to further and deeper indulgences and lack of restraint. There are further similarities between capitalists and drug addicts: the impatience, the disconnection from others, the neediness, as well as a general childlike need to be validated and pampered.

We see where capitalism leads: to a permanent crisis, a never-ending state of emergency. Since the 1970s, workers have increased productivity mightily with little to zero increases in wages considering inflation and other factors. Americans are also working longer hours; young adults are even having less sex partly because of this. There is a huge problem with prescription drug abuse (not just opioids), teen suicide is rising (sadly, at a 40 year high for teen girls in 2017), and child poverty isn’t being addressed properly, if at all, by our own government. All of these absolutely tragic issues are connected to capitalism. When we are forced to compete against each other, in grades at school, for that raise or promotion in the workplace, this breeds a mindset of dehumanization.

I would also posit that the separation of young children from their parents when they begin schooling, either daycare or preschool or kindergarten or afterwards, is one of the first steps in life where the feelings of individual atomization starts, and collective social disintegration begins. Being ripped from your parent’s arms because they have to work just to survive, and the state/private/charter school substituting for the role of a parent, is one of the first deep tragedies inflicted on many of us by the “needs” of the modern world. I believe this suffering is lodged deep in our unconscious selves, and this is not being addressed publicly at all, and barely acknowledged in our private lives.

Treatment starts when we want to become free of the Great Beast of capitalism, the “Babylon system” as some like to call it. We must ground ourselves, and return to a deeper relationship with our mother Earth. Self-reliance is true freedom, and families and communities should begin to grow as much of their own food as possible. I understand the limitations for those in urban areas, or those stuck in jobs where time and effort cannot be adequately put towards farming, of course. Collectively, as a city block,

a suburban neighborhood, a rural township, we are all going to have to learn to get together, share food and technology, and become independent of this beast. We must begin to develop a gift economy, an indigenous-based economy, based on reciprocity and trust, not exploitation and coercion.

Other than that, a mass protest movement must be created so the resources that our federal government controls can be shifted from weapons of destruction to schools, health care, community projects, and renewable energy.

I believe it's important to discuss some of the budding alternatives to capitalism that are developing around the globe. In the US, support for socialism has risen immensely, especially among the younger crowd, thanks to the work of Bernie Sanders—notwithstanding him not really being a socialist—and others. Yet how serious are most American socialists? One of the most popular groups in the US is called Socialist Alternative (SA), led by the charismatic Seattle councilwoman Kshama Sawant. SA has some great ideas, and yet, some of their proposals make it seem as if they're just going through the motions. Let me explain.

On their about page, a few things stand out. They write:

“We see the global capitalist system as the root cause of the economic crisis, poverty, discrimination, war, and environmental destruction.”

Very well put. Yet then, this is followed by the line below:

“As capitalism moves deeper into crisis, a new generation of workers and youth must join together to take the top 500 corporations into public ownership under democratic control to end the ruling elites' global competition for profits and power.”

This sounds nice, but I wonder how much time was really spent thinking through the implications of this policy. What if democratic control only leads to redistribution of the companies' wealth, and not fundamental transformation of the products, resource usage, and dangerous working conditions? Where is the sense of urgency, the fact that deadlines are being approached regarding global warming, regarding the ecological damage being done by these companies?

One wonders, has SA bothered to take a look at the list of the 500 top companies? For some, perhaps they can be repurposed to make sustainable products. For others, maybe the factories and warehouses can be dismantled and recycled for public use. For a few, it might be feasible that they could be broken up into smaller entities and non-profit co-operatives. For many of

these companies, though, the only democratic thing I can think of to do is to vote on who gets to throw the first brick or Molotov through the empty building. These corporations have done irreparable harm to the planet. Some of them are simply not going to be able to be reformed.

The only way to transform these entities (the ones that can be saved) properly, with the proper protections, would be to rewrite the constitution to include environmental and social rights, as well as the rights of mother Earth, as Bolivia has done (though we'll have to wait and see if that sticks around post-coup). Without a legal framework based on ecology, there is no way to make sure 'democratic control' of a transnational corporation would actually lead to environmentally-safe production.

SA is notable for fighting for a \$15 an hour wage. Of course this fight is for nothing more than the ability to work full-time and barely be above the poverty line—what a fantastic victory that would be.

SA also wants to "slash the military budget," which is great. SA also proclaims that they support internationalism. Allow me to make a proposal: we stop bombing the developing nations with that military and release all of the US-controlled intellectual property into the public domain. Poorer nations will need massive influxes of knowledge to help them develop while avoiding use of fossil fuels and habitat-destroying industry. The West has accumulated ill-gotten wealth from centuries of colonialism, chattel slavery, and genocidal policies towards the "Global South," and now may be the last chance to give back, before it becomes too late.

Are US socialists committed to these sorts of radical proposals? Are SA and others ready to admit to its followers that real socialism will involve hard sacrifices, and almost certainly (in the short-term, at least) lead to less material goods and privileges that Westerners have enjoyed for centuries? Are socialists as ready to support a living wage in China as they are in the USA? Finally, are American socialists committed to transforming the nation, or just promoting an ideology that is centered too much on human needs, and not enough on the needs of non-humans and future human generations?

The Left has been fragmented for decades. Liberals, socialists, communists, greens, and anarchists have all endlessly debated future models for society. One wonders, how many are just talking, and how many are willing to listen? There already are models for society to live sustainably and to prosper, very, very old ways: by following the paths set by the indigenous.

For instance: it is quite clear that humanity is facing huge challenges unlike at any other time in history. Just one-hundred companies have pumped out 70% of worldwide greenhouse gases since 1988. Is the answer, as SA has posited, really just to democratize these corporations and hope for the best, or to shut them down completely?

Westerners are going to have to realize very quickly that despite our space technology, skyscrapers, and instant media, we are the children in the room when it comes to ecological knowledge. Overpopulation now threatens the world with ecosystem degradation, habitat destruction, global warming, resource wars, ocean acidification, plastics proliferation, pandemics, and mass starvation and drought. Advanced technology in most scenarios will only make things worse. What is the best thing one can do to stop global warming? Not a solar array, but planting a tree. Slow down soil erosion? Plant a tree. What is resistance? Planting a community garden is a more socialist, a more significant thing to do now than attending another symposium on Marxism.

We must realize that it is too late in the game to rely simply on voting. Citizens will respond to a mass movement to the degree that it represents the will of the people: to the degree it can articulate a political truth on a deeply visceral level. Most mainstream socialists have so far been too committed to a flailing, abstract ideology—specifically, wrongly committed to a Eurocentric, technocratic, anthropocentric worldview—to capture people’s imaginations. Developing an ecological worldview, one that acknowledges our interdependence and interconnectedness with all species, is crucial.

Thus, as the twenty-first century progresses, Standing Rock will eventually be seen as having more influence than Occupy Wall Street. We are connected to our planet and the web of life more than we can ever know or attempt to explain. For instance, we won’t end warfare until we abolish factory farming: the two are intimately linked, as exploitation of man over animal allows fascists the ideological justification for exploitation and the killing of man by man. Ecology is the keystone science: it allows us to see the linkages between species, food webs, and provides the science needed to develop scale-appropriate, sustainable technology. Ecologists understand that an injury to one is an injury to all, and under capitalism, we’ve all been wounded, plant, animal, and human alike, even the rich, who’ve suffered spiritual decay and moral disintegration.

The only democracy possible is an ecological democracy, with a long-term planning, and rational, sustainably-oriented national constitutions, a 90–95% reduction in fossil fuel use within two decades at most, and an international consensus which will guarantee safeguards against habitat destruction, even in the face of democratic majority opposition.

“Whoever is not prepared to talk about capitalism should also remain silent about the sixth mass extinction.”

Druids & Engineers

“No wonder they disagreed so endlessly; they were talking about different things.”

“Mankind is a part of the earth’s biological system and is not a form of genie that can successfully provide substitutes for the processes of nature.”

The freedom and flexibility touted by advocates of consumer society were an illusion; individuals’ rights mean little if they live in atomized isolation, cut off from Nature and each other. Critics will call people who believe this names like ‘tree-hugger’ and say they are apostles of a new religion, an irrational cult that fetishizes Nature. The tree-huggers might argue they are simply speaking from the tradition of ecology (or what they understand to be ecology)—a holistic view that seeks to place humanity within a framework of overarching natural law. It asks: How can we best fit into the world, and not overstep our bounds? Even to ask such a question calls for a reordering of society.

Boosting agriculture and industry is not the answer, because the resources necessary for both are being wiped out through destruction of watersheds, raw materials, and purchasing power. Simply giving people better tools will only help people hit limits faster. If just ten fish remain in a pond, the solution to running out of fish is not more efficient nets.

Malaria is caused by a single-celled parasite that is spread by mosquitoes. Because no treatment existed for the parasite, researchers believed that it could best be fought by eliminating the wetlands that were the breeding grounds for its mosquito hosts. During World War I workers in eastern states dug ditches to drain ponds and marshes, then sprayed heavy oil or insecticide into the water to poison remaining mosquito larvae. In the Depression, Washington took over the campaign; ditch-digging was instant work for the jobless. Thousands of newly hired mosquito-fighters cut and poisoned tens of thousands of miles of drainage ditches. So many ditches were dug so fast that in some places local governments lost track of them and begged Washington to conduct surveys to identify them.

Although economists since Adam Smith had championed growth, governments had typically focused instead on promoting national security or economic stability. Indeed, some thinkers feared that untrammelled growth would lead to despotism by concentrating wealth; others argued that continued economic expansion was impossible in developed, mature economies like those in Europe and North America. During the Depression, many US New

Deal programs actually were anti-productivity; in the hope of driving up farm incomes by artificially creating shortages, farmers were paid to plow under millions of acres of cotton fields and slaughter huge numbers of pigs.

Partly influenced by the British economist John Maynard Keynes, some officials fought back against “scarcity economics.” World War II strengthened their hand, as the United States pursued all-out production in the name of victory. The Employment Act of 1946 formalized the shift, declaring that Washington was committed to “promot[ing] maximum employment, production, and purchasing power.” Galvanized by the example of the United States, other Western nations also embraced growth as an overriding social goal. “Government and business must work together constantly to achieve more and more jobs and more and more production,” proclaimed President Harry S. Truman.

The druids heard these pronouncements with horror. Ecological law was clear—the “books must balance.” Truman’s call for “more and more production” was intentionally unbalancing the books. Growth-maniacs were warring against the natural systems that nourished them—a war they had no idea they were fighting.

Few felt, then or now, the overriding importance of sustaining the land in the way the druids did. The knowledge made them feel both superior and isolated—the only people with eyes in a world of the willfully blind. All around them others were marching about their business as if the ground were not literally disappearing under their feet. So much folly! So much waste! They were as oblivious to the consequences of their actions as so many protozoa.

“One of the penalties of an ecological education is that one lives alone in a world of wounds. Much of the damage inflicted on land is quite invisible to laymen. An ecologist must either harden his shell or make believe that the consequences of science are none of his business, or he must be the doctor who sees the marks of death in a community that believes itself well and does not want to be told otherwise. How to ring the bell?”

That was the ever-urgent question. The druids saw themselves as benign conspirators, working to awaken a world that was obviously promoting its own destruction by its quest for growth. But their efforts had little impact. Their voices were small and tinny, drowned out in the roar of war and consumption. People were heedlessly flooding the world, a moronic tide rushing out to the edge of the petri dish.

Perched atop their empires, Europeans and Americans feared losing their thrones to swarming mobs of inferiors. Voices shouted that rich nations,

torpid with prosperity, were allowing lesser races to overwhelm them by unfettered breeding. So low were European and US rates of reproduction that the West was said to be committing “race suicide.” Among the most influential of these voices was Lothrop Stoddard, author of *The Rising Tide of Color Against White World-Supremacy*, a big hit in 1920. Stoddard’s father was a famous photographer who introduced millions of middle-class Americans to images of people from faraway places. Stoddard himself became a fierce anti-immigration advocate, demanding that the United States close its borders to people from faraway places.

“If the present drift be not changed, we whites are all ultimately doomed. The disappearance of Caucasians would mean that the race obviously endowed with the greatest creative ability, the race which had achieved most in the past and which gave the richer promise for the future, had passed away, carrying with it to the grave those potencies upon which the realization of man’s highest hopes depends.”

Civilization—by which Stoddard meant white civilization—must “either fully adapt or finally perish.”

More striking still, many of the racial alarmists were also leaders in the nation’s new conservation movement. The blue-blooded toffs who feared that the noble and superior white race was menaced by unwashed rabble also saw wild landscapes as noble and superior wildernesses menaced by the same rabble. Prizing the expert governance of resources, they found little difference between protecting forests and cleaning up the human gene pool.

Hitler viewed our species as a group of genetically distinct races warring for survival. He insisted that “regardless of how any race raises the productivity of the land, the disproportionate population in relation to the land remains.” As a result, the duty of Hitler and every other racial leader was to “reestablish an acceptable ratio between population and land area”—that is, to feed their ever-growing races by seizing an ever-greater share of the planet’s finite resources.

One might describe all of US history as little more than a march of destruction, in which colonists chopped, burned, drained, plowed, and shot their way from the Atlantic to the Pacific.

“Our forefathers were one of the most destructive groups of human beings that have ever raped the earth. They moved into one of the richest treasure houses ever opened to man, and in a few decades turned millions of acres of it into a shambles.”

Some critics might now be wailing, 'Free enterprise has made our country what it is!' To this an ecologist might sardonically assent, 'Exactly.' For free enterprise must bear a large share of the responsibility for devastated forests, vanishing wildlife, crippled ranges, a gullied continent, and roaring flood crests. Free enterprise—divorced from biophysical understanding and social responsibility. Ecological collapse tomorrow will lead the day after to nuclear war. If humankind keeps ignoring ecological realities there is little probability that mankind can long escape the searing downpour of war's death from the skies. And when this comes, in the judgment of some of the best informed authorities, it is probable that at least three-quarters of the human race will be wiped out.

Environmentalism is more than the simple recognition that polluting a neighbor's well or destroying a bald eagle's nest is a bad idea. In most cases that recognition can be viewed as a function of property rights. By poisoning a well, a polluter is, in effect, seizing the water without its owner's permission. More precisely, it is seizing use of the water. The eagles, too, are being taken from their owner, the public. Environmentalism, by contrast, is a political and moral movement based on a set of beliefs about nature and the human place within it. Environmentalists want to stop polluting wells and protect bald eagle nests. But they see the well water not so much as property but as part of a natural cycle with its own value that needs to be maintained. The eagle, for its part, is an individual that should be protected from needless harm. Any set of beliefs about the workings of the world is perforce a statement about what is good and important in that world. Environmentalism is an argument that respecting the rules of nature is indispensable to having a good society and living a good life.

Defining a word in a new sense seems academic and abstract, but its consequences are not. Until something has a name, it can't be discussed or acted upon with intent. People, by naming the world, transform it. Without 'the environment,' there would be no environmental movement.

Carrying capacity can be defined by means of a formula: $B - E = C$. In this equation, B is the biotic potential, the theoretical ability of that piece of land to produce plants for shelter, for clothing, and especially for food. E is the environmental resistance, the practical limitations on the theoretical biotic potential. The actual carrying capacity, C , was never as high as the theoretical biotic potential, because there was always some environmental resistance. Hence $B - E = C$. People are degrading the environment so much that E is rising worldwide. In consequence, C —the planet's capacity to support life—is shrinking.

Malthus offered no evidence in his essay to prove that farm harvests could only increase arithmetically. Indeed, Malthus's theory could be restated as

the claim that one species (humans) reproduces at a geometrically increasing rate, but other species (farm crops) cannot. No obvious reason exists for this to be true—for humans to be special in this way. Malthus's evidence for the rapidity of human reproduction came from an article by Benjamin Franklin. But, Franklin made clear in the same article that he believed that plants and people reproduced at comparable rates—the opposite of Malthus's contention. Instead of concocting some reason why farm crops must be less fecund than people, carrying capacity reset the argument.

Carrying capacity was a threshold that could not be surpassed by any species. Yes scientists might be able to use technology to boost harvests enough to outstrip population growth. But the short-term triumph of raising farm output will lead to a long-term calamity. Our species will surpass Earth's carrying capacity, which will destroy the ecosystems that support us. Carrying capacity can not be avoided. Either people will reduce their numbers and consumption to stay below the world's carrying capacity—or the ecological devastation wrought by overpopulation will do it for them. Nature bats last.

Some argue viewing the human dilemma in terms of an ecological carrying capacity is a mistake. The planet's actual, physical carrying capacity is so large—scores of billions of people—as to be irrelevant. The true problem is not that humankind risks surpassing natural limits, but that our species doesn't know how to tap more than a fraction of the energy provided by nature. Harnessing these energy sources will require new technology. But once created, all human needs for heat, air-conditioning, transportation, electricity, steel, cement, and everything else will be satisfied for eons to come. They may concede that food energy, the second kind of energy, is a different matter: more complicated, harder to resolve. Here, warnings related to carrying capacity might be borne out. Food energy derives from plants, either directly (when people eat them) or indirectly (when people eat animals that have eaten them). And the energy in plants comes from the sun, captured by photosynthesis.

Five- to ten-thousand years ago, indigenous people in south-central Mexico developed the first maize from a much smaller wild plant, a grass called teosinte. Since that time Indian farmers have bred thousands of varieties of maize, each chosen for its taste, texture, color, and suitability for a particular climate and soil type. Red, blue, yellow, orange, black, pink, purple, creamy-white, and multicolored—the jumble of colors of Mexican maize reflects the nation's jumble of cultures and environmental zones. The small, varied plots in Mexico are like the anti-matter version of the huge, uniform maize fields in the US Midwest. Maize is open-pollinated—it scatters pollen far and wide. Wheat and rice plants, by contrast, typically

pollinate themselves.

Because wind often blows pollen from one small Mexican maize field onto another, varieties are constantly mixing. Over time, uncontrolled open pollination would create a few, relatively homogeneous populations of maize. But the pollination is not uncontrolled, because Mexican farmers carefully select the seed to sow in the next season, and generally do not choose obvious hybrids. Thus there is both a steady flow of genes among maize varieties and a force counteracting that flow. This roughly balanced genetic sea, maintained by farmers' individual choices, is a resource not only for Mexico but the entire world; it is the genetic endowment of one of Earth's most important foodstuffs.

Some engineers took a route through Mexico that was much like the route taken by some druids two years later. Both groups wrote reports documenting the same terrible poverty and eroded land, but their ideas about the remedy were starkly different. To the druids, the basic problem was land degradation, and the primary cure was to ease the burden on the land. By contrast, the engineers believed that Mexico's issues were caused, at bottom, by lack of knowledge and tools. The difference between these two approaches is profound, and at the heart of the split between druids and engineers.

At the same time, the two reports had a striking similarity: neither attempted to understand how Mexican farmers had got into these straits. When Mexico won its independence in 1821, most of the citizens of the new country were landless peasants who worked on giant estates in conditions little different from slavery. Over time the situation worsened: under the dictator Porfirio Díaz, who controlled Mexico from 1876 to 1910, wealth and land were concentrated among a few hundred aristocratic families, foreign companies, and the Catholic Church. A bloody civil war led in 1917 to a new constitution that promised to redistribute land. Early efforts to fulfill this promise set off such violent resistance by the rich and the Church that the government pulled back.

In 1934 a new president, Lázaro Cárdenas, tried again. The Cárdenas administration seized almost 50 million acres from estates and awarded them to ejidos, peasant-run collectives. (About 4 million acres of this land was owned by US companies, which led to diplomatic squabbles between Mexico City and Washington, D.C.) As before, landholders fought back, some plotting coups and assassination attempts. Others ensured that the ejidos were forced to accept bad land—plots that were too dry or steep to cultivate. By 1940 the eleven-thousand new ejidos were working almost 2.5 million acres of land that had been left alone ten years before. Unsurprisingly, the consequences were often destructive; erosion and soil depletion soared. Much

of the devastation that the druids saw as the unavoidable consequence of high birth rates was tied to political events that were anything but inevitable; much of the poverty that the engineers saw as lack of access to knowledge was the result of efforts by wealthy elites to maintain their position.

In the past, by planting more land, deploying more irrigation, and pumping in more synthetic fertilizer, farmers increased their actual yields. At the same time, engineers dramatically increased the potential yield of wheat and rice by breeding high-yielding dwarf varieties. Channeling the energy of photosynthesis and the nutrition provided by fertilizer into grain, these varieties had a “harvest index”—the percentage of the plant’s mass that is grain—of about 50 percent, almost twice the previous figure. For maize, dwarfing didn’t work, because the shorter plants shaded themselves too much. Instead scientists bred plants that could tolerate being packed closer together. The sum of the two methods was the Green Revolution.

The situation is different today. Farmers can’t plant much more land; in Asia, almost every acre of arable soil is already in use. Indeed, as cities expand into the countryside the supply of farmland may be decreasing. Nor can fertilizer be increased; it is already being overused everywhere (except some parts of Africa). Irrigation, too, cannot readily be expanded. Most land that can be irrigated is already irrigated. Some increase in actual yield is certainly possible. But most engineers believe they must raise the potential yield.

Darwin proved that man was an integral part of nature itself, and not a separate and independent being. People are not special! But the wonders of airplanes, radar, and the atomic bomb has tricked us into believing that we are masters of the universe. Humanity’s future could be bright but only if people don’t think themselves exempt from natural laws. The sole route to securing a future for our species, democratic society, and the planet itself is to understand our place within nature’s limits and to base civilization on this knowledge.

Currently Western civilization is possessed by dementia economica: the insane substitution of limited symbols—such as dollars, pesos, colones, lempiras, and Bitcoin—for such reality as topsoil, fertility, soil metabolism, available water, and complex interdependencies within the ecosystem—including humans. The symbols say that humanity is doing well, when actually environmental deterioration is being accelerated.

The scientific enterprise studies phenomena—atoms, clouds, organisms, planets—by transferring them from the world we live in, with all of its confusion and sentiment, into a special workshop, a place where they can be reduced to abstract, measurable quantities and manipulated in a controlled manner. This method of working is incredibly powerful. It discovered the

laws of electricity and created antibiotics and built the atom bomb and invented X-rays and generated techniques to harvest and store energy from the sun and wind. But it is also risky.

The air in the scientific workshop is so clean and bracing and the results of researchers sequestering themselves inside so satisfying that they lose their bearings. They don't want to leave the workshop. They prefer to live in its world of abstraction, separate as angels from the messiness of life. Or, worse, the findings of the workshop seem so luminous and clear, so like beacons of truth, they forget that the workshop is a special place within the world and begin to think that it is above the rest of life and should control it. And here lies peril, because the people outside the workshop will come to detest and disbelieve the people within its privileged walls.

Scientists say that because the workshop has found that A is true the world should do B. But people in the world notice that when scientists go into the workshop they strip their objects of study of everything but a few measurable quantities, and then the people object that what was stripped away was worthy, even essential. They see the scientists unable to understand the resistance to following course B as condescending aliens who don't share their values—and, all too often, they are correct. Why would you listen to people who have no idea what you consider important? The ensuing rejection of expertise has surely played a role in the rejection of scientific claims about genetically modified organisms, nuclear power, soil depletion, and climate change.

Put fruit flies in a bottle and they will fuck. Should the fruit flies continue to multiply at their initial compound interest rate, it can be shown by computation that in a relatively few weeks the number would be considerably greater than the capacity of the bottle. This being so, it is a very simple matter to see why there is a definite limit to the number of fruit flies that can live in the bottle. Once the number is reached, the death rate is equal to the birth rate, and population growth ceases. Very little thought and examination of the facts should suffice to convince one that in the case of the production of coal, pig iron, or automobiles, circumstances are not essentially different.

Of course, fruit flies do not have access to weapons of mass destruction to use when fighting over dwindling resources. They have no god which tells them they are the chosen righteous few who must exterminate all the parasites dragging the whole down. And they certainly don't have some kind of program for escaping their confines and acquiring resources outside their bottle.

The future of our civilization largely depends on whether humanity will be able to evolve a culture more nearly in conformity with the limitations

imposed on us by the basic properties of matter and energy.

“The humility you portray, the bending at the knee to nature, isn’t actually very thoughtful or wise.”

What I’m talking about is the sense to know one’s limitations and refrain from acting outside them if there is danger of harming others. If you’re a fair weather sailor, don’t take your family and friends out on your 25-footer in a gale. Similarly, given our scientific and engineering community’s poor record of anticipating secondary and tertiary effects of their innovations, it would seem wise to be extremely cautious when tinkering with geoengineering, cloning, gene modification, et cetera. The call of the Swiss for international review before any geoengineering undertaking would be a minimum of caution, but even that was vetoed by the US and Saudis.

The humility I’m talking about is the kind that would remind a scientist or engineer that we know just about enough about this world to be dangerous. All of that air conditioning and international air travel has come at a price of environmental destruction which was either not foreseen by our wonderful scientists or engineers until it was very late or they advanced the research and engineering knowing the harm it would cause (like the Bomb).

The idea that we are separate from nature and above it has led to an arrogance that threatens the survival of the very civilization that gave birth to it. You want to tag me with worshiping nature when it’s the self-worship of the technocrats that is the real problem. If they were only half as intelligent as they think they are, maybe they could engineer us out of this, but the odds are they will only hasten our destruction.

The hard path creates universal engineered solutions that do not depend on local conditions or knowledge. It leads quite naturally to broad fields of waving grain—visions of concentrated productivity. Societies that adopt the soft path will lead toward networks of smaller farms with drip irrigation and multiple crops—the inhabited, networked spaces preferred by druids. One values a kind of liberty; the other, a kind of community. One sees nature instrumentally, as a set of raw materials freely available for use; the other believes each ecosystem has an inner integrity and meaning that should be preserved, even if it constrains human actions. The choices lead to radically different pictures of how to live. What looks like a dispute over practical matters is an argument of the heart.

There is a very bad habit among modern triumphalists, the types who go on and on about how great the current world is, to confuse capitalism and industrialization. Capitalism is part of how many nations industrialized, but industrialization is where the majority of the gains come from. When

you replace human labor with machines run by coal and hydrocarbons and some other sources of power, you get most of the gains of capitalism. This is why for much of its history the USSR, in fact, did just fine, and actually outgrew most capitalist nations.

Nor is the victory of capitalism as clean and clear as people make it out to be. With a very few exceptions—mostly city states—countries industrialized under protectionism, not under “free trade” or “free markets.” This is beyond question, it is not open to debate: It is true of America, Japan, China, and Britain, among others.

These were very heavily state-managed economies in many cases. Germany’s electrical revolution was a result of the German High Command making sure it happened, “Siemens, my good man, go start an electrical company!” Likewise, Japan had massive government involvement. And this is when we pretend that, say, Britain forbidding the export of raw wool, wasn’t a government action—and without which there is no textile revolution. and thus, likely, no Industrial Revolution at all.

Nonetheless, to be sure, the majority of the world did industrialize under some form of capitalism. Capitalism is how a lot of the decisions of what to do were made. Capitalism is how the right to command resources was allocated. But it doesn’t happen without massive government intervention: Commons don’t enclose themselves, government has to be onside. Chinese villages don’t give up and say, ‘Make me into housing!’ by themselves either, government force is involved. There is little natural capital accumulation: It comes from taking away other people’s stuff and rights.

Unless we run across extra-terrestrials, or we lose our modern technological civilization, we will never know if it would have been possible to industrialize other than through central government mobilization (so-called communism), protectionist capitalism, or free trade capitalism (for city states). However, capitalism was, and is, a way to distribute resources to do things. It is not the things themselves. It is not, itself, industrialization, and confusing the two is a dangerous intellectual error.

It is at least conceivable that we could have industrialized in very different ways than we did. History is contingent, what happened happened, but it was a result of specific historical conditions interacting with principles. Better power sources, funneled through better machines, is the Industrial Revolution. That is not what capitalism is.

And because either we made bad decisions due to our adherence to capitalism, which have lead to the current onrushing climate and ecological crises, *or* it is intrinsic to industrialisms, we’d better hope it was capitalism which was the primary problem. We had better hope that there are ways to use machines and energy that won’t cause environmental catastrophe; that

there are other ways to decide who gets resources and for what purpose they use them. If there aren't, well, we're likely to lose our civilization or even go extinct.

We need to stop being nodes in a shitty resource allocation algorithm, and we need to start actually making sane decisions based on group autonomy and welfare. And capitalism doesn't do that.

Part IV
Sci-Fi Fantasies

In the day we sweat it out on the streets of a runaway American dream
At night we ride through mansions of glory in suicide machines
Sprung from cages on Highway 9
Chrome-wheeled, fuel-injected, and steppin' out over the line
Oh, baby this town rips the bones from your back
It's a death trap, it's a suicide rap
We gotta get out while we're young
'Cause tramps like us, baby we were born to run
Yes, girl, we were

Wendy let me in I wanna be your friend
I wanna guard your dreams and visions
Just wrap your legs round these velvet rims
And strap your hands 'cross my engines
Together we could break this trap
We'll run till we drop, baby we'll never go back
Oh, will you walk with me out on the wire?
'Cause baby I'm just a scared and lonely rider
But I gotta know how it feels
I want to know if love is wild, girl I want to know if love is real
Oh, can you show me

Beyond the Palace, hemi-powered drones scream down the boulevard
Girls comb their hair in rearview mirrors
And the boys try to look so hard
The amusement park rises bold and stark
Kids are huddled on the beach in the mist
I wanna die with you Wendy on the street tonight
In an everlasting kiss

The highway's jammed with broken heroes on a last chance power drive
Everybody's out on the run tonight but there's no place left to hide
Together Wendy we can live with the sadness
I'll love you with all the madness in my soul
Oh, someday girl I don't know when, we're gonna get to that place
Where we really wanna go and we'll walk in the sun
But till then tramps like us baby we were born to run

Oh honey, tramps like us, baby we were born to run
Come on Wendy, tramps like us, baby we were born to run

Progress Traps

Comedy of Progress

Alchemists of the middle ages thought it possible to discover, and accordingly sought after, a Universal Solvent, or Alkahest as they named it. This imaginary fluid was to possess the power of dissolving any substance, whatever its nature, and to reduce all kinds of matter to the liquid form. It does not seem to have occurred to these ingenious dreamers to consider, that what dissolved everything, could be preserved in nothing.

There is a conflict between what we can do scientifically and what we should do morally. While the first is fairly easy to evaluate objectively—either a new technology performs its desired function or it doesn't—the second is much less clear.

We must remember that the history of technology is written by the victors: successful innovations give the illusion of a linear sequence of stepping stones, while the losers fade into obscurity and are forgotten. But what determines the success of an invention is not always necessarily superiority of function. In our history, both compressor and absorption designs for refrigeration were being developed around the same time, but it is the compressor variety that achieved commercial success and now dominates. This is largely due to encouragement by nascent electricity companies keen to ensure growth in demand for their product. Thus the widespread absence of absorber refrigerators today—except for gas-fueled designs for recreation vehicles, where the ability to run without an electrical supply is paramount—is not due to any intrinsic inferiority of the design itself, but far more due to contingencies of social or economic factors. The only products that become available are those the manufacturer believes can be sold at the highest profit margin, and much of that depends on the infrastructure that already happens to be in place. So the reason that the fridge in your kitchen hums—uses an electric compressor rather than a silent absorption design—has less to do with the technological superiority of that mechanism than with quirks of the socioeconomic environment in the early 1900s, when the solution

became locked in.

In fact, electric vehicles have been common once before. In the early years of the twentieth century, there were three fundamentally different automobile technologies battling for supremacy, and electric cars held their own against competition from steam- and gasoline-powered alternatives, as they are mechanically much simpler and more reliable, as well as quiet and smokeless. In Chicago they even dominated the automobile market. At the peak of production of electric vehicles in 1912, 30,000 glided silently along the streets of the USA, and another 4,000 throughout Europe; in 1918 a fifth of Berlin's motor taxis were electric. The drawback of electric cars with their own onboard batteries (rather than trains or trolleys taking a continuous feed from a power line over the track) is that even a large, heavy set cannot store a great deal of energy, and once depleted the battery takes a long time to recharge. The maximum range of these early electric vehicles was around a hundred miles, but this is farther than a horse and in an urban setting is more than adequate. The solution is, rather than waiting for the battery to be recharged, you can simply pull into a station for a quick battery pack exchange: Manhattan successfully operated a fleet of electric cabs in 1900, with a central station that rapidly swapped depleted batteries for a fresh tray.

There are two kinds of fools: one who says this is old and therefore good, and the other who says this is new and therefore better. The argument between the two is as old as humanity itself, but technology's exponential advance has made the divide deeper and more contentious than ever. Transhumanists and Singularitans are Engineers; the Amish and Ted Kaczynski are Druids. It is a pressure we must resist, for to be either a Druid or an Engineer is to be a fool. Druids can't revive the past, and Engineers cannot build technologies that do not carry hidden trouble. Collective minds change at a snail's pace, whereas technology races along an exponential curve. I fear we will not rediscover the middle ground in time to save us from our myriad folly.

Science and democracy still look like the hope of the world—even as we recognize that their intersection gave us the means to burn alive every living thing on the planet at will. The marriage of science and democratic politics represents for us liberal civilization, the twinned hopeful note of our time—along with their depressing extension, mass-conscription wars and a stoic acceptance of deep time and pointless mass dying.

Too many think of science in terms of applications—things like fabrics and tail fins—not a patient search for knowledge for its own sake.

Instant gratification is beside the point. Decades pass before patterns become visible, before hunches can be proven, before the jigsaw puzzle comes

together, if it ever does. Science, by definition, is altruistic. You might be the one who benefited from the information you'd collected over the years, you might not. You might be dead, even. And someone else using your data might go on to win the Nobel Prize.

If we assume that networks will continue to get faster—a pretty safe bet—then we can also conclude that we'll become more and more impatient, more and more intolerant of even microseconds of delay between action and response. As a result, we'll be less likely to experience anything that requires us to wait, that doesn't provide us with instant gratification. That has cultural as well as personal consequences. The greatest of human works—in art, science, politics—tend to take time and patience both to create and to appreciate. The deepest experiences can't be measured in fractions of seconds.

Science has taken over from religion as the main agent of social control. It is science that decides what it is acceptable for us to believe and what is beyond the pale. It is very easy to use science to simply reaffirm our place in the world first posited by theology. The problem with science is that it thinks it can find all the answers, the problem with religion is that it thinks it has all the answers

What is the world if not a maze through which we all navigate, using the tools and maps—cognitive and otherwise—we have at our disposal? And what are scientists if not rats in a maze of inquiry, assembling knowledge and testing it against the observable environment? Science produces a map and a picture of reality, nothing more or less. If it were to present reality in its whole concreteness science would not be a map but a complete replica of reality. And then it would lose its usefulness. The map is not the territory. Even the most comprehensive cognitive map is not the world, which is always mediated by our perceptions of it. There is no escaping the maze.

Though our ability to build and field robots is racing ahead exponentially, ethically we remain infants. We are now living in an exponential age, and yet physiologically our brains are still those of Stone Age hunters, barely upgraded in the past fifty-thousand years: it is not in our nature to grasp the inherent power of exponential technologies.

We exist in a bizarre combination of Stone Age emotions, medieval beliefs, and god-like technology. That, in a nutshell, is how we have lurched into the early twenty-first century.

This is a story we know. It is the story of pioneers, progress, and the transformation of “empty” spaces into industrial resource fields.

Ignorance breeds innovation, or at least the perception of it. Civilization is in a race between education and catastrophe.

One of the great myths surrounding the development of human culture over the past 10,000 years is that things got progressively better as we moved from our hunter-gatherer existence to the sublimely elevated state in which we live today. Most people assume that the lives of our distant ancestors were, to quote Thomas Hobbes, “solitary, poor, nasty, brutish, and short.” When agriculture and government came along their obvious superiority was clear, and after that people’s lives improved immeasurably. The explosion in the size of the human population after 10,000 years ago is assumed to be merely the numerical manifestation of the positive impact of growing our own food, the benefits of the new lifestyle writ in the expanding number of happy farmers. In fact, nothing could be further from the truth.

Despite certain events of the twentieth century, most people in the Western cultural tradition still believe in the Victorian ideal of progress, the assumption that a pattern of change exists in the history of mankind, that it consists of irreversible changes in one direction only, and that this direction is towards improvement.

Humans have always been technological beings, but until the last few centuries most forms of technology came with a set of cultural regulations that had been discovered through trial and error and passed on to the next generation. When my father taught me to chop wood, for example, a lot of his instruction had to do with protecting myself from the axe. Now that children teach their parents how to use technology rather than vice versa, we turn to science or pseudoscience for answers. And science can’t keep up with the questions it raises.

The intellectual activities of many cultures—ours very much included—tend to swing back and forth on a timescale of centuries between two competing ways of understanding the world. We can call these abstraction and reflection. Abstraction is the belief that the world around us obeys a set of laws that can be known by the human mind. Intellectual activity in an age of abstraction therefore focuses on abstracting—literally, “drawing out”—those laws from the buzzing, blooming confusion of the world we experience.

Abstraction is confident, expansive, and it thrives in eras of expansion—economic, political, imperial. It seems obvious in such eras that the kind of intellectual activity that matters is the kind that focuses outward, on the world that human beings experience, and aims at reducing that world to order, number, system. It’s a very successful approach, up to a point. Because people on the intellectual cutting edge in ages of abstraction direct their attention outward to the world, they tend at first to pay close attention to the fit between human ideas and the world those ideas are intended to explain, and the resulting explanations work—again, up to a point.

Over time, though, the successes of abstraction result in vast systems of thought, perfectly rational and interconnected in every detail. Bit by bit, without ever quite noticing that this is what they're doing, the practitioners of abstraction end up studying their own systems of thought under the illusion that they're studying the world. Grand overarching theories that explain everything take center stage, until thinkers at the cutting edge dream of a day not far off when everything that matters is known for certain. Greek philosophy inspired such dreams; so did medieval scholastic theology, and so does modern materialist science.

But the day when everything makes sense never arrives, because the more comprehensive the theories become, the less they have to do with the world human beings actually experience. Outside the narrowing circles of the intellectual elite, it becomes impossible to miss the fact that the supposed universality of the world-theories of abstraction has been obtained by excluding countless things that don't fit. Some of those excluded things are bits of data that contradict the grand theories, but some are much vaster: whole realms of human experience are dismissed as irrelevant because they don't fit the theoretical model or the methods of inquiry that a given age of abstraction happens to prefer.

This also has unwelcome practical consequences. In ages when abstraction predominates, politics and economics become subject to the same notions of abstract reason that guide intellectual inquiry, and policies are proposed and enacted on the basis of abstract rules, without any attention being paid to the way those policies actually work out when applied. The result is pretty consistently catastrophic. Sooner or later you end up with a situation in which most people, and especially most people in positions of political, economic, and intellectual authority, are faced with disastrous and widening gulfs between the world as defined by their preferred set of abstract rules, on the one hand, and the world we actually inhabit on the other, and the only way out is to realize that all those fancy abstractions are ideas in the minds of human beings, not realities out there in the world of our experience. That's when an age of abstraction gives way to an age of reflection. Where abstraction faces confidently outward into the world, convinced that the human mind can grab truth by the short hairs and drag it into plain view, reflection faces ruefully inward, realizing that the human mind has no business making grand pronouncements about the universe when it hasn't yet come to grips with itself.

Reflection is rooted in the recognition that ideas are human constructs rather than objective truths about nature, and that the only thing we can be sure of is the blooming, buzzing confusion of everyday life. 'What actually happens?' becomes more important than 'what is eternally true?' Personal,

tacit knowledge rooted in example and experience comes to be valued above abstract universal theories—and just as abstraction earns respect in its early days because of its successes in understanding the world, reflection earns respect in the corresponding situation because of its successes in managing the world. Reflection also runs into problems in the long-run, of course.

We no longer give much thought to moral progress—a prime concern of earlier times—except to assume that it goes hand in hand with the material. Civilized people, we tend to think, not only smell better but behave better than barbarians or savages.

World models have consequences. How people think has consequences. Our tribal nature and ability to identify with virtually anything has consequences.

Because our power over the natural world has increased so much, errors and characteristics which were adaptive during most of our evolution are now catastrophically dangerous—extinction level dangerous. Not just for us, but for all too many other species with whom we share the globe, many of whom are more than capable of immense levels of suffering.

What am I giving up in order to have a 70-degree living room in July? Nothing that's particularly important to me. For the air conditioner to work, I need to live in a building that has electricity, so I have to be connected to the rest of society. That's fine. That's no problem. Of course, to be accepted by that society, I have to accept the rules and laws of community living. That's fine, too. Now, to thrive and flourish and afford my electric bill, I will also have to earn money. But that's okay—most jobs are social and many are enriching and necessary. However, the only way to earn money is to do something (or provide something) that is valued by other people. And since I don't get to decide what other people value, what I do to make a living is not really my decision. So—in order to have air-conditioning—I will agree to live in a specific place with other people, following whatever rules happen to exist there, all while working at a job that was constructed by someone else for their benefit. In order to have a 70-degree living room, I give up almost everything. Yet nothing that's particularly important to me. When Kaczynski wrote, "Technology is a more powerful social force than the aspiration for freedom," I assume this is what he meant.

Techniques ranging from televisions to propaganda—ways to engineer people's minds—have turned people into slaves of efficient machines. Technology, including the construction of complex cities, has become the dominant and determining factor in society. Technology has so transformed communications, elections, and travel that people can no longer live spontaneously any more than an astronaut can walk freely in space without a life-support system. Humans depend so heavily on this artificial world of technology that

they have lost touch with the natural world. Moreover, these technologies, whether pesticides or fracking, tend to destroy or subordinate the natural world and do not allow this world to restore itself.

Technology eliminates human choice, because the machine world favors technique that gives the maximum efficiency. If a machine can yield a given result, it must be used to capacity and it is considered criminal and antisocial not to do so. Technologies such as propaganda greatly modify society. Technology makes no distinction between good uses and bad ones. It tends on the contrary to create a completely independent technical morality.

The state played a pivotal role in the spread of technology. Technologies and their machines increasingly created social and environmental problems, but only the state had the money to fully research them, and its scientific solutions invariably called for more technology—which ultimately centralized more power. The proliferation of technologies also destroyed any notion of responsibility.

Consider the example of a dam: One day the dam's walls fracture and burst. A community is flooded. Who is responsible for that? Geologists examined the terrain. Engineers drew up the construction plans. Workmen constructed it. And the politicians decided that the dam had to be in that spot. Who is responsible? No one. There is never anyone responsible. Anywhere. In the whole of our technological society the work is so fragmented and broken up into small pieces that no one is responsible. But no one is free either. Everyone has his own specific task. And that's all he has to do.

The Industrial Revolution and its consequences have been a disaster for the human race. They have destabilized society, have made life unfulfilling, have subjected human beings to indignities, have led to widespread psychological and physical suffering and have inflicted severe damage on the natural world. The continued development of technology will worsen the situation. It will certainly subject human beings to greater indignities and inflict greater damage on the natural world, it will probably lead to greater social disruption and psychological suffering, and it may lead to increased physical suffering even in "advanced" countries.

This is a story we need to know. Industrial transformation turned out to be a bubble of promise followed by lost livelihoods and damaged landscapes. And yet: such documents are not enough. If we end the story with decay, we abandon all hope—or turn our attention to other sites of promise and ruin, promise and ruin.

There is a view that this form of the tech is the inevitable form it had to take; if that is the form it took, then it must be the right choice—that the form the tech takes is the form we must accept.

Science and tech give you a range of possibilities, it's potentially a

liberating thing, but we must stop sleepwalking in order to get there. It's not an engineering choice, it's not a scientific choice, it's a moral choice.

One telling of the myth of Pandora is that after all the plagues on humankind got out of the cask she was charged with guarding, only one remained, the worst of them all—Hope—which zipped out into the world before the astonished Pandora could slam the lid. Hope drives us to invent new fixes for old messes, which in turn create even more dangerous messes. Hope elects the politician with the biggest empty promise; and as any stockbroker or lottery seller knows, most of us will take a slim hope over prudent and predictable frugality. Hope, like greed, fuels the engine of capitalism.

The arrogant collect information, not so much to search for truth, but to reinforce their prejudices.

Those Enlightenment writers were writing tomes to justify their own greed and prejudices, while cloaking their greed and prejudices in “morality.” It seemed to me that the Enlightenment was an attempt to destroy the basis of Jesus's and Buddha's philosophy—that the most moral position of humanity was to care for its members, just as clans, tribes, families, and other human societies did. The most frequent response from professors and classmates to my thesis? But those clans, tribes, families, other societies didn't accomplish much, did they? As if the only reason for humanity's existence was to compete against itself.

The Eurocentric modernist program has four planks:

1. A blind faith in science.
2. A self-serving belief in progress.
3. Rampant materialism.
4. A penchant for using state violence to achieve its ends.

In a nutshell, it's a habit of placing individual self-interest above the welfare of community and society.

To illustrate one of its signature follies refer to that great Hollywood ode to the Western spirit, “The Sound of Music.” Early in the film, the Mother Superior bursts into song, calling on the nun Maria to “climb every mountain, ford every stream.”

Sounds exhilarating, but to what end? Why exactly do we need to ford every stream? From the Eurocentric modernist viewpoint the answer is not so innocent: we secretly do it so that we can say to ourselves, ‘Look, I achieved something that's beyond the reach of somebody else. Hooray for me!’

That's our big dream. Everyone and everything is a stepping stone to our personal glorification. When others get in our way, we end up with a grim take on life described succinctly by Jean Paul Sartre:

“Hell is other people.”

Sounds bad, but didn't Eurocentric modernism also give us our great democratic ideals of equality and liberty to elevate and protect us? Maybe these notions are not really our salvation. When we replace the vital ties of kinship and community with abstract contractual relations, or when we find that the only sanctioned paths in life are that of consumer or producer, we become alienated and depressed in spirit. Abstract rights like liberty and equality turn out to be rather cold comfort. These ideas, however lofty, may not get at the most basic human wants and needs.

What we lack is a realistic approach to anthropology, without which our forays into economics, psychology, sociology, and pretty much everything are hopelessly skewed. The Eurocentric modernist tradition, influenced by the Judeo-Christian idea that we are distinct from the world of nature, seeks to separate us from the animal world. We are supposed to be above it, immortal, transcending our bodies and the Earth. But it doesn't quite work.

We may be able to perform dazzling technical feats, like putting a colony on Mars, but we will pay for it by working even harder and longer hours so that a few may get the benefit. A whole lot of lost time and suffering, and for what? The Bushmen do not have a Mars rocket, but they do have a two-and-a-half-day workweek—something that most modern humans can only dream of. What's more significant to the lives of most of us?

We have become unhinged from our own human nature as heat-seeking mammals. What we really crave is warmth, security, and care—the kinds of things we get at home and in close social units. Our greatest human need is something far more humble than launching rockets: we want to huddle.

I love the delusion within our thinking that 'progress' is a one way process.

One of the great debates of nineteenth-century social theory concerned whether social evolution is progressive. In other words, is there some purpose to our lives, and are the exertions of the present leading us to a brighter future? Early evolutionists represented life as a great chain of being, with single-celled organisms at the bottom of the chain and humans at the top, as the pinnacle of the evolutionary process. Furthermore, even humans were divided into those who had achieved a certain level of material culture (“civilized”) and those who in some way lagged behind (“uncivilized”).

Lewis Morgan, an influential nineteenth-century social theorist, wrote in his 1877 magnum opus, *Ancient Society*, about three stages of human

cultural evolution: savagery, barbarism, and civilization. Savagery was hunting and gathering, the way humanity had lived during its earliest stages of evolution. Barbarism was essentially subsistence agriculture of the type practiced during the Neolithic. Civilization was advanced agriculture, urban settlements, written language, and the rule of law.

The theme of nineteenth-century progressive thinking was that the goal of humanity was to arrive at the form of civilization found in Europe and other “advanced” societies, and that alternative ways of life were primitive and undesirable. In fact, according to Morgan, it was inevitable that cultural evolution would follow such a trajectory, with the advanced societies triumphing over those stuck in an earlier evolutionary rut.

The cult of innovation holds every info-age novelty to be inherently good in itself, regardless of its social or political consequences. Few of the people who write or talk about innovation even acknowledge the possibility that innovations might be harmful instead of noble and productive. And yet recent history is littered with exactly such stuff: Innovations that allow companies and governments to spy on us. Innovations that allow terrorist groups to recruit online. Innovations that allowed Enron to do all the fine things it used to do. Come to think of it, the whole economic debacle of the last ten years owes its existence to the financial innovations of the Nineties and the Aughts—the credit default swaps, the algorithms companies used to hand out mortgage loans—innovations that were celebrated in their day in the same mindlessly positive way we celebrate tech today. Somehow that stuff never comes up, however. We know what innovation is about, and it’s righteousness and triumph.

The American Comedy of Progress—the cherished notion that with time, technology, entrepreneurialism, and, if need be, activism, all problems can be solved.

We hear about precarity in the news every day. People lose their jobs or get angry because they never had them. Gorillas and river porpoises hover at the edge of extinction. Rising seas swamp whole Pacific islands. But most of the time we imagine such precarity to be an exception to how the world works. It’s what drops out from the system. What if, as I’m suggesting, precarity is the condition of our time—or, to put it another way, what if our time is ripe for sensing precarity?

Precairety is the condition of being vulnerable to others. Unpredictable encounters transform us; we are not in control, even of ourselves. Unable to rely on a stable structure of community, we are thrown into shifting assemblages, which remake us as well as our others. We can’t rely on the status quo; everything is in flux, including our ability to survive. Thinking through precarity changes social analysis. A precarious world is a world without

teleology. Indeterminacy, the unplanned nature of time, is frightening, but thinking through precarity makes it evident that indeterminacy also makes life possible.

Over the past half century another anti-progress trend has been spawned, one more widespread and potentially dangerous than the more limited movements of the past: fundamentalism. Coalescing in the mid-twentieth century in both the Islamic and the Christian faiths, fundamentalism has increasingly dominated political debates around the world. Born of desperation and anger, and driven forward by charismatic leaders, fundamentalist views provide a focus for people who feel left out of the modern world, offering an alternative vision of how life should be lived.

Members of the American religious right killing doctors at abortion clinics; al-Qaeda members using bombs and hijacked planes to kill thousands; Aum Shinrikyo followers killing a dozen people and injuring hundreds more in the Tokyo subway—all seem like the inhuman acts of crazy zealots, unable to separate right from wrong, but this is a crude oversimplification. Any sort of mass murder is possible only because the human faces of the victims have been dissociated from the action of killing; unlike previous movements that have advocated violent solutions to social problems, however, such as the PLO or the IRA, with their territorial desires, today's violent fundamentalist movements claim to be doing God's will, giving them a sense of higher purpose. Success means not simply achieving proximal goals such as political autonomy, for instance, but changing the world order in the name of God. Crazy though it may appear from the outside, it is not insanity that drives terrorism in the fundamentalist world; rather, it is the God-given certainty that what one is doing is morally just.

When Charles Darwin first proposed his theory of evolution by natural selection in 1859, it met with widespread opposition from the religious establishment. Bishop Samuel Wilberforce, who famously debated evolution with Darwin's ardent supporter T. H. Huxley in 1860, parodied the notion that humans could be descended from apes, but such views were ultimately to fade into the minority. By the early twentieth century, Darwinian evolution was widely accepted, in part because of its misappropriation by proponents of social Darwinism as a way to justify the hardscrabble economic competition of the Victorian era. While the famous Scopes "Monkey Trial," in 1926, briefly brought anti-evolutionist thinking back into public view, ultimately the Great Depression, World War II, and the growing prominence of science during the Cold War would squelch much of this fundamentalist backlash. A 1968 Supreme Court decision overturning an Arkansas law banning the teaching of evolution in schools effectively ended the debate for the next decade.

In the 1980s, flush with Ronald Reagan's victory in the presidential election and the concomitant increase in the prominence of the Moral Majority, anti-evolutionist thinking began to claw back support it had lost during the secular mid-twentieth century. A study published in 2006, examining public acceptance of evolution around the world, found that around 80 percent of the people in major European countries and Japan accepted evolution. In the United States the number was only 40 percent, and among the thirty-four countries surveyed only Turkey ranked lower, at 25 percent. The poll figure in the United States actually represented a decline from 45 percent in 1985, and between 1985 and 2006 the number of people who were "unsure" about evolution increased from 7% to 21%. One of the study's coauthors noted:

"American Protestantism is more fundamentalist than any-body except perhaps the Islamic fundamentalist."

The modern, secular West should ask what it is that fuels the flames of fundamentalism, just as the advocates of jihad should ask why such a war is justified. Ultimately, fundamentalism can exist only in opposition to something else; it is a protest movement. If there were nothing to protest, it would lose its *raison d'être*.

A naïve belief that human history is a linear progression toward equality and greater morality must be dismissed. This absurd positivism is the lie perpetrated by oppressors. All atrocities of the victor, the long series of his attacks, are coldly transformed into constant, inevitable evolution. But the sequence of human things is not inevitable, it can be changed at any moment. Scientific and technological advancement, rather than a harbinger of progress, can be a terrible weapon in the hands of Capital against Labor.

Humanity is never stationary. It advances or goes backwards. Its progressive march leads it to equality. Its regressive march goes back through every stage of privilege to human slavery, the final word of the right to property. I am not amongst those who claim that progress can be taken for granted, that humanity cannot go backwards.

I once thought of achievements such as the Hammurabic Code, Magna Carta, and Bill of Rights as mileposts on humanity's road to a just and free society. But I'm beginning to view them as ever larger and more desperate dams to hold back the swelling flood of abuses of human rights and the centralization of power that are inherent in agricultural and industrial societies. Agriculture results—all too often—in concentration of power by the elite. That is the inevitable result of the large storable surplus that is at the heart of agriculture.

In truth, however, nothing is inevitable and very little is new. And tech is no more the root of the problem than are trade or globalization. Many of our most vaunted innovations are simply methods—electronic or otherwise—of pulling off some age-old profit-maximizing maneuver by new and unregulated means. Sometimes they are designed to accomplish things that would be regulated or even illegal under other circumstances, or else they are designed to alter relationships of economic power in some ingenious way.

Consider the many celebrated business innovations that are, in reality, nothing more than instruments to get around our society's traditional economic arrangements. Uber is the most obvious example: much of its value comes not from the efficiencies in taxi-hailing that it has engineered but rather from the way it allows the company to circumvent state and local taxi rules having to do with safety and sometimes insurance. The circumvention strategy is everywhere in innovation-land once you start looking for it. Airbnb allows consumers and providers to get around various safety and zoning rules with which conventional hotels must comply. Amazon allows customers in many places to avoid paying sales taxes. The circumvention strategy isn't restricted to software innovations, either. One of the great attractions of credit default swaps—a big financial innovation of the last decade—is that they were completely unregulated.

Decades before Uber started, companies in Silicon Valley had begun shifting work to independent contractors, subcontractors, and temporary workers as a way to reduce cost and liability. As an ad for the temporary staffing agency Kelly Services put it in 1971:

Never takes a vacation or holiday.
Never asks for a raise.
Never costs you a dime for slack time.
(When the workload drops, you drop her.)
Never has a cold, slipped disc or loose tooth.
(Not on your time anyway!)
Never costs you for unemployment taxes and social
security payments.
(None of the paperwork, either!)
Never costs you for fringe benefits.
(They add up to 30% of every payroll dollar.)
Never fails to please.
(If your Kelly girl employee doesn't work out, you
don't pay.)

The vaunted forefathers of the internet were a clever lot of schemers whose transgressions were forgiven, per American custom, once they got rich. Consider the career of Vinton G. Cerf, who developed the internet packet protocols still used today. In grad school at the University of California, Los Angeles, in the late 1960s, an old high school pal got Cerf involved with a Pentagon-funded project called ARPANET, the precursor of today's internet. Cerf began following the money into the private sector as early as 1982, when MCI Communications hired him to lobby his former public sector colleagues to allow the company unprecedented access to the publicly owned internet, giving it a jump on all potential competitors. Until then, the internet was reserved for "academic and research activities." Commercial use was forbidden. Over time, the military ceded control of the internet to the National Science Foundation, where networking division director Stephen S. Wolff was bent on privatization.

Wolff oversaw "a backroom deal" that effectively gave managerial control of the internet to a corporate consortium dominated by MCI and IBM (where Cerf had also worked). Wolff's gift of invaluable public property to private interests was his own unilateral decision, made without consulting anyone. Later, the federal Office of the Inspector General found that the early privatization process presented clear conflicts of interest and that Wolff's NSF department made "no effort whatever to seek competition." Investigators complained that a "lack of documentation" forced them to "reconstruct the reasoning behind the decision from interviews," which predictably led to "inaccuracies." Wolff craftily defended his cloak-and-dagger approach as an effort to prevent the abuse of federal open records laws. Not long after, Wolff followed Cerf into the private sector and joined San Jose-based Cisco Systems, a \$49 billion hardware company that remains the world's largest provider of internet infrastructure.

No politician or other official was ever sanctioned for this plunder of public assets. The propriety of the matter was rendered moot by the presidential administration of Bill Clinton and Al Gore, two great friends of the telecom industry who led the political campaign to cement internet privatization as the law of the land. While still in government, Wolff scoffed at warnings that his policies would enable a powerful new set of monopoly corporations.

"Might telcos become dominant? Of course there is such a danger. But remember, if they employ illegal means of increasing market share, we have laws against anticompetitive behavior. I doubt that they would do something questionable and walk away unchallenged."

In America? In Silicon Valley? Never!

Some things hadn't changed since he first arrived in the Valley. It ran on the same old mix of government-subsidized research, cheap labor, and a regulatory outlook inherited from the Ronald Reagan era that permitted corporations to unload the costs of doing business on customers, employees, governments, and the ecosystem.

An individual who evaluated tech company investments for a large pension fund explains his employers' mentality: It didn't matter whether a new technology actually worked. What mattered was that other investors thought it could work. If they did, their confidence would cause the company's value to increase regardless of its actual merit. Everything is sales. The trick was knowing when to buy shares and when to unload them. That was why it helped to have inside information.

With the arrival of Uber and 'Uber for X' startups, an inherent conflict emerged. On one hand, these companies wanted to develop a reputation for providing great service, so that customers would begin to rely on them. On the other, their lawyers advised them that providing independent contractors with training, uniforms, benefits, or regular work shifts—that is, the things that produce happy, well-trained employees—could put the companies at risk of being sued for misclassifying employees as independent contractors. Gig economy companies were in a pickle. They wanted to provide good service, but also to avoid accusations that they were treating their independent contractors like employees. Not training workers or setting expectations at all would lead to inconsistent service. And scheduling them to serve the same customers every week, motivating them with good benefits, and coaching them on how to improve, put the companies at risk of lawsuits which could force them to make an expensive shift to employees.

“Those bright blue roller bags stacked at the back of the room? They had everything cleaners needed to get started, including a vacuum cleaner and a mop. But their cost—\$150—would be deducted from checks, which meant working five jobs at the starting rate for free (a spokesperson for the company told me it has since stopped this practice). Carol did what she could to keep the conversation about supplies in independent contractor territory: ‘These are optional to take; this is your business, you are responsible for supplies.’ Along with cleaning supplies, the bag held branded blue marketing materials, including cards cleaners could leave behind with their names on them, a checklist of tasks completed, and, Carol's favorite, branded stickers to put on the toilet paper after cleaners folded the ends

into triangles. Not only would the startup get its cleaners to distribute marketing materials throughout houses, it would also get them to purchase those marketing materials.”

‘Uber for X’ startups quickly became synonymous with the on-demand economy. Thanks to Uber’s business model, city dwellers who were merely wealthy, and not disgustingly rich, could for the first time have every need filled at the push of a button. Startups would summon independent workers to deliver meals, shop for groceries, do laundry, or even park cars for just a small fee. In the new world of on-demand everything you’re either pampered, isolated royalty—or you’re a twenty-first-century servant.

“When you’re falling straight down the financial cliff face, you reach out to grab hold of anything available to stop your descent and there, just before you land in a homeless shelter or move in with your sister, is Uber. I think of Uber as a modern-day version of the Works Progress Administration during the Depression. Thanks to Uber, I am not poor. I am just nobody.”

Amazon has come up with a nifty device for casual employment called “the Mechanical Turk,” in which tasks that can’t be done by computers are tossed to the reserve army of the millions, who receive pennies for their trouble. This is a good introduction to the so-called sharing economy—‘sharing’ because you’re using your own car or apartment or computer, not your employer’s—which was one of the few robustly growing employment opportunities of the Obama years and beyond. The magic derives from the way just about anyone can sign up at one of these sharing companies and work as a sort of temp, only hooked up with the client and employer via software, which makes it all digital and innovative and convenient.

In nearly every other way, however, the sharing economy is one of the most lopsided, antiworker employment schemes to come down the pike in many years. The costs and risks associated with this industry—insurance, owning a car, saving for sickness and retirement—are all loaded onto the shoulders of the worker, and yet the innovator back in California who has written the software still helps himself to a large cut of whatever the proceeds of your labor happen to be. It is ‘every man for himself’ as a national employment strategy.

Before the Internet, it would be really difficult to find someone, sit them down for ten minutes and get them to work for you, and then fire them after those ten minutes. But with technology, you can actually find them, pay them the tiny amount of money, and then get rid of them when you don’t need them anymore.

Amazon updates the practices of Walmart, for example, while Google has dusted off corporate behavior from the days of the Robber Barons. What Uber does has been compared to the every-man-for-himself hiring procedures of the pre-union shipping docks, while TaskRabbit is just a modern and even more flexible version of the old familiar temp agency. Together, all these developments are the logical culmination of a process that began fifty years ago when corporations began turning over full-time jobs to temporary workers, independent contractors, freelancers, and consultants. This is atavism, not innovation. It has not reversed the trends of the last fifty years; it has accelerated them. And if we keep going in this direction, it will one day reduce all of us to day laborers, standing around like the guys outside the local hardware store, hoping for work.

They fancied themselves budding entrepreneurs, but they were chiefly migrant laborers with MacBook Pros.

Elon's Erection

Technology grants opportunity, but not ethics.

The Rod from God—basically, you get a heavy hunk of metal and throw it from space at an enemy. Given its weight, height, and whatever speed boost you can give it, a simple metal rod could do as much damage as a nuclear bomb. Right now, the only people who go to space are ultraqualified supernerds—the sort of people who pass psychological tests and are willing to spend decades training for a chance to get a few months in space. And even then we know of at least one of them tossing on a diaper and going on a non-stop, rage-fueled road trip. If space becomes more generally populated, we could be putting ourselves in a dangerous position.

“If you’re planning to ship stuff back to Earth, the ideal place for a space base is somewhere with high resources and low gravity. Consider, for example, Phobos, one of the moons of Mars. Phobos is very small, so its escape velocity is a mere 25 miles per hour. This means you could set up a ramp on Phobos, drive a motorcycle up it, and fly off into space. Earth’s own moon has an escape velocity that’s about 200 times greater than Phobos’s. The result is that, in energy terms, it costs less to send a package from Phobos to Earth than from Earth’s moon to Earth. Asteroids are even better. A typical big asteroid has an escape velocity of about half a mile per hour. This means that if you succeed in creating an asteroid mining base, you can pitch refined asteroid contents back to Earth at very low cost.”

Consider that collectively, the populace appears to believe that not only is it possible to colonize another planet, but that we will do so in the not-so-distant future. This is incredible considering the massive odds of and colossal barriers to such an endeavour succeeding. Thus, it is alarming, that this same populace appears to believe it is not possible to create new societies where necessity is detached from want (superfluous consumer goods). This begs the question—have we been fully conditioned to believe only those that represent hegemonic interests? It is a sound question considering the billionaires of the world are currently petrified of the capitalist system collapsing—while those oppressed by the capitalist system believe it cannot be dismantled. Yet we can dismantle institutions. We can dismantle the capitalist economic system devouring what remains of the natural world—but not if we identify with our oppressors and the very system that enslaves us.

“The important thing is not which new technology will work but simply that some new technology be found. There’s an argument that our civilization can continue to exist with the present number of people and the present kind of high technology through conservation. I see that argument as similar to a man being locked in a sealed room with a limited amount of oxygen. And if he breathes more slowly, he’ll be able to live longer, but what he really needs is to get out of the room. And I want to get out of the room.”

To know is not to watch and to think is not to forget.

So, when this creepy infantilism that costs us dearly rises—we are going to move to Mars, fly to Mars, colonize Mars, remake Earth on Mars, market Mars, dream of Mars, immigrate to Mars—the mere positing of this racist, elitist, Brave-New-World bullshit eats at our collective soul, from the child wanting to go into science, to the NASA superstar, to the billionaires, to the celebrities and politicians, to the media, to the consumer of Hollywood crap.

If our descendants will bestride the stars, it would follow that you and I bestride the planet today. How’s that working out for you, dear reader? As you trudge from one part-time, minimum-wage, no-benefits job to another, or fill whatever other role you happen to have in a society that increasingly treats you as a disposable asset for corporations to exploit; as you cope with decaying infrastructure, collapsing public health, a political system caught in permanent gridlock, and mass media that seems to take each new day as a challenge to top the breathtaking dishonesty of the day before; as you watch, one after another, each year’s grandiose predictions of the allegedly inevitable benefits of progress land with a deafening flop—does the thought of your supposed mastery over the Earth fill you with a sense of meaning, purpose, and grandeur?

That question, of course, traces out the chasm that’s widening right now between the old dream of perpetual progress and the billions of us who live in the world that progress has made. Has the pursuit of technological progress brought benefits? Of course it has, but it’s also brought a bumper crop of burdens, costs, and problems. In a good many cases, the downsides of new technologies outweigh their benefits, and of course neither of these are equally distributed—the well-to-do minority get the lion’s share of the benefits, while the poor majority has to carry nearly all the costs. For the comfortable and the sheltered—who never stray outside the bubble of their privilege—it’s easy to insist that all is for the best in this best of all possible

worlds; in the increasingly mean streets outside that bubble, that illusion doesn't last long.

Are you people serious about this? I think we are doing worse than ever. Never have we been more efficient at putting stones into our own way. The doing better you experience is at the cost of those who are more unfortunate than ever: the middle-class in the US is dying, Europe is a big clusterfuck and the immigration is not making things easier, China has built its success on the cost of the less fortunate two-thirds of the population, we have more slaves than ever. Sure the 1% has never had a more easy life than right now but I find it atrocious to say that we are doing better than ever.

Also our "most peaceful moment in history" is quite ironic considering that we never have committed ecocide more efficiently than today. I know that we aren't in war as often and intensive as we used to. but the war against our planet as a whole ecosystem has never been more systematic than now, killing species after species faster than ever before. And what still nobody has been able to explain to me: what are we supposed to do exactly on Mars and in space that is more awesome than on earth? Having fun with friends? Hiking on mountains? Drinking well-aged whiskey? Kicking around red rocks?

"Guess what the best planet is in this solar system? It's easy to know the answer to that question. We've sent robotic probes like this one to all of the planets in our solar system. Now, some of them have been fly-bys, but we've examined them all. Earth is the best planet. It is not close. This one is really good."

Bezos then went on to discuss his plan to ship humans off of the best planet in the solar system and send them to live in floating cylinders in space. Bezos claimed that the growing human population and growing energy consumption will force us to make a choice between "stasis and rationing" and "dynamism and growth," and claimed that the latter item in his dichotomy is possible only by moving humans off the planet.

"If we're out in the solar system, we can have a trillion humans in the solar system, which means we'd have a thousand Mozarts and a thousand Einsteins. This would be an incredible civilization. What would this future look like? Where would a trillion humans live? Well it's very interesting, someone named Gerry O'Neill, a physics professor, looked at this question very carefully and he asked a very precise question that nobody had ever asked before, and it was, 'Is a planetary surface the best

place for humans to expand into the solar system?’ And he and his students set to work on answering that question, and they came to a very surprising—for them—counter-intuitive answer: No.”

Of course, perhaps we could have more “Mozarts and Einsteins” if people simply weren’t forced to slave away in shitholes like your fulfillment centers, Jeff. Bezos went on to describe how the limited surface areas, distance, and gravitational forces of the other planets in our solar system make settling on those planets impractical and cost-prohibitive, while constructing giant space cylinders closer to Earth which can hold a million people is far more practical. These cylinders would spin to replicate Earth’s gravitational pull with centrifugal force. Feel free to go look up some pictures of these things, we’ll wait.

“These are really pleasant places to live. Some of these O’Neill colonies might choose to replicate Earth cities. They might pick historical cities and mimic them in some way. There’d be whole new types of architecture. These are ideal climates. These are short-sleeve environments. This is Maui on its best day, no rain, no storms, no earthquakes.”

No rain? No weather? Just big, spinning cylinders floating monotonously in space? A trillion divided by a million is one-million, which means that the best idea the richest man in the world can come up with for the future of our species is to fill our solar system with a million of these floating homogenized space malls.

“If we build this vision, these O’Neill colonies, where does it take us? What does it mean for Earth? Earth ends up zoned residential and light industry. It’ll be a beautiful place to live, it’ll be a beautiful place to visit, it’ll be a beautiful place to go to college, and to do some light industry. But heavy industry, polluting industry, all the things that are damaging our planet, those will be done off Earth. We get to have both. We get to keep this unique gem of a planet, which is completely irreplaceable—there is no Plan B. We have to save this planet. And we shouldn’t give up a future of our grandchildren’s grandchildren of dynamism and growth. We can have both.”

Now, if you look at the behavior of Jeff Bezos, who exploits his employees and destroys his competitors, and who some experts say is trying to take over

the underlying infrastructure of our entire economy—and the media- and expert-induced panic over the Wuhan Flu is certainly helping this goal—you can feel reasonably confident that this man has no intention of leaving “this unique gem of a planet,” nor of having the heirs to his empire leave either. When you see this Pentagon advisory board member and CIA contractor planning to ship humans off the Earth’s surface so the planet can thrive, you may be certain that he’s talking about other humans. The unworthy ones. The ones who weren’t sociopathic enough to climb the capitalist ladder by stepping on the backs of everyone else.

And make no mistake, when Bezos talks about saving the planet for “our grandchildren’s grandchildren,” he’s not just talking about his heirs, he’s talking about himself. Bezos has invested large amounts of wealth in biotech aimed at reversing the aging process and cracking the secret of immortality. This is the sort of guiding wisdom that is controlling the fate of our species everyone. The world’s most ambitious plutocrat envisions a world in which, rather than evolving beyond our destructive tendencies and learning to live in collaboration with each other and our environment, we are simply shipped off into space so that he can stretch out and enjoy our beautiful planet. That’s his best idea.

Our plutocratic overlords aren’t just sociopaths. They’re morons. I mean, damn, some of them really think they’ll be able to upload their brains into computers. First of all, how stupid do you have to be to overlook the fact that science has virtually no understanding of consciousness and doesn’t even really know what it is? Even if these idiots find a way to upload their neurological patternings onto some AI’s virtual simulation, it’s not like they’d be there to experience it. It would just be a bunch of data running in a computer somewhere, mimicking the personality of a dead person and experienced by no one. People who believe that all there is to them is their dopey mental patterns have not spent any time whatsoever exploring what they are, and have no idea what it is to be human. The fact that anyone would think they could become immortal by digitizing their churning, repetitive personality patterns is crazy, and the fact that they’d want to is even crazier.

People who think this way should shut up and learn about life, not rule the world in a plutocratic system where money translates directly to political influence. People who think that humans can be happily unplugged from the ecosystemic context in which they evolved, the ecosystemic context of which they are an inseparable part, and people who think they can become immortal by uploading their personalities onto a computer, should shut the fuck up, spend some time alone with themselves, maybe try some magic mushrooms, and learn a bit about what it means to be human. They

certainly shouldn't be calling the shots.

Earth is our home. It's what we're made for. Earth went through a lot to give you life. Sparks had to catch, oceans had to freeze, billions of cells had to survive endless disease, all of these amazing things had to happen just right to give you life. You belong here. You are as much a creation of Earth as the air you breathe. You may feel like a singular organism but you're actually as much a singular organism as one of the many billions of organisms that make up your body. You and Earth are one. And because you evolved on Earth, you are perfectly adapted to Earth and it is perfectly adapted to you. It yearns for your breath as you yearn for its breeze on your face.

We absolutely have the ability to transcend our unhealthy tendencies as a species, which, when you really look at them, are merely creations of a mind that feels alone and separate and like it is in a constant fight for its life. If we just put down our mental swords for a hot second and learned to channel our creativity into the thriving of our society and our ecosystem instead of into killing and out-competing one another then we will be okay. The way out of this is the way towards health.

People lament the lack of jobs due to AI and automation but we actually desperately need people to do less. We need a whole lot of people doing nothing, not using the roads every morning and evening, not producing widgets that no one needs and creating advertising campaigns to brainwash people into buying them anyway, just to have them end up in the ocean or leaching heavy metals into the earth. Having a whole lot of people doing nothing for more of their week would take the strain off of our health systems as the single biggest factor in disease is stress. Studies show that stress also shrinks your brain and lessens your creativity and innovation too, so all the punitive-minded libertarians out there who are worried that we won't progress as a species if we start sharing resources around to people who aren't doing things that traditionally made money because we'll be too relaxed can chill too. We don't need to crack the whip to get people to make beautiful innovations. Humans are at their best when feeling playful and relaxed. Nearly all the technological advances of the past came from people who had a lot of leisure time due to their privileged status. Releasing humans from 9-to-5 slavery would be the fastest way to slow our resource consumption and take pressure off of all our systems and would have the added benefit of making us smarter, funnier, more creative and more innovative too.

And for that matter, having every idea and innovation be required to make money is also killing us. We need the ability to fund things that will not make profit. How many times have you been in a conversation and someone's come up with an idea that will solve a major environmental, energy, or

health problem and no one's got excited because it will never get off the ground because it will never make money? Fully disappearing a problem never made anyone any money. Healthy people, for example, never spend a dime at the doctors. The way out of this is detaching human innovation from money and allowing solutions to flourish without the imposition of also having to turn a profit.

The only issue we have as humans is that a handful of highly competitive, highly sociopathic, and yet incredibly mediocre people have all the power to build our future for us with virtually no input from anyone else. Because all the power in the form of all the money has been allowed to pool into the hands of those most willing to do whatever it takes to get it, we have just a few ruthless yet surprisingly dumb individuals calling the shots on the future of all living beings. The competitive mindset that gave rise to Jeff Bezos is the exact opposite of the kind of collaborative, harmonious mindset we'll need if we're going to overcome the challenges we face on the horizon.

We cannot continue using arguments of convenience. Capitalism is also bad in moments of expansion and wealth; capitalist technology is also bad when it works well and doesn't provoke any specific disaster. The only path of discursive attack we have left is a direct confrontation with the Christian spirituality that science as well as socialism inherited: the world, the universe, does not exist for our exploitation. There is no rationalist argument—not even within the parameters of liberalism's most radical current, veganism—against the mining of the moon. It will not harm any human being or other animal, and according to rationalism, everything else is dead matter.

The only solid arguments against capitalism's new atrocities are spiritual. They hold that the Earth is our mother and that we should adapt ourselves to the natural world rather than molding it according to our arrogant caprices; that filling the Earth or the Moon with holes in search of the latest valuable mineral is as unforgivable as massacring an entire people. Those who made use of scientific arguments to justify genocide, slavery, mining, and clear-cutting entire forests are the same—and their institutions are the same—as the ones who today are celebrating the imminent conquest of the moon and Mars. And the technologies that will take us there were developed by the Nazis in the course of the very same Holocaust that liberalism so hypocritically rejects, without ever rejecting its fruits.

We have rendered homage to humanism for so long that we can no longer raise our voices in protest when faced with an atrocity that lacks human victims. But not even the contemptible people who think it is not wrong per se to mine the moon can deny that any introduction of new resources into the capitalist machinery will hasten the processes that are building us

a prison society here on Earth.

The choice is between ecocentrism and totalitarianism.

We can have that good world when a Somali's life matters as much as an American's and when a both a billionaire and a poor person receive quality health care. We can have a good world when the possibility of a species extinction is considered, and treated as an emergency if due to human actions. We can have a good life when we look at the human footprint in the world and we don't allow it to destroy multiple other species. We can have a good world when we make sure everyone gets fed, everyone has a decent set of material goods, and everyone is free to do more or less as they choose, so long as their actions are less harmful than the good they do, and don't lead to the foreseeable and preventable suffering and death of others.

It is insane that we are worried about AI and robotics, for example: The idea that machines might be able to do the work that humans do should fill us with joy. It's insane that we cannot imagine a world in which humans do not have to do mostly meaningless drudge work to survive. That we cannot figure out how to distribute resources to people without making them spend the better part of their waking adult lives doing shit they'd rather not do. If you'd win the lottery and keep your job, congrats, you are the exception. Most people would not.

The right thing to do is generally the right thing to do. It is the great tragedy of the human race that we don't believe that being kind and not hurting other people—or preventing suffering and enabling people to do what they will so they hurt none, and not being mass murderers of other species—is in our self-interest.

It is precisely in our self interest—it is the only way we will ever create a world that is really good to live in for the vast majority of the world's residents.

Powering Our Fantasies

“I want to live my life exactly as I have been, changing nothing but the fact that my power is now clean, renewable.”

This is pure fantasy, a dream, unrealistic. If this is what we are waiting for, then we will be waiting for quite some time, likely more time than we have available to us given growing inequality and environmental damage.

All environmental victories are temporary, while each defeat is a permanent loss. The opposite could be said of corporate sustainability claims: Corporations want everlasting credit for their investments in nature, but for their failures to be instantly forgotten.

The twenty-first century will be defined by how civilization reconciles its powerful hunger for energy with the toll taken on the planet’s basic equilibrium.

Utilities used to talk to one another. No one ever made money off of anybody else’s customer base and so grid instability in any one region could serve as an object lesson for utilities dealing with the same issues in their own locales. Since 2000, however, not only is there far more information pouring into utility databases—a product of the widespread introduction of computerization at many points in the system, of which digital “smart” meters are the most infamous—but that information is treated as proprietary. Electricity trading, in this way, fails to be laissez-faire capitalism because nobody quite has access to the information necessary to make real-time decisions about how to manage their systems, and thus also their capital. Not even, oddly, the utilities themselves, since they now have so much information to contend with that most of it sits unprocessed in giant servers called “historians.” Big data has become just another modern way to use up electricity.

Beginning in the early 1900s utilities made decisions about how electricity was generated and how it moved on their slice of the grid—information they freely shared among themselves. Now they neither make these decisions nor share information about them. Historically, utilities made money when people used electricity; the more we used the more money they made. Now they don’t. Today’s utilities make money by transporting power and by trading it as a commodity. While they are still charged with keeping America’s power supply reliable, they have a real incentive to sell electricity to whomever will pay the most for it, wherever they may be. Long-distance wheeling is to their benefit; it is to the plant owners’ benefit; it is to the energy traders’ benefit; in theory, at least, it is also to our benefit. In fact, the only thing that really suffers from this arrangement is the grid.

Because the electricity we depend so heavily upon cannot be separated from its infrastructure, we cannot reform our energy system without also transforming our grid. There can be no electric power without all the machines and wires that make it, make it safe, and translate it across great distances into our lightbulbs, toasters, servers, and air-conditioning machines. We also have to pay for this system, something that renewables have complicated as they mix up producers with consumers in entirely new ways. And, because it's America, the whole shebang needs to convey a profit into somebody's pocket. Almost all the big utilities are investor-owned, which means they have shareholders who have been promised at least the occasional dividend. Corners get cut in order to ensure that this flow of cash continues apace, and decisions get made with profit motives in mind that brook little concern for the particular capacities, and limitations, of the grid. We may imagine the grid as primarily a machine to make and move electricity, but integral from the very start was that it also make and move vast quantities of money. A lot of people are still happy with this way of doing things.

We got a national grid with power plants far from view, long loping lines between us and them and, nearer at hand, distribution networks strung through neighborhoods, that link individual houses by means of pole-top transformers to the system as a whole. That this is how electricity works in America and pretty much everywhere else in the industrial world is not the logical outcome of physics, it's the product of cultural values, historical exigencies, governmental biases, and the big money dreams of financiers.

In the early days of electrification, any sense of power as a common good was not how electricity was made or marketed. It was by definition an elite product, not for everybody but for those who could afford it. This was not simply because electricity hadn't yet spread to the masses, but because the masses were not considered a market worth reaching until later in our nation's history. Some even argue that it wasn't until after the Great Depression that the notion that one could make money by selling lots of cheap things to lots of relatively poor people made any inroads at all. Most, however, agree that the idea of a "mass market" or "consumer culture" came about in part because utility company entrepreneurs needed new ways to make a profit from electricity. GE (originally Edison General Electric) started out as a power company; it was only with time that it became an appliance company, renting, and then later selling, people stuff that needed to be plugged in to work. Money was made twice over, first with the sale of the refrigerator and second with the ongoing sale of electric power necessary to make it run.

This shift in vision involved both imagining a whole new set of demands,

beyond lighting for elites, for which electricity might be used, and seeing a whole new population—everyone—as a potential market. Not elite light but popular light, popular heat, and popular power. In other words, the notion of consumer or mass culture, in which all people are promised access to all things, was in part the result of the universalization of electricity and not the other way around.

The most important thing about a monopoly or other organization of companies that colludes to fix prices is that the price of a good or service need not be related to the cost of producing it. A farmer with grain to sell also needs to transport and store it. He either pays what the elevator cartel is asking or his grain rots and he loses everything. Or, if he is slightly better off, he can build a silo of his own. For that, he needs steel; he pays the price the steel mill is asking, or he doesn't use that metal in his construction. A customer's choice is limited to paying the price on offer, regardless of how arbitrary or exorbitant, or not partaking of that particular good or service and thus courting his own ruin.

Unlike the trusts held by Standard Oil or US Steel that attempted to control the entire US market, there were many electric companies—they simply never overlapped. In this way, the term 'monopoly' took on a very particular meaning when speaking of power projects; despite the fact that there were numerous players in the market, there was no competition between them because the market itself had been divided into quadrants, the borders of each enforced by a political apparatus designed largely for that purpose. In this the utilities bore a certain resemblance to modern-day street gangs whose territorial agreements, hashed out albeit with submachine guns rather than governmental subcommittees, sport a similar structure. One simply doesn't offer one's product in territory claimed by someone else. Prices are fixed by the provider and the structures of power in place brook no complaint. This will of course sound familiar to anyone attempting to get cable or internet access outside a major metropolitan area.

PG&E—the company that burned Paradise, CA to the ground—sponsored a ballot measure that would change California law to require a yes vote by two thirds of all the residents in a community in order for that community to “aggregate” and then defect from their existing utility. The wording is important. PG&E's measure sponsored not a two-thirds majority of the votes actually cast in an election—already a difficult task—but a two-thirds majority reckoned in terms of the total population of an aggregating area. Given that voter turnout in the United States rarely tops 60 percent, even in hotly contested races, the success of this ballot measure would have virtually ensured that no community in the state would ever manage to gather the necessary votes to secede from their utility. The right would have

remained but the means of realizing that right rendered unattainable.

Though environmentalism grew in force and impact with Love Canal and similar “Superfund” sites, the partial meltdown of one of the nuclear power plants at Three Mile Island in 1979 shifted the tide for good. This event seemed to prove to nuclear power’s naysayers that they had been right all along. Nuclear was a no less poisonous way to make electricity than was coal that blackened lungs and smudged pores, and oil that was uncontrollable because of its origins on the far side of the planet. More than this, each mess, from DDT to acid rain, seemed to further convince a generation already angered and radicalized by the excesses of the Vietnam War that without an abiding wide-scale commitment to fundamental change disaster did indeed loom for America—and maybe, some suspected, we even deserved it.

By the late 1970s the problem was not so much awareness of what was going wrong, but rather how to change any of it. The systems in place that made smog, lakes of industrial pollutants, sweet light crude, and war had been hardening, in some cases to the point of total calcification, since the earliest years of industrial consolidation. In this the electricity business was no different: there was no way for regular people developing a new environmental consciousness to have a say in how power was made, from what, and with what after-effects except through protesting or opting out. Many Americans did both. Protests around nuclear power stations blossomed throughout the late 1960s and into the 1970s as thousands camped out around these power factories whenever they were due to open. Many more people were dissatisfied without taking to streets or going off the grid entirely. The drop in electricity consumption nationally was one sign of this discontent. Even people who couldn’t afford to “turn on, tune in, and drop out” could follow the “Cardigan Path,” and so they did.

“The energy that runs America is brittle—easily shattered by accident or malice. That fragility frustrates the efforts of our Armed Forces to defend a nation that literally can be turned off by a handful of people. It poses, indeed, a grave and growing threat to national security, life, and liberty. This danger comes not from hostile ideology but from misapplied technology. It is not a threat imposed on us by enemies abroad. It is a threat we have heedlessly—and needlessly—imposed on ourselves. Our reliance on these delicately poised energy systems, has unwittingly put at risk our whole way of life. The power outages that occur regularly in the United States regardless of their cause—whether big storms or changing legislation or computer bugs or terrorist

hackers or revolutionary saboteurs—are a natural and utterly predictable side effect of having such a big, centralized electrical grid. The size, complexity, pattern, and control structure of these electrical machines, rotating in exact synchrony across half a continent, and strung together by an easily severed network of aerial arteries whose failure is instantly disruptive make them inherently vulnerable to large-scale failures.”

In the United States today the greatest threat to the security and reliability of our electrical infrastructure is foliage. Trees most especially, though kudzu and its ilk are troublesome creepers in their own right. Politicians may talk a lot, and utility managers may worry a lot, about how terrorists might hack into, shoot up, or bomb various bits of our grid in order to bring the United States to her knees. And yet the trees constitute a far more significant threat to the security and reliability of our national electric infrastructure—and of course to people, pets, and other beings who don’t wish to burn to death so that someone else can profit.

In Oklahoma there have been reports of a great horned owl dropping snakes onto utility poles, thereby causing frequent power outages. In 2011, a stretch of high-voltage lines outside Missoula, Montana, were shorted out by the carcass of a deer freshly killed by a juvenile bald eagle, who then picked it up and attempted to fly away only to discover (much to his chagrin) that a deer is too heavy for an eagle to carry. Down that deer came, accompanied by a hail of sparks, and once again, the power was out.

Rather than attempting the impossible feat of perfect control grounded in perfect information, complex industrial undertakings have for decades been veering toward another model for avoiding serious disaster. This would also seem to be the right approach for the grid, as its premise is that imperfect knowledge should not impede safe, steady functioning. The so-called Swiss Cheese Model of Industrial Accidents assumes glitches all over the place, tiny little failures or unpredicted oddities as a normal side effect of complexity. Rather than trying to “know and control,” systems designers attempt to build, manage, and regulate complexity in such a way that small things are significantly impeded on their path to becoming catastrophically massive things. Three trees and a bug shouldn’t black out half the country. Or, to put it differently, one doesn’t try to eliminate the holes in the Swiss cheese—by compacting all cheese into cheddar, for example—but rather to keep the holes in the cheese from lining up, from becoming one big hole that runs through the entirety of the loaf. The holes will be there—trees will be too tall, budgets will be tampered with, regulators will be put off, computer

bugs will worm their way in—but they won't snowball into total systems collapse. That's the theory anyway.

Solar power's image as the province of baling-wire hippies is at odds with reality. Today's multibillion-dollar photovoltaic industry owes its existence mainly to the Pentagon and Big Oil. The first wide-scale use of solar panels had come in the 1960s: powering military satellites, which couldn't use fossil fuels (too bulky to lift into space) or batteries (impossible to recharge in orbit). By the 1970s photovoltaics were cheaper, but the industry had acquired only one major new user: the petroleum industry. Some 70 percent of the solar modules sold in the United States were bought to run offshore drilling platforms. Realizing that solar had become essential to oil production, petroleum firms set up their own photovoltaic subsidiaries. Exxon became, in 1973, the first commercial manufacturer of solar panels; the second, a year later, was a joint venture with the oil giant Mobil.

“Richter's dream was to be locked in a building alone where he could pursue arc-fusion to his heart's content, and Perón's vision was to lock a German in a building until he could place Argentina at the front of the nuclear power quest.”

Fusion at the experimental level is not particularly difficult to achieve. In August 1971, *Scientific American* encouraged many a talented student to go nuclear by publishing plans for building a Van de Graaff accelerator for producing tritium and neutrons with a deuterium-deuterium (D-D) fusion. Although it is far less efficient than the D-T fusion, one doesn't have to own a tritium source to make it work.

The amateur scientist was encouraged to make his own radioactive sources by bombarding various materials with neutrons generated in his home-built “machine to produce low-energy protons and deuterons.” As an after-message, the article encourages the experimenter to stay out of the way of the “x-rays of substantial intensity,” shield the apparatus with a double layer of solid, 18-inch-thick concrete blocks and boxes of paraffin surrounding the stationary target, wear a dosimeter and a film badge, and keep a Geiger counter turned on. Back in '71, amateur science ran wild and free. These days, such acts would likely get you caught by some ultra-classified hyperspectral analyzer—either floating around in space or on some kind of blimp, drone, et cetera—resulting in a no-knock, three-letter-agency raid ending in the death of any dogs you may have and an all-expenses-paid trip to a windowless box.

Fusion at the center of the Sun is so unlikely, the power density is only 7.85 watts per cubic foot. To put this in perspective, that level of power

density describes the metabolism of a reptile. A large box turtle, awake, generates about as much heat as a like volume of tightly compressed plasma at the center of the Sun. The only reason the Sun gets hot enough to glow is that it is so big. An active compost heap the size of the Sun would generate as much power, and it would warm the Earth just as surely. Generating electricity by fusion in a large concrete building on Earth will therefore not be emulating the Sun. A fusion power reactor will have to establish conditions of pressure and temperature that are orders of magnitude greater than exist in the Sun, and a simple proton-proton fusion scheme, which has the least probability of fusing, has no hope of success. The fusion reaction with the highest probability (5.0 barns), is the one achieved in 1932, the deuterium-tritium reaction. The next best, at 1.2 barns, is the proton-boron-11 reaction, and the deuterium-deuterium fusion is down on the list, at a maximum 0.11 barns. A reliable deuterium-tritium fusion will occur at temperatures over one-billion degrees Kelvin, which is sixty-four times hotter than the center of the Sun.

“A report from the National Renewable Energy Laboratory (NREL) holds that we are already capable, with existing technology, of making 80 percent of American power from renewable sources.”

People can lower their collective and individual use of electricity down to what the various environmentally tolerable and bearable sources can supply. If they don't want to do that sooner, then they can just let the eventual collapse of civilization do it for them later. The insistence on using into the future the quantities of electricity to which people have become accustomed in the present is an infantile insistence. It will be denied by nature. People can either grow up or die. Believe it now or believe it later.

To be distinguished from recession, degrowth means a phase of planned and equitable economic contraction in the richest nations, eventually reaching a steady state that operates within Earth's biophysical limits.

At this point, mainstream economists will accuse degrowth advocates of misunderstanding the potential of technology, markets, and efficiency gains to “decouple” economic growth from environmental impact. But there is no misunderstanding here. Everyone knows that we could produce and consume more efficiently than we do today. The problem is that efficiency without sufficiency is lost.

Despite decades of extraordinary technological advancement and huge efficiency improvements, the energy and resource demands of the global economy are still increasing. This is because within a growth-orientated

economy, efficiency gains tend to be reinvested in more consumption and more growth, rather than in reducing impact.

This is the defining, critical flaw in growth economics: the false assumption that all economies across the globe can continue growing while radically reducing environmental impact to a sustainable level. The extent of decoupling required is simply too great. As we try unsuccessfully to “green” capitalism, we see the face of Gaia vanishing.

The very lifestyles that were once considered the definition of success are now proving to be our greatest failure. Attempting to universalize affluence would be catastrophic. There is absolutely no way that today’s 7+ billion people could live the Western way of life, let alone the 11 billion expected in the future. Genuine progress now lies beyond growth. Tinkering around the edges of capitalism will not cut it.

Seems to me that we are increasingly likely, and apparently destined, to share a common end as a species, while the very few live large at the horrible expense of the people who might hope to live decent, moderate lives, eating only to their reasonable hunger and drinking only to their necessary thirst, through present and future iterations of “progress.”

These are the basic concepts of Degrowth:

- Consumerism is psychological/spiritual junk food that actively reduces well-being rather than increases it.
- Better rather than more: well-being is increased by everything that cannot be commoditized by a market economy or financialized by a cartel-state financial machine—friendship, family, community, self-cultivation. The goal of economic and social growth should be better, not more. On a national scale, the cancerous-growth measured by gross domestic product (GDP) should be replaced with a measure that is more equitable and sustainable.
- A recognition that resources are not infinite, despite claims to the contrary. Indeed, all the evidence suggests that access to cheap energy only speeds up the depletion and despoliation of every other resource.
- The unsustainability of consumerist “growth” that’s dependent on resource depletion funded by financialization—for example the endless expansion of credit and phantom collateral.
- The diminishing returns on private consumption and “bridges to nowhere” (crony-capitalist public consumption).

- The failure of neoliberal capitalism and communism alike in their pursuit of growth at any cost.

Degrowth is heresy in the religion of progress. The faith that growth equals progress is akin to the Cargo Cult of Keynesianism, the notion that expanding debt exponentially to drive diminishing returns of growth is not only necessary but a moral imperative.

Both the religion of growth and its cargo cult are narratives used to justify the expansion of global finance via financialization. Expanding capital, profits, and power is the key driver, and the religion of growth is merely the public-relations narrative that mesmerizes the debt-serfs, political toadies, and media sycophants.

Does this look like a world with plenty of room for everything to expand? A Degrowth economy must fulfill two requirements:

1. The Degrowth economy must provide a universal basic income to all in addition to paid-work livelihoods and opportunities for everyone who wants them.
2. The Degrowth economy must institutionalize a decentralized, democratic, self-organizing process to allocate human, social, resource, and financial capital as an alternative to centralized states/banks and profit-maximizing corporations.

These arise from three key insights:

1. If we don't change the way we create and distribute money, we change nothing.
2. Not everything that is valuable is profitable, and so maximizing profit is not the sole arbiter of 'value,' nor is it a sound process for allocating labor and capital for everything that has value but isn't profitable.
3. Centralization undermines democracy and generates privilege, inequality, insecurity, conflict, and waste by its very nature.

In a petri dish, a colony of bacteria will expand until it runs out of resources and then it will stop. But the bacteria doesn't only stop, it starts to die off rapidly due to poisoning by its own waste products. Anyone who has brewed a batch of beer or wine knows this, the yeast dies when its waste product, alcohol, starts killing it off. Yet there is still sugar (resources) left in the yeasts' environment.

This all will not end well, at least not well for the human species at the rate we are going.

Technological Horrors

In many ways, technological problems are much easier to solve than human ones. It may in fact be why progress has so strongly favored technology throughout most of our modern history.

If there is a problem with a piece of technology, it is always a logical one. It may not be clear except in hindsight, but it is always logical. The computer not turning on is not because it is Jewish and today is a holiday. The server's poor performance is not because it had a rough weekend. The axle did not break because Karen in HR was mean to it at the bar last night.

Due to the fact that AI can never die, can it ever accurately value life or will it be forever limited to what its programmers value? How would we know its alternative decision is actually better? If we were to default to it being correct, are we again not putting ourselves at the mercy of the parameters and biases of the creators at its inception?

We do not need some omnipotent, all-powerful AI. Were we to educate the entirety of our populations—and I mean truly educate, not indoctrinate or propagandize—we would easily find solutions to all our ills. We must cease the focus on machine AIs, which are nothing more than the modern equivalents of gods, and instead focus on the biological being, both human and non-human, and what their immense and diverse capabilities can accomplish for good if directed toward the task.

“Some serious thinkers fear that AI could one day pose an existential threat: a ‘superintelligence’ might pursue goals that prove not to be aligned with the continued existence of humankind.”

The serious thinkers forget the current ruling intelligence on this planet is already doing a good job of not aligning its actions/goals with its continued existence. We might go extinct before we find the secret sauce that crates this mythical super-intelligence. What exists today has no relationship to actual intelligence.

It seemed to me odd, though not especially surprising, that a hypothetical danger arising from a still nonexistent technology would, for these billionaire entrepreneurs, be more worthy of investment than, say, clean water in the developing world or the problem of grotesque income inequality in their own country. It was, of course, a question of return on investment—of time, and money, and effort.

The concerns of existential risk fit into that value metric. If you consider balancing the interests of future people against those who already exist, reducing the probability of a major future catastrophe can be a very high-impact decision. If you succeed in avoiding an event that might wipe out all of future humanity, that clearly exceeds any good you might do for people currently living.

The whole existential risk idea is a narcissistic fantasy of heroism and control—a grandiose delusion, on the part of computer programmers and tech entrepreneurs and other cloistered egomaniacal geeks, that the fate of the species rests in their hands: a ludicrous binary eschatology whereby we would be either destroyed by bad code or saved by good code. The whole thing can seem so childish as to barely be worth thinking about, except as an object lesson in the idiocy of a particular kind of cleverness. But if it all is absolutely, terrifyingly right—that thousands of the world’s smartest people are spending their days using the world’s most sophisticated technology to build something that would destroy us all. It seems, if not quite plausible, on some level intuitively, poetically, mythologically right. This is what we do as a species, after all: we build ingenious devices, and we destroy things.

It’s interesting to speculate about how we’d view the rise of AI if we had a different view of intelligence. Plato believed that philosophers would need to be cajoled into becoming kings, since they naturally prefer contemplation to mastery over men. Other traditions, especially those from the East, see the intelligent person as one who scorns the trappings of power as mere vanity, and who removes him or herself from the trivialities and tribulations of quotidian affairs.

Imagine if such views were widespread: if we all thought that the most intelligent people were not those who claimed the right to rule, but those who went to meditate in remote places, to free themselves of worldly desires; or if the cleverest of all were those who returned to spread peace and enlightenment. Would we still fear robots smarter than ourselves?

Compared to the human brain, machine learning isn’t especially efficient. A child places her finger on the stove, feels pain, and masters for the rest of her life the correlation between the hot metal and her throbbing hand. And she also picks up the word for it: burn. A machine learning program, by contrast, will often require millions or billions of data points to create its statistical models of cause and effect. But for the first time in history, those petabytes of data are now readily available, along with powerful computers to process them. And for many jobs, machine learning proves to be more flexible and nuanced than the traditional programs governed by rules.

Language scientists, for example, spent decades, from the 1960s to the early years of this century, trying to teach computers how to read.

During most of this time, they programmed definitions and grammatical rules into the code. But as any foreign-language student discovers all too quickly, languages teem with exceptions. They have slang and sarcasm. The meaning of certain words changes with time and geography. The complexity of language is a programmer's nightmare. Ultimately, coding it is hopeless. But with the Internet, people across the earth have produced quadrillions of words about our lives and work, our shopping, and our friendships. By doing this, we have unwittingly built the greatest-ever training corpus for natural-language machines. As we turned from paper to e-mail and social networks, machines could study our words, compare them to others, and gather something about their context.

The progress has been fast and dramatic. As late as 2011, Apple underwhelmed most of techdom with its natural-language "personal assistant," Siri. The technology was conversant only in certain areas, and it made laughable mistakes. People found it near useless. But now people are talking to their phones all the time, asking for the weather report, sports scores, or directions. Somewhere between 2008 and 2015, give or take, the linguistic skills of algorithms advanced from pre-K to middle school, and for some applications much higher.

There is a desire for digital slaves which make us the center of the universe. We see this desire manifest itself with rise of on-demand servant services like Uber and TaskRabbit. Digital assistants, AIs, are merely pitched to consumers as the next incarnation of this, finally, a servant for everyone.

Suppose you just had a nasty fight with your boyfriend. The algorithm in charge of your sound system will immediately discern your inner emotional turmoil, and based on what it knows about you personally and about human psychology in general, it will play songs tailored to resonate with your gloom and echo your distress. These particular songs might not work well with other people, but are just perfect for your personality type. After helping you get in touch with the depths of your sadness, the algorithm would then play the one song in the world that is likely to cheer you up—perhaps because your subconscious connects it with a happy childhood memory that even you are not aware of. No human DJ could ever hope to match the skills of such an AI.

The screens make children three magical promises that seem like gifts from the fairies. You will always be heard. You can put your attention wherever you want it to be. And you will never have to be alone. From the youngest age, there is a social media account that will welcome you. From the youngest age, there is a place where you can be an authority, even an authority who can berate and bully. And there is never, ever a moment when you have to quiet yourself and listen only to your inner voice. You

can always find other voices.

Children become drawn in by the three promises, but they may lose out in the end. Why? Because talking to technology, or talking to others through technology, leads children to substitute mere connection for the complexities and nuance of developing conversation. Indeed, many children end up afraid of conversation. In studies of children and technology, when asked “What’s wrong with conversation?” they are able to answer by about age ten. To paraphrase their bottom line, ‘It takes place in real time and you can’t control what you’re going to say.’ They’re right. That’s what is wrong with conversation. And of course, particularly for a child growing up, that’s what is so profoundly right with conversation. Children need practice dealing with other people. With people, practice never leads to perfect. But perfect isn’t the goal. Perfect is the goal only in a simulation. Children become fearful of not being in control in a domain where control is not the point. Beyond this, children use conversations with one another to learn how to have conversations with themselves. For children growing up, the capacity for self-reflection is the bedrock of development.

I worry that the holding power of the screen does not encourage this. It jams that inner voice by offering continual interactivity or continual connection. Unlike time with a book, where one’s mind can wander and there is no constraint on time out for self-reflection, apps bring children back to the task at hand just when a child’s mind should be allowed to wander. So in addition to taking children away from conversation with other children, too much time with screens can take children away from themselves. It is one thing for adults to choose distraction over self-reflection. But children need to learn to hear their own voices.

Why is solitude so important, and why do we want to cultivate it in the young? Solitude is a precondition for creativity, but it is also where we find ourselves so that we can reach out and have relationships with other people, in which we really appreciate them as other people. So solitude is a precondition for conversation. If we aren’t able to be alone with ourselves, we are at risk of using other people as “spare parts” to support our fragile selves. One of the great tasks of childhood is to develop the capacity for this kind of healthy solitude. It is what will enable children to develop friendships of mutuality and respect.

Isaac Asimov imagined three rules of robots, which futuristic robots would be compelled to follow. The first was to never harm humans (or through inaction allow a human to come to harm). The second was to always obey humans. The third was to try to protect itself. These three laws were not equal, however, as earlier laws always took precedent over later laws. This means that a robot told to kill someone for you wouldn’t

obey, unlike a robot told to destroy itself.

Although these three laws facilitate great stories, they are impractical. For example, what constitutes harm? If a robot comes across a homeless person, is it compelled to whisk him away to a shelter? Even if that person doesn't want to be whisked away? Similarly, what happens if the robot is faced with a choice between two different harmful actions, like killing one person to save the life of someone else? How could a machine decide what to do here when people can't even agree on the moral appropriateness of such an action? Just like human morality, machine morality will invariably be messy.

The idea that we're going to unleash self-driving cars in our neighborhoods to take out innocent pedestrians is pretty unreasonable. If you're sitting in a self-driving car it should be at your own risk. Cars are equipped with safety equipment like airbags, seat belts, and steel reinforcement beams to protect the passengers inside. Pedestrians are limited to what evolution provides. Asking the car to keep track of how many people it's transporting and calculating their demographic worth against whoever it's thinking about murdering sounds pretty unreasonable too.

The technology is nowhere near capable of distinguishing such situations anyway, so what we have is another case of hype masquerading as science.

In 2020, we should imagine a visit from a person from the year 2100. Will she look on our choices admiringly, or with her head in her hands at the chaos we are about to create? That is the moment we face.

As I travel back, in my mind, to Simon Morley's New York City of the 1880s, I imagine myself talking to a pedestrian and explaining to him that, within twenty years, we would shine a light in his face and he would stop, that he would hug buildings while he walked, and that he'd only cross at corners when the government said it was okay to proceed. If he failed to comply, he'd be charged with a criminal violation and subject to arrest. This pedestrian from the 1880s would laugh at me and say that no sane society would allow that to happen; it was inconceivable. Keep this conversation in mind—what outrageous, inconceivable concepts might we hear from a visitor from 2100 explaining the “traffic wars” of the twenty-first century?

By the mid-1920s, the auto industry had begun advocating for jaywalking laws as a way to make more room for cars and eliminate a nuisance—people. Their vigorous campaigns to get jaywalking laws passed across the country would be successful. For instance, industry lobbyists were instrumental in getting the 1928 Model Municipal Traffic Ordinance passed during the Hoover administration. The crucial thing it said was that pedestrians would cross only at crosswalks, and only at right angles. Essentially, this is the traffic law that we're still living with today. Crossing against a red light

was also considered jaywalking. For millions of years, humans had been walking on the earth and stopped only when they perceived danger or an obstacle. For the first time, humankind was asked to stop because a colored light appeared.

History urges us to question, if not abandon, the assumption that the only way anybody can go anywhere, or wants to go anywhere, is via car, driverless or not. This assumption is a fairly recent legacy, but an incredibly powerful one. Autonomous vehicles can and should be part of a better system of movement that takes the best from the past, the assumption that streets are for people, and avoids the worst—the idea, barely more than a century old, that streets are only for the car.

Massachusetts has 76,200 lane-miles of roadway, yet the state is just 190 miles long. It has more roadway than Wyoming (60,454 lane-miles), an area several times larger than the Bay State.

It's so easy to be seduced by driverless cars, to wish and believe that they will solve just about all our problems with travel. Traffic will speed up, crashes will be almost nonexistent, and the time we spend in our cars will be enjoyable and productive. A little more than a century ago, we first bought the sales pitch—hook, line, and sinker—that cars would speed our travel, increasing our productivity; that cities would be much healthier without all that horse dung; and that our lives would be more enjoyable. We approached cars with not just a *laissez-faire* attitude but as a society in servitude to the new vehicles. “What’s good for GM is good for America” was a version of a not-so-subliminal message we were already receiving; what is good for the car is good for cities, states, and the country.

Today, industry representatives only want to talk about the good that will come about from AVs for humankind, in the same way early car makers talked about all the good the horseless carriage would bring. We know now that our last century’s approach to cars led to the hollowing out of cities, the destruction of transit systems, and a vicious cycle of urban populations decreasing and becoming poorer, of city services being cut and crime becoming rampant. From 1899 to 2013, 3,613,732 people died in motor vehicle accidents in the United States, with another 80 million people injured, many of them permanently maimed. I don’t think this level of lethality was the outcome Americans were hoping for when they first embraced the car. That was not the promise people were offered.

AV public transit should not be confused with the hype surrounding “AV road trains.” Some proponents of AVs maintain that robo-cars operating in platoons can mimic the performance of bus rapid transit or even a rail line. It isn’t true. A single lane of cars today has a capacity, at best, of 2,000 vehicles per hour. With an average occupancy in the United States of 1.1

persons per car, 2,200 people would be moved. Upgrade those cars to AVs and perhaps 3,600 vehicles could traverse the lane each hour. Others have suggested much higher numbers, but I think spacing vehicles traveling at 60 miles per hour with less than one second between them over the course of an hour is risky and not reasonable where there is merging, weaving, and exiting traffic. Although 3,600 vehicles per hour is still about an 80 percent increase in lane capacity, the goal should be moving people, not vehicles. Some of those vehicles are likely to be empty as they head to a pickup somewhere or after they drop the occupant off and then go home or to a home base. I'll be generous and say that average car occupancy is 2.0, even though Americans drivers have been going increasingly solo for more than a generation. With an occupancy rate of 2.0 people per car, the AV lane capacity would be 7,200 people moved per hour. A lane full of AV buses at, say, 1,500 conventional-sized buses per hour has the capacity to move 60,000 persons per hour. It's no contest: AV transit is the smarter way to go. Unfortunately I have yet to see a Congress since the 1960s that has much appetite for investing in transit.

Imagine the earliest human society—not so much a village as an encampment. For its inhabitants, this encampment defines their world. Whenever they leave it to hunt or gather, they conceive of their present position in relation to their encampment. They know no other way to think of location. This is their reference frame. We might use home-center to describe this basic wayfinding method. Contrast home-center systems with what might be called self-centering methods, which is how we see the world. We define our position objectively, sometimes with help from tools such as maps or GPS, but rarely by where we are in relation to our homes. Dead reckoning is kept to a minimum. The center of our world is us. With some knowledge of ancient Polynesian navigation, we can identify a third system, which might be called local-reference. This defines location in relation to a prominent environmental feature, such as a mountain, coastline, or bridge. Newcomers emerging from the New York City subway into the disconcerting tangle of the West Village—where 4th Street and 13th Street somehow intersect—can use the massive One World Trade Center building to distinguish uptown from downtown.

The Polynesians used a method of dead reckoning called *etak*. The first key to understanding *etak* is that it does not provide the navigator with any new navigational knowledge. *Etak* is wayfinding, not navigation. It will not tell you how to get to where you want to go, any more than knowing what 'miles' are will help you get to my house. But it provides an even more elusive, more primal, more contingent form of knowledge: it will tell you where you are.

This is how it works: When a navigator using etak decides to travel from one island to another, a third island is chosen as a reference point. The reference island will be one that lies between the two, and off to one side—picture a triangle. The reference island is not visible from the origin or the destination, and will never once be visible during the journey. But the navigator knows, from his sidereal compass, the bearing of the reference island. He knows that when he stands on his island and looks in the direction of a certain star, he is looking in the direction of the reference island. He begins the journey. This one will require three segments, or etaks. Most journeys required several more.

As the canoe progresses, its bearing in relation to the reference island changes. After traveling a certain distance on the ocean, the viewing perspective has changed, and the reference island now lies under a second star. The canoe has progressed to the end of the first etak. As the canoe continues further, the perspective shifts again, and a third star comes to lie over the reference island. This is the end of the second etak. The canoe is now traversing the third and final segment. As the destination grows nearer, a fourth star, the one that marks the reference island when seen from the destination island, replaces the third star. As the canoe reaches the beach, the fourth star will be moving into position, directly over the reference island.

It cannot be stressed enough that etak is not providing the navigator with a way to set or maintain a course. Etak is not “data.” It is more like an operating system, running in the background of the CPU in a navigator’s brain. It is a processor into which the navigator’s knowledge of rate, time, geography, and astronomy can be integrated to provide a conveniently expressed and comprehended statement of distance traveled, providing the solution to an essential navigational question: ‘How far away is our destination?’

Etak is only as good as the raw data that lies behind it. How does the navigator know where the reference island lies? A study of etak will not give us the answer. Rather, we must look back to his instruction in the star courses. If the Polynesian navigator errs in his estimates of how far the canoe has traveled, etak will not save him and his crew. The system is workable only because of the vast number of star courses and other items of information stored in the navigator’s memory. A navigator marking a position using etak is seeing the world very differently from someone who is not. To begin with, the canoe isn’t moving. It is stationary on the ocean, watching the islands move. The island where the voyage began recedes, the destination moves closer, and the reference island seems to float between stable star points. Everything passes by the little canoe, everything, except

the stars by night and the sun by day.

It is a frustrating concept for us, and difficult for users to convey its workings to outsiders. It requires a worldview inconsistent with wayfinding as we understand it. Etak is like looking at the world through the window of a moving train. Houses near the tracks seem to fly by, while mountains in the distance keep pace with the train over long distances. In etak, the canoe is the train and the stars the mountains. The stars are fixed in the sky. The islands, like the houses, are in motion. When pressed, Carolinian navigators would always admit that yeah, we get it—the islands aren't really moving. But they would remain puzzled as to why anyone would consider this worldview problematic. For navigation purposes, they would explain, an island doesn't have one location—its position is relative to yours.

In our speech we find it natural to estimate (or measure) distance in arbitrary units. For the etak user, the estimate is relative. It is akin to a person walking across a familiar field in the dark. He is not likely to count his paces even if he knows their exact length. Instead he estimates intuitively that he is one-third or perhaps halfway across by knowing subjectively how long and how fast he has been walking.

There are two main schools of thought. One group believes that a rat's central nervous system may be likened to a complicated telephone switchboard that helps the rat compile stimulus-response connections in its brain. When a rat is confronted with a new maze, the switches are closed. As the rat explores the maze—making decisions, reaching dead ends, doubling back for another approach—the switchboard lights up. It receives incoming calls from the rat's sense organs and relays the message to the animal's muscles. The moves that a rat discovers take it closer to the reward are the switchboard connections that remain open, while the incorrect turns are the switchboard connections that close. This stimulus-and-response school of thought seems to imagine a satisfaction-receiving part of the rat that tells the switchboard operator to hold that connection, it was good; and see to it that you blankety-blank well use it again the next time those stimuli come in.

For the second group, the field theorists, the rat's nervous system is not a switchboard, staffed by a neutral operator, but rather a "map control room," the domain of an active cartographer using sense-organ stimuli to construct a tentative, cognitive map of the environment. Learning is not merely compiling a list of which moves serve the rat's purpose and which do not. It is an ongoing process of adding detail to the cognitive map, increasing the animal's ability to perceive the maze as a totality. The cognitive map concept can be divided into two basic models, strip maps and comprehensive maps. A strip map is analogous to a visual map that depicts only the spatial

relationship between two points: an unbroken line surrounded by blank space on the paper. As the cognitive map gains depth, breadth, and context, it becomes a comprehensive map, so that the organism can now visualize the orientation of point A to point B, point B to point C, point A to point C, and so on. The more intimately one knows an environment, the more details the cognitive cartographer can add to the map. Rat experiments suggest that the animal has the capacity to build strip maps into comprehensive maps.

Taking a long enough view, and a broad enough definition of the concept, the first GPS auto navigation unit was the “south-pointing carriage,” which appeared in China around 2,000 years ago. Whenever the carriage changed direction, a gear-driven mechanism would measure the movement of the wheels and cause a figure with an outstretched arm to always point in the direction of the carriage’s original heading. In the early twentieth century, users of the Jones Live Map for cars could “program” routes on a paper disc mounted on a turntable, which was connected to a gear train attached to one of the car’s wheels. As the car moved, the disc spun, revealing printed directions that told the driver when to turn. A competing technology, the Chadwick Road Guide, used a route disc linked to the odometer, which triggered color-coded signal arms that alerted the driver to an upcoming maneuver.

Selective availability was the term used to describe the intentional degradation of the civilian GPS signal. The Pentagon kept the policy in place while quietly discontinuing it during times of US military activity, so that soldiers could continue to use civilian-grade receivers. When American troops intervened to remove Haiti’s military government in 1994, attentive GPS users worldwide noticed that their receivers gave more accurate readings. But at midnight Eastern Daylight Time on May 1, 2000, the intentional degrading of the civilian signal ceased.

There is a price: the system may fundamentally change us as human beings. We so rely on GPS, have integrated it so deeply into our lives, that it may be altering the nature of human cognition—possibly even rearranging the gray matter in our heads. It is so potentially invasive that it forces us to reconsider cherished notions of privacy. We have let it saturate the world’s systems so completely that it is difficult to imagine life without it, and so quickly that we are just beginning to confront the possible consequences. A single GPS timing flaw, whether accidental or maliciously installed, could bring down the electrical grid, hijack drones, or halt the world financial system. In other words, what governments and security specialists call critical infrastructure—an inclusive term that refers to the systems, installations, and industries that make modern life possible. The US Department of

Homeland Security calls critical infrastructure “the backbone of our nation’s economy, security, and health. So vital to the United States that their incapacitation or destruction would have a debilitating effect.” The US officially designates sixteen critical infrastructure sectors, including energy, financial services, dams, and food and agriculture. All but three of them utilize GPS for some essential functions. For many countries around the world, the same ratio applies.

The fear is not a catastrophic global failure of GPS, a complete cessation of signals. The satellites themselves would be nearly impossible for someone to damage. The worry is localized disruptions, especially attacks on GPS-dependent systems that would have a cascading catastrophic effect.

The Vulnerability Assessment Team decided to test the porosity of GPS by attempting to spoof it. They began by renting, for \$1,000 per week, a GPS satellite simulator, a legal device that tests the accuracy of a GPS receiver by simulating the active GPS satellite constellation. The simulator connects directly to the receiver, so its signal does not go out over the air—but it didn’t take much tinkering to attach an antenna to the simulator so that it was broadcasting a weak signal. To boost it, the team spent another \$300 on a GPS signal amplifier. They placed both components in the back of flatbed truck, along with a desktop computer, monitor, and battery. On the truck’s grill, they mounted an antenna.

After enacting various hijacking scenarios, the good news, the team discovered, was that this kind of attack would require very precise execution. The hijacker would have to first jam the real GPS signal in the vicinity of the target truck, while seamlessly introducing the bogus signal, all while remaining no more than 15 feet from the target—not impossible to imagine on a highway. After control had been gained over the target truck, the attack truck would need to maintain a distance from it of no more than 30 feet, feeding the spoofed signal to the truck’s GPS receiver so that it could continue to accept the fake coordinates and communicate them to the monitoring center. This logistical restraint made the hijacking a difficult proposition. The actual spoofing, however, was shockingly easy. It would require about \$2,000 of legal equipment to disable the Defense Department’s billion-dollar signal.

By around 2005, the team had figured out how to spoof a GPS receiver from nearly two miles away—feeding it bogus location and speed data. Video footage of experiments conducted two years later shows three stationary GPS receivers mounted on a tripod, the camera zooming in to document that the receivers are all displaying an estimated speed of 600 miles per hour. In separate experiments, the team proved that they could spoof a timekeeping device that was getting a time feed from GPS. From more than

300 feet away, they radiated a bogus signal in the direction of an antenna attached to a clock connected to a laptop computer, with the time displayed in huge letters across the screen. At one point the display suddenly changed from 3:00 (the correct time) to 11:58.

For a smart grid to have value, its Synchronphasors must observe and report at exactly the same moment. Because they are spread over a large area, the easiest way to synchronize them is by connecting them to high-precision clocks sourced to GPS. If someone were to introduce a bogus GPS signal that disrupted the clocks and broke the synchrony, causing a distorted and possibly alarming overall view of power flow on the grid, what might happen? For now, probably not much. The technology is at an intermediate stage, not yet considered a “critical cyber asset,” a classification used for hardware, software, data streams, and networks whose disruption could bring key parts of the critical infrastructure to the brink of disaster within fifteen minutes. But the next step is to make these smart grids smarter, giving them the ability to take direct action. They could redirect power to allocate it more efficiently or safely, and even shut the whole mess down, killing the power for thousands of users to isolate a problem before it spreads. If a spoofed GPS signal distorted Synchronphasor data, human operators might sense something was askew before taking action. Left to its own devices, the grid itself might not.

One of the few current examples of PMUs being used for actual control purposes is a line that links two hydroelectric dams on the Grijalva River in Mexico. If somebody went down there and set up a couple of spoofers at strategic locations and spoofed the PMUs, the power transmission lines would pop. It’s not going to be permanent damage but there’s going to be an over-voltage condition. Transformers are going to take themselves offline, and, long story short, there’s no electricity coming out of the wall socket. According to accepted international standards, if a Synchronphasor is off its timing by as little as 26.5 microseconds, its data compromises the grid’s integrity.

We now trust our devices so much that some follow them blindly down abandoned roads, over cliffs, and into the ocean; park rangers call this “death by GPS.” It describes what happens when your GPS fails you, not by being wrong, exactly, but often by being too right. It does such a good job of computing the most direct route from Point A to Point B that it takes you down roads which barely exist, or were used at one time and abandoned, or are not suitable for your car, or which require all kinds of local knowledge that would make you aware that making that turn is bad news.

GPS can lead to a sense of disengagement, because the question of location, which once required a close interaction with the world, is now

solved by unseen technologies far removed from the user. In our society, total disengagement is often an option. We have come to depend on GPS, a technology that, in theory, makes it impossible to get lost. Not only are we still getting lost, we may actually be losing a part of ourselves.

Spending our days moving through various environments, we fill in the details of our cognitive map based on our egocentric experiences. Can the granular detail of that map fade through misuse? The problem with GPS systems is that we are not forced to remember or process the information—as it is permanently at hand, we need not think or decide ourselves. The more we rely on technology to find our way, the less we build up our cognitive maps. Life becomes a series of strip maps: we see the way from A to Z, but we don't see the landmarks along the way. Developing a cognitive map from this reduced information is a bit like trying to get an entire musical piece from a few notes. Moreover, this suggests that we absolve ourselves from even having egocentric experiences to build upon. In some general sense, we lack reference points, stable spots that anchor our position in the world. Without these authoritative positions that, in a very real sense, add meaning to our world, we are left floating. Perhaps there is something to the explanation, by those who have driven their cars into rivers and over cliffs, that GPS told them to do it.

Prior to the innovative and creative thrill rides of the twentieth century, the only ways to feel the sensations caused by acceleration and direction manipulation were accidental, to say the least: being swung back and forth in the mouth of a lion, for instance, or falling down a steep hill, neither of which bodes especially well for our survival. Yet today we've built machines that allow us to experience physical sensations our ancestors couldn't even imagine, just to see what it feels like.

No major river in the United States has escaped damming somewhere along its course; not a single one flows unimpeded from headwaters to the sea.

In 2000, the US Fish and Wildlife Service reported that 77,000 towers were higher than 199 feet, which meant that they were required to have warning lights for aircraft. If calculations were correct, that meant that nearly 200 million birds collided fatally with towers each year in the United States alone. In fact, those figures had already been usurped, because cell phone towers were being erected so fast. By 2005, there were 175,000 of those. Their addition would raise the annual toll to half a billion dead birds—except that this number was still based on scant data and on guesses, because scavengers get to most feathered victims before they're found.

In separate studies, two U.S federal agencies estimate that 60 to 80 million birds also annually end up in radiator grilles or as smears on windshields of

vehicles racing down highways that, just a century ago, were slow wagon trails.

Science shouldn't be characterized only by the latest headline-making discovery. Scientific observation has been going on for centuries, and in that time we have learned a tremendous amount about the world around us. There is a vast heritage of knowledge that explains ordinary, familiar happenings.

“He approached each problem scientifically, experimenting by altering the variables until he arrived at a satisfactory solution—and always remembering that his designs had to be sustainable, using locally available materials. For example, he built a number of canals where instead of using an expensive cement lining that cracked during winter, he allowed weeds to grow and thicken, their roots naturally sealing the canal lining.”

I'm not sure I know the answer. But I know there is no going back to anything. And I know that we are not headed, now, toward convivial tools. We are not headed toward human-scale development. This culture is about superstores, not little shops; synthetic biology, not intentional community; brushcutters, not scythes. This is a culture that develops new life forms first and asks questions later; a species that is in the process of breaking its legs on its own cleverness.

Let me make it clear: *I have no easy solution to the horrors that the 'technological path' engenders.* Right now, neither you nor I have a tiny voice in either the pace and direction of that collective thing called so arbitrarily “advance” and “progress.”

If you don't like any of this, but you know you can't stop it, where does it leave you? The answer is that it leaves you with an obligation to be honest about where you are in history's great cycle, and what you have the power to do and what you don't. If you think you can magic us out of the progress trap with new ideas or new technologies, you are wasting your time. If you think that the usual “campaigning” behavior is going to work today where it didn't work yesterday, you will be wasting your time. If you think the machine can be reformed, tamed, or defanged, you will be wasting your time. If you draw up a great big plan for a better world based on science and rational argument, you will be wasting your time. If you try to live in the past, you will be wasting your time. If you romanticize hunting and gathering or send bombs to computer store owners, you will be wasting your time.

And so I ask myself: what, at this moment in history, would not be a waste of my time? And I arrive at five tentative answers:

1. **Withdrawing.** If you do this, a lot of people will call you a ‘defeatist’ or a ‘doomer,’ or claim you are ‘burnt out.’ They will tell you that you have an obligation to work for climate justice or world peace or the end of bad things everywhere, and that fighting is always better than quitting. Ignore them, and take part in a very ancient practical and spiritual tradition: withdrawing from the fray. Withdraw not with cynicism, but with a questing mind. Withdraw so that you can allow yourself to sit back quietly and feel, intuit, work out what is right for you and what nature might need from you. Withdraw because refusing to help the machine advance—refusing to tighten the ratchet further—is a deeply moral position. Withdraw because action is not always more effective than inaction. Withdraw to examine your worldview: the cosmology, the paradigm, the assumptions, the direction of travel. All real change starts with withdrawal.
2. **Preserving nonhuman life.** The revisionists will continue to tell us that wildness is dead, nature is for people, and Progress is God, and they will continue to be wrong. There is still much remaining of the earth’s wild diversity, but it may not remain for much longer. The human empire is the greatest threat to what remains of life on earth, and you are part of it. What can you do—really do, at a practical level—about this? Maybe you can buy up some land and rewild it; maybe you can let your garden run free; maybe you can work for a conservation group or set one up yourself; maybe you can put your body in the way of a bulldozer; maybe you can use your skills to prevent the destruction of yet another wild place. How can you create or protect a space for nonhuman nature to breathe easier; how can you give something that isn’t us a chance to survive our appetites?
3. **Getting your hands dirty.** Root yourself in something, some practical work, some place, some way of doing. Pick up your scythe or your equivalent and get out there and do physical work in clean air surrounded by things you cannot control. Get away from your laptop and your smartphone, if you have one. Ground yourself in things and places, learn or practice human-scale convivial skills. Only by doing that, rather than just talking about it, do you learn what is real and what’s not, and what makes sense and what is so much hot air.

4. **Insisting that nature has a value beyond utility—and telling everyone.** Remember that you are one life-form among many and understand that everything has intrinsic value. If you want to call this ‘ecocentrism’ or ‘deep ecology,’ do it. If you want to call it something else, do that. If you want to look to tribal societies for your inspiration, do it. If that seems too gooey, just look up into the sky. Sit on the grass, touch a tree trunk, walk into the hills, dig in the garden, look at what you find in the soil, marvel at what the hell this thing called life could possibly be. Value it for what it is, try to understand what it is, and have nothing but pity or contempt for people who tell you that its only value is in what they can extract from it.
5. **Building refuges.** The coming decades are likely to challenge much of what we think we know about what progress is, and about who we are in relation to the rest of nature. Advanced technologies will challenge our sense of what it means to be human at the same time as the tide of extinction rolls on. The ongoing collapse of social and economic infrastructures, and of the web of life itself, will kill off much of what we value. In this context, ask yourself: what power do you have to preserve what is of value—creatures, skills, things, places? Can you work, with others or alone, to create places or networks that act as refuges from the unfolding storm? Can you think, or act, like the librarian of a monastery through the Dark Ages, guarding the old books as empires rise and fall outside?

Or will you say, ‘Fuck your options; fuck your imposed limitations,’ and set out, as so many have before, to bring these petty tyrants to their knees; finally, once and for all, by whatever means necessary?

‘Is’ is not the same as ‘ought’—simply because you can do something doesn’t mean you should. But exactly the opposite seems to be the case today: if we can do something, that seems to provide a justification for doing it. And as we learn to do more things, we want even more—a vicious cycle thriving off the illusion that resources are unlimited. This process started 60,000 years ago as our species expanded from its African homeland to populate the world, and it accelerated abruptly after the Neolithic Revolution. With agriculture, as we have seen, came the power to create far larger problems than we could have even dreamed of as hunter-gatherers, and the driving force behind most of them was greed. While we can never go back to the pre-agricultural era, we can perhaps take as a moral guide the mythos of the world’s remaining hunter-gatherers: we can learn to want less.

Blind, Ignorant Tinkerers

“Your decision to go ahead and build it in the lab means that you are performing an experiment that could affect other people. And if you don’t tell them that you’re doing it in advance, you’re actively denying them a voice in the decision. And frankly, that’s wrong.”

At the age of eleven I collected some eggs of the western swallowtail butterfly and kept an eye on them as they hatched into caterpillars, which later turned into chrysalides. Finally the first of the chrysalides began to crack open, and what I saw was this: The emerging butterfly struggled out, its abdomen distended by some sort of fluid that was pumped out over its wings as it hung upside down on a twig. Half an hour later it was ready to fly, and it took off. As the other chrysalides began to crack, however, I decided to make myself useful. I gently eased open the crack to facilitate the butterflies’ emergence, and they promptly slid out, walked around, and one by one dropped dead. I had failed to realize that the exertions I had spared the butterflies were essential to their survival, because they triggered the flow of fluid that had to reach their wings. This experience taught me a lesson I am still talking about seventy years later: What appears to be kind and is meant to be kind can be the reverse of kind.

“No sooner does man discover intelligence than he tries to involve it in his own stupidity.”

We are researching and developing human abilities mainly according to the immediate needs of the economic and political system, rather than according to our own long-term needs as conscious beings. My boss wants me to answer emails as quickly as possible, but he has little interest in my ability to taste and appreciate the food I am eating. Consequently, I check my emails even during meals, while losing the ability to pay attention to my own sensations. The economic system pressures me to expand and diversify my investment portfolio, but it gives me zero incentives to expand

and diversify my compassion. So I strive to understand the mysteries of the stock exchange, while making far less effort to understand the deep causes of suffering.

Science is shaped in important ways by the worldview of those who engage in it. Our philosophy (broadly understood) shapes the sorts of questions we're liable to ask and the types of answers we'll be open to finding.

A team of scientists trained a large group of spiders to jump up when given the spoken command 'Jump Spiders Jump!' They carefully measured the height each spider jumped and did statistical analysis to arrive at a measure of spider jump-compliance. Then they anesthetized the spiders and carefully removed one leg from each spider. After the spiders recovered they were again commanded 'Jump Spiders Jump!' and the scientists carefully measured the height of each spider's jump and derived a new figure for jump-compliance. As the experiment proceeded the scientists noted a strong correlation between the number of legs remaining on the spiders and their jump-compliance. The experiment proceeded to its end when all the spiders were legless. The legless spiders did not respond to the command 'Jump Spiders Jump!' From this the scientists concluded spiders must have some kind of ear in their legs.

Expertise: knowing more and more about less and less until you know everything about nothing.

In a recent laboratory experiment, polar bears were declared inefficient walkers because they overheated on a treadmill. An experienced polar bear biologist responds:

"The bear can't walk properly on a treadmill. Walking into the wind, making that great pendulum swing of his legs, opening and closing his body to the cool air, you don't see that on a treadmill. Out on the sea ice you see he can walk a long way without overheating."

The analogy I often use is that of the Catholic priest as an expert in Catholicism. There is no question a priest has superior knowledge and experience in the details of the Catholic faith, so in some sense he is an expert. However, if you are a Jew or a Muslim or an atheist, this expertise is not very meaningful, and it is unlikely to convince you that the priest is right about the details of religious controversies. Similarly, while I agree homeopaths know more about homeopathy than I do, I believe that I know

enough to understand the subject of their expertise is an unscientific fantasy, so I have no obligation to defer to their views on the controversies about it.

Under normal conditions the research scientist is not an innovator but a solver of puzzles, and the puzzles upon which he concentrates are just those which he believes can be both stated and solved within the existing scientific tradition.

The reproducibility crisis is, to a large extent, the result of the scientific process always being a complex human process that involves many actors—study designers, all participants, data collectors, implementing practitioners, study statisticians, et cetera—who must make many unique decisions at many different steps over time when designing, implementing, and analyzing any given study—and some degree of bias unavoidably arises during this process. Variation between study outcomes is thus the norm, and one-to-one replication is not possible.

Researchers should thus not assume that the Randomized Control Trial (RCT) method inevitably produces valid causal results—in fact, that all trials face some degree of bias is simply the trade-off for studies to actually be conducted in the real world. A number of things inevitably do not go as planned or designed given the multiple complex processes over time involved in carrying out trials. Once a study is conducted and completed some biases will have arisen and nothing can be done about a number of them.

Some may respond, ‘are RCTs not still more credible than other methods even if they may have biases?’ For most questions we are interested in, RCTs cannot be more credible because they cannot be applied—e.g. for most complex phenomena we study such as effective government institutions, long life expectancy, democracy, inequality, education systems, psychological states. Other methods, such as observational studies, are needed for many questions generally not amenable to randomization but also at times to help design trials, interpret and validate their results, provide further insight on the broader conditions under which treatments may work, among other reasons discussed in the study. Different methods are thus complements—not rivals—in improving understanding.

No single study should be the sole and authoritative source used to inform policy and our decisions.

Scientific judgments of risk cannot—and, indeed, should not—be separated from value judgments: It is a travesty of rational thought to pretend that it is best to take value-free decisions in matters of life and death. One salient difference between experts and the lay public is that the latter, when assessing risks, do not conceal their moral commitments but put them into the argument, explicitly and prominently. The risk expert claims to depoliticize an inherently political problem. But knowledge of danger is necessarily

partial and limited: judgments of risk and safety must be selected as much on the basis of what is valued as on the basis of what is known. Science and risk assessment cannot tell us what we need to know about threats of danger since they explicitly try to exclude moral ideas about the good life.

Weighing risks against benefits sounds great, but the truth is there is no magic formula, especially when the risks are taken by one group and the benefits by another.

Whenever someone invokes science in discussions of food safety, we can be reasonably certain that questions of self-interest are at stake but are excluded from debate. Scientists talk about risk as a matter of illness and death. The public wants dread-and-outrage factors to be considered as well. The failure of food companies, scientists, and government agencies to recognize the need to address values as well as science in matters of food safety leads to widespread distrust of the food industry and its regulators. When officials and experts dismiss dread-and-outrage concerns as emotional, irrational, unscientific, and indefensible, they raise questions about their own credibility and competence. They fail to recognize their own biases as well as the predictability of public responses to food safety risks.

When a risk manager continues to ignore these factors—and continues to be surprised by the public's response of outrage—it is worth asking just whose behavior is irrational.

The food biotechnology industry, in dismissing dread-and-outrage factors as emotional and unscientific, lobbied for—and won—a largely science-based approach to regulation of its products. The dismissal of consumer concerns about value issues related to food biotechnology forced advocacy groups to use safety as the only “legitimate” basis of discussion. In the StarLink affair, for example, advocates could not use concerns about corporate control of the food supply as an argument against approval of genetically modified foods.

Monsanto, the giant biotech corporation, owns the key genetic traits in more than 90 percent of the soybeans planted by farmers in the United States and 80 percent of the corn. Its monopoly grew out of a carefully crafted strategy. It patented its own genetically modified seeds, along with an herbicide that would kill weeds but not soy and corn grown from its seeds. The herbicide and herbicide-resistant seeds initially saved farmers time and money. But the purchase came with a catch that would haunt them in the future: The soy and corn that grow from those seeds don't produce seeds of their own. So every planting season, farmers have to buy new seeds. In addition, if the farmers have any seeds left over, they must agree not to save and replant them in the future. In other words, once hooked, farmers have little choice but to become permanent purchasers of Monsanto seed. To

ensure its dominance, Monsanto has prohibited seed dealers from stocking its competitors' seeds and has bought up most of the small remaining seed companies.

Not surprisingly, in less than fifteen years, most of America's commodity crop farmers became dependent on Monsanto. The result has been higher prices far beyond the cost-of-living rise. Since 2001, Monsanto has more than doubled the price of corn and soybean seeds. The average cost of planting one acre of soybeans increased 325 percent between 1994 and 2011, and the price of corn seed rose 259 percent. Another result has been a radical decline in the genetic diversity of the seeds we depend on. This increases the risk that disease or climate change might wipe out entire crops for years, if not forever. A third consequence has been the ubiquity of genetically modified traits in our food chain.

At every stage, Monsanto's growing economic power has enhanced its political power to shift the rules to its advantage, thereby adding to its economic power. Beginning with the Plant Variety Protection Act of 1970, and extending through a series of court cases, Monsanto has gained increased protection of its intellectual property in genetically engineered seeds. It has successfully fought off numerous attempts in Congress and in several states to require labeling of genetically engineered foods or to protect biodiversity. It has used its political muscle in Washington to fight moves in other nations to ban genetically engineered seed. To enforce and ensure dominance, the company has employed a phalanx of lawyers. They've sued other companies for patent infringement and sued farmers who want to save seed for replanting. Monsanto's lawyers have also prevented independent scientists from studying its seeds, arguing that such inquiries infringe the company's patents.

You might think Monsanto's overwhelming market power would make it a target of antitrust enforcement. Think again. In 2012, it succeeded in putting an end to a two-year investigation by the antitrust division of the Justice Department into Monsanto's dominance of the seed industry. Monsanto has the distinction of spending more on lobbying—nearly \$7 million in 2013 alone—than any other big agribusiness. And Monsanto's former (and future) employees frequently inhabit top posts at the Food and Drug Administration and the Agriculture Department, they staff congressional committees that deal with agriculture policy, and they become advisors to congressional leaders and at the White House. Two Monsanto lobbyists are former congressman Vic Fazio and former senator Blanche Lincoln. Even Supreme Court justice Clarence Thomas was at one time an attorney for Monsanto. Monsanto, like any new monopoly, has strategically used its economic power to gain political power and used its political power to entrench its market power.

“Why the fuck does everything have to be non-GMO?”

Because people don't trust corporations like ADM and Monsanto to develop things that actually benefit people as apposed to just generate profit. The idea behind current GMO trend is to make the plants immune to the heavy herbicides and pesticides they use to keep weeds and pests under control or even more recently, to produce the toxic components within the plant itself. Personally I don't want to eat all these poisons on my food. Oh, but its ok because RoundUp is perfectly safe for humans they say. These are the same kind of ignorant or immoral fuckers that claimed cigarettes, Agent Orange, PCBs, and DDT were safe. I'm sure our ever rising cancer rates are just a coincidence.

GMOs contribute to monoculture and clones that are very susceptible to plague. How would you like our entire nation's corn crop to fail for a decade because of a blight that attacks every corn stock of identical genetic makeup? Having entire fields of clones is not very good for food security. How was your Gros Michel banana this morning?

GMO research targets shit food like corn. Do we really need to increase corn production? Go to McDonald's, order a cheeseburger, fries, and a milkshake. Every single item in that meal is corn based. The meat is corn fed, the fries are fried in corn oil, and the milkshake is corn syrup. We need more plant diversity in our diet not less.

GMO contamination is forever. Having these genes spread throughout the world of food crops via wind or bees or other pollinators is forever. Once the contamination has spread it can't be undone. What happens when one of these GMOs made by a huge corporation, only concerned with profit, has a mistake? What if ADM modifies corn, and ten generations of corn later it turns corn into an inedible mess? That genetic contaminant has now spread though natural pollination worldwide and we just destroyed our corn crop. Yay us!

Monsanto owns a patent on a terminator gene that makes the seeds of crops sterile so farmers can't replant the next years crop without buying more seed from Monsanto. But that's ok, they “promised” not to use it. Monsanto has sued a Canadian farmer named Percy Schmeiser for using “their” seeds without paying royalties because his field was contaminated with GMO shit from the neighbors. It's a seed, since when does Monsanto own a seed?

These are just a few of the reasons people have problems with GMOs. I'm sure with proper oversight and lacking profit motive we could develop reasonable GMOs but I simply don't trust the giant greed driven assholes at Monsanto to have our health in mind when they make these things.

Researchers find this infuriating. Why don't people care that the people who best understand the technology believe it to be useful and safe? After all, scientists eat the food, too. But they are looking at the question as if it were one of risk, whereas men and women on the street also think in terms of fairness—equity, to use the two-dollar word. In the laboratory, scientists ask: 'Is it feasible?' In the world outside the laboratory, people ask: 'Is it right?'

Contrast the behavior of the European and North American consumers who fear putting GMOs into their bodies as food with that of the European and North American patients who willingly put GMOs into their bodies as medicine. Genetically modified *E. coli* creates synthetic insulin for diabetics; genetically modified baker's yeast produces hepatitis B vaccine; genetically modified mammal cells make blood factor VIII for hemophiliacs and tissue plasminogen activator for heart-attack victims. Although activists have occasionally campaigned against these drugs, their efforts have not caught fire.

The divergent reactions are not because people are foolish but because the two circumstances have different ethical benefit-cost calculations. In both cases scientists assure non-scientists that the likelihood of negative side effects is small. But the diabetics who use synthetic insulin personally benefit from it, compensating for any risk. The same is true for the hemophiliacs and cardiac patients. Meanwhile, the Californians who lived around the strawberry and potato patches would receive no benefit whatsoever from the ice-minus test. From their point of view, they were being asked to expose themselves to an unknown peril for the benefit of some rich venture capitalists in a city hundreds of miles away. Imposing any risk, however tiny, would make them worse off. They were being used purely as a means to somebody else's end—something that philosophers have regarded as unethical since the days of Kant.

In February 2001, Greenpeace challenged the fundamental premise (and promise) of Golden Rice. They calculated that adults would have to eat at least 20 pounds (9 kilograms) of Golden Rice to meet daily vitamin A recommendations. Greenpeace called Golden Rice nothing but "fool's gold" and said:

"It is shameful that the biotech industry is using starving children to promote a dubious product. This isn't about solving childhood blindness, it's about solving biotech's public relations problem."

Greenpeace did its homework. It took at face value the scientists' own estimate that a daily intake of 300 grams (nearly 11 ounces) of Golden Rice

should provide the equivalent of 100 units of vitamin A. Beta-carotene must be converted to vitamin A in the body, however, this process is usually incomplete and the amount that is converted into vitamin A is a matter of sharp debate. The scientists who developed Golden Rice assumed that 6 molecules of beta-carotene would yield 1 of vitamin A, whereas US estimates suggest a conversion ratio of 12 to 1. Greenpeace took the scientists' figures and compared them to recommended levels of vitamin A intake for the US population. By US standards, 300 grams (11 ounces) of Golden Rice provides one-third the recommended level of daily intake of vitamin A for a child aged one to three years, one-seventh the level recommended for an adult woman, and one-ninth the level for an adult man. By such standards, young children would need to eat nearly 33 ounces of raw rice per day, which, when cooked, would amount to 99 ounces, or about 6 pounds—an absurdly large amount. If the Golden Rice scientists had used the higher US conversion ratio, that quantity doubles to an even more absurd 12 pounds.

It must be understood that the US standard is deliberately set high to meet the nutritional needs of about 98% of the population; people with average requirements can prevent vitamin A deficiency at much lower levels of intake. Nevertheless, to meet just 10% of the US standard, young children would still need to eat more than a pound of cooked rice a day. The Greenpeace analysis made it clear that on quantitative grounds alone, Golden Rice would constitute—at best—a partial solution to health problems caused by vitamin A deficiency.

In many countries where vitamin A deficiency is common, food sources of beta-carotene are plentiful, but people believe the foods inappropriate for young children, do not cook them enough to make them digestible, or do not consume enough fat to permit much in the way of absorption. It remains to be seen whether the beta-carotene in Golden Rice will fare better under such circumstances. Overall, vitamin A deficiency is a complicated health problem affected by cultural and societal factors as well as dietary factors. In this situation, the genetic engineering of a single nutrient or two into a food, while attractive in theory, raises many questions about its benefits in practice.

All genetically modified crops harm the natural world and human health, in large part because they (by definition) invite and encourage the spraying of toxic pesticides. But their supporters also mislead regulators and society with claims about the seeds themselves that fail to stand up to scientific scrutiny. Industry says that GMO crops are no different from crops developed by natural breeding. They are safe to eat, they say; they need fewer pesticides than conventional crops and make a positive contribution to reducing global warming and world hunger. The truth, however, is different. A review of

the scientific evidence about genetically modified crops concluded that the far-reaching claims of safety and efficacy and usefulness of the genetically modified crops are not true. Genetically modified crops are laboratory-made, using technology that is totally different from natural breeding methods.

Genetically modified crops can also be toxic. In the period between 1996 and 2011, the GM crops in the United States increased the use of pesticides by about seven percent, or 404 million pounds a year. When it comes to nutrition and productivity, genetically modified crops are also no better than conventional crops. They create herbicide-tolerant super weeds. They increase the disease susceptibility of crops, harm soils and ecosystems, and reduce biodiversity. They have not been shown to have a positive impact on hunger or global warming. And—in the end, and as always—genetically modified crops are not adequately regulated to ensure safety.

While the other plants co-evolved in a kind of conversational give-and-take with people, the NewLeaf potato has really only taken, only listened. It may or may not profit from the gift of its new genes; we can't yet say. What we can say, though, is that this potato is not the hero of its own story in quite the same way the apple has been. It didn't come up with this Bt scheme all on its evolutionary own. No, the heroes of the NewLeaf story are scientists working for Monsanto. Certainly the scientists in the lab coats have something in common with the fellow in the coffee sack: both work, or worked, at disseminating plant genes around the world. Yet although Johnny Appleseed and the brewers of beer and makers of cheese, the high-tech pot growers and all the other "biotechnologists" manipulated, selected, forced, cloned, and otherwise altered the species they worked with, the species themselves never lost their evolutionary say in the matter—never became solely the objects of our desires. Now the once irreducible wildness of these plants has been reduced. Whether this is a good or bad thing for the plants or for us, it is unquestionably a new thing.

Scientists have already proved that the Roundup Ready gene can migrate in a single generation from a field of rapeseed oil plants to a related weed in the mustard family, which then exhibits tolerance to the herbicide; the same has happened with genetically modified beets. This came as no great surprise; what did is the discovery, in one experiment, that transgenes migrate more readily than ordinary ones; no one knows why, but these well-traveled genes may prove to be especially jumpy.

The classic case of the unanticipated consequences of nutritional—if not food—biotechnology concerns supplements of the amino acid tryptophan. Like all amino acids, tryptophan is a component of proteins in all organisms. Supplements of tryptophan have been used for years as self-medication for insomnia and neurological conditions. In the 1980s, companies began to

genetically engineer bacteria to produce larger amounts of tryptophan so that this amino acid would be easier to collect and purify. In 1989, tryptophan supplements produced by a Japanese petrochemical company, Showa Denko, caused eosinophilia-myalgia syndrome (EMS), an unusual constellation of symptoms of muscle pain, weakness, and increased blood levels of white cells (eosinophils). Eventually, more than 1,500 people who had taken the supplements became ill, and about 40 died. The FDA prevented further marketing of the supplement, and the company stopped making it.

Scientists and food biotechnology companies promote transgenic projects by focusing on technical achievements, safety, and visions of improving the world's food supply, as expressed by the often repeated idea that biotechnology—and only biotechnology—can help the world produce the food necessary to meet the population needs of the twenty-first century. This statement, however, immediately raises credibility issues. Can biotechnology really solve world food problems? What is the industry doing now to address such problems? Are there other methods—perhaps less technical—for solving them? Food biotechnology first developed bovine growth hormone, Bt corn, and Roundup Ready soybeans, all possessing agronomic traits designed to help food producers. The industry also worked on processing traits, such as insertion of the reversed gene for ripening into tomatoes. More recently, the industry began developing foods with quality attributes (such as nutrient content) that might benefit consumers directly. Until such foods become available, the public has little to gain from genetically modified foods—in price, nutritional benefit, or convenience. Evidence for benefits to the environment or to people in developing countries is also uncertain. In this situation, any risk—no matter how remote—seems pointless, especially when food biotechnology raises so many other issues of concern.

When people object to food biotechnology by focusing on safety issues, they often do so because they have no other choice. Scientists, federal regulators, and biotechnology companies dismiss outrage considerations out of hand and only permit debate about safety issues. Safety is a matter of interpretation, highly political, and difficult to separate from the 'who decides' factors.

If CRISPR were already precise, accurate, and specific there would, for example, be no publications in prominent scientific journals titled "Improving CRISPR-Cas nuclease specificity using truncated guide RNAs." And these would not begin by describing how ordinary CRISPR "can induce mutations at sites that differ by as many as five nucleotides from the intended target," i.e. CRISPR may act at unknown sites in the genome where it is not wanted.

Thus CRISPR itself will need tweaking before it can be useful for safe commercial products, and that is the first error of the tweaking argument.

So far, it is technically not possible to make a single (and only a single) genetic change to a genome using CRISPR and be sure one has done so.

“In mammalian systems Cas9 causes a high degree of off-target effects.”

And at least until modified versions come into use, this will limit the safety, and hopefully limit the application, of CRISPR and related biotechnologies.

There is, furthermore, no guarantee that more precise versions of CRISPR are even biologically possible. Technically therefore, precision is a myth: no form of genome editing can do what is currently being claimed.

The second key error of CRISPR boosters is to assume that even if we had complete precision, this would allow control over the consequences for the resulting organism. Suppose, as a non-Chinese speaker, I were to precisely remove from a Chinese text one character, one line, or one page. I would have 100% precision, but zero control over the change in meaning. Precision, therefore, is only as useful as the understanding that underlies it, and surely no DNA biologist would propose we understand DNA—or else why are we studying it?

A classic example of how DNA can still reveal unexpected functions decades after discovery is the CaMV 35S promoter, a DNA sequence used in commercialized GMO plants for almost twenty years. The CaMV 35S DNA is described in every application for commercial use as a simple DNA promoter (an “on” switch for gene expression). In 1999, however, the CaMV 35S promoter was found to encode a recombinational hostpot. In 2011 it was found to produce massive quantities of small RNAs. These RNAs probably function as decoys to neutralize the plant immune system. One year later still, regulators found it to contain an overlapping viral gene whose functions are still being elucidated. Will we ever know enough about any DNA sequence to accurately describe changing it as ‘editing’?

The third error of CRISPR advocates is to imply that changes to gene functions can be presumed to be discrete and constrained. The concept of the precise editing of a genome leading to a precise biological outcome depends heavily on the conception that genes give rise to simple outputs. This is the genetic paradigm taught in schools. It is also the paradigm presented to the public and that even plays a large role in the thinking of molecular genetic researchers.

However, a defined, discrete, or simple pathway from gene to trait probably never exists. Most gene function is mediated murkily through highly complex biochemical and other networks that depend on many conditional

factors, such as the presence of other genes and their variants, on the environment, on the age of the organism, on chance, and so forth.

Geneticists and molecular biologists, however, since the time of Gregor Mendel, have striven to find or create artificial experimental systems in which environmental or any other sources of variation are minimized so as not to distract from the more “important” business of genetic discovery. But by discarding organisms or traits that do not follow their expectations, geneticists and molecular biologists have built themselves a circular argument in favor of a naïve deterministic account of gene function.

Their paradigm habitually downplays the enormous complexities by which information passes (in both directions) between organisms and their genomes. It has created an immense and mostly unexamined bias in the default public understanding of genes and DNA.

The benefits of naïve genetic determinism to the architects of the genome-industrial complex are very great. Since it pretty much requires that organisms be seen as robots being operated by mini-dictators—rather than, for example, as systems with emergent properties—and those genes as having effects that are narrow and clearly defined rather than being diffuse and unpredictable, it simplifies their sales pitch and frames risk assessment as unnecessary.

The problem comes to a head, however, when this narrow conceptualization of genetics is applied to the real world and situations that have not been, as it were, set up in advance. In the case of the “Super-muscly” pigs reported by *Nature*, strength is not their only feature.

They must also have more skin to cover their bodies and stronger bones to carry themselves. They also, apparently, have difficulty giving birth; and if they were ever released into the wild, they would presumably have to eat more. Thus a supposedly simple genetic tweak can have wide effects on the organism throughout its life-cycle.

Nature also revealed that 30 of the 32 pigs died prematurely and only one animal was still considered healthy at the time the study authors were interviewed. So much for precision.

Why is this discussion of precision important? Because for the last seventy years all chemical and biological technologies, from genetic engineering to pesticides, have been built on a myth of precision and specificity. They have all been adopted under the pretense that they would function without side effects or unexpected complications.

Yet the extraordinary disasters and repercussions of DDT, leaded paint, agent orange, atrazine, C8, asbestos, chlordane, PCBs, and so on, when all is said and done, have been stories of the steady unraveling of a founding myth of precision and specificity.

Nevertheless, with the help of industry propagandists, their friends in the media, even the United Nations, we are once again being preached the gospel of precision. But no matter how you look at it, precision is a fable and should be treated as such.

The issues of CRISPR and other related new genome editing biotechnologies are the subject of intense activity behind the scenes.

The US Department of Agriculture has explained that it will not be regulating organisms whose genomes have been edited since it doesn't consider them to be GMOs at all. The EU was about to call them GMOs but the US caused them to blink, meanwhile the US is in the process of revisiting its GMO regulatory environment entirely.

Will future safety regulations of GMOs be based on a schoolboy version of genetics and an interpretation of genome editing crafted in a corporate public relations department? If history is any guide it will.

When the stakes are as high as they are with gene drive, who could argue with a judicious pause? People in Africa, some say. Every year you delay work on gene drives, another half-million people die.

“Who am I to tell somebody who's lost children to malaria, and has more children at risk, that they can't do it because somebody else doesn't agree? Why should some people get veto power over a technology that could save the lives of other people's children?”

Of course this ignores the preventable deaths due to the capitalist status quo that could be avoided using no potential doomsday technology. Like say bed nets, access to proper nutrition and healthcare—or hell, how about a Sam's Club case of bug spray? But that's not sexy and won't get you fame and wealth. So hold my beaker while I modify the building blocks of life.

In the United States, about 700 new chemicals are introduced to the market every year, most without any testing for health effects.

What mystifies me is the barrier for chemicals' entry seems to be very low, but when it comes to thinking about developing regulation, the barrier is really high.

The idea of the Precautionary Principle can be traced to West German environmental regulations enacted during the 1970s on the basis of *Vorsorge*, or “precaution.” Advocates of the precautionary principle argued that in cases where damage to society or people might be severe and irreversible, preventive action should be taken up front, even if there were important uncertainties about the relevant science. Although it sounds like common sense, in fact the precautionary principle poses a radical challenge to business as usual in a modern, capitalist, technological civilization. Under the

principles of risk analysis, industry lobbyists could often overcome objections by environmentalists or food safety advocates until someone finds the smoking gun. The precautionary principle reversed the burden of proof and sought to address the problem of traditional regulation, namely that long before the science does come in, the harm has already been done. And once a technology has entered the marketplace, the burden of bringing in that science typically falls on the public rather than on the companies selling it.

More and more, we are coming to realize that tinkering with nature can produce unintended effects, even if the tinkering seems well planned and justified. One recent example was described in a 2008 study published in the journal *Science*. The researchers were testing different methods of preserving acacia trees on experimental plots in Kenya. Half of the plots were surrounded by fences that excluded herbivores such as elephants and giraffes, while the other half were left open. The thinking was that if herbivores were kept away, at least for a while, the acacia trees—which had become stressed by overgrazing—would have a chance to thrive. Quite the opposite happened, unfortunately; the trees protected from the herbivores became weaker and were actually more likely to die than those left open to the ravages of wandering leaf nibblers. It seems that the trees' defense system, composed of tiny ants living in their hollow thorns and feeding on nectar produced by the plant, had started to abandon the plot when they were no longer needed and the plants reduced their nectar production. They were replaced by another species of ant that allowed other insects, including a nasty boring beetle, to attack the tree. This simple example illustrates the complex and unpredictable web of interactions among living organisms in a relatively well-understood ecosystem, and the dangers of trying to modify one component without taking into account the effect on others.

The ancient Greeks believed in three goddesses, more powerful than any others. We know them as the Fates. They would arrive at a newborn baby's cradle, where the first goddess spun the thread of life and the second determined the length of thread. The third—the most feared, known as “the inevitable”—cut the life-thread. The baby's path was fixed from that moment. In twenty-first-century America, not many of us still believe in the Fates with their spindle and shears. But we have replaced them with a modern substitute: genetics. There are diseases and disorders that are 100 percent genetically determined. No matter how or where you live, if you have the genetic combination for these conditions, they will manifest. These include Down syndrome, cystic fibrosis, and Huntington's disease, a degenerative brain disorder. Every person with the gene for Huntington's will eventually develop it.

We can think of genes in two ways. There are dictator genes. Those

genes give orders—blue eyes or brown hair—and you don't have any choice. The genes for diabetes, heart disease, or certain forms of cancer, they're more like committees giving suggestions. But you've got a lot of control over whether those genes ever express themselves.

In order to get many diseases, two things have to happen. First, you have a genetic predisposition. Second, something sets that gene in motion. Let's take Okinawans, from one of the Japanese islands. They're skinny, they don't have a lot of cancer, and they're one of the most long-lived cultures in the world. But if you move an Okinawan to America, they gain weight rapidly. They get heart disease, they get diabetes. In China, they used to think they didn't have diabetes. Now suddenly they have a huge increase in the disease, and they're blaming it on Western food, specifically the large amounts of meat.

Look at the genetics of the Papua Highlanders, the Tarahumara in northern Mexico, or the rural Chinese. They have different genetics, but there's no heart disease in these populations. The field of epigenetics is breaking through in spades right now, in which you can actually alter genetic expression. You can turn genes on and off, and by what? By the environment, and perhaps nothing is as powerful as food. And it's not just heart disease, when you look globally, there are certain cultures where breast cancer is much less frequently identified than in the US such as Kenya or rural Japan in the 1950s. Yet, what happened to the Japanese women, when they migrated to the US for the second and third generation, still pure Japanese American? They had the same rates of breast cancer as their Caucasian counterparts.

A dramatic example of this was recently found in an experiment with mice: "researchers" trained a group of mice to become afraid of the odor of acetophenone (which smells like cherry blossoms) by regularly pairing an electric shock to their feet with the odor. Soon, the mice showed a startle reaction whenever they encountered that specific odor. These mice were then allowed to breed, and their offspring also showed the same startle reaction to the smell of cherry blossoms. These offspring were also bred and the next generation continued to show this same cherry-blossom-specific fear. The researchers dissected the animals' brains and found that the mice had larger receptors that responded to this particular smell. Moreover, an analysis of the DNA of the sperm of these conditioned mice found that there were different methylation patterns in the sperm of the mice who learned this fear compared with other mice.

To rule out the possibility that the mice had learned this fear from their parents, the researchers took the sperm from males who were trained to fear the smell of cherry blossoms and artificially inseminated female mice

in another lab. The brains of these offspring were dissected, and they also showed the same larger receptors for this smell. A specific phobia, learned by one generation, was passed through the sperm to other generations, not through the DNA sequence itself, but through the methylation patterns that affected the gene's expression. In other words, one generation's experiences led to heritable changes. We have much more to learn about epigenetic inheritance before we can draw solid conclusions, but findings such as these are fascinating.

Simple genetic explanations are the exception, not the rule, and we are making an inductive error when we generalize from them. Yet switch-thinking explanations are what students primarily learn in high school and even university courses on genetics, and this is how genetic discoveries are usually described in the media. In high school you might have been taught, as I was, a switch-thinking story about the simple Mendelian basis of eye color, or of whether you could roll your tongue into a tube. Yet even these two classic examples don't hold up to closer scrutiny—eye color is determined by several genes, and the geneticist who originally identified tongue-rolling as a Mendelian trait backtracked from this claim over 50 years ago, and added that he was “embarrassed to see it listed in some current works as an established Mendelian case.” But high school genetic classes have relied upon these false examples because there really aren't any obvious Mendelian traits for students to measure.

Some are skeptical about extrapolating from DNA to meaningful difference. While it is true that it is difficult to find coding sequence differences between two modern humans, it is not true that therefore the ones that do exist are unimportant. And we won't be able to tell this just looking at the 'parts list.' In other words, if all you had was an alphabet, you could easily end up concluding that Hamlet and the script for an episode of *The Sopranos* were the same thing, since they use exactly the same letters. Perhaps that idea is a little far-fetched, but I trust the analogy is clear. And when it comes to genes, the parts list is woefully inadequate. The big question is not how many genes differ between ape and human, or between today's human and our ancestors of 50,000 years ago, but which genes differ. Changes in the fine biochemical structure of DNA happen over time, simply by chance. Other changes occur because of selection on human characteristics such as language ability. But how can we identify the smoking guns of human genetic evolution from neutral ticks of the molecular evolutionary clock? Using the alphabet analogy, it means that we need tools to help us distinguish Shakespeare from soap opera in a way that shows the difference in content, not just a difference in the number of times the letter 'a' or 'b' is used.

Populations and their genes can be viewed as if they were in a three-dimensional landscape, with hills and valleys. The vertical axis, or height of the peaks, indicates the success or fitness of a group of genes. If a population on a mountaintop changes the composition of its genes, it is likely to move to a less successful point, and hence any small changes probably will be selected against. Conversely, a population in a valley is likely to improve with small changes. The entire fitness landscape may well contain peaks that are even higher than the one that a given population, even one on a mountain, is already on, but those peaks might have valleys between them. Hence, a population on a peak cannot move very easily to a higher one, whereas a population in a valley probably will get better no matter what direction it takes.

When Jews were first lined up on the unloading docks at Auschwitz, they invariably heard the following command from German officers walking up and down the lines: "Zwillinge! Zwillinge!" ("Twins! Twins!"). Because twins were genetically identical, they were perfect for genetic studies. Mengele wanted to find ways to build a master race: one free of disease and capable of transmitting the best Aryan traits. In the two years he was at Auschwitz, he studied 1,500 pairs of twins. His fellow officers called them "Mengele's Children." Mengele's studies began by taking the children to Barrack 14, Camp F, the "Twin Camp." There he would strip them naked, take photographs, and carefully measure and record every possible physical characteristic. Then he put a syringe into their veins to test their blood, and needles into their backs to test their spinal fluid.

Later, he performed a series of experiments that brought eugenics to its final, hideous end. When he found one twin who sang well and another who didn't, Mengele operated on their vocal cords; one of the brothers never spoke again. He forced twin girls to have sex with twin boys to see if they would produce twins. To create Aryan features artificially, he injected a Nordic blue dye into the eyes of children, leaving many blind. He took one hunchbacked child and connected the veins in his wrists to the veins of his twin; then he connected them back-to-back. He wanted to see if he could transmit the misshapen spine from one child to another; following the surgery, the children couldn't stop screaming in horror. Their mother, who was able to procure a lethal dose of morphine, killed them both.

Mengele thought that two Romany twins were infected with tuberculosis; when other German physicians in the camp disagreed, Mengele brought the children into a back room, shot them in the neck with his pistol, and performed an autopsy. "Yes, I dissected them while they were still warm," he told his colleagues, who had been right about their diagnosis.

He infected children with typhus and tuberculosis to determine their

susceptibilities to disease and performed mismatched blood transfusions to see what would happen. Mengele gave children electric shocks to see how much pain they could endure. He burned 300 children alive in an open fire. When children had heterochromatic eyes, he killed them and sent their eyes to Verschuer in packages marked: WAR MATERIALS: URGENT. Mengele asked one mother to tape up her breasts to see how long her newborn could survive without food. He dissected a one-year-old while the child was still alive.

When the nightmare finally ended, fewer than 200 of the 3,000 children put into Mengele's care survived. And not a single piece of recognizable information was obtained. Josef Mengele and Adolf Hitler showed exactly what could happen when eugenics was put into the hands of narcissistic sadists with absolute power.

Eugenicists completely bastardized Mendel's laws. Most things—traits like criminality, alcoholism, epilepsy, deafness, or susceptibility to venereal diseases—could not be accounted for by strict Mendelian genetics. Nonetheless, the false notion that selective breeding could make for a better society would soon allow Americans to cloak some of their worst prejudices in the gilded robes of science.

In 1933, the year that he came to power, Adolf Hitler passed the Law for the Prevention of Hereditarily Diseased Offspring. The list of those to be sterilized was virtually identical to that first generated by the Eugenics Record Office in Cold Spring Harbor. Clinics were established and doctors were fined if they didn't comply with the law. Within a year, 56,000 Germans had been sterilized; by 1935, 73,000; by 1939, 400,000, dwarfing the number of sterilizations performed in the United States. The procedure was so common that it had a nickname: *Hitlerschnitte*, "Hitler's cut." Americans took note. The superintendent of Virginia's Western State Hospital, lamented:

"Hitler is beating us at our own game!"

Then Hitler moved from sterilization to murder. Handicapped children in hospitals were starved, injected with lethal drugs, or—in a tribute to ancient Sparta—exposed to the cold. Initially, only grossly deformed newborns were killed. Then killing of the unfit extended up to 3 years of age, then 8, then 12, then 16. Then the definition of 'handicapped' broadened to include anyone with an incurable disease or with learning difficulties. Even chronic bedwetters were at risk. Under the auspices of Karl Brandt, Hitler's personal physician, Germany's euthanasia program soon extended to the elderly, infirm, insane, and incurably ill.

More than 70,000 German adults were killed, initially by lethal injection, and eventually by mobile gas chambers that traveled from clinic to clinic.

German physicians sanctioned each and every one of the killings. When Karl Brandt was tried for war crimes in Nuremberg, and later sentenced to death, he offered *The Passing of the Great Race* as an exhibit in his defense. Adolf Hitler's Germany had become the embodiment of "the reign of doctors" that Carrie Buck's lawyer had predicted during his pleadings before the United States Supreme Court.

In 1952, a group of anthropologists, sociologists, geneticists, and psychologists gathered at the United Nations Educational, Scientific, and Cultural Organization (UNESCO) to put an end to Madison Grant's notion that race determined character and to the madness that it had wrought. They issued the following statements:

1. All men belong to the same species: *Homo sapiens*.
2. Race is not a biological reality but a social myth; the term should be dropped in favor of ethnic group.
3. There is no proof that the groups of mankind differ in their innate mental characteristics or intellectual capacity or that there is any connection between the physical and mental characteristics of human beings.

Beware of scientific biases that fit the culture of the time—beware the zeitgeist. Imagine that a study has just been published in a prestigious medical journal claiming that a certain constellation of genes predisposes to violent behavior, like rape and murder. And that people living in Mexico are more likely to carry these genes. In all likelihood, several Republican presidential candidates of 2016 would have enthusiastically embraced this study. Now they would have had clear scientific evidence supporting what they had been saying all along—we need to restrict Mexican immigration and build a great wall to keep the Mexicans out; if not, a group of genetically inferior people will invade our country.

Although this might sound far-fetched, it's exactly what happened in 1916 with the publication of Madison Grant's *The Passing of the Great Race*. As a consequence, immigration slowed to a trickle. People then and now seem perfectly willing to ignore the fact that we all come from a common ancestor and are far more alike than different. There is no Nordic or Aryan or Mexican or Muslim or Syrian race. There's only one race: the human race.

Unfortunately the quest for eugenics is still with us, just repackaged into more subtle, socially-acceptable forms. In plain language, Google has patented a tool to create "designer babies." But plain language is anathema

to Big Tech and its world-changing designs. ‘Biotech’ sounds so much better than ‘selective breeding programs managed by corporations.’

Consider further the case of designer babies or simply screening for certain disorders. A 2001 court case in France, where a child born with Down’s syndrome successfully sued his mother’s physician for allowing him to be born with the disorder, even raised the possibility that such testing could eventually be required—if not legally, then at least *de facto*, in order to avert the risk of a costly lawsuit. Although these decisions may seem very personal, motivated by parental love and the desire for a healthy child, in fact they have a much larger effect. This is because by selecting for certain traits we are not merely affecting our child but also all of his or her offspring. In the same way that the transgenerational power of developing agriculture during the Neolithic period set in motion forces that would play out over thousands of years, so too will choosing the genes of our children. In effect, we will become the agent of selection for future generations. Such a statement may sound extreme, but it is nonetheless true; once genetic variants are removed from a population, either by natural or artificial selection, only additional mutations can reintroduce them. And that raises the specter of where this may be leading us.

Around one percent of people, regardless of ethnic background or geographic origin, are schizophrenic, whereas most other human diseases vary widely in their population incidences. Some suggest that this is because schizophrenia results from having too many copies of “creativity genes” that, in smaller numbers, are useful and have been selected for in human populations because of their beneficial effects. In other words, if you have one or two copies of genetic variants that predispose you to schizophrenia, you might also be predisposed to become a great composer or mathematician, or, to put it in the context of our Paleolithic ancestors, better at developing new tools or anticipating where to find food; having three or four, however, could tip you over the edge to schizophrenia. Such a model is highly speculative, but it would explain both the relationship between mental illness and the creative process and why all human populations exhibit schizophrenia.

But what might happen in a future where such variants are routinely selected against? After all, most parents wouldn’t wish a debilitating illness like bipolar disorder or schizophrenia on their children. In so doing, however, might they also be selecting against creativity? While such a one-to-one correspondence between genetic predisposition and ultimate outcome vastly oversimplifies the complexity of human behavior and psychiatric disorders, it is likely that extreme creativity has at least a partial genetic basis. Perhaps creativity is a knife edge, on which we sit poised to teeter in the direction of either illness or accomplishment—and, indeed, many creative people

alternate between the two. In an effort to avoid the former, could we also be deterring the latter? After all, at its core, creativity is imagining things that aren't there and then making them real. Schizophrenia is largely defined by such vivid imaginings, although to such an extent that it becomes deleterious to the individual.

Psychology isn't the only thing we might be able to influence. For example, if we select for genetic variants that protect against diabetes, will we also be creating hothouse flowers of ourselves—svelte, calorie-burning humans with metabolisms perfectly adapted to the excessive nutritional intake and low exercise levels of modern industrial society? If so, will we lose our ability to cope with any potential disaster that may befall us in the distant future? As our food supply tends toward an ever greater monoculture of clonal genetic strains, what will happen if the equivalent of the Irish potato famine strikes in several hundred years' time? Will our distant grandchildren thank us for having molded them into the perfect twenty-first-century biology—one that may lead them to starve in a time of scarce resources?

Chapter Forty-three

Atomic Folly

The Most Terrible Weapon

“Within four months we shall in all probability have completed the most terrible weapon ever known in human history, one bomb of which could destroy a whole city.”

At 5:29 local time the first atomic bomb exploded at Alamogordo Air Force Base. George Kistiakowsky, who had helped lead development of the bomb and would go on to play a key role as a presidential science advisor in the Eisenhower administration, initially hugged lead scientist J. Robert Oppenheimer and then, more soberly, said:

“I’m sure that at the end of the world—in the last millisecond of the earth’s existence—the last human will see what we saw.”

Four days after Hiroshima, another bomb—nicknamed Fat Man—dropped on Nagasaki. Amazingly, there was no separate presidential order for its deployment; Truman’s initial orders in July had said to just continue dropping additional bombs as they became available. Nagasaki hadn’t even been the primary target when the bomber Bockscar took off that morning—it had intended to bomb the city of Kokura, but there were too many clouds over the target city, so after an hour and three failed bombing runs, the plane diverted its lethal payload to Nagasaki. The citizens of Kokura continued on with their day, not realizing how close they’d come to death. Such were the vicissitudes of the new atomic age.

“I’ve felt it myself, the glitter of nuclear weapons. It is irresistible if you come to them as a scientist. To feel it’s there in your hands to release this energy that fuels the stars. To let it do your bidding. To perform these miracles, to lift a million tons of rock into the sky. It is something that gives people an illusion of illimitable power and it is in some ways responsible for all

our troubles—I would say, this, what you might call ‘technical arrogance’ that overcomes people when they see what they can do with their minds.”

“With the unleashed power of the atom everything has changed, save our modes of thinking, and thus we drift towards unparalleled catastrophe.”

Some might put it less elegantly: We are monkeys with nuclear weapons. But monkeys have tails. So, more accurately: We’re naked apes with nukes.

Jane Goodall reported on a chimp who hit on the novel tactic of banging fuel cans together to achieve alpha status. The noise scared his competitors witless. He didn’t know what the cans were, what they were for, or what they held, but it worked anyway. For a little while.

There’s a lesson in there somewhere.

The invention and continued existence of nuclear weapons is a major sign of both leadership failure and the supreme irrationality and barbarity of those who end up in power.

To a remarkable degree, at the beginning even the US military thought that the atomic bomb should be outlawed or placed under some form of international mandate. General Arnold was a contributor to *One World or None*. He’d been a leading proponent of strategic airpower and supervised the American bombing of both Germany and Japan. The stress had taken its toll. Arnold suffered four heart attacks during the war, and his essay in *One World or None* was a final public statement before retirement. The appeal of nuclear weapons, he wrote, was simply a matter of economics. They had lowered “the cost of destruction.” They had made it “too cheap and easy.” An air raid that used to require five-hundred bombers now needed only one. Atomic bombs were terribly inexpensive, compared to the price of rebuilding cities. The only conceivable defense against such weapons was a strategy of deterrence—a threat to use them promptly against an enemy in retaliation.

“A far better protection lies in developing controls and safeguards that are strong enough to prevent their use on all sides.”

Truman, shared some of the concerns. The only man in history who had ever borne responsibility for a nuclear weapon’s use, he stopped one Oval Office debate over civilian versus military control of the bombs cold:

“You have got to understand that this isn’t a military weapon. It is used to wipe out women and children and unarmed people,

and not for military uses. So we have got to treat this differently from rifles and cannons and ordinary things like that.”

Instead of being outlawed by the UN, the atomic bomb soon became integral to American war plans for the defense of Europe. In June 1947 the Joint Chiefs of Staff sent a top secret report, “The Evaluation of the Atomic Bomb as a Military Weapon,” to President Truman. It contained the latest thinking on how nuclear weapons might be used in battle. The first post-war atomic tests, conducted the previous year at the Bikini atoll in the Marshall Islands, had demonstrated some of the weapon’s limitations. Dropped on a fleet of empty Japanese and American warships, a Mark 3 implosion bomb—like the one used at Nagasaki—had missed its aiming point by almost half a mile and failed to sink eighty-three of the eighty-eight vessels.

“Ships at sea and bodies of troops are, in general, unlikely to be regarded as primary atomic bomb targets. The bomb is preeminently a weapon for use against human life and activities in large urban and industrial areas.”

It was a weapon useful, most of all, for killing and terrorizing civilians. The report suggested that a nuclear attack would stir up “man’s primordial fears” and “break the will of nations.” The military significance of the atomic bomb was clear: it wouldn’t be aimed at the military. Nuclear weapons would be used to destroy an enemy’s morale, and the some of best targets were “cities of especial sentimental significance.”

Like a shootout in the Old West, a nuclear war might be won by whoever fired first. A country with fewer atomic bombs than its adversary had an especially strong incentive to launch an attack out of the blue. And for that reason, among others, a number of high-ranking American officers argued that the United States should bomb the Soviet Union before it obtained any nuclear weapons. General Groves thought that approach would make sense, if “we were ruthlessly realistic.” General Orvil Anderson, commander of the Air University, publicly endorsed an attack on the Soviets. “I don’t advocate preventive war,” Anderson told a reporter. “I advocate the shedding of illusions.” He thought that Jesus Christ would approve of dropping atomic bombs on the Soviet Union: “I think I could explain to Him that I had saved civilization.” Anderson was suspended for the remarks.

And then of course there was Curtis LeMay. The destruction of Japanese cities, one after another, fit perfectly with his philosophy on the use of military force. “I’ll tell you what war is about,” LeMay once said. “You’ve got to kill people and when you kill enough of them, they stop fighting.”

LeMay recognized the destructive power of nuclear weapons but didn't feel the least bit intimidated by them.

“We scorched and boiled and baked to death more people in Tokyo than went up in vapor at Hiroshima and Nagasaki combined.”

He didn't lose any sleep over the morality of Truman's decision. Killing was killing, whether you did it with a rock, a rifle, or an atom bomb.

Albert Einstein read a prepared statement about the hydrogen bomb on national television. He criticized the militarization of American society, the intimidation of anyone who opposed it, the demands for loyalty and secrecy, the “hysterical character” of the nuclear arms race, and the “disastrous illusion” that this new weapon would somehow make America safer.

“Every step appears as the unavoidable consequence of the preceding one. In the end, there beckons more and more clearly general annihilation.”

Truman's decision to develop a hydrogen bomb had great symbolic importance. It sent a message to the Soviet leadership—and to the American people. In a cold war without bloodshed or battlefields, the perception of strength mattered as much as the reality.

A classified Pentagon report later stressed the central role that “psychological considerations” played in nuclear deterrence. “Weapons systems in themselves tell only part of the necessary story,” the report argued. The success of America's defense plans relied on an effective “information program” aimed at the public:

“What deters is not the capabilities and intentions we have, but the capabilities and intentions the enemy thinks we have. The central objective of a deterrent weapons system is, thus, psychological. The mission is persuasion.”

The usefulness of the Super wasn't the issue; the willingness to build it was. And that sort of logic would guide the nuclear arms race for the next forty years.

“Influence depended on possession of force,” Winston Churchill told advisers, not long after the Bravo test. Great Britain would develop its own hydrogen bombs. Once again, the appeal of the H-bomb lay in its symbolism. “We must do it,” Churchill explained. “It's the price we pay to sit at the top table.”

The title of an influential essay on the role of technology in society asked the question: “Do Artifacts Have Politics?” According to its author the answer is yes—the things that we produce are not only shaped by social forces, they also help to mold the political life of a society. Some technologies are flexible and can thrive equally well in democratic or totalitarian countries. But there is one invention that could never be managed with a completely open, democratic spirit: the atomic bomb.

“As long as it exists at all, its lethal properties demand that it be controlled by a centralized, rigidly hierarchical chain of command closed to all influences that might make its workings unpredictable. The internal social system of the bomb must be authoritarian; there is no other way.”

Any individual advocating for targeting cities with nuclear weapons is most certainly unfit for any position of power. Any individual advocating the use of nuclear weapons period is very likely unfit for any position of power. If willing to do that, what else are they then far more likely to do with their power?

“You can’t have this kind of war,” Eisenhower once said at a national security meeting. “There just aren’t enough bulldozers to scrape the bodies off the streets.”

An undersecretary of defense, played down the number of casualties that a nuclear war might cause. “Everybody’s going to make it,” he reassured in one interview, “if there are enough shovels to go around.” He proceeded to outline his simple plan:

“Dig a hole, cover it with a couple of doors, and then throw three feet of dirt on top. It’s the dirt that does it.”

Jones firmly believed that nuclear war was not only survivable but that, with adequate preparation, the destruction would be quite limited.

“The problem is we’ve conditioned our people to believe that once the first nuclear bomb goes off, everybody’s going to die. With protection of people only, your recovery time to pre-war GNP levels would probably be six or eight years. If we used the Russian methods for protecting both the people and the industrial means of production, recovery time could be two to four years.”

Henry Luce’s editors at Life magazine tried to put an optimistic spin on the idea that the atomic bomb would make life aboveground obsolete:

“Consider the ant, whose social problems much resemble man. Constructing beautiful urban palaces and galleries, many ants have long lived underground in entire satisfaction.”

The military also touted the benefits of American society moving underground. “After all, sunlight isn’t so wonderful. You have to be near a window to benefit by it. With fluorescent fixtures, you get an even light all over the place,” one Pentagon official said, explaining that when Sweden buried factories underground during World War II, the plants were cheaper to run: “No paint bills, no roof-fixing, no window washing.”

Chicago’s approach to helping kids was quite graphic: It recommended parents tattoo children’s blood type under their armpit—but not on the arm itself in case it was blown off—which would help speed blood transfusions to avoid radiation poisoning.

In Kansas, officials calculated they could probably assemble two-million pounds of food after an attack and that if survivors reduced consumption to an “austerity diet” of 2,000 calories, the state’s food stocks could last nearly two months. Besides the official stocks, Kansas’s wildlife could help, too: Its forests, plains, and waters contained, officials believed, 11 million “man-days” of food in rabbit meat, 10 million “man-days” of wild birds, five-million “man-days” of edible fish, and—perhaps most macabre of all—nearly 20 million “man-days” of meat in residential pets. After an attack, officials also planned to confiscate household vitamins for the good of the general population and ration carefully the state’s twenty-eight-day supply of coffee. But those calculations—and the countless others that made up the nation’s post-attack planning—left some officials worried:

“I don’t think we are ever very realistic in our approaches. When we came up against a problem for which we had no answer, usually because ‘we could never get the public to accept such a premise,’ we tried to assume ourselves out of the predicament. Assumptions are great little solvers of problems.”

As part of imagining the post-attack world, the Internal Revenue Service ran studies and exercises on how to calculate and levy taxes after a war. After much study from the 1960s to the 1980s, the Treasury Department and IRS concluded that it would be very challenging to levy taxes after a Soviet strike—employers would have lost records needed for W-2s, IRS agents would struggle to verify pre-attack figures during audits, and it seemed unfair to assess homeowners and business owners on the pre-attack tax assessments of their property, since many would likely have seen values reduced drastically by damage.

“Consider a firm whose principal assets consist of a professional football team valued, pre-attack, at \$15 million. Any plan to levy a net-worth tax post-attack must face up to the fact that this firm’s relative net worth in real terms is certainly not going to be the same as pre-attack.”

One of the IRS studies calculated that as much as \$2 trillion in property might disappear in a large strike. IRS planners recommended that the government itself assume the underlying mortgages of damaged properties to help ensure that the banking system didn’t collapse. Then, instead of relying on income and property taxes to fund the government and the nation’s war mobilization, planners suggested that it would likely be necessary to assess a general national sales tax on all goods after an attack—a tax that might range as high as 20 to 24 percent. Even when planning for a nuclear war the concept of monetary sovereignty is nowhere to be found

In an emergency, the US government intended to pay for all the food and supplies necessary to shelter and feed evacuees across the country—all told about \$2 billion a day—although the money might not be available immediately, so private businesses would be expected to “maintain complete and accurate records to justify claims submitted after the Crisis Relocation emergency.” Stores, medical facilities, laundries, and other vital necessities would be kept open in “host areas” for a minimum of sixteen hours a day to ease access, and most would operate twenty-four hours a day—after all, there wouldn’t be any shortage of available labor. Evacuees in the shelters would sleep alternating head-to-toe, “the best position for sleep, in that it decreases the spread of respiratory ailments,” explained FEMA’s comprehensive 1981 guide, “How to Manage Congregate Lodging Facilities and Fallout Shelters.” Family groups would be placed in the middle of each shelter, with unmarried men and women separated on either side to encourage “high social standards, particularly for sexual behavior.”

The Constitution simply didn’t allow for the flexibility necessary to execute and survive a nuclear war—particularly a surprise attack.

“The tension cannot be resolved. As long as we have nuclear weapons, we’re going to have to fudge on the Constitution.”

The overarching goal of the nation’s emergency plans has always been to preserve the United States—but history has shown that presidents are more than willing to make short-term compromises to America’s traditional freedoms if they feel it necessary for the greater good’s future survival, decisions that have ranged from Abraham Lincoln’s suspension of the writ of habeas corpus in the Civil War to FDR’s internment of Japanese Americans

during World War II. However repulsive such actions may appear in historical hindsight, the commanders-in-chief viewed them as necessary in the moment. As the US Supreme Court argued, in reviewing the martial law invoked on Hawaii in 1941, such measures could be justified by the goal “to create conditions wherein civil government can be rapidly reconstituted.” The precise way that happens, the extent of the compromises, and how rapid the return might be to something resembling normal governance are matters open to future emergencies.

‘Martial law’ has no specific constitutional definition; instead, it’s an informal set of powers cobbled together through existing law and emergency executive authorities. Martial law has been declared in exigent circumstances regularly throughout US history—General Andrew Jackson declared it in New Orleans during the War of 1812, President Lincoln invoked it repeatedly during the Civil War, and Hawaii’s territorial governor invoked it after the attack on Pearl Harbor in 1941. Governors have declared more limited martial law in the face of civil insurrections and natural disasters—during labor strikes in the nineteenth century and early twentieth century, in San Francisco after the 1906 earthquake and subsequent fire, and after labor unrest at the North Dakota state capitol in 1933.

If and when a local or national emergency necessitates martial law, there are, in fact, two vastly different martial law scenarios considered: There’s one version of martial law where, following a fast-moving crisis that affects all three federal branches, the executive branch steps in and runs all of government by fiat, disregarding all of peacetime’s constitutional checks and balances, as well as normal state and local prerogatives. Another even more extreme version, though, might see a designated—or self-designated—military commander step in following a devastating crisis and use the might of the armed services to restore order, perhaps with the blessing of a figurehead presidential successor, before returning leadership and full authority to the civilian government, which might or might not entail traditional power sharing and checks and balances with the legislative and judicial branches.

In addition to making preparations for martial law, Eisenhower had secretly given nine prominent citizens the legal authority to run much of American society after a nuclear war. Secretary of Agriculture Ezra Taft Benson had agreed to serve as administrator of the Emergency Food Agency; Harold Boeschstein, the president of the Owens Corning Fiberglas Company, would lead the Emergency Production Agency; Frank Stanton, the president of CBS, would head the Emergency Communications Agency; and Theodore F. Koop, a vice president at CBS, would direct the Emergency Censorship Agency. High Point had its own television studio, from which the latest updates on the war could be broadcast nationwide. Patriotic

messages from Arthur Godfrey and Edward R. Murrow had already been prerecorded to boost the morale of the American people after a nuclear attack.

A government report later outlined the “obstacle course to recovery” that victims of such nuclear attacks would have to navigate:

- 1–2 days:** Blast and thermal
- 2–20 days:** Lethal fallout
- 2–7 days:** Trapped; no medical treatment
- 5–50 days:** Life support inadequacies (food, water, shelter)
- 2 weeks–1 year:** Epidemics and diseases
- 1–2 years:** Economic breakdown
- 5–20 years:** Late radiation effects
- 10–50 years:** Ecological effects
- 2+ generations:** Genetic effects

Although the human toll would be grim, the authors of the report were optimistic about the impact of nuclear detonations on the environment:

“No weight of nuclear attack which is at all probable could induce gross changes in the balance of nature that approach in type or degree the ones that human civilization has already inflicted on the environment. These include cutting most of the original forests, tilling the prairies, irrigating the deserts, damming and polluting the streams, eliminating certain species and introducing others, overgrazing hillsides, flooding valleys, and even preventing forest fires.”

The implication was that nature might find nuclear warfare a relief.

“A nuclear war could alleviate some of the factors leading to today’s ecological disturbances that are due to current high-population concentrations and heavy industrial populations.”

“At times I simply could not believe what I was being shown and told, causing me to doubt my own comprehension. It was an unnerving experience for me personally. It was just a huge

mechanical war plan aimed at creating maximum damage without regard to the political context. I concluded that the United States had surrendered political control over nuclear weapons to a deterministic theory of war that ensured an unprecedented devastation of both the Soviet Union and the United States. And the president would be left with two or three meaningless choices that he might have to make within 10 minutes after he was awakened after a deep sleep late some night.

A policy of launch on warning was absurd and irresponsible, and implementing the SIOP under any conditions would be the height of folly. The SIOP now called for the Soviet Union to be hit with about ten-thousand nuclear weapons. But what disturbed me the most about the Joint Strategic Target Planning Staff in Omaha was that they didn't seem to have any post-attack plans: Things would just cease in their world about 6 to 10 hours after they received the order to execute the SIOP."

Just months after construction on NORAD began, the continent's entire airspace was closed for twelve hours—grounding all civilian air traffic—so that SAC's bombers could simulate a Soviet attack on the country and test North America's defense. The SKY SHIELD II exercise, on October 14, 1961, became known in aviation circles as "The Day the Planes Stood Still." Hundreds of NORAD fighters and SAC bombers took to the air to dogfight over American cities, as bombers tried to sneak south from Canada and evade early warning radars. Chaff from dogfights rained down on homes and businesses up and down the East Coast. Even as the generals involved trumpeted the exercises as the "greatest in all our history," the true results, not declassified until the 1990s, were horrifying: No more than a quarter of the "invading" bombers would have been intercepted and much of the country would have been destroyed by the enemy "attack," even with defenders' full knowledge the attack was coming that day.

For many years, the only time the NORAD bunker at Cheyenne Mountain has entered the public consciousness is around Christmas, when its half-century tradition of tracking Santa Claus makes headlines. The practice of carefully monitoring the path of the sleigh and eight tiny reindeer grew out of a child's innocent wrong number on November 30, 1955. By transposing two digits, the boy reached the Combat Operations Center at the forerunner of NORAD. He asked the man who answered the phone if there was a Santa Claus, and a confused Colonel Harry Shoup responded gruffly:

"There may be a guy called Santa Claus at the North Pole,

but he's not the one I worry about coming from that direction."

That unexpected telephone call, though, gave the air defense team an idea. By Christmas, the Continental Air Defense Command had put together a "Santa tracking" operation and issued a press release predicting that according to its radars the jolly old fellow was on track to arrive in the US on Christmas Eve. In the 1960s, NORAD sent out vinyl records to radio stations that included holiday music from the NORAD house band and prerecorded "reports" about Santa's progress. From year to year, the program grew in ambition as Santa and Christmas became a Cold War bludgeon against the atheistic Communist Soviet Union and offered a friendly sheen over the deadly watch NORAD regularly kept. In the 1970s, NORAD ran three-minute-long TV commercials showing them scrambling jet fighters to intercept an unknown radar track down from the North Pole that turned out to be Santa Claus.

The tradition continued and morphed in the years since, now including a significant online component, with corporate sponsors, fancy graphics, and maps to allow children to follow Santa as he rounds the globe at noradsanta.org. At the command center each Christmas Eve, hundreds of military personnel still answer the phone to update children on Santa's progress, and more than 20 million people visit the website. In recent years, as the program has expanded to include mobile apps and games, Former First Lady Michelle Obama even took a handful of telephone calls, patched through from NORAD to the first family's vacation in Hawaii.

Under FEMA's plans, the agency had a multistage effort for informing civilians about how best to evacuate. First, the agency would air across the country a twenty-five-minute bilingual film, produced in 1978, *Protection in the Nuclear Age*, outlining the threat and putting an optimistic view on a horrible catastrophe, underscoring at every turn that survival was not only possible but—with planning—probable. Copies of the film were distributed in advance to civil defense officials and television stations, and fifteen prewritten newspaper articles distributed by FEMA covered much of the same ground. The low-tech film featured only illustrations and animations of stick figures—no live action—because by the 1970s civil defense planners had grown tired of retaping propaganda films each time fashion or car styles changed. As one FEMA official explained, "Stick figures don't get obsolete."

Nuclear war was enough of a possibility when CNN launched in the early 1980s that its founder, Ted Turner, prepared a video to air during the final moments of life on earth. As Turner said:

"We'll be on, and we will cover the end of the world, live, and that will be our last event. We'll play the National Anthem

only one time, on the first of June [when the network premiered], and when the end of the world comes, we'll play Nearer My God to Thee before we sign off."

It was the same hymn the band aboard the Titanic played during the ship's final moments. The no-frills recording of a joint US military band and honor guard standing at attention sat in the network's archives for years. Slugged as "Turner Doomsday Video," the program's notes read, "HFR till end of the world confirmed," using the network's abbreviation for "hold for release."

"We knew we would only sign off once, and I knew what that would mean."

Ronald Reagan was asked:

"Is there a winnable nuclear war?"

Standing at the podium in the East Room, Reagan answered quickly:

"It's very difficult for me to think that there's a winnable nuclear war, but where our great risk falls is that the Soviet Union has made it very plain that among themselves, they believe it is winnable. And believing that makes them constitute a threat."

Reagan's conclusion was actually at odds with the Soviet Union's own public statements. That same month, Brezhnev had been blunt about his own fears:

"It is dangerous madness to try to defeat each other in the arms race and to count on victory in nuclear war. Only he who has decided to commit suicide can start a nuclear war in the hope of emerging a victor from it."

On January 25, 1991, General George Lee Butler became the head of the Strategic Air Command. During his first week on the job, Butler asked the Joint Strategic Target Planning Staff to give him a copy of the SIOP. General Colin Powell and Secretary of Defense Dick Cheney had made clear that the United States needed to change its targeting policy, now that the Cold War was over. As part of that administrative process, Butler decided to look at every single target in the SIOP, and for weeks he carefully scrutinized the thousands of desired ground zeros. He found bridges and railways and roads in the middle of nowhere targeted with multiple warheads, to assure their destruction. Hundreds of nuclear warheads would hit Moscow—dozens

of them aimed at a single radar installation outside the city. During his previous job working for the Joint Chiefs, Butler had dealt with targeting issues and the damage criteria for nuclear weapons. He was hardly naïve. But the days and weeks spent going through the SIOP, page by page, deeply affected him. For more than forty years, efforts to tame the SIOP, to limit it, reduce it, make it appear logical and reasonable, had failed.

“With the possible exception of the Soviet nuclear war plan, this was the single most absurd and irresponsible document I had ever reviewed in my life. I came to fully appreciate the truth: we escaped the Cold War without a nuclear holocaust by some combination of skill, luck, and divine intervention, and I suspect the latter in greatest proportion.”

In 2005, Indiana senator Richard Lugar surveyed eighty-five national security experts about the possibility of a nuclear detonation “somewhere in the world.” They placed the odds of an attack within the next ten years at around 29 percent. More than ten years have now elapsed, and it doesn’t seem like such a scenario was ever particularly close to coming to fruition. Yet as we continue to look forward, it always seems plausible. In 2010, CBS did a story on the possibility of nuclear terrorism. Martin Hellman, a professor emeritus at Stanford (specializing in engineering and cryptography), estimated that the odds of this event increase about one percent every year and will approach 40 percent in five decades.

Certainly, there’s a logic ladder here that’s hard to refute. An organization like ISIS would love to possess a nuclear weapon, and the potential availability of nuclear technology is proliferating. Everything we know about the group’s ethos suggests that if ISIS were to acquire such a weapon, they would want to use it immediately. If the target wasn’t Israel or France, the target would be the United States. Based on common sense and recent history, the two cities most likely to be attacked would be New York and Washington, D.C. So if one believes that a nuclear weapon will be detonated in their lifetime (which seems probable for a vast majority of the population), and one believes it will happen on US soil (which seems possible), and one lives in New York or D.C., they’re consciously raising their family in one of the few cities where they suspect a nuclear weapon is likely to be utilized. Based on this rationale, it would make way more sense for them to move to Portland, where there’s only a 10 percent chance they’ll drown in a tsunami.

None of the roughly seventy-thousand nuclear weapons built by the United States since 1945 has ever detonated inadvertently or without proper authorization. The technological and administrative controls on those

weapons have worked, however imperfectly at times—and countless people, military and civilian, deserve credit for that remarkable achievement. Had a single weapon been stolen or detonated, America's command-and-control system would still have attained a success rate of 99.99857 percent. But nuclear weapons are one of the most dangerous technologies ever invented. Anything less than 100 percent control of them, anything less than perfect safety and security, would be unacceptable. And if this book has any message to preach, it is that human beings are imperfect.

One measure of a nation's technological proficiency is the rate of industrial accidents. That rate is about two times higher in India, three times higher in Iran, and four times higher in Pakistan than it is in the United States. High-risk technologies are easily transferred across borders; but the organizational skills and safety culture necessary to manage them are more difficult to share. Nuclear weapons have gained allure as a symbol of power and a source of national pride. They also pose a grave threat to any country that possesses them.

Idealistic rhetoric at the UN has not yet been followed, however, by the difficult steps that might lead to the elimination of nuclear weapons: passage of the Comprehensive Nuclear Test Ban Treaty by the US Senate; major reductions in the Russian and American arsenals; arms control talks that include China, India, Pakistan, North Korea, and Israel; strict rules on the production and distribution of fissile materials; and harsh punishments for countries that violate the new international norms. The recent withdrawal of the US from bans on the testing of certain kinds of weapons, along with the fact that China was never a signatory, leads us increasingly towards another arms race.

For the United States, abolishing nuclear weapons ought to be an urgent national security priority. So too should preserving our planet. These are the meta-challenges of our time. Addressing them promises to be the work of decades. Yet ridding the world of nuclear weapons is likely to prove far more plausible and achievable than ridding the world of evil. Transforming humankind's relationship to the environment, which will affect the way people live their daily lives, can hardly prove more difficult than trying to transform the Greater Middle East.

Nuclear weapons are unusable. Their employment in any conceivable scenario would be a political and moral catastrophe. For the United States, they are becoming unnecessary, even as a deterrent. Certainly, they are unlikely to dissuade the adversaries most likely to employ such weapons against us: extremists intent on acquiring their own nuclear capability. If anything, the opposite is true. By retaining a strategic arsenal in readiness—and by insisting that the dropping of atomic bombs on two Japanese cities

in 1945 was justified—the United States continues tacitly to sustain the view that nuclear weapons play a legitimate role in international politics—this at a time when our own interests are best served by doing everything possible to reinforce the existing taboo against their further use.

Furthermore, the day is approaching when the United States will be able to deter other nuclear-armed states without itself relying on nuclear weapons. Modern conventional weapons possess the potential to provide a more effective foundation for deterrence. They offer highly lethal, accurate, responsive second-strike (or even first-strike) capabilities. Precision conventional weapons also carry fewer of the moral complications that make nuclear weapons so inherently problematic. Hence, they have the added advantage of being usable, which enhances credibility.

Hell, even if one assumes that nuclear weapons possess any real utility, what conceivable target set would require more than 100 warheads to destroy?

The strategy of minimum deterrence has lately gained strong support, even in some unexpected places. In 2010 a group of high-ranking Air Force officials, including its chief of strategic planning, argued that the United States needed only 311 nuclear weapons to deter an attack. Any more would be overkill. The arsenal proposed by these Air Force strategists would contain almost 200 fewer weapons than the one recommended by the National Resources Defense Council and the Federation of American Scientists, a pair of liberal groups that also support minimum deterrence. Others argue for the United States to get rid of its land-based missiles, take all its weapons off alert, give up the notion that a counterforce strategy might work, and retain a few hundred ballistic missiles securely deployed on submarines. To avoid accidental launches and mistakes, the subs shouldn't be capable of firing their missiles quickly. And to dissuade foreign enemies from attacking the United States, we would let them know in advance where America's warheads might land on their territory. That knowledge would deter any rational world leader.

But the problems with a strategy of minimum deterrence have changed little in the past fifty years. It cannot defend the United States against an impending attack. It can only kill millions of enemy civilians after the United States has already been attacked.

It Can't Happen Here

The sociologist Charles B. Perrow began his research on dangerous technologies in August 1979, after the partial meltdown of the core at the Three Mile Island nuclear power plant. In the early minutes of the accident, workers didn't realize that the valves on the emergency coolant pipes had mistakenly been shut—one of the indicator lights on the control panel was hidden by a repair tag. Perrow soon learned that similar mistakes had occurred during the operation of other nuclear power plants. At a reactor in Virginia, a worker cleaning the floor got his shirt caught on the handle of a circuit breaker on the wall. He pulled the shirt off it, tripped the circuit breaker, and shut down the reactor for four days. A light bulb slipped out of the hand of a worker at a reactor in California. The bulb hit the control panel, caused a short circuit, turned off sensors, and made the temperature of the core change so rapidly that a meltdown could have occurred. After studying a wide range of “trivial events in nontrivial systems,” Perrow concluded that human error wasn't responsible for these accidents. The real problem lay deeply embedded within the technological systems, and it was impossible to solve:

“Our ability to organize does not match the inherent hazards of some of our organized activities.”

What appeared to be the rare exception, an anomaly, a one-in-a-million accident, was actually to be expected. It was normal.

The most dangerous systems had elements that were “tightly coupled” and interactive. They didn't function in a simple, linear way, like an assembly line. When a problem arose on an assembly line, you could stop the line until a solution was found. But in a tightly coupled system, many things occurred simultaneously—and they could prove difficult to stop. If those things also interacted with each other, it might be hard to know exactly what was happening when a problem arose, let alone know what to do about it. The complexity of such a system was bound to bring surprises.

“No one dreamed that when X failed, Y would also be out of order and the two failures would interact so as to both start a fire and silence the fire alarm.”

Dangerous systems usually required standardized procedures and some form of centralized control to prevent mistakes. That sort of management was likely to work well during routine operations. But during an accident, Perrow argued, “those closest to the system, the operators, have to be able

to take independent and sometimes quite creative action.” Few bureaucracies were flexible enough to allow both centralized and decentralized decision-making, especially in a crisis that could threaten hundreds or thousands of lives. And the large bureaucracies necessary to run high-risk systems usually resented criticism, feeling threatened by any challenge to their authority.

“Time and time again, warnings are ignored, unnecessary risks taken, sloppy work done, deception and downright lying practiced.”

The instinct to blame the people at the bottom not only protected those at the top, it also obscured an underlying truth. The fallibility of human beings guarantees that no technological system will ever be infallible.

Some have called Three Mile Island the most studied accident in US history, at least up to that time. Two weeks after the accident, President Carter appointed the Kemeny Commission to investigate the accident's causes and recommend ways to prevent recurrence. The US Senate conducted its own investigation. The NRC conducted several investigations. The US nuclear industry held its own Three Mile Island postmortem. The various examiners generally agreed that the accident largely resulted from safety studies and reviews that focused too narrowly on nuclear plant designs and hardware and not sufficiently on the human part of the safety equation.

Some of the most damning language came from the twelve-member commission chaired by Dartmouth College president John G. Kemeny. The Kemeny Commission issued a blunt report in October 1979 after an intensive six-month investigation.

“[T]he fundamental problems are people-related problems and not equipment problems,” the commission wrote. “[W]herever we looked, we found problems with the human beings who operate the plant, with the management that runs the key organization, and with the agency that is charged with assuring the safety of nuclear power plants.” The commission also pointed a finger at “the failure of organizations to learn the proper lessons from previous incidents.” As a result, “we are convinced,” the commission wrote, “that an accident like Three Mile Island was eventually inevitable.”

At the heart of the problem, the report said, was a pervasive attitude that nuclear power was already so safe that there was no need to consider extra precautions. The Kemeny Commission urged that “this attitude be changed to one that says nuclear power is by its very nature potentially dangerous, and, therefore, one must continually question whether the safeguards already in place are sufficient to prevent major accidents.”

The nuclear industry was uncowed by these conclusions. Instead, it trumpeted another finding from the report:

“[I]n spite of serious damage to the plant, most of the radiation was contained and the actual release will have a negligible effect on the physical health of individuals.”

In the decades to follow, nuclear power supporters would rally behind this statement and repeat the shibboleth “Nobody died at Three Mile Island.” This would become a huge stumbling block to comprehensive safety reform.

“Fixes, including safety devices, sometimes create new accidents,” Charles Perrow warned, “and quite often merely allow those in charge to run the system faster, or in worse weather, or with bigger explosives.” Normal accident theory isn’t a condemnation of modern technological systems. But it calls for more humility in how we design, build, and operate them.

In near misses, the plant owners and the NRC pointed to the lack of damage as proof that the safety margins built into US reactors and regulations were adequate. That kind of logic, critics have long said, is akin to arguing that if a drunk driver makes it home safely, the public doesn’t need to worry about drunk driving.

One direct response to Three Mile Island by the US nuclear industry was the creation of the Institute of Nuclear Power Operations (INPO). Among other things, INPO functions as an information clearinghouse for the industry—and to some degree as a shadow regulator.

The *déjà vu* sequence of events that led to the Three Mile Island accident eighteen months after a similar occurrence at Davis-Besse was not unique. In the 1970s, nuclear utilities shared little information with each other. Companies were needlessly vulnerable to common problems because of a lack of real-time communication about operating glitches and equipment malfunctions. Now, INPO requires plant owners to share good and bad practices. The goal is to enable everyone to learn from a mistake or malfunction without necessarily having to experience it firsthand.

INPO also established standards of excellence and periodically evaluates each nuclear plant against those standards. But the sharing only goes so far. The INPO assessment reports are among the most closely guarded nuclear industry secrets in the United States. Not even the NRC gets a copy. The nuclear industry defends this secrecy on the grounds that the assessments can be brutally frank—benefits apparently missing from publicly available (and often unjustifiably tame) NRC assessment reports.

In 1993, the public interest group Public Citizen obtained confidential INPO safety reports for all US nuclear plants and compared them with the assessments prepared by the NRC over the same period. Of 463 problems cited by INPO at fifty-six plants, only about a third showed up as matters of concern in the NRC’s reports. INPO identified 185 specific plant problems

the NRC reviews did not address, and in 115 cases the NRC praised plant performance that INPO had red flagged.

A spokesman for the nuclear industry explained the differences:

“The NRC’s mission is to regulate the industry. INPO’s mission is to be painfully candid, come into a plant and lay it bare.”

Another downside of the secrecy—beyond hiding a useful yardstick for the NRC’s own inspection performance—is that the public never knows to what extent nuclear utilities implement INPO’s recommendations to fix problems.

In 1980, the NRC required that plant owners draw up evacuation plans for the public within ten miles of each plant. (Compare that with the NRC’s recommendation that US citizens within fifty miles of Fukushima be advised to leave.) It also mandated that biennial emergency exercises be conducted at each nuclear plant site. During the exercise, a plant accident is simulated and the Federal Emergency Management Agency evaluates the steps local, state, and federal officials take to protect the public from radiation. In parallel, the NRC evaluates how well plant workers respond to the simulated accident and work with off-site officials.

The biennial exercises are better than nothing, but not by much. In the simulation, winds are assumed to blow in only one direction, conveniently but unrealistically limiting the number of people in harm’s way. The evacuations are only simulated, so there is no way to tell if the complicated logistics of evacuating all homes, businesses, schools, hospitals, and prisons could be successfully carried out. Instead, the exercises merely verify that officials have the right phone numbers and contractual agreements for the buses to carry evacuees and the hospitals to treat the injured and contaminated. These exercises only provide an illusion of adequate preparation. As the Fukushima experience painfully demonstrated, rapidly moving people out of harm’s way in the midst of a nuclear crisis is exceedingly difficult, yet critical.

During the Fukushima crisis, a worried White House, members of Congress, and the American public were pressing the NRC for answers to two fundamental questions: Can an accident like Fukushima Daiichi happen here? And if so, what needs to be done to prevent it? The answers recited so often in the past—that nuclear power was inherently safe and that the existing regulations provided ample public protection—might not wash this time. After all, that’s exactly what the Japanese had claimed.

The hastily formed NRC Near-Term Task Force (NTTF), consisting of six senior experts, began its review on March 30, 2011. One of the first and

most obvious issues it would have to take on was whether US plants were adequately prepared to deal with the kind of prolonged station blackout that Fukushima had experienced. Under the rule in existence since 1988, all American plants had to show they could cope with a simultaneous loss of off-site and on-site AC power for a certain period. At the majority of plants, the required coping time was just four hours; at one it was sixteen hours; for the remainder, it was eight.

The NRC countenanced several different approaches for coping with a blackout. One was to rely on batteries for DC power to control plant cooling systems that did not require AC power to function. Because these systems eventually would stop working even with DC power, the NRC restricted reliance on batteries for coping to no more than four hours. To prove they could cope for longer periods, plants would have to add AC power sources beyond the two emergency diesel generators they were already required to have. They could do this by purchasing additional generators or by connecting to power supplies from gas turbines, hydroelectric dams, or even adjacent reactors. The latter option was possible because the NRC permitted licensees to assume that a station blackout would affect only one reactor at a site. Consequently, licensees could assume that equipment from a “nonaffected” reactor would be available to assist the “affected” reactor.

Each plant determined the coping time it would need based on specific factors such as the duration of off-site power outages experienced in the past. But the NRC did not require that coping time analyses postulate extreme events that could cause prolonged outages. Nor did it require that coping strategies evaluate the possibility that alternate AC sources—like those at a reactor next door—might also become unavailable. And finally, it did not envision the possibility that flooding or fire could disable a reactor’s own electrical systems, so that even if power sources were available they might not be usable.

The station blackout rule was casual about these matters in part because a blackout was considered a beyond-design-basis accident. Therefore, the requirements addressing it did not need to be as stringent.

The lax provisions of the station blackout rule were consistent with the NRC’s logic: more robust protection simply wasn’t needed because this kind of event was so improbable.

After the ten-day-long blackout at Fukushima Daiichi, these coping times appeared ridiculously low, and the agency found itself having to justify why immediate action wasn’t needed to extend them. At an NRC briefing on station blackouts on April 28, Commissioner Kristine L. Svinicki asked the staff a question that might have reflected some of what she and her colleagues were hearing, especially about the four-hour limit on batteries.

“Just to a layperson, when they come to you and say, ‘Is it really only four hours that nuclear power plants have to cope with some sort of event of a long duration?’ If you were talking to a family member, what would you say to that?”

The reply of NRC staff member George Wilson had a familiar logic:

“[H]ow I’ve answered is that we’ve only had one station blackout in the United States. Our diesels are very reliable, and they restored that power within fifty-five minutes. I also explain that we have redundant power supplies. So you have to have something to take out multiple sources of power. And once I explain that usually they stop, or I run overboard.”

It seemed the NRC’s only fallback was to say yet again, in effect:

“It can’t happen here.”

When the five NRC commissioners sat down with the task force to have their first public discussion of the report, two of them promptly expressed doubt about the need for fundamental changes in regulation. Commissioner Svinicki asked whether some of the task force’s recommendations, notably those calling for increasing safety margins as a hedge against uncertainty, represented a “repudiation” of the NRC’s increasing reliance on “risk-informed regulation.” Commissioner William C. Ostendorff also took exception to the need for a major overhaul. “I personally do not believe that our existing regulatory framework is broken,” he said. And, he added, any policy changes needed to be done in consultation with “our stakeholders.”

The largest and most influential of those stakeholders, of course, is the nuclear industry. And that industry has always believed that the best defense is a good offense. Its leaders were hurriedly organizing their Fukushima response, hoping to head off new rules. From the industry’s point of view, voluntary actions it devised on its own were preferable to mandatory ones handed down by the NRC, and it soon put forward its own ideas. This tactic was nothing new. The NRC’s embrace of industry-proposed measures over many years was responsible, in part, for the patchwork of regulations criticized by the task force and others.

A tortuous logic flourishes within the commission and influences its decisions. The NRC has always been reluctant to take actions that could call into question its previous judgments that nuclear plants were adequately safe. If it were to require new plants to meet higher safety standards than old ones, for example, the public might no longer accept having an old one

next door. So the NRC is constantly engaged in an elusive quest for a middle ground from which it can direct needed improvements without having to concede that the plants were not already safe enough, thereby alarming the citizenry.

It is not clear, even with the ruins of Fukushima in full view, that the NRC is willing to break out of that pattern. In that regulatory balancing act, what has evolved over the years is a debate over “how safe is safe enough.” In making its determinations on that issue, the NRC has all too often made choices that aligned with what the industry wanted but left gaping holes in the safety net.

There may be no better example than the long-standing controversy over the Mark I boiling water reactor design. Back in 1989, the NRC staff warned the commissioners:

“Mark I containment integrity could be challenged by a large scale core melt accident, principally due to its smaller size.”

The staff argued that certain Mark I containment failure modes, such as liner melt-through, could not be stopped should a core meltdown occur. The only strategy was to prevent meltdowns in the first place—and for that the backup coolant supplies and hardened containment vents were crucial.

Reluctant to directly confront the industry on such a sensitive issue, the NRC gave Mark I owners an offer they couldn’t refuse: install hardened containment vents voluntarily or the NRC staff would conduct plant-specific backfit analysis to determine if the agency could legally require them to comply. The commission’s offer presented an easy choice for most Mark I owners. If they installed the vents as a voluntary initiative, they would not have to submit a license amendment to the NRC for approval, and the NRC would have almost no regulatory control over the vents.

Although the NRC set basic standards for the design, construction, maintenance, and testing of the vents, Mark I operators would be under no obligation to meet them. The NRC would also have no authority to issue violation notices if it found problems, unless the vents interfered with other safety systems. In contrast, if the agency could show that the hardened vents passed the backfit test, it could force reactor owners to install and maintain them on the NRC’s terms.

If the commissioners had taken effective action—action that would have sent a strong message to Mark I operators around the world, including those in Japan—it is quite possible that the worst consequences of Fukushima might have been avoided. Instead, the matter fell into a regulatory morass of competing interests and emerged with a resolution that accomplished little. It wasn’t the first time that had happened.

In the aftermath of the 1979 Three Mile Island accident, the Kemeny Commission made clear that the safety status quo was inadequate. However, the panel explicitly refused to give its own views on “how safe is safe enough.” Without any useful external guidance, the NRC embarked on a multi-decade struggle to provide an acceptable answer to this issue, the bane of regulators everywhere. It is without doubt a difficult public policy question, but the NRC’s methods of addressing it have only created more confusion over the decades. Fukushima makes one thing clear: the process has not yielded the right answer.

In 1981, President Ronald Reagan issued an executive order barring federal agencies from taking regulatory action “unless the potential benefits to society outweigh the potential costs to society.” Although such a cost-benefit analysis approach sounded reasonable to those seeking a way to reduce government interference, it was controversial for its coldly reductionist attempt to convert the value of human lives into dollar figures that could be directly compared to the costs incurred by regulated industries.

The NRC had carried such a number on its books since the mid-1970s: \$1,000 per person-rem, a term used to characterize the total radiation dose to an affected group of people. Based on today’s understanding of cancer risk, that put the value of a human life between \$1 and \$2 million. The NRC failed to adjust for inflation for years, finally doubling the figure in the 1990s to about \$3 million per life. That was about a half to a third the value placed on a human life by other federal agencies.

In the NRC’s world, the issue of “how safe is safe enough” is addressed through the concept of “adequate protection.” When Congress created the agency out of the ashes of the Atomic Energy Commission, the NRC inherited the mandate bestowed upon its predecessor by the 1954 Atomic Energy Act: to “provide adequate protection of public health and safety.” The NRC watered down this hazy concept even further by adopting a standard of “reasonable assurance of adequate protection” in its own guidance. The standard was so vague that it essentially gave the NRC and its five political-appointee commissioners a blank check for deciding exactly what constituted adequate protection. In fact, several months after Three Mile Island, NRC chairman Joseph Hendrie said in a speech that “adequate protection means what the Commission says it means.”

The industry’s proposed reduction of the severe accident source term amounted to a bold jujitsu move to turn the NRC’s original effort to strengthen regulations on its head. One requirement the industry was particularly anxious to undermine was the recently imposed ten-mile emergency evacuation zone around every nuclear plant. At the time, the evacuation requirements were causing a firestorm in New York State, where state and

local authorities were blocking operation of the newly constructed Shoreham plant on Long Island by refusing to certify the evacuation plan. Critics claimed the roads of narrow Long Island couldn't handle a mass exodus.

But if the amount of radiation that could escape the plant was so much smaller than previously believed, then perhaps a ten-mile evacuation zone wasn't needed. The NRC made no attempt to hide its skepticism about the industry's source term recalibrations. At a 1983 conference, Robert Bernero, director of the agency's Office of Accident Source Term Programs, called those involved "snake oil salesmen." To help resolve the growing controversy, the NRC commissioned the American Physical Society, a professional association of physicists, to conduct a review of source term research. The physicists concluded that, although the evidence appeared to support reducing the assumed releases of certain radionuclides in certain accidents, there was no basis for the "sweeping generalization" made by IDCOR.

Ultimately, however, the industry's counter-campaign had an effect. Although the NRC refused to accept the industry's arguments, in 1985 the commission abandoned efforts to require protection against severe accidents and withdrew the Advance Notice of Proposed Rulemaking. In fact, the NRC went a step farther, issuing a Severe Accident Policy Statement that declared by fiat that "existing plants pose no undue risk to public health and safety." In other words, there was no need to raise the safety bar to include beyond-design-basis accidents because the NRC's rules already provided "reasonable assurance of adequate protection," the vague but legally sanctioned seal of approval. The NRC had already addressed Three Mile Island issues, and that was enough.

However, in the face of a growing body of research that suggested the safety picture was not quite that rosy, this declaration raised questions more than it provided answers. In the time-honored tradition of government bureaucracies, the NRC resolved to continue studying the issue, kicking the can farther down the road and confusing matters even more. While asserting that there were no generic beyond-design-basis issues at US reactors, the commission held out the possibility that problems might exist at individual plants and that it should take steps to identify them. Even this proved controversial, requiring three years of give-and-take between the NRC and the industry merely to set ground rules for the study.

"Adequate protection is not absolute protection."

The NRC could consider the costs of backfits that would go beyond "adequate protection," the judges ruled. The NRC revised the backfit rule

accordingly in 1988. The court, by tying its decision to the largely arbitrary “adequate protection” standard, had preserved the agency’s free hand to push safety in any direction it wanted. The NRC rebuffed calls to provide a definition of “adequate protection.” The Union of Concerned Scientists failed to get the revised rule thrown out on appeal. Adequate protection would remain “what the Commission says it is.”

The court’s ruling essentially froze nuclear safety requirements at 1988 levels. If new information revealed safety vulnerabilities at operating plants, the NRC would have three options: conclude changes were needed to “ensure” adequate protection; redefine the meaning of ‘adequate protection’ itself; or subject the proposed rules to the backfit test. The NRC also kept a fourth option, an “administrative exemption,” in its back pocket. In any of these cases, most new safety proposals would have to leap a high—perhaps impossibly high—hurdle.

Over time, the NRC staff appeared to lose its appetite for grappling with the industry over new requirements to reduce severe accident risk. Even worse, in response to growing political pressure, the NRC decided to sweep other stubborn issues under the rug. In fact, as Three Mile Island receded into the past and no other Western-designed reactor experienced an event to jolt the memory—Chernobyl didn’t really count, as it was considered an exotic Soviet beast—the agency in the 1990s embraced a sentiment that its requirements were not too lenient but rather too strict.

According to this line of thinking, severe accident risks were already so low that certain regulations could be weakened without significantly affecting safety. The NRC dubbed this approach “risk-informed regulation,” and counted on probabilistic risk assessment data to justify what it euphemistically referred to as “reducing unnecessary conservatism” but actually amounted to removing safety requirements. Risk-informed regulation was seen by critics as a single-edged sword: it was only used to reduce regulatory requirements, never to strengthen them.

Among the first regulations that the NRC set its sights on risk informing was a post-Three Mile Island requirement that all reactors install “recombiners” that could prevent the accumulation of hydrogen during a loss-of-coolant accident. In reconsidering the requirement for the Mark I and II, the NRC’s analysis found that the recombiners would not be needed to prevent hydrogen explosions during the first twenty-four hours after an accident because the reactor containments were inerted with nitrogen. However, the recombiners could be useful after twenty-four hours had passed because the inerting would become ineffective.

Nonetheless, in 2003 the NRC eliminated the recombiner requirement, concluding that removing this equipment would not be “risk significant.”

The reason: the Severe Accident Management Guidelines (SAMGs) at those plants called for operators to vent or purge hydrogen in a severe accident, and the NRC believed that twenty-four hours gave them plenty of time to prepare to get that done. Based on this calculation, the agency concluded that the monetary value of the increased threat to public health was less than what the utilities would save by not having to maintain the recombiners—\$36,000 per year per reactor. Thus the NRC removed regulatory requirements to prevent hydrogen explosions in part by taking credit for voluntary initiatives—SAMGs—that it did not regulate. This type of twisted logic was typical of the risk analysis that enabled the NRC to weaken its regulations at the beginning of the twenty-first century.

Suppose that decades ago the NRC staff had succeeded in pushing through a much more aggressive approach for dealing with Mark I core damage and containment failure risks, including the challenges of a prolonged station blackout. There is no guarantee that the Japanese would have followed suit, but they would have been hard-pressed to ignore the NRC's example. The NRC staff in the 1980s had all but predicted that something like Fukushima was inevitable without the fixes it prescribed, but the agency's timidity—or perhaps even negligence—contributed to the global regulatory environment that made Fukushima possible. The NRC's reliance on the flawed assumption that severe accident risks are acceptably low helped to perpetuate a dangerous fallacy in the United States and abroad. Ultimately, the NRC must bear some responsibility for the tragedy that struck Japan. And the commissioners must acknowledge that unless they fully correct the flawed processes of the past, they cannot truthfully testify before Congress that a Fukushima-like event “can't happen here.”

This line of reasoning formed the backbone of the NRC's strategy for addressing the threat of severe accidents—namely, that events threatening major harm to the public were so unlikely that they didn't need to be strictly regulated, a view shared by Japanese authorities and other members of the nuclear establishment worldwide.

In its risk assessments, the NRC was careful always to multiply high-consequence figures by tiny probabilities, ending up with small risk numbers. That way, instead of having to talk about thousands of cancer deaths from an accident, the NRC could provide reassuring-sounding risk values like one in one-thousand per year. The NRC was so fixated on this point that it insisted that information about accident consequences also had to refer to probabilities. However, critics argued that the probability estimates were so uncertain—and there was so little real data to validate them—that the NRC could not actually prove that severe accidents were extremely unlikely. Therefore, accident consequences should be considered on their own terms.

There was no credible way to calculate the probability of a terrorist attack and come up with a meaningful number. The NRC had long acknowledged this, and consequently did not incorporate terrorist attacks into its probabilistic risk assessments or cost-benefit analyses. After 9/11, no longer able to hide behind its low-probability fig leaf, the NRC struggled to reassure Americans that they had nothing to fear from an attack on a nuclear power plant. While maintaining that nuclear reactors had multiple lines of defense, from robust containment buildings to highly trained operators, the NRC also had to concede that the reactors were not specifically designed to withstand direct hits from large commercial aircraft, and that it was not sure what would happen if such an attack occurred. The industry steered the public discussion toward the straw-man issue of whether or not the plane would penetrate the containment—it couldn't, according to the NEI—even though many experts pointed out that terrorists could cause a meltdown by targeting other sensitive parts of a plant.

To learn more about what could happen in an attack, the NRC commissioned a series of “vulnerability assessments” from the national laboratories, but the results remained largely classified for security reasons. Aside from a series of carefully constructed and vaguely reassuring talking points, the NRC provided few details beyond ‘Trust us.’ Communities near nuclear plants would get few tangible answers about the vulnerability of reactors in their midst.

The early results of the nuclear plant vulnerability assessments that the NRC had been conducting since shortly after the 9/11 attacks indicated, in the agency's view, that the radiological releases and public health consequences resulting from terrorist-caused meltdowns generally wouldn't be as catastrophic as previous studies, including CRAC2, had found. Unfortunately for the NRC, it could not broadcast this good news because the vulnerability studies, being related to terrorist threats, were considered “classified” or “safeguards” information.

But some inside the NRC reasoned that if the agency applied the same analysis methods to accidents instead of terrorist attacks, it might be able to dodge some of the security restrictions and get the information out to the public. State-of-the-Art Reactor Consequence Analyses (SOARCA) was the result. There was a downside. Opening up the analytical process would also expose the staff's methodology and assumptions to unwelcome scrutiny by outsiders. So the NRC planned to keep a veil of secrecy over the SOARCA program itself, stamping the staff's proposal for how to conduct the study, as well as the commission's response, as “Official Use Only—Sensitive Internal Information.”

The NRC would control all information about the study and report the

results only when it was ready, and in a manner that could not be—in its judgment—misinterpreted or misused. From the outset, one commissioner, Gregory Jaczko, objected, arguing that the study guidelines and other related documents should be publicly released. He was outvoted.

With a vast, complex, and uncertainty-ridden study like SOARCA, it wasn't necessary to commit scientific fraud to guide the process to a desired outcome. There were plenty of dusty corners in the analysis where helpful assumptions could be made without drawing attention. The NRC employed a number of maneuvers to help ensure that the study would produce the results it wanted, selectively choosing criteria—in effect, scripting the accident.

It discarded accident sequences that were considered “too improbable,” screening out events that would produce very large and rapid radiological releases, such as a large coolant pipe break. It only evaluated accidents involving a single reactor, even though some of the events it considered, such as earthquakes, could affect both units at either Peach Bottom or Surry. It considered its “best estimate” to be scenarios in which plant personnel would be able to “mitigate” severe accidents and prevent any radiological releases at all; it analyzed scenarios in which mitigation was unsuccessful but pronounced them unlikely. Perhaps most curious was the NRC's decision to assume that lower doses of radiation are not harmful—an assertion at odds not only with a broad scientific consensus but with the NRC's own regulatory guidelines.

The fog grew even thicker when the time came to decide how the study results would be presented. First, the commissioners decreed that figures such as the numbers of latent cancer fatalities caused by an accident should not appear. Instead, the report would provide only a figure diluted by dividing the total number of cancer deaths by the number of all people within a region. For instance, if the study predicted one-hundred cancer deaths among a population of one-million, the individual risk would be $100 \div 1,000,000$ —one in ten-thousand. So rather than saying hundreds or even thousands of cancer deaths would result from an accident—guaranteed to grab a few headlines—the report would state a less alarming conclusion.

And since the NRC's probabilistic risk assessment studies estimated that the chance of such an accident was only about one in one-million per year, the current risk to an individual—probability times consequences—would be far less. To use the same example, it would be one-million times smaller than one in ten-thousand, or a mere one in ten-billion per year: a number hardly worth contemplating. The communication strategy for SOARCA appeared to be taking its inspiration from the old Reactor Safety Study and its discredited comparisons of the risks of being killed by nuclear plant accidents versus meteor strikes.

But there was more obfuscation. The NRC would only reveal the values of these results for average weather conditions, and not the more extreme values for worst-case weather; this was the same strategy of evasion that had gotten the agency in hot water with Congressman Markey and the media back in the days of the CRAC2 report. The commissioners also told the researchers to drop their original plans to include calculations of land contamination and the associated economic consequences. Earlier, the project staff had carried out such calculations for terrorist attacks at two reactor sites with high population density—Indian Point, north of New York City, and Limerick, northwest of Philadelphia—but apparently decided they did not want that kind of information to be made public. According to a staff memo, the models that had been used produced “excessively conservative” results—meaning, in NRC parlance, that the researchers thought the damage estimates were unrealistically high.

When the NRC staff presented preliminary results of the study to the Advisory Committee in November 2007, it appeared that the staff had successfully obtained the conclusions its bosses wanted. First, the staff judged that all the identified scenarios could reasonably be mitigated—that is, plant workers, using B.5.b measures and SAMGs, would be able to stop core damage or block radiation releases from the plant. Even if they failed to prevent the accident from progressing, the news would not be too dreadful: the release of radioactive material would occur later and likely be much smaller than past studies had assumed, resulting in “significantly less severe” off-site health consequences. And finally, the NRC staff was so confident that it stopped the simulations after forty-eight hours, assuming that by then the situation would have been stabilized.

The results that the NRC staff presented to the Advisory Committee were striking. While CRAC2 had found that following a worst-case or “SST1” release, acute radiation syndrome would kill ninety-two people at Peach Bottom and forty-five at Surry, SOARCA found the number of deaths to be exactly zero at both sites. There was no magic—or fundamental improvement in reactor safety—behind this stunning difference. The NRC had just fiddled with the clock. In the CRAC2 study, the radiation release began ninety minutes after the start of the accident, before most of the population within ten miles of the plant had time to evacuate, putting many more at risk. But the NRC had chosen accidents for SOARCA that unfolded more slowly. As a result, for most of the SOARCA scenarios, analysts assumed that the population within the ten-mile emergency planning zone would be long gone before any radiation was released. That way, by the time a release did occur, people would be too far away to receive a lethal dose. This was not an apples-to-apples comparison to the earlier study.

Harder to understand were the far lower numbers of cancer deaths projected by the SOARCA analysis, because even people beyond the ten-mile emergency planning zone could receive doses high enough to significantly increase their cancer risk. Whereas CRAC2 estimated 2,700 cancer deaths at Peach Bottom and 1,300 at Surry for this group, SOARCA project staff told the Advisory Committee that they had instead found twenty-five and zero cancer deaths, respectively. That, too, involved sleight of hand—and some shopping around to find a convenient statistic. Despite a widespread scientific consensus that there is no safe level of radiation, the NRC staff decided to assume that such a level indeed existed: no cancers would develop until exposures reached five rem per year (or ten rem in a lifetime). Any exposure below that would be harmless.

At a 2007 Advisory Committee briefing closed to the public, Randy Sullivan, an emergency preparedness specialist for the NRC, let slip one reason why the SOARCA staff saw the need to use such an unconventional assumption. Apparently, the staff didn't like the numbers it would get if it used the widely endorsed linear no-threshold hypothesis (LNT), which assumes that any dose of radiation, no matter how low, has the potential to lead to cancer. It was an easy choice: assume a high threshold, predict many fewer cancers. Otherwise, the number of cancer deaths predicted by SOARCA would be so large it could frighten people. At the briefing, Sullivan acknowledged:

“We could easily do LNT, just go ahead, issue the source term, calculate it out to 1,000 miles, run it for four days, assess the consequences for, I don't know, 300 years and say 2 millirem times [the population within] 1,000 miles of Peach Bottom. What is that? Eighty-million people. . . We're going to kill whatever. This is a closed meeting. Right? I hope you don't mind the drama. So then we'll say that our best estimate is that there will be many, many thousands, you'll have 2 millirem times 80 million people and you'll claim that you're going to kill a bunch of them.”

It was easy to understand why the project team wanted to believe that plant workers had the ability to mitigate the severe accidents that were analyzed: everything else led to core meltdowns—albeit more slowly than previous studies had found. An example was the SOARCA staff's analysis of a hypothetical “long-term” station blackout at Peach Bottom, which is located about forty-five miles from Baltimore and eighty-five miles from Washington, D.C. The accident scenario proceeded through a grim sequence of events.

First, all electrically powered coolant pumps would stop working. Using batteries, operators could start up the steam-powered RCIC system, but after four hours, the batteries would fail, and after another hour, so would the RCIC. The temperature and pressure within the reactor vessel would quickly rise, and the safety relief valves on the vessel would eventually stick open, steadily releasing steam. With no makeup water available to replace the steam, the fuel would be uncovered in a matter of minutes. At about nine hours, the fuel would start to melt, eventually collapsing and falling to the bottom of the reactor vessel. After about twenty hours, the molten fuel would breach the vessel bottom and spill onto the containment floor, where it would spread out and rapidly melt its way through the steel containment liner. A few minutes later, hydrogen leaking from the containment into the reactor building would cause an explosion, opening up the refueling bay blowout panels and blowing apart the building's roof.

If batteries were not available for those first four hours—if they were flooded from the adjacent Susquehanna, for instance—the resulting “short-term” station blackout would be even worse. In that case, the models predicted that core damage would start after one hour and the containment would fail at eight hours. In either case, once the containment failed a plume of radioactivity would escape the damaged plant and overspread the area.

Part of the problem was that the commissioners had directed that the requirements be “performance based.” The concept behind performance-based regulation is that requirements should not be too prescriptive. The regulator should specify the desired outcome and let the plant owner figure out the best way to achieve it. While advocates of this approach consider it more efficient because it gives owners more flexibility, it actually makes requirements harder to interpret and enforce. The industry is free to write its own playbook, leaving regulators with the burden of figuring out whether or not it meets the regulatory intent of the safety rules.

Highway departments could put up roadside signs saying ‘Don’t Go Too Fast’ or ‘Drive at a Reasonable Pace.’ Instead, they put up signs reading, for example, “Speed Limit 55” or “Maximum Speed 20” so that drivers understand what is expected and law enforcement officers know when to issue traffic tickets. The former signs would constitute entirely useless measures: a car wrapped around a tree must have been traveling too fast, but another barreling through a school zone at 120 miles per hour must be operating at a reasonable speed if it doesn’t strike any children. Safety requires specificity. Lack of specificity invites a free-for-all.

In the early days, when a regulation or order needed interpreting, the NRC would develop a “regulatory guide” and submit it for comment by the affected industry. But over time the roles were often reversed: the industry,

coordinated by NEI, would write the first drafts of guidance documents and the NRC would comment. This shift gave the industry far greater power to shape the conceptual basis for regulatory compliance, leaving the NRC to tinker around the edges. The NEI guidance documents would then serve as boilerplate text for use by all applicants and licensees.

The NEI guidance for the FLEX program was such a template. The NRC required all plant owners to submit plans by the end of February 2013 to demonstrate how they would implement the program to comply with the mitigation strategies order. On February 28, Exelon Corporation, which owns seventeen reactors, submitted its plan for the Peach Bottom plant in south central Pennsylvania. Exelon's proposal was typical of all the plant owners' responses, closely hewing to the NEI's guidance. It clearly demonstrated the shortcomings of the FLEX approach.

The Peach Bottom plant, situated beside the Susquehanna River, has two Mark I BWRs closely resembling Fukushima Daiichi Units 2 and 3. Exelon's plan for dealing with a beyond-design-basis accident there assumed from the get-go that batteries and electrical distribution systems for both AC and DC power would be available. It assumed that off-site personnel called to duty would be able to reach the plant in as little as six hours, not necessarily a realistic assumption in the event of the type of major natural disaster that the emergency plans were being designed for.

For Peach Bottom, Exelon estimated that the batteries needed to run critical equipment, including the RCIC, would last no longer than five-and-a-half hours—but it also asserted that the FLEX generator could be hooked up and ready to start recharging the batteries within five hours. Therefore, there was no need for Exelon to extend the battery capacity. Exelon's plan assumed that additional backup equipment from the closer of two Regional Response Centers, located nearly one-thousand miles away in Memphis, would arrive at Peach Bottom within twenty-four hours. Exelon contended that it could keep the plant stable forever without any off-site assistance, with repeated torus venting, but conceded that it would be better to eventually have an alternative, less radioactive method.

Consistent with NEI's guidance, Exelon's plan allowed FLEX equipment to be stored below flood level on the assumption that workers would have time to move it to a safer place "prior to the arrival of potentially damaging flood levels."

As questionable as these timelines are, they don't take into account the worst case. Exelon found that if a station blackout occurred during refueling, when the entire core of a unit was in the spent fuel pool, there would be no time for the first coping phase at all: FLEX equipment would have to be set up immediately. Exelon asserted that this was not a problem because even

though the pool would start to boil after two-and-a-half hours, the spent fuel would not become uncovered until eight hours had elapsed.

The Peach Bottom FLEX plan is a perfect example of the mind-set that led to Fukushima. It represents industry and regulators scripting an accident with little room for improvisation. If a single assumption fails—say, that workers don't have time to move FLEX equipment to safety in advance of an impending flood—then all the other barriers would collapse like dominoes. Without the FLEX generator, the batteries would fail after five-and-a-half hours and the RCIC could no longer be counted on to cool the reactors. Operators would eventually lose the ability to vent the containment and it would over-pressurize. Backup equipment, located a thousand miles away in Tennessee—and possibly on the other side of massive floodwaters, downed trees, or earthquake destruction—probably would not arrive in time to save the day. Nobody apparently thought those possibilities were worth considering, even after Fukushima Daiichi.

“We already have mobile—diesel-driven mobile pumps on every site in the country that can be moved around the site to provide another contingency measure should we lose a cooling source. And there's countless other measures like that.”

Those measures are known as 'B.5.b,' named after the section of the regulatory orders where they appear. The B.5.b measures, introduced after 9/11 to help workers cope with the aftermath of an aircraft attack, were one case in which performance-based requirements hadn't worked very well. The industry argued against imposing measures it viewed as too prescriptive or specific, contending that there were simply too many potential disaster scenarios to contemplate. Through their lobbying group, plant owners insisted that they needed maximum flexibility to come up with their own solutions. The NRC relented, imposing only very general requirements for the B.5.b equipment and giving the industry a great deal of leeway to design its own strategies.

However, the industry had not thought through its plans to ensure that they would actually work under real-world conditions, such as high radiation fields, excessive heat, and infrastructure damage. These were the very conditions that contributed to the failure of the Japanese severe accident management measures at Fukushima. Yet in a vote on the Fukushima proposals, the commissioners endorsed the B.5.b process as a model for dealing with beyond-design-basis accidents.

For example, utilities must store B.5.b equipment far enough away that it might be able to survive a plane attack on a reactor. But there is no

requirement that the equipment survive other types of disasters, such as an earthquake. When asked about the ability of the emergency pumps to survive an earthquake, officials said that the pumps are not certified to withstand any earthquake at all, much less a severe one. In other words, in the face of a Fukushima-scale event, the B.5.b measures could well be worthless.

Although the B.5.b equipment has been touted as an added layer of safety in the event of a crisis, post-Fukushima inspections by the NRC showed that at many sites the backup equipment would be unlikely to function at all during a severe event, especially one involving a natural disaster such as a flood or an earthquake. This should not have been a surprise, as the NRC had not required that the equipment be safety-grade, or “hardened,” to withstand either design-basis or beyond-design-basis events. In other words, the B.5.b equipment could legitimately have come straight off the shelf from Home Depot. Safety-grade components, on the other hand, must meet stringent quality standards and be rigorously tested to confirm proper performance.

Now, however, the FLEX program was being promoted by some as “B.5.b on steroids.” A better description might be ‘B.5.b on fertility drugs.’ Instead of hardening the B.5.b equipment to safety-grade standards or beyond, the FLEX approach would simply add more unhardened items. Utilities would place multiple units of equipment at diverse locations on- or off-site in the hope that no matter what the catastrophe, something somewhere would survive to cool the reactor core and spent fuel pools. Even though the FLEX approach would require the purchase of more equipment, it would save the industry money because nuclear safety-grade standards are costly and difficult to meet. As Charles Pardee of Exelon Generation Company summed it up in a December 2011 public meeting:

“It’s cheaper to buy three pumps than one and a heckuva big building to put it in.”

Many reactors in the United States are downstream from large dams. A dam failure, whether caused by an earthquake, a terrorist attack, or a spontaneous breach, could rapidly flood one of these plants with little warning, compounding any problems caused by the same event that breached the dam. Although the NRC had known for many years that it was underestimating the threat of dam breaches, the agency was taking its time deciding what to do about it. To some NRC staff members, the catastrophic flooding at Fukushima was a painful reminder of this unresolved vulnerability at home.

The terrorist attacks of 9/11 had reminded the US government of the threat of catastrophic sabotage against critical infrastructure targets. Like

other federal agencies, the NRC began to reassess the vulnerabilities of nuclear plants. Those included more than terrorists piloting jetliners. An attack on a dam located upstream of nuclear facilities posed a hazard greater than previously thought. And the terrorist threat alerted the NRC to the dangers of accidental failures of upstream dams as well.

Citing domestic security concerns, the NRC concealed for many years its growing worry about the threat to reactors posed by a dam collapse. Thirty-four reactors at twenty sites around the country are downstream from large dams. A dam failure could rapidly inundate a nuclear plant and disable its vital power supplies and cooling systems. The risk of such failures was not taken into account in the design-basis flooding analyses when the plants were licensed. Other causes of flooding, such as rainfall, were considered, but these pose far less risk because the water would rise more gradually, providing greater time to prepare. The issue became public in 2012 when an NRC whistleblower accused the agency of covering up information about the vulnerability.

One plant appeared especially at risk: the three-unit Oconee Nuclear Station in South Carolina. More than 1.4 million people live within fifty miles of Oconee. Although the agency and the company disagreed about the risks there, they did agree on one thing: the consequences—a prolonged station blackout leading to core melting in less than ten hours and containment failure in less than three days. A significant radioactivity dose to the public would result.

Most of the Fukushima responses drafted for the NRC chairman also contained what was marked as “additional, technical non-public information,” which tended to paint a somewhat different picture of the situation. For example:

Q: “What happens when/if a plant ‘melts down’?”

A: *Public answer:* “In short, nuclear power plants in the United States are designed to be safe. To prevent the release of radioactive material, there are multiple barriers between the radioactive material and the environment, including the fuel cladding, the heavy steel reactor vessel itself, and the containment building, usually a heavily reinforced structure of concrete and steel several feet thick.”

Nonpublic addendum: “The melted core may melt through the bottom of the vessel and flow onto the concrete containment floor. The core may melt through the containment liner and release radioactive material to the environment.”

Q: “Will this incident affect new reactor licensing?”

A: *Public answer:* “It is not appropriate to hypothesize on such a future scenario at this point.”

Nonpublic addendum: “This event could potentially call into question the NRC’s seismic requirements, which could require the staff to re-evaluate the staff’s approval of the AP1000 and ESBWR [new reactor] design and certifications.”

As to the question about the risk to US residents from fallout, the public answer—the one that downplayed dangers because of distance—also included a non-public detail that didn’t sound quite so optimistic:

“NRC is working with DHS, EPA, and other federal partners to ensure monitoring equipment for confirmatory readings is properly positioned, based on meteorological and other relevant information.”

It’s unclear for whom the “non-public” information was intended, but the public responses were utilized repeatedly in coming days.

TEPCO was in a fight for its own survival. A company that many believed was too big to fail would soon become a ward of the state. This was more than just a corporate icon falling on hard times. Soon, the cost of TEPCO’s lax oversight, failed planning, and propensity for high-stakes gambles would shift from a private debt to a massive public one. Estimates of the cost of cleanup and compensation to victims of the Fukushima Daiichi accident were pegged at more than \$71 billion (6.6 trillion yen) by late 2012.

To critics of the status quo, the months following the accident had provided some hope that change was possible. During the summer of 2011, the government had imposed power restrictions on large corporate users. Voluntary conservation efforts had been surprisingly successful. Electricity consumption during steamy August had dropped by about 11 percent. The usual chill of air conditioning was gone, as were coats and ties. Some manufacturing operations moved to off-peak nights and weekends. Even some night baseball games were switched to daytime. That led to speculation that reduced consumption could become the norm and there would be no need to restart the reactors. The nation stood at a crossroads, activists argued, needing only visionary leadership to map out a new energy policy.

Shareholder proposals to reject nuclear power were soundly voted down at all the meetings. Unsurprisingly, the utilities’ main institutional investors—life insurers and banks—voted with the company managements on this issue. The status quo seemed to them a safer bet.

Despite their economic benefits, not all neighboring communities were eager to see the Ohi reactors returned so quickly to service. Having a nuclear neighbor once seemed attractive to nearby towns, but that was before they had witnessed the consequences of an accident—the depopulation of a large region, widespread contamination, health risks, uncertainty about a return to normal life. At the height of the restart debate, the government announced that 18 percent of all Fukushima evacuees—including those as far as thirty miles away—might not be able to return to their homes for ten years because of radiation levels. As a result, some argued that if communities tens or even hundreds of miles away were vulnerable to nuclear plant accidents, they too should have a say in the plants' operation. And the calculus might be different for such communities, since they would be exposed to the risks without receiving any of the benefits. That was something new in Japan.

With opposition from local officials and weekly demonstrations in the capital threatening to derail plans for a quick restart at Ohi, Prime Minister Noda stepped up the rhetoric. “Japanese society cannot survive” without the reactors, he warned on national television. And he offered assurances that the government would “continue making uninterrupted efforts” to improve nuclear safety. The growing pressure from Tokyo and Japan's business community had its effect. Local government opposition to the Ohi restart faded, with officials agreeing to a “limited” restart at least through the summer months. On June 16, the Noda government officially gave the go-ahead to restart Ohi Units 3 and 4. Trade Minister Yukio Edano acknowledged public opinion polls were running solidly against the restart.

“We understand that we have not obtained all of the nation's understanding.”

The safety philosophy and regulatory process that governed Fukushima were not fundamentally different from those that exist elsewhere, including the United States. The reactor technology was nearly identical. The reality is that any nuclear plant facing conditions as far beyond its design basis as those at Fukushima would be likely to suffer an equivalent fate. The story line would differ, but the outcome would be much the same—wrecked reactors, off-site radioactive contamination, social disruption, and massive economic cost. The catastrophe at Fukushima should not have been a surprise to anyone familiar with the vulnerabilities of today's global reactor fleet. If those vulnerabilities are not addressed, the next accident won't be a surprise, either.

In the United States, ‘it can't happen here’ was a common refrain while details of the Fukushima accident were still unfolding. In June 2011, for

example, Senator Al Franken joked that “the chances of an earthquake of that level in Minnesota are very low, but if we had a tsunami in Minnesota, we’d have bigger problems than even the reactor.” Senator Franken’s casual attitude illustrates the problem. Yes, it is unlikely that a tsunami will sweep into the northern plains. But serious potential threats to reactors do exist in his home state, as well as the states of many other members of Congress. Two pressurized-water reactors at the Prairie Island nuclear plant, southeast of Minneapolis, are among the thirty-four reactors at twenty sites around the United States downstream from large dams. A dam failure could rapidly inundate a nuclear plant, disabling its power supplies and cooling systems, not unlike the impact of a tsunami.

Nor is a dam failure the only type of accident that could create Fukushima-scale challenges at a US nuclear plant. Fire is another. A fire could damage electric cabling and circuit boards, cutting off electricity from multiple backup safety systems as flooding did at Fukushima. The NRC adopted fire-protection regulations in 1980 following a very serious fire in March 1975 at the Browns Ferry nuclear plant in Alabama.

A worker using a lit candle to check for air leaks accidentally started a fire in a space below the control room. The fire damaged electrical cables that disabled all of the emergency core cooling systems for the Unit 1 reactor and most of those systems for the Unit 2 reactor. Only heroic actions by workers prevented dual meltdowns that day at Browns Ferry. The threat of fires remains a major contributor to the risk of core damage at nuclear plants. Decades later, fire safety regulations imposed by the NRC in the wake of Browns Ferry have not been met at roughly half the reactors operating in the United States—including the three reactors at Browns Ferry.

For all its virtues, defense-in-depth has an Achilles heel, one rarely mentioned in safety pep talks. It is known as the common-mode failure. That happens when a single event results in conditions exceeding the safety margins of all the defense-in-depth barriers, cutting through them like a hatchet through a layer cake. Common-mode failure is what flooding caused at Fukushima and what fire caused at Browns Ferry. Flooding or fire took out all the redundant systems needed to cool the reactor cores, the systems needed to keep the containments from overheating and leaking, and the systems needed to help predict the path and extent of the radioactive plumes. At Browns Ferry, workers managed to employ ad hoc measures in time to prevent disaster. At Fukushima, time ran out.

Defense-in-depth is both a blessing and a curse. It allows many things to go wrong before a nuclear plant disaster occurs. But when too many problems arise or a common-mode failure disables many systems, defense-in-depth can topple like a row of dominoes. The risk of common-mode failure can be

reduced through enhancing defense-in-depth, but it can never be eliminated. The true curse of defense-in-depth is that it has fostered complacency. The existence of multiple layers of defense has excused inattention to weaknesses in each individual layer, increasing the vulnerability to common-mode failure.

Fukushima Daiichi was a well-defended nuclear plant by accepted standards, with robust, redundant layers of protection. When the earthquake knocked out the off-site electrical grid, emergency diesel generators stood ready as the backup power source. Each of the six reactor units had at least two of these generators (one unit had three). A single emergency generator could provide all the power needed for cooling a core and other essential tasks, but defense-in-depth made sure every reactor had at least one spare. It didn't help. The generators were protected, like the reactors themselves, by the seawall erected along the coast. When the tsunami washed over the seawall, it disabled all but one of the emergency generators or their electrical connections.

Even without the generators, defense-in-depth offered protection. Banks of batteries were ready to power a minimal subset of safety equipment while damage to the AC power systems was being repaired. The battery capacity at Fukushima was eight hours per unit, assumed to be ample time for workers to either restore an emergency diesel generator or recover the electrical grid. But it took nine days to partially reconnect the plant to the grid and even longer to restore the generators.

At Fukushima, as in the United States and elsewhere, reactor operators were trained in emergency procedures for responding to severe accidents. These procedures instructed them to take steps like venting the containment to reduce dangerously high pressure and enable cooling water to enter. But the manuals did not envision the conditions the operators actually faced—for example, the need to operate vents manually in darkness—and thus workers could not implement these procedures in time to prevent the meltdowns.

The last defense-in-depth barrier was evacuation. But at Fukushima, emergency planning proved ineffective at protecting the public. Evacuation areas had to be repeatedly expanded in an ad hoc manner, and in some cases the decisions were made far too late to prevent radiation exposures to many evacuees.

All of Fukushima's defensive barriers failed for the same reason. Each had a limit that provided too little safety margin to avert failure. Had just one barrier remained intact, the plant might well have successfully endured the one-two punch from the earthquake and tsunami or at the bare minimum, the public would have been protected from the worst radiation effects. The chance that all the barriers might fall was never part of the planning. In effect, the nuclear establishment was riding a carousel, confident

that the passing scenery of anticipated incidents would never change. Lost in the process was this reality: the brass ring for this not-so-merry-go-round involves both foreseeing hazards and developing independent, robust defense-in-depth barriers to accommodate unforeseen hazards. One without the other has been repeatedly shown, at tremendous cost, to be insufficient.

In November 2012, the NRC staff recommended that filters be installed in the vent pipes, primarily as a defense-in-depth measure. But what might seem a simple, logical decision—install a \$15 million filter to reduce the chance of tens of billions of dollars' worth of land contamination as well as harm to the public—got complicated. The nuclear industry launched a campaign to persuade the NRC commissioners that filters weren't necessary. A key part of the industry's argument was that plant owners could reduce radioactive releases more effectively by using FLEX equipment.

Vent filters would only work, the argument went, if the containment remained intact. If the containment failed, radioactive releases would bypass the filters anyway. And sophisticated FLEX cooling strategies could keep radioactivity inside the containment in the first place. Further, the absence of filters at Fukushima might not have caused the widespread land contamination because it wasn't clear that the largest releases occurred through the vents; the radioactivity may have escaped another way.

The NRC staff countered by claiming that the FLEX strategies were too complicated to rely on: they rested on too many assumptions about what might be taking place within a reactor in crisis and what operators would be capable of doing. In contrast, a passive filter could be counted on under most circumstances to do its job—filter any radioactivity that passed through the vent pipes. The staff argued that filters would be warranted as a defense-in-depth measure. The staff also pointed out that many other countries, like Sweden, simply required vent filters to be installed decades ago as a prudent step.

Without an explicit requirement to consider defense-in-depth, as the NNTF had called for in its first recommendation, the NRC commissioners could feel free to reject the staff's arguments. In March 2013, they voted 3–2 to delay a requirement that filters be installed, and recommended that the staff consider other alternatives to prevent the release of radiation during an accident. However, at the same time the commissioners voted to require that the vents themselves be upgraded to be functional in a severe accident. This second decision didn't make much sense: if the commissioners believed the vents might be needed in a severe accident, then what excuse could there be for not equipping them with filters?

A Severe Accident Mitigation Alternatives (SAMA) analysis entails identifying and evaluating hardware and procedure modifications that have

the potential to reduce the risk from severe accidents, then determining whether the value of the safety benefits justifies their cost. Oddly enough, even though the plant owners and the NRC have identified dozens of measures that would pass this cost-benefit test and thus might be prudent investments, none have had to be implemented under the law. That's because the NRC has thrown into the equation its contorted backfit rule. The rule means that for the changes to be required they also must represent a "substantial safety enhancement"—a standard very hard to meet given the low risk estimates generated by the industry's calculations. Thus, the SAMA process has been merely an academic exercise. But the upgrades identified in the SAMA analyses provide a comprehensive list of changes that could reduce severe accident risk at each plant.

So how safe is safe enough? In that critical decision, the public has largely been shut out of the discussion. This is true in the United States, in Japan, and everywhere else nuclear plants are in operation. Nuclear development, expansion, and oversight have largely occurred behind a curtain. Nuclear technology is extremely complex. Its advocates, in their zeal to promote that technology, have glossed over unknowns and uncertainties, thrown up a screen of arcane terminology, and set safety standards with unquantifiable thresholds such as "adequate protection."

In the process, the nuclear industry has come to believe its own story. Regulators too often have come to believe that there is a firmer technical basis for their decisions than actually exists. Officials, in particular, must grapple with overseeing a technology that few thoroughly understand, especially when things go wrong. Fukushima demonstrated that. Meanwhile, average citizens have been lulled into believing that nuclear power plants are safe neighbors, needing no attention or concern because the owners are responsible and the regulators are thorough. Yet it is those citizens' health, livelihoods, homes, and property that may be permanently jeopardized by the failure of this flawed system.

In the end, the NRC must be able to tell the American public, "We've taken every reasonable step to protect you." And it must be the public, not industry or bureaucrats, who define 'reasonable.'

Perhaps the strongest vote of no confidence comes from the reactor vendors themselves. Even as they heavily promoted the new designs in the United States, the vendors in 2003 successfully lobbied Congress to reauthorize federal liability protection for all reactors—new and old—under the Price-Anderson Act for another twenty years. While they asserted that the next generation of plants would pose an infinitesimally small risk to the public, they wanted to make sure there would be limits on the damage claims they would have to pay if they were wrong.

The Cult of the Singularity

Fruit of the Gods

The agricultural revolution is not an event like the Trojan War, isolated in the distant past and without direct relevance to our lives today. The work begun by those neolithic farmers in the Near East has been carried forward from one generation to the next without a single break, right into the present moment. It's the foundation of our vast civilization today in exactly the same way that it was the foundation of the very first farming village.

This should help you understand why the story you tell your children about the meaning of the world, about divine intentions in the world, and about the destiny of man is of such profound importance to the people of our culture. It's the manifesto of the revolution on which our culture is based. It's the repository of all our revolutionary doctrine and the definitive expression of our revolutionary spirit. It explains why the revolution was necessary and why it must be carried forward at any cost whatever.

About two-thousand years ago an event of exquisite irony occurred within our culture. The Takers—or at least a very large segment of them—adopted as their own a story that seemed to them pregnant with meaning and mystery. It came to them from a Taker people of the Near East who had been telling it to their own children for countless generations—for so many generations that it had become a mystery even to them. Do you know why?

It had become a mystery because those who first told the story—their ancient ancestors—were not Takers but Leavers. About two-thousand years ago, the Takers adopted as their own a story that had originated among Leavers many centuries before. The irony is that it was a story that had once been told among Leavers about the origins of the Takers. The Takers adopted as their own a Leaver story about their origins.

What sort of story would a Leaver people tell about the appearance of the Takers in the world?

There is a very special knowledge you must have if you're going to rule

the world. I'm sure you realize that. The Takers possess this knowledge, of course—at least they imagine they do—and they're very, very proud of it. This is the most fundamental knowledge of all, and it's absolutely indispensable to those who would rule the world. And what do you suppose the Takers find when they go among the Leavers?

They find that the Leavers do not have this knowledge. Isn't that remarkable?

Consider it. The Takers have a knowledge that enables them to rule the world, and the Leavers lack it. This is what the missionaries found wherever they went among the Leavers. They were quite astonished themselves, because they had the impression that this knowledge was virtually self-evident.

Who else would have this knowledge, besides the Takers? The gods would have it.

One day the gods were considering the administration of the world in the ordinary way, and one of them said:

“Here's a spot I've been thinking about for a while—a wide, pleasant savannah. Let's send a great multitude of locusts into this land. Then the fire of life will grow prodigiously in them and in the birds and lizards that will feed on them, and that will be very fine.”

The others thought about this for a while, then one said:

“It's certainly true that, if we send the locusts into this land, the fire of life will blaze in them and in the creatures that feed on them—but at the expense of all the other creatures that live there.”

The others asked him what his point was, and he went on:

“Surely it would be a great crime to deprive all these other creatures of the fire of life so that the locusts and the birds and the lizards can flourish for a time. For the locusts will strip the land bare, and the deer and the gazelles and the goats and the rabbits will go hungry and die.

And with the disappearance of the game, the lions and the wolves and the foxes will soon be dying too. Won't they curse us then and call us criminals for favoring the locusts and the birds and the lizards over them?”

Now the gods had to scratch their heads over this, because they'd never looked at matters in this particular light before. But finally one of them said:

“I don't see that this presents any great problem. We simply won't do it. We won't raise a multitude of locusts to send into this land, then things will go on as before, and no one will have any reason to curse us.”

Most of the gods thought this made sense, but one of them disagreed:

“Surely this would be as great a crime as the other. For don't the locusts and the birds and the lizards live in our hands as well as the rest? Is it never to be their time to flourish greatly, as others do?”

While the gods were debating this point, a fox came out to hunt, and they said:

“Let's send the fox a quail for its life.”

But these words were hardly spoken when one of them said:

“Surely it would be a crime to let the fox live at the quail's expense. The quail has its life that we gave it and lives in our hands. It would be infamous to send it into the jaws of the fox!”

Then another said:

“Look here! The quail is stalking a grasshopper! If we don't give the quail to the fox, then the quail will eat the grasshopper. Doesn't the grasshopper have its life that we gave it and doesn't it live in our hands as truly as the quail? Surely it would be a crime not to give the quail to the fox, so that the grasshopper may live.”

Well, as you can imagine, the gods groaned heavily over this and didn't know what to do. And while they were wrangling over it, spring came, and the snow waters of the mountains began to swell the streams, and one of them said:

“Surely it would be a crime to let these waters flood the land, for countless creatures are bound to be carried off to their deaths.”

But then another said:

“Surely it would be a crime not to let these waters flood the land, for without them the ponds and marshes will dry up, and all the creatures that live in them will die.”

And once more the gods were thrown into confusion. Finally one of them had what seemed to be a new thought:

“It’s clear that any action we take will be good for some and evil for others, so let’s take no action at all. Then none of the creatures that live in our hands can call us criminals.”

Another snapped:

“Nonsense! If we take no action at all, this will also be good for some and evil for others, won’t it? The creatures that live in our hands will say, ‘Look, we suffer, and the gods do nothing!’”

And while the gods bickered among themselves, the locusts swarmed over the savannah, and the locusts and the birds and the lizards praised the gods while the game and the predators died cursing the gods. And because the gods had taken no action in the matter, the quail lived, and the fox went hungry to its hole cursing the gods. And because the quail lived, it ate the grasshopper, and the grasshopper died cursing the gods. And because in the end the gods decided to stem the flood of spring waters, the ponds and the marshes dried up, and all the thousands of creatures that lived in them died cursing the gods.

And hearing all these curses, the gods groaned.

“We’ve made the garden a place of terror, and all that live in it hate us as tyrants and criminals. And they’re right to do this, because by action or inaction we send them good one day and evil the next without knowing what we should do. The savannah stripped by the locusts rings with curses, and we have no answer to make. The fox and the grasshopper curse us because we let the quail live, and we have no answer to make. Surely the whole world must curse the day we made it, for we are criminals who, send good and evil by turns, knowing even as we do it that we don’t know what ought to be done.”

Well, the gods were sinking right into the slough of despond when one of them looked up and said:

“Say, didn’t we make for the garden a certain tree whose fruit is the knowledge of good and evil?”

The others cried:

“Yes! Let’s find that tree and eat of it and see what this knowledge is.”

And when the gods had found this tree and had tasted its fruit, their eyes were opened, and they said:

“Now indeed we have the knowledge we need to tend the garden without becoming criminals and without earning the curses of all who live in our hands.”

And as they were talking in this way, a lion went out to hunt, and the gods said to themselves:

“Today is the lion’s day to go hungry, and the deer it would have taken may live another day.”

And so the lion missed its kill, and as it was returning hungry to its den it began to curse the gods. But they said:

“Be at peace, for we know how to rule the world, and today is your day to go hungry.”

And the lion was at peace.

And the next day the lion went out to hunt, and the gods sent it the deer they had spared the day before. And as the deer felt the lion’s jaws on its neck, it began to curse the gods. But they said:

“Be at peace, for we know how to rule the world, and today is your day to die just as yesterday was your day to live.”

And the deer was at peace.

Then the gods said to themselves:

“Certainly the knowledge of good and evil is a powerful knowledge, for it enables us to rule the world without becoming criminals. If we had yesterday sent the lion away hungry without this knowledge, then indeed it would have been a crime. And if we had today sent the deer into the lion’s jaws without this knowledge, then indeed this too would have been a crime. But with this knowledge we have done both of these things, one seemingly opposed to the other, and have committed no crime.”

Now it happened that one of the gods was away on an errand when the others were eating at the tree of knowledge, and when he returned and heard what the gods had done in the matter of the lion and the deer, he said:

“In doing these two things you have surely committed a crime in one instance or the other, for these two things are opposed, and one must have been right to do and the other wrong.

If it was good for the lion to go hungry on the first day, then it was evil to send it the deer on the second. Or if it was good to send it the deer on the second day, then it was evil to send it away hungry on the first.”

The others nodded and said:

“Yes, this is just the way we would have reasoned before we ate of this tree of knowledge.”

“What knowledge is this?” the god asked, noticing the tree for the first time.

“Taste its fruit. Then you’ll know exactly what knowledge it is.”

So the god tasted, and his eyes were opened.

“Yes, I see. This is indeed the proper knowledge of the gods: the knowledge of who shall live and who shall die.”

When the gods saw that Adam was awakening, they said to themselves:

“Now here is a creature so like us that he might almost be one of our company. What span of life and what destiny shall we fashion for him?”

One of them said:

“He is so fair, let’s give him life for the lifetime of this planet. In the days of his childhood let’s care for him as we care for all others in the garden, so that he learns the sweetness of living in our hands. But in adolescence he will surely begin to realize that he’s capable of much more than other creatures and will become restless in our care. Shall we then lead him to the other tree in the garden, the Tree of Life?”

But another said:

“To lead Adam like a child to the Tree of Life before he had even begun to seek it for himself would deprive him of a great undertaking by which he may gain an important wisdom and prove his mettle to himself. As we would give him the care he needs as a child, let’s give him the quest he needs as an adolescent. Let’s make the quest for the Tree of Life the occupation of his adolescence. In this way he’ll discover for himself how he may have life for the lifetime of this planet.”

The others agreed with this plan, but one said:

“We should take note that this might well be a long and baffling quest for Adam. Youth is impatient, and after a few thousand years of searching, he might despair of finding the Tree of Life. If this should happen, he might be tempted to eat of the Tree of the Knowledge of Good and Evil instead.”

The others replied:

“Nonsense! You know very well that the fruit of this tree nourishes only the gods. It can no more nourish Adam than the grasses of the oxen. He might take it into his mouth and swallow it, but it would pass through his body without benefit. Surely you don’t imagine that he might actually gain our knowledge by eating of this tree?”

The other replied:

“Of course not. The danger is not that he would gain our knowledge but rather that he might imagine that he’d gained it. Having tasted the fruit of this tree, he might say to himself, ‘I have eaten at the gods’ own tree of knowledge and therefore know as well as they how to rule the world. I may do as I will do.’”

Said the other gods:

“This is absurd. How could Adam ever be so foolish as to imagine he had the knowledge that enables us to govern the world and to do what we will do? None of our creatures will ever be master of the knowledge of who shall live and who shall die. This knowledge is ours alone, and if Adam should grow in

wisdom till the very eclipse of the universe, it would be as far beyond him as it is right now.”

But the other was not disconcerted by this argument:

“If Adam should eat of our tree, there’s no telling how he might deceive himself. Not knowing the truth, he might say to himself, ‘Whatever I can justify doing is good and whatever I cannot justify doing is evil.’”

But the others scoffed at this:

“This is not the knowledge of good and evil.”

The other replied:

“Of course it’s not, but how would Adam know this?”

The others shrugged.

“Perhaps in childhood Adam might believe he was wise enough to rule the world, but what of it? Such arrogant foolishness would pass with maturity.”

Replied the other:

“Ah, but possessed of this arrogant foolishness, would Adam survive into maturity? Believing himself our equal, he would be capable of anything. In his arrogance, he might look around the garden and say to himself, ‘This is all wrong. Why should I have to share the fire of life with all these creatures? Look here, the lions and the wolves and the foxes take the game I would have for myself. This is evil. I will kill all these creatures, and this will be good. And look here, the rabbits and the grasshoppers and the sparrows take the fruits of the land that I would have for myself. This is evil. I will kill all these creatures, and this will be good. And look here, the gods have set a limit on my growth just as they’ve set a limit on the growth of all others. This is evil. I will grow without limit, taking all the fire of life that flows through this garden into myself, and that will be good.’ Tell me—if this should happen, how long would Adam live before he had devoured the entire world?”

The others said:

“If this should happen, Adam would devour the world in a single day, and at the end of that day he would devour himself.”

The other replied:

“Just so, unless he managed to escape from this world. Then he would devour the entire universe as he had devoured the world. But even so he would inevitably end by devouring himself, as anything must that grows without limit.”

Another said:

“This would indeed be a terrible end for Adam. But might he not come to the same end even without having eaten at the Tree of Knowledge of Good and Evil? Might he not be tempted by his yearning for growth to take the fire of life into his own hands even without deluding himself that this was good?”

The others replied:

“He might, but what would be the result? He would become a criminal, an outlaw, a thief of life, and a murderer of the creatures around him. Without the delusion that what he was doing was good—and therefore to be done at any cost—he would soon weary of the outlaw’s life. Indeed this is bound to happen during his quest for the Tree of Life. But if he should eat of the tree of our knowledge, then he will shrug off his weariness. He will say, ‘What does it matter that I’m weary of living as a murderer of all the life around me? I know good and evil, and this way of living is good. Therefore I must live this way even though I’m weary unto death, even though I destroy the world and even myself. The gods wrote in the world a law for all to follow, but it cannot apply to me because I’m their equal. Therefore I will live outside this law and grow without limit. To be limited is evil. I will steal the fire of life from the hands of the gods and heap it up for my growth, and that will be good. I will destroy those kinds that do not serve my growth, and that will be good. I will wrest the garden from the hands of the gods and order it anew so that it serves only my growth, and that will be good. And because these things are good, they must be done at any cost. It may be that I’ll destroy the garden and

make a ruin of it. It may be that my progeny will teem over the earth like locusts, stripping it bare, until they drown in their own filth and hate the very sight of one another and go mad. Still they must go on, because to grow without limit is good and to accept the limits of the law is evil. And if any say, "Let's put off the burdens of the criminal life and live in the hands of the gods once again," I will kill them, for what they say is evil. And if any say, "Let's turn aside from our misery and search for that other tree," I will kill them, for what they say is evil. And when at last all the garden has been subjugated to my use and all kinds that do not serve my growth have been cast aside and all the fire of life in the world flows through my progeny, still I must grow. And to the people of this land I will say, "Grow, for this is good," and they will grow. And to the people of the next land I will say, "Grow, for this is good," and they will grow. And when they can grow no more, the people of this land will fall upon the people of the next to murder them, so that they may grow still more. And if the groans of my progeny fill the air throughout the world, I will say to them, "Your sufferings must be borne, for you suffer in the cause of good. See how great we have become! Wielding the knowledge of good and evil, we have made ourselves the masters of the world, and the gods have no power over us. Though your groans fill the air, isn't it sweeter to live in our own hands than in the hands of the gods?" "

And when the gods heard all this, they saw that, of all the trees in the garden, only the Tree of the Knowledge of Good and Evil could destroy Adam. And so they said to him:

"You may eat of every tree in the garden save the Tree of the Knowledge of Good and Evil, for on the day you eat of that tree you will certainly die."

Pick up some bibles—none of these will have any comment to make on why this tree should have been forbidden to Adam. Were you expecting them to?

The Takers write the notes, and this story has always been an impenetrable mystery to them. They've never been able to figure out why the knowledge of good and evil should have been forbidden to man. Don't you see why?

Because, to the Takers, this knowledge is the very best knowledge of all—the most beneficial for man to have. This being so, why would the gods forbid it to him?

The knowledge of good and evil is fundamentally the knowledge the rulers of the world must exercise, because every single thing they do is good for some but evil for others. This is what ruling is all about, isn't it?

And man was born to rule the world, wasn't he? According to Taker mythology at least. Then why would the gods withhold the very knowledge man needs to fulfill his destiny? From the Taker point of view, it makes no sense at all.

The disaster occurred when, ten-thousand years ago, the people of our culture said, 'We're as wise as the gods and can rule the world as well as they.' When they took into their own hands the power of life and death over the world, their doom was assured.

The gods ruled the world for billions of years, and it was doing just fine. After just a few thousand years of human rule, the world is at the point of death.

"True. But the Takers will never give it up."

Then they'll die. As predicted. The authors of this story knew what they were talking about.

"And you're saying this story was written from a Leaver point of view?"

That's right. If it had been written from the Taker point of view, the knowledge of good and evil wouldn't have been forbidden to Adam, it would have been thrust upon him. The gods would have hung around saying, 'Come on, Man, can't you see that you're nothing without this knowledge? Stop living off our bounty like a lion or a wombat. Here, have some of this fruit and you'll instantly realize that you're naked—as naked as any lion or wombat: naked to the world, powerless. Come on, have some of this fruit and become one of us. Then, lucky you, you can leave this garden and begin living by the sweat of your brow, the way humans are supposed to live.' And if people of your cultural persuasion had authored it, this event wouldn't be called the Fall, it would be called the Ascent or the Liberation.

A minute ago, you told me that the Takers will never give up their tyranny over the world, no matter how bad things get. How did they get to be this way?

They got to be this way because they've always believed that what they were doing was right—and therefore to be done at any cost whatever.

They've always believed that, like the gods, they know what is right to do and what is wrong to do, and what they're doing is right. Do you see how they've demonstrated what I'm saying?

They've demonstrated it by forcing everyone in the world to do what they do, to live the way they live. Everyone had to be forced to live like the Takers, because the Takers had the one right way.

Many peoples among the Leavers practiced agriculture, but they were never obsessed by the delusion that what they were doing was right, that everyone in the entire world had to practice agriculture, that every last square yard of the planet had to be devoted to it. They didn't say to the people around them, 'You may no longer live by hunting and gathering. This is wrong. This is evil, and we forbid it. Put your land under cultivation or we'll wipe you out.' What they said was, 'You want to be hunter-gatherers? That's fine with us. That's great. We want to be agriculturalists. You be hunter-gatherers and we'll be agriculturalists. We don't pretend to know which way is right. We just know which way we prefer.'

And if they got tired of being agriculturalists, if they found they didn't like where it was leading them in their particular adaptation, they were able to give it up. They didn't say to themselves, 'Well, we've got to keep going at this even if it kills us, because this is the right way to live.' For example, there was once a people who constructed a vast network of irrigation canals in order to farm the deserts of what is now southeastern Arizona. They maintained these canals for three-thousand years and built a fairly advanced civilization, but in the end they were free to say, 'This is a toilsome and unsatisfying way to live, so to hell with it.' They simply walked away from the whole thing and put it so totally out of mind that we don't even know what they called themselves. The only name we have for them is one the Pima Indians gave them: Hohokam—those who vanished.

But it's not going to be this easy for the Takers. It's going to be hard as hell for them to give it up, because what they're doing is right, and they have to go on doing it even if it means destroying the world and mankind with it.

Giving it up would mean that all along they'd been wrong. It would mean that they'd never known how to rule the world. It would mean relinquishing their pretensions to godhood. It would mean spitting out the fruit of that tree and giving the rule of the world back to the gods.

According to the authors of that story, the people living between the Tigris and Euphrates rivers had eaten at the gods' own tree of knowledge. Where do you suppose they got that idea? Whatever gave the authors of this story the idea that the people living in the Fertile Crescent had eaten at the gods' tree of knowledge? Do you suppose they saw it with their own

eyes? Do you suppose they were there when your agricultural revolution began?

If they'd been there to see it with their own eyes, who would they have been? They would have been the people of the Fall. They would have been the Takers. And if they'd been Takers, they would have told the story a different way.

So the authors of this story were not there to see it with their own eyes. How then did they know it had happened? How did they know that the Takers had usurped the role of the gods in the world? Who were the authors of this story?

Among the people known as the Hebrews, this was already an ancient story—and a mysterious story. The Hebrews stepped into history as Takers—and wanted nothing more than to be like their Taker neighbors. Indeed, that's why their prophets were always bawling them out. So, though they preserved the story, they no longer fully understood it. To find the people who understood it, we have to find its authors. And who were they?

“I'm afraid I have no idea.”

Look, I can't forbid you to say, 'I have no idea,' but I do insist that you spend a few seconds thinking before you say it. The ancient ancestors of the Hebrews were the Semites.

Picture a map of Europe and the Near East in 8500 BC. A blade like a hand sickle very nearly cuts the Arabian peninsula away from the rest. The words Incipient Agriculture make it clear that the sickle blade encloses the Fertile Crescent. A handful of dots indicate sites where early farming implements have been found.

This map, I feel, gives a false impression, though it was not an intended impression. It gives the impression that the agricultural revolution took place in an empty world.

This is why I prefer my own map. As you see, this shows the situation five-hundred years later. The agricultural revolution is well under way. The area in which farming is taking place is indicated by hen-scratches—the area between the Tigris and the Euphrates. This, of course, is the land between the rivers, the birthplace of the Takers. And what do you suppose all these dots represent?

“Leaver peoples?”

Exactly. They're not designed as a statement about population density. Nor are they intended to indicate that every available stretch of land was

inhabited by some Leaver people. What they indicate is that this was far from being an empty world. Do you see what I'm showing you?

The land of the Fall lay within the Fertile Crescent and was surrounded by non-agriculturalists. But I'm also pointing out that at this time, at the beginning of the agricultural revolution, these early Takers, the founders of our culture, were unknown, isolated, unimportant. The next map in your historical atlas is four-thousand years later. What would you expect to see on it?

"I'd expect to see that the Takers have expanded."

Correct. Here a printed oval, labeled Chalcolithic Cultures, with Mesopotamia at its center, encloses the whole of Asia Minor and all the land to the north and east as far as the Caspian Sea and the Persian Gulf. The oval extends southward as far as the entrance to the Arabian peninsula, which is a cross-hatched area labeled Semites. Now, we have some witnesses.

The Semites were not eyewitnesses to the events described in chapter three of Genesis. Those events, cumulatively known as the Fall, took place here, hundreds of miles north of the Semites, among an entirely different people. Do you see who they were?

"According to the map, they were the Caucasians."

But now, in 4500 BC, the Semites are eyewitnesses to an event in their own front yard: the expansion of the Takers. In four-thousand years the agricultural revolution that began in the land between the rivers had spread across Asia Minor to the west and to the mountains in the north and east. And to the south it seems to have been blocked by what?

By the Semites. Why? Why were the Semites blocking it? What were the Semites? Were they agriculturalists?"

"No. The map makes it clear that they weren't a part of what was going on among the Takers. So I assume they were Leavers."

Leavers, yes, but no longer hunter-gatherers. They had evolved another adaptation that was to be traditional for Semitic peoples. They were pastoralists. Herders. So what was happening on the border between the Takers' Chalcolithic Culture and the Semites?

"I don't know."

Read the story of Cain and Abel in Genesis and then you'll know. What was happening along that border was that Cain was killing Abel. The tillers of the soil were watering their fields with the blood of Semitic herders.

What was happening there was what has always happened along the borders of Taker expansion: The Leavers were being killed off so that more land could be put under cultivation. Here at the border that separates tillers of the soil from Semitic herders, Cain and Abel confront each other."

"And biblical scholars don't understand this?"

I cannot say, of course, that not a single scholar has ever understood this. But most read the story as if it were set in a historical never-never land, like one of Aesop's fables. It would scarcely occur to them to understand it as a piece of Semitic war propaganda. But that's what it is, all right. I know it's always been a mystery as to why God accepted Abel and his offering and rejected Cain and his offering. This explains it. With this story, the Semites were telling their children, 'God is on our side. He loves us herders but hates those murderous tillers of the soil from the north.'

If you read it as a story that originated among your own cultural ancestors, it's incomprehensible. It only begins to make sense when you realize that it originated among the enemies of your cultural ancestors.

"If the tillers of the soil from the north were Caucasians, then the mark of Cain is my own fair, maggot-colored face."

It could be. Obviously we'll never know for sure what the authors of the story had in mind.

"But it makes sense this way. The mark was given to Cain as a warning to others: 'Leave this man alone. This is a dangerous man, one who exacts a sevenfold vengeance.' Certainly a lot of people all over the world have learned that it doesn't pay to mess with people with white faces."

What do you suppose happened to these Leaver peoples?

"I would have to say that either they were overrun and assimilated or they took up agriculture in imitation of the Takers."

Doubtless many of these peoples had their own tales to tell of this revolution, their own ways of explaining how these people from the Fertile

Crescent came to be the way they were, but only one of these tales survived—the one told by the Semites to their children about the Fall of Adam and the slaughter of Abel by his brother Cain. It survived because the Takers never managed to overrun the Semites, and the Semites refused to take up the agricultural life. Even their eventual Taker descendants, the Hebrews, who preserved the story without fully understanding it, couldn't work up any enthusiasm for the peasant life-style. And this is how it happened that, with the spread of Christianity and of the Old Testament, the Takers came to adopt as their own a story an enemy once told to denounce them.

So we come again to this question: Where did the Semites get the idea that the people of the Fertile Crescent had eaten at the gods' own tree of knowledge?

It was a sort of reconstruction. They looked at the people they were fighting and said, 'My God, how did they get this way? What's wrong with these people? What's wrong with our brothers from the north? Why are they doing this to us? They act like...'

Here's how it would look to the Semites, I think: 'What's going on here is something wholly new. These aren't raiding parties. These aren't people drawing a line and baring their teeth at us to make sure we know they're there. These guys are saying—Our brothers from the north are saying that we've got to die. They're saying Abel has to be wiped out. They're saying we're not to be allowed to live. Now that's something new, and we don't get it. Why can't they live up there and be farmers and let us live down here and be herders? Why do they have to murder us?'

'Something really weird must have happened up there to turn these people into murderers. What could it have been? Wait, a second... Look at the way these people live. Nobody has ever lived this way before. They're not just saying that we have to die. They're saying that everything has to die. They're not just killing us, they're killing everything. They're saying, "Okay, lions, you're dead. We've had it with you. You're out of here." They're saying, "Okay, wolves, we've had it with you too. You're out of here." They're saying, "Nobody eats but us. All this food belongs to us and no one else can have any without our permission." They're saying, "What we want to live lives and what we want to die dies."'

'That's it! They're acting as if they were the gods themselves. They're acting as if they eat at the gods' own tree of wisdom, as though they were as wise as the gods and could send life and death wherever they please. Yes, that's it. That's what must have happened up there. These people found the gods' own tree of wisdom and stole some of its fruit.'

'Aha! Right! These are an accursed people! You can see that right off the bat. When the gods found out what they'd done, they said, "Okay, you

wretched people, that's it for you! We're not taking care of you anymore. You're out. We banish you from the garden. From now on, instead of living on our bounty, you can wrest your food from the ground by the sweat of your brows." And that's how these accursed tillers of the soil came to be hunting us down and watering their fields with our blood.'

One of the clearest indications that these two stories were not authored by your cultural ancestors is the fact that agriculture is not portrayed as a desirable choice, freely made, but rather as a curse. It was literally inconceivable to the authors of these stories that anyone would prefer to live by the sweat of his brow. So the question they asked themselves was not, 'Why did these people adopt this toilsome life-style?' It was, 'What terrible misdeed did these people commit to deserve such a punishment? What have they done to make the gods withhold from them the bounty that enables the rest of us to live a carefree life?'

In our own cultural history, the adoption of agriculture was a prelude to ascent. In these stories, agriculture is the lot of the fallen.

"I have a question: Why did they describe Cain as Adam's firstborn and Abel as Adam's secondborn?"

The significance is mythological rather than chronological. I mean that you'll find this motif in folktales everywhere: When you have a father with two sons, one worthy and one unworthy, the unworthy son is almost always the cherished firstborn, while the worthy son is the secondborn—which is to say, the underdog in the story.

"Okay. But why would they think of themselves as descendants of Adam at all?"

You mustn't confuse metaphorical thinking with biological thinking. The Semites didn't think of Adam as their biological ancestor.

"How do you know that?"

Do you know what Adam means in Hebrew? We can't know the name the Semites gave him, but presumably it had the same meaning.

"It means man."

Of course. The human race. Do you suppose the Semites thought that the human race was their biological ancestor?

“No, of course not.”

I agree. The relationships in the story have to be understood metaphorically, not biologically. As they perceived it, the Fall divided the race of man into two—into bad guys and good guys, into tillers of the soil and herders, the former bent on murdering the latter.

“But I’m afraid I have another question.”

There’s no need to apologize for it. That’s what you’re here for.

“Okay. My question is, how does Eve figure in all this?”

Her name means what? Life. With this name, the authors of the story have made it clear that Adam’s temptation wasn’t sex or lust or uxoriousness. Adam was tempted by Life.

“I don’t get it.”

Consider: A hundred men and one woman does not spell a hundred babies, but one man and a hundred women does. I’m pointing out that, in terms of population expansion, men and women have markedly different roles. They’re by no means equal in this regard.

“Okay. But I still don’t get it.”

I’m trying to put you in the frame of mind of a non-agricultural people, a people for whom population control is always a critical problem. Let me put it baldly: A band of herders that consists of fifty men and one woman is in no danger of experiencing a population explosion, but a band that consists of one man and fifty women is in big trouble. People being people, that band of fifty-one herders is going to be a band of one-hundred in no time at all.

Let’s go back to the authors of this story, a herding people being pushed into the desert by agriculturalists from the north. Why were their brothers from the north pushing?

They wanted to put the herder’s land under cultivation. They were increasing food production to support an expanded population.

Now you’re ready to do some more reconstruction. You can see that these tillers of the soil have no sense of restraint when it comes to expansion. They don’t control their population; when there isn’t enough food to go

around, they just put some more land under cultivation. So: Whom did these people say yes to?

Think of it this way: The Semites, like most non-agricultural peoples, had to be wary of becoming overbalanced between the sexes. Having too many men didn't threaten the stability of their population, but having too many women definitely did. You see that?

But what the Semites observed in their brothers from the north was that it didn't matter to them. If their population got out of hand, they didn't worry, they just put more land under cultivation.

Or try it this way: Adam and Eve spent three-million years in the garden, living on the bounty of the gods, and their growth was very modest; in the Leaver life-style this is the way it has to be. Like Leavers everywhere, they had no need to exercise the gods' prerogative of deciding who shall live and who shall die. But when Eve presented Adam with this knowledge, he said, 'Yes, I see; with this, we no longer have to depend on the bounty of the gods. With the matter of who shall live and who shall die in our own hands, we can create a bounty that will exist for us alone, and this means I can say yes to Life, and grow without limit.' What you should understand is that saying yes to Life and accepting the knowledge of good and evil are merely different aspects of a single act, and this is the way the story is told in Genesis.

When Adam accepted the fruit of that tree, he succumbed to the temptation to live without limit—and so the person who offered him that fruit is named Life.

Whenever a Taker couple talk about how wonderful it would be to have a big family, they're reenacting this scene beside the Tree of the Knowledge of Good and Evil. They're saying to themselves, 'Of course it's our right to apportion life on this planet as we please. Why stop at four kids or six? We can have fifteen if we like. All we have to do is plow under another few hundred acres of rain forest—and who cares if a dozen other species disappear as a result?'

Don't expect to be able to work it all out in terms of our present knowledge of the world. The Semites at this time were completely isolated on the Arabian peninsula, cut off in all directions either by the sea or by the people of Cain. For all they knew, they and their brothers to the north were literally the whole race of man, the only people on earth. Certainly that's the way they saw the story. They couldn't possibly have known that it was only in that little corner of the world that Adam had eaten at the gods' tree, couldn't possibly have known that the Fertile Crescent was only one of many places where agriculture had begun, couldn't possibly have known that there were still people all over the world living the way Adam

had lived before the Fall.

I think it's safe to say that the story of Adam's Fall is by far the best-known story in the world.

"At least in the West."

Oh, it's well known in the East as well, having been carried into every corner of the world by Christian missionaries. It has a powerful attraction for Takers everywhere. Why is that so?

"I guess because it purports to explain what went wrong here."

What did go wrong? How do people understand the story?

"Adam, the first man, ate the fruit of the forbidden tree."

And what is that understood to mean?

"Frankly, I don't know. I've never heard an explanation that made any sense."

And the knowledge of good and evil?

"Again, I've never heard an explanation that made any sense. I think the way most people understand it, the gods wanted to test Adam's obedience by forbidding him something, and it didn't much matter what it was. And that's what the Fall essentially was—an act of disobedience."

Nothing really to do with the knowledge of good and evil.

"No. But then I suppose there are people who think that the knowledge of good and evil is just a symbol of. . . I don't know exactly what. They think of the Fall as a fall from innocence."

Innocence in this context presumably being a synonym for 'blissful ignorance.'

If you read it from another point of view, the story does explain exactly what went wrong here, doesn't it? But the people of our culture have never been able to understand the explanation, because they've always assumed that it was formulated by people just like them—people who took it for granted that the world was made for man and man was made to conquer

and rule it, people for whom the sweetest knowledge in the world is the knowledge of good and evil, people who consider tilling the soil the only noble and human way to live. Reading the story as if it had been authored by someone with their own point of view, they didn't stand a chance of understanding it.

But when it's read another way, the explanation makes perfectly good sense: Man can never have the wisdom the gods use to rule the world, and if he tries to preempt that wisdom, the result won't be enlightenment, it will be death.

Adam wasn't the progenitor of our race, he was the progenitor of our culture. This is why he's always been a figure of such importance to us. Even though the story itself made no real sense to us, we could identify with Adam as its protagonist. From the beginning, we recognized him as one of our own.

Silicon Valley's Virgins

“I know from our sources deep inside those Silicon Valley institutions: they genuinely believe that they are going to produce artificial intelligences that are so powerful, relatively soon, that people will have their brains digitized, uploaded on these artificial intelligences, and live forever in a simulation—and therefore will have eternal life. It’s a religion for atheists. They’ll have eternal life, and given that you’re in a simulation, why not program the simulation to have endless drug and sex orgy parties all around you. It’s like the 72 virgins, but it’s like the Silicon Valley equivalent.”

Humanity will finally fulfill Descartes’s dreams of liberating the mind from the prison of the body. We will be software, not hardware and able to inhabit whatever hardware we like best. There will not be any difference between us and robots.

“What, after all, is the difference between a human who has upgraded her body and brain using new nanotechnology and computational technologies, and a robot who has gained an intelligence and sensuality surpassing her human creators?”

The world will then change quickly: Computers will complete every basic human task, which will permit lives of leisure; pain will disappear, as will death; technology will solve the basic condition of scarcity that has always haunted life on the planet. Even life under the sheets will be better:

“Virtual sex will provide sensations that are more intense and pleasurable than conventional sex.”

Humans can pretend like they have the power to alter this course, but they are fooling themselves:

“Anybody who is going to be resisting this progress forward is going to be resisting evolution. And fundamentally they will die out.”

“Robots will be our evolutionary heirs, our mind children, built in our image and our likeness, ourselves in more potent and efficient form. Like biological children of previous generations, they will embody humanity’s best chance for a long-term future. It behooves us to give them every advantage and to bow out when we can no longer contribute.”

Such rhetoric is so forceful that it pushes you to adopt defenses of positions you're not sure you hold.

“I was struck by the way in which absolute reason could serve as the faithful handmaiden of absolute lunacy. There are a lot of very clever people building something that, the way they are approaching it at present, will kill us all if they succeed.”

Writing in the wake of the Soviet launch of the first space satellite, Hannah Arendt reflected on the resulting sense of euphoria about escaping what one newspaper report called “men’s imprisonment to the earth.” This same yearning for escape, she wrote, manifested itself in the attempt to create superior humans from laboratory manipulations of germ plasm, to extend natural life spans far beyond their current limits.

“This future man, whom the scientists tell us they will produce in no more than a hundred years, seems to be possessed by a rebellion against human existence as it has been given, a free gift from nowhere (secularly speaking), which he wishes to exchange, as it were, for something he has made himself.”

“Once technology enables us to re-engineer human minds, *Homo sapiens* will disappear, human history will come to an end and a completely new kind of process will begin, which people like you and me cannot comprehend. Many scholars try to predict how the world will look in the year 2100 or 2200. This is a waste of time. Any worthwhile prediction must take into account the ability to re-engineer human minds, and this is impossible. There are many wise answers to the question, ‘What would people with minds like ours do with biotechnology?’ Yet there are no good answers to the question, ‘What would beings with a different kind of mind do with biotechnology?’ All we can say is that people similar to us are likely to use biotechnology to re-engineer their own minds, and our present-day minds cannot grasp what might happen next. Though the details are therefore obscure, we can nevertheless be sure about the general direction of history.”

In the twenty-first century, the third big project of humankind will be to acquire for us divine powers of creation and destruction, and upgrade *Homo sapiens* into *Homo deus*. This third project obviously subsumes the first two projects, and is fueled by them. We want the ability to re-engineer our

bodies and minds in order, above all, to escape old age, death, and misery, but once we have it, who knows what else we might do with such ability? So we may well think of the new human agenda as consisting really of only one project (with many branches): attaining divinity.

Throughout history most gods were believed to enjoy not omnipotence but rather specific super-abilities such as the ability to design and create living beings; to transform their own bodies; to control the environment and the weather; to read minds and to communicate at a distance; to travel at very high speeds; and of course to escape death and live indefinitely. Humans are in the business of acquiring all these abilities, and then some. Certain traditional abilities that were considered divine for many millennia have today become so commonplace that we hardly think about them. The average person now moves and communicates across distances much more easily than the Greek, Hindu, or African gods of old.

For example, the Igbo people of Nigeria believe that the creator god Chukwu initially wanted to make people immortal. He sent a dog to tell humans that when someone dies, they should sprinkle ashes on the corpse, and the body will come back to life. Unfortunately, the dog was tired and he dallied on the way. The impatient Chukwu then sent a sheep, telling her to make haste with this important message. Alas, when the breathless sheep reached her destination, she garbled the instructions, and told the humans to bury their dead, thus making death permanent. This is why to this day we humans must die. If only Chukwu had a Twitter account instead of relying on laggard dogs and dim-witted sheep to deliver his messages!

The prediction that in the twenty-first century humankind is likely to aim for immortality, bliss, and divinity may anger, alienate, or frighten any number of people, so a few clarifications are in order. Firstly, this is not what most individuals will actually do in the twenty-first century. It is what humankind as a collective will do. Most people will probably play only a minor role, if any, in these projects. Even if famine, plague, and war become less prevalent, billions of humans in developing countries and seedy neighbourhoods will continue to deal with poverty, illness, and violence even as the elites are already reaching for eternal youth and godlike powers. This seems patently unjust.

One could argue that as long as there is a single child dying from malnutrition or a single adult killed in drug-lord warfare, humankind should focus all its efforts on combating these woes. Only once the last sword is beaten into a ploughshare should we turn our minds to the next big thing. But history doesn't work like that. Those living in palaces have always had different agendas to those living in shacks, and it is yet to be seen whether that will change in the twenty-first century. Even if we disregard

the fate of slum-dwellers, it is far from clear that we should be aiming at immortality, bliss, and divinity. Adopting these particular projects might be a big mistake. But history is full of big mistakes. Given our past record and our current values, we are likely to reach out for bliss, divinity, and immortality—even if it kills us.

But, reaching out is not the same as obtaining. History is often shaped by exaggerated hope. Such prediction is focused on what humankind will try to achieve in the twenty-first century—not what it will succeed in achieving. Our future economy, society, and politics will be shaped by the attempt to overcome death. It does not follow that in 2100 humans will be immortal.

Finally, and most importantly, such predictions are less of a prophecy and more a way of discussing our present choices. If the discussion makes us choose differently, so that the prediction is proven wrong, all the better. What's the point of making predictions if they cannot change anything? Some complex systems, such as the weather, are oblivious to our predictions. The process of human development, in contrast, reacts to them.

This is the paradox of historical knowledge. Knowledge that does not change behaviour is useless. But knowledge that changes behaviour quickly loses its relevance. The more data we have and the better we understand history, the faster history alters its course, and the faster our knowledge becomes outdated. Centuries ago human knowledge increased slowly, so politics and economics changed at a leisurely pace too. Today our knowledge is increasing at breakneck speed, and theoretically we should understand the world better and better. But the very opposite is happening. Our new-found knowledge leads to faster economic, social, and political changes; in an attempt to understand what is happening, we accelerate the accumulation of knowledge, which leads only to faster and greater upheavals. Consequently we are less and less able to make sense of the present or forecast the future. In 1020 it was relatively easy to predict how Europe would look in 1050. Sure, dynasties might fall, unknown raiders might invade, and natural disasters might strike; yet it was clear that in 1050 Europe would still be ruled by kings and priests, that it would be an agricultural society, that most of its inhabitants would be peasants, and that it would continue to suffer greatly from famines, plagues, and wars. In contrast, in 2020 we have no idea how Europe will look in 2050. We cannot say what kind of political system it will have, how its job market will be structured, or, some might argue, even what kind of bodies its inhabitants will possess.

All the predictions are no more than an attempt to discuss present-day dilemmas, and an invitation to change the future. Predicting that humankind will try to gain immortality, bliss, and divinity is much like predicting that people building a house will want a lawn in their front yard.

It sounds very likely. But once you say it out loud, you can begin to think about alternatives. People are taken aback by dreams of immortality and divinity not because they sound so foreign and unlikely, but because it is uncommon to be so blunt. Yet when they start thinking about it, most people realize that it actually makes a lot of sense. Despite the technological hubris of these dreams, ideologically they are old news. For 300 years the world has been dominated by humanism, which sanctifies the life, happiness, and power of *Homo sapiens*. The attempt to gain immortality, bliss, and divinity merely takes the long-standing humanist ideals to their logical conclusion. It places openly on the table what we have for a long time kept hidden under our napkin.

Humanism—the worship of humankind—has conquered the world. Yet the rise of humanism also contains the seeds of its downfall. While the attempt to upgrade humans into gods takes humanism to its logical conclusion, it simultaneously exposes humanism’s inherent flaws. If you start with a flawed ideal, you often appreciate its defects only when the ideal is close to realization.

Due to humanist beliefs, in the twenty-first century we are likely to push humankind as a whole beyond its limits. The same technologies that can upgrade humans into gods might also make humans irrelevant. For example, computers powerful enough to understand and overcome the mechanisms of aging and death will probably also be powerful enough to replace humans in any and all tasks. Hence the real agenda in the twenty-first century is going to be far more complicated than one might think. At present it might seem that immortality, bliss, and divinity occupy the top slots on our agenda. But once we come nearer to achieving these goals the resulting upheavals are likely to deflect us towards entirely different destinations. The future described is merely the future of the past—a future largely based on the ideas and hopes that dominated the world for the last 300 years. The real future—a future born of the new ideas and hopes of the twenty-first century—might be completely different.

For humanist true-believers, all this may sound very pessimistic and depressing. But it is best not to jump to conclusions. History has witnessed the rise and fall of many religions, empires, and cultures. Such upheavals are not necessarily bad. Humanism has dominated the world for 300 years, which is not such a long time. The pharaohs ruled Egypt for 3,000 years, and the popes dominated Europe for a millennium. If you told an Egyptian in the time of Ramses II that one day the pharaohs will be gone, he would probably have been aghast. ‘How can we live without a pharaoh? Who will ensure order, peace, and justice?’ If you told people in the Middle Ages that within a few centuries God will be dead, they would have been horrified.

'How can we live without God? Who will give life meaning and protect us from chaos?' Looking back, many think that the downfall of the pharaohs and the death of God were both positive developments. Maybe the collapse of humanism will also be beneficial. People are usually afraid of change because they fear the unknown. But the single greatest constant of history is that everything changes.

You cannot have a serious discussion about the nature and future of humankind without beginning with our fellow animals. *Homo sapiens* does its best to forget the fact, but it is an animal. And it is doubly important to remember our origins at a time when we seek to turn ourselves into gods. No investigation of our divine future can ignore our own animal past, or our relations with other animals—because the relationship between humans and animals is the best model we have for future relations between superhumans and humans. You want to know how super-intelligent cyborgs might treat ordinary flesh-and-blood humans? Better start by investigating how humans treat their less intelligent animal cousins. It's not a perfect analogy, of course, but it is the best archetype we can actually observe rather than just imagine.

With regard to other animals, humans have long since become gods. We don't like to reflect on this too deeply, because we have not been particularly just or merciful gods. If you watch the National Geographic channel, go to a Disney film, or read a book of fairy tales, you might easily get the impression that planet Earth is populated mainly by lions, wolves, and tigers who are an equal match for us humans. Simba the lion king holds sway over the forest animals; Little Red Riding Hood tries to evade the Big Bad Wolf; and little Mowgli bravely confronts Shere Khan the tiger. But in reality, they are no longer there. Our televisions, books, fantasies, and nightmares are still full of them, but the Simbas, Shere Khans and Big Bad Wolves of our planet are disappearing.

The world is populated mainly by humans and their domesticated animals. How many wolves live today in Germany, the land of the Grimm brothers, Little Red Riding Hood, and the Big Bad Wolf? Less than a hundred. And even these are mostly Polish wolves that crossed over the border in recent years. In contrast, Germany is home to 5 million domesticated dogs. Altogether about 200,000 wild wolves still roam the earth, but there are more than 400 million domesticated dogs. The world contains 40,000 lions compared to 600 million house cats; 900,000 African buffalo versus 1.5 billion domesticated cows; 50 million penguins and 20 billion chickens. Since 1970, despite growing ecological awareness, wildlife populations have halved (not that they were prospering in 1970). In 1980 there were 2 billion wild birds in Europe. In 2009 only 1.6 billion were left. In the same year, Europeans

raised 1.9 billion chickens for meat and eggs. At present, more than 90 percent of the large animals of the world (those weighing more than a few kilograms) are either humans or domesticated animals.

Alas, domesticated species paid for their unparalleled collective success with unprecedented individual suffering. Although the animal kingdom has known many types of pain and misery for millions of years, the Agricultural Revolution generated completely new kinds of suffering, that only became worse over time. To the casual observer domesticated animals may seem much better off than their wild cousins and ancestors. Wild boars spend their days searching for food, water, and shelter, and are constantly threatened by predators, parasites, and natural disasters. Domesticated pigs, in contrast, enjoy food, water, and shelter provided by humans, who also treat their diseases and protect them against predators and natural disasters. True, most pigs sooner or later find themselves in the slaughterhouse. Yet does that make their fate any worse than the fate of wild boars? Is it better to be devoured by a lion than slaughtered by a man? Are crocodile teeth less deadly than steel blades?

What makes the fate of domesticated farm animals particularly harsh is not just the way they die, but above all the way they live. Two competing factors have shaped the living conditions of farm animals from ancient times to the present day: human desires and animal needs. Thus humans raise pigs in order to get meat, but if they want a steady supply of meat, they must ensure the long-term survival and reproduction of the pigs. Theoretically this should have protected the animals from extreme forms of cruelty. If a farmer did not take good care of his pigs, they would soon die without offspring and the farmer would starve. Unfortunately, humans can cause tremendous suffering to farm animals in various ways, even while ensuring their survival and reproduction. The root of the problem is that domesticated animals have inherited from their wild ancestors many physical, emotional, and social needs that are redundant on human farms. Farmers routinely ignore these needs, without paying any economic penalty. They lock animals in tiny cages, mutilate their horns and tails, separate mothers from offspring and selectively breed monstrosities. The animals suffer greatly, yet they live on and multiply.

Doesn't that contradict the most basic principles of natural selection? The theory of evolution maintains that all instincts, drives, and emotions have evolved in the sole interest of survival and reproduction. If so, doesn't the continuous reproduction of farm animals prove that all their real needs are met? How can a pig have a 'need' that is not really needed for his survival and reproduction? It is certainly true that all instincts, drives, and emotions evolved in order to meet the evolutionary pressures of survival and

reproduction. However, if and when these pressures suddenly disappear, the instincts, drives, and emotions they had shaped do not disappear with them. At least not instantly. Even if they are no longer instrumental for survival and reproduction, these instincts, drives, and emotions continue to mold the subjective experiences of the animal. For animals and humans alike, agriculture changed selection pressures almost overnight, but it did not change their physical, emotional, and social drives. Of course evolution never stands still, and it has continued to modify humans and animals in the 12,000 years since the advent of farming. For example, humans in Europe and western Asia evolved the ability to digest cows' milk, while cows lost their fear of humans, and today produce far more milk than their wild ancestors. Yet these are superficial alterations. The deep sensory and emotional structures of cows, pigs, and humans alike haven't changed much since the Stone Age.

The human farmers take care of everything the sow needs in order to survive and reproduce. She is given enough food, vaccinated against diseases, protected against the elements, and artificially inseminated. From an objective perspective, the sow no longer needs to explore her surroundings, socialize with other pigs, bond with her piglets, or even walk. But from a subjective perspective, the sow still feels very strong urges to do all of these things, and if these urges are not fulfilled she suffers greatly. Sows locked in gestation crates typically display acute frustration alternating with extreme despair. These highly social and intelligent beings spend most of their lives in this condition, as if they were already sausages.

This is the basic lesson of evolutionary psychology: a need shaped thousands of generations ago continues to be felt subjectively even if it is no longer necessary for survival and reproduction in the present. Tragically, the Agricultural Revolution gave humans the power to ensure the survival and reproduction of domesticated animals while ignoring their subjective needs.

But how can we be sure that animals such as pigs actually have a subjective world of needs, sensations, and emotions? Aren't we guilty of humanizing animals—ascribing human qualities to non-human entities—like children believing that dolls feel love and anger? In fact, attributing emotions to pigs doesn't humanize them. It 'mammalizes' them. For emotions are not a uniquely human quality—they are common to all mammals (as well as to all birds and probably to some reptiles and even fish). All mammals evolved emotional abilities and needs, and from the fact that pigs are mammals we can safely deduce that they have emotions. The algorithms controlling vending machines work through mechanical gears and electric circuits. The algorithms controlling humans work through sensations, emotions, and

thoughts. And exactly the same kind of algorithms control pigs, baboons, otters, and chickens.

Consider, for example, the following survival problem: a baboon spots some bananas hanging on a tree, but also notices a lion lurking nearby. Should the baboon risk his life for those bananas? This boils down to a mathematical problem of calculating probabilities: the probability that the baboon will die of hunger if he does not eat the bananas, versus the probability that the lion will catch the baboon. In order to solve this problem the baboon needs to take into account a lot of data. How far am I from the bananas? How far away is the lion? How fast can I run? How fast can the lion run? Is the lion awake or asleep? Does the lion seem to be hungry or satiated? How many bananas are there? Are they big or small? Green or ripe? In addition to these external data, the baboon must also consider information about conditions within his own body. If he is starving, it makes sense to risk everything for those bananas, no matter the odds. In contrast, if he has just eaten, and the bananas are mere greed, why take any risks at all?

In order to weigh and balance all these variables and probabilities, the baboon requires far more complicated algorithms than the ones controlling automatic vending machines. The prize for making correct calculations is correspondingly greater. The prize is the very survival of the baboon. A timid baboon—one whose algorithms overestimate dangers—will starve to death, and the genes that shaped these cowardly algorithms will perish with him. A rash baboon—one whose algorithms underestimate dangers—will fall prey to the lion, and his reckless genes will also fail to make it to the next generation. These algorithms undergo constant quality control by natural selection. Only animals that calculate probabilities correctly leave offspring behind.

Yet this is all very abstract. How exactly does a baboon calculate probabilities? He certainly doesn't draw a pencil from behind his ear, a notebook from a back pocket, and start computing running speeds and energy levels with a calculator. Rather, the baboon's entire body is the calculator. What we call sensations and emotions are in fact algorithms. The baboon feels hunger, he feels fear and trembling at the sight of the lion, and he feels his mouth watering at the sight of the bananas. Within a split second, he experiences a storm of sensations, emotions, and desires, which is nothing but the process of calculation. The result will appear as a feeling: the baboon will suddenly feel his spirit rising, his hairs standing on end, his muscles tensing, his chest expanding, and he will inhale a big breath, and 'Forward! I can do it! To the bananas!' Alternatively, he may be overcome by fear, his shoulders will droop, his stomach will turn, his legs will give way,

and 'Mama! A lion! Help!' Sometimes the probabilities match so evenly that it is hard to decide. This too will manifest itself as a feeling. The baboon will feel confused and indecisive. 'Yes... No... Yes... No... Damn! I don't know what to do!'

Because these algorithms control the lives of all mammals and birds (and likely reptiles and fish), when humans, baboons, and pigs feel fear, similar neurological processes take place in similar brain areas. It is therefore likely that frightened humans, frightened baboons, and frightened pigs have similar experiences.

There are differences too, of course. Pigs don't seem to experience the extremes of compassion and cruelty that characterize *Homo sapiens*, nor the sense of wonder that overwhelms a human gazing up at the infinitude of a starry sky. It is likely that there are also opposite examples, of swinish emotions unfamiliar to humans, but I cannot name any, for obvious reasons. However, one core emotion is apparently shared by all mammals: the mother-infant bond. Indeed, it gives mammals their name. The word 'mammal' comes from the Latin *mamma*, meaning breast. Mammal mothers love their offspring so much that they allow them to suckle from their body. Mammal youngsters, on their side, feel an overwhelming desire to bond with their mothers and stay near them. In the wild, piglets, calves, and puppies that fail to bond with their mothers rarely survive for long. Until recently that was true of human children too. Conversely, a sow, cow, or bitch that due to some rare mutation does not care about her young may live a long and comfortable life, but her genes will not pass to the next generation. The same logic is true among giraffes, bats, whales, and porcupines. We can argue about other emotions, but since mammal youngsters cannot survive without motherly care, it is evident that motherly love and a strong mother-infant bond characterize all mammals.

Today we look back with incomprehension at early twentieth-century child-rearing advice. How could experts fail to appreciate that children have emotional needs, and that their mental and physical health depends as much on providing for these needs as on food, shelter, and medicines? Yet when it comes to other mammals we keep denying the obvious. Like John Watson and the Infant Care experts, farmers throughout history took care of the material needs of piglets, calves, and kids, but tended to ignore their emotional needs. Thus both the meat and dairy industries are based on breaking the most fundamental emotional bond in the mammal kingdom. Farmers get their breeding sows and dairy cows impregnated again and again. Yet the piglets and calves are separated from their mothers shortly after birth, and often pass their days without ever sucking at her teats or feeling the warm touch of her tongue and body. What Harry Harlow did to

a few hundred monkeys, the meat and dairy industries are doing to billions of animals every year.

Anthropological and archaeological evidence indicates that archaic hunter-gatherers were probably animists: they believed that there was no essential gap separating humans from other animals. The world—the local valley and the surrounding mountain chains—belonged to all its inhabitants, and everyone followed a common set of rules. These rules involved ceaseless negotiation between all concerned beings. People talked with animals, trees, and stones, as well as with fairies, demons, and ghosts. Out of this web of communications emerged the values and norms that were binding on humans, elephants, oak trees, and wraiths alike.

The animist worldview still guides some hunter-gatherer communities that have survived into the modern age. One of them is the Nayaka people, who live in the tropical forests of south India. When a Nayaka walking in the jungle encounters a dangerous animal such as a tiger, snake, or elephant, he or she might address the animal and say: ‘You live in the forest. I too live here in the forest. You came here to eat, and I too came here to gather roots and tubers. I didn’t come to hurt you.’ A Nayaka was once killed by a male elephant they called “the elephant who always walks alone.” The Nayakas refused to help officials from the Indian forestry department capture him. They explained that this elephant used to be very close to another male elephant, with whom he always roamed. One day the forestry department captured the second elephant, and since then ‘the elephant who always walks alone’ had become angry and violent.

“How would you have felt if your spouse had been taken away from you? This is exactly how this elephant felt. These two elephants sometimes separated at night, each walking its own path but in the morning they always came together again. On that day, the elephant saw his buddy falling, lying down. If two are always together and then you shoot one—how would the other feel?”

Such an animistic attitude strikes many industrialized people as alien. Most of us automatically see animals as essentially different and inferior. This is because even our most ancient traditions were created thousands of years after the end of the hunter-gatherer era. The Old Testament, for example, was written down in the first millennium BC, and its oldest stories reflect the realities of the second millennium BC. But in the Middle East the age of the hunter-gatherers ended more than 7,000 years earlier. It is hardly surprising, therefore, that the Bible rejects animistic beliefs and its only

animistic story appears right at the beginning, as a dire warning. The Bible is a long book, bursting with miracles, wonders, and marvels. Yet the only time an animal initiates a conversation with a human is when the serpent tempts Eve to eat the forbidden fruit of knowledge. Of course, Bil'am's donkey also speaks a few words, but she is merely conveying to Bil'am a message from God.

The authors of the book of Genesis may have preserved a remnant of archaic animist beliefs in Eve's name, but they took great care to conceal all other traces. Genesis says that, instead of descending from snakes, humans were divinely created from inanimate matter. The snake is not our progenitor: he seduces us to rebel against our heavenly Father. While animists saw humans as just another kind of animal, the Bible argues that humans are a unique creation, and any attempt to acknowledge the animal within us denies God's power and authority. Indeed, when modern humans discovered that they actually evolved from reptiles, they rebelled against God and stopped listening to Him—or even believing in His existence.

Biblical Judaism, for instance, catered to peasants and shepherds. Most of its commandments dealt with farming and village life, and its major holidays were harvest festivals. People today imagine the ancient temple in Jerusalem as a kind of big synagogue where priests clad in snow-white robes welcomed devout pilgrims, melodious choirs sang psalms, and incense perfumed the air. In reality, it looked much more like a cross between a slaughterhouse and a barbecue joint than a modern synagogue. The pilgrims did not come empty-handed. They brought with them a never-ending stream of sheep, goats, chickens, and other animals, which were sacrificed at the god's altar and then cooked and eaten. The psalm-singing choirs could hardly be heard over the bellowing and bleating of calves and kids. Priests in bloodstained outfits cut the victims' throats, collected the gushing blood in jars, and spilled it over the altar. The perfume of incense mixed with the odours of congealed blood and roasted meat, while swarms of black flies buzzed just about everywhere. A modern Jewish family that celebrates a holiday by having a barbecue on their front lawn is much closer to the spirit of biblical times than an orthodox family that spends the time studying scriptures in a synagogue.

Theist religions, such as biblical Judaism, justified the agricultural economy through new cosmological myths. Animist religions had previously depicted the universe as a grand Chinese opera with a limitless cast of colourful actors. Elephants and oak trees, crocodiles and rivers, mountains and frogs, ghosts and fairies, angels and demons—each had a role in the cosmic opera. Theist religions rewrote the script, turning the universe into a bleak Ibsen drama with just two main characters: man and God. The angels

and demons somehow survived the transition, becoming the messengers and servants of the great gods. Yet the rest of the animist cast—all the animals, plants, and other natural phenomena—were transformed into silent decor. True, some animals were considered sacred to this or that god, and many gods had animal features: the Egyptian god Anubis had the head of a jackal, and even Jesus Christ was frequently depicted as a lamb. Yet ancient Egyptians could easily tell the difference between Anubis and an ordinary jackal sneaking into the village to hunt chickens, and no Christian butcher ever mistook the lamb under his knife for Jesus.

We normally think that theist religions sanctified the great gods. We tend to forget that they sanctified humans, too. Hitherto *Homo sapiens* had been just one actor in a cast of thousands. In the new theist drama, *Sapiens* became the central hero around whom the entire universe revolved. The gods, meanwhile, were given two related roles to play. Firstly, they explained what is so special about *Sapiens* and why humans should dominate and exploit all other organisms. Christianity, for example, maintained that humans hold sway over the rest of creation because the Creator charged them with that authority. Moreover, according to Christianity, God gave an eternal soul only to humans. Since the fate of this eternal soul is the point of the whole Christian cosmos, and since animals have no soul, they are mere extras. Humans thus became the apex of creation, while all other organisms were pushed to the sidelines.

Secondly, the gods had to mediate between humans and the ecosystem. In the animistic cosmos, everyone talked with everyone directly. If you needed something from the caribou, the fig trees, the clouds or the rocks, you addressed them yourself. In the theist cosmos, all non-human entities were silenced. Consequently you could no longer talk with trees and animals. What to do, then, when you wanted the trees to give more fruits, the cows to give more milk, the clouds to bring more rain and the locusts to stay away from your crops? That's where the gods entered the picture. They promised to supply rain, fertility, and protection, provided humans did something in return. This was the essence of the agricultural deal. The gods safeguarded and multiplied farm production, and in exchange humans had to share the produce with the gods. This deal served both parties, at the expense of the rest of the ecosystem.

The story of Noah and his ark became a founding myth of the agricultural world. It is possible of course to give it a modern environmentalist spin. The deluge could teach us that our actions can ruin the entire ecosystem, and humans are divinely charged with protecting the rest of creation. Yet traditional interpretations saw the deluge as proof of human supremacy and animal worthlessness. According to these interpretations, Noah was

instructed to save the whole ecosystem in order to protect the common interests of gods and humans rather than the interests of the animals. Non-human organisms have no intrinsic value, and exist solely for our sake. After all, when “the Lord saw how great the wickedness of the human race had become” He resolved to “wipe from the face of the earth the human race I have created—and with them the animals, the birds and the creatures that move along the ground—for I regret that I have made them” (Genesis 6:7). The Bible thinks it is perfectly all right to destroy all animals as punishment for the crimes of *Homo sapiens*, as if the existence of giraffes, pelicans, and ladybirds has lost all purpose if humans misbehave. The Bible could not imagine a scenario in which God repents having created *Homo sapiens*, wipes this sinful ape off the face of the earth, and then spends eternity enjoying the antics of ostriches, kangaroos, and panda bears.

All agricultural religions—Jainism, Buddhism, and Hinduism included—found ways to justify human superiority and the exploitation of animals (if not for meat, then for milk and muscle power). They have all claimed that a natural hierarchy of beings entitles humans to control and use other animals, provided that the humans observe certain restrictions. Hinduism, for example, has sanctified cows and forbidden eating beef, but has also provided the ultimate justification for the dairy industry, alleging that cows are generous creatures, and positively yearn to share their milk with humankind.

Hunter-gatherers had not seen themselves as superior beings because they were seldom aware of their impact on the ecosystem. A typical band numbered in the dozens, it was surrounded by thousands of wild animals, and its survival depended on understanding and respecting the desires of these animals. Foragers had to constantly ask themselves what deer dream about, and what lions think. Otherwise, they could not hunt the deer, nor escape the lions. Farmers, in contrast, lived in a world controlled and shaped by human dreams and thoughts. Humans were still subject to formidable natural forces such as storms and earthquakes, but they were far less dependent on the wishes of other animals. A farm boy learned early on to ride a horse, harness a bull, whip a stubborn donkey, and lead the sheep to pasture. It was easy and tempting to believe that such everyday activities reflected either the natural order of things or the will of heaven.

During the Agricultural Revolution humankind silenced animals and plants, and turned the animist grand opera into a dialogue between man and gods. During the Scientific Revolution humankind silenced the gods too. The world was now a one-man show. Humankind stood alone on an empty stage, talking to itself, negotiating with no one and acquiring enormous powers without any obligations. Having deciphered the mute laws of physics,

chemistry, and biology, humankind now does with them as it pleases. When an archaic hunter went out to the savannah, he asked the help of the wild bull, and the bull demanded something of the hunter. When an ancient farmer wanted his cows to produce lots of milk, he asked some great heavenly god for help, and the god stipulated his conditions. When the white-coated staff in Nestlé's Research and Development department want to increase dairy production, they study genetics—and the genes don't ask for anything in return.

In recent years, as people began to rethink human-animal relations, such practices have come under increasing criticism. We are suddenly showing unprecedented interest in the fate of so-called lower life forms, perhaps because we are about to become one. If and when computer programs attain superhuman intelligence and unprecedented power, should we begin valuing these programs more than we value humans? Would it be okay, for example, for an artificial intelligence to exploit humans and even kill them to further its own needs and desires? If it should never be allowed to do that, despite its superior intelligence and power, why is it ethical for humans to exploit and kill pigs? Do humans have some magical spark, in addition to higher intelligence and greater power, which distinguishes them from pigs, chickens, chimpanzees, and computer programs alike? If yes, where did that spark come from, and why are we certain that an AI could never acquire it? If there is no such spark, would there be any reason to continue assigning special value to human life even after computers surpass humans in intelligence and power? Indeed, what exactly is it about humans that make us so intelligent and powerful in the first place, and how likely is it that non-human entities will ever rival and surpass us?

When we privilege human children over piglets, we want to believe that this reflects something deeper than the ecological balance of power. We want to believe that human lives really are superior in some fundamental way. We Sapiens love telling ourselves that we enjoy some magical quality that not only accounts for our immense power, but also gives moral justification for our privileged status. What is this unique human spark? The traditional monotheist answer is that only Sapiens have eternal souls. Whereas the body decays and rots, the soul journeys on towards salvation or damnation, and will experience either everlasting joy in paradise or an eternity of misery in hell. Since pigs and other animals have no soul, they don't take part in this cosmic drama. They live only for a few years, and then die and fade into nothingness. We should therefore care far more about eternal human souls than about ephemeral pigs.

This is no kindergarten fairy tale, but an extremely powerful myth that continues to shape the lives of billions of humans and animals in the early

twenty-first century. The belief that humans have eternal souls whereas animals are just evanescent bodies is a central pillar of our legal, political, and economic system. It explains why, for example, it is perfectly okay for humans to kill animals for food, or even just for the fun of it.

However, our latest scientific discoveries flatly contradict this monotheist myth. True, laboratory experiments confirm the accuracy of one part of the myth: just as monotheist religions say, animals have no souls. All the careful studies and painstaking examinations have failed to discover any trace of a soul in pigs, rats, or rhesus monkeys. Alas, the same laboratory experiments undermine the second and far more important part of the monotheist myth, namely, that humans do have a soul. Scientists have subjected *Homo sapiens* to tens of thousands of bizarre experiments, and looked into every nook in our hearts and every cranny in our brains. But they have so far discovered no magical spark. There is zero scientific evidence that in contrast to pigs, *Sapiens* have souls. If that were all, we could well argue that scientists just need to keep looking. If they haven't found the soul yet, it is because they haven't looked carefully enough. Yet the life sciences doubt the existence of soul not just due to lack of evidence, but rather because the very idea of soul contradicts the most fundamental principles of evolution. This contradiction is responsible for the unbridled hatred that the theory of evolution inspires among devout monotheists.

The theory of relativity makes nobody angry, because it doesn't contradict any of our cherished beliefs. Most people don't care an iota whether space and time are absolute or relative. If you think it is possible to bend space and time, well, be my guest. Go ahead and bend them. What do I care? In contrast, Darwin has deprived us of our souls. If you really understand the theory of evolution, you understand that there is no soul. This is a terrifying thought not only to devout Christians and Muslims, but also to many secular people who don't hold any clear religious dogma, but nevertheless want to believe that each human possesses an eternal individual essence that remains unchanged throughout life, and can survive even death intact.

Some scientists concede that consciousness is real and may actually have great moral and political value, but that it fulfills no biological function whatsoever. Consciousness is the biologically useless by-product of certain brain processes. Jet engines roar loudly, but the noise doesn't propel the aeroplane forward. Humans don't need carbon dioxide, but each and every breath fills the air with more of the stuff. Similarly, consciousness may be a kind of mental pollution produced by the firing of complex neural networks. It doesn't do anything. It is just there. If this is true, it implies that all the pain and pleasure experienced by billions of creatures for millions of years is

just mental pollution. This is certainly a thought worth thinking, even if it isn't true. But it is quite amazing to realize that as of 2020, this is the best theory of consciousness that contemporary science has to offer us.

Since we aren't familiar with any algorithm that requires consciousness, anything an animal does can be seen as the product of non-conscious algorithms rather than of conscious memories and plans. So the real question concerns the burden of proof. What is the most likely explanation for the behaviour? Should we assume that they are consciously planning for the future, and anyone who disagrees should provide some counter-evidence? Or is it more reasonable to think that a chimpanzee is driven by a non-conscious algorithm, and all he consciously feels is a mysterious urge to place stones under bales of straw? And even if the chimp doesn't remember the past and doesn't imagine the future, does it mean he lacks self-consciousness? After all, we ascribe self-consciousness to humans even when they are not busy remembering the past or dreaming about the future.

For example, when a human mother sees her toddler wandering onto a busy road, she doesn't stop to think about either past or future. Just like the mother elephant, she too just races to save her child. Why not say about her what we say about the elephant, namely that 'when the mother rushed to save her baby from the oncoming danger, she did it without any self-consciousness. She was merely driven by a momentary urge'? Similarly, consider a young couple kissing passionately on their first date, a soldier charging into heavy enemy fire to save a wounded comrade, or an artist drawing a masterpiece in a frenzy of brushstrokes. None of them stops to contemplate the past or the future. Does it mean they lack self-consciousness, and that their state of being is inferior to that of a politician giving an election speech about his past achievements and future plans?

But maybe the life sciences view the problem from the wrong angle. They believe that life is all about data processing, and that organisms are machines for making calculations and taking decisions. However, this analogy between organisms and algorithms might mislead us. In the nineteenth century, scientists described brains and minds as if they were steam engines. Why steam engines? Because that was the leading technology of the day, which powered trains, ships, and factories, so when humans tried to explain life, they assumed it must work according to analogous principles. Mind and body are made of pipes, cylinders, valves, and pistons that build and release pressure, thereby producing movements and actions. Such thinking had a deep influence even on Freudian psychology, which is why much of our psychological jargon is still replete with concepts borrowed from mechanical engineering.

Just as the water technologies of antiquity (pumps, fountains, water-

based clocks) gave rise to the Greek and Roman languages of *pneuma* and the humors; and just as the presiding metaphor for human life during the Renaissance was clockwork; and just as in the wake of the Industrial Revolution, with its steam engines and pressurized energies, Freud brought these forces to bear on our conception of the unconscious, there was now a vision of the minds of humans as devices for the storing and processing of data, as neural code running on the wetware of the central nervous system.

In the twenty-first century it sounds childish to compare the human psyche to a steam engine. Today we know of a far more sophisticated technology—the computer—so we explain the human psyche as if it were a computer processing data rather than a steam engine regulating pressure. But this new analogy may turn out to be just as naïve. After all, computers have no minds. They don't crave anything even when they have a bug, and the Internet doesn't feel pain even when authoritarian regimes sever entire countries from the Web. So why use computers as a model for understanding the mind?

The Turing Test is simply a replication of a mundane test every gay man had to undergo in 1950 Britain: can you pass for a straight man? Turing knew from personal experience that it didn't matter who you really were—it mattered only what others thought about you. According to Turing, in the future computers would be just like gay men in the 1950s. It won't matter whether computers will actually be conscious or not. It will matter only what people think about it.

Humans nowadays completely dominate the planet not because the individual human is far smarter and more nimble-fingered than the individual chimp or wolf, but because *Homo sapiens* is the only species on earth capable of cooperating flexibly in large numbers. Intelligence and tool-making were obviously very important as well. But if humans had not learned to cooperate flexibly in large numbers, our crafty brains and deft hands would still be splitting flint stones rather than uranium atoms.

If cooperation is the key, how come the ants and bees did not beat us to the nuclear bomb even though they learned to cooperate en masse millions of years before us? Because their cooperation lacks flexibility. Bees cooperate in very sophisticated ways, but they cannot reinvent their social system overnight. If a hive faces a new threat or a new opportunity, the bees cannot, for example, guillotine the queen and establish a republic. Social mammals such as elephants and chimpanzees cooperate far more flexibly than bees, but they do so only with small numbers of friends and family members. Their cooperation is based on personal acquaintance. If I am a chimpanzee and you are a chimpanzee and I want to cooperate with you, I must know you personally: what kind of chimp are you? Are you a nice chimp? Are

you an evil chimp? How can I cooperate with you if I don't know you? To the best of our knowledge, only Sapiens can cooperate in very flexible ways with countless numbers of strangers. This concrete capability—rather than an eternal soul or some unique kind of consciousness—explains our mastery of planet Earth.

History provides ample evidence for the crucial importance of large-scale cooperation. Victory almost invariably went to those who cooperated better—not only in struggles between Homo sapiens and other animals, but also in conflicts between different human groups. Thus Rome conquered Greece not because the Romans had larger brains or better tool-making techniques, but because they were able to cooperate more effectively. Throughout history, disciplined armies easily routed disorganized hordes, and unified elites dominated the disorderly masses. In 1914, for example, 3 million Russian noblemen, officials, and business people lorded it over 180 million peasants and workers. The Russian elite knew how to cooperate in defense of its common interests, whereas the 180 million commoners were incapable of effective mobilization. Indeed, much of the elite's efforts focused on ensuring that the 180 million people at the bottom would never learn to cooperate.

In order to mount a revolution, numbers are never enough. Revolutions are usually made by small networks of agitators rather than by the masses. If you want to launch a revolution, don't ask yourself, 'How many people support my ideas?' Instead, ask yourself, 'How many of my supporters are capable of effective collaboration?' The Russian Revolution finally erupted not when 180 million peasants rose against the tsar, but rather when a handful of communists placed themselves at the right place at the right time. In 1917, at a time when the Russian upper and middle classes numbered at least 3 million people, the Communist Party had just 23,000 members. The communists nevertheless gained control of the vast Russian Empire because they organized themselves well. When authority in Russia slipped from the decrepit hands of the tsar and the equally shaky hands of Kerensky's provisional government, the communists seized it with alacrity, gripping the reins of power like a bulldog locking its jaws on a bone.

If Sapiens rule the world because we alone can cooperate flexibly in large numbers, then this undermines our belief in the sacredness of human beings. We tend to think that we are special, and deserve all kinds of privileges. As proof, we point to the amazing achievements of our species: we built the pyramids and the Great Wall of China; we deciphered the structure of atoms and DNA molecules; we reached the South Pole and the moon. If these accomplishments resulted from some unique essence that each individual human has—an immortal soul, say—then it would make sense to sanctify human life. Yet since these triumphs actually result

from mass cooperation, it is far less clear why they should make us revere individual humans. A beehive has much greater power than an individual butterfly, yet that doesn't imply a bee is therefore more hallowed than a butterfly. The Romanian Communist Party successfully dominated the disorganized Romanian population. Does it follow that the life of a party member was more sacred than the life of an ordinary citizen? Humans know how to cooperate far more effectively than chimpanzees, which is why humans launch spaceships to the moon whereas chimpanzees throw stones at zoo visitors. Does it mean that humans are superior beings?

Research indicates that *Sapiens* just can't have intimate relations—whether hostile or amorous—with more than 150 individuals. Whatever enables humans to organize mass-cooperation networks, it isn't intimate relations. This is bad news for psychologists, sociologists, economists, and others who try to decipher human society through laboratory experiments. For both organizational and financial reasons, the vast majority of experiments are conducted either on individuals or on small groups of participants. Yet it is risky to extrapolate from small-group behaviour to the dynamics of mass societies. A nation of 100 million people functions in a fundamentally different way to a band of a hundred individuals.

Many believe that primates have a natural morality, and that equality is a universal and timeless value. People are egalitarian by nature, and unequal societies can never function well due to resentment and dissatisfaction. But is that really so? These theories may work well on chimpanzees, capuchin monkeys and small hunter-gatherer bands. They also work well in the lab, where you test them on small groups of people. Yet once you observe the behaviour of human masses you discover a completely different reality. Most human kingdoms and empires were extremely unequal, yet many of them were surprisingly stable and efficient. In ancient Egypt, the pharaoh sprawled on comfortable cushions inside a cool and sumptuous palace, wearing golden sandals and gem-studded tunics, while beautiful maids popped sweet grapes into his mouth. Through the open window he could see the peasants in the fields, toiling in dirty rags under a merciless sun, and blessed was the peasant who had a cucumber to eat at the end of the day. Yet the peasants rarely revolted.

Why did the Egyptian peasants and Prussian soldiers act so differently than we would have expected on the basis of the Ultimatum Game and primate studies? Because large numbers of people behave in a fundamentally different way than do small numbers. What would scientists see if they conducted the Ultimatum Game experiment on two groups of 1 million people each, who had to share \$100 billion? They would probably have witnessed strange and fascinating dynamics. For example, since 1 million

people cannot make decisions collectively, each group might sprout a small ruling elite. What if one elite offers the other \$10 billion, keeping \$90 billion? The leaders of the second group might well accept this unfair offer, siphon most of the \$10 billion into their Swiss bank accounts, while preventing rebellion among their followers with a combination of sticks and carrots. The leadership might threaten to severely punish dissidents forthwith, while promising the meek and patient everlasting rewards in the afterlife. This is what happened in ancient Egypt and eighteenth-century Prussia, and this is how things still work out in numerous countries around the world.

Such threats and promises often succeed in creating stable human hierarchies and mass-cooperation networks, as long as people believe that they reflect the inevitable laws of nature or the divine commands of God, rather than just human whims. All large-scale human cooperation is ultimately based on our belief in imagined orders. These are sets of rules that, despite existing only in our imagination, we believe to be as real and inviolable as gravity. ‘If you sacrifice ten bulls to the sky god, the rain will come; if you honour your parents, you will go to heaven; and if you don’t believe what I am telling you—you’ll go to hell.’ As long as all Sapiens living in a particular locality believe in the same stories, they all follow the same rules, making it easy to predict the behaviour of strangers and to organize mass-cooperation networks. Sapiens often use visual marks such as a turban, a beard, or a business suit to signal ‘you can trust me, I believe in the same story as you.’ Our chimpanzee cousins cannot invent and spread such stories, which is why they cannot cooperate in large numbers.

The Price of Fictions

People find it difficult to understand the idea of ‘imagined orders’ because they assume that there are only two types of realities: objective realities and subjective realities. In objective reality, things exist independently of our beliefs and feelings. Gravity, for example, is an objective reality. It existed long before Newton, and it affects people who don’t believe in it just as much as it affects those who do. Subjective reality, in contrast, depends on my personal beliefs and feelings. Thus, suppose I feel a sharp pain in my head and go to the doctor. The doctor checks me thoroughly, but finds nothing wrong. So she sends me for a blood test, urine test, DNA test, X-ray, electrocardiogram, fMRI scan, and a plethora of other procedures. When the results come in she announces that I am perfectly healthy, and I can go home. Yet I still feel a sharp pain in my head. Even though every objective test has found nothing wrong with me, and even though nobody except me feels the pain, for me the pain is 100 percent real. Most people presume that reality is either objective or subjective, and that there is no third option. Hence once they satisfy themselves that something isn’t just their own subjective feeling, they jump to the conclusion it must be objective. If lots of people believe in God; if money makes the world go round; and if nationalism starts wars and builds empires—then these things aren’t just a subjective belief of mine. God, money, and nations must therefore be objective realities.

However, there is a third level of reality: the intersubjective level. Intersubjective entities depend on communication among many humans rather than on the beliefs and feelings of individual humans. Many of the most important agents in history are intersubjective. Money, for example, has no objective value. You cannot eat, drink, or wear a dollar bill. Yet as long as billions of people believe in its value, you can use it to buy food, beverages, and clothing. If the baker suddenly loses his faith in the dollar bill and refuses to give me a loaf of bread for this green piece of paper, it doesn’t matter much. I can just go down a few blocks to the nearby supermarket. However, if the supermarket cashiers also refuse to accept this piece of paper, along with the hawkers in the market and the salespeople in the mall, then the dollar will lose its value. The green pieces of paper will go on existing, of course, but they will be worthless.

It is relatively easy to accept that money is an intersubjective reality. Most people are also happy to acknowledge that ancient Greek gods, evil empires, and the values of alien cultures exist only in the imagination. Yet we don’t want to accept that our God, our nation, or our values are mere

fictions, because these are the things that give meaning to our lives. We want to believe that our lives have some objective meaning, and that our sacrifices matter to something beyond the stories in our head. Yet in truth the lives of most people have meaning only within the network of stories they tell one another.

Meaning is created when many people weave together a common network of stories. Why does a particular action—such as getting married in church, fasting on Ramadan or voting on election day—seem meaningful to me? Because my parents also think it is meaningful, as do my brothers, my neighbours, people in nearby cities and even the residents of far-off countries. And why do all these people think it is meaningful? Because their friends and neighbours also share the same view. People constantly reinforce each other's beliefs in a self-perpetuating loop. Each round of mutual confirmation tightens the web of meaning further, until you have little choice but to believe what everyone else believes.

That's how history unfolds. People weave a web of meaning, believe in it with all their heart, but sooner or later the web unravels, and when we look back we cannot understand how anybody could have taken it seriously. With hindsight, going on crusade in the hope of reaching Paradise sounds like utter madness. With hindsight, the Cold War seems even madder. How come thirty years ago people were willing to risk nuclear holocaust because of their belief in a communist paradise or their fanatical faith in the market? A hundred years hence, our belief in democracy and human rights might look equally incomprehensible to our descendants.

Whereas cats and other animals seem to be confined to the objective realm and use their communication systems merely to describe reality, Sapiens use language to create completely new realities. During the last 70,000 years the intersubjective realities that Sapiens invented became ever more powerful, so that today they dominate the world. Will the chimpanzees, the elephants, the Amazon rainforests, and the Arctic glaciers survive the twenty-first century? This depends on the wishes and decisions of intersubjective entities such as the European Union and the World Bank; entities that exist only in our shared imagination.

During the twenty-first century the border between history and biology is likely to blur not because we will discover biological explanations for historical events, but rather because ideological fictions will rewrite DNA strands; political and economic interests will redesign the climate; and the geography of mountains and rivers will give way to cyberspace. As human fictions are translated into genetic and electronic codes, the intersubjective reality will swallow up the objective reality and biology will merge with history. In the twenty-first century fiction might thereby become the most potent force on

earth, surpassing even wayward asteroids and natural selection. Hence if we want to understand our future, cracking genomes and crunching numbers is hardly enough. We must also decipher the fictions that give meaning to the world.

Animals such as wolves and chimpanzees live in a dual reality. On the one hand, they are familiar with objective entities outside them, such as trees, rocks, and rivers. On the other hand, they are aware of subjective experiences within them, such as fear, joy, and desire. Sapiens, in contrast, live in triple-layered reality. In addition to trees, rivers, fears, and desires, the Sapiens world also contains stories about money, gods, nations, and corporations. As history unfolded, the impact of gods, nations, and corporations grew at the expense of rivers, fears, and desires. There are still many rivers in the world, and people are still motivated by their fears and wishes, but Jesus Christ, the French Republic, and Apple Inc. have dammed and harnessed the rivers, and have learned to shape our deepest anxieties and yearnings.

When the Nazis overran France in the spring of 1940, much of its Jewish population tried to escape the country. In order to cross the border south, they needed visas to Spain and Portugal, and tens of thousands of Jews, along with many other refugees, besieged the Portuguese consulate in Bordeaux in a desperate attempt to get the life-saving piece of paper. The Portuguese government forbade its consuls in France to issue visas without prior approval from the Foreign Ministry, but the consul in Bordeaux, Aristides de Sousa Mendes, decided to disregard the order, throwing to the wind a thirty-year diplomatic career. As Nazi tanks were closing in on Bordeaux, Sousa Mendes and his team worked around the clock for ten days and nights, barely stopping to sleep, just issuing visas and stamping pieces of paper. Sousa Mendes issued thousands of visas before collapsing from exhaustion. The Portuguese government—which had little desire to accept any of these refugees—sent agents to escort the disobedient consul back home, and fired him from the foreign office. Yet officials who cared little for the plight of human beings nevertheless had deep respect for documents, and the visas Sousa Mendes issued against orders were respected by French, Spanish, and Portuguese bureaucrats alike, spiriting up to 30,000 people out of the Nazi death trap. Sousa Mendes, armed with little more than a rubber stamp, was responsible for the largest rescue operation by a single individual during the Holocaust.

Written language may have been conceived as a modest way of describing reality, but it gradually became a powerful way to reshape reality. When official reports collided with objective reality, it was often reality that had to give way. Anyone who has ever dealt with the tax authorities, the educational system, or any other complex bureaucracy knows that the truth

hardly matters. What's written on your form is far more important.

In theory, if some holy book misrepresented reality, its disciples would sooner or later find it out, and the text would lose its authority. Abraham Lincoln said you cannot deceive everybody all the time. Well, that's wishful thinking. In practice, the power of human cooperation networks rests on a delicate balance between truth and fiction. If you distort reality too much, it will weaken you, and you will not be able to compete against more clear-sighted rivals. On the other hand, you cannot organize masses of people effectively without relying on some fictional myths. So if you stick to pure reality, without mixing any fiction with it, few people would follow you.

If you used a time machine to send a modern scientist to ancient Egypt, she would not be able to seize power by exposing the fictions of the local priests and lecturing the peasants on evolution, relativity, and quantum physics. Of course, if our scientist could use her knowledge in order to produce a few rifles and artillery pieces, she could gain a huge advantage over pharaoh and the crocodile god Sobek. Yet in order to mine iron, build furnaces, and manufacture gunpowder the scientist would need a lot of hard-working peasants. Do you really think she could inspire them by explaining that energy divided by mass equals the speed of light squared? If you happen to think so, you are welcome to travel to Afghanistan or Somalia and try your luck.

Really powerful human organizations—such as pharaonic Egypt, communist China, the European empires, and the modern school system—are not necessarily clear-sighted. Much of their power rests on their ability to force their fictional beliefs on a submissive reality.

In the mass educational systems of the industrial age, schools began using precise marks on a regular basis. Since both factories and government ministries became accustomed to thinking in the language of numbers, schools followed suit. They started to gauge the worth of each student according to his or her average mark, whereas the worth of each teacher and principal was judged according to the school's overall average. Once bureaucrats adopted this yardstick, reality was transformed. Originally, schools were supposed to focus on enlightening and educating students, and marks were merely a means of measuring success. But naturally enough, schools soon began focusing on getting high marks. As every child, teacher, and inspector knows, the skills required to get high marks in an exam are not the same as a true understanding of literature, biology, or mathematics. Every child, teacher, and inspector also knows that when forced to choose between the two, most schools will go for the marks.

The same thing happens when the educational system declares that ma-

trication exams are the best method to evaluate students. The system has enough authority to influence acceptance conditions to colleges, government offices and private-sector jobs. Students therefore invest all their efforts in getting good marks. Coveted positions are manned by people with high marks, who naturally support the system that brought them there. The fact that the educational system controls the critical exams gives it more power, and increases its influence over colleges, government offices, and the job market. If somebody protests that ‘The degree certificate is just a piece of paper!’ and behaves accordingly, he is unlikely to get very far in life.

Holy scriptures work this way too. The religious establishment proclaims that the holy book contains the answers to all our questions. It simultaneously forces courts, governments, and businesses to behave according to what the holy book says. When a wise person reads scriptures and then looks at the world, he sees that there is indeed a good match. ‘Scriptures say that you must pay tithes to God—and look, everybody pays. Scriptures say that women are inferior to men, and cannot serve as judges or even give testimony in court—and look, there are indeed no women judges and the courts reject their testimony. Scriptures say that whoever studies the word of God will succeed in life—and look, all the good jobs are indeed held by people who know the holy book by heart.’ Such a wise person will naturally begin to study the holy book, and because he is wise, he will become a scriptural pundit. He will consequently be appointed a judge. When he becomes a judge, he will not allow women to bear witness in court, and when he chooses his successor, he will obviously pick somebody who knows the holy book well. If someone protests that ‘This book is just paper!’ and behaves accordingly, such a heretic will not get very far in life. Even when scriptures mislead people about the true nature of reality, they can nevertheless retain their authority for thousands of years. For instance, the biblical perception of history is fundamentally flawed, yet it managed to spread throughout the world, and billions still believe in it.

Such self-absorption characterizes all humans in their childhood. Children of all religions and cultures think they are the center of the world, and therefore show little genuine interest in the conditions and feelings of other people. That’s why divorce is so traumatic for children. A five-year-old cannot understand that something important is happening for reasons unrelated to him. No matter how many times you tell him that mummy and daddy are independent people with their own problems and wishes, and that they didn’t divorce because of him—the child cannot absorb that. He is convinced that everything happens because of him. Most people grow out of this infantile delusion. Monotheists hold on to it till the day they die. Like a child thinking that his parents are fighting because of him, the monotheist

is convinced that the Persians are fighting the Babylonians because of him.

But no matter how mistaken the biblical world view was, it provided a better basis for large-scale human cooperation. Fictions enable us to cooperate better. The price we pay is that the same fictions also determine the goals of our cooperation. So we may have very elaborate systems of cooperation, which are harnessed to serve fictional aims and interests. Consequently the system may seem to be working well, but only if we adopt the system's own criteria.

Suppose you were given a choice between the following two vacation packages:

Stone Age Package: On day one we will hike for ten hours in a pristine forest, setting camp for the night in a clearing by a river. On day two we will canoe down the river for ten hours, camping on the shores of a small lake. On day three we will learn from the native people how to fish in the lake and how to find mushrooms in the nearby woods.

Modern Proletarian Package: On day one we will work for ten hours in a polluted textile factory, passing the night in a cramped apartment block. On day two we will work for ten hours as cashiers in the local department store, going back to sleep in the same apartment block. On day three we will learn from the native people how to open a bank account and fill out mortgage forms.

Which package would you choose? Hence when we come to evaluate human cooperation networks, it all depends on the yardsticks and viewpoint we adopt. Are we judging pharaonic Egypt in terms of production, nutrition, or perhaps social harmony? Do we focus on the aristocracy, the simple peasants, or the pigs and crocodiles? History isn't a single narrative, but thousands of alternative narratives. Whenever we choose to tell one, we are also choosing to silence others.

When examining the history of any human network, it is therefore advisable to stop from time to time and look at things from the perspective of some real entity. How do you know if an entity is real? Very simple—just ask yourself, 'Can it suffer?' When people burn down the temple of Zeus, Zeus doesn't suffer. When the euro loses its value, the euro doesn't suffer. When a bank goes bankrupt, the bank doesn't suffer. When a country suffers a defeat in war, the country doesn't really suffer. It's just a metaphor. In contrast, when a soldier is wounded in battle, he really does suffer. When a famished peasant has nothing to eat, she suffers. When a cow is separated from her newborn calf, she suffers. This is reality. Of course suffering might well be caused by our belief in fictions. For example, belief in national and

religious myths might cause the outbreak of war, in which millions lose their homes, their limbs and even their lives. The cause of war is fictional, but the suffering is 100 percent real. This is exactly why we should strive to distinguish fiction from reality.

Fiction isn't bad. It is vital. Without commonly accepted stories about things like money, states, or corporations, no complex human society can function. We can't play football unless everyone believes in the same made-up rules, and we can't enjoy the benefits of markets and courts without similar make-believe stories. But the stories are just tools. They should not become our goals or our yardsticks. When we forget that they are mere fiction, we lose touch with reality. Then we begin entire wars 'to make a lot of money for the corporation' or 'to protect the national interest.' Corporations, money, and nations exist only in our imagination. We invented them to serve us; how come we find ourselves sacrificing our lives in their service?

Stories serve as the foundations and pillars of human societies. As history unfolded, stories about gods, nations, and corporations grew so powerful that they began to dominate objective reality. Believing in the great god Sobek, the Mandate of Heaven, or the Bible enabled people to build Lake Fayum, the Great Wall of China, and Chartres Cathedral. Unfortunately, blind faith in these stories meant that human efforts frequently focused on increasing the glory of fictional entities such as gods and nations, instead of bettering the lives of real sentient beings.

Modern science certainly changed the rules of the game, but it did not simply replace myths with facts. Myths continue to dominate humankind. Science only makes these myths stronger. Instead of destroying the intersubjective reality, science will enable it to control the objective and subjective realities more completely than ever before. Thanks to computers and bio-engineering, the difference between fiction and reality will blur, as people reshape reality to match their pet fictions. The priests of Sobek imagined the existence of divine crocodiles, while pharaoh dreamt about immortality. In reality, the sacred crocodile was a very ordinary swamp reptile dressed in golden fineries, and pharaoh was as mortal as the simplest of peasants. After death, his corpse was mummified using preservative balms and scented perfumes, but it was as lifeless as one can get. In contrast, twenty-first-century scientists might be able to really engineer super-crocodiles, and to provide the human elite with eternal youth here on earth. Consequently the rise of science will make at least some myths and religions mightier than ever.

Defining religion as 'belief in gods' is also problematic. We tend to say that a devout Christian is religious because she believes in God, whereas a fervent communist isn't religious, because communism has no gods. However,

religion is created by humans rather than by gods, and it is defined by its social function rather than by the existence of deities. Religion is anything that confers superhuman legitimacy on human social structures. It legitimizes human norms and values by arguing that they reflect superhuman laws. Religion asserts that we humans are subject to a system of moral laws that we did not invent and that we cannot change. A devout Jew would say that this is the system of moral laws created by God and revealed in the Bible. A Hindu would say that Brahma, Vishnu, and Shiva created the laws, which were revealed to us humans in the Vedas. Other religions, from Buddhism and Taoism to Nazism, communism, and liberalism, argue that the superhuman laws are natural laws, and not the creation of this or that god. Of course, each believes in a different set of natural laws discovered and revealed by different seers and prophets, from Buddha and Laozi to Hitler and Lenin.

Liberals, communists, and followers of other modern creeds dislike describing their own system as a 'religion,' because they identify religion with superstitions and supernatural powers. If you tell communists or liberals that they are religious, they think you accuse them of blindly believing in groundless pipe dreams. In fact, it means only that they believe in some system of moral laws that wasn't invented by humans, but which humans must nevertheless obey. As far as we know, all human societies believe in this. Every society tells its members that they must obey some superhuman moral law, and that breaking this law will result in catastrophe.

Modern communism, like many other religious systems, dislikes rich people, but it threatens them with class conflict here and now, rather than with burning sulphur after death. The communist laws of history are similar to the commandments of the Christian God, inasmuch as they are superhuman forces that humans cannot change at will. People can decide tomorrow morning to cancel the offside rule in football, because we invented that law, and we are free to change it. However, at least according to Marx, we cannot change the laws of history. No matter what the capitalists do, as long as they continue to accumulate private property they are bound to create class conflict and they are destined to be defeated by the rising proletariat. If you happen to be a communist yourself you might argue that communism and Christianity are nevertheless very different, because communism is right, whereas Christianity is wrong. Class conflict really is inherent in the capitalist system, whereas rich people don't suffer eternal tortures in hell after they die. Yet even if that's the case, it doesn't mean communism is not a religion. Rather, it means that communism is the one true religion. Followers of every religion are convinced that theirs alone is true. Perhaps the followers of one religion are right.

Just as the gap between religion and science is smaller than we commonly think, so the gap between religion and spirituality is much bigger. Religion is a deal, whereas spirituality is a journey. Religion gives a complete description of the world, and offers us a well-defined contract with predetermined goals. ‘God exists. He told us to behave in certain ways. If you obey God, you’ll be admitted to heaven. If you disobey Him, you’ll burn in hell.’ The very clarity of this deal allows society to define common norms and values that regulate human behaviour.

Spiritual journeys are nothing like that. They usually take people in mysterious ways towards unknown destinations. The quest usually begins with some big question, such as who am I? What is the meaning of life? What is good? Whereas many people just accept the ready-made answers provided by the powers that be, spiritual seekers are not so easily satisfied. They are determined to follow the big question wherever it leads, and not just to places you know well or wish to visit. Thus for most people, academic studies are a deal rather than a spiritual journey, because they take us to a predetermined goal approved by our elders, governments, and banks. ‘I’ll study for three years, pass the exams, get my BA certificate and secure a well-paid job.’ Academic studies might be transformed into a spiritual journey if the big questions you encounter on the way deflect you towards unexpected destinations, of which you could hardly even conceive at first. For example, a student might begin to study economics in order to secure a job in Wall Street. However, if what she learns somehow causes her to end up in a Hindu ashram or helping HIV patients in Zimbabwe, then we might call that a spiritual journey.

Religions seek to cement the worldly order whereas spirituality seeks to escape it. Often enough, the most important demand from spiritual wanderers is to challenge the beliefs and conventions of dominant religions. In Zen Buddhism it is said that “If you meet the Buddha on the road, kill him.” Which means that if while walking on the spiritual path you encounter the rigid ideas and fixed laws of institutionalized Buddhism, you must free yourself from them too.

For religions, spirituality is a dangerous threat. Religions typically strive to rein in the spiritual quests of their followers, and many religious systems were challenged not by laypeople preoccupied with food, sex, and power, but rather by spiritual truth-seekers who wanted more than platitudes. Thus the Protestant revolt against the authority of the Catholic Church was ignited not by hedonistic atheists but rather by a devout and ascetic monk, Martin Luther. Luther wanted answers to the existential questions of life, and refused to settle for the rites, rituals, and deals offered by the Church.

Science always needs religious assistance in order to create viable human

institutions. Scientists study how the world functions, but there is no scientific method for determining how humans ought to behave. Science tells us that humans cannot survive without oxygen. However, is it okay to execute criminals by asphyxiation? Science doesn't know how to answer such a question. Only religions provide us with the necessary guidance. Hence every practical project scientists undertake also relies on religious insights.

Take, for example, the building of the Three Gorges Dam over the Yangtze River. When the Chinese government decided to build the dam in 1992, physicists could calculate what pressures the dam would have to withstand, economists could forecast how much money it would probably cost, while electrical engineers could predict how much electricity it would produce. However, the government needed to take additional factors into account. Building the dam flooded huge territories containing many villages and towns, thousands of archaeological sites, and unique landscapes and habitats. More than 1 million people were displaced and hundreds of species were endangered. It seems that the dam directly caused the extinction of the Chinese river dolphin. No matter what you personally think about the Three Gorges Dam, it is clear that building it was an ethical rather than a purely scientific issue. No physics experiment, no economic model, and no mathematical equation can determine whether generating thousands of megawatts and making billions of yuan is more valuable than saving an ancient pagoda or the Chinese river dolphin. Consequently, China cannot function on the basis of scientific theories alone. It requires some religion or ideology too.

Ethical judgments often hide within them factual statements that people don't bother to mention, because they think they have been proven beyond doubt. Thus the ethical judgment 'human life is sacred' (which science cannot test) may shroud the factual statement 'every human has an eternal soul' (which is open for scientific debate). Similarly, when American nationalists proclaim that 'the American nation is sacred,' this seemingly ethical judgment is in fact predicated on factual statements such as 'the USA has spearheaded most of the moral, scientific, and economic advances of the last few centuries.' Whereas it is impossible to scientifically scrutinize the claim that the American nation is sacred, once we unpack this judgment we may well examine scientifically whether the USA has indeed been responsible for a disproportionate share of moral, scientific, and economic breakthroughs.

Some might argue that Islamists, liberals, and nationalists have no ethical dispute; they have a factual disagreement about how best to realize their common goal. Yet even if they are right, and even if all humans cherish happiness, in practice it would be extremely difficult to use this insight to

decide ethical disputes, particularly because we have no scientific definition or measurement of happiness. Consider again the Three Gorges Dam. Even if we agree that the ultimate aim of the project is to make the world a happier place, how can we tell whether generating cheap electricity contributes more to global happiness than protecting traditional lifestyles or saving the rare Chinese river dolphin? As long as we haven't deciphered the mysteries of consciousness, we cannot develop a universal measurement for happiness and suffering, and we don't know how to compare the happiness and suffering of different individuals, let alone different species. How many units of happiness are generated when a billion Chinese enjoy cheaper electricity? How many units of misery are produced when an entire dolphin species becomes extinct? Indeed, are happiness and misery mathematical entities that can be added or subtracted in the first place? Eating ice cream is enjoyable. Finding true love is more enjoyable. Do you think that if you just eat enough ice cream, the accumulated pleasure could ever equal the rapture of true love?

Religion provides the ethical justification for scientific research, and in exchange gets to influence the scientific agenda and the uses of scientific discoveries. Hence you cannot understand the history of science without taking religious beliefs into account. Scientists seldom dwell on this fact, but the Scientific Revolution itself began in one of the most dogmatic, intolerant, and religious societies in history.

It is customary to tell the history of modernity as a struggle between science and religion. In theory, both science and religion are interested above all in the truth, and because each upholds a different truth, they are doomed to clash. In fact, neither science nor religion cares that much about the truth, hence they can easily compromise, coexist, and even cooperate. Religion is interested above all in order. It aims to create and maintain the social structure. Science is interested above all in power. It aims to acquire the power to cure diseases, fight wars and produce food. As individuals, scientists, and priests may give immense importance to the truth; but as collective institutions, science and religion prefer order and power over truth. They can therefore make good bedfellows. The uncompromising quest for truth is a spiritual journey, which can seldom remain within the confines of either religious or scientific establishments.

It would accordingly be far more correct to view modern history as the process of formulating a deal between science and one particular religion—namely, humanism. Modern society believes in humanist dogmas, and uses science not in order to question these dogmas, but rather in order to implement them.

Modernity is a surprisingly simple deal. The entire contract can be summarized in a single phrase: humans agree to give up meaning in exchange

for power.

The modern deal thus offers humans an enormous temptation, coupled with a colossal threat. Omnipotence is in front of us, almost within our reach, but below us yawns the abyss of complete nothingness. On the practical level, modern life consists of a constant pursuit of power within a universe devoid of meaning. Modern culture is the most powerful in history, and it is ceaselessly researching, inventing, discovering, and growing. At the same time, it is plagued by more existential angst than any previous culture.

Evolutionary pressures have accustomed humans to see the world as a static pie. If somebody gets a bigger slice of the pie, somebody else inevitably gets a smaller slice. A particular family or city may prosper, but humankind as a whole is not going to produce more than it produces today. Accordingly, traditional religions such as Christianity and Islam sought ways to solve humanity's problems with the help of current resources, either by redistributing the existing pie, or by promising us a pie in the sky. Modernity, in contrast, is based on the firm belief that economic growth is not only possible but is absolutely essential. Prayers, good deeds, and meditation can be comforting and inspiring, but problems such as famine, plague, and war can only be solved through growth. This fundamental dogma can be summarized in one simple idea: 'If you have a problem, you probably need more stuff, and in order to have more stuff, you must produce more of it.'

Modern politicians and economists insist that growth is vital for three principal reasons. Firstly, when we produce more, we can consume more, raise our standard of living and allegedly enjoy a happier life. Secondly, as long as humankind multiplies, economic growth is needed merely to stay where we are. For example, in India the annual population growth rate is 1.2 percent. That means that unless the Indian economy grows each year by at least 1.2 percent, unemployment will rise, salaries will fall and the average standard of living will decline. Thirdly, even if Indians stop multiplying, and even if the Indian "middle class" can be satisfied with its present standard of living, what should India do about its hundreds of millions of poverty-stricken citizens? If the economy doesn't grow, and the pie therefore remains the same size, you can give more to the poor only by taking something from the rich. That will force you to make some very hard choices, and will probably cause a lot of resentment and even violence. If you wish to avoid hard choices, resentment, and violence, you need a bigger pie.

If only countries such as Pakistan and Egypt could keep a healthy growth rate, their citizens would come to enjoy the benefits of private cars and bulging refrigerators, and they would take the path of earthly prosperity

instead of following the Islamic pied piper. Similarly, economic growth in countries such as Congo and Myanmar would produce a prosperous “middle class” which is the supposed bedrock of liberal democracy. And in the case of the disgruntled couple, their marriage will be saved if they just buy a bigger house (so they don’t have to share a cramped office), purchase a dishwasher (so that they stop arguing whose turn it is to do the dishes), and go to expensive therapy sessions twice a week.

Economic growth has thus become the crucial juncture where almost all modern religions, ideologies, and movements meet. The Soviet Union, with its Five Year Plans, was as obsessed with growth as the most cut-throat American robber baron. Just as Christians and Muslims both believed in heaven, and disagreed only about how to get there, so during the Cold War both capitalists and communists believed in creating heaven on earth through economic growth, and wrangled only about the exact method.

In China the Communist Party still pays lip service to traditional Marxist-Leninist ideals, but in practice it is guided by Deng Xiaoping’s famous maxims that “development is the only hard truth” and that “it doesn’t matter if a cat is black or white, so long as it catches mice.” Which means, in plain language: do anything it takes to promote economic growth, even if Marx and Lenin wouldn’t have been happy with it.

The credo of “more stuff” accordingly urges individuals, firms, and governments to discount anything that might hamper economic growth, such as preserving social equality, ensuring ecological harmony, or honouring your parents. In the Soviet Union, when people thought that state-controlled communism was the fastest way to grow, anything that stood in the way of collectivization was bulldozed, including millions of kulaks, the freedom of expression, and the Aral Sea. Nowadays it is generally accepted that some version of free-market capitalism is a much more efficient way of ensuring long-term growth, hence rich farmers and freedom of expression are protected, but ecological habitats, social structures, and traditional values that stand in the way of free-market capitalism are destroyed and dismantled.

Take, for example, a software engineer making \$250 per hour working for some high-tech start-up. One day her elderly father has a stroke. He now needs help with shopping, cooking, and even showering. She could move her father to her own house, leave home later in the morning, come back earlier in the evening and take care of her father personally. Both her income and the start-up’s productivity would suffer, but her father would enjoy the care of a respectful and loving daughter. Alternatively, the engineer could hire a Mexican carer who, for \$25 per hour, would live with the father and provide for all his needs. That would mean business as usual for the engineer and

her start-up, and even the carer and the Mexican economy would benefit. What should the engineer do? Free-market capitalism has a firm answer. If economic growth demands that we loosen family bonds, encourage people to live away from their parents, and import carers from the other side of the world—so be it. This answer, however, involves an ethical judgment rather than a factual statement. No doubt, when some people specialize in software engineering while others spend their time taking care of the elderly, we can produce more software and give old people more professional care. Yet is economic growth more important than family bonds? By daring to make such ethical judgments, free-market capitalism has crossed the border from the land of science to that of religion.

Most capitalists would probably dislike the title of religion, but as religions go, capitalism can at least hold its head high. Unlike other religions that promise us a pie in the sky, capitalism promises miracles here on earth—and sometimes even provides them.

We will never reach a moment when capitalism says: ‘That’s it. You have grown enough. You can now take it easy.’ If you want to know why the capitalist wheel is unlikely ever to stop, talk for an hour with someone who has just earned \$100,000 and wonders what to do with it. ‘The banks offer such low interest rates,’ he would complain. ‘I don’t want to put my money in a savings account that pays hardly 0.5% a year. You can make perhaps 2% in government bonds. My cousin Richie bought a flat in Seattle last year, and he has already made 20% on his investment! Maybe I should go into real estate too; but everybody is saying there’s a new real-estate bubble. So what do you think about the stock exchange? A friend told me the best deal these days is to buy an ETF that follows emerging economies, like Brazil or China.’ As he stops for a moment to breathe, you ask, ‘Well, why not just be satisfied with your \$100,000?’ He will explain to you better than I can why capitalism will never stop.

In order to provide every person in the world with the same standard of living as affluent Americans, we would need a few more planets—but we only have this one. If progress and growth do end up destroying the ecosystem, the cost will be dear not merely to vampire bats, foxes, and rabbits, but also to Sapiens. An ecological meltdown will cause economic ruin, political turmoil, a fall in human standards of living, and it might threaten the very existence of human civilization. We could lessen the danger by slowing down the pace of progress and growth. If this year investors expect to get a six percent return on their portfolios, in ten years they will be satisfied with a three percent return, in twenty years only one percent, and in thirty years the economy will stop growing and we’ll be happy with what we’ve already got. Yet the creed of growth firmly objects to such a heretical idea.

Instead, it suggests we should run even faster. If our discoveries destabilize the ecosystem and threaten humanity, then we should discover something to protect ourselves. If the ozone layer dwindles and exposes us to skin cancer, we should invent better sunscreen and better cancer treatments, thereby also promoting the growth of new sunscreen factories and cancer centres. If all the new industries pollute the atmosphere and the oceans, causing global warming and mass extinctions, then we should build for ourselves virtual worlds and high-tech sanctuaries that will provide us with all the good things in life even if the planet is hot, dreary, and polluted as hell.

We should of course be concerned that an ecological apocalypse might have different consequences for different human castes. There is no justice in history. When disaster strikes, the poor almost always suffer far more than the rich, even if the rich caused the tragedy in the first place. Global warming is already affecting the lives of poor people in arid African countries more than the lives of affluent Westerners. Paradoxically, the very power of science may increase the danger, because it makes the rich complacent.

Too many politicians and voters believe that as long as the economy grows, scientists and engineers could always save us from doomsday. When it comes to climate change, many growth true-believers do not just hope for miracles—they take it for granted that the miracles will happen.

How rational is it to risk the future of humankind on the assumption that future scientists will make some unknown discoveries? Most of the presidents, ministers, and CEOs who run the world are very rational people. Why are they willing to take such a gamble? Maybe because they don't think they are gambling on their own personal future. Even if bad comes to worse and science cannot hold off the deluge, engineers could still build a high-tech Noah's Ark for the upper caste, while leaving billions of others to drown. The belief in this high-tech Ark is currently one of the biggest threats to the future of humankind and of the entire ecosystem. People who believe in the high-tech Ark should not be put in charge of the global ecology, for the same reason that people who believe in a heavenly afterlife should not be given nuclear weapons.

And what about the poor? Why aren't they protesting? If and when the deluge comes, they will bear the full cost of it. However, they will also be the first to bear the cost of economic stagnation. In a capitalist world, the lives of the poor improve only when the economy grows. Hence they are unlikely to support any steps to reduce future ecological threats that are based on slowing down present-day economic growth. Protecting the environment is a very nice idea, but those who cannot pay their rent are worried about their overdraft far more than about melting ice caps.

For millennia, societies strove to curb individual desires and bring them

into some kind of balance. It was well known that people wanted more and more for themselves, but when the pie was of a fixed size, social harmony depended on restraint. Avarice was bad. Modernity turned the world upside down. It convinced human collectives that equilibrium is far more frightening than chaos, and because avarice fuels growth, it is a force for good. Modernity accordingly inspired people to want more, and dismantled the age-old disciplines that curbed greed. The resulting anxieties were assuaged to a large extent by free-market capitalism, which is one reason why this particular ideology has become so popular. Capitalist thinkers repeatedly calm us: ‘Don’t worry, it will be okay. Provided the economy grows, the invisible hand of the market will take care of everything else.’ Capitalism has thus sanctified a voracious and chaotic system that grows by leaps and bounds, without anyone understanding what is happening and where we are rushing.

The humanist religion worships humanity, and expects humanity to play the part that God played in Christianity and Islam, and that the laws of nature played in Buddhism and Taoism. Whereas traditionally the great cosmic plan gave meaning to the life of humans, humanism reverses the roles, and expects the experiences of humans to give meaning to the great cosmos. According to humanism, humans must draw from within their inner experiences not only the meaning of their own lives, but also the meaning of the entire universe. This is the primary commandment humanism has given us: create meaning for a meaningless world.

Meaning and authority always go hand in hand. Whoever determines the meaning of our actions—whether they are good or evil, right or wrong, beautiful or ugly—also gains the authority to tell us what to think and how to behave.

Humanist Aesthetics: Beauty is in the eyes of the beholder.

Humanist Economics: The customer is always right.

Humanist Education: Think for yourself!

Humanist Ethics: If it feels good—do it!

Humanist Politics: The voter knows best.

It doesn’t matter if all the university professors and all the priests and mullahs cry out from every pulpit that this is a wonderful car—if the customers reject it, it is a bad car. Nobody has the authority to tell customers that they are wrong, and heaven forbid that a government would try to force

citizens to buy a particular car against their will. What's true of cars is true of all other products. Listen, for example, to Professor Leif Andersson from the University of Uppsala. He specializes in the genetic enhancement of farm animals, in order to create faster-growing pigs, dairy cows that produce more milk, and chickens with extra meat on their bones. In an interview he was confronted with the fact that such genetic manipulations might cause much suffering to the animals. Already today "enhanced" dairy cows have such heavy udders that they can barely walk, while "upgraded" chickens cannot even stand up. And I'm sure you recall the masturbation of turkeys who can't fuck. Professor Andersson had a firm answer:

"Everything comes back to the individual customer, to the question how much the customer is willing to pay for meat. We must remember that it would be impossible to maintain current levels of global meat consumption without the enhanced modern chicken. If customers ask us only for the cheapest meat possible—that's what the customers will get. Customers need to decide what is most important to them—price, or something else."

Professor Andersson can go to sleep at night with a clean conscience. The fact that customers are buying his enhanced animal products implies that he is meeting their needs and desires and is therefore doing good.

By the same logic, if some multinational corporation wants to know whether it lives up to its "Don't be evil" motto, it need only take a look at its bottom line. If it makes loads of money, it means that millions of people like its products, which implies that it is a force for good. If someone objects and says that people might make the wrong choice, they will be quickly reminded that the customer is always right, and that human feelings are the source of all meaning and authority. If millions of people freely choose to buy the company's products, who are you to tell them that they are wrong?

"If I believe in God at all, it is my choice to believe. If my inner self tells me to believe in God—then I believe. I believe because I feel God's presence, and my heart tells me He is there. But if I no longer feel God's presence, and if my heart suddenly tells me that there is no God—I will cease believing. Either way, the real source of authority is my own feelings. So even while saying that I believe in God, the truth is I have a much stronger belief in my own inner voice."

In medieval Europe, the chief formula for knowledge was:

$$\textit{Knowledge} = \textit{Scriptures} \times \textit{Logic}$$

The formula takes a multiplication symbol because the elements work one on the other. At least according to medieval scholastics, you cannot understand the Bible without logic. If your logic value is zero, then even if you read every page of the Bible, the sum of your knowledge would still be zero. Conversely, if your scripture value is zero, then no amount of logic can help you. If the formula used the addition symbol, the implication would be that somebody with lots of logic and no scriptures would still have a lot of knowledge—which you and I may find reasonable, but medieval scholastics did not.

If we want to know the answer to some important question, we should read scriptures, and use our logic to understand the exact meaning of the text. For example, scholars who wished to know the shape of the earth scanned the Bible looking for relevant references. One pointed out that in Job 38:13, it says that God can “take hold of the edges of the earth, and the wicked be shaken out of it.” This implies—reasoned the pundit—that because the earth has ‘edges’ of which we can ‘take hold,’ it must be a flat square. Another sage rejected this interpretation, calling attention to Isaiah 40:22, where it says that God “sits enthroned above the circle of the earth.” Isn’t that proof that the earth is round? In practice, that meant that scholars sought knowledge by spending years in schools and libraries, reading more and more texts, and sharpening their logic so they could understand the texts correctly.

The Scientific Revolution proposed a very different formula for knowledge:

$$\textit{Knowledge} = \textit{EmpiricalData} \times \textit{Mathematics}$$

If we want to know the answer to some question, we need to gather relevant empirical data, and then use mathematical tools to analyze the data. For example, in order to gauge the true shape of the earth, we can observe the sun, the moon, and the planets from various locations across the world. Once we have amassed enough observations, we can use trigonometry to deduce not only the shape of the earth, but also the structure of the entire solar system. In practice, that means that scientists seek knowledge by spending years in observatories, laboratories, and research expeditions, gathering more and more empirical data, and sharpening their mathematical tools so they could interpret the data correctly.

However, humanism offered an alternative. As humans gained confidence in themselves, a new formula for attaining ethical knowledge appeared:

$$\textit{Knowledge} = \textit{Experiences} \times \textit{Sensitivity}$$

If we wish to know the answer to any ethical question, we need to connect to our inner experiences, and observe them with the utmost sensitivity. In practice, that means that we seek knowledge by spending years collecting experiences, and sharpening our sensitivity so we could understand these experiences correctly. But what exactly are ‘experiences’? They are not empirical data. An experience is not made of atoms, molecules, proteins, or numbers. Rather, an experience is a subjective phenomenon that includes three main ingredients: sensations, emotions, and thoughts. At any particular moment my experience comprises everything I sense (heat, pleasure, tension, et cetera), every emotion I feel (love, fear, anger, et cetera) and whatever thoughts arise in my mind. And what is ‘sensitivity’? It means two things. Firstly, paying attention to my sensations, emotions, and thoughts. Secondly, allowing these sensations, emotions, and thoughts to influence me. Granted, I shouldn’t allow every passing breeze to sweep me away. Yet I should be open to new experiences, and permit them to change my views, my behaviour and even my personality.

Experiences and sensitivity build up one another in a never-ending cycle. I cannot experience anything if I have no sensitivity, and I cannot develop sensitivity unless I undergo a variety of experiences. Sensitivity is not an abstract aptitude that can be developed by reading books or listening to lectures. It is a practical skill that can ripen and mature only by applying it in practice. Take tea, for example. I start by drinking very sweet ordinary tea while reading the morning paper. The tea is little more than an excuse for a sugar rush. One day I realize that between the sugar and the newspaper, I hardly taste the tea at all. So I reduce the amount of sugar, put the paper aside, close my eyes and focus on the tea itself. I begin to register its unique aroma and flavour. Soon I find myself experimenting with different teas, black and green, comparing their exquisite tangs and delicate bouquets. Within a few months, I drop the supermarket labels and buy my tea at Harrods. I develop a particular liking for ‘Panda Dung tea’ from the mountains of Ya’an in Sichuan province, made from leaves of tea trees fertilized by the dung of panda bears. That’s how, one cup at a time, I hone my tea sensitivity and become a tea connoisseur. If in my early tea-drinking days you had served me Panda Dung tea in a Ming Dynasty porcelain goblet, I would not have appreciated it much more than builder’s tea in a paper cup. You cannot experience something if you don’t have the necessary sensitivity, and you cannot develop your sensitivity except by undergoing a long string of experiences.

What’s true of tea is true of all other aesthetic and ethical knowledge. We aren’t born with a ready-made conscience. As we pass through life, we hurt people and people hurt us, we act compassionately and others show

compassion to us. If we pay attention, our moral sensitivity sharpens, and these experiences become a source of valuable ethical knowledge about what is good, what is right, and who I really am.

In the early nineteenth century, Wilhelm von Humboldt—one of the chief architects of the modern education system—said that the aim of existence is “a distillation of the widest possible experience of life into wisdom.” He also wrote that “there is only one summit in life—to have taken the measure in feeling of everything human.” This could well be the humanist motto.

Whereas liberalism turns my gaze inwards, emphasizing my uniqueness and the uniqueness of my nation, socialism demands that I stop obsessing about me and my feelings and instead focus on what others are feeling and about how my actions influence their experiences. Global peace will be achieved not by celebrating the distinctiveness of each nation, but by unifying all the workers of the world; and social harmony won't be achieved by each person narcissistically exploring their own inner depths, but rather by each person prioritizing the needs and experiences of others over their own desires. A liberal may reply that by exploring her own inner world she develops her compassion and her understanding of others, but such reasoning would have cut little ice with Lenin or Mao.

They would have explained that individual self-exploration is a bourgeois indulgent vice, and that when I try to get in touch with my inner self, I am all too likely to fall into one or another capitalist trap. My current political views, my likes and dislikes, and my hobbies and ambitions do not reflect my authentic self. Rather, they reflect my upbringing and social surrounding. They depend on my class, and are shaped by my neighbourhood and my school. Rich and poor alike are brainwashed from birth. The rich are taught to disregard the poor, while the poor are taught to disregard their true interests. No amount of self-reflection or psychotherapy will help, because the psychotherapists are also working for the capitalist system. Indeed, self-reflection is likely only to distance me even further from understanding the truth about myself, because it gives too much credit to personal decisions and too little credit to social conditions. If I am rich, I am likely to conclude that it is because I made wise choices. If I suffer from poverty, I must have made some mistakes. If I am depressed, a liberal therapist is likely to blame my parents, and to encourage me to set some new aims in life. If I suggest that perhaps I am depressed because I am being exploited by capitalists, and because under the prevailing social system I have no chance of realizing my aims, the therapist may well say that I am projecting onto ‘the social system’ my own inner difficulties, and I am projecting onto ‘the capitalists’ unresolved issues with my mother.

According to socialism, instead of spending years talking about my

mother, my emotions and my complexes, I should ask myself: who owns the means of production in my country? What are its main exports and imports? What's the connection between the ruling politicians and international banking? Only by understanding the surrounding socioeconomic system and taking into account the experiences of all other people could I truly understand what I feel, and only by common action can we change the system. Yet what person can take into account the experiences of all human beings, and weigh them one against the other in a fair way? That's why many authoritarian socialists discourage self-exploration, and advocate the establishment of strong collective institutions—such as socialist parties and trade unions—that aim to decipher the world for us. Whereas in liberal politics the voter knows best, and in liberal economics the customer is always right, in authoritarian socialist politics the party knows best, and in authoritarian socialist economics the trade union is always right. Authority and meaning still come from human experience—both the party and the trade union are composed of people and work to alleviate human misery—yet individuals must listen to the party and the trade union rather than to their personal feelings.

Evolutionary humanism has a different solution to the problem of conflicting human experiences. Rooting itself in the firm ground of Darwinian evolutionary theory, it says that conflict is something to applaud rather than lament. Conflict is the raw material of natural selection, which pushes evolution forward. Some humans are simply superior to others, and when human experiences collide, the fittest humans should steamroll everyone else. The same logic that drives humankind to exterminate wild wolves and to ruthlessly exploit domesticated sheep also mandates the oppression of inferior humans by their superiors. It's a good thing that Europeans conquer Africans and that shrewd businessmen drive the dim-witted to bankruptcy. If we follow this evolutionary logic, humankind will gradually become stronger and fitter, eventually giving rise to superhumans. Evolution didn't stop with *Homo sapiens*—there is still a long way to go. However, if in the name of human rights or human equality we emasculate the fittest humans, it will prevent the rise of the superman, and may even cause the degeneration and extinction of *Homo sapiens*.

Who exactly are these superior humans who herald the coming of the superman? They might be entire races, particular tribes, or exceptional individual geniuses. In any case, what makes them superior is that they have better abilities, manifested in the creation of new knowledge, more advanced technology, more prosperous societies, or more beautiful art. The experience of an Einstein or a Beethoven is far more valuable than that of a drunken good-for-nothing, and it is ludicrous to treat them as if they have

equal merit. Similarly, if a particular nation has consistently spearheaded human progress, we should rightly consider it superior to other nations that contributed little or nothing to the evolution of humankind.

Evolutionary humanism thinks that the human experience of war is valuable and even essential. The movie *The Third Man* takes place in Vienna immediately after the end of the Second World War. Reflecting on the recent conflict, the character Harry Lime says:

“After all, it’s not that awful. . . In Italy for thirty years under the Borgias they had warfare, terror, murder, and bloodshed, but they produced Michelangelo, Leonardo da Vinci, and the Renaissance. In Switzerland they had brotherly love, they had 500 years of democracy and peace, and what did that produce? The cuckoo clock.”

Lime gets almost all his facts wrong—Switzerland was probably the most bloodthirsty corner of early modern Europe (its main export was mercenary soldiers), and the cuckoo clock was actually invented by the Germans—but the facts are of lesser importance than Lime’s idea, namely that the experience of war pushes humankind to new achievements. War allows natural selection free rein at last. It exterminates the weak and rewards the fierce and the ambitious. War exposes the truth about life, and awakens the will for power, for glory and for conquest. Nietzsche summed it up by saying that war is “the school of life” and that “what does not kill me makes me stronger.”

It should be remembered, though, that Hitler and the Nazis represent only one extreme version of evolutionary humanism. Just as Stalin’s gulags do not automatically nullify every socialist idea and argument, so too the horrors of Nazism should not blind us to whatever insights evolutionary humanism might offer. Auschwitz should serve as a blood-red warning sign rather than as a black curtain that hides entire sections of the human horizon. Evolutionary humanism played an important part in the shaping of modern culture, and it is likely to play an even greater role in the shaping of the twenty-first century.

Whereas liberals tiptoe around the minefield of cultural comparisons, fearful of committing some politically incorrect faux pas, and whereas authoritarian socialists leave it to the party to find the right path through the minefield, evolutionary humanists gleefully jump right in, setting off all the mines and relishing the mayhem. They may start by pointing out that both liberals and socialists draw the line at other animals, and have no trouble admitting that humans are superior to wolves, and that consequently

human music is far more valuable than wolf howls. Yet humankind itself is not exempt from the forces of evolution. Just as humans are superior to wolves, so some human cultures are more advanced than others. There is an unambiguous hierarchy of human experiences, and we shouldn't be apologetic about it. The Taj Mahal is more beautiful than a straw hut, Michelangelo's David is superior to my five-year-old niece's latest clay figurine, and Beethoven composed far better music than Chuck Berry or the Congolese pygmies. There, we've said it! According to evolutionary humanists, anyone arguing that all human experiences are equally valuable is either an imbecile or a coward. Such vulgarity and timidity will lead only to the degeneration and extinction of humankind, as human progress is impeded in the name of cultural relativism or social equality. If liberals or socialists had lived in the Stone Age, they would probably have seen little merit in the murals of Lascaux and Altamira, and would have insisted that they are in no way superior to Neanderthal doodles.

Socialists argued that liberalism is in fact a fig leaf for a ruthless, exploitative, and racist system. For vaunted 'liberty,' read 'property.' The defense of the individual's right to do what feels good amounts in most cases to safeguarding the property and privileges of the middle and upper classes. What good is the liberty to live where you want, when you cannot pay the rent; to study what interests you, when you cannot afford the tuition fees; and to travel where you fancy, when you cannot buy a car? Under liberalism, went a famous quip, everyone is free to starve. Even worse, by encouraging people to view themselves as isolated individuals, liberalism separates them from their other class members, and prevents them from uniting against the system that oppresses them. Liberalism thereby perpetuates inequality, condemning the masses to poverty and the elite to alienation.

Racists and fascists blamed both liberalism and socialism for subverting natural selection and causing the degeneration of humankind. They warned that if all humans were given equal value and equal breeding opportunities, natural selection would cease to function. The fittest humans would be submerged in an ocean of mediocrity, and instead of evolving into superman, humankind would become extinct.

As decades passed after World War II liberal democracy increasingly looked like an exclusive club for aging white imperialists, who had little to offer the rest of the world, or even their own youth. Washington presented itself as the leader of the free world, but most of its allies were either authoritarian kings (such as King Khaled of Saudi Arabia, King Hassan of Morocco, and the Persian shah) or military dictators (such as the Greek colonels, General Pinochet in Chile, General Franco in Spain, General Park in South Korea, General Geisel in Brazil, and Generalissimo Chiang Kai-

shek in Taiwan). Despite the support of all these colonels and generals, militarily the Warsaw Pact had a huge numerical superiority over NATO. In order to reach parity in conventional armament, Western countries would probably have had to scrap liberal democracy and the free market, and become totalitarian states on a permanent war footing. Liberal democracy was saved only by nuclear weapons. NATO adopted the doctrine of MAD (mutual assured destruction), according to which even conventional Soviet attacks would be answered by an all-out nuclear strike. ‘If you attack us,’ threatened the liberals, ‘we will make sure nobody comes out of it alive.’ Behind this monstrous shield, liberal democracy and the free market managed to hold out in their last bastions, and Westerners could enjoy sex, drugs, and rock and roll, as well as washing machines, refrigerators, and televisions. Without nukes, there would have been no Woodstock, no Beatles, and no overflowing supermarkets. But in the mid-1970s it seemed that nuclear weapons notwithstanding, the future belonged to socialism.

If a liberal had fallen asleep in June 1914 and woken up in June 2014, he or she would have felt very much at home. Once again people believe that if you just give individuals more freedom, the world will enjoy peace and prosperity. The entire twentieth century looks like a big mistake. Humankind was speeding on the liberal highway back in the summer of 1914, when it took a wrong turn and entered a cul-de-sac. It then needed eight decades and three horrendous global wars to find its way back to the highway. Of course, these decades were not a total waste, as they did give us antibiotics, nuclear energy, and computers, as well as feminism, de-colonialism, and free sex. In addition, liberalism itself smarted from the experience, and is less conceited than it was a century ago. It has adopted various ideas and institutions from its socialist and fascist rivals, in particular a commitment to provide the general public with education, health, and welfare services. Yet the core liberal package has changed surprisingly little. Liberalism still sanctifies individual liberties above all, and still has a firm belief in the voter and the customer. In the early twenty-first century, this is the only show in town.

There is no serious alternative to the liberal package of individualism, human rights, democracy, and a free market. The social protests that swept the Western world in 2011—such as Occupy Wall Street and the Spanish 15-M movement—have absolutely nothing against democracy, individualism, and human rights, or even against the basic principles of free-market economics. Just the opposite—they take governments to task for not living up to these liberal ideals. They demand that the market be really free, instead of being controlled and manipulated by corporations and banks “too big to fail.” They call for truly representative democratic institutions,

which will serve the interests of ordinary citizens rather than of moneyed lobbyists and powerful interest groups. Even those blasting stock exchanges and parliaments with the harshest criticism don't have a viable alternative model for running the world. While it is a favourite pastime of Western academics and activists to find fault with the liberal package, they have so far failed to come up with anything better.

Whereas the Chinese don't know what they believe, religious fundamentalists know it only too well. More than a century after Nietzsche pronounced Him dead, God seems to be making a comeback. But this is a mirage. God is dead—it just takes a while to get rid of the body. Radical Islam poses no serious threat to the liberal package, because for all their fervour, the zealots don't really understand the world of the twenty-first century, and have nothing relevant to say about the novel dangers and opportunities that new technologies are generating all around us. Religions that lose touch with the technological realities of the day lose their ability even to understand the questions being asked.

Why did Marx and Lenin succeed where Hong and the Mahdi failed? Not because socialist humanism was philosophically more sophisticated than Islamic and Christian theology, but rather because Marx and Lenin devoted more attention to understanding the technological and economic realities of their time than to perusing ancient texts and prophetic dreams. Steam engines, railroads, telegraphs, and electricity created unheard-of problems as well as unprecedented opportunities. The experiences, needs, and hopes of the new class of urban proletariats were simply too different from those of biblical peasants. To answer these needs and hopes, Marx and Lenin studied how a steam engine functions, how a coal mine operates, how railroads shape the economy, and how electricity influences politics. Lenin was once asked to define communism in a single sentence:

“Communism is power to worker councils plus electrification of the whole country.”

There can be no communism without electricity, without railroads, without radio. You couldn't establish a communist regime in sixteenth-century Russia, because communism necessitates the concentration of information and resources in one hub. “From each according to his ability, to each according to his needs” only works when produce can easily be collected and distributed across vast distances, and when activities can be monitored and coordinated over entire countries.

Marx and his followers understood the new technological realities and the new human experiences, so they had relevant answers to the new problems

of industrial society, as well as original ideas about how to benefit from the unprecedented opportunities. The socialists created a brave new religion for a brave new world. They promised salvation through technology and economics, thus establishing the first techno-religion in history, and changing the foundations of ideological discourse. Before Marx, people defined and divided themselves according to their views about God, not about production methods. Since Marx, questions of technology and economic structure became far more important and divisive than debates about the soul and the afterlife. In the second half of the twentieth century, humankind almost obliterated itself in an argument about production methods. Even the harshest critics of Marx and Lenin adopted their basic attitude towards history and society, and began thinking about technology and production much more carefully than about God and heaven.

Socialism, which was very up to date a hundred years ago, failed to keep up with the new technology. Leonid Brezhnev and Fidel Castro held on to ideas that Marx and Lenin formulated in the age of steam, and did not understand the power of computers and biotechnology. Liberals, in contrast, adapted far better to the information age. This partly explains why Khrushchev's 1956 prediction never materialized, and why it was the liberal capitalists who eventually buried the Marxists. If Marx came back to life today, he would probably urge his few remaining disciples to devote less time to reading *Das Kapital* and more time to studying the Internet and the human genome.

Islam, Christianity, and other traditional religions are still important players in the world. Yet their role is now largely reactive. In the past, they were a creative force. Christianity, for example, spread the hitherto heretical idea that all humans are equal before God, thereby changing human political structures, social hierarchies, and even gender relations. In his Sermon on the Mount, Jesus went further, insisting that the meek and oppressed are God's favourite people, thus turning the pyramid of power on its head, and providing ammunition for generations of revolutionaries. In addition to social and ethical reforms, Christianity was responsible for important economic and technological innovations. The Catholic Church established medieval Europe's most sophisticated administrative system, and pioneered the use of archives, catalogues, timetables, and other techniques of data processing. The Vatican was the closest thing twelfth-century Europe had to Silicon Valley. The Church established Europe's first economic corporations—the monasteries—which for 1,000 years spearheaded the European economy and introduced advanced agricultural and administrative methods. Monasteries were the first institutions to use clocks, and for centuries they and the cathedral schools were the most important learning centres of Europe, helping

to found many of Europe's first universities, such as Bologna, Oxford, and Salamanca.

Today the Catholic Church continues to enjoy the loyalties and tithes of hundreds of millions of followers—and the mouths, hands, and anuses of a few altar boys. Yet it and the other theist religions have long since turned from a creative into a reactive force. They are busy with rearguard holding operations more than with pioneering novel technologies, innovative economic methods, or groundbreaking social ideas. They now mostly agonize over the technologies, methods, and ideas propagated by other movements. Biologists invent the contraceptive pill—and the Pope doesn't know what to do about it. Computer scientists develop the Internet—and rabbis argue whether orthodox Jews should be allowed to surf it. Feminist thinkers call upon women to take possession of their bodies—and learned muftis debate how to confront such incendiary ideas.

Billions of people, including many scientists, continue to use religious scriptures as a source of authority, but these texts are no longer a source of creativity. Think, for example, about the acceptance of gay marriage or female clergy by the more progressive branches of Christianity. Where did this acceptance originate? Not from reading the Bible, St. Augustine, or Martin Luther. Rather, it came from reading texts like Michel Foucault's *The History of Sexuality* or Donna Haraway's "A Cyborg Manifesto." Yet Christian true-believers—however progressive—cannot admit to drawing their ethics from Foucault and Haraway. So they go back to the Bible, to St. Augustine, and to Martin Luther, and make a very thorough search. They read page after page and story after story with the utmost attention, until they find what they need: some maxim, parable, or ruling that if interpreted creatively enough means that God blesses gay marriages and that women can be ordained to the priesthood. They then pretend the idea originated in the Bible, when in fact it originated with Foucault. The Bible is kept as a source of authority, even though it is no longer a true source of inspiration. That's why traditional religions offer no real alternative to liberalism. Their scriptures don't have anything to say about genetic engineering or artificial intelligence, and most priests, rabbis, and muftis don't understand the latest breakthroughs in biology and computer science. For if you want to understand these breakthroughs, you don't have much choice—you need to spend time reading scientific articles and conducting lab experiments instead of memorizing and debating ancient texts.

The humanist belief in feelings has enabled us to benefit from the fruits of the modern covenant without paying its price. We don't need any gods to limit our power and give us meaning—the free choices of customers and voters supply us with all the meaning we require. What, then, will happen

once we realize that customers and voters never make free choices, and once we have the technology to calculate, design, or outsmart their feelings? If the whole universe is pegged to the human experience, what will happen once the human experience becomes just another designable product, no different in essence from any other item in the supermarket?

Free will can take us far but it cannot carry us infinitely beyond our genetic limits. Bill Gates is never going to be Bill Clinton, no matter how he polishes his social skills, and Bill Clinton can never be Bill Gates, no matter how much time he spends alone with a computer. We might call this the ‘rubber band theory’ of personality. We are like rubber bands at rest. We are elastic and can stretch ourselves, but only so much.

Just as evolution cannot be squared with eternal souls, neither can it swallow the idea of free will. For if humans are free, how could natural selection have shaped them? According to the theory of evolution, all the choices animals make—whether of residence, food, or mates—reflect their genetic code. If, thanks to its fit genes, an animal chooses to eat a nutritious mushroom and copulate with healthy and fertile mates, these genes pass on to the next generation. If, because of unfit genes, an animal chooses poisonous mushrooms and anemic mates, these genes become extinct. However, if an animal freely chooses what to eat and with whom to mate, then natural selection is left with nothing to work on. When confronted with such scientific explanations, people often brush them aside, pointing out that they feel free, and that they act according to their own wishes and decisions. This is true. Humans act according to their desires. If by ‘free will’ you mean the ability to act according to your desires—then yes, humans have free will, and so do chimpanzees, dogs, and parrots. When Polly wants a cracker, Polly eats a cracker.

But the million dollar question is not whether parrots and humans can act out their inner desires—the question is whether they can choose their desires in the first place. Why does Polly want a cracker rather than a cucumber? Why do I decide to kill my annoying neighbour instead of turning the other cheek? Why do I want to buy the red car rather than the black? Why do I prefer voting for the Conservatives rather than the Labour Party? I don’t choose any of these wishes. I feel a particular wish welling up within me because this is the feeling created by the biochemical processes in my brain. These processes might be deterministic or random, but not free. You might reply that at least in the case of major decisions such as murdering a neighbour or electing a government, my choice does not reflect a momentary feeling, but a long and reasoned contemplation of weighty arguments. However, there are many possible trains of arguments I could follow, some of which will cause me to vote Conservative, others to vote

Labour, and still others to vote UKIP or just stay at home. What makes me board one train of reasoning rather than another? In the Paddington of my brain, I may be compelled to get on a particular train of reasoning by deterministic processes, or I may embark at random. But I don't freely choose to think those thoughts that will make me vote Conservative.

Today we can use brain scanners to predict people's desires and decisions well before they are aware of them. In one kind of experiment, people are placed within a huge brain scanner, holding a switch in each hand. They are asked to press one of the two switches whenever they feel like it. Scientists observing neural activity in the brain can predict which switch the person will press well before the person actually does so. The decision to press either the right or left switch certainly reflected the person's choice. Yet it wasn't a free choice. In fact, our belief in free will results from faulty logic. When a biochemical chain reaction makes me desire to press the right switch, I feel that I really want to press the right switch. And this is true. I really want to press it. Yet people erroneously jump to the conclusion that if I want to press it, I choose to want to. This is of course false. I don't choose my desires. I only feel them, and act accordingly.

Once we accept that there is no soul, and that humans have no inner essence called 'the self,' it no longer makes sense to ask, 'How does the self choose its desires?' It's like asking a bachelor, 'How does your wife choose her clothes?' In reality, there is only a stream of consciousness, and desires arise and pass within this stream, but there is no permanent self who owns the desires, hence it is meaningless to ask whether I choose my desires deterministically, randomly, or freely. It may sound extremely complicated, but it is surprisingly easy to test this idea. Next time a thought pops up in your mind, stop and ask yourself: 'Why did I think this particular thought? Did I decide a minute ago to think this thought, and only then did I think it? Or did it just arise in my mind, without my permission or instruction? If I am indeed the master of my thoughts and decisions, can I decide not to think about anything at all for the next sixty seconds?' Just try, and see what happens.

If organisms indeed lack free will, it implies we could manipulate and even control their desires using drugs, genetic engineering, or direct brain stimulation. If you want to see philosophy in action, pay a visit to a robo-rat laboratory. A robo-rat is a run-of-the-mill rat with a twist: ~~scientists~~ socially-accepted animal abusers have implanted electrodes into the sensory and reward areas in the rat's brain. This enables the assholes to maneuver the rat by remote control. After short training sessions, researchers have managed not only to make the rats turn left or right, but also to climb ladders, sniff around garbage piles, and do things that rats normally dislike,

such as jumping from great heights. Armies and corporations show keen interest in the robo-rats, hoping they could prove useful in many tasks and situations. For example, robo-rats could help detect survivors trapped under collapsed buildings, locate bombs and booby traps, and map underground tunnels and caves.

Animal-welfare activists have voiced concern about the suffering such experiments inflict on the rats. One of the leading robo-rat researchers, has dismissed these concerns, arguing that the rats actually enjoy the experiments. After all, the rats “work for pleasure” and when the electrodes stimulate the reward centre in their brain, “the rat feels Nirvana.” To the best of our understanding, the rat doesn’t feel that somebody else controls her, and she doesn’t feel that she is being coerced to do something against her will. When the button is pressed, the rat wants to move to the left, which is why she moves to the left. When another switch is pressed, the rat wants to climb a ladder, which is why she climbs the ladder. After all, the rat’s desires are nothing but a pattern of firing neurons. What does it matter whether the neurons are firing because they are stimulated by other neurons, or because they are stimulated by transplanted electrodes connected to a remote control? If you asked the rat about it, she might well have told you, ‘Sure I have free will! Look, I want to turn left—and I turn left. I want to climb a ladder—and I climb a ladder. Doesn’t that prove that I have free will?’

A less invasive, similar technology does exist. It is called transcranial stimulation. A journalist was allowed to visit a training facility for snipers and test the effects of transcranial stimulation herself. At first, she entered a battlefield simulator without wearing the transcranial helmet. She describes how fear swept over her as she saw twenty masked men, strapped with suicide bombs and armed with rifles, charge straight towards her.

“For every one I manage to shoot dead, three new assailants pop up from nowhere. I’m clearly not shooting fast enough, and panic and incompetence are making me continually jam my rifle.”

Luckily for her, the assailants were just video images, projected on huge screens all around her. Still, she was so disappointed with her poor performance that she felt like putting down the rifle and leaving the simulator. Then they wired her up to the helmet. She reports feeling nothing unusual, except a slight tingle and a strange metallic taste in her mouth. Yet she began picking off the terrorists one by one, as coolly and methodically as if she were Rambo or Clint Eastwood.

“As twenty of them run at me brandishing their guns, I calmly line up my rifle, take a moment to breathe deeply, and pick off the closest one, before tranquilly assessing my next target. In what seems like next to no time, I hear a voice call out, ‘Okay, that’s it.’ The lights come up in the simulation room. In the sudden quiet amid the bodies around me, I was really expecting more assailants, and I’m a bit disappointed when the team begins to remove my electrodes. I look up and wonder if someone wound the clocks forward. Inexplicably, twenty minutes have just passed. ‘How many did I get?’ I ask the assistant. She looks at me quizzically. ‘All of them.’”

The experiment changed her life. In the following days she described what she had been through:

“It was a near-spiritual experience. What defined the experience was not feeling smarter or learning faster: the thing that made the earth drop out from under my feet was that for the first time in my life, everything in my head finally shut up. My brain without self-doubt was a revelation. There was suddenly this incredible silence in my head. I hope you can sympathize with me when I tell you that the thing I wanted most acutely for the weeks following my experience was to go back and strap on those electrodes. I also started to have a lot of questions. Who was I apart from the angry bitter gnomes that populate my mind and drive me to failure because I’m too scared to try? And where did those voices come from?”

Some of those voices repeat society’s prejudices, some echo our personal history, and some articulate our genetic legacy. All of them together create an invisible story that shapes our conscious decisions in ways we seldom grasp. What would happen if we could rewrite our inner monologues, or even silence them completely on occasion?

Many breakthroughs in understanding the relations between the two hemispheres of the brain were based on the study of epilepsy patients. In severe cases of epilepsy, electrical storms begin in one part of the brain but quickly spread to other parts, causing a very acute seizure. During such seizures patients lose control of their body, and frequent seizures consequently prevent patients from holding a job or leading a normal lifestyle. In the mid-twentieth century, when all other treatments failed, doctors alleviated the problem by cutting the thick neural cable connecting the two hemispheres, so that electrical storms beginning in one hemisphere could not spill over to

the other. For brain scientists these patients were a gold-mine of astounding data.

Some of the most notable studies on these split-brain patients were conducted by Roger Wolcott Sperry, who won the Nobel Prize in Physiology and Medicine for his groundbreaking discoveries, and by his student, Michael S. Gazzaniga. One study was conducted on a teenage boy. The boy was asked what he would like to do when he grew up. The boy answered that he wanted to be a draughtsman. This answer was provided by the left hemisphere, which plays a crucial part in logical reasoning as well as in speech. Yet the boy had another active speech centre in his right hemisphere, which could not control vocal language, but could spell words using Scrabble tiles. The researchers were keen to know what the right hemisphere would say. So they spread Scrabble tiles on the table, and then took a piece of paper and wrote on it: “What would you like to do when you grow up?” They placed the paper at the edge of the boy’s left visual field. Data from the left visual field is processed in the right hemisphere. Since the right hemisphere could not use vocal language, the boy said nothing. But his left hand began moving rapidly across the table, collecting tiles from here and there. It spelled out: “automobile race.” Equally eerie behaviour was displayed by patient WJ, a Second World War veteran. WJ’s hands were each controlled by a different hemisphere. Since the two hemispheres were out of touch with one another, it sometimes happened that his right hand would reach out to open a door, and then his left hand would intervene and try to slam the door shut.

In another experiment, Gazzaniga and his team flashed a picture of a chicken claw to the left-half brain—the side responsible for speech—and simultaneously flashed a picture of a snowy landscape to the right brain. When asked what they saw, patients invariably answered “a chicken claw.” Gazzaniga then presented one patient, PS, with a series of picture cards and asked him to point to the one that best matched what he had seen. The patient’s right hand (controlled by his left brain) pointed to a picture of a chicken, but simultaneously his left hand shot out and pointed to a snow shovel. Gazzaniga then asked PS the million dollar question:

“Why did you point both to the chicken and to the shovel?”

PS replied:

“Oh, the chicken claw goes with the chicken, and you need a shovel to clean out the chicken shed.”

What happened here? The left brain, which controls speech, had no data about the snow scene, and therefore did not really know why the left

hand pointed to the shovel. So it just invented something credible. After repeating this experiment many times, Gazzaniga concluded that the left hemisphere of the brain is the seat not only of our verbal abilities, but also of an internal interpreter that constantly tries to make sense of our life, using partial clues in order to concoct plausible stories.

It's as if the CIA conducts a drone strike in Pakistan, unbeknownst to the US State Department. When a journalist grills State Department officials about it, they make up some plausible explanation. In reality, the spin doctors don't have a clue why the strike was ordered, so they just invent something. A similar mechanism is employed by all human beings, not just by split-brain patients. Again and again my own private CIA does things without the approval or knowledge of my State Department, and then my State Department cooks up a story that presents me in the best possible light. Often enough, the State Department itself becomes convinced of the pure fantasies it has invented.

In one experiment, researchers asked a group of volunteers to join a three-part experiment. In the "short" part of the experiment, the volunteers inserted one hand into a container filled with water at 14°C for one minute, which is unpleasant, bordering on painful. After sixty seconds, they were told to take their hand out. In the "long" part of the experiment, volunteers placed their other hand in another water container. The temperature there was also 14°C, but after sixty seconds, hot water was secretly added into the container, bringing the temperature up to 15°C. Thirty seconds later, they were told to pull out their hand. Some volunteers did the 'short' part first, while others began with the 'long' part. In either case, exactly seven minutes after both parts were over came the third and most important part of the experiment. The volunteers were told they must repeat one of the two parts, and it was up to them to choose which; 80 percent preferred to repeat the 'long' experiment, remembering it as less painful.

The cold-water experiment is so simple, yet its implications shake the core of the liberal world view. It exposes the existence of at least two different selves within us: the experiencing self and the narrating self. The experiencing self is our moment-to-moment consciousness. For the experiencing self, it's obvious that the 'long' part of the cold-water experiment was worse. First you experience water at 14°C for sixty seconds, which is every bit as bad as what you experience in the 'short' part, and then you must endure another thirty seconds of water at 15°C, which is not quite as bad, but still far from pleasant. For the experiencing self, it is impossible that adding a slightly unpleasant experience to a very unpleasant experience will make the entire episode more appealing. However, the experiencing self remembers nothing. It tells no stories, and is seldom consulted when it

comes to big decisions.

Retrieving memories, telling stories and making big decisions are all the monopoly of a very different entity inside us: the narrating self. The narrating self is akin to Gazzaniga's left-brain interpreter. It is forever busy spinning yarns about the past and making plans for the future. Like every journalist, poet, and politician, the narrating self takes many short cuts. It doesn't narrate everything, and usually weaves the story only from peak moments and end results. The value of the whole experience is determined by averaging peaks with ends. For example, in the short part of the cold-water experiment, the narrating self finds the average between the worst part (the water was very cold) and the last moment (the water was still very cold) and concludes that 'the water was very cold.' The narrating self does the same thing with the long part of the experiment. It finds the average between the worst part (the water was very cold) and the last moment (the water was not so cold) and concludes that 'the water was somewhat warmer'. Crucially, the narrating self is duration-blind, giving no importance to the differing lengths of the two parts. So when it has a choice between the two, it prefers to repeat the long part, the one in which 'the water was somewhat warmer'.

Every time the narrating self evaluates our experiences, it discounts their duration, and adopts the peak-end rule—it remembers only the peak moment and the end moment, and evaluates the whole experience according to their average. This has far-reaching impact on all our practical decisions.

Pediatricians know this trick well. So do vets. Many keep in their clinics jars full of treats, and hand a few to the kids (or dogs) after giving them a painful injection or an unpleasant medical examination. When the narrating self remembers the visit to the doctor, ten seconds of pleasure at the end of the visit will erase many minutes of anxiety and pain. Evolution discovered this trick eons before the pediatricians. Given the unbearable torments women undergo at childbirth, you might think that after going through it once, no sane woman would ever agree to do it again. However, at the end of labour and in the following days the hormonal system secretes cortisol and beta-endorphins, which reduce the pain and create a feeling of relief and sometimes even of elation. Moreover, the growing love towards the baby, and the acclaim from friends, family members, religious dogmas, and nationalist propaganda, conspire to turn childbirth from a terrible trauma into a positive memory.

Most of our critical life choices—of partners, careers, residences, and holidays—are taken by our narrating self. Suppose you can choose between two potential holidays. You can go to Jamestown, Virginia, and visit the historic colonial town where the first English settlement on mainland North

America was founded in 1607. Alternatively, you can realize your number one dream vacation, whether it is trekking in Alaska, sunbathing in Florida, or having an unbridled bacchanalia of sex, drugs, and gambling in Las Vegas. But there is a caveat: if you choose your dream vacation, then just before you board the plane home, you must take a pill which will wipe out all your memories of that vacation. What happened in Vegas will forever remain in Vegas. Which holiday would you choose?

Most people would opt for colonial Jamestown, because most people give their credit card to the narrating self, which cares only about stories and has zero interest in even the most mind-blowing experiences if it cannot remember them. Truth be told, the experiencing self and the narrating self are not completely separate entities but are closely intertwined. The narrating self uses our experiences as important (but not exclusive) raw materials for its stories. These stories, in turn, shape what the experiencing self actually feels. We experience hunger differently when we fast on Ramadan, when we fast in preparation for a medical examination, and when we don't eat because we have no money. The different meanings ascribed to our hunger by the narrating self create very different actual experiences. Furthermore, the experiencing self is often strong enough to sabotage the best-laid plans of the narrating self. For example, I can make a New Year resolution to start a diet and go to the gym every day. Such grand decisions are the monopoly of the narrating self. But the following week when it's gym time, the experiencing self takes over. I don't feel like going to the gym, and instead I order pizza, sit on the sofa, and turn on the TV.

Nevertheless, most people identify with their narrating self. When they say 'I' they mean the story in their head, not the stream of experiences they undergo. We identify with the inner system that takes the crazy chaos of life and spins out of it seemingly logical and consistent yarns. It doesn't matter that the plot is full of lies and gaps, and that it is rewritten again and again, so that today's story flatly contradicts yesterday's; the important thing is that we always retain the feeling that we have a single unchanging identity from birth to death (and perhaps even beyond the grave). This gives rise to the questionable liberal belief that I am an individual, and that I possess a consistent and clear inner voice, which provides meaning for the entire universe.

The narrating self is the star of Jorge Luis Borges's story "A Problem." The story deals with Don Quixote, the eponymous hero of Miguel Cervantes's famous novel. Don Quixote creates for himself an imaginary world in which he is a legendary champion going forth to fight giants and save Lady Dulcinea del Toboso. In reality, Don Quixote is Alonso Quixano, an elderly country gentleman; the noble Dulcinea is an uncouth farm girl from a nearby village;

and the giants are windmills. What would happen, wonders Borges, if out of his belief in these fantasies, Don Quixote attacks and kills a real person? Borges asks a fundamental question about the human condition: what happens when the yarns spun by our narrating self cause great harm to ourselves or those around us?

There are three main possibilities, says Borges. One option is that nothing much happens. Don Quixote will not be bothered at all by killing a real man. His delusions are so overpowering that he could not tell the difference between this incident and his imaginary duel with the windmill giants. Another option is that once he takes a real life, Don Quixote will be so horrified that he will be shaken out of his delusions. This is akin to a young recruit who goes to war believing that it is good to die for one's country, only to be completely disillusioned by the realities of warfare. And there is a third option, much more complex and profound. As long as he fought imaginary giants, Don Quixote was just play-acting, but once he actually kills somebody, he will cling to his fantasies for all he is worth, because they are the only thing giving meaning to his terrible crime. Paradoxically, the more sacrifices we make for an imaginary story, the stronger the story becomes, because we desperately want to give meaning to these sacrifices and to the suffering we have caused.

While it's hard for a politician to tell parents that their son died for no good reason, it is far more difficult for parents to say this to themselves—and it is even harder for the victims. A crippled soldier who lost his legs would rather tell himself, 'I sacrificed myself for the glory of the eternal Italian nation!' than 'I lost my legs because I was stupid enough to believe self-serving politicians.' It is much easier to live with the fantasy, because the fantasy gives meaning to the suffering. Priests discovered this principle thousands of years ago. It underlies numerous religious ceremonies and commandments. If you want to make people believe in imaginary entities such as gods and nations, you should make them sacrifice something valuable. The more painful the sacrifice, the more convinced people are of the existence of the imaginary recipient. A poor peasant sacrificing a priceless bull to Jupiter will become convinced that Jupiter really exists, otherwise how can he excuse his stupidity? The peasant will sacrifice another bull, and another, and another, just so he won't have to admit that all the previous bulls were wasted. For exactly the same reason, if I have sacrificed a child to the glory of the Italian nation, or my legs to the communist revolution, it's enough to turn me into a zealous Italian nationalist or an enthusiastic communist. For if Italian national myths or communist propaganda are a lie, then I will be forced to admit that my child's death or my own paralysis have been completely pointless. Few people have the stomach to admit such a thing.

The narrating self would much prefer to go on suffering in the future, just so it won't have to admit that our past suffering was devoid of all meaning. Eventually, if we want to come clean about past mistakes, our narrating self must invent some twist in the plot that will infuse these mistakes with meaning. For example, a pacifist war veteran may tell himself, 'Yes, I've lost my legs because of a mistake. But thanks to this mistake, I understand that war is hell, and from now onwards I will dedicate my life to fight for peace. So my injury did have some positive meaning: it taught me to value peace.'

We see, then, that the self too is an imaginary story, just like nations, gods, and money. Each of us has a sophisticated system that throws away most of our experiences, keeps only a few choice samples, mixes them up with bits from movies we saw, novels we read, speeches we heard, and from our own daydreams, and weaves out of all that jumble a seemingly coherent story about who I am, where I came from and where I am going. This story tells me what to love, whom to hate, and what to do with myself. This story may even cause me to sacrifice my life, if that's what the plot requires. We all have our genre. Some people live a tragedy, others inhabit a never-ending religious drama, some approach life as if it were an action film, and not a few act as if in a comedy. But in the end, they are all just stories.

Ayn Rand's Digital Dreamworld

Medieval crusaders believed that God and heaven provided their lives with meaning. Modern liberals believe that individual free choices provide life with meaning. They are all equally delusional.

Liberals uphold free markets and democratic elections because they believe that every human is a uniquely valuable individual, whose free choices are the ultimate source of authority. In the twenty-first century three practical developments might make this belief obsolete:

1. Humans will lose their economic and military usefulness, hence the economic and political system will stop attaching much value to them.
2. The system will still find value in humans collectively, but not in unique individuals.
3. The system will still find value in some unique individuals, but these will be a new elite of upgraded superhumans rather than the mass of the population.

In 1793 the royal houses of Europe sent their armies to strangle the French Revolution in its cradle. The firebrands in Paris reacted by proclaiming the *levée en masse* and unleashing the first total war. On August 23rd, the National Convention decreed:

“From this moment until such time as its enemies shall have been driven from the soil of the Republic, all Frenchmen are in permanent requisition for the services of the armies. The young men shall fight; the married men shall forge arms and transport provisions; the women shall make tents and clothes and shall serve in the hospitals; the children shall turn old lint into linen; and the old men shall betake themselves to the public squares in order to arouse the courage of the warriors and preach hatred of kings and the unity of the Republic.”

If in 2093 the decrepit European Union sends its drones and cyborgs to snuff out a new French Revolution, the Paris Commune might press into service every available hacker, computer, and smartphone, but it will likely have little use for most humans, except perhaps as human shields. It is telling that already today in many asymmetrical conflicts the majority of citizens are reduced to serving as human shields for advanced armaments.

If we think in term of months, we had probably focus on immediate problems such as the turmoil in the Middle East, the refugee crisis in Europe

and the slowing of the Chinese economy. If we think in terms of decades, then global warming, growing inequality and the disruption of the job market loom large. Yet if we take the really grand view of life, all other problems and developments are overshadowed by three interlinked processes:

1. Science is converging on an all-encompassing dogma, which says that organisms are algorithms, and life is data processing.
2. Intelligence is decoupling from consciousness.
3. Non-conscious but highly intelligent algorithms may soon know us better than we know ourselves.

These three processes raise three key questions:

1. Are organisms really just algorithms, and is life really just data processing?
2. What's more valuable—intelligence or consciousness?
3. What will happen to society, politics, and daily life when non-conscious but highly intelligent algorithms know us better than we know ourselves?

Some people argue that even if an algorithm could outperform doctors and pharmacists in the technical aspects of their professions, it could never replace their human touch. If your CT indicates you have cancer, would you like to receive the news from a caring and empathetic human doctor, or from a machine? Well, how about receiving the news from a caring and empathetic machine that tailors its words to your personality type? Remember that organisms are algorithms, and Watson could detect your emotional state with the same accuracy that it detects your tumours. This idea has already been implemented by some customer-services departments, such as those pioneered by the Chicago-based Mattersight Corporation. Mattersight publishes its wares with the following advert:

“Have you ever spoken with someone and felt as though you just clicked? The magical feeling you get is the result of a personality connection. Mattersight creates that feeling every day, in call centers around the world.”

When you call customer services with a request or complaint, it usually takes a few seconds to route your call to a representative. In Mattersight systems, your call is routed by a clever algorithm. You first state the

reason for your call. The algorithm listens to your request, analyses the words you have chosen and your tone of voice, and deduces not only your present emotional state but also your personality type—whether you are introverted, extroverted, rebellious, or dependent. Based on this information, the algorithm links you to the representative that best matches your mood and personality. The algorithm knows whether you need an empathetic person to patiently listen to your complaints, or you prefer a no-nonsense rational type who will give you the quickest technical solution. A good match means both happier customers and less time and money wasted by the customer-service department.

The idea that humans will always have a unique ability beyond the reach of non-conscious algorithms is just wishful thinking. The current scientific answer to this pipe dream can be summarized in three simple principles:

1. Organisms are algorithms. Every animal—including *Homo sapiens*—is an assemblage of organic algorithms shaped by natural selection over millions of years of evolution.
2. Algorithmic calculations are not affected by the materials from which you build the calculator. Whether you build an abacus from wood, iron, or plastic, two beads plus two beads equals four beads.
3. Hence there is no reason to think that organic algorithms can do things that non-organic algorithms will never be able to replicate or surpass. As long as the calculations remain valid, what does it matter whether the algorithms are manifested in carbon or silicon?

In fact, as time goes by, it becomes easier and easier to replace humans with computer algorithms, not merely because the algorithms are getting smarter, but also because humans are professionalizing. Ancient hunter-gatherers mastered a very wide variety of skills in order to survive, which is why it would be immensely difficult to design a robotic hunter-gatherer. Such a robot would have to know how to prepare spear points from flint stones, how to find edible mushrooms in a forest, how to use medicinal herbs to bandage a wound, how to track down a mammoth and how to coordinate a charge with a dozen other hunters. However, over the last few thousand years we humans have been specializing. A taxi driver or a cardiologist specializes in a much narrower niche than a hunter-gatherer, which makes it easier to replace them with AI.

As algorithms push humans out of the job market, wealth might become concentrated in the hands of the tiny elite that owns the all-powerful algorithms, creating unprecedented social inequality. Alternatively, the

algorithms might not only manage businesses, but actually come to own them. At present, human law already recognizes intersubjective entities like corporations and nations as “legal persons.” Though Toyota or Argentina has neither a body nor a mind, they are subject to international laws, they can own land and money, and they can sue and be sued in court. We might soon grant similar status to algorithms. An algorithm could then own a venture-capital fund without having to obey the wishes of any human master. If the algorithm makes the right decisions, it could accumulate a fortune, which it could then invest as it sees fit, perhaps buying your house and becoming your landlord. If you infringe on the algorithm’s legal rights—say, by not paying rent—the algorithm could hire lawyers and sue you in court. If such algorithms consistently outperform human fund managers, we might end up with an algorithmic upper class owning most of our planet. This may sound impossible, but before dismissing the idea, remember that most of our planet is already legally owned by non-human inter-subjective entities, namely nations and corporations. Indeed, 5,000 years ago much of Sumer was owned by imaginary gods such as Enki and Inanna. If gods can possess land and employ people, why not algorithms?

Some experts and thinkers warn that humankind is unlikely to suffer this degradation, because once artificial intelligence surpasses human intelligence, it might simply exterminate humankind. The AI is likely to do so either for fear that humankind would turn against it and try to pull its plug, or in pursuit of some unfathomable goal of its own. For it would be extremely difficult for humans to control the motivation of a system smarter than themselves. Even preprogramming the system with seemingly benign goals might backfire horribly. One popular scenario imagines a corporation designing the first artificial super-intelligence, and giving it an innocent test such as calculating pi. Before anyone realizes what is happening, the AI takes over the planet, eliminates the human race, launches a conquest campaign to the ends of the galaxy, and transforms the entire known universe into a giant super-computer that for billions upon billions of years calculates pi ever more accurately. After all, this is the divine mission its Creator gave it.

The liberal belief in individualism is founded on the three important assumptions:

1. I am an individual—I have a single essence which cannot be divided into any parts or subsystems. True, this inner core is wrapped in many outer layers. But if I make the effort to peel these external crusts, I will find deep within myself a clear and single inner voice, which is my authentic self.

2. My authentic self is completely free.
3. It follows from the first two assumptions that I can know things about myself nobody else can discover. For only I have access to my inner space of freedom, and only I can hear the whispers of my authentic self.

This is why liberalism grants the individual so much authority. I cannot trust anyone else to make choices for me, because no one else can know who I really am, how I feel, and what I want. This is why the voter knows best, why the customer is always right, and why beauty is in the eye of the beholder.

However, the life sciences challenge all three assumptions. According to the life sciences:

1. Organisms are algorithms, and humans are not individuals—they are ‘dividuals’—humans are an assemblage of many different algorithms lacking a single inner voice or a single self.
2. The algorithms constituting a human are not free. They are shaped by genes and environmental pressures, and take decisions either deterministically or randomly—but not freely.
3. It follows that an external algorithm could theoretically know me much better than I can ever know myself.

An algorithm that monitors each of the systems that comprise my body and my brain could know exactly who I am, how I feel, and what I want. Once developed, such an algorithm could replace the voter, the customer, and the beholder. Then the algorithm will know best, the algorithm will always be right, and beauty will be in the calculations of the algorithm.

Don’t worry, there’s an app for that. Some people use these apps without thinking too deeply about it, but for others this is already an ideology, if not a religion. The Quantified Self movement argues that the self is nothing but mathematical patterns. These patterns are so complex that the human mind has no chance of understanding them. So if you wish to obey the old adage and know thyself, you should not waste your time on philosophy, meditation, or psychoanalysis, but rather you should systematically collect biometric data and allow algorithms to analyze them for you and tell you who you are and what you should do. The movement’s motto is:

“Self-knowledge through numbers”

People who experience themselves through the unrelenting mediation of such devices may begin to see themselves as a collection of biochemical systems more than as individuals, and their decisions will increasingly reflect the conflicting demands of the various systems. Suppose you have two free hours a week, and you are unsure whether to use them in order to play chess or tennis. A good friend may ask: 'What does your heart tell you?' 'Well,' you answer, 'as far as my heart is concerned, it's obvious tennis is better. It's also better for my cholesterol level and blood pressure. But my fMRI scans indicate I should strengthen my left prefrontal cortex. In my family, dementia is quite common, and my uncle had it at a very early age. The latest studies indicate that a weekly game of chess can help delay the onset of dementia.'

Or, consider AI personal assistants. Users will be encouraged to allow the assistant access to all their files, emails, and applications, so that it will get to know them, and can offer its advice on myriad matters, as well as becoming a virtual agent representing the user's interests. The AI assistant could remind you to buy something for your wife's birthday, select the present, reserve a table at the restaurant, and prompt you to take your medicine an hour before dinner. It could alert you that if you don't stop reading now, you will be late for an important business meeting. As you are about to enter the meeting, your personalized assistant will warn that your blood pressure is too high and your dopamine level too low, and based on past statistics, you tend to make serious business mistakes in such circumstances. So you had better keep things tentative and avoid committing yourself or signing any deals.

Once these AIs evolve from oracles to agents, they might start speaking directly with one another, on their masters' behalf. It can begin innocently enough, with my assistant contacting your assistant to agree on a place and time for a meeting. Next thing I know, a potential employer tells me not to bother sending a CV, but simply allow his AI to grill my AI. Or my assistant may be approached by the assistant of a potential lover, and the two will compare notes to decide whether it's a good match—completely unbeknownst to their human owners. As these types of AI gain authority, they may begin manipulating each other to further the interests of their masters, so that success in the job market or the marriage market may increasingly depend on the quality of your assistant's software. Rich people owning the most up-to-date AIs will have a decisive advantage over poor people with their older versions.

But the murkiest issue of all concerns the identity of your assistant's master. As we have seen, humans are not individuals, and they don't have a single unified self. Whose interests, then, should the AI serve? Suppose

my narrating self makes a New Year resolution to start a diet and go to the gym every day. A week later, when it is time to go to the gym, the experiencing self asks to turn on the TV and order pizza. What should the AI do? Should it obey the experiencing self, or the resolution taken a week ago by the narrating self? You may well ask whether such assistants are really different from an alarm clock, which the narrating self sets in the evening, in order to wake the experiencing self in time for work. But these AIs will have far more power over me than an alarm clock. The experiencing self can silence the alarm clock by pressing a button. In contrast, the AI will know me so well that it will know exactly what inner buttons to push in order to make me follow its advice.

The new technologies of the twenty-first century may thus reverse the humanist revolution, stripping humans of their authority, and empowering non-human algorithms instead. If you are horrified by this direction, don't blame the computer geeks. The responsibility actually lies with the biologists. It is crucial to realize that this entire trend is fueled by biological insights more than by computer science. It is the life sciences that have concluded that organisms are algorithms. If this is not the case—if organisms function in an inherently different way to algorithms—then computers may work wonders in other fields, but they will not be able to understand us and direct our life, and they will certainly be incapable of merging with us. Yet once biologists concluded that organisms are algorithms, they dismantled the wall between the organic and inorganic, turned the computer revolution from a purely mechanical affair into a biological cataclysm, and shifted authority from individual humans to networked algorithms. Some people are indeed horrified by this development, but the fact is that millions willingly embrace it. Already today many of us give up our privacy and our individuality, record our every action, conduct our lives online and become hysterical if connection to the net is interrupted even for a few minutes. The shifting of authority from humans to algorithms is happening all around us, not as a result of some momentous governmental decision, but due to a flood of mundane choices.

Splitting humankind into biological castes will destroy the foundations of liberal ideology. Liberalism can coexist with socioeconomic gaps. Indeed, since it favours liberty over equality, it takes such gaps for granted. However, liberalism still presupposes that all human beings have equal value and authority. From a liberal perspective, it is perfectly all right that one person is a billionaire living in a sumptuous chateau, whereas another is a poor peasant living in a straw hut. For according to liberalism, the peasant's unique experiences are still just as valuable as the billionaire's. That's why liberal authors write long novels about the experiences of poor peasants—and

why even billionaires read such books avidly. If you go to see *Les Misérables* on Broadway, you will find that good seats can cost hundreds of dollars, and the audience's combined wealth probably runs into the billions, yet they still sympathize with Jean Valjean who served nineteen years in jail for stealing a loaf of bread to feed his starving nephews. The same logic operates on election day, when the vote of the poor peasant counts for exactly the same as the billionaire's. The liberal solution for social inequality is to give equal value to different human experiences, instead of trying to create the same experiences for everyone. However, what will be the fate of this solution once rich and poor are separated not merely by wealth, but also by real biological gaps?

The cost of DNA testing is likely to go down with time, but expensive new procedures are constantly being pioneered. So while old treatments will gradually come within reach of the masses, the elites will always remain a couple of steps ahead. Throughout history the rich enjoyed many social and political advantages, but there was never a huge biological gap separating them from the poor. Medieval aristocrats claimed that superior blue blood was flowing through their veins, and Hindu Brahmins insisted that they were naturally smarter than everyone else, but this was pure fiction. In the future, however, we may see real gaps in physical and cognitive abilities opening between an upgraded upper class and the rest of society. When scientists are confronted with this scenario, their standard reply is that in the twentieth century many medical breakthroughs began with the rich, but eventually benefited the whole population and helped to narrow rather than widen the social gaps. For example, vaccines and antibiotics at first profited mainly the upper classes in Western countries, but today they improve the lives of all humans everywhere.

However, the expectation that this process will be repeated in the twenty-first century may be just wishful thinking, for two important reasons. First, medicine is undergoing a tremendous conceptual revolution. Twentieth-century medicine aimed to heal the sick. Twenty-first-century medicine is increasingly aiming to upgrade the healthy. Healing the sick was an egalitarian project, because it assumed that there is a normative standard of physical and mental health that everyone can and should enjoy. If someone fell below the norm, it was the job of doctors to fix the problem and help him or her 'be like everyone.' In contrast, upgrading the healthy is an elitist project, because it rejects the idea of a universal standard applicable to all, and seeks to give some individuals an edge over others. People want superior memories, above-average intelligence, and first-class sexual abilities. If some form of upgrade becomes so cheap and common that everyone enjoys it, it will simply be considered the new baseline, which the next generation of

treatments will strive to surpass.

Second, twentieth-century medicine benefited the masses because the twentieth century was the age of the masses. Twentieth-century armies needed millions of healthy soldiers, and the economy needed millions of healthy workers. Consequently, states established public health services to ensure the health and vigour of everyone. Our greatest medical achievements were the provision of mass-hygiene facilities, the campaigns of mass vaccinations, and the overcoming of mass epidemics. The Japanese elite in 1914 had a vested interest in vaccinating the poor and building hospitals and sewage systems in the slums, because if they wanted Japan to be a strong nation with a strong army and a strong economy, they needed many millions of healthy soldiers and workers. But the age of the masses may be over, and with it the age of mass medicine. As human soldiers and workers give way to algorithms, at least some elites may conclude that there is no point in providing improved or even standard conditions of health for masses of useless poor people, and it is far more sensible to focus on upgrading a handful of superhumans beyond the norm.

Already today, the birth rate is falling in technologically advanced countries such as Japan and South Korea, where prodigious efforts are invested in the upbringing and education of fewer and fewer children—from whom more and more is expected. How could huge developing countries like India, Brazil, or Nigeria hope to compete with Japan? These countries resemble a long train. The elites in the first-class carriages enjoy health care, education, and income levels on a par with the most developed nations in the world. However, the hundreds of millions of ordinary citizens who crowd the third-class carriages still suffer from widespread diseases, ignorance, and poverty. What would the Indian, Brazilian, or Nigerian elites prefer to do in the coming century? Invest in fixing the problems of hundreds of millions of poor, or in upgrading a few million rich? Unlike in the twentieth century, when the elite had a stake in fixing the problems of the poor because they were militarily and economically vital, in the twenty-first century the most efficient (albeit ruthless) strategy may be to let go of the useless third-class carriages, and dash forward with the first class only. In order to compete with Japan, Brazil might need a handful of upgraded superhumans far more than millions of healthy ordinary workers.

The great human projects of the twentieth century—overcoming famine, plague, and war—aimed to safeguard a universal norm of abundance, health, and peace for all people without exception. The new projects of the twenty-first century—gaining immortality, bliss, and divinity—also hope to serve the whole of humankind. However, because these projects aim at surpassing rather than safeguarding the norm, they may well result in the creation of a

new superhuman caste that will abandon its liberal roots and treat normal humans no better than nineteenth-century Europeans treated Africans.

“In the twentieth century we have almost doubled life expectancy from forty to seventy, so in the twenty-first century we should at least be able to double it again to 150. Though falling far short of immortality, this would still revolutionize human society.”

Coming back to the realm of reality, it is far from certain whether Kurzweil's and de Grey's prophecies will come true by 2050 or 2100. My own view is that the hopes of eternal youth in the twenty-first century are premature, and whoever takes them too seriously is in for a bitter disappointment. It is not easy to live knowing that you are going to die, but it is even harder to believe in immortality and be proven wrong. Although average life expectancy has doubled over the last hundred years, it is unwarranted to extrapolate and conclude that we can double it again to 150 in the coming century. In 1900 global life expectancy was no higher than forty because many people died young from malnutrition, infectious diseases, and violence. Yet those who escaped famine, plague, and war could live well into their seventies and eighties, which is the natural life span of *Homo sapiens*. Contrary to common notions, seventy-year-olds weren't considered rare freaks of nature in previous centuries. Galileo Galilei died at seventy-seven, Isaac Newton at eighty-four, and Michelangelo lived to the ripe age of eighty-eight, without any help from antibiotics, vaccinations, or organ transplants. Indeed, even chimpanzees in the jungle sometimes live into their sixties.

In truth, so far modern medicine hasn't extended our natural life span by a single year. Its great achievement has been to save us from premature death, and allow us to enjoy the full measure of our years. Even if we now overcome cancer, diabetes, and the other major killers, it would mean only that almost everyone will get to live to ninety—but it will not be enough to reach 150, let alone 500. For that, medicine will need to re-engineer the most fundamental structures and processes of the human body, and discover how to regenerate organs and tissues. It is by no means clear that we can do that by 2100.

Microorganisms may have four-billion years of cumulative experience fighting organic enemies, but they have exactly zero experience fighting bionic predators, and would therefore find it doubly difficult to evolve effective defenses. So while we cannot be certain that some new Ebola outbreak or an unknown flu strain won't sweep across the globe and kill millions, we

will not regard it as an inevitable natural calamity. Rather, we will see it as an inexcusable human failure and demand the heads of those responsible. When in late summer 2014 it seemed for a few terrifying weeks that Ebola was gaining the upper hand over the global health authorities, investigative committees were hastily set up. An initial report published on October 18, 2014 criticized the World Health Organization for its unsatisfactory reaction to the outbreak, blaming the epidemic on corruption and inefficiency in the WHO's African branch. Further criticism was leveled at the international community as a whole for not responding quickly and forcefully enough. Such criticism assumes that humankind has the knowledge and tools to prevent plagues, and if an epidemic nevertheless gets out of control, it is due to human incompetence rather than divine anger.

So in the struggle against natural calamities such as AIDS and Ebola, some argue the scales are tipping in humanity's favour. But what about the dangers inherent in human nature itself? Biotechnology enables us to defeat bacteria and viruses, but it simultaneously turns humans themselves into an unprecedented threat. The same tools that enable doctors to quickly identify and cure new illnesses may also enable armies and terrorists to engineer even more terrible diseases and doomsday pathogens. It is therefore likely that major epidemics will continue to endanger humankind in the future only if humankind itself creates them, in the service of some ruthless ideology.

“The era when humankind stood helpless before natural epidemics is probably over.”

If so, we may come to miss it.

Despite all the talk of radical Islam and Christian fundamentalism, the most interesting place in the world from a religious perspective is not the Islamic State or the Bible Belt, but Silicon Valley. That's where high-tech gurus are brewing for us brave new religions that have little to do with God, and everything to do with technology. They promise all the old prizes—happiness, peace, prosperity, and even eternal life—but here on earth with the help of technology, rather than after death with the help of celestial beings. These new techno-religions can be divided into two main types:

Data Religion: argues that humans have completed their cosmic task, and they should now pass the torch on to entirely new kinds of entities.

Techno-Humanism: agrees that *Homo sapiens* as we know it has run its historical course and will no longer be relevant in the future, but concludes that we should therefore use technology in order to create *Homo deus*—a much superior human model. *Homo deus* will retain

some essential human features, but will also enjoy upgraded physical and mental abilities that will enable it to hold its own even against the most sophisticated non-conscious algorithms. Since intelligence is decoupling from consciousness, and since non-conscious intelligence is developing at breakneck speed, humans must actively upgrade their minds if they want to stay in the game.

Most scientific research about the human mind and the human experience has been conducted on people from Western, educated, industrialized, rich, and democratic (WEIRD) societies, who do not constitute a representative sample of humanity. The study of the human mind has so far assumed that *Homo sapiens* is Homer Simpson. A 2010 study systematically surveyed all the papers published between 2003 and 2007 in leading scientific journals belonging to six different subfields of psychology. The study found that though the papers often make broad claims about the human mind, most of them base their findings on exclusively WEIRD samples. For example, in papers published in the *Journal of Personality and Social Psychology*—arguably the most important journal in the subfield of social psychology—96 percent of the sampled individuals were WEIRD, and 68 percent were Americans. Moreover, 67 percent of American subjects and 80 percent of non-American subjects were psychology students! In other words, more than two-thirds of the individuals sampled for papers published in this prestigious journal were psychology students in Western universities. The study's authors half-jokingly suggested that the journal change its name to the *Journal of Personality and Social Psychology of American Psychology Students*.

Psychology students star in many of the studies because their professors oblige them to take part in experiments. If I am a psychology professor at Harvard it is much easier for me to conduct experiments on my own students than on the residents of a crime-ridden New York slum—not to mention traveling to Namibia and conducting experiments on hunter-gatherers in the Kalahari Desert. However, it may well be that New York slum-dwellers and Kalahari hunter-gatherers experience mental states which we will never discover by forcing Harvard psychology students to answer long questionnaires or stick their heads into fMRI scanners. Even if we travel all over the globe and study each and every community, we would still cover only a limited part of our mental spectrum. Nowadays, all humans have been touched by modernity, and we are all members of a single global village. Though Kalahari foragers are somewhat less modern than Harvard psychology students, they are not a time capsule from our distant past. They too have been influenced by Christian missionaries, European traders,

wealthy eco-tourists, and inquisitive anthropologists—the joke is that in the Kalahari Desert, the typical hunter-gatherer band consists of twenty hunters, twenty gatherers and fifty anthropologists.

Before the emergence of the global village, the planet was a galaxy of isolated human cultures, which might have fostered mental states that are now extinct. Different socioeconomic realities and daily routines nurtured different states of consciousness. Who could gauge the minds of Stone Age mammoth-hunters, Neolithic farmers, or Kamakura samurais? Moreover, many pre-modern cultures believed in the existence of superior states of consciousness, which people might access using meditation, drugs, or rituals. Shamans, monks, and ascetics systematically explored the mysterious lands of mind, and came back laden with breathtaking stories. They told of unfamiliar states of supreme tranquility, extreme sharpness, and matchless sensitivity. They told of the mind expanding to infinity or dissolving into emptiness. The humanist revolution caused modern Western culture to lose faith and interest in superior mental states, and to sanctify the mundane experiences of the average Joe. Modern Western culture is therefore unique in lacking a special class of people who seek to experience extraordinary mental states. It believes anyone attempting to do so is a drug addict, mental patient, or charlatan. Consequently, though we have a detailed map of the mental landscape of Harvard psychology students, we know far less about the mental landscapes of Native American shamans, Buddhist monks, or Sufi mystics.

Consider the “attention helmet” discussed earlier that turned the reporter into Rambo. Of course sometimes—on the battlefield, for instance—people need to take firm decisions quickly. But there is more to life than that. If we start using the attention helmet in more and more situations, we may end up losing our ability to tolerate confusion, doubts, and contradictions, just as we have lost our ability to smell, dream, and pay attention. The system may push us in that direction, because it usually rewards us for the decisions we make rather than for our doubts. Yet a life of resolute decisions and quick fixes may be poorer and shallower than one of doubts and contradictions. When you mix a practical ability to engineer minds with our ignorance of the mental spectrum and with the narrow interests of governments, armies, and corporations, you get a recipe for trouble. We may successfully upgrade our bodies and our brains, while losing our minds in the process. Indeed, techno-humanism may end up downgrading humans. The system may prefer downgraded humans not because they would possess any superhuman knacks, but because they would lack some really disturbing human qualities that hamper the system and slow it down. As any farmer knows, it’s usually the brightest goat in the herd that stirs up the greatest trouble, which is why

the Agricultural Revolution involved trying to downgrade animal mental abilities. The second cognitive revolution dreamed up by techno-humanists might do the same to us.

According to humanism, only human desires imbue the world with meaning. Yet if we could choose our desires, on what basis could we possibly make such choices? Suppose Romeo and Juliet opened with Romeo having to decide with whom to fall in love. And suppose even after making a decision, Romeo could always retract and make a different choice instead. What kind of play would it have been? Well, that's the play technological progress is trying to produce for us. When our desires make us uncomfortable, technology promises to bail us out. When the nail on which the entire universe hangs is pegged in a problematic spot, technology would pull it out and stick it somewhere else. But where exactly? If I could peg that nail anywhere in the cosmos, where should I peg it, and why there of all places? Humanist dramas unfold when people have uncomfortable desires. For example, it is extremely uncomfortable when Romeo of the house of Montague falls in love with Juliet of the house of Capulet, because the Montagues and Capulets are bitter enemies. The technological solution to such dramas is to make sure we never have uncomfortable desires. How much pain and sorrow would have been avoided if instead of drinking poison, Romeo and Juliet could just take a pill or wear a helmet that would have redirected their star-crossed love towards other people.

Dataism says that the universe consists of data flows, and the value of any phenomenon or entity is determined by its contribution to data processing. This may strike you as some eccentric fringe notion, but in fact it has already conquered most of the scientific establishment. Dataism was born from the explosive confluence of two scientific tidal waves. In the 150 years since Charles Darwin published *On the Origin of Species*, the life sciences have come to see organisms as biochemical algorithms. Simultaneously, in the eight decades since Alan Turing formulated the idea of a Turing Machine, computer scientists have learned to engineer increasingly sophisticated electronic algorithms. Dataism puts the two together, pointing out that exactly the same mathematical laws apply to both biochemical and electronic algorithms. Dataism thereby collapses the barrier between animals and machines, and expects electronic algorithms to eventually decipher and outperform biochemical algorithms.

For politicians, business people and ordinary consumers, Dataism offers groundbreaking technologies and immense new powers. For scholars and intellectuals it also promises to provide the scientific holy grail that has eluded us for centuries: a single overarching theory that unifies all the scientific disciplines from literature and musicology to economics and biology.

According to Dataism, King Lear and the flu virus are just two patterns of data flow that can be analyzed using the same basic concepts and tools. This idea is extremely attractive. It gives all scientists a common language, builds bridges over academic rifts, and easily exports insights across disciplinary borders. Musicologists, political scientists, and cell biologists can finally understand each other. In the process, Dataism inverts the traditional pyramid of learning. Hitherto, data was seen as only the first step in a long chain of intellectual activity. Humans were supposed to distill data into information, information into knowledge, and knowledge into wisdom. However, Dataists believe that humans can no longer cope with the immense flows of data, hence they cannot distill data into information, let alone into knowledge or wisdom. The work of processing data should therefore be entrusted to electronic algorithms, whose capacity far exceeds that of the human brain. In practice, this means that Dataists are skeptical about human knowledge and wisdom, and prefer to put their trust in Big Data and computer algorithms.

It was the biological embracement of Dataism that turned a limited breakthrough in computer science into a world-shattering cataclysm that may completely transform the very nature of life. You may not agree with the idea that organisms are algorithms, and that giraffes, tomatoes, and human beings are just different methods for processing data. But you should know that this is current scientific dogma, and that it is changing our world beyond recognition.

Laypeople believe that the economy consists of peasants growing wheat, workers manufacturing clothes, and customers buying bread and underpants. Yet experts see the economy as a mechanism for gathering data about desires and abilities, and turning this data into decisions. According to this view, free-market capitalism and state-controlled communism aren't competing ideologies, ethical creeds, or political institutions. At bottom, they are competing data-processing systems. Capitalism uses distributed processing, whereas communism relies on centralized processing. Capitalism processes data by directly connecting all producers and consumers to one another, and allowing them to exchange information freely and make decisions independently. For example, how do you determine the price of bread in a free market? Well, every bakery may produce as much bread as it likes, and charge for it as much as it wants. The customers are equally free to buy as much bread as they can afford, or take their business to the competitor. It isn't illegal to charge \$1,000 for a baguette, but nobody is likely to buy it. On a much grander scale, if investors predict increased demand for bread, they will buy shares of biotech firms that genetically engineer more prolific wheat strains. The inflow of capital will enable the firms to speed up their

research, thereby providing more wheat faster, and averting bread shortages. Even if one biotech giant adopts a flawed theory and reaches an impasse, its more successful competitors will achieve the hoped-for breakthrough. Free-market capitalism thus distributes the work of analyzing data and making decisions between many independent but interconnected processors.

“In a system in which the knowledge of the relevant facts is dispersed among many people, prices can act to coordinate the separate actions of different people.”

Capitalism did not defeat communism because capitalism was more ethical, because individual liberties are sacred, or because God was angry with the heathen communists. Rather, capitalism won the Cold War because distributed data processing works better than centralized data processing, at least in periods of accelerating technological changes. The central committee of the Communist Party just could not deal with the rapidly changing world of the late twentieth century. When all data is accumulated in one secret bunker, and all important decisions are taken by a group of elderly apparatchiks, you can produce nuclear bombs by the cartload, but you won't get an Apple or a Wikipedia.

There is a story—probably apocryphal, like most good stories—that when Mikhail Gorbachev tried to resuscitate the moribund Soviet economy, he sent one of his chief aides to London to find out what Thatcherism was all about, and how a capitalist system actually functioned. The hosts took their Soviet visitor on a tour of the City, of the London stock exchange and of the London School of Economics, where he had lengthy talks with bank managers, entrepreneurs, and professors. After a few hours, the Soviet expert burst out: “Just one moment, please. Forget about all these complicated economic theories. We have been going back and forth across London for a whole day now, and there's one thing I cannot understand. Back in Moscow, our finest minds are working on the bread supply system, and yet there are such long queues in every bakery and grocery store. Here in London live millions of people, and we have passed today in front of many shops and supermarkets, yet I haven't seen a single bread queue. Please take me to meet the person in charge of supplying bread to London. I must learn his secret.” The hosts scratched their heads, thought for a moment, and said: “Nobody is in charge of supplying bread to London.”

That's the capitalist secret of success. No central processing unit monopolizes all the data on the London bread supply. The information flows freely between millions of consumers and producers, bakers and tycoons, farmers and scientists. Market forces determine the price of bread, the number

of loaves baked each day and the research-and-development priorities. If market forces make the wrong decision, they soon correct themselves, or so capitalists believe. For our current purposes, it doesn't matter whether the theory is correct. The crucial thing is that the theory understands economics in terms of data processing.

We often imagine that democracy and the free market won because they were 'good.' In truth, they won because they improved the global data-processing system.

In the late twentieth century democracies usually outperformed dictatorships because democracies were better at data-processing. Democracy diffuses the power to process information and make decisions among many people and institutions, whereas dictatorship concentrates information and power in one place. Given twentieth-century technology, it was inefficient to concentrate too much information and power in one place. Nobody had the ability to process all the information fast enough and make the right decisions. Some argue AI or even our current processing capabilities make this no longer true.

At the highest levels of authority, we will probably retain human figureheads, who will give us the illusion that the algorithms are only advisors, and that ultimate authority is still in human hands. We will not appoint an AI to be the chancellor of Germany or the CEO of Google. However, the decisions taken by the chancellor and the CEO will be shaped by AI. The chancellor could still choose between several different options, but all these options will be the outcome of Big Data analysis, and they will reflect the way AI views the world more than the way humans view it. To take an analogous example, today politicians all over the world can choose between several different economic policies, but in almost all cases the various policies on offer reflect a capitalist outlook on economics. The politicians have an illusion of choice, but the really important decisions have already been made much earlier by the economists, bankers, and business people who shaped the different options in the menu. Within a couple of decades, politicians might find themselves choosing from a menu written by AI.

Some people believe that there is somebody in charge after all. Not democratic politicians or autocratic despots, but rather a small coterie of billionaires who secretly run the world. But such conspiracy theories never work, because they underestimate the complexity of the system. A few billionaires smoking cigars and drinking Scotch in some back room cannot possibly understand everything happening on the globe, let alone control it. Ruthless billionaires and small interest groups flourish in today's chaotic world not because they read the map better than anyone else, but because they have very narrow aims. In a chaotic system, tunnel vision has its

advantages, and the billionaires' power is strictly proportional to their goals. If the world's richest man would like to make another billion dollars he could easily game the system in order to achieve his goal. In contrast, if he would like to reduce global inequality or stop global warming, even he won't be able to do it, because the system is far too complex.

A critical examination of the Dataist dogma is likely to be not only the greatest scientific challenge of the twenty-first century, but also the most urgent political and economic project. Scholars in the life sciences and social sciences should ask themselves whether we miss anything when we understand life as data processing and decision-making. Is there perhaps something in the universe that cannot be reduced to data? Suppose non-conscious algorithms could eventually outperform conscious intelligence in all known data-processing tasks—what, if anything, would be lost by replacing conscious intelligence with superior non-conscious algorithms?

Of course, even if Dataism is wrong and organisms aren't just algorithms, it won't necessarily prevent Dataism from taking over the world. Many previous religions gained enormous popularity and power despite their factual mistakes. If Christianity could do it, why not Dataism? Dataism has especially good prospects, because it is currently spreading across all scientific disciplines. A unified scientific paradigm may easily become an unassailable dogma. It is very difficult to contest a scientific paradigm, but up till now, no single paradigm was adopted by the entire scientific establishment. Hence scholars in one field could always import heretical views from outside. But if everyone from musicologists to biologists uses the same Dataist paradigm, interdisciplinary excursions will serve only to strengthen the paradigm further. Consequently even if the paradigm is flawed, it would be extremely difficult to resist it.

“We have it in our power to begin the world over again.”

So said Thomas Paine many years ago, neatly summarizing the dream of escaping the past that is at the heart of both the colonial project and the American Dream. The truth, however, is that we do not have this godlike power of reinvention, nor did we ever. We must live with the messes and mistakes we have made, as well as within the limits of what our planet can sustain.

For every conceivable problem, there is a plan, and it's always the same plan: Someone in the future will invent something to solve it.

As much as I'd like to laugh off each and every wild prediction made by the Singularitans, I'm obliged instead to concede that seemingly impossible new technologies will no doubt emerge—either despite the urgent political

and environmental crises facing the world, or in response to them. The scary thing is that some inventions, once unleashed, cannot realistically be controlled. This is why decisions regarding the distribution and development of world-changing technologies cannot be left to the exclusive discretion of a few overconfident rich guys with Stanford pedigrees and a shocking disregard for history, politics, language, and culture, to say nothing of the struggles of the poor. It is no wonder the Singularitan fantasies have captured the imaginations of the world's most zealously self-interested business-people: these visions promise ultimate, permanent power. The stated ambitions of America's tech oligarchs are almost comically solipsistic—endless lifespans, superhuman powers, personal hyperspeed transport. They truly imagine themselves as a superior race. And while it is unlikely that they will attain everything they imagine, it is unfortunately true that this hyper-elite class will reap the benefits of any new technologies society develops, while the costs will fall, as ever, on the rest of us. This will not be a situation without precedent. It's exactly how things were with the rotten kings of yore. But if history teaches us one thing, it's that complex problems often have simple solutions: Off with their heads.

In the twentieth century, industrial civilization depended on the 'barbarians' for cheap labour, raw materials and markets. Therefore it conquered and absorbed them. But in the twenty-first century, a post-industrial civilization relying on AI, bioengineering, and nanotechnology might be far more self-contained and self-sustaining.

If so, Ayn Rand's paradise will have been created while we bickered over scraps and pronouns.

Part V
It's a Trap!

Many's the hour I've lain by my window
And thought of the people who've carried the burdens
Who marched in the strange fields in search of an answer
And ended their journeys an unwilling hero

So, here's a song to those who are gone with never a reason why
And a toast of the wine at the end of the line
And a toll of the bell for the next one to die

Back in the coal fields of old Harlan county
Some talked of a union, some talked of good wages
And they lined them up in the dark of the forests
And shot them down without asking no questions

So, here's a song to those who are gone with never a reason why
And a toast of the wine to the end of the line
And a toll of the bell for the next one to die

And over the ocean, to the red Spanish soil
Came the Lincoln brigade with their dreams of a victory
But they fell in the fire of Germany's bombings
And they fell 'cause nobody would hear their sad warning

So, here's a song to those who are gone with never a reason why
And a toast of the wine at the end of the line
And a toll of the bell for the next one to die

In old Alabama, in old Mississippi
Two states of the union so often found guilty
They came on the buses, they came on the marches
And they lay in the jails or they fell by the highways

So, here's a song to those who are gone with never a reason why
And a toast of the wine at the end of the line
And a toll of the bell for the next one to die

The state it was Texas, the town it was Dallas
In the flash of a rifle a life was soon over
And nobody thought of the past million murders
And the long list of ironies had found a new champion

So, here's a song to those who are gone with never a reason why
And a toast of the wine at the end of the line
And a toll of the bell for the next one to die

Chapter Forty-five

Divide & Conquer

Which Noun Are You?

“I imagine that one of the reasons people cling to their hates so stubbornly is because they sense, once hate is gone, that they will be forced to deal with pain.”

No man is an island,
Entire of itself,
Every man is a piece of the continent,
A part of the main.
If a clod be washed away by the sea,
Europe is the less.
As well as if a promontory were.
As well as if a manor of thy friend's
Or of thine own were:
Any man's death diminishes me,
Because I am involved in mankind,
And therefore never send to know for whom the bell tolls;
It tolls for thee.

Wherever you go
My love is close beside you
Wherever I go
You're with me
Whoever we are
We're never far apart
Cause we're so much a part of each other

“You think you're so clever and classless and free but you're still fucking peasants as far as I can see”

Socially Liberal, Fiscally Conservative: Those who have internalized the social values of the sixties counterculture, but have come to view the economy with the eyes of investors.

I am somehow less interested in the weight and convolutions of Einstein's brain than in the near certainty that people of equal talent have lived and died in cotton fields and sweatshops.

I'm not a pawn in some shithead's game of Risk.

Ever since the French Revolution, people throughout the world have gradually come to see both equality and individual freedom as fundamental values. Yet the two values contradict each other. Equality can be ensured only by curtailing the freedoms of those who are better off. Guaranteeing that every individual will be free to do as he wishes inevitably short-changes equality. The entire political history of the world since 1789 can be seen as a series of attempts to reconcile this contradiction.

“There is no unqualified ‘we’ at a demonstration nor anywhere else. To uncritically use ‘we’ without thinking about how different the people present truly are is to level or flatten the real differences that exist between ‘us,’ and produce a group that can only be unified on the basis of its most common features (being human, being present at that demonstration). This erases experiences and over-simplifies the problems that brought people out in the first place. This ‘we’ is not a concrete or already existing group, it is an operation performed each time it is said that erases our differences to give the impression of unity in a group.”

To get groups to form in a population of people, you need only three elements. The first is the opportunity for kindness or cruelty, situations in which two people can interact either nicely or nastily. The second is reciprocity, the technical term for paying people back. Reciprocity is when you are friendly to people who treat you nicely and unfriendly to people who treat you nastily. Over time reciprocity can make for best friends or mortal enemies. Imagine that the first time you meet someone, they compliment your clothes. This leads to a feedback cycle in which you compliment them and the two of you talk about your common interests, grab coffee, see movies together, and become lifelong friends. Conversely, imagine that the first time you meet someone, they insult your clothes. This starts a very different feedback cycle in which you insult their clothes and the two of you spread vicious rumors about each other, vandalize each other's homes, and seduce each other's spouses.

To move beyond individual friends and enemies to groups of ‘us’ and ‘them,’ we need the third element, transitivity. Transitivity means sharing your friends’ opinion of others—liking your friends’ friends and disliking your friends’ enemies. Transitivity is typically established via gossip, in which two people discuss the deeds of mutual acquaintances and align their perceptions accordingly. ‘Did you hear about Becky?’ ‘She’s so sneaky.’ ‘I hate her!’ ‘Me too!’ When transitivity doesn’t hold, awkwardness results—just try making fun of your best friend’s spouse or your spouse’s best friend.

A computer simulation in which mindless, identity-less agents interacted with reciprocity and transitivity resulted in these simple agents robustly clustered into stable groups characterized by in-group cooperation and out-group cruelty. Of course, the agents in our computer simulations are far less sophisticated than real people, but that’s the point. If simple computer agents inevitably cluster into groups, there is no doubt that real humans—with entrenched identities, races, and religions—will also form groups. There seems to be no avoiding ‘us’ and ‘them,’ but some group landscapes encourage more ruthlessness than others. Competition for resources is the catalyst that turns ‘them’ into ‘enemies’ and transforms dislike into cruelty. In the land of plenty there is no need to fight, but when resources are tight, competition becomes a matter of survival—and it’s easier to win if you have a group backing you up.

The link between resource competition and intergroup hostility is neatly demonstrated by comparing chimpanzees with bonobos. Both primates are evolutionary cousins of humans, but they have very different temperaments and social structures. Chimpanzees (*Pan troglodytes*) have a male-dominated society, are quick to aggress, and form gangs that mercilessly eliminate enemies. If a male stumbles alone into enemy territory, rival chimpanzees will attack with overwhelming force, often ripping off his face and testicles (so he won’t have any vengeful heirs). Chimpanzees will also cannibalize the babies of rivals and have been known to bite off the fingers of humans who study them.

In contrast to the male-dominated chimpanzees, bonobos (*Pan paniscus*) are female dominated and solve problems with sex instead of violence. In fact, they have sex all the time, not only standard female-with-male but also other combinations. Female-with-female genital-on-genital rubbing is a popular way to cement power alliances and demonstrate bonds of friendship and is certainly more exciting than meeting for coffee. Of course, bonobos still have conflicts and will sometimes act violently, but much less so than chimpanzees; they’d much rather scissor.

The difference between these two species lies in resource competition across evolutionary history. Chimps live on the north side of the Congo

River, a territory shared with gorillas, which eat much of the same food. Bonobos live on the south side of the Congo River, without gorillas and therefore with less competition for food. The perennial dearth of food on the north side compels chimpanzees to band together in ruthless gangs, fighting for the meager remaining resources. The abundance of food on the south side allows bonobos to instead spend their days indulging their insatiable nymphomania.

Societies are finite games, games that introduce goals, rules, constraints on behavior, and provide a scoring system. They are among the games we engage in so completely that we forget participation is optional, and the rules arbitrary. Most fully formed societies attach their rules to six instinctively used pillars of ethical behavior, each a thematic set of constraints that participants in the society must follow (or flaunt). Durable societies use these constraints to reinforce boundaries between societal insiders and outsiders.

Regarding the question: ‘What works?’ we might reply: For whom? To what end? On the basis of which guiding principles?

The Davos man idea is that they are just applying natural law, or science, or something similar, so if you oppose them you are against physics, or math, or geology instead of disagreeing with rules made by humans. And the funny thing about the rules of humans is that the rules almost always benefit the humans making the rules while those rule-makers claim they benefit all humans.

I will give you a talisman. Whenever you are in doubt, or when the self becomes too much with you, apply the following test. Recall the face of the poorest and the weakest man or woman whom you may have seen, and ask yourself if the step you contemplate is going to be of any use to him or her. Will he or she gain anything by it? Will it restore a control over his or her own life and destiny? In other words, will it lead to aid and autonomy for the hungry and spiritually starving millions? Then you will find your doubts and your self melt away.

Some of the most viscerally anti-Sanders, pro-Establishment, Hamilton-loving types I’ve argued with lately aren’t doing so well. They’re IT support workers; low level administrators; dropouts from various lowly ranked PhD programmes. But they love anti-socialist progressivism with a desperate passion, even though it’s doing nothing to serve their interests.

Instead of the front row kid, I’d like to posit the category of the ‘B+ average graduate.’ Now, anyone familiar with a marking grid knows that you award top marks to students who demonstrate some degree of independent thought, who go beyond the course material and lecture notes to produce something original and unasked for. They realize intuitively that what’s

being offered to them is only one interpretation. They know they're playing with arbitrary language games and they bend them, play with them, see beyond them to other possibilities. These are—in an ideal world—the students you'd want to see coming through into graduate programmes. They're few and far between.

The B+ student, though, sees none of these outside possibilities. For her, the rules of the game laid down by the professor constitute the full set of rules for the entire physical universe. She is quite good at applying them in a formulaic kind of way, but she never asks herself why, or if there might be a better set of rules out there somewhere. No, the lessons of college—and that particular set of courses at that particular college—are universal, simply “reality.” The B+ average student is loyal, passionate, and hardworking, but lacks any sense of perspective or context. She is formal; idealistic in the worst sense of the term.

But she *loves* school. A PhD and an academic career are her dream, her passion. She cannot understand why her professors are distant and lukewarm towards her. She applies the rules so well! So she signs up for some second-tier grad school and ultimately drops out—for impeccable reasons, of course. She finds a non-academic university job. IT support maybe, or booking seminar rooms and organizing events for other, “luckier” people. She is still living the life of the mind, isn't she? In the evenings, on the Internet, she deploys the language and the rules she learned during those, the best years of her life. It's so easy to diagnose people as white supremacists, racists, and transphobes from what they say on Twitter. Close reading! Critique! We learned it in college! Here's my hot take on your 114 characters based on my misunderstanding of Foucault!

These, I fear, are some of the most committed. They're credentialed, sure, but those credentials aren't doing anything for them. Despite having been screwed over, they *love* and are devoted to the institutions that issued them. They cannot understand why their tepid and unoriginal critiques do not win them universal praise and overwhelming political victory. Was it not the case that they applied the rules of the game impeccably? What else could they possibly have done?

There is a belief that a person of a particular identity is necessarily an unquestioned authority on issues pertaining to that identity. I don't think that principle can be held consistently though, because of what we might call the ‘Meghan McCain problem’: If I can't have an argument with Meghan McCain on what's good for women, then left principles cease to exist and we must solely defer to the opinions of those with particular identities, even if those opinions are reactionary or bizarre. There's a sensible compromise position here, though, which is that you should listen empathetically to

people about what it's like to be a member of their identity group, but identity is not a trump card that can override principled concerns.

Why couldn't somebody who is black know what it is like to be white and vice versa? Or someone who is homosexual know what it is like to be heterosexual and vice versa? If you are of a particular identity you may be more motivated to inform yourself about what it is like to be that identity than somebody who isn't, but that is not inevitably the case. And motivation alone doesn't guarantee achievement. If you are of a particular identity, it may give you access to knowledge that a person who is not of that identity would find it more difficult to obtain, but access to knowledge—even experiential knowledge—relevant to a particular identity is by no means restricted to people of that identity. Then there the question of how you make use of that knowledge. Once a truth claim has been constructed, it stands or falls on its own merits, irrespective of the person making it. If I were to put together an argument about some aspect of man-ness and pass it on to a woman to deliver on my behalf it would make no difference to the strength or weakness of my case. The identity of the person making the argument doesn't add some magical extra ingredient.

It is hard to see how having a particular identity confers special legitimacy and authority over the truth claims a person may make on matters relevant to that identity. It certainly can't be used as a basis to claim a veto over the voices of others. Personally, I have no idea what it's like to be a man, as strange as that may sound. Is it that I look down at my dick and don't go 'Ewww, gross'? Do I need to look down and go, 'Damn! That's one fine-looking meat-stick'? Do I have to name it Reginald?

Hell, I'm not even certain I know what it's like to be me.

So practical politics, which has led to such marginal gains while allowing the already privileged people—along with a few Tokens—to continue accumulating vast amounts of wealth, continuing to oppress others, is the one that cares about the black experience? You know there's black people not in the USA, right? Lots of other shades too. And your practical politics blows them up, lets them starve, cripples their countries' economies.

But obviously I just believe the above because I'm an ignorant light-skinned person. Yep, identity politics doesn't make us split into small warring tribes, nosir.

Capitalism encourages turning things into money. Black bodies are things—white bodies too—whether they're making profit on a plantation or a prison. Capitalism encourages the destruction of communities, further hindering the effort to claw oneself out of hardship or even see others as equals. Also basically covers “free trade,” banking issues, and corporate power under its umbrella.

And, your precious Supreme Court has a bit of a dark history when it comes to standing up for black people, you may want to look into that. Also has some dark history for the poor in general, but of course some of those poor would be white, so I imagine that's not as important.

You are correct that comfortable, privileged people are often reluctant to sacrifice privilege so that others may have more. That is the problem, not some outlandish claim that one cannot "know" enough of another's experience.

Evolution has made *Homo sapiens*, like other social mammals, a xenophobic creature. *Sapiens* instinctively divide humanity into two parts, 'we' and 'they.' We are people like you and me, who share our language, religion, and customs. We are all responsible for each other, but not responsible for them. We were always distinct from them, and owe them nothing. We don't want to see any of them in our territory, and we don't care an iota what happens in their territory. They are barely even human.

"The power of the racial epithets is in this 'othering,' and the reason they are used freely within the group is because there is pride and solidarity in being a special 'othered' group. It is affirming to talk about your special nature. It strengthens the team bonds. It is dangerous to allow others to talk of it, in their mouths it is the permission slip they will use to kill you and yours."

Tribalism is the root of nearly all racism, nepotism, ethnic violence, and societal division. Loyalty to some is betrayal to all. I don't identify myself with any group, especially one so large that I could never hope to meet even 0.1% of its members. If some people choose to arbitrarily self-identify themselves into a predefined clan claiming insurmountable cultural and racial differences to others then they deserve scorn from every rational person who choose rather to measure people by their character and actions, not by superstitious traditions and nebulous ancestry.

The idea that identity politics is part of traditional left-wing thought is promoted by the right who seek to demonize left-wing movements; liberals who seek to infiltrate, backstab, and destroy said left-wing movements; and misguided young radicals who know nothing about political theory and have neither the patience nor discipline to learn. The last group seek a cheap thrill that makes them feel as if they have shaken the foundations of the establishment when in reality they strengthen it.

On the campaign trail, Clinton mocked her opponent's "Trumped-up trickle-down economics," but her own philosophy was what we might call

‘trickle-down identity politics’—tweak the system just enough to change the genders, colors, and sexual orientation of some of the people at the top, and wait for the justice to trickle down to everyone else. And it turns out that trickle-down works about as well in the identity sphere as it does in the economic one.

Even Goldman Sachs is hopping on the woke wagon with requirements of one “diverse” person on the board before they’ll underwrite IPOs—don’t worry folks, it goes up to two in 2021! The prospect of having to change a few pronouns and getting a handful of women and minorities on the board and on television poses no real threat to the guiding profit-making principles of Wall Street. The real guilt of political correctness, identity politics, is not its supposed intolerance or rigidity, but that it is not political enough—that it is impersonating political struggle.

“The political left is technological society’s first line of defense against revolution. In fact, the left today serves as a kind of fire extinguisher that douses and quenches any nascent revolutionary movement. What do I mean by ‘the left’? If you think that racism, sexism, gay rights, animal rights, indigenous people’s rights, and ‘social justice’ in general are among the most important issues that the world currently faces, then you are a leftist as I use that term. If you don’t like this application of the word ‘leftist,’ then you are free to designate the people I’m referring to by some other term. But, whatever you call them, the people who extinguish revolutionary movements are the people who are drawn indiscriminately to causes: racism, sexism, gay rights, animal rights, the environment, poverty, sweatshops, neocolonialism it’s all the same to them. These people constitute a subculture that has been labeled ‘the adversary culture.’ Whenever a movement of resistance begins to emerge, these leftists (or whatever you choose to call them) come swarming to it like flies to honey until they outnumber the original members of the movement, take it over, and turn it into just another leftist faction, thereby emasculating it. The history of ‘Earth First!’ provides an elegant example of this process.”

—Theodore J. Kaczynski

Opportunities to rise are no substitute for a general diffusion of the means of civilization, of the dignity and culture that are needed by all whether they rise or not. Social mobility does not undermine the influence of elites; if anything, it helps to solidify their influence by supporting the

illusion that it rests solely on merit. It merely strengthens the likelihood that elites will exercise power irresponsibly, precisely because they recognize so few obligations to their predecessors or to the communities they profess to lead. Their lack of gratitude disqualifies meritocratic elites from the burden of leadership, and in any case, they are less interested in leadership than in escaping from the common lot—the very definition of meritocratic success.

The new managerial and professional elites have a heavy investment in the notion of social mobility—the only kind of equality they understand. They would like to believe that Americans have always equated opportunity with upward mobility, that the opportunity for social mobility for everyone is the very fabric of the “American Dream.” But a careful look at the historical record shows that the promise of American life came to be identified with social mobility only when more hopeful interpretations of opportunity had begun to fade, that the concept of social mobility embodies a fairly recent and sadly impoverished understanding of the “American Dream,” and that its ascendancy, in our own time, measures the recession of the dream and not its fulfillment.

Gay rights benefited in many ways from market forces. There was a highly educated and increasingly vocal gay and lesbian talent pool that companies were eager to engage. So they optimized their models to attract them. But they did this with the focus on the bottom line. Fairness, in most cases, was a byproduct. At the same time, businesses across the country were starting to zero in on wealthy LGB consumers, offering cruises, happy hours, and gay-themed TV shows. While inclusiveness no doubt caused grumbling in some pockets of intolerance, it also paid rich dividends.

Dave Chappelle used the analogy of a car trip shared by passengers G, L, T, and B. The Gs are driving, with the Ls in the passenger seat. The Ts are in the back. “Everyone in the car resents the Ts,” Chappelle says. “The Ts are making the trip take longer.” Trans comedians and activists, who’ve become accustomed to pride of place in the intersectionalist hierarchy, were up in arms. But Chappelle made it abundantly clear that he had no animus toward anyone in the LGB and transgender community: The target of his satire was not any one group, but the increasingly ridiculous conceit that all of these “alphabet people” are happy fellow travelers. LGB rights and T activism have been revealed to be unnatural bedfellows, and it’s inevitable that, as is happening in Britain, they will go their separate ways.

Gays, lesbians, and bisexuals all have something obvious in common: same-sex attraction. This is an alternative sexual orientation that, to some extent at least, shapes their experiences and alters their life outcomes. They typically identify with their biological sex—and in fact, sometimes have spent many years feeling trapped by it. To be gay is to understand that

sex is set at birth. Their sexual attraction, likewise, is based on hard-wired factors beyond their control.

Transgenderism is a separate concept. While homosexuality leads to obvious differences in real-life behavior, transgenderism offers a categorical redefinition of what it means to be a man or a woman. A “gender identity” is a quasi-spiritual concept—almost like a soul—that is something between an internal essence, knowable only to its possessor, and stereotypically masculine or feminine appearance and behavior.

Gay rights activists simply want society to accept their different ways of living and loving—since gay men and lesbians pursue romantic interests and build families in ways that are at odds with conventional heterosexual expectations. Followers of radical gender theory, on the other hand, demand that we all reject our basic understanding of biological sex in favor of a recently conceptualized abstract notion of human identity.

Of course, the idea of transgenderism per se isn’t new—nor is the (perfectly valid and just) demand that people with gender dysphoria be treated with decency and respect. But the original form of this demand was based on the far more reasonable idea that gender is a social construct distinct from biological sex. It was not disputed that a transgender woman is a biologically male human who identifies with the social norms traditionally associated with woman. But in recent years, transgender activists have demanded that sex and gender be conflated, and that the very idea of innate biological differences be pushed into the background. At the most absurd extreme, there are now athletes and scholars who seriously suggest that being male offers no competitive physical advantages over being female, a proposition that even small children know to be unhinged.

One of the unsettling elements embedded within this advocacy is the demand that women—lesbians, more specifically—make themselves sexually available to trans women, on the far-fetched theory that gender identity, not sex, is the real source of human attraction.

“Did you see what happened there? Same-sex attraction has become same-gender attraction. This might seem academic. But take a moment to reflect on what it means in the context of Stonewall’s affirmation of gender identity. Stonewall is asserting that lesbians are attracted to anyone with a female gender identity, whether that person is biologically male or female. This turns gay and lesbian desire into transphobia. I’m a gay man—I’m attracted to male bodies—not people performing male gender roles. And, yes, that means I like male genitalia. (I really like it). Trans activists argue that my sex-focused homosexuality is trans-

phobic. I've seen trans activists compare non-trans-inclusive gay desire to racism and describe gay sexuality as 'genital hang-ups.'"

What moral does identity politics offer?

It is a class politics, the politics of the left-wing of neoliberalism. It is the expression and active agency of a political order and moral economy in which capitalist market forces are treated as unassailable nature. An integral element of that moral economy is displacement of the critique of the discriminatory outcomes produced by capitalist class power onto categories of identity that sort us into groups supposedly defined by what we essentially are rather than what we do. Within that moral economy a society in which 1% of the population controlled 90% of the resources could be just, provided that roughly 12% of the 1% were black, 12% were Latino, 50% were women, and whatever the appropriate proportions were LGB and T people. It would be tough to imagine a normative ideal that expresses more unambiguously the social position of people who consider themselves candidates for inclusion in—or at least significant staff positions in service to—the ruling class.

This perspective may help explain why, the more aggressively and openly capitalist class power destroys and marketizes every shred of social protection working people of all races, genders, and sexual orientations have fought for and won over the last century, the louder and more insistent are the demands from the identitarian left that we focus our attention on statistical disparities and episodic outrages that “prove” that the crucial injustices in the society should be understood in the language of identity.

Representative democracy is designed not to care about individual rights but to care about what noun each person can identify with and how strong is the lobby group associated with that noun. Representative democracy is divisive, ineffectual, and based on impossible principles.

If an individual represents a group we must ask who will have the right to represent the group? What will they be allowed to say? What will the wording be? If any member of the group disagrees, if any word is not approved, then the person speaking for the group is no longer representing the group. That person is now speaking as an individual with words unfairly weighted by group affiliation. The individuals in the represented group who allowed this are equally guilty of misrepresenting themselves as being part of a voice they failed to approve. An individual speaking for a group is a dishonest mask for an unfairly weighted individual voice in almost every circumstance.

Representative democracy is the most dishonest oligarchy of all as it insists on the falsehood that the voice of its oligarchs is the voice of the people and the subsequent falsehood that their rule is rule by the people.

Democracies have not eradicated oligarchy, they have driven it to secrecy, a state of affairs ironically most abhorrent in a democracy. Instead of confronting the problems inherent in an oligarchy, democracy denies it exists while practicing it openly. Oligarchy is not necessary, but it can only be overcome in a completely open and transparent system which allows the most widespread participation by all and knowledge for all and recognizes and accommodates expertise and greater levels of knowledge.

Communist states have failed for the same reasons, by denying and pretending to eradicate elitism instead of acknowledging it and using it to the advantage of society.

If we compare the natural duties of a Father with those of a King, we find them to be all one, with no difference at all except in their latitude or extent. As the Father over one family, so the King, as Father over many families, extends his care to preserve, feed, clothe, instruct, and defend the whole commonwealth.

Lately it has become common to equate patriarchy with oppression of women by men. Patriarchy is simply oppression—of women and men—by a class structure that infantilizes those at the bottom and burdens those at the top. It was not women who overthrew the patriarchy in Europe, it was men. While women fought alongside men, it was men who designed the future structure of society, summed up in the cry for ‘Liberté! Egalité! Fraternité!’ The cry for liberty was a cry for freedom of men, both freedom from subjection by a patriarchal ruler and freedom from responsibility for all of society.

The responsibility and isolation of men in a patriarchal society was frequently empty and unrewarding. The call for fraternity was a call for brotherhood, for a society of equals who would meet without demanding anything of each other. Since that call, libertarian men have fought for their independence from responsibility to society and insisted that the principle of equality means all are equally able to care for themselves.

Most industrialized communities are no longer patriarchal. They are nearly all fraternal. The fraternity denies responsibility to society and in return receives no approval from society. Approval from others is the life force for humanity, our single greatest motivator. Life without approval is an empty shell.

“I think every strong woman in history has had to walk down a similar path, and I think it’s the strength that causes the confusion and the fear. Why is she strong? Where does she get it from? Where is she taking it? Where is she going to use it? Why do the public still support her?”

In JRR Tolkien's Middle Earth, elves are an immortal race of staggering beauty, deep wisdom, rich culture, and advanced magical propensity. The elves often find themselves at odds with the orcs, a hideous race who live for violence and destruction. In Tolkien's *The Silmarillion*, it is revealed that orcs were actually the creation of an evil lord named Melkor, later known as Morgoth, who captured a group of elves and imprisoned them. The elves, "by slow arts of cruelty were corrupted and enslaved; and thus did Melkor breed the hideous race of the Orcs in envy and mockery of the Elves, of whom they were afterwards the bitterest foes."

I always think of this when I see trends in our society which began as healthy and good impulses, but which over time became twisted and warped by egotism and manipulation. Something springs up in human consciousness out of inspiration and natural compassion, quickly gains public support because truth is attractive, and then is eventually hijacked and perverted as power finds a way to twist that energy in a way it can use and exploit. It becomes 'orc-ified.'

You can see examples of this orcification spring up everywhere in real time. You can watch it in yourself as your own ego tries to hijack your own healthy impulses to aggrandize and masturbate itself, and you can watch them in society at large as well. A recent and extremely blatant example would be when the enthusiastic grassroots populism of the Bernie Sanders campaign was twisted by the Democratic establishment into the #Resistance movement after the 2016 election. Now many of the progressives who once were sincerely pushing away from oligarchy and endless war can be seen smearing Julian Assange and cheerleading for new cold war escalations with their support for the CIA/CNN Russia narrative.

Other examples abound. America's brilliant civil rights activism has been largely co-opted by the good cop/bad cop game of partisan dynamics which now sees Black Americans supporting a party that does absolutely nothing to protect them from police brutality, economic hardship, a depraved legal system, for no other reason than that the Republicans are even crueler to them than the Democrats are. On the other side of the aisle, healthy impulses to minimize government intrusiveness and corruption have been used by manipulators like the Kochs—one down, one to go—under the banner of libertarianism to strip corporations of their regulations without ever diminishing government size or corporatist influence upon it, effectively leaving only end-stage neoliberalism and rush-upward economics. The healthy impulse toward truth is orcified to manufacture support for internet censorship under the pretense of protecting the public from "fake news" and "Russian propaganda," the healthy impulse to protect and defend is orcified into support for "humanitarian" war and "public health protection

measures,” and the healthy impulse to become a better person is orificed into religions and philosophies which have been popularized by the powerful in the service of the powerful.

Anywhere you see a healthy impulse arising in society, you will see attempts to twist it into the service of power, and this is very much the case with feminism.

Very recently in the grand scheme of things, a healthy impulse emerged among women to cease being second-class citizens, and to instead stand as equals with their brothers.

In response, after much whining and foot-dragging, the few men who ran things said in effect, ‘Right. Okay. You want equality? Fine. The jobs we invented are over there, the capitol building for the government we invented is over there, the bank for the economic system we invented is across the street, the Department of War is two blocks that way, and the Church of the Patriarchal God is around the corner. Welcome to equality!’ And some rich guys standing by watching leaned in and whispered to each other, ‘Sweet, double the workforce! We can halve their wages!’

And that natural, healthy impulse toward true equality became quickly orificed. ‘Equality’ now looks like women working full time to keep their heads above water in an economic system designed by monsters and fools while still being expected to raise healthy children, and ‘feminism’ looks like fighting men for a few more scraps from the oligarchic table while voting to elect women to the oppressive, elite-serving government. It is an energetic funnel into a system which was not built with any interest in non-wealthy men or women’s struggles.

True feminism is about picking apart that entire system. Fake feminism is about bolstering and feeding into it. True feminism values motherhood and care-giving roles, not just with empty ‘Gosh, yeah, hardest job in the world’ words and a pat on the back now and then, but with the same valuing system which rewards industriousness and other “masculine” accomplishments; in the current system that would mean receiving an equal amount of money for that work instead of having to rely on the hopefully charitable inclinations of a husband. Fake feminism encourages women to take on jobs that are valued by the elite mindset and perform the full-time task of mothering in their spare time—for free, because the herculean job of motherhood “is its own reward.”

True feminism questions the very nature of the governmental systems which were designed hundreds of years ago by men who owned wives and others as functional property, and takes seriously the goal of removing all toxic dynamics from within them. Fake feminism endorses those governmental systems and teaches that the most feminist thing anyone can do is elect

women like Hillary Clinton, Elizabeth Warren, Tulsi Gabbard, who have clawed their way to the top by their facilitation of war, crony capitalism, and rape culture.

True feminism aggressively attacks the cultural mind viruses which say that ‘no’ sometimes means ‘yes,’ that a wife must perform sexually for her husband, that it’s okay to manipulate or guilt a woman into sex, that women ought to be subservient and humble, that it’s okay to harm a woman if she steps out of line. Fake feminism only touches on those things when it is politically advantageous and can be used as a weapon to attack rival ideological factions.

True feminism works to untangle all the toxic, pernicious knots in social consciousness one by one, leaving no norm unquestioned and no default assumption untested, since the reality of oppression is interwoven throughout every single aspect of society without exception. Fake feminism leaves all the default settings in place, then adds on a few cosmetic accessories like equal pay for equal wage slave work.

True feminism is as deeply revolutionary as anything can be, since its realization necessarily means a complete revision of society from the ground up in order to allow all to be truly heard in our culture. Fake feminism gives you a pussy hat, a twenty-three cent raise, and an ‘I Voted’ sticker.

“Yes, Ludlow was guilty—though not of what the university charged him with. His crime was thinking that women over the age of consent have sexual agency, which has lately become a heretical view, despite once being a crucial feminist position. Of course the community had to expel him. That’s what you do with heretics. Still, the history of purification rituals is a pretty squalid one. Heading down this path once again requires a lot of historical amnesia from everyone involved. That college campuses should be where history goes to be forgotten is depressing on all levels, not least when it comes to the future of higher education—and freedoms of every stripe.”

Since roughly 1992–93 other violent crime rates have plummeted, and there is zero reason to suspect that rape or sexual assault on campus would be different than what we see with other types of violence. There is also no evidence that rates of non-reporting have gone up over time. Someone might argue that violence that happens primarily to women follows a different pattern but intimate partner violence (also committed primarily against women) has followed the same pattern of decline since the early 1990s. The question becomes whether, as with off-campus crime, sexual assault as

traditionally defined may have actually gone down, while what counts as sexual assault keeps expanding.

Acclimating to these new realities sometimes feels like being a twenty-first-century Gulliver, that is, if Gulliver had awoken to find himself shipwrecked on an atoll of sanctimony where bureaucracy had supplanted education, and slogans have replaced thinking.

The injustice is in the word ‘assaulting.’ The term ‘sexual assault’ is so vague and slippery that it facilitates accusation inflation: taking claims that someone did X and leading people to think of it as Y, which is much worse than X. In many jurisdictions, sexual assault has grown to include unwanted groping and unwanted kissing:

Nunavut, Canada: “Sexual assault is a crime. It includes unwanted touching, kissing, grabbing, and rape.”

Canada: “Sexual assault is an act of violence committed by a person in order to feel power over another person. It can come in different forms such as sexual touching of any kind that is unwanted or coerced, including kissing or groping.”

Australia: “Sexual assault may or may not begin with sexual harassment. It involves unwanted physical contact such as kissing, touching, fondling, and grabbing and at its worst, culminates in rape, either digital or genital.”

In the United States feminists are continuously pushing for a definition of sexual assault that includes kissing. The chief public affairs officer at National Sexual Violence Resource Centre, explains that any type of unwanted groping, touching, or kissing is certainly in the definition of sexual assault:

“It is absolutely on the continuum of sexual violence. There are a lot of different ways that people can be sexually violated and exploited that don’t need to require any physical contact, let alone sexual penetration. Sexually violent acts fall along a continuum that go from no contact to very brutal physical violations such as rape or sexual homicides. And we absolutely include any unwanted touching, kissing, and groping on that continuum.”

Words can certainly change meaning, no one is arguing that. But with these particular issues, it is quite obvious that this is being used to further agendas, to conjure heavily emotional images in one’s mind.

And it helps almost no one.

“As anthropologists have observed in cultures around the world, people who think themselves bewitched are vulnerable to all manner of mischance. They blunder into ‘accidents’; they lose their effectiveness in work and social relations; at least occasionally they sicken and die.”

My question is the extent to which this sense of vulnerability is learned on campus. The new campus codes don’t just enforce disabling myths and fantasies about power, they also produce a new host of pathologies around power. A student trying to get a professor fired over a joke or some other passing offense is someone who utterly and callously misunderstands the consequences of leaving someone else (often with dependents to support) jobless; and someone who has, in fact, seized power while hiding behind the fiction of powerlessness.

Every culture has its whirlpools of callousness, of cruelty. A description of the Saudi legal system:

“Justice is often situational; the law is what a person in a position of power decides it is.”

It sounds uncomfortably close to life on American campuses at the moment.

Sure, there have always been ideologues on campuses, but the old ideologues were at least expected to argue the validity of their ideas. The new brand are ideologues of feelings, and feelings can’t be argued. I just don’t believe that experience or identity credentialize you intellectually. In fact, it’s usually the opposite: overvaluing subjectivity has a way of stunting intellectual growth, especially when it comes to ideas that threaten your self-coherence, which the best ideas often do. The latest demands for intellectual conformity may come in progressive packaging, but feminists and leftists should be flinging these pieties away like lumps of dung, not kowtowing to the virtue parade.

To expect a drunken college guy to have more self-coherence than you’re willing to have yourself, in the face of all prior evidence to the contrary, is to treat yourself rather nonchalantly. Not that we don’t all want the world to be different from how it is! No one’s saying women get assaulted because they pass out in dicey locales: I fully believe that women should be able to pass out wherever they want—naked, even—and be inviolable. One hopes such social conditions someday arrive. The issue is that acting as if things were different from how they are isn’t, thus far, working out.

Alcohol is an intensifier; it intensifies acting out. Increased male aggressiveness when drinking is inarguably a factor in what's known as rape culture. Men drink and act out stereotypical versions of masculinity, especially men in groups—namely, frat guys and athletes. Men drink because, as one student puts it:

“What you do when you're drunk isn't really you.”

You don't have to take responsibility for it: 'It was the booze, not me.' And of course guys like to drink because the more alcohol you've drunk, the more into you girls seem. Translation: it helps them combat their insecurities about sex. And what about the other side of the gender divide? Is it possible that it's not men alone for whom “gender progress” has been a little superficial? Drinking may be a way of shedding inhibitions, but if we can't also talk about the ways that drinking increases tendencies for stereotypical female behavior, too—namely, female passivity—then we're being gender hypocrites. The pattern, in other words, when it comes to heterosexual sex, is college-age men and women getting bombed and acting out the respective gender extremes: men as aggressors, as predators; women as passive, as objects—because what's more passive than a woman in a drunken stupor or unconscious on the bathroom floor?

Men coercing sex from women may be standard procedure on the normal heterosexuality spectrum, but so is the tendency for women to overvalue men and male attention in ways that make them stupid and self-abnegating. And I don't believe for a second that the supposed sexual equity of campus hookup culture has changed anything on this front, despite the window dressing of mutuality. My point is this: Heterosexual arrangements are a pact that includes men and women both—male and female desires, male and female pathologies. Gender is a system: male aggression and female passivity are both social pathologies that are, to varying degrees, normalized. Changing any element (including reducing female passivity) is going to alter the dynamics of the system. Yes, aggressively disposed men forcing sex on passively inclined women is routine in our culture. But if women can't be taught to protect themselves against such normalcy because men should stop assaulting women, and because learning to defend yourself means capitulating to rape culture—well, here you begin to see the two-way nature of the current social pathology.

Women want to have sexual adventures and make mistakes, but there's a growing tendency, at the moment, to offload the responsibility, to make other people pay for those mistakes—namely, guys. Women don't drink; men get them drunk. Women don't have sex; sex is done to them. This

isn't feminism, it's a return to the most traditional conceptions of female sexuality. What dimwitted sort of feminism wants to shelter women from the richness of their own mistakes? Their own ambivalences? How do such protections prepare students to deal with the sexual messiness and boorish badlands of life post-graduation, when code-wielding bureaucrats aren't on standby?

Male lions can be monsters, murderous and focused. Toxic, if you will. Given the opportunity, male lions will kill the kittens in a pride over which they have gained control. They commit infanticide, which brings the new mothers, freshly childless, back into estrous. The females are quickly impregnated. This, we can all agree, is disturbing behavior, and may make some people feel rather less pleased with lions. Given the opportunity, the vast majority of modern human males would do no such thing.

Those who argue that men are inherently toxic are, ironically, making arguments that are biologically essentialist. And they are making them badly, at that. Evolution built humans, as it did lions. But humans have longer childhoods and greater generational overlap, share more ideas with greater complexity, and usually live in more stable social groups than do lions. In humans, evolution has given us the capacity to shape personality during development to a greater degree than in any other species. As such, and because few human cultures would tolerate such behavior, the vast majority of men would not and could not kill babies, nor rape their grieving mothers for the same reasons lions do.

Over 30 years ago, I came of age as a female in Los Angeles. Being a young woman in LA means being watched—watched for deviations from the norm, for indications of future fame, for signs of weakness. Watched simply for how one looks. There are, unfortunately, many examples, recent and not, that point to LA's most famous industry being a place where young women need to be on guard. I never aspired to the industry, but even just living in LA, the culture is omnipresent.

Two anecdotes should suffice. Walking alone in my sun-kissed west LA neighborhood one summer, I was approached by a man looking for extras for a beach scene in a movie. Before I had said a word, he told me where to go, how much I would be paid per day, and what would be expected of me: that I stand around in a bikini, among others similarly clad. I told him I was going to college. He literally looked me up and down, adopted a frown, and assured me that I did not need to go to college. Beach scenes were my future, and from there—who can say? Better beach scenes, presumably.

Second anecdote: One of my many part-time jobs in high school, along with scooping ice cream and renting out VHS tapes, was staffing high end catering events. Dressed in classic, tailored black and white, I carried platters

of hors d'oeuvres around during cocktail hour, and ferried plated entrees during table service. At indoor events, male attendees would often stop me to engage in small talk, and ask for my number. I wished that they wouldn't, but I felt no risk. One night, though, I worked an event on the backlot of Universal Studios. A group unaffiliated with Hollywood had booked it for a no-expenses-spared fete, and I was to do the usual, except that I would have to cover more ground. The kitchen was further away, the guests more spread out, with no walls to contain them. Before table service, my co-workers and I made the rounds with our platters of bruschetta and cured meats. On this Hollywood backlot, though, the lack of walls proved dangerous. A young man—older than me but younger than 30—maneuvered me away from the crowd. There were many shadows, and he stood too close. He looked at me with predatory eyes. He backed me into a hedge, rubbed up against me. And I got away from him before it went any further.

That was toxic masculinity, before the phrase existed.

Yes, toxic masculinity exists. But the use of the term has been weaponized. It is being hurled without care at every man. When it emerged, its use seemed merely imprecise—in many groups of people, there's some guy waiting for an opportunity to fondle a woman's ass without her consent, put his hand where he shouldn't, right? That's who was being outed as toxic. Those men—and far, far worse—do exist. Obviously. But wait—does every human assemblage contain such men? It does not. This term, toxic masculinity, is being wielded indiscriminately, and with force. We are not talking imprecision now, we are talking thoroughgoing inaccuracy.

Most men are not toxic. Their maleness does not make them toxic, any more than one's 'whiteness' makes one racist. Assume for the moment that we could agree on terms: Is maleness more highly correlated with toxic masculinity than is femaleness? Yes. *Ipsa facto*—the term is about maleness, so men will display more of it than will women. The logical leap is then concluding that all men are toxic. The very communities where 'toxic masculinity' is being discussed most are the communities where the men are, in my experience, compassionate, egalitarian, and not at all toxic.

Calling good men toxic does everyone a deep disservice. Everyone except those who seek empowerment through victim narratives. For the record: I am not suggesting that actual victims do not exist, nor that they do not deserve full emotional, physical, legal, medical, and other support. I also do not want to minimize the fact that most women, perhaps even all, have experienced unpleasantness from a subset of men. But not all women are victims. And even among those women who have truly suffered at the hands of men, many—most, I would hazard to guess—do not want their status in the world to be 'victim.'

All of which leads us directly to a topic not much discussed: toxic femininity. Sex and gender roles have been formed over hundreds of thousands of years in human evolution, indeed, over hundreds of millions of years in our animal lineage. Aspects of those roles are in rapid flux, but ancient truths still exist. Historical appetites and desires persist. Straight men will look at beautiful women, especially if those women are young, hot, and actively displaying. Display invites attention.

Hotness-amplifying femininity puts on a full display, advertising fertility and urgent sexuality. It invites male attention by, for instance, revealing flesh, or by painting on signals of sexual receptivity. This, I would argue, is inviting trouble. No, I did not just say that she was asking for it. I did, however, just say that she was displaying herself, and of course she was going to get looked at. The amplification of hotness is not, in and of itself, toxic, although personally, I don't respect it, and never have. Hotness fades, wisdom grows—wise young women will invest accordingly. Femininity becomes toxic when it cries foul, chastising men for responding to a provocative display.

Where we set our boundaries is a question about which reasonable people might disagree, but two bright-lines are widely agreed upon: Every woman has the right not to be touched if she does not wish to be; and coercive quid pro quo, in which sexual favors are demanded for the possibility of career advancement, getting out of a ticket, et cetera, is unacceptable. But when women doll themselves up in clothes that highlight sexually-selected anatomy, and put on make-up that hints at impending orgasm, it is toxic—yes, toxic—to demand that men do not look, do not approach, do not query.

Young women have vast sexual power. Everyone who is being honest with themselves knows this: Women in their sexual prime who are anywhere near the beauty-norms for their culture have a kind of power that nobody else has. They are also all but certain to lack the wisdom to manage it. Toxic femininity is an abuse of that power, in which hotness is maximized, and victim status is then claimed when straight men don't treat them as peers.

Creating hunger in men by actively inviting the male gaze, then demanding that men have no such hunger—that is toxic femininity. Subjugating men, emasculating them when they display strength—physical, intellectual, or other—that is toxic femininity. Insisting that men, simply by virtue of being men, are toxic, and then acting surprised as relationships between men and women become more strained—that is toxic femininity. It is a game, the benefits of which go to a few while the costs are shared by all of us.

I had a student on one of my study abroad trips who had a perennial problem with clothing. She was never wearing enough of it. She was smart, athletic, and beautiful, but also intent on advertising hotness at all moments. At a field station in a jungle in Latin America, she approached me to complain that the local men were looking at her. The rest of us were wearing field gear—a distinctly unrevealing and unsexy garb. She was in a swimsuit. “Put on more clothes,” I told her. She was aghast. She wanted me to change the men, to talk to them about where to point their eyes. Here in their home, where we were visitors, and one of the gringos had shown up nearly naked, she wanted the men to change.

For a spell before that, my job was to trek around tropical forests studying poison frogs. I was interested in their sex lives, in figuring out how they choose their mates and their territories, in how they parent, and in what that meant about the evolution of sociality more generally. My research revealed, in part, how many different ways there are to be territorial, and to be successful, in male frogs. In Madagascan poison frogs, there are multiple routes to success, both naturally and sexually selected—males can succeed, evolutionarily, by holding high-quality territories, and they can also succeed by having no territories at all (but by being rather more sneaky). Wide variance in strategy, and shifting strategies under different conditions, is well studied in animal behavior and game theory.

Given that we know this to be true in non-human animals, why would we imagine that humans are less, rather than even more, flexible? There are many ways to be female, and many ways to be male, and some of each are bad news for everyone but the individual employing them. As a social species that has become the dominant ecological force on our planet, we can and should aspire to behave in ways that are not merely selfish, not merely competitive, but also collaborative. Toxic masculinity, and toxic femininity, are inherently selfish modes, and those not employing them should be interested in seeing them eradicated.

The movement that has popularized the term ‘toxic masculinity’ shares tools and conclusions with those who see signs of ‘white supremacy’ everywhere they look. Intersectionalists have in common with one another a particular rhetorical trick: Any claim made by a member of a historically oppressed group is unquestionably true. Questioning claims is, itself, an act of oppression. This opens the door for anyone who is willing to lie to obtain power. If you cannot question claims, any claim can be made.

Thus: Racism is ubiquitous. And all men are toxic. I object—but objection is not allowed. Everyone who understands game theory knows how this game ends: Innocent people being vilified with false claims, and exposed to witch hunts. Sexual assault is real, but that does not mean that

all claims of sexual assault are honest.

It is shocking that this bears saying, but there is a world of men who are smart and compassionate and eager to have vibrant, surprising conversations with other people, both men and women. The sex-specific toxicity that I have seen, when it has been obvious, has mostly been in the other court. All men are toxic and all women victims? No. Not in my name.

“We’re all free to change our minds about whether we did or did not love a previous paramour, but when you use an institutional apparatus and federal mandates to enforce your change of mind, we’ve left the realm of the private. Now it’s a matter of public concern.”

If there are still those who deny that the Holocaust occurred, will they be persuaded by imprisoning people who express that view? On the contrary, they will be more likely to think that people are being imprisoned for expressing views that cannot be refuted by evidence and argument alone. In his classic defense of freedom of speech in *On Liberty*, John Stuart Mill wrote that if a view is not “fully, frequently, and fearlessly discussed,” it will become “a dead dogma, not a living truth.”

Freedom of speech is essential to democratic regimes, and it must include the freedom to say what everyone else believes to be false, and even what many people find offensive. We must be free to deny the existence of God, and to criticize the teachings of Jesus, Moses, Muhammad, and Buddha, as reported in texts that millions of people regard as sacred. Without that freedom, human progress will always run up against a basic roadblock.

If there is in fact a question about whether a microaggression really happened, why isn’t it called a “potential” or “alleged” microaggression? By the same token, can one be a recipient of something, the existence of which is, in any given encounter, open to question?

There seems to be a deep nostalgia, not of course for the overt brutality and dehumanization inflicted by Jim Crow and the likes of Bull Connor, but for the moral certainty those evils retrospectively allow for. In some respects, people of color may find an overt and obvious racist act easier to handle so the mind obligingly develops a crude alchemy for transmuting the ambiguous into the obvious. This alchemy is little more than a way of behaving that masquerades as a way of knowing: Act as if ambiguities were certainties, and as if vague feelings were reliable registers of fact. Act, in other words, as if complex interracial encounters—which admit of both mistakes and misunderstandings—are conscious or unconscious acts of racism exercised by a “White perpetrator.” That will indeed make things easier to handle.

But such ease of handling is the product of presumption and simplification. It would be as if a marriage counselor approached every new couple having decided in advance that the complaints or suspicions of the shorter partner, or the male partner, or the minority partner, were necessarily legitimate, and that the other spouse's objections, prejudged as 'defensive,' were evidence of guilt. Moreover, because these objections would—in the pseudo-technical jargon so favored by these folks—"invalidate" the "experiential reality" of the other partner (offer a different point of view), they would constitute yet another offense. Would anyone expect marital relations to improve under the counselor's supervision? Would anyone even hire such a counselor?

By exalting "experiential reality" and "impact," administrators portray students as pure receptors whose reactions are unmediated by expectation, projection, or choice. Hence the language of triggering, which converts students into objects for the sake of rendering their reactions "objective," and by extension valid: a student's triggered response is no more to be questioned than an apple's falling downward or a spark's flying upward.

Administrators talk not just about social justice "training" but also about social justice "literacy." What does that mean? It was explained in an article from 2009. Formatted like a textbook, the article contains highlight boxes and sidebars which detail the terminology of "social-justice studies" with the crisp confidence one would expect from a handbook on Windows 10 or residential wiring. Racism is defined as "white racial and cultural prejudice and discrimination." Black people can be prejudiced, but they lack the "institutional power" that "transforms it into racism." Reverse racism does not exist owing to "power relations that are historic and embedded."

Whatever the merits of those propositions, splicing them into the meaning of words is the lexical equivalent of splicing herbicide resistance into the genes of tobacco plants: It's an attempt to immunize ideas from criticism, such that the student who mentions 'reverse racism' in a discussion of affirmative action might as well have mentioned a unicorn in a discussion of endangered species. If she then drops the qualifier 'reverse' and simply calls it 'racism,' she's again confounded, since racism is something of which only white people can be guilty. As with Newspeak in Orwell's 1984, the aim is to construct a vocabulary in which the expression of unorthodox opinions is near impossible.

Even raising questions is an offense against this version of social justice. Being an "ally" of oppressed groups, we are told, requires:

"Validating and supporting people who are socially or institutionally positioned below yourself, regardless of whether you understand or agree with where they are coming from."

And a sure symptom of having “internalized” one’s own sense of “dominance”?

“Feeling authorized to debate or explain away the experiences of target groups.”

It’s hard to know what’s worse: the condescending implication that oppressed groups require unconditional support and validation (in the way that a child requires unconditional love), or the idea that “feeling authorized” to debate signals one’s racist hauteur rather than one’s democratic citizenship. To say nothing of the assumption that the range of opinion and experience among “target groups” is so narrow and homogenous that one could “validate” one person’s experience without running the risk of invalidating another’s.

The single greatest tool for making moral people commit atrocities is group affiliation. The single greatest tool for promoting global human rights and equality is to end group affiliation.

The faults of personality driven systems have been called by many names, racism, sexism, ageism, nationalism, and more, but all of those -isms mean the same thing. People are being judged as nouns instead of verbs. If instead of supporting nouns, we supported ideas and actions, it would be far easier to follow our chosen principles in all cases.

The true measurement of a person’s worth isn’t what they say they believe in, but what they do in defense of those beliefs. If you’re not acting on your beliefs, then they you probably do not fully understand them; are ignorant of the consequences of your actions; or perhaps you do not actually believe them.

People who struggle with their own prejudices are somehow equal in prejudice to those who never took the trouble to make the struggle. Imperfect effort at being just is no different than perfect indifference to it. A good man who plays footsie for an evening under the table with a single bad idea becomes the equal of a man who spends a lifetime sharing a slovenly bed with an evil ideology.

Virtue Signaling: the conspicuous expression of moral values by an individual done primarily with the intent of enhancing that person’s standing within a social group; the practice of publicly expressing opinions or sentiments intended to demonstrate one’s good character or the moral correctness of one’s position on a particular issue; saying you love or hate something to show off what a virtuous person you are, instead of actually trying to fix the problem.

Virtue-signaling expresses two other key characteristics of an empire in terminal decline: complacency and intellectual sclerosis. There is no room at all, in these ways of thinking, for the novel situations which have now arisen, a situation which needs solutions as radical as itself. The status quo attitude is a complacent acceptance of things as they are, without a single new idea. This acceptance is accompanied by greatly excessive optimism about the present and future

This blind adherence to the ideas of the past ranks high among the principal causes of the downfall of Rome. If you were sufficiently lulled by these traditional fictions, there was no call to take any practical first-aid measures at all.

Some of the cultural and political realities of American life are themselves racially insensitive and elitist and offensive and unfair, and pussyfooting around these realities with euphemistic doublespeak is not only hypocritical but toxic to the project of ever really changing them. Today's most powerful influence on the norms of public English is actually a stern and exacting form of liberal Prescriptivism. I refer here to Politically Correct English (PCE), under whose conventions failing students become 'high-potential' students and poor people 'economically disadvantaged' and people in wheelchairs 'differently abled' and a sentence like 'White English and Black English are different, and you better learn White English or you're not going to get good grades' is not blunt but 'insensitive.' Although it's common to make jokes about PCE—referring to ugly people as 'aesthetically challenged' and so on—be advised that Politically Correct English's various pre- and proscriptions are taken very seriously indeed by colleges and corporations and government agencies, whose institutional dialects now evolve under the beady scrutiny of a whole new kind of Language Police.

Prescriptive PCE is not just silly but ideologically confused and harmful to its own cause. Here is my argument for that opinion. Usage is always political, but it's complexly political. With respect, for instance, to political change, usage conventions can function in two ways: on the one hand they can be a reflection of political change, and on the other they can be an instrument of political change. What's important is that these two functions are different and have to be kept straight. Confusing them—in particular, mistaking for political efficacy what is really just a language's political symbolism—enables the bizarre conviction that America ceases to be elitist or unfair simply because Americans stop using certain vocabulary that is historically associated with elitism and unfairness. This is PCE's core fallacy—that a society's mode of expression is productive of its attitudes rather than a product of those attitudes. A pithier way to put this is that politeness is not the same as fairness.

There's a grosser irony about Politically Correct English. This is that PCE purports to be the dialect of progressive reform but is in fact—in its Orwellian substitution of the euphemisms of social equality for social equality itself—of vastly more help to conservatives and the US status quo than traditional SNOOT prescriptions ever were. Were I, for instance, a political conservative who opposed using taxation as a means of redistributing national wealth, I would be delighted to watch PC progressives spend their time and energy arguing over whether a poor person should be described as 'low-income' or 'economically disadvantaged' or 'pre-prosperous' rather than constructing effective public arguments for redistributive legislation or higher marginal tax rates. Not to mention that strict codes of egalitarian euphemism serve to suppress the sorts of painful, unpretty, and sometimes offensive discourse that in a pluralistic democracy lead to actual political change rather than symbolic political change. In other words, PCE acts as a form of censorship, and censorship always serves the status quo.

As a practical matter, I strongly doubt whether a guy who has four small kids and makes \$12,000 a year feels more empowered or less ill-used by a society that carefully refers to him as 'economically disadvantaged' rather than 'poor.' Were I he, in fact, I'd probably find the PCE term insulting—not just because it's patronizing (which it is) but because it's hypocritical and self-serving in a way that oft-patronized people tend to have really good subliminal antennae for. The basic hypocrisy about usages like 'economically disadvantaged' and 'differently abled' is that PCE advocates believe the beneficiaries of these terms' compassion and generosity to be poor people and people in wheelchairs, which again omits something that everyone knows but nobody ever mentions—that part of any speaker's motive for using a certain vocabulary is always the desire to communicate stuff about himself. PCE functions primarily to signal and congratulate certain virtues in the speaker—scrupulous egalitarianism, concern for the dignity of all people, sophistication about the political implications of language—and so serves the self-regarding interests of the PC far more groups renamed.

The unpleasant truth is that the same self-serving hypocrisy that informs PCE tends to infect and undermine the US Left's rhetoric in almost every debate over social policy. Take the ideological battle over wealth—redistribution via taxes, quotas, welfare, enterprise zones, AFDC/TANF, UBI/JG, you name it. As long as redistribution is conceived as a form of charity or compassion—and the Bleeding Left appears to buy this conception every bit as much as the Heartless Right—then the whole debate centers on utility—'Does welfare help poor people get on their feet or does it foster passive dependence?' 'Is government's bloated social-services bureaucracy an effective way to dispense charity?' and so on—and both camps have their

arguments and preferred statistics, and the whole thing goes around and around.

Opinion: The mistake here lies in both sides' assumption that the real motives for redistributing wealth are charitable or unselfish. The conservatives' mistake (if it is a mistake) is wholly conceptual, but for the Left the assumption is also a serious tactical error. Progressive liberals seem incapable of stating the obvious truth: that we who are well off should be willing to share more of what we have with poor people not for the poor people's sake but for our own; i.e., we should share what we have in order to become less narrow and frightened and lonely and self-centered people. No one ever seems willing to acknowledge aloud the thoroughgoing self-interest that underlies all impulses toward economic equality—especially not US progressives, who seem so invested in an image of themselves as Uniquely Generous and Compassionate and Not Like Those Selfish Conservatives Over There that they allow the conservatives to frame the debate in terms of charity and utility, terms under which redistribution seems far less obviously a good thing.

The type of leftist vanity that informs PCE is actually inimical to the Left's own causes. For in refusing to abandon the idea of themselves as uniquely generous and compassionate (i.e., as morally superior), progressives lose the chance to frame their redistributive arguments in terms that are both realistic and realpolitikal. One such argument would involve a complex, sophisticated analysis of what we really mean by self-interest, particularly the distinctions between short-term financial self-interest and longer-term moral or social self-interest. As it is, though, liberals' vanity tends to grant conservatives a monopoly on appeals to self-interest, enabling the conservatives to depict progressives as pie-in-the-sky idealists and themselves as real-world back-pocket pragmatists. In short, leftists' big mistake here is not conceptual or ideological but spiritual and rhetorical—their narcissistic attachment to assumptions that maximize their own appearance of virtue tends to cost them both the theater and the war.

Class Warfare

The human races were invented by anthropologists like Johann Friedrich Blumenbach back in the eighteenth century in an attempt to categorize new groups of people being encountered and exploited as part of an ever expanding European colonialism.

From the very beginning, the arbitrary and subjective nature of race categories was widely acknowledged. Most of the time races were justified on the grounds of cultural or language differences between groups of people rather than biological ones. This is ethnicity, *not* race.

Their existence was taken as a given right up until the twentieth century when anthropologists were busy writing about races as a biological explanation for differences in psychology, including intelligence, and educational and socioeconomic outcomes between groups of people.

Race is entirely made up and has no biologic underpinnings. Ethnicity is at best analogous to dog breeds and has no real place in public policy other than perhaps the medical field where certain diseases or conditions may be more prevalent.

If race is an artificial human construct—and it is—then do those who use it as a guide for “reparations” simply help support the foundations of racist ideology? Does doing anything but refusing to acknowledge the labels, while acknowledging their general acceptance in the past and the harms caused by this, actually help oppressed individuals?

National Socialist ideology involves a hierarchy of race, an explicit elite group, and the dehumanization of other groups. It is an example of a flawed ideology. When societies are unjust, for example, in the distribution of wealth, we can expect the emergence of flawed ideologies. The flawed ideologies allow for effective propaganda. In a society that is unjust, due to unjust distinctions between persons, ways of rationalizing undeserved privilege become ossified into rigid and unchangeable belief. These beliefs are the barriers to rational thought and empathy that propaganda exploits. Group identities are the coral reefs of cognition; much of the beauty of the production of human intellect is due to their existence. But certain group identities are democratically problematic; the Teutonic identity constructed by National Socialism is an obvious example. Such identities channel rational and affective streams in specific ways, creating obstacles to self-knowledge, as well as to the free flow of deliberation required in a healthy democracy.

Flawed ideology is an obstacle to realizing one’s goals. On the one hand, those benefiting from large material inequalities will tend to adopt flawed ideologies in the form of false legitimation narratives. These false

legitimation narratives will blind them to injustice, and hence from realizing their ethical goals. On the other hand, those suffering materially from large inequalities, via lack of land, access to high-status positions, or other obstacles to equality of opportunity and attainment, will be led to adopt a flawed ideology of their own inferiority. This will prevent them from realizing their material interests.

All human categories are essentially artificial, but we must ask which are useful, which do harm. Race is a useless, harmful category, ethnicity is possibly useful but certainly harmful. We cannot use these categories to achieve justice, equality. We cannot use them to right past wrongs. We must destroy them, wholly, anything less is to leave intact the frameworks required for future individuals to reinstate such injustices.

And therein lies the harm that the ‘middle class’ myth inflicts—it conjures illusions of division where there are none in reality. The belief—the fantasy—that a person is a part of a middle class leads less-poor workers to think their interests differ from the class-interests of the working class at large and ultimately to act against their own interests. Believing they are middle class leads the less-poor to imagine there is some fundamental difference between themselves and folks who cannot feed their families without government benefits. There isn’t. There are two classes—one of them is big and the other is small. One needs to toil daily for food, housing, and other necessities and the other does not. One must work and the other is why.

In the end, it is the divisions gouged by the material fact of class society itself that limit the fullest development of our humanity. One too many classes exist already and it’d be best not to complicate matters with imaginary ones.

Class consciousness is always double: it involves a simultaneous knowledge of the way in which class frames and shapes all experience, and a knowledge of the particular position that we occupy in the class structure. It must be remembered that the aim of our struggle is not recognition by the bourgeoisie, nor even the destruction of the bourgeoisie itself. It is the class structure—a structure that wounds everyone, even those who materially profit from it—that must be destroyed. The interests of the working class are the interests of all; the interests of the bourgeoisie are the interests of capital, which are the interests of no-one. Our struggle must be towards the construction of a new and surprising world, not the preservation of identities shaped and distorted by capital.

Class conflict takes many forms. If police break the bones of the poor to guard the assets of the 1% and private security bloodies workers who join a union, class conflict is violent. If currency speculators short an entire economy to siphon the wealth of all, class conflict is economic. If workers

must accept lower wages or lose their jobs and dining franchises leverage our guilt to subsidize their payrolls by voluntary tipping, class conflict is coercive & psychological. If Big Oil spends millions to elect politicians who golf with their investors and the food industry uses patent law to crush family farms, class conflict is political & judicial. If public space is flooded by advertisers and state-propaganda while news-shows hide the people who die in their name, class conflict is ideological & cultural & moral.

“Shallow understanding from people of good will is more frustrating than absolute misunderstanding from people of ill will. Lukewarm acceptance is much more bewildering than outright rejection.”

People who analyze the world on race, gender, sexuality without first looking at economic discrimination are either fools or conspirators. The net outcome of all discrimination is economic deprivation. All the identity -isms play out in the economic crippling of the discriminated class. Privilege isn't about whiteness, maleness, or heterosexuality, it's about money.

The Obamas, for example, are much more similar to privileged whites than they are to poor black families, or poor white families for that matter. They may face some racial exclusion, in theory, at the upper layers of society, but given their wealth and connections their blackness is a relatively minor discriminatory burden for them directly.

In terms of suffering, poor whites in economically barren locales have it much worse, so how is it fair to give the Obamas the additional sympathy and not the impoverished white family being eaten alive by a broken economy? Why do wealthy homosexuals and trans people deserve equal sympathy to poor homosexuals and trans people?

To ignore economic class when economic class is the real privilege token is intellectually bankrupt.

The heart of the problem isn't 'civil rights.' In every socialist or democratic socialist movement or progressive movement since Marx equality of rights is a given, as in there is no argument. But what they all recognize to be as obvious and self-evident as those rights, is the completely indefensible nature of a political economy that consistently fails to produce justice precisely because it embodies a different, hostile principle: that any individual is entitled to accumulate however much money and power as his/her ability and character can deliver—meritocracy or some similar term. The minute you make climbing a ladder made out of other people the legitimate goal, all of the other stuff fails. It's just absurd to be talking about 'civil rights' when the top-eight richest people in the US have more wealth than the bottom half.

The Democrats are utter hypocrites for even pretending they care about protecting minorities from forms of discrimination when they have simply refused to engage or even acknowledge their own overwhelming commitment to a grotesquely unjust order, not to mention personal addictions to the finer things in life that corruption delivers up to those willing to sell.

Mutual care, generated more by survival needs and self interest than by altruism, is the basis of support in the tribe. Of course there's nothing uniquely human about this. Wherever you find animals joined in foraging bands, you'll find them sharing food—not altruistically but in their own individual best interest. On the other hand, I'm sure there have been tribal societies that have departed from this way of handling hunger, societies in which the rule was 'If food is scarce, don't share it, hoard it.' But none in fact are seen. I'm sure you know why. Because where a rule like that was followed, the tribe would fall apart. Tribes survive by sticking together at all costs, and when it's every man for himself, the tribe ceases to be a tribe.

In our world, this support has been supplanted by services, mainly professional services working within a service system. Service, in fact, is simply the attempt to meet needs outside the context of community. Just as we do not use the word 'service' to label the care we provide within our families, likewise there is no equivalent concept of 'service' among tribal people. For individuals with an especially caring disposition, the service system provides the only available outlet, other than the care provider's own family. The weakening nuclear family, however, like the extended family, clan, village, and tribe before it, has increasingly surrendered its support function to professional services. Following this trend, we could all soon find ourselves supported by service providers alone.

Touch is healing. There's quite a bit of science to back that up. Modern human society has siloed how, when, and why humans get to touch each other in ways that are very detrimental to human physical and mental health.

We are social animals. We need to physically interact with one another to be happy. The fact that this innate drive has been channeled by imperial cultures into men only getting to touch other men when they're fighting or competing, and with women in power-imbalanced, transactional sexual encounters fuels so much destructive behavior. There's all this need to nurture and touch that gets channeled into creatures one can control.

Mass culture is a combination of radical ingratitude with an unquestioned belief in limitless possibility. The mass man takes for granted the benefits conferred by civilization and demands them as if they were natural rights. Heir of all the ages, he is blissfully unconscious of his debt to the past. Though he enjoys advantages brought about by the general rise in the

historic level, he feels no obligation either to his progenitors or to his progeny. He recognizes no authority outside himself, conducting himself as if he were lord of his own existence. His incredible ignorance of history makes it possible for him to think of the present moment as far superior to the civilizations of the past and to forget, moreover, that contemporary civilization is itself the product of centuries of historical development, not the unique achievement of an age that had discovered the secret of progress by turning its back on the past.

In her writings, which have become foundational for libertarian theology, author Ayn Rand suggested that the only purpose of government should be to prevent oppression by force. What she neglected to consider was all the force inherent in nature. If you are hungry, there is the force of biology. If you're homeless, you confront the force of wind and storms, ice and snow. If you're sick, you confront the ravages and force of disease. These were the forces that provoked the first governments; the first communities, clans, and tribes; the first nation-states. It's easy for libertarian elitists, such as multimillionaire TV talking heads or college kids reading *Atlas Shrugged*, to talk about how there should be "no government beyond police, the army, and courts." They all have enough resources that they don't need to deal with the forces of raw nature. And that explains why billionaires would bankroll libertarian-leaning think tanks that will, when the crash comes with its full force, tell us it was "caused" by "big government." However, in the real world, humans must confront both nature and other humans. Which is why we create governments, and why we create economies.

But what the average Tea Partier or MAGA Minion doesn't understand, and what the millionaires and billionaires who fund the movement do understand, is that nature abhors a vacuum. So when Tea Partiers or MAGA Minions clamor for smaller government—or in some cases, no government at all—something must fill the void. And what's always filled the void in the past, from the Gilded Age, to the Roaring Twenties, to Reagan's America, is corporate power and aggregated wealth. So fast-forward to 240 years after the Boston Tea Party, and today's Tea Party is rallying on behalf of some of the very biggest transnational corporations in the world—our own East India Companies.

One community in Tennessee learned a lesson about the wrong way to finance firefighting in September 2010. A teenager burning trash in a barrel was not attentive and the flames spread. First his grandfather's shed caught fire; pretty soon the house was ablaze. But the firefighters in nearby South Fulton, Tennessee, would not put out the blaze because homeowner Gene Cranick had not sent in his \$675 annual fee. Cranick insisted he had always paid and that this nonpayment was just an error of omission, but

the firefighters stood by and watched his house burn, killing a dog inside.

This is simple stuff, but the lesson is important: By holding firm together, by refusing to act on individual self-interest alone, we end up better off. And it's why unions hate scabs so much: The scab who crosses a picket line is like the prisoner who betrays—they ruin the possibility of achieving the outcome most beneficial to the working class as a whole. They do not see that a world in which other people acted the same way would yield the worst set of outcomes.

The 'tragedy of the commons,' then, is not really about the commons: The tragedy in Hardin's scenario is that his herdsmen think 'rationality' means 'trying to maximize your own gains even at the expense of other people.' If, on the other hand, the herdsmen have a cooperative ethic, and refuse to do anything that would harm the interests of others, the commons are preservable indefinitely. 'Ah' the economist replies, 'but what about free riders? If the commons are available to all, even if 99 percent of users act responsibly, if one person comes along and decides not to obey the norm, and takes an unsustainable amount, they can ruin it for everyone else.'

This is true, but note what it means: The moment a libertarian shows up, with their amoral disinterest in the welfare of others, a perfectly good cooperative arrangement will be destroyed. All it implies is that no society that wants to achieve optimal outcomes for all should tolerate libertarians in its midst. They should be banished to their floating sea-cities where they can backstab and betray one another at their leisure.

In its most extreme form, our constitutional rights are reducible to the right not to have to love our neighbor. The irony is that the more energetically we pursue our individual, socially isolated right to "life liberty and the pursuit of happiness," the deader the social and natural worlds become.

Popular fantasies are hardly the whole problem: one-against-all survival has also engaged scholars. Scholars have imagined survival as the advancement of individual interests—whether "individuals" are species, populations, organisms, or genes—human or otherwise. Consider the twin master sciences of the twentieth century, neoclassical economics and population genetics. Each of these disciplines came to power in the early twentieth century with formulations bold enough to redefine modern knowledge. Population genetics stimulated the "modern synthesis" in biology, uniting evolutionary theory and genetics. Neoclassical economics reshaped economic policy, creating the modern economy of its imagination.

While practitioners of each have had little to do with each other, the twins set up similar frames. At the heart of each is the self-contained individual actor, out to maximize personal interests, whether for reproduction or wealth.

Richard Dawkins's "selfish gene" gets across the idea, useful at many life scales: It is the ability of genes (or organisms, or populations) to look out for their own interests that fuels evolution. Similarly, the life of *Homo economicus*, economic man, is a series of choices to follow his best interests. The assumption of self-containment made an explosion of new knowledge possible. Thinking through self-containment and thus the self-interest of individuals (at whatever scale) made it possible to ignore contamination, that is, transformation through encounter. Self-contained individuals are not transformed by encounter. Maximizing their interests, they use encounters—but remain unchanged in them. Noticing is unnecessary to track these unchanging individuals. A "standard" individual can stand in for all as a unit of analysis. It becomes possible to organize knowledge through logic alone. Without the possibility of transformative encounters, mathematics can replace natural history and ethnography. It was the productiveness of this simplification that made the twins so powerful, and the obvious falsity of the original premise was increasingly forgotten. Economy and ecology thus each became sites for algorithms of progress-as-expansion.

The problem of precarious survival helps us see what is wrong. Precarity is a state of acknowledgment of our vulnerability to others. In order to survive, we need help, and help is always the service of another, with or without intent. When I sprain my ankle, a stout stick may help me walk, and I enlist its assistance. I am now an encounter in motion, a human-and-stick. It is hard for me to think of any challenge I might face without soliciting the assistance of others, human and not human. It is un-self-conscious privilege that allows us to fantasize—counter-factually—that we each survive alone.

Contaminated diversity is everywhere. If such stories are so widespread and so well known, the question becomes: Why don't we use these stories in how we know the world? One reason is that contaminated diversity is complicated, often ugly, and humbling. Contaminated diversity implicates survivors in histories of greed, violence, and environmental destruction. The tangled landscape grown up from corporate logging reminds us of the irreplaceable graceful giants that came before. The survivors of war remind us of the bodies they climbed over—or shot—to get to us. We don't know whether to love or hate these survivors. Simple moral judgments don't come to hand.

Worse yet, contaminated diversity is recalcitrant to the kind of "summing up" that has become the hallmark of modern knowledge. Contaminated diversity is not only particular and historical, ever changing, but also relational. It has no self-contained units; its units are encounter-based collaborations. Without self-contained units, it is impossible to compute costs and benefits, or functionality, to any "one" involved. No self-contained individuals

or groups assure their self-interests oblivious to the encounter. Without algorithms based on self-containment, scholars and policymakers might have to learn something about the cultural and natural histories at stake. That takes time, and too much time, perhaps, for those who dream of grasping the whole in an equation. But who put them in charge? If a rush of troubled stories is the best way to tell about contaminated diversity, then it's time to make that rush part of our knowledge practices. Perhaps, like the war survivors themselves, we need to tell and tell until all our stories of death and near-death and gratuitous life are standing with us to face the challenges of the present. It is in listening to that cacophony of troubled stories that we might encounter our best hopes for precarious survival.

Tolerance does not always survive periods of social turbulence. Violent hatred bubbles just under the surface in society.

Certain deep-seated personality traits make potentially fascistic individuals particularly susceptible to antidemocratic propaganda. The crucial traits—tested for by the so-called ‘F-scale’—of the “authoritarian personality” are:

- Rigid adherence to conventional values
- Submissiveness to authority figures
- Aggressiveness toward out-groups
- Opposition to introspection, reflection, and creativity
- A tendency to superstition and stereotyping
- Preoccupation with power and “toughness”
- Destructiveness and cynicism
- Projectivity (the disposition to believe that wild and dangerous things go on in the world; the projection outward of unconscious emotional impulses)
- An exaggerated concern with sexuality

The antidemocratic individual harbors strong underlying aggressive impulses and fascist movements allow him to project this aggression through sanctioned violence against ideologically targeted out-groups.

It is a natural human instinct to turn our fears into symbols, and destroy the symbols, in the hope that it will destroy the fear.

A population alienated and beset by despair and hopelessness finds empowerment and pleasure in an orgy of annihilation that soon morphs into self-annihilation. It has no interest in nurturing a world that has betrayed it and thwarted its dreams. It seeks to eradicate this world and replace it with a mythical landscape. It turns against institutions, as well as ethnic and religious groups, that are scapegoated for its misery. It plunders diminishing natural resources with abandon. It is seduced by the fantastic promises of demagogues and the magical solutions characteristic of the Christian right or what anthropologists call “crisis cults.”

Extremist religious groups—of all faiths, and definitely not only belonging to the Muslim religion—are being groomed by the Western neoliberal ideologues and strategists, then dispersed to all corners of the globe: South Asia, the Middle East, China, Latin America, Africa, and even Oceania.

It is a total disgrace, what imperialism has managed to reduce our humanity to. It is being constantly derailed, attacked, and tormented by the brutal monstrous and merciless hydra—the Western expansionism and its culture of nihilism, greed, cynicism, and slavery. It is so obvious where we are going as a human race.

We want to fly, we want freedom and optimism and beauty to govern our lives. We want to dream and to create something deep, meaningful, happy, and kind. But there are those horrible weights hanging from our feet. There are chains restraining our actions. There is constant fear, which is making us betray all our ideals, as well as each other, again and again; fear that makes us, humans, act like shameless cowards and egoists. As a result we are not flying, we are only crawling, and not even forward, but in bizarre, irrational ellipses and circles.

The old symbols and the old slogans have indeed disappeared, to be replaced by new ones; but the structure of the basic fantasies seems to have changed scarcely at all.

These movements offer a coherent social myth which is capable of taking entire possession of those who believe in it. It explains their suffering, it promises them recompense, it holds their anxieties at bay, it gives them an illusion of security—even while it drives them, held together by a common enthusiasm, on a quest which is always vain and often suicidal.

So it came about that multitudes of people acted out with fierce energy a shared fantasy which, though delusional, brought them such intense emotional relief that they could live only through it and were perfectly willing to die for it. It is a phenomenon which was to recur many times between the eleventh century and the sixteenth century, now in one area, now in another, and which, despite the obvious differences in cultural context and in scale, is not irrelevant to the growth of totalitarian movements, with

their messianic leaders, their millennial mirages, and their demon-scapegoats, in the present century.

It is the amnesia here that is the trouble. A question—What is X?—rings in the air, but they answer it both defiantly and like no one has asked. This is what identity politics looks like when it has gone a little senile. You will jealously guard the clearly defined borders around what an atheist is, or a feminist, or a white person, or a Turk, or an asexual, even as you find yourself forgetting, for a moment or for a generation, exactly how those borders first got thrown up.

Patriots are among the worst offenders. Germany would not be Germany without the French because in order to create a German identity, first a French identity had to be built. The French had to be cosmopolitans, with aggressive rationalism and individualism—“the promised land of steel, of chemical dyes, of method, of efficiency”—for the Germans to be a simple people, spiritual and communal. The French had *Zivilisation*, but the Germans had *Kultur*.

Still, by the twentieth century, most Germans were telling a different tale. It may have been that as the world started to modernize through the spread of the Enlightenment and industrialization, traditional ways of understanding who one was and the meaning of one's existence disappeared. Families and communities may have been split apart as cities became the economic centers, traditions may have been discarded or forgotten, religious beliefs may have been dismissed as superstition, and gender and class roles may have begun to shift. Nations that were able to keep up with this process, like France, may have benefited from modernization, more or less. Nations that lagged behind, like Germany, may not have. But at a certain point, who cared? All that remained of this complex history was a simmering resentment and frustration on the part of many Germans, which they proceeded to brandish like a gun.

Personal struggles to adjust to a daunting modern world, which usually ended in failure, confusion, and drift, deepened the yearning for an uncomplicated belief. Unable to reintegrate or demodernize itself, Germany conjured up a new identity out of folk tales, an artificial sense of authenticity, and memory-effacing legends. One day, these were just fanciful stories that had the cheek to overwrite history. The next, they were excuses for Germans to tell themselves that theirs was the superior way of being, the purest form of life.

Nothing makes self conscious of itself so much as a conflict with non-self. Nothing can weld peoples into a nation and nations into a state as the pressure of a common foe. Hatred separates as well as unites. Now that we've seen how this identity-building routine tends to go, we should probably

add a warning label: May induce memory loss.

One way or another, we all mistake our own history for universal history. The stories we tell about ourselves and our nations so easily become the only ones we want to listen to, which is why male historians tend to see masculine activities like exploration and war as the sum total of the history of the world, or why Americans hopped up on the false notion of progress see the future not only as an inevitable and evolutionary march toward increased freedom, but also as an unalloyed good.

Fascist movements build their base not from the politically active but the politically inactive, the losers who feel—often correctly—they have no voice or role to play in the political establishment. When political debate no longer speaks to us, people become responsive instead to slogans, symbols, and sensation. To some admirers of Trump, for example, facts and arguments appear irrelevant. But then again, the case is equally true of admirers of Establishment Democrats, and even of those “Feeling the Bern”—though I suspect it’s more of a ‘sting’ these days.

What they don’t see is that the strong neoliberal state and weak community ties is what’s ripping their society apart, not evil people—immigrants, muslims, white men, et cetera—with superpowers.

Militant anti-fascists believe, with good reason through long experience, that the state is not a reliable proxy for anti-fascism. That is the task of the organized working class, through direct action, something which the liberals who would “reason” with the Nazis balk at. They balk because for them the whole thing is an intellectual exercise, and they remain divorced from the reality of struggle against fascism.

It must be said, before moving on, that one element of that struggle is propaganda. Militant advocates of No Platform don’t “refuse to engage” with fascist ideas but in fact do so in a way that others never would. By arguing against fascism on a class basis, on working class estates, and with the very people the far-right sees as their core recruits.

Because this is a material reality that makes taking of fascism through pure reason nigh-on impossible—class. The far-right—whether in more openly violent form or having traded boots for suits—preys upon the alienation and disenfranchisement of the white working class. We are alienated and disenfranchised because of capitalism, of course, as our communities are torn apart, our jobs go and we struggle to scrape by.

But the system itself uses racism and migration to both divide the class and distract from the real culprits behind our misery, whilst the left is nowhere to be seen. Pretty hard for reason to win out when those offering the wrong answers are the only ones offering answers. Militant anti-fascists do engage and challenge this situation, but it is an uphill struggle we face.

The other side of the coin, in terms of why anti-fascism cannot be boiled down to a battle of ideas is that fascism is an ideology rooted in violence. It is hard to reason with those kicking your head in or gunning you down as you run for your life, or those who have forced you into binding arbitration, or those whose lobbyists have allowed them to poison you and your children and even your dog. And of course those advocating freedom of speech for fascists are those least likely to be on the receiving end of such attacks.

Obviously, anarchists should not organize against free speech. But the stranglehold of the state on the discourse of free speech seems to set the terms of the debate: either we condone censorship, or we condone state protection of our enemies and their right to organize against us and others. This results in paradoxes, such as radicals being accused of opposing freedom for shutting down a fascist speaker.

In contrast to state protection of KKK rallies and the like, there are models of free expression that neither depend upon the enforcement of rights from above nor sanction oppressive behavior. Anarchists might judge speech not as something fundamentally different from action, but as a form of action: when it harms others, when it reinforces hierarchies and injustices, we confront it the same way we would confront any other kind of abuse or oppression. This is simply self-defense.

When a xenophobic politician comes to speak at a public university, his honorarium is paid with tax money extorted from workers and given to universities so it will continue to circulate among the rich and powerful. Regardless of right-wing whining about the marginalization of conservative opinions, the fact that he is powerful enough to secure lucrative speaking engagements indicates that his views are hardly suppressed. As a wealthy citizen and public figure, his opportunity to express himself can't reasonably be compared to the opportunity of, say, the immigrants he scapegoats. If their voices and agency actually held equal weight, the politician could say whatever he wanted, but would be powerless to subject others to his schemes.

When we confront him directly rather than politely disagreeing, we're not attacking his right to express his opinions. We're confronting the special advantages he is accorded: taxpayer money, police protection, an exclusive soapbox. We're confronting the power he wields over our lives through institutions built on violence, a power he means to extend by using speaking events to gain wealth, legitimacy, and recruits to his racist endeavors. Confronting him is a political practice that does not reduce freedom to rights, but challenges the privileges of the state; that makes no false dichotomy between speech and action, but judges both by the same standards; that does not enable the state to frame itself as the defender

of free speech, but asserts that we are the only ones who can defend and extend our own freedom.

“Have you ever thought that maybe I don’t want to unify or be friends with these people anymore? I don’t want to give them a chance to speak, I want to crush them and make sure they never rise to power again. These people advocate for banning entire religions, many of them want to kill me, many of them would want millions of people deported, they want extreme things, and I don’t want to reason with them, I want to defeat them, because they cannot be reasoned with no matter how hard we try.”

Even Hitler himself said the only way you can defeat the far right is by crushing it right at its nucleus, at the very start. Debate, communication, and education does not work, and in fact can even make them more emboldened.

“Stopping fascists from speaking makes you just as bad as them.”

You could just as easily say that not stopping fascists from speaking makes you as bad as them, because it gives them the opportunity to organize to impose their agenda on the rest of us. If you care about freedom, don’t stand idly by while people mobilize to take it away.

“Shouldn’t we just ignore them? They want attention, and if we give it to them we’re letting them win.”

Actually, fascists usually don’t want to draw attention to their organizing; they do most of it in secret for fear that an outraged public will shut them down. They only organize public events to show potential recruits that they have power, and to try to legitimize their views as part of the political spectrum. By publicly opposing fascists, we make it clear to them—and more importantly, to anyone else interested in joining them—that they will not be able to consolidate power without a fight. Ignoring fascists only allows them to organize unhindered, and history shows that this can be very dangerous. Better we shut them down once and for all.

“The best way to defeat fascism is to let them express their views so that everyone can see how ignorant they are. We can refute them more effectively with ideas than force.”

People don't become fascists because they find their ideas persuasive; they become fascists for the same reason others become police officers or politicians: to wield power over other people. It's up to us to show that fascist organizing will not enable them to obtain this power, but will only result in public humiliation. That is the only way to cut off their source of potential recruits.

History has shown over and over that fascism is not defeated by ideas alone, but by popular self-defense. We're told that if all ideas are debated openly, the best one will win out, but this fails to account for the reality of unequal power. Fascists can be very useful to those with power and privilege, who often supply them with copious resources; if they can secure more airtime and visibility for their ideas than we can, we would be fools to limit ourselves to that playing field. We can debate their ideas all day long, but if we don't prevent them from building the capacity to make them reality, it won't matter.

“Neo-Nazis are irrelevant; institutionalized racism poses the real threat today, not the extremists at the fringe.”

The bulk of racism takes place in subtle, everyday forms. But fascist visibility enables other right-wing groups to frame themselves as moderates, helping to legitimize the racist and xenophobic assumptions underlying their positions and the systems of power and privilege they defend. Taking a stand against fascists is an essential step toward discrediting the structures and values at the root of institutionalized racism.

Here and worldwide, fascists still terrorize and murder people because of racial, religious, and sexual difference. It's both naïve and disrespectful to their victims to gloss over the past and present realities of fascist violence. Because fascists believe in acting directly to carry out their agenda rather than limiting themselves to the Rube Goldberg machine of representative democracy, they can be more dangerous proportionate to their numbers than other bigots. This makes it an especially high priority to deal with them swiftly.

“Free speech means protecting everyone's right to speak, including people you don't agree with. How would you like it if you had an unpopular opinion and other people were trying to silence you?”

We oppose fascists because of what they do, not what they say. We're not opposed to free speech; we're opposed to the fact that they advance an

agenda of hate and terror. We have no power to censor them, nor should we. But we will not let them come into our communities to build the power they need to enact their hatred.

The government and the police have never protected everyone's free speech equally, and never will. It is in their self-interest to repress views and actions that challenge existing power inequalities. They will spend hundreds of thousands of dollars on riot police, helicopters, and sharpshooters to defend a KKK rally, but if there's an anarchist rally the same police will be there to stop it, not to protect it.

Anarchists don't like being silenced by the state—but we don't want the state to define and manage our freedom, either. We support self-defense and self-determination above all. What's the purpose of free speech, if not to foster a world free from oppression? Fascists oppose this vision; thus we oppose fascism by any means necessary.

“If fascists don't have a platform to express their views peacefully, it will drive them to increasingly violent means of expression.”

Fascists are only attempting to express their views “peacefully” in order to lay the groundwork for violent activity. Because fascists require a veneer of social legitimacy to be able to carry out their program, giving them a platform to speak opens the door to their being able to do physical harm to people. Public speech promoting ideologies of hate, whether or not you consider it violent on its own, always complements and correlates with violent actions. By affiliating themselves with movements and ideologies based on oppression and genocide, fascists show their intention to carry on these legacies of violence—but only if they can develop a base of support.

No one has the right to organize violence against our community. Likewise, we reject the “right” of the government and police—who have more in common with fascists than they do with us—to decide for us when fascists have crossed the line from expressing themselves into posing an immediate threat. We will not abdicate our freedom to judge when and how to defend ourselves.

Colonizers study the histories of oppressed peoples to identify with and eventually become—or more securely remain—their oppressors.

It's just like when you've got some coffee that's too black, which means it's too strong. What you do? You integrate it with cream; you make it weak. If you pour too much cream in, you won't even know you ever had coffee. It used to be hot, it becomes cool. It used to be strong, it becomes weak. It used to wake you up, now it'll put you to sleep. This is what they

did with the march on Washington. They joined it. They didn't integrate it; they infiltrated it. They joined it, became a part of it, took it over. And as they took it over, it lost its militancy. They ceased to be angry. They ceased to be hot. They ceased to be uncompromising. Why, it even ceased to be a march. It became a picnic, a circus. Nothing but a circus, with clowns and all.

Democracy is not some meek and mild creed, but a fierce and jealous god that recognizes no higher authority other than its historical obligation to defend, extend, and deepen its rule. People not only have a right to resist, but a moral duty.

If we're going to be exact about it, in fact, the billionaires who still dominate the political donor class mainly reside in the top tenth of a percent. Even in the most conservative possible interpretation of economic data, a general picture of haves and have-nots in the voting population would still be something like 20/80—20% of Americans own 89% of privately held wealth, while the bottom 80% owns just 11%.

The danger implicit in these numbers to the 'broadly satisfied with the status quo' types is obvious. If 80 percent of Americans ever realized their shared economic situation, they could and probably should take over government. Of course, they wouldn't just be taking power for themselves, they'd be taking it from the big-dollar donors who own such a disproportionately huge share of wealth in our society.

Such people of course have many very good reasons to embrace the status quo. The problem is, they're not terribly numerous as a group, which unfortunately for them still matters in a democracy. It's one of the unpleasant paradoxes of exclusive wealth. If you live in a democracy, you're continually forced to manufacture the appearance of broad support for the regressive policies underpinning your awesome lifestyle.

The United States is not a semi-peripheral country like Russia in 1917, but the ruler of history's first global empire. Since World War II, it has been busily remaking the world in its image as it carefully nurtured neo-federal institutions like NATO, the EU, and the European Court of Justice. While the US empire is first and foremost a military and economic alliance, it's also a legal construct based on the concept of an untouchable constitution, a reduction of democracy to a few liberal formulas, and judicial review.

It is a structure that neatly suits the needs of capital. Neoliberalism and US-style constitutionalism go hand in hand because they share a common adherence to a "small government" worldview, a commitment to an expansive conceptualization of the private sphere, and an uneasy attitude—even hostility—toward the less than predictable political sphere.

The goal is to place private ownership and other economic freedoms

beyond the reach of majoritarian politics and state regulation, thereby promoting a minimalist conception of democracy in which the essence of democracy is relegated to the existence of some sort of electoral routine, controlled to a large extent by those who have greater access to and influence on the public agenda.

March the people to the polls, in other words, so they can vote for one of two corporate-controlled candidates, and then march them back home again. Teach them that a two-century-old constitution represents the absolute summit of political thought so they will never be tempted to tamper with the political structure on their own. Tie the people down, Gulliver-style, with innumerable laws and treaties so that capital can be set free.

It's a formula that has only worked as long as the economy continued to grow, wages remained strong, and imperial power was expanding. Now that that is no longer the case, many are beginning to recognize they've been residing in a giant prison and must somehow find a way out.

The liberal bourgeoisie grant reforms with one hand, and with the other always take them back, reduce them to naught, use them to enslave the workers, to divide them into separate groups and perpetuate wage-slavery. For that reason reformism, even when quite sincere, in practice becomes a weapon by means of which the bourgeoisie corrupt and weaken the workers. The experience of all countries shows that the workers who put their trust in the reformists are always fooled.

And conversely, workers who have realized the inevitability of wage-slavery so long as capitalist rule remains, will not be fooled by any bourgeois reforms. Understanding that where capitalism continues to exist reforms cannot be either enduring or far-reaching, the workers fight for better conditions and use them to intensify the fight against wage-slavery. The reformists try to divide and deceive the workers, to divert them from the class struggle by petty concessions. But the workers, having seen through the falsity of reformism, utilize reforms to develop and broaden their class struggle.

There seems to be a growing divide, perhaps not as visible as say, the 0.1%, but a still growing divide between the 10% and the 90%. I think that we need a manifesto too about the 10%. The wealthiest ten percent are living in a different world than the rest of us.

- Their wages seem to have done a much better job of keeping up with living costs.
- They seem to be able to afford expensive housing in many of the most expensive cities.

- Costs such as rising food, insurance, et cetera are not really a problem for them. They are sheltered from the consequences of globalization and in many cases profit from it. The decline in domestic manufacturing has not hit their interests really hard either.
- While costs such as private school and university are a concern, the fact that they will send their kids to a good university is unquestioned. They may also be able to use their personal network to get their kids connections and a good job after.
- After their expenses, they probably have a lot left over to save and invest, and so benefit from the rapid appreciation of stocks since 2008.
- They may work long hours, but they are not struggling to survive and can afford the “finer” things in life, although not to the same extent as the 0.1%.
- Many seem to be completely ignorant—some willfully so—about how tough things are for the less well off. They have more in common with the very wealthy in this regard. Their life expectancy is up, perhaps not far from the very rich, while the working class’s is going down.

I could go on, but the point is that we seem to have a ten-percent problem too. Social mobility in the US and UK are very poor compared to the rest of the Western world as well. That means that the glass ceiling is not so much gender as much as it is class.

They seem satisfied with the status quo and, worse, are helping the very wealthy screw over the less well off citizens. Indeed they aspire to join the ranks of the very rich.

While doctors, lawyers, and accountants don’t pull down the same money as corporate CEOs or the Bill-Gates-types, their success is hugely important in sustaining the conservative nanny state. If the only people doing well in the current economy were a tiny strata of super-rich corporate heads and high-tech entrepreneurs, there would be little political support for sustaining the system. Since the list of winners also includes the most educated segment of society, it creates a much more sustainable system. In addition to being a much broader segment of the population—5–10 percent as opposed to 0.5 percent—this group of highly educated workers includes the people who write news stories and editorial columns, teach college classes, and shape much of what passes for political debate in the country. The fact that these people benefit from the conservative nanny state vastly strengthens its hold.

Every private wish fulfilled contains a danger that one will be oblivious to full impartial truth.

The .1% is comprised of a very few actual people; obviously, even fewer occupy the .01%. Despite their over-sized financial positions, they could not exert the power they do over hundreds of millions of Americans and many more globally without the cooperation of the 10–20% directly below them.

These are the news personalities who spin destructive policies favorably or ignore them altogether, the lawyers who defend the indefensible and judges who look the other way, the advertising execs who sell any product regardless of what it is or whom it hurts, and the politicians and government agency bigwigs who do the bidding of their owners in return for campaign contributions and permanent positions in government, to name a few.

They don't scour the toilets or shine the shoes of the .1%, but they work for them all the same—just for much better pay.

And they convince themselves that their financial success is evidence of their competence, brilliance, righteousness, and “integrity.” Looking the other way pays really, really well. Maybe you'd prefer to call them the ‘enabler class’ instead of the ten-percent, but any way you slice it, they are deserving of a large dose of contempt. Particularly the ones who only get \$105,000 a year to sell out.

In part what we have here is a listening problem. Americans have trouble telling the difference between a social critique and a personal insult. Thus, a writer points to a broad social problem with complex origins, and the reader responds with, “What, you want to punish me for my success?”

In part, too, we're seeing some garden-variety self-centeredness, enabled by the usual cognitive biases. Human beings are very good at keeping track of their own struggles; they are less likely to know that individuals on the other side of town are working two minimum-wage jobs to stay afloat, not getting high and watching Simpsons reruns all day. Human beings have a simple explanation for their victories: ‘I did it.’ They easily forget the people who handed them the crayon and set them up for success. Human beings of the 9.9 percent variety also routinely conflate the stress of status competition with the stress of survival. No, failing to get your kid into Stanford is not a life-altering calamity.

You are never going to get the enabler class to admit that their lifestyles are not possible without the underlying immoral economic conditions. All you have to do is look at Massachusetts and see what liberalism has become there to understand this. The NIMBYism is rampant, and the isolation of minorities and people of other classes is so obvious that no one can deny that it happens. Most of the employment is so dependent on rent seeking—Education, Biotech and Pharma, Technology, Medical—that there is no way that they could be convinced of another course.

It's probably true that only when those middle class professionals them-

selves start to feel economic pain that we will see more enthusiasm for leveling and social cohesion. A crash in the stock market might do it or—god forbid—riots and chaos but it doesn't seem like there's a painless way out.

As I was growing up in England in the latter half of the twentieth century, the concept of intelligence loomed large. It was aspired to, debated and—most important of all—measured.

The idea that intelligence could be quantified, like blood pressure or shoe size, was barely a century old when I took the test that would decide my place in the world. But the notion that intelligence could determine one's station in life was already much older. It runs like a red thread through Western thought, from the philosophy of Plato to the policies of former UK prime minister Theresa May. To say that someone is or is not intelligent has never been merely a comment on their mental faculties. It is always also a judgment on what they are permitted to do. Intelligence, in other words, is political.

Sometimes, this sort of ranking is sensible: we want doctors, engineers, and rulers who are not stupid. But it has a dark side. As well as determining what a person can do, their intelligence—or putative lack of it—has been used to decide what others can do to them. Throughout Western history, those deemed less intelligent have, as a consequence of that judgment, been colonized, enslaved, sterilized, and murdered—and indeed eaten, if we include non-human animals in our reckoning.

In a ground-breaking study in 1936, an anthropologist suggested that it is not what we learn that matters, but the way in which we learn, and that this was something that would be determined by the culture that we grow up in. He had been living with the Iatmul tribe in New Guinea, observing how the men in the tribe sought to know, or possess, extraordinary numbers of ancestral names (as many as twenty-thousand) and the myths connected to them. Different clans in the tribe would challenge each other over such knowledge in open debate, asking questions over specific details, but at the same time never revealing an entire story, since to do so would put their possession of the ancestral names at risk. These curious circumstances, the anthropologist observed, had obliged Iatmul men to develop a kind of learning that was “directly opposed to rote remembering” of the kind used in the West. It was an extremely sophisticated system that affected their cognitive skills in general and the way in which they went about appropriating new knowledge in other spheres of life. The fact that different cultures developed different ways of learning, he thought, might explain why one ethnic group might suppose another was less intelligent; each had different cognitive skills developed in different ways.

Psychologists call this “The Ultimate Attribution Error,” and it plagues us all. When we see good behavior in our in-group (a group we’re a part of), we typically attribute it to innate characteristics of our group members. When we see bad behavior in our in-group, we typically attribute it to other influences or circumstances. For an out-group (a group outside our own), we attribute behaviors the opposite way. It’s easy to see how this tendency fools our minds and reinforces unfounded prejudices.

So at the dawn of Western philosophy, we have intelligence identified with the European, educated, male human. It becomes an argument for his right to dominate women, the lower classes, uncivilized peoples and non-human animals. While Plato argued for the supremacy of reason and placed it within a rather ungainly utopia, only one generation later, Aristotle presents the rule of the thinking man as obvious and natural.

Needless to say, more than 2,000 years later, the train of thought that these men set in motion has yet to be derailed. The giants of Greek philosophy set up a series of linked dualisms that continue to inform our thought. Opposing categories such as intelligent/stupid, rational/emotional, and mind/body are linked, implicitly or explicitly, to others such as male/female, civilized/primitive, and human/animal. These dualisms aren’t value-neutral, but fall within a broader dualism, as Aristotle makes clear: that of dominant/subordinate or master/slave. Together, they make relationships of domination, such as patriarchy or slavery, appear to be part of the natural order of things.

But it was also clear that an all-round increase in wealth threatened the destruction—indeed, in some sense was the destruction—of a hierarchical society. In a world in which everyone worked short hours, had enough to eat, lived in a house with a bathroom and a refrigerator, and possessed a motor-car or even an aeroplane, the most obvious and perhaps the most important form of inequality would already have disappeared. If it once became general, wealth would confer no distinction. It was possible, no doubt, to imagine a society in which wealth, in the sense of personal possessions and luxuries, should be evenly distributed, while power remained in the hands of a small privileged caste. But in practice such a society could not long remain stable. For if leisure and security were enjoyed by all alike, the great mass of human beings who are normally stupefied by poverty would become literate and would learn to think for themselves; and when once they had done this, they would sooner or later realize that the privileged minority had no function, and they would sweep it away. In the long-run, a hierarchical society is only possible on a basis of poverty and ignorance.

Distinctions—between free persons and slaves, between whites and blacks, between rich and poor, between men and women—are rooted in fictions.

Yet it is an iron rule of history that every imagined hierarchy disavows its fictional origins and claims to be natural and inevitable.

Most sociopolitical hierarchies lack a logical or biological basis—they are nothing but the perpetuation of chance events supported by myths. That is one good reason to study history.

Hierarchies aren't natural phenomena within the human race. Outside of parenting, human beings aren't born with the inclination to be ruled, controlled, managed, and supervised by other human beings. Hierarchies are artificial constructs designed to serve a purpose.

How can we distinguish what is biologically determined from what people merely try to justify through biological myths? A good rule of thumb is 'Biology enables, Culture forbids.' Biology is willing to tolerate a very wide spectrum of possibilities. It's culture that obliges people to realize some possibilities while forbidding others. Biology enables women to have children—some cultures oblige women to realize this possibility. Biology enables men to enjoy sex with one another—some cultures forbid them to realize this possibility.

Culture tends to argue that it forbids only that which is unnatural. But from a biological perspective, nothing is unnatural. Whatever is possible is by definition also natural. A truly unnatural behaviour, one that goes against the laws of nature, simply cannot exist, so it would need no prohibition.

Unfortunately, complex human societies seem to require imagined hierarchies and unjust discrimination. Of course not all hierarchies are morally identical, and some societies suffered from more extreme types of discrimination than others, yet scholars know of no large society that has been able to dispense with discrimination altogether. They are absolutely a necessity within any society that boasts high degrees of wealth and power inequities. They are a necessity for maintaining these inequities and ensuring they are not challenged from below.

To widen the Gap between the rich and you, the rich need your participation in their game. The rich need you to believe and defend that Gap-widening is necessary and beneficial and natural.

The rich need you to believe and defend the idea that federal benefits are unaffordable, inflationary, and undeserved. The rich need you to believe and defend the idea that it is only right and logical for their lives to be better than yours.

The rich need you to believe that you must pay FICA so that Social Security and Medicare can exist. And that your healthcare must be unaffordable. And that education either is unaffordable or must put you deeply into debt. And that the government cannot survive without tax dollars. And that you deserve to struggle to feed, clothe, and house your family.

The rich need you to believe that inflation—especially hyper-inflation—is the inevitable result of federal deficit spending on benefits to you, though the rich have been saying this for more than 75 years without evidence, and a monetarily sovereign government has absolute control over the value of its sovereign money.

The rich need you to believe that those “below” you on the totem pole of life, are congenitally inferior and both intellectually and morally deserve their lowly status.

The rich need you to believe this so that you will believe you yourself deserve your inferior status compared with the rich.

The rich need you to believe these things because the rich fear that if ever you discover the truth, you will demand more from the federal government and more equality from the rich.

When a politician spends a lot of time with the people who give him money, he tends to absorb their views. What’s stranger is when the views trickle down to the bottom tiers of power and wealth.

High inequality threatens a country’s political stability because more people are dissatisfied with their economic status, which makes it harder to reach political consensus among population groups with higher and lower incomes.

Almost all social welfare statistics track economic inequality, not absolute access to goods. People are happy, or sick, or whatever, based on how unequal their society is, and almost nothing else, provided the society is beyond the bare subsistence level. Inequality matters, it drives almost everything. People who feel unequal are unhappy, stressed, and sick.

So it doesn’t matter if Thelma has a TV and a smartphone, what matters is that she’s scared all the time because if she loses her job she’s screwed, and as a result she has to do whatever her boss says. She has little real freedom, save the right to become homeless. And that fear is constantly there, even if it is subconscious.

For decades people put up with decline, but now the youngsters, some of whom are in their early 30s, have never known anything but a failed system and a bad economy. This political world has never worked for them, ever: they have no emotional investment in it, no habit of supporting it.

The powerful are in a radically different position of responsibility from the powerless; almost needless to say, Trump supporters—generally victims of propaganda in a system that offers few valid choices (Clinton was hardly a good alternative)—bear considerably less moral responsibility than Trump and the staffers of his thuggish regime. In politics, we should always fire our moral weaponry at the powerful; the powerless, rather like bystanders of armed conflict, should be left to infer the implications of associating closely

with parties rightly under moral assault. Creating shame by proxy, without the resentment provoked by personal blame, is the needed moral tactic.

What keeps a person passive and compliant is fear of repercussions, but once you let go of your attachment to things that don't ultimately matter—money, career, physical safety—you can overcome that fear. Freeing oneself of attachments is always empowering.

The elites should worry about the day when the mob turns from destructive introspection, to directed agency at an external foe. That foe being the rent-seekers and economic manipulators of injustice. Propaganda and monopoly violence don't last forever, and the hysterical response of the establishment to this possibility is what we are witnessing.

We need a new term or word for the class of people dedicated to the spread of inequality. The terms 'bourgeoisie,' 'corporatists,' 'capitalists,' and 'fascists' have been rendered ineffectual in raising the consciousness of working people to their plight. Occupy brought 'the 1%' into consciousness, but there still is a lingering faith that somehow the business community can provide the necessities for a good life, if only "something" can be done to "free" their creative potential. My take on the Fake News phenomenon is that it is yet another phase to keep the working population even more confused and misdirected. It is a strategy to double down on propaganda. Propaganda questioning the validity of propaganda.

In America, the psychic health of the nation is coming into question. Leadership that can provide a vestige of calm amid the rising storm brought about by economic uncertainty will easily gain followers. The crisis of leadership is daily becoming more acute.

Maybe a better strategy would be to come up with a new term for the 80% ruthlessly exploited by the current system. A new term is needed because all others have been corrupted into impotence.

We are confused, in denial, projecting furiously. All this fake news has begun to undermine our vision of ourselves as "the exceptional nation." Our mental pictures of soldiers handing out candy bars to starving child refugees have morphed into drone operators taking out toddlers at wedding parties.

We have elders preaching the American virtues of 'self reliance,' 'personal responsibility,' and the dangers of being coddled by an inefficient nanny state, while enjoying the benefits of a guaranteed monthly social security check deposited into their bank accounts, and having their hip replacements and open heart surgeries paid for by Medicare.

We are still entranced by our national narrative of 'go west, young man,' with acres of fertile prairie and lush coastal valleys ours for the taking; all we need to follow is our sacred work ethic and success will be ours. Well, all the land is posted 'Private' and the water is in the process of being purchased

by faceless corporate entities. And the native Americans, whose land we stole, are pissed and getting organized.

We need new words, a new national narrative, a new vision of where we are, what crimes we committed to get here, how we have managed to bring the planet to the brink of destruction and, finally, how we can salvage what remains and forge a new identity, a better and more sustainable story.

Until then, the next few years (decades?) will be messy. But filled with promise.

The American working classes are uninterested in taking up the world-historical role that Marxist theory assigns to them. All they want is plenty of full time jobs at a living wage. Give them that, and revolutionary activists can bellow themselves hoarse without getting the least flicker of interest out of them.

Every so often, the affluent classes lose track of this, and try to force the working classes to put up with extensive joblessness and low pay, so that affluent Americans can pocket the proceeds. This never ends well. After an interval, the working classes pick up whatever implement is handy—Andrew Jackson, the Grange, the Populist movement, the New Deal, Donald Trump—and beat the affluent classes about the head and shoulders with it until the latter finally get a clue.

This might seem promising for Marxist revolutionaries, but it isn't, because the Marxist revolutionaries inevitably rush in saying, in effect, 'No, no, you shouldn't settle for plenty of full time jobs at a living wage, you should die by the tens of thousands in an orgy of revolutionary violence so that we can seize power in your name.' My readers are welcome to imagine the response of the American working class to this sort of rhetoric.

“Sorry, but I don't have the genetic predisposition to throw myself into a fire for the good of society. In fact, I would go so far as to say that any society that forces its productive members to destroy themselves is pretty close to imploding in any event, so patriotic and righteous self-sacrifice for the whole won't even accomplish anything anyway.”

But, one works at least 50 hours a week, including commute or cumulative small amounts of time thinking about work related shit, or time spent getting ready for work. We make constant sacrifices, but the wrong ones. Our sacrifices are funneled in such a way as to both increase the entrenchment of the status quo and sap our resources for attempting to overturn the existing order. We are clearly willing to sacrifice, even if we may not realize it. Our

freedom and futures depend on us redirecting those sacrifices to where they are needed most, where they can be the most effective agents for change.

Millennials and working classes at-large have no reason not to fight the 1% tooth-and-nail, using every means they can—electoral politics, direct action, and revolutionary struggle. We have nothing to lose—no wealth, status, or bright economic future in this system—and everything to gain.

When we tolerate what we know to be wrong—when we close our eyes and ears to the corrupt because we are too busy, or too frightened; when we fail to speak up and speak out—we strike a blow against freedom and decency and justice.

Should things not improve, should we not quickly gain momentum, we will need to send many more through the meatgrinder.

More and more of the world's people are nobodies: nobody's children, owners of nothing. Not human beings, but human resources who do not have names, but numbers.

There was a girl, and her uncle sold her. Put like that it seems so simple. No man, proclaimed Donne, is an Island, and he was wrong. If we were not islands, we would be lost, drowned in each other's tragedies. We are insulated—a word that means, literally, remember, made into an island—from the tragedy of others, by our island nature, and by the repetitive shape and form of the stories. The shape does not change: there was a human being who was born, lived, and then, by some means or another, died. There. You may fill in the details from your own experience. As unoriginal as any other tale, as unique as any other life. Lives are snowflakes—forming patterns we have seen before, as like one another as peas in a pod, but still unique. Without individuals we see only numbers: a thousand dead, a hundred-thousand dead, 'casualties may rise to a million.' With individual stories, the statistics become people—but even that is a lie, for the people continue to suffer in numbers that themselves are numbing and meaningless. Look, see the child's swollen, swollen belly, and the flies that crawl at the corners of his eyes, his skeletal limbs: will it make it easier for you to know his name, his age, his dreams, his fears? To see him from the inside? And if it does, are we not doing a disservice to his sister, who lies in the searing dust beside him, a distorted, distended caricature of a human child? And there, if we feel for them, are they now more important to us than a thousand other children touched by the same famine, a thousand other young lives who will soon be food for the flies' own myriad squirming children? We draw our lines around these moments of pain, and remain upon our islands, and they cannot hurt us.

I hate it when shit that should never happen in a civilized society gets turned into a feel-good story.

For progressives, best articulated in the Green Party, their strategy remains the same as what was attempted during the 2016 election: to build a third party that can run in local and national elections. But with the push to defeat Trump going to be even greater in 2020, there will most likely be even less of an impetus to build something like the Green Party, and even still, the Green Party got less than 1% of the vote in 2016 at a time when many expected that it was “more safe” than ever to vote for a third option.

In the end, it didn’t matter. The DNC crushed Sanders, the electoral college played its role, and nothing was done about millions of voters who were kicked off the rolls by the Republican CrossCheck program. You want a third party? Great. You just have to figure out how you’re going to move forward in this democracy. If we even had the mass upsurge needed to put a third party into place, let alone protect it from attacks by the ruling elite that would shut it down, we wouldn’t even need to bother with parties to begin with.

“This may be the beginning of a great civil war in this country, between labor and capital. The laboring people, who mostly constitute the militia, will not take up arms to put down their brethren. Even if so-called law and order should beat them down in blood we would, at least, have our revenge on the men who coined our sweat and muscles into millions for themselves.”

David Brooks concludes from his fieldwork in *Red America* that the standard notion of class is flawed. Thinking about class in terms of a hierarchy, where some people occupy more exalted positions than others, he writes, is “Marxist” and presumably illegitimate. The correct model, he suggests, is a high school cafeteria, segmented into self-chosen taste clusters like “nerds, jocks, punks, bikers, techies, druggies, God Squadders,” and so on. “The jocks knew there would always be nerds, and the nerds knew there would always be jocks,” he writes. “That’s just the way life is.” We choose where we want to sit and whom we want to mimic and what class we want to belong to the same way we choose hairstyles or TV shows or extracurricular activities. We’re all free agents in this noncoercive class system, and Brooks eventually concludes that worrying about the problems faced by workers is yet another deluded affectation of the blue-state rich.

Brooks’s inventive explanation for the red-staters’ complete comfort with free-market capitalism is that they don’t know need or envy. “Where they live,” he writes, “they can afford just about anything that is for sale.” On the other hand, blue-state people are reminded constantly that there are people higher than they on the social ladder, simply because of the spatial dynamics

of the city. Evidently, there are no other grounds for disgruntlement at all, which leads to the clear conclusion that no one would ever complain about free-market capitalism—that many of the revolutions and wars and social welfare schemes of the last century could have been avoided—if only the rich would hide themselves better.

This situation may be paradoxical, but it is also universal. For decades Americans have experienced a populist uprising that only benefits the people it is supposed to be targeting. In Kansas we merely see an extreme version of this mysterious situation. The angry workers, mighty in their numbers, are marching irresistibly against the arrogant. They are shaking their fists at the sons of privilege. They are laughing at the dainty affectations of the Leawood toffs. They are massing at the gates of Mission Hills, hoisting the black flag, and while the millionaires tremble in their mansions, they are bellowing out their terrifying demands. “We are here,” they scream, “to cut your taxes.”

“The small-timers in the seafood business... people make fun of them because they don’t know the answers to intelligent questions. Maybe they don’t know the name of the First Lady of the United States, but that’s not what they care about. What they care about is that their motor starts in the morning and that they go out, and go to work. And out there, they’re professionals that nobody can compete with; they’re scientists at their jobs.”

Class, conservatives insist, is not really about money or birth or even occupation. It is primarily a matter of authenticity, that most valuable cultural commodity. Class is about what one drives and where one shops and how one prays, and only secondarily about the work one does or the income one makes. What makes one a member of the noble proletariat is not work per se, but unpretentiousness, humility, and the rest of the qualities that our punditry claims to spy in the red states that voted for George W. Bush and Donald Trump. The nation’s producers don’t care about unemployment or a dead-end life or a boss who makes five-hundred times as much as they do. No. In red land both workers and their bosses are supposed to be united in disgust with those affected college boys at the next table, prattling on about French cheese and villas in Tuscany and the big ideas for running things that they read in books.

“That’s the whole point of being a liberal: to feel superior to people with less money,” seethes the inimitable Ann Coulter. Only when you appreciate the powerful driving force of snobbery in the liberals’ worldview do all their postposterous counter-intuitive arguments make sense. They promote

immoral destructive behavior because they are snobs, they embrace criminals because they are snobs, they oppose tax cuts because they are snobs, they adore the environment because they are snobs. Every pernicious idea to come down the pike is instantly embraced by liberals to show how powerful they are. Liberals hate society and want to bring it down to reinforce their sense of invincibility. Secure in the knowledge that their beachfront haciendas will still be standing when the smoke clears, they giddily fiddle with the little people's rules and morals. Coulter instantiates this thesis about the rich not by opening a copy of *Fortune* or *Cigar Aficionado* but by turning to what's on TV. See, there's all sorts of filth, put there by liberals. We know the liberal elite hate the common people because of what we see on TV, what we read in highbrow modern fiction, all of which can be laid at the doorstep of liberalism. On the other hand, we know that the GOP is the true party of the workers, since the hard-guy Republican is more likely to have a beer with a trucker than the wealthy Nancy Pelosi. We know it because the two social possibilities of American life are mimicking the liberal "beautiful people" of Hollywood or embracing "the working-class hillbillies who go to NASCAR races," that favorite litmus test of the populist right.

They have developed an elaborate theoretical system for generating the politicized anger that is so much in evidence these days and for diverting this resentment from its natural course. By separating class from economics, they have built a Republican-friendly alternative for the disgruntled blue-collar American.

"It is not that anyone thinks that incivility, promiscuity, drug use, and irresponsibility are good things. But we have become embarrassed to criticize them unless we can couch our objections in the legalistic terms of rights, the therapeutic language of self-realization, or the economic jargon of efficiency. The moral condition of the urban poor, romanticized in pop music and advertising, shames us but we dare not say a word. Our new explicitness about sex in television and film, and growing indifference to what we euphemistically call 'sexual preference,' scares the wits out of responsible parents, who see sexual confusion and fear in their children's eyes. But ever since the sixties they risk ridicule for raising objections that earlier would have seemed perfectly obvious to everyone."

The erasure of the economic is a necessary precondition for most of the basic backlash ideas. It is only possible to think that the news is slanted to the left, for example, if you don't take into account who owns the news

organizations and if you never turn your critical powers on that section of the media devoted to business news. The university campus can only be imagined as a place dominated by leftists if you never consider economics departments or business schools. You can believe that conservatives are powerless victims only if you exclude conservatism's basic historical constituency, the business community, from your analysis. Most important, it is possible to understand popular culture as the product of liberalism only if you have blinded yourself to the most fundamental of economic realities, namely, that the networks and movie studios and advertising agencies and publishing houses and record labels are, in fact, commercial enterprises. Indeed, the economic blindness of backlash conservatism is also a product, in large part, of those same commercial cultural enterprises. Conservatives are only able to ignore economics the way they do because they live in a civilization whose highest cultural expressions—movies, advertisements, and sitcoms—have for decades insisted on downplaying the world of work. Conservatives are only able to compartmentalize business as a realm totally separate from politics because the same news media whose “liberal bias” they love to deride has long accepted just such compartmentalization as a basic element of professional journalistic practice.

The truth is that the culture that surrounds us—and that persistently triggers new explosions of backlash outrage—is largely the product of business rationality. It is made by writers and actors, who answer to editors and directors and producers, who answer to senior vice presidents and chief executive officers, who answer to Wall Street bankers, who demand profits above all else. From the mega-mergers of the media giants to the commercial time-outs during the football game to the plots of the Hollywood movies, we live in a market world. The Supreme Court doesn't make American culture; neither does Planned Parenthood nor the ACLU. It is business that speaks to us over the TV set, always in the throbbing tones of cultural insurgency, forever shocking the squares, humiliating the pious, queering tradition, and crushing patriarchy. It is because of the market that our TV is such a sharp-tongued insulter of “family values” and such a zealous promoter of every species of social deviance. It is thanks to New Economy capitalism and its cult of novelty and creativity that our bankers glory in referring to themselves as “revolutionaries” and our discount brokerages tell us that owning stock will smash conformity and usher in the rock ‘n’ roll millennium. We are encouraged to consume Dr. Pepper because it will make us more of an individual; to consume Starbucks because it is somehow more authentic; to pierce our navels and ride souped-up Jet Skis and eat Jell-O because these are such “extreme” experiences. Well maybe the last one is if you were a woman doing it alone with Bill Cosby. Indeed,

counterculture is so commercial and so business-friendly today that a school of urban theorists thrives by instructing municipal authorities on the fine points of luring artists, hipsters, gays, and rock bands to their cities on the ground that where these groups go, corporate offices will follow.

For the aggrieved “Middle Americans,” the experience has been a bummer all around. All they have to show for their Republican loyalty are lower wages, more dangerous jobs, dirtier air, a new overlord class that comports itself like King Farouk—and, of course, a crap culture whose moral free fall continues without significant interference from the grandstanding Christers whom they send triumphantly back to Washington every couple of years. By all rights the charm of Republicanism should have worn off for this part of the conservative coalition long ago. After all, how can you lament the shabby state of American life while absolving business of any responsibility for it? How can you complain so bitterly about culture and yet neglect to mention the main factor making culture what it is? How can you reconcile the two clashing halves of the conservative mind?

By believing in bias, that’s how. Alone among the many, many businesses of the world, the backlash thinkers insist, the culture industry does not respond to market forces. It does the ugly things that it does because it is honeycombed with robotic, alien liberals, trying to drip their corrosive liberalism into our ears. Liberal bias exists because it must exist in order for the rest of contemporary conservatism to be true. As in Saint Anselm’s proof of the existence of God, which flummoxed generations of our ancestors, it simply cannot be any other way. Bias has to be; therefore it is.

Like many of the Conservatives, she gives the impression of intelligence, choosing and enunciating each word carefully, but she also seems oddly naïve, like a person who has sat down and worked out the world’s problems all on her own. She went out of her way to impress upon me their lack of means. But her thoughts on the issues seem all to have been drawn from the playbook of the nineteenth-century Vanderbilts and Fricks. Her solution to urban decline, for example, is school vouchers and the low-wage economy. First we unleash market forces to improve the schools, then “these better schools will produce good workers, that will become attractive to more businesses, that will move in to get these good workers, who will work for lower wages, because they’re from poverty. They aren’t expecting eighty-thousand a year. They’re content to work for six, eight, ten dollars an hour.” And then someday these obedient paupers will be granted the same shot at the good life as everybody else. At least, I hope that’s the plan.

What’s in it for her? Why would a person of limited means make such great sacrifices for a politics that can only leave people like her worse off?

What makes a person who is just scraping by want to help the CEO of Westar pile up the pelf? The answer seems to lie at least partially in the breathtaking beauty of the conservative worldview itself. Everything fits together here; everything has its place; everyone ought to be happy in their station. The god of the market may not have much to offer you personally, but that doesn't change its divinity or blur the awesome clarity of the conservative vision. Besides, there are different ways to serve. Her family themselves may not stand to gain much from, say, a cut in top marginal income tax rates, but there is still joy in doing what is right, in being part of a movement that is advancing so robustly toward its goals.

Although she says she does not oppose a woman's right to vote (obviously she votes all the time), she freely admits to holding old-fashioned views of relations between the sexes:

“I'm a happy captive of forty-three years, and I am obedient to my husband in all things moral. And the other half of it, for a Christian, is my husband has to love and care for me as Jesus loved and cared for the church. And Jesus died for his church, so my husband has to be willing to die for me. And if he's willing to die for me, the least I can do is be obedient in moral things, right?”

The conservatives, it seems to me, can be divided into two basic groups. On one side are the true believers, the average folks who have been driven into right-wing politics by what they see as the tyranny of the lawyers, the America-haters at Harvard, the professional politicians in Washington, or the eviction of God from public space. These kinds of conservative will throw themselves under the wheels of an abortion doctor's car; they will go door-to-door and spend their life savings for their causes; they will agitate, educate, and organize with a conviction that anyone who believes in democracy has to admire. On the other side are the opportunists: professional politicians and lawyers and Harvard men who have discovered in the great right-wing groundswell an easy shortcut to realizing their ambitions. Many of them once aspired to join—maybe even did join—the state's moderate Republican insider club. Rising up that way, however, would take years, maybe a lifetime, when by mouthing some easily memorized God-talk and changing their position on abortion—as many leading conservatives have done—they could instantly have a movement at their back, complete with super-dedicated campaign workers they wouldn't have to pay and a national network of pundits and think tanks and talk-show hosts ready to plug them in.

In rallying average people against those infernal PhDs with their blue-ribbon studies and their government agencies, Republicans have hijacked several legitimate, even honorable, anti-intellectual traditions. The first of these is Protestant evangelicalism, which values the individual's direct emotional contact with God while rejecting the need for a church hierarchy made up of professional clergymen. Critical thinking merely gets in the way of holiness, this tradition holds, and evangelicals have consistently favored charismatic individual preachers over any form of learned organization. Another tradition the backlash swipes is the powerful suspicion of professional expertise associated with the historical left. This attitude originally arose, of course, in opposition to the impositions of the business world, not as a way to get corporations off the hook. Nonviolent social control was the founding rationale for many of the American professions. The professional middle class sold itself as the group that would keep the workers in line, whether with efficiency studies, with public relations experts, or with the pseudoscience of corporate management. And workers responded to its claims, naturally, with skepticism and derision. For working-class people, relations with the middle class are usually a one-way dialogue. From above come commands, diagnoses, instructions, judgments, definitions—even, through the media, suggestions as to how to think, feel, spend money, and relax. Ideas seldom flow upward to the middle class, because there are simply no structures to channel the upward flow of thought from class to class.

Maybe what George Bernard Shaw once wrote is true:

“All professions are conspiracies against the laity.”

It is important when trying to understand the pro-life movement to keep in mind that, whatever else the 1973 *Roe v. Wade* decision might have been, it was also a monument to the power of the professions. In fact, almost the entire history of abortion law can be understood in the context of medical professionalization. Just as the nineteenth-century laws banning the procedure were passed at the behest of physicians just then establishing their own expertise, so the wave of reforms that unbanned the procedure in the sixties and seventies reflected the profession's changing views of itself. Abortion law remained tangled with medical professionalism right to the end: the list of groups that submitted amicus briefs to the Supreme Court in favor of abortion rights in 1973 reads like a veritable Who's Who of the nation's medical hierarchy. Furthermore, the justice who wrote the *Roe* decision, Harry Blackmun, had spent his legal career as the attorney for the Mayo Clinic, and, according to two journalists who have studied the controversy, it was the “rights of the physician” to treat his

patient “according to his best professional judgment” that was foremost in Blackmun’s mind in *Roe*, not the rights of the pregnant woman.

Roe v. Wade also demonstrated in no uncertain manner the power of the legal profession to override everyone from the church to the state legislature. The decision superseded laws in nearly every state. It unilaterally quashed the then-nascent debate over abortion, settling the issue by fiat and from the top down. And it cemented forever a stereotype of liberalism as a doctrine of a tiny clique of experts, an unholy combination of doctors and lawyers, of bureaucrats and professionals, securing their “reforms” by judicial command rather than by democratic consensus.

Ironically, the rise of professionalism among journalists is also one of the cultural factors that has made possible the right’s erasure of the economic. Professionalism’s emphasis on legitimacy and expertise has caused mainstream journalism to define news almost exclusively as the doings of the state, government officials, and rival politicians; the corporate world is not considered a legitimate subject for critical inquiry or the attention of the general public. This lack of true journalistic scrutiny is what made possible such costly debacles as the Enron and WorldCom bankruptcies, the 2008 collapse, and pandemic panics.

A while back the *Wall Street Journal* ran an essay about a place “where hatred trumps bread,” where a manipulative ruling class has for decades exploited an impoverished people while simultaneously fostering in them a culture of victimization that steers this people’s fury back persistently toward a shadowy, cosmopolitan Other. In this tragic land unassuageable cultural grievances are elevated inexplicably over solid material ones, and basic economic self-interest is eclipsed by juicy myths of national authenticity and righteousness wronged. The essay was supposed to be a description of the Arab states in their conflict with Israel, but when I read it I thought immediately of dear old Kansas and the role that locales like Shawnee play in conservatism’s populist myth.

Conservatism’s base constituent, the business community, is the party that has gained the most from the trends that have done such harm out here. But conservatism’s house intellectuals counter this by offering an irresistible alternative way of framing our victimhood. They invite us to take our place among a humble middle-American folk, virtuous and yet suffering under the rule of a snobbish elite who press their alien philosophy down on the heartland. Yes, the conservatives will acknowledge, things have gotten materially worse on the farms and in the small towns, but that’s just business, they tell us. That is just the forces of nature doing their thing. Politics is something different: Politics is about blasphemous art and crazy lawsuits filed by out-of-control trial lawyers and smart-talking pop stars

running down America. Politics is when the people in the small towns look around at what Walmart and ConAgra have wrought and decide to enlist in the crusade against Charles Darwin.

The backlash offers more than this ready-made class identity. It also gives people a general way of understanding the buzzing mass-cultural world we inhabit. Consider, for example, the stereotype of liberals that comes up so often in the backlash oeuvre: arrogant, rich, tasteful, fashionable, and all-powerful. In my real-world experience liberals are nothing of the kind. They are an assortment of complainers—for the most part impoverished complainers—who wield about as much influence over American politics as the cashier at Home Depot does over the company's business strategy. This is not a secret, either; read any issue of *The Nation* or *In These Times* or the magazine sent to members of the United Steelworkers, and you figure out pretty quickly that many liberals don't speak for the powerful or the wealthy. But when you flip through *People* magazine, you come away with a very different impression of what liberals are like. Here you read about movie stars who go to charity balls for causes like animal rights and the "underprivileged." Singers who were big in the seventies express their concern with neatly folded ribbons for this set of victims or that. Minor TV personalities instruct the world to stop saying mean things about the overweight or the handicapped. And beautiful people of every description don expensive transgressive fashions, buy expensive transgressive art, eat at expensive transgressive restaurants, and get edgy with an expensive punk sensibility or an expensive earth-friendly look.

Here liberalism is a matter of shallow appearances, of fatuous self-righteousness; it is arrogant and condescending, a politics in which the beautiful and the wellborn tell the unwashed and the beaten-down and the funny-looking how they ought to behave, how they should stop being racist or homophobic, how they should be better people. In an America where the chief sources of one's ideas about life's possibilities are TV and the movies, it's not hard to be convinced that we inhabit a liberal-dominated world: feminist cartoons for ten-year-olds are followed by commercials for nonconformist deodorants; entire families of movies are organized around some transcendent dick joke; even shows for toddlers have theme songs about keeping it real. Like any industry, though, the culture business exists primarily to advance its own fortunes, not those of the Democratic Party. Winning an audience of teenagers, for example, is the goal that has made the dick joke into a sort of gold standard, not winning elections for liberals. Encouraging demographic self-recognition and self-expression through products is, similarly, the bread and butter not of leftist ideology but of consumerism. These things are part of the culture industry's very

DNA. They are as subject to change by an offended American electorate as is the occupant of the Danish throne.

Never understanding this is a source of strength for the backlash. Its leaders rage against the liberalism of Hollywood. Its voters toss a few liberals out of office and are surprised to see that Hollywood doesn't care. They toss out more liberals and still nothing changes. They return an entire phalanx of pro-business blowhards to Washington, and still the culture industry goes on its merry way. But at least those backlash politicians that they elect are willing to do one thing differently: they stand there on the floor of the US Senate and shout no to it all. And this is the critical point: in a media world where what people shout overshadows what they actually do, the backlash sometimes appears to be the only dissenter out there, the only movement that has a place for the uncool and the funny-looking and the pious, for all the stock buffoons that our mainstream culture glories in lampooning. In this sense the backlash is becoming a perpetual alter-ego to the culture industry, a feature of American life as permanent and as strange as Hollywood itself.

The most important similarity between backlash and mainstream commercial culture is that both refuse to think about capitalism critically. Indeed, conservative populism's total erasure of the economic could only happen in a culture like ours where material politics have already been muted and where the economic has largely been replaced by those aforementioned pseudospiritual fulfillments. This is the basic lie of the backlash, the manipulative strategy that makes the whole senseless parade possible. In all of its rejecting and nay-saying, it resolutely refuses to consider that the assaults on its values, the insults, and the Hollywood sneers are all products of capitalism as surely as are McDonald's hamburgers and Boeing 737s.

The Democratic Leadership Council (DLC), the organization that produced such figures as Bill Clinton, Al Gore, Hillary Clinton, and Barack Obama has long been pushing the party to forget blue-collar voters and concentrate instead on recruiting affluent, white-collar professionals who are liberal on social issues. The larger interests that the DLC wants desperately to court are corporations, capable of generating campaign contributions far outweighing anything raised by organized labor. The way to collect the votes and—more important—the money of these coveted constituencies, “New Democrats” think, is to stand rock-solid on, say, the pro-choice position while making endless concessions on economic issues, on welfare, free-trade, Social Security, labor law, privatization, deregulation, and the rest of it. Such Democrats explicitly rule out what they deride as “class warfare” and take great pains to emphasize their friendliness to business interests. Like the conservatives, they take economic issues off the table.

As for the working-class voters who were until recently the party's very backbone, the DLC figures they will have nowhere else to go; Democrats will always be marginally better on economic issues than Republicans. Besides, what politician in this success-worshipping country really wants to be the voice of poor people? Where's the soft money in that?

The larger result was that both parties became vehicles for upper-middle-class interests and the old class-based language of the left quickly disappeared from the universe of the respectable. The Republicans, meanwhile, were industriously fabricating their own class-based language of the right, and while they made their populist appeal to blue-collar voters, Democrats were giving those same voters—their traditional base—the big brush-off, ousting their representatives from positions within the party and consigning their issues, with a laugh and a sneer, to the dustbin of history. A more ruinous strategy for Democrats would have been difficult to invent. And the ruination just keeps on coming. However desperately they triangulate and accommodate, the losses keep mounting. Curiously enough, though, Democrats of the DLC variety aren't worried. They seem to look forward to a day when their party really is what David Brooks and Ann Coulter claim it to be now: a coming-together of the rich and the self-righteous. While Republicans trick out their poisonous stereotype of the liberal elite, Democrats seem determined to live up to the libel.

The problem is not that Democrats are monolithically pro-choice or anti-school prayer; it's that by dropping the class language that once distinguished them sharply from Republicans they have left themselves vulnerable to cultural wedge issues like guns and abortion and the rest whose hallucinatory appeal would ordinarily be far overshadowed by material concerns. We are in an environment where Republicans talk constantly about class—in a coded way, to be sure—but where Democrats are afraid to bring it up.

The gigantic error in all this is that people don't spontaneously understand their situation in the great sweep of things. They don't just automatically know the courses of action that are open to them, the organizations they might sign up with, or the measures they should be calling for. Liberalism isn't a force of karmic nature that pushes back when the corporate world goes too far; it is a man-made contrivance as subject to setbacks and defeats as any other. Consider our own social welfare apparatus, the system of taxes, regulations, and social insurance that is under sustained attack. Social Security, the FDA, and all the rest of it didn't spring out of the ground fully formed in response to the obvious excesses of a laissez-faire system; they were the result of decades of movement building, of bloody fights between strikers and state militias, of agitating, educating, and thankless organizing. More than forty years passed between the first

glimmerings of a left-wing reform movement in the 1890s and the actual tepid enactment of a few reforms in the 1930s. In the meantime scores of the most rapacious species of robber baron went to their reward untaxed, unregulated, and unquestioned.

As a social system, the backlash works. The two adversaries feed off of each other in a kind of inverted symbiosis: one mocks the other, and the other heaps even more power on the one. This arrangement should be the envy of every ruling class in the world. Not only can it be pushed much, much further, but it is fairly certain that it will be so pushed. All the incentives point that way, as do the never-examined cultural requirements of modern capitalism. Why shouldn't our culture just get worse and worse, if making it worse will only cause the people who worsen it to grow wealthier and wealthier?

The Nature of Identity

If we want to understand the nature of identity, we need to approach it by a different route; not in the timeless depths of our genes and brains, but in the flickering screen of the outside world, which acts as a constant mirror of identity.

That we have an eternal, unchanging self is extremely debatable; the fact that we turn to someone else in our search for it is, by contrast, extremely plausible. Our identity is not an immutable core hidden away in the depths of our being. It is, rather, a collection of ideas that the outside world has inscribed on our bodies. Identity is a construction, and that can be proved by something closely resembling a scientific experiment: adoption.

Take an Indian baby from the Rajasthan village of her birth, have her brought up in Amsterdam, and she will acquire the identity of an Amsterdammer. But if you entrust her instead to a couple from Paris, she will become a Parisienne. If, when she grows up, she goes in search of what she thinks of as her roots, she is going to be disillusioned: they simply don't exist, and in the country of her birth she's likely to find that she's just as alien as any other woman from Amsterdam or Paris. More alien, in fact, because her appearance (skin colour, hair) suggests a bond with the local people that isn't there. We must conclude from this that our psychological identity is shaped by our surroundings. If 'I' had grown up in a different culture with parents belonging to that culture, then 'I' would have been completely different.

Identity is always the temporary product of the interplay between merging and establishing a distance. The mirror that our environment holds up to us determines who we become.

As far as identity is concerned, the most important factor in the genetic hardware is, without doubt, language. We know that the ability to acquire language is innate, but interaction and imitation are crucial: children who grow up in isolation do not learn to speak. The language a child learns depends entirely on its environment. Moreover, the specific nature of that language (each having untranslatable concepts, from *Weltanschauung* to *joie de vivre*) and the way that language is used in the family in which

a child grows up will strongly colour its thinking, including the way the child thinks about itself. Take the fact that various non-Western languages have no equivalent for the word ‘individual’ or ‘personality’: this ensures a completely different context when growing up and acquiring an identity.

Is a baby indeed a blank page, a *tabula rasa* that can be entirely molded by its environment? Every parent knows this isn’t true. Anyone with experience of newborn babies knows that each child has something unique about it as soon as it is born. That ‘something’ is hard to define: an alert look, a sustained attentiveness, or a readiness to interact. It has much more to do with certain traits (introverted or extroverted) and tendencies (quick or slow, persevering or easily deterred) than with content. The mirroring that follows from parents—‘You’re so pigheaded, you’ll come to a sticky end!’ or ‘She’s a strong character just like my grandmother, she’ll go a long way!’—reinforces these tendencies, as do the stories that keep being repeated (‘Right after she was born, she looked at us and then round the whole room. She’s been curious about the world from day one!’). We can’t pin down those unique traits, though I don’t doubt their existence. At the same time, I’m convinced that they are molded by the environmental response to them.

When group cohesion diminishes, identity becomes weaker and more chaotic, and aggression within the group, against the same other, invariably increases. Politicians intuitively exploit this fact: when popular rebellion threatens, create an external enemy, a different other, and the ranks will close again. Ancient Jewish law prescribed that a goat—a scapegoat—be symbolically loaded with the sins of the community and sent into the desert on the Day of Atonement.

A society is deemed successful when it achieves a healthy balance between sameness and difference, diverting aggression into less-dangerous outlets. Football is indeed war, music does soothe the savage breast, Mardi Gras allows licensed misbehaviour, and sending ritual scapegoats into the desert isn’t such a bad idea. This insight needs to be cherished: every group, or, more broadly, every society, needs a safety valve to deal with inevitable aggression. Without that safety valve, every group sooner or later creates actual scapegoats, and sacrifices them on the altar of its anger—bullying is an example of such a practice.

Ideally, societies provide their members with a rich and varied store of narratives to draw on as a starting point for their own identities. A ‘full’ society has ample cultural resources for those seeking answers to existential questions. Its ‘empty’ counterpart has only an impoverished and scanty supply; the mirror it holds up reflects a stereotypical image. A society that heavily censors cultural expression and presents its members with a standard narrative produces stereotypical individuals. Taken to extremes, societies of

both types can induce characteristic identity disorders. In the case of the former, a society can be so full of itself that megalomania results. In the latter case, individuals mean nothing; people are nobodies. This gives rise to the symptoms typical of depression.

Open and closed societies have another significant feature. In an open society, different narratives are allowed to coexist, giving people more options to choose from. As a result, they tend to develop a more open mind. In closed societies, people must make do with a closed narrative, in which everything that is different is shunned as bad and threatening. When taken to extremes, open societies produce a hysterical personality that constantly has to adjust to the latest hype. Closed societies, by contrast, induce classic obsessional neuroses. Like people who are phobic about germs, its members try to keep the outside world at a distance and to have as little to do with it as possible.

Finally, a society can be stable or unstable. This largely depends on the power of the dominant narrative—the more robust it is, the more stable exchanges and thus identity-forming will be. Too much stability can lapse into authoritarian rigidity, with the risk of developing the authoritarian personality. Or, in the absence of a clear narrative, as in today's protean society, a kind of liquid identity has come into being. Beyond a certain point, this liquidity results in borderline personality disorder, when unstable identity causes a constant seesaw of emotions.

Identity is always a construct that derives from an interaction between the identity holder and the wider environment. Identity can be classified as full or empty, open or closed, stable or unstable. Its core is formed by a more-or-less coherent set of norms and values going back to notions and ideology shared by the group, or—to put it in professional jargon—the larger narrative of a particular culture. If that set of norms and values changes dramatically, the identities that are tied to it will invariably change, too, evolving in the direction of the new narrative with the new norms and values. Identity is all about ethics.

Our current conception of ethics, as an external system of rules that is often petty and always disruptive, derives from a particular social evolution. But ethics or morals indeed determine the distinction between good and evil—two words that nowadays immediately put people's backs up. And that's strange, because we've been asking questions about this distinction since human history began—questions that are effectively about the essence of human nature, and therefore also about who we are. They have produced two conflicting answers, along with two entirely different views about the development of identity. One school of thought regards humankind as essentially good, and sees it as society's task to ensure that our benevolent

disposition comes to the fore. The other believes humankind to be essentially bad, and wants society to act as a police officer, to curb our evil tendencies as much as possible. A society in which self-realization is central proceeds from the assumption that people are essentially good—so self-realization is a good idea. A society that takes the opposing view of human nature will be focused on self-denial, because it's all about keeping a check on evil impulses: regular monitoring is necessary, and a firm hand needed on the reins. This notion has dominated Western thought, taking its penultimate shape from Christian ethics.

Aristotle thought that a human is by nature a *zoön politikon*. This is usually translated as “political animal,” but that is not quite right. *Politikon* comes from *polis*, the city-state of antiquity, the precursor of Western democracy. A more accurate translation would be “community animal.” If a person develops optimally, and achieves his or her innate potential, the person will become a true member of the community, and that will in itself bring happiness. Self-realization of this kind within a community boils down to developing certain virtues or *arètai*, the seeds of which are in us all: wisdom, justice, moderation, and courage. This involves maintaining a balance, because if we have too little of a certain characteristic, we won't achieve optimal self-realization. Too much of a certain characteristic is equally bad, and in both cases the individual and the community pay a price. This balance is a product of self-knowledge, because self-knowledge leads to self-control. The better we know ourselves, the more we can control ourselves—*Gnothi seauton*.

The most excellent individual is the one who has the most self-knowledge, making him or her the best-qualified leader. The worst ethical fault that people can be guilty of is hubris—extreme overestimation of their own capabilities—which can cause not only their own downfall, but also bring ruin on those close to them, and even on the community. This theme recurs time and again in Greek tragedies. The opposite of hubris is *sophrosyne*, a virtue combining temperance and wisdom, which fosters self-control.

For Aristotle, as well as for the church, ethics had solid foundations. The former saw it as internal, of biological origin; the latter as external, of divine origin. In other words, ethical rules are not arbitrary. That is the main similarity between the classical interpretation of ethics and Christian morals; for the most part, they largely differ. I shall list some of the differences, as they continue, even now, to shape our thinking much more than we suspect.

The Christian view is that humanity is subject to the authority of the one true God, whose commands have to be obeyed on pain of damnation. Any attempt to escape His all-seeing eye is doomed to failure; sooner or later we will have to pay the price. Instead we must try to live as virtuously

as possible, with only one single aim: to attain eternal life in the next world. Life here on Earth is only significant in the light of the hereafter. Living a virtuous life is very difficult because humanity is, by nature, evil. That's because, according to Christian teaching, we are all tainted with original sin. If people are left to their own devices, they will murder and steal. Self-realization is a very bad idea; self-denial, a necessity. For Christians, ethics is about battling the inner tendency to evil that would otherwise run rampant. Seeking to acquire knowledge is also wicked because that's how the trouble started. Eve wanted to taste the fruit of the Tree of Knowledge—more precisely, knowledge of good and evil. That was why she and Adam were banished from the Garden of Eden. So seeking knowledge is a vain pursuit; mere mortals should leave that kind of thing to God and His earthly representatives, and concentrate on confession, penance, and self-chastisement.

The ancients regarded the man (and it was almost always a man) with the greatest self-knowledge as the most suited to lead the community—the *primus inter pares*, first among equals. Christians take a very different approach: the leader is called by God, and takes an intermediate position between the supreme being and the faithful. A clear pecking order is thus established, with God at the top, followed by his deputized leader. The community and the political leadership occupy an inferior position, and the laws of the land pale into insignificance next to those of the kingdom of God. The Roman emperors threw the Christians to the lions not so much because of their belief, but because they refused to obey the laws of the empire. The Romans were very tolerant when it came to religion, but they regarded civil disobedience as unacceptable.

In the classical world, ethics was rooted in immanence, the notion that everyone carries within them the seed of norms and values. By contrast, Christianity gave rise to the idea of transcendence, originally meaning to “climb beyond” or “surmount.” Everything that is good belongs to the domain of God, who stands above everything. We are created in His image and so we, in turn, stand above nature. The great chain of being, or *Scala Naturae* (Ladder of Nature), a concept that gained popularity in the early Middle Ages, arranged all matter and life in a strictly hierarchical structure. All of creation had its God-given spot on the ladder, and it was vital that everyone knew their allotted place. To study nature was to study that ladder and the creatures perched on its rungs, from the dust at the bottom right up to the seventh heaven at the top. The ladder is both complete and unchanging, given that God has created everything that could be created. Change is impossible, and anyone seeking to leave his or her place commits a cardinal sin: *superbia*, or haughtiness, the successor to the Greek *hubris*.

Even a cursory comparison with Graeco-Roman morality shows what major changes Christianity has wrought in the way we think about ourselves. Ancient ethics is all about habits, character, and self-realization. Man has an innate, inner goal: excellence, which is achieved through self-care leading to self-control. The best leader is the individual with the most self-knowledge. Pride invariably goes before a fall, and its negative consequences aren't confined to the individual, but extend to the community. Conversely, self-care benefits the community as well as the individual. From a Christian point of view, ethics is part of the relationship between a person and something that transcends him or her—that is, God. Human nature is even regarded as inherently evil, so that self-denial is necessary to do good, to approach the divine. In any case, the latter is only possible in the hereafter; life in this vale of tears is fleeting, and serves merely as a means of acquiring God's grace. Every mortal lives in constant fear, and must continually consult his or her conscience. The result is inner conflict, a never-ending battle with the self, often culminating in penitence and punishment, in which it is mainly the body that has to pay. There's no guarantee of salvation, even for those who persevere in their efforts through work and prayer (*ora et labora*); but there is a strong incentive, because on the Day of Judgment, accounts will have to be settled. Efforts of this kind are not made to benefit the community, because a believer's only obligation is towards God.

The double shift in thinking brought about by Christianity persists today and has now become part of our identity. First, we have come to perceive ethics and morality as outside ourselves, and as in conflict with our natural impulses—meaning, of course, that natural impulses are bad. Second, we are convinced that we are accountable to a higher being, an omnipotent agency that watches us all the time. As a result, we have to devise all kinds of escape routes, and we would actually prefer to eliminate that omnipotent agency altogether. At the same time, we have given a new twist to the conviction that humanity is inherently evil, replacing the concept of original sin with equally vague socio-biological notions of man as a wolf for his fellow man, selfish genes, et cetera. Thus, without realizing it, we are espousing the ancient Greek view that ethics is innate—albeit with the opposite conclusion: people are inherently bad and need to have this evil whipped out of them during their upbringing. No wonder that we see ethics and identity as two separate things; inasmuch as we question human nature, the answer tends to be pessimistic.

Christianity introduced yet another important change that is still part of our identity today, and that we may soon come to regret. God, as Supreme Being, is enthroned in Heaven. Beneath Him are the angels; on Earth, men are the closest to Him of all his creations. Consequently, men have dominion

over the rest of creation, starting with women. More importantly, God is above and therefore outside nature. The material universe, the world of the body, is deemed unimportant. Only the spiritual counts, the world of the soul. This is the aspect of transcendence to which I referred earlier. Two-thousand years of Christianity has imprinted this conviction so strongly that we are incapable of reasoning in terms of immanence, of seeing ourselves as part of the wider natural world. A transcendent religion gives believers *carte blanche* to exploit the natural world as they see fit: they are above and outside it, and, anyway, animals don't have a soul (or, in the more modern scientific gloss, aren't able to reason). Inanimate objects such as earth, air, and water are even less important. An immanent religion, by contrast, perceives both the divine and human not as 'above' but as 'in' things, as part of a larger whole. Which means that you should think twice before killing animals, felling forests, or polluting rivers.

Progress—if you ask where this idea comes from, people tend to frown. Surely, progress has always been a concept? We can scarcely conceive that until late into the Renaissance, the opposite—the unchanging nature of all things—was universally assumed to be the case. Even the father of modern botany, Carl Linnaeus, was convinced that all plants had always existed and would always continue to exist; his only task was to systematically chart God's work. Our thinking has undergone a sea change: nothing is fixed; everything is constantly evolving. The development that we go through individually—from little to big, from illiterate to educated—is reflected at the level of society ("primitive" versus "highly developed" societies). It's such a natural assumption that we hardly ever pause to consider it. Note that even the word 'pause' has become somewhat tainted: a lack of motion implies stagnation.

Evolution does not by definition mean progress, and 'fittest' is not the same thing as 'most successful.' Darwin discovered that the extent to which organisms are fitted to their surroundings determines the number of their progeny. A good match or 'fit' between a specific life form and a specific environment results from a combination of chance mutations and environmental changes. If we dub this 'success,' this says more about us than about biology. The most important lesson that evolutionary history teaches us is that the direction taken by evolution is random, unpredictable, and invariably temporary. Progress is a moral judgment by a creature that loves to regard itself in the mirror.

These days, the word 'science' conjures up images of banks of computers operated by white-coated boffins—men as hyper-rational as Mr Spock, albeit without the pointy ears. There is no room for passion; the official thinking is that science must be value-free and objective. Aristotle and

his contemporaries would have been amazed at such naïveté. Science is inherently value-laden because it involves looking for answers to fundamental questions about life. So it's no coincidence that Aristotle elaborated his views on knowledge in two treatises on ethics, because he saw knowledge as subservient to morality. There's no such thing as value-free knowledge, just as there's no such thing as passion-free science. Yet this has been increasingly strongly denied in recent decades, as conceptions of science have got narrower and narrower.

There is an overriding conviction that everything can and should be understood in scientific terms, using propositions that are universally applicable and unaffected by context. Research (which must, of course, be value-free) is based on actual measurements (everything being measurable), and produces data that can then be objectively processed. That such narrowing down can take place in the name of reason is odd, to say the very least. After all, Aristotle distinguished between different forms of knowledge on the basis of an extremely rational conclusion: universal, context-independent knowledge only has a very limited field of application. Indeed, truly important knowledge—in his view, the knowledge needed to administer the city-state—fell entirely outside that sphere, which was why he set greater store by other forms of knowledge. Nowadays, that wisdom has been lost, and the scientific view is that hard science can be applied across the board. More specifically, it can be applied as a rational, perfectly controllable, and predictable instrument, independent of context, in the form of evidence-based protocols. Translated into Aristotelian terms, those protocols will be valid at all times and in all situations, because they are based on generally accepted scientific knowledge.

Both religion and scientism instill in the individual a split identity that springs from a sense of deficiency. I am evil and sinful, or irrational and stupid. If I make enough effort, I can become good or rational, and those in power will help me by continually monitoring me and rewarding or punishing me. If large groups persist in their sinfulness (unbelievers) or stupidity (reactionaries), those in power have to take radical measures: mass conversion, re-education, or if need be, eradication. Even perfectibility has its limits. Both religion and scientism regard present-day humans as imperfect; true perfection will only be found in the hereafter or in a distant future when society is run according to truly scientific principles. In both cases, this requires considerable personal sacrifice. Believers must pray and work hard to attain God's mercy. The ignorant must study hard, and if necessary seek psychological counseling in order to attain reason through the proper insights. The post-modern scientific view is more pessimistic: we will have to wait for a genetic modification of the human race that will

fit us better for the post-industrial society that we have created.

This shift from group to individual is linked to a shift in responsibility. I can have everything I want as long as I come off best in the struggle for life—and that's my responsibility. Society must not hinder me; on the contrary, it must give everyone equal opportunities, and may the best man win. By the same reasoning, care for individuals that have not made it is an anomaly. After all, they only have themselves to blame for their failure, so why should we help them? Progress requires effort, and those who sit around on their backsides must bear the consequences. Adversity can be overcome, and there is no such thing as chance. To fail is to be guilty. People can perfect themselves if they try hard enough—perfection being measured in terms of success and power.

All too easily equated with economic success and financial power, these two factors combine to generate the new goal in life. An unexpected association then arises, with unexpected ethical implications. Rich people are rich by virtue of their own effort and dispositions. Ergo, they are strong characters and, ethically speaking, at the top of the ladder (closest to God, the maker of the ladder). Financial power is equated with moral authority. As a result, we look to bankers and captains of industry to act as leaders of society. Conversely, everyone who fails must be weak characters, if not downright parasites, with dubious norms and values. They are scum, in other words, who are too lazy or stupid to help themselves.

Contrast this with Aristotle's day, when the best leader was the individual with the greatest self-knowledge, which was used to place his or her *arètai*—that is, intellectual and moral virtues—at the disposal of the community. Later, when Christian morals prevailed, the leader was divinely appointed, and his or her task was to curb innate sinfulness to the greater glory of the Kingdom of God. Not so long ago, a press baron could determine the British prime ministership, just as financial lobbies in the US designate presidential candidates. And thus we have made a complete U-turn without noticing it. The Enlightenment assumed that society and ethics could be engineered; evolutionary theory proved that change is the rule. Social Darwinism, by contrast, argued that intervention was wrong, that nature should be allowed free rein: the innate good in man would cause the worthiest to rise to the top. The latest mutation of social Darwinism goes by the name of neoliberalism, and interprets nature to mean market forces. The underlying reasoning remains the same, being demonstrated, where possible, with ever more figures and tables.

Are we essentially good—meaning that if we do go wrong we can blame our environment (from unsuitable friends to too many additives in our baby food)? Or are we innately evil—meaning that only a strict upbringing can

keep us on the straight and narrow? Or are we simply innately ignorant and this ignorance results in actions and outcomes that we see as evil?

Humans are social animals, as Aristotle already knew, but those like Hobbes, Thatcher, and the originators of social-contract theories had apparently forgotten. These theories, which were developed in the eighteenth century, assumed that a person in his or her natural state—nature again!—would be both a solitary and a free being. Only reason could prompt all those solitary creatures to renounce their individual freedom and opt for the group, albeit under certain conditions. These would take the form of a contract (hence contract theory) in which individuals would see the clear benefits of social organization. Those who found the contract wanting could always terminate it. Such a view of humans is scientifically flawed because its premise is wrong. Biology shows that we are social animals; if a member of our species lives a solitary life, he or she is either diseased or has been ostracized. Being ousted from the group is still the earliest punishment in universal use ('Stand in the corner'), and banishment used to be tantamount to death. The concept of the noble savage, leading a solitary life in the wilderness, is no more than a romantic image. Primates live in hierarchically structured groups, in which social relationships very much determine survival and reproduction.

In addition to the importance of the group, primates share another prominent characteristic. In social relationships, the affective basis ("gut feeling") is infinitely more important than the rational and cognitive layers built on top of it. The same applies to humans. We often take crucial decisions in situations that allow little time for conscious thought, and it is mostly only after the event that we rationalize our largely automatic responses, driven by gut feeling. It's not for nothing that rationalization—a retroactive justification of something that we don't really understand and of which we are often ashamed—derives from the Latin word for reason. A system of ethics entirely based on reason, that bypasses gut feelings, only works on paper—like the paper used to draw up social-contract theories.

Sharing behaviour always focuses on a concrete object, ranging from food, to grooming each other for fleas, or scratching each other's back. Societies exist by virtue of the gift—otherwise there would simply be no community—and each culture can be typified, among other things, by the way in which exchanges take place. Identities are determined by the community in which they are formed and consequently by the method of exchange typical of that society. Primates mainly exchange food and sex, and our own economy can be traced back to this form of barter. Different economic systems determine different forms of exchange and, consequently, different identities within different social relationships.

If a society determines social relationships along with norms and values, then in addition to normal identity, society also determines disorders and deviations. Many readers will doubtless find this a dusty old Freudian approach, arguing that there is a medical explanation for such things. Surely psychiatric disorders are diseases originating in the genes and the brain? This notion dominates current thinking, but how much truth is there in it? The fact that genetic factors play a role in a limited number of psychiatric disorders has been more or less established. The rest is conjecture. Moreover, to define something as mentally abnormal is merely to say that it deviates from the norm—that is to say, the social norm. To this day, no single scientific study has succeeded in distinguishing between what is mentally normal and abnormal without using social criteria. To resort to professional jargon: there are no “biological markers.” The current hype surrounding neurobiology and the brain conceals this failure, and the general belief in neurobiology says much about our need for justification: ‘I can’t do anything about it—it’s in my genes; it’s in my brain.’ The need we clearly have for excuses of this kind shows the extent to which we feel accused. Since societies have different norms, they also define deviations differently. Which allows me to bring Freud back into the picture. Mental disorders are also, even primarily, moral disorders. “Patients” no longer comply with the dominant norms and values of their society, causing suffering to themselves and/or others.

A possible explanation for our sense of malaise traces the problem much further back in time—to the collapse of the Grand Narrative. For centuries, religion and ideology provided a source of common identity, centering on ethics and a shared sense of meaning; their loss has created a vacuum. Taking a similar line of reasoning, moral philosophers lay the blame at the door of the Enlightenment, and the soulless, instrumental rationality that it brought forth. Their conclusion is that modern man has nothing left to believe in, depriving us of anchoring points for identity. So it’s hardly surprising that so many problems have arisen. Their proposed solution is to construct a new grand narrative in which we can all believe and from which we can derive a new identity. The problem is that we don’t really know how we could devise, let alone impose, a load-bearing narrative of this kind.

If a great many people are extremely disenchanted with the identity of their fellow beings and want things to go back to how they were, this can only mean one thing: these days, a new identity is setting the tone. This, in turn, means that a new, dominant narrative has taken over, in which the new identity is mirroring itself. And the reason it’s hard to spot is because of its very dominance. An identity-conferring narrative only becomes visible as narrative when it ceases to be coercive. We recently experienced this in

the West in the case of religion: while the Christian narrative was coercive, narrative and reality coincided. Only when secularization took hold did it become visible as narrative, leaving some of the older generation feeling duped. As long as narrative and reality coincide, most people conflate the two. “Get real” means something like, ‘Adapt to the new norm of the new narrative, because that’s the reality.’

Throughout history, economies have always been embedded in religious, ethical, and social structures. This no longer applies in the case of neoliberalism. On the contrary, religion, ethics, and society are subservient to ‘the market.’ In that sense, neoliberalism is no longer an economic theory, but a much broader ideology. Many readers will be surprised to learn that neoliberalism is a progressive movement that, just like other progressive ideologies—such as communism, Nazism, et cetera—seeks to bring about rapid change by revolutionary measures, fully aware that this will entail the (often literal) sacrifice of a generation. This is what the Chicago Boys, the group of economists trained by Milton Friedman, have effectively done in Chile. The same story can be read in the neoliberal bible *Atlas Shrugged*, by Ayn Rand. The book ends as the main character triumphantly flies over the ruined landscape:

“‘The road is closed. We are going back to the world.’ He raised his hand and over the desolate earth he traced in space the sign of the dollar.”

The combination of those two notions, liberty and getting what you deserve, explains meritocracy’s universal attraction. Meanwhile, educational and economic meritocracy have merged, to the extent that intellectual achievements without economic added value are regarded as largely worthless. By way of illustration: the word ‘intellectual’ has now almost become a term of abuse, and many fail to see the irony in the title of the recent critical study “If You’re So Smart, Why Aren’t You Rich?” It is precisely this merger that has brought about a turning point, culminating in what can best be described as a neoliberal meritocracy. The significance of this turning point can be judged by its consequences. In no time, social mobility ground to a halt, the social divide became ever greater, and freedom made way for general paranoia. In other words, exactly the opposite of what was originally intended. There are two reasons for this. First, the notion that everyone starts off in the race of life with equal opportunities is illusory. Second, after a while, a meritocracy gives rise to a new elite, who carefully shut the door on those coming up behind them.

Yet at first sight a combined meritocracy (economic and educational) seems very appealing and easy to sell. Equal opportunities for all, the greatest

rewards for those who make the greatest effort—who could object to that? Experience shows, however, that discrepancies at the start strongly influence the final result. In the case of an educational meritocracy, such discrepancies can be partially offset by investment in primary education, though you can't do much about the intellectual and moral baggage that children get from the home environment. In the case of an economic meritocracy, it is downright impossible to ensure equal starting opportunities. We can't all be born into wealthy families. What's more, the two best starting positions often coincide: a wealthy background usually goes hand in hand with a good education. All in all, we don't have as much free choice as we think, and the idea of the free individual who enjoys unlimited freedom of choice thanks to his or her own efforts is one of the greatest fallacies of our time. Even if inequality could be minimized at the start, the impact of a neoliberal meritocracy will ultimately be very negative. But for that to be understood, it needs to be viewed in the long-term. In its initial stage, a meritocracy has an overwhelmingly positive impact, especially in a society or organization previously dominated by tradition, nepotism, and seniority. At last, people get what they deserve; at last, they can flourish on the basis of their own efforts. This initial period is followed by an interval of stability, after which the system has exactly the opposite effect to that intended.

Social Darwinism and neoliberal meritocracy create the impression that they favour the individual who is naturally the best. He or she would have made it anyway; we are just giving nature a helping hand to speed the fittest up the ladder. But the reality is somewhat different. Both social Darwinists and meritocratists themselves determine who is the fittest and, crucially, how that is to be measured. In practice, they create an increasingly narrow version of reality, while claiming that they promote natural winners. They then preserve that reality by systematically favouring those winners, thus keeping them on top. The fact that they remain there is advanced to prove the validity of this approach.

The supposedly scientific belief in the natural supremacy, first of men over women, and later of the white race (Europeans) and WASPs (White Anglo-Saxon Protestants) over the rest of the world, is a classic illustration of this process. It led to women and non-whites being deprived of a decent education, to say nothing of decent jobs, on the grounds that such things were beyond their capacity. The position of boss was reserved for a few white men, creating the impression that women and non-whites were incapable of leadership, too. On top of that, they could be exploited shamelessly by virtue of their supposed inferiority. Maintaining systems like this creates static societies in which the upper echelons perpetuate their own position and privileges, ensuring above all that they are kept beyond the reach of

the underclass.

A meritocracy can only function through a centrally directed and rigidly planned system that measures “production” and individual contributions to it. The nature of the system limits the number of winners—only the best can be boss. So every appointment or promotion necessarily entails competition, with career growth being an option only for the few. A cut-throat contest ensues, which in turn causes the criteria for success to be tightened yet further.

An increase in top-down management is inherent to all neoliberal processes: a neoliberal organization invariably creates a non-productive top layer whose main task is to maintain its position by monitoring others, resulting in ever-proliferating rules and regulations. Performance measurement is fostered in the name of “transparency,” the idea being that the criteria are clear and apply equally to all. However, studies show that they only apply to those who do the actual work, not to those who do the measuring—that’s the difference between the worker ants and the manager queens. There is a good metaphor to challenge the so-called transparency of those measurements. The famous pane of glass on the work floor, through which everyone can supposedly see and thus monitor everyone else, is in fact much more like the one-way mirror used for covert observation. On one side, they are transparent; on the other, they are regular mirrors. The measuring voyeurs watch the workers from behind the mirror, themselves hidden from view. Meanwhile the workers themselves can only see, in the mirrors that surround them, their own misery multiplying.

Identity develops optimally in a stable environment where clear authority figures ensure secure bonding. In other words, a child flourishes when people take decisions on its behalf in a consistent way (‘First I’ll tell you a story, then it’s time for bed’), until such time as it can do so itself. Once this secure foundation is in place, content is transferred smoothly via the mirroring processes, the child develops confidence in itself and in others, and is able to distance itself and make its own choices. In this way, it gradually acquires a robust identity. The content of someone’s identity depends on the broader group in which they grew up, and particularly on dominant communal notions, the narrative shared by the group. Those notions are invariably moral in nature, consisting largely of norms and values that determine the way we view ourselves and others. They are reflected in mores or ethics and, by extension, laws. Up to two generations ago, these influences largely came from the family in which someone grew up and their own immediate social circle. The explanation is simple: people spent most of their time in their own small orbits; the impact of the outside world was fairly limited.

The way in which our identity develops has not changed: we still mirror

ourselves in the dominant narrative, with its embedded norms and values. But these days we mirror ourselves far less in our parents, and far more in the flat screens from which we cannot escape, now that they also pollute public spaces and our pockets. This is the millennial version of the constantly repeated hypnopaedic messages in *Brave New World*, and its efficacy exceeds even Huxley's worst nightmares. The advertising world and the media bring us glad tidings against which we have little defense. Their hidden, sophisticated strategy is to convince us that they have our own interests at heart. This usually involves us buying a particular product, 'Because you're worth it.'

The paradox of our era as follows: 'Never have we been so free. Never have we felt so powerless.' We are indeed freer than before, in the sense that we can slag off religion (though we have to be careful when it comes to Islam and Judaism—though lets be honest, mainly with the Jews), take advantage of the new laissez-faire attitude to sex, and support any political movement we like. We can do all these things because they no longer have any significance—freedom of this kind is prompted by indifference. Yet, on the other hand, our daily lives have become a constant battle against a bureaucracy that would make Kafka feel weak at the knees.

We feel this hidden yoke all the more when it comes to that second lie, perfectibility. Our presumed freedom is tied to one central condition: we must be successful—that is, make something of ourselves. Here, the Aristotelian notion of self-realization as the ethical cultivation of the seed of self gets an extremely contemporary interpretation. The freedom to choose another form of self-realization, outside the success narrative, is very limited. You don't need to look far for examples. A highly skilled individual who puts parenting before his or her career comes in for criticism. A person with a good job who turns down promotion to invest more time in other things is seen as crazy—unless those other things ensure success. A girl who wants to become a primary-school teacher is told by her parents that she should start off by getting a master's degree in economics—a primary-school teacher, whatever can she be thinking of!

Yes, we have been liberated from priests and the morality they imposed on us; but, no, this does not mean we are free. Quite the reverse. A new morality has arisen, with its own high priests, who force it upon us with Jesuitical fervour, arguing that it is scientific and therefore not to be questioned. Its commandment is "measurable effectiveness," which is also the mantra of the first modern high priest, the manager. The high priest's second-in-command, the father confessor, has now been replaced by the psychotherapist, whose mantra is "adaptation." To this end, psychotherapists have devised their own personal Rank and Yank system, veiled by a pseudo-

psychiatric diagnosis. Systematic effectiveness is nothing more than a moral fiction, a fable. Actually, it is a double fiction. On the one hand, it remains completely unclear whether neoliberal management is effective—and there are numerous economic proofs to the contrary. On the other hand, the term ‘effectiveness’ obscures the actual goal: greater short-term profit. The moral aspect is, if possible, even harder to spot, hidden away behind figures and statistics that may not be questioned, let alone subjected to moral debate, on the grounds that they provide objective proof. Meetings nowadays often start with a presentation of the latest stats, followed by an announcement of measures that the dictatorship of figures makes almost inevitable.

This is the large-scale manipulation of individuals. Not just manipulation of the way in which they organize their work, and thus their lives, but, more broadly, manipulation of the way they think about themselves and others. The main thrust of that thinking is clear. If success is the new moral standard, those who commit the sin of failure need to be referred by the high priest (manager) to the father confessor (psychotherapist) for further treatment. All this must be done as efficiently as possible, of course.

The contrast between a society that makes people ill and a healthy state of nature is misguided. All societies, without exception, induce illness, just as they induce well-being. The explanation is simple. Every community defines and shapes its own normality, in the same breath defining and shaping its abnormality. The mindset that dominates this process defines the practices that result. It makes quite a difference whether those practices are shaped by a religious mindset (so that someone who deviates is a sinner to be converted, a heretic, or a witch); a medical one (someone who deviates is a patient needing treatment); or an economic one (someone who deviates is a parasite). The only common element is exclusion. On this side of the line you have us, the normal ones; on the other, them, the abnormal ones. So a single individual can at one and the same time be a martyr (religious mindset), a dangerous lunatic (medical mindset), and a terrorist (economic mindset). The question, therefore, is not whether a society makes people ill or well. It is rather how a particular society defines deviations, and what consequences this has. When, as is quite conceivable, such definitions are ethically dubious, a society will find itself in conflict with its fundamental principles. In a word, it will destroy the very ties that hold it together. And this is happening now.

Our identity is shaped by two basic urges: the desire to merge with the other, and the desire for autonomy. Both need to be kept in balance. The first promotes sameness, and thus group forming and subjugation; the second fosters difference, and thus individualism and autonomy. If social-group formation is too weak, the need for the other is felt much more strongly.

People will seek affiliation with others on the basis of common characteristics, many of them debatable, from sharing the same illness label to bullying the same victim. If social-group formation is too strong, personal aspirations are stifled. People desperately try to escape the system in a bid to gain some control over their lives. The more totalitarian the state, the greater the urge for autonomy. Pressure to conform breeds defiance: girls forced to wear a school uniform will try to give it a personal touch.

Both urges also create their own brand of fear and aggression. Up to a few generations ago, Western life was dominated by a fixed, unchanging social order, resulting in a safe lethargy. That social order came to be seen as intrusive and overly controlling, sparking a desire for autonomy. Aggression was directed at central authority and its wish for uniformity. These days, society focuses on the individual. As a result, people feel less secure and more mistrustful of others. They are also much quicker to express aggression, against any “other” they perceive as potentially threatening. Yet at the same time the need for that other is universally felt. The fear of abandonment and, even worse, loneliness, is very great.

The death of public spiritedness and the rise of hyper-individualism can largely be attributed to the current economic model, which systematically pits people against each other, heightening feelings of disparity. If we want to restore the balance between sameness and difference, between public spirit and autonomy, we must transform today’s system of labour organization, and rethink the economy.

These days, the calls for more collective care, “more government,” are becoming increasingly vociferous. A growing group believes that our individual freedom has become far too great and the impact of the community far too small; it urgently wants this imbalance to be corrected. It is directly opposed by another group, which is equally vociferous in concluding the opposite, that we have too much State and too much interference from above. Call a halt, they say, and let people do their thing. Both views are wrong. Contrary to what the first group claims, we are not free at all as individuals, and there is in fact too much interference from above. Contrary to what the second group claims, we have too little State; the current political authorities have almost no say left in how things are run.

Neoliberalism is not an emancipatory regime that has made individuals autonomous by curbing external interference. The fact that the neoliberal economy has put politicians in its pockets has not resulted in fewer rules and greater freedom of choice. Quite the reverse. The proliferation in contracts, rules, and regulations is universally felt—and is an inevitable consequence of the way in which a neoliberal society functions. When you no longer have any symbolic, identifiable authority, and when a communal ethos has been

elbowed out by a view of humanity as competing individuals, the result is indeed the survival of the fittest. The vacuum left by authority is filled with ever more regulations. This is the first important paradox of the neoliberal free-market ideology: it invariably culminates in an excess of interference.

The second paradox concerns the so-called liberation of the individual. Anyone who buys into this claim is confusing individualization and loneliness with autonomy and free choice. The obligation to both succeed and enjoy has turned postmodern consumers into clones of each other's exclusiveness, without the advantage of mutual solidarity. Hence the strange combination of excessive individualism and a collective consumerism in which we all cherish the illusion that we are unique. The irony is that we end up flocking together at a "little place that nobody knows about," brandishing the latest "personal" computer and "exclusive" limited-edition handbag or pair of shoes, firmly convinced that we, and we alone, are free spirits who don't just blindly follow the herd. Individualism has indeed gone too far in this day and age. People have been reduced to consumers who live in the illusion that they are unique and make their own choices. In actual fact, they are being made to think and behave alike to an extent that is previously unparalleled. Self-care has fallen by the wayside, because consumerism sweeps away any notions of self-control and restraint. So wrangling about whether 'the government' or 'the individual' should be given a greater say is missing the point. There is no effective government anymore, just as there are no longer any autonomous individuals.

Seeking Connection

Just as we have shifted en masse from eating food to eating junk food, we have shifted from having meaningful values to having junk values. All this mass-produced fried chicken looks like food, and it appeals to the part of us that evolved to need food; yet it doesn't give us what we need from food—nutrition. Instead, it fills us with toxins. In the same way, all these materialistic values, telling us to spend our way to happiness, look like real values; they appeal to the part of us that has evolved to need some basic principles to guide us through life; yet they don't give us what we need from values—a path to a satisfying life. Instead, they fill us with psychological toxins. Junk food is distorting our bodies. Junk values are distorting our minds. Materialism is KFC for the soul.

In 1978, two Canadian social scientists got a bunch of four- and five-year-old kids and divided them into two groups. The first group was shown no commercials. The second group was shown two commercials for a particular toy. Then they offered these four- or five-year-old kids a choice. They told them: You have to choose, now, to play with one of these two boys here. You can play with this little boy who has the toy from the commercials—but we have to warn you, he's not a nice boy. He's mean. Or you can play with a boy who doesn't have the toy, but who is really nice.

If they had seen the commercial for the toy, the kids mostly chose to play with the mean boy with the toy. If they hadn't seen the commercial, they mostly chose to play with the nice boy who had no toys. In other words, the advertisements led them to choose an inferior human connection over a superior human connection—because they'd been primed to think that a lump of plastic is what really matters. Two commercials—just two—did that. Today, every person sees way more advertising messages than that in an average morning. More eighteen-month-olds can recognize the McDonald's 'M' than know their own surname. By the time an average child is thirty-six months old, she already knows a hundred brand logos.

A few years ago, an advertising agency head explained approvingly:

“Advertising at its best is making people feel that without

their product, you're a loser. Kids are very sensitive to that. You open up emotional vulnerabilities, and it's very easy to do with kids because they're the most emotionally vulnerable."

This sounds harsh, until you think through the logic. Imagine if you watched an ad and it told you: you're fine how you are. You look good. You smell good. You're likable. People want to be around you. You've got enough stuff now. You don't need any more. Enjoy life. That would—from the perspective of the advertising industry—be the worst ad in human history, because you wouldn't want to go out shopping, or lunge at your laptop to spend, or do any of the other things that feed our junk values. It would make you want to pursue your intrinsic values—which involve a whole lot less spending, and a whole lot more happiness.

When they talk among themselves, advertising people have been admitting since the 1920s that their job is to make people feel inadequate—and then offer their product as the solution to the sense of inadequacy they have created. Ads are the ultimate frenemy—they're always saying: 'Oh babe, I want you to look/smell/feel great; it makes me so sad that that at the moment you're ugly/stinking/miserable; here's this thing that will make you into the person you and I really want you to be. Oh, did I mention you have to pay a few bucks? I just want you to be the person you deserve to be. Isn't that worth a few dollars? You're worth it.' This logic radiates out through the culture, and we start to impose it on each other, even when ads aren't there. Why did I, as a child, crave Nike air-pumps, even though I was as likely to play basketball as I was to go to the moon? It was partly because of the ads—but mostly because the ads created a group dynamic among everyone I knew. It created a marker of status, that we then policed. As adults, we do the same, only in slightly more subtle ways.

This system trains us to feel there's never enough. When you're focused on money and status and possessions, consumer society is always telling you more, more, more, more. Capitalism is always telling you more, more, more. Your boss is telling you work more, work more, work more. You internalize that and you think: Oh, I got to work more, because my self depends on my status and my achievement. You internalize that. It's a kind of form of internalized oppression. It also explains why junk values lead to such an increase in anxiety. You're always thinking—Are they going to reward me? Does the person love me for who I am, or for my handbag? Am I going to be able to climb the ladder of success? You are hollow, and exist only in other people's reflections. That's going to be anxiety-provoking.

We are all vulnerable to this. The way I understand the intrinsic values is that they are a fundamental part of what we are as humans, but they're

fragile. It's easy to distract us from them. You give people social models of consumerism and they move in an extrinsic way. The desire to find meaningful intrinsic values is there, it's a powerful part of who we are, but it's not hard to distract us. And we have an economic system built around doing precisely that.

I kept thinking of a middle-class married couple who live in a nice semidetached house in the suburbs, where we grew up. They are close to me; I have known them all my life; I love them. If you peeked through their window, you'd think they have everything you need for happiness—each other, two kids, a good home, all the consumer goods we're told to buy. Both of them work really hard at jobs they have little interest in, so that they can earn money, and with the money they earn, they buy the things that we have learned from television will make us happy—clothes and cars, gadgets and status symbols. They display these things to people they know on social media, and they get lots of likes and comments like, “OMG—so jealous!” After the brief buzz that comes from displaying their goods, they usually find they become dissatisfied and down again. They are puzzled by this, and they often assume it's because they didn't buy the right thing. So they work harder, and they buy more goods, display them through their devices, feel the buzz, and then slump back to where they started.

They both seem to me to be depressed. They alternate between being blank, or angry, or engaging in compulsive behaviors. She had a drug problem for a long time, although not anymore; he gambles online at least two hours a day. They are furious a lot of the time, at each other, at their children, at their colleagues, and, diffusely, at the world—at anyone else on the road when they are driving, for example, who they scream and swear at. They have a sense of anxiety they can't shake off, and they often attach it to things outside them—she obsessively monitors where her teenage son is at any moment, and is afraid all the time that he will be a victim of crime or terrorism.

This couple has no vocabulary to understand why they feel so bad. They are doing what the culture has been priming them to do since we were infants—they are working hard and buying the right things, the expensive things. They are every advertising slogan made flesh. Like the kids in the sandbox, they have been primed to lunge for objects and ignore the prospect of interaction with the people around them. They aren't just suffering from the absence of something, such as meaningful work, or community. They are also suffering from the presence of something—an incorrect set of values telling them to seek happiness in all the wrong places, and to ignore the potential human connections that are right in front of them.

At some level I really believe that most people know that intrinsic values

are what's going to give them a good life. When you do surveys and ask people what's most important in life, they almost always name personal growth and relationships as the top two. But I think part of why people are depressed is that our society is not set up in order to help people live lifestyles, have jobs, participate in the economy, or participate in their neighborhoods in ways that support their intrinsic values.

The rise of the hollow brands—selling everything, owning next to nothing—happened over decades when the key institutions that used to provide individuals with a sense of community and shared identity were in sharp decline: tightly knit neighborhoods where people looked out for one another; large workplaces that held out the promise of a job for life; space and time for ordinary people to make their own art, not just consume it; organized religion; political movements and trade unions that were grounded in face-to-face relationships; public-interest media that strove to knit nations together in a common conversation. All these institutions and traditions were and are imperfect, often deeply so. They left many people out, and very often enforced an unhealthy conformity. But they did offer something we humans need for our well-being, and for which we never cease to long: community, connection, a sense of mission larger than our immediate atomized desires.

These two trends—the decline of communal institutions and the expansion of corporate brands in our culture—have had an inverse, seesaw-like relationship to one another over the decades: as the influence of those institutions that provided us with that essential sense of belonging went down, the power of commercial brands went up. I've always taken solace from this dynamic. It means that, while our branded world can exploit the unmet need to be part of something larger than ourselves, it can't fill it in any sustained way: you make a purchase to be part of a tribe, a big idea, a revolution, and it feels good for a moment, but the satisfaction wears off almost before you've thrown out the packaging for that new pair of sneakers, that latest model iPhone, or whatever the surrogate is. Then you have to find a way to fill the void again. It's the perfect formula for endless consumption and perpetual self-commodification through social media, and it's a disaster for the planet, which cannot sustain these levels of consumption.

It's always worth remembering: at the heart of this cycle is that very powerful force—the human longing for community and connection, which simply refuses to die. And that means there is still hope: if we rebuild our communities and begin to derive more meaning and a sense of the good life from them, many of us are going to be less susceptible to the siren song of mindless consumerism (and while we're at it, we might even spend less time producing and editing our personal brands on social media).

Internet obsession is a way of escaping anxiety, through distraction. Before the Internet addiction, they had felt lost and isolated in the world. Then the online world offered these young people things that they craved but that had vanished from the environment—such as a goal that matters to you, or a status, or a tribe. The highly popular games are the multiplayer games, where you get to be part of a guild—which is a team—and you get to earn your status in that guild. The positive side of that, these guys would say, is—‘I’m a team player. I know how to cooperate with my guys.’ It’s tribalism at its core. Once you have that you can immerse yourself in an alternate reality and completely lose track of where you are. You feel rewarded by the challenges of it, by the opportunity for cooperation, by the community that you’re in, and have status in—and you have much more control over it than the real world.

Not long before he died, a Native American named Chief Plenty Coups sat in his home on the flatlands of Montana and looked out across a landscape where once his people had roamed alongside the buffalo, and now there was nothing. He had been born in the last days when his people—the Crow—had lived as a nomadic hunting tribe. One day, a white cowboy arrived and said he wanted to tell the chief’s story—to faithfully record it, in the chief’s own words, for the ages. Many white men had stolen Native American stories and warped them, so it took a long time to build trust between these two men. But once it was there, Chief Plenty Coup began to tell this man a story. It was about the end of the world.

When he was young, he explained, his people had ranged across the Great Plains on horseback, and their lives had always been organized around two crucial activities. They hunted, and they prepared for the wars they fought against rival Native American tribal groups in their area. Everything they did was designed to prepare them for one of these two organizing poles of life. If you cooked a meal, it was in preparation for the hunt, or for the fight. If you conducted the ceremonial Sun Dance, it was to ask for strength in the hunt, or in the fight. Even your name—and the name of everyone you knew—was based on your role in the hunt, or in the fight. This was the world.

He described its many rules. For example, at the heart of the Crow worldview was the idea of planting something called a coupstick—a carved wooden spike. As you traveled across the plains, you would mark out your own tribe’s territory by planting a coupstick in the ground. The stick meant: anybody who passes beyond this point is an enemy and will be attacked. The most admirable thing you could do, in the Crow culture, was to plant and defend the coupsticks. These were at the core of their moral vision.

Chief Plenty Coups continued to describe the rules of his lost world in

great detail. He conjured his life, the spiritual values of his people, their relationship with the buffalo and with their rival tribes. It was a world as complex as the civilizations of Europe or China or India, and as structured with rules and meaning and metaphor. But the cowboy noticed there was something strange about this story. The chief was just a teenager when the white Europeans came, and the wild buffalo were all killed, and the Crow were killed, and the survivors were penned into reservations. But the chief's story always ended there. As for the rest of his life, the majority of it—he had no stories. He had nothing to say.

He would get to the point where the Crow were shut into reservations, and say:

“After this, nothing happened.”

Of course the cowboy knew—everyone knew—that the chief had done many more things in his life. A lot had happened. But in a very real sense, the world had ended, for him, and for his people. Sure, on the reservation, they could still plant coupsticks in the ground, but it made no sense. Who was going to cross them? How could they be defended? Sure, they could talk about courage, the value they most cherished—but how could they show courage in any way that made sense to them when there was no more hunting, no more fighting? Sure, they could still perform the Sun Dance, but why bother, when there were no hunts and no battles to ask for success in? How could you show ambition, or spirit, or bravery? Even everyday activities seemed pointless.

Before, meals had been preparation for the hunt or the fight. Obviously, the Crows continued to cook meals. And if asked, they could say what they were doing. And if asked further about it, they could say that they were trying to survive, trying to hold their family together from one day to the next. But there was no larger framework of significance into which it could fit.

I'd grown up in a Boston suburb where people's homes were set behind deep hedges or protected by huge yards and neighbors hardly knew each other. And they didn't need to: nothing ever happened in my town that required anything close to a collective effort. Anything bad that happened was taken care of by the police or the fire department, or at the very least the town maintenance crews. I worked for them one summer. I remember shoveling a little too hard one day and the foreman telling me to slow down because, as he said:

“Some of us have to get through a lifetime of this.”

The sheer predictability of life in an American suburb left me hoping—somewhat irresponsibly—for a hurricane or a tornado or something that would require us to all band together to survive. Something that would make us feel like a tribe. What I wanted wasn't destruction and mayhem but the opposite: solidarity. I wanted the chance to prove my worth to my community and my peers, but I lived in a time and a place where nothing dangerous ever really happened.

Robert Frost famously wrote that home is the place where, when you have to go there, they have to take you in. The word 'tribe' is far harder to define, but a start might be the people you feel compelled to share the last of your food with.

Over the course of three centuries, America became a booming industrial society that was cleaved by class divisions and racial injustice but glued together by a body of law that, theoretically at least, saw all people as equal. The Indians, on the other hand, lived communally in mobile or semi-permanent encampments that were more or less run by consensus and broadly egalitarian. Individual authority was earned rather than seized and imposed only on people who were willing to accept it. Anyone who didn't like it was free to move somewhere else.

It's easy for people in modern society to romanticize Indian life. That impulse should be guarded against. Virtually all of the Indian tribes waged war against their neighbors and practiced deeply sickening forms of torture. Prisoners who weren't tomahawked on the spot could expect to be disemboweled and tied to a tree with their own intestines or blistered to death over a slow fire or simply hacked to pieces and fed alive to the dogs. If there is any conceivable defense for such cruelty, it might be that in Europe at the time, the Spanish Inquisition was also busy serving up just as much barbarism on behalf of the Catholic Church. Infidels were regularly burned alive, broken on the rack, sawn in half lengthwise, or impaled slowly on wooden stakes from the anus to the mouth. The Protestant Reformation changed a lot of things about Christianity but not its capacity for cruelty, and early Puritan leaders in New England were also renowned for their harsh justice. Cruelty, in other words, was very much the norm for that era, and the native tribes of North America were no exception.

The question for Western society isn't so much why tribal life might be so appealing—it seems obvious on the face of it—but why Western society is so unappealing. On a material level it is clearly more comfortable and protected from the hardships of the natural world. But as societies become more affluent they tend to require more, rather than less, time and commitment by the individual, and it's possible that many people feel that affluence and safety simply aren't a good trade for freedom. One study in the 1960s found

that nomadic !Kung people of the Kalahari Desert needed to work as little as twelve hours a week in order to survive—roughly one-quarter the hours of the average urban executive at the time.

“The ‘camp’ is an open aggregate of cooperating persons which changes in size and composition from day to day. The members move out each day to hunt and gather, and return in the evening to pool the collected foods in such a way that every person present receives an equitable share. Because of the strong emphasis on sharing, and the frequency of movement, surplus accumulation is kept to a minimum.”

The relatively relaxed pace of !Kung life—even during times of adversity—challenged long-standing ideas that modern society created a surplus of leisure time. It created exactly the opposite: a desperate cycle of work, financial obligation, and more work. The !Kung had far fewer belongings than Westerners, but their lives were under much greater personal control.

Among anthropologists, the !Kung are thought to present a fairly accurate picture of how our hominid ancestors lived for more than a million years before the advent of agriculture. Genetic adaptations take around 25,000 years to appear in humans, so the enormous changes that came with agriculture in the last 10,000 years have hardly begun to affect our gene pool. Early humans would most likely have lived in nomadic bands of around fifty people, much like the !Kung. They would have experienced high levels of accidental injuries and deaths. They would have countered domineering behavior by senior males by forming coalitions within the group. They would have been utterly intolerant of hoarding or selfishness. They would have occasionally endured episodes of hunger, violence, and hardship. They would have practiced extremely close and involved childcare. And they would have done almost everything in the company of others. They would have almost never been alone.

The Efe and Aka people of the Western Congo Basin and the !Kung San of the Kalahari desert—these hunter-gatherers are radical egalitarians, meaning they live in groups without hierarchy or socioeconomic stratification, as humans did for nearly all of our evolutionary prehistory. Among these tribes, no one owns anything and no one’s status is any higher or lower than anyone else’s. The notion of property is unknown. This state of affairs is reinforced by several mechanisms. One is object demands. It is common for one woman to walk up to another and demand her beads, for example, or for a child to approach an unrelated adult and demand a portion of his or her food, or for one man to demand and receive another’s spear tips

for hunting. Saying no is unheard of. These gift demands reinforce the notion that nobody owns anything. Self-effacement and downplaying one's own achievements and those of others is another way to ensure no sense of hierarchy develops. "We're not sure who killed the duiker we found under the acacia tree," someone announces after a successful hunt, knowing full well who did. "Maybe it was someone from another group. We will get it, all of us, and we will distribute it to everyone." The man supplying coveted meat cannot take or receive credit. Everyone and no one killed the duiker, and so everyone is and remains equal.

Forager egalitarianism is predicated on the deliberate rejection of attempts to dominate. This attitude serves as a crucial check to the natural human propensity to form hierarchies: active equalization is employed to maintain a level playing field. Numerous means of enforcing egalitarian values have been documented by anthropologists, graduated by severity. Begging, scrounging, and stealing help ensure a more equal distribution of resources. Sanctions against authoritarian behavior and self-aggrandizement range from gossip, criticism, ridicule, disobedience, to ostracism and even physical violence, including homicide. Leadership consequently tends to be subtle, dispersed among multiple group members, and transient; the least assertive have the best chances to influence others. This distinctive moral economy has been called "reverse dominance hierarchy"—operative among adult men (who commonly dominate women and children), it represents the ongoing and preemptive neutralization of authority.

Among the Hadza, a group of a few hundred hunter-gatherers in Tanzania, camp members forage individually and strongly prefer their own households in distributing the acquired food. At the same time, food sharing beyond one's own household is expected and common, especially when resources can readily be spotted by others. Hadza may try to conceal honey because it is easier to hide, but if found out, they are compelled to share. Scrounging is tolerated and widespread. Thus even though individuals clearly prefer to keep more for themselves and their immediate kin, norms interfere: sharing is common because the absence of domination makes sharing hard to resist. Large perishable items such as big game may even be shared beyond the camp group. Saving is not valued, to the extent that available resources tend to be consumed without delay and not even shared with people who happen to be absent at that moment. As a result, the Hadza have only minimal private possessions: jewelry, clothes, a digging stick, and sometimes a cooking pot for women; a bow and arrows, clothes and jewelry, and perhaps a few tools for men. Many of these goods are not particularly durable, and owners do not form strong attachments to them. Property beyond these basic items does not exist, and territory is not defended. The

lack or dispersion of authority makes it hard to arrive at group decisions, let alone enforce them. In all these respects, the Hadza are quite representative of extant foraging groups more generally.

Forager inequality is not nonexistent but merely very low compared to inequality in societies that rely on other modes of subsistence. We also need to allow for the possibility that contemporary hunter-gatherers may differ in important ways from our pre-agrarian ancestors. Surviving forager groups are utterly marginalized and confined to areas that are beyond the reach of, or of little interest to, farmers and herders, environments that are well suited to a lifestyle that eschews the accumulation of material resources and firm claims to territory. Prior to the domestication of plants and animals for food production, foragers were much more widely spread out across the globe and had access to more abundant natural resources. In some cases, moreover, contemporary foraging groups may respond to a dominant world of more hierarchical farmers and pastoralists, defining themselves in contradistinction to outside norms. Remaining foragers are not timeless or “living fossils,” and their practices need to be understood within specific historical contexts.

First agriculture, and then industry, changed two fundamental things about the human experience. The accumulation of personal property allowed people to make more and more individualistic choices about their lives, and those choices unavoidably diminished group efforts toward a common good. And as society modernized, people found themselves able to live independently from any communal group. A person living in a modern city or a suburb can, for the first time in history, go through an entire day—or an entire life—mostly encountering complete strangers. They can be surrounded by others and yet feel deeply, dangerously alone.

Social scientists have been asking a cross-section of US citizens a simple question for years: “How many confidants do you have?” They wanted to know how many people you could turn to in a crisis, or when something really good happens to you. When they started doing the study several decades ago, the average number of close friends an American had was three. By 2004, the most common answer was none. It’s worth pausing on that: there are now more Americans who have no close friends than any other option.

When we talk to each other, more often than not, we make each other secondary in the whole process. We serve as stand-ins, as proxies, for a conversation that isn’t really about or meant for us. Whether real or imagined, there’s always someone else in the room. They’re the real interlocutors. This performativeness is by no means a problem that begins in the digital age with the dawn of social media, but the latter has certainly made the problem

more visible. But only slightly, because it's become such a painfully obvious feature of our daily communicative interactions that it has practically faded from view altogether. So much of what we say to each other on social media posts, for instance, is said for other people, known or unknown, who may see it. The person whom we are supposedly addressing, the one to whom we are ostensibly responding, becomes a vehicle for our own self-validation, which drips like sugar-sweet morphine in the form of 'likes,' 'loves,' 'laughs,' 'shares,' 'retweets,' and so on.

And, again, this doesn't just happen online—we do it everywhere. At our jobs, at the grocery store, on the subway, at the gym, on the street, we use each other. And we grow accustomed to being used. On a daily basis, as the gross spectacle of capitalist life routinely encourages us to, we accept being each other's instruments in our respective, harried races to become ourselves, forsaking our need to see and be seen for who we are, squandering our human capacities for being together, for connecting through genuine bonds of care and cooperation and dignity and equality and duty to each other. We get used to being—and to making out of each other—the tools for living alone.

When researchers put lonely people into brain-scanning machines, they noticed something. Lonely people would spot potential threats within 150 milliseconds, while it took socially connected people twice as long, 300 milliseconds, to notice the same threat. What was happening? Protracted loneliness causes you to shut down socially, and to be more suspicious of any social contact. You become hypervigilant. You start to be more likely to take offense where none was intended, and to be afraid of strangers. You start to be afraid of the very thing you need most. Disconnection spirals into more disconnection. Lonely people are scanning for threats because they unconsciously know that nobody is looking out for them, so no one will help them if they are hurt.

This snowball effect can be reversed—but to help a depressed or severely anxious person out of it, they need more love, and more reassurance, than they would have needed in the first place. The tragedy is that many depressed and anxious people receive less love, as they become harder to be around. Indeed, they receive judgment, and criticism, and this accelerates their retreat from the world. They snowball into an ever colder place.

People must belong to a tribe. Just like a bee goes haywire if it loses its hive, a human will go haywire if she loses her connection to the group. We have become the first humans to ever dismantle our tribes. As a result, we have been left alone on a savanna we do not understand, puzzled by our own sadness.

Telling people their distress is due mostly or entirely to a biological

malfunction has several dangerous effects on them. The first thing that happens when you're told this is you leave the person disempowered, feeling they're not good enough—because their brain's not good enough. The second thing is that it pitches us against parts of ourselves. It says there is a war taking place in your head. On one side there are your feelings of distress, caused by the malfunctions in your brain or genes. On the other side there's the sane part of you. You can only hope to drug the enemy within into submission—forever. But it does something even more profound than that. It tells you that your distress has no meaning—it's just defective tissue.

But I think we're distressed for good reasons. This is the biggest division between the old story about depression and anxiety and the new story. The old story says our distress is fundamentally irrational, caused by faulty apparatus in our head. The new story says our distress is—however painful—in fact rational, and sane. You're not crazy to feel so distressed. You're not broken. You're not defective.

Picture a 1950s housewife living before modern feminism. She goes to her doctor to say there is something terribly wrong with her. She says something like:

“I have everything a woman could possibly want. I have a good husband who provides for me. I have a nice house with a picket fence. I have two healthy children. I have a car. I have nothing to be unhappy about. But look at me—I feel terrible. I must be broken inside. Please—can I have some Valium?”

The feminist classics talk a lot about women like this. There were millions of women saying things just like it. And the women meant what they said. They were sincere. Yet now, if we could go back in a time machine and talk to these women, what we'd say is: You had everything a woman could possibly want by the standards of the culture. You had nothing to be unhappy about by the standards of the culture. But we now know that the standards of the culture were wrong. Women need more than a house and a car and a husband and kids. They need equality, and meaningful work, and autonomy. You aren't broken, we'd tell them. The culture is.

And if the standards of the culture were wrong then, they can be wrong now. You can have everything a person could possibly need by the standards of our culture—but those standards can badly misjudge what a human actually needs in order to have a good or even a tolerable life. The culture can create a picture of what you need to be happy—through all the junk values we have been taught about—that doesn't fit with what you actually need.

When antidepressants had begun to be marketed in Cambodia for the very first time there was a problem for the companies trying to sell them. It turned out there was no obvious translation for the word ‘antidepressant’ into the Khmer language. It was an idea that seemed to puzzle them. When presented with the idea that depression is a profound sense of sadness that you can’t shake off some Cambodians thought about this carefully and said, yes, we do have some people like that. They gave an example: a farmer whose left leg was blown off by a land mine, who came to the doctors for medical help and got fitted with a new limb but didn’t recover. He felt constantly anxious about the future and was filled with despair. They then explained that they didn’t need these newfangled antidepressants, because they already had antidepressants for people like this in Cambodia.

When they realized this man was despondent, the doctors and his neighbors sat with him, and talked through his life and his troubles. They realized that even with his new artificial limb, his old job—working in the rice paddies—was just too difficult, and he was constantly stressed and in physical pain, and that was making him want to just stop living, and give up. So they had an idea. They believed that he would be perfectly capable of being a dairy farmer, and that would involve less painful walking on his false leg and fewer disturbing memories. So they bought him a cow. In the months and years that followed, his life changed. His depression—which had been profound—went away. You see the cow was an analgesic, and antidepressant. To them, an antidepressant wasn’t about changing your brain chemistry, an idea that seemed bizarre to their culture. It was about the community, together, empowering the depressed person to change his life.

According to a global survey by the World Health Organization, people in wealthy countries suffer depression at as much as eight times the rate they do in poor countries, and people in countries with large income disparities—like the United States—run a much higher lifelong risk of developing severe mood disorders. A 2006 study comparing depression rates in Nigeria to depression rates in North America found that across the board, women in rural areas were less likely to get depressed than their urban counterparts. And urban North American women—the most affluent demographic of the study—were the most likely to experience depression. The mechanism seems simple: poor people are forced to share their time and resources more than wealthy people are, and as a result they live in closer communities. Inter-reliant poverty comes with its own stresses—and certainly isn’t the American ideal—but it’s much closer to our evolutionary heritage than affluence. A wealthy person who has never had to rely on help and resources from his community is leading a privileged life that falls way outside more than a million years

of human experience. Financial independence can lead to isolation, and isolation can put people at a greatly increased risk of depression and suicide. This might be a fair trade for a generally wealthier society—but a trade it is.

Self-determination theory holds that human beings need three basic things in order to be content:

1. They need to feel competent at what they do
2. They need to feel authentic in their lives
3. They need to feel connected to others

These values are considered “intrinsic” to human happiness and far outweigh “extrinsic” values such as beauty, money, and status. Bluntly put, modern society seems to emphasize extrinsic values over intrinsic ones, and as a result, mental health issues refuse to decline with growing wealth. The more assimilated a person is into American society, the more likely they are to develop depression during the course of their lifetime, regardless of what ethnicity they are.

The economic and marketing forces of modern society have engineered an environment that maximizes consumption at the long-term cost of well-being. In effect, humans have dragged a body with a long hominid history into an overfed, malnourished, sedentary, sunlight-deficient, sleep-deprived, competitive, inequitable, and socially-isolating environment with dire consequences.

The alienating effects of wealth and modernity on the human experience start virtually at birth and never let up. Infants in hunter-gatherer societies are carried by their mothers as much as 90 percent of the time, which roughly corresponds to carrying rates among other primates. One can get an idea of how important this kind of touch is to primates from an infamous experiment conducted in the 1950s by rape rack enthusiast Harry Harlow. Baby rhesus monkeys were separated from their mothers and presented with the choice of two kinds of surrogates: a cuddly mother made out of terry cloth or an uninviting mother made out of wire mesh. The wire mesh mother, however, had a nipple that dispensed warm milk. The babies took their nourishment as quickly as possible and then rushed back to cling to the terry cloth mother, which had enough softness to provide the illusion of affection. Clearly, touch and closeness are vital to the health of baby primates—including humans.

In America during the 1970s, mothers maintained skin-to-skin contact with babies as little as 16 percent of the time, which is a level that traditional societies would probably consider a form of child abuse.

As modern society reduced the role of community, it simultaneously elevated the role of authority. The two are uneasy companions, and as one goes up, the other tends to go down. In 2007, an analysis of 154 foraging societies that were deemed to be representative of our ancestral past found that one of their most common traits was the absence of major wealth disparities between individuals. Another was the absence of arbitrary authority.

“Social life is politically egalitarian in that there is always a low tolerance by a group’s mature males for one of their number dominating, bossing, or denigrating the others. The human conscience evolved in the Middle to Late Pleistocene as a result of the hunting of large game. This required cooperative band-level sharing of meat.”

Because tribal foragers are highly mobile and can easily shift between different communities, authority is almost impossible to impose on the unwilling. And even without that option, males who try to take control of the group—or of the food supply—are often countered by coalitions of other males. This is clearly an ancient and adaptive behavior that tends to keep groups together and equitably cared for. In addition to murder and theft—one of the most commonly punished infractions was “failure to share.” Freeloading on the hard work of others and bullying were also high up on the list. Punishments included public ridicule, shunning, and, finally, assassination of the culprit by the entire group.

Much of the evolutionary basis for moral behavior stems from group pressure. Not only are bad actions punished, but good actions are rewarded. When a person does something for another person—a prosocial act, as it’s called—they are rewarded not only by group approval but also by an increase of dopamine and other pleasurable hormones in their blood. Group cooperation triggers higher levels of oxytocin, for example, which promotes everything from breast-feeding in women to higher levels of trust and group bonding in men. Both reactions impart a powerful sensation of well-being. Oxytocin creates a feedback loop of good-feeling and group loyalty that ultimately leads members to self-sacrifice to promote group welfare. Hominids that cooperated with one another—and punished those who didn’t—must have outfought, outhunted, and outbred everyone else. These are the hominids that modern humans are descended from.

It’s revealing, then, to look at modern society through the prism of more than a million years of human cooperation and resource sharing. Subsistence-level hunters aren’t necessarily more moral than other people; they just

can't get away with selfish behavior because they live in small groups where almost everything is open to scrutiny. Modern society, on the other hand, is a sprawling and anonymous mess where people can get away with incredible levels of dishonesty without getting caught. What tribal people would consider a profound betrayal of the group, modern society simply dismisses as fraud—or perhaps more often: as perfectly legal.

During the 1960s, senior executives in America typically made around twenty dollars for every dollar earned by a rank-and-file worker. Since then, that figure has climbed to 300-to-1 among S&P 500 companies, and in some cases it goes far higher than that. The US Chamber of Commerce managed to block all attempts to force disclosure of corporate pay ratios until 2015, when a weakened version of the rule was finally passed by the SEC in a strict party-line vote of three Democrats in favor and two Republicans opposed. In hunter-gatherer terms, these senior executives are claiming a disproportionate amount of food simply because they have the power to do so. A tribe like the !Kung would not permit that because it would represent a serious threat to group cohesion and survival, but that is not true for a wealthy country like the United States. There have been occasional demonstrations against economic disparity, like the Occupy Wall Street protest camp of 2011, but they were generally peaceful and ineffective. The riots and demonstrations against racial discrimination that later took place in Ferguson, Missouri, and Baltimore, Maryland, led to changes—though certainly minor ones—in part because they attained a level of violence that threatened the civil order.

A deep and enduring economic crisis like the Great Depression of the 1930s, or a natural disaster that kills tens of thousands of the right kind of people, might change America's fundamental calculus about economic justice. Until then, the American public will probably continue to refrain from broadly challenging both male and female corporate leaders who compensate themselves far in excess of their value to society. That is ironic, because the political origins of the United States lay in confronting precisely this kind of resource seizure by people in power. King George III of England caused the English colonies in America to rebel by trying to tax them without allowing them a voice in government. In this sense, democratic revolutions are just a formalized version of the sort of group action that coalitions of senior males have used throughout the ages to confront greed and abuse.

Thomas Paine, one of the principal architects of American democracy, wrote a formal denunciation of civilization in a tract called "Agrarian Justice":

“Whether civilization has most promoted or most injured the general happiness of man is a question that may be strongly contested. Both the most affluent and the most miserable of the human race are to be found in the countries that are called civilized.”

There is no way to know the effect on Paine’s thought process of living next door to a communal Stone-Age society, but it might have been crucial. Paine acknowledged that these tribes lacked the advantages of the arts and science and manufacturing, and yet they lived in a society where personal poverty was unknown and the natural rights of man were actively promoted. In that sense, Paine claimed, the American Indian should serve as a model for how to eradicate poverty and bring natural rights back into civilized life.

The one thing that might be said for societal collapse is that—for a while at least—everyone is equal. In 1915, an earthquake killed 30,000 people in Avezzano, Italy, in less than a minute. The worst-hit areas had a mortality rate of 96 percent. The rich were killed along with the poor, and virtually everyone who survived was immediately thrust into the most basic struggle for survival: they needed food, they needed water, they needed shelter, and they needed to rescue the living and bury the dead. In that sense, plate tectonics under the town of Avezzano managed to re-create the communal conditions of our evolutionary past quite well. An earthquake achieves what the law promises but does not in practice maintain—the equality of all.

As Thomas Paine labored to articulate his goals for a free society, he could have easily taken his inspiration from earthquake survivors instead of from the American Indians. Communities that have been devastated by natural or man-made disasters almost never lapse into chaos and disorder; if anything, they become more just, more egalitarian, and more deliberately fair to individuals. The kinds of community-oriented behaviors that typically occur after a natural disaster are exactly the virtues that Paine was hoping to promote in his revolutionary tracts. For instance, despite erroneous news reports, New Orleans experienced a drop in crime rates after Hurricane Katrina, and much of the “looting” turned out to be people looking for food. And perhaps most importantly, many of the most extreme acts of violence were committed by agents of the state.

The Blitz, as bad as it was, paled in comparison to what the Allies did. Dresden lost more people in one night than London did during the entire war. Firestorms engulfed whole neighborhoods and used up so much oxygen that people who were untouched by the blasts reportedly died of asphyxiation instead. Fully a third of the German population was subjected to bombardment, and around one-million people were killed or wounded.

American analysts based in England monitored the effects of the bombing to see if any cracks began to appear in the German resolve, and to their surprise found exactly the opposite: the more the Allies bombed, the more defiant the German population became. Industrial production actually rose in Germany during the war. And the cities with the highest morale were the ones—like Dresden—that were bombed the hardest. According to German psychologists who compared notes with their American counterparts after the war, it was the untouched cities where civilian morale suffered the most. Thirty years later, an almost identical phenomenon would be documented in riot-torn Belfast.

After the war some turned their attention to natural disasters in the United States and formulated a broad theory about social resilience. There did not seem to be a single instance where communities that had been hit by catastrophic events lapsed into sustained panic, much less anything approaching anarchy. If anything, it seemed that social bonds were reinforced during disasters, and that people overwhelmingly devoted their energies toward the good of the community rather than just themselves. Modern society has gravely disrupted the social bonds that have always characterized the human experience, and disasters thrust people back into a more ancient, organic way of relating. Disasters create a community of sufferers that allows individuals to experience an immensely reassuring connection to others. As people come together to face an existential threat class differences are temporarily erased, income disparities become irrelevant, race is overlooked, and individuals are assessed simply by what they are willing to do for the group. It is a kind of fleeting social utopia that is enormously gratifying to the average person and downright therapeutic to people suffering from mental illness.

If there are phrases that characterize the life of our early ancestors, ‘community of sufferers’ and ‘brotherhood of pain’ surely must come close. Their lives were probably less labor-intensive than lives in modern society, as demonstrated by the !Kung, but the mortality rate of the young would have been much higher. The advantages of group cooperation would include far more effective hunting and defense, and groups that failed to function cooperatively must have gradually died out. Adaptive behavior tends to be reinforced hormonally, emotionally, and culturally, and one can see all three types of adaptation at work in people who act on behalf of others.

The coming-together that societies often experience during catastrophes is usually temporary, but sometimes the effect can last years or even decades. British historians have linked the hardships of the Blitz—and the social unity that followed—to a landslide vote that brought the Labour Party into power in 1945 and eventually gave the United Kingdom national health

care and a strong welfare state. The Blitz hit after years of poverty in England, and both experiences served to bind the society together in ways that rejected the primacy of business interests over the welfare of the people. That era didn't end until the wartime generation started to fade out and Margaret Thatcher was elected prime minister in 1979. In every upheaval we rediscover humanity and regain freedoms. We relearn some old truths about the connection between happiness, unselfishness, and the simplification of living. But then we fail to ensure these truths remain alive.

“Whatever I say about war, I still hate it. I do miss something from the war. But I also believe that the world we are living in—and the peace that we have—is very fucked up if somebody is missing war. And many people do.

I missed being that close to people, I missed being loved in that way. In Bosnia—as it is now—we don't trust each other anymore; we became really bad people. We didn't learn the lesson of the war, which is how important it is to share everything you have with human beings close to you. The best way to explain it is that the war makes you an animal. We were animals. It's insane—but that's the basic human instinct, to help another human being who is sitting or standing or lying close to you.”

American tribes varied widely in their cultures and economies and so had different relationships to war. The nomadic horse cultures of the Northern Plains, such as the Lakota and the Cheyenne, considered war to be a chance for young men to prove their honor and courage. The Apache avoided face-to-face combat in favor of raiding expeditions that relied on stealth and endurance. The sedentary Papago, whose economy was based largely on agriculture, considered war to be a form of insanity. Men who were forced into combat by attacks from other tribes had to undergo a sixteen-day purification ritual before they could reenter society. The entire community participated in these rituals because every person in the tribe was assumed to have been affected by the war. After the ceremony, the combatants were viewed as superior to their uninitiated peers because—as loathsome and crazy as war was—it was still thought to impart wisdom that nothing else could.

The Iroquois Nation presumably understood the transformative power of war when they developed parallel systems of government that protected civilians from warriors and vice versa. Peacetime leaders, called sachems, were often chosen by women and had complete authority over the civil affairs of the tribe until war broke out. At that point war leaders took over,

and their sole concern was the physical survival of the tribe. They were not concerned with justice or harmony or fairness, they were concerned only with defeating the enemy. If the enemy tried to negotiate an end to hostilities, however, it was the sachems, not the war leaders, who made the final decision. If the offer was accepted, the war leaders stepped down so that the sachems could resume leadership of the tribe. The Iroquois system reflected the radically divergent priorities that a society must have during peacetime and during war. Because modern society often fights wars far away from the civilian population, soldiers wind up being the only people who have to switch back and forth.

Except for sociopaths, one of the most traumatic events that a soldier can experience is witnessing harm to others—even to the enemy. In a survey carried out after the first Gulf War combat veterans reported that killing an enemy soldier, or even witnessing one getting killed, was more distressing than being wounded themselves. But the very worst experience, by far, was having a friend die. In war after war, army after army, losing a buddy is considered the most devastating thing that can possibly happen. It is far more disturbing than experiencing mortal danger oneself and often serves as a trigger for psychological breakdown on the battlefield or later in life.

“Everyone who has lived through something like that has lived through trauma, and you can never go back. You are seventeen or eighteen or nineteen and you just hit that wall. You become very old men.”

They are clearly in need of some way to vent their feelings to the wider community. Modern society rarely gives veterans—gives anyone—opportunities to do that. Fortunately, freedom of speech means that, among other things, veterans are entitled to stand on street corners with bullhorns and disturb the peace. More dignified might be to offer veterans all over the country the use of their town hall every Veterans Day to speak freely about their experience at war. Some will say that war was the best thing that ever happened to them. Others will be so angry that what they say will barely make sense. Still others will be crying so hard that they won't be able to speak at all. But a community ceremony like that would finally return the experience of war to our entire nation, rather than just leaving it to the people who fought. The bland phrase, ‘I support the troops,’ would then mean showing up at the town hall once a year to hear these people out.

Most primates, including humans, are intensely social, and there are very few instances of lone primates surviving in the wild. A modern soldier returning from combat—or a survivor of Sarajevo—goes from the kind of

close-knit group that humans evolved for, back into a society where most people work outside the home, children are educated by strangers, families are isolated from wider communities, and personal gain almost completely eclipses collective good. Even if he or she is part of a family, that is not the same as belonging to a group that shares resources and experiences almost everything collectively. Whatever the technological advances of modern society—and they're nearly miraculous—the individualized lifestyles that those technologies spawn seem to be deeply brutalizing to the human spirit.

“Touch can be especially confusing for men because for most men in our society, touch has been limited to violent and sexual encounters.”

We are not a good society—we are an anti-human society. We are not good to each other. Our tribalism is to an extremely narrow group of people: our children, our spouse, maybe our parents. Our society is alienating, technical, cold, and mystifying. Our fundamental desire, as human beings, is to be close to others, and our society does not allow for that.

Because modern society has almost completely eliminated trauma and violence from everyday life, anyone who does suffer those things is deemed to be extraordinarily unfortunate. This gives people access to sympathy and resources but also creates an identity of victimhood that can delay recovery.

Consider the case of Mende tribal combatants. Both during and after civil wars in Liberia and Sierra Leone, international relief organizations introduced the idea of victimhood to combatants who until then had rarely, if ever, thought of themselves in those terms. The language of ‘I am a victim too’ did not originate from the combatants themselves. Aid organizations would come in and say, ‘This is how you’re supposed to be feeling and if you do, then you’ll have access to food supplies and training.’ In such a poor society, food donations and job training gave an enormous advantage to ex-combatants. The consequence was that ex-combatants were incentivized to see themselves as victims rather than as perpetrators. These people committed terrible acts of violence during their wars, and many of them felt enormously guilty about it, but they were never able to work through those feelings because their victim status eclipsed more accurate and meaningful understandings of violence. Mende combatants often described combat as something that makes the heart “heat up,” transforming a fighter to the point where he is thought to have literally become someone else. In that state he is capable of both great courage and great cruelty. Such a state of hyperarousal is familiar to many soldiers or athletes and has a firm basis

in the neurobiology of the brain. For the Mende, it means that the moral excesses of the battlefield don't necessarily have to be brought home.

During those wars the combatants who had a "hot heart" were unmistakable. They wore amulets and magical charms and acted as if they were possessed, deliberately running into gunfire and dancing while firing their weapons to prove how brave they were. Other people's lives didn't seem to matter to them because their own lives didn't seem to matter to them. They were true nihilists, and that makes them some of the most terrifying human beings ever encountered. Even highly traumatized ex-combatants such as these could have been reincorporated into Mende society if indigenous concepts like the 'hot heart' had been applied. Their classification as victims, however—with the attendant perks and benefits common to Western society—made their reintegration much harder.

Two of the behaviors that set early humans apart were the systematic sharing of food and altruistic group defense. Other primates did very little of either but, increasingly, hominids did, and those behaviors helped set them on an evolutionary path that produced the modern world. The earliest and most basic definition of community—of tribe—would be the group of people that you would both help feed and help defend. A society that doesn't offer its members the chance to act selflessly in these ways isn't a society in any tribal sense of the word; it's just a political entity that, lacking enemies, will probably fall apart on its own. Soldiers experience this tribal way of thinking at war, but when they come home they realize that the tribe they were actually fighting for wasn't their country, it was their unit. It makes absolutely no sense to make sacrifices for a group that, itself, isn't willing to make sacrifices for you. That is the position American soldiers have been in for the past two decades.

As great a sacrifice as soldiers make, American workers arguably make a greater one. Far more Americans lose their lives every year doing dangerous jobs than died during the entire Afghan War. In 2014, for example, 4,679 workers lost their lives on the job. More than 90 percent of those deaths were of young men working in industries that have a mortality rate equivalent to most units in the US military. Jobs that are dangerous and seemingly mundane, like construction, tend to be less respected and less well paid than jobs that are safe and made flashy, like real estate or finance. And yet it is exactly these dangerous and seemingly mundane jobs that provide society's immediate physical needs. Construction workers are more important to everyday life than stockbrokers and yet are far lower down the social and financial ladder.

Skinwalkers were almost always male and wore the pelt of a sacred animal so that they could subvert that animal's powers to kill people in the

community. They could travel impossibly fast across the desert and their eyes glowed like coals and they could supposedly paralyze you with a single look. They were thought to attack remote homesteads at night and kill people and sometimes eat their bodies. Virtually every culture in the world has its version of the skinwalker myth. In Europe, for example, they are called werewolves (literally “man-wolf” in Old English). The myth addresses a fundamental fear in human society: that you can defend against external enemies but still remain vulnerable to one lone madman in your midst.

Anglo-American culture doesn't recognize the skinwalker threat but has its own version. Starting in the early 1980s, the frequency of rampage shootings in the United States began to rise more and more rapidly until it doubled around 2006. Rampages are usually defined as attacks where people are randomly targeted and four or more are killed in one place, usually shot to death by a lone gunman. As such, those crimes conform almost exactly to the kind of threat that the Navajo seemed most to fear on the reservation: murder and mayhem committed by an individual who has rejected all social bonds and attacks people at their most vulnerable and unprepared. For modern society, that would mean not in their log hogans but in movie theaters, schools, shopping malls, places of worship, or simply walking down the street.

It's revealing to look at the kinds of communities where those crimes usually occur. A rampage shooting has never happened in an urban ghetto, for example; in fact, indiscriminate attacks at schools almost always occur in otherwise safe, predominantly white towns. Around half of rampage killings happen in affluent or upper-middle-class communities, and the rest tend to happen in rural towns that are majority-white, Christian, and low-crime. Nearly a thousand people have been killed by rampage shooters since the 1980s. Almost by definition, rampage killers are deeply disturbed sociopaths, but that just begs the question why sociopaths in high-crime urban neighborhoods don't turn their guns on other people the way they do in more affluent communities. Gang shootings—as indiscriminate as they often are—still don't have the nihilistic intent of rampages. Rather, they are rooted in an exceedingly strong sense of group loyalty and revenge, and bystanders sometimes get killed in the process.

The first time that the United States suffered a wave of rampage shootings was during the 1930s, when society had been severely stressed and fractured by the Great Depression. Profoundly disturbed, violent individuals might not have felt inhibited by the social bonds that restrained previous generations of potential killers. Rampage killings dropped significantly during World War II, then rose again in the 1980s and have been rising ever since. It may be worth considering whether middle-class American life—for all its

material good fortune—has lost some essential sense of unity that might otherwise discourage alienated men from turning apocalyptically violent.

It's hard to know how to live for a country that regularly tears itself apart along every possible ethnic and demographic boundary. The income gap between rich and poor continues to widen, many people live in racially segregated communities, the elderly are mostly sequestered from public life, and rampage shootings happen so regularly that they only remain in the news cycle for a day or two. To make matters worse, politicians occasionally accuse rivals of deliberately trying to harm their own country—a charge so destructive to group unity that most past societies would probably have just punished it as a form of treason. It's complete madness,

Coming back to America from a war zone is an illuminating experience. First there is a kind of shock at the level of comfort and affluence that we enjoy, but that is followed by the dismal realization that we live in a society that is basically at war with itself. People speak with incredible contempt about—depending on their views—the rich, the poor, the educated, the foreign-born, the president, or the entire US government. It's a level of contempt that is usually reserved for enemies in wartime, except that now it's applied to our fellow citizens. Unlike criticism, contempt is particularly toxic because it assumes a moral superiority in the speaker. Contempt is often directed at people who have been excluded from a group or declared unworthy of its benefits. Contempt is often used by governments to provide rhetorical cover for torture or abuse. Contempt is one of four behaviors that, statistically, can predict divorce in married couples. People who speak with contempt for one another will probably not remain united for long.

The United States is so powerful that the only country capable of destroying her might be the United States herself, which means that the ultimate terrorist strategy would be to just leave the country alone. That way, America's ugliest partisan tendencies could emerge unimpeded by the unifying effects of war. Of course, beware the death throes of a violent giant. . .

The collective outrage at Sergeant Bergdahl was based on very limited knowledge but provides a perfect example of the kind of tribal ethos that every group—or country—deploys in order to remain unified and committed to itself. If anything, though, the outrage in the United States may not be broad enough. Maybe Bergdahl put a huge number of people at risk and may have caused the deaths of up to six soldiers—though evidence seems to point to this being propaganda. But in purely objective terms, he caused his country far less harm than the financial collapse of 2008, when bankers gambled trillions of dollars on blatantly fraudulent mortgages. These crimes were committed while hundreds of thousands of Americans

were fighting and dying in wars overseas. Almost 9 million people lost their jobs during the financial crisis, 5 million families lost their homes, and the unemployment rate doubled to around 10 percent. For nearly a century, the national suicide rate has almost exactly mirrored the unemployment rate, and after the financial collapse, America's suicide rate increased by nearly five percent. In an article published in 2012 in *The Lancet*, epidemiologists who study suicide estimated that the recession cost almost 5,000 additional American lives during the first two years—disproportionately among middle-aged white men. That is close to the nation's losses in the Iraq and Afghan wars combined. If Sergeant Bergdahl betrayed his country then surely the bankers and traders who caused the financial collapse did as well. And yet they didn't provoke nearly the kind of outcry that Bergdahl did. Not a single high-level CEO has even been charged in connection with the financial collapse, much less been convicted and sent to prison, and most of them went on to receive huge year-end bonuses.

Thomas and Leacock went on a hunting trip. Deep in the bush they encountered two men, strangers, who had run out of food and were extremely hungry. Thomas gave them all his flour and lard, despite the fact that he would have to cut his own trip short as a result. Leacock probed Thomas as to why he did this, and he finally lost patience with her:

“Suppose, now, not to give them flour, lard. Just dead inside.”

“She lost her baby daughter, and she felt the deep sorrow that is natural and right when you have felt deep love and it has been taken from you. Yet she watched as grieving people were told—officially, by psychiatrists—that if their profound distress persisted after a short window, they were mentally ill and needed to be drugged.”

But grief is necessary. We grieve because we have loved. We grieve because the person we have lost mattered to us. To say that grief should disappear on a neat timetable is an insult to the love we have felt. Deep grief and depression have identical symptoms for a reason. Depression is itself a form of grief—for all the connections we need, but don't have. All over the world today, people's pain is being insulted. We need to start throwing that insult back in their faces—and demanding they engage with the real problems that need to be solved.

You have to turn now to all the other wounded people around you, and find a way to connect with them, and build a home with these people—a

place where you are bonded to one another and find meaning in your lives together. We have been tribeless and disconnected for so long now. It's time for us all to come home.

Major Myths

The Big Three

Three major myths—about race, aggression, and sex—have a negative impact on our society and inhibit an accurate understanding of what it means to be human. These myths create a false set of societally accepted truths that in turn cause a range of problems for us. The myth that humans are divided into biological races—that black, white, asian, et cetera are natural categories—helps generate and maintain intolerance and inequality, and leads to difficulties in creating and sustaining communities in our increasingly diverse society. The myth that removing the constraints of culture and civilization reveals the innate, violent beast within us—especially in men—restricts how we can relate to one another, encourages fear, and enables an acceptance of certain kinds of abuse and violence as natural or inevitable. The myth that men and women are dramatically different in behavior, desires, and perspectives due to natural differences in “internal wiring” facilitates poor intersexual relations, creates and maintains sexual inequality, and causes a range of problems for individual men and women laboring under a preconception about who and how they are supposed to be.

In our society most people rely on a set of assumptions about someone when they see them, or first meet them, based on which race they appear to be. It’s not that we are naturally inclined to be racist, or even racial, but rather that race means something in our society and we have a whole suite of myths about what to expect and understand about people and races. None of these reactions are necessarily conscious thoughts; rather, the myths are so pervasive that these responses often go on without any active consideration on our part. The myths provide explanations and contexts so that we don’t have to: they supply ready-made common sense. This does not mean that everything about our societal myths is untrue or that all such myths are false. There are many myths that have a lot of accuracy; however, the myths about race, aggression, and sex generally do not, or at

least not in the ways we tend to think they do.

We encounter a problem of conflating ‘natural’ and ‘right’ (or ‘is’ and ‘ought’) with the misperception that we can identify one true way to be human. This stance has been much debated and discussed by philosophers and scientists for centuries, and has been an especially hot topic over the last five decades. If there is a specific natural way to be a human, then one could rightfully argue that this is the way humans evolved (or were designed) to be. It then follows that if we have societal rules and expectations that contradict or inhibit these natural drives and behaviors, we might see problems as humans try to conform to societal rules and go against their natures. This view assumes that the behaviors and drives emerging from our nature are more correct, and set deeper, than behaviors emerging from externally influenced sources such as societal expectations. In other words, this is a position that can explain and accept human behavior, regardless of its implications, by invoking our inner nature as a justification.

To each his sufferings: all are men,
 Condemned alike to groan;
 The tender for another’s pain,
 The unfeeling for his own.
 Yet ah! why should they know their fate?
 Since sorrow never comes too late,
 And happiness too swiftly flies.
 Thought would destroy their paradise.
 No more; where ignorance is bliss,
 ‘Tis folly to be wise.

Written shortly after his graduation from Eton, the poem seems to be an ode to the happy times as a student and the potentially terrifying realities—knowledge, life, responsibilities—that await the graduate. Many of us hold some idealistic notions that we are happier at times when we do not really know the big picture and are able to live in our clamshells, insulated from the negatives of the larger world. As with Gray, this is often the case for those of us lucky enough to have gentle and protected upbringings, involving good schools and supportive environments. The concept that thought (knowledge) destroys paradise, that not knowing certain things is a blessing, can be a nice literary turn of phrase, but it is a dangerous tool when applied to ideas about human nature.

Should we listen to what scientists have to say? Yes and no. For example, James Watson, the Nobel-Prize-winning geneticist, former director of the Cold Springs Harbor Research Institute, and codiscoverer of the structure

of DNA, told a British audience in 2007 that he was “inherently gloomy about the prospect of Africa” because “all our social policies are based on the fact that their intelligence is the same as ours—whereas all the testing says not really.” The knowledge that Watson helped produce regarding the structure of DNA remains one of the most well-tested and well-supported important contributions to modern genetics. However, his thoughts on race, Africa, and intelligence are opinions that contradict the well-tested scientific knowledge available about how race, geography, and genetics in humans actually work. Here is a case where the scientific knowledge is available, but the scientist is stating a personal opinion regardless of the available information. Conflating the thoughts and opinions of scientists with science itself is a source of much of the misinformation leading to myths about human nature.

Science is the production of convincing knowledge in modern society. By using production we acknowledge that science is not a passive experience. Scientific knowledge is a product—and as a product it is the result of some process. There is a subtler and more threatening point embedded in this recognition, however. If science is the active production of something—say, reliable information about the universe—then it is more than, or at least different from, mere discovery. Discovery is a passive operation: to a suitably primed observer, the fact merely reveals itself the production of scientific knowledge is highly context-specific, and it is the context, more than the particulars of the discovery, that are critical. Science is not a neutral investigation of reality. But it can produce real and important results.

Why should we try to integrate different types of knowledge in our attempts at understanding? The ability to really get to the heart of topics that deal with human behavior requires us to synthesize bits of information from many different sources. Even to understand the simple examples of the success of Airborne and the humor in the joke about men not asking for directions we need a bit of chemistry and engineering, some ideas about biology and health, some familiarity with human physiology and sex differences, and knowledge about the history of gender perspectives in our society. Unfortunately, our education system does not always do a good job of getting us the skills to integrate different types of information. In math classes we do math, in history class, history, and in biology class, biology. This is important when we are trying to get basic skills down, but as you get older and experience more and more in life you need to be able to integrate information from different subject areas to really get good pictures of what is going on.

“I would not have seen it if I hadn’t believed it.”

This reversal of the adage might describe how many researchers become steeped in specific perspectives about how primates—including humans—behave. Through reading only a selection of the available published reports and being trained by individuals strongly committed to a particular way of thinking about evolution and ecology and how it shapes primate behavior, researchers develop a set of expectations about what they are going into the field to observe. This set of expectations can influence the way they record and conceptualize what they see.

For example, in 1999 in Bali, Indonesia, two primatologists were watching a group of macaque monkeys when a series of interactions between a few adults and an infant took place. Standing side by side and having seen the same series of behaviors, they turned to one another and excitedly described two slightly different things. One's training and perspective influenced them to focus on the adults and their behavior toward one another, not considering the infant as a main player in the interactions. The colleague, trained in a different perspective, looked specifically at the actions of the adult males as they related to the infant, not focusing as much on the adult females. They each had a set of expectations about how things are that colored where they looked and how they described what they saw. They were exposed to the same set of information but perceived two different outcomes. They saw the same actions, but their beliefs about the world led them to actually experience different things.

A long time ago there was a king who had an ongoing disagreement with his chancellors and clerics. He was certain that English was the original language, while others in his court argued for Latin, Hebrew, or Aramaic. The discussion went round and round without any resolution. Finally, the king had an idea: he would discover what the original language was by keeping five newborn babies in silent isolation, never hearing a spoken word. Thus, when they finally spoke, in whatever language the babies uttered, their first words must be the original language of man. The king arranged to have five newborns taken from their mothers and set up in five towers isolated from towns, villages, and people. Each infant had a mute wet nurse who would feed them a few times a day and have no other interaction with them at all. The infants would have no interactions with any other people at all until they spoke, keeping them pristine for the experiment.

So what language, if any, did the babies speak? None, they all died.

If you isolate a human infant from human contact and society, you do not discover the innate and original nature of being human, you will just kill the infant. Or if by some miracle the child lives, you will have a very damaged individual—biologically, psychologically, and socially. Just ask Harry Harlow. While I am pretty certain that this story about the king and

his babies is not true, it does illustrate the common misconception that there is an innate core to humans that is altered, masked, or otherwise concealed by culture. This is the wrong way to envision the scenario of becoming human: humans need to be around each other for social, physiological, and psychological reasons, and becoming (and being) human is a process that is simultaneously biological and cultural. We need to grow up around one another to be fully human.

What we think of as normal, what we consider intuitive knowledge and common sense, rarely emerges from some inner biological core subconsciously telling us what is true. Rather it is more likely to be the result of the experiences we have had throughout the course of our lives and the way in which these events interact with and shape or influence our bodies and minds.

A cultural construct is a belief, or social ideology, about the world that originates within a particular society and is (generally) shared by its members. That is to say, it is not necessarily tied to a specific event or a quantifiable and universally shared observation, but rather emerges from a conflux of historical and social elements and becomes widespread within the shared belief system of a culture.

For example, the concept that the appropriate way to live as an adult is in a nuclear family (a married couple with children) in a separate residence from other such families, is a cultural construct common across much of American culture. This is not necessarily considered the preferred form of residence in all societies across the world (nor is it the most common form of residence or family unit); moreover, it is not based in some incontrovertible reality (biological or otherwise). However, the ubiquitousness of this construct in the United States sets up a set of goals and ideals for both youth and adults and its attainment is often used as a gauge of social success.

All too often people make the assumption that because a cultural construct is constructed within a society that it is not a real thing. This is akin to people confusing psychosomatic illness—‘it’s all in your head’—with fake illness. Whether your stomach hurts because of a bacterial infection or because of gastric disequilibrium due to stress from workplace tension, it still hurts. The mind can cause the body to react so as to create pain just as an infection can. The remedies might be different, but the pain can be the same. This is the case with cultural constructs; they are very real for those who hold them. In the example of the nuclear family and single-family residences, a failure to marry, have kids, and own a home can cause a wide range of problems socially and psychologically for individuals in the United States.

There are two common misconceptions about evolution: that it has an

end point and that humans are somehow less affected by evolution than other organisms.

A major misconception about evolution is that it is oriented toward progress and results in organisms fitting perfectly with their environment. The corollary to this is that if something works well we perceive it as having evolved for this particular purpose. This is incorrect. Life on Earth (and evolution) is messy and often haphazard. In some cases we do see amazing, almost perfect, relationships between organisms or an organism and its environment; for example, certain wasps and figs have coevolved and need each other to survive. However, in the vast majority of cases organisms work with each other and their environment in successful but much less than perfect ways. This misconception of perfect coevolution is critical because it leads to the assumption that if something is a certain way, and it is the product of evolution, then it came to be that way for a purpose.

Natural selection results in survival and reproduction of the sufficient or the good enough, not necessarily the best or most ferocious. The idea that nature is brutish and life is short owes more to philosophers such Thomas Hobbes and Adam Smith than it does to Darwin. In fact, this concept is an important and powerful cultural construct that permeates our society.

Another erroneous idea about evolution is that it all happens by chance. Because evolution is not goal directed, not manipulated by an external creative force, many people veer to the exact opposite perspective and assume that all evolutionary change is by chance. This is also incorrect. Evolutionary change is constrained by the materials at hand. That is, the current form of an organism and its evolutionary history (the history of change its ancestors underwent) affect the ways in which it can change in the future. Humans are not about to evolve wings for flight and tortoises' legs will not evolve into wheels, no matter what chance mutations arise. The principle that evolutionary change is constrained by the structure, development, and history of organisms is important and will help us understand why some of the myths about human nature are wrong.

The final major misconception is that if something has evolved a certain way then that is the way it should be. This is the idea that the way things are has been selected for a particular purpose by evolutionary processes, or arisen by a sequence of chance events in nature, and thus must be the correct way (the "natural" way) for that thing to be. So, the beak of the hummingbird perfectly allows it to get nectar from flowers, the big brains of humans allow us to dominate the planet, and the eagle's feathers enable it to soar. However, none of these examples are decisive. There are many different kinds of nectar-feeding birds with an enormous array of beak shapes and sizes (although most are skinny and long); some other primates and many

cetaceans (whales and dolphins) have brains roughly the same size (or larger) relative to their body size than humans do, and birds' feathers initially show up in their ancestors as thermoregulatory (heat-control) structures before there were wings (later feathers were co-opted and modified for use in flight). So all is not what it seems, nor is the status quo always for the best. A trait that currently serves a function for an organism may or may not have been altered by evolutionary processes to perform that function.

So traits that arise from natural selection are called adaptations because they were shaped over time by the fit between what they do and the environments in which they exist. This is actually what is meant by "survival of the fittest," that those traits that become most common due to natural selection are those that fit best in a given environment. However, what makes for a good fit in one environment might not work in a different environment. We are not talking about survival in the sense of living, but rather in the sense of representation across generations in particular environments.

Some key things to keep in mind:

1. Culture helps give meaning to our experiences of the world.
2. Cultural constructs are real for those that share them.
3. Schemata (our worldview) vary depending of a range of elements in their social context—this explains why people in the same society might not see issues (reality) in the same way.
4. Some constructs are more pervasive than others, and thus more important to understand as they affect how we live and act and treat others.
5. Evolution is change over time. Specifically, it is change in genotype and phenotype across generations due to a variety of processes.
6. Mutation generates new genetic variation, gene flow and genetic drift move that variation around, and natural selection shapes the variation in response to environmental pressures.
7. Niche construction theory shows us that humans and their environments are mutually interactive participants in the evolutionary processes and helps us realize that ecological inheritance is important. Multiple inheritance theory illustrates that evolutionarily relevant inheritance can occur at the genetic, epigenetic, behavioral, and symbolic levels.

8. Our DNA alone does not determine who we are and how we behave, but it is a primary component in the development and maintenance of our bodies and behaviors. Genes contain the basic instructions for the building blocks (proteins) of biological systems. Genes and our phenotype are connected, but usually not in a one-to-one relationship; however, the relationship they do have is shaped and influenced by evolutionary processes.

Why are the big three myths so important to bust? The fallacy behind the race myth is that humans are divided into biological races (black, white, asian, et cetera) and that there are certain natural differences among these groups. If we believe this to be true, it shapes the way we act toward and perceive others, what we expect, and what we think we can achieve, as far as human equality, and whether or not we can build community in an increasingly diverse society.

The fallacy behind the myth of aggression is that nature and nurture are different, and that our animal (or evolutionary) core is that of a primitive beast. If this were true, then our nurture (cultural constraints) would manage an inner nature (a primitive, aggressive drive especially in men) that emerges whenever the grasp of civilization weakens. If we believe this then we will accept a wide range of interpersonal violence as inevitable, and we will see war, rape, and murder as just part of the nature of human beings. But if these are all part of our potential, and not our nature, then a much broader range of responses and ways of living together become possible.

Finally, the fallacy behind the myth of sex is that men and women are truly different in nature, and that this difference emerges in our behavior, desires, and internal wiring. The relationships between, and within, the sexes and genders are constrained by such a view, and the possible range of ways to be and become human and express our sexual and social selves is extremely limited. If differences in the sexes are present but less extreme and occur in different ways than we currently envision, the possibilities for human relations expand and, as in the two previous cases, our abilities to build communities and coexist in sustainable ways in our increasingly crowded, diverse, and complex world could become slightly improved.

The idea of 'race' represents one of the most dangerous myths of our time and one of the most tragic. Myths are most effective and dangerous when they remain unrecognized for what they are. The question of whether humans are divided into biological races is answered with a resounding academic 'no' by the American Association of Physical Anthropology's (AAPA) statement on the biological aspects of race:

“Humanity cannot be classified into discrete geographic categories with absolute boundaries. Partly as a result of gene flow, the hereditary characteristics of human populations are in a state of perpetual flux. Distinctive local populations are continually coming into and passing out of existence. Such populations do not correspond to breeds of domestic animals, which have been produced by artificial selection over many generations for specific human purposes. There is no necessary concordance between biological characteristics and culturally defined groups. On every continent, there are diverse populations that differ in language, economy, and culture. There is no national, religious, linguistic, or cultural group or economic class that constitutes a race, there is no causal linkage between these physical and behavioral traits, and therefore it is not justifiable to attribute cultural characteristics to genetic inheritance.”

To bust the myth of race we have to test the core assumptions and refute them.

ASSUMPTION: *Human races are biological units.*

TEST: Is there a set of biological characteristics that naturally divide up humans beings into races? If yes, then the assumption is supported; if no, then it is refuted.

ASSUMPTION: *We live in a (mostly) postracial society.*

TEST: Does our society still use race in assessment, definitions, and daily life? If no, then the assumption is supported; if yes, then it is refuted.

ASSUMPTION: *If race is not a biological category, then racism is not that powerful or important in shaping human lives.*

TEST: Can we demonstrate that racism, without the existence of biological races, is a significant factor affecting human health, well-being, and access to societal goods? If yes, then the assumption is refuted; if no, then it is supported.

ASSUMPTION: *If we can see consistent differences in sports, disease patterns, and other areas tied to physical features between races, these must reflect innate differences between these groups of people.*

TEST: Are these differences consistent over time? Are they due to biological or unique racial characteristics or are they better attributed to other causes? If yes, and they can be linked to biological patterns of human groups, then the assumption is supported; if no, then it is refuted.

If we can refute all four assumptions, the myth is busted.

In all of this scrutiny of human genetic variation there is an extremely important finding about the African continent that affects our understandings of genetics and race: there is nearly twice as much genetic variation among human populations in Africa than among all populations outside the African continent. There also is more DNA sequence variation within Africa than outside Africa. That is, all the genetic variation in the world is a subset of the variation found in populations on the African continent. This is because modern humans have been in Africa longer than anywhere else on the planet. Variation needs time to accumulate, thus the areas with the highest degree of variation will be the areas where humans have resided the longest. Species-wide human genetic variation does not support the concept of three overlapping races; rather, it demonstrates a single human race and the fact that we have a lot of gene flow and a recent shared ancestry in Africa. The patterns in our DNA do not support the concept of discrete races in humans.

When scientists set out to assemble the first complete human genome, which was a composite of several individuals, they deliberately gathered samples from people who self-identified as members of different races. In June 2000, when the results were announced at a White House ceremony, Craig Venter, a pioneer of DNA sequencing, observed:

“The concept of race has no genetic or scientific basis.”

Over the past few decades, genetic research has revealed two deep truths about people. The first is that all humans are closely related—more closely related than all chimps, even though there are many more humans around today. Everyone has the same collection of genes, but with the exception of identical twins, everyone has slightly different versions of some of them. Studies of this genetic diversity have allowed scientists to reconstruct a kind of family tree of human populations. That has revealed the second deep truth: In a very real sense, all people alive today are Africans.

By analyzing the genes of present-day Africans, researchers have concluded that the Khoe-San, who now live in southern Africa, represent one of the oldest branches of the human family tree. The Pygmies of central Africa also have a very long history as a distinct group. What this means is

that the deepest splits in the human family aren't between what are usually thought of as different races—whites, say, or blacks or Asians or Native Americans. They're between African populations such as the Khoe-San and the Pygmies, who spent tens of thousands of years separated from one another even before humans left Africa.

All non-Africans today, the genetics tells us, are descended from a few thousand humans who left Africa maybe 60,000 years ago. These migrants were most closely related to groups that today live in East Africa, including the Hadza of Tanzania. Because they were just a small subset of Africa's population, the migrants took with them only a fraction of its genetic diversity.

Today, generally, most people look around and say that blacks are better at physical sports, whites run companies, and Asians do really well on tests. But are these generalizations really accurate? And if they are, we know that race is not a biological unit, so an explanation for the differences has to be largely non-biological and thus social and historical.

There is no evidence that if you randomly select three men—one black, one white, and one Asian—in the United States that the black will be better at fullback or basketball, that the white will be a great quarterback, and that the Asian will not play sports. However, depending on where you select your young men from (city, suburb, rural town, West Coast, East Coast, Southeast, Midwest, et cetera), what age you select them at, what economic group you select them from, and their number of siblings, religion, health history, and place of birth of their parents, you are going to have varied results. The point is that the patterns we see today in professional sports are due to historical and social realities, residence patterns, socioeconomic access to sports facilities, and popular perceptions of race differences. It was not that long ago that nonwhites were not allowed to play in most professional sports, that there were no black quarterbacks, and that the majority of running backs were white. The role of race in sports is a social, economic, and historical reality that is neither static nor related to genetics. Instead, it is part of the ever-changing social structure of our society.

Some have suggested that we stop saying that race is a myth, and instead accept that parts of it are myths while other aspects are not. They are correct: the myth part about race is that in modern humans there are biological races. The non-myth part is that in our society the social categories of race are a reality that affects our lives. Thus, white, black, and Asian are not real biological, evolutionary, or natural categories nor do they reflect true divisions in human nature. However, white, black, and Asian are real categories in the United States, for historical, political, and social reasons. People get placed in these categories both by themselves

and by others. These social race divisions have real effects on the bodies and minds of the people in the United States. Race is not biology, but race affects biology, experience, and social context. Race is a social reality that can have lasting biological effects.

Race is simply not a valid way to talk about human biological variation.

1. There is substantial variation among individuals within populations.
2. Some biological variation is divided up between individuals in different populations and also among larger population groupings.
3. Patterns of within-group and between-group variation have been substantially shaped by culture, language, ecology, and geography.
4. Race is not an accurate or productive way to describe human biological variation.
5. Human variation research has important social, biomedical, and forensic implications.

In the United States people often confuse race and ethnicity. The two are not the same: ethnicity generally refers to a suite of shared historical, cultural, geographic, and linguistic features that are used to group peoples into clusters whereas race involves these characteristics but also has specific biological factors. The two terms are often used interchangeably, but technically this is an incorrect usage.

Ethnicity is a way of classifying people based on common histories, cultural patterns, social ties, language use, symbolic shared identities, and the like. It lays no claim to biology and is used both by those attempting to classify others and by those within the different ethnic groups as a symbol of social unity. Ethnicity is not a natural set of divisions in humanity; it is fluid, changing over time and space. The terms 'ethnicity' and 'race' are often used interchangeably, even in commercial ancestry testing; this is wrong.

This mistaken usage is a holdover from the patterns established by eugenicists trying to identify as biological groups the various national and ethnic groups who were living in, or entering, the United States in the early twentieth century. From that time on the notion of 'ethnic' has been used as a technique for establishing 'white' as normal and non-ethnic, in contrast to the 'other.' Check out the shampoos and hair care products at your neighborhood drugstore: most places will have an aisle or section marked 'hair care' and another marked 'ethnic products' or 'ethnic hair care.' This is shorthand for black, or frizzy, hair care products. Think about the common

phrase “ethnic food.” Does this refer to what is considered to be typical US (or white) food like hamburgers, hotdogs, or meatloaf? No, it means all the other types of foods associated with nonwhite groups or with subdivisions of southern or eastern European origin, those not considered white in the early parts of the twentieth century, like Jewish, Italian, and Slavic.

If, as a society, we can move beyond the myth of race as describing natural and biological units, then we can better address the inequalities that the race myth—and its concomitant, the social practices of racism—have created. The myth is strong, even in the face of resounding evidence against it. However, education and information (and access to them) are the main tools of myth busting. We will not move completely past this myth in this generation, or maybe not even in the next, but it is a possibility for the future of our society. As more and more of the myth-busting information discussed here becomes part of our social context, as children develop their schemata in the context of an accurate, information-rich social network, the effect on our cultural constructs and societal perceptions can be substantial. Some of these changes are already under way, but the forces maintaining the myth of race are many and massive, especially the current pattern of inertia, or maintenance of the status quo, in adults. We may find it very difficult to change our own views, or once changed, we may find it uncomfortable to speak up against this myth in many situations.

It was the loveliest party that I've ever attended
If anything was broken I'm sure it could be mended
My head can't tolerate this bobbing and pretending
Listen to some bullet-head and the madness that he's saying

This is where the party ends
I'll just sit here wondering how you
Can stand by your racist friend
I know politics bore you
But I feel like a hypocrite talking to you
You and your racist friend

In order to move forward we all have to be active in the discussion about the reality of racism in the United States. We need to confront our racist friends, family, and society. Go seek out, create, and spread more in-depth analyses of the myth of race and all the details that refute it. Many of our social norms and cultural constructs stand in our way; they support the inertia and patterns that maintain the myth or at least make it very difficult to challenge it publicly. However, once we have read this kind of information, we cannot be hypocrites, we must be myth busters.

That humans (especially males) are naturally aggressive is a prominent myth about human nature. To bust this myth we have to test the core assumptions and refute them.

ASSUMPTION: *Human aggression (especially in males) is an evolutionary adaptation; we evolved to be aggressive, big-brained apes.*

TEST: Is aggression a trait that can be selected via evolutionary pressures? Is there evidence that humans, and our closest relatives, are evolved to be aggressive? That is, do aggressive behaviors and violence appear as central parts of our (and our closest relatives') evolutionary history, especially in males? If the answer to these questions is yes, the assumption is supported; if no then it is refuted.

ASSUMPTION: *The nature of human aggression is in our genes.*

TEST: Are there biologically identifiable and measurable factors that clearly demonstrate that aggression and violence are rooted in specific genetic or biological characteristics of humankind? If there are, then the assumption is supported; if not, then it is refuted.

ASSUMPTION: *Aggression results in "survival of the fittest." In an evolutionary sense being aggressive and violent, especially if you are a male, gets you more benefits.*

TEST: Do more aggressive, more violent, or more warlike males do better both in human society and in our closest relatives? If they do, then the assumption can be supported; if not, then the assumption can be refuted.

ASSUMPTION: *Humans, at their core, rely on aggression and violence more than cooperation and mutualistic interactions; everyone is aggressively just out for themselves.*

TEST: If studies show that humans are more successful when being selfish, aggressive, or violent in dealing with challenges and each other, then the assumption is supported. However, if cooperation or mutualistic interactions and non-selfish actions are more pervasive than aggression, then the assumption is refuted.

It is empirically obvious and universally accepted that aggression is not a unitary phenomenon and that there is more than one type of aggression. These types include:

Fear-Induced Aggression: When an animal is prevented from escaping attacks or capture

Maternal Aggression: When mothers defend offspring

Intermale Aggression: A male in conflict with another male of the same species

Irritable Aggression: From exposure to a threatening or irritating item or event

Sex-Related Aggression: Where the sexual act includes aggressive actions

Predatory Aggression: When an attack response is triggered by the presence of a prey item

Territorial Aggression: When an intruder enters into another animal's defended territory

However, most researchers also agree that these types are not exclusive and that any single aggressive interaction can potentially have multiple types of aggression in it. The aggressive behaviors can fall at different places along the continuum of mild to severe. Many researchers also note a specific difference between the behaviors involved in predation (hunting and eating another species) and the types of aggression that occur between members of the same species.

It is good to keep in mind that in the context of normal aggression there are many positive social outcomes. For example, consider the mild aggression used by parents (in humans and in other primates) when socializing young or the aggression that individuals within a group use when breaking up fights or policing and resolving conflicts between group members.

The human emotion of anger comes from an evolutionary ancient interaction of the brain, hormones, and behavior—often called the fight or flight response system—thus linking human aggression in some ways to the more generalized animal aggression. While anger is typically associated with aggression, similar circumstances can elicit both anger and fear, which can result in different types of aggression (reactive and proactive). In animals there is usually a clear separation in the brain-behavior pathway between anger-induced and fear-induced aggression, with actual physical aggression being more restrained in anger-based behavior than in fear-based behavior. However, in humans (relative to other animals) there appears to be a wider range of ways in which aggression can be expressed and the distinction

between anger-induced and fear-induced aggression is not always so clear cut.

The way aggression is displayed depends primarily on the cognitive and experiential factors of the person displaying it. They suggest that the way in which humans perceive and interpret the environment and other persons in it, their assumptions and expectations of their situation, how they believe others will respond to events, and how much they believe in their own abilities to respond to an event, all affect how aggression will be displayed in any given situation. Basically the concept is that how people “see” and experience the world shapes how they perceive events, objects, people, and social interactions as relevant or irrelevant to aggression.

So an act of aggression itself results from the basic capacity for exhibiting these types of behaviors—which are physiological responses related to our evolutionary history and biological present—combined with the convergence of an individual’s experience, history, perceptions, and a given particular situation. Given what we have reviewed here, we can safely say that aggression, as humans exhibit it, is not a single, unitary trait, or even an easily described physical or behavioral system, that can be shaped by evolutionary pressures in the same way as a trait such as a tooth or a femur (leg bone).

The basic behaviors used in aggression have their origin in the fight or flight response. This is a physiological system common in all animals, and developed in a specific way in mammals. When something potentially dangerous happens to a mammal its body responds very quickly with certain hormonal, heart rate, and behavioral actions. For example, say you are a zebra eating grass on a savannah and you look up to see a lion running at you. Your eyes and brain immediately send a series of signals to your heart, muscles, and adrenal glands whose actions then allow you to turn and run, extremely quickly and effectively, without thinking about it. This same scenario, in a slightly different situation, can also result in fighting. Say a zebra is cornered by a pack of wild dogs against a cliff face. The same system of brain, heart, and adrenal glands will act, but in this case the zebra will use the energy and muscle power to fight the dogs instead of fleeing.

The bottom line is that in animals we know where responsive aggressive behavior comes from. It turns out that the bodily systems involved in proactive aggression are basically the same as in responsive aggression; however they are stimulated by, and used in, different situations. In complex social mammals (primates, wolves, whales, dolphins, et cetera) proactive aggression can be especially important in social contexts.

While fighting, having sex, and grooming are very important to primate societies, such social interactions, especially aggressive ones, are not at all

common. Most primates actually spend the vast majority of their time looking for food, eating, and resting. Even the most socially active of primates (macaque and baboon monkeys and chimpanzees) rarely spend more than 20 percent of their time in social interactions. Across the primate order the average total time spent in social interactions ranges from five to ten percent of total active time. Humans are by far the most socially active primates. However, this does not mean that social interactions are not important; they are the glue that hold primate societies together and make up some of the most interesting and central aspects of primate lives. If we look at how social interactions break down we see something very interesting: primates spend most of their time in prosocial behavior; aggression, especially severe aggression, is very rare. A broad overview of the primatological literature, including hundreds of species and tens of thousands of observation hours, demonstrates that intraspecies violence resulting in death is extremely rare, and decidedly not wide scale, in primates.

This does not mean that aggression is not important. It is. Positive social relationships are so central to primate societies that the possibility of aggression, even rare aggression, can elicit a whole suite of behavioral patterns that have evolved to ameliorate, or fix, the damage done by aggression between members of a group. This pattern is called the valuable relationships hypothesis and is strongly supported by a range of research projects.

This is of course very debatable in modern warfare where bombs, missiles, unmanned drones, and robots can carry out many of the actual lethal attacks and face-to-face killing is less common. Thus the action of pushing a button or giving a verbal command far away from the battlefield might not require any aggression at all.

These are the minimal set of points we need to consider when engaging in a discussion about the role of war as it relates to understanding human aggression:

- Our species is not biologically destined for war.
- War is not an inescapable part of social existence.
- Understanding war involves a nested hierarchy of constraints.
- War expresses both pan-human practicalities and culturally specific values.
- War shapes society to its own ends.
- War exists in multiple contexts.

- Opponents are constructed in conflict.
- War is a continuation of domestic politics by other means.
- Leaders favor war because war favors leaders.
- Peace is more than the absence of war.

In most studies of dominance relations, males use a variety of means to move up (and down) the dominance hierarchy. For example, in a five-year study of long-tailed macaque monkeys in Bali, Indonesia, researchers watched three adult males become dominant in their respective groups. Interestingly, each did so via a distinct pathway. One male followed what would be considered the aggression path. He was aggressive to all the females and males in his group, constantly picking fights (and winning them) and physically harassing other group members such that they gave way whenever he was around.

The second male tended to fight when attacked, but almost never started fights. Rather, he spent nearly all of his time approaching all the females in the group and having sex with them, whether they were capable of getting pregnant or not. Over time the females started to support him when other males attacked him. One other male joined forces with him, and the two of them became the favorite partners of the females, always receiving their support in group conflicts. This is the way he ended up as the dominant male in the group.

Finally, the third male spent nearly all of his time grooming and in friendly behavior with males, females, and especially the young members of the group. When fights would break out he (along with a group of young males that hung around him) would almost always go over and break up the fights. This is the way he became the alpha male in his group. However, over the entire time he was the dominant male, females frequently came up to him requesting sex and he almost never acquiesced (researchers only saw him mate a few times over many years). Similar variation in dominance styles, with and without a major role for aggression, is reported for a majority of primate species.

The case for cooperation as central to human success has been made for human ancestors, modern humans in simple foraging societies, agriculturalists, and modern nation states. There is copious fossil and material evidence that from early on in our evolutionary history the ways in which we worked together as opposed to selfish and individually based behaviors is what enabled humans to spread far and wide across the planet. There is also a large body of evidence that demonstrates that agriculture, village

and city structures, large-scale religious interactions and political systems, and trade and market economies all rely on a substantial infrastructure of human cooperation for their success. This does not mean that competition and conflict are not also common, just that these are not the basis for our success. Aggression can emerge out of cooperation, or the breakdown of cooperation, but nearly every study conducted on human social behavior indicates higher frequencies and greater emphasis on cooperation than any other single behavioral pattern. This prevalence of cooperation does not mean that individuals do not act selfishly on occasion or that some might use aggression to take from others. It means, contrary to some perspectives, that a primarily selfish orientation (sometimes referred to as *Homo economicus*) is not characteristic of most people in most societies.

This basic notion of *Homo economicus* is that humans as individuals will make decisions based on what is best for themselves. This turns out not really to be the case. In a study of fifteen societies, researchers demonstrated unequivocally that the central axiom of *Homo economicus* (humans will behave selfishly in economic situations) is refuted. In fact, selfishness as a primary pattern was not found in any of the societies studied. Rather, patterns of cooperation and social reciprocity were dominant, with much variation in details across societies, based on integration into world markets as well as demographic and other social variables. This does not mean that humans are all egalitarian or that we are selfless. It simply reflects the reality that human societies are based on extensive and extremely complex systems of cooperation and mutual inter-reliance on one another, such that a consistently selfish behavioral strategy will not be sustainable in human groups.

“If we weigh the totality of the evidence, we arrive at a new conclusion: Humans are not really so nasty after all.”

“We will never understand violence by looking only at the genes or brains of violent people. Violence is a social and political problem, not just a biological and psychological one.”

Are humans predisposed to behave violently?

“Well, to talk about inherent aggression in us sets off alarm bells for some people because it sounds biologically determinist, it sounds pessimistic. So, I wouldn’t want to quite put it in that term. But, I do think that there’s all sorts of evidence that humans have got a predisposition to behave with violence in certain contexts.”

Most researchers see that context and variability are central to any sincere attempt to understand human violence. Over three-hundred years ago the political philosopher Thomas Hobbes proposed that social order (cooperative society) is not intrinsic to human nature, but is installed by a social contract that constrains and pacifies the natural violent state of humankind and the solitary individual's brutish natural tendencies. Hobbes's assumption, that humans have an inherent violent nature which must be modified by society, is reflected in many of the perspectives discussed here. However, even when there is attention given to context and variability there is resiliency to the popular myth about human nature and human beings' predisposition to aggression.

Such a perspective is incomplete and paints too simplistic a picture of how and why human beings behave aggressively. Sure, certain things spur aggressive actions, but the common notions about our inner, natural, aggressive tendencies (especially in males) ignores the complexity of human biology, psychology, history, and society. It downplays the myriad ways in which aggression is initiated and maintained, and oversimplifies what we can mean by, and understand about, human aggressive behavior. And, most dangerously, it enables a kind of inevitability in our communal sense of aggression and society, especially as it relates to males. This need not be the case.

It is essential that we not base our image of ourselves on false foundations. What is involved here is not simply the understanding of the nature of humanity, but also the image of humanity that grows out of that understanding. Humans are not naturally aggressive, but they do have a great potential for aggression and violence. If we believe we are aggressive at our base, that males stripped of social constraints will resort to a brutish nature, then we will expect and accept certain types of violence as inevitable. This means that instead of really trying to understand and rectify the horrific and complex realities of rape, genocide, civil war, and torture, we will chalk at least a part of these events up to human nature. This is a dangerous state of mind that traps us in a vicious cycle of inaction and futility when it comes to moving forward as societies invested in understanding and managing violence.

Understanding humanity is neither simple nor linear; as humans we are neither violent nor peaceful at heart. We can be aggressive and violent and peaceful and cooperative all at the same time; arguing for a natural state of peace or a natural state of aggression is missing the boat. However, the myth of a natural aggression does not hold up in light of available evidence. What can we make of this? If we are not naturally aggressive how do we explain and understand human aggression and violence today? We do so

by opening our minds to the vast amount of research across the social and biological sciences, to histories and critical assessments of social patterns and lives. We also commit ourselves not to accept simplistic assertions about who we are and what we are capable of. We strive to use this information to make educated and socially involved decisions about aggression and violence. In the end, we try to keep an open mind and cooperate with one another to understand and resolve the impacts of aggression and conflict.

Sex and sexuality are very complicated and they mean a lot for our daily lives. What we really know about men and women and the nature of sex in humans challenges the extent of these differences and any simplistic take on this topic. To bust this myth we have to test the core assumptions and refute them.

ASSUMPTION: *Males and females are biologically very different from one another.*

TEST: Are male and female biologies totally different, sufficiently different, or just versions of the same biological theme? If there is a clearly distinct biological patterning between males and females that mandates radical differences in behavior and function then the assumption is supported; if males and females are basically variations on a theme, and not that different, then it is refuted.

ASSUMPTION: *Behavioral differences between males and females are evolutionary; they are hardwired.*

TEST: If the differences in behavior between males and females are more biologically based (sex) than culturally based (gender) and are best explained as evolutionary adaptations, the assumption is supported. If, however, the differences are complicated, less clear, and mostly related to patterned social differences between genders, not primarily to evolved differences, then this assumption is refuted.

ASSUMPTION: *Males and females are different because they are complementary to one another, resulting in the monogamous pair bond and the nuclear family as a natural state for humans. This means that it is a natural human goal to obtain a unique and powerful sexually monogamous romantic relationship.*

TEST: This has a multipart test: first, are humans monogamous sexually? If yes, then supported; if no, then refuted. Second, are pair bonds and marriage (or at least romantic relationships) the same thing? If yes, then supported; if no, then refuted. Finally, do humans “naturally”

live in nuclear families where the strongest bonds are between husband and wife and children? If yes, then supported; if no, then refuted.

ASSUMPTION: *Men and women are really different when it comes to sexuality: men want sex and women want relationships (and less sex than men).*

TEST: Do men want more sex than women? Are men more sexually focused than women? Do the sexes differ dramatically in how, when, and how much they have sex? If yes, then supported; if no or if it is much more complicated than these simplistic assumptions, then refuted.

For anthropologists, the major distinction between sex and gender is one of societal context. Sex refers to the biological differences between men and women and gender refers to the overall differences in perception and actions. Just as we are acculturated into the society in which we grow up, we are also engendered (literally “to become a gender”). When we talk about sex differences we are referring to differences in biology and when we talk about gender differences we are referring to behavioral patterns and perceptions.

When we talk about differences we tend to think of a point on a line or single figures, not the entire range of variation that actually occurs.

The gender similarities hypothesis holds that males and females are similar on most, but not all, psychological variables. That is, men and women, as well as boys and girls, are more alike than they are different. Results from a review of 46 meta-analyses support the gender similarities hypothesis. Gender differences can vary substantially in magnitude at different ages and depend on the context in which measurement occurs. The question of the magnitude of psychological gender differences is more than just an academic concern. There are serious costs of overinflated claims of gender differences. These costs occur in many areas, including work, parenting, and relationships.

Humans have been cooperative breeders for a long time. At an early stage in our evolutionary history multiple individuals (females and males) were involved in raising and caring for children. The idea that it is natural for one human female to raise her offspring alone, or with just a single male, is a very recent one indeed, and one that is biologically not supported.

The notion that male and female behavioral differences are largely explained by the differences in their reproductive biology is absurdly oversimplified. There is a wide range of recent reviews and refutations of this notion, suggesting that a real understanding of reproductive systems and patterns of investment, aspects of sexual selection, the division of labor, and the wide

array of human ecological, social, and historical contexts better explain male and female reproductive relationships than over-hyped differences in their respective reproductive investments.

Male and female bodies have many differences, but they overlap extensively in structure and function. Looking at average differences blinds us to the important system-wide view, the normative range of variation, and how bodies actually function. When we look at the biology of males and females we are constantly reminded of one major point: we are all *Homo sapiens*. One can easily focus on the clothing, the hairstyles, the cultural behavior, the social history, and the modern-day ideas about gender and being masculine or feminine and see substantial differences between men and women, but very few of those elements match the actual biological patterns in our species. Males are often larger and more muscular than females, and aspects of our skeletons are variations on a theme. This size difference and the slight difference in the way we walk mean a lot to us socially, but biologically these are extremely minor differences.

The strong similarities in male and female bodies and behavior do not mean that gender differences are not very real and very important. Just like the concept of socially constructed races, the perception and expectation of gender differences are part of all cultures and impact individuals and society. We all experience these patterns of gender difference—and they can fool us into thinking that men and women are so very different by nature. Different cultures do it in different ways, but certain patterns are relatively consistent. Males tend to control economic and political resources, not because they are evolved to do so or that women are less capable of doing so, but because of the social and historical paths that have favored patriarchy. Women are associated with the domestic sphere and children due to their giving birth and lactating, not due to any inability of males generally to care for offspring. There is no biological mandate that only females care for young and only males care for economics and politics. In fact, it is highly likely that it is the cooperation between parents and other people in the raising of young that enabled humans to be as successful as we are today.

If this is all true (and it is), then why do so many people—researchers and the public alike—make such strong claims about the nature of human sexual difference? For two reasons: first, they focus only on the differences, ignoring the similarities; and second, they forget, or do not realize, that they are seeing everything around them through their own schemata (their all-encompassing worldviews).

We are all products of our own societies. We are who we meet and grow up with. If we are told from day one that little boys like trucks and little girls like dolls, that women are emotional and nurturing, and that men are

assertive and controlling, we will grow up seeing those behaviors around us. Researchers, especially those looking for evolutionary origins of why we do what we do, have to be extremely careful that they do not overlook the structures of modern human societies and our schemata in their quest to understand the big picture. They must be careful not to already know how the world looks and simply seek an explanation as to why the world is this way without first asking the most basic scientific question: is the world really this way?

Gender: The social, cultural, and psychological constructions that are imposed on the biological differences of sex.

Gender Roles: People of each sex are expected to have psychological characteristics that equip them for the tasks that their sex typically performs.

In general most people, and many researchers, use the words ‘gender’ and ‘sex’ interchangeably. The two are related, entangled even, but not the same thing. Anthropologists have long held that gender is best seen as the culturally influenced perception of what the sexes are and the roles they are expected to play. Sex is a biological definition (XX or XY... more or less, settle down ultrawokers) and gender is how the social worlds, and expectations, of the sexes play out. Gender is best conceived of as a continuum, not a dichotomy. Remember, even biological sex is really more of a continuum than an either/or dichotomy. At one extreme end we have total femininity and at the other end total masculinity, with most people falling in between those points.

In our society, we expect sex-females to fall largely toward the behaviorally feminine side and sex-males to be mostly toward the masculine side. That is, behaviors we culturally associate with masculinity, like assertiveness, aggression, intense interest in athletics, are seen as being normal for the male sex. So when women exhibit these behaviors we see them as behaving like men on the gender spectrum. The same is true for men who exhibit socially feminine behavior such as heightened displays of emotion, subservience to others, intense interest in Broadway musicals or daytime soap operas; we see them as being like women. These examples are very stereotypical, and there are many, many exceptions to this pattern, but I choose them for a reason: everyone reading this book has a social context of gender that enables them to understand these specific examples. More specifically, everyone from the United States, as gender roles and expectations vary from culture to culture and even across time in the same culture. Gender works because it is a core

part of the social fabric in which we develop our schemata, the way we see and interpret the world.

A cross-cultural perspective makes it clear that there are many different—although probably not unlimited—ways that societies can organize their thinking about sex, gender, and sexuality.

We are nature-nurtured, so making a clear distinction between biology and culture is very difficult in many cases. It does not help for us to think of sex as biologically fixed and gender as culturally contingent, like a flexible behavioral cloak thrown over biology. Using such a dichotomy ignores the integration of biology and culture in human life, experience, and behavior. Some opt for the term ‘sex/gender’ to best describe what we are actually talking about. The two are perpetually intertwined, just not always in the ways we think. So it is best to think of sex/gender as a dynamic system of interaction rather than one physical part (biological sex) and one cultural part (gender); you can’t have one without the other.

There is a basic story told by many evolution-minded folks interested in human relationships: the body is wired to find mates. Once the best biological mate is found the brain and hormones kick in to create a particular kind of attachment drive: romantic love. This leads to the monogamous pair bond (which may or may not last), offspring, and the natural family unit—a man, a woman, and their children. When you meet the right person for you the evolved chemical cascade will lead you toward a pair bond relationship. The non-evolutionary version (whether religious or secular) is pretty much the same: just remove the chemical part and replace ideal biological mate with spiritual or soul mate. Underlying both of these scenarios is the assumption shared by many evolutionary psychologists as well as the Judeo-Christian-Muslim religions and most people in the United States, that the bonded male-female pair (with offspring) is the evolved, or natural, unit of the human family; that marriage is part of human nature; and that there is a specific pair bond partner out there for everyone. Whether one sees this as the culmination of an evolutionary history or as a spiritual reality, this vision acts to justify the role of marriage and the nuclear family as primary to human nature.

There is no real anthropological, biological, or psychological support for the notion that there is a perfect (or reasonably perfect) match for everyone, or for anyone. But there is still widespread belief that there are specific biological matches for people and that this mated, romantic pair bond is what humans are evolved to seek. There is substantial evolutionary evidence that humans do seek pair bonds (socially and physiologically), but these bonds do not necessarily involve sex, marriage, exclusivity, or even heterosexuality. Marriage is not equal to evolutionary or physiological pair

bonds, the nuclear family is not the basic unit of human social organization, and social expectations for the quality and structure of life after attaining these two things can lead to an array of social and psychological problems for people.

There are three parts to this section of the myth:

1. The unit consisting of bonded male-female + kids is the basic unit of humanity.
2. Humans are naturally monogamous and that marriage is a reflection of evolutionary origins.
3. Individuals are attracted to a single, specific mate (pair bond mate or soul mate), with whom they are evolved to have sex, marriage, and exclusivity.

These assumptions are not really accurate. We already know that a suite of hormones and neurotransmitters—including oxytocin, vasopressin, prolactin, testosterone, dopamine, et cetera—are involved in developing and maintaining physiological bonds between mothers and infants and fathers and infants. This system also functions in the same way between adults. Physical touch, spending intense social time in contact or near one another, and positive social interactions can trigger it. There is an evolved system in humans that uses social and physical interactions, hormones, and the brain to prime the body to feel closer and more attached to another individual. Some anthropologists call this affect hunger. They argue that the basic system that acts to bond mammalian mothers to their infants has been expanded and co-opted in the human species to act as a social and physiological bonding system between individuals of all ages and sexes. This drive of affect hunger enables humans to form and experience types of social bonds that are not found (to the same extent) in other animals, even in other primates. They also argue that it is these bonds which have enabled humans to do better than almost any other organism on the planet. So the answer to ‘what is love’ in this context is that it is the biology underlying affect hunger, the ability to form multiple, strong social bonds, and part of the human adaptive niche—the evolutionary history that has made us so successful as a species.

It is not human nature to seek marriage and a specific sexually monogamous romantic relationship, but it is in our nature to pair bond and in our culture to seek marriage

So what now? How does this information, the busting of the myth of extreme differences between men and women, impact our daily lives? First,

we need to discard dualisms. Thinking of males and females as opposites is incorrect biologically and socially, so it will not get us good answers to questions. Looking only at culture and social histories or only at biology and evolutionary patterns is also a false dichotomy and will hamper our abilities to ask and answer important questions. We need to be especially careful when using aspects of gendered behavior as reflections of human nature and we need to be aware of our biases, and the biases in our datasets, at all times. We are not blank slates, but we are also not pink and blue notepads. Our brains are not made 'male' or 'female' but develop via interactions between the external world and our own sensory apparatus, our bodily systems have important differences but are more similar than they are different, and gendered behavior and gender relations change over time as our social and structural contexts shift and our schemata change accordingly.

If we discard the myth that men and women are so different then we can see the range of individuals more clearly. If we accept that there are many ways to be male and female and that many of these ways overlap, we can be more accepting of a wider range of masculinity and femininity within and between individuals. A nine-year-old male who picks up a baseball for the first time and throws it ineptly is not 'throwing like a girl' as his teammates might say. He is throwing the ball like a human who has not been trained to throw a small round ball with accuracy and speed. When a nine-year-old girl plays baseball well, sliding hard, getting dirty, and running out every time she is at bat she is called a tomboy or is described with masculine adjectives. She is being a good athlete, not being like a boy. These are simplistic examples, but the idea has significant impact across all aspects of our lives. Taking this perspective can help reduce conflict for individuals, and their families and friends, who feel that they fall outside of the social expectations for their gender. It can also create a more level playing field when we look at the abilities and behavior of others, not thinking they will perform one way or another because of assumed limitations of their sex. Again this does not mean people do not vary in occasionally predictable ways. However, if we broaden our categories we might just be pleasantly surprised.

Another way these ideas might help is with the expectations for love and romance and marriage that permeate our society. There is no evidence that there is a specific chemical/biological and social match for each individual on the planet. There is also no guarantee that any individual will successfully initiate and maintain one or more strong pair bonds socially and sexually across the life span, although many of us probably do desire such relationships. Marriage is not necessarily one of those pair bonds. It might coexist with one, but getting married and having children does not automatically initiate

a pair bond. People need to realize this because spending enormous amounts of time and effort with one other individual is very difficult, and if there is not a pair bond it is probably even more difficult. Romance and marriage are not evolutionary adaptations, they are part of our cultural expectations and patterns, which change over time.

Pair bonds are not necessarily lifelong (in fact most are not) nor are they always the same across the duration of the relationship. Humans can have many pair bonds across their lifetimes and, frequently, multiple ones at the same time. Social and sexual pair bonds can be very similar biologically but their social and cultural impacts can be quite different. Being in a pair bond (social and/or sexual) does not mean that either individual ceases to be sexually attracted to (or active with) other individuals. Monogamy in humans is a social contract, not a biological reality. We can be monogamous, but our bodies and minds are not specifically designed for it.

Men and women do not really want different things from life; in the end we are all humans. However, some biological patterns combined with specific cultural contexts can create different desires, expectations, and patterns of behavior. We must realize that each individual may or may not match the appropriate ideas society has for sex/gender but that such variation is normal for humanity. Understanding how we are similar and different and the range of human variation gives us a broader notion of what is natural for humans. There is no evolved battle of the sexes in humans, nor are gender differences and similarities unimportant, but understanding both how we do and do not vary can help us move forward toward a better society.

Busting Myths

Some key points:

1. **Humans are simultaneously biological and cultural; we are nature and culture creatures with a fascinating evolutionary past and present.** We have complex biology (our bodies) and culture (our schemata) that create and shape, and are shaped by, our perceptions and philosophies. We have not evolved to have one specific way of being, and thus there are a number of potential outcomes to being human. However, our bodies, schemata, and cultural inheritance constrain the ways in which we can envision, construct, and experience those potential paths. We are born into a world of existing social and physical ecologies, patterns, and contexts that immediately become entangled with our biological structures and become a central part of our process of biocultural development. It is abundantly clear that simple explanations for who we are and why we do what we do are usually wrong.
2. **Culture matters.** Our culture is a large part of what makes us unique. We can think of culture as a dynamic web of significance at the core of our becoming and being human. Culture is both a product of human action and something that influences that action; it is the context that helps give meaning to our experiences of the world. This means that cultural constructs are real for those that share them. Some constructs are more pervasive than others, and thus more important to understand because they affect how we live and act and treat others.
3. **Evolution matters.** Evolution is largely misunderstood and misused when thinking about human behavior. Generally, evolution is change over time. Specifically, it is change in genotype and phenotype across generations due to a variety of processes. These processes create, move, and shape biological variation in multiple ways. It is not all about fighting and survival, it is about interactions between organisms and environments and organisms and each other over time. Niche construction theory shows us that humans and their environments are mutually interactive in evolutionary processes, and helps us realize that social and ecological inheritance is very important. Multiple inheritance theory illustrates that evolutionarily relevant inheritance can be genetic, epigenetic, behavioral, and symbolic. Evolution is not goal oriented nor does it produce endpoints: evolution is ongoing.

4. **Genes do not equal human nature.** Our DNA alone does not determine who we are and how we behave, but it is a primary component in the development and maintenance of our bodies and behaviors. Genes contain the basic instructions for the building blocks (proteins) of biological systems. Genes and our phenotype (our bodies and behavior) are connected, but not usually in a one-to-one relationship; however, the relationship they do have is shaped and influenced by evolutionary processes, ecological and social contexts, and histories.
5. **Race is not what we think it is.** The construct of human races is not a biological reality. There is substantial variation among individuals within populations and some biological variation is divided up between different populations and also among larger population groupings. Patterns of variation both within and between groups have been substantially shaped by culture, language, ecology, history, and geography. Race is not an accurate or productive way to describe modern human biological variation, but human variation research does have important social, biomedical, and forensic implications. Race is a cultural construct that can affect our social realities. Racial inequality (racism) is a social reality and can affect individuals' biology. Ethnicity is a valid way to ask questions about social histories and social and symbolic identification, but it is not biology and it is not race.
6. **Humans are not aggressive by nature.** Humans have great potential for aggression and violence. There is variation in conflict styles and aggression across individuals, sexes, genders, societies, and time frames. Aggression itself is not a uniformly or consistently discrete trait, so aggression per se cannot be favored by evolutionary pressures. War is common in the human experience today, but it is not part of our evolutionary heritage. Human aggression, especially in males, is not an evolutionary adaptation: we are not aggressive, big-brained apes. Males and females differ in some facets of aggression, and many of those differences have to do with physical size and the social and experiential contexts in which the genders find themselves. Genes do not control or determine the normative expression of aggression, but abnormal biological function can influence aggressive behavior. Humans are hyper-cooperators and not "naturally" selfish. As a species we do not rely on aggression and violence more than cooperation and there is no pattern of evidence to support a notion that humanity is aggressive and selfish by nature. Aggression is an important part of being human, but it is not who we are at our core.

7. **Men and women are not as different as you may think.** There are important biological differences between the sexes and there are also important similarities; however, there is a greater range of overlap in male and female bodies than most people realize. Behaviorally males and females also overlap extensively. Humans, regardless of sex, seek to form pair bonds of both social and sexual sorts, but pair bonds and marriage are not the same thing. Males and females, given the opportunity, will engage in sex across their lifespan in more or less the same rates and manners. These strong similarities in male and female bodies and behavior do not mean that gender differences are not real and important. Gender is a powerful cultural construct and the perception and expectation of gender differences impacts individuals and society. Males tend to control economic and political resources and women are heavily involved with child rearing because they give birth and lactate, but males and females have the same behavioral ability to care for offspring. There is no biological or evolutionary mandate that only females care for young and only males care for economics and politics. These patterns of gender difference and the strength of the cultural assumptions about sex fool us into thinking that men and women are different by nature.

8. **Busting myths about human nature requires critical thinking and a lot of work.** Myths matter in our daily lives and make sense to our shared schemata, which is why they are tough to challenge. The information to bust most myths about humanity is largely available, but it exists across a range of academic disciplines, books, journals, media sources, and people. To tackle any of the myths about human nature one must compile a variety of information from different sources. Any single approach is not going to get you a sufficient set of information to achieve quality answers nor will it enable you to integrate the kinds of datasets needed to truly bust powerful stories about why we are the way that we are. Myth busting can alter the way we think about ourselves and the society around us; changing our minds is always a difficult and sometimes scary thing to do, but it is important.

Schemata, inertia, historical precedence, and ignorance are very powerful: it is often difficult to challenge the status quo.

Because the basic concepts in these myths are acquired and shared by most members of our society, they act to reproduce themselves at a subconscious level. They offer a common set of knowledge that can be

exploited by advertisers, politicians, and other groups to reach a maximal audience. Reinforcing these myths acts as a self-fulfilling feedback loop, making them more robust. Examine the next ten television commercials you watch and see how many of them have a specific reference to, or a reliance on, some aspect of the myths of sex/gender and aggression; I bet it will be a majority of them.

Another important reason why misinformation, and even overt lies, remain prominent in the public mind is simplicity versus complexity in explanations. To counter what we think of, and experience, as everyday reality requires deconstruction of the assumptions, assessment of the assumptions, and then refutation of the assumptions—whereas supporting popular myths simply relies on reinforcing what you already “know,” thanks to your schemata. Think about how many words you’ve read or have yet to read in this book, yet it barely skims the surface of all the data and information available on the subjects! Because of their powerful place in our culture these myths and others take much fewer words and ideas to be supported. Supporters of these myths can simply refer to common knowledge, to the world you see every day, and to many of the social experiences you yourself have had. They can ignore contradictory data, disregard variation, and focus on averages and cultural constructs, simply by ignoring the actual details of the issues involved. This works because of what we know about human biocultural development and the power of social context. These myths of human nature are promulgated so thoroughly, and successfully, in our society in large part because it is easier to accept the world as we perceive it is than to question and investigate whether the world might be a bit different than we think.

Finally, a core reason that these myths are so resilient is because few of us have the opportunity, the time, or the training to assemble the diverse array of information needed to effectively bust them. However, if we continue with our horrendously skewed and willfully ignorant interpretations of history, we will find ourselves with a generation that’s woefully misinformed and it will be completely our fault.

So, you want to bust some popular myths? To effectively bust myths you need curiosity, perseverance, and the ability to collect and assess copious amounts of information. You have to be ready to read a lot, to think critically about what you read, and to be vigilant about popular assertions, whether you agree with them or not. Today it is also critical to have a computer and access to the Internet. The following are a two tips to think about as you consider trying to figure out what the world is actually like.

Challenge Common Sense: Do not passively accept what you are told.

If something strikes you as incorrect, or even if you just want to know if it is right or wrong, you need to do a little legwork to figure out how to assess the assertion. The easiest way to try this is to ask yourself the following questions about something you believe. Why do you believe it? Experience? School? Read it somewhere? Heard it from parents, a friend, a co-worker? First figure out where information comes from, then ask yourself why it feels right or wrong. Sometimes your gut feeling reflects your schemata, telling you that all is as it should be. But sometimes you might, even subconsciously, have picked up on some of the variation, patterns, or inconsistencies that make you feel differently about this particular topic (whatever it is). This feeling might make you question some assertion of reality that seems clear and correct to others.

How do you figure out how to effectively question the assertion? Clarifying what is actually being said and who is saying it is a good place to start. The assertion that boys play rougher than girls—it is probably going to sound right, but how does anyone actually know this? If the person making the assertion does not study this then they must have heard it or read it somewhere and are simply repeating it. Or maybe the person making the assertion is going solely on their own life experience. Whatever the case, you need to figure out where the original information comes from (or at least where that person heard it) and start there.

Do a little research in libraries or on the Web, ask people, see where this path of inquiry takes you. In the end you might reaffirm your beliefs or maybe they might be challenged. In this effort it is absolutely necessary that you are not afraid to admit you do not understand. We humans have very large and complex brains and one of their major functions is to help us identify when things just do not make sense to us. Being confused or not following a line of argument is a normal part of brain function, especially when it involves thinking about something that contradicts our normative expectations. Our society makes it difficult to admit we do not understand, but it is a critical first step in learning and in busting myths.

Lots of Data: To integrate information across different areas of knowledge requires two steps. First, how do you get the information, and second, once you have it how can you tell what is most worthwhile and relevant? This can be broken down into three parts: Where do we find the information? How do we select the right information from the

vast amount out there? How do we understand details of information in fields/areas that we know little or nothing about?

Where do we find the information? Most people know the answer to this question. Libraries, books, journals, print and visual media, the Internet, real discussions with real people, and professional scientific organizations are a good start. This involves what many folks in the field of education like to call life-long learning, which is the idea that the basic skills of searching for and acquiring information that you learn in school can be applied throughout life to keep enhancing and expanding your knowledge set.

It takes time to brush up on a topic, but in most cases with a bit of serious time and attention our big brains can pick up enormous amounts of information.

“The most dangerous ideas are those that are true. Read the literature, but don’t read too much of it. Read a bit to notice something that everybody is doing wrong. Something that just doesn’t feel right. Read enough to develop your intuitions, and then trust your intuitions. Don’t be too worried if everybody else says it’s nonsense. But, there is one thing. If you think it is a really good idea, and other people tell you it’s *COMPLETE NONSENSE*. Then you are really onto something.”

The Wrong Quantity of Melanin

“As man advances in civilization, and small tribes are united into larger communities, the simplest reason would tell each individual that he ought to extend his social instincts and sympathies to all the members of the same nation, though personally unknown to him. This point being once reached, there is only an artificial barrier to prevent his sympathies extending to the men of all nations and races.”

There are five different genes involved in skin pigmentation that show signals of selection in Europeans. This helps to explain why Europeans have lighter skin than Africans; this trait appears to have been selected for relatively recently in the European population, consistent with what anthropologists had long argued: that humans evolved originally in Africa with dark skin. It was only as we moved out of the tropics and into higher latitudes, with their lower levels of ultraviolet light, that we had to lose some of our dark pigmentation in order to allow the deeper layers of our skin to synthesize enough vitamin D—something they only do when exposed to enough UV light. The reason Europeans have pale skin—and part of the reason some of them have fair hair—is that their ancient ancestors needed to make enough vitamin D for their bones to survive the rigors of northern life thousands of years ago.

That white people are inherently afraid of black people, and particularly black men, has been established by countless scientific studies, ranging from the prosaic (police officers shoot black suspects more quickly than whites in video simulations) to the bizarre (white people are more likely to ascribe superhuman or paranormal powers to black people than to other white people).

Jesse Jackson once described walking through a dangerous neighborhood and whirling around in fear when he heard footsteps behind him. It was a white man, though, not a young black man, and Jackson said that his sense of relief was one of the most painful things in his life.

The Nation of Islam was founded in 1930 by a Detroit clothing salesman named Wallace D. Fard, who preached that blacks had ruled the earth six-thousand years ago, until their destruction by a renegade black wizard named Yakub, who then created the white man—the “white devil,” in the Nation’s mythos; blacks, Fard prophesied, would destroy the white devil in a future apocalypse. Until his disappearance and presumed death in 1934, Fard imbued his disciples with a message of racial pride, economic equality, and personal discipline.

A mosque typically featured a blackboard Islamic flag with the words **FREEDOM, JUSTICE, AND EQUALITY** beneath, alongside an American flag with the words **CHRISTIANITY, SLAVERY, SUFFERING, AND DEATH**.

Technically McGee’s death was not a lynching, it was an execution. In the decades following the Civil War, more than four-thousand black men were lynched in the former Confederate states, but later public lynchings had mostly given way to quasi-legal death sentences. One notable exception happened in Oxford in 1935, when a mob broke into the city jail and lynched a black man named Elwood Higginbotham. He was killed while a jury was still debating his case in the courthouse across the street. Between 1930 and 1964, 455 men were executed for rape in the United States. Most of them were black, and most of them were accused of raping white women. A black man accused of rape was a stand-in for his entire race, and he was lynched—or executed by the state—because a gradual mingling of the races had started to occur that racist whites were powerless to stop. Ultimately the purpose of lynching was not to dispense justice but to control the black population. Since lynching was primarily an instrument of terror, it mattered little whether the accused were guilty or not—in some ways killing an innocent man made even more of an impression than killing a guilty one—and the more gruesome the killing, the more terror it spread.

Variations on that phrase—“persons, party, or parties unknown”—haunt the accounts of lynchings throughout American history generally, and in the deep South in particular. Again and again, reports of lynchings in black publications like the *Chicago Defender* and catalogs of lynchings in the NAACP’s annual reports described coroners’ inquests that concluded the murders were committed “at the hands of persons unknown.” For more than a century, coroners and the juries they convened across the country seem to have had an extraordinarily difficult time identifying members of the white mobs who murdered black people, even when the identities of the people who perpetrated such killings were well known in the community, or even when there were photographs of them carrying out the lynching—even when those photographs were published on the front pages of local newspapers. The problem was especially egregious in the first half of the

twentieth century, when lynchings were often a public spectacle, and the identities of participants weren't just well known, they were celebrated.

Lynchings were often organized—even planned—performances. Local newspapers sometimes posted the time and location. They were frequently witnessed by dozens, some by hundreds, of spectators, with the events then reported on and publicized the following day. The killings were purposeful assertions of white supremacy, a terroristic tool to keep black people docile and subservient. The intended victim wasn't just limited to the doomed soul at the end of the rope, but every black man, woman, and child close enough to be affected by the violence. Publicity was therefore often welcome. In some cases, vendors sold gruesome photos and postcards of lynchings, or pieces of the rope used for the hanging.

In October 1911 in Anderson County, South Carolina, a mob strung up a man named Willis Jackson on a telephone pole and shot him to death. Reporters from the local paper witnessed the entire murder. When the coroner cut Jackson's body down the next day, the paper reported:

“His fingers had been removed as souvenirs. Onlookers took home pieces of the rope that strung him up, too.”

The paper presumably got the scoop on the killing because its editor, Victor B. Cheshire, was part of the mob. So was state representative Joshua W. Ashley. The paper reported that its editor “went out to see the fun, with not the least objection to being a party to help lynch the brute.” Even with the names of the lynch mob published in the local paper, the coroner's jury concluded that Willis Jackson died “at the hands of parties unknown.”

As white power in the South gradually waned after the Civil War, lynchings inevitably attained a savagery that may have shocked even some of the perpetrators. In an 1899 case that became infamous throughout the South, a young black man named Sam Hose was burned alive in front of several thousand people, many of them Christians who had left their church services early to enjoy the spectacle. The ringleaders chained Hose to a tree, cut off his ears, poured kerosene on him, and then lit a match. When he finally stopped writhing, the crowd rushed forward and cut pieces from his smoldering body. When that was gone, they chopped up the tree he was chained to, and when that was gone, they attacked the chain itself. Later that day, spectators were spotted walking through town waving pieces of bone and charred flesh. Hose's knuckles turned up at a local grocery store.

The South's relationship with public torture culminated in 1937, when two black men were accused of murdering a white store owner in the town of Duck Hill, Mississippi. The men were abducted by a mob on the courthouse

steps and taken to some woods outside town where a crowd of several hundred men, women, and children had gathered. The accused would not confess to the crime—there was absolutely no evidence they'd had anything to do with it—so they were whipped with chains and then tortured with a blowtorch. Unable to withstand the pain, one of the men finally admitted to the killing and was quickly rewarded by being shot to death. His companion held out until his eyes were gouged out with a pickax and then he, too, confessed. He was finally doused with gasoline and burned alive.

A fisherman found the bloated, disfigured corpse of Emmett Till in the muddy Tallahatchie River. The fourteen-year-old boy's body had been weighted down with a cotton gin fan that had been tied to his neck with barbed wire.

Today, the general details of Till's murder are well known, and his story is remembered as a touchstone moment in the story of civil rights in America. But less well known is the role the county coroner and Mississippi's death investigation system played in covering for the men who murdered him.

On August 24, 1955, Till and some neighborhood friends visited the Bryant Grocery and Meat Market. Till, from Chicago, was visiting family in and around the town of Money, Mississippi. Till bought some gum and chatted briefly with Carolyn Bryant, the white wife of the store's proprietor. By some accounts, as he and his friends departed, Till allegedly told the woman, "Bye, baby," and waved. By other accounts, he may have "wolf-whistled." According to Bryant, Till grabbed her and made sexually suggestive remarks.

Of course, even if Bryant's worst account of Till's actions had been true, it amounted at most to harassment or minor assault. But by stepping out of his place, by disrespecting a white woman, Till had broken Southern code. Bryant left the store to retrieve a gun from her car. Till and his friends piled into a car and sped off.

Three days later, Bryant's husband, Roy, and his half brother, J. W. Milam, broke into the home where Till was staying and abducted him at gunpoint. They'd later tell *Look* magazine that they beat Till, shot him in the head, and dumped his body in the Tallahatchie River. The fisherman found Till's body four days later, early in the morning of August 31.

What happened next would later help a jury set Till's killers free. Local authorities knew the teen had been missing for days, so once his body was found, both Tallahatchie County Sheriff Clarence Strider and Leflore County Sheriff George Smith had good reason to suspect the corpse was Till's. Law enforcement summoned the boy's uncle, Mose Wright, to the riverside to identify the body. Wright would later testify that as he approached the body, he could immediately tell it was his nephew. He also saw officials

remove from Till's hand a ring that had been carved with the initials of Till's father. Strider called an undertaker to pick up Till's body and take it to a funeral home in Greenwood. The undertaker would later find that the ring had been inscribed with the initials "LT"—Till's father was named Louis Till. He had been executed in Italy when he was stationed there with the US Army. The ring was included in the personal effects the army returned to his wife, Mamie, in Chicago. She had given it to Emmett.

Initially, local officials appeared to be outraged by Till's murder. In the days immediately following the abduction, witnesses identified Bryant and Milam as the men who took Till from his uncle's home. Sheriff Strider told the *New York Post* that a coroner's inquest had been scheduled, and that once the inquest determined Till was murdered in Tallahatchie County, "we're going to charge those men with murder."

Yet according to the Leflore County justice of the peace, the ensuing death investigation was "not exactly an inquest" but "more of a post-mortem." No one ever requested an autopsy. In fact, Till wouldn't be autopsied until decades later. Local officials made only the sparsest effort to preserve the evidence that would confirm that the body was Till's. C. A. Strickland, a twelve-year veteran of the Greenwood, Mississippi, police department's "collision department," used a low-end field camera to take some snapshots of the body as it lay on a table at the Century Burial Funeral Home. The only physician to examine Till's body was a local doctor named Luther Otken. He was not a forensic pathologist and had no training in postmortem examinations. At trial, Otken was asked whether he had examined Till's body. He answered that he was only asked to "view" it. After describing in some detail the body's condition—"badly swollen, badly bloated" and putting off a "terrific" odor—he testified that the body was "in an advanced state of decomposition."

Within hours of the discovery of Till's body, Sheriff Strider made arrangements to have the young boy buried in Mississippi. Till's mother, Mamie Till Bradley, was still in Chicago. By the time she learned that her son's body had been found, his corpse was already headed to the cemetery. She quickly contacted an uncle in the town of Sumner and asked him to put a stop to the burial. When the uncle arrived at the cemetery, they had already dug Till's grave.

The family had Till's body moved to a black-owned funeral home in the town of Tutwiler. The boarded-up, run-down remains of that funeral home still stand today, along with a sign memorializing the fact that Till's body had been prepared there. After preparation, the body was shipped from the depot across the street to Chicago by train.

Till's murder sparked anger and outrage all over the country. NAACP

chief Roy Wilkins issued a public statement declaring that “the state of Mississippi has decided to maintain white supremacy by murdering black children.” The black activist T. R. M. Howard declared that there would be “hell to pay.” Editorial boards across the country condemned not only the killing but the entire state of Mississippi. Such blanket condemnations were understandable, and in many ways justified, but they also provoked a defensive reaction. While Bryant and Milam were initially scorned by local white residents, the criticism from outsiders sparked a backlash. Disgust at Till’s murder morphed into resentment of Northerners and integrationists. J. J. Breland, a local lawyer and leader of one of the Citizens’ Councils, was initially shocked by the killing and declined a request to represent Bryant and Milam. But as the denunciation of Mississippi mounted, he changed his mind. He began to see the case as a front-line battle in the war against integration.

“They’re peckerwoods, but, hell, we’ve got to have our Milams to fight our wars and keep our niggahs in line. There ain’t gonna be no integration. There ain’t gonna be no nigger votin’. And the sooner everybody in this country realizes it the better. If any more pressure is put on us, the Tallahatchie won’t hold all the niggers that’ll be thrown into it.”

Led by Sheriff Strider—the same man who had vowed that Till’s killers would be brought to justice—local authorities backtracked and began to publicly question what had previously been a slam-dunk murder prosecution. Strider and the local coroner had locked Till’s coffin with the seal of the state of Mississippi and made Till’s uncle sign a form promising never to open it. Mamie Till Bradley broke that promise. When she opened the coffin, she discovered that her son’s body had been packed with lime, a chemical commonly thought at the time to hasten the process of decomposition. It was a clue of what was to come: local authorities were preparing a defense for Till’s killers.

Outraged not only at her son’s murder but at the way his body had been handled, Mamie Till Bradley followed the lead of George Lee’s widow and insisted on an open-casket funeral. Photos of Emmett Till’s corpse ran in *Jet* magazine, sparking more national outrage.

On the day of the funeral, Strider gave Till’s killers a gift. He publicly claimed he was never certain that the body recovered from the river was Till’s. It was a baffling thing to say. Strider was the official who released the body to Till’s family. If he had doubts about the identity of the corpse, he not only may have sent Till’s relatives the wrong body, but he would have likely prevented the investigation of a separate murder.

But Strider's comments achieved their intended effect. They set off a host of conspiracy theories, including claims that Till had never been killed at all, but had been secretly sent back to Chicago or was being hidden by his family—all part of a vast conspiracy among Northern agitators to force integration on Mississippi. The local white residents who initially shunned Bryant and Milam later raised over \$10,000 for the two men's defense—about \$90,000 today.

The trial began on September 19, twenty-two days after the murder. The state's failure to perform an autopsy was a critical part of the defense. Breland seized on that fact, using it to argue to the jury the theory that Sheriff Strider had already advanced in public—that the body recovered from the river was someone other than Emmett Till.

The only doctor to look at Till's body played along. "From the condition that you saw the body in, in your opinion, could anybody have identified any particular person as being that body?" Breland asked Dr. Otken.

"I don't think you could," he responded.

"Now suppose it had been another person's brother, could he have identified it in your opinion?"

"I doubt it."

"Or if it had been a person's son, could a mother have identified that body, in your opinion?"

"I doubt it."

Breland continued to press. "Doctor, from your experience and study and your familiarity with the medical authorities, what, in your opinion, had been the length of time that the body had been dead, if it had been in the open air?"

"I would say eight to ten days."

Till had only been missing for three. The defense also argued that the state's strongest piece of physical evidence—the ring—could have been planted. After instilling in the all-white, all-male jury sufficient doubt about Till's body, Breland closed with an appeal to racial solidarity. "I'm sure that every last Anglo-Saxon one of you has the courage to free these men in the face of that [outside] pressure," he said.

And they did. The jury took just a little over an hour to acquit. One juror later reportedly said, "If we hadn't stopped to drink pop, it wouldn't have taken that long."

The following year, safe from state prosecution by the Constitution's prohibition on double jeopardy, Bryant and Milam admitted to killing Emmett Till in an interview with *Look* magazine. They were paid \$4,000 for their story.

On June 1, 2005, fifty years after Emmett Till was first pulled from the Tallahatchie, he was exhumed from his grave in Chicago. Surrounded by squad cars, Till's body was taken to the office of the Cook County, Illinois, medical examiner. The remains were in nearly pristine condition, protected over the years by a glass partition that had been put into place after his mother's demand for an open-casket funeral. The following day, his body was autopsied for the first time. Doctors also conducted a CT scan. The results of the scan showed metal fragments inside Till's cranium, indicating that the boy had been shot. DNA testing then confirmed what had been obvious from the beginning—this was the body of Emmett Till. In 2017, more than sixty years after the fact, Carolyn Bryant admitted that her account of the precipitating incident—that Till had grabbed her and made crude remarks to her—was not true.

Again and again, black Mississippians disappeared, were abducted and never again seen alive, were murdered in the dead of night, or were struck down in broad daylight. And again and again, the state's compromised death investigation system responded with a cascade of failures—or didn't respond at all. Between 1956 and 1959 alone, at least ten black men were killed by white men in Mississippi in racially motivated attacks. None resulted in a conviction. In other cases, while racism was the likely motivation, it's difficult to say for certain because the local coroner didn't bother to investigate. And those are merely the deaths that were in some way recorded.

1958—Two black boys, aged seven and nine, had participated in a schoolyard kissing game in which a white Monroe girl gave one of the boys a peck on the cheek; the boys were arrested for molestation, jailed, beaten, and sent to a reform school. The defense effort eventually included Eleanor Roosevelt and, after a British newspaper exposé, demonstrations in Paris, Rome, and Vienna; in Rotterdam the US embassy was stoned. Soon after, the boys were released.

Over the past few decades, we have developed euphemisms to help us forget how we, as a nation, have segregated African American citizens. We have become embarrassed about saying ghetto, a word that accurately describes a neighborhood where government has not only concentrated a minority but established barriers to its exit. We don't hesitate to acknowledge that Jews in Eastern Europe were forced to live in ghettos where opportunity was limited and leaving was difficult or impossible. Yet when we encounter similar neighborhoods in this country, we now delicately refer to them as the inner city, yet everyone knows what we mean. When affluent whites gentrify the same geographic areas, we don't characterize those whites as inner city families. Before we became ashamed to admit that the country had circumscribed African Americans in ghettos, analysts of race relations,

both African American and white, consistently and accurately used ghetto to describe low-income African American neighborhoods, created by public policy, with a shortage of opportunity, and with barriers to exit. No other term succinctly describes this combination of characteristics.

Racism has gone underground—racism without racists. We are seeing a new way of maintaining white domination in places like Ferguson, Missouri. The main problem nowadays is not the folks with the hoods, but the folks dressed in suits. The more we assume that the problem of racism is limited to the Klan, the alt-right, the Tea Party, or to the Republican Party, the less we understand that racial dominance is a collective process and we are all in this game.

We have not ended racial caste in America; we have merely redesigned it. What has changed since the collapse of Jim Crow has less to do with the basic structure of our society than with the language we use to justify it. In the era of colorblindness, it is no longer socially permissible to use race, explicitly, as a justification for discrimination, exclusion, and social contempt. So we don't. Rather than rely on race, we use our criminal justice system to label people of color 'criminals' and then engage in all the practices we supposedly left behind. Today it is perfectly legal to discriminate against criminals in nearly all the ways that it was once legal to discriminate against African Americans.

Mass incarceration in the United States is a stunningly comprehensive and well-disguised system of racialized social control that functions in a manner strikingly similar to Jim Crow. People who have been incarcerated rarely have difficulty identifying the parallels between these systems of social control. Once they are released, they are often denied the right to vote, excluded from juries, and relegated to a racially segregated and subordinated existence. Through a web of laws, regulations, and informal rules, all of which are powerfully reinforced by social stigma, they are confined to the margins of mainstream society and denied access to the mainstream economy. They are legally denied the ability to obtain employment, housing, and public benefits—much as African Americans were once forced into a segregated, second-class citizenship in the Jim Crow era.

To cite one specific example, while the conspiracy theories were initially dismissed as far-fetched, if not downright loony, the word on the street turned out to be right, at least to a point, about the CIA's involvement with drug smuggling. The CIA admitted in 1998 that guerrilla armies it actively supported in Nicaragua were smuggling illegal drugs into the United States—drugs that were making their way onto the streets of inner-city black neighborhoods in the form of crack cocaine. The CIA also admitted that, in the midst of the War on Drugs, it blocked law enforcement efforts

to investigate illegal drug networks that were helping to fund its covert war in Nicaragua.

Conspiracy theorists surely must be forgiven for their bold accusation of genocide, in light of the devastation wrought by crack cocaine and the drug war, and the odd coincidence that an illegal drug crisis suddenly appeared in the black community after—not before—a drug war had been declared. In fact, the War on Drugs began at a time when illegal drug use was on the decline. During this same time period, however, a war was declared, causing arrests and convictions for drug offenses to skyrocket, especially among people of color. The impact of the drug war has been astounding. In less than thirty years, the U.S. penal population exploded from around 300,000 to more than 2 million, with drug or drug-related convictions accounting for the majority of the increase.

The attention of civil rights advocates has been largely devoted to other issues, such as affirmative action. During the past twenty years, virtually every progressive, national civil rights organization in the country has mobilized and rallied in defense of affirmative action. The struggle to preserve affirmative action in higher education, and thus maintain diversity in the nation's most elite colleges and universities, has consumed much of the attention and resources of the civil rights community and dominated racial justice discourse in the mainstream media, leading the general public to believe that affirmative action is the main battlefield in US race relations—even as our prisons fill with black and brown men.

It may be helpful, in attempting to understand the basic nature of the new caste system, to think of the criminal justice system—the entire collection of institutions and practices that comprise it—not as an independent system but rather as a gateway into a much larger system of racial stigmatization and permanent marginalization. This larger system, referred to here as mass incarceration, is a system that locks people not only behind actual bars in actual prisons, but also behind virtual bars and virtual walls—walls that are invisible to the naked eye but function nearly as effectively as Jim Crow laws once did at locking people of color into a permanent second-class citizenship. The term 'mass incarceration' refers not only to the criminal justice system but also to the larger web of laws, rules, policies, and customs that control those labeled criminals both in and out of prison. Once released, former prisoners enter a hidden underworld of legalized discrimination and permanent social exclusion. They are members of America's new undercaste.

Conversations about class are resisted in part because there is a tendency to imagine that one's class reflects upon one's character. What is key to America's understanding of class is the persistent belief—despite all evidence to the contrary—that anyone, with the proper discipline and drive, can

move from a lower class to a higher class. We recognize that mobility may be difficult, but the key to our collective self-image is the assumption that mobility is always possible, so failure to move up reflects on one's character. By extension, the failure of a race or ethnic group to move up reflects very poorly on the group as a whole.

Many will wonder how a nation that recently elected its first black president could possibly have a racial caste system. It's a fair question given the bounds on reality set by the status quo. But there is no inconsistency whatsoever between the election of Barack Obama to the highest office in the land and the existence of a racial caste system in the era of colorblindness. The current system of control depends on black exceptionalism; it is not disproved or undermined by it.

Others may wonder how a racial caste system could exist when most Americans—of all colors—oppose race discrimination and endorse colorblindness. But racial caste systems do not require racial hostility or overt bigotry to thrive. They need only indifference, as Martin Luther King Jr. warned more than forty-five years ago.

Now that America has officially embraced Martin Luther King Jr.'s dream—by reducing it to the platitude “that we should be judged by the content of our character, not the color of our skin”—the mass incarceration of people of color can be justified only to the extent that the plight of those locked up and locked out is understood to be their choice, not their birthright. In short, mass incarceration is predicated on the notion that an extraordinary number of African Americans (but not all) have freely chosen a life of crime and thus belong behind bars. A belief that all blacks belong in jail would be incompatible with the social consensus that we have “moved beyond” race and that race is no longer relevant. But a widespread belief that a majority of black and brown men unfortunately belong in jail is compatible with the new American creed, provided that their imprisonment can be interpreted as their own fault. If the prison label imposed on them can be blamed on their culture, poor work ethic, or even their families, then society is absolved of responsibility to do anything about their condition.

This is where black exceptionalism comes in. Highly visible examples of black success are critical to the maintenance of a racial caste system in the era of colorblindness. Black success stories lend credence to the notion that anyone, no matter how poor or how black you may be, can make it to the top, if only you try hard enough. These stories “prove” that race is no longer relevant. Whereas black success stories undermined the logic of Jim Crow, they actually reinforce the system of mass incarceration. Mass incarceration depends for its legitimacy on the widespread belief that all those who appear trapped at the bottom actually chose their fate. Viewed from this

perspective, affirmative action no longer appears entirely progressive. So long as some readily identifiable African Americans are doing well, the system is largely immunized from racial critique. People like Barack Obama who are truly exceptional by any standards, along with others who have been granted exceptional opportunities, legitimate a system that remains fraught with racial bias—especially when they fail to challenge, or even acknowledge, the prevailing racial order. In the current era, white Americans are often eager to embrace token or exceptional African Americans, particularly when they go out of their way not to talk about race or racial inequality.

Affirmative action may be counterproductive in yet another sense: it lends credence to a trickle-down theory of racial justice. The notion that giving a relatively small number of people of color access to key positions or institutions will inevitably redound to the benefit of the larger group is belied by the evidence. It also seems to disregard Martin Luther King Jr.'s stern warnings that racial justice requires the complete transformation of social institutions and a dramatic restructuring of our economy, not superficial changes that can be purchased on the cheap. King argued in 1968:

“The changes [that have occurred to date] are basically in the social and political areas; the problems we now face—providing jobs, better housing and better education for the poor throughout the country—will require money for their solution, a fact that makes those solutions all the more difficult.”

He emphasized that “most of the gains of the past decade were obtained at bargain prices,” for the desegregation of public facilities and the election and appointment of a few black officials cost close to nothing.

“White America must recognize that justice for black people cannot be achieved without radical changes in the structure of our society. The comfortable, the entrenched, the privileged cannot continue to tremble at the prospect of change in the status quo.”

Conventional strategies for social change proceed as though a change in who administers power fundamentally affects the structure of power itself. This narrow approach to social change is reflected in the justifications offered for affirmative action, most notably the claim that previous outsiders, once given a chance, will exercise power differently. The reality, however, is that the existing hierarchy disciplines newcomers, requiring them to exercise power in the same old ways and play by the same old rules in order to

survive. The newcomers are easily co-opted, as they have much to lose but little to gain by challenging the rules of the game. See: “The Squad.”

People of color, because of the history of racial subjugation and exclusion, often experience success and failure vicariously through the few who achieve positions of power, fame, and fortune. As a result, cosmetic diversity, which focuses on providing opportunities to individual members of under-represented groups, both diminishes the possibility that unfair rules will be challenged and legitimates the entire system.

Have we unwittingly exaggerated the importance of individuals succeeding within preexisting structures of power, and thereby undermined King’s call for a “complete restructuring” of our society? Have we contributed to the disempowerment and passivity of the black community, not only by letting the lawyers take over, but also by communicating the message that the best path—perhaps the only path—to the promised land is infiltrating elite institutions and seizing power at the top, so racial justice can trickle down?

Strategists on both the left and right, despite their differences, converge on the individual as the unit of power. Conservatives challenge the legitimacy of group rights or race consciousness and argue that the best empowerment strategy is entrepreneurship and individual initiative. Civil rights advocates argue that individual group members “represent” the race and that hierarchies of power that lack diversity are illegitimate. The theory is, when black individuals achieve power for themselves, black people as a group benefit, as does society as a whole. Here we see both liberals and conservatives endorsing the same meta-narrative of American individualism: When individuals get ahead, the group triumphs. When individuals succeed, American democracy prevails.

The absence of a thoroughgoing structural critique of the prevailing racial order explains why so many civil rights advocates responded to Barack Obama’s election with glee, combined with hasty reminders that “we still have a long way to go.” The predictable response from the casual observer is: well, how much further? A black man was just elected president. How much further do black people want to go? If a black person can be elected president, can’t a black person do just about anything now?

According to the 1950 census, among Southerners in their late twenties, the state-by-state percentages of functional illiterates (people with less than five years of schooling) for whites on farms overlapped with those for blacks in the cities. The majority of Southern whites were better off than Southern blacks, but they were not affluent or well educated by any means; they were semiliterate (with less than twelve years of schooling). Only a tiny minority of whites were affluent and well educated. They stood far apart from the

rest of the whites and virtually all blacks. What lower-class whites did have was what W.E.B. Du Bois described as “the public and psychological wage” paid to white workers, who depended on their status and privileges as whites to compensate for low pay and harsh working conditions.

Given that poor and working-class whites (not white elites) were the ones who had their world rocked by desegregation, it does not take a great leap of empathy to see why affirmative action could be experienced as salt in a wound. Du Bois once observed that the psychological wage of whiteness put “an indelible black face to failure.” Yet with the advent of affirmative action, suddenly African Americans were leapfrogging over poor and working-class whites on their way to Harvard and Yale and taking jobs in police departments and fire departments that had once been reserved for whites. Civil rights advocates offered no balm for the wound, publicly resisting calls for class-based affirmative action and dismissing claims of unfairness on the grounds that whites had been enjoying racial preferences for hundreds of years. Resentment, frustration, and anger expressed by poor and working-class whites was chalked up to racism, leading to a subterranean discourse about race and to implicitly racial political appeals, but little honest dialogue. Perhaps the time has come to give up the racial bribes and begin an honest conversation about race in America.

If we continue to tell ourselves the popular myths about race or, worse yet, if we say to ourselves that the problem of mass incarceration is just too big, too daunting for us to do anything about and that we should instead direct our energies to battles that might be more easily won, history will judge us harshly. A human rights nightmare is occurring on our watch.

“The slave went free; stood a brief moment in the sun; then moved back again toward slavery.”

This process, though difficult to recognize at any given moment, is easier to see in retrospect. Since the nation’s founding, African Americans repeatedly have been controlled through institutions such as slavery and Jim Crow, which appear to die, but then are reborn in new form, tailored to the needs and constraints of the time. There is a certain pattern to this cycle. Following the collapse of each system of control, there has been a period of confusion—transition—in which those who are most committed to racial hierarchy search for new means to achieve their goals within the rules of the game as currently defined. It is during this period of uncertainty that the backlash intensifies and a new form of racialized social control begins to take hold. The adoption of the new system of control is never inevitable, but to date it has never been avoided. The most ardent

proponents of racial hierarchy have consistently succeeded in implementing new racial caste systems by triggering a collapse of resistance across the political spectrum. This feat has been achieved largely by appealing to the racism and vulnerability of lower-class whites, a group of people who are understandably eager to ensure that they never find themselves trapped at the bottom of the American hierarchy.

Skeptics will often claim that mass incarceration cannot be understood as a racial caste system because many “get tough on crime” policies are supported by African Americans. Many of these claims are no more persuasive today than arguments made a hundred years ago by blacks and whites who claimed that racial segregation simply reflected “reality,” not racial animus, and that African Americans would be better off not challenging the Jim Crow system but should focus instead on improving themselves within it. Throughout our history, there have been African Americans who, for a variety of reasons, have defended or been complicit with the prevailing system of control.

The answer lies in the system’s design. Every system of control depends for its survival on the tangible and intangible benefits that are provided to those who are responsible for the system’s maintenance and administration. This system is no exception.

If the movement that emerges to challenge mass incarceration fails to confront squarely the critical role of race in the basic structure of our society, and if it fails to cultivate an ethic of genuine care, compassion, and concern for every human being—of every class, race, and nationality—within our nation’s borders (including poor whites, who are often pitted against poor people of color), the collapse of mass incarceration will not mean the death of racial caste in America. Inevitably a new system of racialized social control will emerge—one that we cannot foresee, just as the current system of mass incarceration was not predicted by anyone thirty years ago. No task is more urgent for justice advocates today than ensuring that America’s current caste system is its last.

The concept of race is a relatively recent development. Only in the past few centuries, owing largely to European imperialism, have the world’s people been classified along racial lines. Here, in America, the idea of race emerged as a means of reconciling chattel slavery—as well as the extermination of American Indians—with the ideals of freedom preached by whites in the new colonies.

It may be impossible to overstate the significance of race in defining the basic structure of American society. The structure and content of the original Constitution was based largely on the effort to preserve a racial caste system—slavery—while at the same time affording political and economic rights to

whites, especially propertied whites. The southern slaveholding colonies would agree to form a union only on the condition that the federal government would not be able to interfere with the right to own slaves. Northern white elites were sympathetic to the demand for their “property rights” to be respected, as they, too, wanted the Constitution to protect their property interests. As James Madison put it, the nation ought to be constituted “to protect the minority of the opulent against the majority.” Consequently, the Constitution was designed so the federal government would be weak, not only in its relationship to private property, but also in relationship to the rights of states to conduct their own affairs. The language of the Constitution itself was deliberately colorblind—the words slave or Negro were never used—but the document was built upon a compromise regarding the prevailing racial caste system. Federalism—the division of power between the states and the federal government—was the device employed to protect the institution of slavery and the political power of slaveholding states. Even the method for determining proportional representation in Congress and identifying the winner of a presidential election (the electoral college) were specifically developed with the interest of slaveholders in mind. Under the terms of our country’s founding document, slaves were defined as three-fifths of a man, not a real, whole human being. Upon this racist fiction rests the entire structure of American democracy.

Racial division was a consequence, not a precondition of slavery, but once it was instituted it became detached from its initial function and acquired a social potency all its own.

The radicals of the late nineteenth century, who later formed the Populist Party, viewed the privileged classes as conspiring to keep poor whites and blacks locked into a subordinate political and economic position. For many African American voters, the Populist approach was preferable to the paternalism of liberals. Populists preached an “equalitarianism of want and poverty, the kinship of a common grievance, and a common oppressor.” As described by Tom Watson, a prominent Populist leader, in a speech advocating a union between black and white farmers:

“You are kept apart that you may be separately fleeced of your earnings. You are made to hate each other because upon that hatred is rested the keystone of the arch of financial despotism that enslaves you both. You are deceived and blinded that you may not see how this race antagonism perpetuates a monetary system which beggars both.”

A new race-neutral language was developed for appealing to old racist sentiments, a language accompanied by a political movement that succeeded

in putting the vast majority of blacks back in their place. Proponents of racial hierarchy found they could install a new racial caste system without violating the law or the new limits of acceptable political discourse, by demanding “law and order” rather than “segregation forever.”

For more than a decade—from the mid-1950s until the late 1960s—conservatives systematically and strategically linked opposition to civil rights legislation to calls for law and order, arguing that Martin Luther King Jr.’s philosophy of civil disobedience was a leading cause of crime. Civil rights protests were frequently depicted as criminal rather than political in nature, and federal courts were accused of excessive “lenience” toward lawlessness, thereby contributing to the spread of crime. In the words of then-Vice President Richard Nixon, the increasing crime rate “can be traced directly to the spread of the corrosive doctrine that every citizen possesses an inherent right to decide for himself which laws to obey and when to disobey them.” Civil rights activists who argued that the uprisings were directly related to widespread police harassment and abuse were dismissed by conservatives out of hand. “If blacks conduct themselves in an orderly way, they will not have to worry about police brutality,” argued West Virginia Senator Robert Byrd.

A disproportionate share of the costs of integration and racial equality had been borne by lower-class whites, who were suddenly forced to compete on equal terms with blacks for jobs and status and who lived in neighborhoods adjoining black ghettos. Their children—not the children of wealthy whites—attended schools most likely to fall under busing orders. The affluent white liberals who were pressing the legal claims of blacks and other minorities were often sheltered, in their private lives, and largely immune to the costs of implementing minority claims. This reality made it possible for conservatives to characterize the “liberal Democratic establishment” as being out of touch with ordinary working people—thus resolving one of the central problems facing conservatives: how to persuade poor and working-class voters to join in alliance with corporate interests and the conservative elite. By 1968, 81 percent of those responding to a Gallup Poll agreed with the statement that “law and order has broken down in this country,” and the majority blamed “Negroes who start riots” and “Communists.”

Race had become, yet again, a powerful wedge, breaking up what had been a solid liberal coalition based on economic interests of the poor and the working and lower-middle classes. In the 1968 election, race eclipsed class as the organizing principle of American politics, and by 1972, attitudes on racial issues rather than socioeconomic status were the primary determinant of voters’ political self-identification. The late 1960s and early 1970s marked the dramatic erosion in the belief among working-class whites that the

condition of the poor, or those who fail to prosper, was the result of a faulty economic system that needed to be challenged. The pitting of whites and blacks at the low end of the income distribution against each other intensified the view among many whites that the condition of life for the disadvantaged—particularly for disadvantaged blacks—is the responsibility of those afflicted, and not the responsibility of the larger society. Just as race had been used at the turn of the century by Southern elites to rupture class solidarity at the bottom of the income ladder, race as a national issue had broken up the Democratic New Deal “bottom-up” coalition—a coalition dependent on substantial support from all voters, white and black, at or below the median income.

One of Reagan’s favorite and most-often-repeated anecdotes was the story of a Chicago “welfare queen” with “80 names, 30 addresses, 12 Social Security cards,” whose “tax-free income alone is over \$150,000.” The term ‘welfare queen’ became a not-so-subtle code for a lazy, greedy, black ghetto mother. The food stamp program, in turn, was a vehicle to let “some fellow ahead of you buy a T-bone steak,” while “you were standing in a checkout line with your package of hamburger.”

The War on Drugs, cloaked in race-neutral language, also offered whites opposed to racial reform a unique opportunity to express their hostility toward blacks and black progress, without being exposed to the charge of racism.

In 1992, presidential candidate Bill Clinton vowed that he would never permit any Republican to be perceived as tougher on crime than he. True to his word, just weeks before the critical New Hampshire primary, Clinton chose to fly home to Arkansas to oversee the execution of Ricky Ray Rector, a mentally impaired black man who had so little conception of what was about to happen to him that he asked for the dessert from his last meal to be saved for him until the morning. After the execution, Clinton remarked:

“I can be nicked a lot, but no one can say I’m soft on crime.”

Once elected, far from resisting the emergence of the new caste system, Clinton escalated the drug war beyond what conservatives had imagined possible a decade earlier—a recurring theme throughout history. The Clinton Administration’s ‘tough on crime’ policies resulted in the largest increases in federal and state prison inmates of any president in American history.

Clinton once boasted that the COPS program, which put tens of thousands of officers on the streets, was responsible for the dramatic fifteen-year drop in violent crime that began in the 1990s. Recent studies, however, have shown that is not the case. A 2005 report by the Government Accountabil-

ity Office concluded the program may have contributed to a one percent reduction in crime—at a cost of \$8 billion.

Place yourself in the shoes of Clifford Runoalds, an African American victim of a drug bust. You returned home to Bryan, Texas, to attend the funeral of your eighteen-month-old daughter. Before the funeral services begin, the police show up and handcuff you. You beg the officers to let you take one last look at your daughter before she is buried. The police refuse. You are told by prosecutors that you are needed to testify against one of the defendants in a recent drug bust. You deny witnessing any drug transaction; you don't know what they are talking about. Because of your refusal to cooperate, you are indicted on felony charges. After a month of being held in jail, the charges against you are dropped. You are technically free, but as a result of your arrest and period of incarceration, you lose your job, your apartment, your furniture, and your car. Not to mention the chance to say good-bye to your baby girl.

In every state across our nation, African Americans—particularly in the poorest neighborhoods—are subjected to tactics and practices that would result in public outrage and scandal if committed in middle-class white neighborhoods. In the drug war, the enemy is racially defined. It's a lot easier to go out to the 'hood, so to speak, and pick somebody than to put your resources in an undercover operation in a community where there are potentially politically powerful people.

Nonracial explanations and excuses for the systematic mass incarceration of people of color are plentiful. It is the genius of the new system of control that it can always be defended on nonracial grounds, given the rarity of a noose or a racial slur in connection with any particular criminal case. Moreover, because blacks and whites are almost never similarly situated (given extreme racial segregation in housing and disparate life experiences), trying to “control for race” in an effort to evaluate whether the mass incarceration of people of color is really about race or something else—anything else—is difficult. But it is not impossible.

How exactly does a formally colorblind criminal justice system achieve such racially discriminatory results? Rather easily, it turns out. The process occurs in two stages. The first step is to grant law enforcement officials extraordinary discretion regarding whom to stop, search, arrest, and charge for drug offenses, thus ensuring that conscious and unconscious racial beliefs and stereotypes will be given free reign. Unbridled discretion inevitably creates huge racial disparities. Then, the damning step: Close the courthouse doors to all claims by defendants and private litigants that the criminal justice system operates in racially discriminatory fashion. Demand that anyone who wants to challenge racial bias in the system offer, in advance,

clear proof that the racial disparities are the product of intentional racial discrimination—i.e., the work of a bigot. This evidence will almost never be available in the era of colorblindness, because everyone knows—but does not say—that the enemy in the War on Drugs can be identified by race. This simple design has helped to produce one of the most extraordinary systems of racialized social control the world has ever seen.

Not long after the drug war was ramped up in the media and political discourse, almost no one imagined that drug criminals could be anything other than black. A survey was conducted in 1995 asking the following question: “Would you close your eyes for a second, envision a drug user, and describe that person to me?” Ninety-five percent of respondents pictured a black drug user, while only five percent imagined other racial groups.

Decades of cognitive bias research demonstrates that both unconscious and conscious biases lead to discriminatory actions, even when an individual does not want to discriminate. The quotation commonly attributed to Nietzsche, that “there is no immaculate perception,” perfectly captures how cognitive schemas—thought structures—influence what we notice and how the things we notice get interpreted. Studies have shown that racial schemas operate not only as part of conscious, rational deliberations, but also automatically—without conscious awareness or intent. One study, for example, involved a video game that placed photographs of white and black individuals holding either a gun or other object (such as a wallet, soda can, or cell phone) into various photographic backgrounds. Participants were told to decide as quickly as possible whether to shoot the target. Consistent with earlier studies, participants were more likely to mistake a black target as armed when he was not, and mistake a white target as unarmed, when in fact he was armed. This pattern of discrimination reflected automatic, unconscious thought processes, not careful deliberations. Most striking, perhaps, is the overwhelming evidence that implicit bias measures are disassociated from explicit bias measures. In other words, the fact that you may honestly believe that you are not biased against African Americans, and that you may even have black friends or relatives, does not mean that you are free from unconscious bias. Implicit bias tests may still show that you hold negative attitudes and stereotypes about blacks, even though you do not believe you do and do not want to.

A lawsuit may seem like the best remedy. The purpose of our Constitution—especially the Fourteenth Amendment’s equal-protection guarantee—is to protect minority rights even when, or especially when, they are unpopular. So shouldn’t African American defendants be able to file a successful lawsuit demanding an end to these discriminatory practices or challenge their drug arrests on the grounds that these law enforcement

practices are unlawfully tainted by race? The answer is yes, they should, but no, they probably can't. The Court has imposed nearly insurmountable barriers to persons challenging race discrimination at all stages of the criminal justice system. The barriers are so high that few lawsuits are even filed, notwithstanding shocking and indefensible racial disparities. Procedural hurdles, such as the "standing requirement," have made it virtually impossible to seek reform of law enforcement agencies through the judicial process, even when the policies or practices at issue are illegal or plainly discriminatory.

Adolph Lyons's attempt to ban the use of lethal chokeholds by the Los Angeles Police Department (LAPD) is a good example. Lyons, a twenty-four-year-old black man, was driving his car in Los Angeles one morning when he was pulled over by four police officers for a burnt-out taillight. With guns drawn, police ordered Lyons out of his car. He obeyed. The officers told him to face the car, spread his legs, and put his hands on his head. Again, Lyons did as he was told. After the officers completed a pat-down, Lyons dropped his hands, prompting an officer to slam Lyons's hands back on his head. When Lyons complained that the car keys he was holding were causing him pain, the officer forced Lyons into a chokehold. He lost consciousness and collapsed. When he awoke, "he was spitting up blood and dirt, had urinated and defecated, and had suffered permanent damage to his larynx." The officers issued a traffic ticket for the burnt-out taillight and released him.

Lyons sued the City of Los Angeles for violation of his constitutional rights and sought, as a remedy, a ban against future use of the chokeholds. By the time his case reached the Supreme Court, sixteen people had been killed by police use of the chokehold, twelve of them black men. The Supreme Court dismissed the case, however, ruling that Lyons lacked "standing" to seek an injunction against the deadly practice. In order to have standing, the Court reasoned, Lyons would have to show that he was highly likely to be subject to a chokehold again. Lyons argued that, as a black man, he had good reason to fear he would be stopped by the police for a minor traffic violation and subjected to a chokehold again. He had done nothing to provoke the chokehold; to the contrary, he had obeyed instructions and cooperated fully. Why wouldn't he believe he was at risk of being stopped and choked again? The Court, however, ruled that in order to have standing Lyons would have had not only to allege that he would have another encounter with the police but also to make the incredible assertion either (1) that all police officers in Los Angeles always choke any citizen with whom they have an encounter, whether for the purpose of arrest, issuing a citation or for questioning, or (2) that the City ordered or authorized the police to act in such a manner.

The Court's ruling in *Lyons* makes it extremely difficult to challenge systemic race discrimination in law enforcement and obtain meaningful policy reform. For example, African Americans in Seattle who hope to end the Seattle police department's discriminatory tactics through litigation would be required to prove that they plan to violate drug laws and that they will almost certainly face race discrimination by Seattle police officers engaged in drug-law enforcement, in order to have standing to seek reform—i.e., just to get in the courthouse door. It is worthy of note that the *Lyons* standard does not apply to suits for damages. But any suggestion that litigants need not worry about policy reform because they can always sue for damages would be disingenuous—particularly as applied to race discrimination cases. Why? Neither the state nor the state police can be sued for damages. In a series of cases, the Supreme Court has ruled that the state and its offices are immune from federal suits for damages under the Eleventh Amendment to the Constitution (unless they consent), and the state can't be sued for damages for constitutional violations in state court either.

The litigation that swept the nation in the 1990s challenging racial profiling practices has nearly vanished. The news stories about people being stopped and searched on their way to church or work or school had, until recently, faded from the evening news. This was not because the problem has been solved or because the experience of being of being stopped, interrogated, and searched on the basis of race has become less humiliating, alienating, or demoralizing as time has gone by. The lawsuits have disappeared because, in a little noticed case called *Alexander v. Sandoval*, decided in 2001, the Supreme Court eliminated the last remaining avenue available for challenging racial bias in the criminal justice system. So long as officers refrain from uttering racial epithets and so long as they show the good sense not to say “the only reason I stopped him was ‘cause he's black,” courts generally turn a blind eye to patterns of discrimination by the police.

The risk that African Americans would be unfairly targeted should have been of special concern to the US Supreme Court—the one branch of government charged with the responsibility of protecting “discrete and insular minorities” from the excesses of majoritarian democracy, and guaranteeing constitutional rights for groups deemed unpopular or subject to prejudice. Yet when the time came for the Supreme Court to devise the legal rules that would govern the War on Drugs, the Court adopted rules that would maximize—not minimize—the amount of racial discrimination that would likely occur. It then closed the courthouse doors to claims of racial bias.

Not only did the Court reject the central claim—that using traffic stops as a pretext for drug investigations is unconstitutional—it ruled that claims of racial bias could not be brought under the Fourth Amendment. In other

words, the Court barred any victim of race discrimination by the police from even alleging a claim of racial bias under the Fourth Amendment. According to the Court, whether or not police discriminate on the basis of race when making traffic stops is irrelevant to a consideration of whether their conduct is “reasonable” under the Fourth Amendment. The Court did offer one caveat, however. It indicated that victims of race discrimination could still state a claim under the equal protection clause of the Fourteenth Amendment, which guarantees “equal treatment under the laws.” This suggestion may have been reassuring to those unfamiliar with the Court’s equal protection jurisprudence. But for those who have actually tried to prove race discrimination under the Fourteenth Amendment, the Court’s remark amounted to cruel irony. The Supreme Court has made it virtually impossible to challenge racial bias in the criminal justice system under the Fourteenth Amendment, and it has barred litigation of such claims under federal civil rights laws as well.

The Supreme Court ruled in *McCleskey v. Kemp* that racial bias in sentencing, even if shown through credible statistical evidence, could not be challenged under the Fourteenth Amendment in the absence of clear evidence of conscious, discriminatory intent. On its face, the case appeared to be a straightforward challenge to Georgia’s death penalty scheme. Once the Court’s opinion was released, however, it became clear the case was about much more than the death penalty. The real issue at hand was whether—and to what extent—the Supreme Court would tolerate racial bias in the criminal justice system as a whole. The Court’s answer was that racial bias would be tolerated—virtually to any degree—so long as no one admitted it.

In erecting this high standard, the Court knew full well that the standard could not be met absent an admission that a prosecutor or judge acted because of racial bias. The majority opinion openly acknowledged that longstanding rules generally bar litigants from obtaining discovery from the prosecution regarding charging patterns and motives, and that similar rules forbid introduction of evidence of jury deliberations even when a juror has chosen to make deliberations public. The very evidence that the Court demanded in *McCleskey*—evidence of deliberate bias in his individual case—would almost always be unavailable and/or inadmissible due to procedural rules that shield jurors and prosecutors from scrutiny. This dilemma was of little concern to the Court. It closed the courthouse doors to claims of racial bias in sentencing.

There is good reason to believe that, despite appearances, the *McCleskey* decision was not really about the death penalty at all; rather, the Court’s opinion was driven by a desire to immunize the entire criminal justice system

from claims of racial bias. The best evidence in support of this view can be found at the end of the majority opinion where the Court states that discretion plays a necessary role in the implementation of the criminal justice system, and that discrimination is an inevitable by-product of discretion. Racial discrimination, the Court seemed to suggest, was something that simply must be tolerated in the criminal justice system, provided no one admits to racial bias. The majority observed that significant racial disparities had been found in other criminal settings beyond the death penalty, and that McCleskey's case implicitly calls into question the integrity of the entire system. In the Court's words:

“Taken to its logical conclusion, [Warren McCleskey's claim] throws into serious question the principles that underlie our criminal justice system. [I]f we accepted McCleskey's claim that racial bias has impermissibly tainted the capital sentencing decision, we could soon be faced with similar claims as to other types of penalty.”

The Court openly worried that other actors in the criminal justice system might also face scrutiny for allegedly biased decision-making if similar claims of racial bias in the system were allowed to proceed. Driven by these concerns, the Court rejected McCleskey's claim that Georgia's death penalty system violates the Eighth Amendment's ban on arbitrary punishment, framing the critical question as whether the Baldus study demonstrated a “constitutionally unacceptable risk” of discrimination. Its answer was no. The Court deemed the risk of racial bias in Georgia's capital sentencing scheme “constitutionally acceptable.” Justice Brennan pointedly noted in his dissent that the Court's opinion “seems to suggest a fear of too much justice.”

These are just more proof that the Supreme Court only uses precedent when they align with the current justices' ideological beliefs. In a case called *Yick Wo v. Hopkins*, the Supreme Court had recognized that racially selective enforcement violates equal protection of the laws. In that case, decided in 1886, the Court unanimously overturned convictions of two Chinese men who were operating laundries without a license. San Francisco had denied licenses to all Chinese applicants, but granted licenses to all but one of the non-Chinese laundry operators who applied. Law enforcement arrested more than a hundred people for operating laundries without licenses, and every one of the arrestees was Chinese. Overturning *Yick Wo's* conviction, the Supreme Court declared in a widely quoted passage:

“Though the law itself be fair on its face, and impartial in appearance, yet, if it is applied and administered by public authority with an evil eye and an unequal hand, so as practically to make unjust and illegal discriminations, between persons in similar circumstances. . . the denial of equal justice is still within the prohibition of the Constitution.”

Prosecutors are well aware that the exercise of their discretion is unchecked, provided no explicitly racist remarks are made, as it is next to impossible for defendants to prove racial bias. It is difficult to imagine a system better designed to ensure that racial biases and stereotypes are given free reign—while at the same time appearing on the surface to be colorblind—than the one devised by the US Supreme Court.

For example, achieving an all-white jury, or nearly all-white jury, is easy in most jurisdictions, because relatively few racial minorities are included in the jury pool. Potential jurors are typically called for service based on the list of registered voters or Department of Motor Vehicle lists—sources that contain disproportionately fewer people of color, because people of color are significantly less likely to own cars or register to vote. Making matters worse, thirty-one states and the federal government subscribe to the practice of lifetime felon exclusion from juries. As a result, about 30 percent of black men are automatically banned from jury service for life.

“If prosecutors exist who cannot create a ‘racially neutral’ reason for discriminating on the basis of race, bar exams are too easy.”

A law professor at the University of Chicago reports that his students frequently express shock and dismay when they venture into those communities for the first time and witness the distance between abstract legal principles and actual practice. One student reported, following her ride-along with Chicago police:

“Each time we drove into a public housing project and stopped the car, every young black man in the area would almost reflexively place his hands up against the car and spread his legs to be searched. And the officers would search them. The officers would then get back in the car and stop in another project, and this would happen again. This repeated itself throughout the entire day. I couldn’t believe it. This was nothing like we learned in law school. But it just seemed so normal—for the police and the young men.”

Civil rights advocacy has not always looked the way it does today. Throughout most of our nation's history—from the days of the abolitionist movement through the Civil Rights Movement—racial justice advocacy has generally revolved around grassroots organizing and the strategic mobilization of public opinion. In recent years, however, a bit of mythology has sprung up regarding the centrality of litigation to racial justice struggles. The success of the brilliant legal crusade that led to *Brown v. Board of Education* has created a widespread perception that civil rights lawyers are the most important players in racial justice advocacy. This image was enhanced following the passage of the Civil Rights Acts of 1965, when civil rights lawyers became embroiled in highly visible and controversial efforts to end hiring discrimination, create affirmative action plans, and enforce school desegregation orders. As public attention shifted from the streets to the courtroom, the extraordinary grassroots movement that made civil rights legislation possible faded from public view. The lawyers took over. With all deliberate speed, civil rights organizations became professionalized and increasingly disconnected from the communities they claimed to represent.

They channeled a passion for change into legal negotiations and lawsuits. They defined the issues in terms of developing legal doctrine and establishing legal precedent; their clients became important but secondary players in a formal arena that required lawyers to translate lay claims into technical speech. They then disembodied plaintiffs' claims in judicially manageable or judicially enforceable terms, unenforceable without more lawyers. Simultaneously, the movement's center of gravity shifted to Washington, D.C. As lawyers and national pundits became more prominent than clients and citizens, they isolated themselves from the people who were their anchor and on whose behalf they had previously labored. They not only left people behind; they also lost touch with the moral force at the heart of the movement itself. Lawyers have a tendency to identify and concentrate on problems they know how to solve—i.e., problems that can be solved through litigation. The mass incarceration of people of color is not that kind of problem.

Advocates have found they are most successful when they draw attention to certain types of black people—those who are easily understood by mainstream whites as 'good' and 'respectable'—and tell certain types of stories about them. Since the days when abolitionists struggled to eradicate slavery, racial justice advocates have gone to great lengths to identify black people who defy racial stereotypes, and they have exercised considerable message discipline, telling only those stories of racial injustice that will evoke sympathy among whites. A prime example is the Rosa Parks story.

Rosa Parks was not the first person to refuse to give up her seat on a segregated bus in Montgomery, Alabama. Civil rights advocates considered

and rejected two other black women as plaintiffs when planning a test case challenging segregation practices: Claudette Colvin and Mary Louise Smith. Both of them were arrested for refusing to give up their seats on Montgomery's segregated buses, just months before Rosa Parks refused to budge. Colvin was fifteen years old when she defied segregation laws. Her case attracted national attention, but civil rights advocates declined to use her as a plaintiff because she got pregnant by an older man shortly after her arrest. Advocates worried that her "immoral" conduct would detract from or undermine their efforts to show that blacks were entitled to (and worthy of) equal treatment. Likewise, they decided not to use Mary Louise Smith as a plaintiff because her father was rumored to be an alcoholic.

It was understood that, in any effort to challenge racial discrimination, the litigant—and even the litigant's family—had to be above reproach and free from every negative trait that could be used as a justification for unequal treatment. Rosa Parks, in this regard, was a dream come true. She was, in the words of Jo Ann Gibson Robinson (another key figure in the Montgomery Bus Boycott), a "medium-sized, cultured mulatto woman; a civic and religious worker; quiet, unassuming, and pleasant in manner and appearance; dignified and reserved; of high morals and strong character." No one doubted that Parks was the perfect symbol for the movement to integrate public transportation in Montgomery. Martin Luther King Jr. recalled in his memoir that "Mrs. Parks was ideal for the role assigned to her by history," largely because "her character was impeccable" and she was "one of the most respected people in the Negro community."

Affirmative action, particularly when it is justified on the grounds of diversity rather than equity (or remedy), masks the severity of racial inequality in America, leading to greatly exaggerated claims of racial progress and overly optimistic assessments of the future for African Americans. Seeing black people graduate from Harvard and Yale and become CEOs or corporate lawyers—not to mention president of the United States—causes us all to marvel at what a long way we have come. As recent data shows, however, much of black progress is a myth. Although some African Americans are doing very well—enrolling in universities and graduate schools at record rates thanks to affirmative action—as a group, African Americans are doing no better than they were when Martin Luther King Jr. was assassinated and riots swept inner cities across America. Nearly one-fourth of African Americans live below the poverty line today, approximately the same as in 1968. The child poverty rate is actually higher today than it was then. Unemployment rates in black communities rival those in Third World countries. And that is with affirmative action!

Civil rights activists have created a national movement to save affirmative

action, complete with the marches, organizing, and media campaigns, as well as incessant strategy meetings, conferences, and litigation. Where is the movement to end mass incarceration? For that matter, where is the movement for educational equity? Part of the answer is that it is far easier to create a movement when there is a sense of being under attack. It is also easier when a single policy is at issue, rather than something as enormous (and seemingly intractable) as educational inequity or mass incarceration. Those are decent explanations, but they are no excuse. Try telling a sixteen-year-old black youth in Louisiana who is facing a decade in adult prison and a lifetime of social, political, and economic exclusion that your civil rights organization is not doing much to end the War on Drugs—but would he like to hear about all the great things that are being done to save affirmative action? There is a fundamental disconnect today between the world of civil rights advocacy and the reality facing those trapped in the new racial undercaste.

In response to critics they argue: Shouldn't we direct scarce resources to battles that are more easily won, such as affirmative action? Shouldn't we focus the public's attention on the so-called root causes of mass incarceration, such as educational inequity?

We can continue along this road—it is a road well traveled—but we must admit the strategy has not made much of a difference. African Americans, as a group, are no better off than they were in 1968 in many respects. In fact, to some extent, they are worse off. When the incarcerated population is counted in unemployment and poverty rates, the best of times for the rest of America have been among the worst of times for African Americans, particularly black men. The notion that the 1990s—the Clinton years—were good times for African Americans, and that a rising tide lifts all boats, is pure fiction. As unemployment rates sank to historically low levels in the late 1990s for the general population, jobless rates among non-college black men in their twenties rose to their highest levels ever, propelled by skyrocketing incarceration rates.

Civil rights organizations—like all institutions—are comprised of fallible human beings. The prevailing public consensus affects everyone, including civil rights advocates. Those in the civil rights community are not immune to the racial stereotypes that pervade media imagery and political rhetoric; nor do they operate outside of the political context. Like most people, they tend to resist believing that they might be part of the problem. One day, civil rights organizations may be embarrassed by how long it took them to move out of denial and do the hard work necessary to end mass incarceration.

In June 2001, there were nearly 20,000 more black men in the Illinois state prison system than enrolled in the state's public universities. In fact, there

were more black men in the state's correctional facilities that year just on drug charges than the total number of black men enrolled in undergraduate degree programs in state universities.

The fact that Barack Obama can give a speech on Father's Day dedicated to the subject of fathers who are "AWOL" without ever acknowledging that the majority of young black men in large urban areas are currently under the control of the criminal justice system is disturbing, to say the least. What is more problematic, though, is that hardly anyone in the mainstream media noticed the oversight. Hundreds of thousands of black men are unable to be good fathers for their children, not because of a lack of commitment or desire but because they are warehoused in prisons, locked in cages. They did not walk out on their families voluntarily; they were taken away in handcuffs, often due to a massive federal program known as the War on Drugs. More African Americans are under correctional control today—in prison or jail, on probation or parole—than were enslaved in 1850, a decade before the Civil War began.

The launching of the War on Drugs and the initial construction of the new system required the expenditure of tremendous political initiative and resources. Media campaigns were waged; politicians blasted "soft" judges and enacted harsh sentencing laws; poor people of color were vilified. The system now, however, requires very little maintenance or justification. In fact, if you are white and middle class, you might not even realize the drug war is still going on. Most high school and college students today have no recollection of the political and media frenzy surrounding the drug war in the early years. When the war was declared they were not even born yet. Crack is out; terrorism is in. Today, the political fanfare and the vehement, racialized rhetoric regarding crime and drugs are no longer necessary. Mass incarceration has been normalized, and all of the racial stereotypes and assumptions that gave rise to the system are now embraced (or at least internalized) by people of all colors, from all walks of life, and in every major political party. We may wonder aloud 'where have the black men gone?' but deep down we already know. It is simply taken for granted that, in cities like Baltimore and Chicago, the vast majority of young black men are currently under the control of the criminal justice system or branded criminals for life. This extraordinary circumstance—unheard of in the rest of the world—is treated here in America as a basic fact of life, as normal as separate water fountains were just a half century ago.

A nation is a choice. We could choose to be a nation that extends care, compassion, and concern to those who are locked up and locked out or headed for prison before they are old enough to vote. We could seek for them the same opportunities we seek for our own children; we could treat

them like one of ‘us.’ We could do that. Or we can choose to be a nation that shames and blames its most vulnerable, affixes badges of dishonor upon them at young ages, and then relegates them to a permanent second-class status for life. That is the path we have chosen, and it leads to a familiar place.

For black youth, the experience of being “made black” often begins with the first police stop, interrogation, search, or arrest. The experience carries social meaning—this is what it means to be black. The story of one’s “first time” may be repeated to family or friends, but for ghetto youth, almost no one imagines that the first time will be the last. The experience is understood to define the terms of one’s relationship not only to the state but to society at large. Random and degrading stops and searches tell kids that they are pariahs, that no matter how hard they study, they will remain potential suspects.

“We can be perfect, perfect, doing everything right and still they treat us like dogs. No, worse than dogs, because criminals are treated worse than dogs. How can you tell us we can be anything when they treat us like we’re nothing?”

Are we willing to cast ourselves as a society that creates crimogenic conditions for some of its members, and then acts-out rituals of punishment against them as if engaged in some awful form of human sacrifice? A similar question can be posed with respect to shaming those trapped in ghettos: are we willing to demonize a population, declare a war against them, and then stand back and heap shame and contempt upon them for failing to behave like model citizens while under attack?

“My grandma keeps asking me about when I’m gonna get arrested again. She thinks just ‘cause I went in before, I will go in again. At my school my teachers talk about calling the cops again to take me away. The cop keeps checking up on me. He’s always at the park making sure I don’t get into trouble again. My P.O. is always knocking on my door talking shit to me. Even at the BYA the staff treat me like I’m a fuck up.

Shit don’t change. It doesn’t matter where I go, I’m seen as a criminal. I just say, if you are going to treat me as a criminal then I’m gonna treat you like I am one, you feel me? I’m gonna make you shake so that you can say that there is a reason for calling me a criminal. I grew up knowing that I had to show these fools that I wasn’t going to take their shit. I started to act

like a thug even if I wasn't one. Part of it was me trying to be hard, the other part was them treating me like a criminal."

Should we be shocked when they turn to gangs or fellow inmates for support when no viable family support structure exists? After all, in many respects, they are simply doing what black people did during the Jim Crow era—they are turning to each other for support and solace in a society that despises them. Yet when these young people do what all severely stigmatized groups do—try to cope by turning to each other and embracing their stigma in a desperate effort to regain some measure of self esteem—we, as a society, heap more shame and contempt upon them. We tell them their friends are "no good," that they will "amount to nothing," that they are "wasting their lives," and that "they're nothing but criminals." We condemn their baggy pants (a fashion trend that mimics prison-issue pants) and the music that glorifies a life many feel they cannot avoid. When we are done shaming them, we throw up our hands and then turn our backs as they are carted off to jail.

In the Los Angeles gangland, tribal rivalries have reasserted themselves. In the most extensive city on earth (now half the size of Belgium), many small tribal territories have been established, each confined to a fixed, carefully labeled locality. Here the primeval tribal nature of our species has dramatically resurfaced in the midst of the decaying center of the urban sprawl. The ancient cave paintings and rock art of prehistoric times have been replaced by modern graffiti; the tribal spears by automatic handguns; the ritual skin scarification by modern tattoos; the feathered headdresses by stylized T-shirts. All the tribal trappings and group loyalties have reappeared as the vast network of the city is carved up, once again, into clearly identifiable local communities. For some this is seen as the destruction of the city centers, but for those living there it is a matter of survival—a refusal to be turned into faceless human termites in a huge, teeming human termite-hill.

There is little reason to doubt the prevailing "common sense" that black and brown men have been locked up en masse merely in response to crime rates when one's sources of information are mainstream media outlets. In many respects, the reality of mass incarceration is easier to avoid knowing than the injustices and sufferings associated with slavery or Jim Crow. Those confined to prisons are out of sight and out of mind; once released, they are typically confined in ghettos. Most Americans only come to "know" about the people cycling in and out of prisons through fictional police dramas, music videos, gangsta rap, and "true" accounts of ghetto experience on the evening news. These racialized narratives tend to confirm

and reinforce the prevailing public consensus that we need not care about “those people”—they deserve what they get.

It is useful to put the commodification of gangsta culture in proper perspective. The worst of gangsta rap and other forms of blaxploitation (such as VH1’s *Flavor of Love*) is best understood as a modern-day minstrel show, only this time televised around the clock for a worldwide audience. It is a for-profit display of the worst racial stereotypes and images associated with the era of mass incarceration—an era in which black people are criminalized and portrayed as out-of-control, shameless, violent, oversexed, and generally undeserving. Like the minstrel shows of the slavery and Jim Crow eras, today’s displays are generally designed for white audiences. The majority of consumers of gangsta rap are white, suburban teenagers. VH1 had its best ratings ever for the first season of *Flavor of Love*—ratings driven by large white audiences. MTV expanded its offerings of black-themed reality shows in the hopes of attracting the same crowd. The profits to be made from racial stigma are considerable, and the fact that blacks—as well as whites—treat racial oppression as a commodity for consumption is not surprising. It is a familiar form of black complicity with racialized systems of control.

Many people are unaware that, although minstrel shows were plainly designed to pander to white racism and to make whites feel comfortable with—indeed, entertained by—racial oppression, African Americans formed a large part of the black minstrels’ audience. In fact, their numbers were so great in some areas that theater owners had to relax rules segregating black patrons and restricting them to certain areas of the theater. Historians have long debated why blacks would attend minstrel shows when the images and content were so blatantly racist. Minstrels projected a greatly romanticized and exaggerated image of black life on plantations with cheerful, simple, grinning slaves always ready to sing, dance, and please their masters. Some have suggested that perhaps blacks felt in on the joke, laughing at the over-the-top characters from a sense of in-group recognition. It has also been argued that perhaps they felt some connection to elements of African culture that had been suppressed and condemned for so long but were suddenly visible on stage, albeit in racist, exaggerated form. Undeniably, though, one major draw for black audiences was simply seeing fellow African Americans on stage. Black minstrels were largely viewed as celebrities, earning more money and achieving more fame than African Americans ever had before. Black minstrelsy was the first large-scale opportunity for African Americans to enter show business. To some degree, then, black minstrelsy—as degrading as it was—represented success. It seems likely that historians will one day look back on the images of black men in gangsta rap videos with a similar curiosity.

Another example of a difference that is less significant than it may initially appear is the “fact” that Jim Crow was explicitly race-based, whereas mass incarceration is not. This statement initially appears self-evident, but it is partially mistaken. Although it is common to think of Jim Crow as an explicitly race-based system, in fact a number of the key policies were officially colorblind. Poll taxes, literacy tests, and felon disenfranchisement laws were all formally race-neutral practices that were employed in order to avoid the prohibition on race discrimination in voting contained in the Fifteenth Amendment. These laws operated to create an all-white electorate because they excluded African Americans from the franchise but were not generally applied to whites. Poll workers had the discretion to charge a poll tax or administer a literacy test, or not, and they exercised their discretion in a racially discriminatory manner. Laws that said nothing about race operated to discriminate because those charged with enforcement were granted tremendous discretion, and they exercised that discretion in a highly discriminatory manner.

“Nothing in all the world is more dangerous than sincere ignorance and conscientious stupidity.”

The notion that racial caste systems are necessarily predicated on a desire to harm other racial groups, and that racial hostility is the essence of racism, is fundamentally misguided. Even slavery does not conform to this limited understanding of racism and racial caste. Most plantation owners supported the institution of black slavery not because of a sadistic desire to harm blacks but instead because they wanted to get rich, and black slavery was the most efficient means to that end. By and large, plantation owners were indifferent to the suffering caused by slavery; they were motivated by greed. Preoccupation with the role of racial hostility in earlier caste systems can blind us to the ways in which every caste system, including mass incarceration, has been supported by racial indifference—a lack of caring and compassion for people deemed to be another race.

The widespread and mistaken belief that racial animus is necessary for the creation and maintenance of racialized systems of social control is the most important reason that we, as a nation, have remained in deep denial. The misunderstanding is not surprising. As a society, our collective understanding of racism has been powerfully influenced by the shocking images of the Jim Crow era and the struggle for civil rights. When we think of racism we think of Governor Wallace of Alabama blocking the schoolhouse door; we think of water hoses, lynchings, racial epithets, and “whites only” signs. These images make it easy to forget that many wonderful, good-hearted

white people who were generous to others, respectful of their neighbors, and even kind to their black maids, gardeners, or shoe shiners—and wished them well—nevertheless went to the polls and voted for racial segregation. Many whites who supported Jim Crow justified it on paternalist grounds, actually believing they were doing blacks a favor or believing the time was not yet right for equality. The disturbing images from the Jim Crow era also make it easy to forget that many African Americans were complicit in the Jim Crow system, profiting from it directly or indirectly or keeping their objections quiet out of fear of the repercussions. Our understanding of racism is therefore shaped by the most extreme expressions of individual bigotry, not by the way in which it functions naturally, almost invisibly (and sometimes with genuinely benign intent), when it is embedded in the structure of a social system.

Consider a birdcage. If one thinks about racism by examining only one wire of the cage, or one form of disadvantage, it is difficult to understand how and why the bird is trapped. Only a large number of wires arranged in a specific way, and connected to one another, serve to enclose the bird and to ensure that it cannot escape. What is particularly important to keep in mind is that any given wire of the cage may or may not be specifically developed for the purpose of trapping the bird, yet it still operates, together with the other wires, to restrict its freedom.

Even prisons—the actual buildings—are a rare sight for many Americans, as they are often located far from population centers. Although rural counties contain only 20 percent of the US population, 60 percent of new prison construction occurs there. Prisoners are thus hidden from public view—out of sight, out of mind. In a sense, incarceration is a far more extreme form of physical and residential segregation than Jim Crow segregation. Rather than merely shunting black people to the other side of town or corralling them in ghettos, mass incarceration locks them in cages. Bars and walls keep hundreds of thousands of black and brown people away from mainstream society—a form of apartheid unlike any the world has ever seen.

Under the usual-residence rule, the Census Bureau counts imprisoned individuals as residents of the jurisdiction in which they are incarcerated. Because most new prison construction occurs in predominately white, rural areas, white communities benefit from inflated population totals at the expense of the urban, overwhelmingly minority communities from which the prisoners come. This has enormous consequences for the redistricting process. White rural communities that house prisons wind up with more people in state legislatures representing them, while poor communities of color lose representatives because it appears their population has declined. This policy is disturbingly reminiscent of the three-fifths clause in the

original Constitution, which enhanced the political clout of slave-holding states by including 60 percent of slaves in the population base for calculating Congressional seats and electoral votes, even though they could not vote.

Studies have shown that joblessness—not race or black culture—explains the high rates of violent crime in poor black communities. When researchers have controlled for joblessness, differences in violent crime rates between young black and white men disappear. We declared a war on people residing in racially segregated ghettos—just at the moment their economies had collapsed—rather than providing community investment, quality education, and job training when work disappeared.

The reality for poor blacks trapped in ghettos remains the same: they must live in a state of perpetual insecurity and fear. It is perfectly understandable, then, that some African Americans would be complicit with the system of mass incarceration, even if they oppose, as a matter of social policy, the creation of racially isolated ghettos and the subsequent transfer of black youth from underfunded, crumbling schools to brand-new, high-tech prisons. In the era of mass incarceration, poor African Americans are not given the option of great schools, community investment, and job training. Instead, they are offered police and prisons. If the only choice that is offered blacks is rampant crime or more prisons, the predictable (and understandable) answer will be ‘more prisons.’ The predicament African Americans find themselves in today is not altogether different from the situation they faced during Jim Crow. Jim Crow, as oppressive as it was, offered a measure of security for blacks who were willing to play by its rules. Those who flouted the rules or resisted them risked the terror of the Klan. Cooperation with the Jim Crow system often seemed far more likely to increase or maintain one’s security than any alternative.

That reality helps to explain why African American leaders such as Booker T. Washington urged blacks to focus on improving themselves rather than on challenging racial discrimination. It is also why the Civil Rights Movement initially met significant resistance among some African Americans in the South. Civil rights advocates strenuously argued that it was the mentality and ideology that gave rise to Jim Crow that was the real source of the danger experienced by blacks. Of course they were right. But it is understandable why some blacks believed their immediate safety and security could best be protected by cooperation with the prevailing caste system. The fact that black people during Jim Crow were often complicit with the system of control did not mean they supported racial oppression.

It is fair to say that we have witnessed an evolution in the United States from a racial caste system based entirely on exploitation (slavery), to one based largely on subordination (Jim Crow), to one defined by marginalization

(mass incarceration). While marginalization may sound far preferable to exploitation, it may prove to be even more dangerous. Extreme marginalization, as we have seen throughout world history, poses the risk of extermination. Tragedies such as the Holocaust in Germany or ethnic cleansing in Bosnia are traceable to the extreme marginalization and stigmatization of racial and ethnic groups. It's actually better to be exploited than marginalized, in some respects, because if you're exploited presumably you're still needed.

No task is more urgent for racial justice advocates today than ensuring that America's current racial caste system is its last. Given what is at stake at this moment in history, bolder, more inspired action is required than we have seen to date. Piecemeal, top-down policy reform on criminal justice issues, combined with token exceptionalism will not get us out of our nation's racial quagmire. We must flip the script. Taking our cue from the courageous civil rights advocates who brazenly refused to defend themselves, marching unarmed past white mobs that threatened to kill them, we too must be the change we hope to create. If we want to do more than just end mass incarceration—if we want to put an end to the history of racial caste in America—we must lay down our racial bribes, join hands with people of all colors who are not content to wait for change to trickle down, and say to those who would stand in our way: Accept all of us or none.

That is the basic message that Martin Luther King Jr. aimed to deliver through the Poor People's Movement back in 1968. He argued then that the time had come for racial justice advocates to shift from a civil rights to a human rights paradigm, and that the real work of movement building had only just begun. A human rights approach, he believed, would offer far greater hope for those of us determined to create a thriving, multiracial, multi-ethnic democracy free from racial hierarchy than the civil rights model had provided to date. It would offer a positive vision of what we can strive for—a society in which all human beings are treated with dignity, and have the right to food, shelter, health care, education, and security. This expansive vision could open the door to meaningful alliances between poor and working-class people of all colors, who could begin to see their interests as aligned, rather than in conflict—no longer in competition for scarce resources in a zero-sum game.

A human rights movement, King believed, held revolutionary potential. Speaking at a Southern Christian Leadership Conference staff retreat in May 1967, he told SCLC staff, who were concerned that the Civil Rights Movement had lost its steam and its direction:

“It is necessary for us to realize that we have moved from the era of civil rights to the era of human rights.”

Political reform efforts were no longer adequate to the task at hand:

“For the last 12 years, we have been in a reform movement. [But] after Selma and the voting rights bill, we moved into a new era, which must be an era of revolution. We must see the great distinction between a reform movement and a revolutionary movement. We are called upon to raise certain basic questions about the whole society.”

Fifty years later, civil rights advocacy is stuck in a model of advocacy King was determined to leave behind. Rather than challenging the basic structure of society and doing the hard work of movement building—the work to which King was still committed at the end of his life—we have been tempted too often by the opportunity for people of color to be included within the political and economic structure as-is, even if it means alienating those who are necessary allies. We have allowed ourselves to be willfully blind to the emergence of a new caste system—a system of social excommunication that has denied millions of African Americans basic human dignity. The significance of this cannot be overstated, for the failure to acknowledge the humanity and dignity of all persons has lurked at the root of every racial caste system. This common thread explains why, in the 1780s, the British Society for the Abolition of Slavery adopted as its official seal a woodcut of a kneeling slave above a banner that read:

AM I NOT A MAN AND A BROTHER?

That symbol was followed more than a hundred years later by signs worn around the necks of black sanitation workers during the Poor People’s Campaign answering the slave’s question with the simple statement:

I AM A MAN

Egos, competing agendas, career goals, and inertia may get in the way. It may be that traditional civil rights organizations simply cannot, or will not, change. To this it can only be said: adapt or die. If Martin Luther King Jr. is right that the arc of history is long, but it bends toward justice, a new movement will arise; and if civil rights organizations fail to keep up with the times, they will be pushed to the side as another generation of advocates comes to the fore. Hopefully the new generation will be led by those who know best the brutality of the new caste system—a group with greater vision, courage, and determination than the old guard can muster, trapped as they may be in an outdated paradigm. This new generation of activists should not avoid disrespecting their elders or disparaging their

so-called contributions or achievements; to the contrary, they should quite clearly and openly criticize their failures, their complicity, their inability to complete the task we face, the blood of others that drips from their hands because they were unwilling to spill their own or other's. They should march right past them, emboldened, as King once said, by the fierce urgency of now.

Those who hope to be their allies should not be surprised, if and when this day comes, that when those who have been locked up and locked out finally have the chance to speak and truly be heard, what they speak is rage. The rage may frighten; it may recall images of riots, uprisings, and buildings aflame. Many may be tempted to control it, or douse it with buckets of doubt, dismay, and disbelief. But they should do no such thing. Instead, when a young man who was born in the ghetto and who knows little of life beyond the walls of his prison cell and the invisible cage that has become his life, turns to you in bewilderment and rage, you should do nothing more than look him in the eye and tell him the truth. You should tell him the same truth the great African American writer James Baldwin told his nephew in a letter published in 1962. With great passion and searing conviction, Baldwin had this to say to his young nephew:

“This is the crime of which I accuse my country and my countrymen, and for which neither I nor time nor history will ever forgive them, that they have destroyed and are destroying hundreds of thousands of lives and do not know it and do not want to know it. It is their innocence which constitutes the crime. This innocent country set you down in a ghetto in which, in fact, it intended that you should perish. The limits of your ambition were, thus, expected to be set forever. You were born into a society which spelled out with brutal clarity, and in as many ways as possible, that you were a worthless human being. You were not expected to aspire to excellence: you were expected to make peace with mediocrity.

You have, and many of us have, defeated this intention; and, by a terrible law, a terrible paradox, those innocents who believed that your imprisonment made them safe are losing their grasp on reality. But these men are your brothers—your lost, younger brothers. And if the word ‘integration’ means anything, this is what it means: that we, with love, shall force our brothers to see themselves as they are, to cease fleeing from reality and begin to change it. For this is your home, my friend, do not be driven from it; great men have done great things here, and will

again, and we can make America what it must become. It will be hard, but you come from sturdy, peasant stock, men who picked cotton and dammed rivers and built railroads, and, in the teeth of the most terrifying odds, achieved an unassailable and monumental dignity. You come from a long line of great poets since Homer. One of them said, The very time I thought I was lost, My dungeon shook and my chains fell off. We cannot be free until they are free. God bless you, and Godspeed.”

Tearing Ourselves Apart

The Least Important Thing

When the first Africans arrived in Virginia in 1619, there were no white people there; nor according to colonial records would there be for another sixty years. Oh, yes, there were English and Irish, but nowhere in the colonial record is there evidence that law or society granted special privileges to people based on European origin. The white race and white identity were invented, by the ruling elite of Virginia, in order to divide laboring people in the aftermath of Bacon's Rebellion of 1676. The white race was constructed and used as a political instrument to divide and conquer. How did this come to be?

By 1620 or so, a system of unfree labor became the dominant labor system in Virginia. The system was essentially slavery, some "bond-laborers" had time-limited contracts, but most servitude was open to interpretation by custom. A majority of these bond-laborers were Europeans. The archival evidence is clear, as well, that the role of African and African Americans was "indeterminate." From 1619 to the years following Bacon's Rebellion, the status of black people was contested in the courts and in the fields. Africans held a variety of social and economic positions: some were limited-term slaves, some free, some endured lifetime bondage, while others were property holders, even including a few slave owners. It was not until after Bacon's Rebellion, or the second phase of Bacon's Rebellion to be precise, that law and society created a new custom of racism, and for that to happen, the white race had to be invented. What was the trigger?

"In Virginia, 128 years before William Lloyd Garrison was born, laboring class African-Americans and European-Americans fought side by side for the abolition of slavery. In so doing, they provided the supreme proof that the white race did not then exist."

The Rebellion occupied the capital of Jamestown and pointed the way toward freedom for everyone, by contesting the rule of the oligarchs who had grown rich on slave labor and land stolen from the natives. After the rebellion was suppressed, law and custom began to shift. Europeans were increasingly designated as ‘white’ in the historical record, and given privileges that conferred a “presumption of liberty” while blacks were increasingly subjected to legal and cultural limits to their freedoms. Whites were encouraged to view blacks with contempt and see their inferior social positions as proof of innate inferiority.

All authorities agree that the conditions of the masses of white industrial and agricultural workers, North and South, were abominable in the decades before the Civil War. Still they had their white-skin privileges: The white worker was an actual or potential citizen, with citizen’s rights; the black had no rights. The white, as possessor—if not immediately, then within a definite time—of his own person, had legal freedom of movement; the black did not own himself. The white, if bound by indenture, debtor apprenticeship, or in some other manner, might still succeed in escaping into the free-moving white world much more easily than the black worker. As possessor of himself, the white workers could—even though not always immediately—take a better job, if he could find one; the black had no such chance. The white worker, if opportunity afforded, could learn to read and then study as a means of improving his lot; the black worker was forbidden by law even to learn to read. The white worker could aspire to become a farmer, a merchant or an industrialist; the black had only flight, revolt, revenge to dream of. At this point, the white skin privilege of the white worker was simply the right to be free.

The white race, white supremacy, and black subordination were all products of the same historical period in which the slave system was recreated as a racist system to prevent the threat of united action by the people. Today the new oligarchy still relies on their ability to divide and conquer. Racism is historical, it is the product of human activity. If it was then, it is now. Racism was founded on a system of privileges designed to win working class white people’s support for slavery. And so it is to white privilege that we must look if we want to free ourselves from being the tools and fools of the rich and powerful. We must be pawns no more.

The sickness of racism is gripping substantial sections of the upper-middle-class and dominant sections of the political establishment, academia, and official cultural commentary. The top ten percent of society, immensely jealous of the vast wealth piled up by the financial oligarchy yet fearful of the masses, sees in racial and identity politics a way of pursuing its social interests not only against those above, but, more importantly, against those

below.

This culture of victimhood, identity politics, and social justice activism promotes a simplistic worldview of noble victims and malevolent victimizers. The same is true of other sincere but terribly misguided cognitive traps promoted by social justice activists: the insistence that people's feelings constitute the ultimate authority on truth, that "power" is always bad, and that the powerless always know best. Victimhood culture often mistakes expertise and responsibility for power. Thus, doctors, parents, and teachers are "powerful" and bad, and patients, children, and students are "powerless" and good. Never mind that in this age of rampant individualism and customer satisfaction, children routinely bully parents and teachers, professors are terrified of their students, and doctors live in fear of litigation.

What we have is a contradiction—a working-class movement that has done incalculable harm to working-class people.

If what you want is to preserve your identity, things like continuing to speak your native language will be crucial to you; the resistance of indigenous peoples to globalization is understood from this standpoint as their struggle for the recognition of their cultural identity. But if what you want is to promote socialism, you won't much care what language gets spoken; what you'll want is to find a new economic model to replace the neoliberal insistence on the primacy of the private sector.

Books like *The Great Gatsby* (and there have been a great many of them) give us a vision of our society divided into races rather than into economic classes. And this vision has proven to be extraordinarily attractive. Indeed, it's been so attractive that the vision has survived even though what we used to think were the races have not. In the 1920s, racial science was in its heyday; now very few scientists believe that there are any such things as races. But many of those who are quick to remind us that there are no biological entities called races are even quicker to remind us that races have not disappeared; they should just be understood as social entities instead. And these social entities have turned out to be remarkably tenacious, both in ways we know are bad and in ways we have come to think of as good. The bad ways involve racism, the inability or refusal to accept people who are different from us. The good ways involve just the opposite: embracing difference, celebrating what we have come to call 'diversity.'

The commitment to diversity has become deeply associated with the struggle against racism. Indeed, the goal of overcoming racism, which had sometimes been identified as the goal of creating a "color-blind" society, is now reconceived as the goal of creating a diverse, that is, a color-conscious, society. Instead of trying to treat people as if their race didn't matter, we would not only recognize but celebrate racial identity. Indeed, race

has turned out to be a gateway drug for all kinds of identities, cultural, religious, sexual, even medical. To take what may seem like an extreme case, advocates for the disabled now urge us to stop thinking of disability as a condition to be cured or eliminated and to start thinking of it instead on the model of race: we don't think black people should want to stop being black; why do we assume the deaf want to hear?

The general principle here is that our commitment to diversity has redefined the opposition to discrimination as the appreciation (rather than the elimination) of difference. So with respect to race, the idea is not just that racism is a bad thing (which of course it is) but that race itself is a good thing. Indeed, we have become so committed to the attractions of race that our enthusiasm for racial identity has been utterly undiminished by scientific skepticism about whether there is any such thing. Once students have taken a course in human genetics, they just stop talking about black and white and Asian races and start talking about black and European and Asian cultures instead. We love race, and we love the identities to which it has given birth.

For those who take religion seriously, belief is a burden, not a self-righteous claim to some privileged moral status. Self-righteousness, indeed, may well be more prevalent among skeptics than among believers. The spiritual discipline against self-righteousness is the very essence of religion. Because a secular society does not grasp the need for such a discipline, it misunderstands the nature of religion: to console but, first of all, to challenge and confront. From a secular point of view, the overriding spiritual preoccupation is not self-righteousness but self-esteem. Most of our spiritual energy is devoted precisely to a campaign against shame and guilt, the object of which is to make people "feel good about themselves." The churches themselves have enlisted in this therapeutic exercise, the chief beneficiaries of which, in theory at least, are the victimized minorities that have been systematically deprived of self-esteem by a vicious history of oppression.

What these groups need, according to the prevailing consensus, is the spiritual consolation provided by the dogmatic assertion of their collective identity. They are encouraged to recover their ancestral heritage, to revive discarded rituals, and to celebrate a mythical past in the name of history. Whether or not this bracing account of their distinctive past actually meets accepted standards of historical interpretation is a secondary consideration; what matters is whether it contributes to the positive self-image that allegedly makes for "empowerment." The same benefits misleadingly associated with religion—security, spiritual comfort, dogmatic relief from doubt—are thought to flow from a therapeutic politics of identity. In effect, identity politics has come to serve as a substitute for religion—or at least for the feeling

of self-righteousness that is so commonly confused with religion. These developments shed further light on the decline of democratic debate.

‘Diversity’—a slogan that looks attractive on the face of it—has come to mean the opposite of what it appears to mean. In practice, diversity turns out to legitimize a new dogmatism, in which rival minorities take shelter behind a set of beliefs impervious to rational discussion. The physical segregation of the population in self-enclosed, racially homogeneous enclaves has its counterpart in the balkanization of opinion. Each group tries to barricade itself behind its own dogmas. We have become a nation of minorities; only their official recognition as such is lacking to complete the process. This parody of ‘community’—a term much in favor but not very clearly understood—carries with it the insidious assumption that all members of a given group can be expected to think alike. Opinion thus becomes a function of racial or ethnic identity, of gender or sexual preference. Self-selected minority “spokespersons” enforce this conformity by ostracizing those who stray from the party line—black people, for instance, who “think white.” How much longer can the spirit of free inquiry and open debate survive under these conditions?

The argument, in its simplest form, is that we love race, we love identity, because we don’t love class. We love thinking that the differences that divide us are not the differences between those of us who have money and those who don’t but are instead the differences between those of us who are black and those who are white or Asian or Latino or whatever. A world where some of us don’t have enough money is a world where the differences between us present a problem: the need to get rid of inequality or to justify it. A world where some of us are black and some of us are white—or biracial or Native American or transgendered—is a world where the differences between us present a solution: appreciating our diversity. So we like to talk about the differences we can appreciate, and we don’t like to talk about the ones we can’t.

Indeed, we don’t even like to acknowledge that they exist. As survey after survey has shown, Americans are very reluctant to identify themselves as belonging to the lower class and even more reluctant to identify themselves as belonging to the upper class. The class we like is the middle class. But the fact that we all like to think of ourselves as belonging to the same class doesn’t, of course, mean that we actually do belong to the same class. In reality, we obviously and increasingly don’t. The last few decades have seen a huge increase in inequality in America. The rich are different from you and me, and one of the ways they’re different is that they’re getting richer and we’re not.

And while it’s not surprising that most of the rich and their apologists

on the intellectual right are unperturbed by this development, it is at least a little surprising that the intellectual left has managed to remain almost equally unperturbed. Giving priority to issues like affirmative action and committing itself to the celebration of difference, the intellectual left has responded to the increase in economic inequality by insisting on the importance of cultural identity. So for thirty years, while the gap between the rich and the poor has grown larger, we've been urged to respect people's identities—as if the problem of poverty would be solved if we just appreciated the poor. From the economic standpoint, however, what poor people want is not to contribute to diversity but to minimize their contribution to it—they want to stop being poor. Celebrating the diversity of American life has become the American left's way of accepting their poverty, of accepting inequality.

Americans like stories in which the big problem is whether or not you fit in. It's as if being born poor and managing to become middle-class were like being born light-skinned into a dark-skinned family—too white to be black, too black to be white. Or like being the child of immigrants, with a loyalty to two different cultures. But classes are not like races and cultures, and treating them as if they were like races or cultures—different but equal—is one of our strategies for managing inequality rather than minimizing or eliminating it. White is not better than black, but rich is definitely better than poor. Poor people are an endangered species in elite universities not because the universities put quotas on them—as they did with Jews in the old days—and not even because they can't afford to go to them—Harvard will lend you or even give you the money you need to go there—but because they can't get into them.

Hence the irrelevance of most of the proposed solutions to the systematic exclusion of poor people (it's actually the systematic exclusion of three quarters of the population) from elite universities, which involve ideas like increased financial aid for students who can't afford the high tuition, support systems for the few poor students who manage to end up there anyway and, in general, an effort to increase the “cultural capital” of the poor.

“The rich don't exploit the poor, they just out-compete them.”

And if out-competing people means tying their ankles together and loading them down with extra weight while hiring yourself the most expensive coaches and the best practice facilities, he's right. The entire US school system, from pre-K up, is structured from the very start to enable the rich to outcompete the poor, which is to say, the race is fixed. And the kinds

of solutions that might actually make a difference—financing every school district equally, abolishing private schools, making high-quality child care available to every family—are treated as if they were positively un-American.

But it's the response to Hurricane Katrina that is most illuminating for our purposes, especially the response from the left, not from the right:

“Let's be honest, we live in one of the bleakest moments in the history of black people in this nation. Look at the Super Dome—it's a living hell for black people. It's not a big move from the hull of the slave ship to the living hell of the Super Dome.”

This is what we might call the ‘George Bush doesn't care about black people’ interpretation of the government's failed response to the catastrophe. But nobody doubts that George Bush cares about Condoleezza Rice, who is very much a black person and who is fond of pointing out that she's been black since birth. And there are, of course, lots of other black people—like Clarence Thomas and Thomas Sowell and Janice Rogers Brown, and of course Michelle Obama and her fucking candies—for whom George Bush almost certainly has warm feelings. But what American liberals want is for our conservatives to be racists. We want the black people George Bush cares about to be “some of my best friends are black” tokens. We want a fictional George Bush who doesn't care about black people rather than the George Bush we've actually got, one who doesn't care about poor people.

Celebrating diversity shouldn't be an acceptable alternative to seeking economic equality. In an ideal universe we wouldn't be celebrating diversity at all—we wouldn't even be encouraging it—because in an ideal universe the question of who you wanted to sleep with would be a matter of concern only to you and to your loved (or unloved) ones. As would your skin color; some people might like it, some people might not, but it would have no political significance whatsoever. Diversity of skin color is something we should happily take for granted, the way we do diversity of hair color. When you go to school or to work—just like when you go to vote or run for office—the question of whether you're black or white, straight or gay, a man or a woman shouldn't matter any more than the question of whether you are blond or brunette. An important issue of social justice hangs on not discriminating against people because of their hair color or their skin color or their sexuality. No issue of social justice hangs on appreciating hair color diversity; no issue of social justice hangs on appreciating racial or cultural diversity.

If you're worried about the growing economic inequality in American life, if you suspect that there may be something unjust as well as unpleasant in

the spectacle of the rich getting richer and the poor getting poorer, no cause is less worth supporting, no battle is less worth fighting than the ones we fight for diversity. While some cultural conservatives may wish that everyone should be assimilated to their fantasy of one truly American culture, and while the supposed radicals of the “tenured left” continue to struggle for what they hope will finally become a truly inclusive multiculturalism, the really radical idea of redistributing wealth becomes almost literally unthinkable.

In the early 1930s, Senator Huey Long of Louisiana proposed a law making it illegal for anyone to earn more than a million dollars a year and for anyone to inherit more than five-million dollars. Imagine the response if—even adjusted for inflation—any senator were to propose such a law today, cutting off incomes at, say, \$15 million a year and inheritances at \$75 million. It’s not just the numbers that wouldn’t fly; it’s the whole concept. Such a restriction today would seem as outrageous and unnatural as interracial—not to mention gay—marriage seemed or would have seemed then. But we don’t need to purchase our progress in civil rights at the expense of a commitment to economic justice. More fundamentally still, we should not allow—or we should not continue to allow—the phantasm of respect for difference to take the place of that commitment to economic justice. In short, this is an effort to move beyond diversity—to make it clear that the commitment to diversity is at best a distraction and at worst an essentially reactionary position—and to help put equality back on the national agenda.

“Races are like angels. Many people believe in them, devoutly. They can even tell you what properties they have. But the closer you try to examine them to discover their real nature, the more elusive they become.”

Why, if races don’t exist and the cultures we have attempted to replace them with cannot be said to exist either, are we so determined to hang on to the idea that they do? Perhaps we like the idea of cultural equality better than we like the idea of economic equality (and we like the idea of culture wars much better than we like the idea of class wars). Anti-racism plays an essentially conservative role in American politics today and the universities—as something like the diversity avant-garde—play an equally conservative role. People like David Horowitz are always complaining that universities are hotbeds of liberalism in which conservatives can’t get a job, much less a fair hearing. Even if Horowitz and his friends are right, true conservatives needn’t worry; from their affirmative-action admissions procedures to their multicultural graduation requirements, American universities are propaganda

machines that might as well have been designed to ensure that the class structure of American society remains unchallenged. The commitment to diversity has turned liberalism into a program for making rich people of different skin colors and sexual orientations more “comfortable” while leaving intact the thing that makes them most comfortable of all: their wealth.

The least important thing about us—our identity—is the thing we have become most committed to talking about, and this commitment is, especially from the standpoint of a left politics, a profound mistake. The political left—increasingly committed to the celebration of diversity and the redress of historical grievance—has converted itself into the accomplice rather than the opponent of the right. The old Socialist leader Eugene Debs used to be criticized for being unwilling to interest himself in any social reform that didn’t involve the attack on economic inequality. The situation now is almost exactly the opposite; the left today obsessively interests itself in issues that have nothing to do with economic inequality. And, not content with pretending that our real problem is cultural difference rather than economic difference, we have also started to treat economic difference as if it were cultural difference.

So now we’re urged to be more respectful of poor people and to stop thinking of them as victims, since to treat them as victims is condescending—it denies them their “agency.” And if we can stop thinking of the poor as people who have too little money and start thinking of them instead as people who have too little respect, then it’s our attitude toward the poor, not their poverty, that becomes the problem to be solved, and we can focus our efforts of reform not on getting rid of classes but on getting rid of what we like to call classism. The trick, in other words, is to stop thinking of poverty as a disadvantage, and once you stop thinking of it as a disadvantage then, of course, you no longer need to worry about getting rid of it. More generally, the trick is to think of inequality as a consequence of our prejudices rather than as a consequence of our social system and thus to turn the project of creating a more egalitarian society into the project of getting people—ourselves and, especially, others—to stop being racist, sexist, classist homophobes. This book is an attack on that trick.

Here are two stories, one from the end of the nineteenth century, the other from the end of the twentieth. First, the nineteenth-century one. In 1892, a young man gets on a train going from New Orleans to Covington, Louisiana. Because Louisiana trains have recently been segregated, he can enter either a coach reserved for whites or one marked COLORED. Despite the fact that he is very light-skinned (he is only one-eighth black, and his lawyer would later claim “the mixture of colored blood” was not “discernible”), when he enters the one for whites, he is identified as black and the conductor asks

him to leave. When he refuses, he's arrested. Since his goal is to get the practice of separating the races declared illegal, he immediately petitions for a hearing before the Louisiana Supreme Court, and then, after he loses there, he takes his case to the US Supreme Court, where his lawyer argues that the state has no right to "label one citizen as white and another as colored" and that the conductor's decision to label him black was "arbitrary."

But he loses again. There are "physical differences" between white people and black people, the Court says, and they have different "racial instincts," and these differences justify the state of Louisiana in requiring whites and blacks to ride in different coaches. So, despite Justice John Harlan's famous dissent—"Our Constitution is color-blind"—the decision in *Plessy v. Ferguson* officially inaugurates more than a half century of Jim Crow, of separate schools, separate hospitals, separate water coolers, separate everything.

Now the twentieth-century story. In 1977, a New Orleans woman named Susie Guillory Phipps applies for a passport and goes to the Bureau of Vital Records to get a copy of her birth certificate. In 1977, things are a lot different than they were in 1896. Segregation is now against the law. No one, not even the Louisiana court that will in 1985 have to decide whether she's black or white, believes in Susie Phipps's "racial instincts"—in fact, the court will call the whole idea of racial classification for individuals "scientifically insupportable." And the "physical differences" that had already begun to look a little tenuous in *Plessy* (remember, Homer Plessy's "colored blood" was "not discernible") are in this case ludicrously invisible. The fair-skinned and fair-haired Phipps has lived for forty-three years as a white woman. Not until the birth certificate produced by the Bureau of Vital Records said she was "colored" had anybody ever told her different, and when the Bureau of Vital Records refuses to change her birth certificate, she, like Homer Plessy, goes to court. And, like Homer Plessy, she loses.

The reason that Phipps isn't as famous as *Plessy*, of course, is that an entire social system—Jim Crow—wasn't riding on her case. But the point of telling both these stories is that something important was: not the persistence of segregation by race but the persistence of race itself, the conviction that we can sort different kinds of humans out by assigning them to races. Homer Plessy looked like the other people on the whites-only coach, but he was nonetheless identified—indeed, in order to get himself arrested and get the constitutional challenge to the new law started, he must have identified himself—as a black man. How else could the conductor know to arrest him? Susie Phipps wasn't identified by anybody—including herself—as a black woman, and yet she turned out to be black too. Why is Phipps black? What is race if you get to belong to one without looking like

you do, without feeling like you do, and without even knowing that you do?

In an officially racist society like the one Homer Plessy lived in, this question was obviously important; you can't exclude the black people unless you know which ones they are. In our society, where the commitment is not to disrespecting but to respecting racial difference, it's just as important; you can't celebrate people's blackness unless you can define it. The recent history of the science of race, however, has raised doubts about whether you can define it, and has turned the question raised by people like Plessy and Phipps—why do they belong to the black race?—into the more general question: are there such things as races? And while this question is potentially awkward—since if there aren't any races, what differences are we respecting—there are important ways in which the difficulty of pinning race down has worked to keep it central. As race has turned from a biological into a social fact, racial diversity has morphed into cultural diversity, and a world of cultural—rather than economic or political or even religious—differences has proven to be a very attractive one for many. From this perspective, we might even say that the more amorphous our concept of race has become, the more applicable it has become as a model for treating all difference.

Today we don't talk so much about blood anymore, we talk about genes, and we are able to trace people's ancestry with a specificity that would have amazed even the most passionate nineteenth-century aficionados of physical difference and racial instincts. But it would also have disappointed them, because it has turned out that the more we know about genetic heritage, the more skeptical most scientists have become about the idea of race. In fact, the dominant scientific view now is that race is a myth, and that as a biological rather than a social construct, race has ceased to be seen as a fundamental reality characterizing the human species.

The reason for this is not, of course, that there aren't any physical differences between people. People clearly do have different skin colors and different textures of hair, and we all have ancestors who came from different places or who came out of Africa at different times. The problem is that genetic variation within populations belonging to what we call the same race is often greater than genetic variation between races. So a person from the Congo and a person from Mali are more likely to be genetically different from each other than either is from a person from Belgium. Hence it doesn't make genetic sense to think of people from Mali and the Congo as belonging to the same race and of Belgians as belonging to a different race. On the one hand, then, there are people whose ancestors came from Belgium and people whose ancestors came from Mali and people whose ancestors came from Thailand. But, on the other hand, there isn't—at least from the scientific standpoint—any white or black or Asian race. So it's not that there aren't

“physical differences” (in this sense the Court in *Plessy* had it right); it’s just that there aren’t physical differences between races.

This point is nicely illustrated by recent discoveries about the apparent link between disease and race. For many years, at least in the United States, sickle cell anemia has been a disease—and, of course, a disease of the blood—customarily identified with black people. But it turns out that we can’t really distinguish between black people and white people (between black blood and white blood) by invoking a genetic association with sickle cell. For one thing, not all of the people we call black actually have such an association, since it is characteristic among people whose ancestors were at one point centered in parts of West and Central Africa and isn’t at all associated with black people whose ancestry is elsewhere in Africa. And, for another, there are people we think of as white (i.e., certain parts of the Greek population) with whom the trait is associated. The unifying factor is apparently descent from people who lived where malaria was a problem, since the sickle cell trait is a variant of traits that protect against malaria. Thus in a country composed largely of white people from the Mediterranean and of black people from southern Africa, sickle cell would be thought of as a white disease.

The same point can be made, from the opposite angle, for other groups. Tay-Sachs is supposedly a Jewish disease, but, among Jews, it’s only the Ashkenazi (from eastern Europe) who are frequent carriers, and frequent carriers include non-Jewish populations like French Canadians from the area near the St. Lawrence River. In a country where the population consisted of French Canadians and Sephardic instead of Ashkenazi Jews, Tay-Sachs would be most accurately describable not as a disease Jews get but as a disease Jews don’t get. More striking still, if we imagined a country composed of Ashkenazim, Sephardim, and French Canadians, and we used the statistical probability of being a carrier for the Tay-Sachs gene as a marker of racial difference in our imaginary country, the question of what race you belonged to would have nothing to do with the question of whether you were Jewish. The people formerly known as Jews would belong to both races.

“What joins me to other blacks and other blacks to one another, is not a set of shared physical characteristics, for there is none that all blacks share. Rather it is the shared experience of being visually or cognitively identified as black.”

And once you get identified as black—or Jewish or Asian—there’s no point in telling the person who’s identified you that the physical characteris-

tics are irrelevant, that the genetic differences between you and some other blacks are greater than the genetic differences between you and some other non-blacks, and so calling you black (or Jewish or Asian) doesn't establish any further connection with some biological group (i.e., a race), but just tells you where (some of) your ancestors came from.

The Office of Management and Budget's guidelines for collecting census data about racial identity emphasize, just as the Louisiana court did, that "racial and ethnic data categories are social-political constructs and that they should not be interpreted as being genetic, biological, or anthropological in nature."

But what are you perceiving when you perceive yourself as white? Remember, the only reason that anyone—the courts, the federal government—is interested in your perception of race in the first place is that they're all agreed that there is no biological fact of the matter about what race you belong to. That's why the OMB says that race is not like, say, age, and why it allows census recorders to correct the information when, for example, someone born on January 1, 1950, says on January 1, 2000, that he's thirty years old. Being fifty years old is not a social construction; you aren't fifty because people perceive you as being fifty or because you perceive yourself as being fifty. You're fifty because, however people perceive you—he looks old, he looks young, she dresses as if she thinks she's still thirty—there is some fact of the matter independent of the perception. So when the OMB asks you how old you are, it isn't asking you how old you feel. But when it asks you what race you are, that's exactly what it is asking you.

The idea of race as a social construction was meant to register the fact that even if we don't any longer believe in race as a biological entity, we still treat people as if they belonged to races. Indeed, we routinely—both officially (the government does it) and unofficially (we all do it)—organize the world racially. Susie Phipps's mother would have a lot more choices filling out her birth certificate today, from **WHITE** and **BLACK** to **AMERICAN INDIAN** to **FILIPINO** to **OTHER ASIAN (SPECIFY)** to just plain **OTHER**. And she would be allowed to check as many boxes as she wanted. When you're born American, you're also born black or white or Guamanian or Chamorro.

But we shouldn't think that just because we keep on treating people as if they belonged to races, they somehow do, or that our treating people as if they belonged to races is its own justification. Treating race as a social fact amounts to nothing more than acknowledging that we were mistaken to think of it as a biological fact and then insisting that we ought to keep making the mistake. Maybe instead we ought to stop making the mistake.

But apparently no one wants to stop making it. Often we continue to talk about races as if we knew what they were. Even more often, when

race begins to seem to us a little crude, we redescribe it as culture, taking remarks like “black people are good at basketball because they can jump higher” and turning them into remarks like “basketball plays an important role in black culture.” Thus we don’t hear much in the United States about multiracialism (as opposed to, say, in Singapore where it’s an official policy and is heavily promoted on occasions like Racial Harmony Day), but we hear a great deal about multiculturalism. And if we don’t yet, like Canada, have our very own Multiculturalism Day, we do have an increasing number of Diversity Days, sponsored by individual schools and organizations, where people celebrate their different cultures.

People today may not be entirely comfortable talking about their racial identities, but they’ve already had a lot of practice talking about their cultural identities and about the importance both of cultural memory (don’t forget the Holocaust) and of heritage (don’t forget the Middle Passage). They’re not likely to say, for example, that they’re proud of their race—that’s what those evil white supremacists or radical Black Panthers do—but they are very proud of their culture and they think other people should be proud of their cultures too. To some extent, then, culture is now being used as a virtual synonym for racial identity (the ‘multi’ in multiculturalism has nothing to do with some people liking Mozart and other people liking the Strokes), and to some extent it’s also being used as a replacement for racial identity.

An immediate objection to this way of thinking about culture instead of race is that it just takes the old practice of racial stereotyping and renovates it in the form of cultural stereotyping. Most reasonable observers would agree that, in general, blacks are distinguished from non-blacks by some distinctive cultural practices, but remember that lots of supposedly black cultural traits—from eating soul food to wearing your hair in cornrows—not only are practiced by some whites but are not practiced by most blacks.

If we ask the question what is it that makes gay people gay—what is it that constitutes their being gay, not what causes it—we have an answer. We’re not stereotyping gay people by saying that they all want to sleep with people of the same sex; we’re defining them. So what’s the behavior that makes black people black? There is no equivalent answer. You can be black and not like Jay-Z and not wear your hair in cornrows and not eat soul food and not do any or all of the things currently or historically associated with black culture. And, conversely, there’s nothing you can do that will make you black in the same way that same-sex desire makes gay people gay. If, starting tomorrow, the only people who listened to or performed hip-hop were white (we’re already halfway there), hip-hop would be a part of white culture, and if every black kid in the country were into emo, emo would be

a part of black culture. It's not the blackness of the culture that makes the people black; it's the blackness of the people that makes the culture black.

Two things make the notion of culture look like an attractive alternative to race. One is that culture is learned rather than inherited (it's on the nurture side of nature/nurture); the other is that culture is a looser concept than race; not all black people have to love *The Black Album* in order for it to be a part of black culture (and some white people can love it too). The problem is that the minute we call black culture black, both these advantages disappear since in order for a sentence like 'Some white people are really into black culture' to make sense, we have to have a definition of white and black people that is completely independent of their culture. Culture cannot replace our concept of race as a biological entity. Learning how to rap doesn't make you a black person; it just makes you a rapper. The problem with culture, then, is that it's utterly dependent on race. We can only say what counts as white or black or Jewish culture if we already know who the whites and blacks and Jews are.

The situation is exactly the same for the notions of heritage and memory that go along with the idea of cultural identity. Suppose, for example, that in an American literature class, I teach both Ralph Waldo Emerson's *Nature* and Frederick Douglass's *Narrative of the Life of Frederick Douglass, an American Slave*. Suppose further that sitting in the front row are a black student and a white one. Neither of them has ever read either of these books. Here's one way we could describe what's about to happen. Each student is about to be given the opportunity to do two things: learn about her own heritage and learn about someone else's heritage as well. When we read the Emerson, the white student will be learning about her heritage; when we read the Douglass, she'll learning about someone else's. And the black student will be doing the same thing in reverse. But why should this be?

Why is it that some books we've never read are supposed to count as part of our cultural heritage while other books we've also never read count as part of someone else's heritage (even though they've never read them either)? And what about if they have read them? We can imagine a black student raised by ex-hippie parents, forced as a child to listen to the Jefferson Airplane and the Grateful Dead and read to sleep with Thoreau and Emerson (which sent her right off). It can't really make sense to say that when she reads Emerson in class, she's learning about someone else's heritage. To think that, we'd have to think that your cultural heritage has nothing to do with the books you actually read and has only to do instead with books that are somehow imagined as genetically appropriate for you to read. But, as successful as the Human Genome Project has been, nobody has yet located—nobody is even bothering to look for—the Emerson gene.

Furthermore, even if there were an Emerson gene, it wouldn't make sense of our concept of cultural heritage, since it would of course be reproduction not instruction that kept *Nature* in the canon. The things we do have genes for—like sickle cell anemia and Tay-Sachs disease—are part of our genetic heritage, not our cultural heritage, and our genetic heritage is not the sort of thing it makes sense to be proud of or ashamed of, not the sort of thing we can be true to or give up. When people worry about losing their culture, they aren't worrying about the gene pool. In Quebec, for example, French speakers are worried that their language and their culture more generally will disappear, that French-speaking Canada will be utterly assimilated to English-speaking Canada. Hence their demand that public life in Quebec be carried on in French, and that the use of English be minimized; it provides an incentive for their children to keep speaking French instead of (or at least in addition to) English. But if there were a biological link between the French language and their children, their worry would make no sense. We don't worry, for example, that a child whose genetic heritage has destined him to be tall will, surrounded by short people, be assimilated into shortness. And, to turn the example around, we wouldn't think that if a child genetically slated for shortness managed—by eating the right foods or taking growth hormones—to get tall, he had betrayed his shortness. The dramas of assimilation—the demand that we be loyal to our heritage, the fear that we will fall away from it—depend precisely upon it not being biological.

Even those (the vast majority) who are critical of racism and who do not believe in the biology of racial identity have continued to insist that race is a central and even desirable factor in American life. Thus in what is certainly the most influential academic text on the social construction of race (*Racial Formation in the United States*), the authors write that there are two “temptations” to be avoided in thinking about race. The first is the temptation to think of it as something “fixed, concrete, and objective,” that is, a physical fact. The second is the temptation to think of it as a “mere illusion,” which “an ideal social order would eliminate.” “Race,” they say, “will always be at the center of the American experience,” and it's a good thing too because “without a racial identity, one is in danger of having no identity.”

We've seen some of the ways in which people have gone about trying to make sure that this prediction comes true and to guarantee that even if people can't belong to concrete and objective races, they can still have (social or cultural) racial identities. And what we've also begun to see is how our commitment to diversity is deeply tied to keeping race alive, partly because diversity is itself understood as racial and partly because our

commitment to diversity even with nonracialized groups depends on treating them as if they were races—different but equal, worthy of our respect. What we haven't seen is why. Why are we so eager to keep race at the center of the American experience? Why does racial difference remain so important to us when the racism it was used to justify is so widely condemned and when the basic idea about race that gave it its power—the idea that there are fundamental physical or cultural differences between people that line up with our division of them into black, white, et cetera—has been discredited? Why are we so desperate to have identities that we continue to care about them even when they get reduced to nothing more than the proud boast that you belong to a population with a 1 in 27 chance of being a carrier for the Tay-Sachs gene?

Distracting From Class

It's not so surprising that the relatively recent emergence of the Holocaust as an event in American history has produced a certain exasperation among African Americans, memorably expressed by the notorious black racist Khalid Muhammad when, in the wake of a visit to the US Holocaust Memorial Museum, he told an audience at Howard University in April 1994:

“The black holocaust was 100 times worse than the so-called Jew Holocaust. You say you lost 6 million, we question that, but we lost 600 million. Schindler's List is really a swindler's list.”

The force of these remarks consists not in the absurd Holocaust denial but in the point—made precisely by his visit to the Holocaust Museum—that commemoration of the Nazi murder of the Jews on the Mall was in fact another kind of Holocaust denial, or, more precisely, the denial of another Holocaust. Why should what the Germans did to the Jews be treated as a crucial event in American history, especially when—given the absence of any commemoration of American racism on the Mall—what Americans did to black people is not?

It tells a story that—embodied in the martyrdom of Leo Frank and in the construction of the US Holocaust Memorial Museum—many of us treat as if it were true. It's believable because we think of antisemitism as a significant factor in American history and of the success of Jews in American life as a tribute to the ways in which Jews and America itself overcame that antisemitism. But this is false. Compared to Negrophobia, antisemitism was never a very significant factor in American life. The fact that Jews were white was almost always more important than the fact that they were Jewish, and Jewish success in America today is less an effect of the triumph over racism than it is an effect of the triumph of racism.

If we look at the history of American apartheid, we will remember that money didn't always function as an alternative to race; sometimes it was a way of insisting on race. The poll tax, for example, was one of several devices used in the South for precisely the purpose of drawing the color line where it was no longer legal to do so. The Fourteenth Amendment had made it unconstitutional to keep black people from voting because they were black, but it did not (and would not until the passage of the Twenty-fourth Amendment in 1964) make it illegal to charge a fee for voting. The poll tax could thus be used to deny most black people the right to vote not because they were black but (ostensibly) because they were poor. And if, in theory, the law applied to poor whites too, the infamous “grandfather” clause set

that right. You were exempt from paying the tax if you could prove your grandfather had voted, a test that the children and grandchildren of slaves could never pass.

So the supposedly race-neutral poll tax was in fact one of the first in over a century's worth of color-blind efforts to draw the color line. And as the civil rights movement not only undid the apparatus of state-sponsored discrimination but made serious inroads into the technologies of private discrimination as well, charging people a lot of money (for your food, your school, your golf course and tennis courts) would be a handy way of enforcing the racialized hierarchies of American life. The reason you can't get in here is not that your skin is the wrong color; it's that your bank account is too small. **OUR PRICES DISCRIMINATE BECAUSE WE CAN'T**, reads the sign at what an old episode of *The Simpsons* calls "the rich people's mall." What the state now refuses to do, the market will do for it. Part of the joke in *The Simpsons*, then, is the way the banner tells the truth about racism: high prices can achieve what the law forbids.

But the real joke is the way in which the banner tells a quite different truth, not so much about racism as about the new irrelevance of racism. After all, it's the rich people's mall, not the white people's mall, and the monetarization of the technology of discrimination involves not just a new way of keeping the wrong people out but a new description of who the wrong people are—not the blacks, not the Jews, but the poor. It's as if the poll tax were being applied but without the grandfather clause. And when the point is put this way, we can go one step farther and see that the whole idea of the wrong people has become irrelevant. High prices aren't a clever way of keeping out the poor. The purpose of charging high prices is not to find an indirect way of excluding those whom the law no longer allows you to exclude. People who can't afford to ride in first class, people who shop at (not to mention work at) Walmart instead of at the rich people's mall, are the victims of poverty, not of prejudice. No one even needs to draw the money line; it draws itself.

Although, at the beginning of the twentieth century, segregation wasn't a problem for most Americans or for the Supreme Court, interference with freedom of contract was. In a famous case of 1905, for example, the Court struck down a New York state law that prohibited employees in bakeries from being "required or permitted" to work more than ten hours a day or sixty hours a week. Joseph Lochner, the owner of Lochner's Home Bakery, had been fined for overworking an employee, and on appeal the Court overturned his conviction, declaring that the Bakeshop Act infringed upon "the right of the individual to labor for such time as he may choose" and thereby violated both employer's and employee's "liberty of contract." When

Chesnutt protests against the infringement on his doctor's ability to ride in the first-class car, he is just asking that black doctors be guaranteed the same freedoms as white bakers.

By contrast, no one's liberty of contract is violated when poor people don't shop at the rich people's mall. Rather, the poor people who decline to shop there are like bakers who decide not to work for Lochner. They're just exercising their freedom of contract—in this case, by refusing to enter into one. If you don't like the hours, you don't have to take the job; if you don't like the price, you don't have to buy the product. The injustice in Chesnutt, then, is that racism and the drawing of the color line interfere with the market. If you're forced to ride with the malodorous farm laborers because you're poor, that's unfortunate but not unfair. If you're forced to ride with them because you're black, that's another story. So the poor are not victims of discrimination; they are the unfortunate by-products of an essentially just mechanism—the market. Poverty, in other words, is not a civil rights issue. The government kept black people from voting, and eventually the government made it possible for black people to start voting. The government kept women from voting, and it eventually allowed them to vote too. But you don't need the government to keep poor people from shopping at the rich people's mall. And you can't get the government to enable poor people to start shopping there.

The exemplary instance of victimization in modern American political life remains the victim of discrimination. It's the violation of people's rights as citizens—the failure of the liberal state to live up to its liberalism—that we prefer to deplore. The problem in Chesnutt is not that the farm laborers can't afford to ride in the clean comfortable car; it's that some people who can afford to (like Dr. Miller) aren't allowed to. And Leo Frank—"the Jew they lynched in Georgia because of that little factory girl"—is a version of Dr. Miller, a man whose class can't save him from his race. Indeed, part of the attraction of the Leo Frank story may be the way in which it testifies to the triumph of racial prejudice over class privilege, which is to say, the way in which it demonstrates the irrelevance of wealth and (from the standpoint of the racist) turns class warfare into white supremacy while (from the standpoint of the antiracist) turning class warfare into bigotry.

If you're a racist, it shows you that racism is the solution; if you're an antiracist, it shows you that racism is the problem. Either way, antisemitism is a kind of gift since it makes over the rational anger of the poor as the irrational anger of the racist and enables everyone to agree that the real issue here is not money but race. So if racism makes economic issues irrelevant by asserting that what really matters is the difference between races, antiracism does exactly the same thing. The difference is just that one condemns what

the other celebrates. For both, the fundamental conflicts are between races; antiracism, just as reliably as racism, turns the hostility between rich and poor into the hostility between black and white, Christian and Jew.

When, for example, we look today at old photographs of lynchings, we're shocked not only by the events themselves but by the participants' lack of shame, by the way in which they not only seem happy to be photographed but actually look proud of what they're doing. It's one thing, after all, to be racist; almost all of us are prepared to acknowledge that we each have a little bit of racism hidden away somewhere inside. But it's another thing altogether to be proud of one's racism. Which the lynchers were. Indeed, part of the attraction of lynching was precisely its publicness, its status as an expression of the will of the people. Thus although lynching was always against the law (that's what made it lynching) and often disapproved of, lynchers themselves tended to feel not only that they were doing the right thing but also that they were representing the community. They were doing what everyone knew was right, even if the law was on the other side.

And there was a great deal of public support for their view; none of the more than two-hundred bills condemning lynching managed to get through the US Congress, and it was not until 2005 that the Senate took any action, in the form of an apology for its earlier failure to act. But the fact that the Senate in the twenty-first century was extremely (indeed, unanimously) happy to apologize for its failures in the twentieth century has its own significance. For one thing, by 2005, lynching had become more a figure of speech than an actual event, describing people who were (or who claimed to be) treated unfairly (e.g. Clarence Thomas) rather than people who were hanged from a tree or burned at the stake. And, for another, even the fictional representations of lynchings had moved out of the mainstream.

It's true that the white supremacists in what is probably the most important racist novel of the recent past, Andrew Macdonald's *The Turner Diaries*, are just as proud as and even more ambitious than Dixon's; they lynch not only black rapists but any black men who sleep with white women, and then they lynch the white women too, adorning their corpses with placards that say: I DEFILED MY RACE. But the audience just isn't there. Where *The Clansman* was published by Doubleday and sold at fine bookstores everywhere, *The Turner Diaries* was published by a white supremacist organization called the National Alliance and was (and is) sold mainly at gun shows. That's where Timothy McVeigh got his copy. And if *The Clansman* is best known today as the racist bestseller that inspired an equally racist blockbuster movie—D. W. Griffith's *The Birth of a Nation* (personally endorsed by President Woodrow Wilson)—*The Turner Diaries* is best known today as the inspiration for the bombing of the federal

building in Oklahoma City. Woodrow Wilson famously took one of the last things in American society left unsegregated—the federal civil service—and segregated it. His racism was central to American life, a fundamental part of what then was mainstream American political thought. Now, a century later, the racism of *The Turner Diaries* and of Timothy McVeigh has been pushed to the margins.

Antihate rallies are obviously different from other kinds of events, such as antiwar rallies; there could be and sometimes are pro-war rallies, but there aren't any pro-hate rallies. Even people who do, in fact, hate don't think it's appropriate to have rallies supporting hate, any more than people who steal things think it's appropriate to have rallies supporting theft. The antihate demonstration, then, is mobilized not in response to the pro-hate position but in response to the expression of what the FBI, in its definition of hate crimes, calls bias. There are a lot of antihate rallies in reaction against people using racial slurs or painting swastikas on dorm walls, and nearly everyone will agree that racial slurs and swastikas on dorm walls are a bad thing. Indeed, it's precisely everyone's agreement that makes antihate rallies so powerful: they express a consensus.

But it's also everyone's agreement that makes them a little puzzling. Why are we so committed to combating a position that no one actually holds? Why, in a world where most of us are not racist (where, on the humanities faculties at our universities, we might more plausibly say not that racism is rare but that it is extinct), do we take so much pleasure in reading attacks on racism? Why do we like it so much that not only do we read books that attack a racism that no longer exists—Plessy was overruled a half century ago, and it's been a long time since Wilson was president—but we also make bestsellers out of books that attack a racism that never existed (Lindbergh never was president). What—to put the question in its most general form—is the meaning of antiracism today?

One way to begin to answer this question might be to suggest that antiracism activates a certain nostalgia. There is a nostalgia for Jim Crow among some black intellectuals. What they're nostalgic for is black culture. They're nostalgic, in other words, not exactly for racism but for the distinctive social practices—cultural armor—that the resistance to racism helped create. On the one hand, Jim Crow impoverished and disempowered an entire community; on the other, it solidified that community's identity as a community. The creation of a distinctive African American culture was thus both a consequence of racism and a kind of compensation for it. But African American political life begins to look very different when the terms of the inequality that produced it begin to change, and this produces a certain awkwardness, especially for successful black intellectuals.

Chesnutt's Dr. Miller looks problematic because he doesn't want to ride Jim Crow with the other black people. But he has to. He can't get people to recognize that his class is more important than his race. Today's Dr. Millers look problematic because even when they're riding in what amounts to their very own super-deluxe coach, they think of themselves and want to be thought of by others as riding Jim Crow. They want their race to matter more than their class. And they are nostalgic for Jim Crow because racial segregation created a genuine bond between them and other, poorer—much poorer—black people while the end of segregation placed them in an attractive but difficult position, making possible their great success but only by threatening the bond. Dr. Miller thought that belonging to the black race was not enough to establish community between people of very different classes; some black intellectuals hope that belonging to black culture is.

But antiracism serves another more important and more properly political purpose. As we've seen, the central debates about race in America today are no longer debates between racism and antiracism. Rather, the debate today is between two kinds of antiracism. One, identified with multiculturalism and the left, urges us to respect and preserve the differences between blacks and whites and Native Americans and Jews and whoever. It gives poor people identities and, turning them into black people or Latinx or women, insists on regarding their problems as effects of discrimination and intolerance. The other, identified with the right, regards the respect for racial difference as itself a form of discrimination and insists that the only identity that matters (the one we should be respecting) is "American identity." Where contemporary liberalism's antiracism argues that we can solve our problems by respecting racial difference, contemporary conservatism's antiracism maintains we can solve our problems only by eliminating or ignoring it.

The problem with this debate—or, looked at another way, the virtue of this debate—is that, from the standpoint of economic inequality, it doesn't matter which side you're on and it doesn't matter who wins. Either way, economic inequality is absolutely untouched. The dream of a world free of prejudice, the dream of a world where identities—whether American or hyphenated-American—are not discriminated against, is as foundational to the right as it is to the left. And this dream is completely compatible with—is, actually, essential to—the dream of a truly free and efficient market. Here's where the concept of neoliberalism—the idea of the free market as the essential mechanism of social justice—is genuinely clarifying. A society free not only of racism but of sexism and of heterosexism is a neoliberal utopia where all the irrelevant grounds for inequality have been eliminated and whatever inequalities are left are therefore legitimated.

Thus, when it comes to antiracism, the left is more like a police force for,

than an alternative to, the right. Its commitment to rooting out the residual prejudices that too many of us no doubt continue to harbor deep inside is a tacit commitment to the efficiency of the market. And its commitment to the idea that the victims of social injustice today are the victims of racism, sexism, and heterosexism—the victims of discrimination rather than exploitation, of intolerance rather than oppression, or of oppression in the form of intolerance—is a commitment to the essential justice of the market. The preferred crimes of neoliberalism are always hate crimes; when our favorite victims are the victims of prejudice, we are all neoliberals.

The US Holocaust Memorial Museum opened in 1993; the National Museum of the American Indian opened on the Mall in 2004 and if Khalid Muhammad had only lived a little longer, he might have died happy since the Board of Regents of the Smithsonian Institution has now approved plans for a National Museum of African-American History and Culture near the Washington Monument. Old-style racists like Jesse Helms were against it, but new-style antiracists like Dick Cheney and John Roberts and Bill Frist and Thad Cochran (a senator from Mississippi who doesn't make racist remarks) are all for it.

It goes without saying, however, that there won't—and that there shouldn't—be a National Museum of Lower-Income Americans on the Mall. It's hard to see what good it would be to poor people to start celebrating their culture, much less their survival as a group. We don't worry that poor people run the risk of assimilation to wealth, which is to say, we don't seek to preserve the distinctive things—the bad educations, the inadequate health care—that make poor people who they are. We do think of at least some poor people as inheriting their poverty, but we don't think of their poverty as their heritage; so, for example, where it makes sense to say of some people that they are 'part Jewish' or 'part black,' we don't think it makes sense to say of anyone that he or she is 'part poor' or 'part rich.' There may be people of mixed race, but there are no people of mixed income; we don't even have the concept of mixed income. Above all, we don't, whether or not we are ourselves poor, think that poverty is just as good as wealth, even if—especially if—we think that poor people are just as good as rich people.

The meaning of antiracism today is thus that it gives us an ideal—the ideal of a society without prejudice—that we can all sign on to at the very moment when the inadequacy of that ideal should be entirely obvious. The gap between the rich and the poor may be growing on a daily basis, but when it comes to difference, we prefer fighting racism to fighting poverty. And the distinction between our conservatives and our liberals is just that our conservatives think we've already won that fight while our liberals think we've only just begun. Another way to put this is to say that our

conservatives and our liberals more or less agree about what a just society would be. That's why mainstream commentators like David Brooks can confidently insist that even though the country seems to be "polarized," "this isn't an ideological moment, liberal or conservative." Of course, no moment ever seems like an ideological moment to Brooks, but he's not alone in this and he's not mistaken.

The quarrel between people who think we don't have enough diversity and people who think we have just the right amount is a quarrel over management techniques, not over political ideology. With respect to economic inequality, there is no quarrel; what we might call the neoliberal consensus prevails. The only inequalities we're prepared to do anything about are the ones that interfere with the free market. Chesnutt, insisting that segregation (and especially the law against miscegenation) violated "liberty of contract," was an early adopter. There was no injustice, he thought, in the fact that many people couldn't afford to ride in the first-class car on the train; the injustice was to the people who could afford to ride in that car but weren't allowed to. The injustice was intolerance of racial difference, not acceptance of economic difference.

And this scenario is what gives the fantasy of the rich people's mall its force. The fantasy part, of course, is not that there are such things as rich people's malls. The fantasy is the idea that the injustice in not being able to shop there is the injustice of being discriminated against. Or, to turn the point around, that rich people's malls are fine as long as they're diverse, as long as the black and brown rich people get to buy expensive stuff alongside the white ones. How else can we explain the flurry of disapproval surrounding Hermès's refusal to unlock its doors for some after-hours shopping by Oprah Winfrey? "After-hours shopping is a favor," noted the *Washington Post*. "There's nothing wrong with a store saying not tonight, madame, as long as the reason doesn't have anything to do with skin color." In this universe, social justice means that Oprah Winfrey (like Dr. Miller) ought to be able to spend her money in the same ways the white celebrities (or white doctors) do.

"The problem of the twentieth century," W. E. B. Du Bois observed at its beginning, will be "the problem of the color line." It looks like the twenty-first century will also be fond of that problem. The difference is that the work that used to be done by racism—the work of obscuring class difference—is now done by antiracism. The controversy over the government's response to the catastrophe of Hurricane Katrina is a case in point. It's like an inverted version of the question about the "rich Jew" Leo Frank: was he lynched because he was Jewish or because he was rich? Is the relevant thing about all those people abandoned in New Orleans the fact that they are black

or the fact that they are poor? We like blaming racism, but the truth is there weren't too many rich black people left behind when everybody who could get out of New Orleans did so. The Republican party policies that left the poor behind were not racist, and the economic inequality in American society has grown under Democratic presidents as well as Republicans. This doesn't mean, of course, that racism didn't play a role in New Orleans. It just means that in a society without any racial discrimination, there would still have been poor people who couldn't find their way out of New Orleans. Whereas in a society without poor people (even a racist society without poor people), there wouldn't have been.

Racism requires a commitment to the inequality of the races; antiracism requires a commitment to their equality. And here obviously is one key to the attraction of cultural diversity. It gives us a vision of difference without inequality. For our core conception of culture involves the idea that cultures are essentially and in principle equal, and so it makes no sense to think of a society organized into cultures as hierarchical. When we imagine, in other words, that we live in a world divided into different cultures, what we're imagining is that the political commitment to equality involves not creating it (by, say, redistributing wealth) but just insisting that it's already there. The problem, in this account, is that people have for various reasons (e.g. racism) failed to recognize their essential equality; the solution is to get them to recognize it. The great advantage of culture, then, is that it gives us a model of differences we can love, like those between Asian Americans and Caucasians rather than differences (like the ones between smart people and stupid people or, more to the point, rich people and poor people) that are not so obviously appealing. And the enthusiasm for the lovable differences is widespread.

For college students, after all, your ethnicity is something you can be proud of in a way that your poverty or even your wealth (since it's your parents' wealth) is not. But the greatest value of diversity is not primarily in the contribution it makes to students' self-esteem. Its real value, as the widespread acceptance of affirmative action shows, is in the contribution it makes to the collective fantasy that institutions like Harvard and UIC are—internally and in relation to each other—meritocracies. For if the students at Harvard are appropriately diverse, we know that no student is being kept from Harvard because of his or her race or culture. Every institution, in an ideal affirmative-action world, has the right cultural mix. How, then, do some students end up at Harvard and some at UIC? Since the differences between them that produce this divergence are not—indeed cannot be—cultural (remember, cultures are equal), they are attributed instead to the merit of the individual. As long as we think of people as

belonging to cultures and we think of cultures as equal, we are enabled also to think of the inequalities between people (their test scores, for example) as individual.

This helps explain the popularity on campus (especially among students at the most elite campuses) of affirmative action; it is a powerful tool for legitimizing their sense of their individual merit. Affirmative action guarantees that all cultures will be represented on campus, that no one will be penalized unjustly for belonging to a culture, and therefore that the white students on campus can understand themselves to be there on merit because they didn't get there at the expense of any black people. The problem with affirmative action is not (as is often said) that it violates the principles of meritocracy; the problem is that it produces the illusion that we actually have a meritocracy. We are often reminded of how white our classrooms would look if we did away with affirmative action. But imagine what that Harvard classroom would look like if instead we replaced race-based affirmative action with a genuinely class-based affirmative action.

The median family income in the United States today is a little over \$54,000 per year; almost 90 percent of Harvard students come from families with more than that, so at least half of them would have to go. And almost 75 percent of Harvard students come from families with incomes over \$100,000 per year, although only a little over 20 percent of American families have incomes that high. So most of them would have to go too. If the income distribution at Harvard were made to look like the income distribution of the United States, over half the people in that room would be gone and a great many of the disappeared would be rich and white. It's no wonder that rich white kids and their parents aren't complaining about diversity. Race-based affirmative action, from this standpoint, is a kind of collective bribe rich people pay themselves for ignoring economic inequality. The fact—and it is a fact—that it doesn't help to be white to get into Harvard replaces the much more fundamental fact that it does help to be rich and that it's virtually essential not to be poor.

Hence the irrelevance of Harvard's 2004 announcement that it wouldn't ask parents who earn less than \$40,000 a year to help pay for their children's education, an irrelevance that has only been increased by the fact that it has already (starting in 2006) raised the income ceiling to \$60,000. While this is no doubt great news to those financially pressed students who have gone to top high schools, taken college-prep courses and scored well on their SATs, it's bound to seem a little beside the point to the great majority of the poor, since what's keeping them out of elite universities is not their inability to pay the bill but their inability to qualify for admission in the first place. Even if elite schools followed what is meant to be the radical

advice of those who urge Harvard to send an even more powerful message by eliminating tuition altogether, it wouldn't be of much use to the poor, since by far the largest beneficiaries would be the rich and upper-middle-class students whose parents have paid for private schools or bought houses in expensive neighborhoods, thereby subsidizing the best public schools with their property taxes. Finally, after spending all that money (private schools in New York can now run over \$30,000 a year; the "platinum package" at a "college preparation service" like IvyWise costs another \$30,000; the houses in the really good suburbs cost millions), they would catch a break—free Harvard!

Harvard is not likely to eliminate tuition, but the major trend in American education certainly has been toward rewarding the wealthy when it comes time to pay for college. This is obvious at public universities, where the number of students coming from rich families has risen sharply. At schools like the University of Michigan and the University of Illinois at Urbana-Champaign, 40 percent of the freshmen in 2004 came from families making over \$100,000 a year. And it's even more obvious with respect to the widespread replacement of need-based with merit-based scholarships.

Researchers make this point sharply in their assessment of the effect of the Michigan Merit Award Scholarship Program, funded by tobacco lawsuit settlement funds and designed "to increase access to post-secondary education." They show that at a school like Grosse Ile High, where 64 percent of the students qualified for the merit scholarships, 94 percent of the graduating seniors were already heading to college before the program was established. At Hamtramck High School, by contrast, the college participation rate is only 30 percent and only 14 percent of the students qualified for the award. So these scholarships don't increase access to college; they mainly provide extra funds for kids who were already going. Furthermore, the kids who are already going are the ones who least need the scholarships in the first place. The median family income in Grosse Ile is \$96,226 a year. The median family income in Hamtramck is \$30,496 a year.

One way you can put it is that where need-based scholarships give money to the poor, merit-based scholarships give money to the deserving. Another way you can put it is that where need-based scholarships give money to the poor, merit-based scholarships give money to the rich.

The function of the (very few) poor people at Harvard is to reassure the (very many) rich people at Harvard that you can't just buy your way in.

While it no doubt matters to your self-esteem if you go to one of the really prestigious elite schools instead of to one of the not-so-prestigious ones, it doesn't much matter to your economic position; the graduates of Trinity are also being ushered out of upper-middle-class adolescence into

upper-middle-class adulthood. The difference between the people who go to Trinity and the ones who go to Harvard is a difference in status, not class. Status usually refers to where a person stands in a social hierarchy, but it's crucially not reducible to where a person stands economically. Rather, the inequalities of status presume a certain equality of wealth. The happy senior who's been admitted to Brown has a higher status than the bitter one who's going to Trinity only insofar as whatever economic difference there may be between them doesn't count.

Indeed, inequalities of status are never more powerful than when they're utterly disconnected from inequalities of class. If we can't imagine that we competed on a level playing field, how can we take any pleasure in winning? Because status is not reducible to money, you can think of your high status as having nothing to do with your wealth. And just as the rewards of status presume the irrelevance of material inequality, so do its defeats. When you think your real problem is not that people have more money than you but that the people who have more money condescend to you, your problem is status. And when the solution to your problem is mutual respect across the boundaries of inequality (i.e., no more condescending), you have the imaginative world of neoliberalism, the world where it's OK for a few people to be rich and a lot of people to be poor but where it's definitely not OK to make anyone feel bad about being poor, where it's important above all to remember that there's nothing wrong with being poor and where being rich doesn't make you a better person. The message that there's nothing wrong with being richer than everyone else (hey, you earned it!) as long as you don't act like being rich makes you better than everyone else is conveyed not just in novels but at every level of American life, from electoral politics—even Bernie Sanders gets defensive if you question his right to a million bucks—to reality TV.

A truly brilliant episode of the otherwise undistinguished show *Wife Swap* makes the point effectively. The wives who get swapped are rich Jodi (who has not only inherited money but married a man who makes a lot of it) and poor (or at best working-class) Lynn. Where Jodi spends most of her time working out and shopping ("me time"), with an hour or so a day for her kids (the four nannies do the heavy lifting), Lynn drives a schoolbus, chops wood, cleans her run-down house and spends every remaining moment with her kids. What do they learn when they trade lives for a couple of weeks? Rich Jodi learns that she ought to spend more time with her children: When she goes home, she'll have dinner with them a lot more often. Poor Lynn learns that she's better off where she is than on the Upper East Side:

"Money can't buy what I have."

And poor Lynn's husband, with no one around to do the housework, learns what a treasure his wife is. The only one who doesn't learn anything is Jodi's rich husband, Stephen, the villain of the piece, condemned not only by Lynn but by every critic who reviewed the show because he starts and ends the two weeks a "snob." In contrast to his rich spoiled wife, who has realized:

"I have a little bit of prejudice in me against people who come from different worlds and live different lives"

She can't quite bring herself to say "poor people." Stephen on the other hand openly "looks down," as Lynn puts it, on poor people at the beginning of the show, and, although he unconvincingly claims "It had nothing to do with finances," he is still looking down on them at the end. He doesn't like Lynn's taste in food, in clothes or in decorating the house.

So if the first point of the show is that moms should spend more time with their children, a point that every participant and every critic got (although a few left-behind feminists complained about the unfairness of requiring it to be the mom), the second point—received with unanimous approval—is that the rich shouldn't look down on the poor, that the poor deserve to be treated, as Lynn says, with "respect." At no time, apparently, did it occur to the makers of the show, the people in it or the people reviewing it, that what the show really demonstrates is how much better it is to be rich than to be poor. Or perhaps one should say not that the show ignores this point but that it is devoted to denying it, and that it succeeds so completely—this is its brilliance—that we find ourselves believing that run-down shacks in the woods are just as nice as Park Avenue apartments, especially if your husband remembers to thank you for chopping the wood when you get home from driving the bus.

The idea the show likes is that the problem with being poor is not having less money than rich people but having rich people "look down" on you. And the rich husband is bad because he does indeed look down on the poor people, whereas the rich wife—the one who has never done a day's work in her life and who begins the show by celebrating her "me time"—turns out to be good because she comes to appreciate the poor and even to realize that she can learn from them. The fault here is not in being rich but in thinking that you have better taste—more generally, in thinking that you are a better person.

American egalitarianism—or antielitism—thus takes two contradictory but surprisingly complementary forms. The first consists in thinking not that you're better because you're rich (that would be snobbery) but instead

that you got rich because you're better. That's what got you into Harvard! That's what got you all the money! In this form of egalitarianism, we pretend that everybody had an equal chance. The second kind of egalitarianism consists in thinking that it doesn't matter what colleges people go to, that it doesn't matter how much money they have—no one's better than anyone else. Here we insist that there are no advantages to being rich and that people who went to good colleges are in no way superior to people who didn't. And if the contradiction is obvious (I got to go to Harvard because I'm better than you; just because I went to Harvard, that doesn't make me better than you), the complementarity is even more obvious (there's nothing better about being rich; there's nothing worse about being poor).

As David Brooks puts it:

“In America, nobody is better, nobody is worse.”

Thus his famous comparison of the differences in American life to those in a high school cafeteria, divided into nerds, geeks, jocks, et cetera—they're not classes, they're “cliques.” Sure the jocks have a higher status, but they're not really better than the nerds, and just as the jocks shouldn't be boastful, the nerds shouldn't be resentful. The jocks shouldn't be bullies; the nerds shouldn't bring their AR-15s to school. On this model, then, class is turned into clique, and once the advantages of class are redescribed as the advantages of status, we get the recipe for what we might call right-wing egalitarianism: respect the poor. Which is also, as it turns out, a major ingredient in left-wing egalitarianism. Where the neoliberal right likes status instead of class, the neoliberal left likes culture, and the diversity version of respect the poor is respect the Other. The Other is different from you and me, but neither better nor worse. That's why multiculturalism could go from proclaiming itself a subversive politics to taking up its position as a corporate management tool—try getting your MBA without taking a course like *Managing Diversity* or *Managing a Multicultural Workforce*—in about ten minutes and without having to make the slightest adjustment. Indeed, from this perspective, respecting the Other can't help but be attractive to corporate managers, whatever their politics might be. What CEO doesn't find it easier to respect his employees' culture than to pay them a decent wage?

Diversity, like gout, is a rich people's problem. And it is also a rich people's solution, as attractive to rich people on the left as it is (or ought to be) to rich people on the right. For as long as we're committed to thinking of difference as something that should be respected, we don't have to worry about it as something that should be eliminated. As long as we think that

our best universities are fair if they are appropriately diverse, we don't have to worry that most people can't go to them and that the people who do get to go to them do so because they've had the good luck to be born into relatively wealthy families. As long, in other words, as the left continues to worry about diversity, the right won't have to worry about inequality.

The second point is that when economic inequality does nevertheless manage to rear its ugly head, the left has provided the right a useful technology for learning to love it. Ungrateful conservatives often complain about the political correctness of liberals, but the liberalism that strives to achieve equality by celebrating diversity is a liberalism that every conservative should love and that the opponents of the liberal elite have put to good use. What the commitment to diversity seeks is not a society in which there are no poor people but one in which there's nothing wrong with being poor, a society in which poor people—like blacks and Jews and Asians—are respected. And in the effort to create such a world, liberalism has ended up playing a useful if no doubt unintended role, the role of supplying the right with just the kind of left it wants. What the right wants is culture wars instead of class wars because as long as the wars are about identity instead of money, it doesn't matter who wins. And the left gives it what it wants.

Why should we care about the diversity of the Harvard faculty? Who are the victims of the lack of diversity? Suppose that neither sex has a biological math advantage. It's just that for socially stereotypical reasons men go (are pushed) into math and women (are pushed) into law. Well, here we do have some victims. We have people who are ending up in professions that, absent any social pressure, they might not have chosen. We have lawyers who would rather have been math professors and mathematicians who would rather have been lawyers. Or maybe some other choice entirely. But it's a little hard to think of this as a crucial issue in American life, one that can plausibly separate liberals from conservatives. Because, of course, the real victims in the American system of education are not people who feel social pressure to become lawyers instead of mathematicians. When, for example, a physics teacher at the preparatory school run by the University of Chicago tells the *Chicago Tribune* that the "dirty little secret in physics is that there aren't enough women in it—which is like locking up half the talent pool," he is mistaken. Way more than half the talent pool has been locked up—the huge majority that never sees the inside of a place like the Lab School—and unlocking the women of the upper middle class won't make much of a dent in that. Indeed, although bestowing on the women of the upper middle class all the privileges already held by the men of the upper middle class would make a more just society, it would only do so, obviously, for the members of the upper middle class. It would do no good at all for the people most

conspicuously absent in elite science departments, the people who come from the bottom (or even the bottom half) of American society.

When we recast the issue of faculty diversity from the standpoint of the problem of economic inequality, we can see immediately both why the issue is such a popular one at universities and why it is utterly empty as a way of distinguishing between the right and the left. Or, rather, why it marks the degree to which the supposed left has turned into something like the human resources department of the right, concerned to make sure that the women of the upper middle class have the same privileges as the men. The reason is that it involves no redistribution of wealth whatsoever. And when feminist issues do get raised with respect to money, they tend to be equally irrelevant to the goal of economic equality.

In a much-noted sexual discrimination case in 2004, for example, the banking firm Morgan Stanley settled before going to court with the lead plaintiff, its former employee Allison Schieffelin. Schieffelin had worked at Morgan Stanley for fourteen years but had been fired, she alleged, after complaining to the Equal Opportunity Employment Commission about discriminatory behavior that had led to her making less money than the men she worked with. For example, they were able to take the male clients on certain kinds of “men’s only outings” while telling her, “explicitly or implicitly,” to “go home.” When Schieffelin got \$12 million, and a number of other women received substantial settlements as part of the agreement, and the brokerage house also agreed to spend \$2 million on new “diversity programs,” it certainly was a victory for diversity. But it was no victory for equality—unless you think the fact that Schieffelin was only making a little over \$1 million per year selling bonds before she filed her suit and will now be a lot better off, while the company that discriminated against her will be a little worse off (its projected quarterly profit of something like \$1 billion will be a bit down), counts as a blow for equality. “Diversity is always enhanceable,” remarked the lead lawyer for Morgan Stanley, declining to admit that her client had been indifferent to diversity but suggesting that it was eager to do even better.

And why shouldn’t it be? The commitment to diversity doesn’t threaten its profits; the feminism that demands that the women who sell bonds be treated as well as the men who sell bonds doesn’t either. So there’s no bad faith when the chairman of Morgan Stanley can announce that the company is “proud of our commitment to diversity” and when Schieffelin can praise the settlement as a “great” one “that’s good for everybody.” The \$2 million going to the new diversity programs will be money well spent, making sure that men who make \$1.5 million a year learn how to treat women who make \$1.3 million a year in a manner that guarantees them too the opportunity

to earn \$1.5 million. Now, if you're working for Morgan Stanley, you learn not to dump her in a cab while you and your "male coworkers" take "the client to a strip club."

The point here is not that it's OK for bond salesmen to make more than bond saleswomen or to behave badly to bond saleswomen. The point instead is that nothing about this victory for diversity, this "watershed in safeguarding and promoting the rights of women," has any connection to the liberal goal of creating a more economically equal society. Or, to put it another way, insofar as winning this bias suit counts as a victory for liberalism, it's only because liberalism has itself given up the goal of creating a more economically equal society. Redistributing wealth is one thing; making sure that the women of the upper class are paid just as well as the men of the upper class is another.

The idea here is not, of course, that feminism is intrinsically bad, any more than my critique of antiracism was meant to count as a defense of racism. The idea is rather that our efforts to solve the problem of discrimination—indeed, our formulation of the problem as a problem of discrimination—is not so much a contribution to justice as it is a way of accepting injustice. Compare the mistreated bond saleswomen with the women of Walmart. The average hourly salary of a full-time Walmart employee (according to the CEO of Walmart) is about ten dollars. So if you work a forty-hour week, you make \$400 a week, almost \$21,000 a year. The women who are victims of discrimination are making a little less, the men a little more; the difference between them, according to the statistician who ran the numbers for a discrimination suit, is (for hourly workers) \$1,100 a year. So let's say the Walmart women are making about \$20,500. It would take them sixty years to make what the Wall Street woman—also the victim of discrimination—makes in one year. Of course, the Walmart men—the beneficiaries of that discrimination, they're making \$21,600—do better; it would only take them about fifty-seven years to catch up with Wall Street.

At Walmart, in other words, you've got women struggling for a fair slice of a pie so small that it won't feed them even if they get it. It's ludicrous to think of them as standing shoulder to shoulder with their sisters at Morgan Stanley and at Harvard. It's ludicrous to think of their problem as a problem about gender. The men can't live on their salaries either! Laws against discrimination by gender are what you go for when you've given up on—or turned against—the idea of a strong labor movement. Feminism is what you appeal to when you want to make it sound as if the women of Wall Street and the women of Walmart are both victims of sexism. Which is to say, when you want to disguise the fact that the women of Wall Street are not victims at all.

And just as rich people's problems can be given a certain respectability if they're redescribed as women's problems, gender can also be invoked as a way of concealing or misdescribing the reality of poor people's problems. The literature on domestic abuse, for example, regularly reminds us that this crime occurs at every level of American society, and there is a sense in which this is true, or at least about as true as the claim that there are rich people and poor people at Harvard. Rich women are sometimes abused, and poor children sometimes find their way into the Ivy League. But even though domestic violence claims victims in all races and socioeconomic classes, some women are more likely to be victims of abuse than others. In particular, women in the lowest income households have seven times the abuse rates of those in the highest income household. So the insistence that women of every class are the victims of domestic abuse masks the fact that the great majority of victims are poor and that partner abuse is above all a crime of poverty.

What's happening here is a kind of inversion of the rich-and-poor-at-Harvard effect, since the goal is not to make poor people more visible than they really are but to make them less visible, to mobilize middle- and upper-middle-class action against domestic violence by identifying it as a significant problem for the middle- and upper-middle-classes. Thus the idea that domestic violence is "confined" to lower-income families is regularly denounced as a "myth."

"In reality victims of domestic violence come from all walks of life."

But this, as we have seen, is only technically true. It's not a myth that the vast majority of domestic abuse victims are in lower-income families, and the effects of insisting that it is are often counterproductive. For example, one of the main findings of a study on the issue is that facilities to help the victims of domestic violence are disproportionately located in wealthier areas; that in fact there's an almost inverse relationship between the location of such facilities and the location of the population that needs them.

But there is, of course, a deeper difficulty as well. By disconnecting the problem of domestic violence from the question of social class, we find ourselves misunderstanding and misrepresenting the problem itself. We fail to see that the problem of domestic violence is importantly a function of the problem of economic inequality; we fail to see that in a society with less poverty there would be less domestic violence. In other words, we take a problem that significantly involves people's economic status and pretend instead that it's a problem about the relations between the sexes. The social

message of the campaign against domestic violence is thus that economic inequality is irrelevant; it becomes another way of convincing ourselves that the fundamental problems of American society have nothing to do with the injustices of capitalism and everything to do with the injustices (in this case) of sexism.

So domestic abuse is essentially a poor people's problem, like bad schooling and inadequate health care. Rich people's problems involve things like having to work very long hours and having to move every few years to keep climbing the corporate ladder. One of the featured couples in the New York Times series *Class Matters* "complains of stress and anomie," and the demands not just on the husband's time but also on the wife's. Beyond volunteering at the children's school, taking them to soccer, fund-raising for cheerleading, and so forth, Mrs. Link attends a Bible study group ("two hours on Tuesday mornings") and plays in "three or four tennis leagues." At least politics doesn't take up too much time. In Alpharetta, Georgia, the suburb the Times selected to represent the hundreds of others just like it:

"Republican candidates are shoo-ins. Few Alpharetta lawns sprouted campaign signs in November because the area's four contenders for the state legislature were all Republicans and ran unopposed."

The stress and anomie are at least partially compensated for by all the things salaries like Mr. Link's \$200,000 a year can buy: the big houses (the Links' is five-thousand square feet), the good schools, the country club, the soccer league, the piano lessons and special tutoring for the kids, the tennis for Mrs. Link, in general, the comfort.

"The good thing about Alpharetta is that it is a very comfortable neighborhood to live in. The bad thing is that we're never challenged to learn much about other economic groups. When you talk about tennis, guess what? Everybody you play against looks and acts and generally feels like you. You don't get much of a perspective."

The problem here is economic segregation: the Links live with and socialize with people who belong to their own "economic group," and the lack of nearby housing affordable for poorer people means that they have no social relations with such people. Of course, they still have some relation to poorer people; it's the poorer people who clean their houses and take care of their gardens and work at their supermarkets. But the kids don't go to schools with poor people; the parents don't play tennis with poor

people; there are no weekend barbecues with poor people. This truly is a rich people's problem; the rich people would like a broader experience of life, but they can't get it without having some poor people around.

Since economic diversity is just another name for economic inequality, it's hard to see why we would want to promote it. We ought to want to get rid of it or at least to minimize it.

Apologies for past injustice have become increasingly popular in the last few years, and there is no reason to doubt that when companies declare themselves, as Wachovia did, "deeply saddened" by the discovery of slavery in their corporate heritage, they mean it. Indeed, apologizing for something you didn't do to people to whom you didn't do it (in fact, to people to whom it wasn't done) is something of a growth industry.

The real point is that, since none of the people apologizing for slavery actually owned slaves and since none of the people to whom they're apologizing (black or white) actually were slaves, the apology functions as a general statement of disapproval. And as long as progressive politics consists of disapproving of bad things that happened a long time ago, it isn't all that hard for corporations like Wachovia and JPMorgan to be just as PC as the city councils—not only in Chicago but in Philadelphia, Los Angeles, and Berkeley, among others—with whom they're doing business. But, of course, the Berkeley and Chicago laws that require disclosure also embody a financial hope. They have been generated as part of the reparations movement, and the hope is that they will lead to a victory for diversity more along the lines of Allison Schieffelin's, one that has some money attached to it.

When History Associates found evidence of JPMorgan's involvement in the slave trade, Morgan produced \$5 million for minority scholarships. Due to the hard work of six-figure-salary men like Mr. Link, Wachovia's after-tax profits in 2004 were more than \$5 billion; it wouldn't be unreasonable to hope that this company too might come up with a little something. More ambitious hopes for corporate retributions, however—at least in the United States and for slavery—have failed, defeated above all by the argument, already suggested above, that the presumed plaintiffs (African Americans today) have no standing (since they weren't the ones enslaved) and that the targets of the suits (today's corporate officers and shareholders) cannot be held financially responsible (since they weren't the ones doing the enslaving). But, as a moment's thought will suggest, the argument for holding corporations like Wachovia (or, for that matter, the US government) financially responsible doesn't really depend on their current officers and shareholders either being or feeling guilty. In fact, the argument for making them pay is much stronger than the argument for making them apologize.

Suppose your parents owned a valuable painting and/or deposited money in a secret savings account. Suppose the painting was stolen and your parents murdered by the thief; suppose the money in the secret account was kept by the bank. Suppose further that no one tried to do anything about this for, say, half a century, so not only have your parents (the victims) been dead for a long time, so has their murderer. The bank has been using the money; the painting's been sold and is now hanging in an art museum. Just like the slaveholders, the people who did the bad things can't be punished. But their descendants can give back the money they should never have had. Apologies are irrelevant, but restitution is not. Apologies are irrelevant because people can't feel too sorry about things they didn't do; restitution is relevant because they can give back money they should never have had.

This is a distinction—between being guilty of committing the crime and being responsible for returning the property—that conservatives complaining about the assumption of collective guilt completely miss. But the museums that, finding themselves in possession of paintings stolen by the Nazis from Holocaust victims, have begun returning them to the victims' heirs, understand it. As do the Swiss banks that once refused to identify, much less release, the deposits of Holocaust victims but are now making a settlement of \$1.25 billion, “the bulk of which,” as one of the victims' lawyers claims, “will go to the heirs of the original depositors.” If you support reparations not just to the victims of the Nazis but also to their heirs, there are no coherent grounds for opposing reparations to the heirs of slavery's victims.

As Germany and other interests that profited owed reparations to Jews, America and other interests that profited owe reparations to blacks. Of course, what was stolen from the slaves and from those who lived under Jim Crow is less concrete than bank accounts or works of art; it was more like first the right, and then the opportunity, to acquire those things. Slaves couldn't own property; the victims of Jim Crow were denied the opportunity to acquire it. But although rights and opportunities are not quite as tangible as paintings, it's hard to deny the socioeconomic gap between the races derives from the social depredations of slavery. Even if we agree that African Americans today are not themselves the victims of that slavery and racism, we can't plausibly deny that the economic circumstances of African Americans today are importantly a consequence of slavery and past racism. We can't plausibly deny, that is, that the economic disadvantages under which slaves labored were passed on to their children and that the new economic disadvantages (those produced as well as maintained by Jim Crow) under which the slaves' children labored have been passed on to their children.

Indeed, even if we think—with right-wing polemicists like Dinesh

D'Souza—that the problems of African Americans today derive not from racism but from the “pathology” of their culture, where are we to believe the culture came from? Imagine the case of a little girl falling farther and farther behind in school because her mother is too poor and too overworked to provide her with the support the other kids get or because (as the school sees it) her mother doesn't care enough about the child's progress in school, misses appointments with the teachers and doesn't read to her at home. Some would blame the society; the school (like D'Souza) blames the mother. But we don't have to choose between them to realize that, whoever's fault it is, it's not the girl's. Whether we blame her failure on her poverty or on the pathology of her culture, we can't possibly blame it on her. She didn't make herself poor; she didn't create her culture. Her situation is the effect of a cause, the product of a history that ended before she was ever born.

It is this history—the history of slavery, Jim Crow and their aftermath—that produced the yawning economic gap between whites and blacks in this country, and the purpose of reparations is to undo the consequences of these events. Hence one of the standard objections to reparations—we didn't hold slaves; we're not racists—is completely irrelevant. The whole idea of reparations assumes that the girl's problem is not continuing racial discrimination—if it were, the proper response would be just to stop the discrimination—but is instead the effect of past discrimination. The point is rather to undo as far as possible the consequences of the past; reparations are a technology for trying to create a world that comes as close as possible to the world we would have had if neither slavery nor Jim Crow had happened.

What if we actually got such a technology? Imagine a Martian comes down to Earth and we show him our problem. African Americans today constitute about 13% of the American population. But they currently make up a disproportionately large segment (around 32%) of the poorest quintile of the population. And they make up a disproportionately small segment (1.7%) of the households in the top 5%. The Martian uses his powers, and we make the economic effects of slavery and Jim Crow, the disproportion in American wealth, disappear. Now, just as 13% of America's population is black, 13% of America's poor people are black, and 13% of America's rich people are black. We wave good-bye to the Martian and thank him. . . but for what? It's not as though America has been magically transformed into a more economically equal society; post-reparations America is exactly as unequal as pre-reparations America. Our Martian changed the skin color of many of America's poor and some of its rich, but he didn't change the division of wealth. So all we're thanking him for is eliminating racial inequality in the division of wealth. The economic gap between rich and poor remains, but the economic gap between black and white is gone. Is

this a good thing?

Well, the obvious objection is that leaving the economic inequalities of American society intact while rearranging the skin color of those who suffer from and those who benefit from those inequalities doesn't exactly count as progress. And certainly not if what we are seeking is economic equality. But the problem the movement sets out to solve has nothing to do with economic inequality. Reparations are compensatory; they give you back what you lost. The primary concern, then, is neither with equality nor even with the mere fact of poverty but with the poverty produced by slavery. Reparations would return to the descendants of the slaves at least some of what is rightfully theirs. The injustice they set out to correct is that people had their property taken from them; the justice they hope to provide is giving it back to them.

“Lamentably there will always be poverty.”

But because the poverty that survives will not be the consequence of some past injustice, it will not in itself be unjust.

This is a familiar position, if not necessarily a familiar position of the left. In fact, insofar as it relies on the idea that in a just society we owe the girl the property to which she has a right, the property that would be hers if it hadn't been stolen from her ancestors, it's a conservative position, one with no connection to the goals of alleviating either poverty or inequality. When we're returning stolen property, we don't care whether the stolen painting belonged to a rich person or a poor person; your claim to the painting is based neither on your poverty nor on your wealth. No one today is more committed to property rights than the reparations movement, and conservatives who share that commitment ought to be its most outspoken defenders. They could even appeal to remarks by the most influential conservative philosopher of the last half century, Robert Nozick, who suggested that the “descendants” of “victims” of “the most serious injustice” would be “owed compensation” by “those who benefited from the injustice.”

The principle here is that injustices ought to be rectified, and the fact that they happened in the past does not alter that principle. It's a conservative principle because it relies on the appeal to the restoration of stolen property, whether it's the labor of slaves or the possessions of murdered Jews. And its application need not be so narrow. It isn't just African Americans and Jews who are the descendants of injustice. What about Native Americans? What about Appalachian coal miners and poor white sharecroppers? Once you start looking for past injustice, you don't have a hard time finding it. And, by the same token, you may well find it where you don't really feel

you need it. Critics of reparations for slavery sometimes complain that the rich descendants of former slaves would benefit from reparations as much as the poor ones would. But rich people are just as entitled to the restoration of their property as poor people are; anyone prepared to give the equivalent of forty acres and a mule to the homeless man across the street ought to be just as happy to give it to Tiger Woods. Nevertheless, because the Tiger Woodses of this world are statistically a very small group, it makes sense for those who are interested in a more equal distribution of wealth to support reparations. A lot more of the money would go to poor people than to rich people. But it's more important to recognize that there is nothing egalitarian about the principle of reparations and to see that the injustice done to little girls has nothing to do with them being descended from the victims of past injustice. Indeed, it has nothing to do with the past at all.

Suppose, for example, that I am the little girl's white friend. My father wasn't a slave but was instead a slaveholder. Suppose that, when slavery was abolished, the Radical Republican plans to divide the plantations among the slaves who had worked on them had been put into effect and my slaveholding father lost not only all his slaves but all his land too. Suppose, left destitute, he turned to drink and abandoned my pregnant mother, who was left to raise me without the ability either to support me (since she'd never worked a day in her life) or to care for me (since slaves had done the child rearing in her family). Suppose now, at nine years old, I'm not doing so well in school. My work habits are bad; my mother's too depressed to read with me; my reading proficiency scores are plummeting. Do I deserve reparations?

Obviously not. What would they be reparations for? My ancestors weren't kidnapped and enslaved; just the opposite—they were the ones who did the kidnapping and enslaving. The advocates of reparations describe what they would call the little girl's history (i.e., the history of her ancestors) as a mixture of suffering and nobility; my equivalent is a mixture of exploitation and rapacity. So with respect to the historical claims of the reparations movement, I'm completely different from her. But I am no more responsible for my poverty than she is. I don't deserve compensation, but does that mean I deserve my poverty?

There are two ways in which we can understand our responsibility to children like her. One is to say that in a just society we owe her the property she ought to have had. The other is to say that in a just society we owe her an opportunity as equal as we can make it to the opportunities of all the other children. And if equality of opportunity is our idea of justice, the history of how you came to be born poor may be of interest to you and your loved ones and the other members of your family, but it has nothing to do with the relevant fact about you: the fact that you are not yourself

responsible for your poverty. And our responsibility to you has nothing to do with that history either. Indeed, the idea of equal opportunity, if it were taken seriously, would make all the histories of victimization and the subsequent demands for compensation irrelevant, just as—again, if it were taken seriously—it would make the histories of accumulation irrelevant. Rich children are no more responsible for their advantages than poor ones are for their disadvantages. We've already had occasion to question the current obsession with history, and here's another one: it's powerfully tied to the idea of people getting what they deserve when what they deserve is identified with inherited property rather than with equal opportunity.

But if we do take seriously not just the commitment to private property that reparations relies on but also our commitment to equality of opportunity, a commitment that virtually every American is eager to endorse, things change. The whole point of the commitment to equal opportunity is to make sure not only that people have a right to their property but also that they have a fair chance to earn that property. Only if everybody has a chance to get rich can the people who don't get rich, the people who stay poor, be said to deserve their poverty. And only if everybody has a chance to get rich can the people who do succeed be said to deserve their wealth.

It's often said—both in defense and in criticism—that equality of opportunity is the weakest form of egalitarianism. The strongest form would be equality of outcome. And it's obviously true that a world in which everyone was required to finish the race at the same time would be very different from a world in which everyone was required to start it at the same time. To justify equality of outcome, we have to think that there should be no reward for hard work or ability. Whereas in fact what most of us think is that there should be some such reward. Indeed, we defend equality of opportunity precisely because we believe that if people don't begin with equal opportunities to succeed, hard work and ability won't be rewarded. If, for example, Felicity Huffman's wealth enables her daughter to be tracked from birth into an elite college while your daughter is tracked from birth into a community college or no college at all, Felicity's wealth—and her education, and her connections, and all the other things that we generally use to measure socioeconomic status—is doing at least part of the job that my daughter's hard work and ability ought to be doing. So our commitment to equal opportunity requires us to refuse equality of economic outcome (because that doesn't reward hard work and ability), and it also requires us to refuse the generational transfer of economic inequality—for the very same reason (it doesn't reward hard work and ability).

When the point is put that way, we can also see that the commitment to equality of opportunity is not really a weaker form of the commitment

to equality of outcome; rather, it's a commitment to something altogether different, to the importance of hard work and ability. And we can also see that, genuinely implemented, it's not so weak. For example, a society that really was as committed to equal opportunity as we say we are would not allow the quality of local schools to be dependent on local real estate taxes. If the schools are better where the rich people live, the unearned advantage their children have starts at pre-K. And, of course, it's precisely to provide that unearned advantage that people like the constantly relocating Links make the quality of the schools the "number one" criterion whenever they move.

There's nothing surprising or irrational or immoral about this. Almost any parent, given unequal schools and given the ability (i.e., the money) to choose between them, will choose the good one for his or her children. In fact the immorality, if there is any, seems to be on the other side. How, if you have the opportunity to send your children to the good school, can you justify sending them to the bad one? This is the kind of dilemma that public figures, especially in major cities, frequently confront. But to think of this as an ethical decision for individual parents is to miss the point of the problem, which, if all school districts were funded equally (and if there were no private schools), would begin to look very different. If no school were better or worse than any other, it wouldn't matter which one your children went to. So if we really are committed to equality of opportunity, the relevant choice we make as parents is not between schools but between ways of funding them. If we are committed to equality of opportunity, we should be funding all school districts equally and abolishing private schools, thus removing the temptation for rich parents to buy their children an unfair advantage. But we don't do this, and we can't even imagine it on a ballot.

There are, of course, even more blatant violations of the commitment to equal opportunity. Polls show the majority of Americans, for instance, think there should be no inheritance tax, that is, they think that hard work and ability should make no difference whatsoever when it comes to distributing the billions of dollars that change hands from one generation to another. And another 20 percent think that only estates above \$3.5 million should be taxed. How do we explain this? How do we explain the simultaneous commitment to the importance of hard work and ability (making your money) and to the irrelevance of hard work and ability (inheriting it)? People who are opposed to the inheritance tax are not being hypocritical, choosing their pocketbooks over their principles. Almost none of the 50 percent of the population that opposes the inheritance tax no matter how big the estate is will ever see a dime's worth of taxable inheritance. On the contrary, the vast majority of people who oppose inheritance taxes are taking positions of pure principle,

advocating that people with advantages they themselves never had (like going to the best schools and to elite universities) not only reap the rewards of those advantages but reap them again when their parents die. These people are acting against their own economic interests and on behalf of what seems to them fair: the principle that people should be allowed to do what they like with their money, including passing it on untaxed to their children.

But that notion of fairness completely contradicts the principle of equal opportunity. When it comes to choosing between a world in which people can do whatever they want with their money and a world of equal opportunity, when it comes to choosing between a world in which hard work and ability matter less than inheritance and a world in which they matter more, we seem to be choosing inheritance. So maybe we have to conclude that we Americans just aren't all that committed to equal opportunity after all. But this is a conclusion that's hard to accept. For what is there to justify our respect for other people's property (and our laws protecting that property) if we don't believe that hard work and ability played a central role in earning it?

“Equality of opportunity is a demanding standard and an important one, since people must believe that our system is generally fair for it to remain vital. If this belief no longer exists, if people no longer perceive the rules of the game to be fair, the political repercussions could be significant.”

If you want a more just society, don't accept that you're a competitor in a rat race.

Jeremy Corbyn's announcement that a Labour government would replace social mobility with social justice as a policy benchmark raised more than a few eyebrows. It goes against the received wisdom and bipartisan consensus that social mobility is a good thing. But Corbyn is right to insist that singling out the lucky few leaves the structures of inequality intact, and he is right to place the emphasis on further-reaching motions, such as revamping the education system, to achieve social justice. However, the real problem with social mobility is not that it doesn't go far enough in making society more just for everyone. It has, in fact, the very opposite effect—deepening and perpetuating social injustice.

Public discourse and media narratives are always reminding us that society is dynamic. No one stands still. Everyone is climbing up or down ladders, going from rags to riches and vice versa. Social mobility serves as both a promise and a threat: if we play our cards right we will accrue status and wealth, but we also stand to lose everything if we don't. Playing our cards

right means committing time and money to education, training, and social circles in that hope that they might help us secure better jobs. It means investing in property and financial products that might generate future capital or taking out pension and insurance policies for our long-term security. The idea of social mobility casts each of us as one among a multitude of individuals jockeying for positions that give us a better chance of seizing scarce material resources before others beat us to them.

Seen in this light, social mobility is nothing other than a capitalist version of the age-old strategy of divide and rule: consolidating power and reproducing exploitation by having the powerless duke it out among each other, instead of challenging the institutions that dominate them all. Most of us have to work for a living: we need full-time jobs to make ends meet and support our families. In the work that we spend most of our waking hours doing, others pocket part of the value that we produce. In this sense, we are both dominated and exploited by our work. This predicament intensifies the more devalued and precarious our work is. But the idea of social mobility encourages us to forget about this exploitation and focus, instead, on what each of us has in terms of property and human capital.

Notice the difference. However diverse our jobs and different our salaries, we have common cause to rally around should our exploitation as workers prove unbearable. No such commonality inheres in our possessions, which cast us as competitors. Downplaying the conditions of our work in favour of our pursuit of ownership means substituting what unites us with what divides us.

With only so many gainful employment opportunities, valuable property, public resources and revenue-generating securities to go around—per market forces of supply and demand—their value is higher, the scarcer they are (or in the case of securities, their underlying assets). Credentials have less pull in the job market once too many people possess them, neighborhoods become less lucrative when anyone can afford to move into them, safety nets grow threadbare when more people fall back on them. And so we have a powerful structural incentive to limit popular access to the things we own.

Our possessions are also stepping-stones to positions whose advantages rely on others being disadvantaged. For example, they help some of us charge the rents that others have to pay. In a competitive environment where risks abound and rewards are hard to come by, we see these possessions as necessary (and sometimes as necessary evils) for getting ahead in life rather than falling behind.

The mad rush for relative advantages compels us to work harder, invest more, and take on greater debt—more than would be required to meet our present needs. This holds true even when we have little notion of the future

value of our investments. The all-too-familiar reality of bubbles bursting and property values collapsing alert us to the fact that we invest for uncertain and sporadic returns. And still, we keep investing and taking on debt for the sake of ownership. We do so out of fear that we will be less protected or have fewer chances of advancing if we don't. We convince ourselves that if we have more stuff, skills, or connections than our peers, we will fare better than they will. We further imagine that in dire straights, those with fewer possessions will probably fall first, cushioning us if we follow them.

Social mobility limits our perspective, in this way, to our peers and their fortunes or misfortunes. So transfixed are we by the image of everyone accruing or losing wealth and status, that we fail to question the social, economic, and political forces that determine their value in the first place. The living costs, salary and currency fluctuations affected by property market upheavals, financial crises, and geopolitical power struggles reach us in obscure and roundabout ways. But our individual efforts and their outcomes appear to have more direct consequences.

The connections we draw between our investments (or lack thereof) and their outcomes convince us that if we're poor or struggling in other ways, we have no one to blame but ourselves. We must not have tried hard enough or invested with enough savvy. And conversely, we take pride in our accomplishments as if they were generated by our efforts and investments alone. Despite our lack of control over the circumstances of our jobs and the value of our possessions, social mobility encourages us to think of ourselves as self-determining individuals.

This perspective undermines possibilities of organizing broad and enduring movements for social change. The alliances we are more likely to forge are contingent and opportunistic: we unite with others who possess the same things as we do, in order to limit access to them. We fear that such access might reduce their value and negate the efforts we'd made to attain them. Exclusionary zoning laws that keep lower-income people—disproportionately people of colour—out of more affluent neighbourhoods is one example. The same is true of entry requirements for education, of credit scoring, of insurance-policy criteria, and of policies, like benefit caps, that withhold our public resources from people whose contributions might fall short of what they get out of them.

Social mobility, in sum, serves as an incentive to work harder and expend more, as a distraction from domination and exploitation, and as a barrier to forming durable political movements for social change. Maintaining a certain amount of social mobility is therefore a useful tool in the hands of the agents of accumulation. A great deal of capital is generated by our incessant efforts to advance socially and hedge against decline. Those who pocket this

capital have nothing to worry about so long as we cast a wary eye on our peers and competitors alone. By dint of social mobility, capital can continue being amassed globally and distantly and at our expense, leaving us vying for relative advantages in the throes of our common domination.

Mainstream political thought in America is not the slightest bit anti-Semitic, and you will definitely not find anybody on the Sunday morning talk shows calling for a few “real men, White men” to get out on the streets and start lynching race-mixers. What you will find them worrying about, however, is the “clash of civilizations.” The basic idea—the idea that difference in identity now matters more than difference in belief—is pretty much the same in the center as it is on the margins. The fall of the Soviet Union produced a world in which the ideological conflict between socialism and liberal capitalism (the Cold War) has been replaced by conflict between civilizations. The fundamental source of conflict in this new world is not primarily ideological but is instead cultural. In ideological conflicts, the key question is ‘Which side are you on?’ and people can and do choose sides and change sides. You can, for example, be born into a communist society and become convinced of the virtues of capitalism. But cultural conflict is very different. In conflicts between civilizations the question is ‘What are you,’ not which side are you on, and what you are is a given that can’t be changed. And even if it does somehow get altered, what’s being changed is not your mind but something more fundamental, your self.

Think, for example, of the difference between being convinced (by someone else’s argument) and being assimilated (into someone else’s culture). None of the pathos that attaches to the loss of a culture attaches to the change in beliefs that’s involved in losing an argument. How could it? Since the phenomenon of changing one’s beliefs irreducibly involves the sense that the new beliefs are better than the old ones—after all, the new beliefs are ones that now seem to you right and the old ones seem wrong; that’s why you changed them—it makes no logical and not much emotional sense to mourn the passing of the old beliefs. No one sits around wishing that we still thought human sacrifice was an effective way of appeasing the gods or that bad air caused malaria. But culture and cultural identity seem to us very different. Because we don’t think of cultures as right or wrong, we don’t necessarily experience the passage from one to another as progress. Another way to put this would be to say that people who hold different beliefs disagree; people who belong to different cultures differ without disagreeing.

Indeed, just as the very idea of culture takes us away from the question of ideology (what we believe), so does the idea of cultural diversity. The alternative to diversity is sameness. So where beliefs are relevantly divided not into yours or mine but into right or wrong, the relevant axis of evaluation

for cultures is not right or wrong but same or different. We can be plausibly urged to appreciate and even celebrate difference, but no one thinks we should appreciate mistakenness. Differences in belief, like differences in wealth, are not differences we can love. But we can love the differences between cultures because cultures (and the identities they give us) make no claim to being either better or worse. They're just ours or not ours.

“We don't have to believe that our values are absolutely better than the next fellow's or the next country's, but we have no doubt that they are better for us and that they are worth living and dying for.”

Here multiculturalism and its opponents converge. The identity they want us to love is national; the ones multiculturalists want us to love are racial and ethnic. The basic idea, however, is the same: we love our own not because it's better but because it's “better for us,” because it's ours. This results in arguments for preserving those “qualities” that make America “different.”

“America cannot become the world and still be America. Other peoples cannot become American and still be themselves.”

What they want for Americans is what the titles of journals like *Cultural Survival* suggest the Aymara Indians want for themselves: to preserve their (and our) identities.

So what is it we want to preserve when we want to preserve our identities? Racists have an easy answer to this question: they want to defend the purity of their “genetic heritage” against “mongrelization.” But most of the people defending identity today are not racists. The values they want to preserve are the values they think of as “better for them.” After all, that's what it means to want to preserve your identity, to want to preserve the “distinctive” character of your culture. People who are committed to an ideology instead of an identity don't want to preserve difference; communists, for example, thought the abolition of private property was right and they wanted everyone to give it up. But the *Mati Ke* don't think that their language is either right or wrong, and they don't care if anyone else speaks it; they just want to be able to speak it themselves. Furthermore, they also don't care if American brothers and sisters do or don't talk to each other after puberty. They don't think it's wrong for all brothers and sisters to talk to each other after puberty; they just think it's wrong for them, for the members of *Mati Ke* culture.

But here's where the problem comes in. We don't ordinarily accept the idea that identifying some practice as a part of your culture counts in itself as a defense of your right to continue doing it, much less as support for the idea that you should be able to make your children keep doing it. Of course, not being allowed to talk to your sibling after puberty may not seem really awful to us; it's just a little unfair. But what if we tease it out a little? Because you can't talk to your brother, you can't go to the school he goes to or you can't attend the public meetings where he and the other men debate important issues. Or what if we replace not talking to your sister with some of the social arrangements of different cultures, like not allowing the black people and the white people to sit next to each other on the bus or in the movie theater or in school?

What if American segregationists had described themselves as participating in a culture of segregation and had said (which, sometimes, they did) that they didn't, of course, claim that segregation was good for everyone but they did claim it was good for them and that their culture had a right to survive? We wouldn't for a second accept that argument. We don't think that just re-describing people who believe in segregation as people whose culture is segregationist grants their beliefs a right to recognition and survival. Suppose someone says:

“Look, I'm not claiming that segregation [or clitoridectomy or infanticide or, if you feel strongly about it, not talking to your brother] is absolutely better than other social practices; I'm just saying it's better for us, raised as we have been, with our traditions, et cetera.”

We don't think that statement counts as a defense of the practice in question. So even if we accept the idea that the big ideological differences don't matter anymore, and that what matters instead is identity, we don't accept the idea that all parts of a cultural identity are equally worthy of respect.

The basic idea of the commitment to linguistic diversity is that linguistic diversity is a form of—really the primary form of—cultural diversity and that we should protect cultural diversity because to do so is to respect the cultural identity of others by treating them as we would wish to be treated ourselves.

“If we're concerned with identity then what is more legitimate than one's aspiration that it never be lost?”

Actually, however, the things that we don't want to lose are the things that have nothing to do with our identity. We don't, for example, want

to lose great works of art—not because they're part of our culture but because they're great. If we just thought that Shakespeare was good for us, we would naturally want his plays around as long as we were around, but we wouldn't care if subsequent generations preferred, say, David Mamet. It's only because, rightly or wrongly, we think Shakespeare is good for everyone—regardless of identity—that we want his plays to survive. And we think works of art are different from languages precisely because, unlike languages, they can be better or worse.

If we really thought that every work of art (like every language) was just as good as every other work of art, it would indeed be hard to defend the idea that the works of art we happened to be familiar with should survive; there's no loss worth mourning if the things we love die with us and are just replaced by the things our descendants love instead. And this is even more obviously true of other things we may value. If we live in liberal democracies and if we value the institutions that make those democracies possible, we can't help but wish for those institutions to survive. But we do so, of course, because we believe that those institutions are superior to others, which is to say, we believe, for example, that liberal capitalism is superior to socialism. Our desire, then (if it is our desire), is for liberal capitalism to survive because it seems to us good. It's a desire that can be understood only inasmuch as its object is not a culture, not an identity. This is why I argue that if the important thing about my culture is that it's mine, I can't really care if it survives. And this is also why we should get rid of the idea that the clash of cultures and the preservation of identities is what matters.

For one thing, the clash of cultures not only looks but is disingenuous; when we clash with others it's usually because we think we're right, not because we're defending our identity. When the International Monetary Fund tries to get Bolivia to privatize water rights, it's not an identity it's trying to impose, it's capitalism; the Bolivians are welcome to keep on speaking Aymara. And for another thing, insofar as culture really does work the way language does, identity politics are absolutely inconsequential. The advantage of culture over ideology is that we do not need to find reasons to defend our culture. The fact that it's ours is all that matters; the disadvantage is that once we describe the things we believe as expressions of our identity, we can't logically care whether anyone else does or will believe them. Once we turn the clash of ideologies into the clash of civilizations, we can no longer care who will win; we have no reason to want any particular civilization, including our own, to survive.

Theorists who defend cultural identity think of themselves as defending the right of cultures to survive. But if there really are such things as cultural

identities, no one, not even the theorists who defend them, can possibly—or maybe I should say, coherently—care whether they survive. I say coherently instead of possibly because it's obvious that people do feel quite strongly about the survival (and even the revival) of cultures even though, according to me, they shouldn't. Indeed, the end of the Cold War and what's now described as globalization—the penetration of capitalism into every part of the world—seem to be going hand in hand with an increasingly passionate commitment to culture. Greater indifference to inequality and ideology is happily accompanied by greater attachment to identity. In fact, this is what the commitment to diversity is all about, since a world of people who are different from us looks a lot more appealing than a world of people who are poorer than us or a world of people who think our fundamental beliefs are deeply mistaken. We might even say that this insistence on organizing the world around who we are rather than around what we have or what we believe is one of the defining features of globalization, of a post-Cold War world in which people who used to think of themselves as having an ideology—either capitalist or socialist—now think of themselves above all as having an identity: national, ethnic, cultural, whatever.

It's pretty obvious, then, that when it comes to globalization, there's a big difference between dealing with indigenous peoples who want to protect their culture and socialists who want to nationalize your industry. Nevertheless, the protection of cultures often gets represented as if it were somehow a kind of resistance to globalization. Not, of course, an economic resistance. It is a revolt against the forces of cultural uniformity, and at conferences like "Identities versus Globalization," the basic concern is with the protection of local cultures from homogenization.

Neither tribalism nor nationalism is any obstacle to globalization; indeed, they are both fully compatible with modernization and may even be understood as two of its most successful products. New forms of "ancient" identities are being invented every day. And the function of all of them is to provide people with ways of thinking about themselves that have as little as possible to do with either their material circumstances or their political ideals.

Ethnic, cultural, and linguistic resistance is not tired old political or economic resistance. No need to worry about socialism here or the redistribution of wealth. It's the culture, stupid—when the problem is inequality, the solution is identity. Culture thus does the same kind of work internationally that it does nationally, both economically and ideologically. Economically, it re-describes the material difference between people (I have more, you have less, too bad for you) as cultural difference (I have mine, you have yours, it's all good). It allows us—actually, encourages us—to think that as long

as people get to keep on speaking their own languages—and enjoying their own music, not to mention their characteristic foods—there’s no reason for alarm. But to see how implausible this is, we have only to imagine ourselves for a second on the losing side of globalization.

Imagine the United States fifty years from now—we’re so poor that China and India are outsourcing production to the desperate, and hence very hardworking, masses of Michigan and Ohio. We (the desperate masses) have no unions so we work cheap; we have no health plans so we work sick; we have no retirement plans so we work as long as we possibly can, which, see “no health plans” above, isn’t all that long—but that’s OK because we don’t live as long as we used to (or as the Indians now do). Are we supposed to feel better because no one’s making us speak Mandarin or Hindi? Are we supposed to feel good because, sure we’re broke and sick, but at least we have our culture? Some tell us to fight the “global identity crisis” by remaining American. But when the crisis part actually involves putting us out of work, it’s hard to see how pride in our identity will do us any good. And it’s even harder to imagine that continuing—against all odds!—to speak English, we will somehow be resisting globalization.

Of course, the previous paragraph describes a situation that hasn’t yet and may never come about. Even Thomas Friedman, sounding the alarm about America’s potential loss of “power and influence” if we don’t learn to compete better in the global marketplace, doesn’t think we’re on the verge of losing our edge. But it’s not as if there aren’t costs to winning too, and it’s not as if identity—thinking of yourself as an American rather than, say, as a worker—doesn’t function to obscure them as well. Many American businesses cannot succeed, Friedman argues, without exploiting the “advantages” of manufacturing in China. The main advantage, of course, is that the average wage for a factory worker in China is \$1,800 a year. By contrast, the average wage of an American factory worker is about \$54,000 a year, which is not only 3,000 percent higher than the wage in China but is also 18 percent higher than the average US salary. In America, factory jobs are “good jobs.” And they’re also hard to get—factory workers make up only 11 percent of the American workforce.

Why? Well, one reason is that in order for America to compete in the global market, American companies need to do more of their manufacturing in China. So even when we’re winning, some of us (the ones who no longer work in factories) are losing. Thus, for example, someone like George Will could in 2006 accurately describe the American economy as “in the fifth year of a humming expansion,” while it’s also true that the poverty rate had risen during every year of that expansion. 12.7 percent for 2004—up to 37 million from the 35.9 million it was the year before. And of course we all

know now such expansion was positioned upon a bubble that would burst a few years later.

And it's not just poor people who have lagged:

“The average hourly wage of rank-and-file workers—a group that makes up 80 percent of the workforce—is slightly lower than it was four years ago.”

So instead of saying that some of us are losing, I should have said that most of us are losing. Still, as long we think of ourselves as Americans (beating the French, even beating the Chinese), we can be proud. Not only are we speaking English and hanging on to our traditional cultural practices, our economy is kicking butt. But, of course, the minute we stop thinking of ourselves as Americans—the minute, in other words, we start thinking that the ‘we’ means poor and middle-class people, not Americans, and that the relevant ‘they’ is rich people, not the French or Chinese—things look a little different. What the resisters think of as a struggle to preserve cultural identities and what the advocates think of as a competition between national identities has nothing to do with identities at all.

But we can get a sense of how attractive the idea of cultural equality has become and of how successfully it can function to obscure more consequential forms of inequality by recognizing that even in situations where the disappearance of the language would seem to be an unequivocally good thing, some people refuse to let go. Suppose the language you speak is not English but ASL, American Sign Language. You speak it because you're deaf. Like English and Hindi, ASL is neither better nor worse than any other language—you can use it to say everything you need to say—but, like *Mati Ke*, it may have a problematic future. You, for instance, if you are young enough, might be a good candidate for a cochlear implant and no longer need to speak ASL. Or you and everybody else might have access to a health-care system that radically reduces the chances of your children being born deaf. Indeed, it's precisely insofar as events like this seem to be taking place that some have become increasingly concerned about the possibility of sign's disappearance.

“Early implementation of mainstreamed education, free universal access to hearing aids for children under age 18 years, and a federally funded universal health care scheme that subsidizes most of the cost of an initial cochlear implant are producing a decline in the signing deaf community that will eventually lead to a loss of language and culture. It goes without saying, that this scenario gives me no joy.”

So even though he himself acknowledges that he may be sounding the alarm prematurely—after all, as he points out, there are still “millions of severely and profoundly deaf children and adults in the underdeveloped and developing world,” and, besides, “new and totally unexpected causes for deafness could appear tomorrow”—he can’t help but feel “deep sorrow” at what he regards as the eventual and “inevitable” “loss of language and culture.” The hope for ASL is that inadequate health care and some really catastrophic new diseases could keep it alive for a while longer; the fear is that the cochlear implant and genetic testing will eventually kill it. But why should anyone be made sorrowful if American and Australian and all the other sign languages disappear?

Well, obviously, the disappearance of sign languages would be a bad thing if the people who used them—deaf people—were left without a language. We don’t want to lose something useful. But of course the scenario he is predicting is not one in which deaf people are left high and dry while their language dies out; it’s one in which the language dies out because there are no more deaf people. So the real cause for sorrow is not the disappearance of a useful language; it’s the disappearance of the people who used the language. And at least some people do claim that if deaf people were to disappear, they would be sad.

“Deaf people have a language and they’ve got a culture. So what’s wrong with being deaf?”

If the commitment to diversity can make us think we’re supposed to be sad when the *Mati Ke* disappear, why shouldn’t we be sad if deaf people disappear too?

This question represents a certain triumph for what is called the “cultural model”—as opposed to the “medical” or “pathological model”—of deafness, and for the effort to get disability in general recognized as “a marker of identity” rather than as a “problem.” People who accept the medical model are inclined to think of the deaf as a group whose hearing loss interferes with the normal reception of speech. But people who go for the cultural model are inclined instead to think of them as a group of persons who share a common language (ASL) and a common culture. From the standpoint of the medical model, the invention of the cochlear implant gets celebrated as a potential cure for deafness; from the standpoint of the cultural model, it gets deplored as at worst a kind of cultural genocide and at best a kind of surgical assimilation. A few may be reminded of the satirical novel called *Black No More*, featuring a procedure—the black-no-more procedure—that solved the problem of antiblack prejudice by turning black people white. To

those who think of deafness as essentially a culture, the cochlear implant and genetic testing look like versions of the deaf-no-more procedure, more a symptom of the problem than a solution to it.

In 2004, the poverty rate overall was 12.7 percent. The rate for blacks was 24.7 percent, and for Hispanics, 21.9 percent; whites were at 8.6 percent and Asians at 9.8 percent. Presented in this form—racialized—these numbers are profoundly disturbing, and they are even more profoundly reassuring. They're disturbing because they remind us of the degree to which both the legacy of racism and racism itself are a problem. They're reassuring for what amounts to the same reason. They suggest that people are poor in America today mainly because they are the victims of discrimination, and they thus imply that if we could end discrimination, we could end poverty. But if you look at the statistics a slightly different way, you get a very different story. Of the 37 million poor people in 2004, almost 17 million (45.6 percent of the total) were white. Many of these people are not the victims of discrimination either past or present. And the fact that they aren't is the really disturbing part. We like to think of the American system as essentially fair but marred—as both the right and the left will agree—by racism. But in the case of white people's poverty, the reassurance of the right—that discrimination is a thing of the past—won't help them. And the promises of the left—that they're finally going to wipe discrimination out—won't help them either. Discrimination is not their problem. Diversity is not their solution.

The right tends to regard economic inequality less as a political issue than as something like a fact of nature—maybe temporary (when free markets triumph, it will go away), maybe permanent (if people make the wrong choices, they have to pay for them), and, either way, not that big a deal (today even poor people have TVs and smartphones; no one had those a hundred years ago). The left, as we have already had occasion to remark, insists on giving poor people identities; it turns them into black people or Latinx or women and treats them as victims of discrimination as if in a world without discrimination, inequality would disappear. The debate we might have about inequality thus becomes a debate instead about prejudice and respect, and—since no one's defending prejudice and no one's attacking respect—we end up having no debate at all. And when people do want to have the debate—when they want to talk about inequality instead of identity—they are criticized by the right as too ideological and by the left as insufficiently sensitive to the importance of race, sex, gender, et cetera—that is, as too ideological.

Hence another version of the trouble with diversity: it obscures political difference just as well as it does economic difference. It makes it hard not

only to solve the problem of inequality but even to argue about whether it is a problem and about what its solution should be. This obfuscation is what happens when political disagreement gets turned into “diversity of thought”: all thoughts are of equal value; none is better or worse than any other. In this way, political belief and affiliation are reconceived along the cultural model, that is, genuine disagreements are turned into mere differences in perspective. Indeed, cultural difference has made ideological conflict look like a thing of the Cold War. Ideology’s claims to truth have come to seem irrelevant. This process has been applied not only to politics but even more vividly to the area in which the importance of belief should be the most obvious, religion, and it is in this area that the cultural model is exposed at its most vacuous.

It’s one thing, for example, to promote the virtues of religious tolerance. But it’s a very different thing to celebrate religious diversity as if religion too could be transformed into an identity category along the lines of race and culture. Only someone who doesn’t believe in any religion can take the view that all religions may plausibly be considered equal and that their differences can be appreciated. From the standpoint of the religions themselves, those differences are a problem, as the claims of both Christianity and Islam to what Pope Benedict XVI called “universality” make clear. Defending the church against the charge that it is essentially a European institution whose missionary efforts in Africa and elsewhere are attempts to impose European culture, the pope distinguished between the “false claim to universality on the part of what is simply European” and the core “connection” between salvation and the truth that is “actually universal.” Jesus’s claim to be “the way, and the truth, and the life,” according to the pope, “expresses the basic claim of the Christian faith.” Christianity is universal because it is a religion for all peoples (not only Europeans), and it is a religion for all peoples because it tells the “truth.”

The big selling point of cultural identity—the selling point, really, of the very idea of identity—is that cultures are essentially equal. That’s what makes them different from classes, since classes are essentially unequal—they involve more or less money.

If Christianity tells the truth, all other religions must be false. If you believe that Jesus is the way and I don’t believe that Jesus is the way, one of us must be wrong. If the Christian view of human history is true, it is true for everybody, whether they know it or not. As is the Muslim view, the Marxist view, et cetera. Of course, insofar as they contradict each other, they can’t all be true; that’s what it means to say that there are fundamental disagreements between Christianity and Islam, and even between Catholicism and Protestantism. This is what the pope means

when he acknowledges the justice of a Protestant critique of ecumenism which argues that “although they claim to be based on the same Lord, Catholicism and Protestantism are two different ways of understanding and living Christianity,” and goes on to insist that “these different ways are not complementary but alternative.”

They are alternative instead of complementary because they involve doctrinal differences, differences of belief. Contradictory beliefs cannot be complementary; that’s what it means to call them contradictory. This view of religion understandably makes people of different religions (or no religion) nervous. When Pope Benedict insists on the “connection between salvation and truth” and when he maintains that the relevant truth is that “there is one God Christ Jesus,” he isn’t leaving much room for those of us who aren’t Christian. And he doesn’t mean to. In his old Cardinal Ratzinger days, Pope Benedict was known as “God’s rottweiler” because of his enthusiastic (and effective) defense of dogma. But his defense of dogma can’t be reduced to a mere matter of temperament. If you think that Christianity is a “universal” religion because “it is based on knowledge,” you have to think that the alternatives to Christianity are based on lack of knowledge. If you think that Christianity is true, you have to think that everything else isn’t. That’s why the problem with other Gods is not that they are foreign or malign or weaker but that they are “false.”

From the standpoint of the pope, and of all those who wish to bring religion back into the public square, it’s what people believe rather than how they feel or who they are that matters. Our beliefs are already essentially public in ways that our feelings are not, and they are intrinsically “normative,” that is, they have a relation to truth and thus inject us into the public sphere in ways that our identities cannot. If you think abortion is wrong, you think it’s wrong not just for you, or for Americans or even for Christians, but for everyone. The conflict between people who believe that abortion is justifiable and people who believe that it is murder is significant precisely because it’s not a conflict of identities, but of convictions. Clarence Thomas’s race was no doubt essential in getting him nominated to the Supreme Court, but it’s his beliefs, not his identity, that have produced his decisions. Indeed, his performance on the bench has been a constant and useful reminder that there is no connection between who you are and what you think; that there is no set of beliefs that goes with being black or white and that as a black (or white or whatever) man, you are not required to have some specific set of beliefs.

But, of course, this is completely untrue of religion. There are lots of things that, as a Christian or Muslim or Jew, you are required to believe, and if you don’t believe them you can’t count as a Christian, Muslim, or

Jew. And since politics to some degree involves your beliefs—you run for office in part by expressing and arguing for them; you govern more or less according to them—it can make no sense to say that religion should be kept out of the public square. If you're running for office and you think God means for you to liberate Iraq, now is the time to mention it.

For the same reason, it makes no sense to complain—as many do—of prejudice against fundamentalist Christians or to argue that the old hatred of Jews and blacks is being refocused as hatred of the growing evangelical Christian political movement. The hyperbole involved in describing newspaper attacks on evangelicals as reminiscent of “the lynch mobs we used to see back when black folks were accused of being too uppity” is of course immense. But the truly bizarre thing here is not so much the exaggeration as it is the redescription of people who have certain beliefs—that Jesus is their savior, that they themselves are born again, et cetera—as people who have a certain identity. Fundamentalist Christians are not an ethnic group or a culture. They are people who believe in things like the inerrancy of scripture, the sinfulness of homosexuality, the divinity of Jesus. And if they encounter people who think that all these beliefs are false, what they're encountering is not prejudice but disagreement.

Prejudice involves the unjustified assumption that your identity is somehow better than someone else's identity; disagreement involves the absolutely justified—indeed unavoidable—assumption that your belief is better than someone else's belief. If you didn't think yours was better, you'd give it up. So we think that Republicans are opposed to Democrats, not prejudiced against them; and libertarians aren't prejudiced against socialists, and people who believe in God aren't prejudiced against people who don't. If, as one of the Pew polls suggests, 66 percent of Americans have an “unfavorable” view of atheists, not only is there nothing surprising about that, there's nothing wrong with it. If you are devout, why shouldn't you have an unfavorable view of someone who seems to you profoundly mistaken about what you regard as one of the most fundamental issues of human life?

And the argument obviously works both ways. If you don't believe in God, how can you help but have an “unfavorable” view of all the deeply deluded people who do? That's why those who argue that just as Americans have become more sensitive to the inequalities of race and gender, they should extend the same sympathy to those who are different in the sincerity of their belief, are missing the point. They are mistaking an inappropriate response to people who seem to us different (prejudice) with an appropriate one to people who seem to us wrong (disagreement). The sympathy we extend to those who have been victimized by prejudice requires us to stop being prejudiced against them; the sympathy we might extend to those who

have different beliefs cannot possibly require us to stop thinking they're mistaken. So although it's no doubt true that we shouldn't hate anyone, treating Christians (or atheists) with contempt is not the same as treating black people with contempt; even if we hate Christians (or atheists), we hate them for what they believe, not for who they are.

When, in the run-up to John Roberts's confirmation hearings for the Supreme Court, a senator declared that we should be as "religious-blind" as we are "color-blind" in considering the qualifications of nominees, he got this exactly wrong. We should be color-blind because color has nothing to do with beliefs. But we shouldn't be religion-blind because religion has everything to do with beliefs. In the public square, the crucial thing about Christians, Muslims, Jews, et cetera, is not whether (like blacks and Asians and women) they're entitled to respect but whether they can convince us that their beliefs are true.

The problem, then, with thinking of religious diversity on the model of cultural diversity is that it turns what should be a debate about the validity of different religious beliefs into a consensus about their equal worth and thus obscures their relevance to public policy. It's precisely religion's claim to universality that makes religiously based public values matter in American political life. By public, I mean first that the religious component should not be privatized; we can't think of someone's faith the way Jefferson famously did when he remarked that:

"It does me no injury for my neighbor to say there are twenty gods or no God. It neither picks my pocket nor breaks my leg."

If my neighbor's belief in God involves also, say, a belief that abortion is wrong, it does and it ought to affect me. It cannot be treated as a merely private fact about him, such as the fact that he likes Chinese food or opera. And by public, I also mean that the religious arguments made in the public or political sphere should themselves be based on public knowledge. Public decisions must be made by arguments that are public in character—not derived from sources of revelation or disposition that are essentially private and arbitrary. Identities can be private—it really does do me no injury if my neighbor is black. Identities are not subjective—the things that make me who I am need not make anybody else who she is. But beliefs are neither.

There is, however, a certain tension between these two senses of the public, between the requirement that we recognize the public claims of religious belief and the requirement that those claims not be "derived" from "private" sources like "revelation." The difficulty is in preserving the religious base of the values in question while meeting the criteria that enable them

to go public. Suppose we take two political issues—one had an undeniable public importance in the past and the other still does—that are often linked to religious convictions: abortion and gay marriage. What contribution does religion have to make to the debate over these issues? The argument against abortion is that it is murder, and you don't need to be a Christian or, for that matter, to have any religious convictions at all to think that murder is wrong. Indeed, almost all the people who support abortion, including atheists, oppose murder but deny that abortion is murder, insisting that the fetus does not yet count as a person (and thus cannot be murdered) or that the pregnant woman's refusal to accept the unchosen obligation to bear the child does not meet the legal definition of murder. So what the opponents of abortion need to do is show these people that they are mistaken, that the fetus does count as a person. How does religion help? Why, for example, should the fact that most Protestant evangelical churches and the Catholic Church oppose abortion count as a reason for people who don't oppose abortion to change their minds? How does telling people that God doesn't want them to do it make a difference if the people you're telling don't believe in God?

The problem here is that the specifically religious part of the argument is entirely private and arbitrary, dependent on revelation in a way that the conviction that we can't draw a sharp line between the fetus and a person is not. If I am trying to convince you that the fetus is a person, I can—to take a standard argument—point out that if you don't regard the fetus as a person, you won't be able to regard people in comas as persons either, since they are similarly unconscious, dependent on others, et cetera. And you may be led to reflect that the considerations that cause you to think it's wrong to pull the plug on people in comas (they may recover consciousness; they may once again come to function as persons) are applicable to the unborn child as well: if nurtured, it too will come to be a person. So you may decide that you were mistaken in distinguishing so sharply between the fetus and a person, and you may come to believe that abortion is wrong.

Or you may not. For our purposes here, it doesn't matter how we come out on the abortion debate; what matters is just that we recognize how limited is the role that religious conviction plays in that debate. For consider the alternative, the idea that in convincing you that abortion is wrong, I'm convincing you not simply to alter your values but somehow to take into account the importance of their being religiously based. What this means is that not only do I have to convince you; I have to convert you. I have to get you to believe not only that abortion is wrong but that it's wrong because God forbids it. Which is to say, I have to get you to believe in God, specifically my God. And here it's notoriously the case that arguments

of the sort that might conceivably prevail in the public square will be of very little use. How many people get argued into a belief in God? And why should people who don't believe in God, or don't believe in your God, be the slightest bit impressed by your insistence that (your) God forbids abortion? Or that your God is against gay marriage?

The gay marriage example is actually a sharper one because it's so different. The strength of the antiabortion argument is its appeal to our intuition that murder is wrong, an intuition we have no problem fleshing out with considerations involving our own desires not to be ourselves the victims of murder and not to have our loved ones be the victims of murder. But it's a lot harder to come up with equally plausible intuitions about homosexuality; it's a lot harder to see how anyone is victimized by homosexuality. No doubt, this is why being antigay often seems like a kind of prejudice—more like being anti-Semitic, say, than like being anti-Republican. If, however, you think that homosexuality is wrong, it's hard to see how you can be accused of prejudice against gays, just as it's hard to see how people who think that fundamentalists are wrong can be accused of being prejudiced against them. Disapproval of what people do doesn't count as prejudice any more than disagreement with what people believe. So the good news for homophobes is that they're not bigots; they believe that homosexuality is wrong, and they have their reasons. But the bad news is that their reasons are so weak.

Because while it's easy to see that homosexuality is bad if it goes against the laws of God, it's really hard to see much wrong with it if it doesn't go against the laws of God or if we don't believe there are any such things as the laws of God. So while the arguments against abortion don't rely on religious belief, the arguments against gay marriage seem to rely on almost nothing but religious belief. It says in Leviticus 18:22:

“Thou shalt not lie with mankind, as with womankind: it is abomination.”

Other things Leviticus tells you not to do include:

- Trimming the corners of your beard (21:5)
- Wearing clothes made of linen “mingled” with wool (19:19)
- Sleeping with your wife (much less anyone else's wife) while she's being “put apart for her uncleanness” (18:19)

When asked why certain attitudes or behavior is right or wrong, the great majority of Americans answer that the Bible or the church or religious teaching says it is so. But almost no Americans believe that trimming your

beard at the corners is wrong despite the fact that the Bible says it is. And if homosexuality is wrong only in the way that trimming the corners of your beard is wrong, why should Americans be against it?

But it's not the inconsistency that's the problem here. Even though the degree to which literalist readers of scripture feel free to pick and choose the bits they're obligated to obey and the bits they're not is pretty impressive, the real problem is the appeal to nothing but God's stated prohibition. This doesn't mean that you shouldn't be allowed to make the appeal. It doesn't mean that people who really do believe Leviticus can't cite it. It just means that it's hard to see why the rest of us should heed them.

“If we witness a son who routinely abuses his aged mother, we know that it is wrong, if we're asked to give our reasons, most Americans would likely invoke biblical injunctions about the honor due parents. But according to current doctrine, that reason is not publicly admissible.”

Well, it obviously is publicly admissible, but, depending on who the public is, it may not be very convincing. The force of examples like the ones from Leviticus is that many of us (even those of us who believe the Bible is divinely inspired) don't feel a moral obligation to do things just because the Bible tells us to. If we think the son abusing his aged mother is doing wrong, we have reasons in addition to or utterly separate from the fact that the Bible says it is.

People who think you shouldn't trim the corners of your beard have every right to try to convince others that they shouldn't either. They even have every right to try to pass laws forbidding the trimming. It's no doubt true that such laws would be unconstitutional, but the fact that something isn't constitutional doesn't in itself make it wrong. Slavery was constitutional but wrong, which was what Supreme Court Justice Thurgood Marshall had in mind when in his famous speech on the bicentennial of the US Constitution, he described it as a document that was “defective from the start.” And the effort today to imagine that all the things we think are good should be at worst allowed by and at best actually mandated by the Constitution is, despite its popularity, implausible on its face. Some of the strategies for the enforcement of equal opportunity that I myself would like to see enacted in the United States (e.g. the abolition of private schools) are almost certainly not constitutional. In other words, this is not a point about the separation of church and state. It's a point about the limitations of the appeal to divine revelation as an argument: if the people you're arguing with already believe in the revelation, you don't need the argument; if they don't, the argument can't possibly convince them.

Because Christianity importantly (if not exclusively) consists in a set of beliefs about public issues, it must have a role to play on the public square. But because many of its beliefs seem so false to so many, we ought to seek to constrain that role—not by ruling the appeal to religion out of court but by objecting to the false things the religious may say. So if one reason we want to keep the Ten Commandments out of our courtrooms is to prevent the establishment of Christianity as a state religion, another reason is that many of us don't believe them. The point about the Ten Commandments is that they are commandments; They are not, as it has been said, Ten Suggestions or Ten Significant Moral Insights, to be more or less appreciated according to one's subjective disposition. What it means to be a believer in the Ten Commandments is to believe that it is in fact wrong to do the things they enjoin against, and that anybody who does not believe in the Ten Commandments is mistaken, and that anyone who does not follow them is behaving wrongly.

But it's for this very reason that unbelievers will find their presence in the courtroom obnoxious. They think the claim ("I am the Lord thy God") that authorizes the first one ("thou shalt not have other gods before me") is false and that therefore none of the first four commandments (no graven images, et cetera) needs to be followed. Number five—"Honor thy Father and Mother"—has a different kind of force, precisely, as we already noted, because it does not depend on believing in the Lord, our God, but we may or may not think it's a good idea and, more to the point, we may believe it's a bad one and act on our belief without breaking the laws of the state. Numbers six through nine are like number five in that our belief in them need not hinge on our feelings about the Lord, but they are stronger than five because they are not only things that Christians should and shouldn't do; they are things that, broadly speaking, no one should do. And number ten is kind of ambiguous, depending on what we think is meant by covet. So if you're an unbeliever, the problem with the Ten Commandments is that four of them are false.

And when I say they're false, I don't mean that they're not true for me or that they don't make an impact on me. Although the preferred target of people who argue for the importance of religion in our lives is relativism—the idea that there are different truths for different people—it should be obvious that the argument I am making here has nothing to do with this idea. The clarifying thing about religious disputes—the thing that distinguishes conflicts of belief from the conflicts of identity in which nationalists and multiculturalists have so much invested—is that the conflicts of belief are precisely not relativized. When I say that four of the ten commandments are not true, I mean that they're not true for me or for anyone else and that

the people who think they are true—who think that they are being told to, say, keep the Sabbath by the Lord their God—are mistaken. Those who defend the significance of religion in daily life are right to argue that even if one is not a believer, the divorce of public business from the moral vitalities of the society is not desirable. But the identification of “moral vitalities” with the belief in supernatural entities issuing instructions from above is not such a good idea either.

My main point here is not, however, that religious beliefs are mistaken. It is instead that disputes about religion—understood as the pope understands them, as disputes about what is universally true—are useful reminders that you can’t exactly be for diversity of beliefs in the way that you can be for diversity of identities. We encourage diversity of belief in the hope that having lots of different ideas will help us figure out which ones are true. So ideological diversity is valuable not in itself but instrumentally. But no one thinks the point of encouraging different identities is to help us decide which ones are the best. Just the opposite; they’re all good. When it comes to cultural identity, it’s the diversity itself, not the thing the diversity leads to, that we’re supposed to like. The trouble with diversity, from this perspective, is that it tries to imagine a world in which no one is a believer, as if even our belief in God (or our belief that there is no God) were just another aspect of our identity.

But belief is at the heart of both our religion and politics, and insofar as the displacement of ideology by identity has helped bring religious beliefs to the fore, it cannot possibly make sense to keep pretending that the best way to deal with them is by asserting that religion has no place in politics. It has a lot more place in politics than race and culture do. It is not so unthinkable that people should be willing to kill and be killed for religion. One reason it’s not so unthinkable is, of course, that it has often happened. The more important reason, however, is that fighting for your religion involves fighting for something you believe in, for something you think is better than what you’re fighting against. The point can be made more obvious by being made less melodramatic. Forget killing and being killed; go with arguing. You can’t even get the argument started unless you understand that the relevant difference between you and the other party is not the difference in identity but the difference in beliefs, and that what the argument is about is whose beliefs are better.

Michael teaches at the University of Illinois, Chicago. He makes \$175,000 a year. But he wants more; one of his motives for writing a book was the cash advance offered him by his publishers. Some readers will be tempted to see a discrepancy between these facts and the arguments against economic inequality made in his book. But they should remember that those

arguments are true (if they are true) even if Michael's motives are bad, and they would be false (if they were false) even if his motives were good. Not to put too fine a point on it, the validity of the arguments does not depend on the virtue of the person making them. Furthermore, the point of the book is not that people, including its author, should be virtuous.

During the summer in which most of his book was written, a homeless man lived in the railroad underpass Michael can see out his study window. A more virtuous person might have been at least tempted to go down and bring him some breakfast or maybe even invite him in for a shower and a meal. It never occurred to Michael to do either of these things. Mainly he wished the man would go away.

The fact that Michael makes \$175,000 a year puts him in the top five percent of the American population. The fact that his total household income is more like \$250,000 a year almost gets him into the top one percent. And maybe the money earned through a book will push him over the line—the top one percent! What this means is that he is not a member of the “middle class.” He is a member of the “upper middle class.” Comparatively few people are richer than he is. And, yet, he finds this very hard to believe. He does not feel rich. Why not?

Well, for one thing, he is confronted on a daily basis by the spectacle of people who are much richer than he is. For example, like many members of the upper middle class, he is a daily reader of the *New York Times*, and one of the primary functions the *Times* performs for its upper-middle-class readers is to make them feel poorer. It does this by publishing articles like “Is \$200,000 the New \$100,000?” or articles about the difference in status between people who have the nanny pick the children up after school and people who bring the nanny along with them when they themselves pick the children up. For the curious: If you send the nanny in your place, it shows you haven't got the time to do the job yourself but you do have the money to pay someone to do it for you; if you bring the nanny with you, it shows you have the time but you're so rich you're prepared to pay anyway—you win. Reading these stories, Michael experiences the standard mixture of envy and disapproval, but what he experiences above all is a deeply legitimating disidentification. He could never afford to do that! His household may be in the top five or so percent, but his \$250,000 a year puts him a lot closer to the median than to the people who bring the nanny or to the people who send her.

Why is this disidentification legitimating? Because it leads Michael to think of himself as not rich; it leads him to think that when he talks about the problem of economic inequality, he is not the problem, the super-rich are. And, of course, the super-rich are part of the problem. But, unfortunately,

he is too. Compared to the super-rich, he may feel poor, but feeling poor doesn't make you poor. And, even more to the point, feeling rich doesn't make you rich.

American Idol—once the most watched show among people twenty-five and younger—is a kind of emblem of our fantasies about success, and the popularity of the show and its countless knockoffs and derivatives is a function of its ability to portray us to ourselves. Although, as in any tournament, only one person will win, the system the show embodies is in a certain sense absolutely fair: every contestant has a chance to win, and to take your chance, all you have to do is try out. So there's a kind of formal equality of opportunity among the contestants. But that formal equality is not, from a statistical standpoint, very encouraging since, when there are over 100,000 people auditioning for the contest, your individual chance of winning looks very small. So this is where what one critic has called the “delusional self-confidence” of the participants kicks in. If you start factoring in your talent and your hard work and the intensity of your commitment to “following your dream”—a phrase that at this moment in American history appears to have almost talismanic power—you can find yourself thinking you've got a real shot. And sometimes it's not till you actually get yourself on TV that someone—the English guy—makes it clear that in fact you have no talent and no chance whatsoever. So what the show presents is both a vision of the world in which the truly talented will succeed, the American dream, and a vision of the high level of self-deception—I'm talented! I will succeed!—required to live happily in that world, the American delusion

As long as you think you're middle class, you are middle class; believing makes it so. Indeed, not only can poor people get richer by just believing, rich people can get poorer too. When a man making \$130,000 a year sums up his economic achievement by saying, ‘I'm in the middle and I'm happy,’ he is at best only half right. He's actually closer to the ninety-fifth percentile in income, nowhere near the middle. We know what he means, of course: he doesn't feel rich. He sees lots of people richer than he is, both in reality and in the newspapers and, especially, on TV. And just as the black kids on campus make the white kids feel better about themselves, so do the super-rich make the merely rich feel better.

In fact, the social construction of class is even more useful than the social construction of race, since the social construction of race just enables you to ignore the difference between the rich and the poor while the social construction of class makes it possible to eliminate it. If you really can convince yourself that people belong to whatever class they think they belong to and if you can get everybody (the rich and the poor) to think they belong to the middle class, then you've accomplished the magical trick of

redistributing wealth without actually transferring any money. Marx used to describe religion as the opium of the people because it promised them in heaven what they couldn't get on earth. The American dream of being middle class is more effective; it assures us that we don't have to wait for the afterlife. The poor already have what they haven't got, and the rich don't really have what they do. Everybody's happy.

The right thinks university English departments (and humanities departments more generally) are radical because they castigate dead white males and foreground the roles of the nonwhite, of women, and of the gay, the lesbian and the transgendered. And the English departments themselves, understanding perfectly well that this is a caricature, nevertheless try to push the envelope even farther, adding, say, the disabled to the identity categories above and thinking of themselves as more truly radical for doing so. But they are both wrong. There is nothing politically radical about insisting on and even celebrating diversity; on the contrary, celebrating diversity is now our way of accepting inequality. This is why it's a mistake to believe that the humanities departments of our universities are hotbeds of leftism, even though both the supposedly left-wing professors and their right-wing critics love to believe it. In fact, they're more like the research and development division of neoliberalism. The more kinds of difference they can come up with to appreciate—not just many races but mixed races, not just gay and lesbian but gay, lesbian, bisexual, transgendered, cisgendered, questioning, heteronormative, queer, pansexual—the more invisible becomes the difference that a truly left politics would want to eliminate: class difference.

If you are committed to equality, that commitment is—must be—based on the idea that those who have been denied equality have been deprived. And the commitment to the poor is based precisely on the sense that they are deprived, that they are victims. But once we start insisting that working-class literature has its own value and that, as literary critics, we have done the poor an injustice by failing to appreciate their literature—you commit yourself not only to ignoring but to erasing the inequality, not by removing the deprivation but by denying that it is deprivation. My point here is not that working class or poor people can't produce great literature but that they do so only by overcoming an obstacle, the obstacle of being working class or poor. Denying that poverty is an obstacle—treating working-class literature on the model of, say, French literature—denies the relevance of class inequality. From this perspective, the idea that teachers of literature should be committed to what one critic calls “valuing working-class cultures” is fundamentally reactionary. Indeed, the minute you start reading literature by poor people in the same way you read ethnic literatures, you've arrived in

something like inequality heaven. Where you used to just distract yourself from economic difference by focusing on cultural difference, now you can celebrate economic difference by pretending that it is cultural difference.

Immigration continues apace, and it's supported not just by liberals who see opposition to it as a form of racism but by many conservatives who see opposition to it as a threat to profits. From the late nineteenth century, when Italian immigrants fresh off the boat were used as scabs against (mainly white) striking Pennsylvania coal miners, to the early twenty-first century, when Mexican immigrants have been brought in to displace (mainly black) farmworkers in the Vidalia, Georgia onion fields, American employers have understood the value of cheap labor. The nineteenth-century miners expressed their skepticism about workforce diversity by fighting a pitched battle against the immigrants and killing seven of them; the more law-abiding twenty-first-century farm workers went to court, alleging they'd been "fired because of their race and national origin." To which their employers replied that they had nothing against black, white, or American workers; it's just that:

"When José gets on the bus to come here from Mexico he is committed to the work. He leaves his family at home. The work is hard, but he's ready. A domestic (born in America) wants to know: What's the pay? What are the conditions? In these communities, I am sorry to say, there are no fathers at home, no role models for hard work. They want rewards without input."

By which they meant that domestics are not satisfied with the forty cents they get for each five-pound bucket of onions they pick. Of course the farmers' complaint that Americans don't work hard enough because they were brought up without fathers is a little hard to swallow—is "José" at home with his kids in Mexico?—but the relevant point is that the employers' commitment to diversity and to cheap labor are indistinguishable. Which is why both liberal and conservative economists have almost always supported lots of legal immigration and why some of them even speak approvingly of illegal immigration (because it responds fastest to market forces; illegals come when there's the possibility of jobs; they leave when those jobs dry up). The advantage of the immigrants is that, unlike the domestics, they're too desperate to ask:

"What's the pay? What are the conditions?"

And that's good for employers because, unsurprisingly, as diversity has flourished, the pay and the conditions have only gotten worse. Since the

Great Recession (2007–2009), it's no longer exactly true that we ignore economic inequality, and the Occupy movement certainly drew our attention to the difference between the 1% and the 99%. But neither Occupy nor anyone else has managed to do anything about reducing that difference. Since 2005, the poor have gotten poorer. In 2005, if you were in the twentieth percentile, you were making \$21,668; in 2013, you were making \$20,885. The rich have gotten richer: the ninetieth percentile went from \$142,288 to \$150,000. And the very rich are much richer; in fact, in recent years, while the average income of the bottom 99% has fallen (by 0.4%), the average of the 1 percent rose by 36.8% (to \$1,303,198).

Furthermore, as economic inequality rises, so does the enthusiasm for addressing every other, non-economic kind of inequality. Everyone knows that the whole point of working on Wall Street is to make lots of money: in 2014, while the median salary for US workers was about \$53,000, the average bonus on Wall Street was \$172,860. And that's just the bonus; the average base pay was \$355,900. But probably not everyone realizes just how committed Wall Street is to diversity. Goldman Sachs, for example, has (among many other honors) been named a Stonewall Star Performer (for consistently demonstrating exemplary practices to support lesbian, gay, and bisexual staff), a Best Company for Multicultural Women and the Overall Best Employer for Asian Pacific Americas Professionals. And when it comes to sexual reassignment (as opposed to income redistribution), Wall Street and what's left of Occupy Wall Street—essentially a Web site and a twitter feed—share values that run at least as deep as their differences: Occupy celebrates Carrie Davis becoming the first transgender person to win a “Woman of Distinction” Award from the state of New York, while Citigroup, Credit Suisse and, of course, Goldman win plaudits for offering their employees insurance that will help pay for treatments and procedures “related to gender transition or sex reassignment.”

But it's not just Wall Street that embraces both inequality and diversity. Gary Becker, the conservative Not-a-Nobel Prize-winning economist, disapproved of what he thought of as the bad inequality produced by discrimination just as fervently as he approved of the good kind produced by markets. The “inequality in earnings” that labor markets produced was “mainly the good kind,” rewarding hard work and ability, while the inequality produced by racism, is not only morally wrong but also bad for capitalism, and especially for capitalists. Why? In competitive markets employers can't afford to indulge what he called the “taste” for discrimination, a preference for one racial group over another—they need to be able to get people who will work as hard as possible for as little as possible. Which is why those Georgia onion farmers want to hire Mexicans. If they could afford to indulge

their real racial “taste,” they might want to hire white people like themselves. But if they want to keep the costs of labor as low as possible, even the most racist employers can’t afford their racism, they can’t afford arbitrarily to constrict their labor pool. So as fathers and husbands, even as voters and taxpayers, they may well be prejudiced against both Mexicans and blacks but, as employers, they’re extremely eager to hire the cheapest and most frightened.

Over half of Harvard’s students come from families making more than \$125,000 a year and almost a third from families making more than \$250,000 a year. Only four percent come from the bottom quintile. The number of minority students, in other words, is about ten times the number of poor students, a fact that, repeated in less-extreme form at elite colleges around the country, has led to widespread calls to supplement or even replace race-based affirmative action with class-based affirmative action. Unfortunately, class-based affirmative action has its own problems. For one thing, the whole idea of affirmative action is based on proportionate representation and if poor and middle-class people were proportionately represented in elite colleges, the first thing that would happen is that most of the current students would need to leave. At Harvard today only 17 percent come from the bottom 60 percent of the population; at a Harvard that had achieved not only racial but economic diversity, 60 percent of the students would come from the bottom 60 percent of the population. That leaves out a lot of outraged rich people.

And the second thing that would happen is that most of the colleges would go broke. The newly enrolled bottom 60 percent would consist entirely of people from households making less than \$65,000 a year (which is almost exactly what a year’s tuition and room and board costs) and while it’s no doubt true that a few super-rich schools like Harvard could afford to subsidize their newly impoverished student body, the vast majority of the merely wealthy ones would sink like stones. So when people talk about class-based affirmative action, what they’re really talking about is adding a few more poor kids to the mix. Which is why people who really care about everyone having a chance to succeed are increasingly committed to making at least some or maybe even all public higher education free to everyone.

From this standpoint, the unfairness of the current system is pretty obvious. The students coming into college are from economically advantaged families; the students coming out of college perpetuate that advantage. So the way to make the system fairer is to make it possible for everyone to go to college, giving everyone a chance at those rapidly growing jobs that require a postsecondary education. But the problem with this scenario is even more fundamental than the problem with economic diversity, and it’s a problem

with the jobs, not the universities. On the Bureau of Labor Statistics's list of the fastest-growing occupations, number one is industrial-organizational psychologists. Even after reading their job description—"Apply principles of psychology to human resources, management, sales, and marketing problems, work with management to improve worker productivity"—I admit I'm still not totally sure what they do. But they get paid well for doing it: their median salary is \$83,580 a year, well worth the required four years of college and several years of postgraduate work. The only downside is that there are only about 1,100 industrial-organizational psychologists right now and even at the rate demand is growing, ten years from now, only 2,000 will be needed.

So let's go the second-fastest-growing job, personal care aides. The good news here is that there are a lot of these jobs and there will be a lot more, the bad news is these jobs don't require a college degree (or even a high school degree), and the pay sucks. The median salary is \$19,910 a year, and it isn't getting better. In fact, it's getting worse. A recent report says that since 2009, low-wage jobs have been becoming even-lower-wage jobs and that "wage declines" have been especially pronounced for janitors and cleaners, personal care aides, home health aides and maids and housekeeping cleaners. All these jobs are growing; they don't pay well and they don't require a college degree. Indeed, in 2012, only a little over 20 percent of jobs required a Bachelor of Arts degree: in 2022, that number will be virtually unchanged.

So the reason to get a college degree is not to prepare for the jobs of the future; most of them won't require one. It's to have a shot at the good jobs of the future, and it's no doubt true that making a four-year college education available to everyone who wanted one would probably give more people a real shot at those good jobs. Right now, the people who end up as personal and home care aides are predominantly women of color from poor families. They never had the chance to go to college to better themselves. But if college were free, they would have that chance, and some of them would be doctors and lawyers and nurses and organizational psychologists. Some of them would even be CEOs. The health care industry pays its CEOs very well—their median income is \$13.6 million a year. Right now, there probably isn't even one black woman in the health care industry making that kind of money. If everyone had an equal opportunity to qualify themselves for those jobs, there'd be a bunch of them, around 6.5 percent of the total.

But of course, the vast majority of people working in health care—black women, white women, white men, Latinx—would not be earning \$13.6 million a year. They'd be earning \$9.38 an hour. Making equality of opportunity real would diversify both the bosses and the workers but it

wouldn't reduce the gap between them; the workers would still be paid so badly that more than half of them would have to rely on some sort of public assistance to make ends meet. And the high pay of the bosses would be directly related to the low pay of the workers. One of the central challenges facing health care employers today is "finding people to work for you at a wage where you can be profitable." In other words, the reason your boss gets paid so much is as a reward for getting you to work so cheap. It's because you only make one six-hundredth of what she does that she has met her challenge. The word for this challenge is not discrimination, it's exploitation: the fact that the work you're doing is worth more than what you're being paid to do it. And you can't solve the problem of exploitation by giving everyone a fair chance to become an exploiter.

Thus the trouble with education and the trouble with diversity are the same trouble. The White House says a good education is the "pathway to the middle class," and it wants to make that path wider. But with an economy that produces many more low-wage jobs than high-wage ones (48 percent of the new jobs generated in 2013 paid \$15 an hour or less) making the path wider doesn't produce more rich people, it just produces better-educated poor people. A bartender with a PhD gets paid bartender wages, not the wages of a professor. And these days, many of the PhD holders who are professors are also making bartender wages. If the college class you're in is a class for first-year students, your professor may well be a PhD working on a one-year contract and making less than \$35,000 a year. She not only went to college, she was a really good student—ask her how well that's working out.

Education is essentially a sorting system. It's a very unfair sorting system—since it mainly functions to make sure that the wealthy children of wealthy parents stay wealthy—but even if we managed to make it perfectly fair, it would still do nothing but put a small minority on the road to good jobs and a big majority on the road to bad ones. Similarly, the only thing diversity does is try to make sure that the ones who do get the good jobs aren't all white men and the ones who get the bad jobs aren't mainly women of color, which it isn't very successful at doing. But even a successful commitment to diversity would (like everyone going to college) be of absolutely no use to everybody of all races and genders who ended up serving fast food, taking care of old people, selling clothes to young people in malls, et cetera. What the commitment to education and the commitment to diversity have in common, in other words, is that their goal is not to minimize inequality but to legitimate it, not to make sure that no one is stuck in poverty but to make sure that no one is stuck in poverty because of their race or their gender or the fact that they couldn't go to college.

So if education and diversity are just different ways of trying to make inequality seem fair, what are some ways of trying instead to diminish it? What should we do if we're more committed to eliminating poverty than to figuring out who deserves to be poor? Maybe, instead of emphasizing ways to avoid the bad jobs we should start thinking about ways to make the bad jobs better. From 1948 until 1973, productivity and pay were growing in sync; since then, productivity has continued to rise while pay has flat-lined. Where has the income generated by those workers gone? It hasn't disappeared; it has just been redistributed. Instead of going to typical workers, it has gone either to bosses or to owners. That's what rising inequality is: the increasing gap between what the work is worth and what, on the one hand, the many workers get and, on the other hand, the few bosses and owners get.

If, during this period, you've been worried about the glass ceiling, about the forms of discrimination that make it difficult for women or minorities to become bosses and owners of capital, you haven't been concerned about economic inequality at all. Not to put too fine a point on it, what you've actually been worrying about is the fact that not enough women and people of color have been afforded the opportunity to extract profits from—rip off, exploit, plunder—the vast majority of workers. And while it's easy to see how the bosses and owners might start feeling better about themselves if they weren't all white males—'see, everybody has the chance to rise to the top!'—it's very hard to see why this should matter to anyone else since, in fact, almost no one actually will rise to the top.

Now, this last claim—almost no one will rise to the top—might seem a little unfair, at least to the 64 percent of Americans who still believe that upward social mobility is a live option. But the most recent data suggests that those 64 percent are wrong, that the United States is, as the authors of the 2015 report *Economic Mobility in the United States* put it, "very immobile." And even if there were more mobility, the percentage of people who could benefit from it would be tiny. That's why health-care workers; fast-food workers; sales people; shuttle drivers for Facebook, Apple, and eBay; writers for Web sites; and adjunct faculty for universities like Tufts, Georgetown, the University of Oregon or the University of Illinois at Chicago, do not need the false promise that they can somehow get different and better jobs. These are the jobs they have, and these are the jobs that exist. What we need is to make these jobs better.

"A lot could be said about why so many people celebrated Jenner declaring she was transgender while almost no one was prepared to accept Dolezal as transracial."

Every year in America—and increasingly every year in every country whose economy looks like ours—is a year in which we obsess over identity. In part, this is a good thing. If obsessing about what gender people identify as can get us to stop punishing them for identifications some of us may disapprove of, that’s a step in the right direction. But insofar as—in a world where the gap between the rich and the poor keeps on getting worse—the obsession with identity distracts us from that gap or, worse still, tells us a false but comforting story about it, identity becomes part of the problem not the solution. What we like to think is that racism (or, racism plus sexism, plus homophobia, et cetera) is primarily responsible for American inequality. And the reason we like it, the reason it’s comforting, is because we can all disapprove of racism, and even if it’s proving very difficult to actually get rid of it, we can all—rich and poor—agree that it would be a good thing if we did. Just look around your classroom, or your office, or your living room—see if anyone raises their hand to defend white supremacy.

But racism doesn’t create the world in which the people who actually take care of your sick grandmother make so much less than the people who run and own the company they work for. Capitalism does. Sexism hasn’t created the (small) class of people who can send their children to elite colleges. Capitalism has. And, unlike white supremacy, capitalism has its defenders. Any serious conversation about how to make the US a more equal society has to start by talking about the real causes of our inequality. The biggest trouble with diversity is that it keeps us from talking about the trouble with capitalism.

Chapter Fifty-one

Workers of the World

When the union's inspiration through the workers' blood shall run,
There can be no power greater anywhere beneath the sun;
Yet what force on earth is weaker than the feeble strength of one,
But the union makes us strong.

Chorus:

Solidarity forever,
Solidarity forever,
Solidarity forever,
For the union makes us strong.

Is there aught we hold in common with the greedy parasite,
Who would lash us into serfdom and would crush us with his might?
Is there anything left to us but to organize and fight?
For the union makes us strong.

Chorus:

Solidarity forever,
Solidarity forever,
Solidarity forever,
For the union makes us strong.

It is we who plowed the prairies; built the cities where they trade;
Dug the mines and built the workshops, endless miles of railroad laid;
Now we stand outcast and starving midst the wonders we have made;
But the union makes us strong.

Chorus:

Solidarity forever,
Solidarity forever,
Solidarity forever,
For the union makes us strong.

All the world that's owned by idle drones is ours and ours alone.
 We have laid the wide foundations; built it skyward stone by stone.
 It is ours, not to slave in, but to master and to own.
 While the union makes us strong.

Chorus:

Solidarity forever,
 Solidarity forever,
 Solidarity forever,
 For the union makes us strong.

They have taken untold millions that they never toiled to earn,
 But without our brain and muscle not a single wheel can turn.
 We can break their haughty power, gain our freedom when we learn
 That the union makes us strong.

Chorus:

Solidarity forever,
 Solidarity forever,
 Solidarity forever,
 For the union makes us strong.

In our hands is placed a power greater than their hoarded gold,
 Greater than the might of armies, multiplied a thousand-fold.
 We can bring to birth a new world from the ashes of the old
 For the union makes us strong.

As a socialist, I actually have no doubt that free market types are right when they say employers try to make up for the increased minimum wage by firing a bunch of people and just sucking more labor out of the remaining workers. Because employers are profit-maximizing sociopaths, they will always try to cause the workers and the consumers to bear the burden rather than themselves. Free market types think that this proves minimum wage increases can be bad. I think it proves that capitalists are amoral monsters and worker ownership is essential. If it is true that minimum wage increases hurt workers, that is because employers would rather hurt workers than take any less of a portion for themselves. And any attempt to blame consumer choices for such outcomes ignores the fact that the consumers in other instances are underpaid exploited workers—a vicious cycle to the bottom.

“Humans were still not only the cheapest robots around,
 but also, for many tasks, the only robots that could do the job.

They were self-reproducing robots too. They showed up and worked generation after generation; give them 3000 calories a day and a few amenities, a little time off, and a strong jolt of fear, and you could work them at almost anything. Give them some ameliorative drugs and you had a working class, reified and coglike.”

Soon winter will come. Routine layoffs will start at the seasonal jobs. The nomads will pack up camp and return to their real home—the road—moving like blood cells through the veins of the country. They’ll set out in search of friends and family, or just a place that’s warm. Some will journey clear across the continent. All will count the miles, which unspool like a filmstrip of America. Fast-food joints and shopping malls. Fields dormant under frost. Auto dealerships, megachurches, and all-night diners. Featureless plains. Feedlots, dead factories, subdivisions, and big-box stores. Snow-capped peaks. The roadside reels past, through the day and into darkness, until fatigue sets in. Bleary-eyed, they find places to pull off the road and rest. In Walmart parking lots. On quiet suburban streets. At truck stops, amid the lullaby of idling engines. Then in the early morning hours—before anyone notices—they’re back on the highway. Driving on, they’re secure in this knowledge: The last free place in America is a parking spot.

When the deep mines were working years ago, Floyd County had a lot of jobs. A man would work down in the mines for twenty years, pay into his disability—a federal program known as Social Security Disability Insurance (SSDI)—and be out of the mines with black lung by age forty-five with a monthly check large enough to support a family. That became a life strategy in Eastern Kentucky.

How ridiculous that the answer to our economic problems is seen as wasting more of our most important asset—people.

It is the secret scandal of capitalism that at no point has it been organized primarily around free labor.

Workers of the world awaken. Break your chains, demand your rights.

All the wealth you make is taken, by exploiting parasites.
Shall you kneel in deep submission from your cradle to your grave?

Is the height of your ambition to be a good and willing slave?

Change happens when these people stop marching and start striking. At that point they are taking a real risk. Corporations are the gods of

the nation—superhuman, immortal, unbound by law, without shame or conscience, motivated by every human desire and afflicted by the worst human failings. Striking is the only thing that hurts them, and will be the only thing that brings about change. That is why striking is absent from the American political discourse: it is figuratively blasphemous.

Under President Reagan the NLRB went in the opposite direction. In addition to being far friendlier toward management in its decisions, it also became woefully understaffed, leading to long backlogs for cases to be heard. This backlog mattered for organizing drives because one of the main powers of the NLRB is its ability to reinstate workers who are illegally fired for union organizing. If an employer is able to fire all the key workers in an organizing drive and it takes two years for them to have their cases heard, the drive is likely to be over by the time the workers are reinstated.

Another big factor undermining the strength of unions has been the use of replacement workers as substitutes for strikers, thereby costing the strikers their jobs. While hiring replacement workers to replace striking workers was always legal, a set of norms had developed around labor-management relations in the three decades following World War II in which this was rarely done. The standard practice was that companies either shut down entirely during a strike or maintained some operations with skeletal staff of management personnel. This practice changed completely in the 1980s after President Reagan fired striking air traffic controllers and replaced them with controllers from the military. While Reagan had the legal authority to fire the controllers—federal law prohibited strikes by federal employees—up until that time strikes by public employees at both the federal and state levels had generally been resolved without mass dismissals. But soon many private employers took their cue from President Reagan. In the years immediately following the air traffic controllers' strike, several major corporations, such as Eastern Airlines and the Greyhound Bus Company, hired replacements for striking workers.

With the threat of termination heightened, the strike became a less effective weapon for unions. Going on strike meant not only that workers might miss a few days or weeks of pay, it meant that they could permanently lose their jobs. As a result, unions were far more hesitant to strike, which meant they had less ability to press their demands against management. This not only directly hurt workers who were already unionized, it made unions appear much weaker to non-members. The benefits of joining a union became much less apparent in a context where unions were repeatedly forced to make concessions in contracts. Union leadership corruption certainly doesn't help either.

Another way the nanny state hampers efforts by less-skilled workers

to push up their wages is by outlawing many types of union activity. For example, secondary strikes are illegal. This means that one group of workers can't stage a strike in support of a second group of workers (e.g. truck drivers can't refuse to deliver food to a restaurant where the workers are on strike). In the case of a secondary strike, the conservative nanny state will fine or even imprison workers for being too aggressive in pushing for higher wages. Apparently, employers are too weak to be able to bargain with workers without help from the government.

The Knights of Labor rallied women and African Americans together with white male workers under the cry that "an injury to one is the concern of all." Moreover, unlike the trade unions with their rigid segmentation of the workforce, the Knights welcomed men and women from all occupations together under the same banner.

Proletarian culture is inherently subversive. It is funny. It reveres equality and camaraderie; everything else, as a matter of principle, must be subject to question and open to ridicule. It insists that, no matter how serious and prestigious capitalism appears, and how silly and frivolous socialism appears, capitalism has no right to prevail; socialism must win, not because it is serious, but because it is moral and correct and inevitable.

The really critical thing isn't who is sitting in the White House, but who is sitting in—in the streets, in the cafeterias, in the halls of government, in the factories. Who is protesting, who is occupying offices and demonstrating and disrupting. Those are the things that determine what happens.

Power corresponds to the human ability not just to act, but to act in concert. Power is never the property of an individual; it belongs to a group and remains in existence only so long as the group keeps together.

Power itself is not the problem. It never has been and never will be. Power is a constant and will not disappear within any society whether capitalist, socialist, communist, or anarchist. There will always be a power, a controlling force of some nature. Even anarchism is subjected to the power of those within such a system to decide that such society will be anarchist. For if someone decided they wished to live within a communist society or a capitalist society, the power of the prevailing anarchist society would deny such change that the person wished.

Power will not cease. Individual theologies of the moral uprightness of eschewing power does not negate the fact that power itself will exist. Eschewing power—whether individual or group—simply means that some other person or group will wield power. And again, power itself is not the problem.

Historically, power has been wielded by the propertied classes and those with access to money and finance. Indeed, it has been the struggle for power

between classes that has propelled history—for class struggle is history. It is too simplistic to say that a ruling class, by nature, is the enemy. Rather, it is the ruling class within a capitalist state and society that is the enemy, for this specific ruling class is the one that wields an oppressive power against the masses. Indeed though, even oppressive power is not by nature a negative force as it depends on what class is the oppressor and what class is being oppressed. It is without compunction that I say it is a material good for the working class to have power. It is a material good for the working class to have oppressive power when that oppressive power is used to oppress the structures of the capitalist system that subjugates the masses.

It is inherently just for the ills of the capitalist system—nay, the capitalist system itself—to not only be rejected by vitriolic words and defensive measures, but for the working class to engage in active suppression and, subsequently, at the point at which the working class becomes the ruling class, to engage in active oppression of those who would seek to reverse the power of the working class which has now become the ruling class. Without initial suppression and later oppression of reactionary capitalists, the human rights of the working class would once more be trampled under the foot of the capitalist.

No amount of liberal electoral democracy will guarantee the rights of the masses to be secure in the face of reactionary capitalist reversal. It takes one electoral cycle for the capitalist to legally come to power and legally reverse the democratic gains of the working class. One electoral cycle—bought and stolen by the capitalist class—to bring the capitalist elite back into power legally. For electoral democracy in the bourgeois capitalist stage simply means that the capitalist ruling class can legally be elected and legally legislate and legally adjudicate that their legislation is licit and thus legally oppress the working class since bourgeois capitalist democracy provides the “liberal freedom” to change any law—especially those that respect the working class—it sees fit to change. So it is that the working class is forever kept under the heel—legally and liberally—of the capitalist ruling class that wields its power in such a manner.

Power must not be eschewed by the working class. The working class must struggle for power. The working class must struggle to become the ruling class. The current pyramidal structure in which the capitalist ruling class elite sits on top of the masses must be inverted. The working class, which permeates the majority of the pyramid, must invert the pyramid so that the masses at the bottom will now occupy the highest level and the capitalist class, previously alone in its perch, will now be at the bottom, to not merely be sat upon by the masses, but to be driven into the ground by the weight of the masses—the new ruling class.

Do not reject the idea of a ruling class.

Become the ruling class!

Do not reject power.

Seize power!

Consciousness is key. We must understand that there are millions of us in this same boat. That our individual sense of helplessness, if we have it, is real. We cannot fight the one percent on our own. But together we can accomplish anything. We have allies all around us, but allow artificial barriers to prevent us from seeking them out. Those barriers are: race, religion, sexual preference, education, age, employment status, nationality, and more. Only one thing matters. We are *all* victims of the one percent and their lackeys. Our seemingly individual struggles all trace back to one source, the unelected, illegitimate ruling class. Once we understand this, solidarity with our brothers and sisters in struggle will be a natural outcome.

Any accommodation with members of the capitalist class is futile and self-defeating. They are the enemy. They will degrade and destroy everything, including the ecosystem, to get richer. They are not capable of reform. To strive for decent lives in the Anthropocene therefore means freeing ourselves from repressive institutions, from alienating domination. It can be an extraordinary emancipatory experience. There comes a time in human affairs when we must stare the situation squarely in the face.

It seems that the socialist focus on party above all may be required in absence of instant global communication system. And while this is often criticized as a form of authoritarianism or dictatorship, the same critiques are not leveled against capitalist corporations who often do not even offer the illusion of working to benefit the people. However, with universal access to education and information, it would seem that one can rely on the people directly for a much broader set of decisions than in the past.

The economy is a game. This game should be about nonessential things (motorcycles, jet skis, televisions). A person feeding their family, staying alive, having shelter is not a game—these should not be subject to an economy.

Labor unions are on the wane today, as everyone knows, down to 9% of the private-sector workforce from a high water mark of 38% in the fifties. Their decline goes largely unchecked by a Democratic Party anxious to demonstrate its fealty to corporate America, and unmourned by a therapeutic left that never liked those Archie Bunker types in the first place. Among the broader population, accustomed to thinking of organizations as though they were consumer products, it is simply assumed that unions are declining because nobody wants to join them anymore, the same way the public has lost its taste for the music of the Bay City Rollers. And in the offices of the union-

busting specialists and the Wall Street brokers and the retail executives, the news is understood the same way aristocrats across Europe greeted the defeat of Napoléon in 1815: as a monumental victory in a war to the death.

Part VI

The Puppetmasters

Meet the king of cowboys, he rides a pale pony
He fights the bad boys, brings them to their knees
He patrols the highways from the air
He keeps the country safe from long hair
I am the masculine American man
I kill therefore I am

I don't like the black man, for he does not know his place
Take the back of my hand or I'll spray you with my mace
I'm as brave as any man can be
I find my courage through chemistry
I am the masculine American man
I kill therefore I am

I don't like the students now, they don't have no respect
They don't like to work now, I think I'll wring their necks
They call me pig, although I'm underpaid
I'll show those faggots that I'm not afraid
I am the masculine American man
I kill therefore I am

Farewell to the gangsters we don't need them anymore
We've got the police force, they're the ones who break the law
He's got a gun and he's a hater
He shoots first, he shoots later
I am the masculine American man
I kill therefore I am

Violent Systems of Social Control

The Ongoing War

There has been little film criticism of *The Nightmare Before Christmas*, a childhood favorite and now a staple of American popular culture. But *The Nightmare Before Christmas* is more than a holiday favorite. It is an allegory of capitalist modernity. The 1993 stop-motion animated movie is based on Tim Burton's original poem of the same title, which centers on an all-powerful leader seeking to re-enchant his realm with the spirit of Christmas. And it happens to be a story that tells us something about life under capitalism.

The Nightmare Before Christmas begins in Halloweentown, a place inhabited by witches, vampires, ghosts, and other fiendish (though mostly friendly) creatures, but which otherwise contains virtually no magic. It runs and operates like any other town, with a diverse population, an urbanized downtown, an ineffectual and two-faced mayor, and research and development offices run by the creepy Dr. Finkelstein. However, it is Jack Skellington who wields the real power, represented by Burton as a Steve Jobs-style CEO, rather than a feudal-lord.

Jack is seen as a visionary by the townsfolk, a creative politician who wants to make the very state he controls into its own unique work of art. This figure of the friendly captain of industry mirrors others from Burton's films, such as Willy Wonka from *Charlie and the Chocolate Factory*. Burton as a director seems obsessed with the dictatorial powers of these entrepreneurs.

But while Jack is praised for his "brilliant leadership" in organizing each year's Halloween—for making "walls ooze," "flesh crawl," and the "very mountains crack"—Jack is soon bored of the whole scary affair. His life doesn't excite him anymore, and after another successful Halloween is over, he sings his famous lament in a graveyard. The civilization that Jack has built seems exhausted, and Jack cannot justify its existence anymore. As he puts it, this Halloween was "just like last year and the year before that and the year before that."

After Jack sings his Weberian lament of disenchantment, he wanders with his trusted ghost-dog Zero into the woods. He falls asleep, and in the morning wakes, encountering a circle of holiday trees. Each represents a portal into another dimension. At first, he sees a Valentine's tree, then a shamrock tree, an Easter egg tree, and a Thanksgiving turkey tree. But the tree that catches his attention is the Xmas tree. As he turns the knob on the Christmas tree, he is sucked into the world of Christmastown.

Jack is astonished: in the midst of the polar landscape is a little town of vibrant red and green, warm colors that contrast with the orange and black of Jack's land. In contrast to Jack's dead and undead citizens, the elf workers are alive, jolly, and lovingly cared for by Santa Claus. Santa appears to Jack as a strange towering red monster, who is happy and full of laughter. Jack is absolutely in love with this idyllic paradise, the living antithesis of the urbanized nightmare-scape of Halloweentown.

Jack returns to Halloweentown in awe of Christmas, and he undertakes a scientific research program in order to better understand the source of its enchantment. He contacts Dr. Finkelstein for lab equipment, and with the artifacts he gathered from Christmastown, he starts to cut, dissect, and even grind up these Christmas trinkets in order to understand.

But while Jack understands the forms and appearances of Christmas, he cannot understand its special something—its content and soul. Conducting his research in isolation from the townsfolk, Jack is a parody of instrumental reason: he dissects in order to understand, but such blinkered rationality cannot account for what is unique about Christmastown. The scientific enterprise is destined to fail.

Eventually, he resolves that Halloweentown will do Christmas this year, and Jack embarks on the new project with all the energy of a corporate takeover, even transforming himself into Santa Claus after an abduction of the real Father Christmas.

Jack cannot rely on mere legality to pressure Christmastown, so he hires "Halloween's finest trick or treaters," Lock, Shock, and Barrel, to kidnap Santa. Jack realizes that they are his enemy Oogie-boogie's henchmen, the most infamous gangster of Halloweentown, but Jack needs Oogie's mercenaries to carry out this crime. Jack does not want complications, so he asks the trick-or-treaters to keep this mission a secret and to ensure that "no good Oogie-boogie" stays out of it. But the evil trick-or-treaters lie to Jack, and drag the kidnapped Santa Claus to Oogie's lair, where Oogie tortures him.

Meanwhile, Jack ignores what his friend Sally tells him: that she has had visions of this plan ending in disaster and death. Instead of heeding Sally's warnings, he conscripts her to make his Santa Claus outfit.

Jack redesigns the whole concept of Christmas to fit in with Halloweentown. To fulfill his grandiose vision, he enlists the townspeople as helpers, exploiting his labor force in an effort to speed up production and circulation of the Halloween commodities he now repackages as Christmas gifts.

With strong Elon Musk vibes, Jack wants to reengineer Christmas, to make it more tech-savvy: instead of real reindeer, he builds mechanized deer-like robots; instead of simple children's toys he manufactures sleek (but terrifying) creations. Instead of grasping the spirit of Christmas, Jack kills it, turning it into a corporate monstrosity.

Jack descends on the houses of a sleepy and unsuspecting suburbia as the new Santa. But people are shocked by this version of Christmas. Families run in horror from a re-imagined Santa Claus that now takes the form of a dead skeleton. Children are frightened by the gruesome Halloween-themed toys. Eventually, Jack is gunned down by the military, and his mechanized reindeer and sleigh are shot out of the sky.

Jack gives up his ambition to take over Christmas. He endeavors to restore order in Halloweentown and seeks to return the real Santa Claus to his rightful home. The movie ends on a Thanksgiving-like theme (the holiday that is between Halloween and Christmas), and the nations of Halloweentown and Christmastown agree to a *status quo ante bellum*.

At one level, Jack's attempt at overcoming his malaise through exoticism leads to the brutal accumulation and expropriation of another country. But the violence Jack represents is also that of generalized commodity production, of knocking down the walls of the sleepy dreamland of Christmastown. In Jack's hands, all that was sacred about Christmas is profaned. Jack's narcissism is the narcissism of the bourgeoisie, as he tries to create a world after his own image.

In appropriating Christmas for himself, Jack destroys its religious, sentimental, and feudal character. Jack's project conjures Marx's famous description of capitalism: like capitalism, Jack has "drowned the most heavenly ecstasies of religious fervour, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation." In substituting Santa's toys with his own "improved" creations, the children are confronted with the monstrosities of a market that is "shameless and direct" as Marx puts it.

But if Jack ultimately puts an end to his hybrid experiment, the film's resolution only serves to mask the problematic social relations between Santa and his exploited worker elves. In keeping this realm magical, Jack helps to reify Santa's exploitation as a wonderful thing.

Jack consistently exoticizes Christmastown throughout the movie, first as a new and enticing commodity, and then as something precious to be

protected at all costs. But what remains is this othering; of not seeing Santa's elves as workers, but as exotic fixtures in a faraway world. Jack starts the movie as a plundering neoconservative, trying to refashion the other for profit. He ends up as a sentimental paleoconservative, hoping to stave off the globalizing forces of his own city.

The very antinomy between Halloweentown and Christmastown presupposes other basic contradictions of capitalism that Marx said will fester "until its blessed end." This is the contradiction between reason and values, or between instrumental rationality and what has intrinsic worth. Marx argues in the *Grundrisse* that it is the limited forms of bourgeois reason, or positivism, that give birth to its own romantic antithesis. Within the limits of the market, one cannot see beyond the contradictions of capitalism. The hollowed-out forms of reason that we see in liberalism, from Mill to Habermas, cannot provide bourgeois society with its own purpose and meaning. With such gnawing spiritual emptiness, bourgeois society must latch onto an external and extralogical kind of faith to keep it going, and this is why Marx saw clearly the link between positivist rationality and romanticism that looks back to the past.

Jack's quest to appropriate the mystical aura of Christmastown is the same dialectic of a hollowed-out reason looking for justification. In attempting to re-enchant his world, he fails. All he can do is preserve the dualism between reason and faith, since if he attempts to cross these streams, it will end in destruction. Reason and faith must be seen as nonoverlapping magisteria, and everyone must know their place in this world. If reason does not know its limits, then it will try to actualize itself in history, and all such attempts to "immanentize the eschaton" (as conservatives will tell us) will end in totalitarianism.

The limitations of Jack's reason are the same as bourgeois society writ large. Jack's yearning for some mysterious other is itself a flight from the problems he faces in modern Halloweentown. An archaic magical realm such as Christmastown will not solve Jack's problems. Jack is looking for his Holy Family in Christmas while ignoring his own Earthly Family back home.

Jack's dilemma is twofold: he is looking for something beyond reason to sustain his existence and he is also looking for something beyond the mass society of Halloweentown. The people of Halloweentown had to be convinced by Jack to go along with his Christmas plans, but they were already quite happy with practicing the holiday as a mass festival. Yes, they do praise Jack as their king, but they do not see any problem with the holiday. They do not see their world the way Jack does, as dreary and disenchanting. Halloween for them is self-justifying as a form of entertainment, and it does not need a

supernatural supplement from Christmastown to make it better.

This may be seen as too commercialized, but the masses here have the right idea compared to Jack. They have accepted Halloween on secular terms, as most people do: a holiday that can sublimate all our primordial terrors and fears as forms of entertainment. What is wrong with Halloweentown are not its festivals and entertainment, but Jack's attempt to commodify them, in order to better subject consumption to exchange. Jack's pessimistic view that his world and its citizens are not good enough is the excuse he needs to exploit them.

“The big problem is that the government is at the jugular of businessmen. The worker will have to decide: less rights and employment or all the rights and unemployment.”

If we judge from history, the desire to relegate one group of society to the task of manual labor is a powerful feature of human social psychology. The justification for such a division of labor is typically based on differential attributions of the human capacity for theoretical reflection. Some groups, it is said, are best equipped for practical tasks and others for theoretical tasks, a view that has traditionally been at the basis of the justification of slavery. But almost every society, whether or not it has a practice of slavery, endorses some version of it.

It takes only two things to keep people in chains: The ignorance of the oppressed and the treachery of their leaders. To rule a people requires the cooperation of the people being ruled.

Democracy has never been and never can be so durable as aristocracy or monarchy. It soon wastes, exhausts, and murders itself. There never was a democracy yet that did not commit suicide.

Democracy only exists as a collective dream—a dream that, by definition, can never reach a state of complete realization. As soon as people become convinced that the dream has been attained, democracy is already dead. What takes its place is a profound form of anti-democratic paranoia, a marrow-level dread turned against any groups that are perceived as trying to take it away. The repression of these groups is then given tacit or explicit support by the very people who believe they are “protecting” themselves by doing so. American “democracy” becomes a bizarre form of psychosis. It becomes the celebration of a reality that exists most purely in the form of existential fiction, and all matters of democracy are viewed through a purely existential lens. It is the thing you have, the thing you are, the history you embody just by living in it now. It is not the J20 protesters or the NoDAPL

protesters or the citizens of Flint or any other elements who exist on the margins of the already-achieved democratic project.

If the citizens neglect their Duty and place unprincipled men in office, the government will soon be corrupted; laws will be made, not for the public good so much as for selfish or local purposes; corrupt or incompetent men will be appointed to execute the Laws; the public revenues will be squandered on unworthy men; and the rights of the citizen will be violated or disregarded.

Anyone who has ever lived or worked in a corrupt dictatorship knows what happens. When the system is rigged, when ordinary citizens are powerless, and when whistleblowers are pariahs at best, three things happen. First, the worst people rise to the top. They behave appallingly, and they wreak havoc. Second, people who could make productive contributions to society are incentivized to become destructive, because corruption is far more lucrative than honest work. And third, everyone else pays, both economically and emotionally; people become cynical, selfish, fatalistic. Often they go along with the system, but they hate themselves for it. They play the game to survive and feed their families, but both they and society suffer.

Elites—that is, the political and corporate ruling classes, and the professional classes who do much of those rulers' thinking for them—hate to listen to people.

“I know I personally get very frustrated because I'm in several disadvantaged groups, and the decisions of politics directly impact my everyday life, and have since the day I was born. I often find the people who disagree with me are people who came from good or at least middle class families and have often never had to apply for Welfare, wait hours at methadone clinics for their parents because of ridiculous laws, find ways to get from one side of town to the other so your parent won't go to jail because they missed this one appointment.

I mean, most people in America legitimately do not understand what it is like to live truly poor and at the subject of arbitrary, often very difficult to follow rules that politicians like to tack on to the end of bills or laws or help that's supposed to prevent you from being homeless. So I get passionate about it, and I get angry, because I feel they aren't listening to me or even taking a moment to consider how they would feel if they were in those situations, how lucky they are to have been randomly birthed in their family rather than mine. It's hard to

stay impartial sometimes dealing with people who have so much and never once know it.”

Our society constantly proclaims that anyone can make it if they just try hard enough, all the while reinforcing privilege and putting increasing pressure on its overstretched and exhausted citizens. An increasing number of people fail, feeling humiliated, guilty, ashamed. We are forever told that we are freer to choose the course of our lives than ever before, but the freedom to choose outside the success narrative is limited. Furthermore, those who fail are deemed to be losers or scroungers, taking advantage of our social security system.

America is the wealthiest nation on Earth, but its people are mainly poor, and poor Americans are urged to hate themselves. It ain't no disgrace to be poor, but it might as well be.

It is in fact a crime for an American to be poor, even though America is a nation of poor. Every other nation has folk traditions of men who were poor but extremely wise and virtuous, and therefore more estimable than anyone with power and gold. No such tales are told by the American poor. They mock themselves and glorify their betters. The meanest eating or drinking establishment, owned by a man who is himself poor, is very likely to have a sign on its wall asking this cruel question: ‘If you're so smart, why ain't you rich?’ There will also be an American flag no larger than a child's hand—glued to a lollipop stick and flying from the cash register.

Americans, like human beings everywhere, believe many things that are obviously untrue. Our most destructive untruth is that it is very easy for any American to make money. We will not acknowledge how hard money is to come by, and, therefore, those who have no money blame and blame and blame themselves. This inward blame has been a treasure for the rich and powerful, who have had to do less for their poor, publicly and privately, than any other ruling class since, say, Napoleonic times.

Many novelties have come from America. The most startling of these, a thing without precedent, is a mass of undignified poor. They do not love one another because they do not love themselves.

Popular morality blames victims for going into debt—not only individuals, but also national governments. The trick in this ideological war is to convince debtors to imagine that general prosperity depends on paying bankers and making bondholders rich—a veritable Stockholm Syndrome in which debtors identify with their financial captors.

Utilitarianism isn't how people behave. One must not confuse prescription with depiction. Society behaves with brutal exploitation. It isn't the greatest happiness for the greatest number, but for the fewest number. So

the Elites are always on a knife edge, they fear to go to sleep, just like when they owned Southern plantations. Their slaves might make sure they never wake up. This is why the Elite must always hate the exploited, in any economic system. The Elite must treat the average person like Hell in order to get into or stay in the Elite. The price is blowback. So yes, better slaving technology to control blowback would help them superficially, but it doesn't get rid of the slavery. The wage and debt slavery of today, is merely the more sophisticated version of chattel slavery of the past. You can never fix things by only dealing with symptoms.

People of privilege will always risk their complete destruction rather than surrender any material part of their advantage. Intellectual myopia, often called stupidity, is no doubt a reason. But the privileged also feel that their privileges—however egregious they may seem to others—are a solemn, basic, God-given right. The sensitivity of the poor to injustice is a trivial thing compared with that of the rich.

“There is not an industrial company on earth, not an institution of any kind—not mine, not yours, not anyone's—that is sustainable. I stand convicted by me, myself alone, not by anyone else, as a plunderer of the earth. But not by our civilization's definition. By our civilization's definition, I'm a captain of industry and in the eyes of many, a kind of modern-day hero.”

Or here's what Dalio wrote about being a Wall Street hyena:

“When a pack of hyenas takes down a young wildebeest, is this good or bad? At face value, this seems terrible; the poor wildebeest suffers and dies. Some people might even say that the hyenas are evil. Yet this type of apparently evil behavior exists throughout nature through all species . . . like death itself, this behavior is integral to the enormously complex and efficient system that has worked for as long as there has been life. It is good for both the hyenas, who are operating in their self-interest, and the interests of the greater system, which includes the wildebeest, because killing and eating the wildebeest fosters evolution, i.e., the natural process of improvement. Like the hyenas attacking the wildebeest, successful people might not even know if or how their pursuit of self-interest helps evolution, but it typically does.

How much money people have earned is a rough measure of how much they gave society what it wanted.”

As it happens, the vast majority of Americans are unprofessional: they are the managed, not the managers. But people whose faith lies in “cream rising to the top” tend to disdain those at the bottom. Those who succeed, the doctrine of merit holds, are those who deserve to—who race to the top, who get accepted to good colleges and get graduate degrees in the right subjects. Those who don’t sort of deserve their fates.

“One of the challenges in our society is that the truth is kind of a disequalizer. One of the reasons that inequality has probably gone up in our society is that people are being treated closer to the way that they’re supposed to be treated.”

—Larry Summers

People are ‘worth’ what they’re paid in the market in the trivial sense that if the market rewards them a certain amount of money they must be. Some confuse this tautology for a moral claim that people deserve what they are paid. One of the most broadly held assumptions about the economy is that individuals are rewarded in direct proportion to their efforts and abilities—that our society is a meritocracy. But a moment’s thought reveals many factors other than individual merit that play a role in determining earnings—financial inheritance, personal connections, discrimination in favor of or against someone because of how they look, luck, marriage, and, perhaps most significantly, the society one inhabits. If we are very generous with ourselves I suppose we might claim that we earned as much as one-fifth of our income. The rest is the result of being a member of an enormously productive social system.

In portraying the concentration of money in society as a reasonable development—as a reward for successfully competing against other capitalists—the libertarian tradition completely dismisses the power of concentrated money. Hayek, for example, claims that in a “competitive society”—a meaningless abstraction, different kinds of societies can be ‘competitive’—nobody possesses excessive power, arguing, “so long as property is divided among many owners, none of them acting independently has exclusive power to determine the income and position of particular people.” Okay, fine, maybe not exclusive power, but to the degree that property is divided among fewer and fewer owners, these people can achieve overwhelming power to determine the income and position of others. Such as by acquiring greater “positive freedom” to dominate the state in their interests and against the interests of others, who thus proportionately lose positive freedom and possibly (again) even negative freedom; such as if the

wealthy can get laws passed that restrict dissidents' right to free speech or free assembly.

More generally, it goes without saying that positive freedom is proportional to how much money you have. It apparently doesn't bother most libertarians that if you're poor and unable to find an employer to rent yourself to—in the gloriously 'free, voluntary, and non-coercive' labor market—you won't be able to eat or have a minimally decent life. Hopefully private charities and compassionate individuals will come forward to help you; but if not, well, it's nothing that society as a whole should care about. Strictly speaking, there is no right to live—or to have shelter, food, health care, education—there is only a right not to be interfered with by others. What a magnificent moral vision.

In light of all these practices and policies that have emerged, directly or indirectly, out of the dynamics of the West's market economy, to argue that capitalism promotes human freedom is to be a hopeless intellectual fraud and amoral minion of power. If that judgment sounds harsh, consider this gem from Hayek, directed against measures to ensure worker security:

“It is essential that we should relearn frankly to face the fact that freedom can be had only at a price and that as individuals we must be prepared to make severe material sacrifices to preserve our liberty.”

More exactly, working-class individuals have to make severe sacrifices to preserve the liberty of the capitalist class.

If I could fly out to some other country, hire a driver, protection, et cetera, I could be a psychotic recluse much as I currently am, but it could all be done with variety and power.

It makes me realize why I hate capitalism so much. The people in power have so fucking much control that average people can't even comprehend that addiction. As much as I have to my benefit, I can't fly to some random location and buy a new home to escape. I can't buy humans for their high quality labor, meaning their lives through their time. When it gets down to it, what need is there for slavery when we can simply buy all the people we could ever need? The only problem with not having outright slavery is that we'd be empowering them, as they slave for us, away from their ties to our capital.

No one can possibly become wealthy unless they steal from someone. And we know that those who are wealthy have stolen from the majority of the population throughout history.

As a society we've convinced ourselves the only way to measure our own success or self-worth is by the number of people who die from being less fortunate than us.

It has always seemed strange to me the things we admire in people—kindness and generosity, openness, honesty, understanding and feeling—are the recipes for failure in our system. And those traits we detest—sharpness, greed, acquisitiveness, meanness, egotism, and self-interest—are the traits of success. And while we admire the quality of the first, we love the products of the second.

The great merit of the capitalist system, it has been said, is that it succeeds in using the nastiest motives of nasty people for the ultimate benefit of society.

There are constant laments about the so-called loss of norms and values in our culture. Yet our norms and values make up an integral and essential part of our identity. So they cannot be lost, only changed. And that is precisely what has happened: a changed economy reflects changed ethics and brings about changed identity. The current economic system is bringing out the worst in us.

With the loss of an awareness of the common good, there is no stomach for sacrifice of any kind. Moral decay at the top quickly infects the entire social-order pyramid. Once injustice is institutionalized in unearned privileges, rentier skims and scams, systemic fraud, state-enforced rackets, a some-are-more-equal-than-others judicial system and a drug-war Gulag for the disenfranchised, the systemic injustices corrupt not just every institution but the culture that is internalized by every participant.

“All our things are right and wrong together. The wave of evil washes all our institutions alike.”

An economic system that rewards psychopathic personality traits has changed our ethics and our personalities. They're rich because they are ruthless and unprincipled, or were born rich, or both. The rich are rich because they are lucky and immoral.

Grabbing what you can get isn't any less wicked when you grab it with the power of your brains than with the power of your fists.

Instead of empires ripping out people's hearts to sacrifice to gods, we have people voluntarily selling their organs and blood to the powerful in order to survive, or being attacked by others who wish to sell their organs. Peter Thiel can buy the blood of the young legally. West African politicians can buy amulets made from the young with impunity. Those who thrived in the trade economy did not turn out to have any greater merit, only greater

proximity to power and less social obligations. Freedom to act without concern for social obligations created a system designed for the promotion of sociopaths.

Functional societies need algorithms which reward us for being of service to those who need it most. Instead we have algorithms which reward us for being of service to those who need it least.

Unfortunately trading ethics for comfort is par for the course in America. We can aspire to become conscious participants in the system. We can understand where our money is going before we give it out, and be aware of how our actions collude with economic oppression and exploitation. But I can't help feeling that more is required. What could stop the march of convenience? It's a question my generation may one day have to answer. But by then, will the luckier ones among us have become too comfortable to care?

Ah yes. The point where what's keeping you back is basic human empathy. You can succeed if you just get rid of that. It's a dead weight holding you down from profiting off complete commercialization of your marketable skills.

I honestly wonder how many honest people thought of the whole ride sharing idea and were in the process of trying to build their business the legitimate way before Uber broke laws and sailed right by them. It goes to show you: the people who get the biggest rewards in capitalism are the ones who play closest to the line of dishonesty without getting arrested.

The dominance of the ideology of competition has created a really toxic social environment in the West. Some people prefer to base their opinions of themselves not on who they can beat in any given competition, but rather on how they live up to their own expectations. Some people prefer not to compete with themselves or others, and are happy to just go about their own business. Having competition and competitiveness at the foundation of a dominant social ideology creates a dynamic in which those who are not inclined towards competitiveness will always have to compete with those who are more naturally inclined to it, often resulting in a descent to the lowest common denominator—the pursuit of wealth by any means and to the exclusion of all else—for the competitive and frustration or depression for those less inclined towards competitiveness.

That said, there's nothing wrong with competition and competitiveness per se, but it is a poor ideological foundation for a society to be built on, as things like love and kindness are much more important to the overall well-being and happiness of any given society. The very foundations of this culture are problematic.

“Problematic culture? Humans have a comparative sense of achievement. We’ve been around for 200,000 years and have been building more and better tools and toys, eating more, reproducing more, fucking the most attractive people we can, and just straight up competing the whole time. In fact we were doing it long before we were even what we consider to be modern humans!

We could have stopped at any time. Just sit around in shade and occasionally murder a gazelle, done. To put this on culture seems a little ridiculous. I mean hell, you can bow out of this shitshow whenever you want. A homeless person in a Western country is going to be more sheltered from the elements, more secure in their food source, have better access to clean drinking water, be safer from animals and disease, than pretty much any of our ancestors.

If not working long hours for tech companies, we’d be finding some other way to throw hours at triumphing over our fellow man. Tech companies are just the latest brand of competitive achievement. It’s always been around. It’s always been a primary motivator. It’s always made things suck for a large amount of people. And it’s always going to be here.

Shit, 300 years from now Basic Income Utopia—where everything we currently consider a job has been automated—is going to be full of people working 80+ hour weeks and others that are genuinely depressed at having to put in 50 to try to keep up. They’ll be putting that time in to having the perfect body, or writing poetry to seem artsy and creative, or practicing their conversational skills so they can be the wittiest person at the weekly pre-orgy drinking ceremony so they can be the one with the privilege to take a run at the prettiest girl before she’s sloppy with semen.

We were doomed to this bullshit by our own biology. Problematic culture it is not.”

A primate which has invented the concept of god and has gotten the vast majority of its kin to believe in some form of this god, cannot overcome urges that perhaps are rooted in some way in biology?

Profit, or money in general, is all these people live for, it’s their altar. That’s why they are successful in this world. It’s also why the world is doomed. Is there any chance I could persuade you to dwell on that for a few seconds? That, say, Bloomberg and Carney, and all they represent, are

the problem dressed up as the solution? That our definition of success is what dooms us?

It was to resist personal gain-seeking at the expense of the body politic and group solidarity that the world's major philosophies and religions for the past two-thousand years urged self-control, generosity, care for the weak and poor, and rules to limit the luxurious self-indulgence and anti-social egotism it bred in ruling elites. Excluding this intellectual legacy from the curriculum has paved the way for inverting today's moral attitude upholding creditor claims against the rest of society.

To help cover up this heist of the economy, an appealing intellectual gloss was needed. So public intellectuals were recruited and subsidized to turn "globalization," "neoliberalism," and "the Washington Consensus" into a theological belief system. The "dismal science of economics" became a miracle of faith. Wall Street glistened as the new promised land, while few noticed that those angels dancing on the head of a pin were really witch-doctors with MBAs brewing voodoo magic. The greed of the Gordon Gekkos—once considered a vice—was transformed into a virtue. One of the high priests of this faith, Lloyd Blankfein, CEO of Goldman Sachs, looking in wonder on all that his company had wrought, pronounced it "God's work."

Having on more than one occasion suffered through management restructuring organized by MBA's which did nothing other than reduce productivity in favour of meaningless metrics and increase the power of managers who had no idea how to actually do the job, I'm increasingly coming to the conclusion that the MBA was a clever invention by an anarchist determined to create a virus to undermine capitalism from within. At least, that's the only possible theory that makes sense to me.

We are throwing more and more of our resources, including the cream of our youth, into financial activities remote from the production of goods and services.

"I'm a little surprised this discussion can be held without mention of the notion that swept the nation in the 1980s that 'greed is good.' Yes, I know I'm quoting Gordon Gekko, but he was our hero. He spoke the credo by which we lived our lives: each of us, individually, acting solely in our own selfish interest, improved conditions for everyone. Greed was the tide that would lift all all boats.

I was one of those young men who felt he had the world by the balls in the 1980s. I was a total unquestioning believer in 'Reaganomics,' the theory that society benefits most when wealth

is transferred from those at the bottom and middle economic tiers into the pockets of the already-rich, from which it would 'trickle-down' to the masses. We loved to identify to each other those who weren't contributing their 'fair share.' We loved to rag on them at the office. Reagan's notion of the 'welfare queen' gave us all moral cover for our attitude: 'I got mine; you're on your own, Buddy.'

And, largely within my own lifetime, the notion of 'you're on your own' replaced the traditional American belief of a family, a community, a nation. . . that 'we're all in this together.' But, then, I suffered the big twin—the two life-changing events that result in the large majority of American bankruptcies—a sudden loss of income (I was laid off from a high-tech job during the 'dot-com' bubble bust in 2002), and my wife had a life-threatening cancer. I realized quickly that I lived in a society with an inadequate safety net for its citizens. It's not a cruel society; it's a dispassionate one, it is a society in which an increasing number of people cannot feel basic empathy for others, not if they can identify some characteristic that turns those people into 'others.'

I simply chose not to be like that, in my personal life, and in my choice of a home in which to grow old and die. We immigrated to Canada in 2005, when I was 48 years old, already well past the point when most people make such a huge life change. Mine was a very personal choice and not one I feel I have the right to expect others to make. And that, in itself, was the major way in which I changed as a man: I stopped trying to make other people live up to my own expectations, and I stopped that incessant, sanctimonious, self-pitying whining, 'Everybody hates us, everyone wants to kill us, they envy us for our freedom because we're so good.' Oh, grow up.

What most Americans need most is a good hard dose of reality. I know I certainly did. I'm a better man for it, And if you're twenty-something today; I think you'll be better for it. Want to prosper? Help others. Make real friends, and value them. You want to live free and peacefully? Defend the freedom of others, who are often the victims of US aggression. Don't think 'more war means more jobs.' That's sick. And I was, in my youth, a very sick man."

Most of the problems in our society stem from the wealthy, the divide between them and the rest, and the things these people do to maintain their

positions of dominance over the rest.

In the FDR-liberal world, the function of government is to provide services to citizens and protection from predators in the private sector. In the neoliberal world, the function of government is to manage government services so the private sector is given the most profit opportunities possible. This is why the ACA, the brainchild of a neoliberal president and his party, is written the way it is. It provides a public service—health care coverage—in a way that supports and ensures the profits of the predatory health insurance industry. These cooperative agreements and policies, in which government serves up its citizens to private-sector profiteers, are often called “public-private partnerships.”

After the failure and abuses of privatization and contracting-out services from the 1980s, there has been renewed appreciation for the role of the state or government. Earlier promoters of privatization have taken a step backward, only to take two more forward to instead promote public-private partnerships (PPPs). PPPs are essentially long-term contracts, underwritten by government guarantees, with which the private sector builds (and sometimes runs) major infrastructure projects or services traditionally provided by the state, such as hospitals, schools, roads, railways, water, sanitation, and energy. PPPs are promoted by many governments associated with the Organization for Economic Co-operation and Development (OECD) and some multilateral development banks—especially the World Bank—as the solution to the financing shortfall needed to achieve development, including the Sustainable Development Goals (SDGs).

Since the late 1990s, many countries have embraced PPPs in many areas ranging from healthcare and education to transport and infrastructure—with mixed consequences. They were less common in developing countries, but that is changing rapidly, with many countries in Asia, Latin America, and Africa now introducing enabling legislation and initiating PPP projects. PPPs are now an increasingly popular means to finance mega-infrastructure projects, but dams, highways, large plantations, pipelines, and energy or transport infrastructure can ruin habitats, displace communities and devastate natural resources. Typically, social and environmental legislation is weakened or circumscribed to attract investors for PPPs. There are also a growing number of dirty energy PPPs, devastating the environment, undermining progressive environmental conservation efforts and exacerbating climate change. PPPs have also led to forced displacement, repression, and other abuses of local communities, indigenous peoples, displaced farmers, and labourers among others.

Experiences with PPPs have been largely, although not exclusively, negative, and very few PPPs have delivered results in the public interest.

There has been some supposed success with infrastructure PPPs, mainly due to financing arrangements. Generally, PPPs for hospitals and schools have much poorer records compared to infrastructure. One can have good financing arrangements, due to preferential interest rates, for a poor PPP project. Nevertheless, private finance all over the world still accounts for a small share of infrastructure financing. However, good financing arrangements will not make a bad PPP project any better.

PPPs typically involve public financing for developing countries to attract bids from influential private companies, often from abroad. “Blended finance,” export financing, and new supposed aid arrangements have become means for foreign governments to support powerful corporations bidding for PPP contracts abroad, especially in developing countries. Incredibly, such arrangements are increasingly counted as overseas development assistance, as North-South, South-South, or triangular development cooperation.

Like privatization, PPPs often increase fees or charges for users. PPP contracts often undermine the public interest in other ways, with generous host government incentives and other privileges, often compromising and undermining the state’s obligation to regulate in the public interest. PPPs can limit government capacity to enact new legislation and other policies—such as strengthened environmental or social regulations—that might adversely affect or constrain investor interests.

PPP contracts are typically complex. Negotiations are subject to commercial confidentiality, making it hard for civil society and parliamentarians to provide checks and balances in the public and national interest. Such limited transparency significantly increases the likelihood of corruption and undermines democratic accountability. It is important to establish the circumstances required to achieve efficiency gains and to recognize the longer-term fiscal implications of PPP-related contingent liabilities. Shifting public debt to government guaranteed debt does not really reduce government debt liabilities, but obscures accountability as it is taken off-budget and is no longer subject to parliamentary, let alone public scrutiny.

Hence, PPPs are more likely to be abused because they are typically “off balance sheet” so that they do not show up as government debt, giving the illusion of easy money or credit. Despite claims to the contrary, PPPs are typically riskier for governments than for the private companies involved, as the government may be required to step in to assume costs and liabilities if things go wrong. PPPs also undermine democracy and national sovereignty as such contracts tend not to be transparent and subject to unaccountable international adjudication—due to investor-state dispute settlement (ISDS) commitments—rather than national or international courts. Under World Bank-proposed PPP contracts, for example, national governments can even

be liable for losses due to strikes by workers.

One alternative, of course, is government or public procurement. In many instances, PPPs have become the most expensive financing option and much less cost-effective than transparent competitive government procurement. They cost governments significantly more in the long-run than if the government procures on an open competitive basis, or if projects are directly financed by government. Generally, PPPs are much more expensive than government procurement despite government subsidized credit. However, with a competent government doing good work, government procurement can be efficient and low cost. With a competent government and accountable consultants, efficient government procurement has generally proved far more cost-effective than PPP alternatives. It is therefore important to establish when and why meaningful gains can be achieved through PPPs, and when these are unlikely.

In the FDR-liberal world, the function of government is called “promoting the general welfare.” In the neoliberal world, the function of government is called “wealth creation.” Another way to say it is this: In the neoliberal world, citizens are the product whose money is delivered to corporations in exchange for government services. It’s quite a lucrative scam.

As I see it, the system is an ongoing war. Regardless of my opinions, capitalists are infringing on our freedoms and trying more and more to cage and milk us for all our worth, from our labor directly, and through our consumption, as well. Hence the hatred of concrete abuses of demand by businesses like Comcast and concrete abuses of labor by jobs in fast food and at Walmart. Ignorance is what lets Comcast tack on fees for equipment we already returned, or for businesses like Walmart and fast food places to exploit our tax subsidies to their employees because they refuse to pay a living wage despite their profits.

My envy and greed is absolutely the thing I’m against, which is why I have to retain it. I’ve been shamed all my life for my potential greed. Unions have been undermined and demonized as greedy, yet the capitalist dictators are given full respect for their greed. How can balance form when only one side is allowed to be greedy? We’re talking about institutions versus individuals. Individual merit can never stand up against the greed of institutions that further link together to empower themselves through media propaganda and control of laws.

Media elites, by virtue of their position, adore the status quo. It rewards them, vests them with prestige and position; welcomes them into exclusive circles; allows them to be close to—if not themselves wielding—great power while traveling their country and the world; provides them with a platform; fills them with esteem and purpose. The same is true of academic elites,

and financial elites, and political elites. Elites love the status quo that has given them, and then protected, their elite position.

Remember: Journalism, by definition, is publishing something that somebody doesn't want to be published. Everything else is just PR.

A democracy requires an informed electorate. The media fought tooth and nail to keep the US electorate uninformed. Poorly educated white voters are essentially fooled into voting against their own economic interests in favor of partisan ideologies that reward the wealthy, usually by means of straw man arguments about ethnic and religious minorities.

This kind of voter alienation is a tactic. The demands political systems make of us—of constituting ourselves as subjects, of liberating ourselves, expressing ourselves at whatever cost, of voting, producing, deciding—are in their own way an exercise of power. In these conditions, resistance takes the form of the refusal to do so—the renunciation of the subject position and of meaning—precisely the practices of the masses.

The idea that politics resets itself every four years is a fiction that benefits only those who devote their lives to satisfying personal ambition through political power. In other words, exactly the people we should be criticizing, opposing, and fighting, not enabling or whitewashing in article after article, television sermon after television sermon.

“This disposition to admire, and almost to worship, the rich and the powerful is the great and most universal cause of the corruption of our moral sentiments.”

Autonomy is only possible as a whole society and as we have no more societies we are farther than ever from autonomy. There is no diversity under one grey, global empire. The prevailing culture around the world—in fashion, in music, in architecture, in lifestyle—is mass produced corporate ugliness, not evolved from any regional culture. We are educated in the same way for the same jobs and coerced by the same news and celebrities. We are all under the same empire but we have no great collaborative projects or joint plans for the future. We have lost our tribal societies but instead of receiving protection from outside plunder, the current empire has convinced us to plunder ourselves, to destroy our own homes and poison our own children and walk willingly into lifelong slavery with no chains. The global elite have no basis of authority, but with no existing societies or system of collaboration that is not based on the trade economy, most feel helpless to change the underlying structure.

Economists have replaced philosophers, banks have replaced churches, searching for profit has replaced searching for knowledge. People have been

reduced to live, consume, die. The artisans have not won, or the athletes, the philosophers, the caregivers, the artists, or even the warriors. The parasites have won.

If you put the two trends together—increased individual income inequality and increased corporate savings—what we’re witnessing then is increasing private control over the social surplus. Wealthy individuals and large corporations are able to capture and decide on their own what to do with the surplus, with all the social ramifications associated with their decisions to invest where and when they want—or not to invest, and thus to accumulate cash, repay debt, and repurchase their own equity shares. Proposals to decrease tax rates for wealthy individuals and corporations will only increase that private control.

And here we come to the real meaning of the “freedom” that capitalists and their publicists so love to extol. ‘Freedom’ for industrialists and financiers is freedom to rule over, control and exploit others; ‘justice’ is the unfettered ability to enjoy this freedom, a justice reflected in legal structures. Working people are free to compete in a race to the bottom set up by capitalists. The world’s central banks have printed and spent trillions to buy bonds, mostly those issued by their own governments. Imagine what that spending could have done if that money had been given to people or used for productive social spending instead of a free lunch for financial speculators.

In Switzerland an often used expression to describe ‘the people’ is “the sovereign.” This is a very accurate description of the status of the people in a real democracy: they are sovereign in the sense that nobody rules over them. In that sense, the issue in the United States is one of sovereignty: as of today, the real sovereign of the US are the corporations, the deep state, the Neocons, the plutocracy, the financiers, the Israel Lobby—you name it, anybody but the people.

Our society runs on a simple ethic: nothing can be allowed to happen if someone important doesn’t get rich doing it.

I have always found it odd that people rail against government intervention as if it is a blight on our freedom, but ignore the governance of workplaces by capital, who seek every way possible to destroy our freedom and initiative unless it is serving to advance their bottom line. We ignore the benefits of collective goods and laws that protect us, but turn a blind eye to the ongoing, minute-by-minute, repression in the workplace.

Allowing private parties to own our major industries, managing them for private profit, is at odds with true democracy. It hands to a few individuals power over people’s jobs and lives, over wealth that should belong to us all, and over critical decisions that affect our destiny. Capitalism is incompatible with solving the climate crisis and addressing other injustices.

We are at a point where government and every way we have organized society are under great stress and the only organized structures left are corporations which attack any organized society as an impediment to their interests.

Small government and privatization always benefit the rich and punish the rest. When you hear a politician talk about small government and privatization, ask yourself just one question: Who is bribing this guy?

The privatization or marketization of public services such as energy, water, trains, health, education, roads, and prisons has enabled corporations to set up tollbooths in front of essential assets and charge rent, either to citizens or to government, for their use. Rent is another term for unearned income. When you pay an inflated price for a train ticket, only part of the fare compensates the operators for the money they spend on fuel, wages, rolling stock, and other outlays. The rest reflects the fact that they have you over a barrel.

Like rent, interest is unearned income that accrues without any effort. As the poor become poorer and the rich become richer, the rich acquire increasing control over another crucial asset: money. Interest payments, overwhelmingly, are a transfer of money from the poor to the rich. As property prices and the withdrawal of state funding load people with debt—think of the switch from student grants to student loans—the banks and their executives clean up.

We pay people for doing things, and we pay people for owning things. Increasingly, the latter.

The words used by neoliberalism often conceal more than they elucidate. ‘The market’ sounds like a natural system that might bear upon us equally, like gravity or atmospheric pressure. But it is fraught with power relations. What “the market wants” tends to mean what corporations and their bosses want. ‘Investment’ means two quite different things. One is the funding of productive and socially useful activities, the other is the purchase of existing assets to milk them for rent, interest, dividends, and capital gains. Using the same word for different activities camouflages the sources of wealth, leading us to confuse wealth extraction with wealth creation.

A century ago, the *nouveau riche* were disparaged by those who had inherited their money. Entrepreneurs sought social acceptance by passing themselves off as rentiers. Today, the relationship has been reversed: the rentiers and inheritors style themselves entrepreneurs. They claim to have earned their unearned income.

They differ from bandits only in that they wielded pens to steal with stock options instead of pointing pistols while demanding cash or jewelry. Their techniques were subtle and not overtly violent, but for society they

are worse than street robbery, for their actions undermine the legitimacy of society's rules in ways that bandits cannot.

That any American who forgoes wages today for the promise of a pension tomorrow is not paid in full is a scandal. He has been robbed as surely as if a burglar broke into his or her home.

A thousand years ago, if you were a marauding gang and you wanted to take over a country's land and its natural resources and public sector, you'd have to invade it with military troops. Now you use finance to take over countries. So it leads us into a realm where everything that the classical economists saw and argued for—public investment, bringing costs in line with the actual cost of production—that's all rejected in favor of a rentier class evolving into an oligarchy. Basically, financiers—the 1%—are going to pry away the public domain from the government. Pry away and privatize the public enterprises, land, natural resources, so that bondholders and privatizers get all of the revenue for themselves. It's all sucked up to the top of the pyramid, impoverishing the 99%.

The dismantling of society left lifegivers and caregivers isolated, overworked, despised, and exhausted. They were told that dissociation was there to help them. You don't have to look after dependents, they are better off in institutions, the authorities said. Dependency became a product for corporations to profit from and caregivers were given the freedom to be enslaved by corporations.

The central myth of the United States: *Private Enterprise can serve people better than government.*

But they cannot because the Government's objective is to serve people, and private enterprise's objective is to extract rent from people. Private enterprise's objective is to make a return on investment of over 40% a year—a payback period of under three years—using the commons provided by the Government: schools, education, roads, police, et cetera. Government's objective is to invest with a expected payback in 20 years, by investing and building the commons, schools, education, roads, police, et cetera. The taxes paid by business in no way at all have payback period under three years. For example: education is a 20 year investment by parents—taxes, schooling and university costs—with *no* expectation of return by the parents of the children.

This complete focus on profit is disgusting and dishonest, and was considered a mortal sin less than 300 years ago.

Hayek forgot that vital national services cannot be allowed to collapse, which means that competition cannot run its course. Business takes the profits, the state keeps the risk.

Nothing good can come of relinquishing that control for any society, ever. There's not a thing wrong with protecting your control of your own water and food and shelter, and these are indeed things that should never be traded or negotiated in global markets.

So claiming that 'do no harm' equals *not* protecting your basics is nothing but a self-serving and dangerous kind of baloney coming your way courtesy of those people whose plush seats and plusher bank accounts depend on your ongoing personal loss of control over what you need to survive.

The SEC is an agency that polices the broken windows on the street level and rarely goes to the penthouse floors. The oft-cited explanations—campaign contributions and the allure of private-sector jobs to low-paid government lawyers—have certainly played a role. But the driving force was something subtler. Over the course of three decades, the concept of the government as an active player had been tarnished in the minds of the public and the civil servants working inside the agency. Regulatory capture is a psychological process in which officials become increasingly gun shy in the face of criticism from their bosses, Congress, and the industry the agency is supposed to oversee. Leads aren't pursued. Cases are never opened. Wall Street executives are not forced to explain their actions.

Oppression is violent. Oppression is public. Oppression is barbaric. Tyrannical regimes rule by overt force or implied physical harm. These lies are part of our velvet cages. Your house, your child's healthcare, your car, even your dog, all no different than the prisoner's cell bars. They keep you contained. They restrain your actions. Responsibilities. Things to lose. Loved ones. Important tools for survival. These are what they tell you, what you believe, what you subconsciously absorbed.

We assume when the oppression comes it will be overt, brutal, obvious. But why. How do you control that many millions of disgruntled people? You cannot, any intelligent person knows this. So you provide them with velvet cages, the cost a mere pittance after you've extracted the labor and health from them and others around the world. And the plushness of the cage renders it essentially invisible once you've layered on an adequate supply of cultural propaganda. We fight to preserve our cages as they are.

You've worked so hard. You've come so far. You know these rules, the lines familiar. Other avenues are unknown. You understand and have come to terms with the dangers as they currently exist. You've mitigated these dangers. This is the only way.

Content in our cages, we watch. We ho, we hum, we move the fuck on. This is the only way.

Will future generations, if there are any, be able to look back and reflect, 'what were these people thinking?' There is no justification for the levels

of inequality and environmental destruction we are experiencing. We can all consider ourselves fools, even for entertaining debate of these issues much longer. We need to be discussing concrete actions, not theoretical justifications.

Everyone must face the randomness of the universe every day. The only certainty known is the one we create as human beings together. Why is it, do you think, that the elite never break ranks? They are creating their own certainty in an uncertain world. Heads I win, tails you lose; Too Big to Fail; Race to the bottom; The new normal; Political capture using the revolving door techniques.

Human civilization is racing toward a crisis point. Ending inequality and world conflict are at the focal point of this outcome. Leaders that continue to use the outdated modes of social control will either drive us over the cliff to destruction, or will lose the ability to control outcomes as their numbers dwindle. The day the revelation is made that the elite are full of shit, is the day change becomes possible.

It seems large social structures will always come crashing down. The weakness in human nature and flaws in our social structures lead to eventual failure. Greed and selfish action is seldom tolerated in smaller structures.

You see, when educated people with excellent credentials band together to advance their collective interest, it's all part of serving the public good by ensuring a high quality of service, establishing fair working conditions, and giving merit its due. That's why we do it through "associations," and with the assistance of fellow professionals wearing white shoes. When working-class people do it—through unions—it's a violation of the sacred principles of the free market. It's thuggish and anti-modern. Imagine if workers hired consultants and "compensation committees," consisting of their peers at other companies, to recommend how much they should be paid. The result would be—well, we know what it would be, because that's what CEOs do.

America is controlled by capitalist corporations. They control our food, our utilities, our medicine/healthcare, and most importantly our politicians, our news, and information. Power over information and thought is a very powerful tool for keeping the public ignorant. They like to tout a "fair and free" market, denounce regulation/government interference; yet when labor unions start up all of a sudden they aren't about fair and free anymore and call upon government muscle to be their bodyguards to bully them back to work.

There has been anti-union, anti-communist, anti-socialist rhetoric for our country's entire existence. If you care enough you could do some research on our country's violent history towards labor and unions. For a time we had literal slavery being the backbone of our economy.

When a country is controlled from head to toe by narcissism, greed, and corruption, they will of course use every trick in the book to trick workers into being against their own interests. Capitalist extremism is just as dangerous as authoritarian communism, but the century of anti-communist propaganda has made people believe that the exact opposite of communism is inherently good.

“Those things weren’t forced on the population, they were demanded by them.”

Marketing manufactures demand. We know the psychology of consumers very well, and we are bombarded with targeted marketing daily that predisposes us to consumer culture from a very young age. Most of it is deceptive, and all of it is knowingly exploiting well-researched cognitive biases and failings in the population in order to achieve the stated goal of maximizing profits and minimizing costs.

Edward Bernays and Henry Ford are in part the founders of modern business practices. Henry Ford dreamed of a laborer-consumer population which gave rise to the modern concept of low-end consumer luxury goods. Edward Bernays argued that propaganda itself was necessary to maintain democracy and public order. He is seen as the founder of modern public relations and consumer marketing. Read more about these two men and you will very clearly see that the population did not initially demand these things, but rather were coerced into believing that these things were wanted, and not just wanted, but beneficial.

This is exactly what America figured out after WWII. The government was afraid of mass riots and even possibly a revolution so they hired Bernays to help them control the masses. He told them all they have to do is keep people content and distracted and no one will ever feel the need to revolt. The government called it the “happiness bubble” and it’s one of the main reasons capitalism exploded in developed countries. Before WWII people pretty much only bought things they needed, only the rich had excessive possessions. So when the government realized that buying materialistic things makes people happy they created propaganda to encourage it. Nowadays, we refer to such propaganda as advertisements. Ever since then mass consumerism has taken over developed world. And because of it, it’s extremely unlikely the masses will ever truly stand up to their governments.

“If we understand the mechanism and motives of the group mind, is it not possible to control and regiment the masses according to our will without their knowing about it?”

Bernays's favorite means of accomplishing this was not to attempt to influence the masses directly but by the "engineering of consent," finding a key group of leaders involved in a certain issue, changing their opinions, and letting them do the rest of the work. Bernays famously conducted a survey of five-thousand doctors, who almost unanimously agreed that people should eat a "hearty breakfast." He then took the results to newspapers around the country, adding as an aside that bacon and eggs were just such a morning meal. His client was the pork industry.

The age of modern advertisement—think *Mad Men*—was kicked off by behavioral psychology professor John B. Watson who is most popularly known for the "Baby Albert" experiments. What is not widely known is that he was kicked out of John Hopkins for having an affair with his research assistant shortly after said experiments. Where did he take his talents? You guessed it: Advertising—where he popularized the notion of selling "sex appeal" rather than a product. In my opinion, the rest of the Western world's economic and political history, then, are all gaslighting footnotes to the recently discovered ability to psychologically manipulate people to create demand where there was none previously.

It is worth considering the impact media creating ideological demand where there was none before has had—on individuals, communities, organizations, nations.

"I have to challenge the notion that 'we,' taking 'we' to mean what Hillary called the 'deplorables,' that include soccer moms and cops and school teachers and the kinds of fellow citizens you can see on 'Jerry Springer' and all those YouTube videos where the punch line of the old joke about 'What's a redneck's last words? HOLD MAH BEER AN' WATCH THIS!' and working people generally, have 'allowed' the country—founded on looting and killing in the first place of course, and an imperial dream from the beginning—to become what 'it' is. A lot of very subtle people, with all kinds of Bernaysian tricks up their sleeves, have seduced us and much of the rest of the world, into a combusto-consumption political economy, where all transactions with any power in them are conducted in money.

And yes, the Rulers, who are 'ours' only by linguistic convention, are leading us, driving us, eating us like ants eat the aphids they 'herd' when they have a taste for some protein to go with the nectar they extract."

The reason why so many Americans are abstaining from voting, a cornerstone of democracy, is intrinsically related to the long-stemming pathologies of the American political culture, namely an individualistic and consumer-driven society where the great majority of people cannot name a single Supreme Court justice but trust the military to act in the public interest and act as a cheerleader for the US's militaristic adventures and wars, and a political system increasingly controlled by the wealthy and business.

The manufacturing of an individualistic, consumer-driven culture is intended to promote conformism, ignorance, and apathy about public affairs, but also a perverted sense of patriotism which targets critically oriented voices as being "anti-American," thereby opening up a political space for the rise of the likes of Trump, Bush, and Reagan. That is to say, authoritarian, anti-labour, neoliberal, and jingoist politicians who wish to roll back whatever economic and social progress average Americans have made since the 1960s and maintain the empire.

We've been conditioned over the last one-hundred years to conflate the two, so that when you hear the word 'Capitalist' you think of some industrious chap with a great idea for a good or a service, providing them to an eager, self-correcting market—so as to prevent monopoly or fraud—and earning a tidy profit from their endeavor. Everybody wins and they all live happily ever after in their little fairy tale world. What the Masters of the Universe don't want you to think is what Capitalism really is: Using the power of money, asymmetric knowledge, and fraud to create monopoly and extract rents, either through over-inflated prices or inadequate wages (or both).

Most of the time we never think about why we like what we like or think the way we think. I have a really hard time understanding how more people don't think about this. I mean I get it, because theory and philosophy are mired in dense rhetoric and jargon, but it drives me crazy to talk to people who refuse to consider that a large portion of their personality and worldview is taught by media stereotypes and corporate profiteers.

In democracies, laws supporting freedom of thought, expression, and debate once contrasted with the communist governments which put ideology and social stability ahead of diversity and individual thought. In practice, Western media and Hollywood were all powerful, allowing the Five Eyes and their corporations to use censorship by noise instead of Chinese-style censorship by blocking. Freedom of the western corporate press also aided the western empires in controlling the governance of foreign states through propaganda. Insisting on "press freedom" throughout their empires ensured their influence was impossible to counter. China's recent investment in media in Africa acknowledges that this is still the case in parts of the world.

Even where state government had power, it was easily controlled. Unlike monarchies, democracies had elections. It is no longer necessary to fight wars to remove rulers if they can just be removed in an election with no resistance from the people. Increasingly, it has cost money to be a political candidate anywhere and those with the money and the inclination to support political candidates are corporations and the rich. Merchants also own the most powerful media and drive the dialogue behind the main issues in elections. To people who see jobs as freedom, any suggestion that a candidate would lose jobs, hurt industry, or cause the almighty economy to falter is lethal.

There's always some opinion you're not socially allowed to hold, in every society, and there's always at least one taboo that has no basis in reality.

The problem is not that the third world and developing countries have too many children, though that certainly can play a part. The issue is that the so-called educated and advanced West, embraces an insane, unsustainable ideology. Through propaganda it is held up as a great way to live. By targeting ancient pleasure centers, existing before we did as a species, it feels good to the masses.

Many elsewhere see this and wish to emulate—even if it is a small portion of their peoples at first, it will grow. The worldwide dominance and continued colonial nature of the West helps ensure that. But this ideology is not the only way in which to live, others in these countries and the West see this, though it is often easier to see before the Western ideology becomes dominant.

It should not be up to the non-West to lead the sacrifice. They have both knowingly and unknowingly sacrificed enough already. The West must reduce its standard of living with regards to luxuries and excessively elaborate necessities. Since they are apparently so smart, innovative, and well educated it should be trivial for them to do so.

Our Republic was supposed to be a place where citizens could be proud of their representative government, which was directly accountable to them. The sad truth is that we are now much closer to being subjects of our ruling class, than we are to being citizens of a democratic republic.

The only power that the corporate power structure still allows, to average people, is a very limited amount of “consumer choice.” Coke or Pepsi; Democrat or Republican; crappy high-deductible plan A or B. ‘We set the menu. Your freedom consists in making a selection from it.’ Never have so many been so screwed over for the benefit of so few.

There is a dangerous trend toward government relying on tech companies to build massive dossiers on people using nothing but constitutionally protected speech.

The first problem with this arrives when one party achieves the right to determine what everybody else is allowed to discuss. Facebook has attained this position. By being the de facto default discussion forum, it has effectively limited public rights to Freedom of Speech to its own “community standards.”

This is no small nut to crack from a policymaking perspective. Freedom of speech always assumed that people were speaking in the public square, eye to eye. But when that speech happens on somebody else’s servers, we have so far accepted that the property rights of those servers supersede the freedoms of speech.

But what if speech practically only happens on such private platforms? On Facebook, Twitter, Instagram? What happens when the network effect practically forces you to publish an idea on these private platforms if you hope to reach anyone at all, and those companies have every right to cancel your posting according to their own policies?

We’ve arrived at a completely unanticipated point where Freedom of Speech—in practice—has come at odds with property rights. This is a very serious conflict from a liberty perspective, and we’re at a fork in that road. Whatever road is chosen, whether freedom of speech or property rights is given precedence for the future, we’re laying groundwork that will have repercussions for centuries ahead. More importantly, this is true whether we lay that groundwork through action or inaction.

It is there again when protesters are thrown out of shopping malls for handing out political leaflets, told by the security guards that although the edifice may have replaced the public square in their town, it is, in fact, private property. A decade ago, any attempt to connect the dots among this mess of trends would have seemed strange indeed: what does synergy have to do with the chain-store craze? What does copyright and trademark law have to do with personal fan culture? Or corporate consolidation with freedom of speech? But today, a clear pattern is emerging: as more and more companies seek to be the one overarching brand under which we consume, make art, even build our homes, the entire concept of public space is being redefined. And within these real and virtual branded edifices, options for unbranded alternatives, for open debate, criticism, and uncensored art—for real choice—are facing new and ominous restrictions.

When you tear out a man’s tongue, you are not proving him a liar, you’re only telling the world that you fear what he might say. The day will come when our silence will be more powerful than the voice you are throttling today.

Responsibility to your tribe is replaced by dependency on authority. Instead of duties that the entire tribe owes to each member, people are given

rights, which must be enforced by a higher authority. Instead of talking to the tribe to ask for help, people are told to pray. Society does not have to be responsible because God is. If God refuses to help, “offer it up” in the afterlife and God will add it to your salvation since humanity refused. If not the church, people are told to go to the union, the police, or the Minister of Indigenous Affairs, and in all cases wait in a child-like state for solutions to be doled out instead of creating their own. Dignified, autonomous nations are reduced to children forever sitting in the waiting rooms of the powerful.

Industrialization depends on standardization. That’s why since the nineteenth century there have been constant attempts to standardize the population, with those that lie too far from the standard marginalized and treated as broken in some way, requiring either exclusion from society or medical intervention to fix them and bring them closer to the standard.

Recall that since change does not and cannot come from the masses who conform and those who may initiate radical change are shunned by society, leadership of change is taken over by Great Men, demagogues who interpret the thoughts of radicals for their own benefit and steer society in the directions most suitable to them. Great Men are accepted by the majority as they are not actually radical or unusual. They are instead a glossy version of the average, just attractive and superior enough that they can lead but not so different that they would be unaccepted by the majority. Truly radical ideas cannot be directly accepted by the majority, they must be interpreted by knowledge bridges as must highly specialized innovation. Great Men have the education, understanding and access to appreciate and intercept new ideas and package them, or easily palatable pieces of them, in an attractive and widely accessible format. They also have the ability to suppress the ones dangerous to themselves.

“Failing to maintain infrastructure didn’t ‘just happen.’ Older generations who vote more chose not to maintain that after their parents sacrificed to build it. It’s going to last out their lifetimes more or less, and fuck anyone else.

And what’s probably the most important factor didn’t ‘just happen’ either. College subsidies and investment in K-12 education didn’t ‘just happen’ to disappear, leaving us with hundreds of thousands of K-12 teachers making under \$40,000 a year and even students who work full-time during in-state bachelor’s degrees leaving \$20,000 in debt. That didn’t ‘just happen.’

Baby boomers and their own spoiled kids voted for the lowest possible property and income taxes many, many, many times. We’re chock-full again of insane, selfish twits in the older gen-

erations spouting things like ‘all taxation is theft’ and talking about which cabinet branches of the federal government should be completely closed down.

This ‘happy accident’ theory of American success in the twentieth century is mostly bullshit. We benefited greatly from the way World War II turned out, but it wasn’t just some accident that we continued succeeding like no other country in history for 60 years afterward. We invested hundreds of trillions of dollars over those decades in infrastructure, education, and research. Now the oldest two or three generations consistently vote to spend nothing on any of that, or even cut what we spend.

It’s not stuff that ‘just happened’ when education, all manner of infrastructure, et cetera are falling down around us and despite the fact we know it’s happening and these people vote to do nothing about it.”

This is why the idea of the “democracy of the market” is nonsense. People will always have a tendency to gravitate towards cheapness and convenience and trust that our democratic system is eliminating injustice and exploitation at the source, even though we know that very often this is far from the case. Willful ignorance is all pervasive because in the back of our minds we know that taking the moral high ground will cost us and if we act alone, it’s all for nothing.

The problem lies in the economic and political climate; because corporations wield so much power they bend “our” representatives to their will to externalize pesky costs like job security, environmental protection, even wages. We can now buy—on our identical high streets: cheap burgers; caramel lattes; washing up liquid with added aloe vera; razors with not one, but five blades—all it has cost us is job security, a healthy long-term economy, a wage that is enough to live on, the environment, a democracy that serves the people and pretty much the entire global ecosystem. What a bargain.

As long as the neoliberal economic model is favored, the race to the bottom will continue.

Downward Mobility

Primitive accumulation says that in order for there to be capitalism, there must first be capital. Primitive accumulation is the process before capitalism that creates that capital. In other words, theft.

Yup, capitalism's dirty little secret of original sin. The real problem is that it never really stops. Oligarchs only get to be oligarchs because they manage to find a way to rob or sponge off of the state. Or—as in the case of the US—conquering a land by genocide and then accumulating wealth via slave labour. So yes, theft, and on a grand scale.

Bourgeois society is by its very nature matter-of-fact, sober and businesslike, peaceable and modest, methodical, calculating, and prudential—unromantic to the bone. Its true and only hero is the acquisitive individual writ large: the businessman as warrior. The larger-than-life financial titans, coal and steel barons, and railroad Napoleons who lit up the stage of Gilded Age industrialism were the heroes of middle-class society. As the architects of Progress, they absorbed into their otherwise unprepossessing lives all the honorariums that once attached to the soldier, the aristocrat, the knight errant, the conquistador, the adventurer, the explorer—the doers who turned a society's most cherished dream, its most valued value, into reality, a reality so grand and transformative it takes the breath away. Yet a question remains. If Progress was, as this account would have it, a benign outcome of indigenous talents and natural endowments, a perfect union of temperament, institutional genius, and felicitous political invention, then why all the deep misgivings and uproar it incited? Where was the devil hiding in the weeds that would dim for millions the infatuation with Progress?

The whole industrializing enterprise may be seen to rest on the systematic cannibalizing of various forms of pre-capitalist economies and the societies they supported. Capital accumulation at the expense of these “others”—a process that has been characterized as “primitive accumulation”—constitutes the underground history of Gilded Age Progress. It is what accounts for the gross inequalities of income and wealth that emerged alongside a rise in the standard of living for some. It is why it is possible to speak of those days as the best of times and the worst of times. More profoundly than that, primitive accumulation fostered an abiding sense of loss felt by all sorts of ordinary people. It inspired them to resist their own social extinction, to form counter-dreams to the official romance of Progress. Indeed, resisting what some chose to call, both at the time and in hindsight, ‘the inevitable’ did not seem that way to those living through the agonies of primitive accumulation back then.

Capitalism did not emerge *de novo* out of the ether. Native pastoralists and buffalo hunters, slaves and ex-slaves, artisans, homesteaders, European peasants and peddlers, small-town shopkeepers, Southern hillbillies, New England fishermen, prairie sodbusters, and subsistence agrarians were the raw material of the miracle of Progress. Wealth once embedded in these societies was absorbed by fair means and foul into the musculature of the new economy. The mechanisms included conquest, legerdemain, and theft. Slavery depended on all that and more, transforming the flesh and blood of whole African civilizations into the liquid capital of Atlantic commerce. Funds accumulated that way later became the foundation of industrial investment.

Export of factory-made goods swamped local, self-contained economies not involved in accumulating capital but rather in the reproduction of ancient ways of life. Cheaper goods drove under peasants, husbandmen, and handicraftsmen, detaching men and women from traditional occupations, “freeing” them to join the founding generations of wage labor. Banks built up their resources by similarly digesting alien life forms silently and most of the time lawfully. Farmers who might have been content to maintain the family homestead were inexorably caught up in the web of international commerce, making them ever more dependent on lines of credit to survive. Depending on creditors until they couldn’t bear the load anymore also afflicted handicraftsmen and local merchants, corroding away their independence until they too joined the new ranks of the proletariat. Something as homely as taxes could function as a kind of forced savings, extracted from people involved in small-scale farming or artisanal pursuits, the revenue then used to subsidize capitalist enterprises like railroads.

Nor did primitive accumulation entail strictly an economic uprooting, which ended once the ex-peasant, homesteader, artisan, slave, or shopkeeper walked through a factory gate or descended down some mine shaft or found herself picking strawberries on someone else’s plantation. Slavic or Italian immigrants stoking furnaces in Pittsburgh or threading a needle in a New York City sweatshop had not all of a sudden become acclimated to capitalism’s brave new world simply by virtue of pocketing a weekly paycheck. It would take decades, more than a single generation, before primitive accumulation as a social undertaking had extinguished the last vestiges of older ways of life.

Take Native Americans. They were subject to the whole repertoire of primitive accumulation. In a generation millions of bison that had supported communities for centuries—providing their food, clothing, shelter, and tools—were reduced to hundreds, their hides filling up the arteries of domestic and international trade. Buffalo skins morphed into leather belts for millions of

industrial machines so that the nomadic way of life became insupportable. Cross-country trains traveled the Great Plains, stopping to allow armed passengers to slaughter whole herds as part of a deliberate policy to coerce tribal resettlement on reservations. Even the Dawes Act of 1887, ostensibly designed to convert Native American communalists into private farmers and tradesmen, ended finishing off the bloodier story of mass Indian removal: under the act's allotment system, most tribes suffered catastrophic losses of land and resources that reduced their members to a state of woeful dependency.

Collateral damage up to and including social extinction had been the market price paid by native cultures even before the advent of industrialism, beginning with the first New England settlers. The Montauketts of eastern Long Island, for example, did not think of their lands as privately owned and alienable but rather as, like them, part of the natural order of things, to be used, not possessed in perpetuity. Europeans thought otherwise. They treated parcels as if they were commodities like any other, to be bought and sold whether or not the "owner" maintained any other active connection to that land.

"The expropriation of the direct producers was accomplished by means of the most merciless barbarianism, and under the stimulus of the most infamous, the most sordid, the most petty, and the most odious of passions."

Certainly the Montauketts could testify to that. But so too might John Locke, who called for children to be put to work at the age of three, or Jeremy Bentham, who preferred four-year-olds. About that and bearing on the miracle of American Progress, Marx noted that "a great deal of capital, which appears today in the US without any birth certificate, was yesterday in England, the capitalized blood of children."

"Capital must begin by planning for the systematic destruction and annihilation of the non-capitalist social units which obstruct its development so that it ransacks the whole world, all corners of the earth, seizing them, if necessary by force, from all levels of civilization and all forms of society."

Particularly galling was the way the Homestead Act was abused. Passed during the Civil War, it was supposed to make a reality out of Lincoln's version of the free labor, free soil dream. But fewer than half a million people actually set up viable farms over nearly half a century. Most public lands

were taken over by the railroads, thanks to the government's beneficent land-grant policy (another form of primitive accumulation); by land speculators backed by eastern bankers, who sometimes hired pretend homesteaders in acts of outright fraud; or by giant cattle ranches and timber companies and the like who worked hand in glove with government land agents. As early as 1862 two-thirds of Iowa (or ten-million acres) was owned by speculators. Railroads closed off one-third of Kansas to homesteading and that was the best land available.

Mushrooming cities back east became, in a kind of historical inversion, the safety valve for overpopulated areas in the west. At least the city held out the prospect of remunerative wage labor if no longer a life of propertied independence. Few city workers had the capital to migrate west anyway; when one Pennsylvania legislator suggested that the state subsidize such moves, he was denounced as "the Pennsylvania Communist" for his trouble. During the last land boom of the nineteenth century—from about 1883 to 1887—16 million acres underwent that conversion every year. Railroads doubled down by selling off or mortgaging portions of the public domain they had just been gifted to finance construction or to speculate with. But land-grant roads were built at costs 100 percent greater than warranted and badly built at that, needing to be rebuilt just fifteen years later. Cattle companies, often financed from abroad, used newly invented barbed wire to fence in millions of acres of land once depended on by small farmers and ranchers to water and graze their animals in common. This American version of the British enclosure acts of the seventeenth century—which turned British landlords into commercialized land barons and British yeomen into wayfaring, itinerant laborers—left in its wake dead cattle and bankrupted homesteads.

To survive this mercantile cyclone, farmers hooked themselves up to long lines of credit that stretched circuitously back to the financial centers of the east. These lifelines provided the wherewithal to buy the seeds and fertilizers and machines, to pay for storage and freight charges, to keep house and home together while the plants ripened and hogs fattened. When market day finally arrived, the farmer found out what all his backbreaking work was really worth. If the news was bad, then those life-support systems of credit were turned off and became the means of his own dispossession. Impoverished Southern tenants and sharecroppers turned to large planters or local "furnishing agents" to borrow what they needed for essentials—from seed to clothing to machinery—to get through the growing season. In such situations, no money changed hands, just a note scribbled in the agent's ledger, with payment due at "settling up" time. This granted the lender a lien, or title, to the crop, a lien that never went away. Their creditors charged

usurious rates of interest, ranging from 25 to 80 percent; such creditors in Louisiana were charging 60 percent in the late 1880s. Usury laws, which once existed in most states, were systematically attacked and often modified or eliminated entirely as “barbaric relics” to please investment institutions back east.

Debt: An ingenious substitute for the chain and whip of the slave-driver.

Making sure the supply of coerced workers was ample became a function of the South’s policing and judicial systems. Wholesale arrests among black men in Georgia and throughout the South for disobeying a boss, being impudent, gambling, partying, talking to white women, having lascivious sex, riding freight cars without a ticket, vagrancy, or even for just being out of work produced a robust supply of convict labor at harvest-time or when railroad track needed to be laid or phosphate mined. Some didn’t survive the ordeal, having been worked to death: 44 percent of the 285 convicts building the South Carolina Greenwood and Augusta Railroad died. The mortality rate among convict laborers in Alabama was 45 percent. At the Pratt mines in the Appalachian foothills of northern Alabama, among the largest in the South, the mortality rate was 18 percent. At Tennessee Coal and Iron, workers were shackled together in underground pits, lived in fetid, disease-ridden barracks, worked to exhaustion from sunup to sundown, were regularly whipped and sometimes tortured (water torture was commonly resorted to) for every imagined infraction, and were hunted down by dogs if daring enough to attempt escape. If they didn’t die of whipping, disease, near starvation, or a bullet in the brain, they committed suicide at alarming rates, their bodies tossed into unmarked roadside graves.

A rare government investigation in Alabama in 1882 concluded these prisons “were totally unfit for use, without ventilation, without water supplies, crowded to excess, filthy beyond description,” where the prisoners were “excessively and sometimes cruelly punished.” An equally rare ex-Confederate plantation owner appalled by what was going on described these prison mining operations as “nurseries of death.” Unlike slave masters of old, those overseeing the process in this way had no stake in, nor did they offer any paternal pretense about caring for, the health, well-being, or reproductive potential of their unfree workers. Those more candid among them admitted they thought of these peons as mere “clever mules.”

Moreover, the whole judicial system of the South, from the lowliest country sheriff and justice of the peace to the highest reaches of state capitals, conspired to replenish the supply of convict labor as a lucrative source of self-enrichment and government revenue. In effect the legal apparatus became a

mechanism of primitive accumulation by monetizing criminal behavior (if it could even be called that) of the most trivial or contrived nature through a web of debt. Labor in this arrangement became a kind of currency used to pay off judicial fines and accumulate capital in the private sector.

Most Dixie labor contracts—when they existed at all—contained all sorts of obligations coercing workers to stay put for a year or more (even sometimes including lifetime contracts). In Mississippi if you hadn't entered into a contract by January 1st, you were subject to arrest. In Alabama, North Carolina, and Florida it was a crime to change employers without permission. Together with all the other disabling features of post-Reconstruction life and labor, the network of debt peonage functioned to forestall or destroy independent farming and other forms of economic self-reliance, reducing a whole population to a state of abject dependency. At the turn of the twentieth century, a young black man in the South (and some poor whites as well) faced three options:

1. Free labor camps that functioned like prisons.
2. Cotton tenancy that equated to serfdom.
3. Prison mines filled with slaves.

Resistance, when it miraculously surfaced, was met with violence and, not infrequently, consignment to forced labor. And while young African American males languished in industrial and agricultural prison camps, black women—if they weren't also working in prisons, sometimes as unpaid prostitutes—once the helpmates of their husbands on small family plots, found work instead as wage earners in canning and tobacco factories, as domestics, in mechanized laundries and textile mills, and in the fields.

Debt-based capital formation, which may or may not be reinvested in industry, has been a classic mode of primitive accumulation around the world. Here in the United States, it was enforced by adherence to the gold standard, which offered debtors no relief, safeguarded creditors, and kept foreign investment capital—British funds especially—flowing into what was after all still a developing country and a risky one. Creditors and investors were reassured by the gold standard that they could always redeem their paper assets in a fixed amount of gold. For debtors, however, this meant their obligations became ever more onerous as prices for agricultural commodities and other goods declined. It was because so many independent proprietors, especially on the land, but also in small towns and cities, found themselves entangled in webs of credit and debt which threatened their social existence that Gilded Age politics often seemed obsessed with the money question,

with greenbacks and the gold standard, with cries for the free coinage of silver and fiat money.

Capitalist victory, however, emerged only gradually. In the early decades of the nineteenth century, farmers, handicraftsmen, and various tradespeople swept into the new textile or shoe factories or the farm women set to work out in the countryside spinning and weaving for merchant-capitalists still held on to some semblance of their old ways of life. They maintained vegetable gardens, continued to hunt and fish, and perhaps kept a few domestic animals. When the first commercial panics erupted and business came to a standstill, many could fall back on pre-capitalist ways of making a living, even if a bare one. When industrial capitalism exploded after the Civil War, unemployment suddenly became a chronic and frightening aspect of modern life affecting millions. Crushing helplessness in the face of unemployment was also a devastating new experience for those great waves of immigrants landing on American shores, many of them peasants accustomed to falling back on their own meager resources in fields and forests when times were bad.

Inexorably, or so it seemed, capital prevailed, and its triumph could assume a somber shape. During this formative phase of industrialization, 35,000 workers died each year in industrial accidents, many of them key skilled mechanics. In 1910, one-quarter of all workers in the iron and steel industries were injured at least once, partly because of management's failure to install safety devices or shorten the hours of work. Two-thousand coal miners died each year on the job. Every day, around that same time, there were one-hundred industrial accidents somewhere in the country.

Various skilled occupations, the railroads, for example, became a killing ground. Between 1890 and 1917, 158,000 mechanics and laborers were killed in railroad repair shops and roundhouses. In 1888–89 alone, of 704,000 railroad employees, 20,000 were injured and nearly 2,000 killed. On the Illinois Central between 1874 and 1884, one of every twenty trainmen died or was disabled; among brakemen—railroaders who did the most dangerous work—the ratio was one in seven; and among railroad switchmen, another skilled position, the number was almost as alarming.

Part of the reason for this appalling record of disfigurement and death was management's relentless drive to increase the workload; brakemen, for example, were required to brake four or five cars rather than the two or three that had been the custom earlier. The bones of thousands of workmen were encased in the concrete of dams and bridges, bodies interred by the thousands in underground caverns, limbs shattered and sheared off by gears, wheels, lathes, chains, pulleys, spindles, cables, and flywheels; mountains of fingers, forearms, legs, ears, and even heads made up the human geography

of industrial Progress.

High death, injury, and unemployment rates; precipitous deterioration in diet as well as in the size and comforts of home; abandoned backyard vegetable gardens; common hunting grounds and fisheries privatized; urban squalor; obsolescent skills and forsaken traditions; exhausting, high-speed work routines lasting twelve hours or more unlike anything experienced before; a daily life cycle consisting of work, punctuated by shorts bouts of eating and sleeping; chained to the inorganic respiration of machines and the befouled climate of “dark Satanic mills”; chronic insecurity and dread, of work, of no work, of the foreman, of the poorhouse; periodic or permanent excommunication as vagabonds and tramps; social disgrace, demoralization, dependency. Loss.

A typical coal mining family in Pennsylvania during the 1870s lived like this: in a two-room “black coated shack,” dining on potatoes, soda crackers, and water, forced to buy their paltry groceries with company scrip exchangeable only at a “truck store” (also known as “pluck me” stores) run by the mine. When one of their kids got sick, there was no way to pay a doctor. Nor was there any money to bury them when they died.

Downward mobility—more precisely, the descent into social oblivion—is the arc inscribed by primitive accumulation. It is the underground, invisible story of industrial Progress, the counterpoint to that widely celebrated tale of upward mobility at the heart of the American mythos. And it left its mark not only among the “lower orders”—struggling farmers, peasant immigrants, dispossessed, *déclassé* handicraftsmen—but also among middling merchants, storekeepers, and petty producers in towns and small cities across the nation. They succumbed to the relentless pressures of the giant corporation. Often enough, that corporation was erected on their remains, sometimes absorbing their facilities, their equipment, their personnel, or else leaving all that bankrupt and inert by the side of the road. Or just as frequently those small businessmen devoured one another or effectively committed suicide, driven to compete close to and then past the point of economic survival. Their death cleared the market, opened up the way for enormous industrial combines, raw materials producers, mass market distributors, nationwide transportation and communications corporations, the champions of consolidated capital accumulation and the integrated national marketplace—all the purveyors of Progress.

Eighty percent of Americans were self-employed in 1820; by 1940 that number had shrunk to twenty percent. Six-thousand firms went under in 1874 alone. Similarly, business activity plummeted by 25 percent in the downturn of the early 1880s, dragging down railroad revenues, pig iron and coal production, domestic cotton consumption, imports, and multitudes of petty busi-

It settled down among us, and never went away.
Whatever we kept from it seemed almost as bad as theft;
It watched us every minute and ruled us right and left.
The rust and blight were with us sometimes, and sometimes not;
The dark-browed, scowling mortgage was forever on the spot.
The weevil and the cut-worm, they went as well as came;
The mortgage staid forever, eating hearty all the same.
It nailed up every window—stood guard at every door—
And happiness and sunshine made their home with us no more.

By the midpoint of the Gilded Age about 4,000 families owned as much wealth as the remaining 11.6 million. Two-hundred-thousand individuals controlled 70–80% of the nation's property. The arithmetic of dispossession and of the descent into the new American proletariat went like this: while 87% of private wealth belonged to a privileged fifth of the population and 11% to the next luckiest fifth, the bottom 40% had none at all. Multimillionaires (another invention of the Gilded Age) accounted for 0.33% of the population but owned one-sixth of the country's wealth. The richest 1% owned 51% of all real and personal property, while the bottom 44% came away with 1.1%. Most workers earned less than \$800 annually, which wasn't enough to keep them out of poverty. And most of them had to toil for nearly sixty hours a week to make even that much.

Progress—that is, capital accumulation—had created a nation of haves and have-nots. Whether pleased with the result or not, all were astonished at its strangeness. The shock reverberated up and down the ranks of this new world, now pockmarked by a steep hierarchy once thought alien to the American experiment. Nor did the lower orders, those living on the edge of social if not physical extinction, think they'd ended up there by accident. On the contrary, they were convinced they had been driven down by an overweening aristocracy, presumptuous beyond measure, a noxious import from the Old World.

“The class struggles here in England, too, were more turbulent during the period of development of large-scale industry, and died down just in the period of England's undisputed industrial domination of the world and it will be no different probably in America. It is the revolutionizing of all traditional relations by industry as it develops that also revolutionizes people's minds.”

Melville's short story “Tartarus of Maids” is a chilling portrait of women slaving away in a paper mill in an isolated gulag high in the Berkshire

Mountains of Massachusetts. Young, virginal, and deathly white, wraith-like, nearly inanimate, subject to the despotism of machinery and male superintendents, these women stood like a barely living reproach to those early utopian hopes associated with the first textile mills farther east in Lowell and Waltham. There, back in the 1820s, young farm girls came to work and were treated like family by the proprietors, who showed concern for everything from their literary tastes to their housing; they were sheltered in well-kept dormitories, supplied with nourishing food, looked after by matronly housekeepers charged with maintaining a “tranquil scene of moral deportment and mutual good will.” A mere twenty years later Lowell had become Lawrence, the site of the New World’s own version of Blake’s “dark satanic mills,” staffed now not by American girls from the countryside, but by a despised class of Irish immigrant women.

Other Melville creations were populated by deeply angry, often inscrutable workingmen, burning with rage or stubborn impassivity or a sense of wounded dignity, as in *Bartleby’s* famous “I prefer not to” or Redburn’s mordant observation that “there are classes of men in the world who bear the same relation to society at large that the wheels do to a coach,” and that such men are “shunned by the better class of people and cut off from all access to respectable and improving society.” In this world, work maims, kills, ruins, and is fatal to desire. Yet it ought to be hallowed. Ishmael from *Moby Dick* celebrates the democratic dignity that regardless of rank “shines in the arm that wields a pick or drives a spike; that democratic dignity which on all hands, radiates without end from God; Himself. . . His omnipresence, our divine equality,” which, however, was being poisoned at its source by the shark-like competitiveness of the new commercial order, “mean and meager.”

Ideological defenders of Southern slavery were quick to zero in on the emerging new order of “free labor” as a hypocritical sham, far worse than their own labor system. However commercially active they actually were, Southern planters and their media denounced the mercenary mean-spiritedness of northern capitalism. Slave owners’ paternalism, their chivalry, their love of the land—the whole self-deluded romance that allowed the slaveocracy to look down their noses at northern self-seeking and moneygrubbing—would shield them against the commercial dark arts that lured people away from the “wholesome labors of the field and the enjoyment of modern independence.” It was a grand delusion, but a telling one. Profits north of the Mason-Dixon line were based on the “increased suffering of labourers and the hardworking mass.” Senator John C. Calhoun of South Carolina, the South’s leading political defender, chastised the Whig Party for mortgaging the people’s inheritance to parasitic circles that “look to

debts, stocks, banks, distributions, and taxes as the choicest of blessings. The greater the debt—the more abundantly the Stock Market is supplied.”

For Southerners it was naturally tempting to condemn the new system outright: there was no escape from this charnel house. It bred demoralization and social insurrection, and was ultimately doomed. The “only check on its diffusion is the existence of slavery; for the institution, and the social system determined by it, have hitherto repelled its ravages, and even its extensive admission in the Southern States.” Southern spokesmen declaimed against abolition, arguing that emancipation would end only in the creation of a class of “white slaves,” people abandoned to the merciless ravages of the marketplace and lacking the paternal protections enjoyed by black bondsmen. Proletarians, unlike chattel to be protected and preserved, were instead to be used, then disposed of. What happened to them after hours was a matter of indifference to Yankee manufacturers and abolitionists alike.

The labor question was not confined to life in the coal mines, steel mills, railroads, and sweatshops of the industrial heartland. Instead it embraced multitudes, exposing the machinations of the new slavery here, there, and everywhere: in the countryside, where self-reliant farmers were being reduced to some form of debt peonage or migratory wage labor; in small towns and cities, where once independent businessmen were being driven into bankruptcy and down into the ranks of the property-less; in the ateliers of craftsmen compelled to surrender their cherished skills and work to the drone-like regimen of shoe and textile factories; in Southern lumber and turpentine camps, coal mines, iron forges, and cotton plantations, where convict laborers, overwhelmingly African American, descended into an invisible world of coerced labor hard to differentiate from legal slavery. Bondage had died at the hands of the sword. Long live the new slavery.

Language as strong as that seems overwrought to our ears. How could it not? It has been at least another three-quarters of a century since people regularly talked or thought about working for wages as a kind of slavery. The whole notion strikes us as odd. Yet for a long time references to wage slavery were a journalistic commonplace. That doesn't mean everyone back then agreed that working for wages entailed enslavement. Nor is it the case that most people in those days concurred that the money power was subverting the freedoms fought for in the Revolution—far from it. But it does mean that these claims, which now appear so alien, were once upon a time treated with great seriousness and hotly debated. A society that feels it may be living on the precipice of slavery is a society living on the precipice, on the edge of some final confrontation, pregnant with violent emotion. Violent language and the language of violence did indeed characterize this era to a degree hard to imagine today. Thoughts of this sort, moreover, emanated

from all quarters, not from oddball eccentrics and fringe elements.

When thousands of destitute unemployed, many of them homeless, including women and children, gathered in Tompkins Square Park in New York City in 1874, “Bread or Blood” is what they cried. They were demanding work or relief in what one labor activist called “a folk movement of primitive need.” Plans were to march on City Hall to ask the city to distribute food and funds, and to suspend evictions (some may have talked of marching on Wall Street as well; a similar gathering at the park had done that during the panic of 1857). Barricades were erected. Then the police, on horseback, dispersed the protesters in a spasm of brutality—the police commissioner later described the assault as “the most glorious sight I ever saw.”

The local press applauded, damning the protesters as “communards.” Wild claims were made that these “Communists” had smuggled diamonds and jewels stolen from the churches of Paris with which to buy ammunition and bombs. ‘Communards’ was a word needing little definition, since the Paris Commune three years earlier conjured up memories of barricades and blood in the streets, rioting and pillage, and primitive nightmares about “petroleuses”—Amazonian women, their hair streaming wantonly behind them in the wind, armed with the nineteenth century’s version of the Molotov cocktail, setting Paris aflame. Harper’s Weekly rejoiced at the mob’s suppression because it taught the lesson that “follies and ferocities of the Commune are alien to American thought and methods.” Glad that the “American Commune” had met its master, the Philadelphia Inquirer advised that in the future, should it rear its head again, public authority should “club it to death at the hands of the police or shoot it to death at the hands of the militia.”

Farther west, in St. Louis, the stakes were raised even higher when what began as a railroad strike became a citywide general strike; Toledo and Chicago came close to experiencing the same. A local Workingmen’s Party with a considerable following set up an executive committee to run the city, keep order, distribute food, and provide medical assistance. The very sight of men “who had hitherto been buried in the depths of obscurity, possessing neither social, financial, or political importance in the community” suddenly reigning “as princes” was to say the least shocking to the city’s establishment. It retaliated by setting up a committee of public safety equipped with a cavalry and artillery to put down the uprising. The city fathers of St. Louis—judges, politicians, army officers, police officials—mobilized private troops of white-collar clerks, tradespeople, and others to fight a local civil war. They likened the executive committee running the strike to “Robespierre and his brace of fellow conspirators,” who “sit in darkness and plot.” Some local newspapers scared the citizenry with headlines like “The Reign of the

Canaille” and “Glutted with Gore.” But others, just as bellicose, lined up on the other side; the *St. Louis Journal*, for one, declared:

“If the laboring men of this country must choose between revolution and abject submission to the heartless demands of capital, they will certainly not be condemned by the *Journal* if they prefer war to starvation.”

The country’s most celebrated clergyman, Henry Ward Beecher, offered up this bit of pious cruelty:

“God has intended the great to be great and the little to be little. I do not say that a dollar a day is enough to support a workingman, not if he insists on smoking and drinking beer. But the man who cannot live on bread and water is not fit to live.”

All the stigmata of class contempt were meticulously noted down by the press and the inquisitive guardians of law and order; every hat brim askew, dirty shirt, or missing collar was duly cited as a telltale sign of lower-class contempt for civility and good order. Today these fuckers have barely changed the script.

A mass strike is something akin to but much rarer than an ordinary strike and one that comes much closer to turning the world upside down. The relative frequency with which such events happened during the long nineteenth century is itself perhaps the best evidence of just how fragile and provisional the new order of things remained. What came to be known as the Great Upheaval, the movement for the eight-hour day, elicited a strange enthusiasm. The normal trade union strike is a finite event joining two parties contesting over limited if sometimes intractable issues. The mass strike in 1886 or before that in 1877—all the many localized mass strikes that erupted in towns and small industrial cities after the Civil War and through into the new century—was open-ended and ecumenical in reach. Its desires, however exalted, were always tethered to the needs of the most abused and exploited.

So, for example, in Baltimore when the skilled and better paid railroad brakemen on the Baltimore and Ohio Railroad first struck in 1877 so too did less well off box-makers, sawyers, and can-makers, engaged in the shops and factories of that city, who abandoned their places and swarmed into the streets. This in turn stimulated the railroad men to commit bolder acts. When the governor of West Virginia sent out the Berkeley Light Guard and Infantry to confront the strikers at Martinsburg at the request of the railroad’s vice president, the militia retreated and the citizens of the town,

the disbanded militia, and the rural population of the surrounding country fraternized, encouraging the strikers. This centrifugal dynamic of the mass strike, widening the orbit of its influence and engagement so long as it was in the ascendancy, was characteristic of this extraordinary phenomenon.

By the third day in Martinsburg the strikers had been reinforced during the night at all points by accessions of working men engaged in other avocations than railroading, which, by the way, made it virtually impossible for federal troops by then on the scene to recruit scabs to run the trains. By the fourth day, mechanics, artisans, and laborers in every department of human industry began to show symptoms of restlessness and discontent. Seeping deeper and deeper into the subsoil of proletarian life, down below the “respectable” working class of miners and mechanics and canal boatmen, frightened observers reported a “mighty current of passion and hate” sweeping up a “vast swarm of vicious idlers, vagrants, and tramps.” And so it went.

It is hard to say precisely just what this heterodoxy of desires and imaginings added up to, what blueprint if any it formed. Yet it unmistakably opened up the prospect of a new society founded on principles at odds with the tooth-and-claw struggle for self-advancement so celebrated in many precincts of social Darwinian America. That yearning for an alternative was best expressed not in some formalized credo, but in the mass strike’s tactical repertoire. Its two principal weapons were the boycott and the sympathy strike. And indeed what else was to be expected from a movement whose social character and capacious programmatic embrace made it the living embodiment of sympathy? The boycott drew on a long rural tradition of resistance to landlords. It was the perfect tactical expression of communal mobilization, which perhaps is why Harper’s Weekly decried it as “a new form of terrorism” and “an outrage upon the American principle” because it violated the market and property rights. Used so frequently, the boycott was declared here and there a violation of the statutes against conspiracy.

Sympathy strikes and boycotts expressed solidarity as an organized social emotion, not merely a piece of inspiring rhetoric, but as palpable reality, the spirit come to life, discovering all the exfoliating networks of its social nervous system. The form of the mass strike was its content, the medium the message. For the legions who participated, or for those perhaps greater in number who looked on in vicarious empathy, the experience excited the imagination just because it was so fluid, its purpose and outcome uncertain yet pregnant with possibilities. Depending on one’s location along the social hierarchy, it could also be deeply alarming. What was at stake, many believed, was nothing less than the future of the good society.

The mass strike, precisely because it seemed to place everything about

the prevailing social order on the agenda all at the same time, infused the atmosphere with a mounting readiness to settle accounts once and for all and in terms not reducible to dollars and cents.

Compared with the class-inflected political upheavals that preoccupied much of western Europe and Russia throughout this period, culminating in the continent-wide near revolutions of 1917–1919, the United States seems remarkably even-keeled. No land seizures disturbed life in the countryside. No soviets were set up here. Although a general strike did paralyze Seattle near the beginning of 1919, it stayed there rather than spread across the country, as happened a few years later in Britain. No Socialist, Social Democratic, Communist, or labour parties ran the government or won significant representation in the halls of Congress or even further down the political food chain. And while the Populists did get elected to hundreds of local and state offices, including governorships, and to the House and Senate, their triumphs were fleeting. Should we conclude then that America was indeed exceptional? Is that story of a long century of anticapitalist resistance in rural and industrial America, one fired by the existential trials and tribulations of primitive accumulation, more mythic than real?

Not if we take the reaction of Jane Addams to the Pullman strike as emblematic. Her anxiety about the imminence of civil war was echoed again and again all through this period by people from all walks of life—high and low, artists and farmers, preachers and presidents, Fifth Avenue matrons and denizens of the Lower East Side’s “rag-pickers alley,” anarcho-terrorists and Wall Street bankers, coal miners and steel magnates, hard-boiled journalists and utopian dreamers.

Plaintive, angry, despairing, outraged, and frightened, this chorus suggests a different set of questions: Why for such a long time was the country so infected with anticapitalism? Why did this contagion embrace both the countryside and the city? How could it be that a vast population of petty commodity producers, whose conditions of life normally left them in a state of localized, isolated competition—if they summoned up resistance to their victimization, they usually did so informally, tacitly, without programmatic or ideological clarity in prepolitical hidden acts of everyday self-advancement and resistance—managed to mount a sustained collective political alternative? How could they hold that together during the severest years of economic depression when “devil take the hindmost” was an instinct hard to resist? Why did social emotions rage so violently that armed confrontations between workers and employers in the United States were far more common than anywhere else in the Western world? Why did people feel obliged to characterize their social enemies in the most apocalyptic terms, such as Wall Street “devil fish” or anarchist “offal”? Why did others—theologians,

manufacturers, novelists, architects, social workers, engineers, handicraftsmen, and poets—feel driven to devise ways around the social conflagration they all saw headed their way, schemes that sometimes were and sometimes were emphatically not socialist, but were decidedly averse to capitalism as it actually existed then?

When we look back at that time and note its striking contrast to our last half century—during which the labor question and all the tributary questions it once gave rise to have dropped beneath the horizon of public life—it is hard to deny the profound transformation. To point out that back then most people went along to get along is not a refutation that nonetheless society was at a boil. After all, it is always the case that societies set off in some new direction—when those rare moments arise—largely through the catalytic behavior of minorities, whether they are elites or insurgents.

The long nineteenth century witnessed the convergence of three ecological extinctions or near extinctions—handicraft production; the family farm and peasant agriculture; and a kind of urban family enterprise as familiar to fifteenth-century mercantile Italy as it still was in 1840 America, but which feared for its life just a half century or so later. That this multidimensional existential crisis happened alongside the promise of infinite Progress forced a reckoning with a future of which no one could be certain. It aroused premonitions both exalted and dreadful. Utopias and dystopias—literary, political, and social—marked the era and emerged from all levels of the country's crystallizing hierarchy. They were impassioned evidence of how disturbing and deeply unsettled matters had become.

Americans shared this hunger for utopias, political panaceas, and gloomy previsions with others in the West undergoing similar wrenching dispossession. Tolstoy romanced the peasant village, and narodniks, young revolutionary offspring of the Russian gentry, fancied it a pathway to communal living. William Morris revered the world of the artisan, seeking in its rekindling an end run around the dehumanization of Adam Smith's pin factory. The first half of the nineteenth century witnessed journeys of intellectuals and the pietistic to self-contained communal laboratories of the disaffected—Brook Farm, the Shakers, Oneida, the Moravians, New Lanark, and many other utopian communities. During the urbanizing/industrializing century's second half, the instinct to withdraw was supplanted by the urge to overthrow the new order of things, to replace it with something old and something new.

The main substantive achievement of neoliberalism has been to redistribute rather than to generate wealth and income. Accumulation by dispossession. The commodification and privatization of land, and the forceful expulsion of peasant populations, conversion of various forms of property

rights—common, collective, state, et cetera—into exclusive, private property rights. Suppression of rights to the commons. Colonial, neocolonial, and the imperial processes of appropriation of assets, including natural resources. And usury. The national debt, and most devastating at all, the use of the credit system as a radical means of accumulation by dispossession. To this list of mechanisms, we may now add a raft of techniques such as the extraction of rents from patents, and intellectual property rights, and the decrease or erasure of various forms of common property rights, such as state pensions, paid vacations, and access to education and healthcare, won through a generation or more of class struggle. The proposal to privatize all state pension rights, pioneered in Chile under the dictatorship is, for example, one of the cherished objectives of the Republicans in the US.

Income inequality, gross disparities in wealth—we're told daily, incessantly, that these are the necessary consequences of a free market, as if the market was a force of nature on the order of weather or tides, and not the entirely manmade construct that it is. In light of recent history, blind acceptance of this sort of economics would seem to require a firm commitment to stupidity, but let's assume for the moment that it's true, that the free market exists as a universe unto itself, as immutable in its workings as the laws of physics. Does that universe include some ironclad rule that requires inequality of opportunity? I've yet to hear the case for that, though doubtless some enterprising think-tanker could manufacture one out of this same free-market economics, along with whiffs of genetic determinism as it relates to qualities of discipline and character. And it would be bogus, that case. And more than that, immoral. That we should allow for wildly divergent opportunities due to accidents of birth ought to strike us as a crime equal in violence to child abuse or molestation.

Freedom is no half-and-half affair. If the average citizen is guaranteed equal opportunity in the polling place, he must have equal opportunity in the marketplace. The proposition goes deeper than sentiment, deeper than policy, deeper even than adherence to equality and 'the pursuit of happiness' as set forth in the Declaration. It cuts all the way to the nature of democracy, and to the prospects for its continued existence in America. We may have democracy in this country or we may have great wealth concentrated in the hands of a few, but we can't have both. Those few will inevitably use their power to subvert the free will of the majority; the super-rich as a class simply can't be trusted to do otherwise. A thesis that's being starkly acted out in the current era of Citizens United, Super-PACs, and truckloads of dark money.

This is not the way the world works; it's the way the world is made to work by those with the money and power. The movers and shakers—the

big winners—keep repeating the mantra that this inequality was inevitable, the result of the globalization of finance and advances in technology in an increasingly complex world. Those are part of the story, but only part.

“In every serious doctrine of the destiny of men, there is some trace of the doctrine of the equality of men. But the capitalist really depends on some religion of inequality.”

One of our deepest and most persistent shared delusions is that many take for granted that the path we took was the only one that really could have been taken. Sure, you could change things here or there, but you’d eventually end up with certain similarities—advanced technology, higher living standards, space exploration, and so on. But this is not the case, rather it is nothing more than a chosen preference, based on cultural norms, for technology evolution.

Sure, we have iPhones now and at least 2 billion people can send pictures of their dicks to another 5 or so billion. But is this better or worse than there being a few hundred-million, living simple lives of subsistence? Is it a false choice? At this point it absolutely is. We can have much of both, as we’ve already spent the resources developing the technology. But why do we need a new iPhone every year? A new Mac? A new sneaker? Shirt? Should we cure all cancers? What if instead we guaranteed you could have the opportunity for a meaningful life and that your loved ones would be taken care of when you passed? None of these questions are asked, we, for the most part, simply march on, safe in the delusion of the inevitability of now.

No human construct is set in stone. Everything is the way it is because we accept it as so. That is not to say that we can change everything we do not like. But you can either be a disgruntled population, voicing vocal dissent about policies, or you can be a popular revolt crushed by the authorities. Is there one choice that is the better? One can never say with certainty.

Is it better to know your oppressor exists or to be ignorant of his presence and simply recognize it as an unchangeable obstacle to be routed around whenever possible? Is one man better than the other?

No conspiracy needed—if your society and culture promotes selfishness, greed, and ignorance, you end up in the current situation, every time. Those three values will inevitably lead to exactly the wrong type of individual and worldview gaining power.

Our tribal ancestors would have put a stop to that toxicity quite quickly, but being so removed from our ancestral way of thinking, having suffered millennia of oppression and violence from the few cultures who initially went against the trend, we find ourselves here.

The paradox of our era: Never have we been so free. Never have we felt so powerless. We are indeed freer than before, in the sense that we can criticize religion, take advantage of the new laissez-faire attitude to sex, support any political movement we like. We can do all these things because they no longer have any significance—freedom of this kind is prompted by indifference. Yet, on the other hand, our daily lives have become a constant battle against a bureaucracy that would make Kafka weak at the knees. There are regulations about everything, from the salt content of bread to urban poultry-keeping.

The ideas of the ruling class are in every epoch the ruling ideas. When the history of our times is written, an honest accounting will no doubt add Netanyahu's wicked shadow—and that of his predecessors—to the list of fiends that have seen the world as little more than a playground within which to use their toys of death and despair. Always, of course, for the right reasons and always, of course, against the meek and defenseless among us.

In the world of Joseph Stalin, induced famine was the prime weapon of choice, though mass execution and exile helped him dispose of tens of millions he viewed as “enemies of the people.”

To Henry Kissinger, the world, particularly Indochina, was very much a small chess game. Civilians were mere pawns ripe for sacrifice through high-tech weaponry, including biological and chemical warfare, to enforce his worldview at any cost. Millions lost their lives to his cerebral game board.

To Pol Pot, struggle was little more than purification, erasing through starvation, overwork, execution of a quarter of his people whose sole crime was to see life through a prism that collided with his own—no matter how soft their view or backward his sight.

In Rwanda up to half a million women were sexually assaulted, mutilated, or murdered, along with an equal number of male Tutsis, as enemy agents of the Hutu state—machetes and rape induced AIDs the plentiful weapons of preference.

The sorts of psychopaths that tend to be in control of modern human societies clearly prefer money as a tool of social control to money as any sort of public utility that would facilitate individual productivity and affirm human dignity, whether in the context of neoliberal derangement or not. That's the view from the long-frozen Rust Belt and certainly nothing new in history.

It also appears that any human capacity for moral innovation is easily constrained by our basic feces-hurling primate OS, particularly if said primates consider money to be something finite and concrete.

On the real balance sheet, though, the sweet old Earth likely can't afford a Jobs Guarantee for a population of 7 billion, at least not under any current or

previously existing model of labor exploitation. We're resource-constrained, not dollar-constrained.

So we arrive back at the same old power relationships, the coercion, desperation, and ecocide to which we have been accustomed, in the absence of any disruptive moral innovation. Can anyone suggest that modern humans have demonstrated a capacity for moral innovation outside of prison camps? Actual, non-hopey-changeey varieties of moral innovation? If so, is that capacity retarded only by incorrect perceptions regarding the nature of money? Retarded perhaps by an exceptional propaganda system? One might only answer that for themselves, and likely only until the SWAT team arrives. It seems unlikely that some rational and compassionate bureaucracies will be established to compensate in their stead: Congress is wholly unable to formulate policy in the public interest for very good reasons, none of them admirable. It seems the social economic entities they protect require human desperation just as much as they require currency liquidity or juvenile male soldiers.

In the absence of representation, rule of law, or some meager rational public policy, a reproductive strike may be a better individual approach as not having children avoids the voluntary provisioning of debt slaves into a corrupt and violent system of social control. There is also the many ecologically beneficial effects of less humans and a potential opportunity to avoid being forced to constantly sell one's labor at a sharp discount. Couples I know, both having made catastrophic errors in career choice, are able to persist with some degree of dignity only and precisely because they have avoided begetting, in the very biblical sense, more debt slaves.

Chapter Fifty-three

Misleadership

Every day Yeroen was being groomed by two rivaling males, each one eager to gain his backing. He seemed to enjoy the attention. Being groomed by the mighty alpha male, the one who had deposed him a year earlier, was utterly relaxing because no one would dare disturb them. But being groomed by the second, younger male was tricky. Their get-togethers greatly upset alpha, who regarded them as plots against himself and tried to disrupt them. Alpha would put up all his hair and hoot and display around, banging doors and hitting females, until the other two males became so nervous that they'd break up and leave the scene. Separating them was the only way to calm down alpha. Since male chimps never cease to jockey for position and are always making and breaking pacts, innocent grooming sessions don't really exist. Every single one carries political implications.

The current alpha male enjoyed massive popularity and support, including that of the old matriarch, Mama, leader of the females. If Yeroen had wanted an easy life, he would have opted to play sidekick to this male. He wouldn't have rocked the boat, and there would never have been any threat to his position. Aligning himself with the ambitious young male, on the other hand, was fraught with risk. However big and muscular this male might be, he had barely left his adolescence behind. He was an untried entity who carried so little authority that whenever he tried to break up a female fight, as top males are wont to do, he risked the wrath of both contestants. Ironically, this meant that he did resolve the discord, but at his own expense. Instead of screaming at one another, the females now supported one another in chasing the would-be arbitrator. Once they got him cornered, however, they were smart enough not to physically grapple with him, being all too familiar with his speed, strength, and canine teeth. He had become a player to be reckoned with.

The alpha male, in contrast, was so skilled at peacekeeping, so impartial in his interventions, and so protective of the underdog that he had become immensely beloved. He had brought peace and harmony to the group after a long period of upheaval. Females were always ready to groom him and let him play with their children. They were likely to resist anyone who dared

challenge his reign.

Nonetheless, this is exactly what Yeroen went for when he sided with the young upstart. The two of them entered a long campaign to dethrone the established leader that took a great toll in tensions and injuries. Whenever the young male would position himself at some distance from the alpha male, provoking him with increasingly loud hooting, Yeroen would go sit right behind the challenger, wrap his arms around his middle, and softly hoot along. This way there was no doubt about his allegiance. Mama and her female friends did resist this revolt, occasionally resulting in massive pursuits of both troublemakers, but the combination of the young male's brawn and Yeroen's brain was too much.

From the start, it was obvious that Yeroen was not out to claim the alpha position for himself but was content to let his partner do the dirty work. They never backed down, and after several months of daily confrontations, the young male became the new alpha. The two of them ruled for years, with Yeroen acting like a Dick Cheney or a Ted Kennedy, a power behind the throne; he remained so influential that as soon as his support began to waver, the throne wobbled. This happened occasionally after conflicts over sexually attractive females. The new alpha quickly learned that in order to keep Yeroen on his side, he'd need to grant him privileges. Most of the time Yeroen was allowed to mate with females, something the young alpha did not tolerate from any other male.

Why did Yeroen throw his support behind this upstart instead of joining the established power? It is informative to look at studies of human coalition formation, in which players win games through cooperation, and to study the balance-of-power theories about international pacts. The basic principle here is the "strength is weakness" paradox, according to which the most powerful player is often the least attractive political ally because this player doesn't really need others, hence takes them for granted and treats them like dirt. In Yeroen's case, the established alpha male was too mighty for his own good. By joining him, Yeroen would have gained little, because all this male truly needed was his neutrality. The smarter strategy was to pick a partner who couldn't win without him. By throwing his weight behind the young male, Yeroen became the kingmaker. He regained both prestige and fresh mating opportunities.

bully pulpit: a public office or position of authority that provides its occupant with an outstanding opportunity to speak out on any issue. Apparently originally used by President Theodore Roosevelt, explaining his personal view of the presidency.

When President John Kennedy was killed, people expressed immense grief. When Martin Luther King was killed, grief turned in many cases to anger. But when Robert Kennedy was killed, there seemed to be a sort of finality that left only despair.

“Now I realized what makes our generation unique, what defines us apart from those who came before the hopeful winter of 1961, and those who came after the murderous spring of 1968. We are the first generation that learned from experience that things were not really getting better, that we shall not overcome. We felt, by the time we reached thirty, that we had already glimpsed the most compassionate leaders our nation could produce, and they had all been assassinated. And from this time forward, things would get worse: our best political leaders were part of memory now, not hope. The stone was at the bottom of the hill, and we were alone.”

The major problem—well, one of the major problems, for there are several—one of the many major problems with governing people is that of whom you get to do it; or rather of who manages to get people to let them do it to them. To summarize: it is a well known fact, that those people who most want to rule people are, ipso facto, those least suited to do it.

The ultimate weapon of mass destruction is a state. When a state is taken over by a leader with the classic triad of narcissistic symptoms—grandiosity, need for admiration, and lack of empathy—the result can be imperial adventures with enormous human costs. Think of the rivers of blood spilled by all those generals and emperors so that in glory and triumph they could become the momentary masters of a fraction of a dot.

With long-lived figures, enough evidence, argument, apology, autobiography, memoir, and frail old-age memories usually emerge to blur an image into being—like a television picture, most of our visions of big men and women are made up of countless tiny lines and points of information and utterance emitted over a lifetime, shimmering and flickering together to give us at least the illusion of a fixed image.

During the presidential campaigns the contest is waged between two sets of public relations consultants nobody knows. Afterwards, the public image of the victor—including his face, words, and publicized actions—is a public relations product. But it is not quite correct to say that presidents are sold to the public like soap. In this case the product itself is remarkably active. One might suggest that all recent presidents have shown the combined talents of huckster and actor.

Probably the last real leader we had as US president was JFK. It's not that Kennedy was a better human being than the presidents we've had since: we know he lied about his WWII record, and had spooky Mob ties, and popped pills like Tic-Tacs, and screwed around more in the White House than poor old Slick Willy could ever dream of. But JFK had that special leader-type magic, and when he said things like "Ask not what your country can do for you; ask what you can do for your country," nobody rolled their eyes or saw it as just a clever line. Instead, a lot of them felt inspired. And the decade that followed, however fucked up it was in other ways, saw millions of Young Voters devote themselves to social and political causes that had nothing to do with getting a plum job or owning expensive stuff or finding the best parties; and the 60s were, by most accounts, a generally cleaner and happier time than now.

It is worth considering why. True, JFK's audience was in some ways more innocent than we are: Vietnam hadn't happened yet, or Watergate, or the S&L scandals, et cetera. But there's also something else. The science of sales and marketing was still in its drooling infancy in 1961 when Kennedy was saying "Ask not. . ." The young people he inspired had not been skillfully marketed to all their lives. They knew nothing of spin. They were not totally, terribly familiar with salesmen.

A real leader is somebody who can help us overcome the limitations of our own individual laziness and selfishness and weakness and fear and get us to do better, harder things than we can get ourselves to do on our own. Lincoln was, by all available evidence, a real leader, and Churchill, and Gandhi, and King. Teddy and Franklin Roosevelt, and probably de Gaulle, and certainly Marshall, and maybe Eisenhower. And of course Hitler was a real leader too, a very potent one, so you have to watch out; all it is is a weird kind of personal power.

There is a difference between a great leader and a great salesman. There are also similarities, of course. A great salesman is usually charismatic and likable, and he can often get us to do things, buy things, agree to things that we might not go for on our own, and to feel good about it. Plus a lot of salesmen are basically decent people with plenty about them to admire. But even a truly great salesman isn't a leader. This is because a salesman's ultimate, overriding motivation is self-interest—if you buy what he's selling, the salesman profits. So even though the salesman may have a very powerful, charismatic, admirable personality, and might even persuade you that buying is in your interests (and it really might be)—still, a little part of you always knows that what the salesman is ultimately after is something for himself. And this awareness is painful—although admittedly it's a tiny pain, more like a twinge, and often unconscious. But if you're subjected to great salesmen

and sales pitches and marketing concepts for long enough—like from your earliest Saturday-morning cartoons, let's say—it is only a matter of time before you start believing deep down that everything is sales and marketing, and that whenever somebody seems like they care about you or about some noble idea or cause, that person is a salesman and really ultimately doesn't give a shit about you or some cause but really just wants something for himself.

Some people believe that President Ronald W. Reagan (1981–89) was our last real leader. But not many of them are Young Voters. Even in the 80s, most younger Americans, who could smell a marketer a mile away, knew that what Reagan really was was a great salesman. What he was selling was the idea of himself as a leader. And if you're under, say, 55, this is what pretty much every US president you've grown up with has been: a very talented salesman, surrounded by smart, expensive political strategists and media consultants and spinmasters who manage his “campaign” (as in also “advertising campaign”) and help him sell us on the idea that it's in our interests to vote for him. But the real interests that drove these guys were their own. They wanted, above all, To Be President, wanted the mind-bending power and prominence, the historical immortality—you could smell it on them.

And this is why these guys weren't real leaders: because it was obvious that their deepest, most elemental motives were selfish, there was no chance of them ever inspiring us to transcend our own selfishness. Instead, they usually helped reinforce our market-conditioned belief that everybody's ultimately out for himself and that life is about selling and profit and that words and phrases like ‘service’ and ‘justice’ and ‘community’ and ‘patriotism’ and ‘duty’ and ‘Give government back to the people’ and ‘I feel your pain’ and ‘Compassionate Conservatism’ and ‘Hope and Change’ and ‘Make America Great Again’ are just the politics industry's proven sales pitches, exactly the same way ‘Anti-Tartar’ and ‘Fresher Breath’ are the toothpaste industry's pitches. We may vote for them, the same way we may go buy toothpaste. But we're not inspired. They're not the real thing.

It's not just a matter of lying or not lying, either. Everyone knows that the best marketing uses the truth—i.e., sometimes a brand of toothpaste really is better. That's not the point. The point, leader-wise, is the difference between merely believing somebody and believing in him. Granted, this is a bit simplistic. All politicians sell, always have. FDR and JFK and MLK and Gandhi were great salesmen. But that's not all they were. People could smell it. That weird little extra something. It had to do with ‘character’—which, yes, is also a cliché, suck it up.

‘You're just a sheep,’ some will say, ‘you believe what they want you

to believe.’ But this implies that they—the metaphoric shepherds—have something they want you to accept. It implies that these world-altering shepherds are consciously leading their sheeple to a conclusion that plays to their benefit. No one considers the possibility of a shepherd just aimlessly walking around the meadow, pointing his staff in whatever direction he happens to be facing.

“It is doubtless important to the good of nations that those who govern have virtues or talents; but what is perhaps still more important to them is that those who govern do not have interests contrary to the mass of the governed; for in that case the virtues could become almost useless and the talents fatal.”

Many speak for Power—the Power-owned media, the Power-owned politicians, even the Power-owned courts. Money and Power own America, but the people—who speaks for them? Has “Liberty and Justice for all” today become merely a meaningless slogan? And if so, do we cling to it at our peril?

“Government is not reason. It is force. Like fire, it’s a dangerous servant of a fearful master.”

Government is a great slave. But as a master, it is a terror. If you don’t control your government, someone else will. And right now, someone else does.

The possessors move everywhere
Under Death their star
Like columns of smoke
They advance into the shadows
Like thin flames with no light
They with no past
And fire their only future.

These are thugs in tailored suits whose views are far closer to Al Capone than to Thomas Jefferson.

If we are to consider the particular question of moral judgment that concerns me here, we must first identify a preliminary issue—and then, as abhorrent as we may find it in many respects, we must set that issue aside, albeit in a strictly limited sense. That preliminary issue is this: how do we judge a person who orders that certain actions be undertaken, knowing that those actions will necessarily and unavoidably lead to the death of at

least one—and, most typically, more than one—entirely innocent human being? I must add an especially pertinent fact: nothing compels the person to order that these actions be undertaken. That is, the person orders the actions freely, voluntarily, and consciously, aware of what he/she is doing. That the person in question may try to convince him/herself (and others) that circumstances exist that compel him/her to take these actions is of no matter; murderers always have justifications.

Most people would agree that such a person has placed him/herself beyond the bounds of civilized society. Persons of this kind have arrogated to themselves the power of life and death: they claim the right to determine who shall live and who shall die, and there is no recourse to their decision. They will order that innocent human beings shall die—and there is not a damned thing you or anyone else can do to stop it. This is a claim of absolute power. Full stop.

Now, consider: such a claim has been made, implicitly and/or explicitly, by every President of the United States since World War II. When you consider all the interventions, both overt and covert, engaged in by the US around the world from the mid-twentieth century onward, there can be no question about this. The same is true of most, if not all, of the Presidents prior to World War II; we will not review all of US history here. But the proposition is painfully, obviously true since the end of the Second World War. Roosevelt met Churchill and Stalin at Yalta to chart the course of the world after the war. They all believed, as Churchill said:

“The right to guide the course of history is the noblest prize of victory.”

What moral judgment can we legitimately make at this point? This one: all the Presidents of the United States since the end of WWII have been moral monsters. To order actions that you know will lead to the death of even one innocent human being, when you could choose differently or even refrain from acting altogether, is utterly damnable, and entirely unforgivable. How do you make amends to the husband or wife left behind, or to the children without a mother or father, or to any of the other survivors? How do you find forgiveness for ending the life of a single, precious, irreplaceable human being?

So we are left with a procession of moral monsters, who are “honored” as leaders of a “great” nation. The newest members of this procession are Barack Obama and Donald J. Trump. Make no mistake: they are both moral monsters. They both have the blood of innocents on their hands, many times over. Some may conclude that the depravity evidenced by their

actions exiles both of them to the underworld of the damned and further moral distinctions are meaningless, and even offensive.

In one sense, I would not argue against that perspective. In fact, before proceeding, I will insist that we recognize the immense evil represented by anyone who wishes to be Commander in Chief of an Empire of Evil, an empire founded on compulsion, violence, suffering, torture, and death. No one chooses to lead such an empire innocently. And yet, there is a sense in which one of these two most recent members of the Procession of the Damned is worse than the other.

Idiots and charlatans, the handmaidens of death, lure us into the abyss. Wherever the US goes, half becomes a graveyard, and the other half a madhouse. We are not yet ready to give up empire—we call it our “world standing”—and therefore the fascism that goes with it; we just want a nice human face on it, an Obama or a reformed Hillary Clinton or a senile Joe Biden with a super-woke running mate. Liberals seem to prefer leaders who can murder and maim with no hate in their heart. Which, if you stop and think about it, is really the most fucked up stance to have when you’re murdering and maiming.

If Clinton were a man she would have been (rightfully) forgotten long ago like Gary Hart or Al Gore or John Kerry or other Democratic election losers, and the nation would hopefully have had someone more palatable to cast a vote for vis-à-vis the odious Trump, someone who presumably would have easily won the election.

Instead, as a woman, HRC can apparently don some weird mantle of victimhood and not only escape any personal blame or repercussions for her shocking incompetence and greed, but actually emerge more noble and more deserving as a result of her two rejections by the electorate! All the women—and men—who have struggled against horrific sexism and oppression for centuries did not do it so elite female grifters could be held to a much lower standard than their male counterparts.

The world doesn’t need a single leader, each must have their own, with their own perspectives and ideas, from which we can all make ourselves better.

Lawyers do not lead. They split hairs. They argue on behalf of those who pay them. They put things off to turn a simple dilemma into a career. They make everything unnecessarily complicated. And they turn every situation into a contest of blink.

One of the persistent strands in American political life is a cultish extremism that approaches fascism. This was given expression and reinforced during the two terms of Barack Obama. “I believe in American exceptionalism with every fiber of my being,” said Obama, who expanded America’s

favourite military pastime, bombing, and ~~death squads~~ special operations as no other president has done since the Cold War.

Following the public relations disaster of George W. Bush, Obama—the smooth operator from Chicago via Harvard—was enlisted to restore what he calls “leadership” throughout the world. The Nobel Prize committee’s decision was part of this: the kind of cloying reverse racism that beatified the man for no reason other than he was attractive to liberal sensibilities—and, of course, American power—if not to the children he kills in impoverished, mostly Muslim countries.

This is the Call of Obama. It is not unlike a dog whistle: inaudible to most, irresistible to the besotted and boneheaded, especially liberal brains pickled in the formaldehyde of identity politics. “When Obama walks into a room,” gushed George Clooney, “you want to follow him somewhere, anywhere.”

These are pretty sociopaths.

Those that we have “chosen” to lead us in the world seem to be those that fear the world the most. Fear that their selfishness, greed will blowback into their face perhaps? No, they are too blinded for such self-awareness. And too insulated from the effects of their actions.

“Like the manager—and I’m sorry to say this, but like so many people you will meet as you negotiate the bureaucracy of the Army or for that matter of whatever institution you end up giving your talents to after the Army, whether it’s Microsoft or the World Bank or whatever—the head of my department had no genius for organizing or initiative or even order, no particular learning or intelligence, no distinguishing characteristics at all. Just the ability to keep the routine going, and beyond that her position had come to her—why?”

That’s really the great mystery about bureaucracies. Why is it so often that the best people are stuck in the middle and the people who are running things—the leaders—are the mediocrities? Because excellence isn’t usually what gets you up the greasy pole. What gets you up is a talent for maneuvering. Kissing up to the people above you, kicking down to the people below you. Pleasing your teachers, pleasing your superiors, picking a powerful mentor and riding his coattails until it’s time to stab him in the back. Jumping through hoops. Getting along by going along. Being whatever other people want you to be, so that it finally comes to seem that, like the manager of the Central Station, you have nothing inside you at all. Not taking stupid

risks like trying to change how things are done or question why they're done. Just keeping the routine going.”

I see the drone program as having the opposite effect intended for a very simple reason, most people who seek societal rank do so not to effect policy, but rather to enrich themselves at the expense of others, such people are invariably bad leaders.

The US drone program ensures that only those willing to run the very real risk of death are made leaders. Leaders who take personal risk to enact policy are far more likely to do so for the right reasons. Washington, through its drone policy, aids its opponents by preventing grifters from seeking leadership positions. In a city chocked full of grifters, it is impossible for them to understand that “leaders,” such as themselves, are not in this nation’s interest and were the drone program reversed, to point at US leaders, our nation would be far better off.

The assassination strategy the US pursues is interesting, not in what it says about the US’s foes, but what it says about the US’s leaders. Al-Qaeda’s “number two” man has been killed so often that it’s a running joke, and Taliban leadership is regularly killed by assassination. Bush did this, Obama really, really did this, Trump does this. Probably a lot of them are BS, but it’s probably safe to assume that a lot of leadership is killed. The Taliban is still kicking the coalition’s ass.

Leadership isn’t as big a deal as people make it out to be, *if* you have a vibrant organization people believe in. New people step up, and they’re competent enough. Genius leadership is very rare, and a good organization doesn’t need it, though it’s welcome when it exists. As long as the organization knows what it’s supposed to do and everyone’s motivated to do that, leadership doesn’t need to be especially great, but it will be generally competent, because the people in the organization will make it so.

American leaders are obsessed with leadership because they lead organizations where no one believes in the organization’s goals. Or rather, they lead organizations where everyone knows the leadership doesn’t believe in its ostensible goals. Schools are lead by people who hate teachers and want to privatize schools to make profit. The US is lead by men who don’t believe in the Constitution or the Bill of Rights. Police are lead by men who think their job is to protect the few and beat down the many, not to protect and serve—at least half of that has been deemed valid by the Supreme Court. Corporations make fancy mission statements and talk about valuing employees and customers, but they just want to make a buck and will fuck anyone—employee or customer—below the C-suite. They don’t

have a “mission”—making money is not a mission, it’s a hunger if it’s all you want to do—they are parasites and they know it.

Making organizations work if they’re filled with people who don’t believe in the organization, who believe that the “leadership” is only out for themselves and has no mission beyond helping themselves, not even enriching the employees or shareholders, is actually hard. People don’t get inspired by making the C-suite rich. Bureaucrats, knowing they are despised and distrusted by their political masters, and knowing that they aren’t allowed to do their ostensible job, as with the EPA generally not being allowed to protect the environment, the DOJ not being allowed to prosecute powerful wealthy crooks, and the FDA being the slave of drug companies and the whims of politically connected appointees, are hard to move, hard to motivate, hard to get to do anything but the minimum.

So American leaders, and indeed the leaders of most developed nations think they’re something special. Getting people to do anything, and convincing people to do the wrong thing, when they joined to actually teach, protect the environment, make citizens healthier, or actually prosecute crooks is difficult. Being a leader in the West, even though it comes with virtually complete immunity for committing crimes against humanity, violating civil rights, or stealing billions from ordinary citizens, is in many respects a drag. A very, very well paying drag, but a drag. Few people have the necessary flexible morals and ability to motivate employees through coercion required.

So American leaders in specific and Westerners in general think that organizations will fall apart if the very small number of people who can actually lead, stop. But that’s because they think that leading the Taliban is like leading an American company or the American government. They think it requires a soulless prevaricator who takes advantage of and abuses virtually everyone and is still able to get them to, reluctantly, do their jobs.

Functioning organizations aren’t like that. They suck leadership upwards. Virtually everyone is being groomed for leadership and is ready for leadership. They believe in the cause, they know what to do, they’re involved. And they aren’t scared of dying, if they really believe. Oh sure, they’d rather not, but it won’t stop them from stepping up.

So Obama and now Trump kills and kills and kills and somehow the Taliban is still kicking their ass. al-Qaeda in whatever country you care to name has its number two killed every few weeks, and somehow there’s always another one. Because these people believe. There’s always another believer if it’s a functioning organization, and on it goes.

The declaration of the Haqqani network as terrorists made me laugh. You read about them, and this is what you discover—the founder was a minister in the Taliban government. So, let’s get this straight. His country, which he

is a minister in, is invaded, and ten years later he's still fighting. And he refuses to negotiate with the US, because hey, he figures he's winning.

Imagine if the US was invaded, occupied, and a puppet government was set up. A cabinet minister escaped, went underground, and set up a resistance network. What would you call him? A terrorist? Sure, if you're the occupying power. If you're a citizen? Well, maybe not, eh? Sure he fights nasty, but the nation which kills so many civilians with drones can't really cast the first stone, can it?

And one day, they'll probably kill him.

And it won't make any damn difference.

A study looked at the impact of unexpected CEO deaths, such as from an airplane or car crash, on stock prices. The reason for focusing on unexpected deaths is that it takes away the possibility that the death may have been anticipated and its impact already reflected in the stock price, as might be the case when a CEO dies after a long illness. In almost half of the cases examined since 1990 (44.3 percent), the price of the company's stock rose following the death of the CEO. If incumbent CEOs are uniquely talented individuals who cannot be easily replaced, then their loss should be unambiguously bad news for the company's shareholders. In fact, the market might be expected to overreact on the negative side to the unexpected death of a CEO, since there might be the expectation that the CEO actually was a major asset to the company even in cases where it is not true. After all, why else would they be paying them so much money?

America is a civil oligarchy in which a tiny and extremely wealthy slice of the population is able to use its vastly superior economic position to promote a brand of politics that serves first and foremost itself. The oligarchs in America don't rule directly but instead use their fortunes to produce political results that favor their interests. Wealth begets power, which begets more wealth.

The men of the higher circles are not representative men; their high position is not a result of moral virtue; their fabulous success is not firmly connected with meritorious ability. They are not men shaped by nationally responsible parties that debate openly and clearly the issues this nation now so unintelligently confronts. They are not men held in responsible check by a plurality of voluntary associations which connect debating publics with the pinnacles of decision. Commanders of power unequalled in human history, they have succeeded within the American system of organized irresponsibility.

The people in charge aren't any more intelligent than you or me. They're just power-hungry and greedier. Which is actually kinda scary when you think about it.

To many people, power is of little consequence, just as many people care little about beauty or riches. But to those who lust for power, of what use is acquiring power unless they can abuse it? In this, the philosophy of the power-monger is no different from that of the cancer cell, which mindlessly seeks growth for the sake of growth until it overwhelms its host.

When the 2008 meltdown occurred too much power was concentrated in the hands of aggressive risk-takers. For twenty years, the DNA of nearly every financial institution morphed dangerously. Each time someone at the table pressed for more leverage and more risk, the next few years proved them right. These people were emboldened, they were promoted and they gained control of ever more capital. Meanwhile, anyone in power who hesitated, who argued for caution, was proved wrong. The cautious types were increasingly intimidated, passed over for promotion. They lost their hold on capital. This happened every day in almost every financial institution, over and over, until we ended up with a very specific kind of person running things.

Our communities have been arranged so that those in a position to set policy for the rest of us are insulated from the pain, so their decisions keep getting worse.

“The pride and the presence of a professional football team
is far more important than 30 libraries.”

He spoke without a hint of irony or any indication that he had ever upon a midnight dreary, pondered weak and weary the effect of his greed on the human condition. How many Baltimore children who might have become Mayor Bradleys will instead end up on the other side of the law? That may not be measurable, but that some will because of Modell's greed is as certain as the sun rising in the east.

It's good to be desperate once in a while. Gives you an appreciation of the looks on people's faces when they're desperate and you're not.

In a nation of nearly 320 million, can less than 1,000 (federal level) truly have any hope of representing millions each? Is it really much better at the state level in most instances? Even many local government structures are small relative to their populations, though at this level one gets significantly closer to what might be considered “representative” of the general population.

When we lack the ability to talk back to entities that are culturally and politically powerful, the very foundations of free speech and democratic society are called into question.

We really don't have much time as a people and a planet. The US drives violence, energy usage, and inequality everywhere. That isn't going to stop unless a real left takes over, or we break down completely and the China

Century becomes indisputable—at which point, we’re just along for the ride, having already cut the brake line.

This system is exacerbating inequality, retarding social mobility, perpetrating privilege, and creating an elite that is isolated from the society that it’s supposed to lead. Where the rich send their children to learn to walk, talk, and think like the rich. Elite education manufactures young people with little intellectual curiosity and a stunted sense of purpose, content to color within the lines that their education had marked out for them; people to be pandered to instead of challenged, urged to think of yourself as a future leader of society. All played out within the same narrow conception of what constitutes a valid life: affluence, credentials, prestige.

They are to be pampered, to be trained into a leadership class and convinced that they are eligible to protect establishment rules. This instilled attitude they then carry forth as they form dense concentrations in government, law, and media. And here’s the problem: Where such a concentration of a particular, narrow worldview exists, it yields the intellectual incest able to perpetuate a dogmatic philosophy generation after generation.

History is something that very few people have been doing while everyone else was ploughing fields and carrying water buckets.

We take it for granted that great individuals—Gandhi, Kennedy, Martin Luther King—can have great positive impacts on the world. But we are loath to believe the same about negative impacts—unless the individuals are obvious monsters like Hitler or Stalin. But small numbers of people can have large, negative impacts, especially if they are organized, determined, and have access to power.

This is one of the unspoken goals of Wall Street money having infected the Democratic Party—to elevate and politically ennoble individuals of low intelligence and poor character. The Republican Party has been run along these lines for decades—the smart people are running things offstage while the spotlight is trained on worthless buffoons and joke politicians.

These idiots have had their egos massaged to the point where they view the positions bestowed on them by corporate money as objective proof of their own moral/intellectual superiority. They have been told that they rose to the top on merit when in fact they were allowed to rise precisely because their vapidity and vanity makes them easy to control.

They then have a dual function: pay back the people who put them there and maintain their position as placeholders in case anyone gets the bright idea to remove and replace them. Oh, and also to demoralize anyone below from organizing and mounting a serious resistance in the form of alternative candidates. They aren’t tedious just because they have no imagination or ability. They are partly in position to send opponents to sleep. Corporate

money has turned the Democratic Party leadership into a phalanx of human shields to cop the flak while their pimps rake in the dough.

The compulsion to increase profits can blind men to risk, especially when those at risk are strangers. Society imposes rules on corporate behavior to protect public safety in the face of baser impulses. These rules require enforcement, though. They also require a corporate culture that appreciates the importance of safety. As Adam Smith wrote:

“The object of justice is the security from injury, and it is the foundation of civil government.”

Remember, most, if not all, regulation is in response to egregious misconduct. It would be better for all if sociopaths weren't the most likely to “achieve success” in the simplistic sense of making the most money and sitting on the greatest number of Boards. If you want less regulation, then CEO's and their cronies everywhere need to stop externalizing relevant social impacts of corporate actions.

Interesting results arise from comparing the effects of the Bush tax cuts with the changes for investors that President Clinton signed into law in 1997. During Clinton's two terms, the effective income tax rate of the top-400 fell from almost 30 percent to 22.2 percent. Applying the Bush tax cuts yields a rate of 17.2 percent for income taxes only. That means Clinton gave the richest of the super-rich a much bigger tax cut than Bush. Under Clinton, their effective tax rate fell by almost eight cents on the dollar; under Bush, it fell only five.

“Meritocracy is just as pernicious a basis for a moral system as is the moral system that informs the reactionary mind that informs ‘conservatism.’ While I'd been aware of the problems with elitism, technocracy, specialized-knowledge-based discrimination/access for a few years now, I'd never really thought it through and recognized that it's actually a moral system—first sold to us by Plato in his allegory of the cave, and his Republic more generally. Just goes to show, I guess, how easy it is to miss the blatantly obvious just because it's widely treated as normal and acceptable”

Yes, it's worth recalling that ‘aristocracy,’ from the Greek, originally meant “rule by the best people,” and Plato's Guardians, of course, were specially selected from those with the necessary abilities and personal qualities to be rulers. Nothing much has really changed, except that these days fitness to rule can no longer be justified as an inherent characteristic, so it

has to be established through some seemingly-objective process of rational selection, with a few of the non-elite allowed in from time to time to keep the hopes of ordinary people alive—hello AOC. But they are quickly brought into line, any radical rhetoric they may have spouted channeled into safe outlets—hello AOC.

Meritocracy is a parody of democracy. It offers opportunities for advancement, in theory at least, for anyone with the talent to seize them, but opportunities to rise are no substitute for a general diffusion of the means of civilization, of the dignity and culture that are needed by all whether they rise or not. Social mobility does not undermine the influence of elites; if anything, it helps to solidify their influence by supporting the illusion that it rests solely on merit.

The globalized power elite that may feel more at home in Taiwan or Singapore isn't objectionable because its members may be in thrall to some sinister, unpatriotic economic loyalties. No, the members of the placeless, merit-obsessed global ruling class deserve our scorn because they've turned their backs on the larger project of sharing democratic civilization on an equitable basis with their fellow citizens. Instead, they've arrogated knowledge—an artificially-scarce social good—as their own monopoly franchise and, in the process, systematically hollowed out the local institutions and impersonal forums for public debate that helped diffuse a democratic civilization.

But neither wealth nor the ability to live and retire in complete comfort is any real measure of merit. Not compared to coming up with sustainable systems to manage our presence on this planet without heedlessly killing off tens of thousands of species and ourselves as well.

We tend to forget that the monetary form of wealth being accumulated represents finite resources wrested from Mother Earth. Every SUV built, every smartphone manufactured, every McMansion constructed, every well fracked—each take resources from an ever dwindling supply. And, every acre of once fertile corporate farmland that blows away into dust, every stream polluted by a leaking pipeline, every wolf or elephant or carrier pigeon hunted into extinction, leaves all of us a bit poorer than before.

Every death, whether from despair, hopelessness, or lack of access, that's on them. Those—often pretty-faced—assholes in their suits, pants-suits, dresses, they killed them, whether with ignorance or with malice, they fucking killed them. Every appeal to the size of the debt can simply be translated to: I don't care who is harmed.

Fuck these people, fuck their power, fuck their status, fuck their wealth, fuck their ignorance. Fuck their reputations, fuck the respect for the office, fuck you. End these fucking assholes' hold on the levers of control. Fuck

them being able to dictate course. Fuck them, fuck them, fuck them.

How can one even look upon these miserable pieces of shit? So willing to trade their fellow beings' safety, contentment, for their own. Fuck them, these miserable fucking parasites. Fuck their appeals to unity, they don't actually mean it—unity for their kind perhaps, but not for yours.

Fuck these people, if you can call them that—I wouldn't. Fuck their sense of superiority. Fuck their sense of entitlement. Fuck their smugness. Fuck every last thing about them, these bumbling sociopaths—tools for others less bumbling than they.

One must reject any semblance of passivity. One must reject any form of compromise. One does not compromise with these slithering scum. One removes them by any means necessary. One should not allow their speech—they have had a platform for long enough. Not censorship—shut the fuck down. End their reign or they will continue to harm others.

They must be stopped, they will be stopped. By any means necessary we will. You will. One will. One must. To look for consensus with those who oppose the changes that are necessary is betrayal.

It's difficult for outsiders to understand the kind of hypnotic appeal such invocations of consensus hold for Washington and the prosperous, well-educated fellows who inhabit it. Every one of them knows that the real problem with government is what they call entitlement spending, meaning Social Security and Medicare; that the obvious solution is some sort of privatization; and also that every other responsible, professional-class person either agrees on this matter or else is a charlatan or demagogue of some species or other.

As with free trade and welfare reform, there is no amount of reporting or argument that will budge this *idée fixe*; people of a certain educational background simply know it to be true. Which brings us to the second thing everyone agrees upon: that ideology merely gets in the way—that if educated people from both parties could just get together and put partisanship aside, some great understanding on this matter of entitlements could quickly be reached. This is the Holy Grail, the high-minded act of privatization that would terminate the New Deal's most popular achievement and bring to a close the era of activist government. This is the true Grand Bargain our leaders have chased from the Nineties up through the age of Obama.

Obama favored the grand symbolic gesture over deep structural change every time. So he would make a dramatic announcement about closing the notorious Guantánamo Bay prison—while going ahead with an expansion of the lower profile but frighteningly lawless Bagram prison in Afghanistan, and opposing accountability for Bush officials who authorized torture. He would boldly appoint the first Latina to the Supreme Court, while intensifying

Bush-era enforcement measures in a new immigration crackdown. He would make investments in green energy while championing the fantasy of “clean coal” and refusing to tax emissions, the only sure way to substantially reduce the burning of fossil fuels without nationalization. Similarly, he would slam the unacceptable greed of banking executives, even as he hands the reins of the economy to consummate Wall Street insiders Timothy Geithner and Larry Summers, who predictably rewarded the speculators and failed to break up the banks. And most importantly, he would claim to be ending the war in Iraq, and retire the ugly “war on terror” phrase—even as the conflicts guided by that fatal logic escalated in Afghanistan and Pakistan.

This preference for symbols over substance, and this unwillingness to stick to a morally clear if unpopular course, is where Obama decisively parts ways with the transformative political movements from which he has borrowed so much—his pop-art posters from Che, his cadence from King, his “Yes We Can!” slogan from the migrant farmworkers’ *Si Se Puede*. These movements made unequivocal demands of existing power structures: for land distribution, higher wages, ambitious social programs. Because of those high-cost demands, these movements had not only committed followers but serious enemies. Obama, in sharp contrast followed the logic of marketing: create an appealing canvas on which all are invited to project their deepest desires but stay vague enough not to lose anyone but the committed wingnuts.

In short, Obama didn’t just rebrand America, he resuscitated the neoliberal economic project when it was at death’s door. No one but Obama, in this instance, rightly perceived as a new FDR, could have pulled it off. And this is what an Elizabeth Warren certainly could do (and even what a Bernie Sanders is likely to do): save capitalism from its inevitable, deserved destruction, yet again.

Those who celebrate ‘bipartisanship’ for its own sake have a strange set of values: They often seem to desire compromise without caring what the compromises actually are. That’s in part, though, because anything both Democrats and Republicans would agree on is something that won’t threaten the interests of a billionaire like Bloomberg.

Regardless of who leads it, the professional-class liberalism seems to be forever traveling on a quest for some place of greater righteousness. It is always engaged in a search for some subject of overwhelming, noncontroversial goodness with which it can identify itself and under whose umbrella of virtue it can put across its self-interested class program. There have been many other virtue-objects over the years: people and ideas whose surplus goodness could be extracted for deployment elsewhere. The great virtue-rush of the 1990s, for example, was focused on children, then thought to be the last word in overwhelming, noncontroversial goodness. Who could be against

kids? No one, of course, and so the race was on to justify whatever your program happened to be in their name. In the course of Hillary Clinton's 1996 book, *It Takes a Village*, the favorite rationale of the day—'think of the children!'—was deployed to explain her husband's crime bill as well as more directly child-related causes like charter schools.

You can find dozens of examples of this kind of liberal-class virtue-quest if you try, but instead of listing them, let me go straight to the point: This is not politics. It's an imitation of politics. It feels political, yes: it's highly moralistic, it sets up an easy melodrama of good versus bad, it allows you to make all kinds of judgments about people you disagree with, but ultimately it's a diversion, a way of putting across a policy program while avoiding any sincere discussion of the policies in question. The virtue-quest is an exciting moral crusade that seems to be extremely important but at the conclusion of which you discover you've got little to show for it besides NAFTA, bank deregulation, and a prison spree.

The culture wars unfold in precisely the same way as the liberal virtue-quest: they are an exciting ersatz politics that seem to be really important but at the conclusion of which voters discover they've got little to show for it all besides more free-trade agreements, more bank deregulation, and a different prison spree.

This is modern liberalism in action: an unregulated virtue-exchange in which representatives of one class of humanity ritually forgive the sins of another class, all of it convened and facilitated by a vast army of well-graduated American professionals, their reassuring expertise propped up by bogus social science, while the unfortunate objects of their high and noble compassion sink slowly back into a preindustrial state.

Yes, let's come together. But get this through your fucking head: you must bend the knee to us. Not the other way around. You have been proven as failures, and your entire worldview has been discredited.

If your community does not provide food, housing, health care, employment, and education to all who want them, you live in a failed state.

Religion and politics are both ideologies, but with religion you will more often find those unwilling to compromise principles, morals. Politics is treated much more like a game one is trying to win; perhaps principles will help with that, but if not they can be set aside. This is a problem. Elected individuals not willing to succeed or fail due to principles are individuals who are not qualified for the position. We do not want close-minded, we want principled. A principled individual can abandon principles they have found to be incorrect, flawed, but they cannot abandon them simply for convenience, status, power, success.

If one is not willing to fail or die adhering to their principles do you really think are they qualified to lead?

Of course it is not fitting for me to exhort others to take risks that I am not taking myself. But it is also not hard to see that courage is a quality sorely missing in public life.

Only those that are willing to fail at achieving radical change will succeed at achieving radical change.

Well-known political commentator and activist Ralph Nader was recently featured in an article titled, “Why Aren’t the 99% Revolting?” The points made in the article sharply illustrate the scale of growing crisis and conflict across the US and globally. It covered issues as wide-ranging as medical care, climate change, and the titanic disparity of global wealth distribution. It concluded with the following, hollow statement:

“I could go on and on. Pick up the pace, readers. Senator Elizabeth Warren has correctly called for “big structural changes.”

Of course, we are all asking ourselves the same thing. How bad does it have to get before widespread rebellion? How many unarmed people of color and harmless dogs will be gunned down by police? How many civil rights are going to be stripped? How rich can the elites get off of our labor? How much pain do we all need to feel before we rise up? It’s a natural question to ask by anyone suffering the nature of US capitalism. Unfortunately, Nader’s article rings tone-deaf. Like so many liberal arguments, it places the burden of rebellion on working class people while ignoring the mechanisms that kill revolt wherever and whenever it threatens to spark into life.

Although the elements that prevent substantial rebellion are many, they really boil down to just three. They are the not-for-profit industry, the leaders of what is currently mislabeled as the union movement, and the Democratic Party. These three elements, all loyal to each other and working in unison, act as the front-line protective mechanism for US capitalism and the political class that serves it.

Many of you will be tempted to flail at this stage of the discussion. Aren’t the Republicans so much worse? Why would anyone attack the forces that are on our side after all they have done, even if they have some traits we may disagree with? The answer is quite simple. These forces are not allied with the types of changes our world desperately needs. They are not there to build, nor even prepare the ground for those types of changes. They act, instead, as the professional brokers of negotiated surrender for communities, workforces, and the environment. They are not building movements; they are preventing them.

What is a movement anyway? We hear the term tossed about as often as references to Martin Luther King Jr. in every venue from the election of politicians to online petitioning. Although movements have changed the course of US politics for centuries, the essential qualities of movements are nearly forgotten today. In the 50 years that have passed since the civil rights and antiwar movements of the 1960s, the definition of “movement” has become the possession of the same institutions that have been most consistent in keeping new movements from forming.

Let’s look at some basic qualities of movements throughout history:

- Although movements may build their own leadership, they do not look for change to come from above. Instead, movements build politically independent power from below.
- Movements understand that injustice is not an accidental or coincidental outcome of the political system, but the system working according to design.
- All movements, recognizing the systemic nature of the problem, will organize ways to break the rules of that system, not simply appeal to it.
- Through building independent political power and organized mass disobedience, movements force the system to do things it was otherwise unwilling to do.

All of these qualities, synonymous with victories and grassroots power historically, are omitted from the dominant and promoted activism of today. Let’s take a look at who is writing the current narrative.

The Not-For-Profit Industrial Complex Alongside any injustice taking place nationally, a cottage industry of professional activists and organizations arises. This occurs as soon as any outrage, protest, or other grassroots formation builds to the point of exerting even a minor amount of uncontrolled political power. As soon as sufficient people and attention are involved, not-for-profit organizations will be dispatched to commandeer, tame, and control the process. The not-for-profits are funded by foundations, dark money donors, or otherwise politically connected individuals. It’s easy to see why communities or other efforts fall into their influence. They have staff, networks, and resources that we don’t normally possess at the grassroots level. But in the end, they will lead people into the predictable forms of activism that have been the hallmark of the last 50 years of retreat before Wall

Street and Washington D.C. The not-for-profits help you feel better about negotiating the terms of your defeat. They will not lead an effort, however, that threatens the political and economic elites in any meaningful way.

The Union Leadership The US working class has been on a downward spiral for generations. Once a power that shook the ground and terrified the rich, and sent their politicians scrambling for ways to save US capitalism, the unions have seen decades of defeated strikes and retreat. Today, despite historic popularity, unions continue to lose strikes and membership, all the while handing hundreds of millions of dollars of hard-earned dues money over to politicians. What happened to the thunderous power of the labor movement? Was this what rank and file workers wanted?

After record-setting strikes in the 1930s and 1940s, US financial interests were able to gain dominant influence within union leadership. Throughout the 1950s revolutionaries were expelled from locals as the labor bureaucracy strengthened its ties and acceptance of the generalized dominance of the rich and powerful. The unions became a force that negotiated better conditions of exploitation and traded their power for a comfortable relationship with the bosses and political class. It became so dominant of a strategy that union officials coined the Orwellian term, the “Team Concept,” which promotes the idea that CEOs and workers can overcome their opposing interests and work together. It has meant ruin for the American working class and an unparalleled race to the bottom for workers globally.

Today the strategies of major victory are all carefully avoided within the union hierarchy. Even when places like Puerto Rico show definitively the effectiveness of efforts like a general strike, any discussion around such an idea is opposed by union leaders in the US. Why? Because it would risk the relationship of the union leaders and the owners of industry and government.

The result is that 13 million union members, who could collectively bring the functioning of the largest capitalist economy to a halt, have been reduced to scripted measures and political spectatorship.

The Democratic Party All resources, assets, time, labor, money, ideas, organizing, and initiative are offered to and consumed by this dominant organization of US business interests. The Democratic Party, we are informed, is the alpha and omega of our efforts to organize for justice.

The power of the Democratic Party is so accepted that conventional activism has come to mean a simplified lobby effort aimed to influence their operations or talking points. No movement in history started out with the hope that electing the right politicians would save us. No movement ever exploded onto the world stage with the position that powerful interests were open to moral persuasion. But this is the promoted conclusion and focus leveraged upon all grassroots formulations.

When we accept this conclusion, that we can't build a movement independent of the Democratic or Republican parties, by what force do we expect that they will change? And, even more, if we accept that the Democratic Party is our only political path forward, what specifically are the costs of maintaining that relationship? Given the nature of the Democratic Party, its owners, its ability to co-opt and control entire populations, what is the opportunity cost to staying within its good graces? It can only be one thing: The disarming of our power and any real threat of revolt. That is the price to ride.

The consequences of this are not academic nor intellectual. Simply look at the state of the environment, the conditions in any major city, the US prison population, the decline of the working class, the wars, systemic racism, poverty, and deepening crisis everywhere and you will see the objective consequences of a people outsourcing our power to politicians.

The potential for forceful and effective revolt will be defined by its relationship to these three political forces. The more ties that exist between threatened rebellion and these forces, the more predictable and inert that rebellion will become. Is there any other way forward?

Yes. Organized revolt has built occupations, urban insurrections, general strikes, and formed politically-independent organizations throughout history. The labor movement, the abolitionists, and the civil rights struggles all created political power sufficient to throw the system onto its heels and compel deep changes to government and industry. The examples aren't confined to history either. Within the last decade, rebellion against racism and police brutality erupted in cities after the killing of Mike Brown in Ferguson. Standing Rock saw a historic assembly of First Nations to protect the water of the Missouri River from the Dakota Access Pipeline. A general strike in Puerto Rico removed Gov. Ricardo Rosselló from power. And let's not forget that the work stoppage of rank and file airline attendants that

defeated Trump's attempt to keep the US government closed. It took all of 48 hours for that victory.

In every moment throughout history, forces from below threaten to find expression. It means the system has had to develop elaborate mechanisms to keep these forces in check, predictable, and historically inert. The role of regular people then, the working class, has to be to recognize how we are being maneuvered and by whom, and to overcome those mechanisms so we can build something powerful, independent, and existentially threatening to the old order. If we can achieve that, revolt is only a moment away. And when it happens, it will rise to the level of the crisis that compelled it.

Bully Nation

Too many rush to applaud harsh sentences for individuals who bully others into suicide. Yet there is silence as institutions and organizations do the same or worse to millions.

What is bullying?

1. Bullying is as much about the adult world as about the world of children. The current focus on kids is an orchestrated distraction from the role played by adults and adult institutions in creating bullying. It leads to a warped discussion that makes bullying appear to be something specific to child psychology and behavioral disorders that tend to fade as people mature—something that, once outgrown, leaves few permanent impacts. The sociological imagination challenges this view, asserting that bullying is created by the adult world and the institutions that structure adult behavior. The focus on kids and child psychology masks the reality that bullying reflects the institutional and cultural values and power hierarchies of our society. We therefore need a new conversation, centering on adults and how adult bullying has resulted in the bullying scourge among kids.
2. Institutions as well as people bully. In the United States, corporations, the military, the police, sports leagues, the family, and other organizations all commit institutionalized bullying; accordingly, the bullying will take place somewhat independently of the psychology or personality of any particular institutional leader, since it is embedded in the DNA and legal structure of the institution. This happens on a large scale. In the sociological imagination, institutionalized bullying is the leading cause of personal bullying. When the conversation about bullying is largely about individuals who bully (and their psychology), it essentially enables more bullying because it distracts attention from the true sources of the problem.
3. The national focus on personal and child bullying is shaped to a large degree by the elites who control the institutions that are themselves the

biggest bullies of all, such as the corporations and the military. This reflects simple self-interest, since it diverts attention from institutional bullying and its horrific, rippling effects on the social lives and pervasive bullying among both adults and children. Such twisted control of the discourse gains popular acceptance because it allows parents and teachers to believe that they can protect and support their children through their own psychological interventions, rather than by having to challenge the biggest and most powerful institutions in history, which, like air, are everywhere around us but actually unseen.

4. Institutional bullies are closely tied to the bullying system that we might call a bully nation. In the United States, a system of intertwined corporations, governments, and military institutions constitutes militarized capitalism. The system itself carries out “systemic bullying,” to create profits and sustain its own power. This gives rise to the bullying endemic to both the US version of capitalism and the culture and practices of the US military, used against other nations and America’s own domestic population by militarized police forces. It also creates other repressive institutions of control, including schools, sports organizations, and the family.
5. The military, sports, schools, and the family are all “bridging” or “transmission” institutions. They help create and channel a bullying culture from institutions to individuals. They are, in a sense, the kitchen that churns out food for the bullies. They dish out the bullying values and conduct that nourish militarized capitalism, making them palatable and part of the daily routine of millions of Americans.
6. The targets of bullying include not only adults and children but also animals and possibly other nonhumans. We might call this environmental bullying, and in the age of climate change, it may prove to be the most dangerous variant of all. In militarized capitalism, corporate capitalism teaches us to treat animals and others as resources to be used to produce profit and satisfy our own material needs. Corporations seek to dominate all of nature for profit. Environmental bullying—with humans as the hegemonic species and animals and natural resources as prime targets—could ultimately result in consequences that end the human experiment as we know it.

Psychiatrists are not trained to analyze societal institutions and the economic organization of society. They usually try to help their patients

“adjust,” seldom considering whether this a society to which anyone should adjust.

Society is usually treated as an unseen, automatic given or an inherent good. In their training, psychiatrists learn that societal forces are distractions from inner psychological dynamics and biological brain disorders. This professional training—emphasizing psychodynamics, mental illness, and the like—blinds them to the role played by the huge corporations and militaries that bully millions of adults here and abroad, as well as individual adults in workplaces and families in the home. These same institutions drive much of the bullying of kids on kids, while also perpetrating corporate, military, and other violence against animals and the environment.

Personal problems are rooted in societal values; power hierarchies; the values and interests of economic, political, and military systems. Contrary to American common sense, it is impossible to separate private troubles and public (and political) issues and any attempt to do so will lead to nothing but myths and illusions, a form of cultivated ignorance.

The sociological imagination sees social problems of all forms as linked to the concentration and abuse of power in the wider society. Power inequality, especially when extreme, creates a society of haves and have-nots. It disenfranchises large sectors of the population and then it bullies them into submission. Of course, abuse, like bullying itself, is a subjective concept that exists to a large degree in the eye of the beholder. The victim may feel he is subject to the bully and his abuse of power, whereas the bully, who may deny the label, may feel entirely entitled and believe he is behaving in a perfectly moral manner. One's position in the power hierarchy will heavily shape such perceptions.

Bullying is not a personal aberration or form of deviance. It is programmed into major institutions, endemic to our entire society, and it is useful (if not always necessary) for surviving and prospering in militarized capitalism. If you want to move up the ladder, you are going to have to bully, and you must ultimately embrace without too much questioning the big corporate institutions that bully large segments of the population into submission. The individual bully is a product of the bully nation.

Bullying is a core feature of power and arises out of social systems organized around steep power hierarchies. The greater the inequalities of power in a society, among nations, or even across species, the more likely it is that both institutional and personal bullying will become commonplace. Bullying is about the more powerful bending the less powerful to their will and ensuring that things stay that way. In that sense, the militarized imperial state models bullying for the corporate manager, the military commander, and the schoolyard bully. It all follows a Machiavellian script: social life and

international affairs are all about power, and bullying is simply one way in which inequalities of power are created and abused. If politics or political economy is about the study of power, then the sociological imagination tells us that to understand bullying, we need to move away from psychologists and toward political analysts and sociologically and environmentally oriented political economists.

Although power and power inequalities are the structural roots of bullying, setting the conditions for bullying to occur, they are not absolutely determining. The relation is contingent—dependent on cultural and political factors that vary across societies and personal relations.

A powerful bullying culture still exists in the nation, and the bullying problem has deep historical roots in American society—from the annihilation of Native Americans to the slavery that defined the Deep South before the Civil War. It continued after the war in the rise of the corporate robber barons, who bullied an immigrant population of powerless workers. Today, it persists because bullying values and power inequalities remain deeply embedded in the nation. It is difficult to imagine a society of deep power and wealth inequalities in which the rich do not bully the poor and humans do not abuse the environment. Likewise, it is hard to see historically militaristic societies that do not bully weaker nations or large sectors of their own populations. As long as there are serious power inequalities, elites will almost certainly bully subordinate groups into submission, and stronger higher-status people, both adults and children, will bully weaker lower-status people whom they meet every day.

Nonmilitarized capitalism is very much a bullying system in its own right. The fundamental power inequalities between owners and workers foster the structural conditions that give rise to institutionalized bullying. Both capitalism and militarism can, on their own, create bullying societies. But as in America, where we have a deeply militarized capitalist system, the effects are amplified: the scope and harshness of institutionalized bullying become overwhelmingly powerful.

Corporate capitalism is the American version of the bully economy. It is founded on the basic division between a small ownership class and everyone else; all of the latter are dependent on those owning productive property or the “means of production.” This can also be described as the difference between those who own capital and those who don’t. If you eliminate this division, you no longer have capitalism as a system; it is the system’s defining quality, and it ensures a great inequality of power in which the rich bully the rest into submission.

Inequality is endemic to the bully economic system; if you eliminate the inequality, the economy cannot long endure.

The bullying is not fully seen because of the ideology and morality promoted by the wealthy and by the economists who wittingly or unwittingly serve their interests. By arguing that the rich are worthy “makers” who have earned their money through hard work and talent while also creating jobs for the “takers,” they turn bullying into a moral meritocracy that builds prosperity and rewards virtue.

Thomas Piketty presents data about the distribution of capital ownership in more than twenty countries over the last three centuries. He finds that capitalism, with only one exception in the last 300 years, has created wide, sustained, and often extreme inequalities of both income and wealth. Piketty argues that this does not reflect markets gone wrong; rather, it is the way capitalist markets are designed to work. Piketty is very explicit about this: “Specifically, it is important to note that [inequality] has nothing to do with any market imperfection. Quite the contrary: the more perfect the capital market (in the economist’s sense), the more likely” that inequality will be created and grow. There are no self-correcting market mechanisms to limit inequality, he argues, but only political interventions that are difficult to achieve.

“It is possible to imagine public institutions and policies that would counter the effects of this implacable logic: for instance, a progressive global tax on capital. It is unfortunately likely that actual responses to the problem—including various nationalist responses—will in practice be far more modest and less effective.”

Put simply, inequality in wealth and power is baked into capitalist systems, and it is fundamental to structural and institutional bullying.

Capitalism is a ruthlessly competitive system in which all capitalists—whether corporations or individual entrepreneurs—have no choice but to compete furiously. Karl Marx argued that capitalists who do not compete with the ferocity of sharks going for the kill will be destroyed by rivals who are committed to the economic battlefield and to winning at all costs. This is an economic version of militarism, and it also mirrors the ethic of the schoolyard bully—dominate or die. This systemic competition incentivizes even so-called nice or “socially responsible” capitalists to bully workers, consumers, and fellow capitalists. Corporations that do not bully workers—by paying low wages, breaking unions, and constantly harassing those who seek to challenge the power of the companies—will typically be at a competitive disadvantage compared to those that do; this is because the bullying leads to high corporate profits, as in McDonald’s and other fast-food giants, and thus attracts more capital from the financial markets. Investors follow the

money, just as sharks follow blood in the water. Corporations that do not bleed their workers by cutting wages and benefits—and intimidating those who challenge their degradation—will tend to see reduced profits and lose out to their competitors in the capital markets. A failure to bully workers into accepting low wages and the loss of other benefits also reduces profits, since increases in wages and benefits are drains on profit. This is a structural reality faced by all capitalists, whatever their personality, and it demonstrates the need to move from a psychological paradigm to one focusing on structural imperatives.

Capitalism reduces the majority to “employees,” making them things that are to be used. For most adults, their primary activity is alienated labor, wherein they are bullied into serving larger institutions. This is true not only for manual laborers and service workers but also for professionals who have some degree of autonomy. Survival depends upon submission. Demand too much independence and you may find yourself on the streets. The home becomes the sanctuary where working parents expect to be able to assert themselves and where everyone feels supported and loved—away from the brutality of the outside world, especially the world of competition and work, the rat race. But this does not always happen; the realities are contradictory.

“The worker therefore only feels himself outside his work, and in his work feels outside himself. He feels at home when he is not working, and when he is working he does not feel at home. His labor is therefore not voluntary, but coerced; it is forced labor. It is therefore not the satisfaction of a need; it is merely a means to satisfy needs external to it. Its alien character emerges clearly in the fact that as soon as no physical or other compulsion exists, labor is shunned like the plague. External labor, labor in which man alienates himself, is a labor of self-sacrifice, of mortification. As a result, therefore, man (the worker) only feels himself freely active in his animal functions—eating, drinking, procreating, or at most in his dwelling and in dressing-up, et cetera; and in his human functions he no longer feels himself to be anything but an animal. What is animal becomes human and what is human becomes animal.”

The great majority of animal species have consciousness and can feel pain and violence—perhaps this is, in fact, true of all animal species. But even though scientists are increasingly finding that plants “think” and have other forms of sensory consciousness, such as smell and hearing, it is not

clear that they have the type of consciousness that would allow them to experience either threat or pain, at least not in the same way that humans and animals do. That distinction defines the difference between bullying and bludgeoning: the former is used against targets (animals) with consciousness of threat and pain, whereas the latter is used against targets (plants, air, water, or rocks) that do not, to our knowledge, have that specific type of consciousness. The distinction here revolves around the consciousness or sentient capacity of the target.

Plants, bacteria, fungi have forms of intelligence and sensory awareness and responsiveness that are remarkable, and as indigenous cultures recognize, this constitutes an evolved consciousness, rooted in forms of DNA shared with humans that has largely been unknown despite the unfolding scientific discoveries. But we do not know whether they have a kind of sentient capacity involving the experience of threat and pain resembling that of people or animals (though many indigenous cultures have believed they do for thousands of years). Since we do not have full clarity about these matters, we reserve the idea of environmental bullying for animals and might best describe the destruction of plants and natural resources as bludgeoning.

The mind-set of power and dominance endemic to militarism mirrors the mind-set of environmental bullying: I will take what I can conquer. This is also the mantra of the schoolyard bully. Humans, schooled as they are in humancentrism, are generally too ready to sacrifice other species for human benefit.

It may be possible to reconceive growth in ways that do not imply environmental destruction, but this would require two forces that are not part of US capitalism. First, it would require the growth of public goods—education, conversation, community—while ending the growth, at least in rich nations, of private commodities. This is extremely difficult to accomplish in the United States because wealth is conceived as created only through private markets—and it cannot be created by government or public entities. In fact the United States lacks a robust concept of public goods, and it does not recognize the public goods deficit that is the true deficit in American society. Second, growth that is not environmentally destructive, involving neither bludgeoning nor bullying, would require regenerative rather than extractive production processes. Consequently, any extraction of natural resources would have to be structured such that waste is recycled and natural resources are regenerated to ecological balance after production is completed. This would be extremely difficult to accomplish in US capitalism because it would limit many forms of production that are cheap and meet the needs of short-term investors. Regenerative growth requires a long-term economic framework that accepts the true costs of extractive production—with all its

environmental externalities—and moves toward a more ecologically balanced and steady-state model. Such a scenario would be impossible within the current US economic framework.

For nearly 200 years the US expelled or mostly exterminated indigenous populations, many millions of people, conquered half of Mexico, depredated the Caribbean and Central America, conquered Hawaii and the Philippines (killing 100,000 Filipinos in the process). Since World War II, the US has extended its reach around the world. But the fighting was always somewhere else and it was always others who were being slaughtered. The world looks very different, depending on whether you are holding the lash or whether you have been whipped for centuries. Perhaps that is why the rest of the world, although horrified by the 9/11 attacks, nevertheless sees them from a different perspective.

States and many nonstate groups are bullies who listen only to more powerful bullies. The only way to survive and prosper is to be tougher than anyone else and bully the others into submission. This is more or less the way schoolyard bullies see their world: to survive and prosper, you have to be the toughest dude on the block.

A paper titled “Rebuilding American Defenses,” was published in 2000 by the Project for the New American Century (PNAC), a leading neoconservative establishment organization founded by William Kristol and Robert Kagan. This work proclaims that “at present the United States faces no global rival. America’s grand strategy should aim to preserve and extend this advantageous position as far into the future as possible.” It calls for the United States to build the capacity “to fight and decisively win in multiple, simultaneous major theater wars.” This would necessitate a massive military buildup, including an increase in US “nuclear strategic superiority,” and an overall military plan to “preserve and extend the preeminence of US military forces” and “perform the ‘constabulary’ duties associated with shaping the security environment in critical regions.”

The argument for developing a surefire bullying power that no nation could even imagine challenging became an obsession of the US military and political establishment. Just nine days after 9/11, PNAC sent a letter to President Bush urging:

“Even if evidence does not link Iraq directly to the attack, any strategy aiming at the eradication of terrorism and its sponsors must include a determined effort to remove Saddam Hussein from power in Iraq. Failure to undertake such an effort will constitute an early and perhaps decisive surrender in the war on international terrorism.”

In other words, the United States had to invade and overthrow opposing regimes that had nothing to do with 9/11, including especially Saddam Hussein's government in Iraq because he had defiantly opposed US power moves for over a decade since the Gulf War.

PNAC was not subtle about its view of the international arena as something similar to the schoolyard, where the bully must assert his own dominance over and secure the obedience of any challenger, no matter how weak:

“The true cost of not meeting our defense requirements will be a lessened capacity for American global leadership and, ultimately, the loss of a global security order that is uniquely friendly to American principles and prosperity.”

In the modern school, the teacher, whatever her intentions, clearly acts as a bully as she carries out the imperatives of the larger bullying institution and conveys its values and expectations to her students. She may appear to bully gently, but she is expected to bring students to accept authority, seek her approval, and comply with her views and directions. As a reward for docility, students receive good grades, something directly parallel to receiving paychecks in the adult world. Ironically, the desire to get high marks can negatively impact learning. First, as motivation to get good grades goes up, motivation to explore ideas tends to go down. Second, students try to avoid challenging tasks whenever possible. More difficult assignments, after all, would be seen as an impediment to getting a top grade. Finally, the quality of students' thinking is less impressive. One study after another shows that creativity and even long-term recall of facts are adversely affected by the use of traditional grades.

Grades teach that learning is not something intrinsically valuable but an external reward for learning information for a test and then promptly forgetting it. Moreover, students have to turn against each other, competing to see who can best impress the bullying authority. Students must act like bullied workers, not question authority, and let the rulers rule. Defiant students face a variety of sanctions from the adults, although they often are popular among their fellow pupils. They will receive poor or even failing grades, or they may be compelled to repeat a year. For punishment, they will be given detention and required to stay after school. Today, they will be sent to the school guidance counselor or school psychologist. In the past, they may have been spanked, paddled, caned, hit.

An institution whose ostensible purpose is to promote education is not designed to instill a love of learning in most students. If anything, it produces

the attitude that learning is something to avoid. From a corporate point of view, that may make sense because learning can lead to questioning. From the perspective of a military, which expects blind obedience, it makes even more sense. The No Child Left Behind Act (NCLBA) considers high schools that send their graduates to the army to be as effective as those that send them to college. It also requires schools that receive federal funds to actively assist the military in recruiting students by giving military recruiters the same access to secondary school students as is provided generally to post secondary educational institutions or to prospective employers of those students. Schools that fail to comply risk losing federal funds.

Veterans of the protest movements and counterculture of the 1960s and 1970s, many of whom were alienated from their own educational experiences, went into teaching to transform schools from bullying institutions that reinforced authority to “child-centered” places where children could explore, express themselves, develop their curiosity, learn to appreciate other cultures, and be creative. But if the real purpose of school is to provide a docile labor force for corporations and cannon fodder for the military, then child-centered education was not doing its job.

In reaction, a “back-to-basics” movement emerged, beginning in the Reagan regime. Schools were to build respect for authority and patriotism; place more emphasis on memorizing facts than on independent thinking; and teach basic skills such as reading, writing, and arithmetic. One of the original architects of the back-to-basics approach, Diane Ravitch, later denounced it for creating schools that served corporations, not children.

“The reformers define the purpose of education as preparation for global competitiveness, higher education, or the workforce. They view students as ‘human capital’ or ‘assets.’ One seldom sees any reference in their literature or public declarations to the importance of developing full persons to assume the responsibilities of citizenship.”

In most high schools, there is a clear hierarchy, and students are supposed to know their place. One may have been at the top academically, but they would more than likely be on the bottom socially. The hierarchy is reinforced by both students and faculty, who are transmitting precisely the values the corporations and the military require. Even those who do not bully directly often find it entertaining to watch the bullying.

“When someone put his hand over my notebook, teachers, who considered me their best student, chuckled. When I left my seat to get back my Scholastic Assessment Test (SAT) scores

(very high by the norms of the school), which another student had grabbed, the supervising teacher made me stay after school. When someone put my hand over a Bunsen burner in chemistry lab, the teacher asked me, 'Where are you going to repeat chemistry next year?'

Years later, I was invited to describe my experience before a group of handicapped people—and even they reacted by saying that anyone who can be so bullied must deserve it. 'Who are you to complain? You got legs,' they said, and they asked me repeatedly why I didn't fight back."

To avoid being labeled as a nerd many boys deliberately undermine their own academic performance. For those in the working-class this can be a fatal mistake. These working-class boys define success as making money, essentially the same way capitalists do, but most of them will end up working on a factory assembly line or in Walmart or McDonald's; others will be in the army or unemployed. So by their own criteria, how street smart or life smart are they really? They are rebelling against the confinement and regimentation of school and the stratification system that locks them into poverty and lack of status. Ironically, though, it is a rebellion that serves the very authorities against whom it is fought. With their intellectual interests destroyed, working-class youth compete against each other to show their indifference to school and to be cool, often by becoming sports heroes and sometimes by being aggressive or even violent. They will strive for sex partners, alcohol, drugs, clothes, and cars that they cannot afford. To pay for these desires, they will take low-paying, low-status jobs at gas stations, McDonald's, and Dunkin' Donuts. The time and energy this absorbs makes their failure at school all the more severe.

Many drop out of school altogether, but even if they graduate, they are typically trapped in low-level jobs like the ones they held in high school—if they are able to find work at all. Those working at the worst jobs are told that they are lucky and that they better not do anything to risk them. Romancing violence and aggression, many working-class youth consider joining the army the coolest thing they can do: they get to blow shit up and maybe they can come back as war heroes. Their rebellion does not become an organized movement that threatens the elites, but rather, it becomes a culture that the rich and powerful can manipulate to their benefit. The ultimate result is that they become compliant workers and soldiers who can console themselves with recalling their success in bullying the outcasts in the schoolyard.

Therapy for individual bullies or their victims will not end the problem.

Schools designed to serve a bullying society such as militaristic capitalism ultimately will reinforce bullying, not cure it. As long as we live in a bullying society, bullying will persist.

Bullying is unlikely to be eliminated. It has been present throughout history, and it exists in nearly every society. This is partly because it is latent in our biological programming, as is evident in the bullying seen in the natural world among animal species. And it is also because bullying is a part of the exercise of power; the elimination of bullying would require the elimination of power, both interpersonally and in economic, political, and military systems.

Steven Pinker suggests that violent bullying has diminished; in fact, he argues, the twentieth was the gentlest and the kindest century in the history of the world. However, that assessment seems dubious when we realize he was talking about a century that brought us to the brink of nuclear annihilation and gave us the two most destructive world wars in all of history, a series of near genocides on several continents, and an environment so polluted that it endangers the survival of the biosphere.

The condition of alienation, of being asleep, of being unconscious, of being out of one's mind, is the condition of the normal man. Society highly values its normal man. It educates children to lose themselves and to become absurd, and thus to be normal. Normal men have killed perhaps 100,000,000 of their fellow normal men in the last 50 years—expanded to encompass all those non-humans, the death toll becomes unfathomable.

Human Tumors

Modern Dragons

Once the basis of social status became wealth itself—rather than, say, wisdom, knowledge, moral integrity, or skill in battle—the rich needed to find ways of spending money that had no other objective than the display of wealth itself. This is the definition of conspicuous consumption.

“The man who dies rich, dies disgraced.”

We can adapt that judgment to the man or woman who wears a \$30,000 watch, or buys similar luxury goods, like a \$12,000 handbag. Essentially such a person is saying: ‘I am either extraordinarily ignorant, or just plain selfish. If I were not ignorant, I would know that children are dying from diarrhea or malaria because they don’t have safe drinking water, or a mosquito net, and obviously what I have spent on this watch or handbag would have been enough to help several of them survive; but I care so little about them that I would rather spend my money on something that I wear for ostentation alone.’ Of course, we all have our little indulgences. I am not arguing that every luxury is wrong. But to laugh at someone for having a sensible watch at a modest price puts pressure on others to join the race to greater and greater extravagance. That pressure should be turned in the opposite direction, and we should celebrate those with modest tastes and higher priorities than conspicuous consumption.

“Money may not buy happiness, but I’d rather cry in a Jaguar than on a bus.”

It is an ancient principle that the greater one’s economic gain, the greater his burden to sustain the civilization that made his gains possible. The communist creed: From each according to his ability, to each according to his need. The capitalist creed: From each according to his gullibility, to each according to his greed.

The 1% have accumulated their increasingly massive share of global wealth by siphoning off collectively produced surpluses not through hard work but through financial machinations such as dividends, capital gains, interests, and rent, much of which is then hidden in tax havens. Indeed, if we consider the massive upward transfer of global wealth that has taken place over the last half century, it would be fair to say that never before was so much owed by so few to so many.

In the United States, the best-earning one percent of the top one percent (those in the highest 0.01% income bracket) raised their share to almost six times what it had been in the 1970s even as the top tenth of the one percent (the top 0.1%) quadrupled it. The remainder averaged gains of about three-quarters—nothing to frown at, but a far cry from the advances in higher tiers. The ‘one percent’ may be a convenient moniker that smoothly rolls off the tongue, and one that I repeatedly use in this book, but it also serves to obscure the degree of wealth concentration in even fewer hands. In the 1850s, Nathaniel Parker Willis coined the term ‘Upper Ten-Thousand’ to describe New York high society. We may now be in need of a variant, the ‘Upper Fifty-Thousand,’ to do justice to those who contribute the most to widening inequality. And even within this rarefied group, those at the very top continue to outdistance all others. The largest American fortune currently equals about one-million times the average annual household income, a multiple twenty times larger than it was in 1982.

In the US during the 2009–11 “recovery,” the 1% actually gained at the expense of the 99%. So it certainly wasn’t a recovery for the vast majority. Just in 2009–10, the top 0.01% captured 37% of this additional income, gaining an average of \$4.2 million per household.

Across the pond, the collective wealth of the UK’s 1,000 richest people:

1997 £98 billion

2008 £413 billion

2010 £336 billion

2012 £414 billion

2013 £450 billion

2014 £519 billion

That £519 billion would fund the UK education system for 5.9 years, or the state pension bill for 3.7 years, or the public health system for 4.2 years. It’s also 4.6 times the size of the country’s annual welfare bill. It’s worth

pausing to let these figures sink in; the UK has 64 million people and yet many of their most important needs could be met several times over just by the collective wealth of the richest 1,000. (Could there be a solution here?) When people worry about the effect of an aging population on the pension bill and the NHS bill, we need to remember that just the annual growth of the wealth of the super-rich could easily pay for it. This is a ridiculous and obscene misallocation of resources. And why should we celebrate the growth of the financial sector, but see the growth of the health sector as a problem?

Globally, according to the Bloomberg Billionaires website, the top 100 billionaires controlled \$1.9 trillion in 2012, adding \$240 billion that year. Oxfam calculates that just over a quarter of this—\$66 billion—would have been enough to have raised everyone in the world over the \$1.25 per day that represents the ridiculously conservative “poverty line.”

Economic inequality in the United States is the highest it’s been in the last 50 years. In recent decades, the richest 1% of Americans have accumulated nearly 40% of the country’s wealth. The net worth of just three individuals—Jeff Bezos, Bill Gates and Warren Buffett—dwarfs that of the entire bottom 50% of Americans. And it only seems to be getting worse.

How did we get here? The answer has much to do with changes to the tax code that have reduced the taxation on America’s wealthiest groups and made it easier than ever for corporations to evade paying their dues.

Policy proposals from people like Elizabeth Warren and Bernie Sanders are seeking to do very little to change that. Warren’s “Ultra-Millionaire Tax” would impose only a 2% tax rate on net worth in excess of \$50 million, which becomes only a 3% tax rate beyond \$1 billion. In other words, any wealth between \$50 million and \$1 billion would be taxed at 2%, and anything beyond that would be taxed at 3%. Sanders’ “Tax on Extreme Wealth” plan institutes only a 1% tax rate on net worth above \$32 million that rises steadily to only 8% on all wealth over \$10 billion. Warren’s campaign claims her plan would bring in \$2.75 trillion. Sanders’ would likely raise more, which he—propping up the myth of money—proposes to use as funding for his affordable housing plan, universal childcare, and some of Medicare for All.

Here are nine statistics that show how tax injustice has contributed to inequality in America and the urgent need for reform:

52%: US corporate tax rate in 1952

21%: US corporate tax rate after Trump’s tax law

0%: Corporate tax rate in Bermuda

60%: Portion of profits US multinationals collectively book in low-tax countries like Bermuda and Ireland

\$25,000: FDR's proposed "maximum income" in 1942 (about \$400,000 today), above which income would be taxed 100%

\$1,500,000: Average income of the top 1% of American earners today

37%: Current top marginal tax rate in America, 20% below the historical average

2018: First year in history that America's top 400 richest individuals paid less in taxes than the bottom 50% of earners

25%: Fraction of unpaid taxes owed by the ultra-rich, almost 15% more than for other income levels

In 2015 the estimated private financial wealth of individuals stashed unreported in tax havens around the globe was somewhere between \$24 trillion and \$36 trillion.

In 2016, Credit Suisse estimated that there is roughly \$256 trillion in total global wealth—with a staggeringly unequal distribution: While the bottom half collectively own less than one percent of total wealth, the wealthiest top 10 percent own 89 percent of all global assets. Which is why there just aren't many serious people left who are willing to argue, with a straight face, that giving more to the wealthy is the best way to help the poor.

Some important notes however: Around \$800,000 is necessary to gain entrance to the top in 1% of global wealth holders and only around \$35,000 to find yourself among the global 1% by income. To find yourself in the global 10% wealth bracket you need only be worth \$75,000.

If we made an income pyramid out of a child's blocks, with each layer portraying \$1,000 of income, the peak would be far higher than the Eiffel Tower, but almost all of us would be within a yard of the ground.

"I think equality is great too, just that it doesn't work. Equality of opportunity, yes. But equality for equality's sake... people are not equal."

Four icons of American consumer culture—Budweiser, Burger King, Heinz, and Kraft—now belong to a trio of billionaires from Rio.

Behind every family fortune is a great theft, long forgotten or indeed never been found out, because it was properly executed.

From a cold economic perspective, once corruption is the norm, you risk a competitive disadvantage if you fail to keep up. You can't develop the country just with the kind of people you'd invite home for dinner. In the nineteenth-century United States, after all, railroad tycoons laid tens of thousands of miles of track not out of selfless civic interest but for profit, engaging in a crony capitalism that would be very familiar today.

Steal a little and they throw you in jail. Steal a lot and they make you king.

References to millions, billions, and trillions have become familiar since the 2007 financial crisis and, as many have said, it's hard to appreciate just how big such numbers are. We know \$1 billion (\$1,000 million) is a huge sum, but cannot imagine it. Here's one way. Imagine you were given \$1 every second until you had \$1 billion. You might think you would soon reach that figure—after all, after just one hour you'd already have \$3,600. But you'd actually have to wait over 31 years and 8 months. So billionaires are astonishingly wealthy. As for trillions (1,000 billion), the unit now often used for estimating the sums needed for bailing out the financial crisis, the time you would need to accumulate \$1 trillion is nearly 32,000 years.

Wealth has been redefined as a measure of success that needs no other justification. Conspicuous consumption—jets, yachts, art, mansions, maybe a fucking car in your living room—is your just reward for your “contribution” to society.

In the summer of 1724, a middle-aged London doctor with polemical inclinations named Bernard Mandeville was brought before the Court of the King's Bench to be prosecuted as a public nuisance. His offense was the publication of a book titled *The Fable of the Bees: or Private Vices, Publick Benefits*. Sometime later, upon the appearance of a French translation, the book was set on fire by Paris's public executioner. Naturally, all this, in combination with denunciations from clergy and philosophers alike, considerably increased the book's appeal, and Mandeville and his Fable became internationally notorious. Every young man had a copy on his shelf. The inflammatory idea that so outraged Mandeville's readers was that, in a flourishing market economy such as England's, virtue had become an anachronism. What had formerly been considered vices, he claimed—particularly avarice and pride—were now beneficial, indeed crucial, to the public welfare. If an economy was to prosper, it needed people to buy things, and not just the bare necessities but stupid, extravagant, frivolous things. If people were frugal and self-abnegating now, the market would suffer, and that would be a disaster for everyone—worse than a terrible plague!

In the past, he surmised, virtues such as frugality and self-abnegation,

along with the promise of heaven, had been promoted by the powerful as a means of keeping the masses docile. Man was naturally selfish, but virtue was an excellent way of setting yourself apart from your fellows, so you behaved virtuously out of pride, in order to excite admiration and avoid trouble. But in the affluent new market society, pride could be more easily satisfied through ostentatious spending, and that spending in turn ensured the perpetuation of affluence. And that was not all: a society of contented, honest, virtuous people, Mandeville insisted, would be a slothful, barren place with no art, science, or material comforts. Man must be roused to invention by greed and pride.

Kant observed that it was fortunate that so few men acted according to moral principle, because it was so easy to get principles wrong, and a determined person acting on mistaken principles could really do some damage. Most men, he wrote, “seek to turn everything around self-interest as around the great axis,” and this was all to the good; “for these are the most diligent, orderly, and prudent; they give support and solidity to the whole, while without intending to do so they serve the common good, provide the necessary requirements, and supply the foundation over which finer souls can spread beauty and harmony.”

Smith used the term ‘invisible hand’ only once in his book, in making the narrow argument that individuals were likely to invest in domestic rather than foreign industry not for patriotic reasons but because doing so would contribute to their own security. But his invisible hand metaphor proved so resonant, and so enduringly popular, that it came to stand for something much larger. It implanted deep in Western culture the idea that individual self-interestedness could be beneficial for society as a whole; which in turn suggested that, if the moral goal was helping others (as opposed to self-perfection), a selfish man might do better than a selfless one.

“May the rich get richer so that, thanks to them, the poor may in turn become less poor.”

If those who have do not give, those who haven’t must take.

Businessmen wish for two ideals: at the top, state support; at the company level, free enterprise. In other words, they want the best of both worlds. And they often get it.

The nanny state conservatives think that it is the role of the government to act as a strong-arm debt collector for businesses that did not accurately assess the risks associated with their loans. This applies both nationally and internationally. They want the government to chase after individual debtors, following them throughout their lives, to wring out every possible

cent of debt repayment. Internationally, they rely on the power of the International Monetary Fund to help them collect on bad loans. After all, huge multinational banks can't be expected to understand credit risks in places like South Korea, Indonesia, or Argentina, that would be hard work. And, who needs to do hard work when the nanny state will come to the rescue?

It's about how wealth is accumulated in the modern world and the stories we tell ourselves to explain this process.

In 2014, according to a much-discussed think tank report, the total of all the bonuses handed out on Wall Street was more than twice as much as the total earned by every person in the country who worked full-time for the minimum wage.

America is on the cusp of the largest intergenerational transfer of wealth in history. A study from the Boston College Center on Wealth and Philanthropy projects that \$36 trillion could be passed down to heirs in the half century leading up to 2061. A 2013 US Trust bank poll of Americans with more than \$3 million of investable assets shows a significant generational divide: Nearly three-quarters of those over age sixty-nine and a majority of boomers just below them are the first in their generation to accumulate significant wealth. For the rich under the age of thirty-five, however, inherited wealth is more common. This is the dynastic form of wealth that has provided the major source of income for European aristocracy for centuries. It is about to become the major source for a new American aristocracy.

A healthy society, some argue, is built around "egoistic altruism," in which every individual sets about doing his utmost to win the adoration of others. This produces a form of natural equilibrium, in which the egotist becomes integral to his own social system: No one will make personal enemies if his egotism, his compulsive hoarding of valuables, manifest itself only by inciting life, goodwill, gratitude, respect, and all other positive feelings that render him useful and often indispensable to his neighbours. This characteristically monistic assumption is that any society or organization was merely a larger, more complex biological system, whose behaviour could be reduced back to the actions of organisms and cells.

The elderly are taught to live in fear of outliving their rights to care, or even a home and food, and the pressure to hoard everything for the time when they can no longer work hangs over the lives of every worker. Since no one can know when they will become ill, when they will die, or what the vagaries of the financial system will bring, this stress colours the lives of everyone in society and makes generosity with any current surplus unlikely.

Ancient mythology asked how King Midas could survive with nothing to eat but his gold. This threatens to be a metaphor for today's finance

capitalism—a dream that one can live purely off money, without means of production and living labor. Cue the AIs and robot slaves.

Financial independence is really our term for being able to survive without society. What follows is the idea that if we are independent, our contributions to society are charitable and voluntary. This independence is part of the system of dissociation that stands in our way of creating a real society.

While they will easily accept responsibility for a road that they may or may not use, a person without children has been taught to feel robbed by responsibility for a school. In a society of plenty, children are no longer presented as the support of the future but simply as the burden of the present.

The study of hunter-gatherers, who live for the day and do not accumulate surpluses, shows that humanity can live more or less as Keynes suggests. It's just that we're choosing not to. A key to that lost or forsworn ability lies in the ferocious egalitarianism of hunter-gatherers. For example, the most valuable thing a hunter can do is come back with meat. Unlike gathered plants—whose proceeds are not subject to any strict conventions on sharing—hunted meat is very carefully distributed according to protocol, and the people who eat the meat that is given to them go to great trouble to be rude about it. This ritual is called “insulting the meat,” and it is designed to make sure the hunter doesn't get above himself and start thinking that he's better than anyone else.

“When a young man kills much meat he comes to think of himself as a chief or a big man, and he thinks of the rest of us as his servants or inferiors. We can't accept this.”

The insults are designed to “cool his heart and make him gentle.” For these hunter-gatherers the sum of individual self-interest and the jealousy that policed it was a fiercely egalitarian society where profitable exchange, hierarchy, and significant material inequality were not tolerated.

This egalitarian impulse is central to the hunter-gatherer's ability to live a life that is—on its own terms—affluent, but without abundance, without excess, and without competitive acquisition. The secret ingredient seems to be the positive harnessing of the general human impulse to envy. If this kind of egalitarianism is a precondition for us to embrace a post-labor world, then I suspect it may prove a very hard nut to crack. There's a lot that we could learn from the oldest extant branch of humanity, but that doesn't mean we're going to put the knowledge into effect. A socially positive use of envy—now, that would be a technology almost as useful as fire.

“My greatest skill has been to want but little. A man is rich in proportion to the number of things which he can afford to let alone.”

Classical economics explained why prices for land sites, mineral deposits, and other natural endowments rise for reasons that do not involve an expenditure of labor or enterprise by their owners. Public investment in roads and other transportation, schools and parks, water and other infrastructure is provided freely or at prices subsidized by taxpayers as a whole. The result is that taxpayers as well as rent-payers end up paying to create wealth for landlords—enabling them to borrow more or obliging new homebuyers to borrow more to obtain ownership of such sites. To the extent that rental values are paid to the banks as interest, landlords as well as taxpayers end up creating revenue and wealth for the financial sector.

Take a civilized country. The forests which once covered it have been cleared, the marshes drained, the climate “improved.” It has been made habitable. The soil, which bore formerly only a coarse vegetation, is covered today with rich harvests. Thousands of highways and railroads furrow the earth and pierce the mountains. The rivers have been made navigable; the coasts, carefully surveyed, are easy of access; artificial harbors, laboriously dug out and protected against the fury of the sea, afford shelter to the ships. Millions of human beings have labored to create this civilization on which we pride ourselves today. Other millions, scattered through the globe, labor to maintain it. Without them nothing would be left in fifty years but ruins.

There is not even a thought, or an invention, which is not common property, born of the past and the present. Thousands of inventors, known and unknown, who have died in poverty, have cooperated in the invention of each of these machines which embody the “genius of man.” Thousands of writers, of poets, of scholars, have labored to increase knowledge, to dissipate error, and to create that atmosphere of scientific thought without which the marvels of our century could never have appeared. And these thousands of philosophers, of scholars, of inventors have been upheld and nourished through life, both physically and mentally, by legions of workers and craftsmen of all sorts.

By what right then can anyone appropriate the least morsel of this immense whole and say: This is mine, not yours?

“The power of enclosing land and owning property was brought into creation by your ancestors via the sword; which first did murder their fellow creatures, men, and after plunder or steal away their land, and left this land successively to you,

their children. And therefore, though you did not kill or thief, yet you hold that cursed thing in your hand by the power of the sword; and so you justify the wicked deeds of your fathers, and that sin of your fathers shall be visited upon the head of you and your children to the third and fourth generation, and longer too, till your bloody and thieving power be rooted out of the land.”

Police violence and private property is the only way that a landlord can convince an apartment building full of people to pay most of their wages in rent just because he “owns” it. And there is only one way millions of folks can be convinced to sleep on the street right by many more millions of unused buildings, hotel rooms, and vacant, unaffordable houses. The credible threat of violence—it is the only way five people can control more wealth than the bottom 50% of the global human population.

Personal possessions can easily be maintained without the state-sanctioned violence of a police state—humanity did that for thousands of years with citizen-led, community-level policing. And we can do it again. But private property rights cannot be maintained without violence. A capitalist society can never be a free society—it takes the constant presence of violent force to sustain private rights of ownership over society’s productive forces and resources for billionaires and business interests. Property or liberty—we only get to pick one.

We need to differentiate between private property and personal property. Everybody loves the notion of private property. Until the fact that the 1% own as much private property as the 90% is realized—then not so much. Define ‘personal property’ as property that one can maintain and control personally and not with an army of managers and professionals. It is time to destroy the shibboleths that have diverted the electorate from its true interests. It is time to redefine private property and monopoly power. The electorate fears progressive collectivization. It is time to assert the importance of personal property over private property and free enterprise as opposed to monopoly enterprise.

Violated, dishonored, wading in blood, dripping filth—there stands bourgeois society. This is it in reality. Not all spic and span and moral, with pretense to culture, philosophy, ethics, order, peace, and the rule of law—but the ravening beast, the witches’ sabbath of anarchy, a plague to culture and humanity. Thus it reveals itself in its true, its naked form.

Did mounting population exhaust the land, tempting Petexbatún rulers to seize their neighbors’ property, leading to a cycle of response that spiraled into cataclysmic war? If anything, it was the other way around: An unleashed

lust for wealth and power turned them into aggressors, resulting in reprisals that required their cities to abandon vulnerable outlying fields and intensify production closer to home, eventually pushing land beyond its tolerance. Society had evolved too many elites, all demanding exotic baubles—a culture wobbling under the weight of an excess of nobles, all needing quetzal feathers, jade, obsidian, fine chert, custom polychrome, fancy corbeled roofs, and animal furs. Nobility is expensive, nonproductive, and parasitic, siphoning away too much of society's energy to satisfy its frivolous cravings. Too many heirs wanted thrones, or needed some ritual bloodletting to confirm their stature. So dynastic warfare heightened.

As more temples need building, the higher caloric demand on workers requires more food production. Population rises to insure enough food-producers. War itself often increases population—as it did in the Aztec, Incan, and Chinese empires—because rulers require cannon fodder. Stakes rise, trade is disrupted, and population concentrates (lethal in a rain forest). There is dwindling investment in long-term crops that maintain diversity. Refugees living behind defensive walls farm only adjacent areas, inviting ecological disaster. Their confidence in leaders who once seemed all-knowing, but are obsessed with selfish, short-term goals, declines with the quality of life. People lose faith. Ritual activity ceases. They abandon centers.

Luxury is morally repugnant, and its incompatibility with democratic ideals, moreover, has been consistently recognized in the traditions that shape our political culture. The difficulty of limiting the influence of wealth suggests that wealth itself needs to be limited. When money talks, everybody else is condemned to listen. For that reason a democratic society cannot allow unlimited accumulation. Social and civic equality presuppose at least a rough approximation of economic equality. A moral condemnation of great wealth must inform any defense of the free market, and that moral condemnation must be backed up with effective political action.

Inequality is the reason some people find such significance in the ceiling height of an entrance foyer or the hop content of a beer while others will never believe in anything again. Inequality is not an issue, as that term is generally used; it is the eternal conflict of management and labor, owner and worker, rich and poor—only with one side pinned to the ground and the other leisurely pounding away at its adversary's face. 'Inequality' is not even the right word for the situation, really, since it implies a technical problem we can solve with a twist of the knobs back in D.C. The nineteenth century understood it better: they called it "the social question," and for once their polite Victorian euphemism beats ours. This is nothing less than the whole vast mystery of how we are going to live together.

Having little, you can not risk loss.

Having much, you should the more carefully protect it.

A possession that is so valuable that you have to spend a lot of money and psychic bandwidth to protect it often feels like more of a burden than a boon.

I'd like to suggest a different approach as to how you view your hard-earned wealth. View it not as a treasure trove to place behind you and defend with sword and shield against the hordes clashing at your gates. Instead, think of it as a wellspring that affords you the privilege of helping others in times of drought. The ability to help others not focus as much on survival is a gift. It's a gift of a society built upon, for good or ill, inequality; the same society that placed a high enough value on your chosen profession to remunerate you in the way it did. But your money isn't the reward for your hard work. The reward is the ability to help others.

“Start with a 90% marginal rate on the richest people in America and spend the money on making everyone else's lives better.”

No, start with a 90% marginal tax rate on the richest people to prevent them from having the money to ruin everything for the rest of us. I could make arguments that we don't need their money to make a decent society, but the bottom line is, they are using their money to ruin our society, and we need to stop them.

So, Elizabeth Warren has a 2% wealth tax plan with 3% on people with more than a billion dollars. She has suggested raising the over a billion percentage to 6%. Bill Gates is the second-richest person in the world, according to Forbes magazine, with a net worth of \$106.2bn. And Bill Gates says:

“I'm all for super-progressive tax systems. I've paid over \$10 billion in taxes. I've paid more than anyone in taxes. If I had to pay \$20 billion, it's fine. But when you say I should pay \$100 billion, then I'm starting to do a little math about what I have left over. You really want the incentive system to be there without threatening that.”

Well, of course, she didn't say that, she said 6%. A little over 6 billion in the first year. Bill's 64, and of course, the actual nominal amount will decrease each year unless he can grow his money faster than 6%, in which case, what's the problem? He'll never ever be anything less than a

multi-billionaire, in other words. His bullshit about 100 billion is just that, fearmongering bullshit. And if he's paid 10 billion on 106 billion, well his tax rate was about 10%. Most middle class families would love to have that low a tax rate. Yes, I know it's on income, not wealth, but the point is he obviously paid very low income taxes. Which, actually, is what the data shows—the middle and working classes pay a higher percentage than the rich.

Bill, of course, is the “good” billionaire. But he's the guy who gave straight up fascist Modi a reward. He's the guy who spent millions to change the education system in the US, then admitted that the model he successfully pushed doesn't actually work. He's the guy who used brutal monopolistic practices to build Microsoft. And he doesn't want to pay a 6% wealth tax. Billionaires are bad—they shouldn't even exist. As for Billy, he thinks he deserves to be one of the richest people in the world because he created the Wintel monopoly and crushed rivals with practices which were, under black letter law, illegal. But one can understand why he might prefer a Republican president. After all, it was George Bush Jr. who withdrew the anti-trust suit which would have broken up Microsoft and left him worth a lot less than a 106 billion dollars. Trump, of course, massively dropped tax rates on the rich. Money comes first, ethics come second. Bill's always understood that. Republicans have been pretty good to Bill. Woke performism and his good image aren't worth a 6% wealth tax.

Billionaires are rising all over, even in developed countries hit hard by the Great Recession. In 2006 Forbes had named some eight-hundred billionaires across the world. Five years later there were twelve-hundred. Billionaires control huge swaths of the economy. They influence our lives far more than your average senator but receive only a fraction of the public scrutiny.

What does it mean to be a billionaire, at least in material terms? It's a lot different from having a hundred million. With a hundred million, you can't buy a fifty-million-dollar jet and a forty-million-dollar penthouse and a twenty-million-dollar yacht—you have to choose one. With a billion, not only can you have all these things but they're sensible investments. When the waiting list for new jets grows, used ones can rise in value. And as the population of billionaires expands, so the price of super-luxury apartments climbs, regardless of what's happening in the economy of the masses.

Purchasing art confers a patina of status and culture for money made in unsexy sectors like cement or packaged foods. A sort of money laundering if you will, it makes art a must in any billionaire's portfolio. Art, like any other product, follows the laws of supply and demand. The canonical works (Picasso, Cézanne) tend to appreciate faster than the S&P 500—but unlike stocks, blue-chip art is as crisis proof as a penthouse on Central Park West.

In 2005, the 300,000 men, women, and children who comprised the top tenth of the one percent had nearly as much income as all 150 million Americans who make up the economic lower half of our population. Add the income the rich are not required to report and those 300,000 made more than the 150 million.

The share of corporate income devoted to compensating the five highest-paid executives of large public firms went from an average of 5% in 1993 to more than 15% in 2013. Not incidentally, this was money corporations could have invested in research and development, additional jobs, or higher wages for average workers. In addition, almost all of it was deducted from corporate income taxes.

One justification is that CEOs and top executives are worth their soaring pay because the stock market has also soared during these years, and the job of CEOs and top executives is to maximize shareholder returns. Ergo, they have accomplished their mission. As Harvard economist N. Gregory Mankiw argues, for example:

“The most natural explanation of high CEO pay is that the value of a good CEO is extraordinarily high.”

But even assuming maximizing shareholder returns should be their goal, it hardly follows that CEOs are worth so much more than they used to be. The entire stock market boomed over this period. Even had a CEO locked himself in his office and played online solitaire for these three decades, his company would still have become far more valuable. Unless the company did better than the stock market as a whole, there is no reason to suppose the CEO did anything in particular to justify his escalating pay.

So why, exactly, did CEO pay skyrocket, even though these top executives may have made no direct economic contribution to the growing values of their companies? One theory is that CEOs play large roles in appointing their corporations' directors, for whom a reliable tendency toward agreeing with the CEO has become a prerequisite. Directors are amply paid for the three or four times a year they meet and naturally want to remain in the good graces of their top executives. Being a board director is the best part-time job in America. In 2012, the average compensation for a board member at an S&P 500 company was \$251,000. In addition, boards often consist of other CEOs who have considerable interest in ensuring their compatriots are paid generously. To advise on executive pay, boards typically hire people euphemistically called “compensation consultants,” whose actual roles are more akin to that of the oldest profession in the world. Such consultants typically establish benchmarks based on the pay of other

CEOs, whose boards typically hire them for the same purpose. Since all boards want to demonstrate to their CEO as well as to analysts on Wall Street their willingness to pay generously for the very best, pay packages ratchet upward annually in this faux competition, conducted and directed by CEOs for CEOs, in the interest of CEOs.

‘Income’ is usually measured as a yearly flow of earnings. ‘Wealth’ is the pool into which yearly flows of unspent income accumulate. It is usually held in the form of stocks, bonds, real estate, and other assets. Wealth also generates its own income: interest and dividends from savings and investments and rental income from real estate.

Andrew Mellon is the oil man and banker whose words are often invoked in support of current policies favoring the rich. As with Adam Smith, Mellon’s words are often quoted selectively by those who shill for the rich. Consider what Mellon wrote in his 1924 book *Taxation: The People’s Business*:

“The fairness of taxing more lightly income from wages, salaries, or from investments is beyond question. In the first case, the income is uncertain and limited in duration; sickness or death destroys it and old age diminishes it; in the other, the source of income continues; the income may be disposed of during a man’s life and it descends to his heirs. Surely we can afford to make a distinction between the people whose only capital is their mental and physical energy and the people whose income is derived from investments. Such a distinction would mean much to millions of American workers and would be an added inspiration to the man who must provide a competence during his few productive years to care for himself and his family when his earnings capacity is at an end.”

The private sector owns 85% of our critical infrastructure. This is unacceptable.

Profit shouldn’t be our only measure of success—the future of the planet depends on it. There must be other bottom lines. These bottom lines will have to be richer; they’ll have to consider social and environmental questions. These are cultural questions, questions of values. The definition of happiness, the definition of success in business—both have to change.

The forces that used to shape inequality have not in fact changed beyond recognition. If we seek to rebalance the current distribution of income and wealth in favor of greater equality, we cannot simply close our eyes to what it took to accomplish this goal in the past. We need to ask whether great

inequality has ever been alleviated without great violence, how more benign influences compare to the power of this Great Leveler, and whether the future is likely to be very different—even if we may not like the answers.

Economic Royalists

Three familiar words—‘earnings,’ ‘investment,’ and ‘wealth’—can lead us astray in thinking about economic matters, effectively concealing a great deal about how our economy works.

Important though it is to think about moral economy, it’s different from explaining economic arrangements. Few of our ways of doing things in economic matters are arrived at through democratic decision or careful deliberation on what is good and fair. Most are products of power. Usually, the best explanation of what people do and what they get in economic matters is because they can. Why do chief executive officers (CEOs) of big companies pay themselves such vast amounts? Because they can. They may offer justifications, but these are not only invariably feeble but redundant. They can get their pay rises even if the majority of people think they’re unjustifiable. And usually the fuss over their pay hikes dies down in a week or two anyway. Equally, when we ask why care workers get so little for doing work that clearly benefits people, the answer is because that’s all they can get, given their limited power. What we think people should justifiably get or contribute is one thing, and what they can actually get is another. Justifications and explanations are usually different. Many of the defenses of existing economic institutions are surprisingly weak, but particularly if people start treating those arrangements as natural—as ‘just how things are’—they can persist on the basis of power.

Mainstream economics takes the particular features of capitalism—a very recent form of economic organization in human history—as if they were universal, timeless, and rational. It treats market exchange as if it’s the essential feature of economic behaviour and relegates production or work—a necessity of all provisioning—to an afterthought. It also focuses primarily on the relationship between people and goods (what determines how many oranges we buy?) and pays little attention to the relationships between people that this presupposes. It values mathematical models based on if-pigs-could-fly assumptions more than it values empirical research; so it pays little attention to real economies, having little to say about money and debt, for example.

“As soon as the land of any country has all become private property, the landlords, like all other men, love to reap where they have not sowed, and demand a rent even for its natural produce. The wood of the forest, the grass of the field, and all the natural fruits of the earth, which, when land is held in common, cost the labourer only the trouble of gathering them,

come, even to him, to have an additional price fixed upon them. He must then pay for the license to gather them; and must give up to the landlord a portion of what his labour either collects or produces. This portion, or, what comes to the same thing, the price of this portion, constitutes the rent of land.”

—Adam Smith

“Roads are made, streets are made, railway services are improved, electric light turns night into day, electric trams glide swiftly to and fro, water is brought from reservoirs a hundred miles off in the mountains—and all the while the landlord sits still. Every one of those improvements is effected by the labour and at the cost of other people. Many of the most important are effected at the cost of the municipality and of the ratepayers. To not one of those improvements does the land monopolist as a land monopolist contribute, and yet by every one of them the value of his land is sensibly enhanced. He renders no service to the community, he contributes nothing to the general welfare; he contributes nothing even to the process from which his own enrichment is derived. The unearned increment in land is reaped by the land monopolist in exact proportion, not to the service but to the disservice done.”

—Winston Churchill

“Men did not make the earth. It is the value of the improvement only, and not the earth itself, that is individual property.”

—Tom Paine

Here’s an example of a taken-for-granted economic institution—private ownership of land by a minority. You may know the story of the stranger who trespassed on a landowner’s land and was told to “get off my land,” whereupon the stranger asked the owner how he got this land. “From my father,” was the answer. “And where did he get it from then?” “From his father,” who got it from his father, and so on. “So how did one of your ancestors get this land in the first place?” asked the stranger. “By fighting someone for it,” said the landlord. “Right,” said the stranger, “I’ll fight you for it. If it was all right for your ancestor to seize the land in the first place, it must be all right to seize it back now. And if it wasn’t all right for them to seize it, it should be seized back now!”

The story is striking but it’s not clear what a better alternative might be. Would private ownership of land be OK if it was divided up equally

so everyone had some? Or should land be publicly owned with individuals renting plots from the state, with the use of the rent revenue to be decided democratically? What the story does, at least, is jolt us out of our uncritical acceptance of the institution of minority land ownership. At this time of crisis we need much more jolting.

If land is owned by a minority, then because everybody needs land to live on, and new land can't easily be produced, the landowners can charge others rent for the right to use "their" land. As the land and any minerals or other useful properties that it has already exist, the rent is not a payment for the creation of something useful; there are no costs of production to pay for. Nor does ownership in itself make land more productive. Only if the landlord improves the land or builds something on it is any of their income earned, and then only to the extent that users are paying for the work of improvement—the costs of production—rather than anything more. Any more is the unearned increment. But even where landlords buy land in order to put up buildings to let out, the tenants are usually not just contributing to the cost of producing the building but paying pure economic rent on top of that. 33–35% of US national income goes to rent. Although income from rent is often called 'earnings,' it is not. Rent is like a private tax on the industry of others.

In the infancy of modern taxation, it seemed obvious that the first thing that should be taxed was unearned income from rent. How strange—and interesting—that modern governments would rather tax earned income than unearned income! As Adam Smith correctly recognized, the unearned income of the rentier depends on producers producing a surplus over and above what they consume themselves. Rentiers free-ride on others' work.

Some people can get an income by extracting wealth from the economy simply through their control of key resources that others need but lack, and by charging them for their use. This is the key to the exceptional wealth of the rich: access to mechanisms of wealth extraction, rather than wealth creation.

Two quite different concepts of investment are involved here:

Object-focused definitions: These focus on what people or organizations invest in (infrastructure, equipment, people) and its usefulness and benefit in the future. A school or a wind farm or a railway or a training programme can provide long-term benefits by increasing our capacities. They enable the production of new goods, services, and skills—things with useful qualities, or use-values in the language of political economy: a better teaching environment, a cleaner source of energy, a better means of travel, a more skilled workforce and so on.

Or it might involve repairing or replacing worn-out equipment. These are examples of what we might call real or objective investment.

Investor-focused definitions: These focus on the financial gains to the ‘investor’ from any kind of spending, lending, saving, purchase of financial assets or speculation—regardless of whether they contribute to any objective investment, or provide anything socially useful. In other words, instead of focusing on the benefits of the investment in terms of use-values, the focus is on how much money it yields to the investor.

The financial sector uses the term ‘investment’ mainly in this sense, because it is largely indifferent to where its money comes from: \$1 million derived from an objective investment is no different from \$1 million obtained as interest on a loan, or through stock market speculation; money is money and masks all such crucial distinctions. As long as there’s a good chance of it bringing a financial return, then gambling, including gambling with other people’s money, gets called ‘investment.’ A tollbooth set up on a bridge for extracting money out of the bridge’s users, could, in contemporary economic parlance, be called an ‘investment’ for the owners, even though the bridge already existed and no maintenance or improvements were made by the tollbooth owners.

Using the same word for different things allows people to mistake wealth extraction for wealth creation. The first meaning of investment refers to attempts to create wealth, the second to attempts to extract it. This indifference as to whether individuals or institutions are funding genuine investment or merely vehicles for providing money for the “investor” is a major irrationality of capitalism, and the way we use the word ‘investment’ helps to conceal it.

There is no necessary link between the practices identified by these two usages of the term. While you might get a return on a genuine investment, you might not; even if it yields you nothing personally, it may still have produced material benefits somewhere—perhaps a hospital at the other end of the country that you’ll never need. You might even lose money on it, but it could still be an investment in the first sense if it brings benefits to someone. Parents may feel the effort they put into bringing up their children is like this. From the point of view of the second definition, such cases would be seen as bad investments. Equally, those usages that focus merely on financial gains can refer to actions that produce no objective investment in anything whatsoever; indeed they may, like asset stripping, have negative

effects by sacrificing long-term objective investment for short-term gains made from closing down production and selling stuff off. Speculators almost always call themselves investors.

“The few own the many because they possess the means of livelihood of all. The country is governed for the richest, for the corporations, the bankers, the land speculators, and for the exploiters of labor. The majority of mankind are working people. So long as their fair demands—the ownership and control of their livelihoods—are set at naught, we can have neither men’s rights nor women’s rights. The majority of mankind is ground down by industrial oppression in order that the small remnant may live in ease.”

Means of production are certainly important, indeed vital, for they boost the productivity of each worker, enabling them to produce far more than would otherwise be the case. One could easily think that since the machinery and computers make a difference here, the owner or ‘provider’ of such equipment should get the benefits. Mainstream economics, as ever the sycophant of the powerful, sometimes justifies capitalists’ profit as a return for their contribution of capital, meaning means of production. But merely owning means of production does not make it productive; to make it productive you have to use it, operate it, and the pure capitalist leaves this to employee workers and managers. Owning a fast-food chain and its equipment and living off the profit that its workers produce is not like grilling burgers all day. Owning a chain of residential care homes for the elderly and living off the profit is not like doing the labour of washing, dressing, feeding, and caring for the residents. Nor is it like doing the managerial work of organizing the home. Ownership itself produces nothing.

If the means of production were owned by the workers in a cooperative, then the difference between their pay and other costs and the revenue their products brought in would accrue to them rather than to a capitalist, though of course that revenue would come from putting the productive equipment to work, not from mere ownership. In a cooperative, the benefits of using means of production are shared by those who use them to produce, instead of being pocketed by those who just own but who do no work.

Pure capitalists—that is, ones who merely own their firms and delegate management to others—are not contributing to wealth creation, but just using their power relative to that of employees to appropriate the difference between costs and the value of what the workers (and managers) produce.

Ordinary men, even today, are prone to explain and to justify power and wealth in terms of knowledge and ability.

Whatever they might want to believe, the rich are indeed rich largely at the expense of the rest. How tempting it is for not only the rich but also the merely comfortably-off to imagine that, through their own efforts and special qualities, they deserve what they have, disregarding the fact that by the accident of birth they were born into an already rich country and in many cases an already well-off family within it that gives them significant advantages. How easy to overlook that they rely on getting cheap products made and grown by people from poor countries, who are no less hard-working or deserving but can be paid much less because they have little alternative.

But it's not only the rich who believe that they deserve their wealth. Many in the rest of the population think so too: 'they've earned it so they're entitled to it' is a common sentiment, even among those on low incomes. This is an example of belief in a just world. In economic matters, it's the idea that, roughly speaking, we get paid what we deserve and deserve what we get paid. Believing the rich deserve their wealth may seem a pleasingly generous sentiment, though assuming the poor also deserve their lot does not. It produces an unwarranted deference to the rich. The belief in a just world is a delusion, a kind of wishful thinking. Who wouldn't want to live in a just world, where need was recognized and effort and merit rewarded, while their opposites were not? But it doesn't follow that we do.

The ideology that the rich shower on us is meant to justify their privilege, but it turns the truth completely inside out. When inequality reaches the insane levels it has done, the rich depend on hoodwinking us all into thinking that they are the source of jobs, prosperity, and everything we value. But, once we stop believing this, either governments have to tackle inequality or revolutions arise.

Unpaid labour can produce vital goods and services too, like family meals, childcare, and eldercare, though there are arguments for paying carers via the state. No society can exist without care work, but nobody ever got rich by doing it. What could be more productive and socially useful than teaching a child to read, for example? People who parrot the glib saying 'Those who can, do; those who can't, teach' need to do some thinking for a change—though if they hold off long enough, "curriculum specialists" really might drive every competent teacher out of the profession and they won't need to do anything thinking after all.

Non-material services—whether they provide advice and information, healing, training, education, or entertainment—can be hugely beneficial. And if we expect to have specialists in these things, as well as in material production, then giving them an income both rewards and compensates

them for their work and enables them to do it. We can also ditch the prejudices that unless work generates money it's of no value, and that only the private sector produces wealth. Money and financial wealth have value only if there are goods and services for sale, but goods and services that are made available for free, like school lessons, can also be produced.

Any reasonable and civilized society would feel obliged to support such people. We should turn our attention to the undeserving at the other end of the income scale. There's a further question to be asked about unearned income that unfortunately is all too often overlooked: How can it be possible for someone to live without producing anything? If they're consuming goods and services—in the case of the rich, in vast quantities—but not contributing to their production, then who is producing them? The answer can only be this: for it to be possible for some to consume without producing, others who are producing goods and services must be producing more than they themselves consume. In other words, others must be producing a surplus. Even though they may be getting a wage or salary, part of their labour must be unpaid. The one who lives by owning without working is necessarily supported by the industry of someone else, and is, therefore, too expensive a luxury to be encouraged.

Unearned income derived from mere ownership of assets is problematic, whoever benefits from it, because it relies on power rather than contribution or need. In the case of the very rich it is power rather than contribution that accounts for most of their income. The fact that many ordinary people benefit from small amounts of asset-based unearned income shouldn't allow us to miss the elephant in the room: the rich get so much more of this undeserved income than others.

The richest 1% of the population receive 57.5% of all the income generated by wealth—that is, payment for privilege, most of it inherited. These returns—interest, rent, and capital gains—are not primarily a return for enterprise. They are pure inertia, weighing down markets. They do not “free” markets, except by providing a free lunch to the wealthiest families. The richest 20% of the population receives some 86% of all this income.

Meet the destructive forces who've looted the United States of America over the last several decades. One might describe them the same way FDR did: Economic Royalists.

These Economic Royalists complain that we seek to overthrow the institutions of America. What they really complain of is that we seek to take away their power. Our allegiance to American institutions requires the overthrow of this kind of power.

While the divide between the rich and the rest has certainly grown, how can it be claimed that we can't afford the rich? Here's a short answer.

Their wealth is mostly dependent ultimately on the production of goods and services by others and siphoned off through dividends, capital gains, interest, and rent, and much of it is hidden in tax havens. They are able to control much of economic life and the media and dominate politics, so their special interests and view of the world come to restrict what democracies can do. Their consumption is excessive and wasteful and diverts resources away from the more needy and deserving. Their carbon footprints are grotesquely inflated and many have an interest in continued fossil fuel production, threatening the planet.

Of course, this brief summary leaves out many qualifications, not to mention the actual argument and evidence. Some readers may agree straightaway, some may have a few objections, but others may respond with incredulity, perhaps outrage, for to claim that we can't afford the rich is to imply that they are a cost to the rest of us, a burden. Aren't the rich wealth creators, job creators, entrepreneurs, investors—indeed, just the kind of people we need? Don't entrepreneurs like Bill Gates deserve their wealth for having introduced products that benefit millions? Aren't the rich entitled to spend what they have earned how they like? What right has anyone to say their consumption is excessive? Couldn't the rich cut their carbon footprints by switching to low-carbon consumption? Wouldn't the world miss their philanthropy and the “trickle-down effects” of their spending? In fact, isn't this book just an example of “the politics of envy”—directed at those whom former UK Prime Minister Tony Blair used to call “the successful”? Shouldn't we thank, rather than begrudge, these “high net worth individuals”?

This is not about the politics of envy—a cheap slur used by those who want to duck the arguments and evidence—but the politics of injustice. I don't envy the rich, in fact I regard such envy as thoroughly misguided. But I resent the unjust system by which the rich are allowed to extract wealth that others produce and to dominate society for their own interests. What's more, this is not only unjust but profoundly dysfunctional and inefficient, and it creates inhumane, rat-race societies.

It's absolutely imperative that we begin to understand what unfettered, unregulated capitalism does, the violence of that system. Consider sacrifice zones, areas that have been destroyed for quarterly profit—and we're talking about environmentally destroyed, communities destroyed, human beings destroyed, families destroyed. They are places like Camden, New Jersey, which is the poorest city per capita in America. There are also the sacrifice zones of West Virginia, where mountaintop mining is poisoning local populations with sky-high cancer rates, and crippling the environment. The Royalists are rendering the area a moonscape. It becomes uninhabitable. They are

destroying the lungs of the Eastern seaboard. It's all destroyed and it's not coming back. And of course who can forget Cancer Alley. Because there are no impediments left in this cancer stage of capitalism, these sacrifice zones are just going to spread outward.

History tells us that in these times of crisis, the Economic Royalists—the bankers, industrialists, billionaires, kleptocrats, fascists—who know exactly what's going on and whose ill-gotten gains have caused the Great Crash to begin with, immediately try to exploit the crisis to further enrich themselves. They demand compensation for their losses, extracting bailouts and enacting austerity measures on working people, squeezing what little wealth there is left in the common economy, thus deepening the economic crisis. Under calls for privatization, they assault democratic institutions, cutting off vital lifelines and services for working people. Aware that just as nature abhors a vacuum, power does also, they use words such as 'freedom' and 'free market' to push for weaker government, or weaker institutions of organized people, thus clearing room for organized money to take power. As the situation for working people deteriorates further, extremist political parties rise up. Desperate populations flock to racist and nationalistic organizations to place blame on someone or something for their economic plight.

“Men will not always die quietly. For starvation, which brings to some lethargy and a helpless despair, drives other temperaments to the nervous instability of hysteria and to a mad despair. And these in their distress may overturn the remnants of organization.”

Our nation has a long history with the corporate death penalty. Beginning in the early 1800s, laws were passed in several states to make it easier for legislators to revoke corporate charters if businesses were operating against the public's interest. And this routinely happened. In Ohio, Mississippi, and Pennsylvania, banks were shut down for being “financially unsound.” In New York and Massachusetts, the corporations that ran the turnpikes were given a corporate death sentence for not keeping the roads in good repair. By 1825, twenty states had amended their constitutions to make it easier for the state to “revoke, alter, or annul” corporate charters whenever a corporation “may be injurious to citizens of the community.” And in just one year, 1832, the state of Pennsylvania sentenced ten corporations to death, revoking their charters for “operating contrary to the public interest.”

There's an easy way to understand why letting wealth concentrate in the hands of a few is a bad idea. Consider the game Monopoly. If your opponent scoops up Boardwalk, Park Place, North Carolina Avenue, Pacific

Avenue, both utilities, the four railroads, and an array of other properties on the board—that’s it, the game’s over. The other players, who were once property owners, will go bankrupt as they are forced to pay higher and higher costs for rent and services, utilities, and transportation. Eventually, one player has all the money, and the losers are left standing out in the cold. But what if the Monopoly game didn’t end there? What if the once-property-owning-but-now-broke players kept rolling the dice and kept going around the board, using their credit cards and lines of credit to stay in the game? While they’re running up massive personal or small-business debt, the monopolist who owns everything is finding it harder and harder to collect income from the increasingly impoverished players. They can’t afford to pay rent, they can’t pay utilities, and they can’t ride on the railroads. Eventually, when the consumers run out of both cash and credit and can no longer spend any money, even the monopolist goes broke. Then not only is the game over, but the game is over in a massive disaster.

The board game Monopoly was invented when America’s Gilded Age was in its final death throes. The game’s inventor, Lizzie Magie, named it “The Landlord’s Game.” But as she said:

“It might well have been called the ‘Game of Life,’ as it contains all the elements of success and failure in the real world, and the object is the accumulation of wealth.”

Lizzie was a Georgist—one who follows the teachings of economist Henry George—and believed that things found in nature, particularly land itself but also things like mineral wealth, are part of the commons and thus should really be owned by “we the people,” not private profiteers. It was an ideology directly born out of the times—the Gilded Age—when Robber Barons used monopolies in steel, oil, rail, and finance to dominate the American economy. They built vast fortunes by owning all the stops on the Monopoly board of America, while working people’s conditions collapsed to the point where we went into the Great Depression.

In the census of 1900, per capita income was less than \$5,000 annually in today’s dollars. And more and more Americans who were once self-employed had their lives uprooted and were thrown under the juggernaut of the Robber Barons. In 1850, prior to this so-called Gilded Age, most Americans worked for themselves. But by 1900, the majority of Americans worked for someone else—in many cases the monopolists.

This was why Lizzie Magie invented that early version of what we today call the board game Monopoly. It was her hope, and that of many, that the stranglehold of the Economic Royalists of the era could somehow be broken.

“Let the children once see clearly the gross injustice of our present system and when they grow up, if they are allowed to develop naturally, the evil will soon be remedied.”

Early on, before Parker Brothers acquired the patent on Monopoly, turning it into the game we know today, well-to-do college students would play the game in fraternity houses at the behest of far-left economic teachers. The game was meant to answer a question about the current economy. An early instruction manual for the game of Monopoly in 1925 reads:

“At the start of the game every player is provided with the same amount of capital and presumably has exactly the same chance of success as every other player. The game ends with one person in possession of all the money. What accounts for the failure of the rest, and what one factor can be singled out to explain the obviously ill-adjusted distributions of the community’s wealth which this situation represents?”

So much for equality of opportunity being a savior.

In a 1966 article, *TIME* magazine looked ahead toward the future and what the rise of automation would mean for average working Americans. It concluded:

“By 2000, the machines will be producing so much that everyone in the US will, in effect, be independently wealthy. With Government benefits, even nonworking families will have, by one estimate, an annual income of \$30,000–\$40,000. How to use leisure meaningfully will be a major problem.”

And that was \$30,000–\$40,000 in 1966 dollars, which would be roughly \$199,000 to \$260,000 in 2010 dollars. Ask anybody who was teenage or older in the 1960s, this was the big sales pitch for automation and the coming computer age. There was even a cartoon show about it—*The Jetsons*—and everybody looked forward to the day when increased productivity from robots, computers, and automation would translate into fewer hours worked, or more pay, or both, for every American worker. And there was good logic behind the idea. The premise was simple. With better technology, companies would become more efficient. They’d be able to make more things in less time. Revenues would skyrocket, and Americans would bring home higher and higher paychecks, all the while working less and less. So by the year 2000, we would enter what was then referred to as “The Leisure Society.” Futurists speculated that the biggest problem facing America in

that Jetsons future would be just how the heck everyone would use all their extra leisure time! And, of course, there were also those who were worried about what kind of degeneracy would emerge when a nation has lots of money and lots of free time on its hands. This didn't happen. And it didn't happen because Ronald Reagan stole the Leisure Society from us and he handed it over to the Economic Royalists.

The reason why the Leisure Society could be imagined by TIME magazine is because, ever since 1900, working people's wages tracked evenly with working people's productivity. So, as productivity continued to rise, which was likely, due to increasing automation and better technology, so, too, would everyone's wages. And the glue holding this logic together was the current top marginal income tax rate. In 1966, when the TIME article was written, the top marginal income tax rate was 70 percent. And what that effectively did was encourage CEOs to keep more money in their businesses, to invest in new technology, to pay their workers more, to hire new workers and expand. After all, what's the point of sucking millions and millions of dollars out of your business if it's going to be taxed at 70 percent? And perhaps you'll also see why going even higher, say to 90 percent—where it was at one point—or even more is not a recipe for disaster. According to this line of reasoning, if businesses were to suddenly become way more profitable and efficient thanks to automation, then that money would flow throughout the business—raising everyone's standard of living, increasing everyone's leisure time. But when Reagan dropped that top tax rate down to 28 percent, everything changed. Now as businesses became far more profitable, there was a far greater incentive for CEOs to pull those profits out of the company and pocket them, because they were suddenly paying an incredibly low tax rate. And that's exactly what they did. All those new profits, thanks to automation, that were supposed to go to everyone, giving us all higher paychecks and more time off, went to the top—to the Economic Royalists.

In the 1950s, before that TIME magazine article predicting the Leisure Society was written, the average American working in manufacturing put in about forty-two hours of work a week. Today, the average American working in manufacturing puts in about forty hours of work a week. This means that despite the fact that productivity has increased 400 percent since 1950, Americans are working, on average, only two fewer hours a week. If productivity is four times higher today than in 1950, then Americans should be able to work four times less, or just ten hours a week, to afford the same 1950s lifestyle when a family of four could get by on just one paycheck, own a home, own a car, put their kids through school, take a vacation every now and then, and retire comfortably. That's the definition of the Leisure

Society: ten hours of work a week, and the rest of the time spent with family, with travel, with creativity, with whatever you want. But all of this was washed away by the Reagan tax cuts. Combine this with Reagan's brutal crackdown on striking PATCO (Professional Air Traffic Controllers Organization) members that kicked off a four-decades-long assault on another substantial pillar of the working class—organized labor—and life has been anything but leisurely for working people in America.

The return of the rich over the last four decades has been closely associated with developments in capitalism. Most important has been the rise of a new political economic orthodoxy, called neoliberalism. Initiated aggressively by Margaret Thatcher and Ronald Reagan in the 1980s, it was consolidated with more stealth by their successors, New Labour as well as Conservative, Democrat as well as Republican. Now, after the crash of 2007–08 and in the ensuing recession—exactly when it has most clearly failed—it is being imposed with renewed vigour.

It has three key features:

1. Markets are assumed to be the optimal or default form of economic organization, and to work best with the minimum of regulation. Competitive markets supposedly reward efficiency and penalize inefficiency and thereby “incentivize” us to improve. Governments and the public sector, by comparison, are claimed to be inferior at organizing things—monopolistic and prone to complacency, inefficiency, and cronyism. Governments should therefore privatize as much as possible. Financial markets should be deregulated and there should be “flexible labour markets”—political code language for jobs in which pay can fall as well as rise and in which there is little security. Where parts of the public sector can't be privatized, league tables should be established and individuals, schools, universities, hospitals, museums, and so on should be made to compete for funds and be rewarded or penalized according to their placing. Democracy needs to be reined in because the ballot box can't match markets in governing complex economies; people can express themselves better through what they buy and sell. Unsurprisingly, neoliberals keep their anti-democracy agenda under wraps.
2. The rise of neoliberalism also involves a political and cultural shift compatible with its market fundamentalism. Through a host of small changes in everyday life, we are increasingly nudged towards thinking and acting in ways that fit with a market rationality. More and more, the media address us as self-seeking consumers, savvy investors, ever

pursuing new ways of supplementing our incomes through “smart investments.” Risk and responsibility are transferred to the individual. Job shortages are no longer acknowledged, let alone seen as a responsibility of the state: there are just inadequate individuals unable to find work: “skivers,” “losers.” No injustice, just bad choices and hapless individuals. The word ‘loser’ now evokes contempt, not compassion. Those unable to find jobs that pay enough to allow them to cope and who still need the welfare state are marginalized, disciplined, and stigmatized as actual or potential cheats.

State health services and pensions are run down and replaced by private health insurance and private pensions. You’re on your own, free to choose, free to lose, depending on how you navigate through the world of opportunities and dangers. Instead of seeing ourselves as members of a common society, contributing what we can, sharing in its growth, pooling risks and providing mutual support, we are supposed to see ourselves as competing individuals with no responsibility for anyone else. Want to jump the queue for medical services? Click [here](#). Want to give your child an advantage? Pay for private tuition. We should compete for everything and imagine that what is actually only possible for the better off is possible for everyone; everyone can win simultaneously if they try. We are expected to see ourselves as commodities for sale on the labour market, but also as ‘entrepreneurs of the self.’ Hence the rise of the cult of the curriculum vitae (résumé) and self-promotional culture. Education is increasingly debased by efforts to turn it into a means for making young people in this mould.

Some people—probably many readers of this book—may want to resist these tendencies, but in a neoliberal society it is impossible to avoid them totally, not least because in so much of life using markets (disguised as “choice”) and competing in league tables have become the only choices we can make.

3. Neoliberalism has ushered in a shift in the economic class structure of the countries it has most affected. It involves not only a shift of power and wealth towards the rich, marked most clearly by the weakening of organized labour in industrialized economies and the enrichment of the 1%, but a shift of power within the rich: from those whose money comes primarily from control of the production of goods and services, to those who get most of their income from control of existing assets that yield rent, interest, or capital gains, including gains from speculation on financial products. The traditional term for members

of this latter group is ‘rentier.’ Many of the changes noted in 1 and 2 above benefit them. Neoliberalism as a political system supports rentier interests, particularly by making the 99% indebted to the 1%.

In 1986, Reagan lowered tariffs. He also secured a free-trade deal with Canada in 1988. He vetoed protectionist trade bills throughout his presidency. And he doubled America’s spending in the global economy. But Clinton really did a number on working people. In the 1992 presidential debate, third-party candidate Ross Perot famously warned about a “giant sucking sound” of American jobs going south of the border to low-wage nations once trade protections were dropped. Perot was right, but no one in our government listened to him. Tariffs were ditched, and then Bill Clinton moved in to the White House in the 1990s. He continued Reagan’s trade policies and committed the United States to so-called free-trade agreements such as GATT, NAFTA, and the WTO, thus removing all the protections that had kept our domestic manufacturing industries safe from foreign corporate predators for two centuries. In the 1960s, one-in-three Americans worked in manufacturing, producing things of lasting wealth. Today, after jumping headfirst into one free-trade agreement after another, only one in ten Americans works in manufacturing.

Under the watch of the Royalists, the Reagan administration was philosophically opposed to the government breaking up companies. Over the next few decades, the monopolies of the Gilded Age returned. On Wall Street, the twenty biggest banks own assets equivalent to 84 percent of the nation’s entire GDP. And just twelve of those banks own 70 percent of all the banking assets. That means our entire banking system relies on just a few whales that must be saved at all costs from going belly up, or else the entire system goes belly up.

And consider our food industry. Agriculture oligopolies exist from farm to shelf. Just four companies control 90 percent of the global grain trade. Just three companies control 70 percent of the beef industry. And just four companies control 58 percent of the pork and chicken industry. On the retail side, Walmart controls a quarter of the entire US grocery market. And just four companies produce 75 percent of the breakfast cereal, 75 percent of the snack foods, 60 percent of the cookies, and half of all the ice cream sold in supermarkets around the nation.

And then there’s the health insurance market. Just four health insurance companies—UnitedHealth Group, WellPoint, Aetna, and Humana—control three-quarters of the entire health insurance market. And as a 2007 study uncovered, in thirty-eight states, just two insurers controlled 57 percent of the market. In fifteen states, one insurer controlled 60 percent of the market.

Since there's no functional competition in such a market, prices continue to get higher and higher while the profits for these whales skyrocket too.

In the cellular phone market, just four companies—AT&T, Verizon, T-Mobile, and Sprint—control 89 percent of the market. And in the Internet market, just a handful of corporations—AT&T, Comcast, Time Warner, and Verizon—control more than half of the market. From newspapers to television, radio to movies, monopolies dominate the markets.

Through trade agreements, deregulation, and privatization, we seriously weaken the ability of nation-states to act with any political independence.

Our economy has been dangerously hollowed out by the twin combination of well-meaning ideologues and the psychopaths they empowered.

It's a Second Gilded Age, and it's headed for another Monopoly Endgame. And this time it will be worse than before. We are no longer dealing with the Robber Barons, who savaged working people through the last half of the nineteenth century. And we aren't talking about the Economic Royalists of FDR's day, who plotted a coup. This is a new form of Royalist. The Robber Barons, however feudal they were, ran their enterprises within the nation-state itself. Now, we have corporate entities which seek the lowest possible wage around the world, in essence the prison labor in China or new frontiers, and are forcing the rest of the planet's workforce to compete with this slave labor. It's similar to the age of the Robber Barons but in fact worse because there is no loyalty to the nation-state. The corporations are actually hollowing the country out from the inside. Neoliberalism is creating a kind of neofeudalism.

For most of American history, businesses—for-profit and nonprofit—had mission statements that were broader than simply serving the interests of the shareholders and CEOs, and referred instead to the long-term interest of the company, its workers, and its customers. And perhaps most important, the long-term interest of the nation it belonged to. After all, if your nation goes to hell, so does your market—a collapse isn't good for business. But globalism changed the game. Globalism is the breaking down of economic borders. What globalism does is peel away those government protections of national industries, and let global Economic Royalists dive in and feast on the goods.

Once government is out of the way the transnational corporations rise to power. Richer than a majority of nation-states on the planet, free of the geographical and social obligations of these old states, beyond the embarrassing demands of nationalism, freed in fact from the emotional, immeasurable demands of the citizenry, the transnational is able to organize world affairs in a "more rational, efficient manner." Without the demands of nationalism, corporations can skate by without hiring American workers,

they can dodge taxes, and they can spew toxic chemicals all over our commons. Instead of nationalism, corporations are bound by efficiency, which in turn yields higher profits. And it's far more efficient and profitable to hire low-wage workers in India, to spend millions lobbying to avoid billions in taxes, and to skirt regulations that keep people working on oil rigs alive and prevent ecological disasters.

In the past thirty years, foreign investors bought roughly \$3 trillion worth of American industry. That means \$3 trillion worth of assets that were generating profits for America, hiring American workers, and making things with a "Made in America" stamp on them are now in the possession of foreign nations, so if they continue to operate, all their profits go overseas. It's like a giant liquidation sale in a nation that's on the verge of going out of business.

In the first decade of this new century, some of the biggest transnational corporations in America—corporations that employ one-fifth of all American workers—have been shipping jobs away en masse. Since 2000, these transnationals have laid off 2.9 million Americans, and hired 2.4 million foreign workers.

There's inherent instability in a capitalist system. It's the structure of finance itself. Capitalism demands a banking system and that banking system is wired to misbehave, since there's always an inherent temptation to create and sell as much debt as possible—whether it's in the form of oil derivatives, mortgages, or student loans. They will always want to lend more money since the banking sector profits by creating debt. If the banking sector simply lent money to businesses to fund productive investments and homeowners who could actually afford a home, then bank profits would be only 5 to 10 percent of total profits in America. But with manufacturing decimated from so-called free trade, and no rules on Wall Street, bankers lunged for a bigger piece of the profit pie. They force-fed the nation more and more debt.

Another debt bubble, even bigger than the one in the 1920s, was being inflated. The bubble had started in the early 80s. After such a terrifying experience during the Great Depression and the Second World War we had tamed much bad behavior in the financial sector and people's willingness to take on debt. But then people forgot. If you look at when people started to really take on debt again, it was when the first baby boomer turned eighteen. We lost that memory, and then that same irresponsible behavior that gave us the Roaring Twenties came back. As the boomer generation took the reins of business in the seventies and eighties, there was no remembered sense of the dangers of reckless banking practices or even of reckless personal debt.

Look at America today and see the rich building their metaphorical buildings with gates on the outside and discos indoors. Gated communities. Home theaters. Private schools. Private jets. Privately run public parks. Private world-saving behind the backs of those to be saved. Life goes more and more behind the gate. More and more of our civic activities and public activities become private activities. Inequality gave some the resources to build their own discos and sequester themselves indoors. But it took the further ingredient of culture to make this way of life desirable. People chose to live in this way when they lacked faith in what lay beyond their gates—in the public. They felt this way when ‘public’ had been allowed to tumble to lower status than ‘private’ in our imaginations, in a reversal of their historic rankings: There was a time when we loved ‘public’ enough to place our most elevated hopes in republics, and when ‘private’ reminded us of its cousins ‘privation’ and ‘deprived.’ An achievement of modernity has been its gradual persuasion of citizens to expand the circle of their concern beyond family and tribe, to encompass the fellow citizen. Inequality was reversing that. Government still had the responsibility, but, more and more, the wealthy made the rules.

The National Committee for Responsive Philanthropy produced a report in 2004 questioning the charitable nature of the Kochs’ donations. Their report concludes that the Kochs aren’t actually making charitable contributions; they’re making investments in ideas that will eventually lead to higher profits. According to the report, Koch foundations “give money to nonprofit organizations that do research and advocacy on issues that impact the profit margin of Koch Industries.”

It takes a lot of money to get the entire political and economic class to buy into an ideology that has repeatedly caused massive economic crashes—especially since the last crash was still fresh in everyone’s mind.

Koch-funded Royalist spin machines aren’t exclusive to George Mason University. At Florida State University, Charles Koch inked a multimillion-dollar deal with the economics department to advance Royalist economics. Under the agreement with the Charles G. Koch Charitable Foundation, faculty only retain the illusion of control. The contract specifies that an advisory committee appointed by Koch decides which candidates should be considered. The foundation can also withdraw its funding if it’s not happy with the faculty’s choice or if the hires don’t meet “objectives” set by Koch during annual evaluations. In other words, the Kochs get final say on new professors—especially ones who don’t subscribe to the Kochs’ own free-market economic philosophy. In 2009, Charles Koch nixed nearly 60 percent of the university faculty’s suggestions. The Kochs have similar strings-attached deals with public universities all across the country, including West

Virginia University, Troy University, Utah State University, and Clemson University. All in all, over 150 higher-education institutions receive some sort of financial contribution from the Koch brothers—often in the form of quid pro quos. Our higher-education system is being used by Economic Royalists such as the Kochs to fund economic brainwashing and a hearts-and-minds assault against the government.

The divide between the Davos class and everyone else has been widening since the 1980s. But for a lot of people, the breaking point came with the 2008 financial crisis. After forcing decades of grinding austerity on people, Treasury secretaries and finance ministers and chancellors of the exchequer suddenly found trillions of dollars to rescue the banks; people witnessed their governments printing vast sums of money. They had given up so much—pensions, wages, decent schools—when in fact, contrary to what Margaret Thatcher claimed, there were alternatives. All of a sudden it turned out that governments can do all kinds of things to interfere in the market, and have seemingly unlimited resources with which to help you out if only you are rich enough. At that moment, everyone on earth saw that they had been lied to.

A Great Crash is a painful event, often too terrible for its citizens even to contemplate. History tells us that when the foundations collapse, and a society's cultural core is hollowed out and the madness takes hold, its members will pretend all is well. Life seems to go on as average citizens try to get by, while the very rich, who understand what's happening, consolidate their power and wealth before the final crash. This is the cancer stage of capitalism—the point at which the Royalists have fully contaminated the body economic and politic, making the crash inevitable. This is where we are today.

We have powerful corporate interests that have commodified everything, including human labor, which means human beings no longer have any intrinsic value in the ethics of corporations. They are commodities to exploit until exhaustion or collapse. The same is true of the natural world—we exploit the natural world until exhaustion or collapse.

I think historians when they look at this time, they're going to wonder why the wealthy overplayed their hand like this. Why would they, when they had it so good? They had the "middle class" to buffer them from the poor and voting for the politicians that the wealthy bought, everything was running just fine, they were posting profits of a billion a year, but that wasn't enough for them. What they did was started to ruin the lives of the very people who voted for their politicians and supported them all these years, the "middle class."

The irony is, when you look back at the history of empires, it has

been that narrowness, that failure to look at the long-term, that absorbed self-interest, that has been the final end of those empires.

Capitalism has unleashed waves of enclosure, imperialism, warfare, and ecocide over the last five-hundred years that have benefited a very small segment of humanity while displacing, immiserating, enslaving, and destroying countless numbers of people, animals, and plants. Everyone is not equally responsible for the destruction of nature, despite suggestions that “if you want to think about why humans are so dangerous to other species, you can picture a poacher in Africa carrying an AK-47 or a logger in the Amazon gripping an ax, or, better still, you can picture yourself, holding a book in your lap.” Such a sweeping indictment of an undifferentiated humanity is both historically inaccurate and politically disempowering. Such a perspective offers us no understanding of the structural forces that generate exploitation and ecocide, no sense of how such forces may push the vulnerable to behave in ways that are antithetical to their long-term interest, and no conception of how people in the relatively affluent global North might act in solidarity with those whom Frantz Fanon called “the wretched of the earth.” Such a perspective is truly hopeless.

It has been said that it is easier to imagine the end of the world than to envisage the overthrow of capitalism. I would respond to this aphorism from dark times that it is easier to imagine the end of capitalism than it is to articulate any other genuine solution to the extinction crisis. If capitalism is the ultimate cause and prime engine of the extinction crisis, surely we can only conclude that we may find hope in challenging its baleful power with all means at our disposal. Capitalism is not eternal; it is a specific economic system grounded in a set of historically particular economic arrangements and social values. It came onto the world stage relatively recently, and, one way or another, it will eventually make an exit. The question for us, then, is what kind of end we wish to make.

Climate science has made it blindingly clear that our economic system is destroying the planetary life support systems upon which we depend. Climate change therefore makes it imperative that we discuss radical transformations in capitalist social relations, a topic that has been largely taboo for the last three decades.

We have always used animals and plants to symbolize our most intimate fears, our hopes, and even our greatest loves. As capitalism tears increasingly gaping holes in the beautiful web of life of which we are a part, our capacity to dream, to imagine different, more manifold worlds is radically impoverished. Every species that is consigned to oblivion is a grave loss to the planet in general and a serious threat to the many whose lives are intertwined with that species. In addition, however, such losses are the most concrete possible

testimony to the ecocidal character of capitalism. In the face of such an irredeemably rapacious and ultimately impoverishing system, we must insist on the human capacity to dream and to build a more just, more biologically diverse world.

Augustine stated that an unjust law is no law at all—*Lex iniusta non est lex*—which Martin Luther King Jr. repeated in his Letter from a Birmingham Jail. The obvious implication is that a law must be just for it to stand qua law. Another implication is that one is not bound to enforce or obey an unjust law, for to do so would mean participating in an injustice. Naturally, unjust laws are accompanied by institutions charged with enforcing them, making disobedience precarious. If we shift here to those who make the laws, three observations can be made. First, it is usually the case that legislators do not believe that the laws they make are unjust. They typically offer “good” reasons for a law and these reasons may go unquestioned by most of the populace, especially those who may benefit from the law. Second, it is rare that persons who possess the power to make and enforce laws do so at the expense of themselves, which leads to a question regarding the making of any law, *cui bono*—who benefits? Third, an unjust law either enacts or simply codifies existing unjust practices. Laws enacted regarding slavery, for instance, reinforced the already existing injustices associated with trafficking and exploiting human beings.

An unjust law by its nature cannot result in just effects; it cannot be accidentally just, regardless of how it is rationalized and justified. While a tautology, a law is unjust because what it enacts and enables are forms of injustice. Someone might point out that some laws are unjust, yet their effects appear to be “just” for those who benefit from them. Is the unjust law accidentally just? Those who benefit from unjust laws obtain their benefits at the expense of others, which means the unjust law remains unjust in its effects. To return to laws associated with slavery, there was never any justice that resulted from these laws, even though white people benefited from these laws. Slave laws codified and enacted horrific forms of oppression and marginalization for the sake of profit (and a sense of white superiority). No amount of rationalization can alter this reality and anyone who accepted or actively supported these kinds of laws acted unjustly. Of course, there are also laws that are just, but unjust in their application. For instance, there are just laws that prohibit citizens from physically harming other human beings. Yet, in some circumstances the application of these laws is unjust. Harsher sentences for persons of color versus white persons who commit the same crime is an example.

Let me add a further thought. Laws that are considered to be just by most people may later be deemed unjust. Consider, for example, laws that

stated men of property have the right to vote. These laws, constructed by white men of property, benefited the lawmakers and other white men of the propertied class, yet were generally accepted. Only in time did people raise their voices arguing that these laws were unjust because they excluded women and people of color. It took over seven decades after Seneca Falls (1848) for women to obtain the right to vote (1920). Can anyone imagine going back to the disenfranchisement of women not voting and arguing that it is just?

This raises a question: can a law be accepted as just in one era and be considered fundamentally unjust at a later time? Are there, in other words, laws that are simply unjust at their core? Or is it possible for a law to be just at the time and later experienced as unjust because of changes in historical circumstances? There is no easy answer to this question, but I would suggest a general rule: laws that privilege one group's survival and flourishing, while depriving another group can never be deemed to be just. A law that is deemed to be just at the time it is enacted, but then later found to be unjust, means that it was unjust at the start. At the dawn of the US, laws privileging white men of property, despite being considered just at the time, were fundamentally unjust because they impeded women, unpropertied white men, people of color, and slaves from flourishing. It took time for enough people to experience and lament the injustices before these laws were changed or eradicated.

The worse kind of unjust laws are those that are hidden from view, ensconced in language of Nature, God, or simply the way it is and always has been. The meta-message in these language games is that the law is just and unquestionable. There is no alternative. We have no choice but to accept and submit to the law and accept our lot in life. At the same time, occult unjust laws may have been enforced for so long that they have become part of the ethos and common practice of the people; this feels as if it is natural despite obvious injustices. An occult unjust law operates such that those who suffer the effects of the law do not or are unable to question it or accurately attribute the real source of their suffering. In fact, they may find some other source to blame for their suffering.

Despite some awareness among people of the injustices rising from capitalism, I would argue that some of the foundational laws of capitalism are unjust. While the effects of these laws can be seen to result in various forms of injustice, the laws themselves are rarely questioned. It is as if most of us concede that Margaret Thatcher was right when she said there is no alternative to capitalism. Many people have acknowledged the shortcomings of capitalism and work to ameliorate its injustices, yet leave intact the very laws that created the injustice. For instance, Roosevelt's New Deal and his

use of Keynesian economic theory to establish regulations were meant to limit the negative effects of capitalism that socialists and communists had been lamenting since the nineteenth century. Despite the good these programs and laws led to, they never questioned the core tenets of capitalism and the laws that supported it. Indeed, Keynesian capitalism is still capitalism even though it tries to stem some of the excesses endemic to capitalism. Another example is advocating for a living wage. This has been going on since the nineteenth century and continues today. When people in Seattle, for instance, obtain enough votes to enact a hike in the minimum wage, most of us see this as a victory. On the one hand, it is a victory, because it forces producers and owners to provide higher wages for workers. On the other hand, this is a Pyrrhic victory because laws that support capitalism remain unquestioned. One can raise criticisms about the effects of capitalism, but ignore the very laws that give it life.

The hidden aspect of the unjust laws vis-à-vis capitalism is furthered by the media, more often than not, unwittingly. Recently I listened to an interview with several economists who observed that the economy is doing well, although workers' wages have remained flat when inflation is taken into account. One economist speculated that a tightening labor market will result in higher wages, because companies are competing for workers. Another wondered if the increasing use of technology (replacing workers with robots) accounts for stagnant growth despite worker productivity. The laws of the market, it is believed, determine whether wages increase (unless you are a CEO). So, workers, since the 1980s, have had to wait for a time when the labor market is very tight before corporate coffers will provide a bit more compensation. The interviewer and the economists are familiar with the rules of the game and not one of them argued that the rules are unjust. They seemed to accept the reality as a given—just the way the market operates.

To understand the occult injustice of laws undergirding capitalism, I take a brief detour to the possible origins of capitalism. Some argue that capitalism began in the sixteenth century in England where ruling landowners, who already benefited from property laws, were able to enact laws and practices that enabled them to secure greater profits by enhancing competition and, later, increased agrarian efficiencies (resulting in displacement of large numbers of citizens). Laws associated with capitalism grew to other sectors of the economy, as well as to other countries, becoming an integral part of Western imperialism and its insatiable pursuit of markets—exploitation of foreign peoples and their lands. A simple reading of these laws is that owners of businesses and farms are legally entitled to the profits, because they own the property, machinery, et cetera—today, even immaterial factors

such as ideas are deemed to be property. Laborers are entitled to whatever wage the owner is willing to give. Since these wages are operating expenses that deplete profit, one would expect, as Marx indicated, there would be a tendency to keep wages (and benefits) as a low as possible.

The laws that undergird capitalism sanction accumulation by dispossession. Consider Charles Dickens famous Christmas story. Scrooge may have been a detestable figure before his conversion, but he was completely legitimate in securing greater profits by keeping Bob Cratchit's wages low. Indeed, in the story Bob Cratchit is calmly resigned to obtaining low wages and a bare existence for himself and his family. Scrooge's conversion meant that he was more generous with the profits he legally obtained. Dickens, in other words, may have written this story as a cautionary tale for greedy businessmen, but what remained unquestioned was the fundamental injustice of the laws that legitimated the exploitation of Bob Cratchit and his family. If conversion means change, then the real conversion would have been ridding the country of laws that justified profit at the expense of workers and their families. Willy Loman in *Death of a Salesman* is an analogous figure who accepts the "game" even if it means struggling for decades to provide for himself and his family, while the owner of the business lived well. I think, though, that Arthur Miller, unlike Dickens, was leaning into the idea that capitalism and its laws are fundamentally unjust.

I say unjust because a company's profits are made possible by the work of everyone in the company. Even if it is recognized that everyone contributes to the profits, the law bestows sole discretion of the disposition of the profits to those who own the company. Regular workers are to be content with their wages and have no say about how company profits are to be used or distributed. Of course, labor is valued differently in capitalism and while there are laws about minimum wage, there are no laws against how much a CEO can make. The maintenance worker's labor, for example, is deemed of significantly less value than that of the CEO, because, as the story goes, the CEO has more responsibility and is thus due more of the share of the profits. Whether that is 340 or 400 times that of the lowest paid worker, is immaterial. It could be 10,000 times the lowest paid worker and the law would say this is legitimate. Laborers have no say not only with regard to their meager wages, but also the exorbitant salaries and benefits of corporate elites. Even with more equitable pay and benefits, the unjust nature of the laws supporting capitalism remain—laws that restrict profits and decision-making about the use of those profits to the owners.

Naturally, someone might say that if workers had a living wage, then the laws associated with capitalism would not be unjust either in terms of its foundation or in its application. But I contend that these laws are by their

nature unjust. This is most notable in that these laws not only inevitably lead to exploitation, they also objectify workers. Workers in the capitalist system obtain their conditional value by virtue of their participation in creating profits. Fail in this and a worker is easily discarded, while the company owners secure their profits. Willie Loman and Bob Crachit were mere cogs, easily replaced.

Another person might point out that differences in education, experience, skills, et cetera impact a worker's productivity. Shouldn't they receive more remuneration than the lowly line worker or janitor? And if individuals were paid the same, what would be the incentive to work harder? One basic problem with this last question is that it presumes that persons' creativity or productivity is motivated simply and solely by money. If that were true, we would not have any teachers. Second and more problematic is that even if there is smaller disparities in wages, workers are excluded from a decision-making process that impacts them directly and significantly. Workers have no voice or seat at the table because they do not own the company, which makes them more vulnerable to exploitation, as history has repeatedly shown. Any group whose voice is denied and who are excluded from sitting at the table will likely be marginalized and oppressed by those who have voices and seats. They remain, like Bob Crachit, forever dependent on the whims of the bosses. A critic may counter, saying they have a voice in that they could find another job or they could speak out or they could get more education. These responses are usually made by people of privilege who aren't trapped in a job, fearing that the loss of the job will result in losing one's apartment, car, et cetera. Moreover, these responses overlook the fact that the only option a worker may have is to work low wage jobs—jobs where she or he has no voice about the company's use of profits. Worse, these neoliberal responses deflect attention from the exploitative nature of business.

Let me shift to unions and what remains of them. No can deny that despite corruption, unions were responsible for workers obtaining better wages and benefits, as well as protections. But unions by and large rarely questioned the rules of the game. They simply agitated for company boards to make decisions so that workers received fairer, living wages and benefits. While unions were never at the seat of the board room, they did represent a collective voice even as they contributed to the occult aspect of ownership laws. Even today, when we hear unions advocating for a living wage, one hears little from their leaders about the fact that the very laws that ensure a perennial struggle for just wages are unjust themselves.

Any cursory glance at history during the last three centuries reveals not simply booms and busts in the economy, but a consistent thread of workers struggling to obtain a living wage and some protections from the

vagaries of the capitalist system and its laws. Conversations about living wages were occurring in the nineteenth century. Even if we establish laws regarding a living wage—adjusted for inflation—I am confident that the capitalist class will work diligently to secure greater profits at the expense of workers, because the occult unjust laws of capitalism will remain alive and well. As long as workers are not owners, as long as they have no voice and no seat at the table when decisions are made about how profits are used and shared, one can confidently predict they will be exploited. I suspect, or more accurately hope, that in time more people, perhaps even a majority, will become increasingly aware that laws—no longer occult—that place profits in the hands of the owners are fundamentally unjust. And these very same people will overturn them. By any means necessary.

Making the Dog Ride the Donkey

Koch Finds Religion

“Public interest has been subordinated to private interest, and when there is no clear distinction between them, it opens the door to endless opportunities for corruption.”

Scholars and journalists in many nations are now grappling with how numerous democracies have been, in effect, losing sovereignty and responsiveness to voters, and hence popularity. Yet most write in the passive voice, focusing on impact more than sources, and attributing the action to abstract nouns rather than human agents. What no one has identified with adequate clarity is the individuals and institutions that are intentionally insulating the economy from intervention, in what has become a bipartisan and transnational project.

The head of Koch Industries’ government and public affairs operation, told an invitation-only audience of billionaire and multimillionaire donors that those who are worried about what is happening to American politics are “afraid of us,” but ineffectual in stopping the assembled donors and operatives. “We’re close to winning. I don’t know how close, but we should be,” he told them, because “they [the critics] don’t have the real path.”

Koch made clear he was looking for something, but what that something was, beyond a “technology” of revolution, remained unclear. By the late 1990s, Koch had concluded that he’d finally found the set of ideas he had been seeking for at least a quarter century by then—ideas so groundbreaking, so thoroughly thought-out, so rigorously tight, that once put into operation, they could secure the transformation in American governance he wanted. From then on, Koch contributed generously to turning those ideas into his personal operational strategy to, as the team saw it, save capitalism from democracy—permanently.

“Since we are greatly outnumbered,” Koch conceded to the assembled team, the movement could not win simply by persuasion. Instead, the cause’s insiders had to use their knowledge of “the rules of the game”—that

game being how modern democratic governance works—“to create winning strategies.” Koch warned:

“The failure to use our superior technology ensures failure.”

Translation: the American people would not support their plans, so to win they had to work behind the scenes, using a covert strategy instead of open declaration of what they really wanted.

To James Buchanan, what others described as taxation to advance social justice or the common good was nothing more than a modern version of mob attempts to take by force what the takers had no moral right to: the fruits of another person’s efforts. In his mind, to protect wealth was to protect the individual against a form of legally sanctioned gangsterism. Where did this gangsterism begin? Not in the way we might have expected him to explain it: with do-good politicians, aspiring attorneys seeking to make a name for themselves in constitutional law, or even activist judges. It began before that: with individuals, powerless on their own, who had figured out that if they joined together to form social movements, they could use their strength in numbers to move government officials to hear their concerns and act upon them.

The most powerful social movement back then was what Buchanan’s proposal referred to as “the labor monopoly movement,” or what most of us would today call organized labor. But other movements, also injurious in his mind, were on the horizon, including the increasingly influential civil rights movement and a resumed push by elderly citizens to organize as they had not since the Great Depression. From his vantage point, it did not matter whether the movement in question consisted of union members, civil rights activists, or aging women and men fearful of ending their lives in poverty. Nor did the justness of the cause they advocated, the pain of their present condition, or the duration of the injustice they were attempting to reverse move him in any way. The only fact that registered in his mind was the collective source of their power—and that, once formed, such movements tended to stick around, keeping tabs on government officials and sometimes using their numbers to vote out those who stopped responding to their needs. How was this fair to other individuals? How was this American?

Buchanan believed with every fiber of his being that if what a group of people wanted from government could not, on its own merits, win the freely given backing of each individual citizen, including the very wealthiest among us, any attempt by that group to use its numbers to get what it wanted constituted not persuasion of the majority but coercion of the minority, a violation of the liberty of individual taxpayers. To end the coercion, he

counseled, one had to stop “government corruption.” By that he meant the quiet quid pro quo reached between government officials and organized groups that keeps these officials reflexively attuned and responsive to the demands of such groups in exchange for their votes.

Our trouble in grasping what has happened comes, in part, from our inherited way of seeing the political divide. Americans have been told for so long, from so many quarters, that political debate can be broken down into conservative versus liberal, pro-market versus pro-government, Republican versus Democrat, that it is hard to recognize that something more confounding is afoot, a shrewd long game blocked from our sight by these stale classifications. We don’t understand that the old Republican Party exists no more. Many do grasp that the body with that name has somehow become hard-line and disciplined to a degree never before seen in an American major party; yet, not having words to fit what it has become, we assume that what we are seeing is just very ugly partisanship, perhaps made worse by social media.

I have found myself more and more fixated on one gnawing question. Is what we are dealing with merely a social movement of the right whose radical ideas must eventually face public scrutiny and rise or fall on their merits? Or is this the story of something quite different, something never before seen in American history? Could it be—and I use these words quite hesitantly and carefully—a fifth-column assault on American democratic governance?

The phrase originated in the Spanish Civil War, when one of Francisco Franco’s subgenerals in the military rebellion against the elected government, according to the contemporaneous New York Times report, “stated that he was counting on four columns of troops outside Madrid and another column of persons hiding within the city who would join the invaders as soon as they entered the capital.” Since then, the term ‘fifth column’ has been applied to stealth supporters of an enemy who assist by engaging in propaganda and even sabotage to prepare the way for its conquest. It is a fraught term among scholars, not least because the specter of a secretive, infiltrative fifth column has been used in instrumental ways by the powerful—such as in the Red Scare of the Cold War era—to conjure fear and lead citizens and government to close ranks against dissent, with grave costs for civil liberties.

Imperfect though it may be, the concept of a fifth column does seem to be the best one available for capturing what is distinctive in a few key dimensions about this quest to ensure the supremacy of capital. For a movement that knows it can never win majority support is not a classic social movement. Throughout our history America has been changed by social movements, some of them quite radical—the abolition movement,

above all. Our national experience over the past two-and-a-half centuries has demonstrated time and again that the citizenry can learn and grow from social movements, sifting through their claims to adopt and reject as we see fit. Where movement activists win over majorities, they make headway; when they fail to, they in time falter. This cause is different. Pushed by relatively small numbers of radical-right billionaires and millionaires who have become profoundly hostile to America's modern system of government, an apparatus decades in the making, funded by those same billionaires and millionaires, has been working to undermine the normal governance of our democracy. Indeed, one such manifesto calls for a "hostile takeover" of Washington, D.C.

The dream of this movement, its leaders will tell you, is liberty. "I want a society where nobody has power over the other," Buchanan told an interviewer early in the new century. "I don't want to control you and I don't want to be controlled by you." It sounds so reasonable, fair, and appealing. But the story told here shows that the last part of that statement is by far the most telling. This cause defines the 'you' its members do not want to be controlled by as the majority of the American people. And its architects have never recognized economic power as a potential tool of domination: to them, unrestrained capitalism is freedom.

There is a pattern, which we see again and again: while criticizing government action that threatened their own liberty as a property owner, they see nothing untoward in calling on the federal government to use its police powers to help their class stifle debate about its practices. That sleight of hand—denying the legitimacy of government power to act for the common good while using government power to suppress others—appears repeatedly throughout history. The members of the team now applying Buchanan's thought are interested not so much in fighting big government, *per se*, as in elevating that branch of government they can best control in a given situation.

Their yen for repression appears in another way that is revealing: While they wax eloquent on the threat of a strong federal state, do not imagine that they prefer local government to state government as a more authentic expression of the people's will. On the contrary, in the name of property and individual rights, they advocate taking powers away from local authorities, upon whom ordinary people have more influence, and shift them to central state governments. Why? State government is the level that people like them can most easily control.

What we are seeing today is a new iteration of a very old impulse in America: the quest of some of the propertied—always, it bears noting, a particularly ideologically extreme (and some would say greedy) subsection

of the propertied—to restrict the promise of democracy for the many, acting in the knowledge that the majority would choose other policies if it could.

What early free-state American voters liked about tax policy in their self-governing republic was that they, the people, decided by majority rule what they wanted their elected officials to do and how to tax for it. For these citizens, liberty meant having a say in questions of governance, being able to enter the public debate about the best way forward. Tracing such debates from the Colonial Era to the Civil War, it could be concluded that American governments were more democratic, stronger, and more competent where slavery was negligible or nonexistent. They were more aristocratic, weaker, and less competent where slavery dominated, as well as more likely to be captured by the wealthy few, who turned them to their own ends.

Voters in free states wanted active government: they taxed themselves for public schools, roads to travel from place to place, canals to move their goods, and more. In the southern states, the yeomen of the backcountry, where slaves were fewer, often tried to get their governments to take up their concerns but found that planters saw threats to their property in any political action they did not control, even if the yeomen actually were demanding roads, schools, and other mundane services. The irony of all this is vast. The anti-government rhetoric that continues to saturate our political life is rooted in support for slavery rather than liberty. The paralyzing suspicion of government so much on display today came originally not from average people but from elite extremists who saw federal power as a menace to their system of racial slavery.

What exactly did they so fear coming from the American people collectively? They feared, as their successors today do, a government that their band of like-minded property supremacists could not control. It is unlikely that many of their current heirs have read them in the original. Rather, these heirs have learned the ideas from modern-day libertarians who exhumed such analysis to address matters that troubled them, too.

The Road to Serfdom was a clarion call. Hayek argued that “the rise of fascism and Nazism was not a reaction against the socialist trends of the preceding period but a necessary outcome of these tendencies.” In his view, their distinguishing and shared feature was reliance on the central state; their people’s break with individual self-reliance was the germ that caused the disease. Millions who hated Nazism, he wrote, “work at the same time for ideals whose realization would lead straight to the abhorred tyranny.” Here was the rub:

“It is because nearly everybody wants it that we are moving in this direction.”

Everywhere, people were deluding themselves “that socialism and freedom can be combined” when in fact they were dire enemies. The growth of government, he argued, would in time undermine all freedom and usher in totalitarian states.

Like the Austrians Hayek and von Mises, Buchanan in particular wanted to help others see that the market could coordinate millions of individual projects far better than government could. The market was simply the most efficient means of allocating goods and services but also the best social decision-maker, one that might allow escape from the contentious political realm. To look to politics to promote one’s interpretation of fairness, Buchanan came to argue, was to enable an establishment-controlled economy and coerce others.

President Franklin Roosevelt had used the new phrase “economic constitutional order” to explain back to Americans what so many of them had been seeking in their organizing efforts. Pointing to the chaos of the Great Depression as the climax of structural changes that were leading to “economic oligarchy,” he argued that in the age of the large corporation, capitalism had shown that it would demolish itself and society unless constitutional reform precluded such “a state of anarchy” by ensuring economic security. Buchanan, in stark contrast, argued that representative government had shown that it would destroy capitalism by fleecing the propertied class—unless constitutional reform ensured economic liberty, no matter what most voters wanted.

Buchanan set out to prescribe “what economists should do.” They should cease focusing on problems of resource distribution—what the field called “allocation problems”—because the very idea that inequality was a bad thing led to looking for remedies, which in turn led the discipline toward an applied “mathematics of social engineering.” Instead, they should adopt his radical methodological individualism in all that they studied, and assume that individuals always sought personal gain, whether in the economy or in politics. But, he opined, markets were good, whereas politics was bad. In the economy, individuals engaged in voluntary exchange; politics, by contrast, was a “whole system of coercive or potentially coercive relationships,” because it relied on government force. Buchanan insisted that his hyper-individualistic method was ideologically “neutral.”

However, the late-nineteenth-century notion of a pure market was a fiction. That fiction helped emerging corporate elites to shape law and governance to their advantage while devastating the societies over which they held sway by virtue of their wealth and the control over others it could purchase.

Mainstream economists in the past had enlisted the concept of ‘rents’

to describe the additional profits a firm might secure without creating additional value for the economy by productive activity—say, by lobbying to extend the patent on an existing product. Buchanan’s team, though, gave the concept a new and distinctive meaning, one in wide use on the right today. They depicted as “rent-seeking” any collective efforts by citizens or public servants to prompt government action that involved tax revenues. And, in their assumption that individuals always acted to advance their personal economic self-interest rather than collective goals or the common good, Buchanan’s school went further, projecting unseemly motives onto strangers about whom they knew nothing.

Similarly, Virginia school economists deployed the existing term “special interests” to refer primarily to organized citizens seeking government action and occasionally to corporations seeking legislative favor. Their usage of the phrase implied that these people were scheming, trying to extract money from the economic producers through vote gathering and lobbying rather than earning it from personal labor. The scholars were conducting, in effect, thought experiments, or hypothetical scenarios with no true research—no facts—to support them, while the very terms of their analysis denied such motives as compassion, fairness, solidarity, generosity, justice, and sustainability.

It was an old saw on the American right that the people were so dull and inert that any call for government action could come only from self-interested third parties, outside agitators—whether abolitionists, “labor bosses,” Communists, or politicians—seeking to make personal hay.

Privately, Gordon Tullock and Jim Buchanan discussed the social control function of denying a liberal arts education to young people from lower-income families who had not saved to pay for it.

“We may be producing a positively dangerous class situation by educating so many working-class youth who would probably not make it into management but might make trouble, having had their sights raised.”

Modern society, with its widespread affluence, was showing itself “willing to allow for the existence of parasites,” freeloaders who took from it without adding value. “This is essentially what the student class has already become,” Buchanan told the scholars, businessmen, and funders. “If we do not like what we see,” the “simple solution” was clear: “close off the parasitic option.” Before the decade was out, he would be recommending that for nearly all who looked to government for assistance with one thing or another.

What the cause needed, Buchanan told the men he brought together, was to “create, support, and activate an effective counter-intelligentsia” to

begin to transform “the way people think about government.” A kind of bottleneck existed in which liberal intellectuals influenced the media, which in turn influenced the “elected political leaders,” thwarting the men’s shared cause. The center-left all but owned the university, and its “intellectual establishment” effectively indoctrinated political actors in both parties. Because of this, any attempt at fundamental change would be “frustrated and subverted.” It was essential, therefore, to pull together the like-minded and seed a new crop of surrogates who could be “indoctrinated” with intellectually compelling arguments and then “mobilized, organized, and directed” to spread them in a strategic manner. If the job was done right, ultimately, in time, this new “vast network of political power will be the Establishment.”

The original Populists had extolled the ordinary men and women who produced needed goods by the sweat of their brows and reviled as “parasites” the mortgage bankers, furnishing merchants, and robber barons who lived in luxury by exploiting them. The People’s Party called on the federal government to intervene, as the only conceivable counterweight to the vast corporate power altering their society. Because that government was representative of the people (or could be made so, through organizing), they saw it as wholly legitimate to endow Congress with new powers that the people believed it needed to ensure justice in a land changed by concentrated corporate power.

By contrast, the twentieth-century libertarian directed hostility toward college students, public employees, recipients of any kind of government assistance, and liberal intellectuals. His intellectual lineage went back to such bitter establishment opponents of Populism as the social Darwinists Herbert Spencer and William Graham Sumner. The battle between “the oppressed and their oppressors,” as one People’s Party publication had termed it in 1892, was redefined in his milieu: “the working masses who produce” became businessmen, and “the favored parasites who prey and fatten on the toil of others” became those who gained anything from government without paying proportional income taxes. “The mighty struggle” became one to hamstring the people who refused to stop making claims on government.

A Handbook for Assault

In no other area was the process of strategic investment by right-wing funders as prolonged, ambitious, complicated, and successful as the law. The “campaign for the courts sought to mold a new jurisprudence that would radically change the way justice is dispensed in our society. In particular, those waging the campaign sought to make the protection and enhancement of corporate profits and private wealth the cornerstones of our legal system.

The field of “law and economics” was dedicated to shaping the understanding and practice of law in a manner that CEOs and CFOs could—and did—appreciate.

“Corporations had a long-range interest in what went on in universities, and if they didn’t begin tending to it, it was going to jump up and bite them.”

Bringing a corporate-oriented cost-benefit analysis to regulation and legal liberalism more generally, the field sought to do to mid-century legal thought what public choice was doing to social science thought about government: to “undermine the intellectual foundations on which its arguments, and its claim to represent the public interest, were based.” Some work in the 1960s had argued, for example, that insider trading was good for the economy and that hostile takeovers offered an ideal way for investors to control managers.

This too, was playing a long game. They looked to transform the legal profession wholesale rather than retail. Instead of turning out individual mentees, the field planned to alter the way the law was understood and taught by luring existing leaders in the legal academy, from institutions including Harvard and Columbia—eventually more than six-hundred of them—to two-week summer institutes. As the guests went back to their institutions—and the sessions always made sure to take a minimum of two from any given law school so they could back each other and not give in—they would push their skeptical colleagues to be more open to hiring faculty in the field of law and economics, particularly when the new colleagues came at little or no cost because the funds for them were provided by the Olin Foundation or its imitators. Some entire law schools became bastions of this new approach to the law.

The Mont Pelerin Society’s golden anniversary provided an opportunity for Buchanan and his colleague Henry Manne, the newly retired dean of the George Mason School of Law, to define the content of the push to come. Manne had by then more than proved his value to Koch. His summer legal programs had provided intensive training in applying free market economic

analyses to legal decision-making for law professors and for federal judges, luring them with luminaries and luxury accommodations. To name just one index of how successful Manne had been: by 1990, more than two of every five sitting federal judges had participated in this program—a stunning 40 percent of the US federal judiciary had been treated to a Koch-backed curriculum.

“There is an ethical urgency about acting on libertarian values, among them emancipation from taxation. Government in the United States is now taking from persons’ incomes an amount equivalent to the complete enslavement of 42 million persons. Compare that figure, and the concern about it, with the figure of 4 million privately-owned slaves in the United States at the outbreak of the War Between the States!

Why did so few see the outrage of it? The power to tax is the power to destroy. Democratic government is increasing the power of certain persons to destroy other persons. It is time to fight such special privilege, stop slavery, and restore liberty.”

This is the world as Koch understood it, a world in which entrepreneurs were drastically underappreciated and overcontrolled. And it drew a vision of what a society might become if the entrepreneurs were freed from both interference and government-granted favors: a paradise of individual freedom, world peace, and social progress. “Goodness in man can only grow in a climate of liberty” was the message Charles Koch took from his “beloved” teacher: only if one were totally free of coercion and fully self-responsible could one make truly ethical choices. Not surprisingly, Koch credited Harper with the “life-changing” teaching that made the quest for economic liberty the passionate mission of his life.

Koch believed that what the famed economist Joseph Schumpeter called “creative destruction” was so critical to the health of the capitalist system that empathy was an obstacle to acceptance of the world that must be brought into being. “Envision what could be,” Koch urges; act with “urgency” and “discipline” to “drive creative destruction.” Businessman who did not have the savvy to serve the customer “should be a janitor or a worker.” In Koch’s view of the world, that is what a lifelong wage earner was: the less able or the one sentenced to a form of serfdom by his or her own failures.

“Government should not interfere with profit making because greed is a return on investment, the risk you took.”

Koch referred to Friedman and the rest of the post-Hayek Chicago school of economics he led, as well as to Alan Greenspan, as “sellouts to the system.” Why? Because they sought “to make government work more efficiently when the true libertarian should be tearing it out at the root.” They actually tried to help government deliver better results, which could only prolong the disease. Koch believed that only in its “radical, pure form,” without compromise, would the ideas “appeal to the brightest, most enthusiastic, most capable people.” Is it any wonder, then, that his allies would now rather bring down the government than improve it?

The “cadre” was to play the vital role: its full-time devotion to the cause, as a militant minority of foot-soldier ideologues, would assure purity and continuity while building the ranks and expanding the cadre’s influence on others. You cannot understand the influence of the stealth movement that is transforming America today without understanding this critical turning point.

“We came to realize, that, as the Marxian groups had discovered in the past, a cadre with no organization and with no continuous program of ‘internal education’ and reinforcement is bound to defect and melt away in the course of working with far stronger allies.”

Training was crucial so that the cadre’s members could “make strong and fruitful alliances” with partners who might at the time of the alliance be stronger than the cadre without fear of members going over to the temporary ally.

The Republican Party’s officialdom after 2008 could stand as Exhibit A of Koch’s success with this model. The venerable major party’s leaders did not turn the heads of the cadre, despite their apparently greater authority and power; instead, the disciplined cadre turned them. The mission of the cadre was, quite literally, revolutionary, although a cause with so much money would not need violence. The ruling class to be overthrown consisted of the leaders of labor unions, those corporations and business associations that continued to seek special benefits through lobbying, and the intellectuals who supported government action. The task facing the libertarian cadre who would staff the Cato Institute and related efforts would be to drive home to the populace the parasitic nature of all three groups, exposing every practical instance of it to help larger numbers see the evil of statist corruption—and what must be done to vanquish it.

James Buchanan published an article called “The Samaritan’s Dilemma,” a piece that has been used by the right ever since to show, in effect, that the

ethics of Jesus as reported in the Gospel of Luke produced perverse results in the modern world. Buchanan summarized this piece of what he termed “prescriptive diagnosis” thus:

“We may simply be too compassionate for our own well-being or for that of an orderly and productive free society.”

He then applied a game-theory thought experiment—never, of course, empirical research, which he spurned—to make the argument. His “hypothesis” was:

“Modern man has become incapable of making the choices that are required to prevent his exploitation by predators of his own species, whether the predation be conscious or unconscious.”

Predators of his own species? It was a perverse appropriation of the parable of the Good Samaritan, in which a kind resident of Samaria comes to the aid of a Jewish traveler who has been stripped, robbed, beaten, and left to die—a victim of predators, in other words—in the story Jesus used to show his followers that one should love his neighbor as himself, even when the suffering neighbor was a member of a despised out-group, as Jews were to Samaritans.

But in the view of the libertarian economist, Jesus was mistaken. Conscripting the Good Samaritan story, Buchanan made his case that modern man had “gone soft,” he lacked the “strategic courage” needed to restore the market to its proper ordering. By this logic, what seemed to be the ethical thing to do—help someone in need—was not, after all, the correct thing to do, because the assistance would encourage the recipient to “exploit” the giver rather than to solve his own problems. Buchanan used as an analogy the spanking of children by parents: it might hurt, but it taught “the fear of punishment that will inhibit future misbehavior.” Similarly, “the potential parasite” needed curbing to prevent efforts to “deliberately exploit” society’s “producers.”

More than any other piece, this article captured the stark morality of libertarianism, offering, as it were, the cause’s prescription for how America’s third century could reverse the “soft” errors of its second. The trick, though, was to figure out how to bind the foolish Samaritan, qua government, from giving out perverse incentives—how to shackle the Samaritan, so to speak. As Buchanan noted in conclusion, “welfare reform” was “only one of many applications, and by no means the most important.”

“I figured that if you could gradually build up to socialism, you could probably undo it, dismantling the state step by step,” he later told an

interviewer. You could hack away at government, that is, “by privatizing one function after the other, selling each move as justified for its own sake rather than waiting until the majority of the population is convinced of the case for a libertarian utopia.” “Selling” was perhaps the key word. Why wait for popular opinion to catch up when you could portray as “reform” what was really slow-motion demolition through privatization?

Facing the reality that he and his assembled allies were destined to remain “a permanent minority” whose ideas were “widely rejected,” Stigler pushed on to an “uncomfortable” question:

“If in fact we seek what many do not wish, will we not be more successful if we take this into account and seek political institutions and policies that allow us to pursue our goals?”

He did not equivocate, adding that this might mean “non-democratic” institutions and policies. One “possible route” Stigler suggested for achieving the desired future was “the restriction of the franchise to property owners, educated classes, employed persons, or some such group.”

Faced with the inescapable reality that they could not win by persuasion, these globetrotting scholars were sounding more and more like the southern oligarchy that had authorized Buchanan’s first program. There is a photograph of Jim Buchanan from the late 1970s that he was said to like. It shows him at his mountain farm, Dry Run, in a fenced ring alongside two animals in a peculiar pose: a dog is riding a donkey, looking scared. The founder of the Virginia school of political economy walks alongside them, riding crop in hand, training the animals to perform this utterly unnatural act. Sometimes, as the old saying goes, a picture is worth a thousand words. Where persuasion failed, the lash might work.

On September 11, 1973, General Augusto Pinochet led a successful coup that overthrew the elected socialist government of President Salvador Allende in Chile. Ruling in the name of economic liberty, the Pinochet junta became one of the most notorious authoritarian regimes in recent history. With mass killings, widespread torture, and systematic intimidation, Pinochet’s forces crushed the trade union movement, vanquished the rural farmers seeking land reform, stifled student activism, and imposed radical and unpopular changes in schooling, health care, social security, and more. As Orlando Letelier, the soon-to-be-assassinated Chilean ambassador to the United States, explained in *The Nation*, the economic program and the repression were inseparable: social and political “regression for the majorities and ‘economic freedom’ for small privileged groups” went together. The military coup obliterated the citizen-led organizing that had made Chile a beacon

to the rest of Latin America; of what might be achieved by democratic, electoral means.

To grasp the significance of the Chilean story for our own world today, it is important to remember that the reforms did not begin with Allende. His predecessor, the anti-Communist Christian Democrat Eduardo Frei (whose government lasted from 1964 to 1970), proudly oversaw what he called a “Revolution in Liberty,” a kind of Chilean New Deal, supported by the US presidents Kennedy and Johnson, that included support for labor rights, expansion of voting rights, and land redistribution in rural communities. Frei’s opening up of Chilean democracy helped encourage the popular mobilization that led to the election of Allende. The military officers who led the coup concluded that, once in power, not only did they have to reverse the gains that had been made under elected governments, but they also wanted to find a way to ensure that Chileans never again embraced socialism, no matter how strong the popular cries for reform. The solution they came up with was to rewrite the nation’s constitution to forever insulate the interests of the propertied class they represented from the reach of a classic democratic majority.

As the Pinochet regime became a fulcrum of human rights activism in the 1970s and a cautionary tale thereafter, many critics indicted leading thinkers of the Mont Pelerin Society for abetting the despot. Milton Friedman was widely condemned for advice he provided on a visit to Santiago in 1975 about how to bring down the country’s soaring inflation. That advice resulted in draconian policies that inflicted mass hardship, to be sure. But Friedman was a monetarist. Whether or not one approved of the painful “shock treatment” he proposed, what Friedman recommended was ultimately reversible policy. The society’s aging founder, F. A. Hayek, also visited Pinochet and shared with the dictator his own distaste for “unlimited democracy.” Such moral support from scholars helped the junta weather the international storm of condemnation. But while Hayek became an apologist for the regime, there is no evidence that he left a lasting mark on Chile, either.

The same cannot be said of James Buchanan. His impact is still being felt today. For it was Buchanan who guided Pinochet’s team in how to arrange things so that even when the country finally returned to representative institutions, its capitalist class would be all but permanently entrenched in power. The first stage was the imposition of radical structural transformation influenced by Buchanan’s ideas; the second stage, to lock the transformation in place, was the kind of constitutional revolution Buchanan had come to advocate. Whereas the US Constitution famously enshrined “checks and balances” to prevent majorities from abusing their power over minorities, this one, a Chilean critic later complained, bound democracy with “locks

and bolts.”

The first phase was a series of structural “reforms” devised by a young devotee of the Virginia school, Minister of Labor José Piñera. Piñera had been working toward his doctorate at Harvard University when the coup occurred; elated, he came home “to help found a new country, dedicated to liberty.” His contribution was a series of deep alterations in governance, collectively dubbed “the seven modernizations.” Their common threads were privatization, deregulation, and the state-induced fragmentation of group power.

Under the new labor code Piñera promulgated in 1979, for example, industry-wide labor unions were banned. Instead, plant-level unions could compete, making one another weaker while their attention was thus diverted from the federal government (“depoliticizing” economic matters, in Buchanan terms). Individual wage earners were granted “freedom of choice” to make their own deals with employers. It would be more accurate to say that they were forced to act solely as individuals. “One simply cannot finish the job,” Piñera later explained to would-be emulators, if workers maintain the capacity to exercise real collective power.

Piñera designed another core prop of the new order: privatization of the social security system. This freed companies of the obligation to make any contributions to their employees’ retirement and also greatly limited the government’s role in safeguarding citizens’ well-being. Ending the principle of social insurance, much as Barry Goldwater had advocated in 1964, the market-based system instead steered workers toward individual accounts with private investment firms. It was essentially self-insurance. Fortunately for the plan, the regime had full control of television. At a time when three of every four households had televisions, Piñera made weekly appearances over six months to sell the new system, playing to fear of old-age insecurity owing to “this sinkhole of a bureaucracy,” the nation’s social security system. “Wouldn’t you rather,” he queried viewers, holding up “a handsome, simulated leather passbook,” see your individual savings recorded every month in such a book “that you can open at night and say, ‘As of today I have invested \$50,000 toward my golden years?’” The junta overruled the suggestion that Chileans might decide which system they wanted in a referendum—after all, “who could say where such a precedent might lead?”—and imposed Piñera’s plan by military decree. In short order, two private corporations—BHC Group and Cruzat-Larrain, both with strong ties to the regime—acquired two-thirds of the invested retirement funds, the equivalent, within ten years, of one-fifth of the nation’s GDP. José Piñera, for his part, went on to work for Cruzat and then promoted US Social Security privatization for Charles Koch’s Cato Institute.

Other “modernizations” included the privatization of health care, the opening of agriculture to world market forces, the transformation of the judiciary, new limits on the regulatory ability of the central government, and the signature of both the Chicago and Virginia schools of thought: K–12 school vouchers. In higher education, the regime applied the counsel of Buchanan’s book on how to combat campus protest. As the nation’s premier public universities were forced to become “self-financing,” and for-profit corporations were freed to launch competitors with little government supervision, the humanities and liberal arts were edged out in favor of utilitarian fields that produced less questioning. Universities with politically troublesome students stood to lose their remaining funding. Through these combined measures, education, health care, and social insurance, once provided by the state, ceased to be entitlements of citizens. With the seven modernizations in place, Pinochet’s appointees could now focus fully on drafting a constitution to entrench this new order behind what they hoped would be impassable moats.

Buchanan provided detailed advice on how to bind democracy, delivered over the course of five formal lectures to top representatives of a governing elite that melded the military and the corporate world, to say nothing of counsel he conveyed in private, unrecorded conversations. He spoke plainly and in the imperative mode, suggesting the government “must” and “should” do this or that. He defined public choice as a “science”—even though he, of all people, knew that there was no empirical research to back its claims—that “should be adopted” for matters ranging from “the power of a constitution over fiscal policy” to “what the optimum number of lawmakers in a legislative body should be.” He said of members of his school of thought:

“We are formulating constitutional ways in which we can limit government intervention in the economy and make sure it keeps its hand out of the pockets of productive contributors.”

Buchanan understood what his hosts were asking for: a road map. He thus explained that the constitution needed “severe restrictions on the power of government.” He instructed that “the first” such restriction “is that the government must not be free to spend without also, at the same time, collecting the necessary taxes to offset expenses”—Harry Byrd’s sacred pay-as-you-go principle. “It must have a constitution that requires a balanced budget”—no more Keynesian deficits under any circumstances. Also, “the independence of the Central Bank should be enshrined in the constitution”; the government should be denied the authority to make “monetary policy because doing so would surely lead to inflation.” A last restriction he urged

was to require supermajorities for any change of substance. “It must be ensured that a system exists in which only a large majority,” he said, “ $2/3$ or $5/6$ of the legislative body, can approve each new expense.” With this formula the scholar overshot the mark even with the junta’s members, just as he had in his proposal for a fire sale of public schools to Virginia’s legislature in 1959: none had the nerve to float a five-sixths requirement.

“It promised a democracy protected from too much democracy.”

The new constitution guaranteed the power of the armed forces over government in the near term, and over the long-term curtailed the group influence of non-elite citizens. The document guaranteed the rule of General Pinochet and his aides until a 1988 plebiscite that might extend his term to 1997, when a new generation would have learned the role of the citizen in a restrictive democracy.

The devil is in the details, goes the old adage, and it is true: the wicked genius of Buchanan’s approach to binding popular self-government was that he did it with detailed rules that made most people’s eyes glaze over. In the boring fine print, he understood, transformations can be achieved by increments that few will notice, because most people have no patience for minutiae. But the kind of people he was advising can hire others to make sure that the fine print gets them what they want. The net impact of the new constitution’s intricate rules changes was to give the president unprecedented powers, hobble the congress, and enable unelected military officials to serve as a power brake on the elected members of the congress. A cunning new electoral system, not in use anywhere else in the world and clearly the fruit of Buchanan’s counsel, would permanently overrepresent the right-wing minority party to ensure “a system frozen by elite interests.” To seal the elite control, the constitution forbade union leaders from belonging to political parties and from “intervening in activities alien to their specific goals”—defined solely as negotiating wages and hours in their particular workplaces. It also barred advocating “class conflict” or “attack[ing] the family.” Anyone deemed “antifamily” or “Marxist” could be sent into exile, without access to an appeal process.

Buchanan never publicly criticized the final constitution as promulgated by the junta. On the contrary, he continued to promote constitutional revolution, thereafter more single-mindedly, and to seek out support from wealthy funders who might help effect it. From this we can only conclude that he was well aware of the Pandora’s box he had helped open in Chile for the genuine, not merely metaphorical, corruption of politics, but he valued

economic liberty so much more than political freedom that he simply did not care about the invitation to abuse inherent in giving nearly unchecked power to an alliance of capital and the armed forces. His silence, it must be said, safeguarded his reputation. Buchanan had surely noticed that Milton Friedman never lived down having advised the junta on how to combat inflation: protesters disrupted the 1976 award ceremony in Stockholm at which he received the Not-a-Nobel Prize and hounded his speaking engagements thereafter. Whereas Friedman's name became permanently and embarrassingly paired with Pinochet's, Buchanan, the stealth visitor, largely escaped notice for the guidance he provided. But, then, unlike Friedman, Buchanan never craved the spotlight. He was content to work in the shadows.

“There is no widespread support for basic structural reform, among any membership group in the American polity, among the old or the young, the black, the brown, or the white, the female or the male, the rich or the poor, the Frost Belt or the Sunbelt.”

The near-universal popularity of Social Security meant that any attempt to fight it on philosophical grounds was doomed. Buchanan therefore devised and taught a more circuitous and sequential—indeed, devious and deceptive—approach, but one that served the new crab-walking cause well. “Those who seek to undermine the existing structure,” he advised, must do two things. First, they must alter beneficiaries' view of Social Security's viability, because that would “make abandonment of the system look more attractive.”

If you have ever seen a television ad showing older people with worried faces wondering if Social Security will be around when they need it, or heard a politician you think is opposed to the retirement program suddenly fretting about whether it will be there for you and others, listen more carefully the next time for a possible subliminal message. Is the speaker really in favor of preserving the system as we know it? Or is he or she trying to diminish the reputation of the system with the public, so that when the right time comes to make changes to it, even small ones that in fact reduce benefits or change the rules for beneficiaries, those affected will be less likely to feel that something good is being taken away from them?

While step one would soften public support for the system by making it seem unreliable, step two would apply a classic strategy of divide and conquer. Recipients could be split apart in this way. The first group he defined as those already receiving Social Security benefits and (although Buchanan did not include them, his ideological heirs would) those nearing

the age when they could begin to collect. These current recipients and those close to retirement (some said within ten years; more recently politicians on the right have suggested five years) should be reassured that their benefits would not be cut. This tactic Buchanan referred to as “paying off” existing claims. The reasoning behind it is vintage public choice analysis: as the citizens most attentive to any change in the system, they were the ones who would fight the hardest to preserve it. Getting them out of the struggle to preserve the system would greatly enfeeble the remaining coalition (to say nothing of the resentment their departure would cause among those who found they were being denied something others had secured for themselves).

The second group, Buchanan coached, consisted of high earners. The plan here would be to suggest that they be taxed at higher rates than others to get their benefits, thus sully the image of Social Security as an insurance program in the minds of the wealthy by making it look more like now-unpopular means-tested income transfer programs popularly understood as “welfare.” Progressives would likely fall for a proposal to make the wealthiest pay more, not realizing the damage that could do to Social Security’s support among group two. And if the message was repeated enough, such that the wealthy began to believe that others are not paying their fair share, they in turn would also become less opposed to altering the program.

The third group would consist of younger workers. They needed to be constantly reminded that their payroll deductions were providing “a tremendous welfare subsidy” to the aged. Finally, those who would just miss the cutoff for the old system should be targeted for short-term changes. As Buchanan put it, “those who seek to undermine the support of the system (over the longer term) would do well to propose increases in the retirement age and increases in payroll taxes,” so as to irritate recipients at all income levels, but particularly those who are just on the wrong side of the cutoff and now would have to pay more and work longer.

This “patchwork pattern of ‘reforms,’” (the quotation marks around ‘reforms’ were added by Buchanan, to make sure the message was clear that reform was not really the endgame) could tear asunder groups that hitherto had been united in their support of Social Security. Better still, Buchanan noted, the member groups of the once unified coalition that protected it might be induced by such changes to fight one another.

The overall message shared among insiders was always this:

“If the political dynamics are not altered, no radical reform of Social Security is possible.”

For the libertarian right, Social Security privatization meant a savvy triple win, in which ideological triumph over the most successful and popular federal program was the least of the gains. First, it would break down citizens' lived connection to government, their habit of believing it offered them something of value in navigating their lives. Second, it would weaken the appeal of collective organization by inducing fracture among groups that had looked to government for solutions to their common problems.

But third and just as important, by putting a vast pool of money into the hands of capitalists, enriching them, it would both make them eager to lobby for further change and willing to shell out dollars to the advocacy groups leading the charge for change. The stronger these already well-heeled right-wing advocacy groups became, the more powerful partners shared their interests, the quicker they would be able to alter power relations in America in a manner that advanced the libertarian revolution. Charles Koch later used an apt metaphor that captures this process, too:

“I often think of what we do as stonemasonry. Once a stone has been carefully selected and set, it shapes a new space in which the mason can set yet another well-chosen stone. Each stone is different, but they all fit together to create a framework that is mutually reinforcing.”

While others focused on advancing the new stealth strategy, Buchanan never lost sight of the fact that such rearguard assaults on the welfare state would take the movement only so far. What was needed was a way to amend the Constitution so that public officials would be legally constrained from offering new social programs to the public or engaging in regulation on their behalf even when vast constituencies were demanding them. Again and again, at every opportunity he had, he told his allies that no “mere changing of the political guard will suffice,” that “the problems of our times require attention to the rules rather than the rulers.” And that meant that real change would come “only by Constitutional law.” The project must aim toward the practical “removal of the sacrosanct status assigned to majority rule.”

Some had long urged seeing political actors as self-aggrandizing individuals rather than the civic-minded altruists they portrayed themselves as:

“What we did was take the bar-room approach to politics, and bring it out in the open—by presuming that politicians were crooks, voters were selfish, and bureaucrats were incompetent.”

With these portrayals, the libertarian mavericks had aimed to show that government action would cause worse trouble than the problems it was called on to cure.

In the end, as their representatives in Washington should have known all along, even those voters who revered Ronald Reagan, and cheered on the contract-signing candidates in principle, were not ready when they learned that freed markets would leave them with sole responsibility for their own fates, to give up their Social Security and Medicare, their public schools, and their government-backed air, water, and earth protections.

Only James Buchanan had also developed an operational strategy for how to get to that radically new society, one that took as axiomatic what both Buchanan and Koch understood viscerally: that the enduring impediment to the enactment of their political vision was the ability of the American people, through the power of their numbers, to reject the program. What was holding the movement back now became clear: the lack of a strategy to break that power, or at least to debilitate it, the very approach Buchanan had spent a lifetime thinking about and designing. Operationally, as Buchanan had repeatedly explained, such a program must ultimately change the rules, not simply who rules.

In the near term, it had to have two components. First, it had to create a pathway from here to there that could be executed in small, piecemeal steps that on their own polled well enough with the American people that they could win passage without raising the public's ire. But each step had to connect back to the previous step and forward to the next one so that when the entire path was laid, all the pieces would reinforce the route to the ultimate destination. By then it would be too late for the American public to cry foul.

Second, and as important, because some of those piecemeal steps, no matter how prettified, could not be fully disguised, where necessary they had to be presented to the American public as the opposite of what they really were—as attempts to shore up rather than ultimately destroy—what the majority of Americans wanted, such as sound Medicare and Social Security programs. For such programs, the framing should be one of the right's concern to “reform” the programs, to protect them, because without such change they would go bankrupt—even though the real goal was to destroy them.

“What happens if individuals do not value liberty sufficiently highly?” James Buchanan's colleague and friend Charles K. Rowley asked after the failure of the Reagan revolution. “Should they be forced to be free?”

“If you tell a great lie and repeat it often enough, the people will eventually come to believe it,” Joseph Goebbels, a particularly ruthless, yet

shrewd, propagandist, is said to have remarked. Today the big lie of the Koch-sponsored radical right is that society can be split between makers and takers, justifying on the part of the makers a Manichaeian struggle to disarm and defeat those who would take from them. Attend a Tea Party gathering and you will hear endless cries about the “moocher class.” People who failed to foresee and save money for their future needs, Buchanan wrote in 2005, “are to be treated as subordinate members of the species, akin to animals who are dependent.”

Tyler Cowen, the man who succeeded Buchanan and now directs the cause’s base camp at George Mason—the Mercatus Center—has explained that with the “rewriting of the social contract” under way, people will be “expected to fend for themselves much more than they do now.” While some will flourish, he says, “others will fall by the wayside.” And because “worthy individuals” will manage to climb their way out of poverty, “that will make it easier to ignore those who are left behind.” Cowen foresees that “we will cut Medicaid for the poor.” Also, “the fiscal shortfall will come out of real wages as various cost burdens are shifted to workers” from employers and a government that does less. To “compensate,” the chaired professor in the nation’s second-wealthiest county recommends, “people who have had their government benefits cut or pared back” should pack up and move to lower-cost states like Texas. Granted, he says, “Texas is skimpy on welfare benefits and Medicaid coverage,” and nearly three in ten of its residents have no health insurance, but the state does have jobs and “very cheap housing” to offset its “subpar public services.” Indeed, Cowen forecasts, “the United States as a whole will end up looking more like Texas.”

His tone is matter-of-fact, as though he is simply reporting the inevitable. And he enjoys great authority, as his blog, *The Marginal Revolution*, is the most visited intellectual blog in professional economics, known for criticizing Republicans as well as Democrats, and also respected for Cowen’s signature incorporation of economic concepts to analyze cultural phenomena from food to travel. He presents himself as a pragmatic libertarian (indeed, the blog’s motto is “small steps toward a much better world”). Yet when one reads his flip remarks on the fate now facing his fellow citizens with the knowledge that he has been the leader of a team working in earnest with Charles Koch for two decades to bring about the society he is describing, the words assume a different weight. They sound like premeditation. For example, the economist prophesies lower-income parts of America “recreating a Mexico-like or Brazil-like environment” complete with favelas like those in Rio de Janeiro. The “quality of water” might not be what US citizens are used to, but “partial shantytowns” would satisfy the need for cheaper housing as “wage polarization” grows and government shrinks. “Some version of

Texas—and then some—is the future for a lot of us,” the economist advises. “Get ready.”

Thom Tillis, a North Carolina state senator elevated to the US Senate in 2014 with backing from the Koch apparatus, has said that restaurants should be able “to opt out of” laws requiring employees to wash their hands after using the toilet, “as long as they post a sign that says, ‘We don’t require our employees to wash their hands after leaving the restroom.’ The market will take care of that.” Somehow requiring a sign is not an infringement of rights, but requiring handwashing—the far saner thing given that we now know germs exist—is an unjust infringement upon one’s liberty.

Paul Ryan once explained that public provision for popular needs not only violates the liberty of the taxpayers whose earnings are transferred to others, but also violates the recipients’ spiritual need to earn their own sustenance. He told one audience that the nation’s school lunch program left poor children with “a full stomach—and an empty soul.”

The nation’s public school system has been a target of the Mont Pelerin Society cause since the 1950s—well before the rise of “powerful” teachers’ unions, it bears noting. Rather than admit their ideological commitment to ending public education, they have convinced a sizable segment of the American population that the problems in schools today are the result of those teachers’ unions having too much power. In the states where they have won control, like North Carolina, the cadre’s allied elected officials, pushed by affiliates of the State Policy Network, have rushed to pass laws to debilitate teachers’ unions, one bill being hurried through passage after midnight. The Republican-dominated North Carolina General Assembly then also cut seven-thousand teacher assistants, allotted \$100 million less than the state budget office said was needed merely to maintain the schools, and budgeted \$500 million less to public schools than it had in 2008. Even the school supplies budget was cut by more than half; students can no longer take home textbooks in some poor communities, for fear they may be lost.

Where is this money going? Into corporate America, to a new “education industry” of private schools, many of which are held to no standards or even disclosure requirements. One shocked superior court judge found that the North Carolina General Assembly had violated the state constitution in sending children with tax subsidies to “private schools that have no legal obligation to teach them anything.” His verdict was overruled by the state supreme court, which the Koch cadre had spent handsomely to control for just such eventualities. The new for-profit virtual charter schools, whose CEO personally earned \$4 million in 2014, were found, by one Stanford University research study, to have left their enrolled students falling far behind their public school counterparts, equivalent to missing “72 days of

learning in reading and 180 days of learning in math” in a 180-day school year. In other words, the online schools in this study taught nothing in math, and little in reading. As a result of all this, North Carolina, which during the twentieth century, through wise investments in public education, had climbed from the poorest of southern states to one of the best-off, now ranks beneath Mississippi in per-pupil spending.

Turning public functions over to corporations was a “potent strategy” to “create new pro-privatization coalitions,” because the corporations that profit from the spun-off government functions would push for further change.

In one emblem of the perverse incentives for-profit prisons have created, a Pennsylvania judge was convicted in a “cash for kids” scheme in which private detention centers paid judges \$2.8 million in kickbacks for sentencing thousands of children to their facilities. With no rights or collective voice and few allies, detained immigrants have proven to be even more ideal commodities for a reliable cash stream to such corporations, so lucrative that one recent report on the facilities that house them bore the title “Banking on Detention.”

A large body of research by economists and political scientists over the past two decades has demonstrated that the surging inequality on display in America today is not an inevitable result of impersonal developments such as globalization and new technology, even as these have contributed. Rather, the extremity of our current situation is in good part due to the outsized power of corporations and wealthy donors over our politics and public policy. A case in point: According to the International Monetary Fund—an organization known for decades of draconian fiscal prescriptions, crippling developing nations with debt—“the decline in unionization is strongly associated with the rise of income shares at the top.” The IMF concluded that the rights of workers to bargain collectively must be restored to slow the growth of inequality and enable economic growth.

The new anti-union rules unfurled first by Governor Scott Walker in Wisconsin in 2011 are more devilishly lethal in their cumulative impact than anything the cause had theretofore produced. Their elaborate precision evoked the analogous changes in Chilean labor law instituted in the Pinochet era with Buchanan’s input. In the new Wisconsin, public employees would no longer be allowed to negotiate working conditions and benefits, only wages (with those held to the rate of inflation). Each contract would be only a year in duration, thus draining staff time and energy away from addressing the concerns of existing members and from organizing new members in order to prepare for now back-to-back annual negotiations. Unions would lose the right to have dues deducted from members’ paychecks and instead have to chase down individuals who did not pay. And, in a final slap, with the

unions no longer able to do anything of substance for their members, they would face recertification elections each year. No wonder Walker boasted that “we dropped the bomb.” His approach cut in half, over just five years, the share of public employees who belong to unions.

Who will care for America’s children and the elderly now that two-thirds of mothers with children under six are in the workforce, yet market fundamentalism—the irrational belief that markets solve all problems—has succeeded in dismantling so many federal regulations, services, and protections? But the cause would argue that it has answered that question over and over again: You will. And if you can’t, you should have thought of that before you had kids or before you grew old without adequate savings. The solution to every problem—from young people loaded down with student loan debt to the care of infants and toddlers and the sick and the elderly—is for each individual to think, from the time they are sentient, about their possible future needs and prepare for them with their own earnings, or pay the consequences. Indeed, Tyler Cowen told young Americans a few years ago that they “should not be occupying Wall Street, they should be occupying AARP” (to keep retirees from taking from them).

One key finding of a Cowen study was that by the 1920s, in both Europe and the United States, “the expansion of the voter franchise” beyond “wealthy male landowners” had produced the unfortunate result of enlarged public sectors. Alas, “the elimination of poll taxes and literacy tests leads to higher turnout and higher welfare spending.” “The freest countries have not generally been democratic,” Cowen noted, with Chile being “the most successful” in securing freedom, defined not as most of us would, as personal freedom, but as supplying the greatest economic liberty.

The professor identified another commonality in the success stories:

“In no case were reforms brought on by popular demand for market-oriented ideas.”

The pro-liberty cause faced the same problem it always had: it wanted a radical transformation that “finds little or no support” among the people. Cowen delivered the action implication of its minority following without mincing words:

“If American political institutions render market-oriented reforms too difficult to achieve, then perhaps those institutions should be changed.”

The economist was creating, it seems fair to say, a handbook for how to conduct a fifth-column assault on democracy. “The weakening of the

checks and balances” in the American system, Cowen suggested, “would increase the chance of a very good outcome.” Alas, given the pervasive reverence for the US Constitution, a direct bid to manipulate the system could prove “disastrous.” Cowen’s best advice, informed by the Chilean experience, was sudden percussive policy bombing, akin in nature, one could say, to the military doctrine of shock and awe, which uses colossal displays of force and calculated interlinked maneuvers to shock the enemy into submission. When the right opportunity arose, the economist advised, “big-bang style clustered bursts” could dispense with multiple democratic constraints on economic liberty in the same surge. Rather like, one could infer, the radical policy changes imposed on multiple fronts in the same sessions in newly Republican-dominated states after 2011, among them education, employment, environment, taxation, and voting rights.

Research being done at George Mason also suggested a good deal of irrationality in the electorate, which could be turned to advantage. “It might be possible for ‘irrationally held’ views to in fact support good policies,” particularly if the cause were to enlist insights from “cognitive science and perhaps evolutionary biology.” Knowledge of just how vulnerable humans are to hardwired drives that resist reasoned evidence, it seemed, might prove helpful in getting voters to unwittingly enable an “unpopular” agenda.

Most do not realize the US Constitution already restrains what we the people can do to a degree not seen in any other democratic nation.

Let me explain. Americans are taught from an early age to revere the checks and balances built into our political system by that document, features designed to act as imposing speed bumps, if not complete roadblocks, to radical change from hotheaded majorities, particularly those who may encroach upon the property rights of the minority. The most obvious among these binding features is our grossly malapportioned Senate, designed to put brakes on the House of Representatives, which was to represent the people directly. A state with comparatively few residents, such as Wyoming, has the same Senate representation as the most populous state, California. That means the vote of a Wyoming resident carries nearly seventy times more weight than the vote of a Californian in Senate elections and deliberations. How fair is that? It’s not. It is precisely the kind of malapportionment that the Supreme Court, in the early 1960s, ruled unconstitutional in internal affairs of the states, whose officials were purposely over-representing rural residents over urban and suburban residents—indeed, a much more egregious departure from the “one person, one vote” standard. But because the apportionment of Senate seats is written into the Constitution, in the one section that cannot be amended, the remedy cannot be applied nationally.

On the one hand, this constitutional system has helped make the United

States the most stable republic in the modern world. On the other hand, it has also made ours by far the least responsive of all the leading democracies to what the people want and need. It takes upheaval of truly historic proportions to achieve significant change in America, even when it is supported by the vast majority—as evidenced by the civil war required to end slavery, the tens of thousands of strikes and other struggles needed to achieve reform during the Great Depression, and the mass disruption and political crisis that civil rights activists had to bring about in order to win for African Americans the same constitutional rights enjoyed by other citizens. The existing checks and balances, in short, create an all but insurmountable barrier to those seeking to right even gross social injustice. The problem is systemic. Built into our Constitution, the change-blocking mechanisms prevent us as a polity from addressing our most profound challenges until there is supermajority support for doing so. We can see the toll of these constraints by looking at the problem of economic inequality.

Researchers recently compared the number of stumbling blocks that advanced industrial democracies put in the way of their citizens' ability to achieve their collective will through the legislative process. Calling these inbuilt "majority constraining" obstacles "veto players," they found a striking correlation: the nations with the fewest veto players have the least inequality, and those with the most veto players have the greatest inequality. Only the United States has four such veto players. All four were specified in the slavery-defending founders' Constitution: absolute veto power for the Senate, for the House, and for the president (if not outvoted by a two-thirds majority), and a Constitution that cannot be altered without the agreement of two-thirds of the states after Congress. Other features of the US system further obstruct majority rule, including a winner-take-all Electoral College that encourages a two-party system; the Tenth Amendment, which steers power toward the states; and a system of representation in the unusually potent Senate that violates the principle of "one person, one vote" to a degree not seen anywhere else.

Owing to such mechanisms, even in the late 1960s, the heyday of income equality in the United States, no other country in the set of long-standing democracies was as unequal as America, and most were substantially more equal. As arresting, even the most equal US state is less equal than any comparable country. What makes the US system "exceptional," sadly, is the number of built-in vetoes to constrain the majority.

While media attention has focused on the impact of Citizens United on the presidential and congressional races, the opening of the spigots in state judicial races may prove more consequential over the decades ahead as corporate donors invest in those they believe will interpret the Constitution

and the laws in their favor. The Republican majorities that are rushing through “radical reform” know that citizens of their states are likely to turn to the only branch of government left that might blunt the blows. That is why the large donors have invested so heavily in judicial races: to elect judges who will allow the revolution to go forward.

A flagship success of the constitutional wing of the cause was Chief Justice John Roberts’s decision in the Affordable Care Act case, *National Federation of Independent Business v. Sebelius*. While some on the right excoriated Roberts for having upheld the ACA, smart court watchers noted not the verdict but what Roberts said about the Commerce Clause. Some context: In 1937, when the Supreme Court upheld a minimum wage law for the first time and then the Wagner Act, too, signaling its acceptance of the New Deal, it did so by agreeing with government attorneys that the Commerce Clause of Article I of the Constitution gives Congress the ability to regulate interstate trade. Under the rubric of regulating interstate trade, the federal government then dramatically increased its oversight of what used to be considered strictly private or state matters.

But in the Affordable Care Act case, Roberts, who in his first year on the bench did more to limit the reach of *Brown v. Board of Education* than any previous justice, commented that “the Commerce Clause is not a general license to regulate an individual from cradle to grave” (a proposition no one has suggested). Justice Ruth Bader Ginsburg, in her opinion, rightly picked up on that surprising assertion, calling the chief justice’s claim “stunningly retrogressive.” But Roberts’ narrow conception of the Commerce Clause is now the law of the land—and an invitation to legal challenges to other federal legislation and programs. Faculty at the George Mason School of Law, now aptly named after Antonin Scalia, are urging the court to go back to its pre-1937 jurisprudence, when the justices routinely struck down government action to advance popular economic security or social justice goals.

Democracy is essentially an act of faith. When that faith is willfully exterminated, we should not be surprised that we reap the whirlwind. The public choice way of thinking, one sage critic warned at the time James Buchanan was awarded the Not-a-Nobel Prize in Economic Sciences, is not simply “descriptively inaccurate”—indeed, “a terrible caricature” of how the political process works. It also constitutes an insidious attack on the very “norm of public spiritedness” so crucial to shaping good government policy and ethical conduct in civic life. That is to say, public choice theory was wrong in its explanations, and would be toxic if believed by the public or its representatives. We have seen the truth of that prediction.

The libertarian cause, from the time it first attracted wider support

during the southern schools crisis, was never really about freedom as most people would define it. It was about the promotion of crippling division among the people so as to end any interference with what those who held vast power over others believed should be their prerogatives. Its leaders had no scruples about enlisting white supremacy to achieve capital supremacy. And today, knowing that the majority does not share their goals and would stop them if they understood the endgame, the team of paid operatives seeks to win by stealth. Now, as then, the leaders seek liberty for the few—the liberty to concentrate vast wealth, so as to deny elementary fairness and freedom to the many. Is this the country we want to live in and bequeath to our children and future generations? That is the real public choice. If we delay much longer, those who are imposing their stark utopia will choose for us. One of them has announced flatly:

“America will soon make a decision about its future. It will be a permanent decision. There will be no going back.”

As we consider the future of our democracy in light of all that has happened already, we may take heed of a Koch maxim:

“Playing it safe is slow suicide.”

Public Policy Privatized

Although it is called a “charitable deduction,” very little of this public subsidy ends up with the poor. A 2005 analysis by Indiana University’s Center on Philanthropy showed that even under the most generous assumptions only about a third of “charitable” giving is targeted to helping poor people. A large portion is allocated to operas, art museums, symphonies, and theaters—all worthy enterprises, to be sure, but not ‘charities’ as we normally use the term. A while ago, New York’s Lincoln Center held a fundraising gala supported by the charitable contributions of hedge-fund industry leaders, several of whom take home \$1 billion a year. Poor New Yorkers rarely attend concerts at Lincoln Center.

Even when the desire to help is genuine, these are the dreams of empire builders. Take Bill Gates, first he created the world’s largest software company, then he created the world’s largest private foundation. Whatever the benefits his philanthropy has brought—and there are many—the fact is that he hopped from one world-size conquest to another. Billionaires never put their giving in these terms. Gates says he wants to “give back.” He implies he owes something to society, and maybe he does. His money comes from Microsoft, and like other tech companies, Microsoft keeps billions of dollars offshore to avoid paying taxes at home. For years, to maintain its dominance of the market, he also engaged in anticompetitive practices that brought government lawsuits from the United States and the European Union. What did Gates’s monopoly cost us? It’s hard to calculate the size of that debt.

The Bill and Melinda Gates Foundation was launched in 2000 and has \$46.8 billion in assets. It is the largest charitable foundation in the world and distributes more aid for global health than any government. One of the foundation’s stated goals is to globally enhance healthcare and reduce extreme poverty. The Gates Foundation is a major funder of CGIAR—a global partnership whose stated aim is to strive for a food-secured future. Its research is aimed at reducing rural poverty, increasing food security, improving human health and nutrition and ensuring sustainable management of natural resources.

In 2016, the Gates Foundation was accused of dangerously and unaccountably distorting the direction of international development. The charges were laid out in a report by Global Justice Now: “Gated Development: Is the Gates Foundation always a force for good?” According to the report, the foundation’s strategy is based on deepening the role of multinational companies in the Global South.

“The Gates Foundation has rapidly become the most influential actor in the world of global health and agricultural policies, but there’s no oversight or accountability in how that influence is managed.”

This concentration of power and influence is even more problematic when you consider that the philanthropic vision of the Gates Foundation seems to be largely based on the values of corporate America:

“The foundation is relentlessly promoting big business-based initiatives such as industrial agriculture, private health care and education. But these are all potentially exacerbating the problems of poverty and lack of access to basic resources that the foundation is supposed to be alleviating.”

The foundation’s promotion of industrial agriculture across Africa will undermine existing sustainable, small-scale farming that is providing the vast majority of food across the continent. The foundation is working with US agri-commodity trader Cargill in an \$8 million project to “develop the soya value chain” in southern Africa. Cargill is the biggest global player in the production of and trade in soya with heavy investments in South America where GM soya monocrops—and associated agrochemicals—have displaced rural populations and caused health problems and environmental damage. The Gates-funded project will likely enable Cargill to capture a hitherto untapped African soya market and eventually introduce GM soya onto the continent.

The Gates Foundation is also supporting projects involving other chemical and seed corporations, including DuPont, Syngenta and Bayer. It is effectively promoting a model of industrial agriculture, the increasing use of agrochemicals and patented seeds, the privatization of extension services, and a very large focus on genetically modified crops.

What the Gates Foundation is doing is part of the Alliance for a Green Revolution in Africa (AGRA) initiative, which is based on the premise that hunger and malnutrition in Africa are mainly the result of a lack of technology and functioning markets. AGRA has been intervening directly

in the formulation of African governments' agricultural policies on issues like seeds and land, opening up African markets to US agribusiness.

More than 80% of Africa's seed supply comes from millions of small-scale farmers recycling and exchanging seed from year to year. But AGRA is promoting the commercial production of seed and is thus supporting the introduction of commercial (chemical-dependent) seed systems, which risk enabling a few large companies to control seed research and development, production, and distribution. Over the past two decades, a long and slow process of national seed law reviews, sponsored by USAID and the G8 along with Bill Gates and others, has opened the door to multinational corporations' involvement in seed production, including the acquisition of every sizable seed enterprise on the African continent.

The Gates Foundation is also very active in the area of health, which is ironic given its promotion of industrial agriculture and its reliance on health-damaging agrochemicals. The Gates Foundation is also reported to be collaborating in Bayer's promotion of "new chemical approaches" and "biological crop protection" (i.e. encouraging agrochemical sales and GM crops) in the Global South.

After having read the recent "A Future for the World's Children? A WHO-UNICEF-Lancet Commission," one might have noticed that pesticides were conspicuous by their absence. In the report there is much talk about greater regulation of marketing of tobacco, alcohol, formula milk, and sugar-sweetened beverages, but no mention of pesticides. But perhaps this should come as little surprise: some 42 authors are attached to the report and in one way or another via the organizations they belong to, many—if not most—have received funding from the Bill and Melinda Gates Foundation.

The Gates Foundation is a prominent funder of the World Health Organization and UNICEF. Gates has been the largest or second-largest contributor to the WHO's budget in recent years. His foundation provided 11% of the WHO's entire budget in 2015, which is 14 times greater than the UK government's contribution. Perhaps this sheds some light onto why a major report on child health would omit the effects of pesticides. This is a serious omission given what the UN expert on toxics, Baskut Tuncak, said in 2017:

"Our children are growing up exposed to a toxic cocktail of weedkillers, insecticides, and fungicides. It's on their food and in their water, and it's even doused over their parks and playgrounds. Many governments insist that our standards of protection from these pesticides are strong enough. But as a scientist and a lawyer who specializes in chemicals and their potential impact on people's fundamental rights, I beg to differ. Last month

it was revealed that in recommending that glyphosate—the world’s most widely-used pesticide—was safe, the EU’s food safety watchdog copied and pasted pages of a report directly from Monsanto, the pesticide’s manufacturer. Revelations like these are simply shocking.”

In February 2020, Tuncak rejected the idea that the risks posed by highly hazardous pesticides could be managed safely. There is nothing sustainable about the widespread use of highly hazardous pesticides for agriculture. Whether they poison workers, extinguish biodiversity, persist in the environment, or accumulate in a mother’s breast milk, Tuncak argued that these are unsustainable, cannot be used safely, and should have been phased out of use long ago.

“The UN Convention on the Rights of the Child, the most ratified international human rights treaty in the world (only the US is not a party), makes it clear that states have an explicit obligation to protect children from exposure to toxic chemicals, from contaminated food and polluted water, and to ensure that every child can realize their right to the highest attainable standard of health. These and many other rights of the child are abused by the current pesticide regime. These chemicals are everywhere and they are invisible.”

Pediatricians have referred to childhood exposure to pesticides as creating a “silent pandemic” of disease and disability. Exposure in pregnancy and childhood is linked to birth defects, diabetes, and cancer. And children are particularly vulnerable to these toxic chemicals: increasing evidence shows that even at ‘low’ doses of childhood exposure, irreversible health impacts can result. The overwhelming reliance of regulators on industry-funded studies, the exclusion of independent science from assessments, and the confidentiality of studies relied upon by authorities must change.

However, it seems that the profits of agrochemical manufacturers trump the rights of children and the public at large: an investigation has found the world’s five biggest pesticide manufacturers are making more than a third of their income from leading products, chemicals that pose serious hazards to human health and the environment. Consider an analysis of a huge database of 2018’s top-selling “crop protection products” which revealed the world’s leading agrochemical companies made more than 35% of their sales from pesticides classed as “highly hazardous” to people, animals or ecosystems. The investigation identified billions of dollars of income

for agrochemical giants BASF, Bayer, Corteva, FMC, and Syngenta from chemicals found by regulatory authorities to pose health hazards like cancer or reproductive failure. This investigation is based on an analysis of a huge dataset of pesticide sales from the agribusiness intelligence company Phillips McDougall. This firm conducts detailed market research all over the world and sells databases and intelligence to pesticide companies. The data covers around 40% of the \$57 billion global market for agricultural pesticides in 2018. It focuses on 43 countries, which between them represent more than 90% of the global pesticide market by value.

While Bill Gates promotes a chemical-intensive model of agriculture that dovetails with the needs and value chains of agri-food conglomerates, some outline the spiraling rates of disease in the UK and the US and lay the blame at the door of the agrochemical corporations that Gates has opted to get into bed with. They focus on the impact of glyphosate-based herbicides as well as the cocktail of chemicals sprayed on crops.

Peer-reviewed studies and official statistics indicate that glyphosate affects the gut microbiome and is responsible for a global metabolic health crisis provoked by an obesity epidemic. Moreover, there is evidence that glyphosate causes epigenetic changes in humans and animals. However, the mainstream narrative is to blame individuals for their ailments and conditions which are said to result from “lifestyle choices.” Yet Monsanto’s German owner Bayer has confirmed that more than 42,700 people have filed suits against Monsanto alleging that exposure to Roundup herbicide caused them or their loved ones to develop non-Hodgkin lymphoma and that Monsanto covered up the risks.

Each year there are steady increases in the numbers of new cancers and increases in deaths from the same cancers, with no treatments making any difference to the numbers; at the same time, these treatments maximize the bottom line of the drug companies while the impacts of agrochemicals remains conspicuously absent from the disease narrative. We are exposed to a lifetime’s exposure to thousands of synthetic chemicals that contaminate the blood and urine of nearly every person tested—“a global mass poisoning.”

As part of its hegemonic strategy, the Gates Foundation says it wants to ensure global food security and optimize health and nutrition. However, the Gates Foundation seems happy to ignore the deleterious health impacts of agrochemicals while promoting the interests of the firms that produce them. And it facilitates many health programmes that help boost the bottom line of drug companies.

Health and health programmes seem only to be defined with certain parameters which facilitate the selling of the products of the major pharmaceutical companies which the foundation partners with. Indeed, the Gates

Foundation not merely facilitates unethical low-cost clinical trials in the Global South—with often devastating effects for participants—but also assists in the creating new markets for the dubious products of pharmaceuticals corporations.

As for food security, the foundation would do better by supporting agroecological (agrochemical-free) approaches to agriculture, which various high-level UN reports have advocated for ensuring equitable global food security. But this would leave smallholder agriculture both intact and independent from Western agro-capital, something which runs counter to the underlying aims of the corporations that the foundation supports: dispossession and market dependency.

And these aims have been part of a decades-long strategy where we have seen the strengthening of an emerging global food regime based on agro-export mono-cropping linked to sovereign debt repayment and World Bank/IMF “structural adjustment” directives. The outcomes have included a displacement of a food-producing peasantry, the consolidation of Western agri-food oligopolies, and the transformation of many countries from food self-sufficiency into food deficit areas.

While Bill Gates is busy supporting the consolidation of Western agro-capital in Africa under the guise of ensuring “food security,” it is very convenient for him to ignore the fact that at the time of decolonization in the 1960s, Africa was not just self-sufficient in food but was actually a net food exporter, with exports averaging 1.3 million tons a year between 1966–70.

The continent now imports 25% of its food, with almost every country being a net food importer. More generally, developing countries produced a billion-dollar yearly surplus in the 1970s but by 2004 were importing \$11 billion a year.

The Gates Foundation promotes a heavily subsidized and inefficient—certainly when the externalized health, social, and environment costs are factored in—corporate-industrial farming system and the strengthening of a global neoliberal, fossil-fuel-dependent food regime that by its very nature fuels and thrives on, among other things, unjust trade policies, population displacement and land dispossession (something which the Gates Foundation once called for but euphemistically termed “land mobility”), commodity monocropping, soil and environmental degradation, illness, nutrient-deficient diets, a narrowing of the range of food crops, water shortages, pollution, and the eradication of biodiversity.

At the same time, the foundation is helping powerful corporate interests to appropriate and commodify knowledge. For instance, since 2003, CGIAR and its 15 centres have received more than \$720 million from the Gates

Foundation. The centres are accelerating the transfer of research and seeds to corporations, facilitating intellectual property piracy and seed monopolies created through IP laws and seed regulations. Besides taking control of the seeds of farmers in CGIAR seed banks, the Gates Foundation—along with the Rockefeller Foundation—is investing heavily in collecting seeds from across the world and storing them in a facility in Svalbard in the Arctic—the “doomsday vault.” The foundation is also funding Diversity Seek (DivSeek), a global initiative to take patents on the seed collections through genomic mapping. Seven million crop accessions are in public seed banks. DivSeek could allow five corporations to own this diversity.

“Today, biopiracy is carried out through the convergence of information technology and biotechnology. It is done by taking patents by ‘mapping’ genomes and genome sequences. DivSeek is a global project launched in 2015 to map the genetic data of the peasant diversity of seeds held in gene banks. It robs the peasants of their seeds and knowledge, it robs the seed of its integrity and diversity, its evolutionary history, its link to the soil, and reduces it to ‘code.’ It is an extractive project to ‘mine’ the data in the seed to ‘censor’ out the commons.”

The peasants who evolved this diversity have no place in DivSeek; their knowledge is being mined and not recognized, honoured, or conserved—an enclosure of the genetic commons. This process is the very foundation of capitalism: appropriation of the commons—seeds, water, knowledge, land, et cetera—which are then made artificially scarce and transformed into marketable commodities.

The Gates Foundation talks about health but facilitates the roll-out of a toxic form of agriculture whose agrochemicals cause immense damage. It talks of alleviating poverty and malnutrition and tackling food insecurity but it bolsters an inherently unjust global food regime which is responsible for perpetuating food insecurity, population displacement, land dispossession, privatization of the commons and neoliberal policies that remove support from the vulnerable and marginalized, while providing lavish subsidies to corporations.

The Gates Foundation is part of the problem, not the solution. The ultimate aim of promoting new technologies—whether GM seeds, agrochemicals, or commodified knowledge—on a colossal scale is to make agricultural inputs and outputs essential commodities, create dependency, and bring all farming operations into the capitalist fold.

To properly understand Bill Gates's "philanthropy" is not to take stated goals and objectives at face value but to regard his ideology as an attempt to manufacture consent and prevent and marginalize more radical agrarian change that would challenge prevailing power structures and act as impediments to capitalist interests. The foundation's activities must be located within the hegemonic and dispossessive strategies of imperialism: displacement of the peasantry and subjugating those who remain in agriculture to the needs of global distribution and supply chains dominated by the Western agri-food conglomerates whose interests the Gates Foundation facilitates and legitimizes.

The initiatives mostly aren't democratic, nor do they reflect collective problem-solving or universal solutions. Rather, they favor the use of the private sector and its charitable spoils, the market way of looking at things, and the bypassing of government. They reflect a highly influential view that the winners of an unjust status quo—and the tools and mentalities and values that helped them win—are the secret to redressing the injustices. Those at greatest risk of being resented in an age of inequality are thereby recast as our saviors from an age of inequality. Socially minded financiers at Goldman Sachs seek to change the world through "win-win" initiatives like "green bonds" and "impact investing." Tech companies like Uber and Airbnb cast themselves as empowering the poor by allowing them to chauffeur people around or rent out spare rooms. Management consultants and Wall Street brains seek to convince the social sector that they should guide its pursuit of greater equality by assuming board seats and leadership positions.

Conferences and idea festivals sponsored by plutocrats and big business host panels on injustice and promote "thought leaders" who are willing to confine their thinking to improving lives within the faulty system rather than tackling the faults. Profitable companies built in questionable ways and employing reckless means engage in corporate social responsibility, and some rich people make a splash by "giving back"—regardless of the fact that they may have caused serious societal problems as they built their fortunes. Elite networking forums like the Aspen Institute and the Clinton Global Initiative groom the rich to be self-appointed leaders of social change, taking on the problems people like them have been instrumental in creating or sustaining. A new breed of community-minded so-called 'B Corporations' has been born, reflecting a faith that more enlightened corporate self-interest—rather than, say, public regulation—is the surest guarantor of the public welfare. A pair of Silicon Valley billionaires fund an initiative to rethink the Democratic Party, and one of them can claim, without a hint of irony, that their goals are to amplify the voices of the powerless and reduce the political influence of rich people like them.

There are many ways to make sense of all this elite concern and predation. One is that the elites are doing the best they can. The world is what it is; the system is what it is; the forces of the age are bigger than anyone can resist; the most fortunate are helping. This view may allow that this helpfulness is just a drop in the bucket, but it is something. The slightly more critical view is that this elite-led change is well-meaning but inadequate. It treats symptoms, not root causes; it does not change the fundamentals of what ails us. According to this view, elites are shirking the duty of more meaningful reform.

But there is still another, darker way of judging what goes on when elites put themselves in the vanguard of social change: that it not only fails to make things better, but also serves to keep things as they are. After all, it takes the edge off of some of the public's anger at being excluded from progress. It improves the image of the winners. With its private and voluntary half-measures, it crowds out public solutions that would solve problems for everyone, and do so with or without the elite's blessing. There is no question that the outpouring of elite-led social change in our era does great good and soothes pain and saves lives. But we should also recall Oscar Wilde's words about such elite helpfulness being "not a solution" but "an aggravation of the difficulty." More than a century ago, in an age of churn like our own, he wrote:

"Just as the worst slave-owners were those who were kind to their slaves, and so prevented the horror of the system being realized by those who suffered from it, and understood by those who contemplated it, so, in the present state of things in England, the people who do most harm are the people who try to do most good."

Wilde's formulation may sound extreme to modern ears. How can there be anything wrong with trying to do good? The answer may be: when the good is an accomplice to even greater, perhaps more invisible, harm. In our era that harm is the concentration of money and power among a small few, who reap from that concentration a near monopoly on the benefits of change. And do-gooding pursued by elites tends not only to leave this concentration untouched, but actually to shore it up. For when elites assume leadership of social change, they are able to reshape what social change is—above all, to present it as something that should never threaten winners. In an age defined by a chasm between those who have power and those who don't, elites have spread the idea that people must be helped, but only in market-friendly ways that do not upset fundamental power equations.

The society should be changed in ways that do not change the underlying economic system that has allowed the winners to win and fostered many of the problems they seek to solve. The broad fidelity to this law helps make sense of what we observe all around: the powerful fighting to “change the world” in ways that essentially keep it the same, and “giving back” in ways that sustain an indefensible distribution of influence, resources, and tools. Is there a better way?

One thing that unites those who voted for Trump and those who despaired at his being elected is a sense that the country requires transformational reform. The question we confront is whether moneyed elites, who already rule the roost in the economy and exert enormous influence in the corridors of political power, should be allowed to continue their conquest of social change and of the pursuit of greater equality. The only thing better than controlling money and power is to control the efforts to question the distribution of money and power. The only thing better than being a fox is being a fox asked to watch over hens.

“She had absorbed the ascendant message, all but unavoidable for the elite American college student, that those tools were essential to serving others. The best way to bring about meaningful reform was to apprentice in the bowels of the status quo.”

Much of what appears to be reform in our time is in fact the defense of stasis. When we see through the myths that foster this misperception, the path to genuine change will come into view. It will once again be possible to improve the world without permission slips from the powerful.

Some argue that the new private world-changing, led by people, businesses, foundations, is preferable to the old-fashioned public, democratic way:

“In a bygone era government was solely responsible for addressing the nation’s biggest problems, from building the interstate highway system to the New Deal social programs. However, today’s challenges are more complicated and interconnected than ever before and cannot be solved by a single actor or solution. That is why government has an opportunity to engage with the actors in the Impact Economy from non-profits to businesses.”

It is curious to see the US government, arguably the most powerful institution in human history, reduced to being a “single actor” among actors, one inadequate to modern problems. Building a continental highway network

or waging a New Deal was easy, according to this view. But today's problems were too hard for the government. They had therefore to be solved through partnerships among rich donors, NGOs, and the public sector. There is no mention of the fact that this method, by putting the moneyed into a leadership position on public problem-solving, gives them the power to thwart solutions that threaten them. If your preferred way of solving big problems requires my money and gives me a board seat on the initiative, I may not encourage solutions involving inheritance taxes or the breakup of companies like the one from which I have made the money I am giving.

These elites believe and promote the idea that social change should be pursued principally through the free market and voluntary action, not public life and the law and the reform of the systems that people share in common; that it should be supervised by the winners of capitalism and their allies, and not be antagonistic to their needs; and that the biggest beneficiaries of the status quo should play a leading role in the status quo's reform.

Neoliberalism is a theory of political economic practices that proposes that human well-being can best be advanced by liberating individual entrepreneurial freedoms and skills within an institutional framework characterized by strong private property rights, free markets, and free trade. Where the theory goes, deregulation, privatization, and withdrawal of the state from many areas of social provision tend to follow. While personal and individual freedom in the marketplace is guaranteed, each individual is held responsible and accountable for his or her own actions and well-being. This principle extends into the realms of welfare, education, health care, and even pensions. It has ushered in a new age of responsibility, in which responsibility—which once meant the moral duty to help and support others—has come to suggest an obligation to be self-sufficient.

“It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages.”

This idea that self-love trickles down to others is an early ancestor of win-win-ism. In his *Theory of Moral Sentiments*, Smith elaborates on the idea with his famous metaphor of the “invisible hand.”

“The rich in spite of their natural selfishness and rapacity, though they mean only their own conveniency, though the sole end which they propose from the labours of all the thousands

whom they employ, be the gratification of their own vain and insatiable desires, they divide with the poor the produce of all their improvements. They are led by an invisible hand to make nearly the same distribution of the necessaries of life, which would have been made, had the earth been divided into equal portions among all its inhabitants, and thus without intending it, without knowing it, advance the interest of the society.”

The selfish pursuit of prosperity, Smith is arguing, takes care of everyone just as well as actually attempting to take care of everyone. From this general idea familiar theories derive. Trickle-down economics. A rising tide lifts all boats. Entrepreneurs expand the pie. Smith tells the rich man to focus on running his business on the assumption that positive social consequences will occur automatically, as a happy by-product of his selfishness. Through the magic of the “free market”—an oxymoron ever since the first regulation was imposed on it—he unwittingly arranges for the common good.

The new win-win-ism is arguably a far more radical theory than the “invisible hand.” That old idea merely implied that capitalists should not be excessively regulated, lest the happy by-products of their greed not reach the poor. The new idea goes further, in suggesting that capitalists are more capable than any government could ever be of solving the underdogs’ problems.

She could tell herself what so many bright young people tell themselves these days and thereby get through the months and years: that they are entering the world of money in order to master the tools needed to help those it has forsaken.

“Now that I’ve been trained to structure, break down, and solve business problems, I can apply those same skills to any issue or challenge I choose.”

Then she began to see through that idea. From the outside, she had been awed by the claim that people trained in business would gain some elusive way of thinking that was vital to helping people. Once inside, though, she realized that while this way of thinking was indeed useful for helping a tire company shave costs or a solar panel maker select a promising market for global expansion, it didn’t deserve its status as a cure-all across domains. Accountancy, medicine, education, espionage, and seafaring all have their own tools and modes of analysis, but none of those approaches was widely promoted as the solution to virtually everything else.

“It’s like, ‘Okay, we caused these problems, but we also know how to solve problems.’ So this is just the new problem that we’re going to solve—the one that we have caused.”

Perhaps the biggest risk of putting a corporate consulting firm in charge of designing fixes for societal problems is that it may sideline certain fundamental questions about power. The MarketWorld problem-solver does not tend to hunt for perpetrators and is not interested in blame.

Once seen as sacrificial to growth and returns, pursuing a social mission now plays a big role when attracting both customers and employees. Consider a Venn diagram used to illustrate an investment thesis created in view of this trend: One circle is labeled “Better for me (self-interest)”; the other is labeled “Better for the world (broader interest).” The overlap is labeled “exponential opportunity.” A charitable interpretation of this idea is that the world deserves to benefit from flourishing business. A more sinister interpretation is that business deserves to benefit from any attempt to better the condition of the world.

The working philosophy of many technology founders could be called Optimism, though in many ways it seems to be just a slightly tech-inflected version of standard-issue neoliberalism. The ideology’s central thrust is a belief in the possibility of the win-win and the harmony of human interests. People typically think of government and market working in opposition to each other—and regulation being the tool by which government constrains the market. This new ideology believes that government is an investor in capitalism. The government works not as a check on capitalism but for capitalism—to make capitalism successful, to ensure that the conditions for its success are in place: that there is a decent education system to produce the requisite number of workers, that trade agreements get written so as to allow companies to buy from and sell to far-off places, that the infrastructure allows trucks to get produce to the supermarket before it rots, that their property is protected.

“The next twenty, thirty years, my best piece of advice is stay alive. Don’t take really stupid risks, physically, I’m saying. And get ready, because the things that are coming down the pipe in terms of genetic research, our life spans and the health of our lives are going to be longer, and it’s going to challenge the very basis of our current civilization: The way things are structured today are not going to be relevant to what the reality is going to be of people who are going to have so much knowledge and

living so long and healthier lives. The idea of retiring at seventy is gonna seem like people telling you at thirty to retire.”

Here is someone who is engaging in advocacy that disguised itself as prophecy, which is common among technology barons and one of the ways in which they mask the fact of their power in an age rattled by the growing anxieties of the powerless. VCs and entrepreneurs are considered by many to be thinkers these days, their commercial utterances treated like ideas, and these ideas are often in the future tense: claims about the next world, forged by adding up the theses of their portfolio companies or extrapolating from their own start-up’s mission statement. That people listened to their ideas gave them a chance to launder their self-interested hopes into more selfless-sounding predictions about the world.

For example, a baron wishing to withhold benefits from workers might reframe that desire as a prediction about a future in which every human being is a solo entrepreneur. A social media billionaire keen to profit from the higher advertising revenue that video posts draw, compared to text ones, might recast that interest—and his rewriting of the powerful algorithms he owns to get what he wants—as a prediction that “I just think that we’re going to be in a world a few years from now where the vast majority of the content that people consume online will be video.” And it doesn’t hurt if you inflate your numbers too.

In the Valley, prediction has become a popular way of fighting for a particular future while claiming merely to be describing what has yet to occur. Prediction has a useful air of selflessness to it. Predictors aren’t caught in the here and now of their own appetites and interests. It seems like they aren’t choosing how things will be in the future any more than they chose the color of their eyes. Yet selecting one scenario among many possible scenarios and persuading everybody of its inevitability—and of the futility of a society’s exercising its collective choice among these futures—is a deft way to shape the future. As he predicted the elongation of life and other such “things that are coming down the pipe,” he was in fact pushing those things down the pipe. He was part of a group of elites who had been very smart and very lucky with start-up investments, and who now got to make decisions of enormous social consequence about what to do about the human life span. This power gave them great responsibility and exposed them to the possibility of resentment—unless they convinced people that the future they were fighting for would unfold automatically, would be the fruit of forces rather than their choices, of providence rather than power. Hence the cleverness of the passive framing of his own goals:

“The way things are structured today are not going to be relevant to what the reality is going to be.”

Longer lives for rich people were just something that happened to be coming down the pipe. Not so much a better health care system for all.

The stage lights came up from darkness. Cuddy stood center stage with her hands on her hips, her feet planted shoulder-width apart, tucked into a pair of brown cowboy boots that only added to what would come to be called her signature “power pose.” On the giant screen behind her was an image of Wonder Woman, whose hands and feet were in the same powerful posture, engaged in the same willful taking of space. What she and her colleagues had found was that standing in a forceful position like this could stir confidence in people—and perhaps blunt some effects of the sexism that she had long studied. For twenty seconds that felt like eternity, Cuddy stood there, looking powerful and remaining silent, as the Wonder Woman theme song played. She pivoted from side to side, holding her position.

Then she broke character and smiled. “I’m going to talk to you today about body language,” she began. The title of her talk, revealed on the second slide, was “Power Posing: Gain Power Through Body Language.” She began to explain her and her colleagues’ research showing that without changing any of the larger dynamics of power and sexism and prejudice, there were poses people could strike in private that would help them gain confidence. Without necessarily intending to, she was giving MarketWorld what it craved in a thinker: a way of framing a problem that made it about giving bits of power to those who lack it without taking power away from those who hold it. She was, to use a metaphor she would later employ, giving people a ladder up across a forbidding wall—without proposing to tear down the wall. She was giving people a way of rolling with the waves, instead of trying to stop the ocean.

We might start out by defining two distinct kinds of thinkers, who share in common a desire to develop important ideas and at the same time reach a broad audience. One of these types, the dying one, is the public intellectual, a wide-ranging critic and a foe of power; she perhaps stays aloof from the market, society, or the state, and she proudly bears a duty to point out when an emperor has no clothes. The ascendant type is the thought leader, who is more congenial to the plutocrats who sponsor so much intellectual production today. Thought leaders tend, to know one big thing and believe that their important idea will change the world; they are not skeptics but true believers; they are optimists, telling uplifting stories; they reason inductively from their own experiences more than deductively from authority. They go easy on the powerful. Public intellectuals argue

with each other in the pages of books and magazines; thought leaders give TED talks that leave little space for criticism or rebuttal, and emphasize hopeful solutions over systemic change. Public intellectuals pose a genuine threat to winners; thought leaders promote the winners' values, talking up "disruption, self-empowerment, and entrepreneurial ability."

It can be said that MarketWorld's circuit, and the world of the thought leader more generally, has had many virtuous effects. It has made ideas more accessible and available to many people. It has created, with the new form of videotaped talks, an alternative to the heavy tomes that many people, frankly, didn't read a generation ago and aren't about to start reading now. It has extended the opportunity to reach a wide audience to people from backgrounds long shut out by the old gatekeepers at publishing houses and newspapers. But the world of thought leadership is easily conquered by charlatans. It is long on affirmation without any constructive criticism, emphasizing beautiful storytelling and sidelining the hurly-burly of disputation that helps ideas to get better and keeps bad ones from attracting too many adherents. And it puts thinkers in a compromised relationship to the very thing they are supposed to keep honest and in check: power.

This phenomenon matters far beyond the world of thinkers, because on issue after issue, the ascendant thought leaders, if they are positive, unthreatening, mute about larger systems and structures, congenial to the rich, big into private problem-solving, devoted to win-wins—these thought leaders will edge out other voices, and not just at conferences. They get asked to write op-eds, sign book deals, opine on TV, advise presidents and premiers. And their success could be said to come at the expense of the critics'. For every thought leader who offered advice on how to build a career in a merciless new economy, there were many less-heard critics aspiring to make the economy less merciless.

In an age of inequality, these winners longed to feel, on one hand, that they had some kind of ethical philosophy. They needed language to justify themselves to themselves and others. They needed the idea of change itself to be redefined to emphasize rolling with the waves, instead of trying to stop the ocean. The thought leaders gave these winners what they needed.

The ability of a powerful group to reward those who agree with it and punish those who don't also distorts the marketplace of ideas. This isn't about corruption—beliefs naturally shift in accord with interests. As Upton Sinclair said, "It is difficult to get a man to understand something when his salary depends on not understanding it." The result can be an entire society twisted to serve the interests of its most powerful group.

The irony of all this is dark: Scaling back her critique of the system had allowed Cuddy to be wildly popular with MarketWorld elites and more

easily digested by the world at large; and so she became famous, which drew the system of sexism into her life as never before and heightened her awareness of it; and its ferocity convinced her not to take on that system but to conclude that it might never change; and this acquiescence made her turn from uprooting sexism to helping women survive it. She had been drafted into a growing brigade: the theorists of the kind of change that leaves the underlying issues untouched.

Strangely, one of the things that makes it easier to accept the system is that when you do, you will find yourself being told more often that you are changing things. Many genuine agents of change must make peace with never being seen as such, at least within their own lifetimes. One presumes that the scholars mentioned above, having coined the new verbiage of a nation awakening to the realities of identity and power, were rarely stopped on the street and told about the difference they had made in so-and-so's life. And Cuddy, during her years of throwing scholarly rocks at sexism and other prejudices, had to trust that she was changing things, but wasn't told so by the public. Yet when she scaled back her claims, when she depoliticized, when she focused on the actionable, when she accepted that she didn't "see the -isms going away," when she focused on how individual women could navigate a bad system, ironically, at that very moment of relinquishing hope of changing systems in a serious way, she began to be stopped everywhere she went by women who thanked her for changing their lives. Even if she had narrowed her ambitions, she was attracted to the personal gratification that came with the more doable kind of change.

What the thought leaders offer MarketWorld's winners, wittingly or unwittingly, is the semblance of being on the right side of change. The kinds of changes favored by the public in an age of inequality, as reflected from time to time in some electoral platforms, are usually unacceptable to elites. Simple rejection of those types of changes can only invite greater hostility toward the elites. It is more useful for the elites to be seen as favoring change—their kind of change, of course.

Take, for example, the question of educating poor children in a time of declining social mobility. A true critic might call for an end to funding schools by local property taxes and the creation, as in many advanced countries, of a common national pool that funds schools more or less equally. What a thought leader might offer MarketWorld and its winners is a kind of intellectual counteroffer—the idea, say, of using Big Data to better compensate star teachers and weed out bad ones. On the question of extreme wealth inequality, a critic might call for economic redistribution. A thought leader, by contrast, could opine on how foundation bosses should be paid higher salaries so that the poor can benefit from the most capable

leadership. When this denuding of criticism happens on not one or two issues but every issue of import, the thought leaders are not merely suppressing their own ideas and intuitions. They are also participating in MarketWorld's preservation of a troubled status quo by gesturing to change-making.

MarketWorld finds certain ideas more acceptable and less threatening than others and it does its part to help them through its patronage of thought leaders. For example, ideas framed as being about 'poverty' are more acceptable than ideas framed as being about 'inequality.' The two ideas are related. But poverty is a material fact of deprivation that does not point fingers, and inequality is something more worrying: It speaks of what some have and others lack; it flirts with the idea of injustice and wrongdoing; it is relational. Poverty is essentially a question that you can address via charity. A person of means, seeing poverty, can write a check and reduce that poverty. But inequality you can't, because inequality is not about giving back. Inequality is about how you make the money that you're giving back in the first place. Inequality is about the nature of the system. To fight inequality means to change the system. For a privileged person, it means to look into one's own privilege. And, you cannot change it by yourself. You can change the system only together. With charity, essentially, if you have money, you can do a lot of things alone.

Many plutocrats object to shining the spotlight on inequality, instead of the issues they are more comfortable talking about, like poverty or opportunity. They dislike framing the issue in a way that blames them rather than invites them to participate in a solution. They dislike a focus on how money is made rather than how it is given away.

"I just think you should stop ranting at inequality. It's a real turn-off."

In these circles this is an important taboo: Inspire the rich to do more good, but never, ever tell them to do less harm; inspire them to give back, but never, ever tell them to take less; inspire them to join the solution, but never, ever accuse them of being part of the problem.

"Wealth is like an orchard. You have to share the fruit, not the orchard."

A critic in the traditional mold is often a loser figure—a thorn, an outside agitator, a rumpiled cynic. The rising thought leaders, even though their product is ideas, are less like that and more like sidekicks of the powerful—buying parkas in the same Aspen stores, traveling the same conference circuit, reading the same Yuval Noah Harari books, getting paid from the

same corporate coffers, accepting the same basic consensus, observing the same intellectual taboos.

The creation of foundations allowed a small handful of wealthy people like Carnegie and Rockefeller to commit monumental sums of money to the public good and thus gain a say in the nation's affairs that rivaled that of many public officials. Vast new foundations concerned themselves not with niche causes so much as with the general welfare of mankind, much like states. The new philanthropy was professionally managed by an entity analogous to a corporation, and, like governments, it was advised by experts, unlike the more willy-nilly voluntary associations. It was important, Rockefeller wrote at the time, to do "this business of benevolence properly and effectively." This emerging philanthropy would be less and less about the local barn-raising, the coming together to solve common problems, and ever more about the private redistribution of wealth—usually first earned through private capitalist profitmaking—through a 'nonprofit sector.'

Of course, even if inequality was the price of progress, the rising millionaires of the age didn't have to extract quite so much from their industries, and pay the laborers quite so little. Refraining from such greed would allow the laborers to upgrade from cottages, if not to palaces, then at least to decent houses. Carnegie rejected this. There is no choice, he said, but to operate in the most aggressive, if miserly, way, lest you go out of business: Under the law of competition, the employer of thousands is forced into the strictest economies, among which the rates paid to labor figure prominently, and often there is friction between the employer and the employed, between capital and labor, between rich and poor. This is the first step of Carnegie's intellectual two-step: If you want progress, you have to let rich people make their money however they can, even if it widens inequality. Businesspersons deserve this permission, he said, because "this talent for organization and management is rare among men." Its methods aren't to be questioned.

"We accept and welcome therefore, as conditions to which we must accommodate ourselves, great inequality of environment, the concentration of business, industrial and commercial, in the hands of a few."

Lest there be doubt that these industrial stewards know best, Carnegie said their talent is "proved by the fact that it invariably secures for its possessor enormous rewards." In other words, rich people must be freed to make money however they can, because when they are, they tend to make a lot of money, which in turn brings progress for all. In this way, Carnegie effectively declared the economic system that generates wealth off-limits for the discussion.

The question then arises, and, if the foregoing be correct, it is the only question with which we have to deal: What is the proper mode of administering wealth after the laws upon which civilization is founded have thrown it into the hands of the few?

Actively giving one's own wealth away was the only approach Carnegie supported, because wealth, in his view, belonged to the community. Keeping was hoarding. A rich man should practice "modest, unostentatious living, shunning display or extravagance." Of what wealth remained, he was "the mere agent and trustee for his poorer brethren." Hoarding was thus akin to thieving the public:

"Men who continue hoarding great sums all their lives, the proper use of which for public ends would work good to the community, should be made to feel that the community, in the form of the state, cannot thus be deprived of its proper share."

Here the justifier of extreme taking had laid out a doctrine of extreme giving. It isn't just good to give to the public. Money that you don't need and that the public could employ isn't really your money. Carnegie was proposing an extreme idea of the right to make money in any which way, and an extreme idea of the obligation to give back.

It is a strange, seemingly contradictory picture: Carnegie at his desk, writing one letter to his lieutenants at the Carnegie Steel Company, imploring them to slash wages, then writing another to one of his philanthropic lieutenants, giving his wealth (the profits earned by slashing those wages) away at his own discretion. For Carnegie, then, inequality was a brief state between the taking and giving phases. Giving back, he wrote, is "the true antidote for the temporary unequal distribution of wealth, the reconciliation of the rich and the poor—a reign of harmony." This idea of temporary inequality is vital: For Carnegie, inequality is transitional—a necessity for progress, but soon reversible thanks to the fruits of that progress.

Carnegie believed that he could not pay workers well, could not be sentimental about how many hours of work were too many, for that would hurt the public interest. But he could give back to the workers. He financed libraries, museums, and other public amenities for the eventual pleasure and edification of his underpaid workers.

"Thus is the problem of Rich and Poor to be solved. The laws of accumulation will be left free; the laws of distribution free. Individualism will continue, but the millionaire will be but a trustee for the poor; intrusted for a season with a great part of the increased wealth of the community, but administering it

for the community far better than it could or would have done for itself.”

This is the compromise, the truce, distilled: Leave us alone in the competitive marketplace, and we will tend to you after the winnings are won. The money will be spent more wisely on you than it would be by you. You will have your chance to enjoy our wealth, in the way we think you should enjoy it. Here lay the almost constitutional principles that one day would govern MarketWorld giving: the idea that after-the-fact benevolence justifies anything-goes capitalism; that callousness and injustice in the cutthroat souk are excused by later philanthropy; that giving should not only help the underdogs but also, and more important, serve to keep them out of the top dogs’ hair—and, above all, that generosity is a substitute for and a means of avoiding the necessity of a more just and equitable system and a fairer distribution of power.

He just didn’t trust society to allocate the money properly on his behalf. As the greatest philanthropist of his day, Carnegie managed to remake history. Still surrounded by the libraries and music halls he funded, most people forgot how he amassed his fortune to begin with: by taking illegal kickbacks as a railroad executive, leveraging them into a steel empire protected by government tariffs, colluding with his fellow steel makers to fix prices, and busting unions to keep work hours long and wages low. Carnegie believed all the while that his philanthropic ends justified the brutal means he used to build his wealth. Though not a religious man, he conceived a kind of divine order that placed him at the top. He held up the writings of Herbert Spencer, a philosopher who saw Carnegie and his fellow tycoons as harbingers of a natural march toward prosperity and perfection.

It makes sense, in this light, that the billionaires who oppose higher taxes often philanthropize the most—like Stephen Schwarzman of Blackstone, the private-equity giant. They too want to give back, just on their own terms. Governments are not efficient, the thinking goes; businessmen are. Take this vision to its logical end, and it’s public policy privatized. Philanthropy can do real good, and government can make bad spending decisions, but as these guys have so much power through their wealth that they, instead of the government elected by the people, can decide what’s good and what should be promoted and subsidized. All while hiding behind fig leaves such as the Giving Pledge.

He has a foundation that carries his name. Over the years he’s funded fifteen-hundred scholarships for Brazilians to study abroad and made generous gifts to Harvard, Stanford, and UCLA. He spends money to improve Brazilian public education too. These are good causes. If you add it all up,

though, it appears to be less than what his beer empire spends on lobbying and political campaigns in the United States and Brazil. One of Lemann's largest gifts, a fourteen-million-dollar donation to the University of Illinois, amounted to less than 0.1 percent of his wealth. For someone with a net worth of a hundred-thousand dollars, an equivalent donation would be less than a hundred dollars.

“The key is to meet people where they are and not be judgmental. When I worked in Harlem, it was hard getting parents to bring kids to medical appointments. There was a temptation to judge and criticize: Here we are trying to help you, and you can't even get up off your couch. That's not the right approach. They have their own logic, their own story. You don't knock on the door and say, ‘You're a loser. You're a bad’ You've got to meet people where they are.

That's my view writ large. And so where we're meeting them [the highly privileged] where they are, which is they actually believe that they are doing good, they are contributing to our economy. They're contributing to the tax base. They are contributing to philanthropy through their own personal giving and commitments to boards and whatever. So that's where they are.”

The analogy is telling, because it illustrates how an ethic of not judging that had developed to protect the weak could serve just as well to guard the strong. Meeting people where they are means one thing when applied to a mother in Harlem, juggling three jobs, two kids, and their appointments. It is quite another thing for the private equity tycoon to enjoy that same suspension of judgment. Should he, like the mother, really be met wherever he is?

Renzi dropped a casual aside in talking about his labor-market reforms that reflected another aspect of the globalist consensus. He said Italy's rewriting, the previous year, of its hiring-and-firing laws had finally caught the country up to the standards of Germany and Britain. He added, “Obviously, USA arrived to this point twenty years ago.” The globalists believed that there were “right answers” in public policy—answers that made a place safe for the foreign investors that Macri had been worried about—and having a very flexible labor market, in which it is easy to hire and fire people, is one of those right answers. The right answer, then, was not arrived at democratically: It was not the answer the people of Italy had chosen, by action or inaction, during those twenty years of “delay.” It was

a globalist truism that hovered over the country, waiting for it to get with the program and accept the prudent way of the world. And when at last it did, the nation's prime minister could describe those earlier years, defined by other choices, as a delay. Italians, not famous for punctuality, were late in arriving at the globalists' "right answer." Leaders like Renzi saw the checklist program pushed by multilateral agencies and foreign investors as possessing a moral validity that democratic choices by his citizens lacked, because they were bad for efficiency and growth.

Bill Clinton piled on to this idea of false consciousness:

"All these English counties voted to give up economic aid from the EU. And they needed it, but they had no idea what they were doing. They just wanted to come inside and close the door. There is a kind of a visceral us-and-them mentality developing."

This was the diagnosis of the former president of the United States a few months after Brexit's unexpected success, and two months before his wife's unexpected defeat to a populist demagogue who allied himself with the Brexit campaign. The people setting themselves the task of understanding the anger around them were precommitted to the idea that the anger had no possible basis in reason or conscious choice. They could not process people who saw the world fundamentally differently than MarketWorlders did and, misguided or not, wanted to be heard.

Here was represented the complex of Clinton Global Initiative (CGI) values in a single panel: doing the market-friendly thing instead of the idealistic thing; elevating what the people supposedly needed economically over what they wanted politically; believing that the right, data-driven, technocratic answers speak for themselves; judging politicians' success by investors' returns; thinking of market forces as an inevitability one must give in to, make way for, adapt to.

The four panelists and Clinton speculated about "these people," as Okonjo-Iweala called them. They mused about the anger on the other side and came up with convenient theories. Clinton offered that "the conflict model works better at a time of economic distress." Okonjo-Iweala suggested that making vaccines more accessible—her bailiwick as the leader of a global vaccine alliance called GAVI—might help to reduce anger. She didn't mention the bankers for whom she now worked, and how it might also reduce anger if they were punished for their sins, if they compensated the public for the bailouts they got, if they had the humility to stop thwarting regulation of their conduct. She plugged vaccines to the MarketWorld crowd

in language they would understand: They didn't just save lives; they were an investment, for healthy citizens mean more growth and taxes paid and companies started. Vaccines, she said, are "one of the best buys in economics today," since "\$1 invested in vaccines returns \$16." She gushed, "The rate of return on that is very high."

A moment later, Okonjo-Iweala said the globalist tribe represented in the room needed to "debunk those who are trying to use them as a platform"—the 'them' being the angry voters. The people were being used; they were rubes. There was a total refusal to accept that angry people were actively, concertedly trying to tell their fellow citizens something, however flawed. And they weren't here to tell them what it was in person. The panel members saw themselves as above and apart from fearful, conflictual politics. Their politics was technocratic, dedicated to discovering right answers that were knowable and out there, and just needed to be analyzed and spreadsheeted into being. Their politics had borrowed from the business world the pleasantness and mutualism of the win-win. It was striking to have five political figures share a stage and have not one moment of real argument. They all seemed to suppose that the good society was the society of entrepreneurs, whose success was tantamount to that of the society itself. That the weaving of the world was among the most vital human strivings. That government should work as a partner to the private sector, not a counterweight to it.

"But we aren't engaging in politics when we come to CGI or Davos or the Aspen Institute or Skoll. We are just helping people."

Many—if not most—people who get together in these congregations don't think of what they're doing as politics. But of course it's politics. It's just a politics that has a different locus and has a different view of who matters and how you can change things, and has a different theory of change and who the agents of change are. To put it another way, if you are trying to shape the world for the better, you are engaging in a political act—which raises the question of whether you are employing an appropriately political process to guide the shaping. The problem with the globalists' vision of world citizens changing the world through partnerships is that you're not accountable to anybody, because it is just a bunch of other global citizens like you as your audience. The whole idea about having a polity, having a demos, is that there's accountability within that demos. That's what a political system is supposed to ensure and these mechanisms don't. The political system is not just Congress or the Supreme Court or governorships.

It is all of those things and other things. It is civic life. It is the habit of solving problems together, in the public sphere, through the tools of government and in the trenches of civil society. It is solving problems in ways that give the people you are helping a say in the solutions, that offer that say in equal measure to every citizen, that allow some kind of access to your deliberations or at least provide a meaningful feedback mechanism to tell you it isn't working. It is not re-imagining the world at conferences.

When elites solve public problems privately, they can do so in ways that contribute to democracy, and they can do so in ways that disrupt it. The former occurs when elite help contributes to and enlarges the public goods provided by the state, and attends to interests not readily provided for by the state. But the same elite help, backed by the same noble intentions, can instead disrupt democracy when it replaces the public sphere with all manner of private initiatives for special public purposes. These latter works don't simply do what government cannot do. They crowd out the public sector, further reducing both its legitimacy and its efficacy, and replace civic goals with narrower concerns about efficiency and markets.

How can private hotel ballroom hangouts have their way with democracies in possession of their own standing armies? The seasoned and astute private world-changer seeks to alter the public conversation about which social issues matter, sets an agenda for how they matter, and specifies who is the preferred provider of services to address these issues without any engagement with the deliberative processes of civil society. The savviest of these elite saviors recognize that they live in democracies and respect that. They don't ignore public opinion, but that doesn't mean they base their help on that opinion. The disruptive approach to private helping in lieu of soliciting public input, seeks to influence or change public opinion and demand.

For example, what you didn't hear asked at CGI was: Didn't the beauty industry fuel the very commodification of women that sustained gender inequality? In a world of true gender equality, might not the beauty industry shrink? Isn't it possible that there would be millions fewer nails done and heads blow-dried and bottles of foundation sold in the egalitarian world the panelists claimed to want? Whatever is deeply, essentially female—the life in a woman's expression, the feel of her flesh, the shape of her breasts, the transformations after childbirth of her skin—is being reclassified as ugly, and ugliness as disease. This perceived ugliness is good for business, because industries like retail and advertising—not to mention salons and plastic surgeons—are fueled by sexual dissatisfaction.

If anyone truly believes that the same ski-town conferences and fellowship programs, the same politicians and policies, the same entrepreneurs and social businesses, the same campaign donors, the same thought leaders, the

same consulting firms and protocols, the same philanthropists and reformed Goldman Sachs executives, the same win-wins and doing-well-by-doing-good initiatives and private solutions to public problems that had promised grandly, if superficially, to change the world—if anyone thinks that the MarketWorld complex of people and institutions and ideas that failed to prevent this mess even as it harped on making a difference, and whose neglect fueled populism’s flames, is also the solution, wake them up by tapping them, gently, with this book. For the inescapable answer to the overwhelming question—Where do we go from here?—is: somewhere other than where we have been going, led by people other than the people who have been leading us.

To do a modest bit of good while doing nothing about the larger system is to keep the painting. You are chewing on the fruit of an injustice. You may be working on a prison education program, but you are choosing not to prioritize the pursuit of wage and labor laws that would make people’s lives more stable and perhaps keep some of them out of jail. You may be sponsoring a loan forgiveness initiative for law school students, but you are choosing not to prioritize seeking a tax code that would take more from you and cut their debts. Your management consulting firm may be writing reports about unlocking trillions of dollars’ worth of women’s potential, but it is choosing not to advise its clients to stop lobbying against the social programs that have been shown in other societies to help women achieve the equality fantasized about in consultants’ reports.

Economistic reasoning dominates our age, and we may be tempted to focus on the first half of each of the above sentences—a marginal contribution you can see and touch—and to ignore the second half, involving a vaguer thing called complicity. But elites should view what they allow to be done in their name, what they refuse to resist, as being as much of a moral action as the initiatives they actively promote.

Today’s “climate wealth opportunity” is an opportunity for “philanthropists” to expand their epic largesse accumulated via the exploitation of labour coupled with the destruction of the natural world. Through the magic of language and framing, the money captured from the citizenry is repackaged as a gift from those that stole it. Criminals repackaged into divine beings via the media construct and societal conditioning.

No amount of charity in spending such fortunes can compensate in any way for the misconduct in acquiring them.

Billionaires use philanthropy to bribe us not to hate them. We must respond by redoubling our hate. Despite having wealth so vast that it is a challenge even to comprehend its magnitude, Jeff Bezos has long been known as one of the world’s stingiest billionaires. He was the only one of the

world's top five billionaires not to sign Warren Buffett's "Giving Pledge," and for a long time limited his charitable activity to such idiosyncratic gestures as giving away free bananas on the streets of Seattle. He lives extravagantly, having bought the largest private residence in Washington, D.C., a 27,000 square-foot megamansion, in addition to many other homes. Bezos has previously expressed little interest in charity, saying that instead he plans to spend his fortune on establishing his own private space program.

"The only way that I can see to deploy this much financial resource is by converting my Amazon winnings into space travel."

Lately, however, whether because his winnings have also purchased him a functioning heart or more likely because Bezos realizes that his status as a cartoonish villain could hurt Amazon's growth, Bezos has started giving out a bit of cash here and there. He started drawing up plans for a network of schools where "the child will be the customer," whatever that means—it sounds awful—and has recently publicly announced that he has given \$100 million on various anti-homelessness charities.

I am not very impressed by billionaires making large public donations to things, for a very simple reason: If you have billions of dollars, there is only so much luxury you can buy yourself. You can buy five houses, as Bezos has. But after a certain number of houses, it becomes impossible even to visit them all. Anyone who has played the game where you try to spend Bill Gates' money knows that it's not actually easy to come up with ways of frittering away billions upon billions of dollars even if you are extremely selfish. Once you have everything, though, there is still one thing you can spend your money on: power. Sure you've got a 27,000 square foot house. But you also have something else, something even more satisfying: You get to decide who lives and who dies. If you give a person who urgently needs medical treatment the money to pay for it, they will be in your debt forever. You will sacrifice nothing, and you will get to play God by going around bestowing your favor on those who please you.

That's basically what I think philanthropists are doing. They're just enjoying the power that comes with having a lot of money. Always think of billionaires like you would think of feudal lords. If a lord wanders the land handing out trinkets to his flatterers, do we think of him as a good person? No, of course not. Philanthropy is not selfless. You give up nothing and yet you get something in return: People tell you you're a wonderful person. Who wouldn't want that? It's just purchasing a good reputation.

Now, if the lord gave up all his riches and distributed them to the peasants, and didn't put out a press release about it but simply went to live

as a normal person, we might think of them quite differently. That might be admirable: They were given great power over other people, and instead of wielding it, they gave it out to others to decide for themselves how to use it. Instead of the lord's idiosyncratic preferences (bananas for all!) guiding what would happen in society, resources were divvied up democratically.

Let us talk briefly about what it means for a billionaire of Bezos' wealth to give away \$100 million. It is difficult to understand what billions of dollars really mean, but it's been pointed out that if you want to think about this in relatable terms, Bezos giving away this sum is basically the equivalent of a person earning \$50,000 giving away \$45. Similarly, Michael Bloomberg made the largest one-week political ad buy in history, spending \$31,000,000 or 0.06 percent of his net worth. For a family with the median net worth of \$97,300, this would be \$55.86. These comparisons are actually misleading, though, because they overstate how much Bezos or Bloomberg is "giving up." This is because of diminishing utility, familiar from economics 101. The difference in satisfaction between having zero cookies and one cookie is much greater than the difference between one cookie and two cookies, and by the time you get to the difference between 10 cookies and 11 cookies, it's negligible.

A person's first few dollars are very valuable. If a homeless person finds \$10 on the ground, it will be significant to them. \$10 does not mean the same thing to Jeff Bezos, however. In fact, it might not even be worth him pausing to pick up the money. So it's not necessarily right to say that Bezos giving \$100 million is the equivalent of you giving \$45. \$45 is a lot to you if you earn \$50,000 a year. For you, if you give the \$45 to charity, it could be one nice restaurant meal that you have to give up that year. Bezos, on the other hand, will never have to give up a nice restaurant meal ever in his life. So: Instead of saying that Bezos giving \$100 million is like you giving \$45, it's more accurate to say that Bezos giving \$100 million is like you giving... nothing. Absolutely nothing. It makes no difference to his life. He has sacrificed zilch.

I think this is important: We should not conspire in the belief that rich people are being good when they do charity work. They are doing something that is in their interest, for several reasons:

1. It lets them play God and essentially run society as they please. Bezos is interested in Montessori schools, so his schools are going to be Montessori. Not because that was decided democratically, but because being a billionaire makes you a kind of king.
2. People will flatter you and tell you how good you are.

3. It involves giving up absolutely nothing.

We on the left have contempt and scorn for billionaires who do this, in part because they are simply acting as private governments. Usually, they try to avoid paying taxes and will fight to the death before they accept any new forms of mandatory wealth redistribution—Amazon crushed a small tax in Seattle that was designed to help the homeless. What Bezos wants is not a democracy: He wants us to live in Bezosland, where the schools are as he designs them and more money is spent on his personal space travel than on housing. Mark Zuckerberg and Bill Gates are similar: Both were willing to spend money on education, if it was spent their way. This is not benevolence. It is megalomania, and should be treated accordingly.

The principle is simple. There should not be feudal lords making decisions for the rest of us. The fact that one individual can spend \$100 million and not even notice is a problem. At a time when schools are crumbling and 4 million children go homeless each year, it's despicable. It's very important that when someone like Bezos, who makes money by working his employees to the brink, tries to buy "moral credits" on the cheap, we heap contempt on him. We cannot let people like this get away with what they're trying to do, which is to soften our feelings toward them so that we will let them keep their status. They know that if the lord is evil, we will be more inclined to overthrow him, and if the lord appears good, it won't be as easy to make the case that a feudal system is indefensible.
